def _get_color_filter(name):
    """
    Given a color filter name, create a color filter function.

    Parameters
```

(continues on next page)

(continued from previous page)

```
    ----------
    name : str
        The color filter name, one of the following:

        - ``"none"``: ...
        - ``"greyscale"``: Convert the input to luminosity.
        - ``"deuteranopia"``: Simulate the most common form of red-green
          colorblindness.
        - ``"protanopia"``: Simulate a rarer form of red-green colorblindness.
        - ``"tritanopia"``: Simulate the rare form of blue-yellow
          colorblindness.

        Color conversions use `colorspacious`_.

    Returns
    -------
    callable
        A color filter function that has the form:

        def filter(input: np.ndarray[M, N, D])-> np.ndarray[M, N, D]

        where (M, N) are the image dimensions, and D is the color depth (3 for
        RGB, 4 for RGBA). Alpha is passed through unchanged and otherwise
        ignored.

SVG Histogram

Demonstrate how to create an interactive histogram, in which bars are hidden or shown by clicking on legend markers.

The interactivity is encoded in ecmascript (javascript) and inserted in the SVG code in a post-processing step. To render the image, open it in a web browser. SVG is supported in most web browsers used by Linux and OSX users. Windows IE9 supports SVG, but earlier versions do not.

Notes

The matplotlib backend lets us assign ids to each object. This is the mechanism used here to relate matplotlib objects created in python and the corresponding SVG constructs that are parsed in the second step. While flexible, ids are cumbersome to use for large collection of objects. Two mechanisms could be used to simplify things:

- systematic grouping of objects into SVG <g> tags,
- assigning classes to each SVG object according to its origin.

For example, instead of modifying the properties of each individual bar, the bars from the *hist* function could either be grouped in a PatchCollection, or be assigned a class="hist_##" attribute.

CSS could also be used more extensively to replace repetitive markup throughout the generated SVG.

SVG Tooltip

This example shows how to create a tooltip that will show up when hovering over a matplotlib patch.

Although it is possible to create the tooltip from CSS or javascript, here we create it in matplotlib and simply toggle its visibility on when hovering over the patch. This approach provides total control over the tooltip placement and appearance, at the expense of more code up front.

The alternative approach would be to put the tooltip content in `title` attributes of SVG objects. Then, using an existing js/CSS library, it would be relatively straightforward to create the tooltip in the browser. The content would be dictated by the `title` attribute, and the appearance by the CSS.

Tool Manager

This example demonstrates how to

- modify the Toolbar
- create tools
- add tools
- remove tools

using *matplotlib.backend_managers.ToolManager*.

```
import matplotlib.pyplot as plt

from matplotlib.backend_tools import ToolBase, ToolToggleBase

plt.rcParams['toolbar'] = 'toolmanager'

class ListTools(ToolBase):
    """List all the tools controlled by the `ToolManager`."""
    default_keymap = 'm'  # keyboard shortcut
    description = 'List Tools'

    def trigger(self, *args, **kwargs):
        print('_' * 80)
        fmt_tool = "{:12} {:45} {}".format
        print(fmt_tool('Name (id)', 'Tool description', 'Keymap'))
        print('-' * 80)
        tools = self.toolmanager.tools
        for name in sorted(tools):
            if not tools[name].description:
                continue
```

(continues on next page)

(continued from previous page)

```
            keys = ', '.join(sorted(self.toolmanager.get_tool_keymap(name)))
            print(fmt_tool(name, tools[name].description, keys))
        print('_' * 80)
        fmt_active_toggle = "{!s:12} {!s:45}".format
        print("Active Toggle tools")
        print(fmt_active_toggle("Group", "Active"))
        print('-' * 80)
        for group, active in self.toolmanager.active_toggle.items():
            print(fmt_active_toggle(group, active))

```
# the navigation group
fig.canvas.manager.toolbar.add_tool('Show', 'navigation', 1)

plt.show()
```

Embedding in a web application server (Flask)

When using Matplotlib in a web server it is strongly recommended to not use pyplot (pyplot maintains references to the opened figures to make *show* work, but this will cause memory leaks unless the figures are properly closed).

Since Matplotlib 3.1, one can directly create figures using the *Figure* constructor and save them to in-memory buffers. In older versions, it was necessary to explicitly instantiate an Agg canvas (see e.g. *CanvasAgg demo*).

The following example uses Flask, but other frameworks work similarly:

```
import base64
from io import BytesIO

from flask import Flask

from matplotlib.figure import Figure

app = Flask(__name__)

@app.route("/")
def hello():
    # Generate the figure **without using pyplot**.
    fig = Figure()
    ax = fig.subplots()
    ax.plot([1, 2])
    # Save it to a temporary buffer.
    buf = BytesIO()
    fig.savefig(buf, format="png")
    # Embed the result in the html output.
    data = base64.b64encode(buf.getbuffer()).decode("ascii")
    return f"<img src='{data}'/>"
```

Since the above code is a Flask application, it should be run using the flask command-line tool Assuming that the working directory contains this script:

Unix-like systems

```
FLASK_APP=web_application_server_sgskip flask run
```

Windows

```
set FLASK_APP=web_application_server_sgskip
flask run
```

Clickable images for HTML

Andrew Dalke of Dalke Scientific has written a nice article on how to make html click maps with Matplotlib agg PNGs. We would also like to add this functionality to SVG. If you are interested in contributing to these efforts that would be great.

Adding a cursor in WX

Example to draw a cursor and report the data coords in wx.

```
import wx

import numpy as np

from matplotlib.backends.backend_wx import NavigationToolbar2Wx
from matplotlib.backends.backend_wxagg import FigureCanvasWxAgg as␣
 ↪FigureCanvas
from matplotlib.figure import Figure

class CanvasFrame(wx.Frame):
    def __init__(self, ):
        super().__init__(None, -1, 'CanvasFrame', size=(550, 350))

        self.figure = Figure()
        self.axes = self.figure.add_subplot()
        t = np.arange(0.0, 3.0, 0.01)
        s = np.sin(2*np.pi*t)

        self.axes.plot(t, s)
        self.axes.set_xlabel('t')
        self.axes.set_ylabel('sin(t)')
        self.figure_canvas = FigureCanvas(self, -1, self.figure)

        # Note that event is a MplEvent
        self.figure_canvas.mpl_connect(
            'motion_notify_event', self.UpdateStatusBar)
        self.figure_canvas.Bind(wx.EVT_ENTER_WINDOW, self.ChangeCursor)

        self.sizer = wx.BoxSizer(wx.VERTICAL)
        self.sizer.Add(self.figure_canvas, 1, wx.LEFT | wx.TOP | wx.GROW)
        self.SetSizer(self.sizer)
        self.Fit()

        self.statusBar = wx.StatusBar(self, -1)
        self.SetStatusBar(self.statusBar)
```

(continues on next page)

(continued from previous page)

```
        self.toolbar = NavigationToolbar2Wx(self.figure_canvas)
        self.sizer.Add(self.toolbar, 0, wx.LEFT | wx.EXPAND)
        self.toolbar.Show()

    def ChangeCursor(self, event):
        self.figure_canvas.SetCursor(wx.Cursor(wx.CURSOR_BULLSEYE))

    def UpdateStatusBar(self, event):
        if event.inaxes:
            self.statusBar.SetStatusText(f"x={event.xdata}  y={event.ydata}")

class App(wx.App):
    def OnInit(self):
        """Create the main window and insert the custom frame."""
        frame = CanvasFrame()
        self.SetTopWindow(frame)
        frame.Show(True)
        return True

if __name__ == '__main__':
    app = App()
    app.MainLoop()
```

6.25.24 Widgets

Examples of how to write primitive, but GUI agnostic, widgets in matplotlib

Annotated cursor

Display a data cursor including a text box, which shows the plot point close to the mouse pointer.

The new cursor inherits from *Cursor* and demonstrates the creation of new widgets and their event callbacks.

See also the *cross hair cursor*, which implements a cursor tracking the plotted data, but without using inheritance and without displaying the currently tracked coordinates.

Note: The figure related to this example does not show the cursor, because that figure is automatically created in a build queue, where the first mouse movement, which triggers the cursor creation, is missing.

```
import matplotlib.pyplot as plt
import numpy as np

from matplotlib.backend_bases import MouseEvent
```

(continues on next page)

(continued from previous page)

```
from matplotlib.widgets import Cursor

class AnnotatedCursor(Cursor):
    """
    A crosshair cursor like `~matplotlib.widgets.Cursor` with a text showing \
    the current coordinates.

    For the cursor to remain responsive you must keep a reference to it.
    The data of the axis specified as *dataaxis* must be in ascending
    order. Otherwise, the `numpy.searchsorted` call might fail and the text
    disappears. You can satisfy the requirement by sorting the data you plot.
    Usually the data is already sorted (if it was created e.g. using
    `numpy.linspace`), but e.g. scatter plots might cause this problem.
    The cursor sticks to the plotted line.

    Parameters
    ----------
    line : `matplotlib.lines.Line2D`
        The plot line from which the data coordinates are displayed.

    numberformat : `python format string <https://docs.python.org/3/\
    library/string.html#formatstrings>`_, optional, default: "{0:.4g};{1:.4g}"
        The displayed text is created by calling *format()* on this string
        with the two coordinates.

    offset : (float, float) default: (5, 5)
        The offset in display (pixel) coordinates of the text position
        relative to the cross-hair.

    dataaxis : {"x", "y"}, optional, default: "x"
        If "x" is specified, the vertical cursor line sticks to the mouse
        pointer. The horizontal cursor line sticks to *line*
        at that x value. The text shows the data coordinates of *line*
        at the pointed x value. If you specify "y", it works in the opposite
        manner. But: For the "y" value, where the mouse points to, there might
        be multiple matching x values, if the plotted function is not␣
↪biunique.
        Cursor and text coordinate will always refer to only one x value.
        So if you use the parameter value "y", ensure that your function is
        biunique.

    Other Parameters
    ----------------
    textprops : `matplotlib.text` properties as dictionary
        Specifies the appearance of the rendered text object.

    **cursorargs : `matplotlib.widgets.Cursor` properties
        Arguments passed to the internal `~matplotlib.widgets.Cursor`␣
↪instance.
        The `matplotlib.axes.Axes` argument is mandatory! The parameter
        *useblit* can be set to *True* in order to achieve faster rendering.
```

(continues on next page)

(continued from previous page)

```
    """

Lasso Selector

Interactively selecting data points with the lasso tool.

This examples plots a scatter plot. You can then select a few points by drawing a lasso loop around the points on the graph. To draw, just click on the graph, hold, and drag it around the points you need to select.

```
import numpy as np

from matplotlib.path import Path
from matplotlib.widgets import LassoSelector

class SelectFromCollection:
    """
    Select indices from a matplotlib collection using `LassoSelector`.

    Selected indices are saved in the `ind` attribute. This tool fades out the
    points that are not part of the selection (i.e., reduces their alpha
    values). If your collection has alpha < 1, this tool will permanently
    alter the alpha values.

    Note that this tool selects collection objects based on their *origins*
    (i.e., `offsets`).

    Parameters
    ----------
    ax : `~matplotlib.axes.Axes`
        Axes to interact with.
    collection : `matplotlib.collections.Collection` subclass
        Collection you want to select from.
    alpha_other : 0 <= float <= 1
        To highlight a selection, this tool sets all selected points to an
        alpha value of 1 and non-selected points to *alpha_other*.
    """

Thresholding an Image with RangeSlider

Using the RangeSlider widget to control the thresholding of an image.

The RangeSlider widget can be used similarly to the *widgets.Slider* widget. The major difference is that RangeSlider's `val` attribute is a tuple of floats `(lower val, upper val)` rather than a single float.

See *Slider* for an example of using a `Slider` to control a single float.

See *Snapping Sliders to Discrete Values* for an example of having the `Slider` snap to discrete values.

```
import matplotlib.pyplot as plt
import numpy as np

from matplotlib.widgets import RangeSlider

# generate a fake image
np.random.seed(19680801)
N = 128

Slider

In this example, sliders are used to control the frequency and amplitude of a sine wave.

See *Snapping Sliders to Discrete Values* for an example of having the `Slider` snap to discrete values.

See *Thresholding an Image with RangeSlider* for an example of using a `RangeSlider` to define a range of values.

```
import matplotlib.pyplot as plt
import numpy as np

from matplotlib.widgets import Button, Slider
```

(continues on next page)

(continued from previous page)

```
# The parametrized function to be plotted
def f(t, amplitude, frequency):
    return amplitude * np.sin(2 * np.pi * frequency * t)

t = np.linspace(0, 1, 1000)

# Define initial parameters
init_amplitude = 5
init_frequency = 3

# Create the figure and the line that we will manipulate
fig, ax = plt.subplots()
line, = ax.plot(t, f(t, init_amplitude, init_frequency), lw=2)
ax.set_xlabel('Time [s]')

# adjust the main plot to make room for the sliders
fig.subplots_adjust(left=0.25, bottom=0.25)

# Make a horizontal slider to control the frequency.
axfreq = fig.add_axes([0.25, 0.1, 0.65, 0.03])
freq_slider = Slider(
    ax=axfreq,
    label='Frequency [Hz]',
    valmin=0.1,
    valmax=30,
    valinit=init_frequency,
)

# Make a vertically oriented slider to control the amplitude
axamp = fig.add_axes([0.1, 0.25, 0.0225, 0.63])
amp_slider = Slider(
    ax=axamp,
    label="Amplitude",
    valmin=0,
    valmax=10,
    valinit=init_amplitude,
    orientation="vertical"
)

# The function to be called anytime a slider's value changes
def update(val):
    line.set_ydata(f(t, amp_slider.val, freq_slider.val))
    fig.canvas.draw_idle()

# register the update function with each slider
freq_slider.on_changed(update)
amp_slider.on_changed(update)
```

(continues on next page)

Snapping Sliders to Discrete Values

You can snap slider values to discrete values using the `valstep` argument.

In this example the Freq slider is constrained to be multiples of pi, and the Amp slider uses an array as the `valstep` argument to more densely sample the first part of its range.

See *Slider* for an example of using a `Slider` to control a single float.

See *Thresholding an Image with RangeSlider* for an example of using a `RangeSlider` to define a range of values.

```
import matplotlib.pyplot as plt
import numpy as np

from matplotlib.widgets import Button, Slider

t = np.arange(0.0, 1.0, 0.001)
a0 = 5
f0 = 3
s = a0 * np.sin(2 * np.pi * f0 * t)

fig, ax = plt.subplots()
fig.subplots_adjust(bottom=0.25)
l, = ax.plot(t, s, lw=2)

ax_freq = fig.add_axes([0.25, 0.1, 0.65, 0.03])
ax_amp = fig.add_axes([0.25, 0.15, 0.65, 0.03])

# define the values to use for snapping
allowed_amplitudes = np.concatenate([np.linspace(.1, 5, 100), [6, 7, 8, 9]])

# create the sliders
samp = Slider(
    ax_amp, "Amp", 0.1, 9.0,
    valinit=a0, valstep=allowed_amplitudes,
    color="green"
)

sfreq = Slider(
    ax_freq, "Freq", 0, 10*np.pi,
    valinit=2*np.pi, valstep=np.pi,
    initcolor='none'  # Remove the line marking the valinit position.
)

def update(val):
    amp = samp.val
    freq = sfreq.val
    l.set_ydata(amp*np.sin(2*np.pi*freq*t))
    fig.canvas.draw_idle()
```

(continues on next page)

(continued from previous page)

```
sfreq.on_changed(update)
samp.on_changed(update)

ax_reset = fig.add_axes([0.8, 0.025, 0.1, 0.04])
button = Button(ax_reset, 'Reset', hovercolor='0.975')

def reset(event):
    sfreq.reset()
    samp.reset()
button.on_clicked(reset)

plt.show()
```

Span Selector

The *SpanSelector* is a mouse widget that enables selecting a range on an axis.

Here, an x-range can be selected on the upper axis; a detailed view of the selected range is then plotted on the lower axis.

Note: If the SpanSelector object is garbage collected you will lose the interactivity. You must keep a hard reference to it to prevent this.

```
import matplotlib.pyplot as plt
import numpy as np

from matplotlib.widgets import SpanSelector

# Fixing random state for reproducibility
np.random.seed(19680801)

fig, (ax1, ax2) = plt.subplots(2, figsize=(8, 6))

x = np.arange(0.0, 5.0, 0.01)
y = np.sin(2 * np.pi * x) + 0.5 * np.random.randn(len(x))

ax1.plot(x, y)
ax1.set_ylim(-2, 2)
ax1.set_title('Press left mouse button and drag '
              'to select a region in the top graph')

line2, = ax2.plot([], [])

def onselect(xmin, xmax):
    indmin, indmax = np.searchsorted(x, (xmin, xmax))
    indmax = min(len(x) - 1, indmax)

    region_x = x[indmin:indmax]
    region_y = y[indmin:indmax]

    if len(region_x) >= 2:
        line2.set_data(region_x, region_y)
        ax2.set_xlim(region_x[0], region_x[-1])
        ax2.set_ylim(region_y.min(), region_y.max())
        fig.canvas.draw_idle()

span = SpanSelector(
    ax1,
    onselect,
```

(continues on next page)

(continued from previous page)

```
    "horizontal",
    useblit=True,
    props=dict(alpha=0.5, facecolor="tab:blue"),
    interactive=True,
    drag_from_anywhere=True
)
# Set useblit=True on most backends for enhanced performance.

plt.show()
```

Textbox

The Textbox widget lets users interactively provide text input, including formulas. In this example, the plot is updated using the *on_submit* method. This method triggers the execution of the *submit* function when the user presses enter in the textbox or leaves the textbox.

Note: The *matplotlib.widgets.TextBox* widget is different from the following static elements: *Annotations* and *Placing text boxes*.

```
import matplotlib.pyplot as plt
import numpy as np

from matplotlib.widgets import TextBox

fig, ax = plt.subplots()
fig.subplots_adjust(bottom=0.2)

t = np.arange(-2.0, 2.0, 0.001)
l, = ax.plot(t, np.zeros_like(t), lw=2)

def submit(expression):
    """
    Update the plotted function to the new math *expression*.

    *expression* is a string using "t" as its independent variable, e.g.
    "t ** 3".
    """
    ydata = eval(expression, {'np': np}, {'t': t})
    l.set_ydata(ydata)
    ax.relim()
    ax.autoscale_view()
    plt.draw()

axbox = fig.add_axes([0.1, 0.05, 0.8, 0.075])
text_box = TextBox(axbox, "Evaluate", textalignment="center")
text_box.on_submit(submit)
text_box.set_val("t ** 2")  # Trigger `submit` with the initial string.

plt.show()
```

Custom box styles

This example demonstrates the implementation of a custom *BoxStyle*. Custom *ConnectionStyle*s and *ArrowStyle*s can be similarly defined.

```
import matplotlib.pyplot as plt

from matplotlib.patches import BoxStyle
from matplotlib.path import Path
```

Custom box styles can be implemented as a function that takes arguments specifying both a rectangular box and the amount of "mutation", and returns the "mutated" path. The specific signature is the one of `custom_box_style` below.

Here, we return a new path which adds an "arrow" shape on the left of the box.

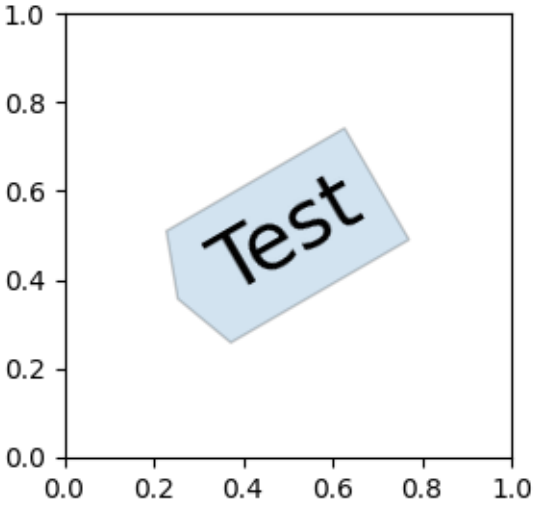
The custom box style can then be used by passing `bbox=dict(boxstyle=custom_box_style, ...)` to *Axes.text*.

```
def custom_box_style(x0, y0, width, height, mutation_size):
    """
    Given the location and size of the box, return the path of the box around
    it.

    Rotation is automatically taken care of.

    Parameters
    ----------
    x0, y0, width, height : float
        Box location and size.
    mutation_size : float
        Mutation reference scale, typically the text font size.
    """
    # padding
    mypad = 0.3
    pad = mutation_size * mypad
    # width and height with padding added.
    width = width + 2 * pad
    height = height + 2 * pad
    # boundary of the padded box
    x0, y0 = x0 - pad, y0 - pad
    x1, y1 = x0 + width, y0 + height
    # return the new path
    return Path([(x0, y0),
                 (x1, y0), (x1, y1), (x0, y1),
                 (x0-pad, (y0+y1)/2), (x0, y0),
                 (x0, y0)],
                closed=True)

fig, ax = plt.subplots(figsize=(3, 3))
ax.text(0.5, 0.5, "Test", size=30, va="center", ha="center", rotation=30,
        bbox=dict(boxstyle=custom_box_style, alpha=0.2))
```



Likewise, custom box styles can be implemented as classes that implement `__call__`.

The classes can then be registered into the `BoxStyle._style_list` dict, which allows specifying the box style as a string, `bbox=dict(boxstyle="registered_name,param=value,...", ...)`. Note that this registration relies on internal APIs and is therefore not officially supported.

```
class MyStyle:
    """A simple box."""

    def __init__(self, pad=0.3):
        """

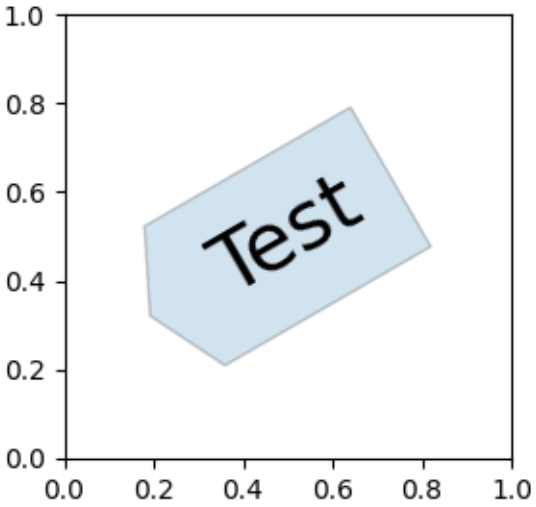
                     (x0, y0)],
                    closed=True)

BoxStyle._style_list["angled"] = MyStyle  # Register the custom style.

fig, ax = plt.subplots(figsize=(3, 3))
ax.text(0.5, 0.5, "Test", size=30, va="center", ha="center", rotation=30,
        bbox=dict(boxstyle="angled,pad=0.5", alpha=0.2))

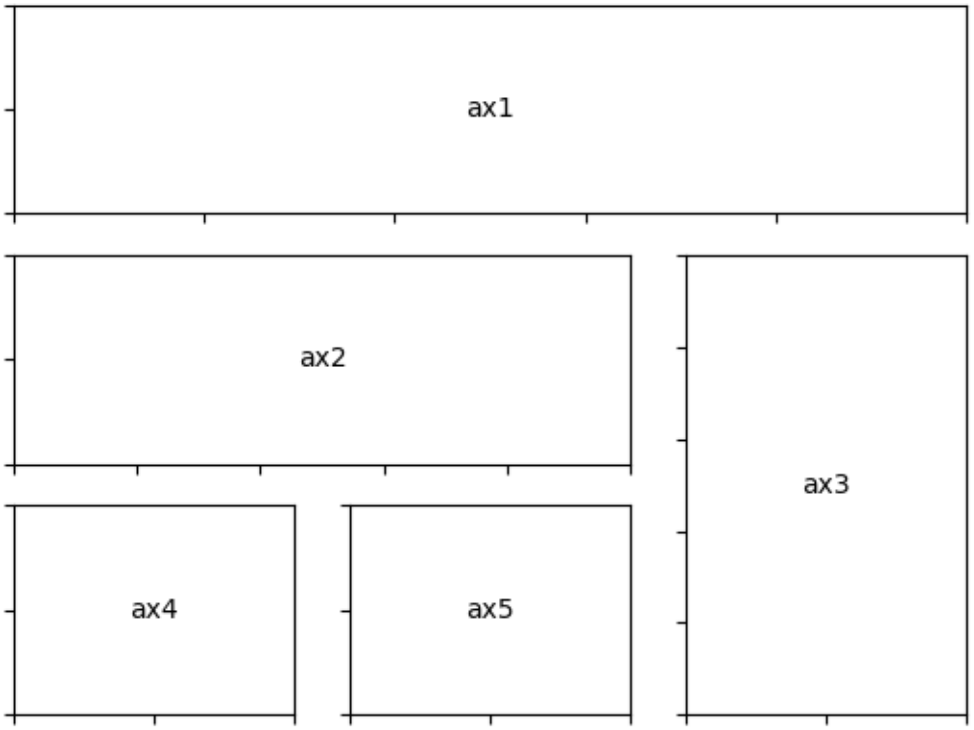
del BoxStyle._style_list["angled"]  # Unregister it.

plt.show()
```



subplot2grid demo

This example demonstrates the use of *pyplot.subplot2grid* to generate subplots. Using *GridSpec*, as demonstrated in *GridSpec demo* is generally preferred.



```
import matplotlib.pyplot as plt

def annotate_axes(fig):
    for i, ax in enumerate(fig.axes):
        ax.text(0.5, 0.5, "ax%d" % (i+1), va="center", ha="center")
        ax.tick_params(labelbottom=False, labelleft=False)

fig = plt.figure()
ax1 = plt.subplot2grid((3, 3), (0, 0), colspan=3)
ax2 = plt.subplot2grid((3, 3), (1, 0), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)
ax4 = plt.subplot2grid((3, 3), (2, 0))
ax5 = plt.subplot2grid((3, 3), (2, 1))

annotate_axes(fig)
```

(continues on next page)

(continued from previous page)

```
plt.show()
```

GridSpec demo

This example demonstrates the use of *GridSpec* to generate subplots, the control of the relative sizes of subplots with *width_ratios* and *height_ratios*, and the control of the spacing around and between subplots using subplot params (*left*, *right*, *bottom*, *top*, *wspace*, and *hspace*).

```
import matplotlib.pyplot as plt

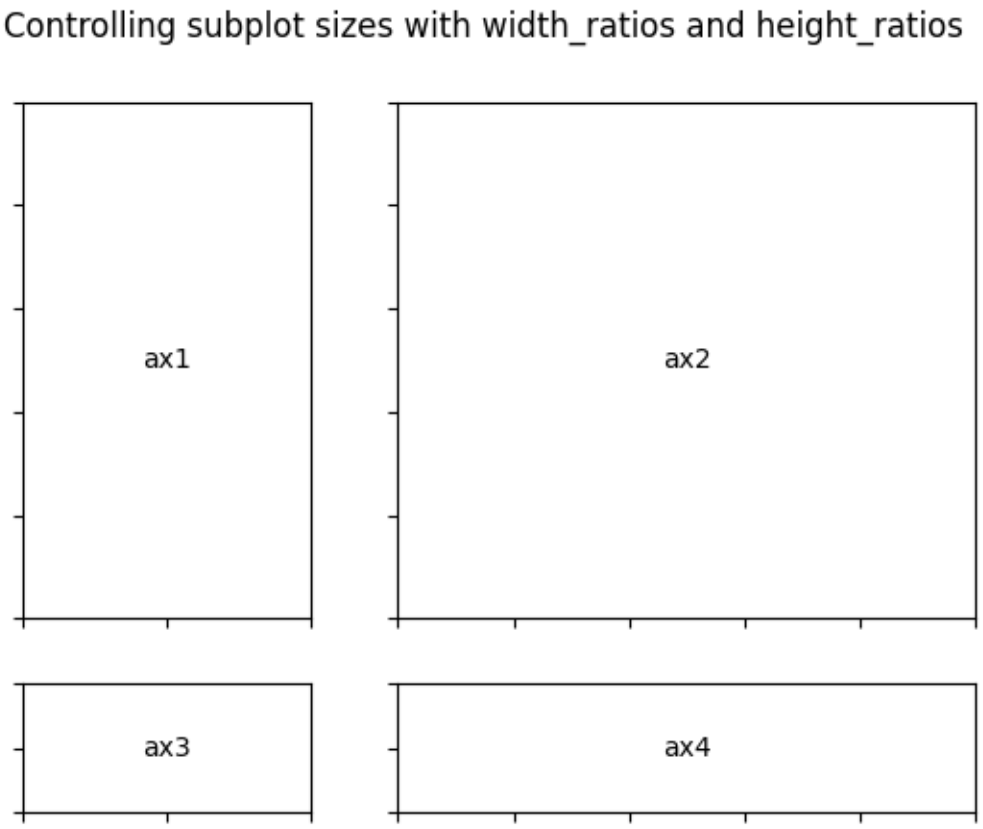
from matplotlib.gridspec import GridSpec

def annotate_axes(fig):
    for i, ax in enumerate(fig.axes):
        ax.text(0.5, 0.5, "ax%d" % (i+1), va="center", ha="center")
        ax.tick_params(labelbottom=False, labelleft=False)

fig = plt.figure()
fig.suptitle("Controlling subplot sizes with width_ratios and height_ratios")

gs = GridSpec(2, 2, width_ratios=[1, 2], height_ratios=[4, 1])
ax1 = fig.add_subplot(gs[0])
ax2 = fig.add_subplot(gs[1])
ax3 = fig.add_subplot(gs[2])
ax4 = fig.add_subplot(gs[3])

annotate_axes(fig)
```



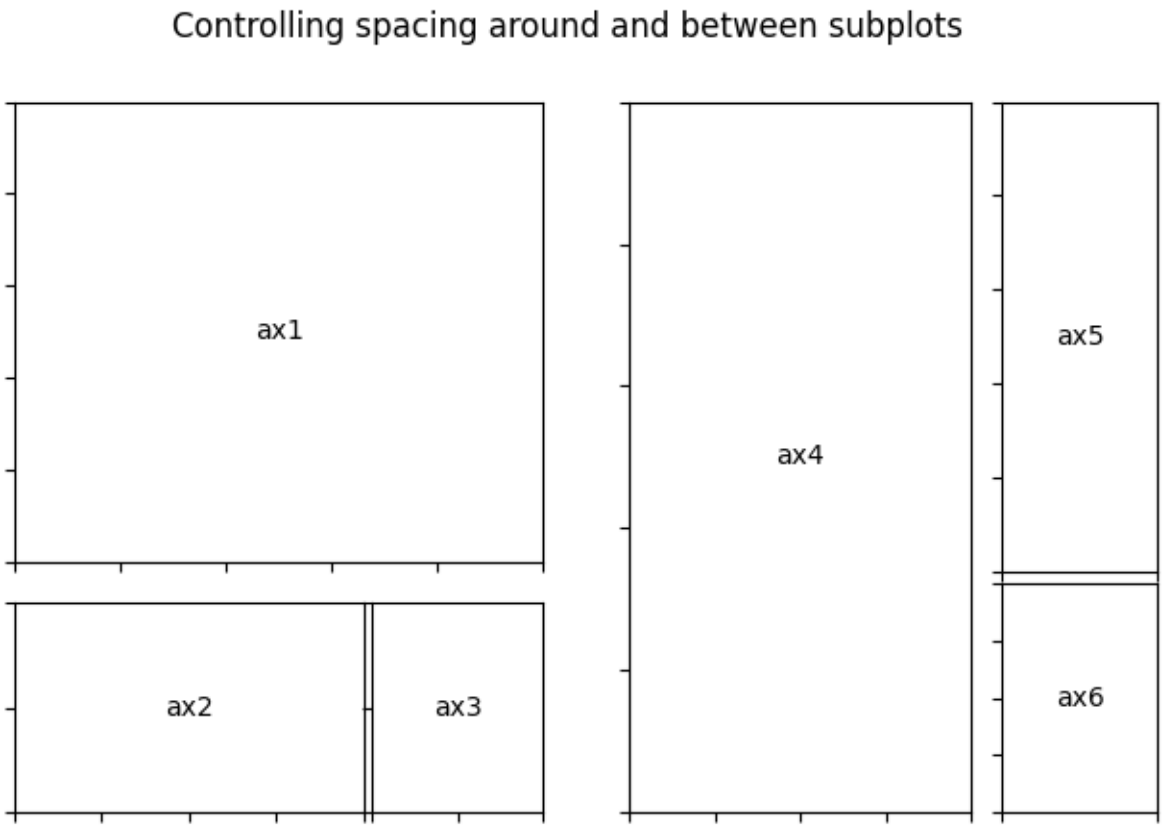
```
fig = plt.figure()
fig.suptitle("Controlling spacing around and between subplots")

gs1 = GridSpec(3, 3, left=0.05, right=0.48, wspace=0.05)
ax1 = fig.add_subplot(gs1[:-1, :])
ax2 = fig.add_subplot(gs1[-1, :-1])
ax3 = fig.add_subplot(gs1[-1, -1])

gs2 = GridSpec(3, 3, left=0.55, right=0.98, hspace=0.05)
ax4 = fig.add_subplot(gs2[:, :-1])
ax5 = fig.add_subplot(gs2[:-1, -1])
ax6 = fig.add_subplot(gs2[-1, -1])

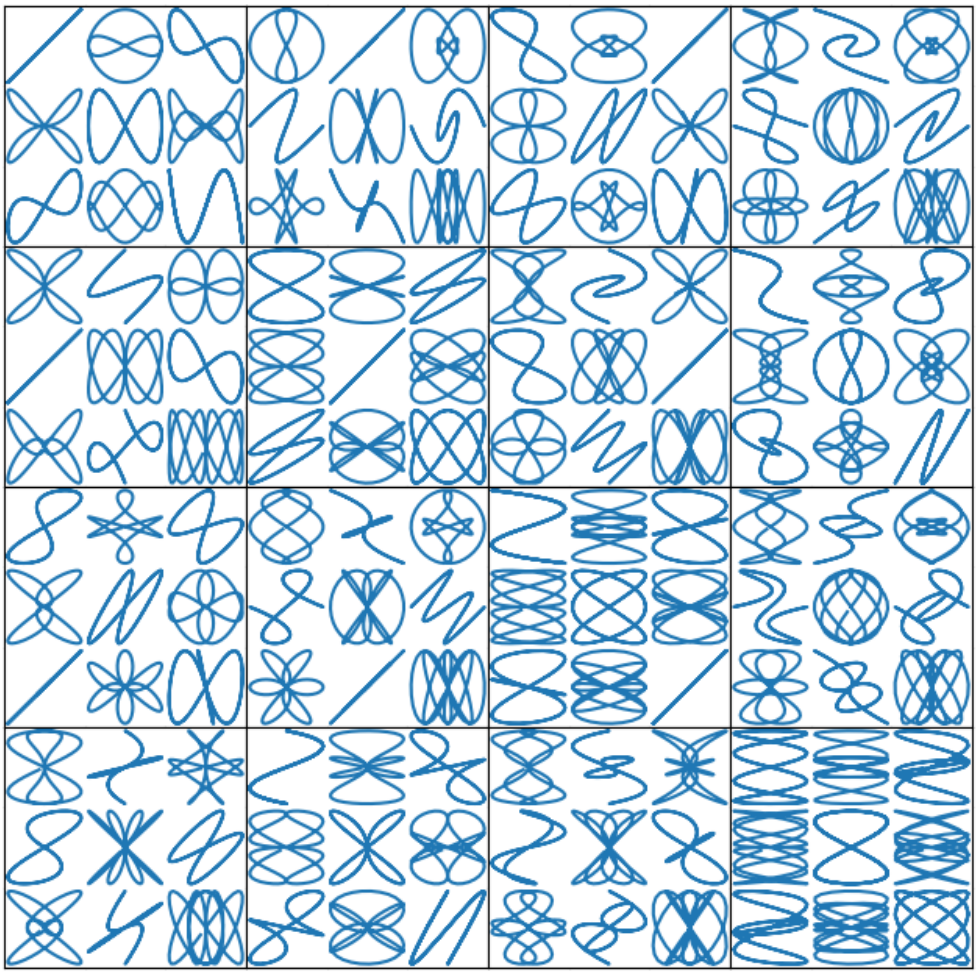
annotate_axes(fig)

plt.show()
```



Nested GridSpecs

This example demonstrates the use of nested *GridSpec*s.



```
import matplotlib.pyplot as plt
import numpy as np

def squiggle_xy(a, b, c, d):
    i = np.arange(0.0, 2*np.pi, 0.05)
    return np.sin(i*a)*np.cos(i*b), np.sin(i*c)*np.cos(i*d)

fig = plt.figure(figsize=(8, 8))
outer_grid = fig.add_gridspec(4, 4, wspace=0, hspace=0)

for a in range(4):
```

(continues on next page)

(continued from previous page)

```
    for b in range(4):
        # gridspec inside gridspec
        inner_grid = outer_grid[a, b].subgridspec(3, 3, wspace=0, hspace=0)
        axs = inner_grid.subplots()  # Create all subplots for the inner grid.
        for (c, d), ax in np.ndenumerate(axs):
            ax.plot(*squiggle_xy(a + 1, b + 1, c + 1, d + 1))
            ax.set(xticks=[], yticks=[])

# show only the outside spines
for ax in fig.get_axes():
    ss = ax.get_subplotspec()
    ax.spines.top.set_visible(ss.is_first_row())
    ax.spines.bottom.set_visible(ss.is_last_row())
    ax.spines.left.set_visible(ss.is_first_col())
    ax.spines.right.set_visible(ss.is_last_col())

plt.show()
```

Reference

CHAPTER

SEVEN

API REFERENCE

7.1 Matplotlib interfaces

Matplotlib has two interfaces. See *Matplotlib Application Interfaces (APIs)* for a more detailed description of both and their recommended use cases.

Axes interface (object-based, explicit)

create a *Figure* and one or more *Axes* objects, then *explicitly* use methods on these objects to add data, configure limits, set labels etc.

API:

- *subplots*: create Figure and Axes
- *axes*: add data, limits, labels etc.
- *Figure*: for figure-level methods

Example:

```
fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_title("Sample plot")
plt.show()
```

pyplot interface (function-based, implicit)

consists of functions in the *pyplot* module. Figure and Axes are manipulated through these functions and are only *implicitly* present in the background.

API:

- *matplotlib.pyplot*

Example:

```
plt.plot(x, y)
plt.title("Sample plot")
plt.show()
```

7.2 Modules

Alphabetical list of modules:

7.2.1 matplotlib

An object-oriented plotting library.

A procedural interface is provided by the companion pyplot module, which may be imported directly, e.g.:

```
import matplotlib.pyplot as plt
```

or using ipython:

```
ipython
```

at your terminal, followed by:

```
In [1]: %matplotlib
In [2]: import matplotlib.pyplot as plt
```

at the ipython shell prompt.

For the most part, direct use of the explicit object-oriented library is encouraged when programming; the implicit pyplot interface is primarily for working interactively. The exceptions to this suggestion are the pyplot functions *pyplot.figure*, *pyplot.subplot*, *pyplot.subplots*, and *pyplot.savefig*, which can greatly simplify scripting. See *Matplotlib Application Interfaces (APIs)* for an explanation of the tradeoffs between the implicit and explicit interfaces.

Modules include:

matplotlib.axes

The *Axes* class. Most pyplot functions are wrappers for *Axes* methods. The axes module is the highest level of OO access to the library.

matplotlib.figure

The *Figure* class.

matplotlib.artist

The *Artist* base class for all classes that draw things.

matplotlib.lines

The *Line2D* class for drawing lines and markers.

matplotlib.patches

Classes for drawing polygons.

matplotlib.text

The *Text* and *Annotation* classes.

matplotlib.image

The *AxesImage* and *FigureImage* classes.

matplotlib.collections

Classes for efficient drawing of groups of lines or polygons.

matplotlib.colors

Color specifications and making colormaps.

matplotlib.cm

Colormaps, and the *ScalarMappable* mixin class for providing color mapping functionality to other classes.

matplotlib.ticker

Calculation of tick mark locations and formatting of tick labels.

matplotlib.backends

A subpackage with modules for various GUI libraries and output formats.

The base matplotlib namespace includes:

rcParams

Default configuration settings; their defaults may be overridden using a `matplotlibrc` file.

use

Setting the Matplotlib backend. This should be called before any figure is created, because it is not possible to switch between different GUI backends after that.

The following environment variables can be used to customize the behavior:

MPLBACKEND

This optional variable can be set to choose the Matplotlib backend. See *What is a backend?*.

MPLCONFIGDIR

This is the directory used to store user customizations to Matplotlib, as well as some caches to improve performance. If *MPLCONFIGDIR* is not defined, *HOME*`/.config/matplotlib` and *HOME*`/.cache/matplotlib` are used on Linux, and *HOME*`/.matplotlib` on other platforms, if they are writable. Otherwise, the Python standard library's `tempfile.gettempdir` is used to find a base directory in which the `matplotlib` subdirectory is created.

Matplotlib was initially written by John D. Hunter (1968-2012) and is now developed and maintained by a host of others.

Occasionally the internal documentation (python docstrings) will refer to MATLAB®, a registered trademark of The MathWorks, Inc.

Backend management

matplotlib.**use**(*backend*, *, *force=True*)

Select the backend used for rendering and GUI integration.

If pyplot is already imported, *switch_backend* is used and if the new backend is different than the current backend, all Figures will be closed.

Parameters

backend

[str] The backend to switch to. This can either be one of the standard backend names, which are case-insensitive:

- interactive backends: GTK3Agg, GTK3Cairo, GTK4Agg, GTK4Cairo, MacOSX, nbAgg, QtAgg, QtCairo, TkAgg, TkCairo, WebAgg, WX, WXAgg, WXCairo, Qt5Agg, Qt5Cairo
- non-interactive backends: agg, cairo, pdf, pgf, ps, svg, template

or a string of the form: `module://my.module.name`.

Switching to an interactive backend is not possible if an unrelated event loop has already been started (e.g., switching to GTK3Agg if a TkAgg window has already been opened). Switching to a non-interactive backend is always possible.

force

[bool, default: True] If True (the default), raise an `ImportError` if the backend cannot be set up (either because it fails to import, or because an incompatible GUI interactive framework is already running); if False, silently ignore the failure.

See also:

Backends
matplotlib.get_backend
matplotlib.pyplot.switch_backend

matplotlib.**get_backend**()

Return the name of the current backend.

See also:

matplotlib.use

matplotlib.**interactive**(*b*)

Set whether to redraw after every plotting command (e.g. *pyplot.xlabel*).

matplotlib.**is_interactive**()

Return whether to redraw after every plotting command.

Note: This function is only intended for use in backends. End users should use *pyplot.isinteractive* instead.

Default values and styling

matplotlib.**rcParams**

An instance of *RcParams* for handling default Matplotlib values.

class matplotlib.**RcParams**(**args*, ***kwargs*)

A dict-like key-value store for config parameters, including validation.

Validating functions are defined and associated with rc parameters in *matplotlib.rcsetup*.

The list of rcParams is:

- _internal.classic_mode
- agg.path.chunksize
- animation.bitrate
- animation.codec
- animation.convert_args
- animation.convert_path
- animation.embed_limit

See also:

The matplotlibrc file

find_all(*pattern*)

Return the subset of this RcParams dictionary whose keys match, using `re.search()`, the given `pattern`.

Note: Changes to the returned dictionary are *not* propagated to the parent RcParams dictionary.

copy()

Copy this RcParams instance.

matplotlib.**rc_context**(*rc=None*, *fname=None*)

Return a context manager for temporarily changing rcParams.

The *rcParams["backend"]* will not be reset by the context manager.

rcParams changed both through the context manager invocation and in the body of the context will be reset on context exit.

Parameters

rc

[dict] The rcParams to temporarily set.

fname

[str or path-like] A file with Matplotlib rc settings. If both *fname* and *rc* are given, settings from *rc* take precedence.

See also:

The matplotlibrc file

Examples

Passing explicit values via a dict:

```
with mpl.rc_context({'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('example.png')
    plt.close(fig)
```

Loading settings from a file:

```
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, y)  # uses 'print.rc'
```

Setting in the context body:

```
with mpl.rc_context():
    # will be reset
    mpl.rcParams['lines.linewidth'] = 5
    plt.plot(x, y)
```

matplotlib.**rc**(*group*, ***kwargs*)

Set the current *rcParams*. *group* is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., (*xtick*, *ytick*). *kwargs* is a dictionary attribute name/value pairs, e.g.,:

```
rc('lines', linewidth=2, color='r')
```

sets the current *rcParams* and is equivalent to:

```
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

Alias	Property
'lw'	'linewidth'
'ls'	'linestyle'
'c'	'color'
'fc'	'facecolor'
'ec'	'edgecolor'
'mew'	'markeredgewidth'
'aa'	'antialiased'

Thus you could abbreviate the above call as:

```
rc('lines', lw=2, c='r')
```

Note you can use python's kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```
font = {'family' : 'monospace',
        'weight' : 'bold',
        'size'   : 'larger'}
rc('font', **font)  # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or *rcdefaults()* to restore the default *rcParams* after changes.

Notes

Similar functionality is available by using the normal dict interface, i.e. `rcParams.update({"lines.linewidth": 2, ...})` (but `rcParams.update` does not support abbreviations or grouping).

`matplotlib.`**`rcdefaults`**`()`

Restore the *rcParams* from Matplotlib's internal default style.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

See also:

matplotlib.rc_file_defaults

Restore the *rcParams* from the rc file originally loaded by Matplotlib.

matplotlib.style.use

Use a specific style file. Call `style.use('default')` to restore the default style.

`matplotlib.`**`rc_file_defaults`**`()`

Restore the *rcParams* from the original rc file loaded by Matplotlib.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

`matplotlib.`**`rc_file`**`(`*fname*, *, *use_default_template=True*`)`

Update *rcParams* from file.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

Parameters

fname

[str or path-like] A file with Matplotlib rc settings.

use_default_template

[bool] If True, initialize with default parameters before updating with those in the given file. If False, the current configuration persists and only the parameters specified in the file are updated.

matplotlib.**rc_params**(*fail_on_error=False*)

Construct a *RcParams* instance from the default Matplotlib rc file.

matplotlib.**rc_params_from_file**(*fname*, *fail_on_error=False*, *use_default_template=True*)

Construct a *RcParams* from file *fname*.

Parameters

fname

[str or path-like] A file with Matplotlib rc settings.

fail_on_error

[bool] If True, raise an error when the parser fails to convert a parameter.

use_default_template

[bool] If True, initialize with default parameters before updating with those in the given file. If False, the configuration class only contains the parameters specified in the file. (Useful for updating dicts.)

matplotlib.**get_configdir**()

Return the string path of the configuration directory.

The directory is chosen as follows:

1. If the MPLCONFIGDIR environment variable is supplied, choose that.
2. On Linux, follow the XDG specification and look first in `$XDG_CONFIG_HOME`, if defined, or `$HOME/.config`. On other platforms, choose `$HOME/.matplotlib`.
3. If the chosen directory exists and is writable, use that as the configuration directory.
4. Else, create a temporary directory, and use it as the configuration directory.

matplotlib.**matplotlib_fname**()

Get the location of the config file.

The file location is determined in the following order

- `$PWD/matplotlibrc`
- `$MATPLOTLIBRC` if it is not a directory
- `$MATPLOTLIBRC/matplotlibrc`
- `$MPLCONFIGDIR/matplotlibrc`
- **On Linux,**

  - `$XDG_CONFIG_HOME/matplotlib/matplotlibrc` (if `$XDG_CONFIG_HOME` is defined)
  - or `$HOME/.config/matplotlib/matplotlibrc` (if `$XDG_CONFIG_HOME` is not defined)

- On other platforms, - `$HOME/.matplotlib/matplotlibrc` if `$HOME` is defined
- Lastly, it looks in `$MATPLOTLIBDATA/matplotlibrc`, which should always exist.

`matplotlib.`**`get_data_path`**`()`

Return the path to Matplotlib data.

Logging

`matplotlib.`**`set_loglevel`**(*level*)

Configure Matplotlib's logging levels.

Matplotlib uses the standard library `logging` framework under the root logger 'matplotlib'. This is a helper function to:

- set Matplotlib's root logger level
- set the root logger handler's level, creating the handler if it does not exist yet

Typically, one should call `set_loglevel("info")` or `set_loglevel("debug")` to get additional debugging information.

Users or applications that are installing their own logging handlers may want to directly manipulate `logging.getLogger('matplotlib')` rather than use this function.

Parameters

level

[{"notset", "debug", "info", "warning", "error", "critical"}] The log level of the handler.

Notes

The first time this function is called, an additional handler is attached to Matplotlib's root handler; this handler is reused every time and this function simply manipulates the logger and handler's level.

Colormaps and color sequences

matplotlib.**colormaps**

Container for colormaps that are known to Matplotlib by name.

The universal registry instance is *matplotlib.colormaps*. There should be no need for users to instantiate *ColormapRegistry* themselves.

Read access uses a dict-like interface mapping names to *Colormap*s:

```
import matplotlib as mpl
cmap = mpl.colormaps['viridis']
```

Returned *Colormap*s are copies, so that their modification does not change the global definition of the colormap.

Additional colormaps can be added via *ColormapRegistry.register*:

```
mpl.colormaps.register(my_colormap)
```

To get a list of all registered colormaps, you can do:

```
from matplotlib import colormaps
list(colormaps)
```

matplotlib.**color_sequences**

Container for sequences of colors that are known to Matplotlib by name.

The universal registry instance is *matplotlib.color_sequences*. There should be no need for users to instantiate *ColorSequenceRegistry* themselves.

Read access uses a dict-like interface mapping names to lists of colors:

```
import matplotlib as mpl
cmap = mpl.color_sequences['tab10']
```

The returned lists are copies, so that their modification does not change the global definition of the color sequence.

Additional color sequences can be added via *ColorSequenceRegistry.register*:

```
mpl.color_sequences.register('rgb', ['r', 'g', 'b'])
```

Miscellaneous

class matplotlib.**MatplotlibDeprecationWarning**

A class for issuing deprecation warnings for Matplotlib users.

matplotlib.**get_cachedir**()

Return the string path of the cache directory.

The procedure used to find the directory is the same as for *get_configdir*, except using `$XDG_CACHE_HOME/$HOME/.cache` instead.

7.2.2 matplotlib.afm

Attention: This module is considered internal.

Its use is deprecated and it will be removed in a future version.

A python interface to Adobe Font Metrics Files.

Although a number of other Python implementations exist, and may be more complete than this, it was decided not to go with them because they were either:

1) copyrighted or used a non-BSD compatible license
2) had too many dependencies and a free standing lib was needed
3) did more than needed and it was easier to write afresh rather than figure out how to get just what was needed.

It is pretty easy to use, and has no external dependencies:

```
>>> import matplotlib as mpl
>>> from pathlib import Path
>>> afm_path = Path(mpl.get_data_path(), 'fonts', 'afm', 'ptmr8a.afm')
>>>
>>> from matplotlib.afm import AFM
>>> with afm_path.open('rb') as fh:
...     afm = AFM(fh)
>>> afm.string_width_height('What the heck?')
(6220.0, 694)
>>> afm.get_fontname()
'Times-Roman'
>>> afm.get_kern_dist('A', 'f')
0
>>> afm.get_kern_dist('A', 'y')
-92.0
```

(continues on next page)

(continued from previous page)

```
>>> afm.get_bbox_char('!')
[130, -9, 238, 676]
```

As in the Adobe Font Metrics File Format Specification, all dimensions are given in units of 1/1000 of the scale factor (point size) of the font being used.

class matplotlib._afm.**AFM**(*fh*)

Bases: object

Parse the AFM file in file object *fh*.

property family_name

The font family name, e.g., 'Times'.

get_angle()

Return the fontangle as float.

get_bbox_char(*c*, *isord=False*)

get_capheight()

Return the cap height as float.

get_familyname()

Return the font family name, e.g., 'Times'.

get_fontname()

Return the font name, e.g., 'Times-Roman'.

get_fullname()

Return the font full name, e.g., 'Times-Roman'.

get_height_char(*c*, *isord=False*)

Get the bounding box (ink) height of character *c* (space is 0).

get_horizontal_stem_width()

Return the standard horizontal stem width as float, or *None* if not specified in AFM file.

get_kern_dist(*c1*, *c2*)

Return the kerning pair distance (possibly 0) for chars *c1* and *c2*.

get_kern_dist_from_name(*name1*, *name2*)

Return the kerning pair distance (possibly 0) for chars *name1* and *name2*.

get_name_char(*c*, *isord=False*)

Get the name of the character, i.e., ';' is 'semicolon'.

get_str_bbox(*s*)

Return the string bounding box.

get_str_bbox_and_descent(*s*)

Return the string bounding box and the maximal descent.

get_underline_thickness()

Return the underline thickness as float.

get_vertical_stem_width()

Return the standard vertical stem width as float, or *None* if not specified in AFM file.

get_weight()

Return the font weight, e.g., 'Bold' or 'Roman'.

get_width_char(*c*, *isord=False*)

Get the width of the character from the character metric WX field.

get_width_from_char_name(*name*)

Get the width of the character from a type1 character name.

get_xheight()

Return the xheight as float.

property postscript_name

string_width_height(*s*)

Return the string width (including kerning) and string height as a (*w*, *h*) tuple.

class matplotlib._afm.**CharMetrics**(*width*, *name*, *bbox*)

Bases: tuple

Represents the character metrics of a single character.

Notes

The fields do currently only describe a subset of character metrics information defined in the AFM standard.

Create new instance of CharMetrics(width, name, bbox)

bbox

The bbox of the character (B) as a tuple (*llx*, *lly*, *urx*, *ury*).

name

The character name (N).

width

The character width (WX).

class matplotlib._afm.**CompositePart**(*name*, *dx*, *dy*)

Bases: tuple

Represents the information on a composite element of a composite char.

Create new instance of CompositePart(name, dx, dy)

dx

x-displacement of the part from the origin.

dy

y-displacement of the part from the origin.

name

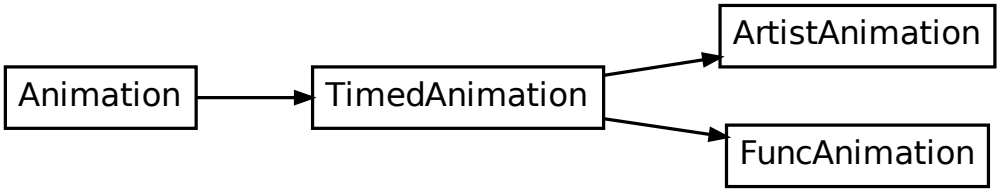
Name of the part, e.g. 'acute'.

7.2.3 matplotlib.animation

Table of Contents

Animation

The easiest way to make a live animation in Matplotlib is to use one of the `Animation` classes.



`Animation`	A base class for Animations.
`FuncAnimation`	`TimedAnimation` subclass that makes an animation by repeatedly calling a function *func*.
`ArtistAnimation`	`TimedAnimation` subclass that creates an animation by using a fixed set of `Artist` objects.

matplotlib.animation.Animation

class matplotlib.animation.**Animation**(*fig*, *event_source=None*, *blit=False*)

A base class for Animations.

This class is not usable as is, and should be subclassed to provide needed behavior.

Note: You must store the created Animation in a variable that lives as long as the animation should run. Otherwise, the Animation object will be garbage-collected and the animation stops.

Parameters

fig

[*Figure*] The figure object used to get needed events, such as draw or resize.

event_source

[object, optional] A class that can run a callback when desired events are generated, as well as be stopped and started.

Examples include timers (see *TimedAnimation*) and file system notifications.

blit

[bool, default: False] Whether blitting is used to optimize drawing. If the backend does not support blitting, then this parameter has no effect.

See also:

FuncAnimation, ***ArtistAnimation***

__init__(*fig*, *event_source=None*, *blit=False*)

Methods

__init__(fig[, event_source, blit])	
new_frame_seq()	Return a new sequence of frame information.
new_saved_frame_seq()	Return a new sequence of saved/cached frame information.
pause()	Pause the animation.
resume()	Resume the animation.
save(filename[, writer, fps, dpi, codec, ...])	Save the animation as a movie file by drawing every frame.
to_html5_video([embed_limit])	Convert the animation to an HTML5 `<video>` tag.
to_jshtml([fps, embed_frames, default_mode])	Generate HTML representation of the animation.

new_frame_seq()

Return a new sequence of frame information.

new_saved_frame_seq()

Return a new sequence of saved/cached frame information.

pause()

Pause the animation.

resume()

Resume the animation.

save(*filename*, *writer=None*, *fps=None*, *dpi=None*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*, *extra_anim=None*, *savefig_kwargs=None*, *, *progress_callback=None*)

Save the animation as a movie file by drawing every frame.

Parameters

filename

[str] The output filename, e.g., `mymovie.mp4`.

writer

[*MovieWriter* or str, default: *rcParams["animation.writer"]* (default: `'ffmpeg'`)] A *MovieWriter* instance to use or a key that identifies a class to use, such as 'ffmpeg'.

fps

[int, optional] Movie frame rate (per second). If not set, the frame rate from the animation's frame interval.

dpi

[float, default: *rcParams["savefig.dpi"]* (default: 'figure')] Controls the dots per inch for the movie frames. Together with the figure's size in inches, this controls the size of the movie.

codec

[str, default: *rcParams["animation.codec"]* (default: 'h264').] The video codec to use. Not all codecs are supported by a given *MovieWriter*.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the output filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] Dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

extra_anim

[list, default: []] Additional *Animation* objects that should be included in the saved movie file. These need to be from the same *Figure* instance. Also, animation frames will just be simply combined, so there should be a 1:1 correspondence between the frames from the different animations.

savefig_kwargs

[dict, default: {}] Keyword arguments passed to each *savefig* call used to save the individual frames.

progress_callback

[function, optional] A callback function that will be called for every frame to notify the saving progress. It must have the signature

```
def func(current_frame: int, total_frames: int) -> Any
```

where *current_frame* is the current frame number and *total_frames* is the total number of frames to be saved. *total_frames* is set to None, if the total number of frames cannot be determined. Return values may exist but are ignored.

Example code to write the progress to stdout:

```
progress_callback = lambda i, n: print(f'Saving frame {i}
↪/{n}')
```

Notes

fps, *codec*, *bitrate*, *extra_args* and *metadata* are used to construct a `MovieWriter` instance and can only be passed if *writer* is a string. If they are passed as non-*None* and *writer* is a `MovieWriter`, a `RuntimeError` will be raised.

to_html5_video(*embed_limit=None*)

Convert the animation to an HTML5 `<video>` tag.

This saves the animation as an h264 video, encoded in base64 directly into the HTML5 video tag. This respects `rcParams["animation.writer"]` (default: `'ffmpeg'`) and `rcParams["animation.bitrate"]` (default: `-1`). This also makes use of the *interval* to control the speed, and uses the *repeat* parameter to decide whether to loop.

Parameters

embed_limit

[float, optional] Limit, in MB, of the returned animation. No animation is created if the limit is exceeded. Defaults to `rcParams["animation.embed_limit"]` (default: `20.0`) = 20.0.

Returns

str

An HTML5 video tag with the animation embedded as base64 encoded h264 video. If the *embed_limit* is exceeded, this returns the string "Video too large to embed."

to_jshtml(*fps=None*, *embed_frames=True*, *default_mode=None*)

Generate HTML representation of the animation.

Parameters

fps

[int, optional] Movie frame rate (per second). If not set, the frame rate from the animation's frame interval.

embed_frames

[bool, optional]

default_mode

[str, optional] What to do when the animation ends. Must be one of `{'loop', 'once', 'reflect'}`. Defaults to `'loop'` if the *repeat* parameter is True, otherwise `'once'`.

matplotlib.animation.FuncAnimation

class matplotlib.animation.**FuncAnimation**(*fig*, *func*, *frames=None*, *init_func=None*, *fargs=None*, *save_count=None*, *, *cache_frame_data=True*, ***kwargs*)

TimedAnimation subclass that makes an animation by repeatedly calling a function *func*.

Note: You must store the created Animation in a variable that lives as long as the animation should run. Otherwise, the Animation object will be garbage-collected and the animation stops.

Parameters

fig

[*Figure*] The figure object used to get needed events, such as draw or resize.

func

[callable] The function to call at each frame. The first argument will be the next value in *frames*. Any additional positional arguments can be supplied using `functools.partial` or via the *fargs* parameter.

The required signature is:

```
def func(frame, *fargs) -> iterable_of_artists
```

It is often more convenient to provide the arguments using `functools.partial`. In this way it is also possible to pass keyword arguments. To pass a function with both positional and keyword arguments, set all arguments as keyword arguments, just leaving the *frame* argument unset:

```
def func(frame, art, *, y=None):
    ...

ani = FuncAnimation(fig, partial(func, art=ln, y='foo'))
```

If `blit == True`, *func* must return an iterable of all artists that were modified or created. This information is used by the blitting algorithm to determine which parts of the figure have to be updated. The return value is unused if `blit == False` and may be omitted in that case.

frames

[iterable, int, generator function, or None, optional] Source of data to pass *func* and each frame of the animation

- If an iterable, then simply use the values provided. If the iterable has a length, it will override the *save_count* kwarg.
- If an integer, then equivalent to passing `range(frames)`
- If a generator function, then must have the signature:

```
def gen_function() -> obj
```

- If *None*, then equivalent to passing `itertools.count`.

In all of these cases, the values in *frames* is simply passed through to the user-supplied *func* and thus can be of any type.

init_func

[callable, optional] A function used to draw a clear frame. If not given, the results of drawing from the first item in the frames sequence will be used. This function will be called once before the first frame.

The required signature is:

```
def init_func() -> iterable_of_artists
```

If `blit == True`, *init_func* must return an iterable of artists to be re-drawn. This information is used by the blitting algorithm to determine which parts of the figure have to be updated. The return value is unused if `blit == False` and may be omitted in that case.

fargs

[tuple or None, optional] Additional arguments to pass to each call to *func*. Note: the use of `functools.partial` is preferred over *fargs*. See *func* for details.

save_count

[int, optional] Fallback for the number of values from *frames* to cache. This is only used if the number of frames cannot be inferred from *frames*, i.e. when it's an iterator without length or a generator.

interval

[int, default: 200] Delay between frames in milliseconds.

repeat_delay

[int, default: 0] The delay in milliseconds between consecutive animation runs, if *repeat* is True.

repeat

[bool, default: True] Whether the animation repeats when the sequence of frames is completed.

blit

[bool, default: False] Whether blitting is used to optimize drawing. Note: when using blitting, any animated artists will be drawn according to their zorder; however, they will be drawn on top of any previous artists, regardless of their zorder.

cache_frame_data

[bool, default: True] Whether frame data is cached. Disabling cache might be helpful when frames contain large objects.

__init__(*fig*, *func*, *frames=None*, *init_func=None*, *fargs=None*, *save_count=None*, *, *cache_frame_data=True*, ***kwargs*)

Methods

__init__(fig, func[, frames, init_func, ...])	
new_frame_seq()	Return a new sequence of frame information.
new_saved_frame_seq()	Return a new sequence of saved/cached frame information.
pause()	Pause the animation.
resume()	Resume the animation.
save(filename[, writer, fps, dpi, codec, ...])	Save the animation as a movie file by drawing every frame.
to_html5_video([embed_limit])	Convert the animation to an HTML5 <video> tag.
to_jshtml([fps, embed_frames, default_mode])	Generate HTML representation of the animation.

Attributes

repeat	[*Deprecated*]
save_count	[*Deprecated*]

new_frame_seq()

Return a new sequence of frame information.

new_saved_frame_seq()

Return a new sequence of saved/cached frame information.

property save_count

[*Deprecated*]

Notes

Deprecated since version 3.7:

matplotlib.animation.ArtistAnimation

class matplotlib.animation.**ArtistAnimation**(*fig*, *artists*, **args*, ***kwargs*)

TimedAnimation subclass that creates an animation by using a fixed set of *Artist* objects.

Before creating an instance, all plotting should have taken place and the relevant artists saved.

Note: You must store the created Animation in a variable that lives as long as the animation should run. Otherwise, the Animation object will be garbage-collected and the animation stops.

Parameters

fig

[*Figure*] The figure object used to get needed events, such as draw or resize.

artists

[list] Each list entry is a collection of *Artist* objects that are made visible on the corresponding frame. Other artists are made invisible.

interval

[int, default: 200] Delay between frames in milliseconds.

repeat_delay

[int, default: 0] The delay in milliseconds between consecutive animation runs, if *repeat* is True.

repeat

[bool, default: True] Whether the animation repeats when the sequence of frames is completed.

blit

[bool, default: False] Whether blitting is used to optimize drawing.

__init__(*fig*, *artists*, **args*, ***kwargs*)

Methods

`__init__`(fig, artists, *args, **kwargs)	
`new_frame_seq`()	Return a new sequence of frame information.
`new_saved_frame_seq`()	Return a new sequence of saved/cached frame information.
`pause`()	Pause the animation.
`resume`()	Resume the animation.
`save`(filename[, writer, fps, dpi, codec, ...])	Save the animation as a movie file by drawing every frame.
`to_html5_video`([embed_limit])	Convert the animation to an HTML5 `<video>` tag.
`to_jshtml`([fps, embed_frames, default_mode])	Generate HTML representation of the animation.

Attributes

`repeat`	[*Deprecated*]

In both cases it is critical to keep a reference to the instance object. The animation is advanced by a timer (typically from the host GUI framework) which the *Animation* object holds the only reference to. If you do not hold a reference to the *Animation* object, it (and hence the timers) will be garbage collected which will stop the animation.

To save an animation use *Animation.save*, *Animation.to_html5_video*, or *Animation.to_jshtml*.

See *Helper Classes* below for details about what movie formats are supported.

FuncAnimation

The inner workings of *FuncAnimation* is more-or-less:

```
for d in frames:
    artists = func(d, *fargs)
    fig.canvas.draw_idle()
    fig.canvas.start_event_loop(interval)
```

with details to handle 'blitting' (to dramatically improve the live performance), to be non-blocking, not repeatedly start/stop the GUI event loop, handle repeats, multiple animated axes, and easily save the animation to a movie file.

'Blitting' is a standard technique in computer graphics. The general gist is to take an existing bit map (in our case a mostly rasterized figure) and then 'blit' one more artist on top. Thus, by managing a saved 'clean'

bitmap, we can only re-draw the few artists that are changing at each frame and possibly save significant amounts of time. When we use blitting (by passing `blit=True`), the core loop of *FuncAnimation* gets a bit more complicated:

```
ax = fig.gca()

def update_blit(artists):
    fig.canvas.restore_region(bg_cache)
    for a in artists:
        a.axes.draw_artist(a)

    ax.figure.canvas.blit(ax.bbox)

artists = init_func()

for a in artists:
   a.set_animated(True)

fig.canvas.draw()
bg_cache = fig.canvas.copy_from_bbox(ax.bbox)

for f in frames:
    artists = func(f, *fargs)
    update_blit(artists)
    fig.canvas.start_event_loop(interval)
```

This is of course leaving out many details (such as updating the background when the figure is resized or fully re-drawn). However, this hopefully minimalist example gives a sense of how `init_func` and `func` are used inside of *FuncAnimation* and the theory of how 'blitting' works.

Note: The zorder of artists is not taken into account when 'blitting' because the 'blitted' artists are always drawn on top.

The expected signature on `func` and `init_func` is very simple to keep *FuncAnimation* out of your book keeping and plotting logic, but this means that the callable objects you pass in must know what artists they should be working on. There are several approaches to handling this, of varying complexity and encapsulation. The simplest approach, which works quite well in the case of a script, is to define the artist at a global scope and let Python sort things out. For example:

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

fig, ax = plt.subplots()
xdata, ydata = [], []
ln, = ax.plot([], [], 'ro')

def init():
    ax.set_xlim(0, 2*np.pi)
    ax.set_ylim(-1, 1)
```

(continues on next page)

(continued from previous page)

```
    return ln,

def update(frame):
    xdata.append(frame)
    ydata.append(np.sin(frame))
    ln.set_data(xdata, ydata)
    return ln,

ani = FuncAnimation(fig, update, frames=np.linspace(0, 2*np.pi, 128),
                    init_func=init, blit=True)
plt.show()
```

The second method is to use `functools.partial` to pass arguments to the function:

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation
from functools import partial

fig, ax = plt.subplots()
line1, = ax.plot([], [], 'ro')

def init():
    ax.set_xlim(0, 2*np.pi)
    ax.set_ylim(-1, 1)
    return line1,

def update(frame, ln, x, y):
    x.append(frame)
    y.append(np.sin(frame))
    ln.set_data(x, y)
    return ln,

ani = FuncAnimation(
    fig, partial(update, ln=line1, x=[], y=[]),
    frames=np.linspace(0, 2*np.pi, 128),
    init_func=init, blit=True)

plt.show()
```

A third method is to use closures to build up the required artists and functions. A fourth method is to create a class.

Examples

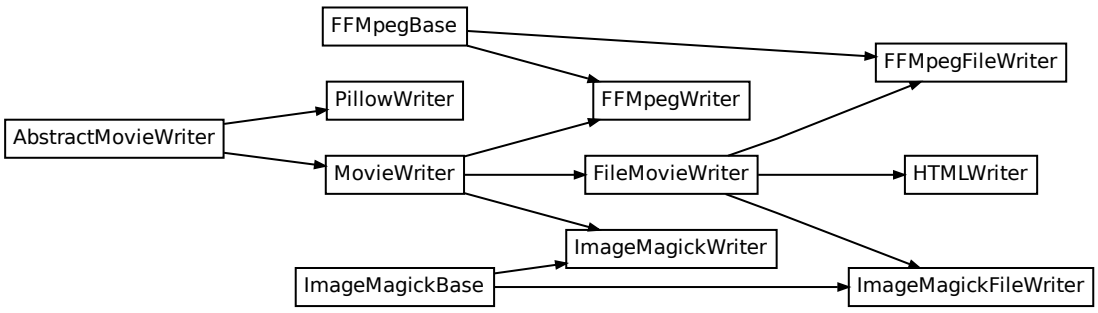
- *Decay*
- *The Bayes update*
- *The double pendulum problem*
- *Animated histogram*
- *Rain simulation*
- *Animated 3D random walk*
- *Animated line plot*
- *Oscilloscope*
- *MATPLOTLIB UNCHAINED*

`ArtistAnimation`

Examples

- *Animated image using a precomputed list of images*

Writer Classes



The provided writers fall into a few broad categories.

The Pillow writer relies on the Pillow library to write the animation, keeping all data in memory.

```
PillowWriter
```

matplotlib.animation.PillowWriter

class matplotlib.animation.**PillowWriter**(*fps=5*, *metadata=None*, *codec=None*, *bitrate=None*)

__init__(*fps=5*, *metadata=None*, *codec=None*, *bitrate=None*)

Methods

__init__([fps, metadata, codec, bitrate])	
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

frame_size	A tuple (width, height) in pixels of a movie frame.

finish()

Finish any processing for writing the movie.

grab_frame(***savefig_kwargs*)

Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure. However, several keyword arguments that are supported by *savefig* may not be passed as they are controlled by the MovieWriter:

- ***dpi*, *bbox_inches*: These may not be passed because each frame of the**

  animation much be exactly the same size in pixels.

- *format*: This is controlled by the MovieWriter.

classmethod isAvailable()

setup(*fig*, *outfile*, *dpi=None*)

Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure object that contains the information for frames.

outfile

[str] The filename of the resulting movie file.

dpi

[float, default: `fig.dpi`] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.

The HTML writer generates JavaScript-based animations.

HTMLWriter	Writer for JavaScript-based HTML movies.

matplotlib.animation.HTMLWriter

class matplotlib.animation.**HTMLWriter**(*fps=30*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*, *embed_frames=False*, *default_mode='loop'*, *embed_limit=None*)

Writer for JavaScript-based HTML movies.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: `'h264'`)] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__ (*fps=30*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*, *embed_frames=False*, *default_mode='loop'*, *embed_limit=None*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: `'h264'`)] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__([fps, codec, bitrate, extra_args, ...])	Parameters
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi, frame_dir])	Setup for writing the movie file.

Attributes

frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
frame_size	A tuple (width, height) in pixels of a movie frame.
supported_formats	

finish()

Finish any processing for writing the movie.

grab_frame(***savefig_kwargs*)

Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the savefig call that saves the figure. However, several keyword arguments that are supported by savefig may not be passed as they are controlled by the MovieWriter:

- ***dpi*, *bbox_inches*: These may not be passed because each frame of the**

  animation much be exactly the same size in pixels.

- *format*: This is controlled by the MovieWriter.

classmethod isAvailable()

Return whether a MovieWriter subclass is actually available.

setup (*fig*, *outfile*, *dpi=None*, *frame_dir=None*)

Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure to grab the rendered frames from.

outfile

[str] The filename of the resulting movie file.

dpi

[float, default: `fig.dpi`] The dpi of the output file. This, with the figure size, controls the size in pixels of the resulting movie file.

frame_prefix

[str, optional] The filename prefix to use for temporary files. If *None* (the default), files are written to a temporary directory which is deleted by *finish*; if not *None*, no temporary files are deleted.

supported_formats = ['png', 'jpeg', 'tiff', 'svg']

The pipe-based writers stream the captured frames over a pipe to an external process. The pipe-based variants tend to be more performant, but may not work on all systems.

FFMpegWriter	Pipe-based ffmpeg writer.
ImageMagickWriter	Pipe-based animated gif writer.

matplotlib.animation.FFMpegWriter

class matplotlib.animation.**FFMpegWriter** (*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Pipe-based ffmpeg writer.

Frames are streamed directly to ffmpeg via a pipe and written in a single pass.

This effectively works as a slideshow input to ffmpeg with the fps passed as `-framerate`, so see also their notes on frame rates for further details.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: `'h264'`)] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: `'h264'`)] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__([fps, codec, bitrate, extra_args, ...])	Parameters
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

frame_size	A tuple (width, height) in pixels of a movie frame.
output_args	
supported_formats	

matplotlib.animation.ImageMagickWriter

class matplotlib.animation.**ImageMagickWriter**(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Pipe-based animated gif writer.

Frames are streamed directly to ImageMagick via a pipe and written in a single pass.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: 'h264')] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: 'h264')] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__([fps, codec, bitrate, extra_args, ...])	Parameters
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

frame_size	A tuple (width, height) in pixels of a movie frame.
input_names	
supported_formats	

input_names = '-'

The file-based writers save temporary files for each frame which are stitched into a single file at the end. Although slower, these writers can be easier to debug.

FFMpegFileWriter	File-based ffmpeg writer.
ImageMagickFileWriter	File-based animated gif writer.

matplotlib.animation.FFMpegFileWriter

class matplotlib.animation.**FFMpegFileWriter**(**args*, ***kwargs*)

File-based ffmpeg writer.

Frames are written to temporary files on disk and then stitched together at the end.

This effectively works as a slideshow input to ffmpeg with the fps passed as `-framerate`, so see also their notes on frame rates for further details.

__init__(**args*, ***kwargs*)

Methods

__init__(*args, **kwargs)	
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi, frame_prefix])	Setup for writing the movie file.

Attributes

frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
frame_size	A tuple (width, height) in pixels of a movie frame.
output_args	
supported_formats	

supported_formats = ['png', 'jpeg', 'tiff', 'raw', 'rgba']

matplotlib.animation.ImageMagickFileWriter

class matplotlib.animation.**ImageMagickFileWriter**(**args*, ***kwargs*)

File-based animated gif writer.

Frames are written to temporary files on disk and then stitched together at the end.

__init__(**args*, ***kwargs*)

Methods

__init__(*args, **kwargs)	
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi, frame_prefix])	Setup for writing the movie file.

Attributes

frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
frame_size	A tuple (width, height) in pixels of a movie frame.
input_names	
supported_formats	

property input_names

supported_formats = ['png', 'jpeg', 'tiff', 'raw', 'rgba']

The writer classes provide a way to grab sequential frames from the same underlying *Figure*. They all provide three methods that must be called in sequence:

- *setup* prepares the writer (e.g. opening a pipe). Pipe-based and file-based writers take different arguments to setup().
- *grab_frame* can then be called as often as needed to capture a single frame at a time
- *finish* finalizes the movie and writes the output file to disk.

Example:

```
moviewriter = MovieWriter(...)
moviewriter.setup(fig, 'my_movie.ext', dpi=100)
for j in range(n):
```

(continues on next page)

(continued from previous page)

```
    update_figure(j)
    moviewriter.grab_frame()
moviewriter.finish()
```

If using the writer classes directly (not through *Animation.save*), it is strongly encouraged to use the *saving* context manager:

```
with moviewriter.saving(fig, 'myfile.mp4', dpi=100):
    for j in range(n):
        update_figure(j)
        moviewriter.grab_frame()
```

to ensure that setup and cleanup are performed as necessary.

Examples

- *Frame grabbing*

Helper Classes

Animation Base Classes

Animation	A base class for Animations.
TimedAnimation	*Animation* subclass for time-based animation.

matplotlib.animation.TimedAnimation

class matplotlib.animation.**TimedAnimation**(*fig*, *interval=200*, *repeat_delay=0*, *repeat=True*, *event_source=None*, **args*, ***kwargs*)

Animation subclass for time-based animation.

A new frame is drawn every *interval* milliseconds.

Note: You must store the created Animation in a variable that lives as long as the animation should run. Otherwise, the Animation object will be garbage-collected and the animation stops.

Parameters

fig

[*Figure*] The figure object used to get needed events, such as draw or resize.

interval

[int, default: 200] Delay between frames in milliseconds.

repeat_delay

[int, default: 0] The delay in milliseconds between consecutive animation runs, if *repeat* is True.

repeat

[bool, default: True] Whether the animation repeats when the sequence of frames is completed.

blit

[bool, default: False] Whether blitting is used to optimize drawing.

__init__(*fig*, *interval=200*, *repeat_delay=0*, *repeat=True*, *event_source=None*, **args*, ***kwargs*)

Methods

__init__(fig[, interval, repeat_delay, ...])	
new_frame_seq()	Return a new sequence of frame information.
new_saved_frame_seq()	Return a new sequence of saved/cached frame information.
pause()	Pause the animation.
resume()	Resume the animation.
save(filename[, writer, fps, dpi, codec, ...])	Save the animation as a movie file by drawing every frame.
to_html5_video([embed_limit])	Convert the animation to an HTML5 <video> tag.
to_jshtml([fps, embed_frames, default_mode])	Generate HTML representation of the animation.

Attributes

repeat	[*Deprecated*]

property repeat

[*Deprecated*]

Notes

Deprecated since version 3.7:

Writer Registry

A module-level registry is provided to map between the name of the writer and the class to allow a string to be passed to *Animation.save* instead of a writer instance.

MovieWriterRegistry	Registry of available writer classes by human readable name.

matplotlib.animation.MovieWriterRegistry

class matplotlib.animation.**MovieWriterRegistry**

Registry of available writer classes by human readable name.

__init__()

Methods

__init__()	
is_available(name)	Check if given writer is available by name.
list()	Get a list of available MovieWriters.
register(name)	Decorator for registering a class under a name.

is_available(*name*)

Check if given writer is available by name.

Parameters

name

[str]

Returns

bool

list()

Get a list of available MovieWriters.

register(*name*)

Decorator for registering a class under a name.

Example use:

```
@registry.register(name)
class Foo:
    pass
```

Writer Base Classes

To reduce code duplication base classes

AbstractMovieWriter	Abstract base class for writing movies, providing a way to grab frames by calling *grab_frame*.
MovieWriter	Base class for writing movies.
FileMovieWriter	*MovieWriter* for writing to individual files and stitching at the end.

matplotlib.animation.AbstractMovieWriter

class matplotlib.animation.**AbstractMovieWriter**(*fps=5*, *metadata=None*, *codec=None*, *bitrate=None*)

Abstract base class for writing movies, providing a way to grab frames by calling *grab_frame*.

setup is called to start the process and *finish* is called afterwards. *saving* is provided as a context manager to facilitate this process as

```
with moviewriter.saving(fig, outfile='myfile.mp4', dpi=100):
    # Iterate over frames
    moviewriter.grab_frame(**savefig_kwargs)
```

The use of the context manager ensures that *setup* and *finish* are performed as necessary.

An instance of a concrete subclass of this class can be given as the `writer` argument of *Animation.save()*.

__init__(*fps=5*, *metadata=None*, *codec=None*, *bitrate=None*)

Methods

__init__([fps, metadata, codec, bitrate])	
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

frame_size	A tuple `(width, height)` in pixels of a movie frame.

abstract finish()

Finish any processing for writing the movie.

property frame_size

A tuple `(width, height)` in pixels of a movie frame.

abstract grab_frame(***savefig_kwargs*)

Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure. However, several keyword arguments that are supported by *savefig* may not be passed as they are controlled by the MovieWriter:

- ***dpi*, *bbox_inches*: These may not be passed because each frame of the**

  animation much be exactly the same size in pixels.

- *format*: This is controlled by the MovieWriter.

saving(*fig*, *outfile*, *dpi*, **args*, ***kwargs*)

Context manager to facilitate writing the movie file.

`*args, **kw` are any parameters that should be passed to *setup*.

abstract setup(*fig*, *outfile*, *dpi=None*)

Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure object that contains the information for frames.

outfile

[str] The filename of the resulting movie file.

dpi

[float, default: `fig.dpi`] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.

matplotlib.animation.MovieWriter

class matplotlib.animation.**MovieWriter**(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Base class for writing movies.

This is a base class for MovieWriter subclasses that write a movie frame data to a pipe. You cannot instantiate this class directly. See examples for how to use its subclasses.

Attributes

frame_format

[str] The format used in writing frame data, defaults to 'rgba'.

fig

[*Figure*] The figure to capture data from. This must be provided by the subclasses.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: `'h264'`)] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(*fps=5*, *codec=None*, *bitrate=None*, *extra_args=None*, *metadata=None*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: `'h264'`)] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__([fps, codec, bitrate, extra_args, ...])	Parameters
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi])	Setup for writing the movie file.

Attributes

frame_size	A tuple (width, height) in pixels of a movie frame.
supported_formats	

classmethod bin_path()

Return the binary path to the commandline tool used by a specific subclass. This is a class method so that the tool can be looked for before making a particular MovieWriter subclass available.

finish()

Finish any processing for writing the movie.

grab_frame(***savefig_kwargs*)

Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure. However, several keyword arguments that are supported by *savefig* may not be passed as they are controlled by the MovieWriter:

- ***dpi*, *bbox_inches*: These may not be passed because each frame of the**

  animation much be exactly the same size in pixels.

- *format*: This is controlled by the MovieWriter.

classmethod isAvailable()

Return whether a MovieWriter subclass is actually available.

setup (*fig*, *outfile*, *dpi=None*)

Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure object that contains the information for frames.

outfile

[str] The filename of the resulting movie file.

dpi

[float, default: `fig.dpi`] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.

supported_formats = ['rgba']

matplotlib.animation.FileMovieWriter

class matplotlib.animation.**FileMovieWriter**(**args*, ***kwargs*)

MovieWriter for writing to individual files and stitching at the end.

This must be sub-classed to be useful.

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: `'h264'`)] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(**args*, ***kwargs*)

Parameters

fps

[int, default: 5] Movie frame rate (per second).

codec

[str or None, default: *rcParams["animation.codec"]* (default: `'h264'`)] The codec to use.

bitrate

[int, default: *rcParams["animation.bitrate"]* (default: `-1`)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args

[list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. These arguments are passed last to the encoder, just before the filename. The default, None, means to use *rcParams["animation.[name-of-encoder]_args"]* for the builtin writers.

metadata

[dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(*args, **kwargs)	Parameters
bin_path()	Return the binary path to the commandline tool used by a specific subclass.
finish()	Finish any processing for writing the movie.
grab_frame(**savefig_kwargs)	Grab the image information from the figure and save as a movie frame.
isAvailable()	Return whether a MovieWriter subclass is actually available.
saving(fig, outfile, dpi, *args, **kwargs)	Context manager to facilitate writing the movie file.
setup(fig, outfile[, dpi, frame_prefix])	Setup for writing the movie file.

Attributes

frame_format	Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
frame_size	A tuple (width, height) in pixels of a movie frame.
supported_formats	

finish()

Finish any processing for writing the movie.

property frame_format

Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.

grab_frame(***savefig_kwargs*)

Grab the image information from the figure and save as a movie frame.

All keyword arguments in *savefig_kwargs* are passed on to the *savefig* call that saves the figure. However, several keyword arguments that are supported by *savefig* may not be passed as they are controlled by the MovieWriter:

- ***dpi*, *bbox_inches*: These may not be passed because each frame of the**

  animation much be exactly the same size in pixels.

- *format*: This is controlled by the MovieWriter.

setup (*fig*, *outfile*, *dpi=None*, *frame_prefix=None*)

Setup for writing the movie file.

Parameters

fig

[*Figure*] The figure to grab the rendered frames from.

outfile

[str] The filename of the resulting movie file.

dpi

[float, default: `fig.dpi`] The dpi of the output file. This, with the figure size, controls the size in pixels of the resulting movie file.

frame_prefix

[str, optional] The filename prefix to use for temporary files. If *None* (the default), files are written to a temporary directory which is deleted by *finish*; if not *None*, no temporary files are deleted.

and mixins

FFMpegBase	Mixin class for FFMpeg output.
ImageMagickBase	Mixin class for ImageMagick output.

matplotlib.animation.FFMpegBase

class matplotlib.animation.**FFMpegBase**

Mixin class for FFMpeg output.

This is a base class for the concrete *FFMpegWriter* and *FFMpegFileWriter* classes.

__init__ (**args*, ***kwargs*)

Methods

__init__(*args, **kwargs)

Attributes

output_args

property output_args

matplotlib.animation.ImageMagickBase

class matplotlib.animation.**ImageMagickBase**

Mixin class for ImageMagick output.

This is a base class for the concrete *ImageMagickWriter* and *ImageMagickFileWriter* classes, which define an `input_names` attribute (or property) specifying the input names passed to ImageMagick.

__init__(**args*, ***kwargs*)

Methods

__init__(*args, **kwargs)
bin_path()
isAvailable()

classmethod bin_path()

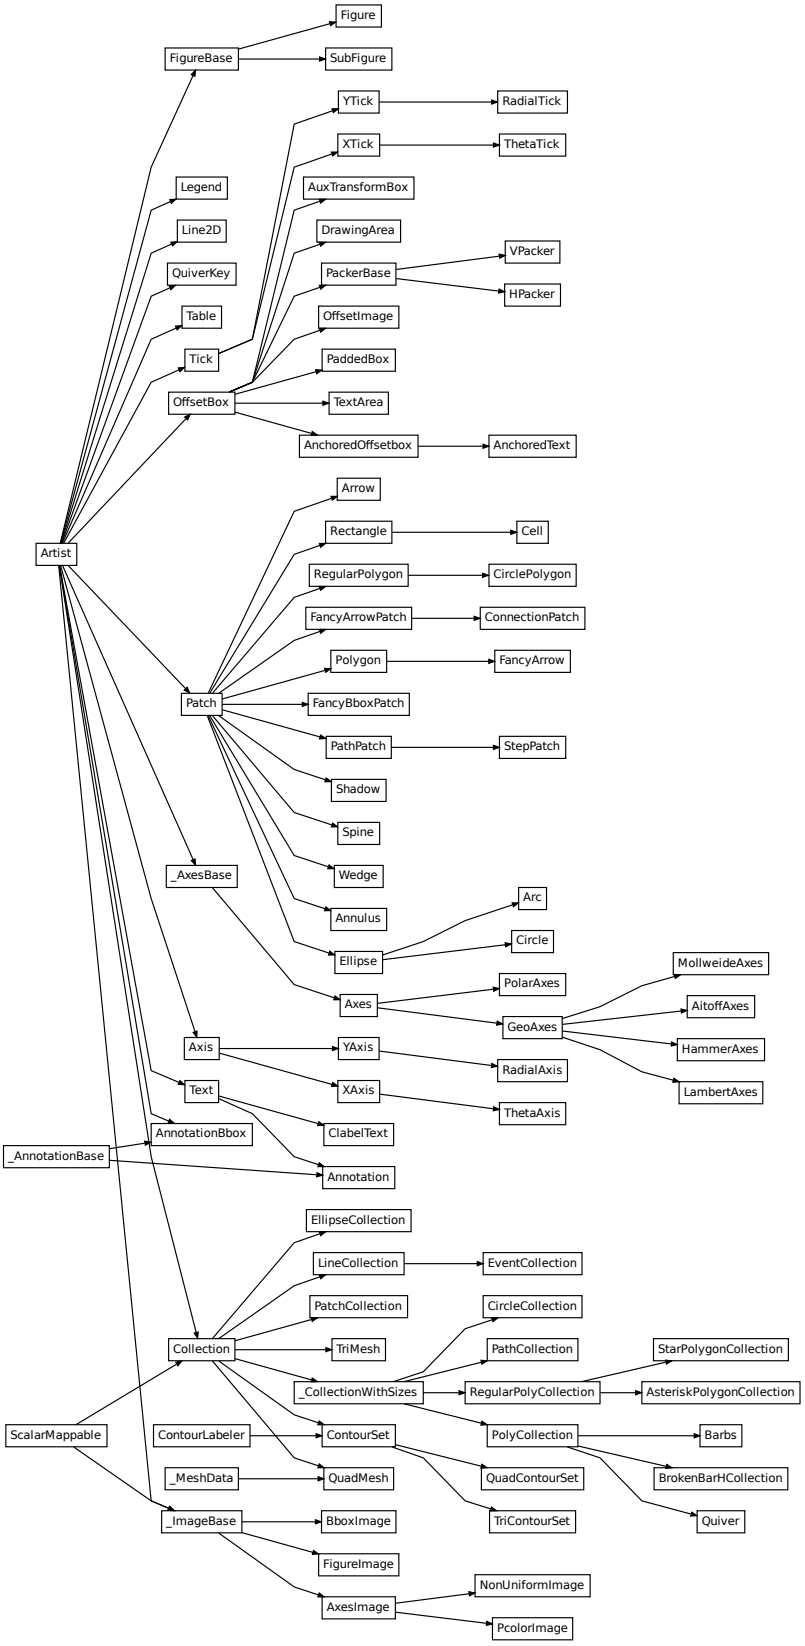
classmethod isAvailable()

are provided.

See the source code for how to easily implement new *MovieWriter* classes.

7.2.4 matplotlib.artist

Inheritance Diagrams



`Artist` class

class matplotlib.artist.**Artist**

Abstract base class for objects that render into a FigureCanvas.

Typically, all visible elements in a figure are subclasses of Artist.

Interactive

Artist.add_callback	Add a callback function that will be called whenever one of the *Artist*'s properties changes.
Artist.remove_callback	Remove a callback based on its observer id.
Artist.pchanged	Call all of the registered callbacks.
Artist.get_cursor_data	Return the cursor data for a given event.
Artist.format_cursor_data	Return a string representation of *data*.
Artist.set_mouseover	Set whether this artist is queried for custom context information when the mouse cursor moves over it.
Artist.get_mouseover	Return whether this artist is queried for custom context information when the mouse cursor moves over it.
Artist.mouseover	Return whether this artist is queried for custom context information when the mouse cursor moves over it.
Artist.contains	Test whether the artist contains the mouse event.
Artist.pick	Process a pick event.
Artist.pickable	Return whether the artist is pickable.
Artist.set_picker	Define the picking behavior of the artist.
Artist.get_picker	Return the picking behavior of the artist.

matplotlib.artist.Artist.add_callback

Artist.**add_callback**(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

matplotlib.artist.Artist.remove_callback

Artist.**remove_callback**(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

matplotlib.artist.Artist.pchanged

Artist.**pchanged**()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

matplotlib.artist.Artist.get_cursor_data

Artist.**get_cursor_data**(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

matplotlib.artist.Artist.format_cursor_data

Artist.**format_cursor_data**(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

matplotlib.artist.Artist.set_mouseover

Artist.**set_mouseover**(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

matplotlib.artist.Artist.get_mouseover

Artist.**get_mouseover**()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

matplotlib.artist.Artist.mouseover

property Artist.**mouseover**

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

matplotlib.artist.Artist.contains

Artist.**contains**(*mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

Examples using `matplotlib.artist.Artist.contains`

- *Looking Glass*

matplotlib.artist.Artist.pick

Artist.**pick**(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

matplotlib.artist.Artist.pickable

Artist.**pickable**()

Return whether the artist is pickable.

See also:

set_picker, ***get_picker***, ***pick***

matplotlib.artist.Artist.set_picker

Artist.**set_picker**(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

Examples using `matplotlib.artist.Artist.set_picker`

- *Legend picking*
- *Pick event demo*

matplotlib.artist.Artist.get_picker

Artist.**get_picker**()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

Clipping

Artist.set_clip_on	Set whether the artist uses clipping.
Artist.get_clip_on	Return whether the artist uses clipping.
Artist.set_clip_box	Set the artist's clip *Bbox*.
Artist.get_clip_box	Return the clipbox.
Artist.set_clip_path	Set the artist's clip path.
Artist.get_clip_path	Return the clip path.

matplotlib.artist.Artist.set_clip_on

Artist.**set_clip_on**(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

Examples using `matplotlib.artist.Artist.set_clip_on`

- *Text alignment*

matplotlib.artist.Artist.get_clip_on

`Artist.`**`get_clip_on`**`()`

Return whether the artist uses clipping.

matplotlib.artist.Artist.set_clip_box

`Artist.`**`set_clip_box`**`(`*clipbox*`)`

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

Examples using `matplotlib.artist.Artist.set_clip_box`

- *Annotating Plots*
- *Ellipse Demo*

matplotlib.artist.Artist.get_clip_box

`Artist.`**`get_clip_box`**`()`

Return the clipbox.

matplotlib.artist.Artist.set_clip_path

`Artist.`**`set_clip_path`**`(`*path*, *transform=None*`)`

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

Examples using `matplotlib.artist.Artist.set_clip_path`

- *Clipping images with patches*
- *Many ways to plot images*
- *Dolphins*
- *Looking Glass*

matplotlib.artist.Artist.get_clip_path

`Artist.`**`get_clip_path`**`()`

Return the clip path.

Bulk Properties

Artist.update	Update this artist's properties from the dict *props*.
Artist.update_from	Copy properties from *other* to *self*.
Artist.properties	Return a dictionary of all the properties of the artist.
Artist.set	Set multiple properties at once.

matplotlib.artist.Artist.update

`Artist.`**`update`**`(`*`props`*`)`

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

matplotlib.artist.Artist.update_from

Artist.**update_from**(*other*)

Copy properties from *other* to *self*.

Examples using `matplotlib.artist.Artist.update_from`

- *Poly Editor*

matplotlib.artist.Artist.properties

Artist.**properties**()

Return a dictionary of all the properties of the artist.

matplotlib.artist.Artist.set

Artist.**set**(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure
gid	str
in_layo	bool
label	object
mouseov	bool
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

Examples using `matplotlib.artist.Artist.set`

- *Bar Label Demo*
- *Curve with error band*
- *Bar chart with gradients*
- *Scatter plot with histograms*
- *Simple Plot*
- *Creating a timeline with lines, dates, and text*
- *Contouring the solution space of optimizations*
- *Contour plot of irregularly spaced data*
- *Axes Demo*

- *Creating multiple subplots using plt.subplots*
- *Boxplots*
- *Hexagonal binned plot*
- *Nested pie charts*
- *Angle annotations on bracket arrows*
- *Annotating Plots*
- *Arrow Demo*

- *Simple Annotate01*
- *The Lifecycle of a Plot*
- *plot(x, y)*
- *scatter(x, y)*
- *bar(x, height)*
- *stem(x, y)*
- *fill_between(x, y1, y2)*
- *stackplot(x, y)*
- *stairs(values)*
- *hist(x)*
- *boxplot(X)*
- *errorbar(x, y, yerr, xerr)*
- *violinplot(D)*
- *eventplot(D)*
- *hist2d(x, y)*
- *hexbin(x, y, C)*
- *pie(x)*
- *barbs(X, Y, U, V)*
- *quiver(X, Y, U, V)*
- *tricontour(x, y, z)*
- *tricontourf(x, y, z)*
- *tripcolor(x, y, z)*
- *triplot(x, y)*
- *scatter(xs, ys, zs)*

- *plot_surface(X, Y, Z)*
- *plot_trisurf(x, y, z)*
- *voxels([x, y, z], filled)*
- *plot_wireframe(X, Y, Z)*
- *Animations using Matplotlib*
- *Arranging multiple Axes in a Figure*
- *Annotations*

Drawing

`Artist.draw`	Draw the Artist (and its children) using the given renderer.
`Artist.set_animated`	Set whether the artist is intended to be used in an animation.
`Artist.get_animated`	Return whether the artist is animated.
`Artist.set_alpha`	Set the alpha value used for blending - not supported on all backends.
`Artist.get_alpha`	Return the alpha value used for blending - not supported on all backends.
`Artist.set_snap`	Set the snapping behavior.
`Artist.get_snap`	Return the snap setting.
`Artist.set_visible`	Set the artist's visibility.
`Artist.get_visible`	Return the visibility.
`Artist.zorder`	
`Artist.set_zorder`	Set the zorder for the artist.
`Artist.get_zorder`	Return the artist's zorder.
`Artist.set_agg_filter`	Set the agg filter.
`Artist.set_sketch_params`	Set the sketch parameters.
`Artist.get_sketch_params`	Return the sketch parameters for the artist.
`Artist.set_rasterized`	Force rasterized (bitmap) drawing for vector graphics output.
`Artist.get_rasterized`	Return whether the artist is to be rasterized.
`Artist.set_path_effects`	Set the path effects.
`Artist.get_path_effects`	
`Artist.get_agg_filter`	Return filter function to be used for agg filter.
`Artist.get_window_extent`	Get the artist's bounding box in display space.
`Artist.get_tightbbox`	Like `Artist.get_window_extent`, but includes any clipping.
`Artist.get_transformed_clip_path_ar`	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.artist.Artist.draw

Artist.**draw**(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

Examples using `matplotlib.artist.Artist.draw`

- *Artist within an artist*

matplotlib.artist.Artist.set_animated

Artist.**set_animated**(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

matplotlib.artist.Artist.get_animated

Artist.**get_animated**()

Return whether the artist is animated.

matplotlib.artist.Artist.set_alpha

Artist.**set_alpha**(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

Examples using `matplotlib.artist.Artist.set_alpha`

- *Violin plot customization*
- *Ellipse Demo*
- *Legend picking*
- *violinplot(D)*

matplotlib.artist.Artist.get_alpha

Artist.**get_alpha**()

Return the alpha value used for blending - not supported on all backends.

matplotlib.artist.Artist.set_snap

Artist.**set_snap**(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.

- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

matplotlib.artist.Artist.get_snap

`Artist.get_snap()`

Return the snap setting.

See *set_snap* for details.

matplotlib.artist.Artist.set_visible

`Artist.set_visible(b)`

Set the artist's visibility.

Parameters

b

[bool]

Examples using `matplotlib.artist.Artist.set_visible`

- *Creating a timeline with lines, dates, and text*
- *Broken Axis*
- *axis_direction demo*
- *Simple Axis Pad*
- *Stock prices over 32 years*
- *Multiple axes animation*
- *Keypress event*
- *Legend picking*
- *Spines*
- *Nested GridSpecs*
- *Tight layout guide*
- *Arranging multiple Axes in a Figure*

matplotlib.artist.Artist.get_visible

Artist.**get_visible**()

Return the visibility.

Examples using matplotlib.artist.Artist.get_visible

- *Keypress event*
- *Legend picking*

matplotlib.artist.Artist.zorder

Artist.**zorder = 0**

matplotlib.artist.Artist.set_zorder

Artist.**set_zorder**(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

Examples using matplotlib.artist.Artist.set_zorder

- *SVG filter pie*
- *Zorder Demo*

matplotlib.artist.Artist.get_zorder

Artist.**get_zorder**()

Return the artist's zorder.

Examples using `matplotlib.artist.Artist.get_zorder`

- *SVG Filter Line*
- *SVG filter pie*
- *Transformations Tutorial*

matplotlib.artist.Artist.set_agg_filter

Artist.**set_agg_filter**(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

matplotlib.artist.Artist.set_sketch_params

Artist.**set_sketch_params**(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

matplotlib.artist.Artist.get_sketch_params

Artist.**get_sketch_params**()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

matplotlib.artist.Artist.set_rasterized

Artist.**set_rasterized**(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

Examples using matplotlib.artist.Artist.set_rasterized

- *Rasterization for vector graphics*

matplotlib.artist.Artist.get_rasterized

Artist.**get_rasterized**()

Return whether the artist is to be rasterized.

matplotlib.artist.Artist.set_path_effects

Artist.**set_path_effects**(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

Examples using `matplotlib.artist.Artist.set_path_effects`

- *Patheffect Demo*
- *Path effects guide*

matplotlib.artist.Artist.get_path_effects

Artist.**get_path_effects**()

matplotlib.artist.Artist.get_agg_filter

Artist.**get_agg_filter**()

Return filter function to be used for agg filter.

matplotlib.artist.Artist.get_window_extent

Artist.**get_window_extent**(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

Examples using `matplotlib.artist.Artist.get_window_extent`

- *BboxImage Demo*
- *Programmatically controlling subplot adjustment*
- *Annotations*

matplotlib.artist.Artist.get_tightbbox

`Artist.`**`get_tightbbox`**(*renderer=None*)

Like *`Artist.get_window_extent`*, but includes any clipping.

Parameters

renderer

[*`RendererBase`* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***`Bbox`* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

matplotlib.artist.Artist.get_transformed_clip_path_and_affine

`Artist.`**`get_transformed_clip_path_and_affine`**()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

Figure and Axes

`Artist.remove`	Remove the artist from the figure if possible.
`Artist.axes`	The *`Axes`* instance the artist resides in, or *None*.
`Artist.set_figure`	Set the *`Figure`* instance the artist belongs to.
`Artist.get_figure`	Return the *`Figure`* instance the artist belongs to.

matplotlib.artist.Artist.remove

Artist.**remove**()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

Examples using matplotlib.artist.Artist.remove

- *Combining two subplots using subplots and GridSpec*
- *Figure subfigures*
- *Artist tutorial*

matplotlib.artist.Artist.axes

property Artist.**axes**

The *Axes* instance the artist resides in, or *None*.

matplotlib.artist.Artist.set_figure

Artist.**set_figure**(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

matplotlib.artist.Artist.get_figure

Artist.**get_figure**()

Return the *Figure* instance the artist belongs to.

Children

Artist.get_children	Return a list of the child *Artist*s of this *Artist*.
Artist.findobj	Find artist objects.

matplotlib.artist.Artist.get_children

Artist.**get_children**()

Return a list of the child *Artist*s of this *Artist*.

matplotlib.artist.Artist.findobj

Artist.**findobj**(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

Examples using `matplotlib.artist.Artist.findobj`

- *Findobj Demo*

Transform

Artist.set_transform	Set the artist transform.
Artist.get_transform	Return the *Transform* instance used by this artist.
Artist.is_transform_set	Return whether the Artist has an explicitly set transform.

matplotlib.artist.Artist.set_transform

Artist.**set_transform**(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

Examples using `matplotlib.artist.Artist.set_transform`

- *Artist within an artist*
- *Text alignment*
- *Line, Poly and RegularPoly Collection with autoscaling*

matplotlib.artist.Artist.get_transform

Artist.**get_transform**()

Return the *Transform* instance used by this artist.

Examples using `matplotlib.artist.Artist.get_transform`

- *SVG Filter Line*
- *Axis scales*

matplotlib.artist.Artist.is_transform_set

`Artist.`**`is_transform_set`**`()`

Return whether the Artist has an explicitly set transform.

This is *True* after *`set_transform`* has been called.

Units

`Artist.convert_xunits`	Convert *x* using the unit type of the xaxis.
`Artist.convert_yunits`	Convert *y* using the unit type of the yaxis.
`Artist.have_units`	Return whether units are set on any axis.

matplotlib.artist.Artist.convert_xunits

`Artist.`**`convert_xunits`**`(`*x*`)`

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

matplotlib.artist.Artist.convert_yunits

`Artist.`**`convert_yunits`**`(`*y*`)`

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

matplotlib.artist.Artist.have_units

`Artist.`**`have_units`**`()`

Return whether units are set on any axis.

Metadata

Artist.set_gid	Set the (group) id for the artist.
Artist.get_gid	Return the group id.
Artist.set_label	Set a label that will be displayed in the legend.
Artist.get_label	Return the label used for this artist in the legend.
Artist.set_url	Set the url for the artist.
Artist.get_url	Return the url.

matplotlib.artist.Artist.set_gid

Artist.**set_gid**(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

Examples using `matplotlib.artist.Artist.set_gid`

- *SVG filter pie*

matplotlib.artist.Artist.get_gid

Artist.**get_gid**()

Return the group id.

Examples using `matplotlib.artist.Artist.get_gid`

- *SVG filter pie*

matplotlib.artist.Artist.set_label

Artist.**set_label**(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

matplotlib.artist.Artist.get_label

Artist.**get_label**()

Return the label used for this artist in the legend.

Examples using `matplotlib.artist.Artist.get_label`

- *Parasite Simple*
- *SVG Filter Line*
- *SVG filter pie*

matplotlib.artist.Artist.set_url

Artist.**set_url**(*url*)

Set the url for the artist.

Parameters

url

[str]

matplotlib.artist.Artist.get_url

Artist.**get_url**()

Return the url.

Miscellaneous

Artist.sticky_edges	x and y sticky edge lists for autoscaling.
Artist.set_in_layout	Set if artist is to be included in layout calculations, E.g.
Artist.get_in_layout	Return boolean flag, True if artist is included in layout calculations.
Artist.stale	Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.artist.Artist.sticky_edges

property Artist.**sticky_edges**

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

matplotlib.artist.Artist.set_in_layout

Artist.**set_in_layout**(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

Examples using `matplotlib.artist.Artist.set_in_layout`

- *Constrained layout guide*
- *Tight layout guide*

matplotlib.artist.Artist.get_in_layout

Artist.**get_in_layout**()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

matplotlib.artist.Artist.stale

property Artist.**stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

Functions

`allow_rasterization`	Decorator for Artist.draw method.
`get`	Return the value of an *`Artist`*'s *property*, or print all of them.
`getp`	Return the value of an *`Artist`*'s *property*, or print all of them.
`setp`	Set one or more properties on an *`Artist`*, or list allowed values.
`kwdoc`	Inspect an *`Artist`* class (using *`ArtistInspector`*) and return information about its settable properties and their current values.
`ArtistInspector`	A helper class to inspect an *`Artist`* and return information about its settable properties and their current values.

matplotlib.artist.allow_rasterization

matplotlib.artist.**allow_rasterization**(*draw*)

Decorator for Artist.draw method. Provides routines that run before and after the draw call. The before and after functions are useful for changing artist-dependent renderer attributes or making other setup function calls, such as starting and flushing a mixed-mode renderer.

matplotlib.artist.get

matplotlib.artist.**get**(*obj*, *property=None*)

Return the value of an *Artist*'s *property*, or print all of them.

Parameters

obj

[*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

property

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If it's None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

See also:

setp

matplotlib.artist.getp

matplotlib.artist.**getp**(*obj*, *property=None*)

Return the value of an *Artist*'s *property*, or print all of them.

Parameters

obj

[*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

property

[str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If it's None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

See also:

setp

matplotlib.artist.setp

matplotlib.artist.**setp**(*obj*, **args*, *file=None*, ***kwargs*)

Set one or more properties on an *Artist*, or list allowed values.

Parameters

obj

[*Artist* or list of *Artist*] The artist(s) whose properties are being set or queried. When setting properties, all artists are affected; when querying the allowed values, only the first instance in the sequence is queried.

For example, two lines can be made thicker and red with a single call:

```
>>> x = arange(0, 1, 0.01)
>>> lines = plot(x, sin(2*pi*x), x, sin(4*pi*x))
>>> setp(lines, linewidth=2, color='r')
```

file

[file-like, default: sys.stdout] Where *setp* writes its output when asked to list allowed values.

```
>>> with open('output.log') as file:
...     setp(line, file=file)
```

The default, None, means sys.stdout.

***args, **kwargs**

The properties to set. The following combinations are supported:

- Set the linestyle of a line to be dashed:

```
>>> line, = plot([1, 2, 3])
>>> setp(line, linestyle='--')
```

- Set multiple properties at once:

```
>>> setp(line, linewidth=2, color='r')
```

- List allowed values for a line's linestyle:

```
>>> setp(line, 'linestyle')
linestyle: {'-', '--', '-.', ':', '', (offset, on-off-
 ↪seq), ...}
```

- List all properties that can be set, and their allowed values:

```
>>> setp(line)
agg_filter: a filter function, ...
[long output listing omitted]
```

setp also supports MATLAB style string/value pairs. For example, the following are equivalent:

```
>>> setp(lines, 'linewidth', 2, 'color', 'r')  # MATLAB␣
 ↪style
>>> setp(lines, linewidth=2, color='r')        # Python␣
 ↪style
```

See also:

getp

matplotlib.artist.kwdoc

matplotlib.artist.**kwdoc**(*artist*)

Inspect an *Artist* class (using *ArtistInspector*) and return information about its settable properties and their current values.

Parameters

artist

[*Artist* or an iterable of *Artist*s]

Returns

str

The settable properties of *artist*, as plain text if *rcParams["docstring.hardcopy"]* (default: False) is False and as a rst table (intended for use in Sphinx) if it is True.

matplotlib.artist.ArtistInspector

class matplotlib.artist.**ArtistInspector**(*o*)

Bases: object

A helper class to inspect an *Artist* and return information about its settable properties and their current values.

Initialize the artist inspector with an *Artist* or an iterable of *Artist*s. If an iterable is used, we assume it is a homogeneous sequence (all *Artist*s are of the same type) and it is your responsibility to make sure this is so.

aliased_name(*s*)

Return 'PROPNAME or alias' if *s* has an alias, else return 'PROPNAME'.

For example, for the line markerfacecolor property, which has an alias, return 'markerfacecolor or mfc' and for the transform property, which does not, return 'transform'.

aliased_name_rest(*s*, *target*)

Return 'PROPNAME or alias' if *s* has an alias, else return 'PROPNAME', formatted for reST.

For example, for the line markerfacecolor property, which has an alias, return 'markerfacecolor or mfc' and for the transform property, which does not, return 'transform'.

get_aliases()

Get a dict mapping property fullnames to sets of aliases for each alias in the *ArtistInspector*.

e.g., for lines:

```
{'markerfacecolor': {'mfc'},
 'linewidth'      : {'lw'},
}
```

get_setters()

Get the attribute strings with setters for object.

For example, for a line, return `['markerfacecolor', 'linewidth', ....]`.

get_valid_values(*attr*)

Get the legal arguments for the setter associated with *attr*.

This is done by querying the docstring of the setter for a line that begins with "ACCEPTS:" or ".. ACCEPTS:", and then by looking for a numpydoc-style documentation for the setter's first argument.

static is_alias(*method*)

Return whether the object *method* is an alias for another method.

static number_of_parameters(*func*)

Return number of parameters of the callable *func*.

pprint_getters()

Return the getters and actual values as list of strings.

pprint_setters(*prop=None*, *leadingspace=2*)

If *prop* is *None*, return a list of strings of all settable properties and their valid values.

If *prop* is not *None*, it is a valid property name and that property will be returned as a string of property : valid values.

pprint_setters_rest(*prop=None*, *leadingspace=4*)

If *prop* is *None*, return a list of reST-formatted strings of all settable properties and their valid values.

If *prop* is not *None*, it is a valid property name and that property will be returned as a string of "property : valid" values.

properties()

Return a dictionary mapping property name -> value.

7.2.5 matplotlib.axes

The `Axes` class represents one (sub-)plot in a figure. It contains the plotted data, axis ticks, labels, title, legend, etc. Its methods are the main interface for manipulating the plot.

Table of Contents

The Axes class

`Axes`	An Axes object encapsulates all the elements of an individual (sub-)plot in a figure.

matplotlib.axes.Axes

class matplotlib.axes.**Axes**(*fig*, **args*, *facecolor=None*, *frameon=True*, *sharex=None*, *sharey=None*, *label=''*, *xscale=None*, *yscale=None*, *box_aspect=None*, ***kwargs*)

An Axes object encapsulates all the elements of an individual (sub-)plot in a figure.

It contains most of the (sub-)plot elements: `Axis`, `Tick`, `Line2D`, `Text`, `Polygon`, etc., and sets the coordinate system.

Like all visible elements in a figure, Axes is an `Artist` subclass.

The *Axes* instance supports callbacks through a callbacks attribute which is a *CallbackRegistry* instance. The events you can connect to are 'xlim_changed' and 'ylim_changed' and the callback will be called with func(*ax*) where *ax* is the *Axes* instance.

Note: As a user, you do not instantiate Axes directly, but use Axes creation methods instead; e.g. from *pyplot* or *Figure*: *subplots*, *subplot_mosaic* or *Figure.add_axes*.

Attributes

dataLim

[*Bbox*] The bounding box enclosing all data displayed in the Axes.

viewLim

[*Bbox*] The view limits in data coordinates.

Build an Axes in a figure.

Parameters

fig

[*Figure*] The Axes is built in the *Figure* *fig*.

***args**

`*args` can be a single `(left, bottom, width, height)` rectangle or a single *Bbox*. This specifies the rectangle (in figure coordinates) where the Axes is positioned.

`*args` can also consist of three numbers or a single three-digit number; in the latter case, the digits are considered as independent numbers. The numbers are interpreted as `(nrows, ncols, index)`: `(nrows, ncols)` specifies the size of an array of subplots, and `index` is the 1-based index of the subplot being created. Finally, `*args` can also directly be a *SubplotSpec* instance.

sharex, sharey

[*Axes*, optional] The x- or y-*axis* is shared with the x- or y-axis in the input *Axes*.

frameon

[bool, default: True] Whether the Axes frame is visible.

box_aspect

[float, optional] Set a fixed aspect for the Axes box, i.e. the ratio of height to width. See *set_box_aspect* for details.

****kwargs**

Other optional keyword arguments:

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, ar
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	*Cycler*
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	*Transform*
url	str
visible	bool
xbound	(lower: float, upper: float)
xlabel	str
xlim	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown

Table 1 – continued from pre

Property	Description
ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

Returns

Axes

The new *Axes* object.

Plotting

Basic

Axes.plot	Plot y versus x as lines and/or markers.
Axes.errorbar	Plot y versus x as lines and/or markers with attached errorbars.
Axes.scatter	A scatter plot of *y* vs.
Axes.plot_date	[*Discouraged*] Plot coercing the axis to treat floats as dates.
Axes.step	Make a step plot.
Axes.loglog	Make a plot with log scaling on both the x- and y-axis.
Axes.semilogx	Make a plot with log scaling on the x-axis.
Axes.semilogy	Make a plot with log scaling on the y-axis.
Axes.fill_between	Fill the area between two horizontal curves.
Axes.fill_betweenx	Fill the area between two vertical curves.
Axes.bar	Make a bar plot.
Axes.barh	Make a horizontal bar plot.
Axes.bar_label	Label a bar plot.
Axes.stem	Create a stem plot.
Axes.eventplot	Plot identical parallel lines at the given positions.
Axes.pie	Plot a pie chart.
Axes.stackplot	Draw a stacked area plot.
Axes.broken_barh	Plot a horizontal sequence of rectangles.
Axes.vlines	Plot vertical lines at each *x* from *ymin* to *ymax*.
Axes.hlines	Plot horizontal lines at each *y* from *xmin* to *xmax*.
Axes.fill	Plot filled polygons.

matplotlib.axes.Axes.plot

Axes.**plot**(**args*, *scalex=True*, *scaley=True*, *data=None*, ***kwargs*)

Plot y versus x as lines and/or markers.

Call signatures:

```
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by *x*, *y*.

The optional parameter *fmt* is a convenient way for defining basic formatting like color, marker and linestyle. It's a shortcut string notation described in the *Notes* section below.

```
>>> plot(x, y)        # plot x and y using default line style and color
>>> plot(x, y, 'bo')  # plot x and y using blue circle markers
>>> plot(y)           # plot y using x as index array 0..N-1
>>> plot(y, 'r+')     # ditto, but with red plusses
```

You can use *Line2D* properties as keyword arguments for more control on the appearance. Line properties and *fmt* can be mixed. The following two calls yield identical results:

```
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',
...      linewidth=2, markersize=12)
```

When conflicting with *fmt*, keyword arguments take precedence.

Plotting labelled data

There's a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index `obj['y']`). Instead of giving the data in *x* and *y*, you can provide the object in the *data* parameter and just give the labels for *x* and *y*:

```
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a `dict`, a `pandas.DataFrame` or a structured numpy array.

Plotting multiple sets of data

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call *plot* multiple times. Example:

  ```
  >>> plot(x1, y1, 'bo')
  >>> plot(x2, y2, 'go')
  ```

- If *x* and/or *y* are 2D arrays a separate data set will be drawn for every column. If both *x* and *y* are 2D, they must have the same shape. If only one of them is 2D with shape (N, m) the other must have length N and will be used for every data set m.

  Example:

```
>>> x = [1, 2, 3]
>>> y = np.array([[1, 2], [3, 4], [5, 6]])
>>> plot(x, y)
```

is equivalent to:

```
>>> for col in range(y.shape[1]):
...     plot(x, y[:, col])
```

- The third way is to specify multiple sets of *[x]*, *y*, *[fmt]* groups:

```
>>> plot(x1, y1, 'g^', x2, y2, 'g-')
```

In this case, any additional keyword argument applies to all datasets. Also, this syntax cannot be combined with the *data* parameter.

By default, each line is assigned a different style specified by a 'style cycle'. The *fmt* and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using *rcParams["axes.prop_cycle"]* (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

Parameters

x, y

[array-like or scalar] The horizontal / vertical coordinates of the data points. *x* values are optional and default to `range(len(y))`.

Commonly, these parameters are 1D arrays.

They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

These arguments cannot be passed as keywords.

fmt

[str, optional] A format string, e.g. 'ro' for red circles. See the *Notes* section for a full description of the format strings.

Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

Note: Technically there's a slight ambiguity in calls where the second label is a valid *fmt*. `plot('n', 'o', data=obj)` could be `plt(x, y)` or `plt(y, fmt)`. In such cases, the former interpretation is chosen, but a warning is issued.

You may suppress the warning by adding an empty format string `plot('n', 'o', '', data=obj)`.

Returns

list of *Line2D*

A list of lines representing the plotted data.

Other Parameters

scalex, scaley

[bool, default: True] These parameters determine if the view limits are adapted to the data limits. The values are passed on to *autoscale_view*.

****kwargs**

[*Line2D* properties, optional] *kwargs* are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

```
>>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1',␣
↪linewidth=2)
>>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')
```

If you specify multiple lines with one plot call, the kwargs apply to all those lines. In case the label object is iterable, each element is used as labels for each set of data.

Here is a list of available *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default:
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None

Table 2 – continued from

Property	Description
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, floa
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

scatter

XY scatter plot with markers of varying size and/or color (sometimes also called bubble chart).

Notes

Format Strings

A format string consists of a part for color, marker and line:

```
fmt = '[marker][line][color]'
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If `line` is given, but no `marker`, the data will be a line without markers.

Other combinations such as `[color][marker][line]` are also supported, but note that their parsing may be ambiguous.

Markers

character	description
`'.'`	point marker
`','`	pixel marker
`'o'`	circle marker
`'v'`	triangle_down marker
`'^'`	triangle_up marker
`'<'`	triangle_left marker
`'>'`	triangle_right marker
`'1'`	tri_down marker
`'2'`	tri_up marker
`'3'`	tri_left marker
`'4'`	tri_right marker
`'8'`	octagon marker
`'s'`	square marker
`'p'`	pentagon marker
`'P'`	plus (filled) marker
`'*'`	star marker
`'h'`	hexagon1 marker
`'H'`	hexagon2 marker
`'+'`	plus marker
`'x'`	x marker
`'X'`	x (filled) marker
`'D'`	diamond marker
`'d'`	thin_diamond marker
`'|'`	vline marker
`'_'`	hline marker

Line Styles

character	description
`'-'`	solid line style
`'--'`	dashed line style
`'-.'`	dash-dot line style
`':'`	dotted line style

Example format strings:

```
'b'    # blue markers with default shape
'or'   # red circles
'-g'   # green solid line
```

(continues on next page)

(continued from previous page)

```
'--'    # dashed line with default color
'^k:'   # black triangle_up markers connected by a dotted line
```

Colors

The supported color abbreviations are the single letter codes

character	color
`'b'`	blue
`'g'`	green
`'r'`	red
`'c'`	cyan
`'m'`	magenta
`'y'`	yellow
`'k'`	black
`'w'`	white

and the `'CN'` colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any *matplotlib.colors* spec, e.g. full names (`'green'`) or hex strings (`'#008000'`).

matplotlib.axes.Axes.errorbar

Axes.**errorbar**(*x*, *y*, *yerr=None*, *xerr=None*, *fmt=''*, *ecolor=None*, *elinewidth=None*, *capsize=None*, *barsabove=False*, *lolims=False*, *uplims=False*, *xlolims=False*, *xuplims=False*, *errorevery=1*, *capthick=None*, ***, *data=None*, ***kwargs*)

Plot y versus x as lines and/or markers with attached errorbars.

x, *y* define the data locations, *xerr*, *yerr* define the errorbar sizes. By default, this draws the data markers/lines as well as the errorbars. Use fmt='none' to draw errorbars without any data markers.

New in version 3.7: Caps and error lines are drawn in polar coordinates on polar plots.

Parameters

x, y

[float or array-like] The data positions.

xerr, yerr

[float or array-like, shape(N,) or shape(2, N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar.

All values must be >= 0.

See *Different ways of specifying error bars* for an example on the usage of `xerr` and `yerr`.

fmt

[str, default: ''] The format for the data points / data lines. See `plot` for details.

Use 'none' (case-insensitive) to plot errorbars without any data markers.

ecolor

[color, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

elinewidth

[float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

capsize

[float, default: *rcParams["errorbar.capsize"]* (default: 0.0)] The length of the error bar caps in points.

capthick

[float, default: None] An alias to the keyword argument *markeredgewidth* (a.k.a. *mew*). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if *mew* or *markeredgewidth* are given, then they will over-ride *capthick*. This may change in future releases.

barsabove

[bool, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

lolims, uplims, xlolims, xuplims

[bool or array-like, default: False] These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. *lims*-arguments may be scalars, or array-likes of the same length as *xerr* and *yerr*. To use limits with inverted axes, *set_xlim* or *set_ylim* must be called before *errorbar()*. Note the tricky parameter names: setting e.g. *lolims* to True means that the y-value is a *lower* limit of the True value, so, only an *upward*-pointing arrow will be drawn!

errorevery

[int or (int, int), default: 1] draws error bars on a subset of the data. *errorevery* =N draws error bars on the points (x[::N], y[::N]). *errorevery* =(start, N) draws error bars on the points (x[start::N], y[start::N]). e.g. errorevery=(6, 3) adds error bars to the data at (x[6], x[9], x[12], x[15], ...). Used to avoid overlapping error bars when two series share x-axis values.

Returns

ErrorbarContainer

The container contains:

- plotline: *Line2D* instance of x, y plot markers and/or line.
- caplines: A tuple of *Line2D* instances of the error bar caps.

- barlinecols: A tuple of *LineCollection* with the horizontal and vertical error ranges.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*, *xerr*, *yerr*

****kwargs**

All other keyword arguments are passed on to the *plot* call drawing the markers. For example, this code makes big red squares with thick green edges:

```
x, y, yerr = rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red',
         mec='green', ms=20, mew=4)
```

where *mfc*, *mec*, *ms* and *mew* are aliases for the longer property names, *markerfacecolor*, *markeredgecolor*, *markersize* and *markeredgewidth*.

Valid kwargs for the marker properties are:

- *dashes*
- *dash_capstyle*
- *dash_joinstyle*
- *drawstyle*
- *fillstyle*
- *linestyle*
- *marker*
- *markeredgecolor*
- *markeredgewidth*
- *markerfacecolor*
- *markerfacecoloralt*
- *markersize*
- *markevery*
- *solid_capstyle*
- *solid_joinstyle*

Refer to the corresponding *Line2D* property for more details:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	CapStyle or {'butt', 'projecting', 'round'}
dash_joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default:
figure	Figure
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}

- *Log Demo*
- *errorbar(x, y, yerr, xerr)*

matplotlib.axes.Axes.scatter

`Axes.`**`scatter`**(*x*, *y*, *s=None*, *c=None*, *marker=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, ***, *edgecolors=None*, *plotnonfinite=False*, *data=None*, ***kwargs*)

A scatter plot of *y* vs. *x* with varying marker size and/or color.

Parameters

x, y

[float or array-like, shape (n,)] The data positions.

s

[float or array-like, shape (n,), optional] The marker size in points**2 (typographic points are 1/72 in.). Default is `rcParams['lines.markersize'] ** 2`.

The linewidth and edgecolor can visually interact with the marker size, and can lead to artifacts if the marker size is smaller than the linewidth.

If the linewidth is greater than 0 and the edgecolor is anything but *'none'*, then the effective size of the marker will be increased by half the linewidth because the stroke will be centered on the edge of the shape.

To eliminate the marker edge either set *linewidth=0* or *edgecolor='none'*.

c

[array-like or list of colors or color, optional] The marker colors. Possible values:

- A scalar or sequence of n numbers to be mapped to colors using *cmap* and *norm*.
- A 2D array in which the rows are RGB or RGBA.
- A sequence of colors of length n.
- A single color format string.

Note that *c* should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. If you want to specify the same RGB or RGBA value for all points, use a 2D array with a single row. Otherwise, value-matching will have precedence in case of a size matching with *x* and *y*.

If you wish to specify a single color for all points prefer the *color* keyword argument.

Defaults to `None`. In that case the marker color is determined by the value of *color*, *facecolor* or *facecolors*. In case those are not specified or `None`, the marker color is determined by the next color of the `Axes`' current "shape and fill" color cycle. This cycle defaults to *rcParams["axes.prop_cycle"]* (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

marker

[*MarkerStyle*, default: *rcParams["scatter.marker"]* (default: `'o'`)] The marker style. *marker* can be either an instance of the class or the text shorthand for a particular marker. See *matplotlib.markers* for more information about marker styles.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *c* is RGB(A).

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *c* is RGB(A).

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

This parameter is ignored if *c* is RGB(A).

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float or array-like, default: *rcParams["lines.linewidth"]* (default: `1.5`)] The linewidth of the marker edges. Note: The default *edgecolors* is 'face'. You may want to change this as well.

edgecolors

[{'face', 'none', *None*} or color or sequence of color, default: *rcParams["scatter.edgecolors"]* (default: `'face'`)] The edge color of the marker. Possible values:

- 'face': The edge color will always be the same as the face color.
- 'none': No patch boundary will be drawn.
- A color or sequence of colors.

For non-filled markers, *edgecolors* is ignored. Instead, the color is determined like with 'face', i.e. from *c*, *colors*, or *facecolors*.

plotnonfinite

[bool, default: False] Whether to plot points with nonfinite *c* (i.e. `inf`, `-inf` or `nan`). If `True` the points are drawn with the *bad* colormap color (see *Colormap.set_bad*).

Returns

PathCollection

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*, *s*, *linewidths*, *edgecolors*, *c*, *facecolor*, *facecolors*, *color*

****kwargs**

[*Collection* properties]

See also:

plot

To plot scatter plots when markers are identical in size and color.

Notes

- The *plot* function will be faster for scatterplots where markers don't vary in size or color.
- Any or all of *x*, *y*, *s*, and *c* may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.
- Fundamentally, scatter works with 1D arrays; *x*, *y*, *s*, and *c* may be input as N-D arrays, but within scatter they will be flattened. The exception is *c*, which will be flattened only if its size matches the size of *x* and *y*.

Examples using `matplotlib.axes.Axes.scatter`

- *Scatter Demo2*
- *Scatter plot with histograms*
- *Scatter plots with a legend*
- *Advanced quiver and quiverkey functions*

matplotlib.axes.Axes.plot_date

`Axes.`**`plot_date`**(*x*, *y*, *fmt='o'*, *tz=None*, *xdate=True*, *ydate=False*, ***, *data=None*, ***kwargs*)

[*Discouraged*] Plot coercing the axis to treat floats as dates.

Discouraged

This method exists for historic reasons and will be deprecated in the future.

- `datetime`-like data should directly be plotted using `plot`.
- If you need to plot plain numeric data as *Matplotlib date format* or need to set a timezone, call `ax.xaxis.axis_date` / `ax.yaxis.axis_date` before `plot`. See `Axis.axis_date`.

Similar to `plot`, this plots *y* vs. *x* as lines or markers. However, the axis labels are formatted as dates depending on *xdate* and *ydate*. Note that `plot` will work with `datetime` and `numpy.datetime64` objects without resorting to this method.

Parameters

x, y

[array-like] The coordinates of the data points. If *xdate* or *ydate* is *True*, the respective values *x* or *y* are interpreted as *Matplotlib dates*.

fmt

[str, optional] The plot format string. For details, see the corresponding parameter in *plot*.

tz

[timezone string or `datetime.tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] The time zone to use in labeling dates.

xdate

[bool, default: True] If *True*, the *x*-axis will be interpreted as Matplotlib dates.

ydate

[bool, default: False] If *True*, the *y*-axis will be interpreted as Matplotlib dates.

Returns

list of *Line2D*

Objects representing the plotted data.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default:
figure	*Figure*

Table 4 – continued from

Property	Description
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, floa
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

matplotlib.dates

Helper functions on dates.

matplotlib.dates.date2num

Convert dates to num.

matplotlib.dates.num2date

Convert num to dates.

matplotlib.dates.drange

Create an equally spaced sequence of dates.

Notes

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to *plot_date*. *plot_date* will set the default tick locator to *AutoDateLocator* (if the tick locator is not already set to a *DateLocator* instance) and the default tick formatter to *AutoDateFormatter* (if the tick formatter is not already set to a *DateFormatter* instance).

matplotlib.axes.Axes.step

Axes.**step**(*x*, *y*, **args*, *where='pre'*, *data=None*, ***kwargs*)

Make a step plot.

Call signatures:

```
step(x, y, [fmt], *, data=None, where='pre', **kwargs)
step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)
```

This is just a thin wrapper around *plot* which changes some formatting options. Most of the concepts and parameters of plot can be used here as well.

Note: This method uses a standard plot with a step drawstyle: The *x* values are the reference positions and steps extend left/right/both directions depending on *where*.

For the common case where you know the values and edges of the steps, use *stairs* instead.

Parameters

x

[array-like] 1D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.

y

[array-like] 1D sequence of y levels.

fmt

[str, optional] A format string, e.g. 'g' for a green line. See *plot* for a more detailed description.

Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument *linestyle* instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.

where

[{'pre', 'post', 'mid'}, default: 'pre'] Define where the steps should be placed:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*.

****kwargs**

Additional parameters are the same as those for *plot*.

Returns

list of *Line2D*

Objects representing the plotted data.

Examples using `matplotlib.axes.Axes.step`

- *Step Demo*
- *stairs(values)*

matplotlib.axes.Axes.loglog

`Axes.`**`loglog`**`(`*args*, ***kwargs*`)`

Make a plot with log scaling on both the x- and y-axis.

Call signatures:

```
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes both the x-axis and the y-axis to log scaling. All the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs* and *nonpositive* control the x/y-axis properties. They are just forwarded to *Axes.set_xscale* and *Axes.set_yscale*. To use different properties on the x-axis and the y-axis, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

Parameters

base

[float, default: 10] Base of the logarithm.

subs

[sequence, optional] The location of the minor ticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_xscale*/*Axes.set_yscale* for details.

nonpositive

[{'mask', 'clip'}, default: 'clip'] Non-positive values can be masked as invalid, or clipped to a very small positive number.

****kwargs**

All parameters supported by *plot*.

Returns

list of *Line2D*

Objects representing the plotted data.

Examples using `matplotlib.axes.Axes.loglog`

- *Secondary Axis*
- *Log Demo*
- *Axis scales*

matplotlib.axes.Axes.semilogx

Axes.**semilogx**(**args*, ***kwargs*)

Make a plot with log scaling on the x-axis.

Call signatures:

```
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes the x-axis to log scaling. All the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the x-axis properties. They are just forwarded to *Axes.set_xscale*.

Parameters

base

[float, default: 10] Base of the x logarithm.

subs

[array-like, optional] The location of the minor xticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See *Axes.set_xscale* for details.

nonpositive

[{'mask', 'clip'}, default: 'clip'] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

****kwargs**

All parameters supported by *plot*.

Returns

list of *Line2D*

Objects representing the plotted data.

Examples using `matplotlib.axes.Axes.semilogx`

- *Log Demo*
- *Log Axis*
- *Axis scales*

matplotlib.axes.Axes.semilogy

`Axes.`**`semilogy`**(**args*, ***kwargs*)

Make a plot with log scaling on the y-axis.

Call signatures:

```
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes the y-axis to log scaling. All the concepts and parameters of plot can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the y-axis properties. They are just forwarded to *Axes.set_yscale*.

Parameters

base

[float, default: 10] Base of the y logarithm.

subs

[array-like, optional] The location of the minor yticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_yscale` for details.

nonpositive

[{'mask', 'clip'}, default: 'clip'] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

****kwargs**

All parameters supported by `plot`.

Returns

list of *Line2D*

Objects representing the plotted data.

Examples using `matplotlib.axes.Axes.semilogy`

- *Log Demo*
- *SkewT-logP diagram: using transforms and custom projections*
- *Axis scales*

matplotlib.axes.Axes.fill_between

`Axes.`**`fill_between`**(*x*, *y1*, *y2=0*, *where=None*, *interpolate=False*, *step=None*, ***, *data=None*, ***kwargs*)

Fill the area between two horizontal curves.

The curves are defined by the points (*x*, *y1*) and (*x*, *y2*). This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *x*.

Parameters

x

[array (length N)] The x coordinates of the nodes defining the curves.

y1

[array (length N) or scalar] The y coordinates of the nodes defining the first curve.

y2

[array (length N) or scalar, default: 0] The y coordinates of the nodes defining the second curve.

where

[array of bool (length N), optional] Define *where* to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates `x[where]`. More precisely, fill between `x[i]` and `x[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

interpolate

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for *y1 > y2* or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the *x* array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *x*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

PolyCollection

A *PolyCollection* containing the plotted polygons.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y1*, *y2*, *where*

**kwargs

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a d
alpha	array-like or scalar or None

fill_between

Fill between two sets of y-values.

fill_betweenx

Fill between two sets of x-values.

Examples using `matplotlib.axes.Axes.fill_between`

- *Fill Between and Alpha*
- *Filling the area between lines*
- *Hatch-filled histograms*
- *Shade regions defined by a logical mask using fill_between*
- *fill_between(x, y1, y2)*

matplotlib.axes.Axes.fill_betweenx

Axes.**fill_betweenx**(*y*, *x1*, *x2=0*, *where=None*, *step=None*, *interpolate=False*, ***, *data=None*, ***kwargs*)

Fill the area between two vertical curves.

The curves are defined by the points (*y*, *x1*) and (*y*, *x2*). This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *y*.

Parameters

y

[array (length N)] The y coordinates of the nodes defining the curves.

x1

[array (length N) or scalar] The x coordinates of the nodes defining the first curve.

x2

[array (length N) or scalar, default: 0] The x coordinates of the nodes defining the second curve.

where

[array of bool (length N), optional] Define *where* to exclude some vertical regions from being filled. The filled regions are defined by the coordinates `y[where]`. More precisely, fill between `y[i]` and `y[i+1]` if `where[i] and where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

interpolate

[bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for *x1 > x2* or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the *y* array. Such a polygon cannot describe the above semantics close to the intersection. The y-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

step

[{'pre', 'post', 'mid'}, optional] Define *step* if the filling should be a step function, i.e. constant in between *y*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every *x* position, i.e. the interval `(x[i-1], x[i]]` has the value `y[i]`.
- 'post': The y value is continued constantly to the right from every *x* position, i.e. the interval `[x[i], x[i+1])` has the value `y[i]`.
- 'mid': Steps occur half-way between the *x* positions.

Returns

PolyCollection

A *PolyCollection* containing the plotted polygons.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

y, *x1*, *x2*, *where*

**kwargs

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a d
alpha	array-like or scalar or None

See also:

fill_between

Fill between two sets of y-values.

fill_betweenx

Fill between two sets of x-values.

Examples using `matplotlib.axes.Axes.fill_betweenx`

- *Fill Betweenx Demo*
- *Hatch-filled histograms*

matplotlib.axes.Axes.bar

`Axes.`**`bar`**(*x*, *height*, *width=0.8*, *bottom=None*, *, *align='center'*, *data=None*, ***kwargs*)

Make a bar plot.

The bars are positioned at *x* with the given *align*ment. Their dimensions are given by *height* and *width*. The vertical baseline is *bottom* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

x

[float or array-like] The x coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

height

[float or array-like] The height(s) of the bars.

Note that if *bottom* has units (e.g. datetime), *height* should be in units that are a difference from the value of *bottom* (e.g. timedelta).

width

[float or array-like, default: 0.8] The width(s) of the bars.

Note that if *x* has units (e.g. datetime), then *width* should be in units that are a difference (e.g. timedelta) around the *x* values.

bottom

[float or array-like, default: 0] The y coordinate(s) of the bottom side(s) of the bars.

Note that if *bottom* has units, then the y-axis will get a Locator and Formatter appropriate for the units (e.g. dates, or categorical).

align

[{'center', 'edge'}, default: 'center'] Alignment of the bars to the *x* coordinates:

- 'center': Center the base on the *x* positions.
- 'edge': Align the left edges of the bars with the *x* positions.

To align the bars on the right edge pass a negative *width* and `align='edge'`.

Returns

BarContainer

Container with all the bars and optionally errorbars.

Other Parameters

color

[color or list of color, optional] The colors of the bar faces.

edgecolor

[color or list of color, optional] The colors of the bar edges.

linewidth

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

label

[str or list of str, optional] A single label is attached to the resulting *BarContainer* as a label for the whole dataset. If a list is provided, it must be the same length as *x* and labels the individual bars. Repeated labels are not de-duplicated and will cause repeated label entries, so this is best used when bars also differ in style (e.g., by passing a list to *color*.)

xerr, yerr

[float or array-like of shape(N,) or shape(2, N), optional] If not *None*, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars

- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (Default)

See *Different ways of specifying error bars* for an example on the usage of *xerr* and *yerr*.

ecolor

[color or list of color, default: 'black'] The line color of the errorbars.

capsize

[float, default: `rcParams["errorbar.capsize"]` (default: `0.0`)] The length of the error bar caps in points.

error_kw

[dict, optional] Dictionary of keyword arguments to be passed to the `errorbar` method. Values of *ecolor* or *capsize* defined here take precedence over the independent keyword arguments.

log

[bool, default: False] If *True*, set the y-axis to be log scale.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

[`Rectangle` properties]

Property	Description
`agg_filter`	a filter function, which takes a (m, n, 3) float array and a dpi value, and return
`alpha`	scalar or None
`angle`	unknown

- *Path Tutorial*

matplotlib.axes.Axes.barh

`Axes.`**`barh`**(*y*, *width*, *height=0.8*, *left=None*, *, *align='center'*, *data=None*, ***kwargs*)

Make a horizontal bar plot.

The bars are positioned at *y* with the given *align*ment. Their dimensions are given by *width* and *height*. The horizontal baseline is *left* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

y

[float or array-like] The y coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

width

[float or array-like] The width(s) of the bars.

Note that if *left* has units (e.g. datetime), *width* should be in units that are a difference from the value of *left* (e.g. timedelta).

height

[float or array-like, default: 0.8] The heights of the bars.

Note that if *y* has units (e.g. datetime), then *height* should be in units that are a difference (e.g. timedelta) around the *y* values.

left

[float or array-like, default: 0] The x coordinates of the left side(s) of the bars.

Note that if *left* has units, then the x-axis will get a Locator and Formatter appropriate for the units (e.g. dates, or categorical).

align

[{'center', 'edge'}, default: 'center'] Alignment of the base to the *y* coordinates*:

- 'center': Center the bars on the *y* positions.
- 'edge': Align the bottom edges of the bars with the *y* positions.

To align the bars on the top edge pass a negative *height* and `align='edge'`.

Returns

BarContainer

Container with all the bars and optionally errorbars.

Other Parameters

color

[color or list of color, optional] The colors of the bar faces.

edgecolor

[color or list of color, optional] The colors of the bar edges.

linewidth

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

label

[str or list of str, optional] A single label is attached to the resulting *BarContainer* as a label for the whole dataset. If a list is provided, it must be the same length as *y* and labels the individual bars. Repeated labels are not de-duplicated and will cause repeated label entries, so this is best used when bars also differ in style (e.g., by passing a list to *color*.)

xerr, yerr

[float or array-like of shape(N,) or shape(2, N), optional] If not *None*, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (default)

See *Different ways of specifying error bars* for an example on the usage of *xerr* and *yerr*.

ecolor

[color or list of color, default: 'black'] The line color of the errorbars.

capsize

[float, default: *rcParams["errorbar.capsize"]* (default: `0.0`)] The length of the error bar caps in points.

error_kw

[dict, optional] Dictionary of keyword arguments to be passed to the *errorbar* method. Values of *ecolor* or *capsize* defined here take precedence over the independent keyword arguments.

log

[bool, default: False] If `True`, set the x-axis to be log scale.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

[*Rectangle* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and return
alpha	scalar or None
angle	unknown
animated	bool
antialiased or aa	bool or None
bounds	(left, bottom, width, height)
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
height	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
width	unknown
x	unknown
xy	(float, float)
y	unknown
zorder	float

See also:

bar

Plot a vertical bar plot.

Notes

Stacked bars can be achieved by passing individual *left* values per bar. See *Discrete distribution as horizontal bar chart*.

Examples using `matplotlib.axes.Axes.barh`

- *Bar Label Demo*
- *Horizontal bar chart*
- *Discrete distribution as horizontal bar chart*
- *Producing multiple histograms side by side*
- *The Lifecycle of a Plot*
- *Animations using Matplotlib*

matplotlib.axes.Axes.bar_label

`Axes.`**`bar_label`**(*container*, *labels=None*, *, *fmt='%g'*, *label_type='edge'*, *padding=0*, ***kwargs*)

Label a bar plot.

Adds labels to bars in the given `BarContainer`. You may need to adjust the axis limits to fit the labels.

Parameters

container

[`BarContainer`] Container with all the bars and optionally errorbars, likely returned from `bar` or `barh`.

labels

[array-like, optional] A list of label texts, that should be displayed. If not given, the label texts will be the data values formatted with *fmt*.

fmt

[str or callable, default: '%g'] An unnamed %-style or {}-style format string for the label or a function to call with the value as the first argument. When *fmt* is a string and can be interpreted in both formats, %-style takes precedence over {}-style.

New in version 3.7: Support for {}-style format string and callables.

label_type

[{'edge', 'center'}, default: 'edge'] The label type. Possible values:

- 'edge': label placed at the end-point of the bar segment, and the value displayed will be the position of that end-point.

- 'center': label placed in the center of the bar segment, and the value displayed will be the length of that segment. (useful for stacked bars, i.e., *Bar Label Demo*)

padding

[float, default: 0] Distance of label from the end of the bar, in points.

****kwargs**

Any remaining keyword arguments are passed through to `Axes.annotate`. The alignment parameters (*horizontalalignment* / *ha*, *verticalalignment* / *va*) are not supported because the labels are automatically aligned to the bars.

Returns

list of `Annotation`

A list of `Annotation` instances for the labels.

Examples using `matplotlib.axes.Axes.bar_label`

- *Bar Label Demo*
- *Grouped bar chart with labels*
- *Discrete distribution as horizontal bar chart*
- *Percentiles as horizontal bar chart*
- *Bar of pie*

matplotlib.axes.Axes.stem

`Axes.`**`stem`**`(`**args*, *linefmt=None*, *markerfmt=None*, *basefmt=None*, *bottom=0*, *label=None*, *orientation='vertical'*, *data=None*`)`

Create a stem plot.

A stem plot draws lines perpendicular to a baseline at each location *locs* from the baseline to *heads*, and places a marker there. For vertical stem plots (the default), the *locs* are *x* positions, and the *heads* are *y* values. For horizontal stem plots, the *locs* are *y* positions, and the *heads* are *x* values.

Call signature:

```
stem([locs,] heads, linefmt=None, markerfmt=None, basefmt=None)
```

The *locs*-positions are optional. *linefmt* may be provided as positional, but all other formats must be provided as keyword arguments.

Parameters

locs

[array-like, default: (0, 1, ..., len(heads) - 1)] For vertical stem plots, the x-positions of the stems. For horizontal stem plots, the y-positions of the stems.

heads

[array-like] For vertical stem plots, the y-values of the stem heads. For horizontal stem plots, the x-values of the stem heads.

linefmt

[str, optional] A string defining the color and/or linestyle of the vertical lines:

Character	Line Style
`'-'`	solid line
`'--'`	dashed line
`'-.'`	dash-dot line
`':'`	dotted line

Default: 'C0-', i.e. solid line with the first color of the color cycle.

Note: Markers specified through this parameter (e.g. 'x') will be silently ignored. Instead, markers should be specified using *markerfmt*.

markerfmt

[str, optional] A string defining the color and/or shape of the markers at the stem heads. If the marker is not given, use the marker 'o', i.e. filled circles. If the color is not given, use the color from *linefmt*.

basefmt

[str, default: 'C3-' ('C2-' in classic mode)] A format string defining the properties of the baseline.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] If 'vertical', will produce a plot with stems oriented vertically, If 'horizontal', the stems will be oriented horizontally.

bottom

[float, default: 0] The y/x-position of the baseline (depending on orientation).

label

[str, default: None] The label to use for the stems in legends.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Returns

StemContainer

The container may be treated like a tuple (*markerline*, *stemlines*, *baseline*)

Notes

See also:

The MATLAB function stem which inspired this method.

Examples using `matplotlib.axes.Axes.stem`

- *Stem Plot*
- *Legend Demo*
- *3D stem*
- *stem(x, y)*

matplotlib.axes.Axes.eventplot

`Axes.`**`eventplot`**(*positions*, *orientation='horizontal'*, *lineoffsets=1*, *linelengths=1*, *linewidths=None*, *colors=None*, *alpha=None*, *linestyles='solid'*, ***, *data=None*, ***kwargs*)

Plot identical parallel lines at the given positions.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

Parameters

positions

[array-like or list of array-like] A 1D array-like defines the positions of one sequence of events.

Multiple groups of events may be passed as a list of array-likes. Each group can be styled independently by passing lists of values to *lineoffsets*, *linelengths*, *linewidths*, *colors* and *linestyles*.

Note that *positions* can be a 2D array, but in practice different event groups usually have different counts so that one will use a list of different-length arrays rather than a 2D array.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The direction of the event sequence:

- 'horizontal': the events are arranged horizontally. The indicator lines are vertical.
- 'vertical': the events are arranged vertically. The indicator lines are horizontal.

lineoffsets

[float or array-like, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to *orientation*.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linelengths

[float or array-like, default: 1] The total height of the lines (i.e. the lines stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linewidths

[float or array-like, default: *`rcParams["lines.linewidth"]`* (default: `1.5`)] The line width(s) of the event lines, in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

colors

[color or list of colors, default: *`rcParams["lines.color"]`* (default: `'C0'`)] The color(s) of the event lines.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

alpha

[float or array-like, default: 1] The alpha blending value(s), between 0 (transparent) and 1 (opaque).

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

linestyles

[str or tuple or list of such values, default: 'solid'] Default is 'solid'. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

positions, *lineoffsets*, *linelengths*, *linewidths*, *colors*, *linestyles*

****kwargs**

Other keyword arguments are line collection properties. See *LineCollection* for a list of the valid properties.

Returns

list of *EventCollection*

The *EventCollection* that were added.

Notes

For *linelengths*, *linewidths*, *colors*, *alpha* and *linestyles*, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as *positions*, and each value will be applied to the corresponding row of the array.

Examples

Examples using `matplotlib.axes.Axes.eventplot`

- *eventplot(D)*

matplotlib.axes.Axes.pie

`Axes.`**`pie`**(*x*, *explode=None*, *labels=None*, *colors=None*, *autopct=None*, *pctdistance=0.6*, *shadow=False*, *labeldistance=1.1*, *startangle=0*, *radius=1*, *counterclock=True*, *wedgeprops=None*, *textprops=None*, *center=(0, 0)*, *frame=False*, *rotatelabels=False*, ***, *normalize=True*, *hatch=None*, *data=None*)

Plot a pie chart.

Make a pie chart of array *x*. The fractional area of each wedge is given by `x/sum(x)`.

The wedges are plotted counterclockwise, by default starting from the x-axis.

Parameters

x

[1D array-like] The wedge sizes.

explode

[array-like, default: None] If not *None*, is a `len(x)` array which specifies the fraction of the radius with which to offset each wedge.

labels

[list, default: None] A sequence of strings providing the labels for each wedge

colors

[color or array-like of color, default: None] A sequence of colors through which the pie chart will cycle. If *None*, will use the colors in the currently active cycle.

hatch

[str or list, default: None] Hatching pattern applied to all pie wedges or sequence of patterns through which the chart will cycle. For a list of valid patterns, see *Hatch style reference*.

New in version 3.7.

autopct

[None or str or callable, default: None] If not *None*, *autopct* is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If *autopct* is a format string, the label will be `fmt % pct`. If *autopct* is a function, then it will be called.

pctdistance

[float, default: 0.6] The relative distance along the radius at which the text generated by *autopct* is drawn. To draw the text outside the pie, set *pctdistance* > 1. This parameter is ignored if *autopct* is `None`.

labeldistance

[float or None, default: 1.1] The relative distance along the radius at which the labels are drawn. To draw the labels inside the pie, set *labeldistance* < 1. If set to `None`, labels are not drawn but are still stored for use in *legend*.

shadow

[bool or dict, default: False] If bool, whether to draw a shadow beneath the pie. If dict, draw a shadow passing the properties in the dict to *Shadow*.

New in version 3.8: *shadow* can be a dict.

startangle

[float, default: 0 degrees] The angle by which the start of the pie is rotated, counterclockwise from the x-axis.

radius

[float, default: 1] The radius of the pie.

counterclock

[bool, default: True] Specify fractions direction, clockwise or counterclockwise.

wedgeprops

[dict, default: None] Dict of arguments passed to each *patches.Wedge* of the pie. For example, `wedgeprops = {'linewidth': 3}` sets the width of the wedge border lines equal to 3. By default, `clip_on=False`. When there is a conflict between these properties and other keywords, properties passed to *wedgeprops* take precedence.

textprops

[dict, default: None] Dict of arguments to pass to the text objects.

center

[(float, float), default: (0, 0)] The coordinates of the center of the chart.

frame

[bool, default: False] Plot Axes frame with the chart if true.

rotatelabels

[bool, default: False] Rotate each label to the angle of the corresponding slice if true.

normalize

[bool, default: True] When *True*, always make a full pie by normalizing x so that `sum(x) == 1`. *False* makes a partial pie if `sum(x) <= 1` and raises a `ValueError` for `sum(x) > 1`.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *explode*, *labels*, *colors*

Returns

patches

[list] A sequence of *matplotlib.patches.Wedge* instances

texts

[list] A list of the label *Text* instances.

autotexts

[list] A list of *Text* instances for the numeric labels. This will only be returned if the parameter *autopct* is not *None*.

Notes

The pie chart will probably look best if the figure and Axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to "equal". The Axes aspect ratio can be controlled with *Axes.set_aspect*.

Examples using `matplotlib.axes.Axes.pie`

- *Pie charts*
- *Bar of pie*
- *Nested pie charts*
- *Labeling a pie and a donut*
- *SVG filter pie*
- *pie(x)*

matplotlib.axes.Axes.stackplot

Axes.**stackplot**(*x*, **args*, *labels=()*, *colors=None*, *baseline='zero'*, *data=None*, ***kwargs*)

Draw a stacked area plot.

Parameters

x

[(N,) array-like]

y

[(M, N) array-like] The data is assumed to be unstacked. Each of the following calls is legal:

```
stackplot(x, y)           # where y has shape (M, N)
stackplot(x, y1, y2, y3)  # where y1, y2, y3, y4 have␣
 ↪length N
```

baseline

[{'zero', 'sym', 'wiggle', 'weighted_wiggle'}] Method used to calculate the baseline:

- `'zero'`: Constant zero baseline, i.e. a simple stacked plot.
- `'sym'`: Symmetric around zero and is sometimes called 'ThemeRiver'.
- `'wiggle'`: Minimizes the sum of the squared slopes.
- `'weighted_wiggle'`: Does the same but weights to account for size of each layer. It is also called 'Streamgraph'-layout. More details can be found at http://leebyron.com/streamgraph/.

labels

[list of str, optional] A sequence of labels to assign to each data series. If unspecified, then no labels will be applied to artists.

colors

[list of color, optional] A sequence of colors to be cycled through and used to color the stacked areas. The sequence need not be exactly the same length as the number of provided *y*, in which case the colors will repeat from the beginning.

If not specified, the colors from the Axes property cycle will be used.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

All other keyword arguments are passed to *`Axes.fill_between`*.

Returns

list of *`PolyCollection`*

A list of `PolyCollection` instances, one for each element in the stacked area plot.

Examples using `matplotlib.axes.Axes.stackplot`

- *Stackplots and streamgraphs*
- *stackplot(x, y)*

matplotlib.axes.Axes.broken_barh

`Axes.`**`broken_barh`**(*xranges*, *yrange*, *, *data=None*, ***kwargs*)

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of *xranges*. All rectangles have the same vertical position and size defined by *yrange*.

Parameters

xranges

[sequence of tuples (*xmin*, *xwidth*)] The x-positions and extents of the rectangles. For each tuple (*xmin*, *xwidth*) a rectangle is drawn from *xmin* to *xmin* + *xwidth*.

yrange

[(*ymin*, *yheight*)] The y-position and extent for all the rectangles.

Returns

PolyCollection

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

[*PolyCollection* properties] Each *kwarg* can be either a single argument applying to all rectangles, e.g.:

```
facecolors='black'
```

or a sequence of arguments over which is cycled, e.g.:

```
facecolors=('black', 'blue')
```

would create interleaving black and blue rectangles.

Supported keywords:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a d
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof

Table 9 – continued fro

Property	Description
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

Examples using `matplotlib.axes.Axes.broken_barh`

- *Broken Barh*

matplotlib.axes.Axes.vlines

Axes.**vlines**(*x*, *ymin*, *ymax*, *colors=None*, *linestyles='solid'*, *label=''*, ***, *data=None*, ***kwargs*)

Plot vertical lines at each *x* from *ymin* to *ymax*.

Parameters

x

[float or array-like] x-indexes where to plot the lines.

ymin, ymax

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have the same length.

colors

[color or list of colors, default: *rcParams["lines.color"]* (default: 'C0')]

linestyles

[{'solid', 'dashed', 'dashdot', 'dotted'}, default: 'solid']

label

[str, default: '']

Returns

LineCollection

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *ymin*, *ymax*, *colors*

****kwargs**

[*LineCollection* properties.]

See also:

hlines

horizontal lines

axvline

vertical line across the Axes

Examples using `matplotlib.axes.Axes.vlines`

- *Creating a timeline with lines, dates, and text*
- *hlines and vlines*
- *Violin plot customization*
- *Angle annotations on bracket arrows*

matplotlib.axes.Axes.hlines

Axes.**hlines**(*y*, *xmin*, *xmax*, *colors=None*, *linestyles='solid'*, *label=''*, ***, *data=None*, ***kwargs*)

Plot horizontal lines at each *y* from *xmin* to *xmax*.

Parameters

y

[float or array-like] y-indexes where to plot the lines.

xmin, xmax

[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have the same length.

colors

[color or list of colors, default: *rcParams["lines.color"]* (default: 'C0')]

linestyles

[{'solid', 'dashed', 'dashdot', 'dotted'}, default: 'solid']

label

[str, default: '']

Returns

LineCollection

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

y, *xmin*, *xmax*, *colors*

****kwargs**

[*LineCollection* properties.]

See also:

vlines

vertical lines

axhline

horizontal line across the Axes

Examples using `matplotlib.axes.Axes.hlines`

- *hlines and vlines*
- *Specifying colors*

matplotlib.axes.Axes.fill

`Axes.`**`fill`**(**args*, *data=None*, ***kwargs*)

Plot filled polygons.

Parameters

***args**

[sequence of x, y, [color]] Each polygon is defined by the lists of *x* and *y* positions of its nodes, optionally followed by a *color* specifier. See *matplotlib.colors* for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple *x*, *y*, *[color]* groups.

For example, each of the following is legal:

```
ax.fill(x, y)                    # a polygon with default␣
 ↪color
ax.fill(x, y, "b")               # a blue polygon
ax.fill(x, y, x2, y2)            # two polygons
ax.fill(x, y, "b", x2, y2, "r")  # a blue and a red polygon
```

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in *x* and *y*, e.g.:

```
ax.fill("time", "signal",
        data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

Returns

list of *Polygon*

Other Parameters

****kwargs**

[*Polygon* properties]

Notes

Use `fill_between()` if you would like to fill the region between two curves.

Examples using `matplotlib.axes.Axes.fill`

- *Filled polygon*
- *Radar chart (aka spider or star chart)*
- *Ellipse with units*

Spans

`Axes.axhline`	Add a horizontal line across the Axes.
`Axes.axhspan`	Add a horizontal span (rectangle) across the Axes.
`Axes.axvline`	Add a vertical line across the Axes.
`Axes.axvspan`	Add a vertical span (rectangle) across the Axes.
`Axes.axline`	Add an infinitely long straight line.

matplotlib.axes.Axes.axhline

Axes.**axhline**(*y=0*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal line across the Axes.

Parameters

y

[float, default: 0] y position in data coordinates of the horizontal line.

xmin

[float, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

xmax

[float, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

Returns

Line2D

Other Parameters

**kwargs

Valid keyword arguments are *Line2D* properties, except for 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default:
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, floa
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array

Table 10 – continued from

Property	Description
ydata	1D array
zorder	float

See also:

hlines

Add horizontal lines in data coordinates.

axhspan

Add a horizontal span (rectangle) across the axis.

axline

Add a line with an arbitrary slope.

Examples

- draw a thick red hline at 'y' = 0 that spans the xrange:

```
>>> axhline(linewidth=4, color='r')
```

- draw a default hline at 'y' = 1 that spans the xrange:

```
>>> axhline(y=1)
```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:

```
>>> axhline(y=.5, xmin=0.25, xmax=0.75)
```

Examples using `matplotlib.axes.Axes.axhline`

- *Filling the area between lines*
- *Shade regions defined by a logical mask using fill_between*
- *axhspan Demo*
- *Plot a confidence ellipse of a two-dimensional dataset*
- *Multiline*
- *Usetex Baseline Test*
- *Colors in the default property cycle*
- *Infinite lines*
- *Cross-hair cursor*

matplotlib.axes.Axes.axhspan

Axes.**axhspan**(*ymin*, *ymax*, *xmin=0*, *xmax=1*, ***kwargs*)

Add a horizontal span (rectangle) across the Axes.

The rectangle spans from *ymin* to *ymax* vertically, and, by default, the whole x-axis horizontally. The x-span can be set using *xmin* (default: 0) and *xmax* (default: 1) which are in axis units; e.g. `xmin = 0.5` always refers to the middle of the x-axis regardless of the limits set by *set_xlim*.

Parameters

ymin

[float] Lower y-coordinate of the span, in data units.

ymax

[float] Upper y-coordinate of the span, in data units.

xmin

[float, default: 0] Lower x-coordinate of the span, in x-axis (0-1) units.

xmax

[float, default: 1] Upper x-coordinate of the span, in x-axis (0-1) units.

Returns

Polygon

Horizontal span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

****kwargs**

[*Polygon* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	scalar or None
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
closed	bool
color	color
edgecolor or ec	color or None

Table 11 – continued from previc

Property	Description
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}

See also:

axvspan

Add a vertical span across the Axes.

Examples using `matplotlib.axes.Axes.axhspan`

- *Fill Between and Alpha*
- *axhspan Demo*

matplotlib.axes.Axes.axvline

Axes.**axvline**(*x=0*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical line across the Axes.

Parameters

x

[float, default: 0] x position in data coordinates of the vertical line.

ymin

[float, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

ymax

[float, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

Returns

Line2D

Other Parameters

****kwargs**

Valid keyword arguments are *Line2D* properties, except for 'transform':

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default:
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float

Table 12 – continued from

mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See also:

vlines

Add vertical lines in data coordinates.

axvspan

Add a vertical span (rectangle) across the axis.

axline

Add a line with an arbitrary slope.

Examples

- draw a thick red vline at $x = 0$ that spans the yrange:

```
>>> axvline(linewidth=4, color='r')
```

- draw a default vline at $x = 1$ that spans the yrange:

```
>>> axvline(x=1)
```

- draw a default vline at $x = .5$ that spans the middle half of the yrange:

```
>>> axvline(x=.5, ymin=0.25, ymax=0.75)
```

Examples using `matplotlib.axes.Axes.axvline`

- *axhspan Demo*
- *Plot a confidence ellipse of a two-dimensional dataset*
- *Usetex Baseline Test*
- *Colors in the default property cycle*
- *Infinite lines*
- *Cross-hair cursor*

- *The Lifecycle of a Plot*
- *Annotations*

matplotlib.axes.Axes.axvspan

Axes.**axvspan**(*xmin*, *xmax*, *ymin=0*, *ymax=1*, ***kwargs*)

Add a vertical span (rectangle) across the Axes.

The rectangle spans from *xmin* to *xmax* horizontally, and, by default, the whole y-axis vertically. The y-span can be set using *ymin* (default: 0) and *ymax* (default: 1) which are in axis units; e.g. `ymin = 0.5` always refers to the middle of the y-axis regardless of the limits set by *set_ylim*.

Parameters

xmin

[float] Lower x-coordinate of the span, in data units.

xmax

[float] Upper x-coordinate of the span, in data units.

ymin

[float, default: 0] Lower y-coordinate of the span, in y-axis units (0-1).

ymax

[float, default: 1] Upper y-coordinate of the span, in y-axis units (0-1).

Returns

Polygon

Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

****kwargs**

[*Polygon* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	scalar or None
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None

axhspan

Add a horizontal span across the Axes.

Examples

Draw a vertical, green, translucent rectangle from x = 1.25 to x = 1.55 that spans the yrange of the Axes.

```
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

Examples using `matplotlib.axes.Axes.axvspan`

- *Fill Between and Alpha*
- *axhspan Demo*

matplotlib.axes.Axes.axline

Axes.**axline**(*xy1*, *xy2=None*, *, *slope=None*, ***kwargs*)

Add an infinitely long straight line.

The line can be defined either by two points *xy1* and *xy2*, or by one point *xy1* and a *slope*.

This draws a straight line "on the screen", regardless of the x and y scales, and is thus also suitable for drawing exponential decays in semilog plots, power laws in loglog plots, etc. However, *slope* should only be used with linear scales; It has no clear meaning for all other scales, and thus the behavior is undefined. Please specify the line using the points *xy1*, *xy2* for non-linear scales.

The *transform* keyword argument only applies to the points *xy1*, *xy2*. The *slope* (if given) is always in data coordinates. This can be used e.g. with `ax.transAxes` for drawing grid lines with a fixed slope.

Parameters

xy1, xy2

[(float, float)] Points for the line to pass through. Either *xy2* or *slope* has to be given.

slope

[float, optional] The slope of the line. Either *xy2* or *slope* has to be given.

Returns

AxLine

Other Parameters

****kwargs**

Valid kwargs are *Line2D* properties

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	CapStyle or {'butt', 'projecting', 'round'}
dash_joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default:
figure	Figure
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, Path or MarkerStyle
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, floa
mouseover	bool
path_effects	list of AbstractPathEffect
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	CapStyle or {'butt', 'projecting', 'round'}
solid_joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

axhline

for horizontal lines

axvline

for vertical lines

Examples

Draw a thick red line passing through (0, 0) and (1, 1):

```
>>> axline((0, 0), (1, 1), linewidth=4, color='r')
```

Examples using `matplotlib.axes.Axes.axline`

- *axhspan Demo*
- *Infinite lines*
- *Anscombe's quartet*

Spectral

Axes.acorr	Plot the autocorrelation of *x*.
Axes.angle_spectrum	Plot the angle spectrum.
Axes.cohere	Plot the coherence between *x* and *y*.
Axes.csd	Plot the cross-spectral density.
Axes.magnitude_spectrum	Plot the magnitude spectrum.
Axes.phase_spectrum	Plot the phase spectrum.
Axes.psd	Plot the power spectral density.
Axes.specgram	Plot a spectrogram.
Axes.xcorr	Plot the cross correlation between *x* and *y*.

matplotlib.axes.Axes.acorr

Axes.**acorr**(*x*, *, *data=None*, ***kwargs*)

Plot the autocorrelation of *x*.

Parameters

x

[array-like]

detrend

[callable, default: *mlab.detrend_none* (no detrending)] A detrending function applied to *x*. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

normed

[bool, default: True] If `True`, input vectors are normalised to unit length.

usevlines

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the acorr value using *Axes.vlines*. Additionally, a horizontal line is plotted at y=0 using *Axes.axhline*.

If `False`, markers are plotted at the acorr values using *Axes.plot*.

maxlags

[int, default: 10] Number of lags to show. If `None`, will return all `2 * len(x) - 1` lags.

Returns

lags

[array (length `2*maxlags+1`)] The lag vector.

c

[array (length `2*maxlags+1`)] The auto correlation vector.

line

[*LineCollection* or *Line2D*] *Artist* added to the Axes of the correlation:

- *LineCollection* if *usevlines* is True.
- *Line2D* if *usevlines* is False.

b

[*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

Other Parameters

linestyle

[*Line2D* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is `False`.

marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is `False`.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x

****kwargs**

Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is `True`; otherwise they are passed to *Axes.plot*.

Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

Examples using `matplotlib.axes.Axes.acorr`

- *Cross- and auto-correlation*

matplotlib.axes.Axes.angle_spectrum

Axes.**angle_spectrum**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *, *data=None*, ***kwargs*)

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the angle spectrum in radians (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool
antialiased or aa	bool

xdata	1D array
ydata	1D array
zorder	float

See also:

magnitude_spectrum

Plots the magnitudes of the corresponding frequencies.

phase_spectrum

Plots the unwrapped version of this function.

specgram

Can plot the angle spectrum of segments within the signal in a colormap.

matplotlib.axes.Axes.cohere

Axes.**cohere**(*x*, *y*, *NFFT=256*, *Fs=2*, *Fc=0*, *detrend=<function detrend_none>*, *window=<function window_hanning>*, *noverlap=0*, *pad_to=None*, *sides='default'*, *scale_by_freq=None*, ***, *data=None*, ***kwargs*)

Plot the coherence between *x* and *y*.

Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

Parameters

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between blocks.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

Cxy

[1-D array] The coherence vector.

freqs

[1-D array] The frequencies for the elements in *Cxy*.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*

****kwargs**

Keyword arguments control the *Line2D* properties:

matplotlib.axes.Axes.csd

Axes.**csd**(*x*, *y*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, *, *data=None*, ***kwargs*)

Plot the cross-spectral density.

The cross spectral density P_{xy} by Welch's average periodogram method. The vectors x and y are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of x and y are averaged over each segment to compute P_{xy}, with a scaling to correct for power loss due to windowing.

If len(x) < *NFFT* or len(y) < *NFFT*, they will be zero padded to *NFFT*.

Parameters

x, y

[1-D arrays or sequences] Arrays or sequences containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot,

allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line

[bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxy

[1-D array] The values for the cross spectrum P_{xy} before scaling (complex valued).

freqs

[1-D array] The frequencies corresponding to the elements in *Pxy*.

line

[`Line2D`] The line created by this function. Only returned if *return_line* is True.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool

psd

is equivalent to setting `y = x`.

Notes

For plotting, the power is plotted as $10\log_{10}(P_{xy})$ for decibels, though P_{xy} itself is returned.

References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Examples using `matplotlib.axes.Axes.csd`

- *Cross spectral density (CSD)*

matplotlib.axes.Axes.magnitude_spectrum

`Axes.`**`magnitude_spectrum`**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, *scale=None*, ***, *data=None*, ***kwargs*)

Plot the magnitude spectrum.

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale, i.e., the dB amplitude (20 * log10). 'default' is 'linear'.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the magnitude spectrum before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x

****kwargs**

Keyword arguments control the *Line2D* properties:

Plots the angles of the corresponding frequencies.

phase_spectrum

Plots the phase (unwrapped angle) of the corresponding frequencies.

specgram

Can plot the magnitude spectrum of segments within the signal in a colormap.

matplotlib.axes.Axes.phase_spectrum

Axes.**phase_spectrum**(*x*, *Fs=None*, *Fc=None*, *window=None*, *pad_to=None*, *sides=None*, ***, *data=None*, ***kwargs*)

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum

[1-D array] The values for the phase spectrum in radians (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

line

[*Line2D*] The line created by this function.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

See also:

magnitude_spectrum

Plots the magnitudes of the corresponding frequencies.

angle_spectrum

Plots the wrapped version of this function.

specgram

Can plot the phase spectrum of segments within the signal in a colormap.

matplotlib.axes.Axes.psd

Axes.**psd**(*x*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *return_line=None*, *, *data=None*, ***kwargs*)

Plot the power spectral density.

The power spectral density P_{xx} by Welch's average periodogram method. The vector x is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The $|\mathrm{fft}(i)|^2$ of each segment i are averaged to compute P_{xx}, with a scaling to correct for power loss due to windowing.

If len(x) < *NFFT*, it will be zero padded to *NFFT*.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line

[bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxx

[1-D array] The values for the power spectrum P_{xx} before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in *Pxx*.

line

[*Line2D*] The line created by this function. Only returned if *return_line* is True.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x

****kwargs**

Keyword arguments control the *Line2D* properties:

Property	Description

See also:

specgram

Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

magnitude_spectrum

Plots the magnitude spectrum.

csd

Plots the spectral density between two signals.

Notes

For plotting, the power is plotted as $10\log_{10}(P_{xx})$ for decibels, though *Pxx* itself is returned.

References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

Examples using `matplotlib.axes.Axes.psd`

- *Power spectral density (PSD)*

matplotlib.axes.Axes.specgram

Axes.**specgram**(*x*, *NFFT=None*, *Fs=None*, *Fc=None*, *detrend=None*, *window=None*, *noverlap=None*, *cmap=None*, *xextent=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *mode=None*, *scale=None*, *vmin=None*, *vmax=None*, *, *data=None*, **kwargs*)

Plot a spectrogram.

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*. The spectrogram is plotted as a colormap (using imshow).

Parameters

x

[1-D array or sequence] Array or sequence containing the data.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

mode

[{'default', 'psd', 'magnitude', 'angle', 'phase'}] What sort of spectrum to use. Default is 'psd', which takes the power spectral density. 'magnitude' returns the magnitude spectrum. 'angle' returns the phase spectrum without unwrapping. 'phase' returns the phase spectrum with unwrapping.

noverlap

[int, default: 128] The number of points of overlap between blocks.

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale. When *mode* is 'psd', this is dB power (10 * log10). Otherwise, this is dB amplitude (20 * log10). 'default' is 'dB' if *mode* is 'psd' or 'magnitude' and 'linear' otherwise. This must be 'linear' if *mode* is 'angle' or 'phase'.

Fc

[int, default: 0] The center frequency of *x*, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

cmap

[`Colormap`, default: `rcParams["image.cmap"]` (default: `'viridis'`)]

xextent

[*None* or (xmin, xmax)] The image extent along the x-axis. The default sets *xmin* to the left border of the first bin (*spectrum* column) and *xmax* to the right border

of the last bin. Note that for *noverlap>0* the width of the bins is smaller than those of the segments.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x

****kwargs**

Additional keyword arguments are passed on to *imshow* which makes the specgram image. The origin keyword argument is not supported.

Returns

spectrum

[2D array] Columns are the periodograms of successive segments.

freqs

[1-D array] The frequencies corresponding to the rows in *spectrum*.

t

[1-D array] The times corresponding to midpoints of segments (i.e., the columns in *spectrum*).

im

[*AxesImage*] The image created by imshow containing the spectrogram.

See also:

psd

Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

magnitude_spectrum

A single spectrum, similar to having a single segment when *mode* is 'magnitude'. Plots a line instead of a colormap.

angle_spectrum

A single spectrum, similar to having a single segment when *mode* is 'angle'. Plots a line instead of a colormap.

phase_spectrum

A single spectrum, similar to having a single segment when *mode* is 'phase'. Plots a line instead of a colormap.

Notes

The parameters *detrend* and *scale_by_freq* do only apply when *mode* is set to 'psd'.

Examples using `matplotlib.axes.Axes.specgram`

- *Spectrogram*

matplotlib.axes.Axes.xcorr

`Axes.`**`xcorr`**(*x*, *y*, *normed=True*, *detrend=<function detrend_none>*, *usevlines=True*, *maxlags=10*, ***, *data=None*, ***kwargs*)

Plot the cross correlation between *x* and *y*.

The correlation with lag k is defined as $\sum_n x[n+k] \cdot y^*[n]$, where y^* is the complex conjugate of y.

Parameters

x, y

[array-like of length n]

detrend

[callable, default: *mlab.detrend_none* (no detrending)] A detrending function applied to *x* and *y*. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

normed

[bool, default: True] If `True`, input vectors are normalised to unit length.

usevlines

[bool, default: True] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the xcorr value using *Axes.vlines*. Additionally, a horizontal line is plotted at y=0 using *Axes.axhline*.

If `False`, markers are plotted at the xcorr values using *Axes.plot*.

maxlags

[int, default: 10] Number of lags to show. If None, will return all `2 * len(x) - 1` lags.

Returns

lags

[array (length `2*maxlags+1`)] The lag vector.

c

[array (length `2*maxlags+1`)] The auto correlation vector.

line

[*LineCollection* or *Line2D*] *Artist* added to the Axes of the correlation:

- *LineCollection* if *usevlines* is True.
- *Line2D* if *usevlines* is False.

b

[*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

Other Parameters

linestyle

[*Line2D* property, optional] The linestyle for plotting the data points. Only used if *usevlines* is `False`.

marker

[str, default: 'o'] The marker for plotting the data points. Only used if *usevlines* is `False`.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*

****kwargs**

Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is `True`; otherwise they are passed to *Axes.plot*.

Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

Examples using `matplotlib.axes.Axes.xcorr`

- *Cross- and auto-correlation*

Statistics

Axes.ecdf	Compute and plot the empirical cumulative distribution function of *x*.
Axes.boxplot	Draw a box and whisker plot.
Axes.violinplot	Make a violin plot.
Axes.bxp	Drawing function for box and whisker plots.
Axes.violin	Drawing function for violin plots.

matplotlib.axes.Axes.ecdf

Axes.**ecdf**(*x*, *weights=None*, ***, *complementary=False*, *orientation='vertical'*, *compress=False*, *data=None*, ***kwargs*)

Compute and plot the empirical cumulative distribution function of *x*.

New in version 3.8.

Parameters

x

[1d array-like] The input data. Infinite entries are kept (and move the relevant end of the ecdf from 0/1), but NaNs and masked values are errors.

weights

[1d array-like or None, default: None] The weights of the entries; must have the same shape as *x*. Weights corresponding to NaN data points are dropped, and then the remaining weights are normalized to sum to 1. If unset, all entries have the same weight.

complementary

[bool, default: False] Whether to plot a cumulative distribution function, which increases from 0 to 1 (the default), or a complementary cumulative distribution function, which decreases from 1 to 0.

orientation

[{"vertical", "horizontal"}, default: "vertical"] Whether the entries are plotted along the x-axis ("vertical", the default) or the y-axis ("horizontal"). This parameter takes the same values as in *hist*.

compress

[bool, default: False] Whether multiple entries with the same values are grouped together (with a summed weight) before plotting. This is mainly useful if *x* contains many identical data points, to decrease the rendering complexity of the plot. If *x* contains no duplicate points, this has no effect and just uses some time and memory.

Returns

Line2D

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *weights*

****kwargs**

Keyword arguments control the *Line2D* properties:

Notes

The ecdf plot can be thought of as a cumulative histogram with one bin per data entry; i.e. it reports on the entire dataset without any arbitrary binning.

If *x* contains NaNs or masked entries, either remove them first from the array (if they should not taken into account), or replace them by -inf or +inf (if they should be sorted at the beginning or the end of the array).

Examples using `matplotlib.axes.Axes.ecdf`

- *Plotting cumulative distributions*
- *ecdf(x)*

matplotlib.axes.Axes.boxplot

Axes.**boxplot**(*x*, *notch=None*, *sym=None*, *vert=None*, *whis=None*, *positions=None*, *widths=None*, *patch_artist=None*, *bootstrap=None*, *usermedians=None*, *conf_intervals=None*, *meanline=None*, *showmeans=None*, *showcaps=None*, *showbox=None*, *showfliers=None*, *boxprops=None*, *labels=None*, *flierprops=None*, *medianprops=None*, *meanprops=None*, *capprops=None*, *whiskerprops=None*, *manage_ticks=True*, *autorange=False*, *zorder=None*, *capwidths=None*, *, *data=None*)

Draw a box and whisker plot.

The box extends from the first quartile (Q1) to the third quartile (Q3) of the data, with a line at the median. The whiskers extend from the box to the farthest data point lying within 1.5x the inter-quartile range (IQR) from the box. Flier points are those past the end of the whiskers. See https://en.wikipedia.org/wiki/Box_plot for reference.

```
     Q1-1.5IQR   Q1   median  Q3   Q3+1.5IQR
                  |-----:-----|
  o      |--------|     :     |--------|    o  o
                  |-----:-----|
flier             <----------->            fliers
                       IQR
```

Parameters

x

[Array or a sequence of vectors.] The input data. If a 2D array, a boxplot is drawn for each column in *x*. If a sequence of 1D arrays, a boxplot is drawn for each array in *x*.

notch

[bool, default: False] Whether to draw a notched boxplot (`True`), or a rectangular boxplot (`False`). The notches represent the confidence interval (CI) around the median. The documentation for *bootstrap* describes how the locations of the notches are computed by default, but their locations may also be overridden by setting the *conf_intervals* parameter.

Note: In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive "flipped" appearance. This is expected behavior and consistent with other statistical visualization packages.

---

sym

[str, optional] The default symbol for flier points. An empty string ('') hides the fliers. If `None`, then the fliers default to 'b+'. More control is provided by the *flierprops* parameter.

vert

[bool, default: True] If `True`, draws vertical boxes. If `False`, draw horizontal boxes.

whis

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above `Q1 - whis*(Q3-Q1)`, and the upper whisker at the highest datum below `Q3 + whis*(Q3-Q1)`, where Q1 and Q3 are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data.

In the edge case where `Q1 == Q3`, *whis* is automatically set to (0, 100) (cover the whole range of the data) if *autorange* is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

bootstrap

[int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If *bootstrap* is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

usermedians

[1D array-like, optional] A 1D array-like of length `len(x)`. Each entry that is not `None` forces the value of the median for the corresponding dataset. For entries that are `None`, the medians are computed by Matplotlib as normal.

conf_intervals

[array-like, optional] A 2D array-like of shape `(len(x), 2)`. Each entry that is not None forces the location of the corresponding notch (which is only drawn if *notch* is `True`). For entries that are `None`, the notches are computed by the method specified by the other parameters (e.g., *bootstrap*).

positions

[array-like, optional] The positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to `range(1, N+1)` where N is the number of boxes to be drawn.

widths

[float or array-like] The widths of the boxes. The default is 0.5, or `0.15*(distance between extreme positions)`, if that is smaller.

patch_artist

[bool, default: False] If `False` produces boxes with the Line2D artist. Otherwise, boxes are drawn with Patch artists.

labels

[sequence, optional] Labels for each dataset (one per dataset).

manage_ticks

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

autorange

[bool, default: False] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, *whis* is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

meanline

[bool, default: False] If `True` (and *showmeans* is `True`), will try to render the mean as a line spanning the full width of the box according to *meanprops* (see below). Not recommended if *shownotches* is also True. Otherwise, means will be shown as points.

zorder

[float, default: `Line2D.zorder = 2`] The zorder of the boxplot.

Returns

dict

A dictionary mapping each component of the boxplot to a list of the *Line2D* instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- `means`: points or lines representing the means.

Other Parameters

showcaps

[bool, default: True] Show the caps on the ends of whiskers.

showbox

[bool, default: True] Show the central box.

showfliers

[bool, default: True] Show the outliers beyond the caps.

showmeans

[bool, default: False] Show the arithmetic means.

capprops

[dict, default: None] The style of the caps.

capwidths

[float or array, default: None] The widths of the caps.

boxprops

[dict, default: None] The style of the box.

whiskerprops

[dict, default: None] The style of the whiskers.

flierprops

[dict, default: None] The style of the fliers.

medianprops

[dict, default: None] The style of the median.

meanprops

[dict, default: None] The style of the mean.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

See also:

violinplot

Draw an estimate of the probability density function.

Examples using `matplotlib.axes.Axes.boxplot`

- *Artist customization in box plots*
- *Box plots with custom fill colors*
- *Boxplots*
- *Box plot vs. violin plot comparison*
- *boxplot(X)*

matplotlib.axes.Axes.violinplot

Axes.**violinplot**(*dataset*, *positions=None*, *vert=True*, *widths=0.5*, *showmeans=False*, *showextrema=True*, *showmedians=False*, *quantiles=None*, *points=100*, *bw_method=None*, *, *data=None*)

Make a violin plot.

Make a violin plot for each column of *dataset* or each vector in sequence *dataset*. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and user-specified quantiles.

Parameters

dataset

[Array or a sequence of vectors.] The input data.

positions

[array-like, default: [1, 2, ..., n]] The positions of the violins. The ticks and limits are automatically set to match the positions.

vert

[bool, default: True.] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.

widths

[array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

showmeans

[bool, default: False] If `True`, will toggle rendering of the means.

showextrema

[bool, default: True] If `True`, will toggle rendering of the extrema.

showmedians

[bool, default: False] If `True`, will toggle rendering of the medians.

quantiles

[array-like, default: None] If not None, set a list of floats in interval [0, 1] for each violin, which stands for the quantiles that will be rendered for that violin.

points

[int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimations at.

bw_method

[str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a *matplotlib.mlab.GaussianKDE* instance as its only parameter and return a scalar. If None (default), 'scott' is used.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

dataset

Returns

dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- `bodies`: A list of the *PolyCollection* instances containing the filled area of each violin.
- `cmeans`: A *LineCollection* instance that marks the mean values of each of the violin's distribution.
- `cmins`: A *LineCollection* instance that marks the bottom of each violin's distribution.
- `cmaxes`: A *LineCollection* instance that marks the top of each violin's distribution.
- `cbars`: A *LineCollection* instance that marks the centers of each violin's distribution.
- `cmedians`: A *LineCollection* instance that marks the median values of each of the violin's distribution.
- `cquantiles`: A *LineCollection* instance created to identify the quantile values of each of the violin's distribution.

Examples using `matplotlib.axes.Axes.violinplot`

- *Box plot vs. violin plot comparison*
- *Violin plot customization*
- *Violin plot basics*
- *violinplot(D)*

matplotlib.axes.Axes.bxp

Axes.**bxp**(*bxpstats*, *positions=None*, *widths=None*, *vert=True*, *patch_artist=False*, *shownotches=False*, *showmeans=False*, *showcaps=True*, *showbox=True*, *showfliers=True*, *boxprops=None*, *whiskerprops=None*, *flierprops=None*, *medianprops=None*, *capprops=None*, *meanprops=None*, *meanline=False*, *manage_ticks=True*, *zorder=None*, *capwidths=None*)

Drawing function for box and whisker plots.

Make a box and whisker plot for each column of *x* or each vector in sequence *x*. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters

bxpstats

[list of dicts] A list of dictionaries containing stats for each boxplot. Required keys are:

- `med`: Median (scalar).
- `q1`, `q3`: First & third quartiles (scalars).
- `whislo`, `whishi`: Lower & upper whisker positions (scalars).

Optional keys are:

- `mean`: Mean (scalar). Needed if `showmeans=True`.
- `fliers`: Data beyond the whiskers (array-like). Needed if `showfliers=True`.
- `cilo`, `cihi`: Lower & upper confidence intervals about the median. Needed if `shownotches=True`.
- `label`: Name of the dataset (str). If available, this will be used a tick label for the boxplot

positions

[array-like, default: [1, 2, ..., n]] The positions of the boxes. The ticks and limits are automatically set to match the positions.

widths

[float or array-like, default: None] The widths of the boxes. The default is `clip(0.15*(distance between extreme positions), 0.15, 0.5)`.

capwidths

[float or array-like, default: None] Either a scalar or a vector and sets the width of each cap. The default is `0.5*(width of the box)`, see *widths*.

vert

[bool, default: True] If `True` (default), makes the boxes vertical. If `False`, makes horizontal boxes.

patch_artist

[bool, default: False] If `False` produces boxes with the *Line2D* artist. If `True` produces boxes with the *Patch* artist.

shownotches, showmeans, showcaps, showbox, showfliers

[bool] Whether to draw the CI notches, the mean value (both default to False), the caps, the box, and the fliers (all three default to True).

boxprops, whiskerprops, capprops, flierprops, medianprops, meanprops

[dict, optional] Artist properties for the boxes, whiskers, caps, fliers, medians, and means.

meanline

[bool, default: False] If `True` (and *showmeans* is `True`), will try to render the mean as a line spanning the full width of the box according to *meanprops*. Not recommended if *shownotches* is also True. Otherwise, means will be shown as points.

manage_ticks

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

zorder

[float, default: `Line2D.zorder = 2`] The zorder of the resulting boxplot.

Returns

dict

A dictionary mapping each component of the boxplot to a list of the *Line2D* instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: main bodies of the boxplot showing the quartiles, and the median's confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: vertical lines up to the last non-outlier data.
- `caps`: horizontal lines at the ends of the whiskers.
- `fliers`: points representing data beyond the whiskers (fliers).
- `means`: points or lines representing the means.

Examples

Examples using `matplotlib.axes.Axes.bxp`

- *Boxplot drawer function*

matplotlib.axes.Axes.violin

`Axes.`**`violin`**(*vpstats*, *positions=None*, *vert=True*, *widths=0.5*, *showmeans=False*, *showextrema=True*, *showmedians=False*)

Drawing function for violin plots.

Draw a violin plot for each column of *vpstats*. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and the quantiles values.

Parameters

vpstats

[list of dicts] A list of dictionaries containing stats for each violin plot. Required keys are:

- `coords`: A list of scalars containing the coordinates that the violin's kernel density estimate were evaluated at.
- `vals`: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in *coords*.
- `mean`: The mean value for this violin's dataset.
- `median`: The median value for this violin's dataset.
- `min`: The minimum value for this violin's dataset.
- `max`: The maximum value for this violin's dataset.

Optional keys are:

- `quantiles`: A list of scalars containing the quantile values for this violin's dataset.

positions

[array-like, default: [1, 2, ..., n]] The positions of the violins. The ticks and limits are automatically set to match the positions.

vert

[bool, default: True.] If true, plots the violins vertically. Otherwise, plots the violins horizontally.

widths

[array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

showmeans

[bool, default: False] If true, will toggle rendering of the means.

showextrema

[bool, default: True] If true, will toggle rendering of the extrema.

showmedians

[bool, default: False] If true, will toggle rendering of the medians.

Returns

dict

A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- `bodies`: A list of the *`PolyCollection`* instances containing the filled area of each violin.
- `cmeans`: A *`LineCollection`* instance that marks the mean values of each of the violin's distribution.
- `cmins`: A *`LineCollection`* instance that marks the bottom of each violin's distribution.
- `cmaxes`: A *`LineCollection`* instance that marks the top of each violin's distribution.
- `cbars`: A *`LineCollection`* instance that marks the centers of each violin's distribution.
- `cmedians`: A *`LineCollection`* instance that marks the median values of each of the violin's distribution.
- `cquantiles`: A *`LineCollection`* instance created to identify the quantiles values of each of the violin's distribution.

Binned

Axes.hexbin	Make a 2D hexagonal binning plot of points *x*, *y*.
Axes.hist	Compute and plot a histogram.
Axes.hist2d	Make a 2D histogram plot.
Axes.stairs	A stepwise constant function as a line with bounding edges or a filled plot.

matplotlib.axes.Axes.hexbin

Axes.**hexbin**(*x*, *y*, *C=None*, *gridsize=100*, *bins=None*, *xscale='linear'*, *yscale='linear'*, *extent=None*, *cmap=None*, *norm=None*, *vmin=None*, *vmax=None*, *alpha=None*, *linewidths=None*, *edgecolors='face'*, *reduce_C_function=<function mean>*, *mincnt=None*, *marginals=False*, ***, *data=None*, ***kwargs*)

Make a 2D hexagonal binning plot of points *x*, *y*.

If *C* is *None*, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, *C* specifies values at the coordinate (x[i], y[i]). For each hexagon, these values are reduced using *reduce_C_function*.

Parameters

x, y

[array-like] The data positions. *x* and *y* must be of the same length.

C

[array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as *x* and *y*.

gridsize

[int or (int, int), default: 100] If a single int, the number of hexagons in the *x*-direction. The number of hexagons in the *y*-direction is chosen such that the hexagons are approximately regular.

Alternatively, if a tuple (*nx*, *ny*), the number of hexagons in the *x*-direction and the *y*-direction. In the *y*-direction, counting is done along vertically aligned hexagons, not along the zig-zag chains of hexagons; see the following illustration.

To get approximately regular hexagons, choose $n_x = \sqrt{3}\,n_y$.

bins

['log' or int or sequence, default: None] Discretization of the hexagon values.

- If *None*, no binning is applied; the color of each hexagon directly corresponds to its count value.

- If 'log', use a logarithmic scale for the colormap. Internally, $log_{10}(i+1)$ is used to determine the hexagon color. This is equivalent to `norm=LogNorm()`.
- If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
- If a sequence of values, the values of the lower bound of the bins to be used.

xscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

yscale

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.

mincnt

[int >= 0, default: *None*] If not *None*, only display cells with at least *mincnt* number of points in the cell.

marginals

[bool, default: *False*] If marginals is *True*, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

extent

[4-tuple of float, default: *None*] The limits of the bins (xmin, xmax, ymin, ymax). The default assigns the limits based on *gridsize*, *x*, *y*, *xscale* and *yscale*.

If *xscale* or *yscale* is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Returns

PolyCollection

A *PolyCollection* defining the hexagonal bins.

- *PolyCollection.get_offsets* contains a Mx2 array containing the x, y positions of the M hexagon centers.
- *PolyCollection.get_array* contains the values of the M hexagons.

If *marginals* is *True*, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes *hbar* and *vbar*.

Other Parameters

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

alpha

[float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float, default: *None*] If *None*, defaults to *rcParams["patch.linewidth"]* (default: `1.0`).

edgecolors

[{'face', 'none', *None*} or color, default: 'face'] The color of the hexagon edges. Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- *None*: Draw outlines in the default color.
- An explicit color.

reduce_C_function

[callable, default: `numpy.mean`] The function to aggregate *C* within the bins. It is ignored if *C* is not given. This must have the signature:

```
def reduce_C_function(C: array) -> float
```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpy.amax`: value taken from the largest point

By default will only reduce cells with at least 1 point because some reduction functions (such as `numpy.amax`) will error/warn with empty input. Changing *mincnt* will adjust the cutoff, and if set to 0 will pass empty input to the reduction function.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*, *C*

****kwargs**

[*PolyCollection* properties] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a d
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like

hist2d

2D histogram rectangular bins

Examples using `matplotlib.axes.Axes.hexbin`

- *Hexagonal binned plot*
- *hexbin(x, y, C)*

matplotlib.axes.Axes.hist

Axes.**hist**(*x*, *bins=None*, *range=None*, *density=False*, *weights=None*, *cumulative=False*, *bottom=None*, *histtype='bar'*, *align='mid'*, *orientation='vertical'*, *rwidth=None*, *log=False*, *color=None*, *label=None*, *stacked=False*, ***, *data=None*, ***kwargs*)

Compute and plot a histogram.

This method uses numpy.histogram to bin the data in *x* and count the number of values in each bin, then draws the distribution either as a *BarContainer* or *Polygon*. The *bins*, *range*, *density*, and *weights* parameters are forwarded to numpy.histogram.

If the data has already been binned and counted, use *bar* or *stairs* to plot the distribution:

```
counts, bins = np.histogram(x)
plt.stairs(counts, bins)
```

Alternatively, plot pre-computed bins and counts using `hist()` by treating each bin as a single point with a weight equal to its count:

```
plt.hist(bins[:-1], bins, weights=counts)
```

The data input *x* can be a singular array, a list of datasets of potentially different lengths ([*x0*, *x1*, ...]), or a 2D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form. If the input is an array, then the return value is a tuple (*n*, *bins*, *patches*); if the input is a sequence of arrays, then the return value is a tuple ([*n0*, *n1*, ...], *bins*, [*patches0*, *patches1*, ...]).

Masked arrays are not supported.

Parameters

x

[(n,) array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

bins

[int or sequence or str, default: *rcParams["hist.bins"]* (default: `10`)] If *bins* is an integer, it defines the number of equal-width bins in the range.

If *bins* is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, bins may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if *bins* is:

```
[1, 2, 3, 4]
```

then the first bin is `[1, 2)` (including 1, but excluding 2) and the second `[2, 3)`. The last bin, however, is `[3, 4]`, which *includes* 4.

If *bins* is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: 'auto', 'fd', 'doane', 'scott', 'stone', 'rice', 'sturges', or 'sqrt'.

range

[tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, *range* is `(x.min(), x.max())`. Range has no effect if *bins* is a sequence.

If *bins* is a sequence or *range* is specified, autoscaling is based on the specified bin range instead of the range of x.

density

[bool, default: False] If `True`, draw and return a probability density: each bin will display the bin's raw count divided by the total number of counts *and the bin width* (`density = counts / (sum(counts) * np.diff(bins))`), so that the area under the histogram integrates to 1 (`np.sum(density * np.diff(bins)) == 1`).

If *stacked* is also `True`, the sum of the histograms is normalized to 1.

weights

[(n,) array-like or None, default: None] An array of weights, of the same shape as *x*. Each value in *x* only contributes its associated weight towards the bin count (instead of 1). If *density* is `True`, the weights are normalized, so that the integral of the density over the range remains 1.

cumulative

[bool or -1, default: False] If `True`, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If *density* is also `True` then the histogram is normalized such that the last bin equals 1.

If *cumulative* is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if *density* is also `True`, then the histogram is normalized such that the first bin equals 1.

bottom

[array-like, scalar, or None, default: None] Location of the bottom of each bin, i.e. bins are drawn from `bottom` to `bottom + hist(x, bins)` If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

histtype

[{'bar', 'barstacked', 'step', 'stepfilled'}, default: 'bar'] The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- 'barstacked' is a bar-type histogram where multiple data are stacked on top of each other.
- 'step' generates a lineplot that is by default unfilled.
- 'stepfilled' generates a lineplot that is by default filled.

align

[{'left', 'mid', 'right'}, default: 'mid'] The horizontal alignment of the histogram bars.

- 'left': bars are centered on the left bin edges.
- 'mid': bars are centered between the bin edges.
- 'right': bars are centered on the right bin edges.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', *barh* will be used for bar-type histograms and the *bottom* kwarg will be the left edges.

rwidth

[float or None, default: None] The relative width of the bars as a fraction of the bin width. If `None`, automatically compute the width.

Ignored if *histtype* is 'step' or 'stepfilled'.

log

[bool, default: False] If `True`, the histogram axis will be set to a log scale.

color

[color or array-like of colors or None, default: None] Color or sequence of colors, one per dataset. Default (`None`) uses the standard line color sequence.

label

[str or None, default: None] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that *legend* will work as expected.

stacked

[bool, default: False] If `True`, multiple data are stacked on top of each other If `False` multiple data are arranged side by side if histtype is 'bar' or on top of each other if histtype is 'step'

Returns

n

[array or list of arrays] The values of the histogram bins. See *density* and *weights* for a description of the possible semantics. If input *x* is an array, then this is an array of length *nbins*. If input is a sequence of arrays `[data1, data2, ...]`, then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array *n* (or of its element arrays) will always be float even if no weighting or normalization is used.

bins

[array] The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

patches

[*BarContainer* or list of a single *Polygon* or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.

Other Parameters

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *weights*

****kwargs**

stairs

Plot a pre-computed histogram

bar

Plot a pre-computed histogram

Notes

For large numbers of bins (>1000), plotting can be significantly accelerated by using *stairs* to plot a pre-computed histogram (`plt.stairs(*np.histogram(data))`), or by setting *histtype* to 'step' or 'stepfilled' rather than 'bar' or 'barstacked'.

Examples using `matplotlib.axes.Axes.hist`

matplotlib.axes.Axes.hist2d

Axes.**hist2d**(*x*, *y*, *bins=10*, *range=None*, *density=False*, *weights=None*, *cmin=None*, *cmax=None*, *, *data=None*, ***kwargs*)

Make a 2D histogram plot.

Parameters

x, y

[array-like, shape (n,)] Input values

bins

[None or int or [int, int] or array-like or [array, array]] The bin specification:

- If int, the number of bins for the two dimensions (`nx = ny = bins`).
- If `[int, int]`, the number of bins in each dimension (`nx, ny = bins`).
- If array-like, the bin edges for the two dimensions (`x_edges = y_edges = bins`).
- If `[array, array]`, the bin edges in each dimension (`x_edges, y_edges = bins`).

The default value is 10.

range

[array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): `[[xmin, xmax], [ymin, ymax]]`. All values outside of this range will be considered outliers and not tallied in the histogram.

density

[bool, default: False] Normalize histogram. See the documentation for the *density* parameter of *hist* for more details.

weights

[array-like, shape (n,), optional] An array of values w_i weighing each sample (x_i, y_i).

cmin, cmax

[float, default: None] All bins that has count less than *cmin* or more than *cmax* will not be displayed (set to NaN before passing to *pcolormesh*) and these count values in the return value count histogram will also be set to nan upon return.

Returns

h

[2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

xedges

[1D array] The bin edges along the x-axis.

yedges

[1D array] The bin edges along the y-axis.

image

[*QuadMesh*]

Other Parameters

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a

norm instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

alpha

[`0 <= scalar <= 1` or `None`, optional] The alpha blending value.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*, *weights*

****kwargs**

Additional parameters are passed along to the *pcolormesh* method and *QuadMesh* constructor.

See also:

hist

1D histogram plotting

hexbin

2D histogram with hexagonal bins

Notes

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.
- Rendering the histogram with a logarithmic color scale is accomplished by passing a *colors.LogNorm* instance to the *norm* keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with *colors.PowerNorm*.

Examples using `matplotlib.axes.Axes.hist2d`

- *Histograms*
- *Exploring normalizations*
- *hist2d(x, y)*

matplotlib.axes.Axes.stairs

Axes.**stairs**(*values*, *edges=None*, ***, *orientation='vertical'*, *baseline=0*, *fill=False*, *data=None*, ***kwargs*)

A stepwise constant function as a line with bounding edges or a filled plot.

Parameters

values

[array-like] The step heights.

edges

[array-like] The edge positions, with `len(edges) == len(vals) + 1`, between which the curve takes on vals values.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] The direction of the steps. Vertical means that *values* are along the y-axis, and edges are along the x-axis.

baseline

[float, array-like or None, default: 0] The bottom value of the bounding edges or when `fill=True`, position of lower edge. If *fill* is True or an array is passed to *baseline*, a closed path is drawn.

fill

[bool, default: False] Whether the area under the step curve should be filled.

Returns

StepPatch

[*StepPatch*]

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

StepPatch properties

Examples using `matplotlib.axes.Axes.stairs`

- *Stairs Demo*
- *stairs(values)*

Contours

Axes.clabel	Label a contour plot.
Axes.contour	Plot contour lines.
Axes.contourf	Plot filled contours.

matplotlib.axes.Axes.clabel

Axes.**clabel**(*CS*, *levels=None*, ***kwargs*)

Label a contour plot.

Adds labels to line contours in given *ContourSet*.

Parameters

CS

[*ContourSet* instance] Line contours to label.

levels

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `CS.levels`. If not given, all levels are labeled.

****kwargs**

All other parameters are documented in *clabel*.

Examples using `matplotlib.axes.Axes.clabel`

- *Contour Demo*
- *Contour Label Demo*
- *Contourf demo*
- *Contouring the solution space of optimizations*
- *Patheffect Demo*
- *TickedStroke patheffect*

matplotlib.axes.Axes.contour

Axes.**contour**(**args*, *data=None*, ***kwargs*)

Plot contour lines.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

contour and *contourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y

[array-like, optional] The coordinates of the values in *Z*.

X and *Y* must both be 2D with the same shape as *Z* (e.g. created via numpy.meshgrid), or they must both be 1-D such that `len(X) == N` is the number of columns in *Z* and `len(Y) == M` is the number of rows in *Z*.

X and *Y* must both be ordered monotonically.

If not given, they are assumed to be integer indices, i.e. `X = range(N), Y = range(M)`.

Z

[(M, N) array-like] The height values over which the contour is drawn. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between minimum and maximum numeric values of *Z*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

QuadContourSet

Other Parameters

corner_mask

[bool, default: *rcParams["contour.corner_mask"]* (default: `True`)] Enable/disable corner masking, which only has an effect if *Z* is a masked array. If

`False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for *contour* and the areas for *contourf*.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *colors* is set.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *colors* is set.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

If *vmin* or *vmax* are not given, the default color scaling is based on *levels*.

This parameter is ignored if *colors* is set.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams["image.origin"]* (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls `QuadContourSet.changed()`.

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both
 ↪')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *False*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: `True`).

nchunk

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

linewidths

[float or array-like, default: *rcParams["contour.linewidth"]* (default: `None`)] *Only applies to* *contour*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to *rcParams["lines.linewidth"]* (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *contour*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will instead take their linestyle from the *negative_linestyles* argument.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

negative_linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *contour*.

If *linestyles* is *None* and the lines are monochrome, this argument specifies the line style for negative contours.

If *negative_linestyles* is *None*, the default is taken from *rcParams["contour.negative_linestyles"]*.

negative_linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches

[list[str], optional] *Only applies to* *contourf*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

algorithm

[{'mpl2005', 'mpl2014', 'serial', 'threaded'}, optional] Which contouring algorithm to use to calculate the contour lines and polygons. The algorithms are implemented in ContourPy, consult the ContourPy documentation for further information.

The default is taken from *rcParams["contour.algorithm"]* (default: `'mpl2014'`).

clip_path

[*Patch* or *Path* or *TransformedPath*] Set the clip path. See *set_clip_path*.

New in version 3.8.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Notes

1. *contourf* differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to *contour*.
2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

3. `contour` and `contourf` use a marching squares algorithm to compute contour locations. More information can be found in ContourPy documentation.

Examples using `matplotlib.axes.Axes.contour`

- *Contour Corner Mask*
- *Contour Demo*
- *Contour Image*

- *Plot contour (level) curves in 3D*
- *Plot contour (level) curves in 3D using the extend3d option*
- *Project contour profiles onto a graph*
- *contour(X, Y, Z)*

matplotlib.axes.Axes.contourf

Axes.**contourf**(**args*, *data=None*, ***kwargs*)

Plot filled contours.

Call signature:

```
contourf([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y

[array-like, optional] The coordinates of the values in *Z*.

X and *Y* must both be 2D with the same shape as *Z* (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == N` is the number of columns in *Z* and `len(Y) == M` is the number of rows in *Z*.

X and *Y* must both be ordered monotonically.

If not given, they are assumed to be integer indices, i.e. `X = range(N), Y = range(M)`.

Z

[(M, N) array-like] The height values over which the contour is drawn. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between minimum and maximum numeric values of *Z*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

QuadContourSet

Other Parameters

corner_mask

[bool, default: *rcParams["contour.corner_mask"]* (default: `True`)] Enable/disable corner masking, which only has an effect if *Z* is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for *contour* and the areas for *contourf*.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *colors* is set.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *colors* is set.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

If *vmin* or *vmax* are not given, the default color scaling is based on *levels*.

This parameter is ignored if *colors* is set.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *Z* by specifying the position of `Z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `Z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `Z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `Z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams["image.origin"]* (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of Z[0, 0], and (*x1*, *y1*) is the position of Z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `contourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls `QuadContourSet.changed()`.

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
    colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both
 ↪')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *False*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: `True`).

nchunk

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

linewidths

[float or array-like, default: *rcParams["contour.linewidth"]* (default: `None`)] *Only applies to* *contour*.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to *rcParams["lines.linewidth"]* (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *contour*.

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will instead take their linestyle from the *negative_linestyles* argument.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

negative_linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to* *contour*.

If *linestyles* is *None* and the lines are monochrome, this argument specifies the line style for negative contours.

If *negative_linestyles* is *None*, the default is taken from *rcParams["contour.negative_linestyles"]*.

negative_linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches

[list[str], optional] *Only applies to* *contourf*.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

algorithm

[{'mpl2005', 'mpl2014', 'serial', 'threaded'}, optional] Which contouring algorithm to use to calculate the contour lines and polygons. The algorithms are implemented in ContourPy, consult the ContourPy documentation for further information.

The default is taken from *rcParams["contour.algorithm"]* (default: `'mpl2014'`).

clip_path

[*Patch* or *Path* or *TransformedPath*] Set the clip path. See *set_clip_path*.

New in version 3.8.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Notes

1. *contourf* differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to *contour*.
2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

   except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).
3. *contour* and *contourf* use a marching squares algorithm to compute contour locations. More information can be found in ContourPy documentation.

Examples using `matplotlib.axes.Axes.contourf`

- *Contour Corner Mask*

- *Contourf Hatching*
- *Contourf and log color scale*
- *Contour plot of irregularly spaced data*
- *pcolormesh*

- *Triinterp Demo*
- *3D box surface plot*
- *Filled contours*
- *Project filled contour onto a graph*
- *contourf(X, Y, Z)*

2D arrays

`Axes.imshow`	Display data as an image, i.e., on a 2D regular raster.
`Axes.matshow`	Plot the values of a 2D matrix or array as color-coded image.
`Axes.pcolor`	Create a pseudocolor plot with a non-regular rectangular grid.
`Axes.pcolorfast`	Create a pseudocolor plot with a non-regular rectangular grid.
`Axes.pcolormesh`	Create a pseudocolor plot with a non-regular rectangular grid.
`Axes.spy`	Plot the sparsity pattern of a 2D array.

matplotlib.axes.Axes.imshow

`Axes.`**`imshow`**(*X*, *cmap=None*, *norm=None*, ***, *aspect=None*, *interpolation=None*, *alpha=None*, *vmin=None*, *vmax=None*, *origin=None*, *extent=None*, *interpolation_stage=None*, *filternorm=True*, *filterrad=4.0*, *resample=None*, *url=None*, *data=None*, ***kwargs*)

Display data as an image, i.e., on a 2D regular raster.

The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image, set up the colormapping using the parameters `cmap='gray', vmin=0, vmax=255`.

The number of pixels used to render an image is set by the Axes size and the figure *dpi*. This can lead to aliasing artifacts when the image is resampled, because the displayed image size will usually not match the size of *X* (see *Image antialiasing*). The resampling can be controlled via the *interpolation* parameter and/or *`rcParams["image.interpolation"]`* (default: `'antialiased'`).

Parameters

X

[array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).

- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *X* is RGB(A).

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *X* is RGB(A).

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

This parameter is ignored if *X* is RGB(A).

aspect

[{'equal', 'auto'} or float or None, default: None] The aspect ratio of the Axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set_aspect*. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using *extent*).
- 'auto': The Axes is kept fixed and the aspect is adjusted so that the data fit in the Axes. In general, this will result in non-square pixels.

Normally, None (the default) means to use *rcParams["image.aspect"]* (default: 'equal'). However, if the image uses a transform that does not contain the axes data transform, then None means to not modify the axes aspect at all (in that case, directly call *Axes.set_aspect* if desired).

interpolation

[str, default: *rcParams["image.interpolation"]* (default: 'antialiased')] The interpolation method used.

Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos', 'blackman'.

The data *X* is resampled to the pixel size of the image on the figure canvas, using the interpolation method to either up- or downsample the data.

If *interpolation* is 'none', then for the ps, pdf, and svg backends no down- or upsampling occurs, and the image data is passed to the backend as a native image. Note that different ps, pdf, and svg viewers may display these raw pixels differently. On other backends, 'none' is the same as 'nearest'.

If *interpolation* is the default 'antialiased', then 'nearest' interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller than 3, or the image is downsampled, then 'hanning' interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See *Interpolations for imshow* for an overview of the supported interpolation methods, and *Image antialiasing* for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

interpolation_stage

[{'data', 'rgba'}, default: 'data'] If 'data', interpolation is carried out on the data provided by the user. If 'rgba', the interpolation is carried out after the colormapping has been applied (visual interpolation).

alpha

[float or array-like, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If *alpha* is an array, the alpha blending values are applied pixel by pixel, and *alpha* must have the same shape as *X*.

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the Axes. The convention (the default) 'upper' is typically used for matrices and images.

Note that the vertical axis points upward for 'lower' but downward for 'upper'.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

extent

[floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. These values may be unitful and match the units of the Axes. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on *origin*:

- For `origin == 'upper'` the default is `(-0.5, numcols-0.5, numrows-0.5, -0.5)`.
- For `origin == 'lower'` the default is `(-0.5, numcols-0.5, -0.5, numrows-0.5)`.

See the *origin and extent in imshow* tutorial for examples and a more detailed description.

filternorm

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If *filternorm* is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

filterrad

[float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

resample

[bool, default: *rcParams["image.resample"]* (default: `True`)] When *True*, use a full resampling method. When *False*, only resample when the output image is larger than the input image.

url

[str, optional] Set the url of the created *AxesImage*. See *Artist.set_url*.

Returns

AxesImage

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

[*Artist* properties] These parameters are passed on to the constructor of the *AxesImage* artist.

See also:

matshow

Plot a matrix or an array as an image.

Notes

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

imshow expects RGB images adopting the straight (unassociated) alpha representation.

matplotlib.axes.Axes.matshow

Axes.**matshow**(*Z*, ***kwargs*)

Plot the values of a 2D matrix or array as color-coded image.

The matrix will be shown the way it would be printed, with the first row at the top. Row and column numbering is zero-based.

Parameters

Z

[(M, N) array-like] The matrix to be displayed.

Returns

AxesImage

Other Parameters

****kwargs**

[*imshow* arguments]

See also:

imshow

More general function to plot data on a 2D regular raster.

Notes

This is just a convenience function wrapping *imshow* to set useful defaults for displaying a matrix. In particular:

- Set `origin='upper'`.
- Set `interpolation='nearest'`.
- Set `aspect='equal'`.
- Ticks are placed to the left and above.
- Ticks are formatted to show integer indices.

matplotlib.axes.Axes.pcolor

`Axes.`**`pcolor`**(**args*, *shading=None*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y,] C, **kwargs)
```

X and *Y* can be used to specify the corners of the quadrilaterals.

Hint: `pcolor()` can be very slow for large arrays. In most cases you should use the similar but much faster *pcolormesh* instead. See *Differences between pcolor() and pcolormesh()* for a discussion of the differences.

Parameters

C

[2D array-like] The color-mapped values. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])         (X[i+1, j+1], Y[i+1, j+1])
                       ●━━━━━●
                       ┃     ┃
                       ●━━━━━●
    (X[i, j], Y[i, j])         (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at `C[i, j]`. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a ValueError will be raised). The color `C[i, j]` will be centered on `(X[i, j], Y[i, j])`.

If *X* and/or *Y* are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2D arrays, making a rectangular grid.

shading

[{'flat', 'nearest', 'auto'}, default: *rcParams["pcolor.shading"]* (default: `'auto'`)] The fill style for the quadrilateral. Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by `C[i, j]`. The dimensions of *X* and *Y* should be one greater than those of *C*; if they are the same as *C*, then a deprecation warning is raised, and the last row and column of *C* are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of *X* and *Y* must be the same as *C*.
- 'auto': Choose 'flat' if dimensions of *X* and *Y* are one larger than *C*. Choose 'nearest' if dimensions are the same.

See *pcolormesh grids and shading* for more description.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.
- *None*: *`rcParams["patch.edgecolor"]`* (default: `'black'`) will be used. Note that currently *`rcParams["patch.force_edgecolor"]`* (default: `False`) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

alpha

[float, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edgecolor is currently not affected by this.

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

matplotlib.collections.PolyQuadMesh

Other Parameters

antialiaseds

[bool, default: False] The default *antialiaseds* is False if the default *edgecolors*="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If *edgecolors* is not "none", then the default *antialiaseds* is taken from *`rcParams["patch.antialiased"]`* (default: `True`). Stroking the edges may be preferred if *alpha* is 1, but will cause artifacts otherwise.

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

**kwargs

Additionally, the following arguments are allowed. They are passed along to the *PolyQuadMesh* constructor:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a d
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool

Table 23 – continued fro

Property	Description
zorder	float

See also:

pcolormesh

for an explanation of the differences between pcolor and pcolormesh.

imshow

If *X* and *Y* are each equidistant, *imshow* can be a faster alternative.

Notes

Masked arrays

X, *Y* and *C* may be masked arrays. If either `C[i, j]`, or one of the vertices surrounding `C[i, j]` (*X* or *Y* at `[i, j]`, `[i+1, j]`, `[i, j+1]`, `[i+1, j+1]`) is masked, nothing is plotted.

Grid orientation

The grid orientation follows the standard matrix convention: An array *C* with shape (nrows, ncolumns) is plotted with the column number as *X* and the row number as *Y*.

Examples using `matplotlib.axes.Axes.pcolor`

- *pcolor images*
- *Controlling view limits using margins and sticky_edges*

matplotlib.axes.Axes.pcolorfast

Axes.**pcolorfast**(**args*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
ax.pcolorfast([X, Y], C, /, **kwargs)
```

This method is similar to *pcolor* and *pcolormesh*. It's designed to provide the fastest pcolor-type plotting with the Agg backend. To achieve this, it uses different algorithms internally depending on the complexity of the input grid (regular rectangular, non-regular rectangular or arbitrary quadrilateral).

Warning: This method is experimental. Compared to `pcolor` or `pcolormesh` it has some limitations:

- It supports only flat shading (no outlines)
- It lacks support for log scaling of the axes.
- It does not have a pyplot wrapper.

Parameters

C

[array-like] The image data. Supported array shapes are:

- (M, N): an image with scalar data. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

This parameter can only be passed positionally.

X, Y

[tuple or array-like, default: `(0, N), (0, M)`] *X* and *Y* are used to specify the coordinates of the quadrilaterals. There are different ways to do this:

- Use tuples `X=(xmin, xmax)` and `Y=(ymin, ymax)` to define a *uniform rectangular grid*.

  The tuples define the outer edges of the grid. All individual quadrilaterals will be of the same size. This is the fastest version.

- Use 1D arrays *X*, *Y* to specify a *non-uniform rectangular grid*.

  In this case *X* and *Y* have to be monotonic 1D arrays of length *N+1* and *M+1*, specifying the x and y boundaries of the cells.

  The speed is intermediate. Note: The grid is checked, and if found to be uniform the fast version is used.

- Use 2D arrays *X*, *Y* if you need an *arbitrary quadrilateral grid* (i.e. if the quadrilaterals are not rectangular).

  In this case *X* and *Y* are 2D arrays with shape (M + 1, N + 1), specifying the x and y coordinates of the corners of the colored quadrilaterals.

  This is the most general, but the slowest to render. It may produce faster and more compact output using ps, pdf, and svg backends, however.

These arguments can only be passed positionally.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *C* is RGB(A).

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *C* is RGB(A).

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

This parameter is ignored if *C* is RGB(A).

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

AxesImage* or *PcolorImage* or *QuadMesh

The return type depends on the type of grid:

- *AxesImage* for a regular rectangular grid.
- *PcolorImage* for a non-regular rectangular grid.
- *QuadMesh* for a non-rectangular grid.

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

Supported additional parameters depend on the type of grid. See return types of *image* for further description.

Examples using `matplotlib.axes.Axes.pcolorfast`

- *pcolor images*

matplotlib.axes.Axes.pcolormesh

`Axes.`**`pcolormesh`**(**args*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *shading=None*, *antialiased=False*, *data=None*, ***kwargs*)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolormesh([X, Y,] C, **kwargs)
```

X and *Y* can be used to specify the corners of the quadrilaterals.

Hint: `pcolormesh` is similar to `pcolor`. It is much faster and preferred in most cases. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

Parameters

C

[array-like] The mesh data. Supported array shapes are:

- (M, N) or M*N: a mesh with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the mesh data.

X, Y

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j])       (X[i+1, j+1], Y[i+1, j+1])
                       ●─────●
                       │     │
                       ●─────●
    (X[i, j], Y[i, j])       (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the *Notes* section below.

If `shading='flat'` the dimensions of *X* and *Y* should be one greater than those of *C*, and the quadrilateral is colored due to the value at `C[i, j]`. If *X*, *Y* and *C* have equal dimensions, a warning will be raised and the last row and column of *C* will be ignored.

If `shading='nearest'` or `'gouraud'`, the dimensions of *X* and *Y* should be the same as those of *C* (if not, a ValueError will be raised). For `'nearest'` the color `C[i, j]` is centered on `(X[i, j], Y[i, j])`. For `'gouraud'`, a smooth interpolation is caried out between the quadrilateral corners.

If *X* and/or *Y* are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2D arrays, making a rectangular grid.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a

norm instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

edgecolors

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.
- *None*: *rcParams["patch.edgecolor"]* (default: `'black'`) will be used. Note that currently *rcParams["patch.force_edgecolor"]* (default: `False`) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

shading

[{'flat', 'nearest', 'gouraud', 'auto'}, optional] The fill style for the quadrilateral; defaults to *rcParams["pcolor.shading"]* (default: `'auto'`). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by `C[i, j]`. The dimensions of *X* and *Y* should be one greater than those of *C*; if they are the same as *C*, then a deprecation warning is raised, and the last row and column of *C* are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of *X* and *Y* must be the same as *C*.
- 'gouraud': Each quad will be Gouraud shaded: The color of the corners (i', j') are given by `C[i', j']`. The color values of the area in between is interpolated from the corner values. The dimensions of *X* and *Y* must be the same as *C*. When Gouraud shading is used, *edgecolors* is ignored.
- 'auto': Choose 'flat' if dimensions of *X* and *Y* are one larger than *C*. Choose 'nearest' if dimensions are the same.

See *pcolormesh grids and shading* for more description.

snap

[bool, default: False] Whether to snap the mesh to pixel boundaries.

rasterized

[bool, optional] Rasterize the pcolormesh when drawing vector graphics. This can speed up rendering and produce smaller files for large data sets. See also *Rasterization for vector graphics*.

Returns

matplotlib.collections.QuadMesh

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

Additionally, the following arguments are allowed. They are passed along to the *QuadMesh* constructor:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a d
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like

Table 24 – continued fro

Property	Description
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
urls	list of str or None
visible	bool
zorder	float

See also:

pcolor

An alternative implementation with slightly different features. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

imshow

If *X* and *Y* are each equidistant, imshow can be a faster alternative.

Notes

Masked arrays

C may be a masked array. If `C[i, j]` is masked, the corresponding quadrilateral will be transparent. Masking of *X* and *Y* is not supported. Use pcolor if you need this functionality.

Grid orientation

The grid orientation follows the standard matrix convention: An array *C* with shape (nrows, ncolumns) is plotted with the column number as *X* and the row number as *Y*.

Differences between pcolor() and pcolormesh()

Both methods are used to create a pseudocolor plot of a 2D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While pcolor returns a PolyQuadMesh, pcolormesh returns a QuadMesh. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both pcolor and pcolormesh support masked arrays for *C*. However, only pcolor supports masked arrays for *X* and *Y*. The reason lies in the internal handling of the masked values. pcolor leaves out the respective polygons from the PolyQuadMesh. pcolormesh sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in pcolor is not drawn as

the corresponding polygons do not exist in the PolyQuadMesh. Because PolyQuadMesh draws each individual polygon, it also supports applying hatches and linestyles to the collection.

Another difference is the support of Gouraud shading in *pcolormesh*, which is not available with *pcolor*.

- *Colormap normalization*

matplotlib.axes.Axes.spy

`Axes.`**`spy`**(*Z*, *precision=0*, *marker=None*, *markersize=None*, *aspect='equal'*, *origin='upper'*, ***kwargs*)

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

Image style

If *marker* and *markersize* are *None*, *imshow* is used. Any extra remaining keyword arguments are passed to this method.

Marker style

If *Z* is a `scipy.sparse.spmatrix` or *marker* or *markersize* are *None*, a *Line2D* object will be returned with the value of marker determining the marker type, and any remaining keyword arguments passed to *plot*.

Parameters

Z

[(M, N) array-like] The array to be plotted.

precision

[float or 'present', default: 0] If *precision* is 0, any non-zero value will be plotted. Otherwise, values of $|Z| > precision$ will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

aspect

[{'equal', 'auto', None} or float, default: 'equal'] The aspect ratio of the Axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set_aspect*. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square.
- 'auto': The Axes is kept fixed and the aspect is adjusted so that the data fit in the Axes. In general, this will result in non-square pixels.
- *None*: Use *rcParams["image.aspect"]* (default: `'equal'`).

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: `'upper'`)] Place the [0, 0] index of the array in the upper left or lower left corner of the Axes. The convention 'upper' is typically used for matrices and images.

Returns

AxesImage* or *Line2D

The return type depends on the plotting style (see above).

Other Parameters

****kwargs**

The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of *imshow*:

- *cmap*
- *alpha*
- *url*
- any *Artist* properties (passed on to the *AxesImage*)

For the marker style, you can pass any *Line2D* property except for *linestyle*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: '
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, floa
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array

Examples using `matplotlib.axes.Axes.spy`

- *Spy Demos*

Unstructured triangles

Axes.tripcolor	Create a pseudocolor plot of an unstructured triangular grid.
Axes.triplot	Draw an unstructured triangular grid as lines and/or markers.
Axes.tricontour	Draw contour lines on an unstructured triangular grid.
Axes.tricontourf	Draw contour regions on an unstructured triangular grid.

matplotlib.axes.Axes.tripcolor

Axes.**tripcolor**(**args*, *alpha=1.0*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *shading='flat'*, *facecolors=None*, ***kwargs*)

Create a pseudocolor plot of an unstructured triangular grid.

Call signatures:

```
tripcolor(triangulation, c, *, ...)
tripcolor(x, y, c, *, [triangles=triangles], [mask=mask], ...)
```

The triangular grid can be specified either by passing a *Triangulation* object as the first parameter, or by passing the points *x*, *y* and optionally the *triangles* and a *mask*. See *Triangulation* for an explanation of these parameters.

It is possible to pass the triangles positionally, i.e. `tripcolor(x, y, triangles, c, ...)`. However, this is discouraged. For more clarity, pass *triangles* via keyword argument.

If neither of *triangulation* or *triangles* are given, the triangulation is calculated on the fly. In this case, it does not make sense to provide colors at the triangle faces via *c* or *facecolors* because there are multiple possible triangulations for a group of points and you don't know which triangles will be constructed.

Parameters

triangulation

[*Triangulation*] An already created triangular grid.

x, y, triangles, mask

Parameters defining the triangular grid. See *Triangulation*. This is mutually exclusive with specifying *triangulation*.

c

[array-like] The color values, either for the points or for the triangles. Which one is automatically inferred from the length of *c*, i.e. does it match the number of points or the number of triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the keyword argument `facecolors=c` instead of just `c`. This parameter is position-only.

facecolors

[array-like, optional] Can be used alternatively to *c* to specify colors at the triangle faces. This parameter takes precedence over *c*.

shading

[{'flat', 'gouraud'}, default: 'flat'] If 'flat' and the color values *c* are defined at points, the color values used for each triangle are from the mean c of the triangle's three points. If *shading* is 'gouraud' then color values must be defined at points.

other_parameters

All other parameters are the same as for *pcolor*.

Examples using `matplotlib.axes.Axes.tripcolor`

- *Tripcolor Demo*
- *tripcolor(x, y, z)*

matplotlib.axes.Axes.triplot

`Axes.`**`triplot`**`(`**args*, ***kwargs*`)`

Draw an unstructured triangular grid as lines and/or markers.

Call signatures:

```
triplot(triangulation, ...)
triplot(x, y, [triangles], *, [mask=mask], ...)
```

The triangular grid can be specified either by passing a *Triangulation* object as the first parameter, or by passing the points *x*, *y* and optionally the *triangles* and a *mask*. If neither of *triangulation* or *triangles* are given, the triangulation is calculated on the fly.

Parameters

triangulation

[*Triangulation*] An already created triangular grid.

x, y, triangles, mask

Parameters defining the triangular grid. See *Triangulation*. This is mutually exclusive with specifying *triangulation*.

other_parameters

All other args and kwargs are forwarded to *plot*.

Returns

lines

[*Line2D*] The drawn triangles edges.

markers

[*Line2D*] The drawn marker nodes.

Examples using `matplotlib.axes.Axes.triplot`

- *Tricontour Smooth Delaunay*
- *Tricontour Smooth User*
- *Trigradient Demo*
- *Triinterp Demo*
- *Triplot Demo*
- *Trifinder Event Demo*
- *triplot(x, y)*

matplotlib.axes.Axes.tricontour

Axes.**tricontour**(**args*, ***kwargs*)

Draw contour lines on an unstructured triangular grid.

Call signatures:

```
tricontour(triangulation, z, [levels], ...)
tricontour(x, y, z, [levels], *, [triangles=triangles], [mask=mask], ...)
```

The triangular grid can be specified either by passing a *Triangulation* object as the first parameter, or by passing the points *x*, *y* and optionally the *triangles* and a *mask*. See *Triangulation* for an explanation of these parameters. If neither of *triangulation* or *triangles* are given, the triangulation is calculated on the fly.

It is possible to pass *triangles* positionally, i.e. `tricontour(x, y, triangles, z, ...)`. However, this is discouraged. For more clarity, pass *triangles* via keyword argument.

Parameters

triangulation

[*Triangulation*, optional] An already created triangular grid.

x, y, triangles, mask

Parameters defining the triangular grid. See *Triangulation*. This is mutually exclusive with specifying *triangulation*.

z

[array-like] The height values over which the contour is drawn. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

Note: All values in *z* must be finite. Hence, nan and inf values must either be removed or *set_mask* be used.

---

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between between minimum and maximum numeric values of *Z*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

TriContourSet

Other Parameters

colors

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour lines.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it is repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *colors* is set.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *colors* is set.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

If *vmin* or *vmax* are not given, the default color scaling is based on *levels*.

This parameter is ignored if *colors* is set.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *z* by specifying the position of `z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.

- 'upper': `z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams["image.origin"]* (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of z[0, 0], and (*x1*, *y1*) is the position of z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontour`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: `True`).

linewidths

[float or array-like, default: *rcParams["contour.linewidth"]* (default: `None`)] The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: `1.5`).

linestyles

[{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: `'dashed'`) setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

Examples using `matplotlib.axes.Axes.tricontour`

- *Contour plot of irregularly spaced data*
- *Tricontour Demo*
- *Tricontour Smooth Delaunay*
- *Tricontour Smooth User*
- *Trigradient Demo*
- *Triangular 3D contour plot*
- *tricontour(x, y, z)*

matplotlib.axes.Axes.tricontourf

`Axes.`**`tricontourf`**`(*args, **kwargs)`

Draw contour regions on an unstructured triangular grid.

Call signatures:

```
tricontourf(triangulation, z, [levels], ...)
tricontourf(x, y, z, [levels], *, [triangles=triangles], [mask=mask], ...
 ↪)
```

The triangular grid can be specified either by passing a `Triangulation` object as the first parameter, or by passing the points *x*, *y* and optionally the *triangles* and a *mask*. See `Triangulation` for an explanation of these parameters. If neither of *triangulation* or *triangles* are given, the triangulation is calculated on the fly.

It is possible to pass *triangles* positionally, i.e. `tricontourf(x, y, triangles, z, ...)`. However, this is discouraged. For more clarity, pass *triangles* via keyword argument.

Parameters

triangulation

[*Triangulation*, optional] An already created triangular grid.

x, y, triangles, mask

Parameters defining the triangular grid. See *Triangulation*. This is mutually exclusive with specifying *triangulation*.

z

[array-like] The height values over which the contour is drawn. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.

Note: All values in *z* must be finite. Hence, nan and inf values must either be removed or *set_mask* be used.

---

levels

[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between between minimum and maximum numeric values of *Z*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

TriContourSet

Other Parameters

colors

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour regions.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it is repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `'red'` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

alpha

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *colors* is set.

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *colors* is set.

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

If *vmin* or *vmax* are not given, the default color scaling is based on *levels*.

This parameter is ignored if *colors* is set.

origin

[{*None*, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of *z* by specifying the position of `z[0, 0]`. This is only relevant, if *X*, *Y* are not given.

- *None*: `z[0, 0]` is at X=0, Y=0 in the lower left corner.
- 'lower': `z[0, 0]` is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': `z[0, 0]` is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams["image.origin"]* (default: `'upper'`).

extent

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of z[0, 0], and (*x1*, *y1*) is the position of z[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontourf`-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

Note: An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

xunits, yunits

[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

antialiased

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: `True`).

hatches

[list[str], optional] A list of crosshatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Notes

tricontourf fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Examples using `matplotlib.axes.Axes.tricontourf`

- *Contour plot of irregularly spaced data*
- *Tricontour Demo*
- *Tricontour Smooth Delaunay*
- *Tricontour Smooth User*
- *Triinterp Demo*
- *Triangular 3D filled contour plot*
- *tricontourf(x, y, z)*

Text and annotations

Axes.annotate	Annotate the point *xy* with text *text*.
Axes.text	Add text to the Axes.
Axes.table	Add a table to an *Axes*.
Axes.arrow	Add an arrow to the Axes.
Axes.inset_axes	Add a child inset Axes to this existing Axes.
Axes.indicate_inset	Add an inset indicator to the Axes.
Axes.indicate_inset_zoom	Add an inset indicator rectangle to the Axes based on the axis limits for an *inset_ax* and draw connectors between *inset_ax* and the rectangle.
Axes.secondary_xaxis	Add a second x-axis to this *Axes*.
Axes.secondary_yaxis	Add a second y-axis to this *Axes*.

matplotlib.axes.Axes.annotate

Axes.**annotate**(*text*, *xy*, *xytext=None*, *xycoords='data'*, *textcoords=None*, *arrowprops=None*, *annotation_clip=None*, ***kwargs*)

Annotate the point *xy* with text *text*.

In the simplest form, the text is placed at *xy*.

Optionally, the text can be displayed in another position *xytext*. An arrow pointing from the text to the annotated point *xy* can then be added by defining *arrowprops*.

Parameters

text

[str] The text of the annotation.

xy

[(float, float)] The point *(x, y)* to annotate. The coordinate system is determined by *xycoords*.

xytext

[(float, float), default: *xy*] The position *(x, y)* to place the text at. The coordinate system is determined by *textcoords*.

xycoords

[single or two-tuple of str or *Artist* or *Transform* or callable, default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'subfigure points'	Points from the lower left of the subfigure
'subfigure pixels'	Pixels from the lower left of the subfigure
'subfigure fraction'	Fraction of subfigure from lower left
'axes points'	Points from lower left corner of axes
'axes pixels'	Pixels from lower left corner of axes
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	*(theta, r)* if not native 'data' coordinates

Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g. *(0, 0)* would be the lower left corner of the bounding box and *(0.5, 1)* would be the center top of the bounding box.
- A *Transform* to transform *xy* to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where *renderer* is a *RendererBase* subclass.

The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple *(xcoords, ycoords)* specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced annotation* for more details.

textcoords

[single or two-tuple of str or *Artist* or *Transform* or callable, default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset, in points, from the *xy* value
'offset pixels'	Offset, in pixels, from the *xy* value
'offset fontsize'	Offset, relative to fontsize, from the *xy* value

arrowprops

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*. Defaults to None, i.e. no arrow is drawn.

For historical reasons there are two different ways to specify arrows, "simple" and "fancy":

Simple arrow:

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any *FancyArrowPatch* property

The arrow is attached to the edge of the text box, the exact position (corners or centers) depending on where it's pointing to.

Fancy arrow:

This is used if 'arrowstyle' is provided in the *arrowprops*.

Valid keys are the following *FancyArrowPatch* parameters:

Key	Description
arrowstyle	The arrow style
connectionstyle	The connection style
relpos	See below; default is (0.5, 0.5)
patchA	Default is bounding box of the text
patchB	Default is None
shrinkA	Default is 2 points
shrinkB	Default is 2 points
mutation_scale	Default is text size (in points)
mutation_aspect	Default is 1
?	Any *FancyArrowPatch* property

The exact starting point position of the arrow is defined by *relpos*. It's a tuple of relative coordinates of the text box, where (0, 0) is the lower left corner and (1, 1) is the upper right corner. Values <0 and >1 are supported and specify points outside the text box. By default (0.5, 0.5), so the starting point is centered in the text box.

annotation_clip

[bool or None, default: None] Whether to clip (i.e. not draw) the annotation when the annotation point *xy* is outside the axes area.

- If *True*, the annotation will be clipped when *xy* is outside the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will be clipped when *xy* is outside the axes and *xycoords* is 'data'.

****kwargs**

Additional kwargs are passed to *Text*.

Returns

Annotation

matplotlib.axes.Axes.text

`Axes.`**`text`**(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to the Axes.

Add the text *s* to the Axes at location *x*, *y* in data coordinates, with a default `horizontalalignment` on the `left` and `verticalalignment` at the `baseline`. See *Text alignment*.

Parameters

x, y

[float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

s

[str] The text.

fontdict

[dict, default: None]

Discouraged

The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `text(..., **fontdict)`.

A dictionary to override the default text properties. If fontdict is None, the defaults are determined by *rcParams*.

Returns

Text

The created *Text* instance.

Other Parameters

****kwargs**

[*Text* properties.] Other miscellaneous text parameters.

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array a
alpha	scalar or None
animated	bool
antialiased	bool
backgroundcolor	color
bbox	dict with properties for patches.FancyBboxPa
clip_box	unknown
clip_on	unknown
clip_path	unknown
color or c	color
figure	Figure
fontfamily or family or fontname	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy'
fontproperties or font or font_properties	font_manager.FontProperties or str or p
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed',
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light',
gid	str
horizontalalignment or ha	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool
multialignment or ma	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	Transform
transform_rotates_text	bool
url	str
usetex	bool or None
verticalalignment or va	{'baseline', 'bottom', 'center', 'center_baseline', 'top'}
visible	bool
wrap	bool
x	float
y	float

Table 26 –

Property	Description
zorder	float

Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the Axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

matplotlib.axes.Axes.table

Axes.**table**(*cellText=None*, *cellColours=None*, *cellLoc='right'*, *colWidths=None*, *rowLabels=None*, *rowColours=None*, *rowLoc='left'*, *colLabels=None*, *colColours=None*, *colLoc='center'*, *loc='bottom'*, *bbox=None*, *edges='closed'*, ***kwargs*)

Add a table to an *Axes*.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the *Table* class and add it to the axes with *Axes.add_table*.

Parameters

cellText

[2D list of str, optional] The texts to place into the table cells.

Note: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

cellColours

[2D list of colors, optional] The background colors of the cells.

cellLoc

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

colWidths

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of *1 / ncols*.

rowLabels

[list of str, optional] The text of the row header cells.

rowColours

[list of colors, optional] The colors of the row header cells.

rowLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the row header cells.

colLabels

[list of str, optional] The text of the column header cells.

colColours

[list of colors, optional] The colors of the column header cells.

colLoc

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the column header cells.

loc

[str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

bbox

[*Bbox* or [xmin, ymin, width, height], optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

edges

[substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}] The cell edges to be drawn with a line. See also *visible_edges*.

Returns

Table

The created table.

Other Parameters

****kwargs**

Table properties.

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	*BboxBase* or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	*Figure*
fontsize	float
gid	str
in_layo	bool
label	object
mouseov	bool
path_ef	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
*sketch_*	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

matplotlib.axes.Axes.arrow

`Axes.`**`arrow`**(*x*, *y*, *dx*, *dy*, ***kwargs*)

Add an arrow to the Axes.

This draws an arrow from `(x, y)` to `(x+dx, y+dy)`.

Parameters

x, y

[float] The x and y coordinates of the arrow base.

dx, dy

[float] The length of the arrow along x and y direction.

width

[float, default: 0.001] Width of full arrow tail.

length_includes_head

[bool, default: False] True if head is to be counted in calculating the length.

head_width

[float or None, default: 3*width] Total width of the full arrow head.

head_length

[float or None, default: 1.5*head_width] Length of arrow head.

shape

[{'full', 'left', 'right'}, default: 'full'] Draw the left-half, right-half, or full arrow.

overhang

[float, default: 0] Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero

[bool, default: False] If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

****kwargs**

Patch properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and return
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}

Table 27 – continued from previc

Property	Description
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

Returns

FancyArrow

The created *FancyArrow* object.

Notes

The resulting arrow is affected by the Axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use *annotate()* for example:

```
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...             arrowprops=dict(arrowstyle="->"))
```

Examples using `matplotlib.axes.Axes.arrow`

- *Arrow Demo*

matplotlib.axes.Axes.inset_axes

`Axes.`**`inset_axes`**(*bounds*, *, *transform=None*, *zorder=5*, ***kwargs*)

Add a child inset Axes to this existing Axes.

Parameters

bounds

[[x0, y0, width, height]] Lower-left corner of inset Axes, and its width and height.

transform

[*Transform*] Defaults to `ax.transAxes`, i.e. the units of *rect* are in Axes-relative coordinates.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the inset *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

axes_class

[subclass type of *Axes*, optional] The *axes.Axes* subclass that is instantiated. This parameter is incompatible with *projection* and *polar*. See *axisartist* for examples.

zorder

[number] Defaults to 5 (same as *Axes.legend*). Adjust higher or lower to change whether it is above or below data plotted on the parent Axes.

****kwargs**

Other keyword arguments are passed on to the inset Axes class.

Returns

ax

The created *Axes* instance.

Warning: This method is experimental as of 3.0, and the API may change.

Examples

This example makes two inset Axes, the first is in Axes-relative coordinates, and the second in data-coordinates:

```
fig, ax = plt.subplots()
ax.plot(range(10))
axin1 = ax.inset_axes([0.8, 0.1, 0.15, 0.15])
axin2 = ax.inset_axes(
        [5, 7, 2.3, 2.3], transform=ax.transData)
```

Examples using `matplotlib.axes.Axes.inset_axes`

- *Scatter plot with histograms*
- *Zoom region inset axes*
- *Check buttons*
- *Placing colorbars*

matplotlib.axes.Axes.indicate_inset

Axes.**indicate_inset**(*bounds*, *inset_ax=None*, *, *transform=None*, *facecolor='none'*, *edgecolor='0.5'*, *alpha=0.5*, *zorder=4.99*, ***kwargs*)

Add an inset indicator to the Axes. This is a rectangle on the plot at the position indicated by *bounds* that optionally has lines that connect the rectangle to an inset Axes (*Axes.inset_axes*).

Parameters

bounds

[[x0, y0, width, height]] Lower-left corner of rectangle to be marked, and its width and height.

inset_ax

[*Axes*] An optional inset Axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset Axes on corners chosen so as to not overlap with the indicator box.

transform

[*Transform*] Transform for the rectangle coordinates. Defaults to `ax.transAxes`, i.e. the units of *rect* are in Axes-relative coordinates.

facecolor

[color, default: 'none'] Facecolor of the rectangle.

edgecolor

[color, default: '0.5'] Color of the rectangle and color of the connecting lines.

alpha

[float, default: 0.5] Transparency of the rectangle and connector lines.

zorder

[float, default: 4.99] Drawing order of the rectangle and connector lines. The default, 4.99, is just below the default level of inset Axes.

****kwargs**

Other keyword arguments are passed on to the *Rectangle* patch:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and return
alpha	scalar or None
angle	unknown
animated	bool
antialiased or aa	bool or None
bounds	(left, bottom, width, height)
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
height	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)

Table 28 – continued from previc

Property	Description
snap	bool or None
transform	*Transform*
url	str
visible	bool
width	unknown
x	unknown
xy	(float, float)
y	unknown
zorder	float

Returns

rectangle_patch

[*patches.Rectangle*] The indicator frame.

connector_lines

[4-tuple of *patches.ConnectionPatch*] The four connector lines connecting to (lower_left, upper_left, lower_right upper_right) corners of *inset_ax*. Two lines are set with visibility to *False*, but the user can set the visibility to True if the automatic choice is not deemed correct.

Warning: This method is experimental as of 3.0, and the API may change.

matplotlib.axes.Axes.indicate_inset_zoom

Axes.**indicate_inset_zoom**(*inset_ax*, ***kwargs*)

Add an inset indicator rectangle to the Axes based on the axis limits for an *inset_ax* and draw connectors between *inset_ax* and the rectangle.

Parameters

inset_ax

[*Axes*] Inset Axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset Axes on corners chosen so as to not overlap with the indicator box.

****kwargs**

Other keyword arguments are passed on to *Axes.indicate_inset*

Returns

rectangle_patch

[*patches.Rectangle*] Rectangle artist.

connector_lines

[4-tuple of *patches.ConnectionPatch*] Each of four connector lines coming from the rectangle drawn on this axis, in the order lower left, upper left, lower right, upper right. Two are set with visibility to *False*, but the user can set the visibility to *True* if the automatic choice is not deemed correct.

Warning: This method is experimental as of 3.0, and the API may change.

Examples using `matplotlib.axes.Axes.indicate_inset_zoom`

- *Zoom region inset axes*

matplotlib.axes.Axes.secondary_xaxis

`Axes.`**`secondary_xaxis`**(*location*, *, *functions=None*, ***kwargs*)

Add a second x-axis to this *Axes*.

For example if we want to have a second scale for the data plotted on the xaxis.

Parameters

location

[{'top', 'bottom', 'left', 'right'} or float] The position to put the secondary axis. Strings can be 'top' or 'bottom' for orientation='x' and 'right' or 'left' for orientation='y'. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

functions

[2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2. Both functions must accept numpy arrays as input.

The user can also directly supply a subclass of *transforms.Transform* so long as it has an inverse.

See *Secondary Axis* for examples of making these conversions.

Returns

ax

[axes._secondary_axes.SecondaryAxis]

Other Parameters

****kwargs**

[*Axes* properties.] Other miscellaneous axes parameters.

Warning: This method is experimental as of 3.1, and the API may change.

Examples

The main axis shows frequency, and the secondary axis shows period.

Examples using `matplotlib.axes.Axes.secondary_xaxis`

- *Secondary Axis*
- *Multilevel (nested) ticks*
- *Quick start guide*

matplotlib.axes.Axes.secondary_yaxis

`Axes.`**`secondary_yaxis`**(*location*, *, *functions=None*, ***kwargs*)

Add a second y-axis to this *Axes*.

For example if we want to have a second scale for the data plotted on the yaxis.

Parameters

location

[{'top', 'bottom', 'left', 'right'} or float] The position to put the secondary axis. Strings can be 'top' or 'bottom' for orientation='x' and 'right' or 'left' for orientation='y'. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

functions

[2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2. Both functions must accept numpy arrays as input.

The user can also directly supply a subclass of *transforms.Transform* so long as it has an inverse.

See *Secondary Axis* for examples of making these conversions.

Returns

ax

[axes._secondary_axes.SecondaryAxis]

Other Parameters

****kwargs**

[*Axes* properties.] Other miscellaneous axes parameters.

Warning: This method is experimental as of 3.1, and the API may change.

Examples

Add a secondary Axes that converts from radians to degrees

Examples using `matplotlib.axes.Axes.secondary_yaxis`

- *Secondary Axis*

Vector fields

Axes.barbs	Plot a 2D field of barbs.
Axes.quiver	Plot a 2D field of arrows.
Axes.quiverkey	Add a key to a quiver plot.
Axes.streamplot	Draw streamlines of a vector flow.

matplotlib.axes.Axes.barbs

Axes.**barbs**(**args*, *data=None*, ***kwargs*)

Plot a 2D field of barbs.

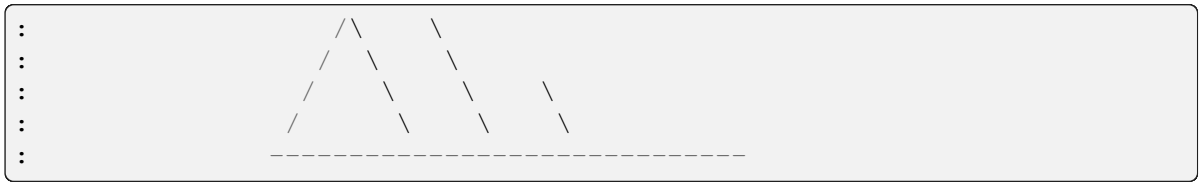
Call signature:

```
barbs([X, Y], U, V, [C], **kwargs)
```

Where *X*, *Y* define the barb locations, *U*, *V* define the barb directions, and *C* optionally sets the color.

All arguments may be 1D or 2D. *U*, *V*, *C* may be masked arrays, but masked *X*, *Y* are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:



The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y components of the barb shaft.

C

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

length

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override facecolor.

flagcolor

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

fill_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

Returns

barbs

[*Barbs*]

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a d
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None

Table 29 – continued fro

Property	Description
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

Examples using `matplotlib.axes.Axes.barbs`

- *Wind Barbs*
- *barbs(X, Y, U, V)*

matplotlib.axes.Axes.quiver

Axes.**quiver**(**args*, *data=None*, ***kwargs*)

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kwargs)
```

X, *Y* define the arrow locations, *U*, *V* define the arrow directions, and *C* optionally sets the color.

Arrow length

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* parameters.

Arrow shape

The arrow shape is determined by *width*, *headwidth*, *headlength* and *headaxislength*. See the notes below.

Arrow styling

Each arrow is internally represented by a filled polygon with a default edge linewidth of 0. As a result, an arrow is rather a filled area, not a line with a head, and *PolyCollection* properties like *linewidth*, *edgecolor*, *facecolor*, etc. act accordingly.

Parameters

X, Y

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

U, V

[1D or 2D array-like] The x and y direction components of the arrow vectors. The interpretation of these components (in data or in screen space) depends on *angles*.

U and *V* must have the same number of elements, matching the number of arrow locations in *X*, *Y*. *U* and *V* may be masked. Locations masked in any of *U*, *V*, and *C* will not be drawn.

C

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

angles

[{'uv', 'xy'} or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': Arrow direction in screen coordinates. Use this if the arrows symbolize a quantity that is not based on *X*, *Y* data coordinates.

  If $U == V$ the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

- 'xy': Arrow direction in data coordinates, i.e. the arrows point from (x, y) to (x+u, y+v). Use this e.g. for plotting a gradient field.

- Arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

  In this case *U*, *V* is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

pivot

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the *X*, *Y* grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

scale

[float, optional] Scales the length of the arrow inversely.

Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale_units* parameter.

scale_units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the *scale* kwarg is *None*, the arrow length unit. Default is *None*.

e.g. *scale_units* is 'inches', *scale* is 2.0, and `(u, v) = (1, 0)`, then the vector will be 0.5 inches long.

If *scale_units* is 'width' or 'height', then the vector will be half the width/height of the axes.

If *scale_units* is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

units

[{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] Affects the arrow size (except for the length). In particular, the shaft *width* is measured in multiples of this unit.

Supported values are:

- 'width', 'height': The width or height of the Axes.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': X, Y or $\sqrt{X^2 + Y^2}$ in data units.

The following table summarizes how these values affect the visible arrow size under zooming and figure size changes:

units	zoom	figure size change
'x', 'y', 'xy'	arrow size scales	—
'width', 'height'	—	arrow size scales
'dots', 'inches'	—	—

width

[float, optional] Shaft width in arrow units. All head parameters are relative to *width*.

The default depends on choice of *units* above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth

[float, default: 3] Head width as multiple of shaft *width*. See the notes below.

headlength

[float, default: 5] Head length as multiple of shaft *width*. See the notes below.

headaxislength

[float, default: 4.5] Head length at shaft intersection as multiple of shaft *width*. See the notes below.

minshaft

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

color

[color or color sequence, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection facecolor* parameter.

Returns

Quiver

Other Parameters

data

[indexable object, optional] If given, all parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

****kwargs**

[*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a d
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like

Table 30 – continued fro

Property	Description
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

See also:

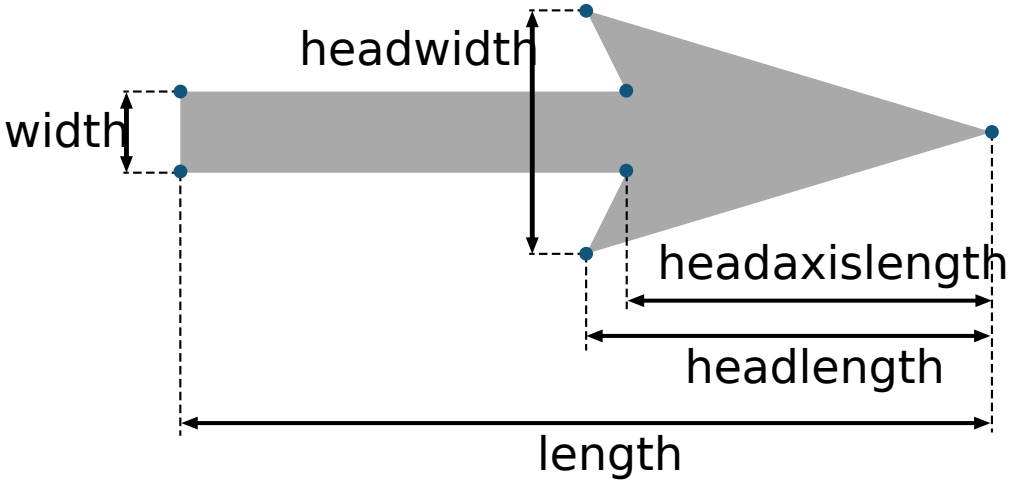
Axes.quiverkey

Add a key to a quiver plot.

Notes

Arrow shape

The arrow is drawn as a polygon using the nodes as shown below. The values *headwidth*, *headlength*, and *headaxislength* are in units of *width*.



The defaults give a slightly swept-back arrow. Here are some guidelines how to get other head shapes:

- To make the head a triangle, make *headaxislength* the same as *headlength*.
- To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*.

- To make the head smaller relative to the shaft, scale down all the head parameters proportionally.
- To remove the head completely, set all *head* parameters to 0.
- To get a diamond-shaped head, make *headaxislength* larger than *headlength*.
- Warning: For *headaxislength* < (*headlength* / *headwidth*), the "headaxis" nodes (i.e. the ones connecting the head with the shaft) will protrude out of the head in forward direction so that the arrow head looks broken.

Examples using `matplotlib.axes.Axes.quiver`

- *Advanced quiver and quiverkey functions*
- *Quiver Simple Demo*
- *Trigradient Demo*
- *3D quiver plot*
- *quiver(X, Y, U, V)*

matplotlib.axes.Axes.quiverkey

`Axes.`**`quiverkey`**(*Q*, *X*, *Y*, *U*, *label*, ***kwargs*)

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

Parameters

Q

[*Quiver*] A *Quiver* object as returned by a call to *quiver()*.

X, Y

[float] The location of the key.

U

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the horizontal axis.

coordinates

[{'axes', 'figure', 'data', 'inches'}, default: 'axes'] Coordinate system and units for *X*, *Y*: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

color

[color] Overrides face and edge colors from *Q*.

labelpos

[{'N', 'S', 'E', 'W'}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor

[color, default: *rcParams["text.color"]* (default: `'black'`)] Label color.

fontproperties

[dict, optional] A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family*, *style*, *variant*, *size*, *weight*.

****kwargs**

Any additional keyword arguments are used to override vector properties taken from *Q*.

Examples using `matplotlib.axes.Axes.quiverkey`

- *Advanced quiver and quiverkey functions*
- *Quiver Simple Demo*

matplotlib.axes.Axes.streamplot

`Axes.`**`streamplot`**(*x*, *y*, *u*, *v*, *density=1*, *linewidth=None*, *color=None*, *cmap=None*, *norm=None*, *arrowsize=1*, *arrowstyle='-|>'*, *minlength=0.1*, *transform=None*, *zorder=None*, *start_points=None*, *maxlength=4.0*, *integration_direction='both'*, *broken_streamlines=True*, ***, *data=None*)

Draw streamlines of a vector flow.

Parameters

x, y

[1D/2D arrays] Evenly spaced strictly increasing arrays to make a grid. If 2D, all rows of *x* must be equal and all columns of *y* must be equal; i.e., they must be as if generated by `np.meshgrid(x_1d, y_1d)`.

u, v

[2D arrays] *x* and *y*-velocities. The number of rows and columns must match the length of *y* and *x*, respectively.

density

[float or (float, float)] Controls the closeness of streamlines. When `density = 1`, the domain is divided into a 30x30 grid. *density* linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (density_x, density_y).

linewidth

[float or 2D array] The width of the streamlines. With a 2D array the line width can be varied across the grid. The array must have the same shape as *u* and *v*.

color

[color or 2D array] The streamline color. If given an array, its values are converted to colors using *cmap* and *norm*. The array must have the same shape as *u* and *v*.

cmap, norm

Data normalization and colormapping parameters for *color*; only used if *color* is an array of floats. See *imshow* for a detailed description.

arrowsize

[float] Scaling factor for the arrow size.

arrowstyle

[str] Arrow style specification. See *FancyArrowPatch*.

minlength

[float] Minimum length of streamline in axes coordinates.

start_points

[(N, 2) array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the *x* and *y* arrays).

zorder

[float] The zorder of the streamlines and arrows. Artists with lower zorder values are drawn first.

maxlength

[float] Maximum length of streamline in axes coordinates.

integration_direction

[{'forward', 'backward', 'both'}, default: 'both'] Integrate the streamline in forward, backward or both directions.

data

[indexable object, optional] If given, the following parameters also accept a string `s`, which is interpreted as `data[s]` (unless this raises an exception):

x, *y*, *u*, *v*, *start_points*

broken_streamlines

[boolean, default: True] If False, forces streamlines to continue until they leave the plot domain. If True, they may be terminated if they come too close to another streamline.

Returns

StreamplotSet

Container object with attributes

- `lines`: *`LineCollection`* of streamlines
- `arrows`: *`PatchCollection`* containing *`FancyArrowPatch`* objects representing the arrows half-way along streamlines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

Examples using `matplotlib.axes.Axes.streamplot`

- *Streamplot*
- *streamplot(X, Y, U, V)*

Clearing

`Axes.cla`	Clear the Axes.
`Axes.clear`	Clear the Axes.

matplotlib.axes.Axes.cla

Axes.**cla**()

Clear the Axes.

matplotlib.axes.Axes.clear

Axes.**clear**()

Clear the Axes.

Examples using `matplotlib.axes.Axes.clear`

- *pyplot animation*
- *Data browser*

Appearance

Axes.axis	Convenience method to get or set some axis properties.
Axes.set_axis_off	Hide all visual components of the x- and y-axis.
Axes.set_axis_on	Do not hide all visual components of the x- and y-axis.
Axes.set_frame_on	Set whether the Axes rectangle patch is drawn.
Axes.get_frame_on	Get whether the Axes rectangle patch is drawn.
Axes.set_axisbelow	Set whether axis ticks and gridlines are above or below most artists.
Axes.get_axisbelow	Get whether axis ticks and gridlines are above or below most artists.
Axes.grid	Configure the grid lines.
Axes.get_facecolor	Get the facecolor of the Axes.
Axes.set_facecolor	Set the facecolor of the Axes.

matplotlib.axes.Axes.axis

Axes.**axis**(*arg=None*, */*, ***, *emit=True*, ***kwargs*)

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

xmin, xmax, ymin, ymax

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

option

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'off' or Fals	Hide all axis decorations, i.e. axis labels, spines, tick marks, tick labels, and grid lines. This is the same as *set_axis_off()*.
'on' or True	Do not hide all axis decorations, i.e. axis labels, spines, tick marks, tick labels, and grid lines. This is the same as *set_axis_on()*.
'equal	Set equal scaling (i.e., make circles circular) by changing the axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scale	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'squar	Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

emit

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to *set_xlim* and *set_ylim*.

Returns

xmin, xmax, ymin, ymax

[float] The axis limits.

See also:

matplotlib.axes.Axes.set_xlim
matplotlib.axes.Axes.set_ylim

Notes

For 3D axes, this method additionally takes *zmin*, *zmax* as parameters and likewise returns them.

Examples using `matplotlib.axes.Axes.axis`

- *Filled polygon*
- *Clipping images with patches*
- *Bar of pie*
- *Hatch style reference*
- *PathPatch object*
- *ggplot style sheet*
- *Parasite Simple2*
- *Simple Axisline4*
- *Axis Direction*
- *axis_direction demo*
- *Axis line styles*
- *floating_axes features*
- *Parasite Axes demo*
- *Parasite axis demo*
- *Ticklabel alignment*
- *Ticklabel direction*
- *Simple axis direction*
- *Simple axis tick label and tick directions*
- *Simple Axis Pad*
- *Custom spines with axisartist*
- *Simple Axisline*

- *Simple Axisline3*
- *Packed-bubble chart*
- *TickedStroke patheffect*
- *Ishikawa Diagram*
- *Quick start guide*
- *Specifying colors*
- *Text in Matplotlib*

matplotlib.axes.Axes.set_axis_off

Axes.**set_axis_off**()

Hide all visual components of the x- and y-axis.

This sets a flag to suppress drawing of all axis decorations, i.e. axis labels, axis spines, and the axis tick component (tick markers, tick labels, and grid lines). Individual visibility settings of these components are ignored as long as *set_axis_off()* is in effect.

Examples using matplotlib.axes.Axes.set_axis_off

- *Marker reference*
- *Barcode*
- *Blend transparency with color in 2D images*
- *Nested pie charts*
- *Annotation arrow style reference*
- *Text alignment*
- *Colormap reference*
- *Reference for Matplotlib artists*
- *Drawing fancy boxes*
- *Choosing Colormaps in Matplotlib*
- *Text properties and layout*

matplotlib.axes.Axes.set_axis_on

Axes.**set_axis_on**()

Do not hide all visual components of the x- and y-axis.

This reverts the effect of a prior *set_axis_off()* call. Whether the individual axis decorations are drawn is controlled by their respective visibility settings.

This is on by default.

matplotlib.axes.Axes.set_frame_on

Axes.**set_frame_on**(*b*)

Set whether the Axes rectangle patch is drawn.

Parameters

b

[bool]

matplotlib.axes.Axes.get_frame_on

Axes.**get_frame_on**()

Get whether the Axes rectangle patch is drawn.

matplotlib.axes.Axes.set_axisbelow

Axes.**set_axisbelow**(*b*)

Set whether axis ticks and gridlines are above or below most artists.

This controls the zorder of the ticks and gridlines. For more information on the zorder see *Zorder Demo*.

Parameters

b

[bool or 'line'] Possible values:

- *True* (zorder = 0.5): Ticks and gridlines are below all Artists.
- 'line' (zorder = 1.5): Ticks and gridlines are above patches (e.g. rectangles, with default zorder = 1) but still below lines and markers (with their default zorder = 2).
- *False* (zorder = 2.5): Ticks and gridlines are above patches and lines / markers.

See also:

get_axisbelow

matplotlib.axes.Axes.get_axisbelow

Axes.**get_axisbelow**()

Get whether axis ticks and gridlines are above or below most artists.

Returns

bool or 'line'

See also:

set_axisbelow

matplotlib.axes.Axes.grid

Axes.**grid**(*visible=None*, *which='major'*, *axis='both'*, ***kwargs*)

Configure the grid lines.

Parameters

visible

[bool or None, optional] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *visible* will be set to True.

If *visible* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

which

[{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.

axis

[{'both', 'x', 'y'}, optional] The axis to apply the changes on.

****kwargs**

[*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi va
alpha	scalar or None
animated	bool

Table 31 – continued from

Property	Description
antialiased or aa	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default:
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, floa
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the `Line2D` objects comprising the grid. Therefore, to set grid zorder, use `set_axisbelow` or, for more control, call the `set_zorder` method of each axis.

matplotlib.axes.Axes.get_facecolor

`Axes.`**`get_facecolor`**`()`

Get the facecolor of the Axes.

matplotlib.axes.Axes.set_facecolor

`Axes.`**`set_facecolor`**`(`*color*`)`

Set the facecolor of the Axes.

Parameters

color

[color]

Examples using `matplotlib.axes.Axes.set_facecolor`

- *Color Demo*
- *Colors in the default property cycle*

Property cycle

Axes.set_prop_cycle	Set the property cycle of the Axes.

matplotlib.axes.Axes.set_prop_cycle

Axes.**set_prop_cycle**(**args*, ***kwargs*)

Set the property cycle of the Axes.

The property cycle controls the style properties such as color, marker and linestyle of future plot commands. The style properties of data already added to the Axes are not modified.

Call signatures:

```
set_prop_cycle(cycler)
set_prop_cycle(label=values[, label2=values2[, ...]])
set_prop_cycle(label, values)
```

Form 1 sets given `Cycler` object.

Form 2 creates a `Cycler` which cycles over one or more properties simultaneously and set it as the property cycle of the Axes. If multiple properties are given, their value lists must have the same length. This is just a shortcut for explicitly creating a cycler and passing it to the function, i.e. it's short for `set_prop_cycle(cycler(label=values label2=values2, ...))`.

Form 3 creates a `Cycler` for a single property and set it as the property cycle of the Axes. This form exists for compatibility with the original `cycler.cycler` interface. Its use is discouraged in favor of the kwarg form, i.e. `set_prop_cycle(label=values)`.

Parameters

cycler

[`Cycler`] Set the given Cycler. *None* resets to the cycle defined by the current style.

label

[str] The property key. Must be a valid *Artist* property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

values

[iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

See also:

matplotlib.rcsetup.cycler

Convenience function for creating validated cyclers for properties.

cycler.cycler

The original function for creating unvalidated cyclers.

Examples

Setting the property cycle for a single property:

```
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'])
```

Setting the property cycle for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'],
...                   marker=['o', '+', 'x'])
```

Examples using `matplotlib.axes.Axes.set_prop_cycle`

- *Stock prices over 32 years*
- *Styling with cycler*

Axis / limits

Axes.get_xaxis	[*Discouraged*] Return the XAxis instance.
Axes.get_yaxis	[*Discouraged*] Return the YAxis instance.

matplotlib.axes.Axes.get_xaxis

Axes.**get_xaxis**()

[*Discouraged*] Return the XAxis instance.

Discouraged

The use of this function is discouraged. You should instead directly access the attribute `ax.xaxis`.

matplotlib.axes.Axes.get_yaxis

Axes.**get_yaxis**()

[*Discouraged*] Return the YAxis instance.

Discouraged

The use of this function is discouraged. You should instead directly access the attribute `ax.yaxis`.

Axis limits and direction

Axes.invert_xaxis	Invert the x-axis.
Axes.xaxis_inverted	Return whether the xaxis is oriented in the "inverse" direction.
Axes.invert_yaxis	Invert the y-axis.
Axes.yaxis_inverted	Return whether the yaxis is oriented in the "inverse" direction.
Axes.set_xlim	Set the x-axis view limits.
Axes.get_xlim	Return the x-axis view limits.
Axes.set_ylim	Set the y-axis view limits.
Axes.get_ylim	Return the y-axis view limits.
Axes.update_datalim	Extend the `dataLim` Bbox to include the given points.
Axes.set_xbound	Set the lower and upper numerical bounds of the x-axis.
Axes.get_xbound	Return the lower and upper x-axis bounds, in increasing order.
Axes.set_ybound	Set the lower and upper numerical bounds of the y-axis.
Axes.get_ybound	Return the lower and upper y-axis bounds, in increasing order.

matplotlib.axes.Axes.invert_xaxis

Axes.**invert_xaxis**()

Invert the x-axis.

See also:

xaxis_inverted
get_xlim*, *set_xlim
get_xbound*, *set_xbound

matplotlib.axes.Axes.xaxis_inverted

Axes.**xaxis_inverted**()

Return whether the xaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

matplotlib.axes.Axes.invert_yaxis

Axes.**invert_yaxis**()

Invert the y-axis.

See also:

yaxis_inverted
get_ylim, ***set_ylim***
get_ybound, ***set_ybound***

Examples using `matplotlib.axes.Axes.invert_yaxis`

- *Bar Label Demo*
- *Horizontal bar chart*
- *Marker reference*

matplotlib.axes.Axes.yaxis_inverted

Axes.**yaxis_inverted**()

Return whether the yaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

matplotlib.axes.Axes.set_xlim

Axes.**set_xlim**(*left=None*, *right=None*, *, *emit=True*, *auto=False*, *xmin=None*, *xmax=None*)

Set the x-axis view limits.

Parameters

left

[float, optional] The left xlim in data coordinates. Passing *None* leaves the limit unchanged.

The left and right xlims may also be passed as the tuple (*left*, *right*) as the first positional argument (or as the *left* keyword argument).

right

[float, optional] The right xlim in data coordinates. Passing *None* leaves the limit unchanged.

emit

[bool, default: True] Whether to notify observers of limit change.

auto

[bool or None, default: False] Whether to turn on autoscaling of the x-axis. True turns on, False turns off, None leaves unchanged.

xmin, xmax

[float, optional] They are equivalent to left and right respectively, and it is an error to pass both *xmin* and *left* or *xmax* and *right*.

Returns

left, right

[(float, float)] The new x-axis limits in data coordinates.

See also:

get_xlim
set_xbound, ***get_xbound***
invert_xaxis, ***xaxis_inverted***

Notes

The *left* value may be greater than the *right* value, in which case the x-axis values will decrease from left to right.

Examples

```
>>> set_xlim(left, right)
>>> set_xlim((left, right))
>>> left, right = set_xlim(left, right)
```

One limit may be left unchanged.

```
>>> set_xlim(right=right_lim)
```

Limits may be passed in reverse order to flip the direction of the x-axis. For example, suppose x represents the number of years before present. The x-axis limits might be set like the following so 5000 years ago is on the left of the plot and the present is on the right.

```
>>> set_xlim(5000, 0)
```

matplotlib.axes.Axes.get_xlim

Axes.**get_xlim**()

Return the x-axis view limits.

Returns

left, right

[(float, float)] The current x-axis limits in data coordinates.

See also:

Axes.set_xlim
Axes.set_xbound, ***Axes.get_xbound***
Axes.invert_xaxis, ***Axes.xaxis_inverted***

Notes

The x-axis may be inverted, in which case the *left* value will be greater than the *right* value.

Examples using `matplotlib.axes.Axes.get_xlim`

- *Decay*

matplotlib.axes.Axes.set_ylim

Axes.**set_ylim**(*bottom=None*, *top=None*, *, *emit=True*, *auto=False*, *ymin=None*, *ymax=None*)

Set the y-axis view limits.

Parameters

bottom

[float, optional] The bottom ylim in data coordinates. Passing *None* leaves the limit unchanged.

The bottom and top ylims may also be passed as the tuple (*bottom*, *top*) as the first positional argument (or as the *bottom* keyword argument).

top

[float, optional] The top ylim in data coordinates. Passing *None* leaves the limit unchanged.

emit

[bool, default: True] Whether to notify observers of limit change.

auto

[bool or None, default: False] Whether to turn on autoscaling of the y-axis. *True* turns on, *False* turns off, *None* leaves unchanged.

ymin, ymax

[float, optional] They are equivalent to bottom and top respectively, and it is an error to pass both *ymin* and *bottom* or *ymax* and *top*.

Returns

bottom, top

[(float, float)] The new y-axis limits in data coordinates.

See also:

get_ylim
set_ybound*, *get_ybound
invert_yaxis*, *yaxis_inverted

Notes

The *bottom* value may be greater than the *top* value, in which case the y-axis values will decrease from *bottom* to *top*.

Examples

```
>>> set_ylim(bottom, top)
>>> set_ylim((bottom, top))
>>> bottom, top = set_ylim(bottom, top)
```

One limit may be left unchanged.

```
>>> set_ylim(top=top_lim)
```

Limits may be passed in reverse order to flip the direction of the y-axis. For example, suppose `y` represents depth of the ocean in m. The y-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

```
>>> set_ylim(5000, 0)
```

matplotlib.axes.Axes.get_ylim

Axes.**get_ylim**()

Return the y-axis view limits.

Returns

bottom, top

[(float, float)] The current y-axis limits in data coordinates.

See also:

Axes.set_ylim
Axes.set_ybound, ***Axes.get_ybound***
Axes.invert_yaxis, ***Axes.yaxis_inverted***

Notes

The y-axis may be inverted, in which case the *bottom* value will be greater than the *top* value.

Examples using `matplotlib.axes.Axes.get_ylim`

- *Line, Poly and RegularPoly Collection with autoscaling*

matplotlib.axes.Axes.update_datalim

Axes.**update_datalim**(*xys*, *updatex=True*, *updatey=True*)

Extend the `dataLim` Bbox to include the given points.

If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of the xydata (*xys*). Otherwise, it will compute the bounds of the union of its current data and the data in *xys*.

Parameters

xys

[2D array-like] The points to include in the data limits Bbox. This can be either a list of (x, y) tuples or a (N, 2) array.

updatex, updatey

[bool, default: True] Whether to update the x/y limits.

matplotlib.axes.Axes.set_xbound

Axes.**set_xbound**(*lower=None*, *upper=None*)

Set the lower and upper numerical bounds of the x-axis.

This method will honor axis inversion regardless of parameter order. It will not change the autoscaling setting (*get_autoscalex_on()*).

Parameters

lower, upper

[float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

See also:

get_xbound
get_xlim, ***set_xlim***
invert_xaxis, ***xaxis_inverted***

matplotlib.axes.Axes.get_xbound

Axes.**get_xbound**()

Return the lower and upper x-axis bounds, in increasing order.

See also:

set_xbound
get_xlim, ***set_xlim***
invert_xaxis, ***xaxis_inverted***

matplotlib.axes.Axes.set_ybound

Axes.**set_ybound**(*lower=None*, *upper=None*)

Set the lower and upper numerical bounds of the y-axis.

This method will honor axis inversion regardless of parameter order. It will not change the autoscaling setting (*get_autoscaley_on()*).

Parameters

lower, upper

[float or None]

The lower and upper bounds. If *None*, the respective axis bound is not modified.

See also:

get_ybound
get_ylim, *set_ylim*
invert_yaxis, *yaxis_inverted*

matplotlib.axes.Axes.get_ybound

Axes.**get_ybound**()

Return the lower and upper y-axis bounds, in increasing order.

See also:

set_ybound
get_ylim, *set_ylim*
invert_yaxis, *yaxis_inverted*

Axis labels, title, and legend

Axes.set_xlabel	Set the label for the x-axis.
Axes.get_xlabel	Get the xlabel text string.
Axes.set_ylabel	Set the label for the y-axis.
Axes.get_ylabel	Get the ylabel text string.
Axes.label_outer	Only show "outer" labels and tick labels.
Axes.set_title	Set a title for the Axes.
Axes.get_title	Get an Axes title.
Axes.legend	Place a legend on the Axes.
Axes.get_legend	Return the *Legend* instance, or None if no legend is defined.
Axes.get_legend_handles_labels	Return handles and labels for legend

matplotlib.axes.Axes.set_xlabel

Axes.**set_xlabel**(*xlabel*, *fontdict=None*, *labelpad=None*, *, *loc=None*, ***kwargs*)

Set the label for the x-axis.

Parameters

xlabel

[str] The label text.

labelpad

[float, default: *rcParams["axes.labelpad"]* (default: 4.0)] Spacing in points from the Axes bounding box including ticks and tick labels. If None, the previous value is left as is.

loc

[{'left', 'center', 'right'}, default: *rcParams["xaxis.labellocation"]* (default: 'center')] The label position. This is a high-level alternative for passing parameters *x* and *horizontalalignment*.

Other Parameters

****kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

See also:

text

Documents the properties supported by *Text*.

matplotlib.axes.Axes.get_xlabel

Axes.**get_xlabel**()

Get the xlabel text string.

matplotlib.axes.Axes.set_ylabel

Axes.**set_ylabel**(*ylabel*, *fontdict=None*, *labelpad=None*, *, *loc=None*, ***kwargs*)

Set the label for the y-axis.

Parameters

ylabel

[str] The label text.

labelpad

[float, default: *rcParams["axes.labelpad"]* (default: 4.0)] Spacing in points from the Axes bounding box including ticks and tick labels. If None, the previous value is left as is.

loc

[{'bottom', 'center', 'top'}, default: *rcParams["yaxis.labellocation"]* (default: 'center')] The label position. This is a high-level alternative for passing parameters *y* and *horizontalalignment*.

Other Parameters

****kwargs**

[*Text* properties] *Text* properties control the appearance of the label.

See also:

matplotlib.axes.Axes.get_ylabel

Axes.**get_ylabel**()

Get the ylabel text string.

matplotlib.axes.Axes.label_outer

Axes.**label_outer**(*remove_inner_ticks=False*)

Only show "outer" labels and tick labels.

x-labels are only kept for subplots on the last row (or first row, if labels are on the top side); y-labels only for subplots on the first column (or last column, if labels are on the right side).

Parameters

remove_inner_ticks

[bool, default: False] If True, remove the inner ticks as well (not only tick labels).

New in version 3.8.

Examples using `matplotlib.axes.Axes.label_outer`

- *Fill Between and Alpha*
- *Creating multiple subplots using plt.subplots*
- *Plotting cumulative distributions*

matplotlib.axes.Axes.set_title

Axes.**set_title**(*label*, *fontdict=None*, *loc=None*, *pad=None*, *, *y=None*, ***kwargs*)

Set a title for the Axes.

Set one of the three available Axes titles. The available titles are positioned above the Axes in the center, flush with the left edge, and flush with the right edge.

Parameters

label

[str] Text to use for the title

fontdict

[dict]

Discouraged

The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `set_title(..., **fontdict)`.

A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

loc

[{'center', 'left', 'right'}, default: *rcParams["axes.titlelocation"]* (default: `'center'`)] Which title to set.

y

[float, default: *rcParams["axes.titley"]* (default: `None`)] Vertical Axes location for the title (1.0 is the top). If None (the default) and *rcParams["axes.titley"]* (default: `None`) is also None, y is determined automatically to avoid decorators on the Axes.

pad

[float, default: *rcParams["axes.titlepad"]* (default: `6.0`)] The offset of the title from the top of the Axes, in points.

Returns

Text

The matplotlib text instance representing the title

Other Parameters

****kwargs**

[*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

Examples using `matplotlib.axes.Axes.set_title`

- *Bar color demo*
- *Bar Label Demo*
- *Stacked bar chart*
- *Grouped bar chart with labels*
- *Horizontal bar chart*

- *Axis ticks*
- *Specifying colors*
- *Colormap normalization*
- *Text in Matplotlib*

matplotlib.axes.Axes.get_title

`Axes.`**`get_title`**(*loc='center'*)

Get an Axes title.

Get one of the three available Axes titles. The available titles are positioned above the Axes in the center, flush with the left edge, and flush with the right edge.

Parameters

loc

[{'center', 'left', 'right'}, str, default: 'center'] Which title to return.

Returns

str

The title text string.

matplotlib.axes.Axes.legend

Axes.**legend**(**args*, ***kwargs*)

Place a legend on the Axes.

Call signatures:

```
legend()
legend(handles, labels)
legend(handles=handles)
legend(labels)
```

The call signatures correspond to the following different ways to use this method:

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the *set_label()* method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Note: Specific artists can be excluded from the automatic legend element selection by using a label starting with an underscore, "_". A string starting with an underscore is the default label for all artists, so calling *Axes.legend* without any arguments and without setting the labels manually will result in no legend being drawn.

---

2. Explicitly listing the artists and labels in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
ax.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

3. Explicitly listing the artists in the legend

This is similar to 2, but the labels are taken from the artists' label properties. Example:

```
line1, = ax.plot([1, 2, 3], label='label1')
line2, = ax.plot([1, 2, 3], label='label2')
ax.legend(handles=[line1, line2])
```

4. Labeling existing plot elements

Discouraged

This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

To make a legend for all artists on an Axes, call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.plot([5, 6, 7])
ax.legend(['First line', 'Second line'])
```

Parameters

handles

[list of (*Artist* or tuple of *Artist*), optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

If an entry contains a tuple, then the legend handler for all Artists in the tuple will be placed alongside a single label.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: *rcParams["legend.loc"]* (default: `'best'`)] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the axes.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the axes.

The string `'center'` places the legend at the center of the axes.

The string `'best'` places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" location can also be given as a numeric value:

Location String	Location Code
'best' (Axes only)	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncols

[int, default: 1] The number of columns that the legend has.

For backward compatibility, the spelling *ncol* is also supported but it is discouraged. If both are given, *ncols* takes precedence.

prop

[None or *FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list, default: *rcParams["legend.labelcolor"]* (default: `'None'`)] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

Labelcolor can be set globally using *rcParams["legend.labelcolor"]* (default: `'None'`). If None, use *rcParams["text.color"]* (default: `'black'`).

numpoints

[int, default: *rcParams["legend.numpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: *rcParams["legend.scatterpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: *rcParams["legend.markerscale"]* (default: `1.0`)] The relative size of legend markers compared to the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

reverse

[bool, default: False] If *True*, the legend labels are displayed in reverse order from the input. If *False*, the legend labels are displayed in the same order as the input.

New in version 3.7.

frameon

[bool, default: *rcParams["legend.frameon"]* (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: *rcParams["legend.fancybox"]* (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[None, bool or dict, default: *rcParams["legend.shadow"]* (default: `False`)] Whether to draw a shadow behind the legend. The shadow can be configured using *Patch* keywords. Customization via *rcParams["legend.shadow"]* (default: `False`) is currently not supported.

framealpha

[float, default: *rcParams["legend.framealpha"]* (default: `0.8`)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

facecolor

["inherit" or color, default: *rcParams["legend.facecolor"]* (default: `'inherit'`)] The legend's background color. If `"inherit"`, use *rcParams["axes.facecolor"]* (default: `'white'`).

edgecolor

["inherit" or color, default: *rcParams["legend.edgecolor"]* (default: `'0.8'`)] The legend's background patch edge color. If `"inherit"`, use take *rcParams["axes.edgecolor"]* (default: `'black'`).

mode

[{"expand", None}] If *mode* is set to `"expand"` the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of `None` (default) the Axes' `transAxes` transform will be used.

title

[str or None] The legend's title. Default is no title (`None`).

title_fontproperties

[None or *FontProperties* or dict] The font properties of the legend's title. If None (default), the *title_fontsize* argument will be used if present; if *title_fontsize* is also None, the current *rcParams["legend.title_fontsize"]* (default: `None`) will be used.

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: *rcParams["legend.title_fontsize"]* (default: `None`)] The font size of the legend's title. Note: This cannot be combined with *title_fontproperties*. If you want to set the fontsize alongside other font properties, use the *size* parameter in *title_fontproperties*.

alignment

[{'center', 'left', 'right'}, default: 'center'] The alignment of the legend title and the box of entries. The entries are aligned as a single block, so that markers always lined up.

borderpad

[float, default: *rcParams["legend.borderpad"]* (default: `0.4`)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: *rcParams["legend.labelspacing"]* (default: `0.5`)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: *rcParams["legend.handlelength"]* (default: `2.0`)] The length of the legend handles, in font-size units.

handleheight

[float, default: *rcParams["legend.handleheight"]* (default: `0.7`)] The height of the legend handles, in font-size units.

handletextpad

[float, default: *rcParams["legend.handletextpad"]* (default: `0.8`)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: *rcParams["legend.borderaxespad"]* (default: `0.5`)] The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: `rcParams["legend.columnspacing"]` (default: `2.0`)]
The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

draggable

[bool, default: False] Whether the legend can be dragged with the mouse.

See also:

Figure.legend

Notes

Some artists are not supported by this function. See *Legend guide* for details.

Examples

Examples using `matplotlib.axes.Axes.legend`

- *Bar color demo*

matplotlib.axes.Axes.get_legend

Axes.**get_legend**()

Return the *Legend* instance, or None if no legend is defined.

matplotlib.axes.Axes.get_legend_handles_labels

Axes.**get_legend_handles_labels**(*legend_handler_map=None*)

Return handles and labels for legend

`ax.legend()` is equivalent to

```
h, l = ax.get_legend_handles_labels()
ax.legend(h, l)
```

Examples using `matplotlib.axes.Axes.get_legend_handles_labels`

- *Legend guide*

Axis scales

Axes.set_xscale	Set the xaxis' scale.
Axes.get_xscale	Return the xaxis' scale (as a str).
Axes.set_yscale	Set the yaxis' scale.
Axes.get_yscale	Return the yaxis' scale (as a str).

matplotlib.axes.Axes.set_xscale

Axes.**set_xscale**(*value*, ***kwargs*)

Set the xaxis' scale.

Parameters

value

[{"linear", "log", "symlog", "logit", ...} or *ScaleBase*] The axis scale type to apply.

****kwargs**

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- *matplotlib.scale.LinearScale*
- *matplotlib.scale.LogScale*
- *matplotlib.scale.SymmetricalLogScale*
- *matplotlib.scale.LogitScale*
- *matplotlib.scale.FuncScale*

Notes

By default, Matplotlib supports the above-mentioned scales. Additionally, custom scales may be registered using *matplotlib.scale.register_scale*. These scales can then also be used here.

Examples using `matplotlib.axes.Axes.set_xscale`

- *Markevery Demo*
- *Labeling ticks using engineering notation*
- *Inset locator demo*
- *Asinh Demo*
- *Loglog Aspect*
- *Log Demo*
- *Scales*
- *Symlog Demo*
- *Axis scales*

matplotlib.axes.Axes.get_xscale

Axes.**get_xscale**()

Return the xaxis' scale (as a str).

matplotlib.axes.Axes.set_yscale

Axes.**set_yscale**(*value*, ***kwargs*)

Set the yaxis' scale.

Parameters

value

[{"linear", "log", "symlog", "logit", ...} or *ScaleBase*] The axis scale type to apply.

****kwargs**

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- *matplotlib.scale.LinearScale*
- *matplotlib.scale.LogScale*
- *matplotlib.scale.SymmetricalLogScale*
- *matplotlib.scale.LogitScale*
- *matplotlib.scale.FuncScale*

Notes

By default, Matplotlib supports the above-mentioned scales. Additionally, custom scales may be registered using *matplotlib.scale.register_scale*. These scales can then also be used here.

Examples using `matplotlib.axes.Axes.set_yscale`

- *Markevery Demo*
- *Artist customization in box plots*
- *Boxplot drawer function*
- *Different ways of specifying error bars*
- *Stock prices over 32 years*
- *Asinh Demo*
- *Loglog Aspect*

- *Log Bar*
- *Log Demo*
- *Scales*
- *Symlog Demo*
- *Axis scales*

matplotlib.axes.Axes.get_yscale

Axes.**get_yscale**()

Return the yaxis' scale (as a str).

Autoscaling and margins

Axes.use_sticky_edges	When autoscaling, whether to obey all `Artist.sticky_edges`.
Axes.margins	Set or retrieve autoscaling margins.
Axes.set_xmargin	Set padding of X data limits prior to autoscaling.
Axes.set_ymargin	Set padding of Y data limits prior to autoscaling.
Axes.relim	Recompute the data limits based on current artists.
Axes.autoscale	Autoscale the axis view to the data (toggle).
Axes.autoscale_view	Autoscale the view limits using the data limits.
Axes.set_autoscale_on	Set whether autoscaling is applied to each axis on the next draw or call to *Axes.autoscale_view*.
Axes.get_autoscale_on	Return True if each axis is autoscaled, False otherwise.
Axes.set_autoscalex_on	Set whether the xaxis is autoscaled when drawing or by *Axes.autoscale_view*.
Axes.get_autoscalex_on	Return whether the xaxis is autoscaled.
Axes.set_autoscaley_on	Set whether the yaxis is autoscaled when drawing or by *Axes.autoscale_view*.
Axes.get_autoscaley_on	Return whether the yaxis is autoscaled.

matplotlib.axes.Axes.use_sticky_edges

property Axes.**use_sticky_edges**

When autoscaling, whether to obey all `Artist.sticky_edges`.

Default is `True`.

Setting this to `False` ensures that the specified margins will be applied, even if the plot includes an image, for example, which would otherwise force a view limit to coincide with its data limit.

The changing this property does not change the plot until *autoscale* or *autoscale_view* is called.

matplotlib.axes.Axes.margins

Axes.**margins**(**margins*, *x=None*, *y=None*, *tight=True*)

Set or retrieve autoscaling margins.

The padding added to each limit of the Axes is the *margin* times the data interval. All input parameters must be floats greater than -0.5. Passing both positional and keyword arguments is invalid and will raise a TypeError. If no arguments (positional or otherwise) are provided, the current margins will remain unchanged and simply be returned.

Specifying any margin changes only the autoscaling; for example, if *xmargin* is not None, then *xmargin* times the X data interval will be added to each end of that interval before it is used in autoscaling.

Parameters

***margins**

[float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as *xmargin*, *ymargin*. If setting the margin on a single axis is desired, use the keyword arguments described below.

x, y

[float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

tight

[bool or None, default: True] The *tight* parameter is passed to *autoscale_view*, which is executed after a margin is changed; the default here is *True*, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting *tight* to *None* preserves the previous setting.

Returns

xmargin, ymargin

[float]

Notes

If a previously used Axes method such as *pcolor()* has set *use_sticky_edges* to True, only the limits not set by the "sticky artists" will be modified. To force all of the margins to be set, set *use_sticky_edges* to False before calling *margins()*.

Examples using `matplotlib.axes.Axes.margins`

- *Marker reference*
- *Creating a timeline with lines, dates, and text*
- *Trigradient Demo*
- *Controlling view limits using margins and sticky_edges*
- *Scale invariant angle label*
- *ggplot style sheet*
- *Autoscaling Axis*

matplotlib.axes.Axes.set_xmargin

Axes.**set_xmargin**(*m*)

Set padding of X data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling. If *m* is negative, this will clip the data range instead of expanding it.

For example, if your data is in the range [0, 2], a margin of 0.1 will result in a range [-0.2, 2.2]; a margin of -0.1 will result in a range of [0.2, 1.8].

Parameters

m

[float greater than -0.5]

Examples using `matplotlib.axes.Axes.set_xmargin`

- *Automatically setting tick positions*

matplotlib.axes.Axes.set_ymargin

`Axes.`**`set_ymargin`**`(`*m*`)`

Set padding of Y data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling. If *m* is negative, this will clip the data range instead of expanding it.

For example, if your data is in the range [0, 2], a margin of 0.1 will result in a range [-0.2, 2.2]; a margin of -0.1 will result in a range of [0.2, 1.8].

Parameters

m

[float greater than -0.5]

matplotlib.axes.Axes.relim

`Axes.`**`relim`**`(`*visible_only=False*`)`

Recompute the data limits based on current artists.

At present, `Collection` instances are not supported.

Parameters

visible_only

[bool, default: False] Whether to exclude invisible artists.

Examples using `matplotlib.axes.Axes.relim`

- *Packed-bubble chart*
- *Textbox*

matplotlib.axes.Axes.autoscale

Axes.**autoscale**(*enable=True*, *axis='both'*, *tight=None*)

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or Axes.

Parameters

enable

[bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

axis

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate. (For 3D Axes, *axis* can also be set to 'z', and 'both' refers to all three axes.)

tight

[bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to *autoscale_view* (regardless of its value); see the description of its behavior there.

Examples using matplotlib.axes.Axes.autoscale

- *Axes box aspect*
- *Autoscaling Axis*

matplotlib.axes.Axes.autoscale_view

Axes.**autoscale_view**(*tight=None*, *scalex=True*, *scaley=True*)

Autoscale the view limits using the data limits.

Parameters

tight

[bool or None] If *True*, only expand the axis limits using the margins. Note that unlike for *autoscale*, `tight=True` does *not* set the margins to zero.

If *False* and *rcParams["axes.autolimit_mode"]* (default: `'data'`) is 'round_numbers', then after expansion by the margins, further expand the axis limits using the axis major locator.

If None (the default), reuse the value set in the previous call to *autoscale_view* (the initial value is False, but the default style sets

rcParams["axes.autolimit_mode"] (default: `'data'`) to 'data', in which case this behaves like True).

scalex

[bool, default: True] Whether to autoscale the x-axis.

scaley

[bool, default: True] Whether to autoscale the y-axis.

Notes

The autoscaling preserves any preexisting axis direction reversal.

The data limits are not updated automatically when artist data are changed after the artist has been added to an Axes instance. In that case, use *matplotlib.axes.Axes.relim()* prior to calling autoscale_view.

If the views of the Axes are fixed, e.g. via *set_xlim*, they will not be changed by autoscale_view(). See *matplotlib.axes.Axes.autoscale()* for an alternative.

Examples using `matplotlib.axes.Axes.autoscale_view`

- *Line, Poly and RegularPoly Collection with autoscaling*
- *Compound path*
- *Ellipse Collection*
- *Packed-bubble chart*
- *Group barchart with units*
- *Textbox*
- *Autoscaling Axis*

matplotlib.axes.Axes.set_autoscale_on

`Axes.`**`set_autoscale_on`**`(`*b*`)`

Set whether autoscaling is applied to each axis on the next draw or call to *Axes.autoscale_view*.

Parameters

b

[bool]

Examples using `matplotlib.axes.Axes.set_autoscale_on`

- *Resampling Data*

matplotlib.axes.Axes.get_autoscale_on

Axes.**get_autoscale_on**()

Return True if each axis is autoscaled, False otherwise.

matplotlib.axes.Axes.set_autoscalex_on

Axes.**set_autoscalex_on**(*b*)

Set whether the xaxis is autoscaled when drawing or by *Axes.autoscale_view*.

Parameters

b

[bool]

matplotlib.axes.Axes.get_autoscalex_on

Axes.**get_autoscalex_on**()

Return whether the xaxis is autoscaled.

matplotlib.axes.Axes.set_autoscaley_on

Axes.**set_autoscaley_on**(*b*)

Set whether the yaxis is autoscaled when drawing or by *Axes.autoscale_view*.

Parameters

b

[bool]

matplotlib.axes.Axes.get_autoscaley_on

Axes.**get_autoscaley_on**()

Return whether the yaxis is autoscaled.

Aspect ratio

Axes.apply_aspect	Adjust the Axes for a specified data aspect ratio.
Axes.set_aspect	Set the aspect ratio of the axes scaling, i.e. y/x-scale.
Axes.get_aspect	Return the aspect ratio of the axes scaling.
Axes.set_box_aspect	Set the Axes box aspect, i.e. the ratio of height to width.
Axes.get_box_aspect	Return the Axes box aspect, i.e. the ratio of height to width.
Axes.set_adjustable	Set how the Axes adjusts to achieve the required aspect ratio.
Axes.get_adjustable	Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

matplotlib.axes.Axes.apply_aspect

Axes.**apply_aspect**(*position=None*)

Adjust the Axes for a specified data aspect ratio.

Depending on *get_adjustable* this will modify either the Axes box (position) or the view limits. In the former case, *get_anchor* will affect the position.

Parameters

position

[None or .Bbox] If not None, this defines the position of the Axes within the figure as a Bbox. See *get_position* for further details.

See also:

matplotlib.axes.Axes.set_aspect

For a description of aspect ratio handling.

matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_anchor

Set the position in case of extra space.

Notes

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

matplotlib.axes.Axes.set_aspect

`Axes.`**`set_aspect`**(*aspect*, *adjustable=None*, *anchor=None*, *share=False*)

Set the aspect ratio of the axes scaling, i.e. y/x-scale.

Parameters

aspect

[{'auto', 'equal'} or float] Possible values:

- 'auto': fill the position rectangle with data.
- 'equal': same as `aspect=1`, i.e. same scaling for x and y.
- *float*: The displayed size of 1 unit in y-data coordinates will be *aspect* times the displayed size of 1 unit in x-data coordinates; e.g. for `aspect=2` a square in data coordinates will be rendered with a height of twice its width.

adjustable

[None or {'box', 'datalim'}, optional] If not `None`, this defines which parameter will be adjusted to meet the required aspect. See *set_adjustable* for further details.

anchor

[None or str or (float, float), optional] If not `None`, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to specify the anchor are abbreviations of cardinal directions:

value	description
'C'	centered
'SW'	lower left corner
'S'	middle of bottom edge
'SE'	lower right corner
etc.	

See *set_anchor* for further details.

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also:

matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_anchor

Set the position in case of extra space.

Examples using `matplotlib.axes.Axes.set_aspect`

- *Tricontour Demo*
- *Tricontour Smooth Delaunay*
- *Tricontour Smooth User*
- *Trigradient Demo*
- *Tripcolor Demo*
- *Triplot Demo*
- *Axes box aspect*
- *Controlling view limits using margins and sticky_edges*
- *Multiline*
- *Mmh Donuts!!!*
- *Inset locator demo 2*
- *Scatter Histogram (Locatable Axes)*
- *Simple Anchored Artists*
- *Simple Axis Pad*
- *The double pendulum problem*
- *Multiple axes animation*
- *Anchored Artists*
- *Rasterization for vector graphics*
- *3D surface (solid color)*
- *3D voxel plot of the NumPy logo*
- *3D voxel / volumetric plot with RGB colors*
- *Loglog Aspect*

- *Annotate Text Arrow*
- *Arranging multiple Axes in a Figure*
- *Placing colorbars*
- *Colormap normalization*

matplotlib.axes.Axes.get_aspect

Axes.**get_aspect**()

Return the aspect ratio of the axes scaling.

This is either "auto" or a float giving the ratio of y/x-scale.

matplotlib.axes.Axes.set_box_aspect

Axes.**set_box_aspect**(*aspect=None*)

Set the Axes box aspect, i.e. the ratio of height to width.

This defines the aspect of the Axes in figure space and is not to be confused with the data aspect (see *set_aspect*).

Parameters

aspect

[float or None] Changes the physical dimensions of the Axes, such that the ratio of the Axes height to the Axes width in physical units is equal to *aspect*. Defining a box aspect will change the *adjustable* property to 'datalim' (see *set_adjustable*).

None will disable a fixed box aspect so that height and width of the Axes are chosen independently.

See also:

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

Examples using `matplotlib.axes.Axes.set_box_aspect`

- *Axes box aspect*
- *Multiple axes animation*
- *3D box surface plot*

matplotlib.axes.Axes.get_box_aspect

`Axes.`**`get_box_aspect`**`()`

Return the Axes box aspect, i.e. the ratio of height to width.

The box aspect is `None` (i.e. chosen depending on the available figure space) unless explicitly specified.

See also:

matplotlib.axes.Axes.set_box_aspect

for a description of box aspect.

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

matplotlib.axes.Axes.set_adjustable

`Axes.`**`set_adjustable`**`(`*adjustable*, *share=False*`)`

Set how the Axes adjusts to achieve the required aspect ratio.

Parameters

adjustable

[{'box', 'datalim'}] If 'box', change the physical dimensions of the Axes. If 'datalim', change the `x` or `y` data limits.

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also:

matplotlib.axes.Axes.set_aspect

For a description of aspect handling.

Notes

Shared Axes (of which twinned Axes are a special case) impose restrictions on how aspect ratios can be imposed. For twinned Axes, use 'datalim'. For Axes that share both x and y, use 'box'. Otherwise, either 'datalim' or 'box' may be used. These limitations are partly a requirement to avoid over-specification, and partly a result of the particular implementation we are currently using, in which the adjustments for aspect ratios are done sequentially and independently on each Axes as it is drawn.

Examples using `matplotlib.axes.Axes.set_adjustable`

- *Loglog Aspect*

matplotlib.axes.Axes.get_adjustable

Axes.**get_adjustable**()

Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

See also:

matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_aspect

For a description of aspect handling.

Ticks and tick labels

Axes.set_xticks	Set the xaxis' tick locations and optionally tick labels.
Axes.get_xticks	Return the xaxis' tick locations in data coordinates.
Axes.set_xticklabels	[*Discouraged*] Set the xaxis' tick labels with list of string labels.
Axes.get_xticklabels	Get the xaxis' tick labels.
Axes.get_xmajorticklabels	Return the xaxis' major tick labels, as a list of *Text*.
Axes.get_xminorticklabels	Return the xaxis' minor tick labels, as a list of *Text*.
Axes.get_xgridlines	Return the xaxis' grid lines as a list of *Line2D*s.
Axes.get_xticklines	Return the xaxis' tick lines as a list of *Line2D*s.
Axes.xaxis_date	Set up axis ticks and labels to treat data along the xaxis as dates.
Axes.set_yticks	Set the yaxis' tick locations and optionally tick labels.
Axes.get_yticks	Return the yaxis' tick locations in data coordinates.
Axes.set_yticklabels	[*Discouraged*] Set the yaxis' tick labels with list of string labels.
Axes.get_yticklabels	Get the yaxis' tick labels.
Axes.get_ymajorticklabels	Return the yaxis' major tick labels, as a list of *Text*.
Axes.get_yminorticklabels	Return the yaxis' minor tick labels, as a list of *Text*.
Axes.get_ygridlines	Return the yaxis' grid lines as a list of *Line2D*s.
Axes.get_yticklines	Return the yaxis' tick lines as a list of *Line2D*s.
Axes.yaxis_date	Set up axis ticks and labels to treat data along the yaxis as dates.
Axes.minorticks_off	Remove minor ticks from the Axes.
Axes.minorticks_on	Display minor ticks on the Axes.
Axes.ticklabel_format	Configure the *ScalarFormatter* used by default for linear Axes.
Axes.tick_params	Change the appearance of ticks, tick labels, and gridlines.
Axes.locator_params	Control behavior of major tick locators.

matplotlib.axes.Axes.set_xticks

Axes.**set_xticks**(*ticks*, *labels=None*, *, *minor=False*, ***kwargs*)

Set the xaxis' tick locations and optionally tick labels.

If necessary, the view limits of the Axis are expanded so that all given ticks are visible.

Parameters

ticks

[1D array-like] Array of tick locations. The axis *Locator* is replaced by a *FixedLocator*.

The values may be either floats or in axis units.

Pass an empty list to remove all ticks:

```
set_xticks([])
```

Some tick formatters will not label arbitrary tick positions; e.g. log formatters only label decade ticks by default. In such a case you can set a formatter explicitly on the axis using *Axis.set_major_formatter* or provide formatted *labels* yourself.

labels

[list of str, optional] Tick labels for each location in *ticks*. *labels* must be of the same length as *ticks*. If not set, the labels are generate using the axis tick *Formatter*.

minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

****kwargs**

Text properties for the labels. Using these is only allowed if you pass *labels*. In other cases, please use *tick_params*.

Notes

The mandatory expansion of the view limits is an intentional design choice to prevent the surprise of a non-visible tick. If you need other limits, you should set the limits explicitly after setting the ticks.

Examples using `matplotlib.axes.Axes.set_xticks`

- *Grouped bar chart with labels*
- *Hat graph*
- *Power spectral density (PSD)*
- *Creating annotated heatmaps*
- *Box plot vs. violin plot comparison*
- *Violin plot customization*
- *Producing multiple histograms side by side*
- *Multiline*
- *Rendering math equations using TeX*
- *ggplot style sheet*

- *Scatter Histogram (Locatable Axes)*
- *Simple Axisline4*
- *Ticklabel alignment*
- *Ticklabel direction*
- *Integral as the area under a curve*
- *Shaded & power normalized rendering*
- *XKCD*
- *Rain simulation*
- *MATPLOTLIB UNCHAINED*
- *Log Bar*
- *Group barchart with units*
- *The Lifecycle of a Plot*
- *Axis ticks*

matplotlib.axes.Axes.get_xticks

Axes.**get_xticks**(*, *minor=False*)

Return the xaxis' tick locations in data coordinates.

The locations are not clipped to the current axis limits and hence may contain locations that are not visible in the output.

Parameters

minor

[bool, default: False] True to return the minor tick directions, False to return the major tick directions.

Returns

array of tick locations

matplotlib.axes.Axes.set_xticklabels

Axes.**set_xticklabels**(*labels*, *, *minor=False*, *fontdict=None*, ***kwargs*)

[*Discouraged*] Set the xaxis' tick labels with list of string labels.

Discouraged

The use of this method is discouraged, because of the dependency on tick positions. In most cases, you'll want to use `Axes.set_[x/y/z]ticks(positions, labels)` or `Axes.set_xticks` instead.

If you are using this method, you should always fix the tick positions before, e.g. by using *Axes.set_xticks* or by explicitly setting a *FixedLocator*. Otherwise, ticks are free to move and the labels may end up in unexpected positions.

Parameters

labels

[sequence of str or of *Text*s] Texts for labeling each tick location in the sequence set by *Axes.set_xticks*; the number of labels must match the number of locations.

minor

[bool] If True, set minor ticks instead of major ticks.

fontdict

[dict, optional]

Discouraged

The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `set_ticklabels(..., **fontdict)`.

A dictionary controlling the appearance of the ticklabels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

****kwargs**

Text properties.

> **Warning:** This only sets the properties of the current ticks. Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that these settings can get lost if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Use `set_tick_params` instead if possible.

Returns

list of *Text*s

For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.

Examples using `matplotlib.axes.Axes.set_xticklabels`

- *Creating annotated heatmaps*
- *Managing multiple figures in pyplot*
- *Boxplots*
- *Rendering math equations using TeX*
- *XKCD*
- *Constrained layout guide*

matplotlib.axes.Axes.get_xticklabels

`Axes.`**`get_xticklabels`**(*minor=False*, *which=None*)

Get the xaxis' tick labels.

Parameters

minor

[bool] Whether to return the minor or the major ticklabels.

which

[None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

Returns

list of *Text*

Examples using `matplotlib.axes.Axes.get_xticklabels`

- *Creating a timeline with lines, dates, and text*
- *Creating annotated heatmaps*
- *Boxplots*
- *Date tick labels*
- *Pick event demo*
- *Centering labels between ticks*
- *Formatting date ticks using ConciseDateFormatter*
- *Evans test*
- *The Lifecycle of a Plot*

matplotlib.axes.Axes.get_xmajorticklabels

Axes.**get_xmajorticklabels**()

Return the xaxis' major tick labels, as a list of *Text*.

matplotlib.axes.Axes.get_xminorticklabels

Axes.**get_xminorticklabels**()

Return the xaxis' minor tick labels, as a list of *Text*.

matplotlib.axes.Axes.get_xgridlines

Axes.**get_xgridlines**()

Return the xaxis' grid lines as a list of *Line2D*s.

matplotlib.axes.Axes.get_xticklines

Axes.**get_xticklines**(*minor=False*)

Return the xaxis' tick lines as a list of *Line2D*s.

matplotlib.axes.Axes.xaxis_date

Axes.**xaxis_date**(*tz=None*)

Set up axis ticks and labels to treat data along the xaxis as dates.

Parameters

tz

[str or datetime.tzinfo, default: *rcParams["timezone"]* (default: 'UTC')] The timezone used to create date labels.

matplotlib.axes.Axes.set_yticks

Axes.**set_yticks**(*ticks*, *labels=None*, *, *minor=False*, ***kwargs*)

Set the yaxis' tick locations and optionally tick labels.

If necessary, the view limits of the Axis are expanded so that all given ticks are visible.

Parameters

ticks

[1D array-like] Array of tick locations. The axis *Locator* is replaced by a *FixedLocator*.

The values may be either floats or in axis units.

Pass an empty list to remove all ticks:

```
set_yticks([])
```

Some tick formatters will not label arbitrary tick positions; e.g. log formatters only label decade ticks by default. In such a case you can set a formatter explicitly on the axis using *Axis.set_major_formatter* or provide formatted *labels* yourself.

labels

[list of str, optional] Tick labels for each location in *ticks*. *labels* must be of the same length as *ticks*. If not set, the labels are generate using the axis tick *Formatter*.

minor

[bool, default: False] If False, set the major ticks; if True, the minor ticks.

****kwargs**

Text properties for the labels. Using these is only allowed if you pass *labels*. In other cases, please use *tick_params*.

Notes

The mandatory expansion of the view limits is an intentional design choice to prevent the surprise of a non-visible tick. If you need other limits, you should set the limits explicitly after setting the ticks.

Examples using `matplotlib.axes.Axes.set_yticks`

- *Bar Label Demo*
- *Horizontal bar chart*
- *Broken Barh*
- *Power spectral density (PSD)*
- *Creating annotated heatmaps*
- *Programmatically controlling subplot adjustment*
- *Rendering math equations using TeX*
- *Make room for ylabel using axes_grid*
- *Scatter Histogram (Locatable Axes)*
- *Ticklabel alignment*
- *Ticklabel direction*
- *Integral as the area under a curve*
- *Shaded & power normalized rendering*
- *XKCD*
- *Rain simulation*
- *MATPLOTLIB UNCHAINED*
- *Create 2D bar graphs in different planes*
- *SkewT-logP diagram: using transforms and custom projections*
- *Axis ticks*

matplotlib.axes.Axes.get_yticks

Axes.**get_yticks**(*, *minor=False*)

Return the yaxis' tick locations in data coordinates.

The locations are not clipped to the current axis limits and hence may contain locations that are not visible in the output.

Parameters

minor

[bool, default: False] True to return the minor tick directions, False to return the major tick directions.

Returns

array of tick locations

matplotlib.axes.Axes.set_yticklabels

Axes.**set_yticklabels**(*labels*, *, *minor=False*, *fontdict=None*, ***kwargs*)

[*Discouraged*] Set the yaxis' tick labels with list of string labels.

Discouraged

The use of this method is discouraged, because of the dependency on tick positions. In most cases, you'll want to use `Axes.set_[x/y/z]ticks(positions, labels)` or `Axes.set_yticks` instead.

If you are using this method, you should always fix the tick positions before, e.g. by using *Axes.set_yticks* or by explicitly setting a *FixedLocator*. Otherwise, ticks are free to move and the labels may end up in unexpected positions.

Parameters

labels

[sequence of str or of *Text*s] Texts for labeling each tick location in the sequence set by *Axes.set_yticks*; the number of labels must match the number of locations.

minor

[bool] If True, set minor ticks instead of major ticks.

fontdict

[dict, optional]

Discouraged

The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `set_ticklabels(..., **fontdict)`.

A dictionary controlling the appearance of the ticklabels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

****kwargs**

Text properties.

> **Warning:** This only sets the properties of the current ticks. Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that these settings can get lost if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Use *set_tick_params* instead if possible.

Returns

list of *Text*s

For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.

Examples using `matplotlib.axes.Axes.set_yticklabels`

- *Artist customization in box plots*
- *Boxplot drawer function*
- *Violin plot basics*
- *Rendering math equations using TeX*
- *Constrained layout guide*

matplotlib.axes.Axes.get_yticklabels

`Axes.`**`get_yticklabels`**(*minor=False*, *which=None*)

Get the yaxis' tick labels.

Parameters

minor

[bool] Whether to return the minor or the major ticklabels.

which

[None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

Returns

list of *Text*

Examples using `matplotlib.axes.Axes.get_yticklabels`

- *Programmatically controlling subplot adjustment*
- *Colorbar Tick Labelling*

matplotlib.axes.Axes.get_ymajorticklabels

Axes.**get_ymajorticklabels**()

Return the yaxis' major tick labels, as a list of *Text*.

matplotlib.axes.Axes.get_yminorticklabels

Axes.**get_yminorticklabels**()

Return the yaxis' minor tick labels, as a list of *Text*.

matplotlib.axes.Axes.get_ygridlines

Axes.**get_ygridlines**()

Return the yaxis' grid lines as a list of *Line2D*s.

matplotlib.axes.Axes.get_yticklines

Axes.**get_yticklines**(*minor=False*)

Return the yaxis' tick lines as a list of *Line2D*s.

matplotlib.axes.Axes.yaxis_date

Axes.**yaxis_date**(*tz=None*)

Set up axis ticks and labels to treat data along the yaxis as dates.

Parameters

tz

[str or datetime.tzinfo, default: *rcParams["timezone"]* (default: 'UTC')] The timezone used to create date labels.

matplotlib.axes.Axes.minorticks_off

Axes.**minorticks_off**()

Remove minor ticks from the Axes.

matplotlib.axes.Axes.minorticks_on

Axes.**minorticks_on**()

Display minor ticks on the Axes.

Displaying minor ticks may reduce performance; you may turn them off using *minorticks_off()* if drawing speed is a problem.

matplotlib.axes.Axes.ticklabel_format

Axes.**ticklabel_format**(*, *axis='both'*, *style=''*, *scilimits=None*, *useOffset=None*, *useLocale=None*, *useMathText=None*)

Configure the *ScalarFormatter* used by default for linear Axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axis to configure. Only major ticks are affected.

style

[{'sci', 'scientific', 'plain'}] Whether to use scientific notation. The formatter default is to use scientific notation.

scilimits

[pair of ints (m, n)] Scientific notation is used only for numbers outside the range 10^m to 10^n (and only if the formatter is configured to use scientific notation at all).

Use (0, 0) to include all numbers. Use (m, m) where m != 0 to fix the order of magnitude to 10^m. The formatter default is *rcParams["axes.formatter.limits"]* (default: `[-5, 6]`).

useOffset

[bool or float] If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is *rcParams["axes.formatter.useoffset"]* (default: `True`).

useLocale

[bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is *rcParams["axes.formatter.use_locale"]* (default: `False`).

useMathText

[bool] Render the offset and scientific notation in mathtext. The formatter default is *rcParams["axes.formatter.use_mathtext"]* (default: `False`).

Raises

AttributeError

If the current formatter is not a *ScalarFormatter*.

Examples using `matplotlib.axes.Axes.ticklabel_format`

- *The default tick formatter*

matplotlib.axes.Axes.tick_params

`Axes.`**`tick_params`**(*axis='both'*, ***kwargs*)

Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless *reset* is True. For the current style settings, see *Axis.get_tick_params*.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axis to which the parameters are applied.

which

[{'major', 'minor', 'both'}, default: 'major'] The group of ticks to which the parameters are applied.

reset

[bool, default: False] Whether to reset the ticks to defaults before updating them.

Other Parameters

direction

[{'in', 'out', 'inout'}] Puts ticks inside the Axes, outside the Axes, or both.

length

[float] Tick length in points.

width

[float] Tick width in points.

color

[color] Tick color.

pad

[float] Distance in points between tick and label.

labelsize

[float or str] Tick label font size in points or as a string (e.g., 'large').

labelcolor

[color] Tick label color.

labelfontfamily

[str] Tick label font.

colors

[color] Tick color and label color.

zorder

[float] Tick and label zorder.

bottom, top, left, right

[bool] Whether to draw the respective ticks.

labelbottom, labeltop, labelleft, labelright

[bool] Whether to draw the respective tick labels.

labelrotation

[float] Tick label rotation

grid_color

[color] Gridline color.

grid_alpha

[float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

grid_linewidth

[float] Width of gridlines in points.

grid_linestyle

[str] Any valid *Line2D* line style spec.

Examples

```
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

Examples using `matplotlib.axes.Axes.tick_params`

- *Scatter plot with histograms*
- *Creating annotated heatmaps*
- *Image Masked*
- *Aligning Labels*
- *Axes Props*
- *Broken Axis*
- *Plots with different scales*
- *Polar legend*
- *Color Demo*
- *Demo Axes Grid*
- *Inset locator demo*
- *Inset locator demo 2*
- *Make room for ylabel using axes_grid*
- *Simple axes divider 3*
- *Anatomy of a figure*
- *Stock prices over 32 years*
- *Anscombe's quartet*
- *Multiple y-axis with Spines*

- *Centering labels between ticks*
- *Date tick locators and formatters*
- *Fig Axes Customize Simple*
- *Major and minor ticks*
- *Move x-axis tick labels to the top*
- *Axis ticks*
- *Text in Matplotlib*

matplotlib.axes.Axes.locator_params

`Axes.`**`locator_params`**(*axis='both'*, *tight=None*, ***kwargs*)

Control behavior of major tick locators.

Because the locator is involved in autoscaling, *autoscale_view* is called automatically after the parameters are changed.

Parameters

axis

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate. (For 3D Axes, *axis* can also be set to 'z', and 'both' refers to all three axes.)

tight

[bool or None, optional] Parameter passed to *autoscale_view*. Default is None, for no change.

Other Parameters

****kwargs**

Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example *set_params* for the *ticker.MaxNLocator* used by default for linear.

Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```
ax.locator_params(tight=True, nbins=4)
```

Examples using `matplotlib.axes.Axes.locator_params`

- *Contourf demo*
- *Constrained layout guide*
- *Tight layout guide*

Units

Axes.convert_xunits	Convert *x* using the unit type of the xaxis.
Axes.convert_yunits	Convert *y* using the unit type of the yaxis.
Axes.have_units	Return whether units are set on any axis.

matplotlib.axes.Axes.convert_xunits

Axes.**convert_xunits**(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

matplotlib.axes.Axes.convert_yunits

Axes.**convert_yunits**(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

matplotlib.axes.Axes.have_units

Axes.**have_units**()

Return whether units are set on any axis.

Adding artists

Axes.add_artist	Add an *Artist* to the Axes; return the artist.
Axes.add_child_axes	Add an AxesBase to the Axes' children; return the child Axes.
Axes.add_collection	Add a *Collection* to the Axes; return the collection.
Axes.add_container	Add a *Container* to the Axes' containers; return the container.
Axes.add_image	Add an *AxesImage* to the Axes; return the image.
Axes.add_line	Add a *Line2D* to the Axes; return the line.
Axes.add_patch	Add a *Patch* to the Axes; return the patch.
Axes.add_table	Add a *Table* to the Axes; return the table.

matplotlib.axes.Axes.add_artist

Axes.**add_artist**(*a*)

Add an *Artist* to the Axes; return the artist.

Use *add_artist* only for artists for which there is no dedicated "add" method; and if necessary, use a method such as *update_datalim* to manually update the dataLim if the artist is to be included in autoscaling.

If no transform has been specified when creating the artist (e.g. artist.get_transform() == None) then the transform is set to ax.transData.

Examples using matplotlib.axes.Axes.add_artist

- *Scatter plots with a legend*
- *BboxImage Demo*
- *Bar of pie*
- *Annotating Plots*
- *AnnotationBbox demo*
- *Using a text as a Path*
- *Reference for Matplotlib artists*
- *Ellipse Demo*
- *Anchored Direction Arrow*
- *Axes Grid2*
- *Inset locator demo 2*

- *Simple Anchored Artists*
- *Anatomy of a figure*
- *Anchored Artists*
- *Artist tests*
- *Annotate Explain*
- *Simple Annotate01*
- *Simple Legend02*
- *Legend guide*
- *Annotations*

matplotlib.axes.Axes.add_child_axes

`Axes.`**`add_child_axes`**(*ax*)

Add an `AxesBase` to the Axes' children; return the child Axes.

This is the lowlevel version. See *`axes.Axes.inset_axes`*.

matplotlib.axes.Axes.add_collection

`Axes.`**`add_collection`**(*collection*, *autolim=True*)

Add a *`Collection`* to the Axes; return the collection.

Examples using `matplotlib.axes.Axes.add_collection`

- *EventCollection Demo*
- *Creating boxes from error bars using PatchCollection*
- *Line, Poly and RegularPoly Collection with autoscaling*
- *Ellipse Collection*
- *Plotting multiple lines with a LineCollection*
- *Circles, Wedges and Polygons*
- *Lasso Demo*
- *Artist tests*
- *Autoscaling Axis*

matplotlib.axes.Axes.add_container

Axes.**add_container**(*container*)

Add a *Container* to the Axes' containers; return the container.

matplotlib.axes.Axes.add_image

Axes.**add_image**(*image*)

Add an *AxesImage* to the Axes; return the image.

Examples using matplotlib.axes.Axes.add_image

- *Image nonuniform*

matplotlib.axes.Axes.add_line

Axes.**add_line**(*line*)

Add a *Line2D* to the Axes; return the line.

Examples using matplotlib.axes.Axes.add_line

- *Artist within an artist*
- *Artist tests*
- *Artist tutorial*

matplotlib.axes.Axes.add_patch

Axes.**add_patch**(*p*)

Add a *Patch* to the Axes; return the patch.

Examples using matplotlib.axes.Axes.add_patch

- *Curve with error band*
- *Many ways to plot images*
- *Axes box aspect*
- *Controlling view limits using margins and sticky_edges*
- *Boxplots*

- *Plot a confidence ellipse of a two-dimensional dataset*
- *Angle annotations on bracket arrows*
- *Annotating Plots*
- *Text alignment*
- *Compound path*
- *Dolphins*
- *Mmh Donuts!!!*

- *Annotations*

matplotlib.axes.Axes.add_table

Axes.**add_table**(*tab*)

Add a *Table* to the Axes; return the table.

Twinning and sharing

Axes.twinx	Create a twin Axes sharing the xaxis.
Axes.twiny	Create a twin Axes sharing the yaxis.
Axes.sharex	Share the x-axis with *other*.
Axes.sharey	Share the y-axis with *other*.
Axes.get_shared_x_axes	Return an immutable view on the shared x-axes Grouper.
Axes.get_shared_y_axes	Return an immutable view on the shared y-axes Grouper.

matplotlib.axes.Axes.twinx

Axes.**twinx**()

Create a twin Axes sharing the xaxis.

Create a new Axes with an invisible x-axis and an independent y-axis positioned opposite to the original one (i.e. at right). The x-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both y-axes align, see *LinearLocator*.

Returns

Axes

The newly created Axes instance

Notes

For those who are 'picking' artists while using twinx, pick events are only called for the artists in the top-most Axes.

Examples using `matplotlib.axes.Axes.twinx`

- *Axes box aspect*
- *Plots with different scales*
- *Percentiles as horizontal bar chart*
- *Parasite Simple*
- *Parasite axis demo*
- *Multiple y-axis with Spines*
- *Quick start guide*

matplotlib.axes.Axes.twiny

`Axes.twiny()`

Create a twin Axes sharing the yaxis.

Create a new Axes with an invisible y-axis and an independent x-axis positioned opposite to the original one (i.e. at top). The y-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both x-axes align, see *LinearLocator*.

Returns

Axes

The newly created Axes instance

Notes

For those who are 'picking' artists while using twiny, pick events are only called for the artists in the top-most Axes.

Examples using `matplotlib.axes.Axes.twiny`

- *Plots with different scales*

matplotlib.axes.Axes.sharex

`Axes.`**`sharex`**(*other*)

Share the x-axis with *other*.

This is equivalent to passing `sharex=other` when constructing the Axes, and cannot be used if the x-axis is already being shared with another Axes.

Examples using `matplotlib.axes.Axes.sharex`

- *Power spectral density (PSD)*

matplotlib.axes.Axes.sharey

`Axes.`**`sharey`**(*other*)

Share the y-axis with *other*.

This is equivalent to passing `sharey=other` when constructing the Axes, and cannot be used if the y-axis is already being shared with another Axes.

Examples using `matplotlib.axes.Axes.sharey`

- *Power spectral density (PSD)*

matplotlib.axes.Axes.get_shared_x_axes

`Axes.`**`get_shared_x_axes`**()

Return an immutable view on the shared x-axes Grouper.

matplotlib.axes.Axes.get_shared_y_axes

`Axes.`**`get_shared_y_axes`**()

Return an immutable view on the shared y-axes Grouper.

Axes position

Axes.get_anchor	Get the anchor location.
Axes.set_anchor	Define the anchor location.
Axes.get_axes_locator	Return the axes_locator.
Axes.set_axes_locator	Set the Axes locator.
Axes.get_subplotspec	Return the *SubplotSpec* associated with the subplot, or None.
Axes.set_subplotspec	Set the *SubplotSpec*.
Axes.reset_position	Reset the active position to the original position.
Axes.get_position	Return the position of the Axes within the figure as a *Bbox*.
Axes.set_position	Set the Axes position.

matplotlib.axes.Axes.get_anchor

Axes.**get_anchor**()

Get the anchor location.

See also:

matplotlib.axes.Axes.set_anchor

for a description of the anchor.

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

matplotlib.axes.Axes.set_anchor

Axes.**set_anchor**(*anchor*, *share=False*)

Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

Parameters

anchor

[(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}] Either an (*x*, *y*) pair of relative coordinates (0 is left or bottom, 1 is right or top), 'C' (center), or a cardinal direction ('SW', southwest, is bottom left, etc.). str inputs are shorthands for (*x*, *y*) coordinates, as shown in the following diagram:

```
┌──────────────────┬──────────────────┬──────────────────┐
│ 'NW' (0.0, 1.0)  │ 'N' (0.5, 1.0)   │ 'NE' (1.0, 1.0)  │
├──────────────────┼──────────────────┼──────────────────┤
│ 'W'  (0.0, 0.5)  │ 'C' (0.5, 0.5)   │ 'E'  (1.0, 0.5)  │
├──────────────────┼──────────────────┼──────────────────┤
│ 'SW' (0.0, 0.0)  │ 'S' (0.5, 0.0)   │ 'SE' (1.0, 0.0)  │
└──────────────────┴──────────────────┴──────────────────┘
```

share

[bool, default: False] If `True`, apply the settings to all shared Axes.

See also:

matplotlib.axes.Axes.set_aspect

for a description of aspect handling.

matplotlib.axes.Axes.get_axes_locator

`Axes.`**`get_axes_locator`**`()`

Return the axes_locator.

matplotlib.axes.Axes.set_axes_locator

`Axes.`**`set_axes_locator`**`(`*`locator`*`)`

Set the Axes locator.

Parameters

locator

[Callable[[Axes, Renderer], Bbox]]

Examples using `matplotlib.axes.Axes.set_axes_locator`

- *HBoxDivider and VBoxDivider demo*

matplotlib.axes.Axes.get_subplotspec

Axes.**get_subplotspec**()

Return the *SubplotSpec* associated with the subplot, or None.

Examples using matplotlib.axes.Axes.get_subplotspec

- *Nested GridSpecs*
- *Arranging multiple Axes in a Figure*

matplotlib.axes.Axes.set_subplotspec

Axes.**set_subplotspec**(*subplotspec*)

Set the *SubplotSpec*. associated with the subplot.

matplotlib.axes.Axes.reset_position

Axes.**reset_position**()

Reset the active position to the original position.

This undoes changes to the active position (as defined in *set_position*) which may have been performed to satisfy fixed-aspect constraints.

matplotlib.axes.Axes.get_position

Axes.**get_position**(*original=False*)

Return the position of the Axes within the figure as a *Bbox*.

Parameters

original

[bool] If `True`, return the original position. Otherwise, return the active position. For an explanation of the positions see *set_position*.

Returns

Bbox

Examples using `matplotlib.axes.Axes.get_position`

- *Contour Demo*

matplotlib.axes.Axes.set_position

`Axes.`**`set_position`**(*pos*, *which='both'*)

Set the Axes position.

Axes have two position attributes. The 'original' position is the position allocated for the Axes. The 'active' position is the position the Axes is actually drawn at. These positions are usually the same unless a fixed aspect is set to the Axes. See *Axes.set_aspect* for details.

Parameters

pos

[[left, bottom, width, height] or *Bbox*] The new position of the Axes in *Figure* coordinates.

which

[{'both', 'active', 'original'}, default: 'both'] Determines which position variables to change.

See also:

matplotlib.transforms.Bbox.from_bounds
matplotlib.transforms.Bbox.from_extents

Examples using `matplotlib.axes.Axes.set_position`

- *Contour Demo*

Async/event based

Axes.stale	Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
Axes.pchanged	Call all of the registered callbacks.
Axes.add_callback	Add a callback function that will be called whenever one of the *Artist*'s properties changes.
Axes.remove_callback	Remove a callback based on its observer id.

matplotlib.axes.Axes.stale

property Axes.**stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axes.Axes.pchanged

Axes.**pchanged**()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

matplotlib.axes.Axes.add_callback

Axes.**add_callback**(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

matplotlib.axes.Axes.remove_callback

Axes.**remove_callback**(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

Interactive

Axes.can_pan	Return whether this Axes supports any pan/zoom button functionality.
Axes.can_zoom	Return whether this Axes supports the zoom box button functionality.
Axes.get_navigate	Get whether the Axes responds to navigation commands.
Axes.set_navigate	Set whether the Axes responds to navigation toolbar commands.
Axes.get_navigate_mode	Get the navigation toolbar button status: 'PAN', 'ZOOM', or None.
Axes.set_navigate_mode	Set the navigation toolbar button status.
Axes.start_pan	Called when a pan operation has started.
Axes.drag_pan	Called when the mouse moves during a pan operation.
Axes.end_pan	Called when a pan operation completes (when the mouse button is up.)
Axes.format_coord	Return a format string formatting the *x*, *y* coordinates.
Axes.format_cursor_data	Return a string representation of *data*.
Axes.format_xdata	Return *x* formatted as an x-value.
Axes.format_ydata	Return *y* formatted as a y-value.
Axes.mouseover	Return whether this artist is queried for custom context information when the mouse cursor moves over it.
Axes.in_axes	Return whether the given event (in display coords) is in the Axes.
Axes.contains	Test whether the artist contains the mouse event.
Axes.contains_point	Return whether *point* (pair of pixel coordinates) is inside the Axes patch.
Axes.get_cursor_data	Return the cursor data for a given event.

matplotlib.axes.Axes.can_pan

Axes.**can_pan**()

Return whether this Axes supports any pan/zoom button functionality.

matplotlib.axes.Axes.can_zoom

Axes.**can_zoom**()

Return whether this Axes supports the zoom box button functionality.

matplotlib.axes.Axes.get_navigate

Axes.**get_navigate**()

Get whether the Axes responds to navigation commands.

matplotlib.axes.Axes.set_navigate

Axes.**set_navigate**(*b*)

Set whether the Axes responds to navigation toolbar commands.

Parameters

b

[bool]

matplotlib.axes.Axes.get_navigate_mode

Axes.**get_navigate_mode**()

Get the navigation toolbar button status: 'PAN', 'ZOOM', or None.

matplotlib.axes.Axes.set_navigate_mode

Axes.**set_navigate_mode**(*b*)

Set the navigation toolbar button status.

> **Warning:** This is not a user-API function.

matplotlib.axes.Axes.start_pan

Axes.**start_pan**(*x*, *y*, *button*)

Called when a pan operation has started.

Parameters

x, y

[float] The mouse coordinates in display coords.

button

[*MouseButton*] The pressed mouse button.

Notes

This is intended to be overridden by new projection types.

matplotlib.axes.Axes.drag_pan

Axes.**drag_pan**(*button*, *key*, *x*, *y*)

Called when the mouse moves during a pan operation.

Parameters

button

[*MouseButton*] The pressed mouse button.

key

[str or None] The pressed key, if any.

x, y

[float] The mouse coordinates in display coords.

Notes

This is intended to be overridden by new projection types.

matplotlib.axes.Axes.end_pan

Axes.**end_pan**()

Called when a pan operation completes (when the mouse button is up.)

Notes

This is intended to be overridden by new projection types.

matplotlib.axes.Axes.format_coord

Axes.**format_coord**(*x*, *y*)

Return a format string formatting the *x*, *y* coordinates.

Examples using `matplotlib.axes.Axes.format_coord`

- *Modifying the coordinate formatter*

matplotlib.axes.Axes.format_cursor_data

Axes.**format_cursor_data**(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

matplotlib.axes.Axes.format_xdata

Axes.**format_xdata**(*x*)

Return *x* formatted as an x-value.

This function will use the `fmt_xdata` attribute if it is not None, else will fall back on the xaxis major formatter.

matplotlib.axes.Axes.format_ydata

Axes.**format_ydata**(*y*)

Return *y* formatted as a y-value.

This function will use the `fmt_ydata` attribute if it is not None, else will fall back on the yaxis major formatter.

matplotlib.axes.Axes.mouseover

property Axes.**mouseover**

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

matplotlib.axes.Axes.in_axes

Axes.**in_axes**(*mouseevent*)

Return whether the given event (in display coords) is in the Axes.

matplotlib.axes.Axes.contains

Axes.**contains**(*mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

matplotlib.axes.Axes.contains_point

Axes.**contains_point**(*point*)

Return whether *point* (pair of pixel coordinates) is inside the Axes patch.

matplotlib.axes.Axes.get_cursor_data

Axes.**get_cursor_data**(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

Children

Axes.get_children	Return a list of the child *Artist*s of this *Artist*.
Axes.get_images	Return a list of *AxesImage*s contained by the Axes.
Axes.get_lines	Return a list of lines contained by the Axes.
Axes.findobj	Find artist objects.

matplotlib.axes.Axes.get_children

Axes.**get_children**()

Return a list of the child *Artist*s of this *Artist*.

matplotlib.axes.Axes.get_images

Axes.**get_images**()

Return a list of *AxesImage*s contained by the Axes.

matplotlib.axes.Axes.get_lines

Axes.**get_lines**()

Return a list of lines contained by the Axes.

matplotlib.axes.Axes.findobj

Axes.**findobj**(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

Drawing

Axes.draw	Draw the Artist (and its children) using the given renderer.
Axes.draw_artist	Efficiently redraw a single artist.
Axes.redraw_in_frame	Efficiently redraw Axes data, but not axis ticks, labels, etc.
Axes.get_rasterization_zorder	Return the zorder value below which artists will be rasterized.
Axes.set_rasterization_zorder	Set the zorder threshold for rasterization for vector graphics output.
Axes.get_window_extent	Return the Axes bounding box in display space.
Axes.get_tightbbox	Return the tight bounding box of the Axes, including axis and their decorators (xlabel, title, etc).

matplotlib.axes.Axes.draw

Axes.**draw**(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

matplotlib.axes.Axes.draw_artist

Axes.**draw_artist**(*a*)

Efficiently redraw a single artist.

Examples using matplotlib.axes.Axes.draw_artist

- *Faster rendering by using blitting*

matplotlib.axes.Axes.redraw_in_frame

Axes.**redraw_in_frame**()

Efficiently redraw Axes data, but not axis ticks, labels, etc.

matplotlib.axes.Axes.get_rasterization_zorder

Axes.**get_rasterization_zorder**()

Return the zorder value below which artists will be rasterized.

matplotlib.axes.Axes.set_rasterization_zorder

Axes.**set_rasterization_zorder**(*z*)

Set the zorder threshold for rasterization for vector graphics output.

All artists with a zorder below the given value will be rasterized if they support rasterization.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

z

[float or None] The zorder below which artists are rasterized. If `None` rasterization based on zorder is deactivated.

Examples using `matplotlib.axes.Axes.set_rasterization_zorder`

- *Rasterization for vector graphics*

matplotlib.axes.Axes.get_window_extent

Axes.**get_window_extent**(*renderer=None*)

Return the Axes bounding box in display space.

This bounding box does not include the spines, ticks, ticklabels, or other labels. For a bounding box including these elements use *get_tightbbox*.

See also:

matplotlib.axes.Axes.get_tightbbox
matplotlib.axis.Axis.get_tightbbox
matplotlib.spines.Spine.get_window_extent

Examples using `matplotlib.axes.Axes.get_window_extent`

- *Annotations*

matplotlib.axes.Axes.get_tightbbox

Axes.**get_tightbbox**(*renderer=None*, *, *call_axes_locator=True*, *bbox_extra_artists=None*, *for_layout_only=False*)

Return the tight bounding box of the Axes, including axis and their decorators (xlabel, title, etc).

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

Parameters

renderer

[*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

bbox_extra_artists

[list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of the Axes are included in the tight bounding box.

call_axes_locator

[bool, default: True] If *call_axes_locator* is `False`, it does not call the `_axes_locator` attribute, which is necessary to get the correct bounding box.

`call_axes_locator=False` can be used if the caller is only interested in the relative size of the tightbbox compared to the Axes bbox.

for_layout_only

[default: False] The bounding box will *not* include the x-extent of the title and the xlabel, or the y-extent of the ylabel.

Returns

BboxBase

Bounding box in figure pixel coordinates.

See also:

matplotlib.axes.Axes.get_window_extent
matplotlib.axis.Axis.get_tightbbox
matplotlib.spines.Spine.get_window_extent

Projection

Methods used by *Axis* that must be overridden for non-rectilinear Axes.

Axes.name	
Axes.get_xaxis_transform	Get the transformation used for drawing x-axis labels, ticks and gridlines.
Axes.get_yaxis_transform	Get the transformation used for drawing y-axis labels, ticks and gridlines.
Axes.get_data_ratio	Return the aspect ratio of the scaled data.
Axes.get_xaxis_text1_transform	**Returns**
Axes.get_xaxis_text2_transform	**Returns**
Axes.get_yaxis_text1_transform	**Returns**
Axes.get_yaxis_text2_transform	**Returns**

matplotlib.axes.Axes.name

Axes.**name = 'rectilinear'**

matplotlib.axes.Axes.get_xaxis_transform

Axes.**get_xaxis_transform**(*which='grid'*)

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

Note: This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Parameters

which

[{'grid', 'tick1', 'tick2'}]

Examples using matplotlib.axes.Axes.get_xaxis_transform

- *Filling the area between lines*
- *hlines and vlines*
- *Boxplots*
- *Scale invariant angle label*
- *Centered spines with arrows*

matplotlib.axes.Axes.get_yaxis_transform

Axes.**get_yaxis_transform**(*which='grid'*)

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

Note: This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Parameters

which

[{'grid', 'tick1', 'tick2'}]

Examples using `matplotlib.axes.Axes.get_yaxis_transform`

- *Centered spines with arrows*

matplotlib.axes.Axes.get_data_ratio

`Axes.`**`get_data_ratio`**`()`

Return the aspect ratio of the scaled data.

Notes

This method is intended to be overridden by new projection types.

matplotlib.axes.Axes.get_xaxis_text1_transform

`Axes.`**`get_xaxis_text1_transform`**`(`*pad_points*`)`

Returns

transform

[Transform] The transform used for drawing x-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

matplotlib.axes.Axes.get_xaxis_text2_transform

Axes.**get_xaxis_text2_transform**(*pad_points*)

Returns

transform

[Transform] The transform used for drawing secondary x-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

matplotlib.axes.Axes.get_yaxis_text1_transform

Axes.**get_yaxis_text1_transform**(*pad_points*)

Returns

transform

[Transform] The transform used for drawing y-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

matplotlib.axes.Axes.get_yaxis_text2_transform

Axes.**get_yaxis_text2_transform**(*pad_points*)

Returns

transform

[Transform] The transform used for drawing secondart y-axis labels, which will add *pad_points* of padding (in points) between the axis and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Other

Axes.zorder	
Axes.get_default_bbox_extra_artists	Return a default list of artists that are used for the bounding box calculation.
*Axes.get_transformed_clip_path_and_*	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
Axes.has_data	Return whether any artists have been added to the Axes.
Axes.set	Set multiple properties at once.

matplotlib.axes.Axes.zorder

Axes.**zorder = 0**

matplotlib.axes.Axes.get_default_bbox_extra_artists

Axes.**get_default_bbox_extra_artists**()

Return a default list of artists that are used for the bounding box calculation.

Artists are excluded either by not being visible or `artist.set_in_layout(False)`.

matplotlib.axes.Axes.get_transformed_clip_path_and_affine

Axes.**get_transformed_clip_path_and_affine**()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axes.Axes.has_data

Axes.**has_data**()

Return whether any artists have been added to the Axes.

This should not be used to determine whether the *dataLim* need to be updated, and may not actually be useful for anything.

matplotlib.axes.Axes.set

Axes.**set**(*, *adjustable=<UNSET>*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *anchor=<UNSET>*, *animated=<UNSET>*, *aspect=<UNSET>*, *autoscale_on=<UNSET>*, *autoscalex_on=<UNSET>*, *autoscaley_on=<UNSET>*, *axes_locator=<UNSET>*, *axisbelow=<UNSET>*, *box_aspect=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *facecolor=<UNSET>*, *frame_on=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *navigate=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *prop_cycle=<UNSET>*, *rasterization_zorder=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *subplotspec=<UNSET>*, *title=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xbound=<UNSET>*, *xlabel=<UNSET>*, *xlim=<UNSET>*, *xmargin=<UNSET>*, *xscale=<UNSET>*, *xticklabels=<UNSET>*, *xticks=<UNSET>*, *ybound=<UNSET>*, *ylabel=<UNSET>*, *ylim=<UNSET>*, *ymargin=<UNSET>*, *yscale=<UNSET>*, *yticklabels=<UNSET>*, *yticks=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	*Cycler*
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	*Transform*
url	str
visible	bool
xbound	(lower: float, upper: float)
xlabel	str
xlim	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown

Table 32 – continued from previous p

Property	Description
ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

class matplotlib.axes.Axes.**ArtistList**(*axes*, *prop_name*, *valid_types=None*, *invalid_types=None*)

A sublist of Axes children based on their type.

The type-specific children sublists were made immutable in Matplotlib 3.7. In the future these artist lists may be replaced by tuples. Use as if this is a tuple already.

Parameters

axes

[*Axes*] The Axes from which this sublist will pull the children Artists.

prop_name

[str] The property name used to access this sublist from the Axes; used to generate deprecation warnings.

valid_types

[list of type, optional] A list of types that determine which children will be returned by this sublist. If specified, then the Artists in the sublist must be instances of any of these types. If unspecified, then any type of Artist is valid (unless limited by *invalid_types*.)

invalid_types

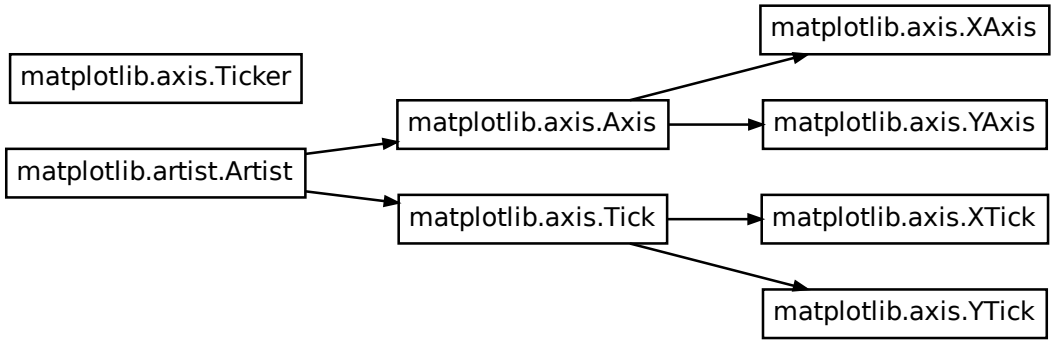
[tuple, optional] A list of types that determine which children will *not* be returned by this sublist. If specified, then Artists in the sublist will never be an instance of these types. Otherwise, no types will be excluded.

7.2.6 `matplotlib.axis`

Table of Contents

Classes for the ticks and x- and y-axis.

Inheritance



`Axis` objects

class matplotlib.axis.**Axis**(*axes*, *, *pickradius=15*, *clear=True*)

Base class for *XAxis* and *YAxis*.

Attributes

isDefault_label

[bool]

axes

[*Axes*] The *Axes* instance the artist resides in, or *None*.

major

[*Ticker*] Determines the major tick positions and their label format.

minor

[*Ticker*] Determines the minor tick positions and their label format.

callbacks

[*CallbackRegistry*]

label

[*Text*] The axis label.

labelpad

[float] The distance between the axis label and the tick labels. Defaults to *rcParams["axes.labelpad"]* (default: `4.0`) = 4.

offsetText

[*Text*] A *Text* object containing the data offset of the ticks (if any).

pickradius

[float] The acceptance radius for containment tests.

majorTicks

[list of *Tick*] The major ticks.

> **Warning:** Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that changes to individual ticks will not survive if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Working on the individual ticks is a method of last resort. Use *set_tick_params* instead if possible.

minorTicks

[list of *Tick*] The minor ticks.

Parameters

axes

[*Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

clear

[bool, default: True] Whether to clear the Axis on creation. This is not required, e.g., when creating an Axis as part of an Axes, as `Axes.clear` will call `Axis.clear`. .. versionadded:: 3.8

class matplotlib.axis.**XAxis**(**args*, ***kwargs*)

Parameters

axes

[*Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

clear

[bool, default: True] Whether to clear the Axis on creation. This is not required, e.g., when creating an Axis as part of an Axes, as `Axes.clear` will call `Axis.clear`. .. versionadded:: 3.8

class matplotlib.axis.**YAxis**(**args*, ***kwargs*)

Parameters

axes

[*Axes*] The *Axes* to which the created Axis belongs.

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

clear

[bool, default: True] Whether to clear the Axis on creation. This is not required, e.g., when creating an Axis as part of an Axes, as `Axes.clear` will call `Axis.clear`. .. versionadded:: 3.8

class matplotlib.axis.**Ticker**

A container for the objects defining tick position and format.

Attributes

locator

[*Locator* subclass] Determines the positions of the ticks.

formatter

[*Formatter* subclass] Determines the format of the tick labels.

Axis.clear	Clear the axis.
Axis.get_scale	Return this Axis' scale (as a str).

matplotlib.axis.Axis.clear

Axis.**clear**()

Clear the axis.

This resets axis properties to their default values:

- the label
- the scale
- locators, formatters and ticks
- major and minor grid

- units
- registered callbacks

matplotlib.axis.Axis.get_scale

Axis.**get_scale**()

Return this Axis' scale (as a str).

Examples using `matplotlib.axis.Axis.get_scale`

- *Axis scales*

Formatters and Locators

Axis.get_major_formatter	Get the formatter of the major ticker.
Axis.get_major_locator	Get the locator of the major ticker.
Axis.get_minor_formatter	Get the formatter of the minor ticker.
Axis.get_minor_locator	Get the locator of the minor ticker.
Axis.set_major_formatter	Set the formatter of the major ticker.
Axis.set_major_locator	Set the locator of the major ticker.
Axis.set_minor_formatter	Set the formatter of the minor ticker.
Axis.set_minor_locator	Set the locator of the minor ticker.
Axis.remove_overlapping_locs	If minor ticker locations that overlap with major ticker locations should be trimmed.
Axis.get_remove_overlapping_locs	
Axis.set_remove_overlapping_locs	

matplotlib.axis.Axis.get_major_formatter

Axis.**get_major_formatter**()

Get the formatter of the major ticker.

Examples using `matplotlib.axis.Axis.get_major_formatter`

- *Axis scales*

matplotlib.axis.Axis.get_major_locator

`Axis.`**`get_major_locator`**`()`

Get the locator of the major ticker.

Examples using `matplotlib.axis.Axis.get_major_locator`

- *Date tick labels*
- *Inset locator demo 2*
- *Quick start guide*
- *Axis scales*

matplotlib.axis.Axis.get_minor_formatter

`Axis.`**`get_minor_formatter`**`()`

Get the formatter of the minor ticker.

matplotlib.axis.Axis.get_minor_locator

`Axis.`**`get_minor_locator`**`()`

Get the locator of the minor ticker.

matplotlib.axis.Axis.set_major_formatter

`Axis.`**`set_major_formatter`**`(`*formatter*`)`

Set the formatter of the major ticker.

In addition to a *`Formatter`* instance, this also accepts a `str` or function.

For a `str` a *`StrMethodFormatter`* is used. The field used for the value must be labeled `'x'` and the field used for the position must be labeled `'pos'`. See the *`StrMethodFormatter`* documentation for more information.

For a function, a *`FuncFormatter`* is used. The function must take two inputs (a tick value `x` and a position `pos`), and return a string containing the corresponding tick label. See the *`FuncFormatter`* documentation for more information.

Parameters

formatter

[*Formatter*, `str`, or function]

Examples using `matplotlib.axis.Axis.set_major_formatter`

- *Creating a timeline with lines, dates, and text*
- *Date tick labels*
- *Labeling ticks using engineering notation*
- *3D surface (colormap)*
- *SkewT-logP diagram: using transforms and custom projections*
- *Centering labels between ticks*
- *Custom Ticker*
- *Formatting date ticks using ConciseDateFormatter*
- *Date Demo Convert*
- *Placing date ticks using recurrence rules*
- *Date tick locators and formatters*
- *Custom tick formatter for time series*
- *Dollar ticks*
- *Major and minor ticks*
- *Multilevel (nested) ticks*
- *Tick formatters*
- *Setting tick labels from a list of values*
- *The Lifecycle of a Plot*
- *Quick start guide*
- *Axis ticks*
- *Choosing Colormaps in Matplotlib*
- *Text in Matplotlib*

matplotlib.axis.Axis.set_major_locator

Axis.**set_major_locator**(*locator*)

Set the locator of the major ticker.

Parameters

locator

[*Locator*]

Examples using `matplotlib.axis.Axis.set_major_locator`

- *Hatch-filled histograms*
- *Creating a timeline with lines, dates, and text*
- *Date tick labels*
- *Anatomy of a figure*
- *3D surface (colormap)*
- *3D surface (checkerboard)*
- *Scales*
- *SkewT-logP diagram: using transforms and custom projections*
- *Centering labels between ticks*
- *Formatting date ticks using ConciseDateFormatter*
- *Date Demo Convert*
- *Placing date ticks using recurrence rules*
- *Date tick locators and formatters*
- *Custom tick formatter for time series*
- *Major and minor ticks*
- *Multilevel (nested) ticks*
- *Tick locators*
- *Setting tick labels from a list of values*
- *Axis scales*
- *Axis ticks*
- *Choosing Colormaps in Matplotlib*
- *Text in Matplotlib*

matplotlib.axis.Axis.set_minor_formatter

Axis.**set_minor_formatter**(*formatter*)

Set the formatter of the minor ticker.

In addition to a *Formatter* instance, this also accepts a `str` or function. See *Axis.set_major_formatter* for more information.

Parameters

formatter

[*Formatter*, `str`, or function]

Examples using `matplotlib.axis.Axis.set_minor_formatter`

- *Anatomy of a figure*
- *Scales*
- *SkewT-logP diagram: using transforms and custom projections*
- *Centering labels between ticks*
- *Axis scales*

matplotlib.axis.Axis.set_minor_locator

Axis.**set_minor_locator**(*locator*)

Set the locator of the minor ticker.

Parameters

locator

[*Locator*]

Examples using `matplotlib.axis.Axis.set_minor_locator`

- *Secondary Axis*
- *Date tick labels*
- *Anatomy of a figure*
- *Centering labels between ticks*
- *Date Demo Convert*
- *Major and minor ticks*

- *Tick locators*
- *Axis ticks*

matplotlib.axis.Axis.remove_overlapping_locs

property Axis.**remove_overlapping_locs**

If minor ticker locations that overlap with major ticker locations should be trimmed.

matplotlib.axis.Axis.get_remove_overlapping_locs

Axis.**get_remove_overlapping_locs**()

matplotlib.axis.Axis.set_remove_overlapping_locs

Axis.**set_remove_overlapping_locs**(*val*)

Axis Label

Axis.set_label_coords	Set the coordinates of the label.
Axis.set_label_position	Set the label position (top or bottom)
Axis.set_label_text	Set the text value of the axis label.
Axis.get_label	Return the axis label as a Text instance.
Axis.get_label_position	Return the label position (top or bottom)
Axis.get_label_text	Get the text of the label.

matplotlib.axis.Axis.set_label_coords

Axis.**set_label_coords**(*x*, *y*, *transform=None*)

Set the coordinates of the label.

By default, the x coordinate of the y label and the y coordinate of the x label are determined by the tick label bounding boxes, but this can lead to poor alignment of multiple labels if there are multiple axes.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system: (0, 0) is bottom left, (0.5, 0.5) is center, etc.

Examples using `matplotlib.axis.Axis.set_label_coords`

- *Align y-labels*

matplotlib.axis.Axis.set_label_position

`Axis.`**`set_label_position`**(*position*)

Set the label position (top or bottom)

Parameters

position

[{'top', 'bottom'}]

Examples using `matplotlib.axis.Axis.set_label_position`

- *Title positioning*

matplotlib.axis.Axis.set_label_text

`Axis.`**`set_label_text`**(*label*, *fontdict=None*, ***kwargs*)

Set the text value of the axis label.

Parameters

label

[str] Text string.

fontdict

[dict] Text properties.

Discouraged

The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `set_label_text(..., **fontdict)`.

****kwargs**

Merged into fontdict.

matplotlib.axis.Axis.get_label

Axis.**get_label**()

Return the axis label as a Text instance.

Examples using matplotlib.axis.Axis.get_label

- *Parasite Simple*

matplotlib.axis.Axis.get_label_position

Axis.**get_label_position**()

Return the label position (top or bottom)

matplotlib.axis.Axis.get_label_text

Axis.**get_label_text**()

Get the text of the label.

Ticks, tick labels and Offset text

Axis.get_major_ticks	Return the list of major *Tick*s.
Axis.get_majorticklabels	Return this Axis' major tick labels, as a list of *Text*.
Axis.get_majorticklines	Return this Axis' major tick lines as a list of *Line2D*s.
Axis.get_majorticklocs	Return this Axis' major tick locations in data coordinates.
Axis.get_minor_ticks	Return the list of minor *Tick*s.
Axis.get_minorticklabels	Return this Axis' minor tick labels, as a list of *Text*.
Axis.get_minorticklines	Return this Axis' minor tick lines as a list of *Line2D*s.
Axis.get_minorticklocs	Return this Axis' minor tick locations in data coordinates.
Axis.get_offset_text	Return the axis offsetText as a Text instance.
Axis.get_tick_padding	
Axis.get_tick_params	Get appearance parameters for ticks, ticklabels, and gridlines.
Axis.get_ticklabels	Get this Axis' tick labels.
Axis.get_ticklines	Return this Axis' tick lines as a list of *Line2D*s.
Axis.get_ticklocs	Return this Axis' tick locations in data coordinates.
Axis.get_gridlines	Return this Axis' grid lines as a list of *Line2D*s.
Axis.grid	Configure the grid lines.
Axis.set_tick_params	Set appearance parameters for ticks, ticklabels, and gridlines.
Axis.axis_date	Set up axis ticks and labels to treat data along this Axis as dates.

matplotlib.axis.Axis.get_major_ticks

Axis.**get_major_ticks**(*numticks=None*)

Return the list of major *Tick*s.

> **Warning:** Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that changes to individual ticks will not survive if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Working on the individual ticks is a method of last resort. Use *set_tick_params* instead if possible.

matplotlib.axis.Axis.get_majorticklabels

Axis.**get_majorticklabels**()

Return this Axis' major tick labels, as a list of *Text*.

matplotlib.axis.Axis.get_majorticklines

Axis.**get_majorticklines**()

Return this Axis' major tick lines as a list of *Line2D*s.

matplotlib.axis.Axis.get_majorticklocs

Axis.**get_majorticklocs**()

Return this Axis' major tick locations in data coordinates.

matplotlib.axis.Axis.get_minor_ticks

Axis.**get_minor_ticks**(*numticks=None*)

Return the list of minor *Tick*s.

> **Warning:** Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that changes to individual ticks will not survive if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Working on the individual ticks is a method of last resort. Use *set_tick_params* instead if possible.

matplotlib.axis.Axis.get_minorticklabels

Axis.**get_minorticklabels**()

Return this Axis' minor tick labels, as a list of *Text*.

matplotlib.axis.Axis.get_minorticklines

Axis.**get_minorticklines**()

Return this Axis' minor tick lines as a list of *Line2D*s.

matplotlib.axis.Axis.get_minorticklocs

Axis.**get_minorticklocs**()

Return this Axis' minor tick locations in data coordinates.

matplotlib.axis.Axis.get_offset_text

Axis.**get_offset_text**()

Return the axis offsetText as a Text instance.

matplotlib.axis.Axis.get_tick_padding

Axis.**get_tick_padding**()

matplotlib.axis.Axis.get_tick_params

Axis.**get_tick_params**(*which='major'*)

Get appearance parameters for ticks, ticklabels, and gridlines.

New in version 3.7.

Parameters

which

[{'major', 'minor'}, default: 'major'] The group of ticks for which the parameters are retrieved.

Returns

dict

Properties for styling tick elements added to the axis.

Notes

This method returns the appearance parameters for styling *new* elements added to this axis and may be different from the values on current elements if they were modified directly by the user (e.g., via `set_*` methods on individual tick objects).

Examples

```
>>> ax.yaxis.set_tick_params(labelsize=30, labelcolor='red',
                             direction='out', which='major')
>>> ax.yaxis.get_tick_params(which='major')
{'direction': 'out',
'left': True,
'right': False,
'labelleft': True,
'labelright': False,
'gridOn': False,
'labelsize': 30,
'labelcolor': 'red'}
>>> ax.yaxis.get_tick_params(which='minor')
{'left': True,
'right': False,
'labelleft': True,
'labelright': False,
'gridOn': False}
```

matplotlib.axis.Axis.get_ticklabels

Axis.**get_ticklabels**(*minor=False*, *which=None*)

Get this Axis' tick labels.

Parameters

minor

[bool] Whether to return the minor or the major ticklabels.

which

[None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

Returns

list of *Text*

Examples using `matplotlib.axis.Axis.get_ticklabels`

- *Fig Axes Customize Simple*
- *Artist tutorial*

matplotlib.axis.Axis.get_ticklines

Axis.**get_ticklines**(*minor=False*)

Return this Axis' tick lines as a list of `Line2D`s.

Examples using `matplotlib.axis.Axis.get_ticklines`

- *Fig Axes Customize Simple*
- *Artist tutorial*

matplotlib.axis.Axis.get_ticklocs

Axis.**get_ticklocs**(*, minor=False*)

Return this Axis' tick locations in data coordinates.

The locations are not clipped to the current axis limits and hence may contain locations that are not visible in the output.

Parameters

minor

[bool, default: False] True to return the minor tick directions, False to return the major tick directions.

Returns

array of tick locations

Examples using `matplotlib.axis.Axis.get_ticklocs`

- *Artist tutorial*

matplotlib.axis.Axis.get_gridlines

Axis.**get_gridlines**()

Return this Axis' grid lines as a list of *Line2D*s.

matplotlib.axis.Axis.grid

Axis.**grid**(*visible=None*, *which='major'*, ***kwargs*)

Configure the grid lines.

Parameters

visible

[bool or None] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *visible* will be set to True.

If *visible* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

which

[{'major', 'minor', 'both'}] The grid lines to apply the changes on.

****kwargs**

[*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Examples using `matplotlib.axis.Axis.grid`

- *Box plots with custom fill colors*
- *Boxplots*
- *Box plot vs. violin plot comparison*
- *Symlog Demo*

matplotlib.axis.Axis.set_tick_params

Axis.**set_tick_params**(*which='major'*, *reset=False*, ***kwargs*)

Set appearance parameters for ticks, ticklabels, and gridlines.

For documentation of keyword arguments, see *matplotlib.axes.Axes.tick_params()*.

See also:

Axis.get_tick_params

View the current style settings for ticks, ticklabels, and gridlines.

Examples using `matplotlib.axis.Axis.set_tick_params`

- *Scatter Histogram (Locatable Axes)*
- *Placing date ticks using recurrence rules*
- *Date Precision and Epochs*
- *Dollar ticks*
- *Choosing Colormaps in Matplotlib*

matplotlib.axis.Axis.axis_date

Axis.**axis_date**(*tz=None*)

Set up axis ticks and labels to treat data along this Axis as dates.

Parameters

tz

[str or `datetime.tzinfo`, default: *`rcParams["timezone"]`* (default: `'UTC'`)] The timezone used to create date labels.

Data and view intervals

`Axis.get_data_interval`	Return the `(min, max)` data limits of this axis.
`Axis.get_view_interval`	Return the `(min, max)` view limits of this axis.
`Axis.get_inverted`	Return whether this Axis is oriented in the "inverse" direction.
`Axis.set_data_interval`	Set the axis data limits.
`Axis.set_view_interval`	Set the axis view limits.
`Axis.set_inverted`	Set whether this Axis is oriented in the "inverse" direction.

matplotlib.axis.Axis.get_data_interval

Axis.**get_data_interval**()

Return the `(min, max)` data limits of this axis.

matplotlib.axis.Axis.get_view_interval

Axis.**get_view_interval**()

Return the `(min, max)` view limits of this axis.

matplotlib.axis.Axis.get_inverted

Axis.**get_inverted**()

Return whether this Axis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

matplotlib.axis.Axis.set_data_interval

Axis.**set_data_interval**(*vmin*, *vmax*, *ignore=False*)

Set the axis data limits. This method is for internal use.

If *ignore* is False (the default), this method will never reduce the preexisting data limits, only expand them if *vmin* or *vmax* are not within them. Moreover, the order of *vmin* and *vmax* does not matter; the orientation of the axis will not change.

If *ignore* is True, the data limits will be set exactly to `(vmin, vmax)` in that order.

matplotlib.axis.Axis.set_view_interval

Axis.**set_view_interval**(*vmin*, *vmax*, *ignore=False*)

Set the axis view limits. This method is for internal use; Matplotlib users should typically use e.g. *set_xlim* or *set_ylim*.

If *ignore* is False (the default), this method will never reduce the preexisting view limits, only expand them if *vmin* or *vmax* are not within them. Moreover, the order of *vmin* and *vmax* does not matter; the orientation of the axis will not change.

If *ignore* is True, the view limits will be set exactly to `(vmin, vmax)` in that order.

matplotlib.axis.Axis.set_inverted

Axis.**set_inverted**(*inverted*)

Set whether this Axis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

Rendering helpers

Axis.get_minpos	
Axis.get_tick_space	Return the estimated number of ticks that can fit on the axis.
Axis.get_tightbbox	Return a bounding box that encloses the axis.

matplotlib.axis.Axis.get_minpos

Axis.**get_minpos**()

matplotlib.axis.Axis.get_tick_space

Axis.**get_tick_space**()

Return the estimated number of ticks that can fit on the axis.

matplotlib.axis.Axis.get_tightbbox

Axis.**get_tightbbox**(*renderer=None*, *, *for_layout_only=False*)

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

If *for_layout_only* is True, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained_layout to ignore too-long labels when doing their layout.

Interactive

Axis.contains	Test whether the artist contains the mouse event.
Axis.pickradius	The acceptance radius for containment tests.
Axis.get_pickradius	Return the depth of the axis used by the picker.
Axis.set_pickradius	Set the depth of the axis used by the picker.

matplotlib.axis.Axis.contains

Axis.**contains**(*mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

matplotlib.axis.Axis.pickradius

property Axis.**pickradius**

The acceptance radius for containment tests. See also *Axis.contains*.

matplotlib.axis.Axis.get_pickradius

Axis.**get_pickradius**()

Return the depth of the axis used by the picker.

matplotlib.axis.Axis.set_pickradius

Axis.**set_pickradius**(*pickradius*)

Set the depth of the axis used by the picker.

Parameters

pickradius

[float] The acceptance radius for containment tests. See also *Axis.contains*.

Units

Axis.convert_units	
Axis.set_units	Set the units for axis.
Axis.get_units	Return the units for axis.
Axis.update_units	Introspect *data* for units converter and update the `axis.converter` instance if necessary.

matplotlib.axis.Axis.convert_units

Axis.**convert_units**(*x*)

matplotlib.axis.Axis.set_units

Axis.**set_units**(*u*)

Set the units for axis.

Parameters

u

[units tag]

Notes

The units of any shared axis will also be updated.

Examples using `matplotlib.axis.Axis.set_units`

- *Artist tests*
- *Group barchart with units*
- *Unit handling*

matplotlib.axis.Axis.get_units

Axis.**get_units**()

Return the units for axis.

matplotlib.axis.Axis.update_units

Axis.**update_units**(*data*)

Introspect *data* for units converter and update the `axis.converter` instance if necessary. Return *True* if *data* is registered for unit conversion.

XAxis Specific

XAxis.axis_name	Read-only name identifying the axis.
XAxis.get_ticks_position	Return the ticks position ("top", "bottom", "default", or "unknown").
XAxis.set_ticks_position	Set the ticks position.
XAxis.set_label_position	Set the label position (top or bottom)
XAxis.tick_bottom	Move ticks and ticklabels (if present) to the bottom of the Axes.
XAxis.tick_top	Move ticks and ticklabels (if present) to the top of the Axes.

matplotlib.axis.XAxis.axis_name

XAxis.**axis_name = 'x'**

Read-only name identifying the axis.

matplotlib.axis.XAxis.get_ticks_position

XAxis.**get_ticks_position**()

Return the ticks position ("top", "bottom", "default", or "unknown").

matplotlib.axis.XAxis.set_ticks_position

XAxis.**set_ticks_position**(*position*)

Set the ticks position.

Parameters

position

[{'top', 'bottom', 'both', 'default', 'none'}] 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at bottom. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

Examples using `matplotlib.axis.XAxis.set_ticks_position`

- *Colorbar with AxesDivider*
- *Controlling the position and size of colorbars with Inset Axes*
- *XKCD*
- *Axis ticks*
- *Choosing Colormaps in Matplotlib*

matplotlib.axis.XAxis.set_label_position

XAxis.**set_label_position**(*position*)

Set the label position (top or bottom)

Parameters

position

[{'top', 'bottom'}]

Examples using `matplotlib.axis.XAxis.set_label_position`

- *Title positioning*

matplotlib.axis.XAxis.tick_bottom

XAxis.**tick_bottom**()

Move ticks and ticklabels (if present) to the bottom of the Axes.

Examples using `matplotlib.axis.XAxis.tick_bottom`

- *Broken Axis*
- *Stock prices over 32 years*

matplotlib.axis.XAxis.tick_top

XAxis.**tick_top**()

Move ticks and ticklabels (if present) to the top of the Axes.

Examples using `matplotlib.axis.XAxis.tick_top`

- *Broken Axis*
- *Title positioning*

YAxis Specific

YAxis.axis_name	Read-only name identifying the axis.
YAxis.get_ticks_position	Return the ticks position ("left", "right", "default", or "unknown").
YAxis.set_offset_position	**Parameters**
YAxis.set_ticks_position	Set the ticks position.
YAxis.set_label_position	Set the label position (left or right)
YAxis.tick_left	Move ticks and ticklabels (if present) to the left of the Axes.
YAxis.tick_right	Move ticks and ticklabels (if present) to the right of the Axes.

matplotlib.axis.YAxis.axis_name

YAxis.**axis_name = 'y'**

Read-only name identifying the axis.

matplotlib.axis.YAxis.get_ticks_position

YAxis.**get_ticks_position**()

Return the ticks position ("left", "right", "default", or "unknown").

matplotlib.axis.YAxis.set_offset_position

YAxis.**set_offset_position**(*position*)

Parameters

position

[{'left', 'right'}]

matplotlib.axis.YAxis.set_ticks_position

YAxis.**set_ticks_position**(*position*)

Set the ticks position.

Parameters

position

[{'left', 'right', 'both', 'default', 'none'}] 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at left. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

matplotlib.axis.YAxis.set_label_position

YAxis.**set_label_position**(*position*)

Set the label position (left or right)

Parameters

position

[{'left', 'right'}]

matplotlib.axis.YAxis.tick_left

YAxis.**tick_left**()

Move ticks and ticklabels (if present) to the left of the Axes.

Examples using `matplotlib.axis.YAxis.tick_left`

- *Stock prices over 32 years*
- *Set default y-axis tick labels on the right*

matplotlib.axis.YAxis.tick_right

YAxis.**tick_right**()

Move ticks and ticklabels (if present) to the right of the Axes.

Other

Axis.OFFSETTEXTPAD	
Axis.axes	The *Axes* instance the artist resides in, or *None*.
Axis.limit_range_for_scale	
Axis.reset_ticks	Re-initialize the major and minor Tick lists.
Axis.set_default_intervals	Set the default limits for the axis data and view interval if they have not been not mutated yet.

matplotlib.axis.Axis.OFFSETTEXTPAD

Axis.**OFFSETTEXTPAD = 3**

matplotlib.axis.Axis.axes

property Axis.**axes**

The *Axes* instance the artist resides in, or *None*.

matplotlib.axis.Axis.limit_range_for_scale

Axis.**limit_range_for_scale**(*vmin*, *vmax*)

matplotlib.axis.Axis.reset_ticks

Axis.**reset_ticks**()

Re-initialize the major and minor Tick lists.

Each list starts with a single fresh Tick.

matplotlib.axis.Axis.set_default_intervals

Axis.**set_default_intervals**()

Set the default limits for the axis data and view interval if they have not been not mutated yet.

Discouraged

These methods should be used together with care, calling `set_ticks` to specify the desired tick locations **before** calling `set_ticklabels` to specify a matching series of labels. Calling `set_ticks` makes a *FixedLocator*; it's list of locations is then used by `set_ticklabels` to make an appropriate *FuncFormatter*.

Axis.set_ticks	Set this Axis' tick locations and optionally tick labels.
Axis.set_ticklabels	[*Discouraged*] Set this Axis' tick labels with list of string labels.

matplotlib.axis.Axis.set_ticks

Axis.**set_ticks**(*ticks*, *labels=None*, *, *minor=False*, ***kwargs*)

Set this Axis' tick locations and optionally tick labels.

If necessary, the view limits of the Axis are expanded so that all given ticks are visible.

Parameters

ticks

[1D array-like] Array of tick locations. The axis *Locator* is replaced by a *FixedLocator*.

The values may be either floats or in axis units.

Pass an empty list to remove all ticks:

```
set_ticks([])
```

Some tick formatters will not label arbitrary tick positions; e.g. log formatters only label decade ticks by default. In such a case you can set a formatter explicitly on the axis using *Axis.set_major_formatter* or provide formatted *labels* yourself.

labels

[list of str, optional] Tick labels for each location in *ticks*. *labels* must be of the same length as *ticks*. If not set, the labels are generate using the axis tick *Formatter*.

minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

****kwargs**

Text properties for the labels. Using these is only allowed if you pass *labels*. In other cases, please use *tick_params*.

Notes

The mandatory expansion of the view limits is an intentional design choice to prevent the surprise of a non-visible tick. If you need other limits, you should set the limits explicitly after setting the ticks.

Examples using `matplotlib.axis.Axis.set_ticks`

- *Multiple axes animation*

matplotlib.axis.Axis.set_ticklabels

`Axis.`**`set_ticklabels`**(*labels*, *, *minor=False*, *fontdict=None*, ***kwargs*)

[*Discouraged*] Set this Axis' tick labels with list of string labels.

Discouraged

The use of this method is discouraged, because of the dependency on tick positions. In most cases, you'll want to use `Axes.set_[x/y/z]ticks(positions, labels)` or `Axis.set_ticks` instead.

If you are using this method, you should always fix the tick positions before, e.g. by using *Axis.set_ticks* or by explicitly setting a *FixedLocator*. Otherwise, ticks are free to move and the labels may end up in unexpected positions.

Parameters

labels

[sequence of str or of *Text*s] Texts for labeling each tick location in the sequence set by *Axis.set_ticks*; the number of labels must match the number of locations.

minor

[bool] If True, set minor ticks instead of major ticks.

fontdict

[dict, optional]

Discouraged

The use of *fontdict* is discouraged. Parameters should be passed as individual keyword arguments or using dictionary-unpacking `set_ticklabels(..., **fontdict)`.

A dictionary controlling the appearance of the ticklabels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

****kwargs**

Text properties.

> **Warning:** This only sets the properties of the current ticks. Ticks are not guaranteed to be persistent. Various operations can create, delete and modify the Tick instances. There is an imminent risk that these settings can get lost if you work on the figure further (including also panning/zooming on a displayed figure).
>
> Use *set_tick_params* instead if possible.

Returns

list of *Text*s

For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.

`Tick` objects

class matplotlib.axis.**Tick**(*axes*, *loc*, ***, *size=None*, *width=None*, *color=None*, *tickdir=None*, *pad=None*, *labelsize=None*, *labelcolor=None*, *labelfontfamily=None*, *zorder=None*, *gridOn=None*, *tick1On=True*, *tick2On=True*, *label1On=True*, *label2On=False*, *major=True*, *labelrotation=0*, *grid_color=None*, *grid_linestyle=None*, *grid_linewidth=None*, *grid_alpha=None*, ***kwargs*)

Abstract base class for the axis ticks, grid lines and labels.

Ticks mark a position on an Axis. They contain two lines as markers and two labels; one each for the bottom and top positions (in case of an *XAxis*) or for the left and right positions (in case of a *YAxis*).

Attributes

tick1line

[*Line2D*] The left/bottom tick marker.

tick2line

[*Line2D*] The right/top tick marker.

gridline

[*Line2D*] The grid line associated with the label position.

label1

[*Text*] The left/bottom tick label.

label2

[*Text*] The right/top tick label.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

class matplotlib.axis.**XTick**(**args*, ***kwargs*)

Contains all the Artists needed to make an x tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

class matplotlib.axis.**YTick**(**args*, ***kwargs*)

Contains all the Artists needed to make a Y tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

Tick.get_loc	Return the tick location (data coords) as a scalar.
Tick.get_pad	Get the value of the tick label pad in points.
Tick.get_tick_padding	Get the length of the tick outside of the Axes.
Tick.get_tickdir	
Tick.get_view_interval	Return the view limits `(min, max)` of the axis the tick belongs to.
Tick.set_label1	[*Deprecated*] Set the label1 text.
Tick.set_label2	[*Deprecated*] Set the label2 text.
Tick.set_pad	Set the tick label pad in points
Tick.set_url	Set the url of label1 and label2.
Tick.update_position	Set the location of tick in data coords with scalar *loc*.

matplotlib.axis.Tick.get_loc

Tick.**get_loc**()

Return the tick location (data coords) as a scalar.

matplotlib.axis.Tick.get_pad

Tick.**get_pad**()

Get the value of the tick label pad in points.

matplotlib.axis.Tick.get_tick_padding

Tick.**get_tick_padding**()

Get the length of the tick outside of the Axes.

matplotlib.axis.Tick.get_tickdir

Tick.**get_tickdir**()

matplotlib.axis.Tick.get_view_interval

Tick.**get_view_interval**()

Return the view limits `(min, max)` of the axis the tick belongs to.

matplotlib.axis.Tick.set_label1

Tick.**set_label1**(*s*)

[*Deprecated*] Set the label1 text.

Parameters

s

[str]

Notes

Deprecated since version 3.8.

matplotlib.axis.Tick.set_label2

Tick.**set_label2**(*s*)

[*Deprecated*] Set the label2 text.

Parameters

s

[str]

Notes

Deprecated since version 3.8.

matplotlib.axis.Tick.set_pad

Tick.**set_pad**(*val*)

Set the tick label pad in points

Parameters

val

[float]

matplotlib.axis.Tick.set_url

Tick.**set_url**(*url*)

Set the url of label1 and label2.

Parameters

url

[str]

matplotlib.axis.Tick.update_position

Tick.**update_position**(*loc*)

Set the location of tick in data coords with scalar *loc*.

7.2.7 matplotlib.backend_bases

Abstract base classes define the primitives that renderers and graphics contexts must implement to serve as a Matplotlib backend.

RendererBase

An abstract base class to handle drawing/rendering operations.

FigureCanvasBase

The abstraction layer that separates the *Figure* from the backend specific details like a user interface drawing area.

GraphicsContextBase

An abstract base class that provides color, line styles, etc.

Event

The base class for all of the Matplotlib event handling. Derived classes such as *KeyEvent* and *MouseEvent* store the meta data like keys and buttons pressed, x and y locations in pixel and *Axes* coordinates.

ShowBase

The base class for the Show class of each interactive backend; the 'show' callable is then set to Show.__call__.

ToolContainerBase

The base class for the Toolbar class of each interactive backend.

class matplotlib.backend_bases.**CloseEvent**(*name*, *canvas*, *guiEvent=None*)

Bases: *Event*

An event triggered by a figure being closed.

class matplotlib.backend_bases.**DrawEvent**(*name*, *canvas*, *renderer*)

Bases: *Event*

An event triggered by a draw operation on the canvas.

In most backends, callbacks subscribed to this event will be fired after the rendering is complete but before the screen is updated. Any extra artists drawn to the canvas's renderer will be reflected without an explicit call to `blit`.

> **Warning:** Calling `canvas.draw` and `canvas.blit` in these callbacks may not be safe with all backends and may cause infinite recursion.

A DrawEvent has a number of special attributes in addition to those defined by the parent *Event* class.

Attributes

renderer

[*RendererBase*] The renderer for the draw event.

class matplotlib.backend_bases.**Event**(*name*, *canvas*, *guiEvent=None*)

Bases: `object`

A Matplotlib event.

The following attributes are defined and shown with their default values. Subclasses may define additional attributes.

Attributes

name

[str] The event name.

canvas

[*FigureCanvasBase*] The backend-specific canvas instance generating the event.

guiEvent

The GUI event that triggered the Matplotlib event.

property guiEvent

class matplotlib.backend_bases.**FigureCanvasBase**(*figure=None*)

Bases: `object`

The canvas the figure renders into.

Attributes

figure

[*Figure*] A high-level figure instance.

blit(*bbox=None*)

Blit the canvas in bbox (default entire canvas).

property button_pick_id

property callbacks

property device_pixel_ratio

The ratio of physical to logical pixels used for the canvas on screen.

By default, this is 1, meaning physical and logical pixels are the same size. Subclasses that support High DPI screens may set this property to indicate that said ratio is different. All Matplotlib interaction, unless working directly with the canvas, remains in logical pixels.

draw(**args*, ***kwargs*)

Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

draw_idle(**args*, ***kwargs*)

Request a widget redraw once control returns to the GUI event loop.

Even if multiple calls to *draw_idle* occur before control returns to the GUI event loop, the figure will only be rendered once.

Notes

Backends may choose to override the method and implement their own strategy to prevent multiple renderings.

```
events = ['resize_event', 'draw_event', 'key_press_event',
'key_release_event', 'button_press_event', 'button_release_event',
'scroll_event', 'motion_notify_event', 'pick_event',
'figure_enter_event', 'figure_leave_event', 'axes_enter_event',
'axes_leave_event', 'close_event']
```

```
filetypes = {'eps': 'Encapsulated Postscript', 'jpeg': 'Joint
Photographic Experts Group', 'jpg': 'Joint Photographic Experts
Group', 'pdf': 'Portable Document Format', 'pgf': 'PGF code for
LaTeX', 'png': 'Portable Network Graphics', 'ps': 'Postscript',
'raw': 'Raw RGBA bitmap', 'rgba': 'Raw RGBA bitmap', 'svg':
'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphics',
'tif': 'Tagged Image File Format', 'tiff': 'Tagged Image File
Format', 'webp': 'WebP Image Format'}
```

fixed_dpi = None

flush_events()

Flush the GUI events for the figure.

Interactive backends need to reimplement this method.

get_default_filename()

Return a string, which includes extension, suitable for use as a default filename.

classmethod get_default_filetype()

Return the default savefig file format as specified in *rcParams["savefig.format"]* (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

classmethod get_supported_filetypes()

Return dict of savefig file formats supported by this backend.

classmethod get_supported_filetypes_grouped()

Return a dict of savefig file formats supported by this backend, where the keys are a file type name, such as 'Joint Photographic Experts Group', and the values are a list of filename extensions used for that filetype, such as ['jpg', 'jpeg'].

get_width_height(*, *physical=False*)

Return the figure width and height in integral points or pixels.

When the figure is used on High DPI screens (and the backend supports it), the truncation to integers occurs after scaling by the device pixel ratio.

Parameters

physical

[bool, default: False] Whether to return true physical pixels or logical pixels. Physical pixels may be used by backends that support HiDPI, but still configure the canvas using its actual size.

Returns

width, height

[int] The size of the figure, in points or pixels, depending on the backend.

grab_mouse(*ax*)

Set the child *Axes* which is grabbing the mouse events.

Usually called by the widgets themselves. It is an error to call this if the mouse is already grabbed by another Axes.

inaxes(*xy*)

Return the topmost visible *Axes* containing the point *xy*.

Parameters

xy

[(float, float)] (x, y) pixel positions from left/bottom of the canvas.

Returns

***Axes* or None**

The topmost visible Axes containing the point, or None if there is no Axes at the point.

is_saving()

Return whether the renderer is in the process of saving to a file, rather than rendering for an on-screen buffer.

manager_class

alias of *FigureManagerBase*

mpl_connect(*s*, *func*)

Bind function *func* to event *s*.

Parameters

s

[str] One of the following events ids:

- 'button_press_event'
- 'button_release_event'
- 'draw_event'
- 'key_press_event'
- 'key_release_event'
- 'motion_notify_event'
- 'pick_event'
- 'resize_event'
- 'scroll_event'
- 'figure_enter_event',
- 'figure_leave_event',
- 'axes_enter_event',
- 'axes_leave_event'

- 'close_event'.

func

[callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the Axes, the `inaxes` attribute of the event will be set to the *Axes* the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See *KeyEvent* and *MouseEvent* for more info.

Note: If func is a method, this only stores a weak reference to the method. Thus, the figure does not influence the lifetime of the associated object. Usually, you want to make sure that the object is kept alive throughout the lifetime of the figure by holding a reference to it.

Returns

cid

A connection id that can be used with *FigureCanvasBase.mpl_disconnect*.

Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

mpl_disconnect(*cid*)

Disconnect the callback with id *cid*.

Examples

```
cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)
```

classmethod new_manager(*figure*, *num*)

Create a new figure manager for *figure*, using this canvas class.

Notes

This method should not be reimplemented in subclasses. If custom manager creation logic is needed, please reimplement `FigureManager.create_with_canvas`.

new_timer(*interval=None*, *callbacks=None*)

Create a new backend-specific subclass of `Timer`.

This is useful for getting periodic events through the backend's native event loop. Implemented only for backends with GUIs.

Parameters

interval

[int] Timer interval in milliseconds.

callbacks

[list[tuple[callable, tuple, dict]]] Sequence of (func, args, kwargs) where `func(*args, **kwargs)` will be executed by the timer every *interval*.

Callbacks which return `False` or `0` will be removed from the timer.

Examples

```
>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1,), {'a': 3})])
```

print_figure(*filename*, *dpi=None*, *facecolor=None*, *edgecolor=None*, *orientation='portrait'*, *format=None*, ***, *bbox_inches=None*, *pad_inches=None*, *bbox_extra_artists=None*, *backend=None*, ***kwargs*)

Render the figure to hardcopy. Set the figure patch face and edge colors. This is useful because some of the GUIs have a gray figure face color background and you'll probably want to override this on hardcopy.

Parameters

filename

[str or path-like or file-like] The file where the figure is saved.

dpi

[float, default: *rcParams["savefig.dpi"]* (default: `'figure'`)] The dots per inch to save the figure in.

facecolor

[color or 'auto', default: *rcParams["savefig.facecolor"]* (default: `'auto'`)] The facecolor of the figure. If 'auto', use the current figure facecolor.

edgecolor

[color or 'auto', default: *rcParams["savefig.edgecolor"]* (default: `'auto'`)] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

orientation

[{'landscape', 'portrait'}, default: 'portrait'] Only currently applies to PostScript printing.

format

[str, optional] Force a specific file format. If not given, the format is inferred from the *filename* extension, and if that fails from *rcParams["savefig.format"]* (default: `'png'`).

bbox_inches

['tight' or *Bbox*, default: *rcParams["savefig.bbox"]* (default: `None`)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

pad_inches

[float or 'layout', default: *rcParams["savefig.pad_inches"]* (default: `0.1`)] Amount of padding in inches around the figure when bbox_inches is 'tight'. If 'layout' use the padding from the constrained or compressed layout engine; ignored if one of those engines is not in use.

bbox_extra_artists

[list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

backend

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

release_mouse(*ax*)

Release the mouse grab held by the *Axes* *ax*.

Usually called by the widgets. It is ok to call this even if *ax* doesn't have the mouse grab currently.

required_interactive_framework = None

property scroll_pick_id

set_cursor(*cursor*)

Set the current cursor.

This may have no effect if the backend does not display anything.

If required by the backend, this method should trigger an update in the backend event loop after the cursor is set, as this method may be called e.g. before a long-running task during which the GUI is not updated.

Parameters

cursor

[*Cursors*] The cursor to display over the canvas. Note: some backends may change the cursor for the entire window.

start_event_loop(*timeout=0*)

Start a blocking event loop.

Such an event loop is used by interactive functions, such as *ginput* and *waitforbuttonpress*, to wait for events.

The event loop blocks until a callback function triggers *stop_event_loop*, or *timeout* is reached.

If *timeout* is 0 or negative, never timeout.

Only interactive backends need to reimplement this method and it relies on *flush_events* being properly implemented.

Interactive backends should implement this in a more native way.

stop_event_loop()

Stop the current blocking event loop.

Interactive backends need to reimplement this to match *start_event_loop*

supports_blit = False

switch_backends(*FigureCanvasClass*)

[*Deprecated*] Instantiate an instance of FigureCanvasClass

This is used for backend switching, e.g., to instantiate a FigureCanvasPS from a FigureCanvasGTK. Note, deep copying is not done, so any changes to one of the instances (e.g., setting figure size or line props), will be reflected in the other

Notes

Deprecated since version 3.8.

class matplotlib.backend_bases.**FigureManagerBase**(*canvas*, *num*)

Bases: object

A backend-independent abstraction of a figure container and controller.

The figure manager is used by pyplot to interact with the window in a backend-independent way. It's an adapter for the real (GUI) framework that represents the visual figure on screen.

The figure manager is connected to a specific canvas instance, which in turn is connected to a specific figure instance. To access a figure manager for a given figure in user code, you typically use `fig.canvas.manager`.

GUI backends derive from this class to translate common operations such as *show* or *resize* to the GUI-specific code. Non-GUI backends do not support these operations and can just use the base class.

This following basic operations are accessible:

Window operations

- *show*
- *destroy*
- *full_screen_toggle*
- *resize*
- *get_window_title*
- *set_window_title*

Key and mouse button press handling

The figure manager sets up default key and mouse button press handling by hooking up the *key_press_handler* to the matplotlib event system. This ensures the same shortcuts and mouse actions across backends.

Other operations

Subclasses will have additional attributes and functions to access additional functionality. This is of course backend-specific. For example, most GUI backends have `window` and `toolbar` attributes that give access to the native GUI widgets of the respective framework.

Attributes

canvas

[*FigureCanvasBase*] The backend-specific canvas instance.

num

[int or str] The figure number.

key_press_handler_id

[int] The default key handler cid, when using the toolmanager. To disable the default key press handling use:

```
figure.canvas.mpl_disconnect(
    figure.canvas.manager.key_press_handler_id)
```

button_press_handler_id

[int] The default mouse button handler cid, when using the toolmanager. To disable the default button press handling use:

```
figure.canvas.mpl_disconnect(
    figure.canvas.manager.button_press_handler_id)
```

classmethod create_with_canvas(*canvas_class*, *figure*, *num*)

Create a manager for a given *figure* using a specific *canvas_class*.

Backends should override this method if they have specific needs for setting up the canvas or the manager.

destroy()

full_screen_toggle()

get_window_title()

Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).

classmethod pyplot_show(*, *block=None*)

Show all figures. This method is the implementation of *pyplot.show*.

To customize the behavior of *pyplot.show*, interactive backends should usually override *start_main_loop*; if more customized logic is necessary, *pyplot_show* can also be overridden.

Parameters

block

[bool, optional] Whether to block by calling `start_main_loop`. The default, None, means to block if we are neither in IPython's `%pylab` mode nor in `interactive` mode.

resize(*w*, *h*)

For GUI backends, resize the window (in physical pixels).

set_window_title(*title*)

Set the title text of the window containing the figure.

This has no effect for non-GUI (e.g., PS) backends.

Examples

```
>>> fig = plt.figure()
>>> fig.canvas.manager.set_window_title('My figure')
```

show()

For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in *Figure.show*.

classmethod start_main_loop()

Start the main event loop.

This method is called by *FigureManagerBase.pyplot_show*, which is the implementation of *pyplot.show*. To customize the behavior of *pyplot.show*, interactive backends should usually override *start_main_loop*; if more customized logic is necessary, *pyplot_show* can also be overridden.

class matplotlib.backend_bases.**GraphicsContextBase**

Bases: object

An abstract base class that provides color, line styles, etc.

copy_properties(*gc*)

Copy properties from *gc* to self.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_antialiased()

Return whether the object should try to do antialiased rendering.

get_capstyle()

Return the *CapStyle*.

get_clip_path()

Return the clip path in the form (path, transform), where path is a *Path* instance, and transform is an affine transform to apply to the path before clipping.

get_clip_rectangle()

Return the clip rectangle as a *Bbox* instance.

get_dashes()

Return the dash style as an (offset, dash-list) pair.

See *set_dashes* for details.

Default value is (None, None).

get_forced_alpha()

Return whether the value given by get_alpha() should be used to override any other alpha-channel values.

get_gid()

Return the object identifier if one is set, None otherwise.

get_hatch()

Get the current hatch style.

get_hatch_color()

Get the hatch color.

get_hatch_linewidth()

Get the hatch linewidth.

get_hatch_path(*density=6.0*)

Return a *Path* for the current hatch.

get_joinstyle()

Return the *JoinStyle*.

get_linewidth()

Return the line width in points.

get_rgb()

Return a tuple of three or four floats from 0-1.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunken or expanded.

May return `None` if no sketch parameters were set.

get_snap()

Return the snap setting, which can be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

get_url()

Return a url if one is set, None otherwise.

restore()

Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack.

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, `alpha` will override them.

set_antialiased(*b*)

Set whether object should be drawn with antialiased rendering.

set_capstyle(*cs*)

Set how to draw endpoints of lines.

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clip_path(*path*)

Set the clip path to a *TransformedPath* or None.

set_clip_rectangle(*rectangle*)

Set the clip rectangle to a *Bbox* or None.

set_dashes(*dash_offset*, *dash_list*)

Set the dash style for the gc.

Parameters

dash_offset

[float] Distance, in points, into the dash pattern at which to start the pattern. It is usually set to 0.

dash_list

[array-like or None] The on-off sequence as points. None specifies a solid line. All values must otherwise be non-negative (≥ 0).

Notes

See p. 666 of the PostScript Language Reference for more info.

set_foreground(*fg*, *isRGBA=False*)

Set the foreground color.

Parameters

fg

[color]

isRGBA

[bool] If *fg* is known to be an `(r, g, b, a)` tuple, *isRGBA* can be set to True to improve performance.

set_gid(*id*)

Set the id.

set_hatch(*hatch*)

Set the hatch style (for fills).

set_hatch_color(*hatch_color*)

Set the hatch color.

set_joinstyle(*js*)

Set how to draw connections between line segments.

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_linewidth(*w*)

Set the linewidth in points.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, default: 128] The length of the wiggle along the line, in pixels.

randomness

[float, default: 16] The scale factor by which the length is shrunken or expanded.

set_snap(*snap*)

Set the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

set_url(*url*)

Set the url for links in compatible backends.

class matplotlib.backend_bases.**KeyEvent**(*name*, *canvas*, *key*, *x=0*, *y=0*, *guiEvent=None*)

Bases: *LocationEvent*

A key event (key press, key release).

A KeyEvent has a number of special attributes in addition to those defined by the parent *Event* and *LocationEvent* classes.

Notes

Modifier keys will be prefixed to the pressed key and will be in the order "ctrl", "alt", "super". The exception to this rule is when the pressed key is itself a modifier key, therefore "ctrl+alt" and "alt+control" can both be valid key values.

Examples

```
def on_key(event):
    print('you pressed', event.key, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('key_press_event', on_key)
```

Attributes

key

[None or str] The key(s) pressed. Could be *None*, a single case sensitive Unicode character ("g", "G", "#", etc.), a special key ("control", "shift", "f1", "up", etc.) or a combination of the above (e.g., "ctrl+alt+g", "ctrl+alt+G").

class matplotlib.backend_bases.**LocationEvent**(*name*, *canvas*, *x*, *y*, *guiEvent=None*, ***, *modifiers=None*)

Bases: *Event*

An event that has a screen location.

A LocationEvent has a number of special attributes in addition to those defined by the parent *Event* class.

Attributes

x, y

[int or None] Event location in pixels from bottom left of canvas.

inaxes

[*Axes* or None] The *Axes* instance over which the mouse is, if any.

xdata, ydata

[float or None] Data coordinates of the mouse within *inaxes*, or *None* if the mouse is not over an Axes.

modifiers

[frozenset] The keyboard modifiers currently being pressed (except for KeyEvent).

lastevent = <matplotlib.backend_bases.MouseEvent object>

class matplotlib.backend_bases.**MouseButton**(*value*, *names=None*, **values*, *module=None*, *qualname=None*, *type=None*, *start=1*, *boundary=None*)

Bases: IntEnum

BACK = 8

FORWARD = 9

LEFT = 1

MIDDLE = 2

RIGHT = 3

class matplotlib.backend_bases.**MouseEvent**(*name*, *canvas*, *x*, *y*, *button=None*, *key=None*, *step=0*, *dblclick=False*, *guiEvent=None*, ***, *modifiers=None*)

Bases: *LocationEvent*

A mouse event ('button_press_event', 'button_release_event', 'scroll_event', 'motion_notify_event').

A MouseEvent has a number of special attributes in addition to those defined by the parent *Event* and *LocationEvent* classes.

Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('button_press_event', on_press)
```

Attributes

button

[None or *MouseButton* or {'up', 'down'}] The button pressed. 'up' and 'down' are used for scroll events.

Note that LEFT and RIGHT actually refer to the "primary" and "secondary" buttons, i.e. if the user inverts their left and right buttons ("left-handed setting") then the LEFT button will be the one physically on the right.

If this is unset, *name* is "scroll_event", and *step* is nonzero, then this will be set to "up" or "down" depending on the sign of *step*.

key

[None or str] The key pressed when the mouse event triggered, e.g. 'shift'. See *KeyEvent*.

> **Warning:** This key is currently obtained from the last 'key_press_event' or 'key_release_event' that occurred within the canvas. Thus, if the last change of keyboard state occurred while the canvas did not have focus, this attribute will be wrong. On the other hand, the `modifiers` attribute should always be correct, but it can only report on modifier keys.

step

[float] The number of scroll steps (positive for 'up', negative for 'down'). This applies only to 'scroll_event' and defaults to 0 otherwise.

dblclick

[bool] Whether the event is a double-click. This applies only to 'button_press_event' and is False otherwise. In particular, it's not used in 'button_release_event'.

class matplotlib.backend_bases.**NavigationToolbar2**(*canvas*)

Bases: object

Base class for the navigation cursor, version 2.

Backends must implement a canvas that handles connections for 'button_press_event' and 'button_release_event'. See *FigureCanvasBase.mpl_connect()* for more information.

They must also define

save_figure()

Save the current figure.

draw_rubberband() **(optional)**

Draw the zoom to rect "rubberband" rectangle.

set_message() **(optional)**

Display message.

set_history_buttons() **(optional)**

You can change the history back / forward buttons to indicate disabled / enabled state.

and override `__init__` to set up the toolbar -- without forgetting to call the base-class init. Typically, `__init__` needs to set up toolbar buttons connected to the *home*, *back*, *forward*, *pan*, *zoom*, and *save_figure* methods and using standard icons in the "images" subdirectory of the data path.

That's it, we'll do the rest!

back(**args*)

Move back up the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

configure_subplots(**args*)

drag_pan(*event*)

Callback for dragging in pan/zoom mode.

drag_zoom(*event*)

Callback for dragging in zoom mode.

draw_rubberband(*event*, *x0*, *y0*, *x1*, *y1*)

Draw a rectangle rubberband to indicate zoom limits.

Note that it is not guaranteed that `x0 <= x1` and `y0 <= y1`.

forward(**args*)

Move forward in the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

home(**args*)

Restore the original view.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

mouse_move(*event*)

pan(**args*)

Toggle the pan/zoom tool.

Pan with left button, zoom with right.

press_pan(*event*)

Callback for mouse button press in pan/zoom mode.

press_zoom(*event*)

Callback for mouse button press in zoom to rect mode.

push_current()

Push the current view limits and position onto the stack.

release_pan(*event*)

Callback for mouse button release in pan/zoom mode.

release_zoom(*event*)

Callback for mouse button release in zoom to rect mode.

remove_rubberband()

Remove the rubberband.

save_figure(**args*)

Save the current figure.

set_history_buttons()

Enable or disable the back/forward button.

set_message(*s*)

Display a message on toolbar or in status bar.

toolitems = (('Home', 'Reset original view', 'home', 'home'), ('Back', 'Back to previous view', 'back', 'back'), ('Forward', 'Forward to next view', 'forward', 'forward'), (None, None, None, None), ('Pan', 'Left button pans, Right button zooms\nx/y fixes axis, CTRL fixes aspect', 'move', 'pan'), ('Zoom', 'Zoom to rectangle\nx/y fixes axis', 'zoom_to_rect', 'zoom'), ('Subplots', 'Configure subplots', 'subplots', 'configure_subplots'), (None, None, None, None), ('Save', 'Save the figure', 'filesave', 'save_figure'))

update()

Reset the Axes stack.

zoom(**args*)

exception matplotlib.backend_bases.**NonGuiException**

Bases: Exception

Raised when trying show a figure in a non-GUI backend.

class matplotlib.backend_bases.**PickEvent**(*name*, *canvas*, *mouseevent*, *artist*, *guiEvent=None*, ***kwargs*)

Bases: *Event*

A pick event.

This event is fired when the user picks a location on the canvas sufficiently close to an artist that has been made pickable with *Artist.set_picker*.

A PickEvent has a number of special attributes in addition to those defined by the parent *Event* class.

Examples

Bind a function `on_pick()` to pick events, that prints the coordinates of the picked data point:

```
ax.plot(np.rand(100), 'o', picker=5)  # 5 points tolerance

def on_pick(event):
    line = event.artist
    xdata, ydata = line.get_data()
    ind = event.ind
    print(f'on pick line: {xdata[ind]:.3f}, {ydata[ind]:.3f}')

cid = fig.canvas.mpl_connect('pick_event', on_pick)
```

Attributes

mouseevent

[*MouseEvent*] The mouse event that generated the pick.

artist

[*Artist*] The picked artist. Note that artists are not pickable by default (see *Artist.set_picker*).

other

Additional attributes may be present depending on the type of the picked object; e.g., a *Line2D* pick may define different extra attributes than a *PatchCollection* pick.

class matplotlib.backend_bases.**RendererBase**

Bases: object

An abstract base class to handle drawing/rendering operations.

The following methods must be implemented in the backend for full functionality (though just implementing *draw_path* alone would give a highly capable backend):

- *draw_path*
- *draw_image*
- *draw_gouraud_triangles*

The following methods *should* be implemented in the backend for optimization reasons:

- *draw_text*
- *draw_markers*
- *draw_path_collection*
- *draw_quad_mesh*

close_group(*s*)

Close a grouping element with label *s*.

Only used by the SVG renderer.

draw_gouraud_triangle(*gc*, *points*, *colors*, *transform*)

[*Deprecated*] Draw a Gouraud-shaded triangle.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

points

[(3, 2) array-like] Array of (x, y) points for the triangle.

colors

[(3, 4) array-like] RGBA colors for each point of the triangle.

transform

[*Transform*] An affine transform to apply to the points.

Notes

Deprecated since version 3.7: Use draw_gouraud_triangles instead.

draw_gouraud_triangles(*gc*, *triangles_array*, *colors_array*, *transform*)

Draw a series of Gouraud triangles.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

triangles_array

[(N, 3, 2) array-like] Array of *N* (x, y) points for the triangles.

colors_array

[(N, 3, 4) array-like] Array of *N* RGBA colors for each point of the triangles.

transform

[*Transform*] An affine transform to apply to the points.

draw_image(*gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[(N, M, 4) array of `numpy.uint8`] An array of RGBA pixels.

transform

[*Affine2DBase*] If and only if the concrete backend is written such that *option_scale_image* returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_path

[*Path*] The path for the marker.

marker_trans

[*Transform*] An affine transform applied to the marker.

path

[*Path*] The locations to draw the markers.

trans

[*Transform*] An affine transform applied to the path.

rgbFace

[color, optional]

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draw a `Path` instance using the given affine transform.

draw_path_collection(*gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offset_trans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)

Draw a collection of *paths*.

Each path is first transformed by the corresponding entry in *all_transforms* (a list of (3, 3) matrices) and then by *master_transform*. They are then translated by the corresponding entry in *offsets*, which has been first transformed by *offset_trans*.

facecolors, *edgecolors*, *linewidths*, *linestyles*, and *antialiased* are lists that set the corresponding properties.

offset_position is unused now, but the argument is kept for backwards compatibility.

The base (fallback) implementation makes multiple calls to `draw_path`. Backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths` and `_iter_collection` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection` can be made globally.

draw_quad_mesh(*gc*, *master_transform*, *meshWidth*, *meshHeight*, *coordinates*, *offsets*, *offsetTrans*, *facecolors*, *antialiased*, *edgecolors*)

Draw a quadmesh.

The base (fallback) implementation converts the quadmesh to paths and then calls `draw_path_collection`.

draw_tex(*gc*, *x*, *y*, *s*, *prop*, *angle*, *, *mtext=None*)

Draw a TeX instance.

Parameters

gc

[`GraphicsContextBase`] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The TeX text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*Text*] The original text object to be rendered.

draw_text(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw a text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

ismath

[bool or "TeX"] If True, use mathtext parser. If "TeX", use tex for rendering.

mtext

[*Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

flipy()

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts.

get_canvas_width_height()

Return the canvas width and height in display coords.

get_image_magnification()

Get the factor by which to magnify images passed to *draw_image*. Allows a backend to have images at a different resolution to other artists.

get_texmanager()

Return the *TexManager* instance.

get_text_width_height_descent(*s*, *prop*, *ismath*)

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

Whitespace at the start and the end of *s* is included in the reported width.

new_gc()

Return an instance of a *GraphicsContextBase*.

open_group(*s*, *gid=None*)

Open a grouping element with label *s* and *gid* (if set) as id.

Only used by the SVG renderer.

option_image_nocomposite()

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return `not rcParams["image.composite_image"]`.

option_scale_image()

Return whether arbitrary affine transformations in *draw_image* are supported (True for most vector backends).

points_to_pixels(*points*)

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like]

Returns

Points converted to pixels

start_filter()

Switch to a temporary renderer for image filtering effects.

Currently only supported by the agg renderer.

start_rasterizing()

Switch to the raster renderer.

Used by *MixedModeRenderer*.

stop_filter(*filter_func*)

Switch back to the original renderer. The contents of the temporary renderer is processed with the *filter_func* and is drawn on the original renderer as an image.

Currently only supported by the agg renderer.

stop_rasterizing()

Switch back to the vector renderer and draw the contents of the raster renderer as an image on the vector renderer.

Used by *MixedModeRenderer*.

class matplotlib.backend_bases.**ResizeEvent**(*name*, *canvas*)

Bases: *Event*

An event triggered by a canvas resize.

A ResizeEvent has a number of special attributes in addition to those defined by the parent *Event* class.

Attributes

width

[int] Width of the canvas in pixels.

height

[int] Height of the canvas in pixels.

class matplotlib.backend_bases.**ShowBase**

Bases: _Backend

Simple base class to generate a show() function in backends.

Subclass must override mainloop() method.

class matplotlib.backend_bases.**TimerBase**(*interval=None*, *callbacks=None*)

Bases: object

A base class for providing timer events, useful for things animations. Backends need to implement a few specific methods in order to use their own timing mechanisms so that the timer events are integrated into their event loops.

Subclasses must override the following methods:

- _timer_start: Backend-specific code for starting the timer.
- _timer_stop: Backend-specific code for stopping the timer.

Subclasses may additionally override the following methods:

- _timer_set_single_shot: Code for setting the timer to single shot operating mode, if supported by the timer object. If not, the Timer class itself will store the flag and the _on_timer method should be overridden to support such behavior.
- _timer_set_interval: Code for setting the interval on the timer, if there is a method for doing so on the timer object.
- _on_timer: The internal function that any timer object should call, which will handle the task of running all callbacks that have been set.

Parameters

interval

[int, default: 1000ms] The time between timer events in milliseconds. Will be stored as timer.interval.

callbacks

[list[tuple[callable, tuple, dict]]] List of (func, args, kwargs) tuples that will be called upon timer events. This list is accessible as timer.callbacks and can be manipulated directly, or the functions *add_callback* and *remove_callback* can be used.

add_callback(*func*, **args*, ***kwargs*)

Register *func* to be called by timer when the event fires. Any additional arguments provided will be passed to *func*.

This function returns *func*, which makes it possible to use it as a decorator.

property interval

The time between timer events, in milliseconds.

remove_callback(*func*, **args*, ***kwargs*)

Remove *func* from list of callbacks.

args and *kwargs* are optional and used to distinguish between copies of the same function registered to be called with different arguments. This behavior is deprecated. In the future, `*args, **kwargs` won't be considered anymore; to keep a specific callback removable by itself, pass it to *add_callback* as a `functools.partial` object.

property single_shot

Whether this timer should stop after a single run.

start(*interval=None*)

Start the timer object.

Parameters

interval

[int, optional] Timer interval in milliseconds; overrides a previously set interval if provided.

stop()

Stop the timer.

class matplotlib.backend_bases.**ToolContainerBase**(*toolmanager*)

Bases: `object`

Base class for all tool containers, e.g. toolbars.

Attributes

toolmanager

[*ToolManager*] The tools with which this `ToolContainer` wants to communicate.

add_tool(*tool*, *group*, *position=-1*)

Add a tool to this container.

Parameters

tool

[tool_like] The tool to add, see *ToolManager.get_tool*.

group

[str] The name of the group to add this tool to.

position

[int, default: -1] The position within the group to place this tool.

add_toolitem(*name*, *group*, *position*, *image*, *description*, *toggle*)

Add a toolitem to the container.

This method must be implemented per backend.

The callback associated with the button click event, must be *exactly* `self.trigger_tool(name)`.

Parameters

name

[str] Name of the tool to add, this gets used as the tool's ID and as the default label of the buttons.

group

[str] Name of the group that this tool belongs to.

position

[int] Position of the tool within its group, if -1 it goes at the end.

image

[str] Filename of the image for the button or `None`.

description

[str] Description of the tool, used for the tooltips.

toggle

[bool]

- `True` : The button is a toggle (change the pressed/unpressed state between consecutive clicks).
- `False` : The button is a normal button (returns to unpressed state after release).

remove_toolitem(*name*)

Remove a toolitem from the `ToolContainer`.

This method must get implemented per backend.

Called when *`ToolManager`* emits a `tool_removed_event`.

Parameters

name

[str] Name of the tool to remove.

set_message(*s*)

Display a message on the toolbar.

Parameters

s

[str] Message text.

toggle_toolitem(*name*, *toggled*)

Toggle the toolitem without firing event.

Parameters

name

[str] Id of the tool to toggle.

toggled

[bool] Whether to set this tool as toggled or not.

trigger_tool(*name*)

Trigger the tool.

Parameters

name

[str] Name (id) of the tool triggered from within the container.

matplotlib.backend_bases.**button_press_handler**(*event*, *canvas=None*, *toolbar=None*)

The default Matplotlib button actions for extra mouse buttons.

Parameters are as for *key_press_handler*, except that *event* is a *MouseEvent*.

matplotlib.backend_bases.**get_registered_canvas_class**(*format*)

Return the registered default canvas for given file format. Handles deferred import of required backend.

matplotlib.backend_bases.**key_press_handler**(*event*, *canvas=None*, *toolbar=None*)

Implement the default Matplotlib key bindings for the canvas and toolbar described at *Navigation keyboard shortcuts*.

Parameters

event

[*KeyEvent*] A key press/release event.

canvas

[*FigureCanvasBase*, default: `event.canvas`] The backend-specific canvas instance. This parameter is kept for back-compatibility, but, if set, should always be equal to `event.canvas`.

toolbar

[*NavigationToolbar2*, default: `event.canvas.toolbar`] The navigation cursor toolbar. This parameter is kept for back-compatibility, but, if set, should always be equal to `event.canvas.toolbar`.

`matplotlib.backend_bases.`**`register_backend`**(*format*, *backend*, *description=None*)

Register a backend for saving to a given file format.

Parameters

format

[str] File extension

backend

[module string or canvas class] Backend for handling file output

description

[str, default: ""] Description of the file type.

7.2.8 `matplotlib.backend_managers`

class `matplotlib.backend_managers.`**`ToolEvent`**(*name*, *sender*, *tool*, *data=None*)

Bases: `object`

Event for tool manipulation (add/remove).

class `matplotlib.backend_managers.`**`ToolManager`**(*figure=None*)

Bases: `object`

Manager for actions triggered by user interactions (key press, toolbar clicks, ...) on a Figure.

Attributes

figure

[*Figure*] Figure that holds the canvas.

keypresslock

[*LockDraw*] *LockDraw* object to know if the *canvas* key_press_event is locked.

messagelock

[*LockDraw*] *LockDraw* object to know if the message is available to write.

property active_toggle

Currently toggled tools.

add_tool(*name*, *tool*, **args*, ***kwargs*)

Add *tool* to `ToolManager`.

If successful, adds a new event `tool_trigger_{name}` where `{name}` is the *name* of the tool; the event is fired every time the tool is triggered.

Parameters

name

[str] Name of the tool, treated as the ID, has to be unique.

tool

[type] Class of the tool to be added. A subclass will be used instead if one was registered for the current canvas class.

***args, **kwargs**

Passed to the *tool*'s constructor.

See also:

matplotlib.backend_tools.ToolBase

The base class for tools.

property canvas

Canvas managed by FigureManager.

property figure

Figure that holds the canvas.

get_tool(*name*, *warn=True*)

Return the tool object with the given name.

For convenience, this passes tool objects through.

Parameters

name

[str or `ToolBase`] Name of the tool, or the tool itself.

warn

[bool, default: True] Whether a warning should be emitted it no tool with the given name exists.

Returns

***ToolBase* or None**

The tool or None if no tool with the given name exists.

get_tool_keymap(*name*)

Return the keymap associated with the specified tool.

Parameters

name

[str] Name of the Tool.

Returns

list of str

List of keys associated with the tool.

message_event(*message*, *sender=None*)

Emit a *ToolManagerMessageEvent*.

remove_tool(*name*)

Remove tool named *name*.

Parameters

name

[str] Name of the tool.

set_figure(*figure*, *update_tools=True*)

Bind the given figure to the tools.

Parameters

figure

[*Figure*]

update_tools

[bool, default: True] Force tools to update figure.

toolmanager_connect(*s*, *func*)

Connect event with string *s* to *func*.

Parameters

s

[str] The name of the event. The following events are recognized:

- 'tool_message_event'
- 'tool_removed_event'
- 'tool_added_event'

For every tool added a new event is created

- 'tool_trigger_TOOLNAME', where TOOLNAME is the id of the tool.

func

[callable] Callback function for the toolmanager event with signature:

```
def func(event: ToolEvent) -> Any
```

Returns

cid

The callback id for the connection. This can be used in *toolmanager_disconnect*.

toolmanager_disconnect(*cid*)

Disconnect callback id *cid*.

Example usage:

```
cid = toolmanager.toolmanager_connect('tool_trigger_zoom', onpress)
#...later
toolmanager.toolmanager_disconnect(cid)
```

property tools

A dict mapping tool name -> controlled tool.

trigger_tool(*name*, *sender=None*, *canvasevent=None*, *data=None*)

Trigger a tool and emit the `tool_trigger_{name}` event.

Parameters

name

[str] Name of the tool.

sender

[object] Object that wishes to trigger the tool.

canvasevent

[Event] Original Canvas event or None.

data

[object] Extra data to pass to the tool when triggering.

update_keymap(*name*, *key*)

Set the keymap to associate with the specified tool.

Parameters

name

[str] Name of the Tool.

key

[str or list of str] Keys to associate with the tool.

class matplotlib.backend_managers.**ToolManagerMessageEvent**(*name*, *sender*, *message*)

Bases: object

Event carrying messages from toolmanager.

Messages usually get displayed to the user by the toolbar.

class matplotlib.backend_managers.**ToolTriggerEvent**(*name*, *sender*, *tool*, *canvasevent=None*, *data=None*)

Bases: *ToolEvent*

Event to inform that a tool has been triggered.

7.2.9 matplotlib.backend_tools

Abstract base classes define the primitives for Tools. These tools are used by *matplotlib.backend_managers.ToolManager*

ToolBase

Simple stateless tool

ToolToggleBase

Tool that has two states, only one Toggle tool can be active at any given time for the same *matplotlib.backend_managers.ToolManager*

class matplotlib.backend_tools.**AxisScaleBase**(**args*, ***kwargs*)

Bases: *ToolToggleBase*

Base Tool to toggle between linear and logarithmic.

disable(*event=None*)

Disable the toggle tool.

trigger call this method when `toggled` is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to *matplotlib.backend_managers.ToolManager.trigger_tool*.
- Another *ToolToggleBase* derived tool is triggered (from the same *ToolManager*).

enable(*event=None*)

Enable the toggle tool.

trigger calls this method when `toggled` is False.

trigger(*sender*, *event*, *data=None*)

Calls *enable* or *disable* based on `toggled` value.

class matplotlib.backend_tools.**ConfigureSubplotsBase**(*toolmanager*, *name*)

Bases: *ToolBase*

Base tool for the configuration of subplots.

description = 'Configure subplots'

Description of the Tool.

`str`: Tooltip used if the Tool is included in a Toolbar.

image = 'subplots'

Filename of the image.

`str`: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

class matplotlib.backend_tools.**Cursors**(*value*, *names=None*, **values*, *module=None*, *qualname=None*, *type=None*, *start=1*, *boundary=None*)

Bases: `IntEnum`

Backend-independent cursor types.

HAND = 2

MOVE = 4

POINTER = 1

RESIZE_HORIZONTAL = 6

RESIZE_VERTICAL = 7

SELECT_REGION = 3

WAIT = 5

class matplotlib.backend_tools.**RubberbandBase**(*toolmanager*, *name*)

Bases: *ToolBase*

Draw and remove a rubberband.

draw_rubberband(**data*)

Draw rubberband.

This method must get implemented per backend.

remove_rubberband()

Remove rubberband.

This method should get implemented per backend.

trigger(*sender*, *event*, *data=None*)

Call *draw_rubberband* or *remove_rubberband* based on data.

class matplotlib.backend_tools.**SaveFigureBase**(*toolmanager*, *name*)

Bases: *ToolBase*

Base tool for figure saving.

property default_keymap

description = 'Save the figure'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

image = 'filesave'

Filename of the image.

str: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

class matplotlib.backend_tools.**ToolBack**(*toolmanager*, *name*)

Bases: *ViewsPositionsBase*

Move back up the view limits stack.

property default_keymap

description = 'Back to previous view'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

image = 'back'

Filename of the image.

str: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

class matplotlib.backend_tools.**ToolBase**(*toolmanager*, *name*)

Bases: object

Base tool class.

A base tool, only implements *trigger* method or no method at all. The tool is instantiated by *matplotlib.backend_managers.ToolManager*.

property canvas

The canvas of the figure affected by this tool, or None.

default_keymap = None

Keymap to associate with this tool.

`list[str]`: List of keys that will trigger this tool when a keypress event is emitted on `self.figure.canvas`. Note that this attribute is looked up on the instance, and can therefore be a property (this is used e.g. by the built-in tools to load the rcParams at instantiation time).

description = None

Description of the Tool.

`str`: Tooltip used if the Tool is included in a Toolbar.

property figure

The Figure affected by this tool, or None.

image = None

Filename of the image.

`str`: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

property name

The tool id (str, must be unique among tools of a tool manager).

set_figure(*figure*)

property toolmanager

The *ToolManager* that controls this tool.

trigger(*sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolCopyToClipboardBase**(*toolmanager*, *name*)

Bases: *ToolBase*

Tool to copy the figure to the clipboard.

property default_keymap

description = 'Copy the canvas figure to clipboard'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

trigger(**args*, ***kwargs*)

Called when this tool gets used.

This method is called by *ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolCursorPosition**(**args*, ***kwargs*)

Bases: *ToolBase*

Send message with the current pointer position.

This tool runs in the background reporting the position of the cursor.

send_message(*event*)

Call *matplotlib.backend_managers.ToolManager.message_event*.

set_figure(*figure*)

class matplotlib.backend_tools.**ToolForward**(*toolmanager*, *name*)

Bases: *ViewsPositionsBase*

Move forward in the view lim stack.

property default_keymap

description = 'Forward to next view'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

image = 'forward'

Filename of the image.

str: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

class matplotlib.backend_tools.**ToolFullScreen**(*toolmanager*, *name*)

Bases: *ToolBase*

Tool to toggle full screen.

property default_keymap

description = 'Toggle fullscreen mode'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

trigger(*sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolGrid**(*toolmanager*, *name*)

Bases: *ToolBase*

Tool to toggle the major grids of the figure.

property default_keymap

description = 'Toggle major grids'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

trigger(*sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolHelpBase**(*toolmanager*, *name*)

Bases: *ToolBase*

property default_keymap

description = 'Print tool list, shortcuts and description'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

static format_shortcut(*key_sequence*)

Convert a shortcut string from the notation used in rc config to the standard notation for displaying shortcuts, e.g. 'ctrl+a' -> 'Ctrl+A'.

image = 'help'

Filename of the image.

str: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

class matplotlib.backend_tools.**ToolHome**(*toolmanager*, *name*)

Bases: *ViewsPositionsBase*

Restore the original view limits.

property default_keymap

description = 'Reset original view'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

image = 'home'

Filename of the image.

str: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

class matplotlib.backend_tools.**ToolMinorGrid**(*toolmanager*, *name*)

Bases: *ToolBase*

Tool to toggle the major and minor grids of the figure.

property default_keymap

description = 'Toggle major and minor grids'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

trigger(*sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolPan**(**args*)

Bases: *ZoomPanBase*

Pan axes with left mouse, zoom with right.

cursor = 4

Cursor to use when the tool is active.

property default_keymap

description = 'Pan axes with left mouse, zoom with right'

Description of the Tool.

`str`: Tooltip used if the Tool is included in a Toolbar.

image = 'move'

Filename of the image.

`str`: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

radio_group = 'default'

Attribute to group 'radio' like tools (mutually exclusive).

`str` that identifies the group or **None** if not belonging to a group.

class matplotlib.backend_tools.**ToolQuit**(*toolmanager*, *name*)

Bases: *ToolBase*

Tool to call the figure manager destroy method.

property default_keymap

description = 'Quit the figure'

Description of the Tool.

`str`: Tooltip used if the Tool is included in a Toolbar.

trigger(*sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolQuitAll**(*toolmanager*, *name*)

Bases: *ToolBase*

Tool to call the figure manager destroy method.

property default_keymap

description = 'Quit all figures'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

trigger(*sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ToolSetCursor**(**args*, ***kwargs*)

Bases: *ToolBase*

Change to the current cursor while inaxes.

This tool, keeps track of all *ToolToggleBase* derived tools, and updates the cursor when a tool gets triggered.

set_figure(*figure*)

class matplotlib.backend_tools.**ToolToggleBase**(**args*, ***kwargs*)

Bases: *ToolBase*

Toggleable tool.

Every time it is triggered, it switches between enable and disable.

Parameters

``*args``

Variable length argument to be used by the Tool.

``**kwargs``

toggled if present and True, sets the initial state of the Tool Arbitrary keyword arguments to be consumed by the Tool

cursor = None

Cursor to use when the tool is active.

default_toggled = False

Default of toggled state.

disable(*event=None*)

Disable the toggle tool.

trigger call this method when *toggled* is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to *matplotlib.backend_managers.ToolManager.trigger_tool*.
- Another *ToolToggleBase* derived tool is triggered (from the same *ToolManager*).

enable(*event=None*)

Enable the toggle tool.

trigger calls this method when *toggled* is False.

radio_group = None

Attribute to group 'radio' like tools (mutually exclusive).

str that identifies the group or **None** if not belonging to a group.

set_figure(*figure*)

property toggled

State of the toggled tool.

trigger(*sender*, *event*, *data=None*)

Calls *enable* or *disable* based on *toggled* value.

class matplotlib.backend_tools.**ToolViewsPositions**(**args*, ***kwargs*)

Bases: *ToolBase*

Auxiliary Tool to handle changes in views and positions.

Runs in the background and should get used by all the tools that need to access the figure's history of views and positions, e.g.

- *ToolZoom*
- *ToolPan*
- *ToolHome*
- *ToolBack*
- *ToolForward*

add_figure(*figure*)

Add the current figure to the stack of views and positions.

back()

Back one step in the stack of views and positions.

clear(*figure*)

Reset the axes stack.

forward()

Forward one step in the stack of views and positions.

home()

Recall the first view and position from the stack.

push_current(*figure=None*)

Push the current view limits and position onto their respective stacks.

update_home_views(*figure=None*)

Make sure that `self.home_views` has an entry for all axes present in the figure.

update_view()

Update the view limits and position for each axes from the current stack position. If any axes are present in the figure that aren't in the current stack position, use the home view limits for those axes and don't update *any* positions.

class matplotlib.backend_tools.**ToolXScale**(**args*, ***kwargs*)

Bases: *AxisScaleBase*

Tool to toggle between linear and logarithmic scales on the X axis.

property default_keymap

description = 'Toggle scale X axis'

Description of the Tool.

`str`: Tooltip used if the Tool is included in a Toolbar.

set_scale(*ax*, *scale*)

class matplotlib.backend_tools.**ToolYScale**(**args*, ***kwargs*)

Bases: *AxisScaleBase*

Tool to toggle between linear and logarithmic scales on the Y axis.

property default_keymap

description = 'Toggle scale Y axis'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

set_scale(*ax*, *scale*)

class matplotlib.backend_tools.**ToolZoom**(**args*)

Bases: *ZoomPanBase*

A Tool for zooming using a rectangle selector.

cursor = 3

Cursor to use when the tool is active.

property default_keymap

description = 'Zoom to rectangle'

Description of the Tool.

str: Tooltip used if the Tool is included in a Toolbar.

image = 'zoom_to_rect'

Filename of the image.

str: Filename of the image to use in a Toolbar. If None, the *name* is used as a label in the toolbar button.

radio_group = 'default'

Attribute to group 'radio' like tools (mutually exclusive).

str that identifies the group or **None** if not belonging to a group.

class matplotlib.backend_tools.**ViewsPositionsBase**(*toolmanager*, *name*)

Bases: *ToolBase*

Base class for *ToolHome*, *ToolBack* and *ToolForward*.

trigger(*sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *ToolManager.trigger_tool*.

Parameters

event

[*Event*] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.**ZoomPanBase**(**args*)

Bases: *ToolToggleBase*

Base class for *ToolZoom* and *ToolPan*.

disable(*event=None*)

Release the canvas and disconnect press/release events.

enable(*event=None*)

Connect press/release events and lock the canvas.

scroll_zoom(*event*)

trigger(*sender*, *event*, *data=None*)

Calls *enable* or *disable* based on `toggled` value.

matplotlib.backend_tools.**add_tools_to_container**(*container*, *tools=[['navigation', ['home', 'back', 'forward']], ['zoompan', ['pan', 'zoom', 'subplots']], ['io', ['save', 'help']]]*)

Add multiple tools to the container.

Parameters

container

[Container] *backend_bases.ToolContainerBase* object that will get the tools added.

tools

[list, optional] List in the form `[[group1, [tool1, tool2 ...]], [group2, [...]]]` where the tools `[tool1, tool2, ...]` will display in group1. See *backend_bases.ToolContainerBase.add_tool* for details.

matplotlib.backend_tools.**add_tools_to_manager**(*toolmanager*, *tools={'back': <class 'matplotlib.backend_tools.ToolBack'>, 'copy': <class 'matplotlib.backend_tools.ToolCopyToClipboardBase'>, 'cursor': <class 'matplotlib.backend_tools.ToolSetCursor'>, 'forward': <class 'matplotlib.backend_tools.ToolForward'>, 'fullscreen': <class 'matplotlib.backend_tools.ToolFullScreen'>, 'grid': <class 'matplotlib.backend_tools.ToolGrid'>, 'grid_minor': <class 'matplotlib.backend_tools.ToolMinorGrid'>, 'help': <class 'matplotlib.backend_tools.ToolHelpBase'>, 'home': <class 'matplotlib.backend_tools.ToolHome'>, 'pan': <class 'matplotlib.backend_tools.ToolPan'>, 'position': <class 'matplotlib.backend_tools.ToolCursorPosition'>, 'quit': <class 'matplotlib.backend_tools.ToolQuit'>, 'quit_all': <class 'matplotlib.backend_tools.ToolQuitAll'>, 'rubberband': <class 'matplotlib.backend_tools.RubberbandBase'>, 'save': <class 'matplotlib.backend_tools.SaveFigureBase'>, 'subplots': <class 'matplotlib.backend_tools.ConfigureSubplotsBase'>, 'viewpos': <class 'matplotlib.backend_tools.ToolViewsPositions'>, 'xscale': <class 'matplotlib.backend_tools.ToolXScale'>, 'yscale': <class 'matplotlib.backend_tools.ToolYScale'>, 'zoom': <class 'matplotlib.backend_tools.ToolZoom'>}*)

Add multiple tools to a *ToolManager*.

Parameters

toolmanager

[*backend_managers.ToolManager*] Manager to which the tools are added.

tools

[{str: class_like}, optional] The tools to add in a {name: tool} dict, see *backend_managers.ToolManager.add_tool* for more info.

matplotlib.backend_tools.**cursors**

alias of *Cursors*

7.2.10 matplotlib.backends

matplotlib.backends.backend_mixed

class matplotlib.backends.backend_mixed.**MixedModeRenderer**(*figure*, *width*, *height*, *dpi*, *vector_renderer*, *raster_renderer_class=None*, *bbox_inches_restore=None*)

Bases: object

A helper class to implement a renderer that switches between vector and raster drawing. An example may be a PDF writer, where most things are drawn with PDF vector commands, but some very complex objects, such as quad meshes, are rasterised and then output as images.

Parameters

figure

[*Figure*] The figure instance.

width

[scalar] The width of the canvas in logical units

height

[scalar] The height of the canvas in logical units

dpi

[float] The dpi of the canvas

vector_renderer

[*RendererBase*] An instance of a subclass of *RendererBase* that will be used for the vector drawing.

raster_renderer_class

[*RendererBase*] The renderer class to use for the raster drawing. If not provided, this will use the Agg backend (which is currently the only viable option anyway.)

start_rasterizing()

Enter "raster" mode. All subsequent drawing commands (until *stop_rasterizing* is called) will be drawn with the raster backend.

stop_rasterizing()

Exit "raster" mode. All of the drawing that was done since the last *start_rasterizing* call will be copied to the vector backend by calling draw_image.

matplotlib.backends.backend_template

A fully functional, do-nothing backend intended as a template for backend writers. It is fully functional in that you can select it as a backend e.g. with

```
import matplotlib
matplotlib.use("template")
```

and your program will (should!) run without error, though no output is produced. This provides a starting point for backend writers; you can selectively implement drawing methods (*draw_path*, *draw_image*, etc.) and slowly see your figure come to life instead having to have a full-blown implementation before getting any results.

Copy this file to a directory outside the Matplotlib source tree, somewhere where Python can import it (by adding the directory to your `sys.path` or by packaging it as a normal Python package); if the backend is importable as `import my.backend` you can then select it using

```
import matplotlib
matplotlib.use("module://my.backend")
```

If your backend implements support for saving figures (i.e. has a `print_xyz` method), you can register it as the default handler for a given file type:

```
from matplotlib.backend_bases import register_backend
register_backend('xyz', 'my_backend', 'XYZ File Format')
...
plt.savefig("figure.xyz")
```

matplotlib.backends.backend_template.**FigureCanvas**

alias of *FigureCanvasTemplate*

class matplotlib.backends.backend_template.**FigureCanvasTemplate**(*figure=None*)

Bases: *FigureCanvasBase*

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc.

Note: GUI templates will want to connect events for button presses, mouse movements and key presses to functions that call the base class methods button_press_event, button_release_event, motion_notify_event, key_press_event, and key_release_event. See the implementations of the interactive backends for examples.

Attributes

figure

[*Figure*] A high-level Figure instance

draw()

Draw the figure using the renderer.

It is important that this method actually walk the artist tree even if not output is produced because this will trigger deferred work (like computing limits auto-limits and tick values) that users may want access to before saving to disk.

filetypes = {'eps': 'Encapsulated Postscript', 'foo': 'My magic Foo format', 'jpeg': 'Joint Photographic Experts Group', 'jpg': 'Joint Photographic Experts Group', 'pdf': 'Portable Document Format', 'pgf': 'PGF code for LaTeX', 'png': 'Portable Network Graphics', 'ps': 'Postscript', 'raw': 'Raw RGBA bitmap', 'rgba': 'Raw RGBA bitmap', 'svg': 'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphics', 'tif': 'Tagged Image File Format', 'tiff': 'Tagged Image File Format', 'webp': 'WebP Image Format'}

get_default_filetype()

Return the default savefig file format as specified in *rcParams["savefig.format"]* (default: `'png'`).

The returned string does not include a period. This method is overridden in backends that only support a single file type.

manager_class

alias of *FigureManagerTemplate*

print_foo(*filename*, ***kwargs*)

Write out format foo.

This method is normally called via *Figure.savefig* and *FigureCanvasBase.print_figure*, which take care of setting the figure facecolor, edgecolor, and dpi to the desired output values, and will restore them to the original values. Therefore, *print_foo* does not need to handle these settings.

matplotlib.backends.backend_template.**FigureManager**

alias of *FigureManagerTemplate*

class matplotlib.backends.backend_template.**FigureManagerTemplate**(*canvas*, *num*)

Bases: *FigureManagerBase*

Helper class for pyplot mode, wraps everything up into a neat bundle.

For non-interactive backends, the base class is sufficient. For interactive backends, see the documentation of the *FigureManagerBase* class for the list of methods that can/should be overridden.

class matplotlib.backends.backend_template.**GraphicsContextTemplate**

Bases: *GraphicsContextBase*

The graphics context provides the color, line styles, etc. See the cairo and postscript backends for examples of mapping the graphics context attributes (cap styles, join styles, line widths, colors) to a particular backend. In cairo this is done by wrapping a cairo.Context object and forwarding the appropriate calls to it using a dictionary mapping styles to gdk constants. In Postscript, all the work is done by the renderer, mapping line styles to postscript calls.

If it's more appropriate to do the mapping at the renderer level (as in the postscript backend), you don't need to override any of the GC methods. If it's more appropriate to wrap an instance (as in the cairo backend) and do the mapping here, you'll need to override several of the setter methods.

The base GraphicsContext stores colors as an RGB tuple on the unit interval, e.g., (0.5, 0.0, 1.0). You may need to map this to colors appropriate for your backend.

class matplotlib.backends.backend_template.**RendererTemplate**(*dpi*)

Bases: *RendererBase*

The renderer handles drawing/rendering operations.

This is a minimal do-nothing class that can be used to get started when writing a new backend. Refer to *backend_bases.RendererBase* for documentation of the methods.

draw_image(*gc*, *x*, *y*, *im*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[(N, M, 4) array of numpy.uint8] An array of RGBA pixels.

transform

[*Affine2DBase*] If and only if the concrete backend is written such that option_scale_image returns True, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_text(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw a text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

ismath

[bool or "TeX"] If True, use mathtext parser. If "TeX", use tex for rendering.

mtext

[*Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

flipy()

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts.

get_canvas_width_height()

Return the canvas width and height in display coords.

get_text_width_height_descent(*s*, *prop*, *ismath*)

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

Whitespace at the start and the end of *s* is included in the reported width.

new_gc()

Return an instance of a *GraphicsContextBase*.

points_to_pixels(*points*)

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like]

Returns

Points converted to pixels

matplotlib.backends.backend_agg

An Anti-Grain Geometry (AGG) backend.

Features that are implemented:

- capstyles and join styles
- dashes
- linewidth
- lines, rectangles, ellipses
- clipping to a rectangle
- output to RGBA and Pillow-supported image formats
- alpha blending
- DPI scaling properly - everything scales properly (dashes, linewidths, etc)
- draw polygon

- freetype2 w/ ft2font

Still TODO:

- integrate screen dpi w/ ppi and text

matplotlib.backends.backend_agg.**FigureCanvas**
alias of *FigureCanvasAgg*

class matplotlib.backends.backend_agg.**FigureCanvasAgg**(*figure=None*)
Bases: *FigureCanvasBase*

buffer_rgba()
Get the image as a memoryview to the renderer's buffer.

draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

copy_from_bbox(*bbox*)

draw()
Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

get_renderer()

print_jpeg(*filename_or_obj*, *, *metadata=None*, *pil_kwargs=None*)
Write the figure to a JPEG file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to PIL.Image.Image.save when saving the figure.

print_jpg(*filename_or_obj*, *, *metadata=None*, *pil_kwargs=None*)
Write the figure to a JPEG file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to PIL.Image.Image.save when saving the figure.

print_png(*filename_or_obj*, *, *metadata=None*, *pil_kwargs=None*)

Write the figure to a PNG file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

metadata

[dict, optional] Metadata in the PNG file as key-value pairs of bytes or latin-1 encodable strings. According to the PNG specification, keys must be shorter than 79 chars.

The PNG specification defines some common keywords that may be used as appropriate:

- Title: Short (one line) title or caption for image.
- Author: Name of image's creator.
- Description: Description of image (possibly long).
- Copyright: Copyright notice.
- Creation Time: Time of original image creation (usually RFC 1123 format).
- Software: Software used to create the image.
- Disclaimer: Legal disclaimer.
- Warning: Warning of nature of content.
- Source: Device used to create the image.
- Comment: Miscellaneous comment; conversion from other image format.

Other keywords may be invented for other purposes.

If 'Software' is not given, an autogenerated value for Matplotlib will be used. This can be removed by setting it to *None*.

For more details see the PNG specification.

pil_kwargs

[dict, optional] Keyword arguments passed to `PIL.Image.Image.save`.

If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

print_raw(*filename_or_obj*, *, *metadata=None*)

print_rgba(*filename_or_obj*, *, *metadata=None*)

print_tif(*filename_or_obj*, *, *metadata=None*, *pil_kwargs=None*)

Write the figure to a TIFF file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure.

print_tiff(*filename_or_obj*, *, *metadata=None*, *pil_kwargs=None*)

Write the figure to a TIFF file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure.

print_to_buffer()

print_webp(*filename_or_obj*, *, *metadata=None*, *pil_kwargs=None*)

Write the figure to a WebP file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure.

restore_region(*region*, *bbox=None*, *xy=None*)

tostring_argb()

Get the image as ARGB `bytes`.

draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

tostring_rgb()

[*Deprecated*] Get the image as RGB `bytes`.

draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

Notes

Deprecated since version 3.8: Use buffer_rgba instead.

class matplotlib.backends.backend_agg.**RendererAgg**(*width*, *height*, *dpi*)

Bases: *RendererBase*

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles

buffer_rgba()

clear()

draw_mathtext(*gc*, *x*, *y*, *s*, *prop*, *angle*)

Draw mathtext using *matplotlib.mathtext*.

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_tex(*gc*, *x*, *y*, *s*, *prop*, *angle*, ***, *mtext=None*)

Draw a TeX instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The TeX text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*Text*] The original text object to be rendered.

draw_text(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw a text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

ismath

[bool or "TeX"] If True, use mathtext parser. If "TeX", use tex for rendering.

mtext

[*Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

get_canvas_width_height()

Return the canvas width and height in display coords.

get_text_width_height_descent(*s*, *prop*, *ismath*)

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

Whitespace at the start and the end of *s* is included in the reported width.

option_image_nocomposite()

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return `not rcParams["image.composite_image"]`.

option_scale_image()

Return whether arbitrary affine transformations in `draw_image` are supported (True for most vector backends).

points_to_pixels(*points*)

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like]

Returns

Points converted to pixels

restore_region(*region*, *bbox=None*, *xy=None*)

Restore the saved region. If bbox (instance of BboxBase, or its extents) is given, only the region specified by the bbox will be restored. *xy* (a pair of floats) optionally specifies the new position (the LLC of the original region, not the LLC of the bbox) where the region will be restored.

```
>>> region = renderer.copy_from_bbox()
>>> x1, y1, x2, y2 = region.get_extents()
>>> renderer.restore_region(region, bbox=(x1+dx, y1, x2, y2),
...                         xy=(x1-dx, y1))
```

start_filter()

Start filtering. It simply creates a new canvas (the old one is saved).

stop_filter(*post_processing*)

Save the current canvas as an image and apply post processing.

The *post_processing* function:

```
def post_processing(image, dpi):
  # ny, nx, depth = image.shape
  # image (numpy array) has RGBA channels and has a depth of 4.
  ...
  # create a new_image (numpy array of 4 channels, size can be
  # different). The resulting image may have offsets from
  # lower-left corner of the original image
  return new_image, offset_x, offset_y
```

The saved renderer is restored and the returned image from post_processing is plotted (using draw_image) on it.

tostring_argb()

tostring_rgb()

[*Deprecated*]

Notes

Deprecated since version 3.8: Use buffer_rgba instead.

matplotlib.backends.backend_agg.**get_hinting_flag**()

matplotlib.backends.backend_cairo

A Cairo backend for Matplotlib

Author

Steve Chaplin and others

This backend depends on cairocffi or pycairo.

matplotlib.backends.backend_cairo.**FigureCanvas**

alias of *FigureCanvasCairo*

class matplotlib.backends.backend_cairo.**FigureCanvasCairo**(*figure=None*)

Bases: *FigureCanvasBase*

copy_from_bbox(*bbox*)

get_renderer()

print_pdf(*fobj*, *, *orientation='portrait'*)

print_png(*fobj*)

print_ps(*fobj*, *, *orientation='portrait'*)

print_raw(*fobj*)

print_rgba(*fobj*)

print_svg(*fobj*, *, *orientation='portrait'*)

print_svgz(*fobj*, *, *orientation='portrait'*)

restore_region(*region*)

class matplotlib.backends.backend_cairo.**GraphicsContextCairo**(*renderer*)

Bases: *GraphicsContextBase*

get_antialiased()

Return whether the object should try to do antialiased rendering.

get_rgb()

Return a tuple of three or four floats from 0-1.

restore()

Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack.

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, `alpha` will override them.

set_antialiased(*b*)

Set whether object should be drawn with antialiased rendering.

set_capstyle(*cs*)

Set how to draw endpoints of lines.

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clip_path(*path*)

Set the clip path to a *TransformedPath* or None.

set_clip_rectangle(*rectangle*)

Set the clip rectangle to a *Bbox* or None.

set_dashes(*offset*, *dashes*)

Set the dash style for the gc.

Parameters

dash_offset

[float] Distance, in points, into the dash pattern at which to start the pattern. It is usually set to 0.

dash_list

[array-like or None] The on-off sequence as points. None specifies a solid line. All values must otherwise be non-negative (≥ 0).

Notes

See p. 666 of the PostScript Language Reference for more info.

set_foreground(*fg*, *isRGBA=None*)

Set the foreground color.

Parameters

fg

[color]

isRGBA

[bool] If *fg* is known to be an `(r, g, b, a)` tuple, *isRGBA* can be set to True to improve performance.

set_joinstyle(*js*)

Set how to draw connections between line segments.

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_linewidth(*w*)

Set the linewidth in points.

class matplotlib.backends.backend_cairo.**RendererCairo**(*dpi*)

Bases: *RendererBase*

draw_image(*gc*, *x*, *y*, *im*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[(N, M, 4) array of `numpy.uint8`] An array of RGBA pixels.

transform

[*Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image` returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, *transform*, *rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_path

[*Path*] The path for the marker.

marker_trans

[*Transform*] An affine transform applied to the marker.

path

[*Path*] The locations to draw the markers.

trans

[*Transform*] An affine transform applied to the path.

rgbFace

[color, optional]

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_text(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw a text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

ismath

[bool or "TeX"] If True, use mathtext parser. If "TeX", use tex for rendering.

mtext

[*Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

get_canvas_width_height()

Return the canvas width and height in display coords.

get_text_width_height_descent(*s*, *prop*, *ismath*)

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

Whitespace at the start and the end of *s* is included in the reported width.

new_gc()

Return an instance of a *GraphicsContextBase*.

points_to_pixels(*points*)

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like]

Returns

Points converted to pixels

set_context(*ctx*)

matplotlib.backends.backend_gtk3agg, matplotlib.backends.backend_gtk3cairo

NOTE These *Backends* are not documented here, to avoid adding a dependency to building the docs.

matplotlib.backends.backend_gtk4agg, matplotlib.backends.backend_gtk4cairo

NOTE These *Backends* are not documented here, to avoid adding a dependency to building the docs.

matplotlib.backends.backend_nbagg

Interactive figures in the IPython notebook.

class matplotlib.backends.backend_nbagg.**CommSocket**(*manager*)

Bases: object

Manages the Comm connection between IPython and the browser (client).

Comms are 2 way, with the CommSocket being able to publish a message via the send_json method, and handle a message with on_message. On the JS side figure.send_message and figure.ws.onmessage do the sending and receiving respectively.

is_open()

on_close()

on_message(*message*)

send_binary(*blob*)

send_json(*content*)

matplotlib.backends.backend_nbagg.**FigureCanvas**

alias of *FigureCanvasNbAgg*

class matplotlib.backends.backend_nbagg.**FigureCanvasNbAgg**(**args*, ***kwargs*)

Bases: *FigureCanvasWebAggCore*

manager_class

alias of *FigureManagerNbAgg*

matplotlib.backends.backend_nbagg.**FigureManager**

alias of *FigureManagerNbAgg*

class matplotlib.backends.backend_nbagg.**FigureManagerNbAgg**(*canvas*, *num*)

Bases: *FigureManagerWebAgg*

ToolbarCls

alias of *NavigationIPy*

clearup_closed()

Clear up any closed Comms.

property connected

classmethod create_with_canvas(*canvas_class*, *figure*, *num*)

Create a manager for a given *figure* using a specific *canvas_class*.

Backends should override this method if they have specific needs for setting up the canvas or the manager.

destroy()

display_js()

classmethod get_javascript(*stream=None*)

remove_comm(*comm_id*)

reshow()

A special method to re-show the figure in the notebook.

show()

For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in *Figure.show*.

class matplotlib.backends.backend_nbagg.**NavigationIPy**(*canvas*)

Bases: *NavigationToolbar2WebAgg*

toolitems = [('Home', 'Reset original view', 'fa fa-home', 'home'), ('Back', 'Back to previous view', 'fa fa-arrow-left', 'back'), ('Forward', 'Forward to next view', 'fa fa-arrow-right', 'forward'), (None, None, None, None), ('Pan', 'Left button pans, Right button zooms\nx/y fixes axis, CTRL fixes aspect', 'fa fa-arrows', 'pan'), ('Zoom', 'Zoom to rectangle\nx/y fixes axis', 'fa fa-square-o', 'zoom'), (None, None, None, None), ('Download', 'Download plot', 'fa fa-floppy-o', 'download')]

matplotlib.backends.backend_nbagg.**connection_info**()

Return a string showing the figure and connection status for the backend.

This is intended as a diagnostic tool, and not for general use.

matplotlib.backends.backend_pdf

A PDF Matplotlib backend.

Author: Jouni K Seppänen <jks@iki.fi> and others.

matplotlib.backends.backend_pdf.**FigureCanvas**

alias of *FigureCanvasPdf*

class matplotlib.backends.backend_pdf.**FigureCanvasPdf**(*figure=None*)

Bases: *FigureCanvasBase*

draw()

Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

filetypes = {'pdf': 'Portable Document Format'}

fixed_dpi = 72

get_default_filetype()

Return the default savefig file format as specified in *rcParams["savefig.format"]* (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

print_pdf(*filename*, *, *bbox_inches_restore=None*, *metadata=None*)

class matplotlib.backends.backend_pdf.**GraphicsContextPdf**(*file*)

Bases: *GraphicsContextBase*

alpha_cmd(*alpha*, *forced*, *effective_alphas*)

capstyle_cmd(*style*)

capstyles = {'butt': 0, 'projecting': 2, 'round': 1}

clip_cmd(*cliprect*, *clippath*)

Set clip rectangle. Calls *pop()* and *push()*.

commands = ((('_cliprect', '_clippath'), <function GraphicsContextPdf.clip_cmd>), (('_alpha', '_forced_alpha', '_effective_alphas'), <function GraphicsContextPdf.alpha_cmd>), (('_capstyle',), <function GraphicsContextPdf.capstyle_cmd>), (('_fillcolor',), <function GraphicsContextPdf.fillcolor_cmd>), (('_joinstyle',), <function GraphicsContextPdf.joinstyle_cmd>), (('_linewidth',), <function GraphicsContextPdf.linewidth_cmd>), (('_dashes',), <function GraphicsContextPdf.dash_cmd>), (('_rgb',), <function GraphicsContextPdf.rgb_cmd>), (('_hatch', '_hatch_color'), <function GraphicsContextPdf.hatch_cmd>))

copy_properties(*other*)

Copy properties of other into self.

dash_cmd(*dashes*)

delta(*other*)

Copy properties of other into self and return PDF commands needed to transform *self* into *other*.

fill(**args*)

Predicate: does the path need to be filled?

An optional argument can be used to specify an alternative _fillcolor, as needed by RendererPdf.draw_markers.

fillcolor_cmd(*rgb*)

finalize()

Make sure every pushed graphics state is popped.

hatch_cmd(*hatch*, *hatch_color*)

joinstyle_cmd(*style*)

joinstyles = {'bevel': 2, 'miter': 0, 'round': 1}

linewidth_cmd(*width*)

paint()

Return the appropriate pdf operator to cause the path to be stroked, filled, or both.

pop()

push()

rgb_cmd(*rgb*)

stroke()

Predicate: does the path need to be stroked (its outline drawn)? This tests for the various conditions that disable stroking the path, in which case it would presumably be filled.

class matplotlib.backends.backend_pdf.**Name**(*name*)

Bases: object

PDF name object.

name

pdfRepr()

class matplotlib.backends.backend_pdf.**Op**(*value*, *names=None*, **values*, *module=None*, *qualname=None*, *type=None*, *start=1*, *boundary=None*)

Bases: Enum

PDF operators (not an exhaustive list).

begin_text = b'BT'

clip = b'W'

close_fill_stroke = b'b'

close_stroke = b's'

closepath = b'h'

concat_matrix = b'cm'

curveto = b'c'

end_text = b'ET'

endpath = b'n'

fill = b'f'

fill_stroke = b'B'

grestore = b'Q'

gsave = b'q'

lineto = b'l'

moveto = b'm'

classmethod paint_path(*fill*, *stroke*)

Return the PDF operator to paint a path.

Parameters

fill

[bool] Fill the path with the fill color.

stroke

[bool] Stroke the outline of the path with the line color.

pdfRepr()

rectangle = b're'

selectfont = b'Tf'

setcolor_nonstroke = b'scn'

setcolor_stroke = b'SCN'

setcolorspace_nonstroke = b'cs'

setcolorspace_stroke = b'CS'

setdash = b'd'

setgray_nonstroke = b'g'

setgray_stroke = b'G'

setgstate = b'gs'

setlinecap = b'J'

setlinejoin = b'j'

setlinewidth = b'w'

setrgb_nonstroke = b'rg'

setrgb_stroke = b'RG'

shading = b'sh'

show = b'Tj'

showkern = b'TJ'

stroke = b'S'

textmatrix = b'Tm'

textpos = b'Td'

use_xobject = b'Do'

class matplotlib.backends.backend_pdf.**PdfFile**(*filename*, *metadata=None*)

Bases: object

PDF file object.

Parameters

filename

[str or path-like or file-like] Output target; if a string, a file will be opened for writing.

metadata

[dict from strings to strings and dates] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: `{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}`.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

addGouraudTriangles(*points*, *colors*)

Add a Gouraud triangle shading.

Parameters

points

[np.ndarray] Triangle vertices, shape (n, 3, 2) where n = number of triangles, 3 = vertices, 2 = x, y.

colors

[np.ndarray] Vertex colors, shape (n, 3, 1) or (n, 3, 4) as with points, but last dimension is either (gray,) or (r, g, b, alpha).

Returns

Name, Reference

alphaState(*alpha*)

Return name of an ExtGState that sets alpha to the given value.

beginStream(*id*, *len*, *extra=None*, *png=None*)

close()

Flush all buffers and free all resources.

createType1Descriptor(*t1font*, *fontfile*)

dviFontName(*dvifont*)

Given a dvi font object, return a name suitable for Op.selectfont. This registers the font information in `self.dviFontInfo` if not yet registered.

embedTTF(*filename*, *characters*)

Embed the TTF font from the named file into the document.

endStream()

finalize()

Write out the various deferred objects and the pdf end matter.

fontName(*fontprop*)

Select a font based on fontprop and return a name suitable for Op.selectfont. If fontprop is a string, it will be interpreted as the filename of the font.

hatchPattern(*hatch_style*)

imageObject(*image*)

Return name of an image XObject representing the given image.

markerObject(*path*, *trans*, *fill*, *stroke*, *lw*, *joinstyle*, *capstyle*)

Return name of a marker XObject representing the given path.

newPage(*width*, *height*)

newTextnote(*text*, *positionRect=[-100, -100, 0, 0]*)

output(**data*)

outputStream(*ref*, *data*, ***, *extra=None*)

pathCollectionObject(*gc*, *path*, *trans*, *padding*, *filled*, *stroked*)

static pathOperations(*path*, *transform*, *clip=None*, *simplify=None*, *sketch=None*)

recordXref(*id*)

reserveObject(*name=''*)

Reserve an ID for an indirect object.

The name is used for debugging in case we forget to print out the object with writeObject.

write(*data*)

writeExtGSTates()

writeFonts()

writeGouraudTriangles()

writeHatches()

writeImages()

writeInfoDict()

Write out the info dictionary, checking it for good form

writeMarkers()

writeObject(*object*, *contents*)

writePath(*path*, *transform*, *clip=False*, *sketch=None*)

writePathCollectionTemplates()

writeTrailer()

Write out the PDF trailer.

writeXref()

Write out the xref table.

class matplotlib.backends.backend_pdf.**PdfPages**(*filename*, *keep_empty=<object object>*, *metadata=None*)

Bases: object

A multi-page PDF file.

Notes

In reality *PdfPages* is a thin wrapper around *PdfFile*, in order to avoid confusion when using *savefig* and forgetting the format argument.

Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

Parameters

filename

[str or path-like or file-like] Plots using *PdfPages.savefig* will be written to a file at this location. The file is opened when a figure is saved for the first time (overwriting any older file with the same name).

keep_empty

[bool, optional] If set to False, then empty pdf files will be deleted automatically when closed.

metadata

[dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: `{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}`.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

attach_note(*text*, *positionRect=[-100, -100, 0, 0]*)

Add a new text note to the page to be saved next. The optional positionRect specifies the position of the new note on the page. It is outside the page per default to make sure it is invisible on printouts.

close()

Finalize this object, making the underlying file a complete PDF file.

get_pagecount()

Return the current number of pages in the multipage pdf file.

infodict()

Return a modifiable information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary').

property keep_empty

[*Deprecated*]

Notes

Deprecated since version 3.8:

savefig(*figure=None*, ***kwargs*)

Save a *Figure* to this file as a new page.

Any other keyword arguments are passed to *savefig*.

Parameters

figure

[*Figure* or int, default: the active figure] The figure, or index of the figure, that is saved to the file.

class matplotlib.backends.backend_pdf.**Reference**(*id*)

Bases: object

PDF reference object.

Use PdfFile.reserveObject() to create References.

pdfRepr()

write(*contents*, *file*)

class matplotlib.backends.backend_pdf.**RendererPdf**(*file*, *image_dpi*, *height*, *width*)

Bases: RendererPDFPSBase

check_gc(*gc*, *fillcolor=None*)

draw_gouraud_triangle(*gc*, *points*, *colors*, *trans*)

[*Deprecated*] Draw a Gouraud-shaded triangle.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

points

[(3, 2) array-like] Array of (x, y) points for the triangle.

colors

[(3, 4) array-like] RGBA colors for each point of the triangle.

transform

[*Transform*] An affine transform to apply to the points.

Notes

Deprecated since version 3.7: Use draw_gouraud_triangles instead.

draw_gouraud_triangles(*gc*, *points*, *colors*, *trans*)

Draw a series of Gouraud triangles.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

triangles_array

[(N, 3, 2) array-like] Array of *N* (x, y) points for the triangles.

colors_array

[(N, 3, 4) array-like] Array of *N* RGBA colors for each point of the triangles.

transform

[*Transform*] An affine transform to apply to the points.

draw_image(*gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[(N, M, 4) array of `numpy.uint8`] An array of RGBA pixels.

transform

[*Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image` returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_path

[*Path*] The path for the marker.

marker_trans

[*Transform*] An affine transform applied to the marker.

path

[*Path*] The locations to draw the markers.

trans

[*Transform*] An affine transform applied to the path.

rgbFace

[color, optional]

draw_mathtext(*gc*, *x*, *y*, *s*, *prop*, *angle*)

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_path_collection(*gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offset_trans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)

Draw a collection of *paths*.

Each path is first transformed by the corresponding entry in *all_transforms* (a list of (3, 3) matrices) and then by *master_transform*. They are then translated by the corresponding entry in *offsets*, which has been first transformed by *offset_trans*.

facecolors, *edgecolors*, *linewidths*, *linestyles*, and *antialiased* are lists that set the corresponding properties.

offset_position is unused now, but the argument is kept for backwards compatibility.

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths` and `_iter_collection` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those

generators, so that changes to the behavior of *draw_path_collection* can be made globally.

draw_tex(*gc*, *x*, *y*, *s*, *prop*, *angle*, *, *mtext=None*)

Draw a TeX instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The TeX text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*Text*] The original text object to be rendered.

draw_text(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw a text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

ismath

[bool or "TeX"] If True, use mathtext parser. If "TeX", use tex for rendering.

mtext

[*Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

encode_string(*s*, *fonttype*)

finalize()

get_image_magnification()

Get the factor by which to magnify images passed to *draw_image*. Allows a backend to have images at a different resolution to other artists.

new_gc()

Return an instance of a *GraphicsContextBase*.

class matplotlib.backends.backend_pdf.**Stream**(*id*, *len*, *file*, *extra=None*, *png=None*)

Bases: object

PDF stream object.

This has no pdfRepr method. Instead, call begin(), then output the contents of the stream by calling write(), and finally call end().

Parameters

id

[int] Object id of the stream.

len

[Reference or None] An unused Reference object for the length of the stream; None means to use a memory buffer so the length can be inlined.

file

[PdfFile] The underlying object to write the stream to.

extra

[dict from Name to anything, or None] Extra key-value pairs to include in the stream header.

png

[dict or None] If the data is already png encoded, the decode parameters.

compressobj

end()
Finalize stream.

extra

file

id

len

pdfFile

pos

write(*data*)
Write some data on the stream.

class matplotlib.backends.backend_pdf.**Verbatim**(*x*)
Bases: object

Store verbatim PDF command content for later inclusion in the stream.

pdfRepr()

matplotlib.backends.backend_pdf.**pdfRepr**(*obj*)
Map Python objects to PDF syntax.

matplotlib.backends.backend_pgf

matplotlib.backends.backend_pgf.**FigureCanvas**
alias of *FigureCanvasPgf*

class matplotlib.backends.backend_pgf.**FigureCanvasPgf**(*figure=None*)
Bases: *FigureCanvasBase*

draw()
Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

filetypes = {'pdf': 'LaTeX compiled PGF picture', 'pgf': 'LaTeX PGF picture', 'png': 'Portable Network Graphics'}

get_default_filetype()

Return the default savefig file format as specified in *rcParams["savefig.format"]* (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

get_renderer()

print_pdf(*fname_or_fh*, *, *metadata=None*, ***kwargs*)

Use LaTeX to compile a pgf generated figure to pdf.

print_pgf(*fname_or_fh*, ***kwargs*)

Output pgf macros for drawing the figure so it can be included and rendered in latex documents.

print_png(*fname_or_fh*, ***kwargs*)

Use LaTeX to compile a pgf figure to pdf and convert it to png.

exception matplotlib.backends.backend_pgf.**LatexError**(*message*, *latex_output=''*)

Bases: Exception

class matplotlib.backends.backend_pgf.**LatexManager**

Bases: object

The LatexManager opens an instance of the LaTeX application for determining the metrics of text elements. The LaTeX environment can be modified by setting fonts and/or a custom preamble in *rcParams*.

get_width_height_descent(*text*, *prop*)

Get the width, total height, and descent (in TeX points) for a text typeset by the current LaTeX environment.

class matplotlib.backends.backend_pgf.**PdfPages**(*filename*, *, *keep_empty=<object object>*, *metadata=None*)

Bases: object

A multi-page PDF file using the pgf backend

Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

Parameters

filename

[str or path-like] Plots using *PdfPages.savefig* will be written to a file at this location. Any older file with the same name is overwritten.

keep_empty

[bool, default: True] If set to False, then empty pdf files will be deleted automatically when closed.

metadata

[dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: `{'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}`.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

Note that some versions of LaTeX engines may ignore the 'Producer' key and set it to themselves.

close()

Finalize this object, running LaTeX in a temporary directory and moving the final pdf file to *filename*.

get_pagecount()

Return the current number of pages in the multipage pdf file.

property keep_empty

[*Deprecated*]

Notes

Deprecated since version 3.8:

savefig(*figure=None*, ***kwargs*)

Save a *Figure* to this file as a new page.

Any other keyword arguments are passed to *savefig*.

Parameters

figure

[*Figure* or int, default: the active figure] The figure, or index of the figure, that is saved to the file.

class matplotlib.backends.backend_pgf.**RendererPgf**(*figure*, *fh*)

Bases: *RendererBase*

Create a new PGF renderer that translates any drawing instruction into text commands to be interpreted in a latex pgfpicture environment.

Attributes

figure

[*Figure*] Matplotlib figure to initialize height, width and dpi from.

fh

[file-like] File handle for the output of the drawing commands.

draw_image(*gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[(N, M, 4) array of numpy.uint8] An array of RGBA pixels.

transform

[*Affine2DBase*] If and only if the concrete backend is written such that *option_scale_image* returns True, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_path

[*Path*] The path for the marker.

marker_trans

[*Transform*] An affine transform applied to the marker.

path

[*Path*] The locations to draw the markers.

trans

[*Transform*] An affine transform applied to the path.

rgbFace

[color, optional]

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_tex(*gc*, *x*, *y*, *s*, *prop*, *angle*, ***, *mtext=None*)

Draw a TeX instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The TeX text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[*Text*] The original text object to be rendered.

draw_text(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw a text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

ismath

[bool or "TeX"] If True, use mathtext parser. If "TeX", use tex for rendering.

mtext

[*Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

flipy()

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts.

get_canvas_width_height()

Return the canvas width and height in display coords.

get_text_width_height_descent(*s*, *prop*, *ismath*)

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

Whitespace at the start and the end of *s* is included in the reported width.

option_image_nocomposite()

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return `not rcParams["image.composite_image"]`.

option_scale_image()

Return whether arbitrary affine transformations in *draw_image* are supported (True for most vector backends).

points_to_pixels(*points*)

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points

[float or array-like]

Returns

Points converted to pixels

matplotlib.backends.backend_pgf.**make_pdf_to_png_converter**()

Return a function that converts a pdf file to a png file.

matplotlib.backends.backend_ps

A PostScript backend, which can produce both PostScript .ps and .eps.

matplotlib.backends.backend_ps.**FigureCanvas**

alias of *FigureCanvasPS*

class matplotlib.backends.backend_ps.**FigureCanvasPS**(*figure=None*)

Bases: *FigureCanvasBase*

draw()

Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

filetypes = {'eps': 'Encapsulated Postscript', 'ps': 'Postscript'}

fixed_dpi = 72

get_default_filetype()

Return the default savefig file format as specified in *rcParams["savefig.format"]* (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

print_eps(*outfile*, *, *metadata=None*, *papertype=None*, *orientation='portrait'*, *bbox_inches_restore=None*, ***kwargs*)

print_ps(*outfile*, *, *metadata=None*, *papertype=None*, *orientation='portrait'*, *bbox_inches_restore=None*, ***kwargs*)

class matplotlib.backends.backend_ps.**PsBackendHelper**

Bases: object

[*Deprecated*]

Notes

Deprecated since version 3.7:

class matplotlib.backends.backend_ps.**RendererPS**(*width*, *height*, *pswriter*, *imagedpi=72*)

Bases: RendererPDFPSBase

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles.

create_hatch(*hatch*)

draw_gouraud_triangle(*gc*, *points*, *colors*, *trans*)

[*Deprecated*] Draw a Gouraud-shaded triangle.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

points

[(3, 2) array-like] Array of (x, y) points for the triangle.

colors

[(3, 4) array-like] RGBA colors for each point of the triangle.

transform

[*Transform*] An affine transform to apply to the points.

Notes

Deprecated since version 3.7: Use draw_gouraud_triangles instead.

draw_gouraud_triangles(*gc*, *points*, *colors*, *trans*)

Draw a series of Gouraud triangles.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

triangles_array

[(N, 3, 2) array-like] Array of *N* (x, y) points for the triangles.

colors_array

[(N, 3, 4) array-like] Array of *N* RGBA colors for each point of the triangles.

transform

[*Transform*] An affine transform to apply to the points.

draw_image(*gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[(N, M, 4) array of `numpy.uint8`] An array of RGBA pixels.

transform

[*Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image` returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_path

[*Path*] The path for the marker.

marker_trans

[*Transform*] An affine transform applied to the marker.

path

[*Path*] The locations to draw the markers.

trans

[*Transform*] An affine transform applied to the path.

rgbFace

[color, optional]

draw_mathtext(*gc*, *x*, *y*, *s*, *prop*, *angle*)

Draw the math text using matplotlib.mathtext.

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_path_collection(*gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offset_trans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)

Draw a collection of *paths*.

Each path is first transformed by the corresponding entry in *all_transforms* (a list of (3, 3) matrices) and then by *master_transform*. They are then translated by the corresponding entry in *offsets*, which has been first transformed by *offset_trans*.

facecolors, *edgecolors*, *linewidths*, *linestyles*, and *antialiased* are lists that set the corresponding properties.

offset_position is unused now, but the argument is kept for backwards compatibility.

The base (fallback) implementation makes multiple calls to `draw_path`. Backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths` and `_iter_collection` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection` can be made globally.

draw_tex(*gc*, *x*, *y*, *s*, *prop*, *angle*, *, *mtext=None*)

Draw a TeX instance.

Parameters

gc

[`GraphicsContextBase`] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The TeX text string.

prop

[`FontProperties`] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

mtext

[`Text`] The original text object to be rendered.

draw_text(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw a text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

ismath

[bool or "TeX"] If True, use mathtext parser. If "TeX", use tex for rendering.

mtext

[*Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

get_image_magnification()

Get the factor by which to magnify images passed to draw_image. Allows a backend to have images at a different resolution to other artists.

set_color(*r*, *g*, *b*, *store=True*)

set_font(*fontname*, *fontsize*, *store=True*)

set_linecap(*linecap*, *store=True*)

set_linedash(*offset*, *seq*, *store=True*)

set_linejoin(*linejoin*, *store=True*)

set_linewidth(*linewidth*, *store=True*)

matplotlib.backends.backend_ps.**get_bbox_header**(*lbrt*, *rotated=False*)

Return a postscript header string for the given bbox lbrt=(l, b, r, t). Optionally, return rotate command.

matplotlib.backends.backend_ps.**gs_distill**(*tmpfile*, *eps=False*, *ptype='letter'*, *bbox=None*, *rotated=False*)

Use ghostscript's pswrite or epswrite device to distill a file. This yields smaller files without illegal encapsulated postscript operators. The output is low-level, converting text to outlines.

matplotlib.backends.backend_ps.**pstoeps**(*tmpfile*, *bbox=None*, *rotated=False*)

Convert the postscript to encapsulated postscript. The bbox of the eps file will be replaced with the given *bbox* argument. If None, original bbox will be used.

matplotlib.backends.backend_ps.**xpdf_distill**(*tmpfile*, *eps=False*, *ptype='letter'*, *bbox=None*, *rotated=False*)

Use ghostscript's ps2pdf and xpdf's/poppler's pdftops to distill a file. This yields smaller files without illegal encapsulated postscript operators. This distiller is preferred, generating high-level postscript output that treats text as text.

matplotlib.backends.backend_qtagg, matplotlib.backends.backend_qtcairo

NOTE These *Backends* are not (auto) documented here, to avoid adding a dependency to building the docs.

Qt Bindings

There are currently 2 actively supported Qt versions, Qt5 and Qt6, and two supported Python bindings per version -- PyQt5 and PySide2 for Qt5 and PyQt6 and PySide6 for Qt6[1]. Matplotlib's qtagg and qtcairo backends (`matplotlib.backends.backend_qtagg` and `matplotlib.backend.backend_qtcairo`) support all these bindings, with common parts factored out in the `matplotlib.backends.backend_qt` module.

At runtime, these backends select the actual binding used as follows:

1. If a binding's `QtCore` subpackage is already imported, that binding is selected (the order for the check is `PyQt6`, `PySide6`, `PyQt5`, `PySide2`).
2. If the *`QT_API`* environment variable is set to one of "PyQt6", "PySide6", "PyQt5", "PySide2" (case-insensitive), that binding is selected. (See also the documentation on *Environment variables*.)
3. Otherwise, the first available backend in the order `PyQt6`, `PySide6`, `PyQt5`, `PySide2` is selected.

In the past, Matplotlib used to have separate backends for each version of Qt (e.g. qt4agg/`matplotlib.backends.backend_qt4agg` and qt5agg/`matplotlib.backends.backend_qt5agg`). This scheme was dropped when support for Qt6 was added. For back-compatibility, qt5agg/`backend_qt5agg` and qt5cairo/`backend_qt5cairo` remain available; selecting one of these backends forces the use of a

[1] There is also PyQt4 and PySide for Qt4 but these are no longer supported by Matplotlib and upstream support for Qt4 ended in 2015.

Qt5 binding. Their use is discouraged and `backend_qtagg` or `backend_qtcairo` should be preferred instead. However, these modules will not be deprecated until we drop support for Qt5.

While both PyQt and Qt for Python (aka PySide) closely mirror the underlying C++ API they are wrapping, they are not drop-in replacements for each other[2]. To account for this, Matplotlib has an internal API compatibility layer in *matplotlib.backends.qt_compat* which covers our needs. Despite being a public module, we do not consider this to be a stable user-facing API and it may change without warning[3].

matplotlib.backends.backend_svg

matplotlib.backends.backend_svg.**FigureCanvas**

alias of *FigureCanvasSVG*

class matplotlib.backends.backend_svg.**FigureCanvasSVG**(*figure=None*)

Bases: *FigureCanvasBase*

draw()

Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

filetypes = {'svg': 'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphics'}

fixed_dpi = 72

get_default_filetype()

Return the default savefig file format as specified in *rcParams["savefig.format"]* (default: `'png'`).

The returned string does not include a period. This method is overridden in backends that only support a single file type.

print_svg(*filename*, *, *bbox_inches_restore=None*, *metadata=None*)

Parameters

filename

[str or path-like or file-like] Output target; if a string, a file will be opened for writing.

metadata

[2] Despite the slight API differences, the more important distinction between the PyQt and Qt for Python series of bindings is licensing.

[3] If you are looking for a general purpose compatibility library please see qtpy.

[dict[str, Any], optional] Metadata in the SVG file defined as key-value pairs of strings, datetimes, or lists of strings, e.g., `{'Creator': 'My software', 'Contributor': ['Me', 'My Friend'], 'Title': 'Awesome'}`.

The standard keys and their value types are:

- *str*: `'Coverage'`, `'Description'`, `'Format'`, `'Identifier'`, `'Language'`, `'Relation'`, `'Source'`, `'Title'`, and `'Type'`.
- *str* or *list of str*: `'Contributor'`, `'Creator'`, `'Keywords'`, `'Publisher'`, and `'Rights'`.
- *str*, *date*, *datetime*, or *tuple* of same: `'Date'`. If a non-*str*, then it will be formatted as ISO 8601.

Values have been predefined for `'Creator'`, `'Date'`, `'Format'`, and `'Type'`. They can be removed by setting them to `None`.

Information is encoded as Dublin Core Metadata.

print_svgz(*filename*, ***kwargs*)

class matplotlib.backends.backend_svg.**RendererSVG**(*width*, *height*, *svgwriter*, *basename=None*, *image_dpi=72*, ***, *metadata=None*)

Bases: *RendererBase*

close_group(*s*)

Close a grouping element with label *s*.

Only used by the SVG renderer.

draw_gouraud_triangle(*gc*, *points*, *colors*, *trans*)

[*Deprecated*] Draw a Gouraud-shaded triangle.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

points

[(3, 2) array-like] Array of (x, y) points for the triangle.

colors

[(3, 4) array-like] RGBA colors for each point of the triangle.

transform

[*Transform*] An affine transform to apply to the points.

Notes

Deprecated since version 3.7: Use draw_gouraud_triangles instead.

draw_gouraud_triangles(*gc*, *triangles_array*, *colors_array*, *transform*)

Draw a series of Gouraud triangles.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

triangles_array

[(N, 3, 2) array-like] Array of *N* (x, y) points for the triangles.

colors_array

[(N, 3, 4) array-like] Array of *N* RGBA colors for each point of the triangles.

transform

[*Transform*] An affine transform to apply to the points.

draw_image(*gc*, *x*, *y*, *im*, *transform=None*)

Draw an RGBA image.

Parameters

gc

[*GraphicsContextBase*] A graphics context with clipping information.

x

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

[(N, M, 4) array of `numpy.uint8`] An array of RGBA pixels.

transform

[*Affine2DBase*] If and only if the concrete backend is written such that *option_scale_image* returns `True`, an affine transformation (i.e., an *Affine2DBase*) *may* be passed to *draw_image*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override *x* and *y*, and has to be applied *before* translating the result by *x* and *y* (this can be accomplished by adding *x* and *y* to the translation vector defined by *transform*).

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, *trans*, *rgbFace=None*)

Draw a marker at each of *path*'s vertices (excluding control points).

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_path

[*Path*] The path for the marker.

marker_trans

[*Transform*] An affine transform applied to the marker.

path

[*Path*] The locations to draw the markers.

trans

[*Transform*] An affine transform applied to the path.

rgbFace

[color, optional]

draw_path(*gc*, *path*, *transform*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_path_collection(*gc*, *master_transform*, *paths*, *all_transforms*, *offsets*, *offset_trans*, *facecolors*, *edgecolors*, *linewidths*, *linestyles*, *antialiaseds*, *urls*, *offset_position*)

Draw a collection of *paths*.

Each path is first transformed by the corresponding entry in *all_transforms* (a list of (3, 3) matrices) and then by *master_transform*. They are then translated by the corresponding entry in *offsets*, which has been first transformed by *offset_trans*.

facecolors, *edgecolors*, *linewidths*, *linestyles*, and *antialiased* are lists that set the corresponding properties.

offset_position is unused now, but the argument is kept for backwards compatibility.

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths` and `_iter_collection` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection* can be made globally.

draw_text(*gc*, *x*, *y*, *s*, *prop*, *angle*, *ismath=False*, *mtext=None*)

Draw a text instance.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

x

[float] The x location of the text in display coords.

y

[float] The y location of the text baseline in display coords.

s

[str] The text string.

prop

[*FontProperties*] The font properties.

angle

[float] The rotation angle in degrees anti-clockwise.

ismath

[bool or "TeX"] If True, use mathtext parser. If "TeX", use tex for rendering.

mtext

[*Text*] The original text object to be rendered.

Notes

Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

finalize()

flipy()

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts.

get_canvas_width_height()

Return the canvas width and height in display coords.

get_image_magnification()

Get the factor by which to magnify images passed to *draw_image*. Allows a backend to have images at a different resolution to other artists.

get_text_width_height_descent(*s*, *prop*, *ismath*)

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

Whitespace at the start and the end of *s* is included in the reported width.

open_group(*s*, *gid=None*)

Open a grouping element with label *s* and *gid* (if set) as id.

Only used by the SVG renderer.

option_image_nocomposite()

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return `not rcParams["image.composite_image"]`.

option_scale_image()

Return whether arbitrary affine transformations in *draw_image* are supported (True for most vector backends).

class matplotlib.backends.backend_svg.**XMLWriter**(*file*)

Bases: object

Parameters

file

[writable text file-like object]

close(*id*)

Close open elements, up to (and including) the element identified by the given identifier.

Parameters

id

Element identifier, as returned by the *start()* method.

comment(*comment*)

Add a comment to the output stream.

Parameters

comment

[str] Comment text.

data(*text*)

Add character data to the output stream.

Parameters

text

[str] Character data.

element(*tag*, *text=None*, *attrib={}*, ***extra*)

Add an entire element. This is the same as calling `start()`, `data()`, and `end()` in sequence. The *text* argument can be omitted.

end(*tag=None*, *indent=True*)

Close the current element (opened by the most recent call to `start()`).

Parameters

tag

Element tag. If given, the tag must match the start tag. If omitted, the current element is closed.

indent

[bool, default: True]

flush()

Flush the output stream.

start(*tag*, *attrib={}*, ***extra*)

Open a new element. Attributes can be given as keyword arguments, or as a string/string dictionary. The method returns an opaque identifier that can be passed to the `close()` method, to close all open elements up to and including this one.

Parameters

tag

Element tag.

attrib

Attribute dictionary. Alternatively, attributes can be given as keyword arguments.

Returns

An element identifier.

matplotlib.backends.backend_tkagg, matplotlib.backends.backend_tkcairo

matplotlib.backends.backend_tkagg.**FigureCanvas**

alias of *FigureCanvasTkAgg*

class matplotlib.backends.backend_tkagg.**FigureCanvasTkAgg**(*figure=None*, *master=None*)

Bases: *FigureCanvasAgg*, FigureCanvasTk

blit(*bbox=None*)

Blit the canvas in bbox (default entire canvas).

draw()

Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

matplotlib.backends.backend_tkcairo.**FigureCanvas**

alias of *FigureCanvasTkCairo*

class matplotlib.backends.backend_tkcairo.**FigureCanvasTkCairo**(*figure=None*, *master=None*)

Bases: *FigureCanvasCairo*, FigureCanvasTk

draw()

Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

matplotlib.backends.backend_webagg_core

Displays Agg images in the browser, with interactivity.

matplotlib.backends.backend_webagg_core.**FigureCanvas**

alias of *FigureCanvasWebAggCore*

class matplotlib.backends.backend_webagg_core.**FigureCanvasWebAggCore**(**args*, ***kwargs*)

Bases: *FigureCanvasAgg*

blit(*bbox=None*)

Blit the canvas in bbox (default entire canvas).

draw()

Render the *Figure*.

This method must walk the artist tree, even if no output is produced, because it triggers deferred work that users may want to access before saving output to disk. For example computing limits, auto-limits, and tick values.

draw_idle()

Request a widget redraw once control returns to the GUI event loop.

Even if multiple calls to *draw_idle* occur before control returns to the GUI event loop, the figure will only be rendered once.

Notes

Backends may choose to override the method and implement their own strategy to prevent multiple renderings.

get_diff_image()

handle_ack(*event*)

handle_button_press(*event*)

handle_button_release(*event*)

handle_dblclick(*event*)

handle_draw(*event*)

handle_event(*event*)

handle_figure_enter(*event*)

handle_figure_leave(*event*)

handle_key_press(*event*)

handle_key_release(*event*)

handle_motion_notify(*event*)

handle_refresh(*event*)

handle_resize(*event*)

handle_scroll(*event*)

handle_send_image_mode(*event*)

handle_set_device_pixel_ratio(*event*)

handle_set_dpi_ratio(*event*)

handle_toolbar_button(*event*)

handle_unknown_event(*event*)

manager_class

alias of *FigureManagerWebAgg*

send_event(*event_type*, ***kwargs*)

set_cursor(*cursor*)

Set the current cursor.

This may have no effect if the backend does not display anything.

If required by the backend, this method should trigger an update in the backend event loop after the cursor is set, as this method may be called e.g. before a long-running task during which the GUI is not updated.

Parameters

cursor

[*Cursors*] The cursor to display over the canvas. Note: some backends may change the cursor for the entire window.

set_image_mode(*mode*)

Set the image mode for any subsequent images which will be sent to the clients. The modes may currently be either 'full' or 'diff'.

Note: diff images may not contain transparency, therefore upon draw this mode may be changed if the resulting image has any transparent component.

show()

supports_blit = False

matplotlib.backends.backend_webagg_core.**FigureManager**

alias of *FigureManagerWebAgg*

class matplotlib.backends.backend_webagg_core.**FigureManagerWebAgg**(*canvas*, *num*)

Bases: *FigureManagerBase*

ToolbarCls

alias of *NavigationToolbar2WebAgg*

add_web_socket(*web_socket*)

classmethod get_javascript(*stream=None*)

classmethod get_static_file_path()

get_window_title()

Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).

handle_json(*content*)

refresh_all()

remove_web_socket(*web_socket*)

resize(*w*, *h*, *forward=True*)

For GUI backends, resize the window (in physical pixels).

set_window_title(*title*)

Set the title text of the window containing the figure.

This has no effect for non-GUI (e.g., PS) backends.

Examples

```
>>> fig = plt.figure()
>>> fig.canvas.manager.set_window_title('My figure')
```

show()

For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in *Figure.show*.

class matplotlib.backends.backend_webagg_core.**NavigationToolbar2WebAgg**(*canvas*)

Bases: *NavigationToolbar2*

draw_rubberband(*event*, *x0*, *y0*, *x1*, *y1*)

Draw a rectangle rubberband to indicate zoom limits.

Note that it is not guaranteed that `x0 <= x1` and `y0 <= y1`.

pan()

Toggle the pan/zoom tool.

Pan with left button, zoom with right.

remove_rubberband()

Remove the rubberband.

save_figure(**args*)

Save the current figure

set_history_buttons()

Enable or disable the back/forward button.

set_message(*message*)

Display a message on toolbar or in status bar.

toolitems = [('Home', 'Reset original view', 'home', 'home'), ('Back', 'Back to previous view', 'back', 'back'), ('Forward', 'Forward to next view', 'forward', 'forward'), (None, None, None, None), ('Pan', 'Left button pans, Right button zooms\nx/y fixes axis, CTRL fixes aspect', 'move', 'pan'), ('Zoom', 'Zoom to rectangle\nx/y fixes axis', 'zoom_to_rect', 'zoom'), (None, None, None, None), ('Download', 'Download plot', 'filesave', 'download')]

zoom()

class matplotlib.backends.backend_webagg_core.**TimerAsyncio**(**args*, ***kwargs*)

Bases: *TimerBase*

Parameters

interval

[int, default: 1000ms] The time between timer events in milliseconds. Will be stored as `timer.interval`.

callbacks

[list[tuple[callable, tuple, dict]]] List of (func, args, kwargs) tuples that will be called upon timer events. This list is accessible as `timer.callbacks` and can be manipulated directly, or the functions *add_callback* and *remove_callback* can be used.

class matplotlib.backends.backend_webagg_core.**TimerTornado**(**args*, ***kwargs*)

Bases: *TimerBase*

Parameters

interval

[int, default: 1000ms] The time between timer events in milliseconds. Will be stored as `timer.interval`.

callbacks

[list[tuple[callable, tuple, dict]]] List of (func, args, kwargs) tuples that will be called upon timer events. This list is accessible as `timer.callbacks` and can be manipulated directly, or the functions *add_callback* and *remove_callback* can be used.

matplotlib.backends.backend_webagg

Displays Agg images in the browser, with interactivity.

matplotlib.backends.backend_webagg.**FigureCanvas**

alias of *FigureCanvasWebAgg*

class matplotlib.backends.backend_webagg.**FigureCanvasWebAgg**(**args*, ***kwargs*)

Bases: *FigureCanvasWebAggCore*

manager_class

alias of *FigureManagerWebAgg*

matplotlib.backends.backend_webagg.**FigureManager**

alias of *FigureManagerWebAgg*

class matplotlib.backends.backend_webagg.**FigureManagerWebAgg**(*canvas*, *num*)

Bases: *FigureManagerWebAgg*

classmethod pyplot_show(*, *block=None*)

Show all figures. This method is the implementation of *pyplot.show*.

To customize the behavior of *pyplot.show*, interactive backends should usually override *start_main_loop*; if more customized logic is necessary, *pyplot_show* can also be overridden.

Parameters

block

[bool, optional] Whether to block by calling `start_main_loop`. The default, None, means to block if we are neither in IPython's `%pylab` mode nor in `interactive` mode.

class matplotlib.backends.backend_webagg.**ServerThread**(*group=None*, *target=None*, *name=None*, *args=()*, *kwargs=None*, ***, *daemon=None*)

Bases: `Thread`

[*Deprecated*]

Notes

Deprecated since version 3.7:

This constructor should always be called with keyword arguments. Arguments are:

group should be None; reserved for future extension when a ThreadGroup class is implemented.

target is the callable object to be invoked by the run() method. Defaults to None, meaning nothing is called.

name is the thread name. By default, a unique name is constructed of the form "Thread-N" where N is a small decimal number.

args is a list or tuple of arguments for the target invocation. Defaults to ().

kwargs is a dictionary of keyword arguments for the target invocation. Defaults to {}.

If a subclass overrides the constructor, it must make sure to invoke the base class constructor (Thread.__init__()) before doing anything else to the thread.

run()

Method representing the thread's activity.

You may override this method in a subclass. The standard run() method invokes the callable object passed to the object's constructor as the target argument, if any, with sequential and keyword arguments taken from the args and kwargs arguments, respectively.

class matplotlib.backends.backend_webagg.**WebAggApplication**(*url_prefix=''*)

Bases: Application

class AllFiguresPage(*application*, *request*, *, *url_prefix=''*, ***kwargs*)

Bases: RequestHandler

get()

class Download(*application*, *request*, ***kwargs*)

Bases: RequestHandler

get(*fignum*, *fmt*)

class FavIcon(*application*, *request*, ***kwargs*)

Bases: RequestHandler

get()

class MplJs(*application*, *request*, ***kwargs*)

Bases: RequestHandler

get()

class SingleFigurePage(*application*, *request*, *, *url_prefix=''*, ***kwargs*)

Bases: RequestHandler

get(*fignum*)

class WebSocket(*application*, *request*, ***kwargs*)

Bases: WebSocketHandler

on_close()

Invoked when the WebSocket is closed.

If the connection was closed cleanly and a status code or reason phrase was supplied, these values will be available as the attributes `self.close_code` and `self.close_reason`.

Changed in version 4.0: Added `close_code` and `close_reason` attributes.

on_message(*message*)

Handle incoming messages on the WebSocket

This method must be overridden.

Changed in version 4.5: `on_message` can be a coroutine.

open(*fignum*)

Invoked when a new WebSocket is opened.

The arguments to *open* are extracted from the `tornado.web.URLSpec` regular expression, just like the arguments to `tornado.web.RequestHandler.get`.

open may be a coroutine. *on_message* will not be called until *open* has returned.

Changed in version 5.1: `open` may be a coroutine.

send_binary(*blob*)

send_json(*content*)

supports_binary = True

classmethod initialize(*url_prefix=''*, *port=None*, *address=None*)

initialized = False

classmethod start()

started = False

matplotlib.backends.backend_webagg.**ipython_inline_display**(*figure*)

matplotlib.backends.backend_wxagg, matplotlib.backends.backend_wxcairo

NOTE These *Backends* are not documented here, to avoid adding a dependency to building the docs.

7.2.11 matplotlib.bezier

A module providing some utility functions regarding Bézier path manipulation.

class matplotlib.bezier.**BezierSegment**(*control_points*)

Bases: object

A d-dimensional Bézier segment.

Parameters

control_points

[(N, d) array] Location of the *N* control points.

axis_aligned_extrema()

Return the dimension and location of the curve's interior extrema.

The extrema are the points along the curve where one of its partial derivatives is zero.

Returns

dims

[array of int] Index i of the partial derivative which is zero at each interior extrema.

dzeros

[array of float] Of same size as dims. The t such that $d/dx_i B(t) = 0$

property control_points

The control points of the curve.

property degree

Degree of the polynomial. One less the number of control points.

property dimension

The dimension of the curve.

point_at_t(*t*)

Evaluate the curve at a single point, returning a tuple of *d* floats.

property polynomial_coefficients

The polynomial coefficients of the Bézier curve.

Warning: Follows opposite convention from `numpy.polyval`.

Returns

(n+1, d) array

Coefficients after expanding in polynomial basis, where n is the degree of the Bézier curve and d its dimension. These are the numbers (C_j) such that the curve can be written $\sum_{j=0}^{n} C_j t^j$.

Notes

The coefficients are calculated as

$$\binom{n}{j} \sum_{i=0}^{j} (-1)^{i+j} \binom{j}{i} P_i$$

where P_i are the control points of the curve.

exception matplotlib.bezier.**NonIntersectingPathException**

Bases: `ValueError`

matplotlib.bezier.**check_if_parallel**(*dx1*, *dy1*, *dx2*, *dy2*, *tolerance=1e-05*)

Check if two lines are parallel.

Parameters

dx1, dy1, dx2, dy2

[float] The gradients *dy*/*dx* of the two lines.

tolerance

[float] The angular tolerance in radians up to which the lines are considered parallel.

Returns

is_parallel

- 1 if two lines are parallel in same direction.
- -1 if two lines are parallel in opposite direction.
- False otherwise.

matplotlib.bezier.**find_bezier_t_intersecting_with_closedpath**(*bezier_point_at_t*, *inside_closedpath*, *t0=0.0*, *t1=1.0*, *tolerance=0.01*)

Find the intersection of the Bézier curve with a closed path.

The intersection point *t* is approximated by two parameters *t0*, *t1* such that *t0* <= *t* <= *t1*.

Search starts from *t0* and *t1* and uses a simple bisecting algorithm therefore one of the end points must be inside the path while the other doesn't. The search stops when the distance of the points parametrized by *t0* and *t1* gets smaller than the given *tolerance*.

Parameters

bezier_point_at_t

[callable] A function returning x, y coordinates of the Bézier at parameter *t*. It must have the signature:

```
bezier_point_at_t(t: float) -> tuple[float, float]
```

inside_closedpath

[callable] A function returning True if a given point (x, y) is inside the closed path. It must have the signature:

```
inside_closedpath(point: tuple[float, float]) -> bool
```

t0, t1

[float] Start parameters for the search.

tolerance

[float] Maximal allowed distance between the final points.

Returns

t0, t1

[float] The Bézier path parameters.

matplotlib.bezier.**find_control_points**(*c1x*, *c1y*, *mmx*, *mmy*, *c2x*, *c2y*)

Find control points of the Bézier curve passing through (*c1x*, *c1y*), (*mmx*, *mmy*), and (*c2x*, *c2y*), at parametric values 0, 0.5, and 1.

matplotlib.bezier.**get_cos_sin**(*x0*, *y0*, *x1*, *y1*)

matplotlib.bezier.**get_intersection**(*cx1*, *cy1*, *cos_t1*, *sin_t1*, *cx2*, *cy2*, *cos_t2*, *sin_t2*)

Return the intersection between the line through (*cx1*, *cy1*) at angle *t1* and the line through (*cx2*, *cy2*) at angle *t2*.

matplotlib.bezier.**get_normal_points**(*cx*, *cy*, *cos_t*, *sin_t*, *length*)

For a line passing through (*cx*, *cy*) and having an angle *t*, return locations of the two points located along its perpendicular line at the distance of *length*.

matplotlib.bezier.**get_parallels**(*bezier2*, *width*)

Given the quadratic Bézier control points *bezier2*, returns control points of quadratic Bézier lines roughly parallel to given one separated by *width*.

matplotlib.bezier.**inside_circle**(*cx*, *cy*, *r*)

Return a function that checks whether a point is in a circle with center (*cx*, *cy*) and radius *r*.

The returned function has the signature:

```
f(xy: tuple[float, float]) -> bool
```

matplotlib.bezier.**make_wedged_bezier2**(*bezier2*, *width*, *w1=1.0*, *wm=0.5*, *w2=0.0*)

Being similar to *get_parallels*, returns control points of two quadratic Bézier lines having a width roughly parallel to given one separated by *width*.

matplotlib.bezier.**split_bezier_intersecting_with_closedpath**(*bezier*, *inside_closedpath*, *tolerance=0.01*)

Split a Bézier curve into two at the intersection with a closed path.

Parameters

bezier

[(N, 2) array-like] Control points of the Bézier segment. See *BezierSegment*.

inside_closedpath

[callable] A function returning True if a given point (x, y) is inside the closed path. See also *find_bezier_t_intersecting_with_closedpath*.

tolerance

[float] The tolerance for the intersection. See also *find_bezier_t_intersecting_with_closedpath*.

Returns

left, right

Lists of control points for the two Bézier segments.

matplotlib.bezier.**split_de_casteljau**(*beta*, *t*)

Split a Bézier segment defined by its control points *beta* into two separate segments divided at *t* and return their control points.

matplotlib.bezier.**split_path_inout**(*path*, *inside*, *tolerance=0.01*, *reorder_inout=False*)

Divide a path into two segments at the point where `inside(x, y)` becomes False.

7.2.12 matplotlib.category

Plotting of string "category" data: `plot(['d', 'f', 'a'], [1, 2, 3])` will plot three points with x-axis values of 'd', 'f', 'a'.

See *Plotting categorical variables* for an example.

The module uses Matplotlib's *matplotlib.units* mechanism to convert from strings to integers and provides a tick locator, a tick formatter, and the *UnitData* class that creates and stores the string-to-integer mapping.

class matplotlib.category.**StrCategoryConverter**

Bases: *ConversionInterface*

static axisinfo(*unit*, *axis*)

Set the default axis ticks and labels.

Parameters

unit

[*UnitData*] object string unit information for value

axis

[*Axis*] axis for which information is being set

Note: *axis* is not used

Returns

AxisInfo

Information to support default tick labeling

static convert(*value*, *unit*, *axis*)

Convert strings in *value* to floats using mapping information stored in the *unit* object.

Parameters

value

[str or iterable] Value or list of values to be converted.

unit

[*UnitData*] An object mapping strings to integers.

axis

[*Axis*] The axis on which the converted value is plotted.

Note: *axis* is unused.

Returns

float or ndarray of float

static default_units(*data*, *axis*)

Set and update the *Axis* units.

Parameters

data

[str or iterable of str]

axis

[*Axis*] axis on which the data is plotted

Returns

UnitData

object storing string to integer mapping

class matplotlib.category.**StrCategoryFormatter**(*units_mapping*)

Bases: *Formatter*

String representation of the data at every tick.

Parameters

units_mapping

[dict] Mapping of category names (str) to indices (int).

format_ticks(*values*)

Return the tick labels for all the ticks at once.

class matplotlib.category.**StrCategoryLocator**(*units_mapping*)

Bases: *Locator*

Tick at every integer mapping of the string data.

Parameters

units_mapping

[dict] Mapping of category names (str) to indices (int).

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.category.**UnitData**(*data=None*)

Bases: `object`

Create mapping between unique categorical values and integer ids.

Parameters

data

[iterable] sequence of string values

update(*data*)

Map new values to integer identifiers.

Parameters

data

[iterable of str or bytes]

Raises

TypeError

If elements in *data* are neither str nor bytes.

7.2.13 matplotlib.cbook

A collection of utility functions and classes. Originally, many (but not all) were from the Python Cookbook -- hence the name cbook.

class matplotlib.cbook.**CallbackRegistry**(*exception_handler=<function _exception_printer>*, ***, *signals=None*)

Bases: `object`

Handle registering, processing, blocking, and disconnecting for a set of signals and callbacks:

```
>>> def oneat(x):
...     print('eat', x)
>>> def ondrink(x):
...     print('drink', x)
```

```
>>> from matplotlib.cbook import CallbackRegistry
>>> callbacks = CallbackRegistry()
```

```
>>> id_eat = callbacks.connect('eat', oneat)
>>> id_drink = callbacks.connect('drink', ondrink)
```

```
>>> callbacks.process('drink', 123)
drink 123
>>> callbacks.process('eat', 456)
eat 456
>>> callbacks.process('be merry', 456)   # nothing will be called
```

```
>>> callbacks.disconnect(id_eat)
>>> callbacks.process('eat', 456)        # nothing will be called
```

```
>>> with callbacks.blocked(signal='drink'):
...     callbacks.process('drink', 123)  # nothing will be called
>>> callbacks.process('drink', 123)
drink 123
```

In practice, one should always disconnect all callbacks when they are no longer needed to avoid dangling references (and thus memory leaks). However, real code in Matplotlib rarely does so, and due to its design, it is rather difficult to place this kind of code. To get around this, and prevent this class of memory leaks, we instead store weak references to bound methods only, so when the destination object needs to die, the CallbackRegistry won't keep it alive.

Parameters

exception_handler

[callable, optional] If not None, *exception_handler* must be a function that takes an `Exception` as single parameter. It gets called with any `Exception` raised by the callbacks during *`CallbackRegistry.process`*, and may either re-raise the exception or handle it in another manner.

The default handler prints the exception (with `traceback.print_exc`) if an interactive event loop is running; it re-raises the exception if no interactive event loop is running.

signals

[list, optional] If not None, *signals* is a list of signals that this registry handles: attempting to *`process`* or to *`connect`* to a signal not in the list throws a `ValueError`. The default, None, does not restrict the handled signals.

blocked(*, *signal=None*)

Block callback signals from being processed.

A context manager to temporarily block/disable callback signals from being processed by the registered listeners.

Parameters

signal

[str, optional] The callback signal to block. The default is to block all signals.

connect(*signal*, *func*)

Register *func* to be called when signal *signal* is generated.

disconnect(*cid*)

Disconnect the callback registered with callback id *cid*.

No error is raised if such a callback does not exist.

process(*s*, **args*, ***kwargs*)

Process signal *s*.

All of the functions registered to receive callbacks on *s* will be called with `*args` and `**kwargs`.

class matplotlib.cbook.**Grouper**(*init=()*)

Bases: `object`

A disjoint-set data structure.

Objects can be joined using *join()*, tested for connectedness using *joined()*, and all disjoint sets can be retrieved by using the object as an iterator.

The objects being joined must be hashable and weak-referenceable.

Examples

```
>>> from matplotlib.cbook import Grouper
>>> class Foo:
...     def __init__(self, s):
...         self.s = s
...     def __repr__(self):
...         return self.s
...
>>> a, b, c, d, e, f = [Foo(x) for x in 'abcdef']
>>> grp = Grouper()
>>> grp.join(a, b)
>>> grp.join(b, c)
>>> grp.join(d, e)
>>> list(grp)
[[a, b, c], [d, e]]
```

(continues on next page)

(continued from previous page)

```
>>> grp.joined(a, b)
True
>>> grp.joined(a, c)
True
>>> grp.joined(a, d)
False
```

clean()

[*Deprecated*] Clean dead weak references from the dictionary.

Notes

Deprecated since version 3.8: Use none, you no longer need to clean a Grouper instead.

get_siblings(*a*)

Return all of the items joined with *a*, including itself.

join(*a*, **args*)

Join given arguments into the same set. Accepts one or more arguments.

joined(*a*, *b*)

Return whether *a* and *b* are members of the same set.

remove(*a*)

Remove *a* from the grouper, doing nothing if it is not there.

class matplotlib.cbook.**GrouperView**(*grouper*)

Bases: object

Immutable view over a *Grouper*.

get_siblings(*a*)

joined(*a*, *b*)

class matplotlib.cbook.**Stack**(*default=None*)

Bases: object

[*Deprecated*] Stack of elements with a movable cursor.

Mimics home/back/forward in a web browser.

Notes

Deprecated since version 3.8.

back()

Move the position back and return the current element.

bubble(*o*)

Raise all references of *o* to the top of the stack, and return it.

Raises

ValueError

If *o* is not in the stack.

clear()

Empty the stack.

empty()

Return whether the stack is empty.

forward()

Move the position forward and return the current element.

home()

Push the first element onto the top of the stack.

The first element is returned.

push(*o*)

Push *o* to the stack at current position. Discard all later elements.

o is returned.

remove(*o*)

Remove *o* from the stack.

Raises

ValueError

If *o* is not in the stack.

matplotlib.cbook.**boxplot_stats**(*X*, *whis=1.5*, *bootstrap=None*, *labels=None*, *autorange=False*)

Return a list of dictionaries of statistics used to draw a series of box and whisker plots using *bxp*.

Parameters

X

[array-like] Data that will be represented in the boxplots. Should have 2 or fewer dimensions.

whis

[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above `Q1 - whis*(Q3-Q1)`, and the upper whisker at the highest datum below `Q3 + whis*(Q3-Q1)`, where Q1 and Q3 are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data.

In the edge case where `Q1 == Q3`, *whis* is automatically set to (0, 100) (cover the whole range of the data) if *autorange* is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

bootstrap

[int, optional] Number of times the confidence intervals around the median should be bootstrapped (percentile method).

labels

[array-like, optional] Labels for each dataset. Length must be compatible with dimensions of *X*.

autorange

[bool, optional (False)] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

Returns

list of dict

A list of dictionaries containing the results for each column of data. Keys of each dictionary are the following:

Key	Value Description
label	tick label for the boxplot
mean	arithmetic mean value
med	50th percentile
q1	first quartile (25th percentile)
q3	third quartile (75th percentile)
iqr	interquartile range
cilo	lower notch around the median
cihi	upper notch around the median
whislo	end of the lower whisker
whishi	end of the upper whisker
fliers	outliers

Notes

Non-bootstrapping approach to confidence interval uses Gaussian-based asymptotic approximation:

$$\mathrm{med} \pm 1.57 \times \frac{\mathrm{iqr}}{\sqrt{N}}$$

General approach from: McGill, R., Tukey, J.W., and Larsen, W.A. (1978) "Variations of Boxplots", The American Statistician, 32:12-16.

matplotlib.cbook.**contiguous_regions**(*mask*)

Return a list of (ind0, ind1) such that `mask[ind0:ind1].all()` is True and we cover all such regions.

matplotlib.cbook.**delete_masked_points**(**args*)

Find all masked and/or non-finite points in a set of arguments, and return the arguments with only the unmasked points remaining.

Arguments can be in any of 5 categories:

1) 1-D masked arrays
2) 1-D ndarrays
3) ndarrays with more than one dimension
4) other non-string iterables
5) anything else

The first argument must be in one of the first four categories; any argument with a length differing from that of the first argument (and hence anything in category 5) then will be passed through unchanged.

Masks are obtained from all arguments of the correct length in categories 1, 2, and 4; a point is bad if masked in a masked array or if it is a nan or inf. No attempt is made to extract a mask from categories 2, 3, and 4 if `numpy.isfinite` does not yield a Boolean array.

All input arguments that are not passed unchanged are returned as ndarrays after removing the points or rows corresponding to masks in any of the arguments.

A vastly simpler version of this function was originally written as a helper for Axes.scatter().

matplotlib.cbook.**file_requires_unicode**(*x*)

Return whether the given writable file-like object requires Unicode to be written to it.

matplotlib.cbook.**flatten**(*seq*, *scalarp=<function is_scalar_or_string>*)

Return a generator of flattened nested containers.

For example:

```
>>> from matplotlib.cbook import flatten
>>> l = (('John', ['Hunter']), (1, 23), [[([42, (5, 23)], )]])
>>> print(list(flatten(l)))
['John', 'Hunter', 1, 23, 42, 5, 23]
```

By: Composite of Holger Krekel and Luther Blissett From: https://code.activestate.com/recipes/121294/ and Recipe 1.12 in cookbook

matplotlib.cbook.**get_sample_data**(*fname*, *asfileobj=True*, ***, *np_load=<deprecated parameter>*)

Return a sample data file. *fname* is a path relative to the `mpl-data/sample_data` directory. If *asfileobj* is `True` return a file object, otherwise just a file path.

Sample data files are stored in the 'mpl-data/sample_data' directory within the Matplotlib package.

If the filename ends in .gz, the file is implicitly ungzipped. If the filename ends with .npy or .npz, and *asfileobj* is `True`, the file is loaded with `numpy.load`.

matplotlib.cbook.**index_of**(*y*)

A helper function to create reasonable x values for the given *y*.

This is used for plotting (x, y) if x values are not explicitly given.

First try `y.index` (assuming *y* is a `pandas.Series`), if that fails, use `range(len(y))`.

This will be extended in the future to deal with more types of labeled data.

Parameters

y

[float or array-like]

Returns

x, y

[ndarray] The x and y values to plot.

matplotlib.cbook.**is_math_text**(*s*)

Return whether the string *s* contains math expressions.

This is done by checking whether *s* contains an even number of non-escaped dollar signs.

matplotlib.cbook.**is_scalar_or_string**(*val*)

Return whether the given object is a scalar or string like.

matplotlib.cbook.**is_writable_file_like**(*obj*)

Return whether *obj* looks like a file object with a *write* method.

matplotlib.cbook.**ls_mapper = {'-': 'solid', '--': 'dashed', '-.': 'dashdot', ':': 'dotted'}**

Maps short codes for line style to their full name used by backends.

matplotlib.cbook.**ls_mapper_r = {'dashdot': '-.', 'dashed': '--', 'dotted': ':', 'solid': '-'}**

Maps full names for line styles used by backends to their short codes.

matplotlib.cbook.**normalize_kwargs**(*kw*, *alias_mapping=None*)

Helper function to normalize kwarg inputs.

Parameters

kw

[dict or None] A dict of keyword arguments. None is explicitly supported and treated as an empty dict, to support functions with an optional parameter of the form `props=None`.

alias_mapping

[dict or Artist subclass or Artist instance, optional] A mapping between a canonical name to a list of aliases, in order of precedence from lowest to highest.

If the canonical value is not in the list it is assumed to have the highest priority.

If an Artist subclass or instance is passed, use its properties alias mapping.

Raises

TypeError

To match what Python raises if invalid arguments/keyword arguments are passed to a callable.

matplotlib.cbook.**open_file_cm**(*path_or_file*, *mode='r'*, *encoding=None*)

Pass through file objects and context-manage path-likes.

matplotlib.cbook.**print_cycles**(*objects*, *outstream=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>*, *show_progress=False*)

Print loops of cyclic references in the given *objects*.

It is often useful to pass in `gc.garbage` to find the cycles that are preventing some objects from being garbage collected.

Parameters

objects

A list of objects to find cycles in.

outstream

The stream for output.

show_progress

[bool] If True, print the number of objects reached as they are found.

`matplotlib.cbook.`**`pts_to_midstep`**(*x*, **args*)

Convert continuous line to mid-steps.

Given a set of `N` points convert to `2N` points which when connected linearly give a step function which changes values at the middle of the intervals.

Parameters

x

[array] The x location of the steps. May be empty.

y1, ..., yp

[array] y arrays to be turned into steps; all must be the same length as `x`.

Returns

array

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length `N`, each of these arrays will be length `2N`.

Examples

```
>>> x_s, y1_s, y2_s = pts_to_midstep(x, y1, y2)
```

`matplotlib.cbook.`**`pts_to_poststep`**(*x*, **args*)

Convert continuous line to post-steps.

Given a set of `N` points convert to `2N + 1` points, which when connected linearly give a step function which changes values at the end of the intervals.

Parameters

x

[array] The x location of the steps. May be empty.

y1, ..., yp

[array] y arrays to be turned into steps; all must be the same length as `x`.

Returns

array

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length `N`, each of these arrays will be length `2N + 1`. For `N=0`, the length will be 0.

Examples

```
>>> x_s, y1_s, y2_s = pts_to_poststep(x, y1, y2)
```

`matplotlib.cbook.`**`pts_to_prestep`**(*x*, **args*)

Convert continuous line to pre-steps.

Given a set of `N` points, convert to `2N - 1` points, which when connected linearly give a step function which changes values at the beginning of the intervals.

Parameters

x

[array] The x location of the steps. May be empty.

y1, ..., yp

[array] y arrays to be turned into steps; all must be the same length as `x`.

Returns

array

The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length `N`, each of these arrays will be length `2N + 1`. For `N=0`, the length will be 0.

Examples

```
>>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)
```

matplotlib.cbook.**safe_first_element**(*obj*)

Return the first element in *obj*.

This is a type-independent way of obtaining the first element, supporting both index access and the iterator protocol.

matplotlib.cbook.**safe_masked_invalid**(*x*, *copy=False*)

matplotlib.cbook.**sanitize_sequence**(*data*)

Convert dictview objects to list. Other inputs are returned unchanged.

class matplotlib.cbook.**silent_list**(*type*, *seq=None*)

Bases: `list`

A list with a short `repr()`.

This is meant to be used for a homogeneous list of artists, so that they don't cause long, meaningless output.

Instead of

```
[<matplotlib.lines.Line2D object at 0x7f5749fed3c8>,
 <matplotlib.lines.Line2D object at 0x7f5749fed4e0>,
 <matplotlib.lines.Line2D object at 0x7f5758016550>]
```

one will get

```
<a list of 3 Line2D objects>
```

If `self.type` is None, the type name is obtained from the first item in the list (if any).

matplotlib.cbook.**simple_linear_interpolation**(*a*, *steps*)

Resample an array with `steps - 1` points between original point pairs.

Along each column of *a*, `(steps - 1)` points are introduced between each original values; the values are linearly interpolated.

Parameters

a

[array, shape (n, ...)]

steps

[int]

Returns

array

shape `((n - 1) * steps + 1, ...)`

`matplotlib.cbook.`**`strip_math`**(*s*)

Remove latex formatting from mathtext.

Only handles fully math and fully non-math strings.

`matplotlib.cbook.`**`to_filehandle`**(*fname*, *flag='r'*, *return_opened=False*, *encoding=None*)

Convert a path to an open file handle or pass-through a file-like object.

Consider using *open_file_cm* instead, as it allows one to properly close newly created file objects more easily.

Parameters

fname

[str or path-like or file-like] If `str` or `os.PathLike`, the file is opened using the flags specified by *flag* and *encoding*. If a file-like object, it is passed through.

flag

[str, default: 'r'] Passed as the *mode* argument to `open` when *fname* is `str` or `os.PathLike`; ignored if *fname* is file-like.

return_opened

[bool, default: False] If True, return both the file object and a boolean indicating whether this was a new file (that the caller needs to close). If False, return only the new file.

encoding

[str or None, default: None] Passed as the *mode* argument to `open` when *fname* is `str` or `os.PathLike`; ignored if *fname* is file-like.

Returns

fh

[file-like]

opened

[bool] *opened* is only returned if *return_opened* is True.

`matplotlib.cbook.`**`violin_stats`**(*X*, *method*, *points=100*, *quantiles=None*)

Return a list of dictionaries of data which can be used to draw a series of violin plots.

See the `Returns` section below to view the required keys of the dictionary.

Users can skip this function and pass a user-defined set of dictionaries with the same keys to *violinplot* instead of using Matplotlib to do the calculations. See the *Returns* section below for the keys that must be present in the dictionaries.

Parameters

X

[array-like] Sample data that will be used to produce the gaussian kernel density estimates. Must have 2 or fewer dimensions.

method

[callable] The method used to calculate the kernel density estimate for each column of data. When called via `method(v, coords)`, it should return a vector of the values of the KDE evaluated at the values specified in coords.

points

[int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimates at.

quantiles

[array-like, default: None] Defines (if not None) a list of floats in interval [0, 1] for each column of data, which represents the quantiles that will be rendered for that column of data. Must have 2 or fewer dimensions. 1D array will be treated as a singleton list containing them.

Returns

list of dict

A list of dictionaries containing the results for each column of data. The dictionaries contain at least the following:

- coords: A list of scalars containing the coordinates this particular kernel density estimate was evaluated at.
- vals: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in *coords*.
- mean: The mean value for this column of data.
- median: The median value for this column of data.
- min: The minimum value for this column of data.
- max: The maximum value for this column of data.
- quantiles: The quantile values for this column of data.

7.2.14 matplotlib.cm

Builtin colormaps, colormap handling utilities, and the *ScalarMappable* mixin.

See also:

Colormap reference for a list of builtin colormaps.

Creating Colormaps in Matplotlib for examples of how to make colormaps.

Choosing Colormaps in Matplotlib an in-depth discussion of choosing colormaps.

Colormap normalization for more details about data normalization.

class matplotlib.cm.**ColormapRegistry**(*cmaps*)

Bases: Mapping

Container for colormaps that are known to Matplotlib by name.

The universal registry instance is *matplotlib.colormaps*. There should be no need for users to instantiate *ColormapRegistry* themselves.

Read access uses a dict-like interface mapping names to *Colormap*s:

```
import matplotlib as mpl
cmap = mpl.colormaps['viridis']
```

Returned *Colormap*s are copies, so that their modification does not change the global definition of the colormap.

Additional colormaps can be added via *ColormapRegistry.register*:

```
mpl.colormaps.register(my_colormap)
```

To get a list of all registered colormaps, you can do:

```
from matplotlib import colormaps
list(colormaps)
```

get_cmap(*cmap*)

Return a color map specified through *cmap*.

Parameters

cmap

[str or *Colormap* or None]

- if a *Colormap*, return it
- if a string, look it up in `mpl.colormaps`
- if None, return the Colormap defined in *rcParams["image.cmap"]* (default: `'viridis'`)

Returns

Colormap

register(*cmap*, *, *name=None*, *force=False*)

Register a new colormap.

The colormap name can then be used as a string argument to any `cmap` parameter in Matplotlib. It is also available in `pyplot.get_cmap`.

The colormap registry stores a copy of the given colormap, so that future changes to the original colormap instance do not affect the registered colormap. Think of this as the registry taking a snapshot of the colormap at registration.

Parameters

cmap

[matplotlib.colors.Colormap] The colormap to register.

name

[str, optional] The name for the colormap. If not given, `cmap.name` is used.

force

[bool, default: False] If False, a ValueError is raised if trying to overwrite an already registered name. True supports overwriting registered colormaps other than the builtin colormaps.

unregister(*name*)

Remove a colormap from the registry.

You cannot remove built-in colormaps.

If the named colormap is not registered, returns with no error, raises if you try to de-register a default colormap.

Warning: Colormap names are currently a shared namespace that may be used by multiple packages. Use *unregister* only if you know you have registered that name before. In particular, do not unregister just in case to clean the name before registering a new colormap.

Parameters

name

[str] The name of the colormap to be removed.

Raises

ValueError

If you try to remove a default built-in colormap.

class matplotlib.cm.**ScalarMappable**(*norm=None*, *cmap=None*)

Bases: object

A mixin class to map scalar data to RGBA.

The ScalarMappable applies data normalization before returning RGBA colors from the given colormap.

Parameters

norm

[*Normalize* (or subclass thereof) or str or None] The normalizing object which scales data, typically into the interval `[0, 1]`. If a `str`, a *Normalize* subclass is dynamically generated based on the scale with the corresponding name. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

cmap

[str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

get_alpha()

Returns

float

Always returns 1.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_cmap()

Return the *Colormap* instance.

property norm

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

matplotlib.cm.**get_cmap**(*name=None*, *lut=None*)

[*Deprecated*] Get a colormap instance, defaulting to rc values if *name* is None.

Parameters

name

[*Colormap* or str or None, default: None] If a *Colormap* instance, it will be returned. Otherwise, the name of a colormap known to Matplotlib, which will be resampled by *lut*. The default, None, means *rcParams["image.cmap"]* (default: `'viridis'`).

lut

[int or None, default: None] If *name* is not already a Colormap instance and *lut* is not None, the colormap will be resampled to have *lut* entries in the lookup table.

Returns

Colormap

Notes

Deprecated since version 3.7: Use `matplotlib.colormaps[name]` or `matplotlib.colormaps.get_cmap(obj)` instead.

`matplotlib.cm.`**`register_cmap`**(*name=None*, *cmap=None*, *, *override_builtin=False*)

[*Deprecated*] Add a colormap to the set recognized by *get_cmap()*.

Register a new colormap to be accessed by name

```
LinearSegmentedColormap('swirly', data, lut)
register_cmap(cmap=swirly_cmap)
```

Parameters

name

[str, optional] The name that can be used in *get_cmap()* or *rcParams["image.cmap"]* (default: `'viridis'`)

If absent, the name will be the `name` attribute of the *cmap*.

cmap

[matplotlib.colors.Colormap] Despite being the second argument and having a default value, this is a required argument.

override_builtin

[bool] Allow built-in colormaps to be overridden by a user-supplied colormap.

Please do not use this unless you are sure you need it.

Notes

Deprecated since version 3.7: Use `matplotlib.colormaps.register(name)` instead.

`matplotlib.cm.`**`unregister_cmap`**(*name*)

[*Deprecated*] Remove a colormap recognized by *get_cmap()*.

You may not remove built-in colormaps.

If the named colormap is not registered, returns with no error, raises if you try to de-register a default colormap.

Warning: Colormap names are currently a shared namespace that may be used by multiple packages. Use *unregister_cmap* only if you know you have registered that name before. In particular, do not unregister just in case to clean the name before registering a new colormap.

Parameters

name

[str] The name of the colormap to be un-registered

Returns

ColorMap or None

If the colormap was registered, return it if not return `None`

Raises

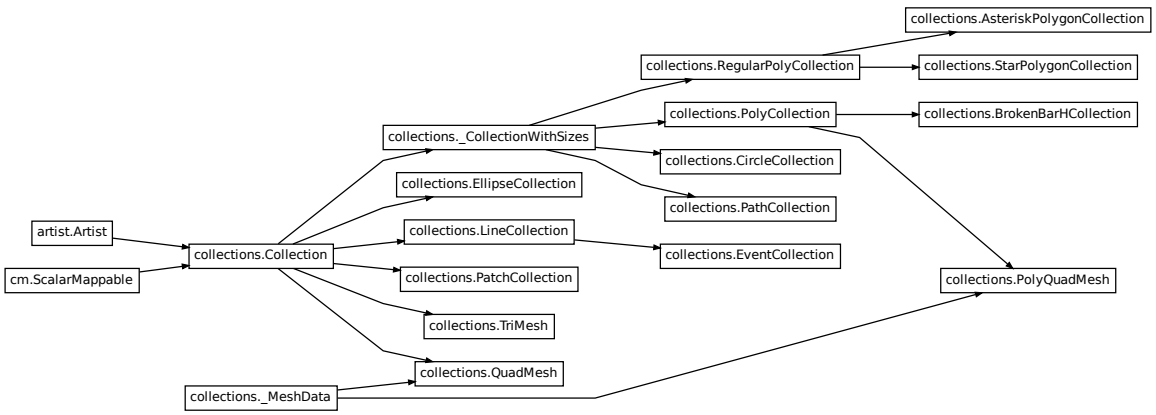
ValueError

If you try to de-register a default built-in colormap.

Notes

Deprecated since version 3.7: Use `matplotlib.colormaps.unregister(name)` instead.

7.2.15 matplotlib.collections



Classes for the efficient drawing of large collections of objects that share most properties, e.g., a large number of line segments or polygons.

The classes are not meant to be as flexible as their single element counterparts (e.g., you may not be able to select all line styles) but they are meant to be fast for common use cases (e.g., a large set of solid line segments).

class matplotlib.collections.**AsteriskPolygonCollection**(*numsides*, *, *rotation=0*, *sizes=(1,)*, ***kwargs*)

Bases: *RegularPolyCollection*

Draw a collection of regular asterisks with *numsides* points.

Parameters

numsides

[int] The number of sides of the polygon.

rotation

[float] The rotation of the polygon in radians.

sizes

[tuple of float] The area of the circle circumscribing the polygon in points^2.

****kwargs**

Forwarded to *Collection*.

Examples

See *Lasso Demo* for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    offset_transform=ax.transData,
    )
```

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()
Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()
Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()
Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()
Alias for *get_facecolor*.

get_fc()
Alias for *get_facecolor*.

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
Return whether face is colored.

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *`get_linestyle`*.

get_linewidth()

get_linewidths()

Alias for *`get_linewidth`*.

get_ls()

Alias for *`get_linestyle`*.

get_lw()

Alias for *`get_linewidth`*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_numsides()

get_offset_transform()

Return the *`Transform`* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_rotation()

get_sizes()

Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, ***get_picker***, ***pick***

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None

Table 33 – continued from p

Property	Description
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor*, *Collection.set_edgecolor

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*paths*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[numpy.ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**BrokenBarHCollection**(*xranges*, *yrange*, ***kwargs*)

Bases: *PolyCollection*

[*Deprecated*] A collection of horizontal bars spanning *yrange* with a sequence of *xranges*.

Notes

Deprecated since version 3.7.

Parameters

xranges

[list of (float, float)] The sequence of (left-edge-position, width) pairs for each bar.

yrange

[(float, float)] The (lower-edge, height) common to all bars.

****kwargs**

Forwarded to *Collection*.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()
Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()
Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()
Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()
Alias for *get_facecolor*.

get_fc()
Alias for *get_facecolor*.

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
Return whether face is colored.

get_gid()
Return the group id.

get_hatch()
Return the current hatching pattern.

get_in_layout()
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()
Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *get_linestyle*.

get_linewidth()

get_linewidths()

Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sizes()

Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *verts_and_codes=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor*, *Collection.set_edgecolor

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*verts*, *closed=True*)

Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[`numpy.ndarray` or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_verts(*verts*, *closed=True*)

Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_verts_and_codes(*verts*, *codes*)

Initialize vertices with path codes.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

classmethod span_where(*x*, *ymin*, *ymax*, *where*, ***kwargs*)

[*Deprecated*] Return a `BrokenBarHCollection` that plots horizontal bars from over the regions in *x* where *where* is True. The bars range on the y-axis from *ymin* to *ymax*

kwargs are passed on to the collection.

Notes

Deprecated since version 3.7: Use fill_between instead.

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension

is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**CircleCollection**(*sizes*, ***kwargs*)

Bases: `_CollectionWithSizes`

A collection of circles, drawn using splines.

Parameters

sizes

[float or array-like] The area of each circle in points^2.

****kwargs**

Forwarded to *Collection*.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()

Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()

Alias for *get_facecolor*.

get_fc()

Alias for *get_facecolor*.

get_figure()

Return the *Figure* instance the artist belongs to.

get_fill()

Return whether face is colored.

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *get_linestyle*.

get_linewidth()

get_linewidths()

Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sizes()

Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, ***get_picker***, ***pick***

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object

Table 35 – continued from p

Property	Description
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a `Rectangle` this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of `set`), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[`Colormap` or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

`Collection.set_facecolor`, **`Collection.set_edgecolor`**

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for `set_linestyle`.

set_ec(*c*)

Alias for `set_edgecolor`.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for `set_edgecolor`.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*paths*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[numpy.ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**Collection**(*, *edgecolors=None*, *facecolors=None*, *linewidths=None*, *linestyles='solid'*, *capstyle=None*, *joinstyle=None*, *antialiaseds=None*, *offsets=None*, *offset_transform=None*, *norm=None*, *cmap=None*, *pickradius=5.0*, *hatch=None*, *urls=None*, *zorder=1*, ***kwargs*)

Bases: *Artist*, *ScalarMappable*

Base class for Collections. Must be subclassed to be usable.

A Collection represents a sequence of *Patch*es that can be drawn more efficiently together than individually. For example, when a single path is being drawn repeatedly at different offsets, the renderer can typically execute a `draw_marker()` call much more efficiently than a series of repeated calls to `draw_path()` with the offsets put in one-by-one.

Most properties of a collection can be configured per-element. Therefore, Collections have "plural" versions of many of the properties of a *Patch* (e.g. *Collection.get_paths* instead of *Patch.get_path*). Exceptions are the *zorder*, *hatch*, *pickradius*, *capstyle* and *joinstyle* properties, which can only be set globally for the whole collection.

Besides these exceptions, all properties can be specified as single values (applying to all elements) or sequences of values. The property of the `i`th element of the collection is:

```
prop[i % len(prop)]
```

Each Collection can optionally be used as its own *ScalarMappable* by passing the *norm* and *cmap* parameters to its constructor. If the Collection's *ScalarMappable* matrix `_A` has been set (via a call to *Collection.set_array*), then at draw time this internal scalar mappable will be used to set the `facecolors` and `edgecolors`, ignoring those that were manually passed in.

Parameters

edgecolors

[color or list of colors, default: *rcParams["patch.edgecolor"]* (default: `'black'`)] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

facecolors

[color or list of colors, default: *rcParams["patch.facecolor"]* (default: `'C0'`)] Face color for each patch making up the collection.

linewidths

[float or list of floats, default: *rcParams["patch.linewidth"]* (default: `1.0`)] Line width for each patch making up the collection.

linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see *Linestyles*.

capstyle

[*CapStyle*-like, default: *rcParams["patch.capstyle"]*] Style to use for capping lines for all paths in the collection. Allowed values are {'butt', 'projecting', 'round'}.

joinstyle

[*JoinStyle*-like, default: *rcParams["patch.joinstyle"]*] Style to use for joining lines for all paths in the collection. Allowed values are {'miter', 'round', 'bevel'}.

antialiaseds

[bool or list of bool, default: *rcParams["patch.antialiased"]* (default: `True`)] Whether each patch in the collection should be drawn with antialiasing.

offsets

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

offset_transform

[*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

cmap, norm

Data normalization and colormapping parameters. See *ScalarMappable* for a detailed description.

hatch

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/', '', '|', '-', '+', 'x', 'o', 'O', '.', '*']. See *Hatch style reference* for the meaning of each hatch type.

pickradius

[float, default: 5.0] If `pickradius <= 0`, then *Collection.contains* will return `True` whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

urls

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See *Hyperlinks* for examples.

zorder

[float, default: 1] The drawing order, shared by all Patches in the Collection. See *Zorder Demo* for all defaults and examples.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()

Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()

Alias for *get_facecolor*.

get_fc()

Alias for *get_facecolor*.

get_figure()

Return the *Figure* instance the artist belongs to.

get_fill()

Return whether face is colored.

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *get_linestyle*.

get_linewidth()

get_linewidths()

Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.

- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns
alpha	array-like or scalar or None
animated	bool
antialiased	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}

Table 36 – continued from previous

Property	Description
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor	color or list of colors or 'face'
facecolor	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle	str or tuple or list thereof
linewidth	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value,

and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor, ***Collection.set_edgecolor***

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
```

(continues on next page)

(continued from previous page)

```
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*paths*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be uint8, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**EllipseCollection**(*widths*, *heights*, *angles*, *, *units='points'*, ***kwargs*)

Bases: *Collection*

A collection of ellipses, drawn using splines.

Parameters

widths

[array-like] The lengths of the first axes (e.g., major axis lengths).

heights

[array-like] The lengths of second axes.

angles

[array-like] The angles of the first axes, degrees CCW from the x-axis.

units

[{'points', 'inches', 'dots', 'width', 'height', 'x', 'y', 'xy'}] The units in which majors and minors are given; 'width' and 'height' refer to the dimensions of the axes, while 'x' and 'y' refer to the *offsets* data units. 'xy' differs from all others in that the angle as plotted varies with the aspect ratio, and equals the specified angle only when the aspect ratio is unity. Hence it behaves the same as the *Ellipse* with `axes.transData` as its transform.

****kwargs**

Forwarded to *Collection*.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()
Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()
Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()
Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()
Alias for *get_facecolor*.

get_fc()
Alias for *get_facecolor*.

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
Return whether face is colored.

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *`get_linestyle`*.

get_linewidth()

get_linewidths()

Alias for *`get_linewidth`*.

get_ls()

Alias for *`get_linestyle`*.

get_lw()

Alias for *`get_linewidth`*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *`Transform`* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

Bbox **or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool

Table 37 – continued from p

Property	Description
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor, *Collection.set_edgecolor*

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*paths*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**EventCollection**(*positions*, *orientation='horizontal'*, ***, *lineoffset=0*, *linelength=1*, *linewidth=None*, *color=None*, *linestyle='solid'*, *antialiased=None*, ***kwargs*)

Bases: *LineCollection*

A collection of locations along a single axis at which an "event" occurred.

The events are given by a 1-dimensional array. They do not have an amplitude and are displayed as parallel lines.

Parameters

positions

[1D array-like] Each value is an event.

orientation

[{'horizontal', 'vertical'}, default: 'horizontal'] The sequence of events is plotted along this direction. The marker lines of the single events are along the orthogonal direction.

lineoffset

[float, default: 0] The offset of the center of the markers from the origin, in the direction orthogonal to *orientation*.

linelength

[float, default: 1] The total height of the marker (i.e. the marker stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

linewidth

[float or list thereof, default: *rcParams["lines.linewidth"]* (default: `1.5`)] The line width of the event lines, in points.

color

[color or list of colors, default: *rcParams["lines.color"]* (default: `'C0'`)] The color of the event lines.

linestyle

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

antialiased

[bool or list thereof, default: *rcParams["lines.antialiased"]* (default: `True`)] Whether to use antialiasing for drawing the lines.

****kwargs**

Forwarded to *LineCollection*.

Examples

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

add_positions(*position*)

Add one or more events at the specified positions.

append_positions(*position*)

Add one or more events at the specified positions.

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

extend_positions(*position*)

Add one or more events at the specified positions.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_color()

Return the color of the lines used to mark each event.

get_colors()

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()

Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()

Alias for *get_facecolor*.

get_fc()

Alias for *get_facecolor*.

get_figure()

Return the *Figure* instance the artist belongs to.

get_fill()

Return whether face is colored.

get_gapcolor()

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linelength()

Return the length of the lines used to mark each event.

get_lineoffset()

Return the offset of the lines used to mark each event.

get_linestyle()

get_linestyles()

Alias for *get_linestyle*.

get_linewidth()

Get the width of the lines used to mark each event.

get_linewidths()

Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_orientation()

Return the orientation of the event line ('horizontal' or 'vertical').

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_positions()

Return an array containing the floating-point values of the positions.

get_rasterized()

Return whether the artist is to be rasterized.

get_segments()

Returns

list

List of segments in the LineCollection. Each list item contains an array of vertices.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_horizontal()

True if the eventcollection is horizontal, False if vertical.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *colors=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gapcolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linelength=<UNSET>*, *lineoffset=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *orientation=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *positions=<UNSET>*, *rasterized=<UNSET>*, *segments=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of colors
colors	color or list of colors
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gapcolor	color or list of colors or None
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linelength	unknown
lineoffset	unknown
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*

Table 38 – continued from p

Property	Description
offsets	(N, 2) or (2,) array-like
orientation	{'horizontal', 'vertical'}
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
positions	unknown
rasterized	bool
segments	unknown
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	unknown
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set the edgecolor(s) of the LineCollection.

Parameters

c

[color or list of colors] Single color (all lines have same color), or a sequence of RGBA tuples; if it is a sequence the lines will cycle through the sequence.

set_colors(*c*)

Set the edgecolor(s) of the LineCollection.

Parameters

c

[color or list of colors] Single color (all lines have same color), or a sequence of RGBA tuples; if it is a sequence the lines will cycle through the sequence.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gapcolor(*gapcolor*)

Set a color to fill the gaps in the dashed line style.

Note: Striped lines are created by drawing two interleaved dashed lines. There can be overlaps between those two, which may result in artifacts when using transparency.

This functionality is experimental and may change.

Parameters

gapcolor

[color or list of colors or None] The color with which to fill the gaps. If None, the gaps are unfilled.

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linelength(*linelength*)

Set the length of the lines used to mark each event.

set_lineoffset(*lineoffset*)

Set the offset of the lines used to mark each event.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_orientation(*orientation*)

Set the orientation of the event line.

Parameters

orientation

[{'horizontal', 'vertical'}]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*segments*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_positions(*positions*)

Set the positions of the events.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_segments(*segments*)

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_verts(*segments*)

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

switch_orientation()

Switch the orientation of the event line, either from vertical to horizontal or vice versus.

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**LineCollection**(*segments*, *, *zorder=2*, ***kwargs*)

Bases: *Collection*

Represents a sequence of *Line2D*s that should be drawn together.

This class extends *Collection* to represent a sequence of *Line2D*s instead of just a sequence of *Patch*s. Just as in *Collection*, each property of a *LineCollection* may be either a single value or a list of values. This list is then used cyclically for each element of the LineCollection, so the property of the `i`th element of the collection is:

```
prop[i % len(prop)]
```

The properties of each member of a *LineCollection* default to their values in *rcParams["lines.*"]* instead of *rcParams["patch.*"]*, and the property *colors* is added in place of *edgecolors*.

Parameters

segments

[list of array-like] A sequence (*line0*, *line1*, *line2*) of lines, where each line is a list of points:

```
lineN = [(x0, y0), (x1, y1), ... (xm, ym)]
```

or the equivalent Mx2 numpy array with two columns. Each line can have a different number of segments.

linewidths

[float or list of float, default: *rcParams["lines.linewidth"]* (default: `1.5`)] The width of each line in points.

colors

[color or list of color, default: *rcParams["lines.color"]* (default: `'C0'`)] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

antialiaseds

[bool or list of bool, default: *rcParams["lines.antialiased"]* (default: `True`)] Whether to use antialiasing for each line.

zorder

[float, default: 2] zorder of the lines once drawn.

facecolors

[color or list of color, default: 'none'] When setting *facecolors*, each line is interpreted as a boundary for an area, implicitly closing the path from the last point to the first point. The enclosed area is filled with *facecolor*. In order to manually specify what should count as the "interior" of each line, please use *PathCollection* instead, where the "interior" can be specified by appropriate usage of *CLOSEPOLY*.

****kwargs**

Forwarded to *Collection*.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_color()

get_colors()

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()

Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()

Alias for *get_facecolor*.

get_fc()

Alias for *get_facecolor*.

get_figure()

Return the *Figure* instance the artist belongs to.

get_fill()

Return whether face is colored.

get_gapcolor()

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *get_linestyle*.

get_linewidth()

get_linewidths()

Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_segments()

Returns

list

List of segments in the LineCollection. Each list item contains an array of vertices.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, ***get_picker***, ***pick***

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *colors=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gapcolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *segments=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	unknown
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of colors

Table 39 – continued from p

Property	Description
colors	color or list of colors
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	Figure
gapcolor	color or list of colors or None
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	Normalize or str or None
offset_transform or transOffset	Transform
offsets	(N, 2) or (2,) array-like
path_effects	list of AbstractPathEffect
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
segments	unknown
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
urls	list of str or None
verts	unknown
visible	bool
zorder	float

set_aa(*aa*)

Alias for set_antialiased.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set the edgecolor(s) of the LineCollection.

Parameters

c

[color or list of colors] Single color (all lines have same color), or a sequence of RGBA tuples; if it is a sequence the lines will cycle through the sequence.

set_colors(*c*)

Set the edgecolor(s) of the LineCollection.

Parameters

c

[color or list of colors] Single color (all lines have same color), or a sequence of RGBA tuples; if it is a sequence the lines will cycle through the sequence.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gapcolor(*gapcolor*)

Set a color to fill the gaps in the dashed line style.

Note: Striped lines are created by drawing two interleaved dashed lines. There can be overlaps between those two, which may result in artifacts when using transparency.

This functionality is experimental and may change.

Parameters

gapcolor

[color or list of colors or None] The color with which to fill the gaps. If None, the gaps are unfilled.

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*segments*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_segments(*segments*)

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_verts(*segments*)

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**PatchCollection**(*patches*, *, *match_original=False*, ***kwargs*)

Bases: *Collection*

A generic collection of patches.

PatchCollection draws faster than a large number of equivalent individual Patches. It also makes it easier to assign a colormap to a heterogeneous collection of patches.

Parameters

patches

[list of *Patch*] A sequence of Patch objects. This list may include a heterogeneous assortment of different patch types.

match_original

[bool, default: False] If True, use the colors and linewidths of the original patches. If False, new colors may be assigned by providing the standard collection arguments, facecolor, edgecolor, linewidths, norm or cmap.

****kwargs**

All other parameters are forwarded to *Collection*.

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their *rcParams* patch setting, in sequence form.

Notes

The use of *ScalarMappable* functionality is optional. If the *ScalarMappable* matrix _A has been set (via a call to *set_array*), at draw time a call to scalar mappable will be made to set the face colors.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()
Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()
Alias for *get_facecolor*.

get_fc()
Alias for *get_facecolor*.

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
Return whether face is colored.

get_gid()
Return the group id.

get_hatch()
Return the current hatching pattern.

get_in_layout()
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()
Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()
Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()
Alias for *get_linestyle*.

get_linewidth()

get_linewidths()
Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, ***get_picker***, ***pick***

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*

Table 40 – continued from p

Property	Description
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a `Rectangle` this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of `set`), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[`Colormap` or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

`Collection.set_facecolor`, **`Collection.set_edgecolor`**

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for `set_linestyle`.

set_ec(*c*)

Alias for `set_edgecolor`.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for `set_edgecolor`.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*patches*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**PathCollection**(*paths*, *sizes=None*, ***kwargs*)

Bases: `_CollectionWithSizes`

A collection of *Path*s, as created by e.g. *scatter*.

Parameters

paths

[list of *path.Path*] The paths that will make up the *Collection*.

sizes

[array-like] The factor by which to scale each drawn *Path*. One unit squared in the Path's data space is scaled to be `sizes**2` points when rendered.

****kwargs**

Forwarded to *Collection*.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()

Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()

Alias for *get_facecolor*.

get_fc()

Alias for *get_facecolor*.

get_figure()

Return the *Figure* instance the artist belongs to.

get_fill()

Return whether face is colored.

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *get_linestyle*.

get_linewidth()

get_linewidths()

Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sizes()

Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

legend_elements(*prop='colors'*, *num='auto'*, *fmt=None*, *func=<function PathCollection.<lambda>>*, ***kwargs*)

Create legend handles and labels for a PathCollection.

Each legend handle is a *Line2D* representing the Path that was drawn, and each label is a string that represents the Path.

This is useful for obtaining a legend for a *scatter* plot; e.g.:

```
scatter = plt.scatter([1, 2, 3],  [4, 5, 6],  c=[7, 2, 3], num=None)
plt.legend(*scatter.legend_elements())
```

creates three legend elements, one for each color with the numerical values passed to *c* as the labels.

Also see the *Automated legend creation* example.

Parameters

prop

[{"colors", "sizes"}, default: "colors"] If "colors", the legend handles will show the different colors of the collection. If "sizes", the legend will show the different sizes. To set both, use *kwargs* to directly edit the *Line2D* properties.

num

[int, None, "auto" (default), array-like, or *Locator*] Target number of elements to create. If None, use all unique elements of the mappable array. If an integer, target to use *num* elements in the normed range. If *"auto"*, try to determine which option better suits the nature of the data. The number of created elements may slightly deviate from *num* due to a *Locator* being used to find useful locations. If a list or array, use exactly those elements for the legend. Finally, a *Locator* can be provided.

fmt

[str, *Formatter*, or None (default)] The format or formatter to use for the labels. If a string must be a valid input for a *StrMethodFormatter*. If None (the default), use a *ScalarFormatter*.

func

[function, default: `lambda x: x`] Function to calculate the labels. Often the size (or color) argument to *scatter* will have been pre-processed by the user using a function `s = f(x)` to make the markers visible; e.g. `size = np.log10(x)`. Providing the inverse of this function here allows that pre-processing to be inverted, so that the legend labels have the correct values; e.g. `func = lambda x: 10**x`.

****kwargs**

Allowed keyword arguments are *color* and *size*. E.g. it may be useful to set the color of the markers if *prop="sizes"* is used; similarly to set the size of the markers if *prop="colors"* is used. Any further parameters are passed onto the *Line2D* instance. This may be useful to e.g. specify a different *markeredgecolor* or *alpha* for the legend handles.

Returns

handles

[list of *Line2D*] Visual representation of each element of the legend.

labels

[list of str] The string labels for elements of the legend.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor*, *Collection.set_edgecolor

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*paths*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[`numpy.ndarray` or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**PolyCollection**(*verts*, *sizes=None*, ***, *closed=True*, ***kwargs*)

Bases: `_CollectionWithSizes`

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

sizes

[array-like, default: None] Squared scaling factors for the polygons. The coordinates of each polygon *verts_i* are multiplied by the square-root of the corresponding entry in *sizes* (i.e., *sizes* specify the scaling of areas). The scaling is applied before the Artist master transform.

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

****kwargs**

Forwarded to *Collection*.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()
Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()
Alias for *get_facecolor*.

get_fc()
Alias for *get_facecolor*.

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
Return whether face is colored.

get_gid()
Return the group id.

get_hatch()
Return the current hatching pattern.

get_in_layout()
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()
Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()
Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()
Alias for *get_linestyle*.

get_linewidth()

get_linewidths()
Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sizes()

Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.

- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *verts_and_codes=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None

Table 42 – continued from p

Property	Description
capstyle	CapStyle or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	Colormap or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	Figure
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	Normalize or str or None
offset_transform or transOffset	Transform
offsets	(N, 2) or (2,) array-like
path_effects	list of AbstractPathEffect
paths	list of array-like
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

set_aa(*aa*)

Alias for set_antialiased.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor*, *Collection.set_edgecolor

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*verts*, *closed=True*)

Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[`numpy.ndarray` or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_verts(*verts*, *closed=True*)

Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_verts_and_codes(*verts*, *codes*)

Initialize vertices with path codes.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

classmethod span_where(*x*, *ymin*, *ymax*, *where*, ***kwargs*)

[*Deprecated*] Return a `BrokenBarHCollection` that plots horizontal bars from over the regions in *x* where *where* is True. The bars range on the y-axis from *ymin* to *ymax*

kwargs are passed on to the collection.

Notes

Deprecated since version 3.7: Use fill_between instead.

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**PolyQuadMesh**(*coordinates*, ***kwargs*)

Bases: _MeshData, *PolyCollection*

Class for drawing a quadrilateral mesh as individual Polygons.

A quadrilateral mesh is a grid of M by N adjacent quadrilaterals that are defined via a (M+1, N+1) grid of vertices. The quadrilateral (m, n) is defined by the vertices

```
    (m+1, n) ----------- (m+1, n+1)
       /                   /
      /                   /
     /                   /
(m, n) -------- (m, n+1)
```

The mesh need not be regular and the polygons need not be convex.

Parameters

coordinates

[(M+1, N+1, 2) array-like] The vertices. `coordinates[m, n]` specifies the (x, y) coordinates of vertex (m, n).

Notes

Unlike *QuadMesh*, this class will draw each cell as an individual Polygon. This is significantly slower, but allows for more flexibility when wanting to add additional properties to the cells, such as hatching.

Another difference from *QuadMesh* is that if any of the vertices or data of a cell are masked, that Polygon will **not** be drawn and it won't be in the list of paths returned.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

sizes

[array-like, default: None] Squared scaling factors for the polygons. The coordinates of each polygon *verts_i* are multiplied by the square-root of the corresponding entry in *sizes* (i.e., *sizes* specify the scaling of areas). The scaling is applied before the Artist master transform.

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

****kwargs**

Forwarded to *Collection*.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_coordinates()

Return the vertices of the mesh as an (M+1, N+1, 2) array.

M, N are the number of quadrilaterals in the rows / columns of the mesh, corresponding to (M+1, N+1) vertices. The last dimension specifies the components (x, y).

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()

Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()

Alias for *get_facecolor*.

get_fc()

Alias for *get_facecolor*.

get_figure()

Return the *Figure* instance the artist belongs to.

get_fill()

Return whether face is colored.

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *`get_linestyle`*.

get_linewidth()

get_linewidths()

Alias for *`get_linewidth`*.

get_ls()

Alias for *`get_linestyle`*.

get_lw()

Alias for *`get_linewidth`*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *`Transform`* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sizes()

Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set (*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *verts=<UNSET>*, *verts_and_codes=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	unknown
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	list of array-like
picker	None or bool or float or callable
pickradius	float

Table 43 – continued from p

Property	Description
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
verts	list of array-like
verts_and_codes	unknown
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the data values.

Parameters

A

[array-like] The mesh data. Supported array shapes are:

- (M, N) or (M*N,): a mesh with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

If the values are provided as a 2D grid, the shape must match the coordinates grid. If the values are 1D, they are reshaped to 2D. M, N follow from the coordinates grid, where the coordinates grid shape is (M, N) for 'gouraud' *shading* and (M+1, N+1) for 'flat' shading.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a `Rectangle` this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of `set`), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[`Colormap` or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

`Collection.set_facecolor`, **`Collection.set_edgecolor`**

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for `set_linestyle`.

set_ec(*c*)

Alias for `set_edgecolor`.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for `set_edgecolor`.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*verts*, *closed=True*)

Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[numpy.ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_verts(*verts*, *closed=True*)

Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts_i* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_verts_and_codes(*verts*, *codes*)

Initialize vertices with path codes.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

classmethod span_where(*x*, *ymin*, *ymax*, *where*, ***kwargs*)

[*Deprecated*] Return a `BrokenBarHCollection` that plots horizontal bars from over the regions in *x* where *where* is True. The bars range on the y-axis from *ymin* to *ymax*

kwargs are passed on to the collection.

Notes

Deprecated since version 3.7: Use fill_between instead.

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**QuadMesh**(*coordinates*, *, *antialiased=True*, *shading='flat'*, ***kwargs*)

Bases: _MeshData, *Collection*

Class for the efficient drawing of a quadrilateral mesh.

A quadrilateral mesh is a grid of M by N adjacent quadrilaterals that are defined via a (M+1, N+1) grid of vertices. The quadrilateral (m, n) is defined by the vertices

```
    (m+1, n) ----------- (m+1, n+1)
       /                   /
      /                   /
     /                   /
(m, n) -------- (m, n+1)
```

The mesh need not be regular and the polygons need not be convex.

Parameters

coordinates

[(M+1, N+1, 2) array-like] The vertices. `coordinates[m, n]` specifies the (x, y) coordinates of vertex (m, n).

antialiased

[bool, default: True]

shading

[{'flat', 'gouraud'}, default: 'flat']

Notes

Unlike other *Collection*s, the default *pickradius* of *QuadMesh* is 0, i.e. *contains* checks whether the test point is within any of the mesh quadrilaterals.

Parameters

edgecolors

[color or list of colors, default: *rcParams["patch.edgecolor"]* (default: `'black'`)] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

facecolors

[color or list of colors, default: *rcParams["patch.facecolor"]* (default: `'C0'`)] Face color for each patch making up the collection.

linewidths

[float or list of floats, default: *rcParams["patch.linewidth"]* (default: `1.0`)] Line width for each patch making up the collection.

linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see *Linestyles*.

capstyle

[*CapStyle*-like, default: *rcParams["patch.capstyle"]*] Style to use for capping lines for all paths in the collection. Allowed values are {'butt', 'projecting', 'round'}.

joinstyle

[*JoinStyle*-like, default: *rcParams["patch.joinstyle"]*] Style to use for joining lines for all paths in the collection. Allowed values are {'miter', 'round', 'bevel'}.

antialiaseds

[bool or list of bool, default: *rcParams["patch.antialiased"]* (default: `True`)] Whether each patch in the collection should be drawn with antialiasing.

offsets

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

offset_transform

[*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

cmap, norm

Data normalization and colormapping parameters. See *ScalarMappable* for a detailed description.

hatch

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/', '', '|', '-', '+', 'x', 'o', 'O', '.', '*']. See *Hatch style reference* for the meaning of each

hatch type.

pickradius

[float, default: 5.0] If `pickradius <= 0`, then *`Collection.contains`* will return `True` whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

urls

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See *Hyperlinks* for examples.

zorder

[float, default: 1] The drawing order, shared by all Patches in the Collection. See *Zorder Demo* for all defaults and examples.

`add_callback`(*func*)

Add a callback function that will be called whenever one of the *`Artist`*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *`Artist`*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *`remove_callback`* later.

See also:

`remove_callback`

`autoscale`()

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None`()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.

- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_coordinates()

Return the vertices of the mesh as an (M+1, N+1, 2) array.

M, N are the number of quadrilaterals in the rows / columns of the mesh, corresponding to (M+1, N+1) vertices. The last dimension specifies the components (x, y).

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()
Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()
Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()
Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()
Alias for *get_facecolor*.

get_fc()
Alias for *get_facecolor*.

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
Return whether face is colored.

get_gid()
Return the group id.

get_hatch()
Return the current hatching pattern.

get_in_layout()
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()
Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *get_linestyle*.

get_linewidth()

get_linewidths()

Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}

Table 44 – continued from p

Property	Description
clim	(vmin: float, vmax: float)
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	Colormap or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	Figure
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	Normalize or str or None
offset_transform or transOffset	Transform
offsets	(N, 2) or (2,) array-like
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for set_antialiased.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of

the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the data values.

Parameters

A

[array-like] The mesh data. Supported array shapes are:

- (M, N) or (M*N,): a mesh with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).

- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

If the values are provided as a 2D grid, the shape must match the coordinates grid. If the values are 1D, they are reshaped to 2D. M, N follow from the coordinates grid, where the coordinates grid shape is (M, N) for 'gouraud' *shading* and (M+1, N+1) for 'flat' shading.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor*, *Collection.set_edgecolor

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths()

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**RegularPolyCollection**(*numsides*, *, *rotation=0*, *sizes=(1,)*, ***kwargs*)

Bases: _CollectionWithSizes

A collection of n-sided regular polygons.

Parameters

numsides

[int] The number of sides of the polygon.

rotation

[float] The rotation of the polygon in radians.

sizes

[tuple of float] The area of the circle circumscribing the polygon in points^2.

****kwargs**

Forwarded to *Collection*.

Examples

See *Lasso Demo* for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    offset_transform=ax.transData,
    )
```

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()

Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()

Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()

Alias for *get_facecolor*.

get_fc()

Alias for *get_facecolor*.

get_figure()

Return the *Figure* instance the artist belongs to.

get_fill()

Return whether face is colored.

get_gid()

Return the group id.

get_hatch()

Return the current hatching pattern.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()

Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()

Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()
Alias for *get_linestyle*.

get_linewidth()

get_linewidths()
Alias for *get_linewidth*.

get_ls()
Alias for *get_linestyle*.

get_lw()
Alias for *get_linewidth*.

get_mouseover()
Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_numsides()

get_offset_transform()
Return the *Transform* instance used by this artist offset.

get_offsets()
Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()
Return whether the artist is to be rasterized.

get_rotation()

get_sizes()
Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None

Table 45 – continued from p

Property	Description
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor, ***Collection.set_edgecolor***

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*paths*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[`numpy.ndarray` or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**StarPolygonCollection**(*numsides*, *, *rotation=0*, *sizes=(1,)*, ***kwargs*)

Bases: *RegularPolyCollection*

Draw a collection of regular stars with *numsides* points.

Parameters

numsides

[int] The number of sides of the polygon.

rotation

[float] The rotation of the polygon in radians.

sizes

[tuple of float] The area of the circle circumscribing the polygon in points^2.

****kwargs**

Forwarded to *Collection*.

Examples

See *Lasso Demo* for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    offset_transform=ax.transData,
    )
```

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.

- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()
Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()
Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()
Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()
Alias for *get_facecolor*.

get_fc()
Alias for *get_facecolor*.

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
Return whether face is colored.

get_gid()
Return the group id.

get_hatch()
Return the current hatching pattern.

get_in_layout()
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()
Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()
Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()

Alias for *get_linestyle*.

get_linewidth()

get_linewidths()

Alias for *get_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_numsides()

get_offset_transform()

Return the *Transform* instance used by this artist offset.

get_offsets()

Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()

Return whether the artist is to be rasterized.

get_rotation()

get_sizes()

Return the sizes ('areas') of the elements in the collection.

Returns

array

The 'area' of each element.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, ***get_picker***, ***pick***

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sizes=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
paths	unknown
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sizes	numpy.ndarray or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor*, *Collection.set_edgecolor

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths(*paths*)

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sizes(*sizes*, *dpi=72.0*)

Set the sizes of each member of the collection.

Parameters

sizes

[`numpy.ndarray` or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi

[float, default: 72] The dpi of the canvas.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding `ndarray` of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an `ndarray` with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be `uint8`, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be `uint8` in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

class matplotlib.collections.**TriMesh**(*triangulation*, ***kwargs*)

Bases: *Collection*

Class for the efficient drawing of a triangular mesh using Gouraud shading.

A triangular mesh is a *Triangulation* object.

Parameters

edgecolors

[color or list of colors, default: *rcParams["patch.edgecolor"]* (default: `'black'`)] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

facecolors

[color or list of colors, default: *rcParams["patch.facecolor"]* (default: `'C0'`)] Face color for each patch making up the collection.

linewidths

[float or list of floats, default: *rcParams["patch.linewidth"]* (default: `1.0`)] Line width for each patch making up the collection.

linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see *Linestyles*.

capstyle

[*CapStyle*-like, default: *rcParams["patch.capstyle"]*] Style to use for capping lines for all paths in the collection. Allowed values are {'butt', 'projecting', 'round'}.

joinstyle

[*JoinStyle*-like, default: *rcParams["patch.joinstyle"]*] Style to use for joining lines for all paths in the collection. Allowed values are {'miter', 'round', 'bevel'}.

antialiaseds

[bool or list of bool, default: *rcParams["patch.antialiased"]* (default: `True`)] Whether each patch in the collection should be drawn with antialiasing.

offsets

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

offset_transform

[*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

cmap, norm

Data normalization and colormapping parameters. See *ScalarMappable* for a detailed description.

hatch

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/', '', '|', '-', '+', 'x', 'o', 'O', '.', '*']. See *Hatch style reference* for the meaning of each hatch type.

pickradius

[float, default: 5.0] If `pickradius <= 0`, then *Collection.contains* will return `True` whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

urls

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See *Hyperlinks* for examples.

zorder

[float, default: 1] The drawing order, shared by all Patches in the Collection. See *Zorder Demo* for all defaults and examples.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

autoscale()

Autoscale the scalar limits on the norm instance using the current array

autoscale_None()

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The *Axes* instance the artist resides in, or *None*.

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

colorbar

The last colorbar associated with this ScalarMappable. May be None.

contains(*mouseevent*)

Test whether the mouse event occurred in the collection.

Returns `bool, dict(ind=itemlist)`, where every item in itemlist contains the event.

static convert_mesh_to_paths(*tri*)

Convert a given mesh into a sequence of *Path* objects.

This function is primarily of use to implementers of backends that do not directly support meshes.

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.

- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

get_aa()

Alias for *get_antialiased*.

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_antialiased()

Get the antialiasing state for rendering.

Returns

array of bools

get_antialiaseds()

Alias for *get_antialiased*.

get_array()

Return the array of values, that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the array.

get_capstyle()

Return the cap style for the collection (for all its elements).

Returns

{'butt', 'projecting', 'round'} or None

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_clim()

Return the values (min, max) that are mapped to the colormap limits.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cmap()

Return the *Colormap* instance.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_dashes()
Alias for *get_linestyle*.

get_datalim(*transData*)

get_ec()
Alias for *get_edgecolor*.

get_edgecolor()

get_edgecolors()
Alias for *get_edgecolor*.

get_facecolor()

get_facecolors()
Alias for *get_facecolor*.

get_fc()
Alias for *get_facecolor*.

get_figure()
Return the *Figure* instance the artist belongs to.

get_fill()
Return whether face is colored.

get_gid()
Return the group id.

get_hatch()
Return the current hatching pattern.

get_in_layout()
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle()
Return the join style for the collection (for all its elements).

Returns

{'miter', 'round', 'bevel'} or None

get_label()
Return the label used for this artist in the legend.

get_linestyle()

get_linestyles()
Alias for *get_linestyle*.

get_linewidth()

get_linewidths()
Alias for *get_linewidth*.

get_ls()
Alias for *get_linestyle*.

get_lw()
Alias for *get_linewidth*.

get_mouseover()
Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_offset_transform()
Return the *Transform* instance used by this artist offset.

get_offsets()
Return the offsets for the collection.

get_path_effects()

get_paths()

get_picker()
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_pickradius()

get_rasterized()
Return whether the artist is to be rasterized.

get_sketch_params()
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.

- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_transOffset()

Alias for *get_offset_transform*.

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms()

get_url()

Return the url.

get_urls()

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See *Hyperlinks* for an example.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

property norm

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}

Table 47 – continued from p

Property	Description
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of

the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[array-like or scalar or None] All values must be within the 0-1 range, inclusive. Masked values and nans are not supported.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_antialiased(*aa*)

Set the antialiasing state for rendering.

Parameters

aa

[bool or list of bools]

set_antialiaseds(*aa*)

Alias for *set_antialiased*.

set_array(*A*)

Set the value array from array-like *A*.

Parameters

A

[array-like or None] The values that are mapped to colors.

The base class *ScalarMappable* does not make any assumptions on the dimensionality and shape of the value array *A*.

set_capstyle(*cs*)

Set the *CapStyle* for the collection (for all its elements).

Parameters

cs

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_clim(*vmin=None*, *vmax=None*)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of RGBA tuples]

See also:

Collection.set_facecolor, ***Collection.set_edgecolor***

For setting the edge or face color individually.

set_dashes(*ls*)

Alias for *set_linestyle*.

set_ec(*c*)

Alias for *set_edgecolor*.

set_edgecolor(*c*)

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(*c*)

Alias for *set_edgecolor*.

set_facecolor(*c*)

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]

set_facecolors(*c*)

Alias for *set_facecolor*.

set_fc(*c*)

Alias for *set_facecolor*.

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(*hatch*)

Set the hatching pattern

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
```

(continues on next page)

(continued from previous page)

```
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_joinstyle(*js*)

Set the *JoinStyle* for the collection (for all its elements).

Parameters

js

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linestyle(*ls*)

Set the linestyle(s) for the collection.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

set_linestyles(*ls*)

Alias for *set_linestyle*.

set_linewidth(*lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw

[float or list of floats]

set_linewidths(*lw*)

Alias for *set_linewidth*.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*lw*)

Alias for *set_linewidth*.

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_transform(*offset_transform*)

Set the artist offset transform.

Parameters

offset_transform

[*Transform*]

set_offsets(*offsets*)

Set the offsets for the collection.

Parameters

offsets

[(N, 2) or (2,) array-like]

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_paths()

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

Parameters

pickradius

[float] Pick radius, in points.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transOffset(*offset_transform*)

Alias for *set_offset_transform*.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_urls(*urls*)

Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(*x*, *alpha=None*, *bytes=False*, *norm=True*)

Return a normalized RGBA array corresponding to *x*.

In the normal case, *x* is a 1D or 2D sequence of scalars, and the corresponding ndarray of RGBA values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already RGB or RGBA, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an RGB or RGBA array, and no mapping will be done. The array can be uint8, or it can be floats with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, any masked elements will be set to 0 alpha. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the preexisting alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the RGBA array will be floats in the 0-1 range; if it is *True*, the returned RGBA array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from other to self.

update_scalarmappable()

Update colors from the scalar mappable array, if any.

Assign colors to edges and faces based on the array and/or colors that were directly set, as appropriate.

zorder = 0

7.2.16 matplotlib.colorbar

Colorbars are a visualization of the mapping from scalar values to colors. In Matplotlib they are drawn into a dedicated *Axes*.

Note: Colorbars are typically created through *Figure.colorbar* or its pyplot wrapper *pyplot.colorbar*, which internally use *Colorbar* together with *make_axes_gridspec* (for *GridSpec*-positioned axes) or *make_axes* (for non-*GridSpec*-positioned axes).

End-users most likely won't need to directly use this module's API.

---

class matplotlib.colorbar.**Colorbar**(*ax*, *mappable=None*, *, *cmap=None*, *norm=None*, *alpha=None*, *values=None*, *boundaries=None*, *orientation=None*, *ticklocation='auto'*, *extend=None*, *spacing='uniform'*, *ticks=None*, *format=None*, *drawedges=False*, *extendfrac=None*, *extendrect=False*, *label=''*, *location=None*)

Bases: object

Draw a colorbar in an existing axes.

Typically, colorbars are created using *Figure.colorbar* or *pyplot.colorbar* and associated with *ScalarMappable*s (such as an *AxesImage* generated via *imshow*).

In order to draw a colorbar not associated with other elements in the figure, e.g. when showing a colormap by itself, one can create an empty *ScalarMappable*, or directly pass *cmap* and *norm* instead of *mappable* to *Colorbar*.

Useful public methods are *set_label()* and *add_lines()*.

Parameters

ax

[*Axes*] The *Axes* instance in which the colorbar is drawn.

mappable

[*ScalarMappable*] The mappable whose colormap and norm will be used.

To show the under- and over- value colors, the mappable's norm should be specified as

```
norm = colors.Normalize(clip=False)
```

To show the colors versus index instead of on a 0-1 scale, use:

```
norm=colors.NoNorm()
```

cmap

[*Colormap*, default: *rcParams["image.cmap"]* (default: 'viridis')] The colormap to use. This parameter is ignored, unless *mappable* is None.

norm

[*Normalize*] The normalization to use. This parameter is ignored, unless *mappable* is None.

alpha

[float] The colorbar transparency between 0 (transparent) and 1 (opaque).

orientation

[None or {'vertical', 'horizontal'}] If None, use the value determined by *location*. If both *orientation* and *location* are None then defaults to 'vertical'.

ticklocation

[{'auto', 'left', 'right', 'top', 'bottom'}] The location of the colorbar ticks. The *ticklocation* must match *orientation*. For example, a horizontal colorbar can only have ticks at the top or the bottom. If 'auto', the ticks will be the same as *location*, so a colorbar to the left will have ticks to the left. If *location* is None, the ticks will be at the bottom for a horizontal colorbar and at the right for a vertical.

drawedges

[bool] Whether to draw lines at color boundaries.

extend

[{'neither', 'both', 'min', 'max'}] Make pointed end(s) for out-of-range values (unless 'neither'). These are set for a given colormap using the colormap set_under and set_over methods.

extendfrac

[{*None*, 'auto', length, lengths}] If set to *None*, both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting).

If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when *spacing* is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when *spacing* is set to 'proportional').

If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum

and maximum colorbar extensions respectively as a fraction of the interior colorbar length.

extendrect

[bool] If *False* the minimum and maximum colorbar extensions will be triangular (the default). If *True* the extensions will be rectangular.

spacing

[{'uniform', 'proportional'}] For discrete colorbars (*BoundaryNorm* or contours), 'uniform' gives each color the same space; 'proportional' makes the space proportional to the data interval.

ticks

[None or list of ticks or Locator] If None, ticks are determined automatically from the input.

format

[None or str or Formatter] If None, *ScalarFormatter* is used. Format strings, e.g., `"%4.2e"` or `"{x:.2e}"`, are supported. An alternative *Formatter* may be given instead.

drawedges

[bool] Whether to draw lines at color boundaries.

label

[str] The label on the colorbar's long axis.

boundaries, values

[None or a sequence] If unset, the colormap will be displayed on a 0-1 scale. If sequences, *values* must have a length 1 less than *boundaries*. For each region delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in values will be used. Normally only useful for indexed colors (i.e. `norm=NoNorm()`) or other unusual circumstances.

location

[None or {'left', 'right', 'top', 'bottom'}] Set the *orientation* and *ticklocation* of the colorbar using a single argument. Colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal. The *ticklocation* is the same as *location*, so if *location* is 'top', the ticks are on the top. *orientation* and/or *ticklocation* can be provided as well and overrides the value set by *location*, but there will be an error for incompatible combinations.

New in version 3.7.

Attributes

ax

[*Axes*] The *Axes* instance in which the colorbar is drawn.

lines

[list] A list of *LineCollection* (empty if no lines were drawn).

dividers

[*LineCollection*] A LineCollection (empty if *drawedges* is `False`).

add_lines(**args*, ***kwargs*)

Draw lines on the colorbar.

The lines are appended to the list `lines`.

Parameters

levels

[array-like] The positions of the lines.

colors

[color or list of colors] Either a single color applying to all lines or one color value for each line.

linewidths

[float or array-like] Either a single linewidth applying to all lines or one linewidth for each line.

erase

[bool, default: True] Whether to remove any previously added lines.

Notes

Alternatively, this method can also be called with the signature `colorbar.add_lines(contour_set, erase=True)`, in which case *levels*, *colors*, and *linewidths* are taken from *contour_set*.

drag_pan(*button*, *key*, *x*, *y*)

property formatter

Major tick label *Formatter* for the colorbar.

get_ticks(*minor=False*)

Return the ticks as a list of locations.

Parameters

minor

[boolean, default: False] if True return the minor ticks.

property locator

Major tick *Locator* for the colorbar.

property minorformatter

Minor tick *Formatter* for the colorbar.

property minorlocator

Minor tick *Locator* for the colorbar.

minorticks_off()

Turn the minor ticks of the colorbar off.

minorticks_on()

Turn on colorbar minor ticks.

n_rasterize = 50

remove()

Remove this colorbar from the figure.

If the colorbar was created with `use_gridspec=True` the previous gridspec is restored.

set_alpha(*alpha*)

Set the transparency between 0 (transparent) and 1 (opaque).

If an array is provided, *alpha* will be set to None to use the transparency values associated with the colormap.

set_label(*label*, *, *loc=None*, ***kwargs*)

Add a label to the long axis of the colorbar.

Parameters

label

[str] The label text.

loc

[str, optional] The location of the label.

- For horizontal orientation one of {'left', 'center', 'right'}
- For vertical orientation one of {'bottom', 'center', 'top'}

Defaults to *rcParams["xaxis.labellocation"]* (default: `'center'`) or *rcParams["yaxis.labellocation"]* (default: `'center'`) depending on the orientation.

****kwargs**

Keyword arguments are passed to *set_xlabel* / *set_ylabel*. Supported keywords are *labelpad* and *Text* properties.

set_ticklabels(*ticklabels*, *, *minor=False*, ***kwargs*)

[*Discouraged*] Set tick labels.

Discouraged

The use of this method is discouraged, because of the dependency on tick positions. In most cases, you'll want to use `set_ticks(positions, labels=labels)` instead.

If you are using this method, you should always fix the tick positions before, e.g. by using *Colorbar.set_ticks* or by explicitly setting a *FixedLocator* on the long axis of the colorbar. Otherwise, ticks are free to move and the labels may end up in unexpected positions.

Parameters

ticklabels

[sequence of str or of *Text*] Texts for labeling each tick location in the sequence set by *Colorbar.set_ticks*; the number of labels must match the number of locations.

update_ticks

[bool, default: True] This keyword argument is ignored and will be removed. Deprecated

minor

[bool] If True, set minor ticks instead of major ticks.

****kwargs**

Text properties for the labels.

set_ticks(*ticks*, *, *labels=None*, *minor=False*, ***kwargs*)

Set tick locations.

Parameters

ticks

[1D array-like] List of tick locations.

labels

[list of str, optional] List of tick labels. If not set, the labels show the data value.

minor

[bool, default: False] If `False`, set the major ticks; if `True`, the minor ticks.

****kwargs**

Text properties for the labels. These take effect only if you pass *labels*. In other cases, please use *tick_params*.

update_normal(*mappable*)

Update solid patches, lines, etc.

This is meant to be called when the norm of the image or contour plot to which this colorbar belongs changes.

If the norm on the mappable is different than before, this resets the locator and formatter for the axis, so if these have been customized, they will need to be customized again. However, if the norm only changes values of *vmin*, *vmax* or *cmap* then the old formatter and locator will be preserved.

update_ticks()

Set up the ticks and ticklabels. This should not be needed by users.

matplotlib.colorbar.**ColorbarBase**

alias of *Colorbar*

matplotlib.colorbar.**make_axes**(*parents*, *location=None*, *orientation=None*, *fraction=0.15*, *shrink=1.0*, *aspect=20*, ***kwargs*)

Create an *Axes* suitable for a colorbar.

The axes is placed in the figure of the *parents* axes, by resizing and repositioning *parents*.

Parameters

parents

[*Axes* or iterable or numpy.ndarray of *Axes*] The Axes to use as parents for placing the colorbar.

location

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

Returns

cax

[*Axes*] The child axes.

kwargs

[dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

matplotlib.colorbar.**make_axes_gridspec**(*parent*, *, *location=None*, *orientation=None*, *fraction=0.15*, *shrink=1.0*, *aspect=20*, ***kwargs*)

Create an *Axes* suitable for a colorbar.

The axes is placed in the figure of the *parent* axes, by resizing and repositioning *parent*.

This function is similar to *make_axes* and mostly compatible with it. Primary differences are

- *make_axes_gridspec* requires the *parent* to have a subplotspec.
- *make_axes* positions the axes in figure coordinates; *make_axes_gridspec* positions it using a subplotspec.
- *make_axes* updates the position of the parent. *make_axes_gridspec* replaces the parent gridspec with a new one.

Parameters

parent

[*Axes*] The Axes to use as parent for placing the colorbar.

location

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom

are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

Returns

cax

[*Axes*] The child axes.

kwargs

[dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

7.2.17 matplotlib.colors

Note: The Color *tutorials* and *examples* demonstrate how to set colors and colormaps. You may want to read those instead.

A module for converting numbers or color arguments to *RGB* or *RGBA*.

RGB and *RGBA* are sequences of, respectively, 3 or 4 floats in the range 0-1.

This module includes functions and classes for color specification conversions, and for mapping numbers to colors in a 1-D array of colors called a colormap.

Mapping data onto colors using a colormap typically involves two steps: a data array is first mapped onto the range 0-1 using a subclass of `Normalize`, then this number is mapped to a color using a subclass of `Colormap`. Two subclasses of `Colormap` provided here: `LinearSegmentedColormap`, which uses piecewise-linear interpolation to define colormaps, and `ListedColormap`, which makes a colormap from a list of colors.

See also:

Creating Colormaps in Matplotlib for examples of how to make colormaps and

Choosing Colormaps in Matplotlib for a list of built-in colormaps.

Colormap normalization for more details about data normalization

More colormaps are available at palettable.

The module also provides functions for checking whether an object can be interpreted as a color (`is_color_like`), for converting such an object to an RGBA tuple (`to_rgba`) or to an HTML-like hex string in the "#rrggbb" format (`to_hex`), and a sequence of colors to an (n, 4) RGBA array (`to_rgba_array`). Caching is used for efficiency.

Colors that Matplotlib recognizes are listed at *Specifying colors*.

Color norms

Normalize([vmin, vmax, clip])	A class which, when called, linearly normalizes data into the `[0.0, 1.0]` interval.
NoNorm([vmin, vmax, clip])	Dummy replacement for *Normalize*, for the case where we want to use indices directly in a *ScalarMappable*.
AsinhNorm([linear_width, vmin, vmax, clip])	The inverse hyperbolic sine scale is approximately linear near the origin, but becomes logarithmic for larger positive or negative values.
BoundaryNorm(boundaries, ncolors[, clip, extend])	Generate a colormap index based on discrete intervals.
CenteredNorm([vcenter, halfrange, clip])	Normalize symmetrical data around a center (0 by default).
FuncNorm(functions[, vmin, vmax, clip])	Arbitrary normalization using functions for the forward and inverse.
LogNorm([vmin, vmax, clip])	Normalize a given value to the 0-1 range on a log scale.
PowerNorm(gamma[, vmin, vmax, clip])	Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.
SymLogNorm(linthresh[, linscale, vmin, ...])	The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.
TwoSlopeNorm(vcenter[, vmin, vmax])	Normalize data with a set center.

matplotlib.colors.Normalize

class matplotlib.colors.**Normalize**(*vmin=None*, *vmax=None*, *clip=False*)

Bases: `object`

A class which, when called, linearly normalizes data into the `[0.0, 1.0]` interval.

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed linearly, resulting in values outside `[0, 1]`. For a standard use with colormaps,

this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Notes

Returns 0 if `vmin == vmax`.

__call__(*value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool, optional] See the description of the parameter *clip* in *Normalize*.

If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

autoscale(*A*)

Set *vmin*, *vmax* to min, max of *A*.

autoscale_None(*A*)

If vmin or vmax are not set, use the min/max of *A* to set them.

property clip

inverse(*value*)

static process_value(*value*)

Homogenize the input *value* for easy and efficient normalization.

value can be a scalar or sequence.

Returns

result

[masked array] Masked array with the same shape as *value*.

is_scalar

[bool] Whether *value* is a scalar.

Notes

Float dtypes are preserved; integer types with two bytes or smaller are converted to np.float32, and larger types are converted to np.float64. Preserving float32 when possible, and using in-place operations, greatly improves speed for large arrays.

scaled()

Return whether vmin and vmax are set.

property vmax

property vmin

Examples using `matplotlib.colors.Normalize`

- *Multicolored lines*
- *Mapping marker properties to multivariate data*
- *Colormap normalizations*
- *Colormap normalizations SymLogNorm*

- *Hillshading*
- *Left ventricle bullseye*
- *Quick start guide*
- *Constrained layout guide*
- *Customized Colorbars Tutorial*

- *Colormap normalization*

matplotlib.colors.NoNorm

class matplotlib.colors.**NoNorm**(*vmin=None*, *vmax=None*, *clip=False*)

Bases: *Normalize*

Dummy replacement for *Normalize*, for the case where we want to use indices directly in a *ScalarMappable*.

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed linearly, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Notes

Returns 0 if `vmin == vmax`.

__call__(*value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool, optional] See the description of the parameter *clip* in *Normalize*.

If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

inverse(*value*)

matplotlib.colors.AsinhNorm

class matplotlib.colors.**AsinhNorm**(*linear_width=1*, *vmin=None*, *vmax=None*, *clip=False*)

Bases: *AsinhNorm*

The inverse hyperbolic sine scale is approximately linear near the origin, but becomes logarithmic for larger positive or negative values. Unlike the *SymLogNorm*, the transition between these linear and logarithmic regions is smooth, which may reduce the risk of visual artifacts.

Note: This API is provisional and may be revised in the future based on early user feedback.

Parameters

linear_width

[float, default: 1] The effective width of the linear region, beyond which the transformation becomes asymptotically logarithmic

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed linearly, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Notes

Returns 0 if `vmin == vmax`.

__call__(*value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool, optional] See the description of the parameter *clip* in *Normalize*.

If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

autoscale_None(*A*)

If vmin or vmax are not set, use the min/max of *A* to set them.

inverse(*value*)

Examples using `matplotlib.colors.AsinhNorm`

- *Colormap normalizations SymLogNorm*

matplotlib.colors.BoundaryNorm

class matplotlib.colors.**BoundaryNorm**(*boundaries*, *ncolors*, *clip=False*, ***, *extend='neither'*)

Bases: *Normalize*

Generate a colormap index based on discrete intervals.

Unlike *Normalize* or *LogNorm*, *BoundaryNorm* maps values to integers instead of to the interval 0-1.

Parameters

boundaries

[array-like] Monotonically increasing sequence of at least 2 bin edges: data falling in the n-th bin will be mapped to the n-th color.

ncolors

[int] Number of colors in the colormap to be used.

clip

[bool, optional] If clip is `True`, out of range values are mapped to 0 if they are below `boundaries[0]` or mapped to `ncolors - 1` if they are above `boundaries[-1]`.

If clip is `False`, out of range values are mapped to -1 if they are below `boundaries[0]` or mapped to *ncolors* if they are above `boundaries[-1]`. These are then converted to valid indices by *Colormap.__call__*.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Extend the number of bins to include one or both of the regions beyond the boundaries. For example, if `extend` is 'min', then the color to which the region between the first pair of boundaries is mapped will be distinct from the first color in the colormap, and by default a *Colorbar* will be drawn with the triangle extension on the left or lower end.

Notes

If there are fewer bins (including extensions) than colors, then the color index is chosen by linearly interpolating the `[0, nbins - 1]` range onto the `[0, ncolors - 1]` range, effectively skipping some colors in the middle of the colormap.

__call__(*value*, *clip=None*)

This method behaves similarly to *Normalize.__call__*, except that it returns integers or arrays of int16.

inverse(*value*)

Raises

ValueError

BoundaryNorm is not invertible, so calling this method will always raise an error

Examples using `matplotlib.colors.BoundaryNorm`

- *Multicolored lines*
- *Colormap normalizations*
- *Creating annotated heatmaps*
- *Image Masked*
- *pcolormesh*
- *Left ventricle bullseye*
- *Customized Colorbars Tutorial*
- *Colormap normalization*

matplotlib.colors.CenteredNorm

class matplotlib.colors.**CenteredNorm**(*vcenter=0*, *halfrange=None*, *clip=False*)

Bases: *Normalize*

Normalize symmetrical data around a center (0 by default).

Unlike *TwoSlopeNorm*, *CenteredNorm* applies an equal rate of change around the center.

Useful when mapping symmetrical data around a conceptual center e.g., data that range from -2 to 4, with 0 as the midpoint, and with equal rates of change around that midpoint.

Parameters

vcenter

[float, default: 0] The data value that defines `0.5` in the normalization.

halfrange

[float, optional] The range of data values that defines a range of `0.5` in the normalization, so that *vcenter* - *halfrange* is `0.0` and *vcenter* + *halfrange* is `1.0` in the normalization. Defaults to the largest absolute difference to *vcenter* for the values in the dataset.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Examples

This maps data values -2 to 0.25, 0 to 0.5, and 4 to 1.0 (assuming equal rates of change above and below 0.0):

```
>>> import matplotlib.colors as mcolors
>>> norm = mcolors.CenteredNorm(halfrange=4.0)
>>> data = [-2., 0., 4.]
>>> norm(data)
array([0.25, 0.5 , 1.  ])
```

autoscale(*A*)

Set *halfrange* to `max(abs(A-vcenter))`, then set *vmin* and *vmax*.

autoscale_None(*A*)

Set *vmin* and *vmax*.

property halfrange

property vcenter

property vmax

property vmin

Examples using `matplotlib.colors.CenteredNorm`

- *Colormap normalization*

matplotlib.colors.FuncNorm

class matplotlib.colors.**FuncNorm**(*functions*, *vmin=None*, *vmax=None*, *clip=False*)

Bases: *FuncNorm*

Arbitrary normalization using functions for the forward and inverse.

Parameters

functions

[(callable, callable)] two-tuple of the forward and inverse functions for the normalization. The forward function must be monotonic.

Both functions must have the signature

```
def forward(values: array-like) -> array-like
```

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed by the function, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed linearly, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Notes

Returns 0 if `vmin == vmax`.

__call__(*value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool, optional] See the description of the parameter *clip* in *Normalize*.

If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

autoscale_None(*A*)

If vmin or vmax are not set, use the min/max of *A* to set them.

inverse(*value*)

Examples using `matplotlib.colors.FuncNorm`

- *Colormap normalization*

matplotlib.colors.LogNorm

class matplotlib.colors.**LogNorm**(*vmin=None*, *vmax=None*, *clip=False*)

Bases: *Normalize*

Normalize a given value to the 0-1 range on a log scale.

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed linearly, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Notes

Returns 0 if `vmin == vmax`.

__call__(*value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool, optional] See the description of the parameter *clip* in *Normalize*.

If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

autoscale_None(*A*)

If vmin or vmax are not set, use the min/max of *A* to set them.

inverse(*value*)

Examples using `matplotlib.colors.LogNorm`

- *Colormap normalizations*
- *pcolor images*
- *Histograms*
- *Quick start guide*
- *Colormap normalization*

matplotlib.colors.PowerNorm

class matplotlib.colors.**PowerNorm**(*gamma*, *vmin=None*, *vmax=None*, *clip=False*)

Bases: *Normalize*

Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.

Parameters

gamma

[float] Power law exponent.

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed by the power function, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Notes

The normalization formula is

$$\left(\frac{x - v_{min}}{v_{max} - v_{min}}\right)^{\gamma}$$

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed linearly, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Notes

Returns 0 if `vmin == vmax`.

__call__(*value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool, optional] See the description of the parameter *clip* in *Normalize*.

If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

inverse(*value*)

Examples using `matplotlib.colors.PowerNorm`

- *Colormap normalizations*
- *Shaded & power normalized rendering*
- *Exploring normalizations*
- *Colormap normalization*

matplotlib.colors.SymLogNorm

class matplotlib.colors.**SymLogNorm**(*linthresh*, *linscale=1.0*, *vmin=None*, *vmax=None*, *clip=False*, ***, *base=10*)

Bases: *SymLogNorm*

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter *linthresh* allows the user to specify the size of this range (-*linthresh*, *linthresh*).

Parameters

linthresh

[float] The range within which the plot is linear (to avoid having the plot go to infinity around zero).

linscale

[float, default: 1] This allows the linear range (-*linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

base

[float, default: 10]

Parameters

vmin, vmax

[float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

clip

[bool, default: False] Determines the behavior for mapping values outside the range `[vmin, vmax]`.

If clipping is off, values outside the range `[vmin, vmax]` are also transformed linearly, resulting in values outside `[0, 1]`. For a standard use with colormaps, this behavior is desired because colormaps mark these outside values with specific colors for *over* or *under*.

If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer. This makes these values indistinguishable from regular boundary values and can lead to misinterpretation of the data.

Notes

Returns 0 if `vmin == vmax`.

__call__(*value*, *clip=None*)

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

Parameters

value

Data to normalize.

clip

[bool, optional] See the description of the parameter *clip* in *Normalize*.

If `None`, defaults to `self.clip` (which defaults to `False`).

Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

autoscale_None(*A*)

If vmin or vmax are not set, use the min/max of *A* to set them.

inverse(*value*)

Examples using `matplotlib.colors.SymLogNorm`

- *Colormap normalizations*
- *Colormap normalizations SymLogNorm*
- *Colormap normalization*

matplotlib.colors.TwoSlopeNorm

class matplotlib.colors.**TwoSlopeNorm**(*vcenter*, *vmin=None*, *vmax=None*)

Bases: *Normalize*

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

Parameters

vcenter

[float] The data value that defines `0.5` in the normalization.

vmin

[float, optional] The data value that defines `0.0` in the normalization. Defaults to the min value of the dataset.

vmax

[float, optional] The data value that defines `1.0` in the normalization. Defaults to the max value of the dataset.

Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                  vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

__call__(*value*, *clip=None*)

Map value to the interval [0, 1]. The *clip* argument is unused.

autoscale_None(*A*)

Get vmin and vmax.

If vcenter isn't in the range [vmin, vmax], either vmin or vmax is expanded so that vcenter lies in the middle of the modified range [vmin, vmax].

inverse(*value*)

property vcenter

Examples using `matplotlib.colors.TwoSlopeNorm`

- *Colormap normalization*

Colormaps

Colormap(name[, N])	Baseclass for all scalar to RGBA mappings.
LinearSegmentedColormap(name, segmentdata[, ...])	Colormap objects based on lookup tables using linear segments.
ListedColormap(colors[, name, N])	Colormap object generated from a list of colors.

matplotlib.colors.Colormap

class matplotlib.colors.**Colormap**(*name*, *N=256*)

Bases: `object`

Baseclass for all scalar to RGBA mappings.

Typically, Colormap instances are used to convert data values (floats) from the interval `[0, 1]` to the RGBA color that the respective Colormap represents. For scaling of data into the `[0, 1]` interval see *matplotlib.colors.Normalize*. Subclasses of *matplotlib.cm.ScalarMappable* make heavy use of this `data -> normalize -> map-to-color` processing chain.

Parameters

name

[str] The name of the colormap.

N

[int] The number of RGB quantization levels.

__call__(*X*, *alpha=None*, *bytes=False*)

Parameters

X

[float or int, ndarray or scalar] The data value(s) to convert to RGBA. For floats, *X* should be in the interval `[0.0, 1.0]` to return the RGBA values `X*100` percent along the Colormap line. For integers, *X* should be in the interval `[0, Colormap.N)` to return RGBA values *indexed* from the Colormap with index `X`.

alpha

[float or array-like or None] Alpha must be a scalar between 0 and 1, a sequence of such floats with shape matching X, or None.

bytes

[bool] If False (default), the returned RGBA values will be floats in the interval `[0, 1]` otherwise they will be `numpy.uint8`s in the interval `[0, 255]`.

Returns

Tuple of RGBA values if X is scalar, otherwise an array of RGBA values with a shape of `X.shape + (4, )`.

colorbar_extend

When this colormap exists on a scalar mappable and colorbar_extend is not False, colorbar creation will pick up `colorbar_extend` as the default value for the `extend` keyword in the *matplotlib.colorbar.Colorbar* constructor.

copy()

Return a copy of the colormap.

get_bad()

Get the color for masked values.

get_over()

Get the color for high out-of-range values.

get_under()

Get the color for low out-of-range values.

is_gray()

Return whether the colormap is grayscale.

resampled(*lutsize*)

Return a new colormap with *lutsize* entries.

reversed(*name=None*)

Return a reversed instance of the Colormap.

Note: This function is not implemented for the base class.

Parameters

name

[str, optional] The name for the reversed colormap. If None, the name is set to `self.name + "_r"`.

See also:

LinearSegmentedColormap.reversed
ListedColormap.reversed

set_bad(*color='k'*, *alpha=None*)

Set the color for masked values.

set_extremes(*, *bad=None*, *under=None*, *over=None*)

Set the colors for masked (*bad*) values and, when `norm.clip = False`, low (*under*) and high (*over*) out-of-range values.

set_over(*color='k'*, *alpha=None*)

Set the color for high out-of-range values.

set_under(*color='k'*, *alpha=None*)

Set the color for low out-of-range values.

with_extremes(*, *bad=None*, *under=None*, *over=None*)

Return a copy of the colormap, for which the colors for masked (*bad*) values and, when `norm.clip = False`, low (*under*) and high (*over*) out-of-range values, have been set accordingly.

Examples using `matplotlib.colors.Colormap`

- *Multicolored lines*
- *Contourf demo*
- *Creating a colormap from a list of colors*
- *Selecting individual colors from a colormap*
- *Lasso Demo*
- *Left ventricle bullseye*
- *Customized Colorbars Tutorial*
- *Creating Colormaps in Matplotlib*

matplotlib.colors.LinearSegmentedColormap

class matplotlib.colors.**LinearSegmentedColormap**(*name*, *segmentdata*, *N=256*, *gamma=1.0*)

Bases: *Colormap*

Colormap objects based on lookup tables using linear segments.

The lookup table is generated using linear interpolation for each primary color, with the 0-1 domain divided into any number of segments.

Create colormap from linear mapping segments

segmentdata argument is a dictionary with a red, green and blue entries. Each entry should be a list of *x*, *y0*, *y1* tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```
cdict = {'red':   [(0.0,  0.0, 0.0),
                   (0.5,  1.0, 1.0),
                   (1.0,  1.0, 1.0)],

         'green': [(0.0,  0.0, 0.0),
                   (0.25, 0.0, 0.0),
                   (0.75, 1.0, 1.0),
                   (1.0,  1.0, 1.0)],

         'blue':  [(0.0,  0.0, 0.0),
                   (0.5,  0.0, 0.0),
                   (1.0,  1.0, 1.0)]}
```

Each row in the table for a given color is a sequence of *x*, *y0*, *y1* tuples. In each sequence, *x* must increase monotonically from 0 to 1. For any input value *z* falling between *x[i]* and *x[i+1]*, the output value of a given color will be linearly interpolated between *y1[i]* and *y0[i+1]*:

```
row i:   x  y0  y1
               /
              /
row i+1: x  y0  y1
```

Hence y0 in the first row and y1 in the last row are never used.

See also:

LinearSegmentedColormap.from_list

Static method; factory function for generating a smoothly-varying LinearSegmentedColormap.

static from_list(*name*, *colors*, *N=256*, *gamma=1.0*)

Create a *LinearSegmentedColormap* from a list of colors.

Parameters

name

[str] The name of the colormap.

colors

[array-like of colors or array-like of (value, color)] If only colors are given, they are equidistantly mapped from the range [0, 1]; i.e. 0 maps to `colors[0]` and 1 maps to `colors[-1]`. If (value, color) pairs are given, the mapping is from *value* to *color*. This can be used to divide the range unevenly.

N

[int] The number of RGB quantization levels.

gamma

[float]

resampled(*lutsize*)

Return a new colormap with *lutsize* entries.

reversed(*name=None*)

Return a reversed instance of the Colormap.

Parameters

name

[str, optional] The name for the reversed colormap. If None, the name is set to `self.name + "_r"`.

Returns

LinearSegmentedColormap

The reversed colormap.

set_gamma(*gamma*)

Set a new gamma value and regenerate colormap.

matplotlib.colors.ListedColormap

class matplotlib.colors.**ListedColormap**(*colors*, *name='from_list'*, *N=None*)

Bases: *Colormap*

Colormap object generated from a list of colors.

This may be most useful when indexing directly into a colormap, but it can also be used to generate special colormaps for ordinary mapping.

Parameters

colors

[list, array] Sequence of Matplotlib color specifications (color names or RGB(A) values).

name

[str, optional] String to identify the colormap.

N

[int, optional] Number of entries in the map. The default is *None*, in which case there is one colormap entry for each element in the list of colors. If

```
N < len(colors)
```

the list will be truncated at *N*. If

```
N > len(colors)
```

the list will be extended by repetition.

Parameters

name

[str] The name of the colormap.

N

[int] The number of RGB quantization levels.

resampled(*lutsize*)

Return a new colormap with *lutsize* entries.

reversed(*name=None*)

Return a reversed instance of the Colormap.

Parameters

name

[str, optional] The name for the reversed colormap. If None, the name is set to `self.name + "_r"`.

Returns

ListedColormap

A reversed instance of the colormap.

Examples using `matplotlib.colors.ListedColormap`

- *Multicolored lines*
- *Mapping marker properties to multivariate data*
- *Layer Images*
- *QuadMesh Demo*
- *Histograms*

Other classes

ColorSequenceRegistry()	Container for sequences of colors that are known to Matplotlib by name.
LightSource([azdeg, altdeg, hsv_min_val, ...])	Create a light source coming from the specified azimuth and elevation.

matplotlib.colors.ColorSequenceRegistry

class matplotlib.colors.**ColorSequenceRegistry**

Bases: Mapping

Container for sequences of colors that are known to Matplotlib by name.

The universal registry instance is *matplotlib.color_sequences*. There should be no need for users to instantiate *ColorSequenceRegistry* themselves.

Read access uses a dict-like interface mapping names to lists of colors:

```
import matplotlib as mpl
cmap = mpl.color_sequences['tab10']
```

The returned lists are copies, so that their modification does not change the global definition of the color sequence.

Additional color sequences can be added via *ColorSequenceRegistry.register*:

```
mpl.color_sequences.register('rgb', ['r', 'g', 'b'])
```

register(*name*, *color_list*)

Register a new color sequence.

The color sequence registry stores a copy of the given *color_list*, so that future changes to the original list do not affect the registered color sequence. Think of this as the registry taking a snapshot of *color_list* at registration.

Parameters

name

[str] The name for the color sequence.

color_list

[list of colors] An iterable returning valid Matplotlib colors when iterating over. Note however that the returned color sequence will always be a list regardless of the input type.

unregister(*name*)

Remove a sequence from the registry.

You cannot remove built-in color sequences.

If the name is not registered, returns with no error.

matplotlib.colors.LightSource

class matplotlib.colors.**LightSource**(*azdeg=315*, *altdeg=45*, *hsv_min_val=0*, *hsv_max_val=1*, *hsv_min_sat=1*, *hsv_max_sat=0*)

Bases: object

Create a light source coming from the specified azimuth and elevation. Angles are in degrees, with the azimuth measured clockwise from north and elevation up from the zero plane of the surface.

shade is used to produce "shaded" RGB values for a data array. *shade_rgb* can be used to combine an RGB image with an elevation map. *hillshade* produces an illumination map of a surface.

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

Parameters

azdeg

[float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

altdeg

[float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

hsv_min_val

[number, default: 0] The minimum value ("v" in "hsv") that the *intensity* map can shift the output image to.

hsv_max_val

[number, default: 1] The maximum value ("v" in "hsv") that the *intensity* map can shift the output image to.

hsv_min_sat

[number, default: 1] The minimum saturation value that the *intensity* map can shift the output image to.

hsv_max_sat

[number, default: 0] The maximum saturation value that the *intensity* map can shift the output image to.

Notes

For backwards compatibility, the parameters *hsv_min_val*, *hsv_max_val*, *hsv_min_sat*, and *hsv_max_sat* may be supplied at initialization as well. However, these parameters will only be used if "blend_mode='hsv'" is passed into `shade` or `shade_rgb`. See the documentation for `blend_hsv` for more details.

blend_hsv(*rgb*, *intensity*, *hsv_max_sat=None*, *hsv_max_val=None*, *hsv_min_val=None*, *hsv_min_sat=None*)

Take the input data array, convert to HSV values in the given colormap, then adjust those color values to give the impression of a shaded relief map with a specified light source. RGBA values are returned, which can then be used to plot the shaded image with imshow.

The color of the resulting image will be darkened by moving the (s, v) values (in HSV colorspace) toward (hsv_min_sat, hsv_min_val) in the shaded regions, or lightened by sliding (s, v) toward (hsv_max_sat, hsv_max_val) in regions that are illuminated. The default extremes are chose so that completely shaded points are nearly black (s = 1, v = 0) and completely illuminated points are nearly white (s = 0, v = 1).

Parameters

rgb

[ndarray] An (M, N, 3) RGB array of floats ranging from 0 to 1 (color image).

intensity

[ndarray] An (M, N, 1) array of floats ranging from 0 to 1 (grayscale image).

hsv_max_sat

[number, optional] The maximum saturation value that the *intensity* map can shift the output image to. If not provided, use the value provided upon initialization.

hsv_min_sat

[number, optional] The minimum saturation value that the *intensity* map can shift the output image to. If not provided, use the value provided upon initialization.

hsv_max_val

[number, optional] The maximum value ("v" in "hsv") that the *intensity* map can shift the output image to. If not provided, use the value provided upon initialization.

hsv_min_val

[number, optional] The minimum value ("v" in "hsv") that the *intensity* map can shift the output image to. If not provided, use the value provided upon initialization.

Returns

ndarray

An (M, N, 3) RGB array representing the combined images.

blend_overlay(*rgb*, *intensity*)

Combine an RGB image with an intensity map using "overlay" blending.

Parameters

rgb

[ndarray] An (M, N, 3) RGB array of floats ranging from 0 to 1 (color image).

intensity

[ndarray] An (M, N, 1) array of floats ranging from 0 to 1 (grayscale image).

Returns

ndarray

An (M, N, 3) RGB array representing the combined images.

blend_soft_light(*rgb*, *intensity*)

Combine an RGB image with an intensity map using "soft light" blending, using the "pegtop" formula.

Parameters

rgb

[ndarray] An (M, N, 3) RGB array of floats ranging from 0 to 1 (color image).

intensity

[ndarray] An (M, N, 1) array of floats ranging from 0 to 1 (grayscale image).

Returns

ndarray

An (M, N, 3) RGB array representing the combined images.

property direction

The unit vector direction towards the light source.

hillshade(*elevation*, *vert_exag=1*, *dx=1*, *dy=1*, *fraction=1.0*)

Calculate the illumination intensity for a surface using the defined azimuth and elevation for the light source.

This computes the normal vectors for the surface, and then passes them on to *shade_normals*

Parameters

elevation

[2D array-like] The height values used to generate an illumination map

vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topographic effects.

dx

[number, optional] The x-spacing (columns) of the input *elevation* grid.

dy

[number, optional] The y-spacing (rows) of the input *elevation* grid.

fraction

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

ndarray

A 2D array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

shade(*data*, *cmap*, *norm=None*, *blend_mode='overlay'*, *vmin=None*, *vmax=None*, *vert_exag=1*, *dx=1*, *dy=1*, *fraction=1*, ***kwargs*)

Combine colormapped data values with an illumination intensity map (a.k.a. "hillshade") of the values.

Parameters

data

[2D array-like] The height values used to generate a shaded map.

cmap

[*Colormap*] The colormap used to color the *data* array. Note that this must be a *Colormap* instance. For example, rather than passing in `cmap='gist_earth'`, use `cmap=plt.get_cmap('gist_earth')` instead.

norm

[*Normalize* instance, optional] The normalization used to scale values before colormapping. If None, the input will be linearly scaled between its min and max.

blend_mode

[{'hsv', 'overlay', 'soft'} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. Default is "overlay". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an (M, N, 3) RGB array of floats (ranging 0 to 1) with an (M, N, 1) hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend_mode* function.

vmin

[float or None, optional] The minimum value used in colormapping *data*. If *None* the minimum value in *data* is used. If *norm* is specified, then this argument will be ignored.

vmax

[float or None, optional] The maximum value used in colormapping *data*. If *None* the maximum value in *data* is used. If *norm* is specified, then this argument will be ignored.

vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

dx

[number, optional] The x-spacing (columns) of the input *elevation* grid.

dy

[number, optional] The y-spacing (rows) of the input *elevation* grid.

fraction

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

****kwargs**

Additional kwargs are passed on to the *blend_mode* function.

Returns

ndarray

An (M, N, 4) array of floats ranging between 0-1.

shade_normals(*normals*, *fraction=1.0*)

Calculate the illumination intensity for the normal vectors of a surface using the defined azimuth and elevation for the light source.

Imagine an artificial sun placed at infinity in some azimuth and elevation position illuminating our surface. The parts of the surface that slope toward the sun should brighten while those sides facing away should become darker.

Parameters

fraction

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

ndarray

A 2D array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

shade_rgb(*rgb*, *elevation*, *fraction=1.0*, *blend_mode='hsv'*, *vert_exag=1*, *dx=1*, *dy=1*, ***kwargs*)

Use this light source to adjust the colors of the *rgb* input array to give the impression of a shaded relief map with the given *elevation*.

Parameters

rgb

[array-like] An (M, N, 3) RGB array, assumed to be in the range of 0 to 1.

elevation

[array-like] An (M, N) array of the height values used to generate a shaded map.

fraction

[number] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

blend_mode

[{'hsv', 'overlay', 'soft'} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. For backwards

compatibility, this defaults to "hsv". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an (M, N, 3) RGB array of floats (ranging 0 to 1) with an (M, N, 1) hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend_mode* function.

vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

dx

[number, optional] The x-spacing (columns) of the input *elevation* grid.

dy

[number, optional] The y-spacing (rows) of the input *elevation* grid.

****kwargs**

Additional kwargs are passed on to the *blend_mode* function.

Returns

ndarray

An (m, n, 3) array of floats ranging between 0-1.

Examples using `matplotlib.colors.LightSource`

- *Shading example*
- *Shaded & power normalized rendering*
- *AGG filter*
- *Custom hillshading in a 3D surface plot*
- *Hillshading*
- *Topographic hillshading*

Functions

from_levels_and_colors(levels, colors[, extend])	A helper routine to generate a cmap and a norm instance which behave similar to contourf's levels and colors arguments.
hsv_to_rgb(hsv)	Convert HSV values to RGB.
rgb_to_hsv(arr)	Convert an array of float RGB values (in the range [0, 1]) to HSV values.
to_hex(c[, keep_alpha])	Convert *c* to a hex color.
to_rgb(c)	Convert *c* to an RGB color, silently dropping the alpha channel.
to_rgba(c[, alpha])	Convert *c* to an RGBA color.
to_rgba_array(c[, alpha])	Convert *c* to a (n, 4) array of RGBA colors.
is_color_like(c)	Return whether *c* can be interpreted as an RGB(A) color.
same_color(c1, c2)	Return whether the colors *c1* and *c2* are the same.
get_named_colors_mapping()	Return the global mapping of names to named colors.
make_norm_from_scale(scale_cls[, ...])	Decorator for building a *Normalize* subclass from a *ScaleBase* subclass.

matplotlib.colors.from_levels_and_colors

matplotlib.colors.**from_levels_and_colors**(*levels*, *colors*, *extend='neither'*)

A helper routine to generate a cmap and a norm instance which behave similar to contourf's levels and colors arguments.

Parameters

levels

[sequence of numbers] The quantization levels used to construct the *BoundaryNorm*. Value `v` is quantized to level `i` if `lev[i] <= v < lev[i+1]`.

colors

[sequence of colors] The fill color to use for each level. If *extend* is "neither" there must be `n_level - 1` colors. For an *extend* of "min" or "max" add one extra color, and for an *extend* of "both" add two colors.

extend

[{'neither', 'min', 'max', 'both'}, optional] The behaviour when a value falls out of range of the given levels. See *contourf* for details.

Returns

cmap

[*Colormap*]

norm

[*Normalize*]

matplotlib.colors.hsv_to_rgb

matplotlib.colors.**hsv_to_rgb**(*hsv*)

Convert HSV values to RGB.

Parameters

hsv

[(..., 3) array-like] All values assumed to be in range [0, 1]

Returns

(..., 3) ndarray

Colors converted to RGB values in range [0, 1]

Examples using matplotlib.colors.hsv_to_rgb

- *3D voxel / volumetric plot with cylindrical coordinates*

matplotlib.colors.rgb_to_hsv

matplotlib.colors.**rgb_to_hsv**(*arr*)

Convert an array of float RGB values (in the range [0, 1]) to HSV values.

Parameters

arr

[(..., 3) array-like] All values must be in the range [0, 1]

Returns

(..., 3) ndarray

Colors converted to HSV values in range [0, 1]

Examples using `matplotlib.colors.rgb_to_hsv`

- *List of named colors*
- *Style sheets reference*

matplotlib.colors.to_hex

`matplotlib.colors.`**`to_hex`**(*c*, *keep_alpha=False*)

Convert *c* to a hex color.

Parameters

c

[*color* or `numpy.ma.masked`]

keep_alpha

[bool, default: False] If False, use the `#rrggbb` format, otherwise use `#rrggbbaa`.

Returns

str

`#rrggbb` or `#rrggbbaa` hex color string

matplotlib.colors.to_rgb

`matplotlib.colors.`**`to_rgb`**(*c*)

Convert *c* to an RGB color, silently dropping the alpha channel.

Examples using `matplotlib.colors.to_rgb`

- *List of named colors*
- *Style sheets reference*
- *Ribbon Box*

matplotlib.colors.to_rgba

matplotlib.colors.**to_rgba**(*c*, *alpha=None*)

Convert *c* to an RGBA color.

Parameters

c

[Matplotlib color or `np.ma.masked`]

alpha

[float, optional] If *alpha* is given, force the alpha value of the returned RGBA tuple to *alpha*.

If None, the alpha value from *c* is used. If *c* does not have an alpha channel, then alpha defaults to 1.

alpha is ignored for the color value `"none"` (case-insensitive), which always maps to `(0, 0, 0, 0)`.

Returns

tuple

Tuple of floats `(r, g, b, a)`, where each channel (red, green, blue, alpha) can assume values between 0 and 1.

Examples using `matplotlib.colors.to_rgba`

- *List of named colors*

matplotlib.colors.to_rgba_array

matplotlib.colors.**to_rgba_array**(*c*, *alpha=None*)

Convert *c* to a (n, 4) array of RGBA colors.

Parameters

c

[Matplotlib color or array of colors] If *c* is a masked array, an `ndarray` is returned with a (0, 0, 0, 0) row for each masked value or row in *c*.

alpha

[float or sequence of floats, optional] If *alpha* is given, force the alpha value of the returned RGBA tuple to *alpha*.

If None, the alpha value from *c* is used. If *c* does not have an alpha channel, then alpha defaults to 1.

alpha is ignored for the color value `"none"` (case-insensitive), which always maps to `(0, 0, 0, 0)`.

If *alpha* is a sequence and *c* is a single color, *c* will be repeated to match the length of *alpha*.

Returns

array

(n, 4) array of RGBA colors, where each channel (red, green, blue, alpha) can assume values between 0 and 1.

Examples using `matplotlib.colors.to_rgba_array`

- *Specifying colors*

matplotlib.colors.is_color_like

`matplotlib.colors.`**`is_color_like`**`(c)`

Return whether *c* can be interpreted as an RGB(A) color.

matplotlib.colors.same_color

`matplotlib.colors.`**`same_color`**`(c1, c2)`

Return whether the colors *c1* and *c2* are the same.

c1, *c2* can be single colors or lists/arrays of colors.

matplotlib.colors.get_named_colors_mapping

`matplotlib.colors.`**`get_named_colors_mapping`**`()`

Return the global mapping of names to named colors.

matplotlib.colors.make_norm_from_scale

matplotlib.colors.**make_norm_from_scale**(*scale_cls*, *base_norm_cls=None*, *, *init=None*)

Decorator for building a *Normalize* subclass from a *ScaleBase* subclass.

After

```
@make_norm_from_scale(scale_cls)
class norm_cls(Normalize):
    ...
```

norm_cls is filled with methods so that normalization computations are forwarded to *scale_cls* (i.e., *scale_cls* is the scale that would be used for the colorbar of a mappable normalized with *norm_cls*).

If *init* is not passed, then the constructor signature of *norm_cls* will be `norm_cls(vmin=None, vmax=None, clip=False)`; these three parameters will be forwarded to the base class (`Normalize.__init__`), and a *scale_cls* object will be initialized with no arguments (other than a dummy axis).

If the *scale_cls* constructor takes additional parameters, then *init* should be passed to *make_norm_from_scale*. It is a callable which is *only* used for its signature. First, this signature will become the signature of *norm_cls*. Second, the *norm_cls* constructor will bind the parameters passed to it using this signature, extract the bound *vmin*, *vmax*, and *clip* values, pass those to `Normalize.__init__`, and forward the remaining bound values (including any defaults defined by the signature) to the *scale_cls* constructor.

Exported colors

The data used to populate the *List of named colors* are exposed as dictionaries that map color names to hex strings.

matplotlib.colors.**BASE_COLORS**

matplotlib.colors.**TABLEAU_COLORS**

matplotlib.colors.**CSS4_COLORS**

matplotlib.colors.**XKCD_COLORS**

7.2.18 matplotlib.container

class matplotlib.container.**BarContainer**(**args*, ***kwargs*)

Bases: *Container*

Container for the artists of bar plots (e.g. created by *Axes.bar*).

The container can be treated as a tuple of the *patches* themselves. Additionally, you can access these and further parameters by the attributes.

Attributes

patches

[list of *Rectangle*] The artists of the bars.

errorbar

[None or *ErrorbarContainer*] A container for the error bar artists if error bars are present. *None* otherwise.

datavalues

[None or array-like] The underlying data values corresponding to the bars.

orientation

[{'vertical', 'horizontal'}, default: None] If 'vertical', the bars are assumed to be vertical. If 'horizontal', the bars are assumed to be horizontal.

class matplotlib.container.**Container**(**args*, ***kwargs*)

Bases: tuple

Base class for containers.

Containers are classes that collect semantically related Artists such as the bars of a bar plot.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

get_children()

get_label()

Return the label used for this artist in the legend.

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

remove()

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

class matplotlib.container.**ErrorbarContainer**(**args*, ***kwargs*)

Bases: *Container*

Container for the artists of error bars (e.g. created by *Axes.errorbar*).

The container can be treated as the *lines* tuple itself. Additionally, you can access these and further parameters by the attributes.

Attributes

lines

[tuple] Tuple of `(data_line, caplines, barlinecols)`.

- data_line : *Line2D* instance of x, y plot markers and/or line.
- caplines : tuple of *Line2D* instances of the error bar caps.
- barlinecols : list of *LineCollection* with the horizontal and vertical error ranges.

has_xerr, has_yerr

[bool] `True` if the errorbar has x/y errors.

class matplotlib.container.**StemContainer**(**args*, ***kwargs*)

Bases: *Container*

Container for the artists created in a *Axes.stem()* plot.

The container can be treated like a namedtuple `(markerline, stemlines, baseline)`.

Attributes

markerline

[*Line2D*] The artist of the markers at the stem heads.

stemlines

[list of *Line2D*] The artists of the vertical lines for all stems.

baseline

[*Line2D*] The artist of the horizontal baseline.

Parameters

markerline_stemlines_baseline

[tuple] Tuple of `(markerline, stemlines, baseline)`. `markerline` contains the *LineCollection* of the markers, `stemlines` is a *LineCollection* of the main lines, `baseline` is the *Line2D* of the baseline.

7.2.19 matplotlib.contour

Classes to support contour plotting and labelling for the Axes class.

class matplotlib.contour.**ClabelText**(*x=0*, *y=0*, *text=''*, ***, *color=None*, *verticalalignment='baseline'*, *horizontalalignment='left'*, *multialignment=None*, *fontproperties=None*, *rotation=None*, *linespacing=None*, *rotation_mode=None*, *usetex=None*, *wrap=False*, *transform_rotates_text=False*, *parse_math=None*, *antialiased=None*, ***kwargs*)

Bases: *Text*

[*Deprecated*] Unlike the ordinary text, the get_rotation returns an updated angle in the pixel coordinate assuming that the input rotation is an angle in data coordinate (or whatever transform set).

Notes

Deprecated since version 3.7: Use Text.set_transform_rotates_text instead.

Create a *Text* instance at *x*, *y* with string *text*.

The text is aligned relative to the anchor point (*x*, *y*) according to `horizontalalignment` (default: 'left') and `verticalalignment` (default: 'baseline'). See also *Text alignment*.

While Text accepts the 'label' keyword argument, by default it is not added to the handles of a legend.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi
alpha	scalar or None
animated	bool
antialiased	bool
backgroundcolor	color
bbox	dict with properties for *patches.FancyBboxPatch*
clip_box	unknown
clip_on	unknown
clip_path	unknown
color or c	color
figure	*Figure*
fontfamily or family or fontname	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monosp
fontproperties or font or font_properties	*font_manager.FontProperties* or `str` or `pathli`
fontsize or size	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-larg
fontstretch or stretch	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-co
fontstyle or style	{'normal', 'italic', 'oblique'}
fontvariant or variant	{'normal', 'small-caps'}
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal'
gid	str
horizontalalignment or ha	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool
multialignment or ma	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)

Table 48 – continu

Property	Description
snap	bool or None
text	object
transform	*Transform*
transform_rotates_text	bool
url	str
usetex	bool or None
verticalalignment or va	{'baseline', 'bottom', 'center', 'center_baseline', 'top'}
visible	bool
wrap	bool
x	float
y	float
zorder	float

get_rotation()

Return the text angle in degrees between 0 and 360.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *backgroundcolor=<UNSET>*, *bbox=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *fontfamily=<UNSET>*, *fontproperties=<UNSET>*, *fontsize=<UNSET>*, *fontstretch=<UNSET>*, *fontstyle=<UNSET>*, *fontvariant=<UNSET>*, *fontweight=<UNSET>*, *gid=<UNSET>*, *horizontalalignment=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linespacing=<UNSET>*, *math_fontfamily=<UNSET>*, *mouseover=<UNSET>*, *multialignment=<UNSET>*, *parse_math=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *position=<UNSET>*, *rasterized=<UNSET>*, *rotation=<UNSET>*, *rotation_mode=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *text=<UNSET>*, *transform=<UNSET>*, *transform_rotates_text=<UNSET>*, *url=<UNSET>*, *usetex=<UNSET>*, *verticalalignment=<UNSET>*, *visible=<UNSET>*, *wrap=<UNSET>*, *x=<UNSET>*, *y=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

zorder	float

class matplotlib.contour.**ContourLabeler**

Bases: object

Mixin to provide labelling capability to ContourSet.

add_label(*x*, *y*, *rotation*, *lev*, *cvalue*)

Add contour label without *Text.set_transform_rotates_text*.

add_label_clabeltext(*x*, *y*, *rotation*, *lev*, *cvalue*)

Add contour label with *Text.set_transform_rotates_text*.

add_label_near(*x*, *y*, *inline=True*, *inline_spacing=5*, *transform=None*)

Add a label near the point `(x, y)`.

Parameters

x, y

[float] The approximate location of the label.

inline

[bool, default: True] If *True* remove the segment of the contour beneath the label.

inline_spacing

[int, default: 5] Space in pixels to leave on each side of label when placing inline. This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

transform

[*Transform* or `False`, default: `self.axes.transData`] A transform applied to `(x, y)` before labeling. The default causes `(x, y)` to be interpreted as data coordinates. `False` is a synonym for *IdentityTransform*; i.e. `(x, y)` should be interpreted as display coordinates.

calc_label_rot_and_inline(*slc*, *ind*, *lw*, *lc=None*, *spacing=5*)

[*Deprecated*] Calculate the appropriate label rotation given the linecontour coordinates in screen units, the index of the label location and the label width.

If *lc* is not None or empty, also break contours and compute inlining.

spacing is the empty space to leave around the label, in pixels.

Both tasks are done together to avoid calculating path lengths multiple times, which is relatively costly.

The method used here involves computing the path length along the contour in pixel coordinates and then looking approximately (label width / 2) away from central point to determine rotation and then to break contour if desired.

Notes

Deprecated since version 3.8.

clabel(*levels=None*, ***, *fontsize=None*, *inline=True*, *inline_spacing=5*, *fmt=None*, *colors=None*, *use_clabeltext=False*, *manual=False*, *rightside_up=True*, *zorder=None*)

Label a contour plot.

Adds labels to line contours in this *ContourSet* (which inherits from this mixin class).

Parameters

levels

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `cs.levels`. If not given, all levels are labeled.

fontsize

[str or float, default: *rcParams["font.size"]* (default: `10.0`)] Size in points or relative size e.g., 'smaller', 'x-large'. See *Text.set_size* for accepted string values.

colors

[color or colors or None, default: None] The label colors:

- If *None*, the color of each label matches the color of the corresponding contour.
- If one string color, e.g., *colors* = 'r' or *colors* = 'red', all labels will be plotted in this color.
- If a tuple of colors (string, float, RGB, etc), different labels will be plotted in different colors in the order specified.

inline

[bool, default: True] If `True` the underlying contour is removed where the label is placed.

inline_spacing

[float, default: 5] Space in pixels to leave on each side of label when placing inline.

This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

fmt

[*Formatter* or str or callable or dict, optional] How the levels are formatted:

- If a *Formatter*, it is used to format all levels at once, using its *Formatter.format_ticks* method.
- If a str, it is interpreted as a %-style format string.

- If a callable, it is called with one level at a time and should return the corresponding label.
- If a dict, it should directly map levels to labels.

The default is to use a standard *ScalarFormatter*.

manual

[bool or iterable, default: False] If `True`, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).

manual can also be an iterable object of (x, y) tuples. Contour labels will be created as if mouse is clicked at each (x, y) position.

rightside_up

[bool, default: True] If `True`, label rotations will always be plus or minus 90 degrees from level.

use_clabeltext

[bool, default: False] If `True`, use *Text.set_transform_rotates_text* to ensure that label rotation is updated whenever the axes aspect changes.

zorder

[float or None, default: `(2 + contour.get_zorder())`] zorder of the contour labels.

Returns

labels

A list of *Text* instances for the labels.

get_text(*lev*, *fmt*)

Get the text of the label.

property labelFontProps

[*Deprecated*]

Notes

Deprecated since version 3.7: Use cs.labelTexts[0].get_font() instead.

property labelFontSizeList

[*Deprecated*]

Notes

Deprecated since version 3.7: Use [cs.labelTexts[0].get_font().get_size()] * len(cs.labelLevelList) instead.

property labelTextsList

[*Deprecated*]

Notes

Deprecated since version 3.7: Use cs.labelTexts instead.

labels(*inline*, *inline_spacing*)

locate_label(*linecontour*, *labelwidth*)

Find good place to draw a label (relatively flat part of the contour).

pop_label(*index=-1*)

Defaults to removing last label, but any index can be supplied

print_label(*linecontour*, *labelwidth*)

Return whether a contour is long enough to hold a label.

remove()

set_label_props(*label*, *text*, *color*)

[*Deprecated*] Set the label properties - color, fontsize, text.

Notes

Deprecated since version 3.7: Use Artist.set instead.

too_close(*x*, *y*, *lw*)

Return whether a label is already near this location.

class matplotlib.contour.**ContourSet**(*ax*, **args*, *levels=None*, *filled=False*, *linewidths=None*, *linestyles=None*, *hatches=(None,)*, *alpha=None*, *origin=None*, *extent=None*, *cmap=None*, *colors=None*, *norm=None*, *vmin=None*, *vmax=None*, *extend='neither'*, *antialiased=None*, *nchunk=0*, *locator=None*, *transform=None*, *negative_linestyles=None*, *clip_path=None*, ***kwargs*)

Bases: *ContourLabeler*, *Collection*

Store a set of contour lines or filled regions.

User-callable method: *clabel*

Parameters

ax

[*Axes*]

levels

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs

[[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

allkinds

[`None` or [level0kinds, level1kinds, ...]] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

****kwargs**

Keyword arguments are as described in the docstring of *contour*.

Attributes

ax

[*Axes*] The Axes object in which the contours are drawn.

collections

[*silent_list* of *PathCollection*s] [*Deprecated*]

levels

[array] The values of the contour levels.

layers

[array] Same as levels for line contours; half-way between levels for filled contours. See `ContourSet._process_colors`.

Draw contour lines or filled regions, depending on whether keyword arg *filled* is `False` (default) or `True`.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

Parameters

ax

[*Axes*] The *Axes* object to draw on.

levels

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs

[[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

allkinds

[[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

****kwargs**

Keyword arguments are as described in the docstring of *contour*.

property allkinds

property allsegs

property alpha

property antialiased

changed()

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

property collections

[*Deprecated*]

Notes

Deprecated since version 3.8:

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

find_nearest_contour(*x*, *y*, *indices=None*, *pixel=True*)

Find the point in the contour plot that is closest to `(x, y)`.

This method does not support filled contours.

Parameters

x, y

[float] The reference point.

indices

[list of int or None, default: None] Indices of contour levels to consider. If None (the default), all levels are considered.

pixel

[bool, default: True] If *True*, measure distance in pixel (screen) space, which is useful for manual contour labeling; else, measure distance in axes space.

Returns

path

[int] The index of the path that is closest to `(x, y)`. Each path corresponds to one contour level.

subpath

[int] The index within that closest path of the subpath that is closest to `(x, y)`. Each subpath corresponds to one unbroken contour line.

index

[int] The index of the vertices within that subpath that are closest to `(x, y)`.

xmin, ymin

[float] The point in the contour plot that is closest to `(x, y)`.

d2

[float] The squared distance from `(xmin, ymin)` to `(x, y)`.

get_transform()

Return the *Transform* instance used by this ContourSet.

legend_elements(*variable_name='x'*, *str_format=<class 'str'>*)

Return a list of artists and labels suitable for passing through to *legend* which represent this ContourSet.

The labels have the form "0 < x <= 1" stating the data ranges which the artists represent.

Parameters

variable_name

[str] The string used inside the inequality used on the labels.

str_format

[function: float -> str] Function used to format the numbers in the labels.

Returns

artists

[list[*Artist*]] A list of the artists.

labels

[list[str]] A list of the labels.

property linestyles

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *label_props=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
label_props	unknown
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats

zorder	float

property tcolors

[*Deprecated*]

Notes

Deprecated since version 3.8:

property tlinewidths

[*Deprecated*]

Notes

Deprecated since version 3.8:

class matplotlib.contour.**QuadContourSet**(*ax*, **args*, *levels=None*, *filled=False*, *linewidths=None*, *linestyles=None*, *hatches=(None,)*, *alpha=None*, *origin=None*, *extent=None*, *cmap=None*, *colors=None*, *norm=None*, *vmin=None*, *vmax=None*, *extend='neither'*, *antialiased=None*, *nchunk=0*, *locator=None*, *transform=None*, *negative_linestyles=None*, *clip_path=None*, ***kwargs*)

Bases: *ContourSet*

Create and store a set of contour lines or filled regions.

This class is typically not instantiated directly by the user but by *contour* and *contourf*.

Attributes

ax

[*Axes*] The Axes object in which the contours are drawn.

collections

[*silent_list* of *PathCollection*s] [*Deprecated*]

levels

[array] The values of the contour levels.

layers

[array] Same as levels for line contours; half-way between levels for filled contours. See `ContourSet._process_colors`.

Draw contour lines or filled regions, depending on whether keyword arg *filled* is `False` (default) or `True`.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

Parameters

ax

[*Axes*] The *Axes* object to draw on.

levels

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs

[[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

allkinds

[[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not `None`, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not `None`, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

****kwargs**

Keyword arguments are as described in the docstring of *contour*.

set (*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *array=<UNSET>*, *capstyle=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *label_props=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *offset_transform=<UNSET>*, *offsets=<UNSET>*, *path_effects=<UNSET>*, *paths=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *urls=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi v
alpha	array-like or scalar or None
animated	bool
antialiased or aa or antialiaseds	bool or list of bools
array	array-like or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
color	color or list of RGBA tuples
edgecolor or ec or edgecolors	color or list of colors or 'face'
facecolor or facecolors or fc	color or list of colors
figure	*Figure*
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
label_props	unknown
linestyle or dashes or linestyles or ls	str or tuple or list thereof
linewidth or linewidths or lw	float or list of floats
mouseover	bool
norm	*Normalize* or str or None
offset_transform or transOffset	*Transform*
offsets	(N, 2) or (2,) array-like

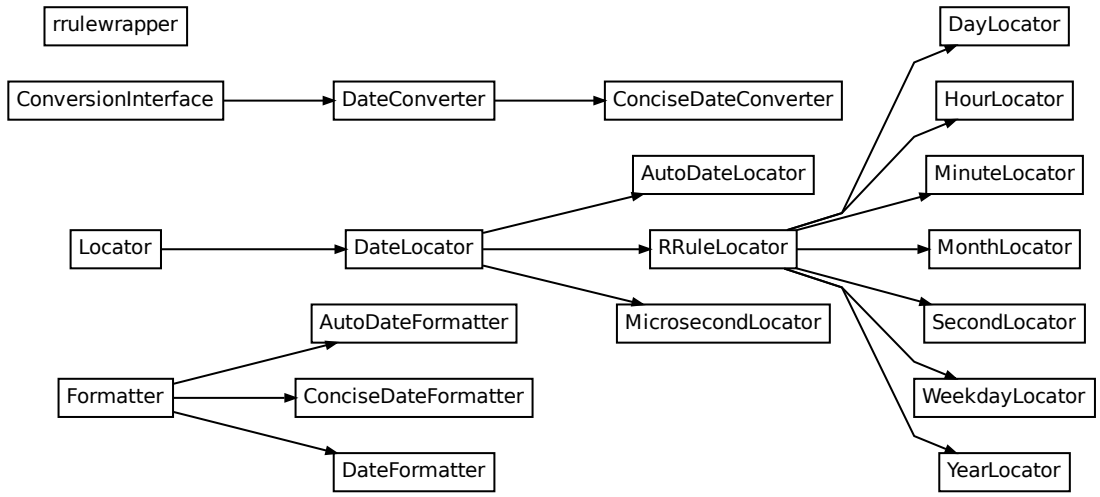
snap	bool or None
transform	*Transform*
url	str
urls	list of str or None
visible	bool
zorder	float

7.2.20 matplotlib.dates



Matplotlib provides sophisticated date plotting capabilities, standing on the shoulders of python `datetime` and the add-on module dateutil.

By default, Matplotlib uses the units machinery described in *units* to convert `datetime.datetime`, and `numpy.datetime64` objects when plotted on an x- or y-axis. The user does not need to do anything for dates to be formatted, but dates often have strict formatting needs, so this module provides many tick locators and formatters. A basic example using `numpy.datetime64` is:

```
import numpy as np

times = np.arange(np.datetime64('2001-01-02'),
                  np.datetime64('2002-02-03'), np.timedelta64(75, 'm'))
y = np.random.randn(len(times))

fig, ax = plt.subplots()
ax.plot(times, y)
```

Matplotlib date format

Matplotlib represents dates using floating point numbers specifying the number of days since a default epoch of 1970-01-01 UTC; for example, 1970-01-01, 06:00 is the floating point number 0.25. The formatters and locators require the use of `datetime.datetime` objects, so only dates between year 0001 and 9999 can be represented. Microsecond precision is achievable for (approximately) 70 years on either side of the epoch, and 20 microseconds for the rest of the allowable range of dates (year 0001 to 9999). The epoch can be changed at import time via *`dates.set_epoch`* or *`rcParams["dates.epoch"]`* to other dates if necessary; see *Date Precision and Epochs* for a discussion.

Note: Before Matplotlib 3.3, the epoch was 0000-12-31 which lost modern microsecond precision and also made the default axis limit of 0 an invalid datetime. In 3.3 the epoch was changed as above. To convert old ordinal floats to the new epoch, users can do:

```
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31'))
```

There are a number of helper functions to convert between `datetime` objects and Matplotlib dates:

`datestr2num`	Convert a date string to a datenum using `dateutil.parser.parse`.
`date2num`	Convert datetime objects to Matplotlib dates.
`num2date`	Convert Matplotlib dates to `datetime` objects.
`num2timedelta`	Convert number of days to a `timedelta` object.
`drange`	Return a sequence of equally spaced Matplotlib dates.
`set_epoch`	Set the epoch (origin for dates) for datetime calculations.
`get_epoch`	Get the epoch used by *`dates`*.

Note: Like Python's `datetime.datetime`, Matplotlib uses the Gregorian calendar for all conversions between dates and floating point numbers. This practice is not universal, and calendar differences can cause confusing differences between what Python and Matplotlib give as the number of days since 0001-01-01 and what other software and databases yield. For example, the US Naval Observatory uses a calendar that switches from Julian to Gregorian in October, 1582. Hence, using their calculator, the number of days between 0001-01-01 and 2006-04-01 is 732403, whereas using the Gregorian calendar via the datetime module we find:

```
In [1]: date(2006, 4, 1).toordinal() - date(1, 1, 1).toordinal()
Out[1]: 732401
```

All the Matplotlib date converters, locators and formatters are timezone aware. If no explicit timezone is provided, *rcParams["timezone"]* (default: `'UTC'`) is assumed, provided as a string. If you want to use a different timezone, pass the *tz* keyword argument of *num2date* to any date tick locators or formatters you create. This can be either a `datetime.tzinfo` instance or a string with the timezone name that can be parsed by `gettz`.

A wide range of specific and general purpose date tick locators and formatters are provided in this module. See *matplotlib.ticker* for general information on tick locators and formatters. These are described below.

The dateutil module provides additional code to handle date ticking, making it easy to place ticks on any kinds of dates. See examples below.

Date tick locators

Most of the date tick locators can locate single or multiple ticks. For example:

```
# import constants for the days of the week
from matplotlib.dates import MO, TU, WE, TH, FR, SA, SU

# tick on Mondays every week
loc = WeekdayLocator(byweekday=MO, tz=tz)

# tick on Mondays and Saturdays
loc = WeekdayLocator(byweekday=(MO, SA))
```

In addition, most of the constructors take an interval argument:

```
# tick on Mondays every second week
loc = WeekdayLocator(byweekday=MO, interval=2)
```

The rrule locator allows completely general date ticking:

```
# tick every 5th easter
rule = rrulewrapper(YEARLY, byeaster=1, interval=5)
loc = RRuleLocator(rule)
```

The available date tick locators are:

- *MicrosecondLocator*: Locate microseconds.
- *SecondLocator*: Locate seconds.
- *MinuteLocator*: Locate minutes.
- *HourLocator*: Locate hours.
- *DayLocator*: Locate specified days of the month.
- *WeekdayLocator*: Locate days of the week, e.g., MO, TU.
- *MonthLocator*: Locate months, e.g., 7 for July.
- *YearLocator*: Locate years that are multiples of base.
- *RRuleLocator*: Locate using a *rrulewrapper*. *rrulewrapper* is a simple wrapper around dateutil's `dateutil.rrule` which allow almost arbitrary date tick specifications. See *rrule example*.
- *AutoDateLocator*: On autoscale, this class picks the best *DateLocator* (e.g., *RRuleLocator*) to set the view limits and the tick locations. If called with `interval_multiples=True` it will make ticks line up with sensible multiples of the tick intervals. For example, if the interval is 4 hours, it will pick hours 0, 4, 8, etc. as ticks. This behaviour is not guaranteed by default.

Date formatters

The available date formatters are:

- *AutoDateFormatter*: attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.
- *ConciseDateFormatter*: also attempts to figure out the best format to use, and to make the format as compact as possible while still having complete date information. This is most useful when used with the *AutoDateLocator*.
- *DateFormatter*: use `strftime` format strings.

class matplotlib.dates.**AutoDateFormatter**(*locator*, *tz=None*, *defaultfmt='%Y-%m-%d'*, ***, *usetex=None*)

Bases: *Formatter*

A *Formatter* which attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.

AutoDateFormatter has a `.scale` dictionary that maps tick scales (the interval in days between one major tick) to format strings; this dictionary defaults to

```
self.scaled = {
    DAYS_PER_YEAR: rcParams['date.autoformatter.year'],
    DAYS_PER_MONTH: rcParams['date.autoformatter.month'],
    1: rcParams['date.autoformatter.day'],
    1 / HOURS_PER_DAY: rcParams['date.autoformatter.hour'],
    1 / MINUTES_PER_DAY: rcParams['date.autoformatter.minute'],
```

(continues on next page)

(continued from previous page)

```
    1 / SEC_PER_DAY: rcParams['date.autoformatter.second'],
    1 / MUSECONDS_PER_DAY: rcParams['date.autoformatter.microsecond'],
}
```

The formatter uses the format string corresponding to the lowest key in the dictionary that is greater or equal to the current scale. Dictionary entries can be customized:

```
locator = AutoDateLocator()
formatter = AutoDateFormatter(locator)
formatter.scaled[1/(24*60)] = '%M:%S' # only show min and sec
```

Custom callables can also be used instead of format strings. The following example shows how to use a custom format function to strip trailing zeros from decimal seconds and adds the date to the first ticklabel:

```
def my_format_function(x, pos=None):
    x = matplotlib.dates.num2date(x)
    if pos == 0:
        fmt = '%D %H:%M:%S.%f'
    else:
        fmt = '%H:%M:%S.%f'
    label = x.strftime(fmt)
    label = label.rstrip("0")
    label = label.rstrip(".")
    return label

formatter.scaled[1/(24*60)] = my_format_function
```

Autoformat the date labels.

Parameters

locator

[*ticker.Locator*] Locator that this axis is using.

tz

[str or `tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

defaultfmt

[str] The default format to use if none of the values in `self.scaled` are greater than the unit returned by `locator._get_unit()`.

usetex

[bool, default: *rcParams["text.usetex"]* (default: `False`)] To enable/disable the use of TeX's math mode for rendering the results of the formatter. If any entries in `self.scaled` are set as functions, then it is up to the customized function to enable or disable TeX's math mode itself.

class matplotlib.dates.**AutoDateLocator**(*tz=None*, *minticks=5*, *maxticks=None*, *interval_multiples=True*)

Bases: *DateLocator*

On autoscale, this class picks the best *DateLocator* to set the view limits and the tick locations.

Attributes

intervald

[dict] Mapping of tick frequencies to multiples allowed for that ticking. The default is

```
self.intervald = {
    YEARLY  : [1, 2, 4, 5, 10, 20, 40, 50, 100, 200, 400,␣
 ↪500,
               1000, 2000, 4000, 5000, 10000],
    MONTHLY : [1, 2, 3, 4, 6],
    DAILY   : [1, 2, 3, 7, 14, 21],
    HOURLY  : [1, 2, 3, 4, 6, 12],
    MINUTELY: [1, 5, 10, 15, 30],
    SECONDLY: [1, 5, 10, 15, 30],
    MICROSECONDLY: [1, 2, 5, 10, 20, 50, 100, 200, 500,
                    1000, 2000, 5000, 10000, 20000, 50000,
                    100000, 200000, 500000, 1000000],
}
```

where the keys are defined in dateutil.rrule.

The interval is used to specify multiples that are appropriate for the frequency of ticking. For instance, every 7 days is sensible for daily ticks, but for minutes/seconds, 15 or 30 make sense.

When customizing, you should only modify the values for the existing keys. You should not add or delete entries.

Example for forcing ticks every 3 hours:

```
locator = AutoDateLocator()
locator.intervald[HOURLY] = [3]  # only show every 3 hours
```

Parameters

tz

[str or tzinfo, default: *rcParams["timezone"]* (default: 'UTC')] Ticks timezone. If a string, *tz* is passed to dateutil.tz.

minticks

[int] The minimum number of ticks desired; controls whether ticks occur yearly, monthly, etc.

maxticks

[int] The maximum number of ticks desired; controls the interval between ticks (ticking every other, every 3, etc.). For fine-grained control, this can be a dictionary mapping individual rrule frequency constants (YEARLY, MONTHLY, etc.) to their own maximum number of ticks. This can be used to keep the number of ticks appropriate to the format chosen in *AutoDateFormatter*. Any frequency not specified in this dictionary is given a default value.

interval_multiples

[bool, default: True] Whether ticks should be chosen to be multiple of the interval, locking them to 'nicer' locations. For example, this will force the ticks to be at hours 0, 6, 12, 18 when hourly ticking is done at 6 hour intervals.

get_locator(*dmin*, *dmax*)

Pick the best locator based on a distance.

nonsingular(*vmin*, *vmax*)

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.dates.**ConciseDateConverter**(*formats=None*, *zero_formats=None*, *offset_formats=None*, *show_offset=True*, ***, *interval_multiples=True*)

Bases: *DateConverter*

axisinfo(*unit*, *axis*)

Return the *AxisInfo* for *unit*.

unit is a `tzinfo` instance or None. The *axis* argument is required but not used.

class matplotlib.dates.**ConciseDateFormatter**(*locator*, *tz=None*, *formats=None*, *offset_formats=None*, *zero_formats=None*, *show_offset=True*, ***, *usetex=None*)

Bases: *Formatter*

A *Formatter* which attempts to figure out the best format to use for the date, and to make it as compact as possible, but still be complete. This is most useful when used with the *AutoDateLocator*:

```
>>> locator = AutoDateLocator()
>>> formatter = ConciseDateFormatter(locator)
```

Parameters

locator

[*ticker.Locator*] Locator that this axis is using.

tz

[str or tzinfo, default: *rcParams["timezone"]* (default: 'UTC')] Ticks timezone, passed to *dates.num2date*.

formats

[list of 6 strings, optional] Format strings for 6 levels of tick labelling: mostly years, months, days, hours, minutes, and seconds. Strings use the same format codes as strftime. Default is ['%Y', '%b', '%d', '%H:%M', '%H:%M', '%S.%f']

zero_formats

[list of 6 strings, optional] Format strings for tick labels that are "zeros" for a given tick level. For instance, if most ticks are months, ticks around 1 Jan 2005 will be labeled "Dec", "2005", "Feb". The default is ['', '%Y', '%b', '%b-%d', '%H:%M', '%H:%M']

offset_formats

[list of 6 strings, optional] Format strings for the 6 levels that is applied to the "offset" string found on the right side of an x-axis, or top of a y-axis. Combined with the tick labels this should completely specify the date. The default is:

```
['', '%Y', '%Y-%b', '%Y-%b-%d', '%Y-%b-%d', '%Y-%b-%d %H:%M
 ↪']
```

show_offset

[bool, default: True] Whether to show the offset or not.

usetex

[bool, default: *rcParams["text.usetex"]* (default: False)] To enable/disable the use of TeX's math mode for rendering the results of the formatter.

Examples

See *Formatting date ticks using ConciseDateFormatter*

Autoformat the date labels. The default format is used to form an initial string, and then redundant elements are removed.

format_data_short(*value*)

Return a short string version of the tick value.

Defaults to the position-independent long value.

format_ticks(*values*)

Return the tick labels for all the ticks at once.

get_offset()

class matplotlib.dates.**DateConverter**(*, *interval_multiples=True*)

Bases: *ConversionInterface*

Converter for `datetime.date` and `datetime.datetime` data, or for date/time data represented as it would be converted by *date2num*.

The 'unit' tag for such data is None or a `tzinfo` instance.

axisinfo(*unit*, *axis*)

Return the *AxisInfo* for *unit*.

unit is a `tzinfo` instance or None. The *axis* argument is required but not used.

static convert(*value*, *unit*, *axis*)

If *value* is not already a number or sequence of numbers, convert it with *date2num*.

The *unit* and *axis* arguments are not used.

static default_units(*x*, *axis*)

Return the `tzinfo` instance of *x* or of its first element, or None

class matplotlib.dates.**DateFormatter**(*fmt*, *tz=None*, *, *usetex=None*)

Bases: *Formatter*

Format a tick (in days since the epoch) with a `strftime` format string.

Parameters

fmt

[str] `strftime` format string

tz

[str or `tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

usetex

[bool, default: *rcParams["text.usetex"]* (default: `False`)] To enable/disable the use of TeX's math mode for rendering the results of the formatter.

set_tzinfo(*tz*)

class matplotlib.dates.**DateLocator**(*tz=None*)

Bases: *Locator*

Determines the tick locations when plotting dates.

This class is subclassed by other Locators and is not meant to be used on its own.

Parameters

tz

[str or `tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

datalim_to_dt()

Convert axis data interval to datetime objects.

hms0d = {'byhour': 0, 'byminute': 0, 'bysecond': 0}

nonsingular(*vmin*, *vmax*)

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

set_tzinfo(*tz*)

Set timezone info.

Parameters

tz

[str or `tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

viewlim_to_dt()

Convert the view interval to datetime objects.

class matplotlib.dates.**DayLocator**(*bymonthday=None*, *interval=1*, *tz=None*)

Bases: *RRuleLocator*

Make ticks on occurrences of each day of the month. For example, 1, 15, 30.

Parameters

bymonthday

[int or list of int, default: all days] Ticks will be placed on every day in *bymonthday*. Default is `bymonthday=range(1, 32)`, i.e., every day of the month.

interval

[int, default: 1] The interval between each iteration. For example, if `interval=2`, mark every second occurrence.

tz

[str or `tzinfo`, default: *`rcParams["timezone"]`* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

class matplotlib.dates.**HourLocator**(*byhour=None*, *interval=1*, *tz=None*)

Bases: *RRuleLocator*

Make ticks on occurrences of each hour.

Parameters

byhour

[int or list of int, default: all hours] Ticks will be placed on every hour in *byhour*. Default is `byhour=range(24)`, i.e., every hour.

interval

[int, default: 1] The interval between each iteration. For example, if `interval=2`, mark every second occurrence.

tz

[str or `tzinfo`, default: *`rcParams["timezone"]`* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

class matplotlib.dates.**MicrosecondLocator**(*interval=1*, *tz=None*)

Bases: *DateLocator*

Make ticks on regular intervals of one or more microsecond(s).

Note: By default, Matplotlib uses a floating point representation of time in days since the epoch, so plotting data with microsecond time resolution does not work well for dates that are far (about 70 years) from the epoch (check with *`get_epoch`*).

If you want sub-microsecond resolution time plots, it is strongly recommended to use floating point seconds, not datetime-like time representation.

If you really must use datetime.datetime() or similar and still need microsecond precision, change the time origin via *`dates.set_epoch`* to something closer to the dates being plotted. See *Date Precision and Epochs*.

Parameters

interval

[int, default: 1] The interval between each iteration. For example, if `interval=2`, mark every second occurrence.

tz

[str or `tzinfo`, default: *`rcParams["timezone"]`* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

set_axis(*axis*)

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.dates.**MinuteLocator**(*byminute=None*, *interval=1*, *tz=None*)

Bases: *RRuleLocator*

Make ticks on occurrences of each minute.

Parameters

byminute

[int or list of int, default: all minutes] Ticks will be placed on every minute in *byminute*. Default is `byminute=range(60)`, i.e., every minute.

interval

[int, default: 1] The interval between each iteration. For example, if `interval=2`, mark every second occurrence.

tz

[str or `tzinfo`, default: *`rcParams["timezone"]`* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

class matplotlib.dates.**MonthLocator**(*bymonth=None*, *bymonthday=1*, *interval=1*, *tz=None*)

Bases: *RRuleLocator*

Make ticks on occurrences of each month, e.g., 1, 3, 12.

Parameters

bymonth

[int or list of int, default: all months] Ticks will be placed on every month in *bymonth*. Default is `range(1, 13)`, i.e. every month.

bymonthday

[int, default: 1] The day on which to place the ticks.

interval

[int, default: 1] The interval between each iteration. For example, if `interval=2`, mark every second occurrence.

tz

[str or `tzinfo`, default: *`rcParams["timezone"]`* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

class matplotlib.dates.**RRuleLocator**(*o*, *tz=None*)

Bases: *DateLocator*

Parameters

tz

[str or `tzinfo`, default: *`rcParams["timezone"]`* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

static get_unit_generic(*freq*)

tick_values(*vmin*, *vmax*)

Return the values of the located ticks given **vmin** and **vmax**.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated `axis` simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

class matplotlib.dates.**SecondLocator**(*bysecond=None*, *interval=1*, *tz=None*)

Bases: *RRuleLocator*

Make ticks on occurrences of each second.

Parameters

bysecond

[int or list of int, default: all seconds] Ticks will be placed on every second in *bysecond*. Default is `bysecond = range(60)`, i.e., every second.

interval

[int, default: 1] The interval between each iteration. For example, if `interval=2`, mark every second occurrence.

tz

[str or `tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

class matplotlib.dates.**WeekdayLocator**(*byweekday=1*, *interval=1*, *tz=None*)

Bases: *RRuleLocator*

Make ticks on occurrences of each weekday.

Parameters

byweekday

[int or list of int, default: all days] Ticks will be placed on every weekday in *byweekday*. Default is every day.

Elements of *byweekday* must be one of MO, TU, WE, TH, FR, SA, SU, the constants from `dateutil.rrule`, which have been imported into the *matplotlib.dates* namespace.

interval

[int, default: 1] The interval between each iteration. For example, if `interval=2`, mark every second occurrence.

tz

[str or `tzinfo`, default: *rcParams["timezone"]* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

class matplotlib.dates.**YearLocator**(*base=1*, *month=1*, *day=1*, *tz=None*)

Bases: *RRuleLocator*

Make ticks on a given day of each year that is a multiple of base.

Examples:

```
# Tick every year on Jan 1st
locator = YearLocator()

# Tick every 5 years on July 4th
locator = YearLocator(5, month=7, day=4)
```

Parameters

base

[int, default: 1] Mark ticks every *base* years.

month

[int, default: 1] The month on which to place the ticks, starting from 1. Default is January.

day

[int, default: 1] The day on which to place the ticks.

tz

[str or `tzinfo`, default: *`rcParams["timezone"]`* (default: `'UTC'`)] Ticks timezone. If a string, *tz* is passed to `dateutil.tz`.

`matplotlib.dates.`**`date2num`**(*d*)

Convert datetime objects to Matplotlib dates.

Parameters

d

[`datetime.datetime` or `numpy.datetime64` or sequences of these]

Returns

float or sequence of floats

Number of days since the epoch. See *`get_epoch`* for the epoch, which can be changed by *`rcParams["date.epoch"]`* (default: `'1970-01-01T00:00:00'`) or *`set_epoch`*. If the epoch is "1970-01-01T00:00:00" (default) then noon Jan 1 1970 ("1970-01-01T12:00:00") returns 0.5.

Notes

The Gregorian calendar is assumed; this is not universal practice. For details see the module docstring.

`matplotlib.dates.`**`datestr2num`**(*d*, *default=None*)

Convert a date string to a datenum using `dateutil.parser.parse`.

Parameters

d

[str or sequence of str] The dates to convert.

default

[datetime.datetime, optional] The default date to use when fields are missing in *d*.

matplotlib.dates.**drange**(*dstart*, *dend*, *delta*)

Return a sequence of equally spaced Matplotlib dates.

The dates start at *dstart* and reach up to, but not including *dend*. They are spaced by *delta*.

Parameters

dstart, dend

[datetime] The date limits.

delta

[datetime.timedelta] Spacing of the dates.

Returns

numpy.array

A list floats representing Matplotlib dates.

matplotlib.dates.**get_epoch**()

Get the epoch used by *dates*.

Returns

epoch

[str] String for the epoch (parsable by numpy.datetime64).

matplotlib.dates.**num2date**(*x*, *tz=None*)

Convert Matplotlib dates to datetime objects.

Parameters

x

[float or sequence of floats] Number of days (fraction part represents hours, minutes, seconds) since the epoch. See *get_epoch* for the epoch, which can be changed by *rcParams["date.epoch"]* (default: '1970-01-01T00:00:00') or *set_epoch*.

tz

[str or tzinfo, default: *rcParams["timezone"]* (default: 'UTC')] Timezone of *x*. If a string, *tz* is passed to dateutil.tz.

Returns

datetime or sequence of datetime

Dates are returned in timezone *tz*.

If *x* is a sequence, a sequence of datetime objects will be returned.

Notes

The Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

matplotlib.dates.**num2timedelta**(*x*)

Convert number of days to a `timedelta` object.

If *x* is a sequence, a sequence of `timedelta` objects will be returned.

Parameters

x

[float, sequence of floats] Number of days. The fraction part represents hours, minutes, seconds.

Returns

datetime.timedelta or list[datetime.timedelta]

class matplotlib.dates.**relativedelta**(*dt1=None*, *dt2=None*, *years=0*, *months=0*, *days=0*, *leapdays=0*, *weeks=0*, *hours=0*, *minutes=0*, *seconds=0*, *microseconds=0*, *year=None*, *month=None*, *day=None*, *weekday=None*, *yearday=None*, *nlyearday=None*, *hour=None*, *minute=None*, *second=None*, *microsecond=None*)

Bases: `object`

The relativedelta type is designed to be applied to an existing datetime and can replace specific components of that datetime, or represents an interval of time.

It is based on the specification of the excellent work done by M.-A. Lemburg in his mx.DateTime extension. However, notice that this type does *NOT* implement the same algorithm as his work. Do *NOT* expect it to behave like mx.DateTime's counterpart.

There are two different ways to build a relativedelta instance. The first one is passing it two date/datetime classes:

```
relativedelta(datetime1, datetime2)
```

The second one is passing it any number of the following keyword arguments:

```
relativedelta(arg1=x,arg2=y,arg3=z...)

year, month, day, hour, minute, second, microsecond:
    Absolute information (argument is singular); adding or subtracting a
    relativedelta with absolute information does not perform an␣
 ↪arithmetic
    operation, but rather REPLACES the corresponding value in the
    original datetime with the value(s) in relativedelta.
```

(continues on next page)

(continued from previous page)

```
years, months, weeks, days, hours, minutes, seconds, microseconds:
    Relative information, may be negative (argument is plural); adding
    or subtracting a relativedelta with relative information performs
    the corresponding arithmetic operation on the original datetime value
    with the information in the relativedelta.

weekday:
    One of the weekday instances (MO, TU, etc) available in the
    relativedelta module. These instances may receive a parameter N,
    specifying the Nth weekday, which could be positive or negative
    (like MO(+1) or MO(-2)). Not specifying it is the same as specifying
    +1. You can also use an integer, where 0=MO. This argument is always
    relative e.g. if the calculated date is already Monday, using MO(1)
    or MO(-1) won't change the day. To effectively make it absolute, use
    it in combination with the day argument (e.g. day=1, MO(1) for first
    Monday of the month).

leapdays:
    Will add given days to the date found, if year is a leap
    year, and the date found is post 28 of february.

yearday, nlyearday:
    Set the yearday or the non-leap year day (jump leap days).
    These are converted to day/month/leapdays information.
```

There are relative and absolute forms of the keyword arguments. The plural is relative, and the singular is absolute. For each argument in the order below, the absolute form is applied first (by setting each attribute to that value) and then the relative form (by adding the value to the attribute).

The order of attributes considered when this relativedelta is added to a datetime is:

1. Year
2. Month
3. Day
4. Hours
5. Minutes
6. Seconds
7. Microseconds

Finally, weekday is applied, using the rule described above.

For example

```
>>> from datetime import datetime
>>> from dateutil.relativedelta import relativedelta, MO
>>> dt = datetime(2018, 4, 9, 13, 37, 0)
>>> delta = relativedelta(hours=25, day=1, weekday=MO(1))
>>> dt + delta
datetime.datetime(2018, 4, 2, 14, 37)
```

First, the day is set to 1 (the first of the month), then 25 hours are added, to get to the 2nd day and 14th hour, finally the weekday is applied, but since the 2nd is already a Monday there is no effect.

normalized()

Return a version of this object represented entirely using integer values for the relative attributes.

```
>>> relativedelta(days=1.5, hours=2).normalized()
relativedelta(days=+1, hours=+14)
```

Returns

Returns a *dateutil.relativedelta.relativedelta* object.

property weeks

class matplotlib.dates.**rrulewrapper**(*freq*, *tzinfo=None*, ***kwargs*)

Bases: object

A simple wrapper around a dateutil.rrule allowing flexible date tick specifications.

Parameters

freq

[{YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, SECONDLY}] Tick frequency. These constants are defined in dateutil.rrule, but they are accessible from *matplotlib.dates* as well.

tzinfo

[datetime.tzinfo, optional] Time zone information. The default is None.

****kwargs**

Additional keyword arguments are passed to the dateutil.rrule.

set(***kwargs*)

Set parameters for an existing wrapper.

matplotlib.dates.**set_epoch**(*epoch*)

Set the epoch (origin for dates) for datetime calculations.

The default epoch is *rcParams["dates.epoch"]* (by default 1970-01-01T00:00).

If microsecond accuracy is desired, the date being plotted needs to be within approximately 70 years of the epoch. Matplotlib internally represents dates as days since the epoch, so floating point dynamic range needs to be within a factor of 2^52.

set_epoch must be called before any dates are converted (i.e. near the import section) or a RuntimeError will be raised.

See also *Date Precision and Epochs*.

Parameters

epoch

[str] valid UTC date parsable by `numpy.datetime64` (do not include timezone).

7.2.21 matplotlib.docstring

Attention: This module is considered internal.

Its use is deprecated and it will be removed in a future version.

class matplotlib._docstring.**Substitution**(**args*, ***kwargs*)

Bases: `object`

A decorator that performs %-substitution on an object's docstring.

This decorator should be robust even if `obj.__doc__` is None (for example, if -OO was passed to the interpreter).

Usage: construct a docstring.Substitution with a sequence or dictionary suitable for performing substitution; then decorate a suitable function with the constructed object, e.g.:

```
sub_author_name = Substitution(author='Jason')

@sub_author_name
def some_function(x):
    "%(author)s wrote this function"

# note that some_function.__doc__ is now "Jason wrote this function"
```

One can also use positional arguments:

```
sub_first_last_names = Substitution('Edgar Allen', 'Poe')

@sub_first_last_names
def some_function(x):
    "%s %s wrote the Raven"
```

update(**args*, ***kwargs*)

Update `self.params` (which must be a dict) with the supplied args.

matplotlib._docstring.**copy**(*source*)

Copy a docstring from another source function (if present).

7.2.22 matplotlib.dviread

A module for reading dvi files output by TeX. Several limitations make this not (currently) useful as a general-purpose dvi preprocessor, but it is currently used by the pdf backend for processing usetex text.

Interface:

```
with Dvi(filename, 72) as dvi:
    # iterate over pages:
    for page in dvi:
        w, h, d = page.width, page.height, page.descent
        for x, y, font, glyph, width in page.text:
            fontname = font.texname
            pointsize = font.size
            ...
        for x, y, height, width in page.boxes:
            ...
```

class matplotlib.dviread.**Dvi**(*filename*, *dpi*)

Bases: object

A reader for a dvi ("device-independent") file, as produced by TeX.

The current implementation can only iterate through pages in order, and does not even attempt to verify the postamble.

This class can be used as a context manager to close the underlying file upon exit. Pages can be read via iteration. Here is an overly simple way to extract text without trying to detect whitespace:

```
>>> with matplotlib.dviread.Dvi('input.dvi', 72) as dvi:
...     for page in dvi:
...         print(''.join(chr(t.glyph) for t in page.text))
```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use None to return TeX's internal units.

close()

Close the underlying file if it is open.

class matplotlib.dviread.**DviFont**(*scale*, *tfm*, *texname*, *vf*)

Bases: object

Encapsulation of a font that a DVI file can refer to.

This class holds a font's texname and size, supports comparison, and knows the widths of glyphs in the same units as the AFM file. There are also internal attributes (for use by dviread.py) that are *not* used for comparison.

The size is in Adobe points (converted from TeX points).

Parameters

scale

[float] Factor by which the font is scaled from its natural size.

tfm

[Tfm] TeX font metrics for this font

texname

[bytes] Name of the font as used internally by TeX and friends, as an ASCII bytestring. This is usually very different from any external font names; *PsfontsMap* can be used to find the external name of the font.

vf

[Vf] A TeX "virtual font" file, or None if this font is not virtual.

Attributes

texname

[bytes]

size

[float] Size of the font in Adobe points, converted from the slightly smaller TeX points.

widths

[list] Widths of glyphs in glyph-space units, typically 1/1000ths of the point size.

size

texname

widths

class matplotlib.dviread.**PsFont**(*texname*, *psname*, *effects*, *encoding*, *filename*)

Bases: tuple

Create new instance of PsFont(texname, psname, effects, encoding, filename)

effects

Alias for field number 2

encoding

Alias for field number 3

filename

Alias for field number 4

psname

Alias for field number 1

texname

Alias for field number 0

class matplotlib.dviread.**PsfontsMap**(*filename*)

Bases: object

A psfonts.map formatted file, mapping TeX fonts to PS fonts.

Parameters

filename

[str or path-like]

Notes

For historical reasons, TeX knows many Type-1 fonts by different names than the outside world. (For one thing, the names have to fit in eight characters.) Also, TeX's native fonts are not Type-1 but Metafont, which is nontrivial to convert to PostScript except as a bitmap. While high-quality conversions to Type-1 format exist and are shipped with modern TeX distributions, we need to know which Type-1 fonts are the counterparts of which native fonts. For these reasons a mapping is needed from internal font names to font file names.

A texmf tree typically includes mapping files called e.g. `psfonts.map`, `pdftex.map`, or `dvipdfm.map`. The file `psfonts.map` is used by **dvips**, `pdftex.map` by **pdfTeX**, and `dvipdfm.map` by **dvipdfm**. `psfonts.map` might avoid embedding the 35 PostScript fonts (i.e., have no filename for them, as in the Times-Bold example above), while the pdf-related files perhaps only avoid the "Base 14" pdf fonts. But the user may have configured these files differently.

Examples

```
>>> map = PsfontsMap(find_tex_file('pdftex.map'))
>>> entry = map[b'ptmbo8r']
>>> entry.texname
b'ptmbo8r'
>>> entry.psname
b'Times-Bold'
>>> entry.encoding
'/usr/local/texlive/2008/texmf-dist/fonts/enc/dvips/base/8r.enc'
>>> entry.effects
{'slant': 0.16700000000000001}
>>> entry.filename
```

class matplotlib.dviread.**Tfm**(*filename*)

Bases: object

A TeX Font Metric file.

This implementation covers only the bare minimum needed by the Dvi class.

Parameters

filename

[str or path-like]

Attributes

checksum

[int] Used for verifying against the dvi file.

design_size

[int] Design size of the font (unknown units)

width, height, depth

[dict] Dimensions of each character, need to be scaled by the factor specified in the dvi file. These are dicts because indexing may not start from 0.

checksum

depth

design_size

height

width

class matplotlib.dviread.**Vf**(*filename*)

Bases: *Dvi*

A virtual font (*.vf file) containing subroutines for dvi files.

Parameters

filename

[str or path-like]

Notes

The virtual font format is a derivative of dvi: http://mirrors.ctan.org/info/knuth/virtual-fonts This class reuses some of the machinery of *Dvi* but replaces the `_read` loop and dispatch mechanism.

Examples

```
vf = Vf(filename)
glyph = vf[code]
glyph.text, glyph.boxes, glyph.width
```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use None to return TeX's internal units.

matplotlib.dviread.**find_tex_file**(*filename*)

Find a file in the texmf tree using kpathsea.

The kpathsea library, provided by most existing TeX distributions, both on Unix-like systems and on Windows (MikTeX), is invoked via a long-lived luatex process if luatex is installed, or via kpsewhich otherwise.

Parameters

filename

[str or path-like]

Raises

FileNotFoundError

If the file is not found.

7.2.23 matplotlib.figure

matplotlib.figure implements the following classes:

Figure

Top level *Artist*, which holds all plot elements. Many methods are implemented in *FigureBase*.

SubFigure

A logical figure inside a figure, usually added to a figure (or parent *SubFigure*) with *Figure.add_subfigure* or *Figure.subfigures* methods (provisional API v3.4).

SubplotParams

Control the default spacing between subplots.

Figures are typically created using pyplot methods *figure*, *subplots*, and *subplot_mosaic*.

```
fig, ax = plt.subplots(figsize=(2, 2), facecolor='lightskyblue',
                       layout='constrained')
fig.suptitle('Figure')
ax.set_title('Axes', loc='left', fontstyle='oblique', fontsize='medium')
```

Some situations call for directly instantiating a *Figure* class, usually inside an application of some sort (see *Embedding Matplotlib in graphical user interfaces* for a list of examples) . More information about Figures can be found at *Introduction to Figures*.

class matplotlib.figure.**Figure**(*figsize=None*, *dpi=None*, *, *facecolor=None*, *edgecolor=None*, *linewidth=0.0*, *frameon=None*, *subplotpars=None*, *tight_layout=None*, *constrained_layout=None*, *layout=None*, ***kwargs*)

The top level container for all the plot elements.

Attributes

patch

The *Rectangle* instance representing the figure background patch.

suppressComposite

For multiple images, the figure will make composite images depending on the renderer option_image_nocomposite function. If *suppressComposite* is a boolean, this will override the renderer.

Parameters

figsize

[2-tuple of floats, default: *rcParams["figure.figsize"]* (default: `[6.4, 4.8]`)] Figure dimension `(width, height)` in inches.

dpi

[float, default: *rcParams["figure.dpi"]* (default: `100.0`)] Dots per inch.

facecolor

[default: *rcParams["figure.facecolor"]* (default: `'white'`)] The figure patch facecolor.

edgecolor

[default: *rcParams["figure.edgecolor"]* (default: `'white'`)] The figure patch edge color.

linewidth

[float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

frameon

[bool, default: *rcParams["figure.frameon"]* (default: `True`)] If `False`, suppress drawing the figure background patch.

subplotpars

[*SubplotParams*] Subplot parameters. If not given, the default subplot parameters *rcParams["figure.subplot.*"]* are used.

tight_layout

[bool or dict, default: *rcParams["figure.autolayout"]* (default: `False`)] Whether to use the tight layout mechanism. See *set_tight_layout*.

Discouraged

The use of this parameter is discouraged. Please use `layout='tight'` instead for the common case of `tight_layout=True` and use *set_tight_layout* otherwise.

---

constrained_layout

[bool, default: *rcParams["figure.constrained_layout.use"]* (default: `False`)] This is equal to `layout='constrained'`.

Discouraged

The use of this parameter is discouraged. Please use `layout='constrained'` instead.

---

layout

[{'constrained', 'compressed', 'tight', 'none', *LayoutEngine*, None}, default: None] The layout mechanism for positioning of plot elements to avoid overlapping Axes decorations (labels, ticks, etc). Note that layout managers can have significant performance penalties.

- 'constrained': The constrained layout solver adjusts axes sizes to avoid overlapping axes decorations. Can handle complex plot layouts and colorbars, and is thus recommended.

  See *Constrained layout guide* for examples.

- 'compressed': uses the same algorithm as 'constrained', but removes extra space between fixed-aspect-ratio Axes. Best for simple grids of axes.

- 'tight': Use the tight layout mechanism. This is a relatively simple algorithm that adjusts the subplot parameters so that decorations do not overlap.

  See *Tight layout guide* for examples.

- 'none': Do not use a layout engine.

- A *LayoutEngine* instance. Builtin layout classes are *ConstrainedLayoutEngine* and *TightLayoutEngine*, more easily accessible by 'constrained' and 'tight'. Passing an instance allows third parties to provide their own layout engine.

If not given, fall back to using the parameters *tight_layout* and *constrained_layout*, including their config defaults *rcParams["figure.autolayout"]* (default: `False`) and *rcParams["figure.constrained_layout.use"]* (default: `False`).

Other Parameters

****kwargs**

[*Figure* properties, optional]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi valu
alpha	scalar or None
animated	bool
canvas	FigureCanvas
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
constrained_layout	unknown
constrained_layout_pads	unknown
dpi	float
edgecolor	color
facecolor	color
figheight	float
figure	*Figure*
figwidth	float
frameon	bool
gid	str
in_layout	bool
label	object
layout_engine	{'constrained', 'compressed', 'tight', 'none', *LayoutEngine*, No
linewidth	number
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
size_inches	(float, float) or float
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
tight_layout	unknown
transform	*Transform*
url	str
visible	bool
zorder	float

add_artist(*artist*, *clip=False*)

Add an *Artist* to the figure.

Usually artists are added to *Axes* objects using *Axes.add_artist*; this method can be used in the rare cases where one needs to add artists directly to the figure instead.

Parameters

artist

[*Artist*] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transSubfigure`.

clip

[bool, default: False] Whether the added artist should be clipped by the figure patch.

Returns

Artist

The added artist.

add_axes(**args*, ***kwargs*)

Add an *Axes* to the figure.

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

Parameters

rect

[tuple (left, bottom, width, height)] The dimensions (left, bottom, width, height) of the new *Axes*. All quantities are in fractions of figure width and height.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

axes_class

[subclass type of *Axes*, optional] The *axes.Axes* subclass that is instantiated. This parameter is incompatible with *projection* and *polar*. See *axisartist* for examples.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned Axes.

Returns

Axes, or a subclass of _Axes_

The returned axes class depends on the projection used. It is _Axes_ if rectilinear projection is used and _projections.polar.PolarAxes_ if polar projection is used.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes class. The keyword arguments for the rectilinear Axes class _Axes_ can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual Axes class.

Property	Description
adjustable	{'box', 'datalim'}
_agg_filter_	a filter function, which takes a (m, n, 3) float array and a dpi value,
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
_autoscale_on_	bool
_autoscalex_on_	unknown
_autoscaley_on_	unknown
_axes_locator_	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
_box_aspect_	float or None
_clip_box_	_BboxBase_ or None
_clip_on_	bool
_clip_path_	Patch or (Path, Transform) or None
facecolor or fc	color
figure	_Figure_
_frame_on_	bool
gid	str
_in_layout_	bool
label	object
mouseover	bool
navigate	bool
_navigate_mode_	unknown
_path_effects_	list of _AbstractPathEffect_
picker	None or bool or float or callable

See also:

Figure.add_subplot
pyplot.subplot
pyplot.axes
Figure.subplots
pyplot.subplots

Notes

In rare circumstances, *add_axes* may be called with a single argument, an Axes instance already created in the present figure but not in the figure's list of Axes.

Examples

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

add_axobserver(*func*)

Whenever the Axes state change, `func(self)` will be called.

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

add_gridspec(*nrows=1*, *ncols=1*, ***kwargs*)

Return a *GridSpec* that has this figure as a parent. This allows complex layout of Axes in the figure.

Parameters

nrows

[int, default: 1] Number of rows in grid.

ncols

[int, default: 1] Number of columns in grid.

Returns

GridSpec

Other Parameters

****kwargs**

Keyword arguments are passed to *GridSpec*.

See also:

matplotlib.pyplot.subplots

Examples

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

add_subfigure(*subplotspec*, ***kwargs*)

Add a *SubFigure* to the figure as part of a subplot arrangement.

Parameters

subplotspec

[*gridspec.SubplotSpec*] Defines the region in a parent gridspec where the subfigure will be placed.

Returns

SubFigure

Other Parameters

****kwargs**

Are passed to the *SubFigure* object.

See also:

Figure.subfigures

add_subplot(**args*, ***kwargs*)

Add an *Axes* to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

Parameters

***args**

[int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

In rare circumstances, *add_subplot* may be called with a single argument, a subplot Axes instance already created in the present figure but not in the figure's list of Axes.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

axes_class

[subclass type of *Axes*, optional] The *axes.Axes* subclass that is instantiated. This parameter is incompatible with *projection* and *polar*. See *axisartist* for examples.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned Axes.

Returns

Axes

The Axes of the subplot. The returned Axes can actually be an instance of a subclass, such as *projections.polar.PolarAxes* for polar projections.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value,
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown

See also:

Figure.add_axes
pyplot.subplot
pyplot.axes
Figure.subplots
pyplot.subplots

Examples

```
fig = plt.figure()

fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1)  # equivalent but more general

fig.add_subplot(232, frameon=False)  # subplot with no frame
fig.add_subplot(233, projection='polar')  # polar subplot
fig.add_subplot(234, sharex=ax1)  # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor="red")  # red subplot

ax1.remove()  # delete ax1 from the figure
fig.add_subplot(ax1)  # add ax1 back to the figure
```

align_labels(*axs=None*)

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

Parameters

axs

[list of *Axes*] Optional list (or ndarray) of *Axes* to align the labels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_xlabels
matplotlib.figure.Figure.align_ylabels

align_xlabels(*axs=None*)

Align the xlabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on Axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on Axes with the same top-most row.

Parameters

axs

[list of *Axes*] Optional list of (or ndarray) *Axes* to align the xlabels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_ylabels
matplotlib.figure.Figure.align_labels

Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

Examples

Example with rotated xtick labels:

```
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

align_ylabels(*axs=None*)

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on Axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on Axes with the same right-most column.

Parameters

axs

[list of *Axes*] Optional list (or `ndarray`) of *Axes* to align the ylabels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_xlabels
matplotlib.figure.Figure.align_labels

Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

Examples

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

autofmt_xdate(*bottom=0.2*, *rotation=30*, *ha='right'*, *which='major'*)

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared x-axis where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

Parameters

bottom

[float, default: 0.2] The bottom of the subplots for *subplots_adjust*.

rotation

[float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

ha

[{'left', 'center', 'right'}, default: 'right'] The horizontal alignment of the xticklabels.

which

[{'major', 'minor', 'both'}, default: 'major'] Selects which ticklabels to rotate.

property axes

List of Axes in the Figure. You can access and modify the Axes in the Figure through this list.

Do not modify the list itself. Instead, use *add_axes*, *add_subplot* or *delaxes* to add or remove an Axes.

Note: The *Figure.axes* property and *get_axes* method are equivalent.

clear(*keep_observers=False*)

Clear the figure.

Parameters

keep_observers

[bool, default: False] Set *keep_observers* to True if, for example, a gui widget is tracking the Axes in the figure.

clf(*keep_observers=False*)

[*Discouraged*] Alias for the *clear()* method.

Discouraged

The use of `clf()` is discouraged. Use `clear()` instead.

Parameters

keep_observers

[bool, default: False] Set *keep_observers* to True if, for example, a gui widget is tracking the Axes in the figure.

colorbar(*mappable*, *cax=None*, *ax=None*, *use_gridspec=True*, ***kwargs*)

Add a colorbar to a plot.

Parameters

mappable

The *matplotlib.cm.ScalarMappable* (i.e., *AxesImage*, *ContourSet*, etc.) described by this colorbar. This argument is mandatory for the *Figure.colorbar* method but optional for the *pyplot.colorbar* function, which sets the default to the current image.

Note that one can create a *ScalarMappable* "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap),␣
↪ax=ax)
```

cax

[*Axes*, optional] Axes into which the colorbar will be drawn. If `None`, then a new Axes is created and the space for it will be stolen from the Axes(s) specified in *ax*.

ax

[*Axes* or iterable or `numpy.ndarray` of Axes, optional] The one or more parent Axes from which space for a new colorbar Axes will be stolen. This parameter is only used if *cax* is not set.

Defaults to the Axes that contains the mappable used to create the colorbar.

use_gridspec

[bool, optional] If *cax* is `None`, a new *cax* is created as an instance of Axes. If *ax* is positioned with a subplotspec and *use_gridspec* is `True`, then *cax* is also positioned with a subplotspec.

Returns

colorbar

[*Colorbar*]

Other Parameters

location

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

extend

[{'neither', 'both', 'min', 'max'}] Make pointed end(s) for out-of-range values (unless 'neither'). These are set for a given colormap using the colormap set_under and set_over methods.

extendfrac

[{*None*, 'auto', length, lengths}] If set to *None*, both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting).

If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when *spacing* is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when *spacing* is set to 'proportional').

If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.

extendrect

[bool] If *False* the minimum and maximum colorbar extensions will be triangular (the default). If *True* the extensions will be rectangular.

spacing

[{'uniform', 'proportional'}] For discrete colorbars (`BoundaryNorm` or contours), 'uniform' gives each color the same space; 'proportional' makes the space proportional to the data interval.

ticks

[None or list of ticks or Locator] If None, ticks are determined automatically from the input.

format

[None or str or Formatter] If None, `ScalarFormatter` is used. Format strings, e.g., `"%4.2e"` or `"{x:.2e}"`, are supported. An alternative `Formatter` may be given instead.

drawedges

[bool] Whether to draw lines at color boundaries.

label

[str] The label on the colorbar's long axis.

boundaries, values

[None or a sequence] If unset, the colormap will be displayed on a 0-1 scale. If sequences, *values* must have a length 1 less than *boundaries*. For each region

delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in values will be used. Normally only useful for indexed colors (i.e. `norm=NoNorm()`) or other unusual circumstances.

Notes

If *mappable* is a `ContourSet`, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified, it determines the size of the colorbar, and *shrink* and *aspect* are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) render white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However, this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

contains(*mouseevent*)

Test whether the mouse event occurred on the figure.

Returns

bool, {}

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

delaxes(*ax*)

Remove the `Axes` *ax* from the figure; update the current Axes.

property dpi

The resolution in dots per inch.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

draw_artist(*a*)

Draw *Artist* *a* only.

draw_without_rendering()

Draw the figure with no output. Useful to get the final size of artists that require a draw before their size is known (e.g. text).

figimage(*X*, *xo=0*, *yo=0*, *alpha=None*, *norm=None*, *cmap=None*, *vmin=None*, *vmax=None*, *origin=None*, *resize=False*, ***kwargs*)

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on *origin*.

Parameters

X

The image data. This is an array of one of the following shapes:

- (M, N): an image with scalar data. Color-mapping is controlled by *cmap*, *norm*, *vmin*, and *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

xo, yo

[int] The *x*/*y* image offset in pixels.

alpha

[None or float] The alpha blending value.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

This parameter is ignored if *X* is RGB(A).

norm

[str or *Normalize*, optional] The normalization method used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling is used, mapping the lowest value to 0 and the highest to 1.

If given, this can be one of the following:

- An instance of *Normalize* or one of its subclasses (see *Colormap normalization*).
- A scale name, i.e. one of "linear", "log", "symlog", "logit", etc. For a list of available scales, call *matplotlib.scale.get_scale_names()*. In that case, a suitable *Normalize* subclass is dynamically generated and instantiated.

This parameter is ignored if *X* is RGB(A).

vmin, vmax

[float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is an error to use *vmin*/*vmax* when a *norm* instance is given (but using a `str` *norm* name together with *vmin*/*vmax* is acceptable).

This parameter is ignored if *X* is RGB(A).

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: `'upper'`)] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.

resize

[bool] If *True*, resize the figure to match the given image size.

Returns

matplotlib.image.FigureImage

Other Parameters

****kwargs**

Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

Notes

figimage complements the Axes image (*imshow*) which will be resampled to fit the current Axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0, 0, 1, 1].

Examples

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

property frameon

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

gca()

Get the current Axes.

If there is currently no Axes on this Figure, a new one is created using *Figure.add_subplot*. (To test whether there is currently an Axes on a Figure, check whether `figure.axes` is empty. To test whether there is currently a Figure on the pyplot figure stack, check whether *pyplot.get_fignums()* is empty.)

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_axes()

List of Axes in the Figure. You can access and modify the Axes in the Figure through this list.

Do not modify the list itself. Instead, use *add_axes*, *add_subplot* or *delaxes* to add or remove an Axes.

Note: The *Figure.axes* property and *get_axes* method are equivalent.

get_children()

Get a list of artists contained in the figure.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_constrained_layout()

Return whether constrained layout is being used.

See *Constrained layout guide*.

get_constrained_layout_pads(*relative=False*)

[*Deprecated*] Get padding for `constrained_layout`.

Returns a list of `w_pad, h_pad` in inches and `wspace` and `hspace` as fractions of the subplot. All values are None if `constrained_layout` is not used.

See *Constrained layout guide*.

Parameters

relative

[bool] If `True`, then convert from inches to figure relative.

Notes

Deprecated since version 3.6: Use fig.get_layout_engine().get() instead.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_default_bbox_extra_artists()

get_dpi()

Return the resolution in dots per inch as a float.

get_edgecolor()

Get the edge color of the Figure rectangle.

get_facecolor()

Get the face color of the Figure rectangle.

get_figheight()

Return the figure height in inches.

get_figure()

Return the *Figure* instance the artist belongs to.

get_figwidth()

Return the figure width in inches.

get_frameon()

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

get_gid()

Return the group id.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

get_label()

Return the label used for this artist in the legend.

get_layout_engine()

get_linewidth()

Get the line width of the Figure rectangle.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_path_effects()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, ***pickable***, ***pick***

get_rasterized()

Return whether the artist is to be rasterized.

get_size_inches()

Return the current size of the figure in inches.

Returns

ndarray

The size (width, height) of the figure in inches.

See also:

matplotlib.figure.Figure.set_size_inches
matplotlib.figure.Figure.get_figwidth
matplotlib.figure.Figure.get_figheight

Notes

The size in pixels can be obtained by multiplying with *Figure.dpi*.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_suptitle()

Return the suptitle as string or an empty string if not set.

get_supxlabel()

Return the supxlabel as string or an empty string if not set.

get_supylabel()

Return the supylabel as string or an empty string if not set.

get_tight_layout()

Return whether *tight_layout* is called when drawing.

get_tightbbox(*renderer=None*, *, *bbox_extra_artists=None*)

Return a (tight) bounding box of the figure *in inches*.

Note that *FigureBase* differs from all other artists, which return their *Bbox* in pixels.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

Parameters

renderer

[*RendererBase* subclass] Renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

bbox_extra_artists

[list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of each Axes are included in the tight bounding box.

Returns

BboxBase

containing the bounding box (in figure inches).

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_url()

Return the url.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

ginput(*n=1*, *timeout=30*, *show_clicks=True*, *mouse_add=MouseButton.LEFT*, *mouse_pop=MouseButton.RIGHT*, *mouse_stop=MouseButton.MIDDLE*)

Blocking call to interact with a figure.

Wait until the user clicks *n* times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments *mouse_add*, *mouse_pop* and *mouse_stop*.

Parameters

n

[int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

timeout

[float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never time out.

show_clicks

[bool, default: True] If True, show a red cross at the location of each click.

mouse_add

[*MouseButton* or None, default: *MouseButton.LEFT*] Mouse button used to add points.

mouse_pop

[*MouseButton* or None, default: *MouseButton.RIGHT*] Mouse button used to remove the most recently added point.

mouse_stop

[*MouseButton* or None, default: *MouseButton.MIDDLE*] Mouse button used to stop input.

Returns

list of tuples

A list of the clicked (x, y) coordinates.

Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right-clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

legend(**args*, ***kwargs*)

Place a legend on the figure.

Call signatures:

```
legend()
legend(handles, labels)
legend(handles=handles)
legend(labels)
```

The call signatures correspond to the following different ways to use this method:

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the *set_label()* method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')
fig.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
fig.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling *Figure.legend* without any arguments and without setting the labels manually will result in no legend being drawn.

2. Explicitly listing the artists and labels in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
fig.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

3. Explicitly listing the artists in the legend

This is similar to 2, but the labels are taken from the artists' label properties. Example:

```
line1, = ax1.plot([1, 2, 3], label='label1')
line2, = ax2.plot([1, 2, 3], label='label2')
fig.legend(handles=[line1, line2])
```

4. Labeling existing plot elements

Discouraged

This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

To make a legend for all artists on all Axes, call this function with an iterable of strings, one for each legend item. For example:

```
fig, (ax1, ax2) = plt.subplots(1, 2)
ax1.plot([1, 3, 5], color='blue')
ax2.plot([2, 4, 6], color='red')
fig.legend(['the blues', 'the reds'])
```

Parameters

handles

[list of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: 'upper right'] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the figure.

The string `'center'` places the legend at the center of the figure.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in figure coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" location can also be given as a numeric value:

Location String	Location Code
'best' (Axes only)	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

If a figure is using the constrained layout manager, the string codes of the *loc* keyword argument can get better layout behaviour using the prefix 'outside'. There is ambiguity at the corners, so 'outside upper right' will make space for the legend above the rest of the axes in the layout, and 'outside right upper' will make space on the right side of the layout. In addition to the values of *loc* listed above, we have 'outside right upper', 'outside right lower', 'outside left upper', and 'outside left lower'. See *Legend guide* for more details.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncols

[int, default: 1] The number of columns that the legend has.

For backward compatibility, the spelling *ncol* is also supported but it is discouraged. If both are given, *ncols* takes precedence.

prop

[None or *FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list, default: *rcParams["legend.labelcolor"]* (default: `'None'`)] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

Labelcolor can be set globally using *rcParams["legend.labelcolor"]* (default: `'None'`). If None, use *rcParams["text.color"]* (default: `'black'`).

numpoints

[int, default: *rcParams["legend.numpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: *rcParams["legend.scatterpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: *rcParams["legend.markerscale"]* (default: `1.0`)] The relative size of legend markers compared to the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

reverse

[bool, default: False] If *True*, the legend labels are displayed in reverse order from the input. If *False*, the legend labels are displayed in the same order as the input.

New in version 3.7.

frameon

[bool, default: *rcParams["legend.frameon"]* (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: *rcParams["legend.fancybox"]* (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[None, bool or dict, default: *rcParams["legend.shadow"]* (default: `False`)] Whether to draw a shadow behind the legend. The shadow can be configured using *Patch* keywords. Customization via *rcParams["legend.shadow"]* (default: `False`) is currently not supported.

framealpha

[float, default: *rcParams["legend.framealpha"]* (default: `0.8`)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

facecolor

["inherit" or color, default: *rcParams["legend.facecolor"]* (default: `'inherit'`)] The legend's background color. If `"inherit"`, use *rcParams["axes.facecolor"]* (default: `'white'`).

edgecolor

["inherit" or color, default: *rcParams["legend.edgecolor"]* (default: '0.8')] The legend's background patch edge color. If "inherit", use take *rcParams["axes.edgecolor"]* (default: 'black').

mode

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of None (default) the Axes' transAxes transform will be used.

title

[str or None] The legend's title. Default is no title (None).

title_fontproperties

[None or *FontProperties* or dict] The font properties of the legend's title. If None (default), the *title_fontsize* argument will be used if present; if *title_fontsize* is also None, the current *rcParams["legend.title_fontsize"]* (default: None) will be used.

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: *rcParams["legend.title_fontsize"]* (default: None)] The font size of the legend's title. Note: This cannot be combined with *title_fontproperties*. If you want to set the fontsize alongside other font properties, use the *size* parameter in *title_fontproperties*.

alignment

[{'center', 'left', 'right'}, default: 'center'] The alignment of the legend title and the box of entries. The entries are aligned as a single block, so that markers always lined up.

borderpad

[float, default: *rcParams["legend.borderpad"]* (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: *rcParams["legend.labelspacing"]* (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: *rcParams["legend.handlelength"]* (default: 2.0)] The length of the legend handles, in font-size units.

handleheight

[float, default: *rcParams["legend.handleheight"]* (default: 0.7)] The height of the legend handles, in font-size units.

handletextpad

[float, default: *rcParams["legend.handletextpad"]* (default: `0.8`)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: *rcParams["legend.borderaxespad"]* (default: `0.5`)] The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: *rcParams["legend.columnspacing"]* (default: `2.0`)] The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

draggable

[bool, default: False] Whether the legend can be dragged with the mouse.

See also:

Axes.legend

Notes

Some artists are not supported by this function. See *Legend guide* for details.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, *get_picker*, *pickable*

pickable()

Return whether the artist is pickable.

See also:

set_picker, *get_picker*, *pick*

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

savefig(*fname*, *, *transparent=None*, ***kwargs*)

Save the current figure.

Call signature:

```
savefig(fname, *, transparent=None, dpi='figure', format=None,
        metadata=None, bbox_inches=None, pad_inches=0.1,
        facecolor='auto', edgecolor='auto', backend=None,
        **kwargs
       )
```

The available output formats depend on the backend being used.

Parameters

fname

[str or path-like or binary file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as *matplotlib.backends.backend_pdf.PdfPages*.

If *format* is set, it determines the output format, and the file is saved as *fname*. Note that *fname* is used verbatim, and there is no attempt to make the extension, if any, of *fname* match *format*, and no extension is appended.

If *format* is not set, then the format is inferred from the extension of *fname*, if there is one. If *format* is not set and *fname* has no extension, then the file is saved with *rcParams["savefig.format"]* (default: 'png') and the appropriate extension is appended to *fname*.

Other Parameters

transparent

[bool, default: *rcParams["savefig.transparent"]* (default: False)] If *True*, the Axes patches will all be transparent; the Figure patch will also be transparent unless *facecolor* and/or *edgecolor* are specified via kwargs.

If *False* has no effect and the color of the Axes and Figure patches are unchanged (unless the Figure patch is specified via the *facecolor* and/or *edgecolor* keyword arguments in which case those colors are used).

The transparency of these patches will be restored to their original values upon exit of this function.

This is useful, for example, for displaying a plot on top of a colored background on a web page.

dpi

[float or 'figure', default: *rcParams["savefig.dpi"]* (default: 'figure')] The resolution in dots per inch. If 'figure', use the figure's dpi value.

format

[str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

metadata

[dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter metadata of *print_png*.
- 'pdf' with pdf backend: See the parameter metadata of *PdfPages*.
- 'svg' with svg backend: See the parameter metadata of *print_svg*.
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

Not supported for 'pgf', 'raw', and 'rgba' as those formats do not support embedding metadata. Does not currently support 'jpg', 'tiff', or 'webp', but may include embedding EXIF metadata in the future.

bbox_inches

[str or *Bbox*, default: *rcParams["savefig.bbox"]* (default: None)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

pad_inches

[float or 'layout', default: *rcParams["savefig.pad_inches"]* (default: 0.1)] Amount of padding in inches around the figure when bbox_inches is 'tight'. If 'layout' use the padding from the constrained or compressed layout engine; ignored if one of those engines is not in use.

facecolor

[color or 'auto', default: *rcParams["savefig.facecolor"]* (default: 'auto')] The facecolor of the figure. If 'auto', use the current figure facecolor.

edgecolor

[color or 'auto', default: *rcParams["savefig.edgecolor"]* (default: 'auto')] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

backend

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

orientation

[{'landscape', 'portrait'}] Currently only supported by the postscript backend.

papertype

[str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

bbox_extra_artists

[list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to PIL.Image.Image.save when saving the figure.

sca(*a*)

Set the current Axes to be *a* and return *a*.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *canvas=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *constrained_layout=<UNSET>*, *constrained_layout_pads=<UNSET>*, *dpi=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *figheight=<UNSET>*, *figwidth=<UNSET>*, *frameon=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *layout_engine=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *size_inches=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *tight_layout=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, a
alpha	scalar or None
animated	bool
canvas	FigureCanvas
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
constrained_layout	unknown
constrained_layout_pads	unknown
dpi	float
edgecolor	color
facecolor	color
figheight	float
figure	*Figure*
figwidth	float
frameon	bool
gid	str
in_layout	bool
label	object
layout_engine	{'constrained', 'compressed', 'tight', 'none', *LayoutEngine*, None}
linewidth	number
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
size_inches	(float, float) or float
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
tight_layout	unknown
transform	*Transform*
url	str
visible	bool

Table 55 – continued from prev

Property	Description
zorder	float

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_canvas(*canvas*)

Set the canvas that contains the figure

Parameters

canvas

[FigureCanvas]

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_constrained_layout(*constrained*)

[*Deprecated*] Set whether `constrained_layout` is used upon drawing.

If None, *rcParams["figure.constrained_layout.use"]* (default: `False`) value will be used.

When providing a dict containing the keys `w_pad`, `h_pad` the default `constrained_layout` paddings will be overridden. These pads are in inches and default to 3.0/72.0. `w_pad` is the width padding and `h_pad` is the height padding.

Parameters

constrained

[bool or dict or None]

Notes

Deprecated since version 3.6: Use set_layout_engine('constrained') instead.

set_constrained_layout_pads(***kwargs*)

[*Deprecated*] Set padding for `constrained_layout`.

Tip: The parameters can be passed from a dictionary by using `fig.set_constrained_layout(**pad_dict)`.

See *Constrained layout guide*.

Parameters

w_pad

[float, default: *rcParams["figure.constrained_layout.w_pad"]* (default: 0.04167)] Width padding in inches. This is the pad around Axes and is meant to make sure there is enough room for fonts to look good. Defaults to 3 pts = 0.04167 inches

h_pad

[float, default: *rcParams["figure.constrained_layout.h_pad"]* (default: 0.04167)] Height padding in inches. Defaults to 3 pts.

wspace

[float, default: *rcParams["figure.constrained_layout.wspace"]* (default: 0.02)] Width padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being w_pad + wspace.

hspace

[float, default: *rcParams["figure.constrained_layout.hspace"]* (default: 0.02)] Height padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being h_pad + hspace.

Notes

Deprecated since version 3.6: Use figure.get_layout_engine().set() instead.

set_dpi(*val*)

Set the resolution of the figure in dots-per-inch.

Parameters

val

[float]

set_edgecolor(*color*)

Set the edge color of the Figure rectangle.

Parameters

color

[color]

set_facecolor(*color*)

Set the face color of the Figure rectangle.

Parameters

color

[color]

set_figheight(*val*, *forward=True*)

Set the height of the figure in inches.

Parameters

val

[float]

forward

[bool] See *set_size_inches*.

See also:

matplotlib.figure.Figure.set_figwidth
matplotlib.figure.Figure.set_size_inches

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_figwidth(*val*, *forward=True*)

Set the width of the figure in inches.

Parameters

val

[float]

forward

[bool] See *set_size_inches*.

See also:

matplotlib.figure.Figure.set_figheight
matplotlib.figure.Figure.set_size_inches

set_frameon(*b*)

Set the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.set_visible()`.

Parameters

b

[bool]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_layout_engine(*layout=None*, ***kwargs*)

Set the layout engine for this figure.

Parameters

layout

[{'constrained', 'compressed', 'tight', 'none', *LayoutEngine*, None}]

- 'constrained' will use *ConstrainedLayoutEngine*
- 'compressed' will also use *ConstrainedLayoutEngine*, but with a correction that attempts to make a good layout for fixed-aspect ratio Axes.
- 'tight' uses *TightLayoutEngine*
- 'none' removes layout engine.

If a *LayoutEngine* instance, that instance will be used.

If `None`, the behavior is controlled by *rcParams["figure.autolayout"]* (default: `False`) (which if `True` behaves as if 'tight' was passed) and *rcParams["figure.constrained_layout.use"]* (default: `False`) (which if `True` behaves as if 'constrained' was passed). If both are `True`, *rcParams["figure.autolayout"]* (default: `False`) takes priority.

Users and libraries can define their own layout engines and pass the instance directly as well.

****kwargs**

The keyword arguments are passed to the layout engine to set things like padding and margin sizes. Only used if *layout* is a string.

set_linewidth(*linewidth*)

Set the line width of the Figure rectangle.

Parameters

linewidth

[number]

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_size_inches(*w*, *h=None*, *forward=True*)

Set the figure size in inches.

Call signatures:

```
fig.set_size_inches(w, h)  # OR
fig.set_size_inches((w, h))
```

Parameters

w

[(float, float) or float] Width and height in inches (if height not specified as a separate argument) or width.

h

[float] Height in inches.

forward

[bool, default: True] If `True`, the canvas size is automatically updated, e.g., you can resize the figure window from the shell.

See also:

matplotlib.figure.Figure.get_size_inches
matplotlib.figure.Figure.set_figwidth
matplotlib.figure.Figure.set_figheight

Notes

To transform from pixels to inches divide by *Figure.dpi*.

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_tight_layout(*tight*)

[*Deprecated*] Set whether and how *tight_layout* is called when drawing.

Parameters

tight

[bool or dict with keys "pad", "w_pad", "h_pad", "rect" or None] If a bool, sets whether to call *tight_layout* upon drawing. If `None`, use *rcParams["figure.autolayout"]* (default: `False`) instead. If a dict, pass it as kwargs to *tight_layout*, overriding the default paddings.

Notes

Deprecated since version 3.6: Use set_layout_engine instead.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

show(*warn=True*)

If using a GUI backend with pyplot, display the figure window.

If the figure was not created using *figure*, it will lack a *FigureManagerBase*, and this method will raise an AttributeError.

> **Warning:** This does not manage an GUI event loop. Consequently, the figure may only be shown briefly or not shown at all if you or your environment are not managing an event loop.
>
> Use cases for *Figure.show* include running this from a GUI application (where there is persistently an event loop running) or from a shell, like IPython, that install an input hook to allow the interactive shell to accept input while the figure is also being shown and interactive. Some, but not all, GUI toolkits will register an input hook on import. See *Command prompt integration* for more details.
>
> If you're in a shell without input hook integration or executing a python script, you should use *matplotlib.pyplot.show* with `block=True` instead, which takes care of starting and running the event loop for you.

Parameters

warn

[bool, default: True] If `True` and we are not running headless (i.e. on Linux with an unset DISPLAY), issue warning when called on a non-GUI backend.

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

subfigures(*nrows=1*, *ncols=1*, *squeeze=True*, *wspace=None*, *hspace=None*, *width_ratios=None*, *height_ratios=None*, ***kwargs*)

Add a set of subfigures to this figure or subfigure.

A subfigure has the same artist methods as a figure, and is logically the same as a figure, but cannot print itself. See *Figure subfigures*.

Note: The *subfigure* concept is new in v3.4, and the API is still provisional.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subfigure grid.

squeeze

[bool, default: True] If True, extra dimensions are squeezed out from the returned array of subfigures.

wspace, hspace

[float, default: None] The amount of width/height reserved for space between subfigures, expressed as a fraction of the average subfigure width/height. If not given, the values will be inferred from rcParams if using constrained layout (see `ConstrainedLayoutEngine`), or zero if not using a layout engine.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

subplot_mosaic(*mosaic*, ***, *sharex=False*, *sharey=False*, *width_ratios=None*, *height_ratios=None*, *empty_sentinel='.'*, *subplot_kw=None*, *per_subplot_kw=None*, *gridspec_kw=None*)

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

See *Complex and semantic figure composition (subplot_mosaic)* for an example and full API documentation

Parameters

mosaic

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [['A panel', 'A panel', 'edge'],
     ['C panel', '.',       'edge']]
```

produces 4 Axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it can either be a multi-line string of the form

```
'''
AAE
C.E
'''
```

where each character is a column and each line is a row. Or it can be a single-line string where rows are separated by `;`:

```
'AB;CC'
```

The string notation allows only single character Axes labels and does not support nesting but is very terse.

The Axes identifiers may be `str` or a non-iterable hashable object (e.g. `tuple`s may not be used).

sharex, sharey

[bool, default: False] If True, the x-axis (*sharex*) or y-axis (*sharey*) will be shared among all subplots. In that case, tick label visibility and axis units behave as for *`subplots`*. If False, each subplot's x- or y-axis will be independent.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

Equivalent to `gridspec_kw={'width_ratios': [...]}`. In the case of nested layouts, this argument applies only to the outer layout.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height. Equivalent to `gridspec_kw={'height_ratios': [...]}`. In the case of nested layouts, this argument applies only to the outer layout.

subplot_kw

[dict, optional] Dictionary with keywords passed to the *Figure.add_subplot* call used to create each subplot. These values may be overridden by values in *per_subplot_kw*.

per_subplot_kw

[dict, optional] A dictionary mapping the Axes identifiers or tuples of identifiers to a dictionary of keyword arguments to be passed to the *Figure.add_subplot* call used to create each subplot. The values in these dictionaries have precedence over the values in *subplot_kw*.

If *mosaic* is a string, and thus all keys are single characters, it is possible to use a single string instead of a tuple as keys; i.e. `"AB"` is equivalent to `("A", "B")`.

New in version 3.7.

gridspec_kw

[dict, optional] Dictionary with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on. In the case of nested layouts, this argument applies only to the outer layout. For more complex layouts, users should use *Figure.subfigures* to create the nesting.

empty_sentinel

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to `'.'`. Note, if *layout* is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

Returns

dict[label, Axes]

A dictionary mapping the labels to the Axes objects. The order of the axes is left-to-right and top-to-bottom of their position in the total layout.

subplots(*nrows=1*, *ncols=1*, ***, *sharex=False*, *sharey=False*, *squeeze=True*, *width_ratios=None*, *height_ratios=None*, *subplot_kw=None*, *gridspec_kw=None*)

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subplot grid.

sharex, sharey

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of x-axis (*sharex*) or y-axis (*sharey*):

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick_params*.

When subplots have a shared axis that has units, calling *Axis.set_units* will update each axis with the new units.

squeeze

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width. Equivalent to `gridspec_kw={'width_ratios': [...]}`.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] /`

`sum(height_ratios)`. If not given, all rows will have the same height. Equivalent to `gridspec_kw={'height_ratios': [...]}`.

subplot_kw

[dict, optional] Dict with keywords passed to the *Figure.add_subplot* call used to create each subplot.

gridspec_kw

[dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

Returns

***Axes* or array of Axes**

Either a single *Axes* object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the *squeeze* keyword, see above.

pyplot.subplots
Figure.add_subplot
pyplot.subplot

Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
fig = plt.figure()

# Create a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar Axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(projection='polar'))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)
```

(continues on next page)

(continued from previous page)

```
# Share an X-axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y-axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X- and Y-axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

subplots_adjust(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by *rcParams["figure.subplot.[name]"]*.

Parameters

left

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

bottom

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float, optional] The width of the padding between subplots, as a fraction of the average Axes width.

hspace

[float, optional] The height of the padding between subplots, as a fraction of the average Axes height.

suptitle(*t*, ***kwargs*)

Add a centered suptitle to the figure.

Parameters

t

[str] The suptitle text.

x

[float, default: 0.5] The x location of the text in figure coordinates.

y

[float, default: 0.98] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: top] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: *rcParams["figure.titlesize"]* (default: `'large'`)] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: *rcParams["figure.titleweight"]* (default: `'normal'`)] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the suptitle.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. *rcParams["figure.titlesize"]* (default: `'large'`) and *rcParams["figure.titleweight"]* (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

supxlabel(*t*, ***kwargs*)

Add a centered supxlabel to the figure.

Parameters

t

[str] The supxlabel text.

x

[float, default: 0.5] The x location of the text in figure coordinates.

y

[float, default: 0.01] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: bottom] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: *rcParams["figure.labelsize"]* (default: `'large'`)] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: *rcParams["figure.labelweight"]* (default: `'normal'`)] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the supxlabel.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. *rcParams["figure.labelsize"]* (default: `'large'`) and *rcParams["figure.labelweight"]* (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

supylabel(*t*, ***kwargs*)

Add a centered supylabel to the figure.

Parameters

t

[str] The supylabel text.

x

[float, default: 0.02] The x location of the text in figure coordinates.

y

[float, default: 0.5] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: left] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: center] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: *rcParams["figure.labelsize"]* (default: `'large'`)] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: *rcParams["figure.labelweight"]* (default: `'normal'`)] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the supylabel.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. *rcParams["figure.labelsize"]* (default: `'large'`) and *rcParams["figure.labelweight"]* (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

text(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to figure.

Parameters

x, y

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

s

[str] The text string.

fontdict

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

Returns

Text

Other Parameters

****kwargs**

[`Text` properties] Other miscellaneous text parameters.

Property	Description
`agg_filter`	a filter function, which takes a (m, n, 3) float array
`alpha`	scalar or None
`animated`	bool
`antialiased`	bool
`backgroundcolor`	color
`bbox`	dict with properties for `patches.FancyBboxP`

tight_layout(*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Adjust the padding between and around subplots.

To exclude an artist on the Axes from the bounding box calculation that determines the subplot parameters (i.e. legend, or annotation), set `a.set_in_layout(False)` for that artist.

Parameters

pad

[float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad

[float, default: *pad*] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.

rect

[tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.

See also:

Figure.set_layout_engine
pyplot.tight_layout

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from *other* to *self*.

waitforbuttonpress(*timeout=-1*)

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within *timeout* seconds. Negative values deactivate *timeout*.

zorder = 0

class matplotlib.figure.**FigureBase**(***kwargs*)

Base class for *Figure* and *SubFigure* containing the methods that add artists to the figure or subfigure, create Axes, etc.

add_artist(*artist*, *clip=False*)

Add an *Artist* to the figure.

Usually artists are added to *Axes* objects using *Axes.add_artist*; this method can be used in the rare cases where one needs to add artists directly to the figure instead.

Parameters

artist

[*Artist*] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transSubfigure`.

clip

[bool, default: False] Whether the added artist should be clipped by the figure patch.

Returns

Artist

The added artist.

add_axes(**args*, ***kwargs*)

Add an *Axes* to the figure.

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

Parameters

rect

[tuple (left, bottom, width, height)] The dimensions (left, bottom, width, height) of the new *Axes*. All quantities are in fractions of figure width and height.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

axes_class

[subclass type of *Axes*, optional] The *axes.Axes* subclass that is instantiated. This parameter is incompatible with *projection* and *polar*. See *axisartist* for examples.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned Axes.

Returns

Axes, or a subclass of _Axes_

The returned axes class depends on the projection used. It is _Axes_ if rectilinear projection is used and _projections.polar.PolarAxes_ if polar projection is used.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes class. The keyword arguments for the rectilinear Axes class _Axes_ can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual Axes class.

Property	Description
adjustable	{'box', 'datalim'}
_agg_filter_	a filter function, which takes a (m, n, 3) float array and a dpi value,
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
_autoscale_on_	bool
_autoscalex_on_	unknown
_autoscaley_on_	unknown
_axes_locator_	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
_box_aspect_	float or None
_clip_box_	_BboxBase_ or None
_clip_on_	bool
_clip_path_	Patch or (Path, Transform) or None
facecolor or fc	color
figure	_Figure_
_frame_on_	bool
gid	str
_in_layout_	bool
label	object
mouseover	bool
navigate	bool
_navigate_mode_	unknown
_path_effects_	list of _AbstractPathEffect_
picker	None or bool or float or callable
position	[left, bottom, width, height] or _Bbox_
_prop_cycle_	_Cycler_
_rasterization_zorder_	float or None
rasterized	bool
_sketch_params_	(scale: float, length: float, randomness: float)

pyplot.subplots

Notes

In rare circumstances, *add_axes* may be called with a single argument, an Axes instance already created in the present figure but not in the figure's list of Axes.

Examples

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

add_gridspec(*nrows=1*, *ncols=1*, ***kwargs*)

Return a *GridSpec* that has this figure as a parent. This allows complex layout of Axes in the figure.

Parameters

nrows

[int, default: 1] Number of rows in grid.

ncols

[int, default: 1] Number of columns in grid.

Returns

GridSpec

Other Parameters

****kwargs**

Keyword arguments are passed to *GridSpec*.

See also:

matplotlib.pyplot.subplots

Examples

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

add_subfigure(*subplotspec*, ***kwargs*)

Add a *SubFigure* to the figure as part of a subplot arrangement.

Parameters

subplotspec

[*gridspec.SubplotSpec*] Defines the region in a parent gridspec where the subfigure will be placed.

Returns

SubFigure

Other Parameters

****kwargs**

Are passed to the *SubFigure* object.

See also:

Figure.subfigures

add_subplot(**args*, ***kwargs*)

Add an *Axes* to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

Parameters

***args**

[int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

In rare circumstances, *add_subplot* may be called with a single argument, a subplot Axes instance already created in the present figure but not in the figure's list of Axes.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

axes_class

[subclass type of *Axes*, optional] The *axes.Axes* subclass that is instantiated. This parameter is incompatible with *projection* and *polar*. See *axisartist* for examples.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned Axes.

Returns

Axes

The Axes of the subplot. The returned Axes can actually be an instance of a subclass, such as *projections.polar.PolarAxes* for polar projections.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value,
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown

Table 58 – continued from

Property	Description
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
position	[left, bottom, width, height] or Bbox
prop_cycle	Cycler
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	Transform
url	str
visible	bool
xbound	(lower: float, upper: float)
xlabel	str
xlim	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown
ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

See also:

Figure.add_axes
pyplot.subplot
pyplot.axes
Figure.subplots
pyplot.subplots

Examples

```
fig = plt.figure()

fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1)  # equivalent but more general

fig.add_subplot(232, frameon=False)  # subplot with no frame
fig.add_subplot(233, projection='polar')  # polar subplot
fig.add_subplot(234, sharex=ax1)  # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor="red")  # red subplot

ax1.remove()  # delete ax1 from the figure
fig.add_subplot(ax1)  # add ax1 back to the figure
```

align_labels(*axs=None*)

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

Parameters

axs

[list of *Axes*] Optional list (or ndarray) of *Axes* to align the labels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_xlabels
matplotlib.figure.Figure.align_ylabels

align_xlabels(*axs=None*)

Align the xlabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on Axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on Axes with the same top-most row.

Parameters

axs

[list of *Axes*] Optional list of (or ndarray) *Axes* to align the xlabels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_ylabels
matplotlib.figure.Figure.align_labels

Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

Examples

Example with rotated xtick labels:

```
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

align_ylabels(*axs=None*)

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on Axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on Axes with the same right-most column.

Parameters

axs

[list of *Axes*] Optional list (or `ndarray`) of *Axes* to align the ylabels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_xlabels
matplotlib.figure.Figure.align_labels

Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

Examples

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

autofmt_xdate (*bottom=0.2*, *rotation=30*, *ha='right'*, *which='major'*)

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared x-axis where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

Parameters

bottom

[float, default: 0.2] The bottom of the subplots for *subplots_adjust*.

rotation

[float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

ha

[{'left', 'center', 'right'}, default: 'right'] The horizontal alignment of the xticklabels.

which

[{'major', 'minor', 'both'}, default: 'major'] Selects which ticklabels to rotate.

property axes

The *Axes* instance the artist resides in, or *None*.

clear (*keep_observers=False*)

Clear the figure.

Parameters

keep_observers

[bool, default: False] Set *keep_observers* to True if, for example, a gui widget is tracking the Axes in the figure.

clf(*keep_observers=False*)

[*Discouraged*] Alias for the *clear()* method.

Discouraged

The use of `clf()` is discouraged. Use `clear()` instead.

Parameters

keep_observers

[bool, default: False] Set *keep_observers* to True if, for example, a gui widget is tracking the Axes in the figure.

colorbar(*mappable*, *cax=None*, *ax=None*, *use_gridspec=True*, ***kwargs*)

Add a colorbar to a plot.

Parameters

mappable

The *matplotlib.cm.ScalarMappable* (i.e., *AxesImage*, *ContourSet*, etc.) described by this colorbar. This argument is mandatory for the *Figure.colorbar* method but optional for the *pyplot.colorbar* function, which sets the default to the current image.

Note that one can create a *ScalarMappable* "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap),␣
↪ax=ax)
```

cax

[*Axes*, optional] Axes into which the colorbar will be drawn. If `None`, then a new Axes is created and the space for it will be stolen from the Axes(s) specified in *ax*.

ax

[*Axes* or iterable or `numpy.ndarray` of Axes, optional] The one or more parent Axes from which space for a new colorbar Axes will be stolen. This parameter is only used if *cax* is not set.

Defaults to the Axes that contains the mappable used to create the colorbar.

use_gridspec

[bool, optional] If *cax* is `None`, a new *cax* is created as an instance of Axes. If *ax* is positioned with a subplotspec and *use_gridspec* is `True`, then *cax* is also positioned with a subplotspec.

Returns

colorbar

[*Colorbar*]

Other Parameters

location

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

extend

[{'neither', 'both', 'min', 'max'}] Make pointed end(s) for out-of-range values (unless 'neither'). These are set for a given colormap using the colormap set_under and set_over methods.

extendfrac

[{*None*, 'auto', length, lengths}] If set to *None*, both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting).

If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when *spacing* is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when *spacing* is set to 'proportional').

If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.

extendrect

[bool] If *False* the minimum and maximum colorbar extensions will be triangular (the default). If *True* the extensions will be rectangular.

spacing

[{'uniform', 'proportional'}] For discrete colorbars (`BoundaryNorm` or contours), 'uniform' gives each color the same space; 'proportional' makes the space proportional to the data interval.

ticks

[None or list of ticks or Locator] If None, ticks are determined automatically from the input.

format

[None or str or Formatter] If None, `ScalarFormatter` is used. Format strings, e.g., `"%4.2e"` or `"{x:.2e}"`, are supported. An alternative `Formatter` may be given instead.

drawedges

[bool] Whether to draw lines at color boundaries.

label

[str] The label on the colorbar's long axis.

boundaries, values

[None or a sequence] If unset, the colormap will be displayed on a 0-1 scale. If sequences, *values* must have a length 1 less than *boundaries*. For each region delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in values will be used. Normally only useful for indexed colors (i.e. `norm=NoNorm()`) or other unusual circumstances.

Notes

If *mappable* is a `ContourSet`, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified, it determines the size of the colorbar, and *shrink* and *aspect* are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) render white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However, this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

contains(*mouseevent*)

Test whether the mouse event occurred on the figure.

Returns

bool, {}

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

delaxes(*ax*)

Remove the `Axes` *ax* from the figure; update the current Axes.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

Parameters

renderer

[`RendererBase` subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

property frameon

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

gca()

Get the current Axes.

If there is currently no Axes on this Figure, a new one is created using *Figure.add_subplot*. (To test whether there is currently an Axes on a Figure, check whether `figure.axes` is empty. To test whether there is currently a Figure on the pyplot figure stack, check whether *pyplot.get_fignums()* is empty.)

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_children()

Get a list of artists contained in the figure.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_default_bbox_extra_artists()

get_edgecolor()
Get the edge color of the Figure rectangle.

get_facecolor()
Get the face color of the Figure rectangle.

get_figure()
Return the *Figure* instance the artist belongs to.

get_frameon()
Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

get_gid()
Return the group id.

get_in_layout()
Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

get_label()
Return the label used for this artist in the legend.

get_linewidth()
Get the line width of the Figure rectangle.

get_mouseover()
Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_path_effects()

get_picker()
Return the picking behavior of the artist.

The possible values are described in *set_picker*.

See also:

set_picker, *pickable*, *pick*

get_rasterized()
Return whether the artist is to be rasterized.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_suptitle()

Return the suptitle as string or an empty string if not set.

get_supxlabel()

Return the supxlabel as string or an empty string if not set.

get_supylabel()

Return the supylabel as string or an empty string if not set.

get_tightbbox(*renderer=None*, *, *bbox_extra_artists=None*)

Return a (tight) bounding box of the figure *in inches*.

Note that *FigureBase* differs from all other artists, which return their *Bbox* in pixels.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

Parameters

renderer

[*RendererBase* subclass] Renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

bbox_extra_artists

[list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of each Axes are included in the tight bounding box.

Returns

BboxBase

containing the bounding box (in figure inches).

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_url()

Return the url.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

legend(**args*, ***kwargs*)

Place a legend on the figure.

Call signatures:

```
legend()
legend(handles, labels)
legend(handles=handles)
legend(labels)
```

The call signatures correspond to the following different ways to use this method:

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the *set_label()* method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')
fig.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
fig.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling *Figure.legend* without any arguments and without setting the labels manually will result in no legend being drawn.

2. Explicitly listing the artists and labels in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
fig.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

3. Explicitly listing the artists in the legend

This is similar to 2, but the labels are taken from the artists' label properties. Example:

```
line1, = ax1.plot([1, 2, 3], label='label1')
line2, = ax2.plot([1, 2, 3], label='label2')
fig.legend(handles=[line1, line2])
```

4. Labeling existing plot elements

Discouraged

This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

To make a legend for all artists on all Axes, call this function with an iterable of strings, one for each legend item. For example:

```
fig, (ax1, ax2) = plt.subplots(1, 2)
ax1.plot([1, 3, 5], color='blue')
ax2.plot([2, 4, 6], color='red')
fig.legend(['the blues', 'the reds'])
```

Parameters

handles

[list of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: 'upper right'] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the figure.

The string `'center'` places the legend at the center of the figure.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in figure coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" location can also be given as a numeric value:

Location String	Location Code
'best' (Axes only)	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

If a figure is using the constrained layout manager, the string codes of the *loc* keyword argument can get better layout behaviour using the prefix 'outside'. There is ambiguity at the corners, so 'outside upper right' will make space for the legend above the rest of the axes in the layout, and 'outside right upper' will make space on the right side of the layout. In addition to the values of *loc* listed above, we have 'outside right upper', 'outside right lower', 'outside left upper', and 'outside left lower'. See *Legend guide* for more details.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncols

[int, default: 1] The number of columns that the legend has.

For backward compatibility, the spelling *ncol* is also supported but it is discouraged. If both are given, *ncols* takes precedence.

prop

[None or *FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list, default: *rcParams["legend.labelcolor"]* (default: `'None'`)] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

Labelcolor can be set globally using *rcParams["legend.labelcolor"]* (default: `'None'`). If None, use *rcParams["text.color"]* (default: `'black'`).

numpoints

[int, default: *rcParams["legend.numpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: *rcParams["legend.scatterpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: `[0.375, 0.5, 0.3125]`] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to `[0.5]`.

markerscale

[float, default: *rcParams["legend.markerscale"]* (default: `1.0`)] The relative size of legend markers compared to the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

reverse

[bool, default: False] If *True*, the legend labels are displayed in reverse order from the input. If *False*, the legend labels are displayed in the same order as the input.

New in version 3.7.

frameon

[bool, default: *rcParams["legend.frameon"]* (default: `True`)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: *rcParams["legend.fancybox"]* (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[None, bool or dict, default: *rcParams["legend.shadow"]* (default: `False`)] Whether to draw a shadow behind the legend. The shadow can be configured using *Patch* keywords. Customization via *rcParams["legend.shadow"]* (default: `False`) is currently not supported.

framealpha

[float, default: *rcParams["legend.framealpha"]* (default: `0.8`)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

facecolor

["inherit" or color, default: *rcParams["legend.facecolor"]* (default: `'inherit'`)] The legend's background color. If `"inherit"`, use *rcParams["axes.facecolor"]* (default: `'white'`).

edgecolor

["inherit" or color, default: *rcParams["legend.edgecolor"]* (default: `'0.8'`)] The legend's background patch edge color. If `"inherit"`, use take *rcParams["axes.edgecolor"]* (default: `'black'`).

mode

[{"expand", None}] If *mode* is set to `"expand"` the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of `None` (default) the Axes' `transAxes` transform will be used.

title

[str or None] The legend's title. Default is no title (`None`).

title_fontproperties

[None or *FontProperties* or dict] The font properties of the legend's title. If None (default), the *title_fontsize* argument will be used if present; if *title_fontsize* is also None, the current *rcParams["legend.title_fontsize"]* (default: None) will be used.

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: *rcParams["legend.title_fontsize"]* (default: None)] The font size of the legend's title. Note: This cannot be combined with *title_fontproperties*. If you want to set the fontsize alongside other font properties, use the *size* parameter in *title_fontproperties*.

alignment

[{'center', 'left', 'right'}, default: 'center'] The alignment of the legend title and the box of entries. The entries are aligned as a single block, so that markers always lined up.

borderpad

[float, default: *rcParams["legend.borderpad"]* (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: *rcParams["legend.labelspacing"]* (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: *rcParams["legend.handlelength"]* (default: 2.0)] The length of the legend handles, in font-size units.

handleheight

[float, default: *rcParams["legend.handleheight"]* (default: 0.7)] The height of the legend handles, in font-size units.

handletextpad

[float, default: *rcParams["legend.handletextpad"]* (default: 0.8)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: *rcParams["legend.borderaxespad"]* (default: 0.5)] The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: *rcParams["legend.columnspacing"]* (default: 2.0)] The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

draggable

[bool, default: False] Whether the legend can be dragged with the mouse.

See also:

Axes.legend

Notes

Some artists are not supported by this function. See *Legend guide* for details.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, ***get_picker***, ***pick***

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

sca(*a*)

Set the current Axes to be *a* and return *a*.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *frameon=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
edgecolor	color
facecolor	color
figure	Figure
frameon	bool
gid	str
in_layo	bool
label	object
linewid	number
mouseov	bool
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_edgecolor(*color*)

Set the edge color of the Figure rectangle.

Parameters

color

[color]

set_facecolor(*color*)

Set the face color of the Figure rectangle.

Parameters

color

[color]

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_frameon(*b*)

Set the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.set_visible()`.

Parameters

b

[bool]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linewidth(*linewidth*)

Set the line width of the Figure rectangle.

Parameters

linewidth

[number]

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

subfigures(*nrows=1*, *ncols=1*, *squeeze=True*, *wspace=None*, *hspace=None*, *width_ratios=None*, *height_ratios=None*, ***kwargs*)

Add a set of subfigures to this figure or subfigure.

A subfigure has the same artist methods as a figure, and is logically the same as a figure, but cannot print itself. See *Figure subfigures*.

Note: The *subfigure* concept is new in v3.4, and the API is still provisional.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subfigure grid.

squeeze

[bool, default: True] If True, extra dimensions are squeezed out from the returned array of subfigures.

wspace, hspace

[float, default: None] The amount of width/height reserved for space between subfigures, expressed as a fraction of the average subfigure width/height. If not given, the values will be inferred from rcParams if using constrained layout (see `ConstrainedLayoutEngine`), or zero if not using a layout engine.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

subplot_mosaic(*mosaic*, ***, *sharex=False*, *sharey=False*, *width_ratios=None*, *height_ratios=None*, *empty_sentinel='.'*, *subplot_kw=None*, *per_subplot_kw=None*, *gridspec_kw=None*)

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

See *Complex and semantic figure composition (subplot_mosaic)* for an example and full API documentation

Parameters

mosaic

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [['A panel', 'A panel', 'edge'],
     ['C panel', '.',       'edge']]
```

produces 4 Axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it can either be a multi-line string of the form

```
'''
AAE
C.E
'''
```

where each character is a column and each line is a row. Or it can be a single-line string where rows are separated by `;`:

```
'AB;CC'
```

The string notation allows only single character Axes labels and does not support nesting but is very terse.

The Axes identifiers may be `str` or a non-iterable hashable object (e.g. `tuple`s may not be used).

sharex, sharey

[bool, default: False] If True, the x-axis (*sharex*) or y-axis (*sharey*) will be shared among all subplots. In that case, tick label visibility and axis units behave as for *`subplots`*. If False, each subplot's x- or y-axis will be independent.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

Equivalent to `gridspec_kw={'width_ratios': [...]}`. In the case of nested layouts, this argument applies only to the outer layout.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height. Equivalent to `gridspec_kw={'height_ratios': [...]}`. In the case of nested layouts, this argument applies only to the outer layout.

subplot_kw

[dict, optional] Dictionary with keywords passed to the *Figure.add_subplot* call used to create each subplot. These values may be overridden by values in *per_subplot_kw*.

per_subplot_kw

[dict, optional] A dictionary mapping the Axes identifiers or tuples of identifiers to a dictionary of keyword arguments to be passed to the *Figure.add_subplot* call used to create each subplot. The values in these dictionaries have precedence over the values in *subplot_kw*.

If *mosaic* is a string, and thus all keys are single characters, it is possible to use a single string instead of a tuple as keys; i.e. `"AB"` is equivalent to `("A", "B")`.

New in version 3.7.

gridspec_kw

[dict, optional] Dictionary with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on. In the case of nested layouts, this argument applies only to the outer layout. For more complex layouts, users should use *Figure.subfigures* to create the nesting.

empty_sentinel

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to `'.'`. Note, if *layout* is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

Returns

dict[label, Axes]

A dictionary mapping the labels to the Axes objects. The order of the axes is left-to-right and top-to-bottom of their position in the total layout.

subplots(*nrows=1*, *ncols=1*, ***, *sharex=False*, *sharey=False*, *squeeze=True*, *width_ratios=None*, *height_ratios=None*, *subplot_kw=None*, *gridspec_kw=None*)

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subplot grid.

sharex, sharey

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of x-axis (*sharex*) or y-axis (*sharey*):

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick_params*.

When subplots have a shared axis that has units, calling *Axis.set_units* will update each axis with the new units.

squeeze

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width. Equivalent to `gridspec_kw={'width_ratios': [...]}`.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] /`

`sum(height_ratios)`. If not given, all rows will have the same height. Equivalent to `gridspec_kw={'height_ratios': [...]}`.

subplot_kw

[dict, optional] Dict with keywords passed to the *Figure.add_subplot* call used to create each subplot.

gridspec_kw

[dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

Returns

***Axes* or array of Axes**

Either a single *Axes* object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the *squeeze* keyword, see above.

See also:

pyplot.subplots
Figure.add_subplot
pyplot.subplot

Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
fig = plt.figure()

# Create a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar Axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(projection='polar'))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)
```

(continues on next page)

(continued from previous page)

```
# Share an X-axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y-axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X- and Y-axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

subplots_adjust(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by *rcParams["figure.subplot.[name]"]*.

Parameters

left

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

bottom

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float, optional] The width of the padding between subplots, as a fraction of the average Axes width.

hspace

[float, optional] The height of the padding between subplots, as a fraction of the average Axes height.

suptitle(*t*, ***kwargs*)

Add a centered suptitle to the figure.

Parameters

t

[str] The suptitle text.

x

[float, default: 0.5] The x location of the text in figure coordinates.

y

[float, default: 0.98] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: top] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: *rcParams["figure.titlesize"]* (default: `'large'`)] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: *rcParams["figure.titleweight"]* (default: `'normal'`)] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the suptitle.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. *rcParams["figure.titlesize"]* (default: `'large'`) and *rcParams["figure.titleweight"]* (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

supxlabel(*t*, ***kwargs*)

Add a centered supxlabel to the figure.

Parameters

t

[str] The supxlabel text.

x

[float, default: 0.5] The x location of the text in figure coordinates.

y

[float, default: 0.01] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: bottom] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: *rcParams["figure.labelsize"]* (default: 'large')] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: *rcParams["figure.labelweight"]* (default: 'normal')] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the supxlabel.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. *rcParams["figure.labelsize"]* (default: 'large') and *rcParams["figure.labelweight"]* (default: 'normal') are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

supylabel(*t*, ***kwargs*)

Add a centered supylabel to the figure.

Parameters

t

[str] The supylabel text.

x

[float, default: 0.02] The x location of the text in figure coordinates.

y

[float, default: 0.5] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: left] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: center] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: *rcParams["figure.labelsize"]* (default: 'large')] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: *rcParams["figure.labelweight"]* (default: 'normal')] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the supylabel.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the *FontProperties* defaults. *rcParams["figure.labelsize"]* (default: 'large') and *rcParams["figure.labelweight"]* (default: 'normal') are ignored in this case.

****kwargs**

Additional kwargs are *matplotlib.text.Text* properties.

text(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to figure.

Parameters

x, y

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

s

[str] The text string.

fontdict

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

Returns

Text

Other Parameters

****kwargs**

[`Text` properties] Other miscellaneous text parameters.

Property	Description
`agg_filter`	a filter function, which takes a (m, n, 3) float array
`alpha`	scalar or None
`animated`	bool
`antialiased`	bool
`backgroundcolor`	color
`bbox`	dict with properties for `patches.FancyBboxP`
`clip_box`	unknown
`clip_on`	unknown
`clip_path`	unknown
`color` or c	color
`figure`	`Figure`
`fontfamily` or family or fontname	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantas
`fontproperties` or font or font_properties	`font_manager.FontProperties` or `str` o
`fontsize` or size	float or {'xx-small', 'x-small', 'small', 'medium', 'la
`fontstretch` or stretch	{a numeric value in range 0-1000, 'ultra-condense
`fontstyle` or style	{'normal', 'italic', 'oblique'}
`fontvariant` or variant	{'normal', 'small-caps'}

Table 59

Property	Description
fontweight or weight	{a numeric value in range 0-1000, 'ultralight', 'ligh
gid	str
horizontalalignment or ha	{'left', 'center', 'right'}
in_layout	bool
label	object
linespacing	float (multiple of font size)
math_fontfamily	str
mouseover	bool
multialignment or ma	{'left', 'right', 'center'}
parse_math	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	(float, float)
rasterized	bool
rotation	float or {'vertical', 'horizontal'}
rotation_mode	{None, 'default', 'anchor'}
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
text	object
transform	*Transform*
transform_rotates_text	bool
url	str
usetex	bool or None
verticalalignment or va	{'baseline', 'bottom', 'center', 'center_baseline', 'top
visible	bool
wrap	bool
x	float
y	float
zorder	float

pyplot.text

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from *other* to *self*.

zorder = 0

class matplotlib.figure.**SubFigure**(*parent*, *subplotspec*, *, *facecolor=None*, *edgecolor=None*, *linewidth=0.0*, *frameon=None*, ***kwargs*)

Logical figure that can be placed inside a figure.

Typically instantiated using *Figure.add_subfigure* or *SubFigure.add_subfigure*, or *SubFigure.subfigures*. A subfigure has the same methods as a figure except for those particularly tied to the size or dpi of the figure, and is confined to a prescribed region of the figure. For example the following puts two subfigures side-by-side:

```
fig = plt.figure()
sfigs = fig.subfigures(1, 2)
axsL = sfigs[0].subplots(1, 2)
axsR = sfigs[1].subplots(2, 1)
```

See *Figure subfigures*

Note: The *subfigure* concept is new in v3.4, and the API is still provisional.

Parameters

parent

[*Figure* or *SubFigure*] Figure or subfigure that contains the SubFigure. SubFigures can be nested.

subplotspec

[*gridspec.SubplotSpec*] Defines the region in a parent gridspec where the subfigure will be placed.

facecolor

[default: "none"] The figure patch face color; transparent by default.

edgecolor

[default: *rcParams["figure.edgecolor"]* (default: 'white')] The figure patch edge color.

linewidth

[float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

frameon

[bool, default: *rcParams["figure.frameon"]* (default: True)] If False, suppress drawing the figure background patch.

Other Parameters

****kwargs**

[*SubFigure* properties, optional]

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	*BboxBase* or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
dpi	float
edgecolor	color
facecolor	color
figure	*Figure*
frameon	bool
gid	str
in_layo	bool
label	object
linewid	number
mouseov	bool
path_ef	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
*sketch_*	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

add_artist(*artist*, *clip=False*)

Add an *Artist* to the figure.

Usually artists are added to *Axes* objects using *Axes.add_artist*; this method can be used in the rare cases where one needs to add artists directly to the figure instead.

Parameters

artist

[*Artist*] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transSubfigure`.

clip

[bool, default: False] Whether the added artist should be clipped by the figure patch.

Returns

Artist

The added artist.

add_axes(**args*, ***kwargs*)

Add an *Axes* to the figure.

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

Parameters

rect

[tuple (left, bottom, width, height)] The dimensions (left, bottom, width, height) of the new *Axes*. All quantities are in fractions of figure width and height.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

axes_class

[subclass type of *Axes*, optional] The *axes.Axes* subclass that is instantiated. This parameter is incompatible with *projection* and *polar*. See *axisartist* for examples.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned Axes.

Returns

Axes*, or a subclass of *Axes

The returned axes class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes class. The keyword arguments for the rectilinear Axes class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual Axes class.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value,
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool

Table 60 – continued from

Property	Description
navigate_mode	unknown
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
position	[left, bottom, width, height] or Bbox
prop_cycle	Cycler
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown

ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

See also:

Figure.add_subplot
pyplot.subplot
pyplot.axes
Figure.subplots
pyplot.subplots

Notes

In rare circumstances, *add_axes* may be called with a single argument, an Axes instance already created in the present figure but not in the figure's list of Axes.

Examples

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

add_callback(*func*)

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

See also:

remove_callback

add_gridspec(*nrows=1*, *ncols=1*, ***kwargs*)

Return a *GridSpec* that has this figure as a parent. This allows complex layout of Axes in the figure.

Parameters

nrows

[int, default: 1] Number of rows in grid.

ncols

[int, default: 1] Number of columns in grid.

Returns

GridSpec

Other Parameters

****kwargs**

Keyword arguments are passed to *GridSpec*.

See also:

matplotlib.pyplot.subplots

Examples

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

add_subfigure(*subplotspec*, ***kwargs*)

Add a *SubFigure* to the figure as part of a subplot arrangement.

Parameters

subplotspec

[*gridspec.SubplotSpec*] Defines the region in a parent gridspec where the subfigure will be placed.

Returns

SubFigure

Other Parameters

****kwargs**

Are passed to the *SubFigure* object.

See also:

Figure.subfigures

add_subplot(**args*, ***kwargs*)

Add an *Axes* to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

Parameters

***args**

[int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

In rare circumstances, *add_subplot* may be called with a single argument, a subplot Axes instance already created in the present figure but not in the figure's list of Axes.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

axes_class

[subclass type of *Axes*, optional] The *axes.Axes* subclass that is instantiated. This parameter is incompatible with *projection* and *polar*. See *axisartist* for examples.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned Axes.

Returns

Axes

The Axes of the subplot. The returned Axes can actually be an instance of a subclass, such as *projections.polar.PolarAxes* for polar projections.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value,
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool

Table 61 – continued from

Property	Description

See also:

Figure.add_axes
pyplot.subplot
pyplot.axes
Figure.subplots
pyplot.subplots

Examples

```
fig = plt.figure()

fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1)  # equivalent but more general

fig.add_subplot(232, frameon=False)  # subplot with no frame
fig.add_subplot(233, projection='polar')  # polar subplot
fig.add_subplot(234, sharex=ax1)  # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor="red")  # red subplot

ax1.remove()  # delete ax1 from the figure
fig.add_subplot(ax1)  # add ax1 back to the figure
```

align_labels(*axs=None*)

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

Parameters

axs

[list of *Axes*] Optional list (or ndarray) of *Axes* to align the labels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_xlabels
matplotlib.figure.Figure.align_ylabels

align_xlabels(*axs=None*)

Align the xlabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on Axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on Axes with the same top-most row.

Parameters

axs

[list of *Axes*] Optional list of (or ndarray) *Axes* to align the xlabels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_ylabels
matplotlib.figure.Figure.align_labels

Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

Examples

Example with rotated xtick labels:

```
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

align_ylabels(*axs=None*)

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on Axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on Axes with the same right-most column.

Parameters

axs

[list of *Axes*] Optional list (or `ndarray`) of *Axes* to align the ylabels. Default is to align all Axes on the figure.

See also:

matplotlib.figure.Figure.align_xlabels
matplotlib.figure.Figure.align_labels

Notes

This assumes that `axs` are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

Examples

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

autofmt_xdate(*bottom=0.2*, *rotation=30*, *ha='right'*, *which='major'*)

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared x-axis where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

Parameters

bottom

[float, default: 0.2] The bottom of the subplots for *subplots_adjust*.

rotation

[float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

ha

[{'left', 'center', 'right'}, default: 'right'] The horizontal alignment of the xticklabels.

which

[{'major', 'minor', 'both'}, default: 'major'] Selects which ticklabels to rotate.

property axes

List of Axes in the SubFigure. You can access and modify the Axes in the SubFigure through this list.

Modifying this list has no effect. Instead, use *add_axes*, *add_subplot* or *delaxes* to add or remove an Axes.

Note: The *SubFigure.axes* property and *get_axes* method are equivalent.

clear(*keep_observers=False*)

Clear the figure.

Parameters

keep_observers

[bool, default: False] Set *keep_observers* to True if, for example, a gui widget is tracking the Axes in the figure.

clf(*keep_observers=False*)

[*Discouraged*] Alias for the *clear()* method.

Discouraged

The use of `clf()` is discouraged. Use `clear()` instead.

Parameters

keep_observers

[bool, default: False] Set *keep_observers* to True if, for example, a gui widget is tracking the Axes in the figure.

colorbar(*mappable*, *cax=None*, *ax=None*, *use_gridspec=True*, ***kwargs*)

Add a colorbar to a plot.

Parameters

mappable

The *matplotlib.cm.ScalarMappable* (i.e., *AxesImage*, *ContourSet*, etc.) described by this colorbar. This argument is mandatory for the *Figure.colorbar* method but optional for the *pyplot.colorbar* function, which sets the default to the current image.

Note that one can create a *ScalarMappable* "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap),␣
↪ax=ax)
```

cax

[*Axes*, optional] Axes into which the colorbar will be drawn. If `None`, then a new Axes is created and the space for it will be stolen from the Axes(s) specified in *ax*.

ax

[*Axes* or iterable or `numpy.ndarray` of Axes, optional] The one or more parent Axes from which space for a new colorbar Axes will be stolen. This parameter is only used if *cax* is not set.

Defaults to the Axes that contains the mappable used to create the colorbar.

use_gridspec

[bool, optional] If *cax* is `None`, a new *cax* is created as an instance of Axes. If *ax* is positioned with a subplotspec and *use_gridspec* is `True`, then *cax* is also positioned with a subplotspec.

Returns

colorbar

[*Colorbar*]

Other Parameters

location

[None or {'left', 'right', 'top', 'bottom'}] The location, relative to the parent axes, where the colorbar axes is created. It also determines the *orientation* of the colorbar (colorbars on the left and right are vertical, colorbars at the top and bottom are horizontal). If None, the location will come from the *orientation* if it is set (vertical colorbars on the right, horizontal ones at the bottom), or default to 'right' if *orientation* is unset.

orientation

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. It is preferable to set the *location* of the colorbar, as that also determines the *orientation*; passing incompatible values for *location* and *orientation* raises an exception.

fraction

[float, default: 0.15] Fraction of original axes to use for colorbar.

shrink

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect

[float, default: 20] Ratio of long to short dimensions.

pad

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

extend

[{'neither', 'both', 'min', 'max'}] Make pointed end(s) for out-of-range values (unless 'neither'). These are set for a given colormap using the colormap set_under and set_over methods.

extendfrac

[{*None*, 'auto', length, lengths}] If set to *None*, both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting).

If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when *spacing* is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when *spacing* is set to 'proportional').

If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.

extendrect

[bool] If *False* the minimum and maximum colorbar extensions will be triangular (the default). If *True* the extensions will be rectangular.

spacing

[{'uniform', 'proportional'}] For discrete colorbars (`BoundaryNorm` or contours), 'uniform' gives each color the same space; 'proportional' makes the space proportional to the data interval.

ticks

[None or list of ticks or Locator] If None, ticks are determined automatically from the input.

format

[None or str or Formatter] If None, `ScalarFormatter` is used. Format strings, e.g., `"%4.2e"` or `"{x:.2e}"`, are supported. An alternative `Formatter` may be given instead.

drawedges

[bool] Whether to draw lines at color boundaries.

label

[str] The label on the colorbar's long axis.

boundaries, values

[None or a sequence] If unset, the colormap will be displayed on a 0-1 scale. If sequences, *values* must have a length 1 less than *boundaries*. For each region

delimited by adjacent entries in *boundaries*, the color mapped to the corresponding value in values will be used. Normally only useful for indexed colors (i.e. `norm=NoNorm()`) or other unusual circumstances.

Notes

If *mappable* is a `ContourSet`, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified, it determines the size of the colorbar, and *shrink* and *aspect* are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) render white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However, this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

contains(*mouseevent*)

Test whether the mouse event occurred on the figure.

Returns

bool, {}

convert_xunits(*x*)

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(*y*)

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

delaxes(*ax*)

Remove the `Axes` *ax* from the figure; update the current Axes.

property dpi

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(*match=None*, *include_self=True*)

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (`isinstance` check).

include_self

[bool] Include *self* in the list to be checked for a match.

Returns

list of *Artist*

format_cursor_data(*data*)

Return a string representation of *data*.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets, unless the artist has an associated colorbar, in which case scalar values are formatted using the colorbar's formatter.

See also:

get_cursor_data

property frameon

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

gca()

Get the current Axes.

If there is currently no Axes on this Figure, a new one is created using *Figure.add_subplot*. (To test whether there is currently an Axes on a Figure, check whether `figure.axes` is empty. To test whether there is currently a Figure on the pyplot figure stack, check whether *pyplot.get_fignums()* is empty.)

get_agg_filter()

Return filter function to be used for agg filter.

get_alpha()

Return the alpha value used for blending - not supported on all backends.

get_animated()

Return whether the artist is animated.

get_axes()

List of Axes in the SubFigure. You can access and modify the Axes in the SubFigure through this list.

Modifying this list has no effect. Instead, use *add_axes*, *add_subplot* or *delaxes* to add or remove an Axes.

Note: The *SubFigure.axes* property and *get_axes* method are equivalent.

get_children()

Get a list of artists contained in the figure.

get_clip_box()

Return the clipbox.

get_clip_on()

Return whether the artist uses clipping.

get_clip_path()

Return the clip path.

get_constrained_layout()

Return whether constrained layout is being used.

See *Constrained layout guide*.

get_constrained_layout_pads(*relative=False*)

Get padding for `constrained_layout`.

Returns a list of `w_pad, h_pad` in inches and `wspace` and `hspace` as fractions of the subplot.

See *Constrained layout guide*.

Parameters

relative

[bool] If `True`, then convert from inches to figure relative.

get_cursor_data(*event*)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format_cursor_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

Parameters

event

[*MouseEvent*]

See also:

format_cursor_data

get_default_bbox_extra_artists()

get_dpi()

Return the resolution of the parent figure in dots-per-inch as a float.

get_edgecolor()

Get the edge color of the Figure rectangle.

get_facecolor()

Get the face color of the Figure rectangle.

get_figure()

Return the *Figure* instance the artist belongs to.

get_frameon()

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

get_gid()

Return the group id.

get_in_layout()

Return boolean flag, `True` if artist is included in layout calculations.

E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

get_label()

Return the label used for this artist in the legend.

get_layout_engine()

get_linewidth()

Get the line width of the Figure rectangle.

get_mouseover()

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

get_path_effects()

get_picker()

Return the picking behavior of the artist.

The possible values are described in *`set_picker`*.

See also:

`set_picker`*, *`pickable`*, *`pick`

get_rasterized()

Return whether the artist is to be rasterized.

get_sketch_params()

Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

get_snap()

Return the snap setting.

See *set_snap* for details.

get_suptitle()

Return the suptitle as string or an empty string if not set.

get_supxlabel()

Return the supxlabel as string or an empty string if not set.

get_supylabel()

Return the supylabel as string or an empty string if not set.

get_tightbbox(*renderer=None*, *, *bbox_extra_artists=None*)

Return a (tight) bounding box of the figure *in inches*.

Note that *FigureBase* differs from all other artists, which return their *Bbox* in pixels.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

Parameters

renderer

[*RendererBase* subclass] Renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

bbox_extra_artists

[list of *Artist* or `None`] List of artists to include in the tight bounding box. If `None` (default), then all artist children of each Axes are included in the tight bounding box.

Returns

BboxBase

containing the bounding box (in figure inches).

get_transform()

Return the *Transform* instance used by this artist.

get_transformed_clip_path_and_affine()

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_url()

Return the url.

get_visible()

Return the visibility.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder()

Return the artist's zorder.

have_units()

Return whether units are set on any axis.

is_transform_set()

Return whether the Artist has an explicitly set transform.

This is *True* after *set_transform* has been called.

legend(**args*, ***kwargs*)

Place a legend on the figure.

Call signatures:

```
legend()
legend(handles, labels)
legend(handles=handles)
legend(labels)
```

The call signatures correspond to the following different ways to use this method:

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the *set_label()* method on the artist:

```
ax.plot([1, 2, 3], label='Inline label')
fig.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
fig.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling *Figure.legend* without any arguments and without setting the labels manually will result in no legend being drawn.

2. Explicitly listing the artists and labels in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
fig.legend([line1, line2, line3], ['label1', 'label2', 'label3'])
```

3. Explicitly listing the artists in the legend

This is similar to 2, but the labels are taken from the artists' label properties. Example:

```
line1, = ax1.plot([1, 2, 3], label='label1')
line2, = ax2.plot([1, 2, 3], label='label2')
fig.legend(handles=[line1, line2])
```

4. Labeling existing plot elements

Discouraged

This call signature is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

To make a legend for all artists on all Axes, call this function with an iterable of strings, one for each legend item. For example:

```
fig, (ax1, ax2) = plt.subplots(1, 2)
ax1.plot([1, 3, 5], color='blue')
ax2.plot([2, 4, 6], color='red')
fig.legend(['the blues', 'the reds'])
```

Parameters

handles

[list of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels

[list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: 'upper right'] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the figure.

The string `'center'` places the legend at the center of the figure.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in figure coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" location can also be given as a numeric value:

Location String	Location Code
'best' (Axes only)	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

If a figure is using the constrained layout manager, the string codes of the *loc* keyword argument can get better layout behaviour using the prefix 'outside'. There is ambiguity at the corners, so 'outside upper right' will make space for the legend above the rest of the axes in the layout, and 'outside right upper' will make space on the right side of the layout. In addition to the values of *loc* listed above, we have 'outside right upper', 'outside right lower', 'outside left upper', and 'outside left lower'. See *Legend guide* for more details.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method

to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncols

[int, default: 1] The number of columns that the legend has.

For backward compatibility, the spelling *ncol* is also supported but it is discouraged. If both are given, *ncols* takes precedence.

prop

[None or *FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list, default: *rcParams["legend.labelcolor"]* (default: `'None'`)] The color of the text in the legend. Either a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

Labelcolor can be set globally using *rcParams["legend.labelcolor"]* (default: `'None'`). If None, use *rcParams["text.color"]* (default: `'black'`).

numpoints

[int, default: *rcParams["legend.numpoints"]* (default: `1`)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: *rcParams["legend.scatterpoints"]* (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

markerscale

[float, default: *rcParams["legend.markerscale"]* (default: 1.0)] The relative size of legend markers compared to the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

reverse

[bool, default: False] If *True*, the legend labels are displayed in reverse order from the input. If *False*, the legend labels are displayed in the same order as the input.

New in version 3.7.

frameon

[bool, default: *rcParams["legend.frameon"]* (default: True)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: *rcParams["legend.fancybox"]* (default: True)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[None, bool or dict, default: *rcParams["legend.shadow"]* (default: False)] Whether to draw a shadow behind the legend. The shadow can be configured using *Patch* keywords. Customization via *rcParams["legend.shadow"]* (default: False) is currently not supported.

framealpha

[float, default: *rcParams["legend.framealpha"]* (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

facecolor

["inherit" or color, default: *rcParams["legend.facecolor"]* (default: 'inherit')] The legend's background color. If "inherit", use *rcParams["axes.facecolor"]* (default: 'white').

edgecolor

["inherit" or color, default: *rcParams["legend.edgecolor"]* (default: '0.8')] The legend's background patch edge color. If "inherit", use take *rcParams["axes.edgecolor"]* (default: 'black').

mode

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of None (default) the Axes' transAxes transform will be used.

title

[str or None] The legend's title. Default is no title (None).

title_fontproperties

[None or *FontProperties* or dict] The font properties of the legend's title. If None (default), the *title_fontsize* argument will be used if present; if *title_fontsize* is also None, the current *rcParams["legend.title_fontsize"]* (default: None) will be used.

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: *rcParams["legend.title_fontsize"]* (default: None)] The font size of the legend's title. Note: This cannot be combined with *title_fontproperties*. If you want to set the fontsize alongside other font properties, use the *size* parameter in *title_fontproperties*.

alignment

[{'center', 'left', 'right'}, default: 'center'] The alignment of the legend title and the box of entries. The entries are aligned as a single block, so that markers always lined up.

borderpad

[float, default: *rcParams["legend.borderpad"]* (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: *rcParams["legend.labelspacing"]* (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: *rcParams["legend.handlelength"]* (default: 2.0)]
The length of the legend handles, in font-size units.

handleheight

[float, default: *rcParams["legend.handleheight"]* (default: 0.7)]
The height of the legend handles, in font-size units.

handletextpad

[float, default: *rcParams["legend.handletextpad"]* (default: 0.8)]
The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: *rcParams["legend.borderaxespad"]* (default: 0.5)]
The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: *rcParams["legend.columnspacing"]* (default: 2.0)]
The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

draggable

[bool, default: False] Whether the legend can be dragged with the mouse.

See also:

Axes.legend

Notes

Some artists are not supported by this function. See *Legend guide* for details.

property mouseover

Return whether this artist is queried for custom context information when the mouse cursor moves over it.

pchanged()

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(*mouseevent*)

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

See also:

set_picker, ***get_picker***, ***pickable***

pickable()

Return whether the artist is pickable.

See also:

set_picker, ***get_picker***, ***pick***

properties()

Return a dictionary of all the properties of the artist.

remove()

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(*oid*)

Remove a callback based on its observer id.

See also:

add_callback

sca(*a*)

Set the current Axes to be *a* and return *a*.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *dpi=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *frameon=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
dpi	float
edgecolor	color
facecolor	color
figure	Figure
frameon	bool
gid	str
in_layo	bool
label	object
linewid	number
mouseov	bool
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

set_agg_filter(*filter_func*)

Set the agg filter.

Parameters

filter_func

[callable] A filter function, which takes a (m, n, depth) float array and a dpi value, and returns a (m, n, depth) array and two offsets from the bottom left corner of

the image

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

set_animated(*b*)

Set whether the artist is intended to be used in an animation.

If True, the artist is excluded from regular drawing of the figure. You have to call *Figure.draw_artist* / *Axes.draw_artist* explicitly on the artist. This approach is used to speed up animations using blitting.

See also *matplotlib.animation* and *Faster rendering by using blitting*.

Parameters

b

[bool]

set_clip_box(*clipbox*)

Set the artist's clip *Bbox*.

Parameters

clipbox

[*BboxBase* or None] Will typically be created from a *TransformedBbox*. For instance, `TransformedBbox(Bbox([[0, 0], [1, 1]]), ax.transAxes)` is the default clipping for an artist added to an Axes.

set_clip_on(*b*)

Set whether the artist uses clipping.

When False, artists will be visible outside the Axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(*path*, *transform=None*)

Set the artist's clip path.

Parameters

path

[*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

transform

[*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

set_dpi(*val*)

Set the resolution of parent figure in dots-per-inch.

Parameters

val

[float]

set_edgecolor(*color*)

Set the edge color of the Figure rectangle.

Parameters

color

[color]

set_facecolor(*color*)

Set the face color of the Figure rectangle.

Parameters

color

[color]

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_frameon(*b*)

Set the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.set_visible()`.

Parameters

b

[bool]

set_gid(*gid*)

Set the (group) id for the artist.

Parameters

gid

[str]

set_in_layout(*in_layout*)

Set if artist is to be included in layout calculations, E.g. *Constrained layout guide*, *`Figure.tight_layout()`*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

in_layout

[bool]

set_label(*s*)

Set a label that will be displayed in the legend.

Parameters

s

[object] *s* will be converted to a string by calling `str`.

set_linewidth(*linewidth*)

Set the line width of the Figure rectangle.

Parameters

linewidth

[number]

set_mouseover(*mouseover*)

Set whether this artist is queried for custom context information when the mouse cursor moves over it.

Parameters

mouseover

[bool]

See also:

get_cursor_data
ToolCursorPosition
NavigationToolbar2

set_path_effects(*path_effects*)

Set the path effects.

Parameters

path_effects

[list of *AbstractPathEffect*]

set_picker(*picker*)

Define the picking behavior of the artist.

Parameters

picker

[None or bool or float or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

set_rasterized(*rasterized*)

Force rasterized (bitmap) drawing for vector graphics output.

Rasterized drawing is not supported by all artists. If you try to enable this on an artist that does not support it, the command has no effect and a warning will be issued.

This setting is ignored for pixel-based output.

See also *Rasterization for vector graphics*.

Parameters

rasterized

[bool]

set_sketch_params(*scale=None*, *length=None*, *randomness=None*)

Set the sketch parameters.

Parameters

scale

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

length

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

The PGF backend uses this argument as an RNG seed and not as described above. Using the same seed yields the same random shape.

set_snap(*snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap

[bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_url(*url*)

Set the url for the artist.

Parameters

url

[str]

set_visible(*b*)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(*level*)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

Moreover, margin expansion "bumps" against sticky edges and cannot cross them. For example, if the upper data limit is 1.0, the upper view limit computed by simple margin application is 1.2, but there is a sticky edge at 1.1, then the actual upper view limit will be 1.1.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

subfigures(*nrows=1*, *ncols=1*, *squeeze=True*, *wspace=None*, *hspace=None*, *width_ratios=None*, *height_ratios=None*, ***kwargs*)

Add a set of subfigures to this figure or subfigure.

A subfigure has the same artist methods as a figure, and is logically the same as a figure, but cannot print itself. See *Figure subfigures*.

Note: The *subfigure* concept is new in v3.4, and the API is still provisional.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subfigure grid.

squeeze

[bool, default: True] If True, extra dimensions are squeezed out from the returned array of subfigures.

wspace, hspace

[float, default: None] The amount of width/height reserved for space between subfigures, expressed as a fraction of the average subfigure width/height. If not given, the values will be inferred from rcParams if using constrained layout (see `ConstrainedLayoutEngine`), or zero if not using a layout engine.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

subplot_mosaic(*mosaic*, *, *sharex=False*, *sharey=False*, *width_ratios=None*, *height_ratios=None*, *empty_sentinel='.'*, *subplot_kw=None*, *per_subplot_kw=None*, *gridspec_kw=None*)

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

See *Complex and semantic figure composition (subplot_mosaic)* for an example and full API documentation

Parameters

mosaic

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [['A panel', 'A panel', 'edge'],
     ['C panel', '.',       'edge']]
```

produces 4 Axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it can either be a multi-line string of the form

```
'''
AAE
C.E
'''
```

where each character is a column and each line is a row. Or it can be a single-line string where rows are separated by `;`:

```
'AB;CC'
```

The string notation allows only single character Axes labels and does not support nesting but is very terse.

The Axes identifiers may be `str` or a non-iterable hashable object (e.g. `tuple`s may not be used).

sharex, sharey

[bool, default: False] If True, the x-axis (*sharex*) or y-axis (*sharey*) will be shared among all subplots. In that case, tick label visibility and axis units behave as for *subplots*. If False, each subplot's x- or y-axis will be independent.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width. Equivalent to `gridspec_kw={'width_ratios': [...]}`. In the case of nested layouts, this argument applies only to the outer layout.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height. Equivalent to `gridspec_kw={'height_ratios': [...]}`. In the case of nested layouts, this argument applies only to the outer layout.

subplot_kw

[dict, optional] Dictionary with keywords passed to the *Figure.add_subplot* call used to create each subplot. These values may be overridden by values in *per_subplot_kw*.

per_subplot_kw

[dict, optional] A dictionary mapping the Axes identifiers or tuples of identifiers to a dictionary of keyword arguments to be passed to the *Figure.add_subplot* call used to create each subplot. The values in these dictionaries have precedence over the values in *subplot_kw*.

If *mosaic* is a string, and thus all keys are single characters, it is possible to use a single string instead of a tuple as keys; i.e. `"AB"` is equivalent to `("A", "B")`.

New in version 3.7.

gridspec_kw

[dict, optional] Dictionary with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on. In the case of nested layouts, this argument applies only to the outer layout. For more complex layouts, users should use *Figure.subfigures* to create the nesting.

empty_sentinel

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to `'.'`. Note, if *layout* is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

Returns

dict[label, Axes]

A dictionary mapping the labels to the Axes objects. The order of the axes is left-to-right and top-to-bottom of their position in the total layout.

subplots(*nrows=1*, *ncols=1*, ***, *sharex=False*, *sharey=False*, *squeeze=True*, *width_ratios=None*, *height_ratios=None*, *subplot_kw=None*, *gridspec_kw=None*)

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

Parameters

nrows, ncols

[int, default: 1] Number of rows/columns of the subplot grid.

sharex, sharey

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of x-axis (*sharex*) or y-axis (*sharey*):

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick_params*.

When subplots have a shared axis that has units, calling *Axis.set_units* will update each axis with the new units.

squeeze

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width. Equivalent to `gridspec_kw={'width_ratios': [...]}`.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height. Equivalent to `gridspec_kw={'height_ratios': [...]}`.

subplot_kw

[dict, optional] Dict with keywords passed to the *Figure.add_subplot* call used to create each subplot.

gridspec_kw

[dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

Returns

***Axes* or array of Axes**

Either a single *Axes* object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the *squeeze* keyword, see above.

pyplot.subplots
Figure.add_subplot
pyplot.subplot

Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
fig = plt.figure()

# Create a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')
```

(continues on next page)

(continued from previous page)

```
# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar Axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(projection='polar'))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share an X-axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y-axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X- and Y-axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

subplots_adjust(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by *rcParams["figure.subplot.[name]"]*.

Parameters

left

[float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

bottom

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float, optional] The width of the padding between subplots, as a fraction of the average Axes width.

hspace

[float, optional] The height of the padding between subplots, as a fraction of the average Axes height.

suptitle(*t*, ***kwargs*)

Add a centered suptitle to the figure.

Parameters

t

[str] The suptitle text.

x

[float, default: 0.5] The x location of the text in figure coordinates.

y

[float, default: 0.98] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: top] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: *rcParams["figure.titlesize"]* (default: `'large'`)] The font size of the text. See *Text.set_size* for possible values.

fontweight, weight

[default: *rcParams["figure.titleweight"]* (default: `'normal'`)] The font weight of the text. See *Text.set_weight* for possible values.

Returns

text

The *Text* instance of the suptitle.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: `'large'`) and `rcParams["figure.titleweight"]` (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

supxlabel(*t*, ***kwargs*)

Add a centered supxlabel to the figure.

Parameters

t

[str] The supxlabel text.

x

[float, default: 0.5] The x location of the text in figure coordinates.

y

[float, default: 0.01] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: center] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: bottom] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: `rcParams["figure.labelsize"]` (default: `'large'`)] The font size of the text. See `Text.set_size` for possible values.

fontweight, weight

[default: `rcParams["figure.labelweight"]` (default: `'normal'`)] The font weight of the text. See `Text.set_weight` for possible values.

Returns

text

The `Text` instance of the supxlabel.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.labelsize"]` (default: `'large'`) and `rcParams["figure.labelweight"]` (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

supylabel(*t*, ***kwargs*)

Add a centered supylabel to the figure.

Parameters

t

[str] The supylabel text.

x

[float, default: 0.02] The x location of the text in figure coordinates.

y

[float, default: 0.5] The y location of the text in figure coordinates.

horizontalalignment, ha

[{'center', 'left', 'right'}, default: left] The horizontal alignment of the text relative to (*x*, *y*).

verticalalignment, va

[{'top', 'center', 'bottom', 'baseline'}, default: center] The vertical alignment of the text relative to (*x*, *y*).

fontsize, size

[default: `rcParams["figure.labelsize"]` (default: `'large'`)] The font size of the text. See `Text.set_size` for possible values.

fontweight, weight

[default: `rcParams["figure.labelweight"]` (default: `'normal'`)] The font weight of the text. See `Text.set_weight` for possible values.

Returns

text

The `Text` instance of the supylabel.

Other Parameters

fontproperties

[None or dict, optional] A dict of font properties. If *fontproperties* is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.labelsize"]` (default: `'large'`) and `rcParams["figure.labelweight"]` (default: `'normal'`) are ignored in this case.

****kwargs**

Additional kwargs are `matplotlib.text.Text` properties.

text(*x*, *y*, *s*, *fontdict=None*, ***kwargs*)

Add text to figure.

Parameters

x, y

[float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

s

[str] The text string.

fontdict

[dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

Returns

Text

Other Parameters

****kwargs**

[`Text` properties] Other miscellaneous text parameters.

Property	Description
`agg_filter`	a filter function, which takes a (m, n, 3) float array
`alpha`	scalar or None
`animated`	bool
`antialiased`	bool
`backgroundcolor`	color
`bbox`	dict with properties for `patches.FancyBboxP`

Table 62

Property	Description

pyplot.text

update(*props*)

Update this artist's properties from the dict *props*.

Parameters

props

[dict]

update_from(*other*)

Copy properties from *other* to *self*.

zorder = 0

class matplotlib.figure.**SubplotParams**(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

A class to hold the parameters for a subplot.

Defaults are given by *rcParams["figure.subplot.[name]"]*.

Parameters

left

[float] The position of the left edge of the subplots, as a fraction of the figure width.

right

[float] The position of the right edge of the subplots, as a fraction of the figure width.

bottom

[float] The position of the bottom edge of the subplots, as a fraction of the figure height.

top

[float] The position of the top edge of the subplots, as a fraction of the figure height.

wspace

[float] The width of the padding between subplots, as a fraction of the average Axes width.

hspace

[float] The height of the padding between subplots, as a fraction of the average Axes height.

update(*left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*)

Update the dimensions of the passed parameters. *None* means unchanged.

matplotlib.figure.**figaspect**(*arg*)

Calculate the width and height for a figure with a specified aspect ratio.

While the height is taken from *rcParams["figure.figsize"]* (default: `[6.4, 4.8]`), the width is adjusted to match the desired aspect ratio. Additionally, it is ensured that the width is in the range [4., 16.] and the height is in the range [2., 16.]. If necessary, the default height is adjusted to ensure this.

Parameters

arg

[float or 2D array] If a float, this defines the aspect ratio (i.e. the ratio height / width). In case of an array the aspect ratio is number of rows / number of columns, so that the array could be fitted in the figure undistorted.

Returns

width, height

[float] The figure size in inches.

Notes

If you want to create an Axes within the figure, that still preserves the aspect ratio, be sure to create it with equal width and height. See examples below.

Thanks to Fernando Perez for this function.

Examples

Make a figure twice as tall as it is wide:

```
w, h = figaspect(2.)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Make a figure with the proper aspect for an array:

```
A = rand(5, 3)
w, h = figaspect(A)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

7.2.24 matplotlib.font_manager

A module for finding, managing, and using fonts across platforms.

This module provides a single *FontManager* instance, `fontManager`, that can be shared across backends and platforms. The *findfont* function returns the best TrueType (TTF) font file in the local or system font path that matches the specified *FontProperties* instance. The *FontManager* also handles Adobe Font Metrics (AFM) font files for use by the PostScript backend. The *FontManager.addfont* function adds a custom font from a file without installing it into your operating system.

The design is based on the W3C Cascading Style Sheet, Level 1 (CSS1) font specification. Future versions may implement the Level 2 or 2.1 specifications.

class matplotlib.font_manager.**FontEntry**(*fname=''*, *name=''*, *style='normal'*, *variant='normal'*, *weight='normal'*, *stretch='normal'*, *size='medium'*)

Bases: `object`

A class for storing Font properties.

It is used when populating the font lookup dictionary.

fname = ''

name = ''

size = 'medium'

stretch = 'normal'

style = 'normal'

variant = 'normal'

weight = 'normal'

class matplotlib.font_manager.**FontManager**(*size=None*, *weight='normal'*)

Bases: `object`

On import, the *FontManager* singleton instance creates a list of ttf and afm fonts and caches their *FontProperties*. The *FontManager.findfont* method does a nearest neighbor search to find the font that most closely matches the specification. If no good enough match is found, the default font is returned.

Fonts added with the *FontManager.addfont* method will not persist in the cache; therefore, *addfont* will need to be called every time Matplotlib is imported. This method should only be used if and when a font cannot be installed on your operating system by other means.

Notes

The *FontManager.addfont* method must be called on the global *FontManager* instance.

Example usage:

```
import matplotlib.pyplot as plt
from matplotlib import font_manager

font_dirs = ["/resources/fonts"]  # The path to the custom font file.
font_files = font_manager.findSystemFonts(fontpaths=font_dirs)

for font_file in font_files:
    font_manager.fontManager.addfont(font_file)
```

addfont(*path*)

Cache the properties of the font at *path* to make it available to the *FontManager*. The type of font is inferred from the path suffix.

Parameters

path

[str or path-like]

Notes

This method is useful for adding a custom font without installing it in your operating system. See the *FontManager* singleton instance for usage and caveats about this function.

property defaultFont

findfont(*prop*, *fontext='ttf'*, *directory=None*, *fallback_to_default=True*, *rebuild_if_missing=True*)

Find a font that most closely matches the given font properties.

Parameters

prop

[str or *FontProperties*] The font properties to search for. This can be either a *FontProperties* object or a string defining a fontconfig patterns.

fontext

[{'ttf', 'afm'}, default: 'ttf'] The extension of the font file:

- 'ttf': TrueType and OpenType fonts (.ttf, .ttc, .otf)
- 'afm': Adobe Font Metrics (.afm)

directory

[str, optional] If given, only search this directory and its subdirectories.

fallback_to_default

[bool] If True, will fall back to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

rebuild_if_missing

[bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).

Returns

str

The filename of the best matching font.

Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the W3C Cascading Style Sheet, Level 1 documentation for a description of the font finding algorithm.

static get_default_size()

Return the default font size.

get_default_weight()

Return the default font weight.

get_font_names()

Return the list of available fonts.

score_family(*families*, *family2*)

Return a match score between the list of font families in *families* and the font family name *family2*.

An exact match at the head of the list returns 0.0.

A match further down the list will return between 0 and 1.

No match will return 1.0.

score_size(*size1*, *size2*)

Return a match score between *size1* and *size2*.

If *size2* (the size specified in the font file) is 'scalable', this function always returns 0.0, since any font size can be generated.

Otherwise, the result is the absolute distance between *size1* and *size2*, normalized so that the usual range of font sizes (6pt - 72pt) will lie between 0.0 and 1.0.

score_stretch(*stretch1*, *stretch2*)

Return a match score between *stretch1* and *stretch2*.

The result is the absolute value of the difference between the CSS numeric values of *stretch1* and *stretch2*, normalized between 0.0 and 1.0.

score_style(*style1*, *style2*)

Return a match score between *style1* and *style2*.

An exact match returns 0.0.

A match between 'italic' and 'oblique' returns 0.1.

No match returns 1.0.

score_variant(*variant1*, *variant2*)

Return a match score between *variant1* and *variant2*.

An exact match returns 0.0, otherwise 1.0.

score_weight(*weight1*, *weight2*)

Return a match score between *weight1* and *weight2*.

The result is 0.0 if both weight1 and weight 2 are given as strings and have the same value.

Otherwise, the result is the absolute value of the difference between the CSS numeric values of *weight1* and *weight2*, normalized between 0.05 and 1.0.

set_default_weight(*weight*)

Set the default font weight. The initial value is 'normal'.

class matplotlib.font_manager.**FontProperties**(*family=None*, *style=None*, *variant=None*, *weight=None*, *stretch=None*, *size=None*, *fname=None*, *math_fontfamily=None*)

Bases: object

A class for storing and manipulating font properties.

The font properties are the six properties described in the W3C Cascading Style Sheet, Level 1 font specification and *math_fontfamily* for math fonts:

- family: A list of font names in decreasing order of priority. The items may include a generic font family name, either 'sans-serif', 'serif', 'cursive', 'fantasy', or 'monospace'. In that case, the actual font to be used will be looked up from the associated rcParam during the search process in *findfont*. Default: *rcParams["font.family"]* (default: ['sans-serif'])
- style: Either 'normal', 'italic' or 'oblique'. Default: *rcParams["font.style"]* (default: 'normal')
- variant: Either 'normal' or 'small-caps'. Default: *rcParams["font.variant"]* (default: 'normal')
- stretch: A numeric value in the range 0-1000 or one of 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded'. Default: *rcParams["font.stretch"]* (default: 'normal')

- weight: A numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'. Default: *rcParams["font.weight"]* (default: 'normal')
- size: Either a relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 10. Default: *rcParams["font.size"]* (default: 10.0)
- math_fontfamily: The family of fonts used to render math text. Supported values are: 'dejavusans', 'dejavuserif', 'cm', 'stix', 'stixsans' and 'custom'. Default: *rcParams["mathtext.fontset"]* (default: 'dejavusans')

Alternatively, a font may be specified using the absolute path to a font file, by using the *fname* kwarg. However, in this case, it is typically simpler to just pass the path (as a pathlib.Path, not a str) to the *font* kwarg of the *Text* object.

The preferred usage of font sizes is to use the relative values, e.g., 'large', instead of absolute font sizes, e.g., 12. This approach allows all text sizes to be made larger or smaller based on the font manager's default font size.

This class will also accept a fontconfig pattern, if it is the only argument provided. This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

Note that Matplotlib's internal font manager and fontconfig use a different algorithm to lookup fonts, so the results of the same pattern may be different in Matplotlib than in other applications that use fontconfig.

copy()

Return a copy of self.

get_family()

Return a list of individual font family names or generic family names.

The font families or generic font families (which will be resolved from their respective rcParams when searching for a matching font) in the order of preference.

get_file()

Return the filename of the associated font.

get_fontconfig_pattern()

Get a fontconfig pattern suitable for looking up the font as specified with fontconfig's fc-match utility.

This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

get_math_fontfamily()

Return the name of the font family used for math text.

The default font is *rcParams["mathtext.fontset"]* (default: 'dejavusans').

get_name()

Return the name of the font that best matches the font properties.

get_size()

Return the font size.

get_size_in_points()

Return the font size.

get_slant()

Return the font style. Values are: 'normal', 'italic' or 'oblique'.

get_stretch()

Return the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'.

get_style()

Return the font style. Values are: 'normal', 'italic' or 'oblique'.

get_variant()

Return the font variant. Values are: 'normal' or 'small-caps'.

get_weight()

Set the font weight. Options are: A numeric value in the range 0-1000 or one of 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

set_family(*family*)

Change the font family. Can be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when *rcParams["text.usetex"]* (default: `False`) is `True`. Default: *rcParams["font.family"]* (default: `['sans-serif']`)

set_file(*file*)

Set the filename of the fontfile to use. In this case, all other properties will be ignored.

set_fontconfig_pattern(*pattern*)

Set the properties by parsing a fontconfig *pattern*.

This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

set_math_fontfamily(*fontfamily*)

Set the font family for text in math mode.

If not set explicitly, *rcParams["mathtext.fontset"]* (default: `'dejavusans'`) will be used.

Parameters

fontfamily

[str] The name of the font family.

Available font families are defined in the *default matplotlibrc file*.

See also:

text.Text.get_math_fontfamily

set_name(*family*)

Change the font family. Can be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when *rcParams["text.usetex"]* (default: `False`) is `True`. Default: *rcParams["font.family"]* (default: `['sans-serif']`)

set_size(*size*)

Set the font size.

Parameters

size

[float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: *rcParams["font.size"]* (default: `10.0`)] If a float, the font size in points. The string values denote sizes relative to the default font size.

set_slant(*style*)

Set the font style.

Parameters

style

[{'normal', 'italic', 'oblique'}, default: *rcParams["font.style"]* (default: `'normal'`)]

set_stretch(*stretch*)

Set the font stretch or width.

Parameters

stretch

[int or {'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'}, default: *rcParams["font.stretch"]* (default: `'normal'`)] If int, must be in the range 0-1000.

set_style(*style*)

Set the font style.

Parameters

style

[{'normal', 'italic', 'oblique'}, default: *rcParams["font.style"]* (default: 'normal')]

set_variant(*variant*)

Set the font variant.

Parameters

variant

[{'normal', 'small-caps'}, default: *rcParams["font.variant"]* (default: 'normal')]

set_weight(*weight*)

Set the font weight.

Parameters

weight

[int or {'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'}, default: *rcParams["font.weight"]* (default: 'normal')] If int, must be in the range 0-1000.

matplotlib.font_manager.**afmFontProperty**(*fontpath*, *font*)

Extract information from an AFM font file.

Parameters

fontpath

[str] The filename corresponding to *font*.

font

[AFM] The AFM font file from which information will be extracted.

Returns

FontEntry

The extracted font properties.

matplotlib.font_manager.**findSystemFonts**(*fontpaths=None*, *fontext='ttf'*)

Search for fonts in the specified font paths. If no paths are given, will use a standard set of system paths, as well as the list of fonts tracked by fontconfig if fontconfig is installed and available. A list of TrueType fonts are returned by default with AFM fonts as an option.

matplotlib.font_manager.**findfont**(*prop*, *fontext='ttf'*, *directory=None*, *fallback_to_default=True*, *rebuild_if_missing=True*)

Find a font that most closely matches the given font properties.

Parameters

prop

[str or *FontProperties*] The font properties to search for. This can be either a *FontProperties* object or a string defining a fontconfig patterns.

fontext

[{'ttf', 'afm'}, default: 'ttf'] The extension of the font file:

- 'ttf': TrueType and OpenType fonts (.ttf, .ttc, .otf)
- 'afm': Adobe Font Metrics (.afm)

directory

[str, optional] If given, only search this directory and its subdirectories.

fallback_to_default

[bool] If True, will fall back to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

rebuild_if_missing

[bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).

Returns

str

The filename of the best matching font.

Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the W3C Cascading Style Sheet, Level 1 documentation for a description of the font finding algorithm.

matplotlib.font_manager.**get_font**(*font_filepaths*, *hinting_factor=None*)

Get an *ft2font.FT2Font* object given a list of file paths.

Parameters

font_filepaths

[Iterable[str, Path, bytes], str, Path, bytes] Relative or absolute paths to the font files to be used.

If a single string, bytes, or `pathlib.Path`, then it will be treated as a list with that entry only.

If more than one filepath is passed, then the returned FT2Font object will fall back through the fonts, in the order given, to find a needed glyph.

Returns

ft2font.FT2Font

matplotlib.font_manager.**get_font_names**()

Return the list of available fonts.

matplotlib.font_manager.**get_fontext_synonyms**(*fontext*)

Return a list of file extensions that are synonyms for the given file extension *fileext*.

matplotlib.font_manager.**is_opentype_cff_font**(*filename*)

Return whether the given font is a Postscript Compact Font Format Font embedded in an OpenType wrapper. Used by the PostScript and PDF backends that cannot subset these fonts.

matplotlib.font_manager.**json_dump**(*data*, *filename*)

Dump *FontManager* *data* as JSON to the file named *filename*.

See also:

json_load

Notes

File paths that are children of the Matplotlib data path (typically, fonts shipped with Matplotlib) are stored relative to that data path (to remain valid across virtualenvs).

This function temporarily locks the output file to prevent multiple processes from overwriting one another's output.

matplotlib.font_manager.**json_load**(*filename*)

Load a *FontManager* from the JSON file named *filename*.

See also:

json_dump

matplotlib.font_manager.**list_fonts**(*directory*, *extensions*)

Return a list of all fonts matching any of the extensions, found recursively under the directory.

matplotlib.font_manager.**ttfFontProperty**(*font*)

Extract information from a TrueType font file.

Parameters

font

[*FT2Font*] The TrueType font file from which information will be extracted.

Returns

FontEntry

The extracted font properties.

matplotlib.font_manager.**win32FontDirectory**()

Return the user-specified font directory for Win32. This is looked up from the registry key

```
\\HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\
↪Shell Folders\Fonts
```

If the key is not found, `%WINDIR%\Fonts` will be returned.

matplotlib.font_manager.**fontManager**

The global instance of *FontManager*.

class matplotlib.font_manager.**FontEntry**(*fname=''*, *name=''*, *style='normal'*, *variant='normal'*, *weight='normal'*, *stretch='normal'*, *size='medium'*)

A class for storing Font properties.

It is used when populating the font lookup dictionary.

7.2.25 matplotlib.ft2font

class matplotlib.ft2font.**FT2Font**(*filename*, *hinting_factor=8*, ***, *_fallback_list=None*, *_kerning_factor=0*)

Bases: object

Create a new FT2Font object.

Parameters

filename

[str or file-like] The source of the font data in a format (ttf or ttc) that FreeType can read

hinting_factor

[int, optional] Must be positive. Used to scale the hinting in the x-direction

_fallback_list

[list of FT2Font, optional] A list of FT2Font objects used to find missing glyphs.

> **Warning:** This API is both private and provisional: do not use it directly

_kerning_factor

[int, optional] Used to adjust the degree of kerning.

> **Warning:** This API is private: do not use it directly

Attributes

num_faces

[int] Number of faces in file.

face_flags, style_flags

[int] Face and style flags; see the ft2font constants.

num_glyphs

[int] Number of glyphs in the face.

family_name, style_name

[str] Face family and style name.

num_fixed_sizes

[int] Number of bitmap in the face.

scalable

[bool] Whether face is scalable; attributes after this one are only defined for scalable faces.

bbox

[tuple[int, int, int, int]] Face global bounding box (xmin, ymin, xmax, ymax).

units_per_EM

[int] Number of font units covered by the EM.

ascender, descender

[int] Ascender and descender in 26.6 units.

height

[int] Height in 26.6 units; used to compute a default line spacing (baseline-to-baseline distance).

max_advance_width, max_advance_height

[int] Maximum horizontal and vertical cursor advance for all glyphs.

underline_position, underline_thickness

[int] Vertical position and thickness of the underline bar.

postscript_name

[str] PostScript name of the font.

ascender

bbox

clear(*self*)

Clear all the glyphs, reset for a new call to *set_text*.

descender

draw_glyph_to_bitmap(*self*, *image*, *x*, *y*, *glyph*, *antialiased=True*)

Draw a single glyph to the bitmap at pixel locations x, y Note it is your responsibility to set up the bitmap manually with `set_bitmap_size(w, h)` before this call is made.

If you want automatic layout, use *set_text* in combinations with *draw_glyphs_to_bitmap*. This function is instead intended for people who want to render individual glyphs (e.g., returned by *load_char*) at precise locations.

draw_glyphs_to_bitmap(*self*, *antialiased=True*)

Draw the glyphs that were loaded by *set_text* to the bitmap. The bitmap size will be automatically set to include the glyphs.

face_flags

family_name

fname

get_bitmap_offset(*self*)

Get the (x, y) offset in 26.6 subpixels for the bitmap if ink hangs left or below (0, 0). Since Matplotlib only supports left-to-right text, y is always 0.

get_char_index(*self*, *codepoint*)

Return the glyph index corresponding to a character *codepoint*.

get_charmap(*self*)

Return a dict that maps the character codes of the selected charmap (Unicode by default) to their corresponding glyph indices.

get_descent(*self*)

Get the descent in 26.6 subpixels of the current string set by *set_text*. The rotation of the string is accounted for. To get the descent in pixels, divide this value by 64.

get_glyph_name(*self*, *index*)

Retrieve the ASCII name of a given glyph *index* in a face.

Due to Matplotlib's internal design, for fonts that do not contain glyph names (per FT_FACE_FLAG_GLYPH_NAMES), this returns a made-up name which does *not* roundtrip through `get_name_index`.

get_image(*self*)

Return the underlying image buffer for this font object.

get_kerning(*self*, *left*, *right*, *mode*)

Get the kerning between *left* and *right* glyph indices. *mode* is a kerning mode constant:

- KERNING_DEFAULT - Return scaled and grid-fitted kerning distances
- KERNING_UNFITTED - Return scaled but un-grid-fitted kerning distances
- KERNING_UNSCALED - Return the kerning vector in original font units

get_name_index(*self*, *name*)

Return the glyph index of a given glyph *name*. The glyph index 0 means 'undefined character code'.

get_num_glyphs(*self*)

Return the number of loaded glyphs.

get_path(*self*)

Get the path data from the currently loaded glyph as a tuple of vertices, codes.

get_ps_font_info(*self*)

Return the information in the PS Font Info structure.

get_sfnt(*self*)

Load the entire SFNT names table, as a dict whose keys are (platform-ID, ISO-encoding-scheme, language-code, and description) tuples.

get_sfnt_table(*self*, *name*)

Return one of the following SFNT tables: head, maxp, OS/2, hhea, vhea, post, or pclt.

get_width_height(*self*)

Get the width and height in 26.6 subpixels of the current string set by `set_text`. The rotation of the string is accounted for. To get width and height in pixels, divide these values by 64.

get_xys(*self*, *antialiased=True*)

Get the xy locations of the current glyphs.

Deprecated since version 3.8.

height

load_char(*self*, *charcode*, *flags=32*)

Load character with *charcode* in current fontfile and set glyph. *flags* can be a bitwise-or of the LOAD_XXX constants; the default value is LOAD_FORCE_AUTOHINT. Return value is a Glyph object, with attributes

- width: glyph width
- height: glyph height
- bbox: the glyph bbox (xmin, ymin, xmax, ymax)
- horiBearingX: left side bearing in horizontal layouts
- horiBearingY: top side bearing in horizontal layouts
- horiAdvance: advance width for horizontal layout
- vertBearingX: left side bearing in vertical layouts
- vertBearingY: top side bearing in vertical layouts
- vertAdvance: advance height for vertical layout

load_glyph(*self*, *glyphindex*, *flags=32*)

Load character with *glyphindex* in current fontfile and set glyph. *flags* can be a bitwise-or of the LOAD_XXX constants; the default value is LOAD_FORCE_AUTOHINT. Return value is a Glyph object, with attributes

- width: glyph width
- height: glyph height
- bbox: the glyph bbox (xmin, ymin, xmax, ymax)
- horiBearingX: left side bearing in horizontal layouts
- horiBearingY: top side bearing in horizontal layouts
- horiAdvance: advance width for horizontal layout
- vertBearingX: left side bearing in vertical layouts
- vertBearingY: top side bearing in vertical layouts
- vertAdvance: advance height for vertical layout

max_advance_height

max_advance_width

num_charmaps

num_faces

num_fixed_sizes

num_glyphs

postscript_name

scalable

select_charmap(*self*, *i*)

Select a charmap by its FT_Encoding number.

set_charmap(*self*, *i*)

Make the i-th charmap current.

set_size(*self*, *ptsize*, *dpi*)

Set the point size and dpi of the text.

set_text(*self*, *string*, *angle=0.0*, *flags=32*)

Set the text *string* and *angle*. *flags* can be a bitwise-or of the LOAD_XXX constants; the default value is LOAD_FORCE_AUTOHINT. You must call this before *draw_glyphs_to_bitmap*. A sequence of x,y positions is returned.

style_flags

style_name

underline_position

underline_thickness

units_per_EM

class matplotlib.ft2font.**FT2Image**

Bases: object

draw_rect(*self*, *x0*, *y0*, *x1*, *y1*)

Draw an empty rectangle to the image.

Deprecated since version 3.8.

draw_rect_filled(*self*, *x0*, *y0*, *x1*, *y1*)

Draw a filled rectangle to the image.

7.2.26 matplotlib.gridspec

gridspec contains classes that help to layout multiple *Axes* in a grid-like pattern within a figure.

The *GridSpec* specifies the overall grid structure. Individual cells within the grid are referenced by *SubplotSpec*s.

Often, users need not access this module directly, and can use higher-level methods like *subplots*, *subplot_mosaic* and *subfigures*. See the tutorial *Arranging multiple Axes in a Figure* for a guide.

Classes

GridSpec(nrows, ncols[, figure, left, ...])	A grid layout to place subplots within a figure.
SubplotSpec(gridspec, num1[, num2])	The location of a subplot in a GridSpec.
GridSpecBase(nrows, ncols[, height_ratios, ...])	A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.
GridSpecFromSubplotSpec(nrows, ncols, ...[, ...])	GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

matplotlib.gridspec.GridSpec

class matplotlib.gridspec.**GridSpec**(*nrows*, *ncols*, *figure=None*, *left=None*, *bottom=None*, *right=None*, *top=None*, *wspace=None*, *hspace=None*, *width_ratios=None*, *height_ratios=None*)

Bases: GridSpecBase

A grid layout to place subplots within a figure.

The location of the grid cells is determined in a similar way to SubplotParams using *left*, *right*, *top*, *bottom*, *wspace* and *hspace*.

Indexing a GridSpec instance returns a SubplotSpec.

Parameters

nrows, ncols

[int] The number of rows and columns of the grid.

figure

[Figure, optional] Only used for constrained layout to create a proper layoutgrid.

left, right, top, bottom

[float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or rcParams at draw time. See also GridSpec.get_subplot_params.

wspace

[float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or rcParams when necessary. See also GridSpec.get_subplot_params.

hspace

[float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or rcParams when necessary. See also *GridSpec.get_subplot_params*.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

get_subplot_params(*figure=None*)

Return the *SubplotParams* for the GridSpec.

In order of precedence the values are taken from

- non-*None* attributes of the GridSpec
- the provided *figure*
- *rcParams["figure.subplot.*"]*

Note that the `figure` attribute of the GridSpec is always ignored.

locally_modified_subplot_params()

Return a list of the names of the subplot parameters explicitly set in the GridSpec.

This is a subset of the attributes of *SubplotParams*.

tight_layout(*figure*, *renderer=None*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=None*)

Adjust subplot parameters to give specified padding.

Parameters

figure

[*Figure*] The figure.

renderer

[*RendererBase* subclass, optional] The renderer to be used.

pad

[float] Padding between the figure edge and the edges of subplots, as a fraction of the font-size.

h_pad, w_pad

[float, optional] Padding (height/width) between edges of adjacent subplots. Defaults to *pad*.

rect

[tuple (left, bottom, right, top), default: None] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Default (None) is the whole figure.

update(***kwargs*)

Update the subplot parameters of the grid.

Parameters that are not explicitly given are not changed. Setting a parameter to *None* resets it to *rcParams["figure.subplot.*"]*.

Parameters

left, right, top, bottom

[float or None, optional] Extent of the subplots as a fraction of figure width or height.

wspace, hspace

[float, optional] Spacing between the subplots as a fraction of the average subplot width / height.

Examples using `matplotlib.gridspec.GridSpec`

- *Scatter plot with histograms*
- *Streamplot*
- *Aligning Labels*
- *Resizing axes with constrained layout*
- *Resizing axes with tight layout*
- *Combining two subplots using subplots and GridSpec*
- *Using Gridspec to make multi-column/row subplot layouts*
- *Nested Gridspecs*
- *Figure subfigures*
- *Creating multiple subplots using plt.subplots*
- *Custom spines with axisartist*
- *GridSpec demo*
- *Nested GridSpecs*
- *origin and extent in imshow*
- *Constrained layout guide*
- *Tight layout guide*

- *Arranging multiple Axes in a Figure*

matplotlib.gridspec.SubplotSpec

class matplotlib.gridspec.**SubplotSpec**(*gridspec*, *num1*, *num2=None*)

Bases: object

The location of a subplot in a *GridSpec*.

Note: Likely, you will never instantiate a *SubplotSpec* yourself. Instead, you will typically obtain one from a *GridSpec* using item-access.

Parameters

gridspec

[*GridSpec*] The GridSpec, which the subplot is referencing.

num1, num2

[int] The subplot will occupy the *num1*-th cell of the given *gridspec*. If *num2* is provided, the subplot will span between *num1*-th cell and *num2*-th cell **inclusive**.

The index starts from 0.

property colspan

The columns spanned by this subplot, as a range object.

get_geometry()

Return the subplot geometry as tuple `(n_rows, n_cols, start, stop)`.

The indices *start* and *stop* define the range of the subplot within the *GridSpec*. *stop* is inclusive (i.e. for a single cell `start == stop`).

get_gridspec()

get_position(*figure*)

Update the subplot position from `figure.subplotpars`.

get_topmost_subplotspec()

Return the topmost *SubplotSpec* instance associated with the subplot.

is_first_col()

is_first_row()

is_last_col()

is_last_row()

property num2

property rowspan

The rows spanned by this subplot, as a `range` object.

subgridspec(*nrows*, *ncols*, ***kwargs*)

Create a GridSpec within this subplot.

The created *GridSpecFromSubplotSpec* will have this *SubplotSpec* as a parent.

Parameters

nrows

[int] Number of rows in grid.

ncols

[int] Number of columns in grid.

Returns

GridSpecFromSubplotSpec

Other Parameters

****kwargs**

All other parameters are passed to *GridSpecFromSubplotSpec*.

See also:

matplotlib.pyplot.subplots

Examples

Adding three subplots in the space occupied by a single subplot:

```
fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

Examples using `matplotlib.gridspec.SubplotSpec`

- *Nested GridSpecs*
- *Constrained layout guide*
- *Arranging multiple Axes in a Figure*

matplotlib.gridspec.GridSpecBase

class matplotlib.gridspec.**GridSpecBase**(*nrows*, *ncols*, *height_ratios=None*, *width_ratios=None*)

Bases: `object`

A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.

Parameters

nrows, ncols

[int] The number of rows and columns of the grid.

width_ratios

[array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

height_ratios

[array-like of length *nrows*, optional] Defines the relative heights of the rows. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

get_geometry()

Return a tuple containing the number of rows and columns in the grid.

get_grid_positions(*fig*, *raw=<deprecated parameter>*)

Return the positions of the grid cells in figure coordinates.

Parameters

fig

[*Figure*] The figure the grid should be applied to. The subplot parameters (margins and spacing between subplots) are taken from *fig*.

raw

[bool, default: False] If *True*, the subplot parameters of the figure are not taken into account. The grid spans the range [0, 1] in both directions without margins and there is no space between grid cells. This is used for constrained_layout.

Returns

bottoms, tops, lefts, rights

[array] The bottom, top, left, right positions of the grid cells in figure coordinates.

get_height_ratios()
Return the height ratios.

This is *None* if no height ratios have been set explicitly.

get_subplot_params(*figure=None*)

get_width_ratios()
Return the width ratios.

This is *None* if no width ratios have been set explicitly.

property ncols
The number of columns in the grid.

new_subplotspec(*loc*, *rowspan=1*, *colspan=1*)
Create and return a *SubplotSpec* instance.

Parameters

loc

[(int, int)] The position of the subplot in the grid as `(row_index, column_index)`.

rowspan, colspan

[int, default: 1] The number of rows and columns the subplot should span in the grid.

property nrows
The number of rows in the grid.

set_height_ratios(*height_ratios*)
Set the relative heights of the rows.

height_ratios must be of length *nrows*. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`.

set_width_ratios(*width_ratios*)
Set the relative widths of the columns.

width_ratios must be of length *ncols*. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`.

subplots(*, *sharex=False*, *sharey=False*, *squeeze=True*, *subplot_kw=None*)
Add all subplots specified by this *GridSpec* to its parent figure.

See *Figure.subplots* for detailed documentation.

Examples using `matplotlib.gridspec.GridSpecBase`

- *Aligning Labels*
- *Resizing axes with constrained layout*
- *Using Gridspec to make multi-column/row subplot layouts*
- *Nested Gridspecs*
- *GridSpec demo*
- *origin and extent in imshow*
- *Constrained layout guide*
- *Tight layout guide*

matplotlib.gridspec.GridSpecFromSubplotSpec

class matplotlib.gridspec.**GridSpecFromSubplotSpec**(*nrows*, *ncols*, *subplot_spec*, *wspace=None*, *hspace=None*, *height_ratios=None*, *width_ratios=None*)

Bases: `GridSpecBase`

GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

Parameters

nrows, ncols

[int] Number of rows and number of columns of the grid.

subplot_spec

[SubplotSpec] Spec from which the layout parameters are inherited.

wspace, hspace

[float, optional] See `GridSpec` for more details. If not specified default values (from the figure or rcParams) are used.

height_ratios

[array-like of length *nrows*, optional] See `GridSpecBase` for details.

width_ratios

[array-like of length *ncols*, optional] See `GridSpecBase` for details.

get_subplot_params(*figure=None*)

Return a dictionary of subplot layout parameters.

get_topmost_subplotspec()

Return the topmost *SubplotSpec* instance associated with the subplot.

Examples using `matplotlib.gridspec.GridSpecFromSubplotSpec`

- *Resizing axes with constrained layout*
- *Nested Gridspecs*
- *Nested GridSpecs*
- *Constrained layout guide*
- *Arranging multiple Axes in a Figure*

7.2.27 `matplotlib.hatch`

Contains classes for generating hatch patterns.

class matplotlib.hatch.**Circles**(*hatch*, *density*)

Bases: *Shapes*

class matplotlib.hatch.**HatchPatternBase**

Bases: object

The base class for a hatch pattern.

class matplotlib.hatch.**HorizontalHatch**(*hatch*, *density*)

Bases: *HatchPatternBase*

set_vertices_and_codes(*vertices*, *codes*)

class matplotlib.hatch.**LargeCircles**(*hatch*, *density*)

Bases: *Circles*

size = 0.35

class matplotlib.hatch.**NorthEastHatch**(*hatch*, *density*)

Bases: *HatchPatternBase*

set_vertices_and_codes(*vertices*, *codes*)

class matplotlib.hatch.**Shapes**(*hatch*, *density*)

Bases: *HatchPatternBase*

filled = False

set_vertices_and_codes(*vertices*, *codes*)

class matplotlib.hatch.**SmallCircles**(*hatch*, *density*)

Bases: *Circles*

size = 0.2

class matplotlib.hatch.**SmallFilledCircles**(*hatch*, *density*)

Bases: *Circles*

filled = True

size = 0.1

class matplotlib.hatch.**SouthEastHatch**(*hatch*, *density*)

Bases: *HatchPatternBase*

set_vertices_and_codes(*vertices*, *codes*)

class matplotlib.hatch.**Stars**(*hatch*, *density*)

Bases: *Shapes*

filled = True

size = 0.3333333333333333

class matplotlib.hatch.**VerticalHatch**(*hatch*, *density*)

Bases: *HatchPatternBase*

set_vertices_and_codes(*vertices*, *codes*)

matplotlib.hatch.**get_path**(*hatchpattern*, *density=6*)

Given a hatch specifier, *hatchpattern*, generates Path to render the hatch in a unit square. *density* is the number of lines per unit square.

7.2.28 matplotlib.image

The image module supports basic image loading, rescaling and display operations.

class matplotlib.image.**AxesImage**(*ax*, ***, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *extent=None*, *filternorm=True*, *filterrad=4.0*, *resample=False*, *interpolation_stage=None*, ***kwargs*)

Bases: _ImageBase

An image attached to an Axes.

Parameters

ax

[*Axes*] The axes the image will belong to.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: 'viridis')] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*] Maps luminance to 0-1.

interpolation

[str, default: *rcParams["image.interpolation"]* (default: 'antialiased')] Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos', 'blackman'.

interpolation_stage

[{'data', 'rgba'}, default: 'data'] If 'data', interpolation is carried out on the data provided by the user. If 'rgba', the interpolation is carried out after the colormapping has been applied (visual interpolation).

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention 'upper' is typically used for matrices and images.

extent

[tuple, optional] The data axes (left, right, bottom, top) for making image plots registered with data plots. Default is to label the pixel centers with the zero-based row and column indices.

filternorm

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If filternorm is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

filterrad

[float > 0, default: 4] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

resample

[bool, default: False] When True, use a full resampling method. When False, only resample when the output image is larger than the input image.

****kwargs**

[*Artist* properties]

Parameters

norm

[*Normalize* (or subclass thereof) or str or None] The normalizing object which scales data, typically into the interval `[0, 1]`. If a `str`, a *Normalize* subclass is dynamically generated based on the scale with the corresponding name. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

cmap

[str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

get_cursor_data(*event*)

Return the image value at the event position or *None* if the event is outside the image.

See also:

matplotlib.artist.Artist.get_cursor_data

get_extent()

Return the image extent as tuple (left, right, bottom, top).

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) `numpy.uint8` array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[*Affine2D*] The affine transformation from image to pixel space.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *array=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *data=<UNSET>*, *extent=<UNSET>*, *filternorm=<UNSET>*, *filterrad=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *interpolation=<UNSET>*, *interpolation_stage=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *resample=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retu
alpha	float or 2D array-like or None
animated	bool
array	array-like
clim	(vmin: float, vmax: float)
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
cmap	*Colormap* or str or None
data	array-like or PIL.Image.Image
extent	4-tuple of float
figure	*Figure*
filternorm	bool
filterrad	positive float
gid	str
in_layout	bool
interpolation	{'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', '
interpolation_stage	{'data', 'rgba'} or None
label	object
mouseover	bool
norm	*Normalize* or str or None
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
resample	bool or None
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str

Table 63 – continue

Property	Description
visible	bool
zorder	float

set_extent(*extent*, ***kwargs*)

Set the image extent.

Parameters

extent

[4-tuple of float] The position and size of the image as tuple `(left, right, bottom, top)` in data coordinates.

****kwargs**

Other parameters from which unit info (i.e., the *xunits*, *yunits*, *zunits* (for 3D axes), *runits* and *thetaunits* (for polar axes) entries are applied, if present.

Notes

This updates `ax.dataLim`, and, if autoscaling, sets `ax.viewLim` to tightly fit the image, regardless of `dataLim`. Autoscaling state is not changed, so following this with `ax.autoscale_view()` will redo the autoscaling in accord with `dataLim`.

class matplotlib.image.**BboxImage**(*bbox*, *, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *filternorm=True*, *filterrad=4.0*, *resample=False*, ***kwargs*)

Bases: `_ImageBase`

The Image class whose size is determined by the given bbox.

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

kwargs are an optional list of Artist keyword args

contains(*mouseevent*)

Test whether the mouse event occurred within the image.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing

the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) `numpy.uint8` array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[*Affine2D*] The affine transformation from image to pixel space.

set(**, agg_filter=<UNSET>, alpha=<UNSET>, animated=<UNSET>, array=<UNSET>, clim=<UNSET>, clip_box=<UNSET>, clip_on=<UNSET>, clip_path=<UNSET>, cmap=<UNSET>, data=<UNSET>, filternorm=<UNSET>, filterrad=<UNSET>, gid=<UNSET>, in_layout=<UNSET>, interpolation=<UNSET>, interpolation_stage=<UNSET>, label=<UNSET>, mouseover=<UNSET>, norm=<UNSET>, path_effects=<UNSET>, picker=<UNSET>, rasterized=<UNSET>, resample=<UNSET>, sketch_params=<UNSET>, snap=<UNSET>, transform=<UNSET>, url=<UNSET>, visible=<UNSET>, zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

class matplotlib.image.**FigureImage**(*fig*, *, *cmap=None*, *norm=None*, *offsetx=0*, *offsety=0*, *origin=None*, ***kwargs*)

Bases: _ImageBase

An image attached to a figure.

cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1

kwargs are an optional list of Artist keyword args

get_extent()

Return the image extent as tuple (left, right, bottom, top).

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) numpy.uint8 array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[*Affine2D*] The affine transformation from image to pixel space.

zorder	float

set_data(*A*)

Set the image array.

zorder = 0

class matplotlib.image.**NonUniformImage**(*ax*, *, *interpolation='nearest'*, ***kwargs*)

Bases: *AxesImage*

Parameters

ax

[*Axes*] The axes the image will belong to.

interpolation

[{'nearest', 'bilinear'}, default: 'nearest'] The interpolation scheme used in the resampling.

****kwargs**

All other keyword arguments are identical to those of *AxesImage*.

get_extent()

Return the image extent as tuple (left, right, bottom, top).

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) numpy.uint8 array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[*Affine2D*] The affine transformation from image to pixel space.

mouseover = False

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *array=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *data=<UNSET>*, *extent=<UNSET>*, *filternorm=<UNSET>*, *filterrad=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *interpolation=<UNSET>*, *interpolation_stage=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *resample=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Table 66 – continued from previou

Property	Description
url	str
visible	bool
zorder	float

set_array(**args*)

Retained for backwards compatibility - use set_data instead.

Parameters

A

[array-like]

set_cmap(*cmap*)

Set the colormap for luminance data.

Parameters

cmap

[*Colormap* or str or None]

set_data(*x*, *y*, *A*)

Set the grid for the pixel centers, and the pixel values.

Parameters

x, y

[1D array-like] Monotonic arrays of shapes (N,) and (M,), respectively, specifying pixel centers.

A

[array-like] (M, N) `ndarray` or masked array of values to be colormapped, or (M, N, 3) RGB array, or (M, N, 4) RGBA array.

set_filternorm(*filternorm*)

Set whether the resize filter normalizes the weights.

See help for *imshow*.

Parameters

filternorm

[bool]

set_filterrad(*filterrad*)

Set the resize filter radius only applicable to some interpolation schemes -- see help for imshow

Parameters

filterrad

[positive float]

set_interpolation(*s*)

Parameters

s

[{'nearest', 'bilinear'} or None] If None, use *rcParams["image.interpolation"]* (default: `'antialiased'`).

set_norm(*norm*)

Set the normalization instance.

Parameters

norm

[*Normalize* or str or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

class matplotlib.image.**PcolorImage**(*ax*, *x=None*, *y=None*, *A=None*, ***, *cmap=None*, *norm=None*, ***kwargs*)

Bases: *AxesImage*

Make a pcolor-style plot with an irregular rectangular grid.

This uses a variation of the original irregular image code, and it is used by pcolorfast for the corresponding grid type.

Parameters

ax

[*Axes*] The axes the image will belong to.

x, y

[1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to `range(N + 1)` and `range(M + 1)`, respectively.

A

[array-like] The data to be color-coded. The interpretation depends on the shape:

- (M, N) `ndarray` or masked array: values to be colormapped
- (M, N, 3): RGB array
- (M, N, 4): RGBA array

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: `'viridis'`)] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

[str or *Normalize*] Maps luminance to 0-1.

****kwargs**

[*Artist* properties]

get_cursor_data(*event*)

Return the image value at the event position or *None* if the event is outside the image.

See also:

matplotlib.artist.Artist.get_cursor_data

make_image(*renderer*, *magnification=1.0*, *unsampled=False*)

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) `numpy.uint8` array] The RGBA image, resampled unless *unsampled* is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[*Affine2D*] The affine transformation from image to pixel space.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *array=<UNSET>*, *clim=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *cmap=<UNSET>*, *data=<UNSET>*, *extent=<UNSET>*, *filternorm=<UNSET>*, *filterrad=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *interpolation=<UNSET>*, *interpolation_stage=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *norm=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *resample=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

set_array(**args*)

Retained for backwards compatibility - use set_data instead.

Parameters

A

[array-like]

set_data(*x*, *y*, *A*)

Set the grid for the rectangle boundaries, and the data values.

Parameters

x, y

[1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to `range(N + 1)` and `range(M + 1)`, respectively.

A

[array-like] The data to be color-coded. The interpretation depends on the shape:

- (M, N) `ndarray` or masked array: values to be colormapped
- (M, N, 3): RGB array
- (M, N, 4): RGBA array

matplotlib.image.**composite_images**(*images*, *renderer*, *magnification=1.0*)

Composite a number of RGBA images into one. The images are composited in the order in which they appear in the *images* list.

Parameters

images

[list of Images] Each must have a `make_image` method. For each image, `can_composite` should return `True`, though this is not enforced by this function. Each image must have a purely affine transformation with no shear.

renderer

[*RendererBase*]

magnification

[float, default: 1] The additional magnification to apply for the renderer in use.

Returns

image

[(M, N, 4) `numpy.uint8` array] The composited RGBA image.

offset_x, offset_y

[float] The (left, bottom) offset where the composited image should be placed in the output figure.

matplotlib.image.**imread**(*fname*, *format=None*)

Read an image from a file into an array.

Note: This function exists for historical reasons. It is recommended to use `PIL.Image.open` instead for loading images.

Parameters

fname

[str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

Passing a URL is deprecated. Please open the URL for reading and pass the result to Pillow, e.g. with `np.array(PIL.Image.open(urllib.request.urlopen(url)))`.

format

[str, optional] The image file format assumed for reading the data. The image is loaded as a PNG file if *format* is set to "png", if *fname* is a path or opened file with a ".png" extension, or if it is a URL. In all other cases, *format* is ignored and the format is auto-detected by `PIL.Image.open`.

Returns

numpy.array

The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

PNG images are returned as float arrays (0-1). All other formats are returned as int arrays, with a bit depth determined by the file's contents.

matplotlib.image.**imsave**(*fname*, *arr*, *vmin=None*, *vmax=None*, *cmap=None*, *format=None*, *origin=None*, *dpi=100*, ***, *metadata=None*, *pil_kwargs=None*)

Colormap and save an array as an image file.

RGB(A) images are passed through. Single channel images will be colormapped according to *cmap* and *norm*.

Note: If you want to save a single channel image as gray scale please use an image I/O library (such as pillow, tifffile, or imageio) directly.

Parameters

fname

[str or path-like or file-like] A path or a file-like object to store the image in. If *format* is not set, then the output format is inferred from the extension of *fname*, if any, and from *rcParams["savefig.format"]* (default: 'png') otherwise. If *format* is set, it determines the output format.

arr

[array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

vmin, vmax

[float, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

cmap

[str or *Colormap*, default: *rcParams["image.cmap"]* (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

format

[str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

origin

[{'upper', 'lower'}, default: *rcParams["image.origin"]* (default: 'upper')] Indicates whether the `(0, 0)` index of the array is in the upper left or lower left corner of the axes.

dpi

[float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

metadata

[dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information. Currently only supported for "png", "pdf", "ps", "eps", and "svg".

pil_kwargs

[dict, optional] Keyword arguments passed to `PIL.Image.Image.save`. If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

matplotlib.image.**pil_to_array**(*pilImage*)

Load a PIL image and return it as a numpy int array.

Returns

numpy.array

The array shape depends on the image type:

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

matplotlib.image.**thumbnail**(*infile*, *thumbfile*, *scale=0.1*, *interpolation='bilinear'*, *preview=False*)

Make a thumbnail of image in *infile* with output filename *thumbfile*.

See *Image Thumbnail*.

Parameters

infile

[str or file-like] The image file. Matplotlib relies on Pillow for image reading, and thus supports a wide range of file formats, including PNG, JPG, TIFF and others.

thumbfile

[str or file-like] The thumbnail filename.

scale

[float, default: 0.1] The scale factor for the thumbnail.

interpolation

[str, default: 'bilinear'] The interpolation scheme used in the resampling. See the *interpolation* parameter of `imshow` for possible values.

preview

[bool, default: False] If True, the default backend (presumably a user interface backend) will be used which will cause a figure to be raised if `show` is called. If it is False, the figure is created using `FigureCanvasBase` and the drawing backend is selected as `Figure.savefig` would normally do.

Returns

Figure

The figure instance containing the thumbnail.

7.2.29 matplotlib.layout_engine

Classes to layout elements in a *Figure*.

Figures have a `layout_engine` property that holds a subclass of *LayoutEngine* defined here (or *None* for no layout). At draw time `figure.get_layout_engine().execute()` is called, the goal of which is usually to rearrange Axes on the figure to produce a pleasing layout. This is like a `draw` callback but with two differences. First, when printing we disable the layout engine for the final draw. Second, it is useful to know the layout engine while the figure is being created. In particular, colorbars are made differently with different layout engines (for historical reasons).

Matplotlib supplies two layout engines, *TightLayoutEngine* and *ConstrainedLayoutEngine*. Third parties can create their own layout engine by subclassing *LayoutEngine*.

class matplotlib.layout_engine.**ConstrainedLayoutEngine**(*, *h_pad=None*, *w_pad=None*, *hspace=None*, *wspace=None*, *rect=(0, 0, 1, 1)*, *compress=False*, ***kwargs*)

Implements the `constrained_layout` geometry management. See *Constrained layout guide* for details.

Initialize `constrained_layout` settings.

Parameters

h_pad, w_pad

[float] Padding around the axes elements in inches. Default to *rcParams["figure.constrained_layout.h_pad"]* (default: `0.04167`) and *rcParams["figure.constrained_layout.w_pad"]* (default: `0.04167`).

hspace, wspace

[float] Fraction of the figure to dedicate to space between the axes. These are evenly spread between the gaps between the axes. A value of 0.2 for a three-column layout would have a space of 0.1 of the figure width between each column. If h/wspace < h/w_pad, then the pads are used instead. Default to *rcParams["figure.constrained_layout.hspace"]* (default: `0.02`) and *rcParams["figure.constrained_layout.wspace"]* (default: `0.02`).

rect

[tuple of 4 floats] Rectangle in figure coordinates to perform constrained layout in (left, bottom, width, height), each from 0-1.

compress

[bool] Whether to shift Axes so that white space in between them is removed. This is useful for simple grids of fixed-aspect Axes (e.g. a grid of images). See *Grids of fixed aspect-ratio Axes: "compressed" layout*.

property adjust_compatible

Return a boolean if the layout engine is compatible with `subplots_adjust`.

property colorbar_gridspec

Return a boolean if the layout engine creates colorbars using a gridspec.

execute(*fig*)

Perform constrained_layout and move and resize axes accordingly.

Parameters

fig

[`Figure` to perform layout on.]

get()

Return copy of the parameters for the layout engine.

set(*, *h_pad=None*, *w_pad=None*, *hspace=None*, *wspace=None*, *rect=None*)

Set the pads for constrained_layout.

Parameters

h_pad, w_pad

[float] Padding around the axes elements in inches. Default to `rcParams["figure.constrained_layout.h_pad"]` (default: `0.04167`) and `rcParams["figure.constrained_layout.w_pad"]` (default: `0.04167`).

hspace, wspace

[float] Fraction of the figure to dedicate to space between the axes. These are evenly spread between the gaps between the axes. A value of 0.2 for a three-column layout would have a space of 0.1 of the figure width between each column. If h/wspace < h/w_pad, then the pads are used instead. Default to `rcParams["figure.constrained_layout.hspace"]` (default: `0.02`) and `rcParams["figure.constrained_layout.wspace"]` (default: `0.02`).

rect

[tuple of 4 floats] Rectangle in figure coordinates to perform constrained layout in (left, bottom, width, height), each from 0-1.

class matplotlib.layout_engine.**LayoutEngine**(***kwargs*)

Base class for Matplotlib layout engines.

A layout engine can be passed to a figure at instantiation or at any time with *set_layout_engine*. Once attached to a figure, the layout engine `execute` function is called at draw time by *draw*, providing a special draw-time hook.

Note: However, note that layout engines affect the creation of colorbars, so *set_layout_engine* should be called before any colorbars are created.

Currently, there are two properties of *LayoutEngine* classes that are consulted while manipulating the figure:

- **engine.colorbar_gridspec tells *Figure.colorbar* whether to make the**

  axes using the gridspec method (see *colorbar.make_axes_gridspec*) or not (see *colorbar.make_axes*);

- **engine.adjust_compatible stops *Figure.subplots_adjust* from being**

  run if it is not compatible with the layout engine.

To implement a custom *LayoutEngine*:

1. override `_adjust_compatible` and `_colorbar_gridspec`
2. override *LayoutEngine.set* to update *self._params*
3. override *LayoutEngine.execute* with your implementation

property adjust_compatible

Return a boolean if the layout engine is compatible with *subplots_adjust*.

property colorbar_gridspec

Return a boolean if the layout engine creates colorbars using a gridspec.

execute(*fig*)

Execute the layout on the figure given by *fig*.

get()

Return copy of the parameters for the layout engine.

set(***kwargs*)

Set the parameters for the layout engine.

class matplotlib.layout_engine.**PlaceHolderLayoutEngine**(*adjust_compatible*, *colorbar_gridspec*, ***kwargs*)

This layout engine does not adjust the figure layout at all.

The purpose of this *LayoutEngine* is to act as a placeholder when the user removes a layout engine to ensure an incompatible *LayoutEngine* cannot be set later.

Parameters

adjust_compatible, colorbar_gridspec

[bool] Allow the PlaceHolderLayoutEngine to mirror the behavior of whatever layout engine it is replacing.

property adjust_compatible

Return a boolean if the layout engine is compatible with *subplots_adjust*.

property colorbar_gridspec

Return a boolean if the layout engine creates colorbars using a gridspec.

execute(*fig*)

Do nothing.

get()

Return copy of the parameters for the layout engine.

set(***kwargs*)

Set the parameters for the layout engine.

class matplotlib.layout_engine.**TightLayoutEngine**(*, *pad=1.08*, *h_pad=None*, *w_pad=None*, *rect=(0, 0, 1, 1)*, ***kwargs*)

Implements the `tight_layout` geometry management. See *Tight layout guide* for details.

Initialize tight_layout engine.

Parameters

pad

[float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

h_pad, w_pad

[float] Padding (height/width) between edges of adjacent subplots. Defaults to *pad*.

rect

[tuple (left, bottom, right, top), default: (0, 0, 1, 1).] rectangle in normalized figure coordinates that the subplots (including labels) will fit into.

property adjust_compatible

Return a boolean if the layout engine is compatible with *subplots_adjust*.

property colorbar_gridspec

Return a boolean if the layout engine creates colorbars using a gridspec.

execute(*fig*)

Execute tight_layout.

This decides the subplot parameters given the padding that will allow the axes labels to not be covered by other labels and axes.

Parameters

fig

[*Figure* to perform layout on.]

See also:

figure.Figure.tight_layout
pyplot.tight_layout

get()

Return copy of the parameters for the layout engine.

set(*, *pad=None*, *w_pad=None*, *h_pad=None*, *rect=None*)

Set the pads for tight_layout.

Parameters

pad

[float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

w_pad, h_pad

[float] Padding (width/height) between edges of adjacent subplots. Defaults to *pad*.

rect

[tuple (left, bottom, right, top)] rectangle in normalized figure coordinates that the subplots (including labels) will fit into.

7.2.30 matplotlib.legend

The legend module defines the Legend class, which is responsible for drawing legends associated with axes and/or figures.

Important: It is unlikely that you would ever create a Legend instance manually. Most users would normally create a legend via the *legend* function. For more details on legends there is also a *legend guide*.

The *Legend* class is a container of legend handles and legend texts.

The legend handler map specifies how to create legend handles from artists (lines, patches, etc.) in the axes or figures. Default legend handlers are defined in the *legend_handler* module. While not all artist types are covered by the default legend handlers, custom legend handlers can be defined to support arbitrary objects.

See the :ref`<legend_guide>` for more information.

class matplotlib.legend.**DraggableLegend**(*legend*, *use_blit=False*, *update='loc'*)

Bases: *DraggableOffsetBox*

Wrapper around a *Legend* to support mouse dragging.

Parameters

legend

[*Legend*] The *Legend* instance to wrap.

use_blit

[bool, optional] Use blitting for faster image composition. For details see *FuncAnimation*.

update

[{'loc', 'bbox'}, optional] If "loc", update the *loc* parameter of the legend upon finalizing. If "bbox", update the *bbox_to_anchor* parameter.

finalize_offset()

class matplotlib.legend.**Legend**(*parent*, *handles*, *labels*, ***, *loc=None*, *numpoints=None*, *markerscale=None*, *markerfirst=True*, *reverse=False*, *scatterpoints=None*, *scatteryoffsets=None*, *prop=None*, *fontsize=None*, *labelcolor=None*, *borderpad=None*, *labelspacing=None*, *handlelength=None*, *handleheight=None*, *handletextpad=None*, *borderaxespad=None*, *columnspacing=None*, *ncols=1*, *mode=None*, *fancybox=None*, *shadow=None*, *title=None*, *title_fontsize=None*, *framealpha=None*, *edgecolor=None*, *facecolor=None*, *bbox_to_anchor=None*, *bbox_transform=None*, *frameon=None*, *handler_map=None*, *title_fontproperties=None*, *alignment='center'*, *ncol=1*, *draggable=False*)

Bases: *Artist*

Place a legend on the figure/axes.

Parameters

parent

[*Axes* or *Figure*] The artist that contains the legend.

handles

[list of (*Artist* or tuple of *Artist*)] A list of Artists (lines, patches) to be added to the legend.

labels

[list of str] A list of labels to show next to the artists. The length of handles and labels should be the same. If they are not, they are truncated to the length of the shorter list.

Other Parameters

loc

[str or pair of floats, default: *rcParams["legend.loc"]* (default: 'best') for Axes, 'upper right' for Figure] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes/figure coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" location can also be given as a numeric value:

Location String	Location Code
'best' (Axes only)	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

If a figure is using the constrained layout manager, the string codes of the *loc* keyword argument can get better layout behaviour using the prefix 'outside'. There is ambiguity at the corners, so 'outside upper right' will make space for the legend above the rest of the axes in the layout, and 'outside right upper' will make space on the right side of the layout. In addition to the values of *loc* listed above, we have 'outside right upper', 'outside right lower', 'outside left upper', and 'outside left lower'. See *Legend guide* for more details.

bbox_to_anchor

[*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox_transform*, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncols

[int, default: 1] The number of columns that the legend has.

For backward compatibility, the spelling *ncol* is also supported but it is discouraged. If both are given, *ncols* takes precedence.

prop

[None or *FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

labelcolor

[str or list, default: *rcParams["legend.labelcolor"]* (default: `'None'`)] The color of the text in the legend. Either a valid color string (for

example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

Labelcolor can be set globally using *rcParams["legend.labelcolor"]* (default: 'None'). If None, use *rcParams["text.color"]* (default: 'black').

numpoints

[int, default: *rcParams["legend.numpoints"]* (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

scatterpoints

[int, default: *rcParams["legend.scatterpoints"]* (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

scatteryoffsets

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

markerscale

[float, default: *rcParams["legend.markerscale"]* (default: 1.0)] The relative size of legend markers compared to the originally drawn ones.

markerfirst

[bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

reverse

[bool, default: False] If *True*, the legend labels are displayed in reverse order from the input. If *False*, the legend labels are displayed in the same order as the input.

New in version 3.7.

frameon

[bool, default: *rcParams["legend.frameon"]* (default: True)] Whether the legend should be drawn on a patch (frame).

fancybox

[bool, default: *rcParams["legend.fancybox"]* (default: True)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

shadow

[None, bool or dict, default: *rcParams["legend.shadow"]* (default: False)] Whether to draw a shadow behind the legend. The shadow can be

configured using *Patch* keywords. Customization via *rcParams["legend.shadow"]* (default: False) is currently not supported.

framealpha

[float, default: *rcParams["legend.framealpha"]* (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

facecolor

["inherit" or color, default: *rcParams["legend.facecolor"]* (default: 'inherit')] The legend's background color. If "inherit", use *rcParams["axes.facecolor"]* (default: 'white').

edgecolor

["inherit" or color, default: *rcParams["legend.edgecolor"]* (default: '0.8')] The legend's background patch edge color. If "inherit", use take *rcParams["axes.edgecolor"]* (default: 'black').

mode

[{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox_to_anchor* if defines the legend's size).

bbox_transform

[None or *Transform*] The transform for the bounding box (*bbox_to_anchor*). For a value of None (default) the Axes' transAxes transform will be used.

title

[str or None] The legend's title. Default is no title (None).

title_fontproperties

[None or *FontProperties* or dict] The font properties of the legend's title. If None (default), the *title_fontsize* argument will be used if present; if *title_fontsize* is also None, the current *rcParams["legend.title_fontsize"]* (default: None) will be used.

title_fontsize

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: *rcParams["legend.title_fontsize"]* (default: None)] The font size of the legend's title. Note: This cannot be combined with *title_fontproperties*. If you want to set the fontsize alongside other font properties, use the *size* parameter in *title_fontproperties*.

alignment

[{'center', 'left', 'right'}, default: 'center'] The alignment of the legend title and the box of entries. The entries are aligned as a single block, so that markers always lined up.

borderpad

[float, default: *rcParams["legend.borderpad"]* (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: *rcParams["legend.labelspacing"]* (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: *rcParams["legend.handlelength"]* (default: 2.0)] The length of the legend handles, in font-size units.

handleheight

[float, default: *rcParams["legend.handleheight"]* (default: 0.7)] The height of the legend handles, in font-size units.

handletextpad

[float, default: *rcParams["legend.handletextpad"]* (default: 0.8)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: *rcParams["legend.borderaxespad"]* (default: 0.5)] The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: *rcParams["legend.columnspacing"]* (default: 2.0)] The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

draggable

[bool, default: False] Whether the legend can be dragged with the mouse.

Attributes

legend_handles

List of *Artist* objects added as legend entries.

New in version 3.7.

```
codes = {'best': 0, 'center': 10, 'center left': 6, 'center
right': 7, 'lower center': 8, 'lower left': 3, 'lower right': 4,
'right': 5, 'upper center': 9, 'upper left': 2, 'upper right': 1}
```

contains(*mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

draw_frame(*b*)

Set whether the legend box patch is drawn.

Parameters

b

[bool]

get_alignment()

Get the alignment value of the legend box

get_bbox_to_anchor()

Return the bbox that the legend will be anchored to.

get_children()

Return a list of the child *Artist*s of this *Artist*.

classmethod get_default_handler_map()

Return the global default handler map, shared by all legends.

get_draggable()

Return `True` if the legend is draggable, `False` otherwise.

get_frame()

Return the *Rectangle* used to frame the legend.

get_frame_on()

Get whether the legend box patch is drawn.

static get_legend_handler(*legend_handler_map*, *orig_handle*)

Return a legend handler from *legend_handler_map* that corresponds to *orig_handler*.

legend_handler_map should be a dictionary object (that is returned by the get_legend_handler_map method).

It first checks if the *orig_handle* itself is a key in the *legend_handler_map* and return the associated value. Otherwise, it checks for each of the classes in its method-resolution-order. If no matching key is found, it returns `None`.

get_legend_handler_map()

Return this legend instance's handler map.

get_lines()

Return the list of *Line2D*s in the legend.

get_patches()

Return the list of *Patch*s in the legend.

get_texts()

Return the list of *Text*s in the legend.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_title()

Return the *Text* instance for the legend title.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

property legendHandles

[*Deprecated*]

Notes

Deprecated since version 3.7: Use legend_handles instead.

set(*, *agg_filter=<UNSET>*, *alignment=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *draggable=<UNSET>*, *frame_on=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *loc=<UNSET>*, *mouseover=<UNSET>*, *ncols=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *title=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alignment	{'center', 'left', 'right'}.
alpha	scalar or None
animated	bool
*bbox_to_*	*BboxBase* or tuple
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
draggable	bool
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
loc	str or pair of floats, default: *rcParams["legend.loc"]* (default: `'best'`) for Axes, 'upper right' for Figure
mouseover	bool
ncols	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_p	(scale: float, length: float, randomness: float)
snap	bool or None
title	str
transform	*Transform*
url	str
visible	bool
zorder	float

set_alignment(*alignment*)

Set the alignment of the legend title and the box of entries.

The entries are aligned as a single block, so that markers always lined up.

Parameters

alignment

[{'center', 'left', 'right'}.]

set_bbox_to_anchor(*bbox*, *transform=None*)

Set the bbox that the legend will be anchored to.

Parameters

bbox

[*BboxBase* or tuple] The bounding box can be specified in the following ways:

- A *BboxBase* instance
- A tuple of `(left, bottom, width, height)` in the given transform (normalized axes coordinate if None)
- A tuple of `(left, bottom)` where the width and height will be assumed to be zero.
- *None*, to remove the bbox anchoring, and use the parent bbox.

transform

[*Transform*, optional] A transform to apply to the bounding box. If not specified, this will use a transform to the bounding box of the parent.

classmethod set_default_handler_map(*handler_map*)

Set the global default handler map, shared by all legends.

set_draggable(*state*, *use_blit=False*, *update='loc'*)

Enable or disable mouse dragging support of the legend.

Parameters

state

[bool] Whether mouse dragging is enabled.

use_blit

[bool, optional] Use blitting for faster image composition. For details see *FuncAnimation*.

update

[{'loc', 'bbox'}, optional] The legend parameter to be changed when dragged:

- 'loc': update the *loc* parameter of the legend
- 'bbox': update the *bbox_to_anchor* parameter of the legend

Returns

DraggableLegend* or *None

If *state* is `True` this returns the *DraggableLegend* helper instance. Otherwise this returns *None*.

set_frame_on(*b*)

Set whether the legend box patch is drawn.

Parameters

b

[bool]

set_loc(*loc=None*)

Set the location of the legend.

New in version 3.8.

Parameters

loc

[str or pair of floats, default: *rcParams["legend.loc"]* (default: `'best'`) for Axes, 'upper right' for Figure] The location of the legend.

The strings `'upper left'`, `'upper right'`, `'lower left'`, `'lower right'` place the legend at the corresponding corner of the axes/figure.

The strings `'upper center'`, `'lower center'`, `'center left'`, `'center right'` place the legend at the center of the corresponding edge of the axes/figure.

The string `'center'` places the legend at the center of the axes/figure.

The string `'best'` places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes/figure coordinates (in which case *bbox_to_anchor* will be ignored).

For back-compatibility, `'center right'` (but no other location) can also be spelled `'right'`, and each "string" location can also be given as a numeric value:

Location String	Location Code
'best' (Axes only)	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

If a figure is using the constrained layout manager, the string codes of the *loc* keyword argument can get better layout behaviour using the prefix 'outside'. There is ambiguity at the corners, so 'outside upper right' will make space for the legend above the rest of the axes in the layout, and 'outside right upper' will make space on the right side of the layout. In addition to the values of *loc* listed above, we have 'outside right upper', 'outside right lower', 'outside left upper', and 'outside left lower'. See *Legend guide* for more details.

set_ncols(*ncols*)

Set the number of columns.

set_title(*title*, *prop=None*)

Set legend title and title style.

Parameters

title

[str] The legend title.

prop

[*font_manager.FontProperties* or `str` or `pathlib.Path`] The font properties of the legend title. If a `str`, it is interpreted as a fontconfig pattern parsed by *FontProperties*. If a `pathlib.Path`, it is interpreted as the absolute path to a font file.

classmethod update_default_handler_map(*handler_map*)

Update the global default handler map, shared by all legends.

zorder = 5

7.2.31 matplotlib.legend_handler

Default legend handlers.

Important: This is a low-level legend API, which most end users do not need.

We recommend that you are familiar with the *legend guide* before reading this documentation.

Legend handlers are expected to be a callable object with a following signature:

```
legend_handler(legend, orig_handle, fontsize, handlebox)
```

Where *legend* is the legend itself, *orig_handle* is the original plot, *fontsize* is the fontsize in pixels, and *handlebox* is an `OffsetBox` instance. Within the call, you should create relevant artists (using relevant properties from the *legend* and/or *orig_handle*) and add them into the *handlebox*. The artists need to be scaled according to the *fontsize* (note that the size is in pixels, i.e., this is dpi-scaled value).

This module includes definition of several legend handler classes derived from the base class (HandlerBase) with the following method:

```
def legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

class matplotlib.legend_handler.**HandlerBase**(*xpad=0.0*, *ypad=0.0*, *update_func=None*)

A base class for default legend handlers.

The derived classes are meant to override *create_artists* method, which has the following signature:

```
def create_artists(self, legend, orig_handle,
                   xdescent, ydescent, width, height, fontsize,
                   trans):
```

The overridden method needs to create artists of the given transform that fits in the given dimension (xdescent, ydescent, width, height) that are scaled by fontsize if necessary.

Parameters

xpad

[float, optional] Padding in x-direction.

ypad

[float, optional] Padding in y-direction.

update_func

[callable, optional] Function for updating the legend handler properties from another legend handler, used by `update_prop`.

adjust_drawing_area(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

legend_artist(*legend*, *orig_handle*, *fontsize*, *handlebox*)

Return the artist that this HandlerBase generates for the given original artist/handle.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*matplotlib.artist.Artist* or similar] The object for which these legend artists are being created.

fontsize

[int] The fontsize in pixels. The artists being created should be scaled according to the given fontsize.

handlebox

[*OffsetBox*] The box which has been created to hold this legend entry's artists. Artists created in the *legend_artist* method must be added to this handlebox inside this method.

update_prop(*legend_handle*, *orig_handle*, *legend*)

class matplotlib.legend_handler.**HandlerCircleCollection**(*yoffsets=None*, *sizes=None*, ***kwargs*)

Handler for *CircleCollection*s.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerNpoints*.

create_collection(*orig_handle*, *sizes*, *offsets*, *offset_transform*)

class matplotlib.legend_handler.**HandlerErrorbar**(*xerr_size=0.5*, *yerr_size=None*, *marker_pad=0.3*, *numpoints=None*, ***kwargs*)

Handler for Errorbars.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerBase*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

get_err_size(*legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class matplotlib.legend_handler.**HandlerLine2D**(*marker_pad=0.3*, *numpoints=None*, ***kwargs*)

Handler for *Line2D* instances.

See also:

HandlerLine2DCompound

An earlier handler implementation, which used one artist for the line and another for the marker(s).

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerBase*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

class matplotlib.legend_handler.**HandlerLine2DCompound**(*marker_pad=0.3*, *numpoints=None*, ***kwargs*)

Original handler for *Line2D* instances, that relies on combining a line-only with a marker-only artist. May be deprecated in the future.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerBase*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

class matplotlib.legend_handler.**HandlerLineCollection**(*marker_pad=0.3*, *numpoints=None*, ***kwargs*)

Handler for *LineCollection* instances.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerBase*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

get_numpoints(*legend*)

class matplotlib.legend_handler.**HandlerNpoints**(*marker_pad=0.3*, *numpoints=None*, ***kwargs*)

A legend handler that shows *numpoints* points in the legend entry.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerBase*.

get_numpoints(*legend*)

get_xdata(*legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class matplotlib.legend_handler.**HandlerNpointsYoffsets**(*numpoints=None*, *yoffsets=None*, ***kwargs*)

A legend handler that shows *numpoints* in the legend, and allows them to be individually offset in the y-direction.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerNpoints*.

get_ydata(*legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class matplotlib.legend_handler.**HandlerPatch**(*patch_func=None*, ***kwargs*)

Handler for *Patch* instances.

Parameters

patch_func

[callable, optional] The function that creates the legend key artist. *patch_func* should have the signature:

```
def patch_func(legend=legend, orig_handle=orig_handle,
               xdescent=xdescent, ydescent=ydescent,
               width=width, height=height,␣
↪fontsize=fontsize)
```

Subsequently, the created artist will have its `update_prop` method called and the appropriate transform will be applied.

****kwargs**

Keyword arguments forwarded to *HandlerBase*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

class matplotlib.legend_handler.**HandlerPathCollection**(*yoffsets=None*, *sizes=None*, ***kwargs*)

Handler for *PathCollection*s, which are used by *scatter*.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerNpoints*.

create_collection(*orig_handle*, *sizes*, *offsets*, *offset_transform*)

class matplotlib.legend_handler.**HandlerPolyCollection**(*xpad=0.0*, *ypad=0.0*, *update_func=None*)

Handler for *PolyCollection* used in *fill_between* and *stackplot*.

Parameters

xpad

[float, optional] Padding in x-direction.

ypad

[float, optional] Padding in y-direction.

update_func

[callable, optional] Function for updating the legend handler properties from another legend handler, used by *update_prop*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

class matplotlib.legend_handler.**HandlerRegularPolyCollection**(*yoffsets=None*, *sizes=None*, ***kwargs*)

Handler for *RegularPolyCollection*s.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length *numpoints* list of y offsets for each point in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerNpoints*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

create_collection(*orig_handle*, *sizes*, *offsets*, *offset_transform*)

get_numpoints(*legend*)

get_sizes(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

update_prop(*legend_handle*, *orig_handle*, *legend*)

class matplotlib.legend_handler.**HandlerStem**(*marker_pad=0.3*, *numpoints=None*, *bottom=None*, *yoffsets=None*, ***kwargs*)

Handler for plots produced by *stem*.

Parameters

marker_pad

[float, default: 0.3] Padding between points in legend entry.

numpoints

[int, optional] Number of points to show in legend entry.

bottom

[float, optional]

yoffsets

[array of floats, optional] Length *numpoints* list of y offsets for each point in legend entry.

****kwargs**

Keyword arguments forwarded to *HandlerNpointsYoffsets*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

get_ydata(*legend*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*)

class matplotlib.legend_handler.**HandlerStepPatch**(*xpad=0.0*, *ypad=0.0*, *update_func=None*)

Handler for *StepPatch* instances.

Parameters

xpad

[float, optional] Padding in x-direction.

ypad

[float, optional] Padding in y-direction.

update_func

[callable, optional] Function for updating the legend handler properties from another legend handler, used by *update_prop*.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[*Legend*] The legend for which these legend artists are being created.

orig_handle

[*Artist* or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[*Transform*] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

class matplotlib.legend_handler.**HandlerTuple**(*ndivide=1*, *pad=None*, ***kwargs*)

Handler for Tuple.

Parameters

ndivide

[int or None, default: 1] The number of sections to divide the legend area into. If None, use the length of the input tuple.

pad

[float, default: `rcParams["legend.borderpad"]` (default: `0.4`)] Padding in units of fraction of font size.

****kwargs**

Keyword arguments forwarded to `HandlerBase`.

create_artists(*legend*, *orig_handle*, *xdescent*, *ydescent*, *width*, *height*, *fontsize*, *trans*)

Return the legend artists generated.

Parameters

legend

[`Legend`] The legend for which these legend artists are being created.

orig_handle

[`Artist` or similar] The object for which these legend artists are being created.

xdescent, ydescent, width, height

[int] The rectangle (*xdescent*, *ydescent*, *width*, *height*) that the legend artists being created should fit within.

fontsize

[int] The fontsize in pixels. The legend artists being created should be scaled according to the given fontsize.

trans

[`Transform`] The transform that is applied to the legend artists being created. Typically from unit coordinates in the handler box to screen coordinates.

matplotlib.legend_handler.**update_from_first_child**(*tgt*, *src*)

7.2.32 matplotlib.lines

2D lines with support for a variety of line styles, markers, colors, etc.

Classes

Line2D(xdata, ydata, *[, linewidth, ...])	A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex.
VertexSelector(line)	Manage the callbacks to maintain a list of selected vertices for *Line2D*.
AxLine(xy1, xy2, slope, **kwargs)	A helper class that implements *axline*, by recomputing the artist transform at draw time.

matplotlib.lines.Line2D

class matplotlib.lines.**Line2D**(*xdata*, *ydata*, *, *linewidth=None*, *linestyle=None*, *color=None*, *gapcolor=None*, *marker=None*, *markersize=None*, *markeredgewidth=None*, *markeredgecolor=None*, *markerfacecolor=None*, *markerfacecoloralt='none'*, *fillstyle=None*, *antialiased=None*, *dash_capstyle=None*, *solid_capstyle=None*, *dash_joinstyle=None*, *solid_joinstyle=None*, *pickradius=5*, *drawstyle=None*, *markevery=None*, **kwargs*)

Bases: *Artist*

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex. Additionally, the drawing of the solid line is influenced by the drawstyle, e.g., one can create "stepped" lines in various styles.

Create a *Line2D* instance with *x* and *y* data in sequences of *xdata*, *ydata*.

Additional keyword arguments are *Line2D* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
figure	*Figure*

Table 68 – continued from previou

Property	Description
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, float) or list[
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

See *set_linestyle()* for a description of the line styles, *set_marker()* for a description of the markers, and *set_drawstyle()* for a description of the draw styles.

contains(*mouseevent*)

Test whether *mouseevent* occurred on the line.

An event is deemed to have occurred "on" the line if it is less than `self.pickradius` (default: 5 points) away from it. Use *get_pickradius* or *set_pickradius* to get or set the pick radius.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] A dictionary `{'ind': pointlist}`, where *pointlist* is a list of points of the line that are within the pickradius around the event position.

TODO: sort returned indices by distance

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

drawStyleKeys = ['default', 'steps-mid', 'steps-pre', 'steps-post', 'steps']

drawStyles = {'default': '_draw_lines', 'steps': '_draw_steps_pre', 'steps-mid': '_draw_steps_mid', 'steps-post': '_draw_steps_post', 'steps-pre': '_draw_steps_pre'}

fillStyles = ('full', 'left', 'right', 'bottom', 'top', 'none')

filled_markers = ('.', 'o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')

get_aa()

Alias for *get_antialiased*.

get_antialiased()

Return whether antialiased rendering is used.

get_bbox()

Get the bounding box of this line.

get_c()

Alias for *get_color*.

get_color()

Return the line color.

See also *set_color*.

get_dash_capstyle()

Return the *CapStyle* for dashed lines.

See also *set_dash_capstyle*.

get_dash_joinstyle()

Return the *JoinStyle* for dashed lines.

See also *set_dash_joinstyle*.

get_data(*orig=True*)

Return the line data as an `(xdata, ydata)` pair.

If *orig* is *True*, return the original data.

get_drawstyle()

Return the drawstyle.

See also *set_drawstyle*.

get_ds()

Alias for *get_drawstyle*.

get_fillstyle()

Return the marker fill style.

See also *set_fillstyle*.

get_gapcolor()

Return the line gapcolor.

See also *set_gapcolor*.

get_linestyle()

Return the linestyle.

See also *set_linestyle*.

get_linewidth()

Return the linewidth in points.

See also *set_linewidth*.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_marker()

Return the line marker.

See also *set_marker*.

get_markeredgecolor()

Return the marker edge color.

See also *set_markeredgecolor*.

get_markeredgewidth()

Return the marker edge width in points.

See also *set_markeredgewidth*.

get_markerfacecolor()

Return the marker face color.

See also *set_markerfacecolor*.

get_markerfacecoloralt()

Return the alternate marker face color.

See also *set_markerfacecoloralt*.

get_markersize()

Return the marker size in points.

See also *set_markersize*.

get_markevery()

Return the markevery setting for marker subsampling.

See also *set_markevery*.

get_mec()

Alias for *get_markeredgecolor*.

get_mew()

Alias for *get_markeredgewidth*.

get_mfc()

Alias for *get_markerfacecolor*.

get_mfcalt()

Alias for *get_markerfacecoloralt*.

get_ms()

Alias for *get_markersize*.

get_path()

Return the *Path* associated with this line.

get_pickradius()

Return the pick radius used for containment tests.

See *contains* for more details.

get_solid_capstyle()

Return the *CapStyle* for solid lines.

See also *set_solid_capstyle*.

get_solid_joinstyle()

Return the *JoinStyle* for solid lines.

See also *set_solid_joinstyle*.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_xdata(*orig=True*)

Return the xdata.

If *orig* is *True*, return the original data, else the processed data.

get_xydata()

Return the *xy* data as a (N, 2) array.

get_ydata(*orig=True*)

Return the ydata.

If *orig* is *True*, return the original data, else the processed data.

is_dashed()

Return whether line has a dashed linestyle.

A custom linestyle is assumed to be dashed, we do not inspect the `onoffseq` directly.

See also *set_linestyle*.

lineStyles = {'': '_draw_nothing', ' ': '_draw_nothing', '-': '_draw_solid', '--': '_draw_dashed', '-.': '_draw_dash_dot', ':': '_draw_dotted', 'None': '_draw_nothing'}

```
markers = {' ': 'nothing', '': 'nothing', '*': 'star', '+':
'plus', ',': 'pixel', '.': 'point', '1': 'tri_down', '2':
'tri_up', '3': 'tri_left', '4': 'tri_right', '8': 'octagon', '<':
'triangle_left', '>': 'triangle_right', 'D': 'diamond', 'H':
'hexagon2', 'None': 'nothing', 'P': 'plus_filled', 'X': 'x_filled',
'^': 'triangle_up', '_': 'hline', 'd': 'thin_diamond', 'h':
'hexagon1', 'none': 'nothing', 'o': 'circle', 'p': 'pentagon',
's': 'square', 'v': 'triangle_down', 'x': 'x', '|': 'vline', 0:
'tickleft', 1: 'tickright', 10: 'caretupbase', 11:
'caretdownbase', 2: 'tickup', 3: 'tickdown', 4: 'caretleft', 5:
'caretright', 6: 'caretup', 7: 'caretdown', 8: 'caretleftbase', 9:
'caretrightbase'}
```

property pickradius

Return the pick radius used for containment tests.

See *contains* for more details.

recache(*always=False*)

recache_always()

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *dash_capstyle=<UNSET>*, *dash_joinstyle=<UNSET>*, *dashes=<UNSET>*, *data=<UNSET>*, *drawstyle=<UNSET>*, *fillstyle=<UNSET>*, *gapcolor=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *marker=<UNSET>*, *markeredgecolor=<UNSET>*, *markeredgewidth=<UNSET>*, *markerfacecolor=<UNSET>*, *markerfacecoloralt=<UNSET>*, *markersize=<UNSET>*, *markevery=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *solid_capstyle=<UNSET>*, *solid_joinstyle=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xdata=<UNSET>*, *ydata=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	scalar or None
animated	bool
antialiased	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color

Table 69 – continued from previou

Property	Description

label	object
linestyle	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor	color
markeredgewidth	float
markerfacecolor	color
markerfacecoloralt	color
markersize	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
solid_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
solid_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
transform	unknown
url	str
visible	bool
xdata	1D array
ydata	1D array
zorder	float

set_aa(*b*)

Alias for *set_antialiased*.

set_antialiased(*b*)

Set whether to use antialiased rendering.

Parameters

b

[bool]

set_c(*color*)

Alias for *set_color*.

set_color(*color*)

Set the color of the line.

Parameters

color

[color]

set_dash_capstyle(*s*)

How to draw the end caps if the line is *is_dashed*.

The default capstyle is *rcParams["lines.dash_capstyle"]* (default: `<CapStyle.butt: 'butt'>`).

Parameters

s

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_dash_joinstyle(*s*)

How to join segments of the line if it *is_dashed*.

The default joinstyle is *rcParams["lines.dash_joinstyle"]* (default: `<JoinStyle.round: 'round'>`).

Parameters

s

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_dashes(*seq*)

Set the dash sequence.

The dash sequence is a sequence of floats of even length describing the length of dashes and spaces in points.

For example, (5, 2, 1, 2) describes a sequence of 5 point and 1 point dashes separated by 2 point spaces.

See also *set_gapcolor*, which allows those spaces to be filled with a color.

Parameters

seq

[sequence of floats (on/off ink in points) or (None, None)] If *seq* is empty or `(None, None)`, the linestyle will be set to solid.

set_data(**args*)

Set the x and y data.

Parameters

***args**

[(2, N) array or two 1D arrays]

set_drawstyle(*drawstyle*)

Set the drawstyle of the plot.

The drawstyle determines how the points are connected.

Parameters

drawstyle

[{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'] For 'default', the points are connected with straight lines.

The steps variants connect the points with step-like lines, i.e. horizontal lines with vertical steps. They differ in the location of the step:

- 'steps-pre': The step is at the beginning of the line segment, i.e. the line will be at the y-value of point to the right.
- 'steps-mid': The step is halfway between the points.
- 'steps-post: The step is at the end of the line segment, i.e. the line will be at the y-value of the point to the left.
- 'steps' is equal to 'steps-pre' and is maintained for backward-compatibility.

For examples see *Step Demo*.

set_ds(*drawstyle*)

Alias for *set_drawstyle*.

set_fillstyle(*fs*)

Set the marker fill style.

Parameters

fs

[{'full', 'left', 'right', 'bottom', 'top', 'none'}] Possible values:

- 'full': Fill the whole marker with the *markerfacecolor*.

- 'left', 'right', 'bottom', 'top': Fill the marker half at the given side with the *markerfacecolor*. The other half of the marker is filled with *markerfacecoloralt*.
- 'none': No filling.

For examples see *Marker fill styles*.

set_gapcolor(*gapcolor*)

Set a color to fill the gaps in the dashed line style.

Note: Striped lines are created by drawing two interleaved dashed lines. There can be overlaps between those two, which may result in artifacts when using transparency.

This functionality is experimental and may change.

Parameters

gapcolor

[color or None] The color with which to fill the gaps. If None, the gaps are unfilled.

set_linestyle(*ls*)

Set the linestyle of the line.

Parameters

ls

[{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}] Possible values:

- A string:

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line
`'none'`, `'None'`, `' '`, or `''`	draw nothing

- Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq)
```

where `onoffseq` is an even length tuple of on and off ink in points. See also *set_dashes()*.

For examples see *Linestyles*.

set_linewidth(*w*)

Set the line width in points.

Parameters

w

[float] Line width, in points.

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*w*)

Alias for *set_linewidth*.

set_marker(*marker*)

Set the line marker.

Parameters

marker

[marker style string, *Path* or *MarkerStyle*] See *markers* for full description of possible arguments.

set_markeredgecolor(*ec*)

Set the marker edge color.

Parameters

ec

[color]

set_markeredgewidth(*ew*)

Set the marker edge width in points.

Parameters

ew

[float] Marker edge width, in points.

set_markerfacecolor(*fc*)

Set the marker face color.

Parameters

fc

[color]

set_markerfacecoloralt(*fc*)

Set the alternate marker face color.

Parameters

fc

[color]

set_markersize(*sz*)

Set the marker size in points.

Parameters

sz

[float] Marker size, in points.

set_markevery(*every*)

Set the markevery property to subsample the plot when using markers.

e.g., if `every=5`, every 5-th marker will be plotted.

Parameters

every

[None or int or (int, int) or slice or list[int] or float or (float, float) or list[bool]] Which markers to plot.

- `every=None`: every point will be plotted.
- `every=N`: every N-th marker will be plotted starting with marker 0.
- `every=(start, N)`: every N-th marker, starting at index *start*, will be plotted.
- `every=slice(start, end, N)`: every N-th marker, starting at index *start*, up to but not including index *end*, will be plotted.
- `every=[i, j, m, ...]`: only markers at the given indices will be plotted.
- `every=[True, False, True, ...]`: only positions that are True will be plotted. The list must have the same length as the data points.
- `every=0.1`, (i.e. a float): markers will be spaced at approximately equal visual distances along the line; the distance along the line between markers is determined by multiplying the display-coordinate distance of the axes bounding-box diagonal by the value of *every*.
- `every=(0.5, 0.1)` (i.e. a length-2 tuple of float): similar to `every=0.1` but the first marker will be offset along the line by 0.5 multiplied by the display-coordinate-diagonal-distance along the line.

For examples see *Markevery Demo*.

Notes

Setting *markevery* will still only draw markers at actual data points. While the float argument form aims for uniform visual spacing, it has to coerce from the ideal spacing to the nearest available data point. Depending on the number and distribution of data points, the result may still not look evenly spaced.

When using a start offset to specify the first marker, the offset will be from the first data point which may be different from the first the visible data point if the plot is zoomed in.

If zooming in on a plot when using float arguments then the actual data points that have markers will change because the distance between markers is always determined from the display-coordinates axes-bounding-box-diagonal regardless of the actual axes data limits.

set_mec(*ec*)

Alias for *set_markeredgecolor*.

set_mew(*ew*)

Alias for *set_markeredgewidth*.

set_mfc(*fc*)

Alias for *set_markerfacecolor*.

set_mfcalt(*fc*)

Alias for *set_markerfacecoloralt*.

set_ms(*sz*)

Alias for *set_markersize*.

set_picker(*p*)

Set the event picker details for the line.

Parameters

p

[float or callable[[Artist, Event], tuple[bool, dict]]] If a float, it is used as the pick radius in points.

set_pickradius(*pickradius*)

Set the pick radius used for containment tests.

See *contains* for more details.

Parameters

pickradius

[float] Pick radius, in points.

set_solid_capstyle(*s*)

How to draw the end caps if the line is solid (not *is_dashed*)

The default capstyle is *rcParams["lines.solid_capstyle"]* (default: `<CapStyle.projecting: 'projecting'>`).

Parameters

s

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_solid_joinstyle(*s*)

How to join segments if the line is solid (not *is_dashed*).

The default joinstyle is *rcParams["lines.solid_joinstyle"]* (default: `<JoinStyle.round: 'round'>`).

Parameters

s

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_transform(*t*)

Set the artist transform.

Parameters

t

[*Transform*]

set_xdata(*x*)

Set the data array for x.

Parameters

x

[1D array]

set_ydata(*y*)

Set the data array for y.

Parameters

y

[1D array]

update_from(*other*)

Copy properties from *other* to self.

zorder = 2

matplotlib.lines.VertexSelector

class matplotlib.lines.**VertexSelector**(*line*)

Bases: object

Manage the callbacks to maintain a list of selected vertices for *Line2D*. Derived classes should override the *process_selected* method to do something with the picks.

Here is an example which highlights the selected verts with red circles:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.lines as lines

class HighlightSelected(lines.VertexSelector):
    def __init__(self, line, fmt='ro', **kwargs):
        super().__init__(line)
        self.markers, = self.axes.plot([], [], fmt, **kwargs)

    def process_selected(self, ind, xs, ys):
        self.markers.set_data(xs, ys)
        self.canvas.draw()

fig, ax = plt.subplots()
x, y = np.random.rand(2, 30)
line, = ax.plot(x, y, 'bs-', picker=5)

selector = HighlightSelected(line)
plt.show()
```

Parameters

line

[*Line2D*] The line must already have been added to an *Axes* and must have its picker property set.

property canvas

onpick(*event*)

When the line is picked, update the set of selected indices.

process_selected(*ind*, *xs*, *ys*)

Default "do nothing" implementation of the *process_selected* method.

Parameters

ind

[list of int] The indices of the selected vertices.

xs, ys

[array-like] The coordinates of the selected vertices.

matplotlib.lines.AxLine

class matplotlib.lines.**AxLine**(*xy1*, *xy2*, *slope*, ***kwargs*)

Bases: *Line2D*

A helper class that implements *axline*, by recomputing the artist transform at draw time.

Parameters

xy1

[(float, float)] The first set of (x, y) coordinates for the line to pass through.

xy2

[(float, float) or None] The second set of (x, y) coordinates for the line to pass through. Both *xy2* and *slope* must be passed, but one of them must be None.

slope

[float or None] The slope of the line. Both *xy2* and *slope* must be passed, but one of them must be None.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_slope()

Return the *slope* value of the line.

get_transform()

Return the *Transform* instance used by this artist.

get_xy1()

Return the *xy1* value of the line.

get_xy2()

Return the *xy2* value of the line.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *dash_capstyle=<UNSET>*, *dash_joinstyle=<UNSET>*, *dashes=<UNSET>*, *data=<UNSET>*, *drawstyle=<UNSET>*, *fillstyle=<UNSET>*, *gapcolor=<UNSET>*, *gid=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *marker=<UNSET>*, *markeredgecolor=<UNSET>*, *markeredgewidth=<UNSET>*, *markerfacecolor=<UNSET>*, *markerfacecoloralt=<UNSET>*, *markersize=<UNSET>*, *markevery=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *pickradius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *slope=<UNSET>*, *snap=<UNSET>*, *solid_capstyle=<UNSET>*, *solid_joinstyle=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xdata=<UNSET>*, *xy1=<UNSET>*, *xy2=<UNSET>*, *ydata=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value,
alpha	scalar or None
animated	bool
antialiased or aa	bool
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color or c	color
dash_capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
dash_joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
dashes	sequence of floats (on/off ink in points) or (None, None)
data	(2, N) array or two 1D arrays
drawstyle or ds	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'defa
figure	*Figure*
fillstyle	{'full', 'left', 'right', 'bottom', 'top', 'none'}
gapcolor	color or None
gid	str
in_layout	bool
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float
marker	marker style string, *Path* or *MarkerStyle*
markeredgecolor or mec	color

Table 70 – continued from pre

Property	Description
markeredgewidth or mew	float
markerfacecolor or mfc	color
markerfacecoloralt or mfcalt	color
markersize or ms	float
markevery	None or int or (int, int) or slice or list[int] or float or (float, float) or
mouseover	bool
path_effects	list of AbstractPathEffect
picker	float or callable[[Artist, Event], tuple[bool, dict]]
pickradius	float
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
slope	float
snap	bool or None
solid_capstyle	CapStyle or {'butt', 'projecting', 'round'}
solid_joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
transform	Transform
url	str
visible	bool
xdata	1D array
xy1	unknown
xy2	unknown
ydata	1D array
zorder	float

set_slope(*slope*)

Set the *slope* value of the line.

Parameters

slope

[float] The slope of the line.

set_xy1(*x*, *y*)

Set the *xy1* value of the line.

Parameters

x, y

[float] Points for the line to pass through.

set_xy2(*x*, *y*)

Set the *xy2* value of the line.

Parameters

x, y

[float] Points for the line to pass through.

Functions

segment_hits(cx, cy, x, y, radius)	Return the indices of the segments in the polyline with coordinates (*cx*, *cy*) that are within a distance *radius* of the point (*x*, *y*).

matplotlib.lines.segment_hits

matplotlib.lines.**segment_hits**(*cx*, *cy*, *x*, *y*, *radius*)

Return the indices of the segments in the polyline with coordinates (*cx*, *cy*) that are within a distance *radius* of the point (*x*, *y*).

7.2.33 matplotlib.markers

Functions to handle markers; used by the marker functionality of *plot*, *scatter*, and *errorbar*.

All possible markers are defined here:

marker	symbol	description
"."		point
","		pixel
"o"		circle
"v"		triangle_down
"^"		triangle_up
"<"		triangle_left
">"		triangle_right
"1"		tri_down
"2"		tri_up
"3"		tri_left
"4"		tri_right
"8"		octagon
"s"		square

Table 71 – continued from previo

marker	symbol	description
`"p"`		pentagon
`"P"`		plus (filled)
`"*"`		star
`"h"`		hexagon1
`"H"`		hexagon2
`"+"`		plus
`"x"`		x
`"X"`		x (filled)
`"D"`		diamond
`"d"`		thin_diamond
`"|"`		vline
`"_"`		hline
`0 (TICKLEFT)`		tickleft
`1 (TICKRIGHT)`		tickright
`2 (TICKUP)`		tickup
`3 (TICKDOWN)`		tickdown
`4 (CARETLEFT)`		caretleft
`5 (CARETRIGHT)`		caretright
`6 (CARETUP)`		caretup
`7 (CARETDOWN)`		caretdown
`8 (CARETLEFTBASE)`		caretleft (centered at base)
`9 (CARETRIGHTBASE)`		caretright (centered at base)
`10 (CARETUPBASE)`		caretup (centered at base)
`11 (CARETDOWNBASE)`		caretdown (centered at base)
`"none"` or `"None"`		nothing
`" "` or `""`		nothing
`'$...$'`		Render the string using mathtext. E.g `"$f$"` for marker showing the letter `f`.
`verts`		A list of (x, y) pairs used for Path vertices. The center of the marker is located a
path		A *Path* instance.
`(numsides, 0, angle)`		A regular polygon with `numsides` sides, rotated by `angle`.
`(numsides, 1, angle)`		A star-like symbol with `numsides` sides, rotated by `angle`.
`(numsides, 2, angle)`		An asterisk with `numsides` sides, rotated by `angle`.

As a deprecated feature, `None` also means 'nothing' when directly constructing a *MarkerStyle*, but note that there are other contexts where `marker=None` instead means "the default marker" (e.g. *rcParams["scatter.marker"]* (default: `'o'`) for *Axes.scatter*).

Note that special symbols can be defined via the *STIX math font*, e.g. `"$\u266B$"`. For an overview over the STIX font symbols refer to the STIX font table. Also see the *STIX Fonts*.

Integer numbers from `0` to `11` create lines and triangles. Those are equally accessible via capitalized variables, like `CARETDOWNBASE`. Hence the following are equivalent:

```
plt.plot([1, 2, 3], marker=11)
plt.plot([1, 2, 3], marker=matplotlib.markers.CARETDOWNBASE)
```

Markers join and cap styles can be customized by creating a new instance of MarkerStyle. A MarkerStyle can also have a custom *Transform* allowing it to be arbitrarily rotated or offset.

Examples showing the use of markers:

- *Marker reference*
- *Marker examples*
- *Mapping marker properties to multivariate data*

Classes

MarkerStyle(marker[, fillstyle, transform, ...])	A class representing marker types.

matplotlib.markers.MarkerStyle

class matplotlib.markers.**MarkerStyle**(*marker*, *fillstyle=None*, *transform=None*, *capstyle=None*, *joinstyle=None*)

Bases: `object`

A class representing marker types.

Instances are immutable. If you need to change anything, create a new instance.

Attributes

markers

[dict] All known markers.

filled_markers

[tuple] All known filled markers. This is a subset of *markers*.

fillstyles

[tuple] The supported fillstyles.

Parameters

marker

[str, array-like, Path, MarkerStyle, or None]

- Another instance of *MarkerStyle* copies the details of that `marker`.
- *None* means no marker. This is the deprecated default.
- For other possible marker values, see the module docstring *matplotlib.markers*.

fillstyle

[str, default: *rcParams["markers.fillstyle"]* (default: `'full'`)] One of 'full', 'left', 'right', 'bottom', 'top', 'none'.

transform

[transforms.Transform, default: None] Transform that will be combined with the native transform of the marker.

capstyle

[*CapStyle* or %(CapStyle)s, default: None] Cap style that will override the default cap style of the marker.

joinstyle

[*JoinStyle* or %(JoinStyle)s, default: None] Join style that will override the default join style of the marker.

filled_markers = ('.', 'o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')

fillstyles = ('full', 'left', 'right', 'bottom', 'top', 'none')

get_alt_path()

Return a *Path* for the alternate part of the marker.

For unfilled markers, this is *None*; for filled markers, this is the area to be drawn with *markerfacecoloralt*.

get_alt_transform()

Return the transform to be applied to the *Path* from *MarkerStyle.get_alt_path()*.

get_capstyle()

get_fillstyle()

get_joinstyle()

get_marker()

get_path()

Return a *Path* for the primary part of the marker.

For unfilled markers this is the whole marker, for filled markers, this is the area to be drawn with *markerfacecolor*.

get_snap_threshold()

get_transform()

Return the transform to be applied to the *Path* from *MarkerStyle.get_path()*.

get_user_transform()

Return user supplied part of marker transform.

is_filled()

markers = {' ': 'nothing', '': 'nothing', '*': 'star', '+': 'plus', ',': 'pixel', '.': 'point', '1': 'tri_down', '2': 'tri_up', '3': 'tri_left', '4': 'tri_right', '8': 'octagon', '<': 'triangle_left', '>': 'triangle_right', 'D': 'diamond', 'H': 'hexagon2', 'None': 'nothing', 'P': 'plus_filled', 'X': 'x_filled', '^': 'triangle_up', '_': 'hline', 'd': 'thin_diamond', 'h': 'hexagon1', 'none': 'nothing', 'o': 'circle', 'p': 'pentagon', 's': 'square', 'v': 'triangle_down', 'x': 'x', '|': 'vline', 0: 'tickleft', 1: 'tickright', 10: 'caretupbase', 11: 'caretdownbase', 2: 'tickup', 3: 'tickdown', 4: 'caretleft', 5: 'caretright', 6: 'caretup', 7: 'caretdown', 8: 'caretleftbase', 9: 'caretrightbase'}

rotated(*, *deg=None*, *rad=None*)

Return a new version of this marker rotated by specified angle.

Parameters

deg

[float, default: None] Rotation angle in degrees.

rad

[float, default: None] Rotation angle in radians.

.. note:: You must specify exactly one of deg or rad.

scaled(*sx*, *sy=None*)

Return new marker scaled by specified scale factors.

If *sy* is None, the same scale is applied in both the *x*- and *y*-directions.

Parameters

sx

[float] *X*-direction scaling factor.

sy

[float, default: None] *Y*-direction scaling factor.

transformed(*transform*)

Return a new version of this marker with the transform applied.

Parameters

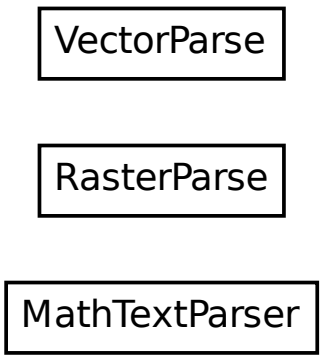
transform

[*Affine2D*, default: None] Transform will be combined with current user supplied transform.

Examples using `matplotlib.markers.MarkerStyle`

- *Marker reference*
- *Mapping marker properties to multivariate data*
- *Ellipse with orientation arrow demo*

7.2.34 `matplotlib.mathtext`



A module for parsing a subset of the TeX math syntax and rendering it to a Matplotlib backend.

For a tutorial of its usage, see *Writing mathematical expressions*. This document is primarily concerned with implementation details.

The module uses pyparsing to parse the TeX expression.

The Bakoma distribution of the TeX Computer Modern fonts, and STIX fonts are supported. There is experimental support for using arbitrary fonts, but results may vary without proper tweaking and metrics for those fonts.

class matplotlib.mathtext.**MathTextParser**(*output*)

Bases: object

Create a MathTextParser for the given backend *output*.

Parameters

output

[{"path", "agg"}] Whether to return a *VectorParse* ("path") or a *RasterParse* ("agg", or its synonym "macosx").

parse(*s*, *dpi=72*, *prop=None*, *, *antialiased=None*)

Parse the given math expression *s* at the given *dpi*. If *prop* is provided, it is a *FontProperties* object specifying the "default" font to use in the math expression, used for all non-math text.

The results are cached, so multiple calls to *parse* with the same expression should be fast.

Depending on the *output* type, this returns either a *VectorParse* or a *RasterParse*.

class matplotlib.mathtext.**RasterParse**(*ox*, *oy*, *width*, *height*, *depth*, *image*)

Bases: NamedTuple

The namedtuple type returned by `MathTextParser("agg").parse(...)`.

Attributes

ox, oy

[float] The offsets are always zero.

width, height, depth

[float] The global metrics.

image

[FT2Image] A raster image.

Create new instance of RasterParse(ox, oy, width, height, depth, image)

depth

Alias for field number 4

height

Alias for field number 3

image

Alias for field number 5

ox
Alias for field number 0

oy
Alias for field number 1

width
Alias for field number 2

class matplotlib.mathtext.**VectorParse**(*width*, *height*, *depth*, *glyphs*, *rects*)
Bases: NamedTuple

The namedtuple type returned by `MathTextParser("path").parse(...)`.

Attributes

width, height, depth
[float] The global metrics.

glyphs
[list] The glyphs including their positions.

rect
[list] The list of rectangles.

Create new instance of VectorParse(width, height, depth, glyphs, rects)

depth
Alias for field number 2

glyphs
Alias for field number 3

height
Alias for field number 1

rects
Alias for field number 4

width
Alias for field number 0

matplotlib.mathtext.**get_unicode_index**(*symbol*)
Return the integer index (from the Unicode table) of *symbol*.

Parameters

symbol
[str] A single (Unicode) character, a TeX command (e.g. r'pi') or a Type1 symbol name (e.g. 'phi').

matplotlib.mathtext.**math_to_image**(*s*, *filename_or_obj*, *prop=None*, *dpi=None*, *format=None*, *, *color=None*)

Given a math expression, renders it in a closely-clipped bounding box to an image file.

Parameters

s

[str] A math expression. The math portion must be enclosed in dollar signs.

filename_or_obj

[str or path-like or file-like] Where to write the image data.

prop

[*FontProperties*, optional] The size and style of the text.

dpi

[float, optional] The output dpi. If not set, the dpi is determined as for *Figure.savefig*.

format

[str, optional] The output format, e.g., 'svg', 'pdf', 'ps' or 'png'. If not set, the format is determined as for *Figure.savefig*.

color

[str, optional] Foreground color, defaults to *rcParams["text.color"]* (default: `'black'`).

7.2.35 matplotlib.mlab

Numerical Python functions written for compatibility with MATLAB commands with the same names. Most numerical Python functions can be found in the NumPy and SciPy libraries. What remains here is code for performing spectral computations and kernel density estimations.

Spectral functions

cohere

Coherence (normalized cross spectral density)

csd

Cross spectral density using Welch's average periodogram

detrend

Remove the mean or best fit line from an array

psd

Power spectral density using Welch's average periodogram

specgram

Spectrogram (spectrum over segments of time)

complex_spectrum

Return the complex-valued frequency spectrum of a signal

magnitude_spectrum

Return the magnitude of the frequency spectrum of a signal

angle_spectrum

Return the angle (wrapped phase) of the frequency spectrum of a signal

phase_spectrum

Return the phase (unwrapped angle) of the frequency spectrum of a signal

detrend_mean

Remove the mean from a line.

detrend_linear

Remove the best fit line from a line.

detrend_none

Return the original line.

class matplotlib.mlab.**GaussianKDE**(*dataset*, *bw_method=None*)

Bases: object

Representation of a kernel-density estimate using Gaussian kernels.

Parameters

dataset

[array-like] Datapoints to estimate from. In case of univariate data this is a 1-D array, otherwise a 2D array with shape (# of dims, # of data).

bw_method

[str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a *GaussianKDE* instance as only parameter and return a scalar. If None (default), 'scott' is used.

Attributes

dataset

[ndarray] The dataset passed to the constructor.

dim

[int] Number of dimensions.

num_dp

[int] Number of datapoints.

factor

[float] The bandwidth factor, obtained from `kde.covariance_factor`, with which the covariance matrix is multiplied.

covariance

[ndarray] The covariance matrix of *dataset*, scaled by the calculated bandwidth (`kde.factor`).

inv_cov

[ndarray] The inverse of *covariance*.

Methods

kde.evaluate(points)	(ndarray) Evaluate the estimated pdf on a provided set of points.
kde(points)	(ndarray) Same as kde.evaluate(points)

covariance_factor()

evaluate(*points*)

Evaluate the estimated pdf on a set of points.

Parameters

points

[(# of dimensions, # of points)-array] Alternatively, a (# of dimensions,) vector can be passed in and treated as a single point.

Returns

(# of points,)-array

The values at each point.

Raises

ValueError

[if the dimensionality of the input points is different] than the dimensionality of the KDE.

scotts_factor()

silverman_factor()

matplotlib.mlab.**angle_spectrum**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the angle of the frequency spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns

spectrum

[1-D array] The angle of the frequency spectrum (wrapped phase spectrum).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the *complex_spectrum*.

angle_spectrum

Returns the angle of the *complex_spectrum*.

phase_spectrum

Returns the phase (unwrapped angle) of the *complex_spectrum*.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.**cohere**(*x*, *y*, *NFFT=256*, *Fs=2*, *detrend=<function detrend_none>*, *window=<function window_hanning>*, *noverlap=0*, *pad_to=None*, *sides='default'*, *scale_by_freq=None*)

The coherence between *x* and *y*. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

Parameters

x, y

Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Returns

Cxy

[1-D array] The coherence vector.

freqs

[1-D array] The frequencies for the elements in *Cxy*.

See also:

psd()*, *csd()

For information about the methods used to compute P_{xy}, P_{xx} and P_{yy}.

matplotlib.mlab.**complex_spectrum**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the complex-valued frequency spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns

spectrum

[1-D array] The complex-valued frequency spectrum.

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the *complex_spectrum*.

angle_spectrum

Returns the angle of the *complex_spectrum*.

phase_spectrum

Returns the phase (unwrapped angle) of the *complex_spectrum*.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.**csd**(*x*, *y*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*)

Compute the cross-spectral density.

The cross spectral density P_{xy} by Welch's average periodogram method. The vectors x and y are divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of x and y are averaged over each segment to compute P_{xy}, with a scaling to correct for power loss due to windowing.

If len(x) < *NFFT* or len(y) < *NFFT*, they will be zero padded to *NFFT*.

Parameters

x, y

[1-D arrays or sequences] Arrays or sequences containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Returns

Pxy

[1-D array] The values for the cross spectrum P_{xy} before scaling (real valued)

freqs

[1-D array] The frequencies corresponding to the elements in *Pxy*

See also:

psd

equivalent to setting `y = x`.

References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

`matplotlib.mlab.`**`detrend`**(*x*, *key=None*, *axis=None*)

Return *x* with its trend removed.

Parameters

x

[array or sequence] Array or sequence containing the data.

key

[{'default', 'constant', 'mean', 'linear', 'none'} or function] The detrending algorithm to use. 'default', 'mean', and 'constant' are the same as *detrend_mean*. 'linear' is the same as *detrend_linear*. 'none' is the same as *detrend_none*. The default is 'mean'. See the corresponding functions for more details regarding the algorithms. Can also be a function that carries out the detrend operation.

axis

[int] The axis along which to do the detrending.

See also:

detrend_mean

Implementation of the 'mean' algorithm.

detrend_linear

Implementation of the 'linear' algorithm.

detrend_none

Implementation of the 'none' algorithm.

`matplotlib.mlab.`**`detrend_linear`**(*y*)

Return *x* minus best fit line; 'linear' detrending.

Parameters

y

[0-D or 1-D array or sequence] Array or sequence containing the data

See also:

detrend_mean

Another detrend algorithm.

detrend_none

Another detrend algorithm.

detrend

A wrapper around all the detrend algorithms.

matplotlib.mlab.**detrend_mean**(*x*, *axis=None*)

Return *x* minus the mean(*x*).

Parameters

x

[array or sequence] Array or sequence containing the data Can have any dimensionality

axis

[int] The axis along which to take the mean. See `numpy.mean` for a description of this argument.

See also:

detrend_linear

Another detrend algorithm.

detrend_none

Another detrend algorithm.

detrend

A wrapper around all the detrend algorithms.

matplotlib.mlab.**detrend_none**(*x*, *axis=None*)

Return *x*: no detrending.

Parameters

x

[any object] An object containing the data

axis

[int] This parameter is ignored. It is included for compatibility with detrend_mean

See also:

detrend_mean

Another detrend algorithm.

detrend_linear

Another detrend algorithm.

detrend

A wrapper around all the detrend algorithms.

matplotlib.mlab.**magnitude_spectrum**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the magnitude (absolute value) of the frequency spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns

spectrum

[1-D array] The magnitude (absolute value) of the frequency spectrum.

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the *complex_spectrum*.

angle_spectrum

Returns the angle of the *complex_spectrum*.

phase_spectrum

Returns the phase (unwrapped angle) of the *complex_spectrum*.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.**phase_spectrum**(*x*, *Fs=None*, *window=None*, *pad_to=None*, *sides=None*)

Compute the phase of the frequency spectrum (unwrapped phase spectrum) of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft`. The default is None, which sets *pad_to* equal to the length of the input signal (i.e. no padding).

Returns

spectrum

[1-D array] The phase of the frequency spectrum (unwrapped phase spectrum).

freqs

[1-D array] The frequencies corresponding to the elements in *spectrum*.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the *complex_spectrum*.

angle_spectrum

Returns the angle of the *complex_spectrum*.

phase_spectrum

Returns the phase (unwrapped angle) of the *complex_spectrum*.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.**psd**(*x*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*)

Compute the power spectral density.

The power spectral density P_{xx} by Welch's average periodogram method. The vector x is divided into *NFFT* length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The $|\mathrm{fft}(i)|^2$ of each segment i are averaged to compute P_{xx}.

If len(x) < *NFFT*, it will be zero padded to *NFFT*.

Parameters

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a

string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between segments.

Returns

Pxx

[1-D array] The values for the power spectrum P_{xx} (real valued)

freqs

[1-D array] The frequencies corresponding to the elements in *Pxx*

See also:

specgram

specgram differs in the default overlap; in not returning the mean of the segment periodograms; and in returning the times of the segments.

magnitude_spectrum

returns the magnitude spectrum.

csd

returns the spectral density between two signals.

References

Bendat & Piersol -- Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

matplotlib.mlab.**specgram**(*x*, *NFFT=None*, *Fs=None*, *detrend=None*, *window=None*, *noverlap=None*, *pad_to=None*, *sides=None*, *scale_by_freq=None*, *mode=None*)

Compute a spectrogram.

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*.

Parameters

x

[array-like] 1-D array or sequence.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to fft. The default is None, which sets *pad_to* equal to *NFFT*

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default: 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend_none*, *detrend_mean*, and *detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of 1/Hz. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 128] The number of points of overlap between blocks.

mode

[str, default: 'psd']

What sort of spectrum to use:

'psd'

Returns the power spectral density.

'complex'

Returns the complex-valued frequency spectrum.

'magnitude'

Returns the magnitude spectrum.

'angle'

Returns the phase spectrum without unwrapping.

'phase'

Returns the phase spectrum with unwrapping.

Returns

spectrum

[array-like] 2D array, columns are the periodograms of successive segments.

freqs

[array-like] 1-D array, frequencies corresponding to the rows in *spectrum*.

t

[array-like] 1-D array, the times corresponding to midpoints of segments (i.e the columns in *spectrum*).

See also:

psd

differs in the overlap and in the return values.

complex_spectrum

similar, but with complex valued frequencies.

magnitude_spectrum

similar single segment when *mode* is 'magnitude'.

angle_spectrum

similar to single segment when *mode* is 'angle'.

phase_spectrum

similar to single segment when *mode* is 'phase'.

Notes

detrend and *scale_by_freq* only apply when *mode* is set to 'psd'.

matplotlib.mlab.**window_hanning**(*x*)

Return *x* times the Hanning (or Hann) window of len(*x*).

See also:

window_none

Another window algorithm.

matplotlib.mlab.**window_none**(*x*)

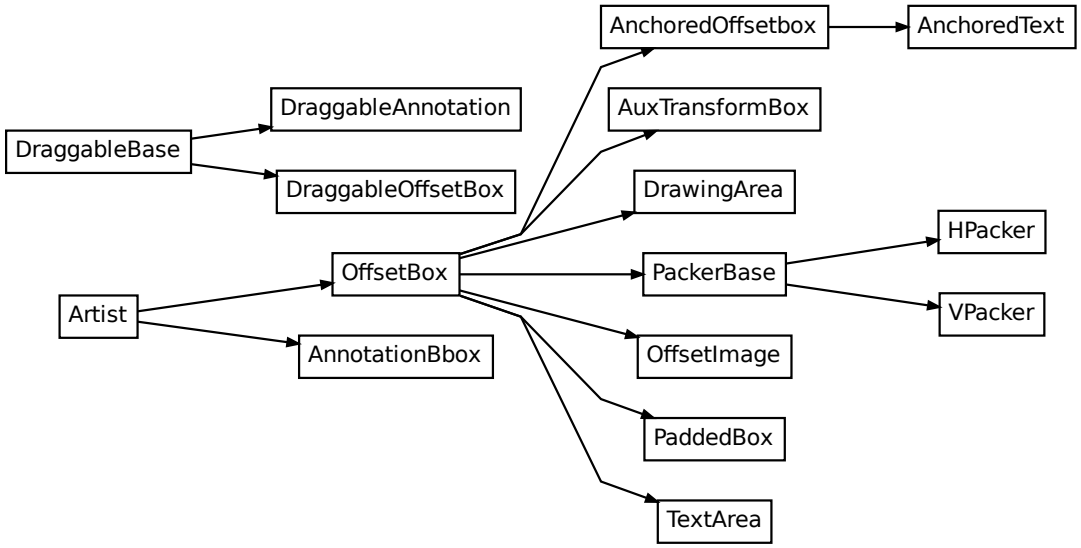
No window function; simply return *x*.

See also:

window_hanning

Another window algorithm.

7.2.36 matplotlib.offsetbox



Container classes for *Artist*s.

OffsetBox

The base of all container artists defined in this module.

AnchoredOffsetbox, ***AnchoredText***

Anchor and align an arbitrary *Artist* or a text relative to the parent axes or a specific anchor point.

DrawingArea

A container with fixed width and height. Children have a fixed position inside the container and may be clipped.

HPacker, ***VPacker***

Containers for layouting their children vertically or horizontally.

PaddedBox

A container to add a padding around an *Artist*.

TextArea

Contains a single *Text* instance.

class matplotlib.offsetbox.**AnchoredOffsetbox**(*loc*, *, *pad=0.4*, *borderpad=0.5*, *child=None*, *prop=None*, *frameon=True*, *bbox_to_anchor=None*, *bbox_transform=None*, ***kwargs*)

Bases: *OffsetBox*

An offset box placed according to location *loc*.

AnchoredOffsetbox has a single child. When multiple children are needed, use an extra OffsetBox to enclose them. By default, the offset box is anchored against its parent axes. You may explicitly specify the *bbox_to_anchor*.

Parameters

loc

[str] The box location. Valid locations are 'upper left', 'upper center', 'upper right', 'center left', 'center', 'center right', 'lower left', 'lower center', 'lower right'. For backward compatibility, numeric values are accepted as well. See the parameter *loc* of `Legend` for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the *bbox_to_anchor*.

child

[`OffsetBox`] The box that will be anchored.

prop

[`FontProperties`] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: `'medium'`) is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[`BboxBase`, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

bbox_transform

[None or `matplotlib.transforms.Transform`] The transform for the bounding box (*bbox_to_anchor*).

****kwargs**

All other parameters are passed on to `OffsetBox`.

Notes

See *Legend* for a detailed description of the anchoring mechanism.

```
codes = {'center': 10, 'center left': 6, 'center right': 7, 'lower
center': 8, 'lower left': 3, 'lower right': 4, 'right': 5, 'upper
center': 9, 'upper left': 2, 'upper right': 1}
```

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

get_bbox(*renderer*)

Return the bbox of the offsetbox, ignoring parent offsets.

get_bbox_to_anchor()

Return the bbox that the box is anchored to.

get_child()

Return the child.

get_children()

Return the list of children.

get_offset(*bbox*, *renderer*)

Return the offset as a tuple (x, y).

The extent parameters have to be provided to handle the case where the offset is dynamically determined by a callable (see *set_offset*).

Parameters

bbox

[*Bbox*]

renderer

[*RendererBase* subclass]

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
*bbox_to_*	unknown
child	unknown
clip_box	*BboxBase* or None
clip_on	bool
clip_pat	Patch or (Path, Transform) or None
figure	*Figure*
gid	str
height	float
in_layou	bool
label	object
mouseove	bool
offset	(float, float) or callable
path_eff	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_p	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
width	float
zorder	float

set_bbox_to_anchor(*bbox*, *transform=None*)

Set the bbox that the box is anchored to.

bbox can be a Bbox instance, a list of [left, bottom, width, height], or a list of [left, bottom] where the width and height will be assumed to be zero. The bbox will be transformed to display coordinate by the given transform.

set_child(*child*)

Set the child to be anchored.

update_frame(*bbox*, *fontsize=None*)

zorder = 5

class matplotlib.offsetbox.**AnchoredText**(*s*, *loc*, *, *pad=0.4*, *borderpad=0.5*, *prop=None*, ***kwargs*)

Bases: *AnchoredOffsetbox*

AnchoredOffsetbox with Text.

Parameters

s

[str] Text.

loc

[str] Location code. See *AnchoredOffsetbox*.

pad

[float, default: 0.4] Padding around the text as fraction of the fontsize.

borderpad

[float, default: 0.5] Spacing between the offsetbox frame and the *bbox_to_anchor*.

prop

[dict, optional] Dictionary of keyword parameters to be passed to the *Text* instance contained inside AnchoredText.

****kwargs**

All other parameters are passed to *AnchoredOffsetbox*.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *bbox_to_anchor=<UNSET>*, *child=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
bbox_to_	unknown
child	unknown
clip_box	BboxBase or None
clip_on	bool
clip_pat	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layou	bool
label	object
mouseove	bool
offset	(float, float) or callable
path_eff	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_p	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zorder	float

class matplotlib.offsetbox.**AnnotationBbox**(*offsetbox*, *xy*, *xybox=None*, *xycoords='data'*, *boxcoords=None*, ***, *frameon=True*, *pad=0.4*, *annotation_clip=None*, *box_alignment=(0.5, 0.5)*, *bboxprops=None*, *arrowprops=None*, *fontsize=None*, ***kwargs*)

Bases: Artist, _AnnotationBase

Container for an OffsetBox referring to a specific position *xy*.

Optionally an arrow pointing from the offsetbox to *xy* can be drawn.

This is like Annotation, but with OffsetBox instead of Text.

Parameters

offsetbox

[*OffsetBox*]

xy

[(float, float)] The point *(x, y)* to annotate. The coordinate system is determined by *xycoords*.

xybox

[(float, float), default: *xy*] The position *(x, y)* to place the text at. The coordinate system is determined by *boxcoords*.

xycoords

[single or two-tuple of str or *Artist* or *Transform* or callable, default: 'data'] The coordinate system that *xy* is given in. See the parameter *xycoords* in *Annotation* for a detailed description.

boxcoords

[single or two-tuple of str or *Artist* or *Transform* or callable, default: value of *xycoords*] The coordinate system that *xybox* is given in. See the parameter *textcoords* in *Annotation* for a detailed description.

frameon

[bool, default: True] By default, the text is surrounded by a white *FancyBboxPatch* (accessible as the `patch` attribute of the *AnnotationBbox*). If *frameon* is set to False, this patch is made invisible.

annotation_clip: bool or None, default: None

Whether to clip (i.e. not draw) the annotation when the annotation point *xy* is outside the axes area.

- If *True*, the annotation will be clipped when *xy* is outside the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will be clipped when *xy* is outside the axes and *xycoords* is 'data'.

pad

[float, default: 0.4] Padding around the offsetbox.

box_alignment

[(float, float)] A tuple of two floats for a vertical and horizontal alignment of the offset box w.r.t. the *boxcoords*. The lower-left corner is (0, 0) and upper-right corner is (1, 1).

bboxprops

[dict, optional] A dictionary of properties to set for the annotation bounding box, for example *boxstyle* and *alpha*. See *FancyBboxPatch* for details.

arrowprops: dict, optional

Arrow properties, see *Annotation* for description.

fontsize: float or str, optional

Translated to points and passed as *mutation_scale* into *FancyBboxPatch* to scale attributes of the box style (e.g. pad or rounding_size). The name is chosen in analogy to *Text* where *fontsize* defines the mutation scale as well. If not given, *rcParams["legend.fontsize"]* (default: 'medium') is used. See *Text.set_fontsize* for valid values.

****kwargs**

Other *AnnotationBbox* properties. See *AnnotationBbox.set* for a list.

property anncoords

contains(*mouseevent*)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_children()

Return a list of the child *Artist*s of this *Artist*.

get_fontsize()

Return the fontsize in points.

get_tightbbox(*renderer=None*)

Like *Artist.get_window_extent*, but includes any clipping.

Parameters

renderer

[*RendererBase* subclass, optional] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

Returns

***Bbox* or None**

The enclosing bounding box (in figure pixel coordinates). Returns None if clipping results in no intersection.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

set(**, agg_filter=<UNSET>, alpha=<UNSET>, animated=<UNSET>, annotation_clip=<UNSET>, clip_box=<UNSET>, clip_on=<UNSET>, clip_path=<UNSET>, fontsize=<UNSET>, gid=<UNSET>, in_layout=<UNSET>, label=<UNSET>, mouseover=<UNSET>, path_effects=<UNSET>, picker=<UNSET>, rasterized=<UNSET>, sketch_params=<UNSET>, snap=<UNSET>, transform=<UNSET>, url=<UNSET>, visible=<UNSET>, zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filt	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
annotation_cli	bool or None
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
figure	unknown
fontsize	unknown
gid	str
in_layou	bool
label	object
mouseove	bool
path_eff	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_p	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

set_figure(*fig*)

Set the *Figure* instance the artist belongs to.

Parameters

fig

[*Figure*]

set_fontsize(*s=None*)

Set the fontsize in points.

If *s* is not given, reset to *rcParams["legend.fontsize"]* (default: 'medium').

update_positions(*renderer*)

Update pixel positions for the annotated point, the text, and the arrow.

property xyann

zorder = 3

class matplotlib.offsetbox.**AuxTransformBox**(*aux_transform*)

Bases: *OffsetBox*

Offset Box with the aux_transform. Its children will be transformed with the aux_transform first then will be offsetted. The absolute coordinate of the aux_transform is meaning as it will be automatically adjust so that the left-lower corner of the bounding box of children will be set to (0, 0) before the offset transform.

It is similar to drawing area, except that the extent of the box is not predetermined but calculated from the window extent of its children. Furthermore, the extent of the children will be calculated in the transformed coordinate.

add_artist(*a*)

Add an *Artist* to the container box.

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

get_bbox(*renderer*)

Return the bbox of the offsetbox, ignoring parent offsets.

get_offset()

Return offset of the container.

get_transform()

Return the *Transform* applied to the children

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layo	bool
label	object
mouseov	bool
offset	(float, float)
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	unknown
url	str
visible	bool
width	float
zorder	float

set_offset(*xy*)

Set the offset of the container.

Parameters

xy

[(float, float)] The (x, y) coordinates of the offset in display units.

set_transform(*t*)

set_transform is ignored.

class matplotlib.offsetbox.**DraggableAnnotation**(*annotation*, *use_blit=False*)

Bases: DraggableBase

save_offset()

update_offset(*dx*, *dy*)

class matplotlib.offsetbox.**DraggableBase**(*ref_artist*, *use_blit=False*)

Bases: object

Helper base class for a draggable artist (legend, offsetbox).

Derived classes must override the following methods:

```
def save_offset(self):
    '''
    Called when the object is picked for dragging; should save the
    reference position of the artist.
    '''

def update_offset(self, dx, dy):
    '''
    Called during the dragging; (*dx*, *dy*) is the pixel offset from
    the point where the mouse drag started.
    '''
```

Optionally, you may override the following method:

```
def finalize_offset(self):
    '''Called when the mouse is released.'''
```

In the current implementation of *DraggableLegend* and *DraggableAnnotation*, *update_offset* places the artists in display coordinates, and *finalize_offset* recalculates their position in axes coordinate and set a relevant attribute.

property canvas

property cids

disconnect()

Disconnect the callbacks.

finalize_offset()

on_motion(*evt*)

on_pick(*evt*)

on_release(*event*)

save_offset()

update_offset(*dx*, *dy*)

class matplotlib.offsetbox.**DraggableOffsetBox**(*ref_artist*, *offsetbox*, *use_blit=False*)

Bases: *DraggableBase*

get_loc_in_canvas()

save_offset()

update_offset(*dx*, *dy*)

class matplotlib.offsetbox.**DrawingArea**(*width*, *height*, *xdescent=0.0*, *ydescent=0.0*, *clip=False*)

Bases: *OffsetBox*

The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The children can be clipped at the boundaries of the parent.

Parameters

width, height

[float] Width and height of the container box.

xdescent, ydescent

[float] Descent of the box in x- and y-direction.

clip

[bool] Whether to clip the children to the box.

add_artist(*a*)

Add an *Artist* to the container box.

property clip_children

If the children of this DrawingArea should be clipped by DrawingArea bounding box.

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

get_bbox(*renderer*)

Return the bbox of the offsetbox, ignoring parent offsets.

get_offset()

Return offset of the container.

get_transform()

Return the *Transform* applied to the children.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layo	bool
label	object
mouseov	bool
offset	(float, float)
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	unknown
url	str
visible	bool
width	float
zorder	float

set_offset(*xy*)

Set the offset of the container.

Parameters

xy

[(float, float)] The (x, y) coordinates of the offset in display units.

set_transform(*t*)

set_transform is ignored.

class matplotlib.offsetbox.**HPacker**(*pad=0.0*, *sep=0.0*, *width=None*, *height=None*, *align='baseline'*, *mode='fixed'*, *children=None*)

Bases: *PackerBase*

HPacker packs its children horizontally, automatically adjusting their relative positions at draw time.

Parameters

pad

[float, default: 0.0] The boundary padding in points.

sep

[float, default: 0.0] The spacing between items in points.

width, height

[float, optional] Width and height of the container box in pixels, calculated if *None*.

align

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}, default: 'baseline'] Alignment of boxes.

mode

[{'fixed', 'expand', 'equal'}, default: 'fixed'] The packing mode.

- 'fixed' packs the given *Artist*s tight with *sep* spacing.
- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

children

[list of *Artist*] The artists to pack.

Notes

pad and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layo	bool
label	object
mouseov	bool
offset	(float, float) or callable
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zorder	float

class matplotlib.offsetbox.**OffsetBox**(**args*, ***kwargs*)

Bases: Artist

The OffsetBox is a simple container artist.

The child artists are meant to be drawn at a relative position to its parent.

Being an artist itself, all parameters are passed on to Artist.

property axes

The *Axes* instance the artist resides in, or *None*.

contains(*mouseevent*)

Delegate the mouse event contains-check to the children.

As a container, the *OffsetBox* does not respond itself to mouseevents.

Parameters

mouseevent

[*MouseEvent*]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

See also:

Artist.contains

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

get_bbox(*renderer*)

Return the bbox of the offsetbox, ignoring parent offsets.

get_children()

Return a list of the child *Artist*s.

get_extent(*renderer*)

[*Deprecated*] Return a tuple `width, height, xdescent, ydescent` of the box.

Notes

Deprecated since version 3.7: Use get_bbox instead.

get_extent_offsets(*renderer*)

[*Deprecated*] Update offset of the children and return the extent of the box.

Parameters

renderer

[*RendererBase* subclass]

Returns

width
height
xdescent
ydescent
list of (xoffset, yoffset) pairs

Notes

Deprecated since version 3.7: Use get_bbox and child.get_offset instead.

get_offset(*bbox*, *renderer*)

Return the offset as a tuple (x, y).

The extent parameters have to be provided to handle the case where the offset is dynamically determined by a callable (see *set_offset*).

Parameters

bbox

[*Bbox*]

renderer

[*RendererBase* subclass]

get_visible_children()

Return a list of the visible child *Artist*s.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layo	bool
label	object
mouseov	bool
offset	(float, float) or callable
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zorder	float

set_figure(*fig*)

Set the Figure for the OffsetBox and all its children.

Parameters

fig

[*Figure*]

set_height(*height*)

Set the height of the box.

Parameters

height

[float]

set_offset(*xy*)

Set the offset.

Parameters

xy

[(float, float) or callable] The (x, y) coordinates of the offset in display units. These can either be given explicitly as a tuple (x, y), or by providing a function that converts the extent into the offset. This function must have the signature:

```
def offset(width, height, xdescent, ydescent, renderer) -
 ↪> (float, float)
```

set_width(*width*)

Set the width of the box.

Parameters

width

[float]

class matplotlib.offsetbox.**OffsetImage**(*arr*, *, *zoom=1*, *cmap=None*, *norm=None*, *interpolation=None*, *origin=None*, *filternorm=True*, *filterrad=4.0*, *resample=False*, *dpi_cor=True*, ***kwargs*)

Bases: *OffsetBox*

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

get_bbox(*renderer*)

Return the bbox of the offsetbox, ignoring parent offsets.

get_children()

Return a list of the child *Artist*s.

get_data()

get_offset()

Return offset of the container.

get_zoom()

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *data=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zoom=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
data	unknown
figure	Figure
gid	str
height	float
in_layo	bool
label	object
mouseov	bool
offset	(float, float) or callable
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
width	float
zoom	unknown
zorder	float

set_data(*arr*)

set_zoom(*zoom*)

class matplotlib.offsetbox.**PackerBase**(*pad=0.0*, *sep=0.0*, *width=None*, *height=None*, *align='baseline'*, *mode='fixed'*, *children=None*)

Bases: OffsetBox

Parameters

pad

[float, default: 0.0] The boundary padding in points.

sep

[float, default: 0.0] The spacing between items in points.

width, height

[float, optional] Width and height of the container box in pixels, calculated if *None*.

align

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}, default: 'baseline'] Alignment of boxes.

mode

[{'fixed', 'expand', 'equal'}, default: 'fixed'] The packing mode.

- 'fixed' packs the given `Artist`s tight with *sep* spacing.
- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

children

[list of `Artist`] The artists to pack.

Notes

pad and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_bo	BboxBase or None
clip_on	bool
clip_pa	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layo	bool
label	object
mouseov	bool
offset	(float, float) or callable
path_ef	list of AbstractPathEffect
picker	None or bool or float or callable

transform	Transform
url	str
visible	bool
width	float
zorder	float

class matplotlib.offsetbox.**PaddedBox**(*child*, *pad=0.0*, *, *draw_frame=False*, *patch_attrs=None*)

Bases: OffsetBox

A container to add a padding around an Artist.

The PaddedBox contains a FancyBboxPatch that is used to visualize it when rendering.

Parameters

child

[Artist] The contained Artist.

pad

[float, default: 0.0] The padding in points. This will be scaled with the renderer dpi. In contrast, *width* and *height* are in *pixels* and thus not scaled.

draw_frame

[bool] Whether to draw the contained `FancyBboxPatch`.

patch_attrs

[dict or None] Additional parameters passed to the contained `FancyBboxPatch`.

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

draw_frame(*renderer*)

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool

visible	bool
width	float
zorder	float

update_frame(*bbox*, *fontsize=None*)

class matplotlib.offsetbox.**TextArea**(*s*, *, *textprops=None*, *multilinebaseline=False*)

Bases: OffsetBox

The TextArea is a container artist for a single Text instance.

The text is placed at (0, 0) with baseline+left alignment, by default. The width and height of the TextArea instance is the width and height of its child text.

Parameters

s

[str] The text to be displayed.

textprops

[dict, default: {}] Dictionary of keyword parameters to be passed to the *Text* instance in the TextArea.

multilinebaseline

[bool, default: False] Whether the baseline for multiline text is adjusted so that it is (approximately) center-aligned with single-line text.

draw(*renderer*)

Update the location of children if necessary and draw them to the given *renderer*.

get_bbox(*renderer*)

Return the bbox of the offsetbox, ignoring parent offsets.

get_multilinebaseline()

Get multilinebaseline.

get_offset()

Return offset of the container.

get_text()

Return the string representation of this area's text.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *multilinebaseline=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *text=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filte	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None
animated	bool
clip_box	BboxBase or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
figure	Figure
gid	str
height	float
in_layout	bool
label	object
mouseover	bool
multilinebaseline	unknown
offset	(float, float)
path_effe	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_pa	(scale: float, length: float, randomness: float)
snap	bool or None
text	unknown
transform	unknown
url	str
visible	bool
width	float
zorder	float

set_multilinebaseline(*t*)

Set multilinebaseline.

If True, the baseline for multiline text is adjusted so that it is (approximately) center-aligned with single-line text. This is used e.g. by the legend implementation so that single-line labels are baseline-aligned, but multiline labels are "center"-aligned with them.

set_offset(*xy*)

Set the offset of the container.

Parameters

xy

[(float, float)] The (x, y) coordinates of the offset in display units.

set_text(*s*)

Set the text of this area as a string.

set_transform(*t*)

set_transform is ignored.

class matplotlib.offsetbox.**VPacker**(*pad=0.0*, *sep=0.0*, *width=None*, *height=None*, *align='baseline'*, *mode='fixed'*, *children=None*)

Bases: *PackerBase*

VPacker packs its children vertically, automatically adjusting their relative positions at draw time.

Parameters

pad

[float, default: 0.0] The boundary padding in points.

sep

[float, default: 0.0] The spacing between items in points.

width, height

[float, optional] Width and height of the container box in pixels, calculated if *None*.

align

[{'top', 'bottom', 'left', 'right', 'center', 'baseline'}, default: 'baseline'] Alignment of boxes.

mode

[{'fixed', 'expand', 'equal'}, default: 'fixed'] The packing mode.

- 'fixed' packs the given *Artist*s tight with *sep* spacing.
- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

children

[list of *Artist*] The artists to pack.

Notes

pad and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *gid=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *label=<UNSET>*, *mouseover=<UNSET>*, *offset=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_fil	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array and two offsets from the bottom left corner of the image
alpha	scalar or None

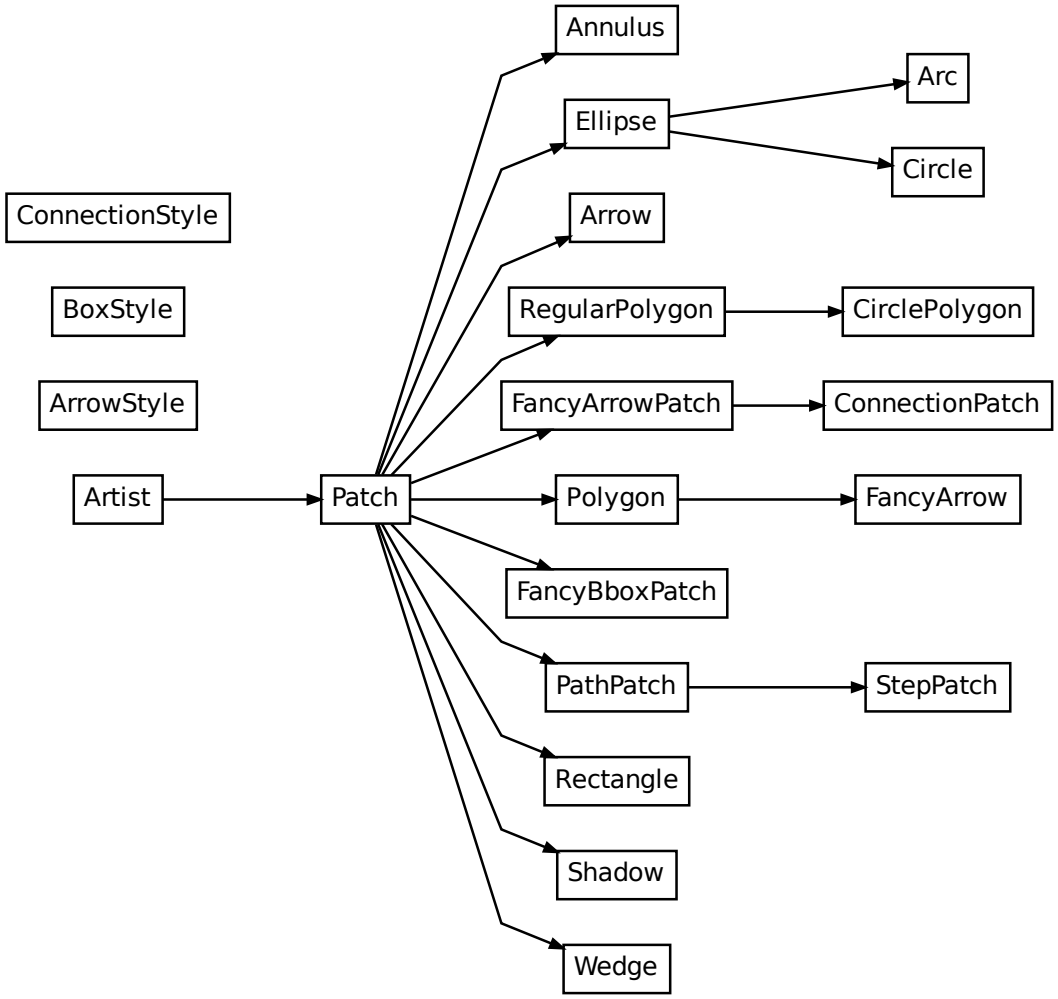
matplotlib.offsetbox.**bbox_artist**(**args*, ***kwargs*)

[*Deprecated*]

Notes

Deprecated since version 3.7: Use patches.bbox_artist instead.

7.2.37 matplotlib.patches



Patches are *Artist*s with a face color and an edge color.

Classes

Annulus(xy, r, width[, angle])	An elliptical annulus.
Arc(xy, width, height, *[, angle, theta1, ...])	An elliptical arc, i.e. a segment of an ellipse.
Arrow(x, y, dx, dy, *[, width])	An arrow patch.
ArrowStyle(stylename, **kwargs)	*ArrowStyle* is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path.
BoxStyle(stylename, **kwargs)	*BoxStyle* is a container class which defines several boxstyle classes, which are used for *FancyBboxPatch*.
Circle(xy[, radius])	A circle patch.
CirclePolygon(xy[, radius, resolution])	A polygon-approximation of a circle patch.
ConnectionPatch(xyA, xyB, coordsA[, ...])	A patch that connects two points (possibly in different axes).
ConnectionStyle(stylename, **kwargs)	*ConnectionStyle* is a container class which defines several connectionstyle classes, which is used to create a path between two points.
Ellipse(xy, width, height, *[, angle])	A scale-free ellipse.
FancyArrow(x, y, dx, dy, *[, width, ...])	Like Arrow, but lets you set head width and head height independently.
FancyArrowPatch([posA, posB, path, ...])	A fancy arrow patch.
FancyBboxPatch(xy, width, height[, ...])	A fancy box around a rectangle with lower left at *xy* = (*x*, *y*) with specified width and height.
Patch(*[, edgecolor, facecolor, color, ...])	A patch is a 2D artist with a face color and an edge color.
PathPatch(path, **kwargs)	A general polycurve path patch.
StepPatch(values, edges, *[, orientation, ...])	A path patch describing a stepwise constant function.
Polygon(xy, *[, closed])	A general polygon patch.
Rectangle(xy, width, height, *[, angle, ...])	A rectangle defined via an anchor point *xy* and its *width* and *height*.
RegularPolygon(xy, numVertices, *[, radius, ...])	A regular polygon patch.
Shadow(patch, ox, oy, *[, shade])	Create a shadow of the given *patch*.
Wedge(center, r, theta1, theta2, *[, width])	Wedge shaped patch.

matplotlib.patches.Annulus

class matplotlib.patches.**Annulus**(*xy*, *r*, *width*, *angle=0.0*, ***kwargs*)

Bases: *Patch*

An elliptical annulus.

Parameters

xy

[(float, float)] xy coordinates of annulus centre.

r

[float or (float, float)] The radius, or semi-axes:

- If float: radius of the outer circle.
- If two floats: semi-major and -minor axes of outer ellipse.

width

[float] Width (thickness) of the annular ring. The width is measured inward from the outer ellipse so that for the inner ellipse the semi-axes are given by `r - width`. *width* must be less than or equal to the semi-minor axis.

angle

[float, default: 0] Rotation angle in degrees (anti-clockwise from the positive x-axis). Ignored for circular annuli (i.e., if *r* is a scalar).

****kwargs**

Keyword arguments control the *Patch* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and return
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}

Table 72 – continued from previc

Property	Description
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

property angle

Return the angle of the annulus.

property center

Return the center of the annulus.

get_angle()

Return the angle of the annulus.

get_center()

Return the center of the annulus.

get_path()

Return the path of this patch.

get_radii()

Return the semi-major and semi-minor radii of the annulus.

get_width()

Return the width (thickness) of the annulus ring.

property radii

Return the semi-major and semi-minor radii of the annulus.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *angle=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *center=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *radii=<UNSET>*, *rasterized=<UNSET>*, *semimajor=<UNSET>*, *semiminor=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

transform	*Transform*

Table 73 – continued from previous p

Property	Description
url	str
visible	bool
width	float
zorder	float

set_angle(*angle*)

Set the tilt angle of the annulus.

Parameters

angle

[float]

set_center(*xy*)

Set the center of the annulus.

Parameters

xy

[(float, float)]

set_radii(*r*)

Set the semi-major (a) and semi-minor radii (b) of the annulus.

Parameters

r

[float or (float, float)] The radius, or semi-axes:

- If float: radius of the outer circle.
- If two floats: semi-major and -minor axes of outer ellipse.

set_semimajor(*a*)

Set the semi-major axis a of the annulus.

Parameters

a

[float]

set_semiminor(*b*)

Set the semi-minor axis *b* of the annulus.

Parameters

b

[float]

set_width(*width*)

Set the width (thickness) of the annulus ring.

The width is measured inwards from the outer ellipse.

Parameters

width

[float]

property width

Return the width (thickness) of the annulus ring.

matplotlib.patches.Arc

class matplotlib.patches.**Arc**(*xy*, *width*, *height*, *, *angle=0.0*, *theta1=0.0*, *theta2=360.0*, ***kwargs*)

Bases: *Ellipse*

An elliptical arc, i.e. a segment of an ellipse.

Due to internal optimizations, the arc cannot be filled.

Parameters

xy

[(float, float)] The center of the ellipse.

width

[float] The length of the horizontal axis.

height

[float] The length of the vertical axis.

angle

[float] Rotation of the ellipse in degrees (counterclockwise).

theta1, theta2

[float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to *angle*, e.g. if *angle* = 45 and *theta1* = 90 the absolute starting angle is 135. Default *theta1* = 0, *theta2* = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

Other Parameters

****kwargs**

[`Patch` properties] Most `Patch` properties are supported as keyword arguments, except *fill* and *facecolor* because filling is not supported.

Property	Description
`agg_filter`	a filter function, which takes a (m, n, 3) float array and a dpi value, and return
`alpha`	unknown
`animated`	bool
`antialiased` or aa	bool or None
`capstyle`	`CapStyle` or {'butt', 'projecting', 'round'}
`clip_box`	`BboxBase` or None
`clip_on`	bool
`clip_path`	Patch or (Path, Transform) or None
`color`	color
`edgecolor` or ec	color or None
`facecolor` or fc	color or None
`figure`	`Figure`
`fill`	bool
`gid`	str
`hatch`	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
`in_layout`	bool
`joinstyle`	`JoinStyle` or {'miter', 'round', 'bevel'}
`label`	object
`linestyle` or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
`linewidth` or lw	float or None
`mouseover`	bool
`path_effects`	list of `AbstractPathEffect`
`picker`	None or bool or float or callable
`rasterized`	bool
`sketch_params`	(scale: float, length: float, randomness: float)
`snap`	bool or None
`transform`	`Transform`
`url`	str
`visible`	bool

Table 74 – continued from previc

Property	Description
zorder	float

draw(*renderer*)

Draw the arc to the given *renderer*.

Notes

Ellipses are normally drawn using an approximation that uses eight cubic Bezier splines. The error of this approximation is 1.89818e-6, according to this unverified source:

> Lancaster, Don. *Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.*
>
> https://www.tinaja.com/glib/ellipse4.pdf

There is a use case where very large ellipses must be drawn with very high accuracy, and it is too expensive to render the entire ellipse with enough segments (either splines or line segments). Therefore, in the case where either radius of the ellipse is large enough that the error of the spline approximation will be visible (greater than one pixel offset from the ideal), a different technique is used.

In that case, only the visible parts of the ellipse are drawn, with each visible arc using a fixed number of spline segments (8). The algorithm proceeds as follows:

1. The points where the ellipse intersects the axes (or figure) bounding box are located. (This is done by performing an inverse transformation on the bbox such that it is relative to the unit circle -- this makes the intersection calculation much easier than doing rotated ellipse intersection directly.)

   This uses the "line intersecting a circle" algorithm from:

   > Vince, John. *Geometry for Computer Graphics: Formulae, Examples & Proofs.* London: Springer-Verlag, 2005.

2. The angles of each of the intersection points are calculated.
3. Proceeding counterclockwise starting in the positive x-direction, each of the visible arc-segments between the pairs of vertices are drawn using the Bezier arc approximation technique implemented in *Path.arc*.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *angle=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *center=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description

Examples using `matplotlib.patches.Arc`

- *Scale invariant angle label*
- *Ellipse with units*

matplotlib.patches.Arrow

class matplotlib.patches.**Arrow**(*x*, *y*, *dx*, *dy*, *, *width=1.0*, ***kwargs*)

Bases: *Patch*

An arrow patch.

Draws an arrow from (*x*, *y*) to (*x* + *dx*, *y* + *dy*). The width of the arrow is scaled by *width*.

Parameters

x

[float] x coordinate of the arrow tail.

y

[float] y coordinate of the arrow tail.

dx

[float] Arrow length in the x direction.

dy

[float] Arrow length in the y direction.

width

[float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.

****kwargs**

Keyword arguments control the *Patch* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or aa	bool or None

See also:

FancyArrow

Patch that allows independent control of the head and tail properties.

get_patch_transform()

Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path()

Return the path of this patch.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Examples using `matplotlib.patches.Arrow`

- *Arrow guide*
- *Reference for Matplotlib artists*

matplotlib.patches.ArrowStyle

class matplotlib.patches.**ArrowStyle**(*stylename*, ***kwargs*)

Bases: `_Style`

ArrowStyle is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path. These are mainly used with *FancyArrowPatch*.

An arrowstyle object can be either created as:

```
ArrowStyle.Fancy(head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy, head_length=.4, head_width=.4, tail_width=.4")
```

The following classes are defined

Class	Name	Attrs
Curve	-	None
CurveA	<-	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None
CurveB	->	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None
CurveAB	<->	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None
CurveFilledA	<|-	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None
CurveFilledB	-|>	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None
CurveFilledAB	<|-|	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None
BracketA	]-	widthA=1.0, lengthA=0.2, angleA=0
BracketB	-[	widthB=1.0, lengthB=0.2, angleB=0
BracketAB	]-[	widthA=1.0, lengthA=0.2, angleA=0, widthB=1.0, lengthB=0.2, angleB=0
BarAB	|-|	widthA=1.0, angleA=0, widthB=1.0, angleB=0
BracketCurve	]->	widthA=1.0, lengthA=0.2, angleA=None
CurveBracket	<-[	widthB=1.0, lengthB=0.2, angleB=None
Simple	simple	head_length=0.5, head_width=0.5, tail_width=0.2
Fancy	fanc	head_length=0.4, head_width=0.4, tail_width=0.4
Wedge	wedg	tail_width=0.3, shrink_factor=0.5

For an overview of the visual appearance, see *Annotation arrow style reference*.

An instance of any arrow style class is a callable object, whose call signature is:

```
__call__(self, path, mutation_size, linewidth, aspect_ratio=1.)
```

and it returns a tuple of a `Path` instance and a boolean value. *path* is a `Path` instance along which the arrow will be drawn. *mutation_size* and *aspect_ratio* have the same meaning as in `BoxStyle`. *linewidth* is a line width to be stroked. This is meant to be used to correct the location of the head so that it does not overshoot the destination point, but not all classes support it.

Notes

angleA and *angleB* specify the orientation of the bracket, as either a clockwise or counterclockwise angle depending on the arrow type. 0 degrees means perpendicular to the line connecting the arrow's head and tail.

Return the instance of the subclass with the given style name.

class BarAB(*widthA=1.0*, *angleA=0*, *widthB=1.0*, *angleB=0*)

Bases: _Curve

An arrow with vertical bars | at both ends.

Parameters

widthA, widthB

[float, default: 1.0] Width of the bracket.

angleA, angleB

[float, default: 0 degrees] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

arrow = '|-|'

class BracketA(*widthA=1.0*, *lengthA=0.2*, *angleA=0*)

Bases: _Curve

An arrow with an outward square bracket at its start.

Parameters

widthA

[float, default: 1.0] Width of the bracket.

lengthA

[float, default: 0.2] Length of the bracket.

angleA

[float, default: 0 degrees] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

arrow = ']-'

class BracketAB(*widthA=1.0*, *lengthA=0.2*, *angleA=0*, *widthB=1.0*, *lengthB=0.2*, *angleB=0*)

Bases: _Curve

An arrow with outward square brackets at both ends.

Parameters

widthA, widthB

[float, default: 1.0] Width of the bracket.

lengthA, lengthB

[float, default: 0.2] Length of the bracket.

angleA, angleB

[float, default: 0 degrees] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

arrow = ']-['

class BracketB(*widthB=1.0*, *lengthB=0.2*, *angleB=0*)

Bases: _Curve

An arrow with an outward square bracket at its end.

Parameters

widthB

[float, default: 1.0] Width of the bracket.

lengthB

[float, default: 0.2] Length of the bracket.

angleB

[float, default: 0 degrees] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

arrow = '-['

class BracketCurve(*widthA=1.0*, *lengthA=0.2*, *angleA=None*)

Bases: _Curve

An arrow with an outward square bracket at its start and a head at the end.

Parameters

widthA

[float, default: 1.0] Width of the bracket.

lengthA

[float, default: 0.2] Length of the bracket.

angleA

[float, default: 0 degrees] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

arrow = ']->'

class Curve

Bases: _Curve

A simple curve without any arrow head.

Parameters

head_length

[float, default: 0.4] Length of the arrow head, relative to *mutation_size*.

head_width

[float, default: 0.2] Width of the arrow head, relative to *mutation_size*.

widthA, widthB

[float, default: 1.0] Width of the bracket.

lengthA, lengthB

[float, default: 0.2] Length of the bracket.

angleA, angleB

[float, default: 0] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

scaleA, scaleB

[float, default: *mutation_size*] The scale of the brackets.

class CurveA(*head_length=0.4*, *head_width=0.2*, *widthA=1.0*, *widthB=1.0*, *lengthA=0.2*, *lengthB=0.2*, *angleA=0*, *angleB=0*, *scaleA=None*, *scaleB=None*)

Bases: _Curve

An arrow with a head at its start point.

Parameters

head_length

[float, default: 0.4] Length of the arrow head, relative to *mutation_size*.

head_width

[float, default: 0.2] Width of the arrow head, relative to *mutation_size*.

widthA, widthB

[float, default: 1.0] Width of the bracket.

lengthA, lengthB

[float, default: 0.2] Length of the bracket.

angleA, angleB

[float, default: 0] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

scaleA, scaleB

[float, default: *mutation_size*] The scale of the brackets.

arrow = '<-'

class CurveAB(*head_length=0.4*, *head_width=0.2*, *widthA=1.0*, *widthB=1.0*, *lengthA=0.2*, *lengthB=0.2*, *angleA=0*, *angleB=0*, *scaleA=None*, *scaleB=None*)

Bases: _Curve

An arrow with heads both at the start and the end point.

Parameters

head_length

[float, default: 0.4] Length of the arrow head, relative to *mutation_size*.

head_width

[float, default: 0.2] Width of the arrow head, relative to *mutation_size*.

widthA, widthB

[float, default: 1.0] Width of the bracket.

lengthA, lengthB

[float, default: 0.2] Length of the bracket.

angleA, angleB

[float, default: 0] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

scaleA, scaleB

[float, default: *mutation_size*] The scale of the brackets.

arrow = '<->'

class CurveB(*head_length=0.4*, *head_width=0.2*, *widthA=1.0*, *widthB=1.0*, *lengthA=0.2*, *lengthB=0.2*, *angleA=0*, *angleB=0*, *scaleA=None*, *scaleB=None*)

Bases: _Curve

An arrow with a head at its end point.

Parameters

head_length

[float, default: 0.4] Length of the arrow head, relative to *mutation_size*.

head_width

[float, default: 0.2] Width of the arrow head, relative to *mutation_size*.

widthA, widthB

[float, default: 1.0] Width of the bracket.

lengthA, lengthB

[float, default: 0.2] Length of the bracket.

angleA, angleB

[float, default: 0] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

scaleA, scaleB

[float, default: *mutation_size*] The scale of the brackets.

arrow = '->'

class CurveBracket(*widthB=1.0*, *lengthB=0.2*, *angleB=None*)

Bases: _Curve

An arrow with an outward square bracket at its end and a head at the start.

Parameters

widthB

[float, default: 1.0] Width of the bracket.

lengthB

[float, default: 0.2] Length of the bracket.

angleB

[float, default: 0 degrees] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

arrow = '<-['

class CurveFilledA(*head_length=0.4*, *head_width=0.2*, *widthA=1.0*, *widthB=1.0*, *lengthA=0.2*, *lengthB=0.2*, *angleA=0*, *angleB=0*, *scaleA=None*, *scaleB=None*)

Bases: _Curve

An arrow with filled triangle head at the start.

Parameters

head_length

[float, default: 0.4] Length of the arrow head, relative to *mutation_size*.

head_width

[float, default: 0.2] Width of the arrow head, relative to *mutation_size*.

widthA, widthB

[float, default: 1.0] Width of the bracket.

lengthA, lengthB

[float, default: 0.2] Length of the bracket.

angleA, angleB

[float, default: 0] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

scaleA, scaleB

[float, default: *mutation_size*] The scale of the brackets.

arrow = '<|-'

class CurveFilledAB(*head_length=0.4*, *head_width=0.2*, *widthA=1.0*, *widthB=1.0*, *lengthA=0.2*, *lengthB=0.2*, *angleA=0*, *angleB=0*, *scaleA=None*, *scaleB=None*)

Bases: _Curve

An arrow with filled triangle heads at both ends.

Parameters

head_length

[float, default: 0.4] Length of the arrow head, relative to *mutation_size*.

head_width

[float, default: 0.2] Width of the arrow head, relative to *mutation_size*.

widthA, widthB

[float, default: 1.0] Width of the bracket.

lengthA, lengthB

[float, default: 0.2] Length of the bracket.

angleA, angleB

[float, default: 0] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

scaleA, scaleB

[float, default: *mutation_size*] The scale of the brackets.

arrow = '<|-|>'

class CurveFilledB(*head_length=0.4*, *head_width=0.2*, *widthA=1.0*, *widthB=1.0*, *lengthA=0.2*, *lengthB=0.2*, *angleA=0*, *angleB=0*, *scaleA=None*, *scaleB=None*)

Bases: _Curve

An arrow with filled triangle head at the end.

Parameters

head_length

[float, default: 0.4] Length of the arrow head, relative to *mutation_size*.

head_width

[float, default: 0.2] Width of the arrow head, relative to *mutation_size*.

widthA, widthB

[float, default: 1.0] Width of the bracket.

lengthA, lengthB

[float, default: 0.2] Length of the bracket.

angleA, angleB

[float, default: 0] Orientation of the bracket, as a counterclockwise angle. 0 degrees means perpendicular to the line.

scaleA, scaleB

[float, default: *mutation_size*] The scale of the brackets.

arrow = '-|>'

class Fancy(*head_length=0.4*, *head_width=0.4*, *tail_width=0.4*)

Bases: _Base

A fancy arrow. Only works with a quadratic Bézier curve.

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.4] Width of the arrow head.

tail_width

[float, default: 0.4] Width of the arrow tail.

transmute(*path*, *mutation_size*, *linewidth*)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the *path* object along which the arrow will be drawn, and the *mutation_size*, with which the arrow head etc. will be scaled. The *linewidth* may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a `Path` instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of the same length.

class Simple(*head_length=0.5*, *head_width=0.5*, *tail_width=0.2*)

Bases: `_Base`

A simple arrow. Only works with a quadratic Bézier curve.

Parameters

head_length

[float, default: 0.5] Length of the arrow head.

head_width

[float, default: 0.5] Width of the arrow head.

tail_width

[float, default: 0.2] Width of the arrow tail.

transmute(*path*, *mutation_size*, *linewidth*)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the *path* object along which the arrow will be drawn, and the *mutation_size*, with which the arrow head etc. will be scaled. The *linewidth* may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a `Path` instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of the same length.

class Wedge(*tail_width=0.3*, *shrink_factor=0.5*)

Bases: `_Base`

Wedge(?) shape. Only works with a quadratic Bézier curve. The start point has a width of the *tail_width* and the end point has a width of 0. At the middle, the width is *shrink_factor*x*tail_width*.

Parameters

tail_width

[float, default: 0.3] Width of the tail.

shrink_factor

[float, default: 0.5] Fraction of the arrow width at the middle point.

transmute(*path*, *mutation_size*, *linewidth*)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the *path* object along which the arrow will be drawn, and the *mutation_size*, with which the arrow head etc. will be scaled. The *linewidth* may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a *Path* instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of the same length.

Examples using `matplotlib.patches.ArrowStyle`

- *Angle annotations on bracket arrows*
- *Annotation arrow style reference*

matplotlib.patches.BoxStyle

class matplotlib.patches.**BoxStyle**(*stylename*, ***kwargs*)

Bases: `_Style`

BoxStyle is a container class which defines several boxstyle classes, which are used for *FancyBoxPatch*.

A style object can be created as:

```
BoxStyle.Round(pad=0.2)
```

or:

```
BoxStyle("Round", pad=0.2)
```

or:

```
BoxStyle("Round, pad=0.2")
```

The following boxstyle classes are defined.

Class	Name	Attrs
Square	`square`	pad=0.3
Circle	`circle`	pad=0.3
Ellipse	`ellipse`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
DArrow	`darrow`	pad=0.3
Round	`round`	pad=0.3, rounding_size=None
Round4	`round4`	pad=0.3, rounding_size=None
Sawtooth	`sawtooth`	pad=0.3, tooth_size=None
Roundtooth	`roundtooth`	pad=0.3, tooth_size=None

An instance of a boxstyle class is a callable object, with the signature

```
__call__(self, x0, y0, width, height, mutation_size) -> Path
```

x0, *y0*, *width* and *height* specify the location and size of the box to be drawn; *mutation_size* scales the outline properties such as padding.

Return the instance of the subclass with the given style name.

class Circle(*pad=0.3*)

Bases: object

A circular box.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class DArrow(*pad=0.3*)

Bases: object

A box in the shape of a two-way arrow.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class Ellipse(*pad=0.3*)

Bases: object

An elliptical box.

New in version 3.7.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class LArrow(*pad=0.3*)

Bases: object

A box in the shape of a left-pointing arrow.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class RArrow(*pad=0.3*)

Bases: *LArrow*

A box in the shape of a right-pointing arrow.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class Round(*pad=0.3*, *rounding_size=None*)

Bases: object

A box with round corners.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

rounding_size

[float, default: *pad*] Radius of the corners.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class Round4(*pad=0.3*, *rounding_size=None*)

Bases: object

A box with rounded edges.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

rounding_size

[float, default: *pad*/2] Rounding of edges.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class Roundtooth(*pad=0.3*, *tooth_size=None*)

Bases: *Sawtooth*

A box with a rounded sawtooth outline.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

tooth_size

[float, default: *pad*/2] Size of the sawtooth.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class Sawtooth(*pad=0.3*, *tooth_size=None*)

Bases: object

A box with a sawtooth outline.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

tooth_size

[float, default: *pad*/2] Size of the sawtooth.

__call__(*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

class Square(*pad=0.3*)

Bases: object

A square box.

Parameters

pad

[float, default: 0.3] The amount of padding around the original box.

__call__ (*x0*, *y0*, *width*, *height*, *mutation_size*)

Call self as a function.

Examples using `matplotlib.patches.BoxStyle`

- *Reference for Matplotlib artists*
- *Drawing fancy boxes*

matplotlib.patches.Circle

class matplotlib.patches.**Circle**(*xy*, *radius=5*, ***kwargs*)

Bases: *Ellipse*

A circle patch.

Create a true circle at center *xy* = (*x*, *y*) with given *radius*.

Unlike *CirclePolygon* which is a polygonal approximation, this uses Bezier splines and is much closer to a scale-free circle.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object

Table 78 – continued from previous page

Property	Description
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

get_radius()

Return the radius of the circle.

property radius

Return the radius of the circle.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *angle=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *center=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *radius=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	scalar or None
angle	float
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
center	(float, float)
clip_box	*BboxBase* or None
clip_on	bool

Table 79 – continued from previous p

matplotlib.patches.CirclePolygon

class matplotlib.patches.**CirclePolygon**(*xy*, *radius=5*, *, *resolution=20*, ***kwargs*)

Bases: `RegularPolygon`

A polygon-approximation of a circle patch.

Create a circle at $xy = (x, y)$ with given *radius*.

This circle is approximated by a regular polygon with *resolution* sides. For a smoother circle drawn with splines, see `Circle`.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool

matplotlib.patches.ConnectionPatch

class matplotlib.patches.**ConnectionPatch**(*xyA*, *xyB*, *coordsA*, *coordsB=None*, ***, *axesA=None*, *axesB=None*, *arrowstyle='-'*, *connectionstyle='arc3'*, *patchA=None*, *patchB=None*, *shrinkA=0.0*, *shrinkB=0.0*, *mutation_scale=10.0*, *mutation_aspect=None*, *clip_on=False*, ***kwargs*)

Bases: *FancyArrowPatch*

A patch that connects two points (possibly in different axes).

Connect point *xyA* in *coordsA* with point *xyB* in *coordsB*.

Valid keys are

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for `matplotlib.patches.PathPatch`

coordsA and *coordsB* are strings that indicate the coordinates of *xyA* and *xyB*.

Property	Description
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0, 0 is lower left of figure and 1, 1 is upper right
'subfigure points'	points from the lower left corner of the subfigure
'subfigure pixels'	pixels from the lower left corner of the subfigure
'subfigure fraction'	fraction of the subfigure, 0, 0 is lower left.
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0, 0 is lower left of axes and 1, 1 is upper right
'data'	use the coordinate system of the object being annotated (default)
'offset points'	offset (in points) from the *xy* value
'polar'	you can specify *theta*, *r* for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native "data" coordinate system.

Alternatively they can be set to any valid *Transform*.

Note that 'subfigure pixels' and 'figure pixels' are the same for the parent figure, so users who want code that is usable in a subfigure can use 'subfigure pixels'.

Note: Using *ConnectionPatch* across two *Axes* instances is not directly compatible with *constrained layout*. Add the artist directly to the *Figure* instead of adding it to a specific Axes, or exclude it from the layout using `con.set_in_layout(False)`.

```
fig, ax = plt.subplots(1, 2, constrained_layout=True)
con = ConnectionPatch(..., axesA=ax[0], axesB=ax[1])
fig.add_artist(con)
```

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_annotation_clip()

Return the clipping behavior.

See *set_annotation_clip* for the meaning of the return value.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *annotation_clip=<UNSET>*, *antialiased=<UNSET>*, *arrowstyle=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *connectionstyle=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *mutation_aspect=<UNSET>*, *mutation_scale=<UNSET>*, *patchA=<UNSET>*, *patchB=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *positions=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

set_annotation_clip(*b*)

Set the annotation's clipping behavior.

Parameters

b

[bool or None]

- True: The annotation will be clipped when `self.xy` is outside the axes.
- False: The annotation will always be drawn.
- None: The annotation will be clipped when `self.xy` is outside the axes and `self.xycoords == "data"`.

Examples using `matplotlib.patches.ConnectionPatch`

- *Bar of pie*
- *Multiple axes animation*
- *Constrained layout guide*
- *Annotations*

matplotlib.patches.ConnectionStyle

class matplotlib.patches.**ConnectionStyle**(*stylename*, ***kwargs*)

Bases: `_Style`

ConnectionStyle is a container class which defines several connectionstyle classes, which is used to create a path between two points. These are mainly used with *FancyArrowPatch*.

A connectionstyle object can be either created as:

```
ConnectionStyle.Arc3(rad=0.2)
```

or:

```
ConnectionStyle("Arc3", rad=0.2)
```

or:

```
ConnectionStyle("Arc3, rad=0.2")
```

The following classes are defined

Class	Name	Attrs
Arc3	`arc3`	rad=0.0
Angle3	`angle3`	angleA=90, angleB=0
Angle	`angle`	angleA=90, angleB=0, rad=0.0
Arc	`arc`	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Bar	`bar`	armA=0.0, armB=0.0, fraction=0.3, angle=None

An instance of any connection style class is a callable object, whose call signature is:

```
__call__(self, posA, posB,
         patchA=None, patchB=None,
         shrinkA=2., shrinkB=2.)
```

and it returns a *Path* instance. *posA* and *posB* are tuples of (x, y) coordinates of the two points to be connected. *patchA* (or *patchB*) is given, the returned path is clipped so that it start (or end) from the boundary of the patch. The path is further shrunk by *shrinkA* (or *shrinkB*) which is given in points.

Return the instance of the subclass with the given style name.

class Angle(*angleA=90*, *angleB=0*, *rad=0.0*)

Bases: _Base

Creates a piecewise continuous quadratic Bézier path between two points. The path has a one passing-through point placed at the intersecting point of two lines which cross the start and end point, and have a slope of *angleA* and *angleB*, respectively. The connecting edges are rounded with *rad*.

Parameters

angleA

[float] Starting angle of the path.

angleB

[float] Ending angle of the path.

rad

[float] Rounding radius of the edge.

connect(*posA*, *posB*)

class Angle3(*angleA=90*, *angleB=0*)

Bases: _Base

Creates a simple quadratic Bézier curve between two points. The middle control point is placed at the intersecting point of two lines which cross the start and end point, and have a slope of *angleA* and *angleB*, respectively.

Parameters

angleA

[float] Starting angle of the path.

angleB

[float] Ending angle of the path.

connect(*posA*, *posB*)

class Arc(*angleA=0*, *angleB=0*, *armA=None*, *armB=None*, *rad=0.0*)

Bases: _Base

Creates a piecewise continuous quadratic Bézier path between two points. The path can have two passing-through points, a point placed at the distance of *armA* and angle of *angleA* from point A, another point with respect to point B. The edges are rounded with *rad*.

Parameters

angleA

[float] Starting angle of the path.

angleB

[float] Ending angle of the path.

armA

[float or None] Length of the starting arm.

armB

[float or None] Length of the ending arm.

rad

[float] Rounding radius of the edges.

connect(*posA*, *posB*)

class Arc3(*rad=0.0*)

Bases: _Base

Creates a simple quadratic Bézier curve between two points. The curve is created so that the middle control point (C1) is located at the same distance from the start (C0) and end points(C2) and the distance of the C1 to the line connecting C0-C2 is *rad* times the distance of C0-C2.

Parameters

rad

[float] Curvature of the curve.

connect(*posA*, *posB*)

class Bar(*armA=0.0*, *armB=0.0*, *fraction=0.3*, *angle=None*)

Bases: _Base

A line with *angle* between A and B with *armA* and *armB*. One of the arms is extended so that they are connected in a right angle. The length of *armA* is determined by (*armA* + *fraction* x AB distance). Same for *armB*.

Parameters

armA

[float] Minimum length of armA.

armB

[float] Minimum length of armB.

fraction

[float] A fraction of the distance between two points that will be added to armA and armB.

angle

[float or None] Angle of the connecting line (if None, parallel to A and B).

connect(*posA*, *posB*)

matplotlib.patches.Ellipse

class matplotlib.patches.**Ellipse**(*xy*, *width*, *height*, *, *angle=0*, ***kwargs*)

Bases: *Patch*

A scale-free ellipse.

Parameters

xy

[(float, float)] xy coordinates of ellipse centre.

width

[float] Total length (diameter) of horizontal axis.

height

[float] Total length (diameter) of vertical axis.

angle

[float, default: 0] Rotation in degrees anti-clockwise.

Notes

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool

Table 83 – continued from previous page

Property	Description
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

property angle

Return the angle of the ellipse.

property center

Return the center of the ellipse.

get_angle()

Return the angle of the ellipse.

get_center()

Return the center of the ellipse.

get_co_vertices()

Return the co-vertices coordinates of the ellipse.

The definition can be found here

New in version 3.8.

get_corners()

Return the corners of the ellipse bounding box.

The bounding box orientation is moving anti-clockwise from the lower left corner defined before rotation.

get_height()

Return the height of the ellipse.

get_patch_transform()

Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path()

Return the path of the ellipse.

get_vertices()

Return the vertices coordinates of the ellipse.

The definition can be found here

New in version 3.8.

get_width()

Return the width of the ellipse.

property height

Return the height of the ellipse.

set_angle(*angle*)

Set the angle of the ellipse.

Parameters

angle

[float]

set_center(*xy*)

Set the center of the ellipse.

Parameters

xy

[(float, float)]

set_height(*height*)

Set the height of the ellipse.

Parameters

height

[float]

set_width(*width*)

Set the width of the ellipse.

Parameters

width

[float]

property width

Return the width of the ellipse.

matplotlib.patches.FancyArrow

class matplotlib.patches.**FancyArrow**(*x*, *y*, *dx*, *dy*, *, *width=0.001*, *length_includes_head=False*, *head_width=None*, *head_length=None*, *shape='full'*, *overhang=0*, *head_starts_at_zero=False*, ***kwargs*)

Bases: *Polygon*

Like Arrow, but lets you set head width and head height independently.

Parameters

x, y

[float] The x and y coordinates of the arrow base.

dx, dy

[float] The length of the arrow along x and y direction.

width

[float, default: 0.001] Width of full arrow tail.

length_includes_head

[bool, default: False] True if head is to be counted in calculating the length.

head_width

[float or None, default: 3*width] Total width of the full arrow head.

head_length

[float or None, default: 1.5*head_width] Length of arrow head.

shape

[{'full', 'left', 'right'}, default: 'full'] Draw the left-half, right-half, or full arrow.

overhang

[float, default: 0] Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero

[bool, default: False] If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

****kwargs**

Property	Description
zorder	float

set_data(*, *x=None*, *y=None*, *dx=None*, *dy=None*, *width=None*, *head_width=None*, *head_length=None*)

Set *FancyArrow* x, y, dx, dy, width, head_with, and head_length. Values left as None will not be updated.

Parameters

x, y

[float or None, default: None] The x and y coordinates of the arrow base.

dx, dy

[float or None, default: None] The length of the arrow along x and y direction.

width

[float or None, default: None] Width of full arrow tail.

head_width

[float or None, default: None] Total width of the full arrow head.

head_length

[float or None, default: None] Length of arrow head.

Examples using matplotlib.patches.FancyArrow

- *Arrow guide*

matplotlib.patches.FancyArrowPatch

class matplotlib.patches.**FancyArrowPatch**(*posA=None*, *posB=None*, *, *path=None*, *arrowstyle='simple'*, *connectionstyle='arc3'*, *patchA=None*, *patchB=None*, *shrinkA=2*, *shrinkB=2*, *mutation_scale=1*, *mutation_aspect=1*, ***kwargs*)

Bases: *Patch*

A fancy arrow patch.

It draws an arrow using the *ArrowStyle*. It is primarily used by the *annotate* method. For most purposes, use the annotate method for drawing arrows.

The head and tail positions are fixed at the specified start and end points of the arrow, but the size and shape (in display coordinates) of the arrow does not change when the axis is moved or zoomed.

There are two ways for defining an arrow:

- If *posA* and *posB* are given, a path connecting two points is created according to *connectionstyle*. The path will be clipped with *patchA* and *patchB* and further shrunken by *shrinkA* and *shrinkB*. An arrow is drawn along this resulting path using the *arrowstyle* parameter.
- Alternatively if *path* is provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

Parameters

posA, posB

[(float, float), default: None] (x, y) coordinates of arrow tail and arrow head respectively.

path

[`Path`, default: None] If provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

arrowstyle

[str or `ArrowStyle`, default: 'simple'] The `ArrowStyle` with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional attributes are meant to be scaled with the *mutation_scale*. The following arrow styles are available:

Class	Nam	Attrs
Curve	-	None
CurveA	<-	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None
CurveB	->	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None
CurveA	<->	head_length=0.4, head_width=0.2, widthA=1.0, widthB=1.0, lengthA=0.2, lengthB=0.2, angleA=0, angleB=0, scaleA=None, scaleB=None

Wedge	wedg	tail_width=0.3, shrink_factor=0.5

connectionstyle

[str or *ConnectionStyle* or None, optional, default: 'arc3'] The *ConnectionStyle* with which *posA* and *posB* are connected. If a string, it should be one of the available connectionstyle names, with optional comma-separated attributes. The following connection styles are available:

Class	Name	Attrs
Arc3	`arc3`	rad=0.0
An-gle3	`an-gle3`	angleA=90, angleB=0
Angle	`angle`	angleA=90, angleB=0, rad=0.0
Arc	`arc`	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Bar	`bar`	armA=0.0, armB=0.0, fraction=0.3, angle=None

patchA, patchB

[*Patch*, default: None] Head and tail patches, respectively.

shrinkA, shrinkB

[float, default: 2] Shrinking factor of the tail and head of the arrow respectively.

mutation_scale

[float, default: 1] Value with which attributes of *arrowstyle* (e.g., *head_length*) will be scaled.

mutation_aspect

[None or float, default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

Other Parameters

****kwargs**

[*Patch* properties, optional] Here is a list of available *Patch* properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool

Table 87 – continued from previc

Property	Description
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

In contrast to other patches, the default `capstyle` and `joinstyle` for *FancyArrowPatch* are set to `"round"`.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_arrowstyle()

Return the arrowstyle object.

get_connectionstyle()

Return the *ConnectionStyle* used.

get_mutation_aspect()

Return the aspect ratio of the bbox mutation.

get_mutation_scale()

Return the mutation scale.

Returns

scalar

get_path()

Return the path of the arrow in the data coordinates.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *arrowstyle=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *connectionstyle=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *mutation_aspect=<UNSET>*, *mutation_scale=<UNSET>*, *patchA=<UNSET>*, *patchB=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *positions=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	scalar or None
animated	bool
antialiased or aa	bool or None
arrowstyle	str or *ArrowStyle*

visible	bool
zorder	float

set_arrowstyle(*arrowstyle=None*, ***kwargs*)

Set the arrow style, possibly with further attributes.

Attributes from the previous arrow style are not reused.

Without argument (or with `arrowstyle=None`), the available box styles are returned as a human-readable string.

Parameters

arrowstyle

[str or *ArrowStyle*] The style of the arrow: either a *ArrowStyle* instance, or a string, which is the style name and optionally comma separated attributes (e.g. "Fancy,head_length=0.2"). Such a string is used to construct a *ArrowStyle* object, as documented in that class.

The following arrow styles are available:

%(ArrowStyle:table_and_accepts)s

****kwargs**

Additional attributes for the arrow style. See the table above for supported parameters.

Examples

```
set_arrowstyle("Fancy,head_length=0.2")
set_arrowstyle("fancy", head_length=0.2)
```

set_connectionstyle(*connectionstyle=None*, ***kwargs*)

Set the connection style, possibly with further attributes.

Attributes from the previous connection style are not reused.

Without argument (or with `connectionstyle=None`), the available box styles are returned as a human-readable string.

Parameters

connectionstyle

[str or *ConnectionStyle*] The style of the connection: either a *ConnectionStyle* instance, or a string, which is the style name and optionally comma separated attributes (e.g. "Arc,armA=30,rad=10"). Such a string is used to construct a *ConnectionStyle* object, as documented in that class.

The following connection styles are available:

Class	Name	Attrs
Arc3	`arc3`	rad=0.0
Angle3	`angle3`	angleA=90, angleB=0
Angle	`angle`	angleA=90, angleB=0, rad=0.0
Arc	`arc`	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Bar	`bar`	armA=0.0, armB=0.0, fraction=0.3, angle=None

****kwargs**

Additional attributes for the connection style. See the table above for supported parameters.

Examples

```
set_connectionstyle("Arc,armA=30,rad=10")
set_connectionstyle("arc", armA=30, rad=10)
```

set_mutation_aspect(*aspect*)

Set the aspect ratio of the bbox mutation.

Parameters

aspect

[float]

set_mutation_scale(*scale*)

Set the mutation scale.

Parameters

scale

[float]

set_patchA(*patchA*)

Set the tail patch.

Parameters

patchA

[*patches.Patch*]

set_patchB(*patchB*)

Set the head patch.

Parameters

patchB

[*patches.Patch*]

set_positions(*posA*, *posB*)

Set the start and end positions of the connecting path.

Parameters

posA, posB

[None, tuple] (x, y) coordinates of arrow tail and arrow head respectively. If `None` use current value.

Examples using `matplotlib.patches.FancyArrowPatch`

- *Bar of pie*
- *Angle annotations on bracket arrows*
- *Arrow guide*
- *Multiple axes animation*
- *Connection styles for annotations*

- *Annotations*

matplotlib.patches.FancyBboxPatch

class matplotlib.patches.**FancyBboxPatch**(*xy*, *width*, *height*, *boxstyle='round'*, ***, *mutation_scale=1*, *mutation_aspect=1*, ***kwargs*)

Bases: *Patch*

A fancy box around a rectangle with lower left at $xy = (x, y)$ with specified width and height.

FancyBboxPatch is similar to *Rectangle*, but it draws a fancy box around the rectangle. The transformation of the rectangle box to the fancy box is delegated to the style classes defined in *BoxStyle*.

Parameters

xy

[(float, float)] The lower left corner of the box.

width

[float] The width of the box.

height

[float] The height of the box.

boxstyle

[str or *BoxStyle*] The style of the fancy box. This can either be a *BoxStyle* instance or a string of the style name and optionally comma separated attributes (e.g. "Round, pad=0.2"). This string is passed to *BoxStyle* to construct a *BoxStyle* object. See there for a full documentation.

The following box styles are available:

Class	Name	Attrs
Square	square	pad=0.3
Circle	circle	pad=0.3
Ellipse	ellipse	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
DArrow	darrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None

mutation_scale

[float, default: 1] Scaling factor applied to the attributes of the box style (e.g. pad or rounding_size).

mutation_aspect

[float, default: 1] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. For example, this allows different horizontal and vertical padding.

Other Parameters

****kwargs**

Table 89 – continued from previc

Property	Description
zorder	float

get_bbox()

Return the *Bbox*.

get_boxstyle()

Return the boxstyle object.

get_height()

Return the height of the rectangle.

get_mutation_aspect()

Return the aspect ratio of the bbox mutation.

get_mutation_scale()

Return the mutation scale.

get_path()

Return the mutated path of the rectangle.

get_width()

Return the width of the rectangle.

get_x()

Return the left coord of the rectangle.

get_y()

Return the bottom coord of the rectangle.

set_bounds(**args*)

Set the bounds of the rectangle.

Call signatures:

```
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```

Parameters

left, bottom

[float] The coordinates of the bottom left corner of the rectangle.

width, height

[float] The width/height of the rectangle.

set_boxstyle(*boxstyle=None*, ***kwargs*)

Set the box style, possibly with further attributes.

Attributes from the previous box style are not reused.

Without argument (or with `boxstyle=None`), the available box styles are returned as a human-readable string.

Parameters

boxstyle

[str or *BoxStyle*] The style of the box: either a *BoxStyle* instance, or a string, which is the style name and optionally comma separated attributes (e.g. "Round,pad=0.2"). Such a string is used to construct a *BoxStyle* object, as documented in that class.

The following box styles are available:

Class	Name	Attrs
Square	`square`	pad=0.3
Circle	`circle`	pad=0.3
Ellipse	`ellipse`	pad=0.3
LArrow	`larrow`	pad=0.3
RArrow	`rarrow`	pad=0.3
DArrow	`darrow`	pad=0.3
Round	`round`	pad=0.3, rounding_size=None
Round4	`round4`	pad=0.3, rounding_size=None
Sawtooth	`sawtooth`	pad=0.3, tooth_size=None
Roundtooth	`roundtooth`	pad=0.3, tooth_size=None

****kwargs**

Additional attributes for the box style. See the table above for supported parameters.

Examples

```
set_boxstyle("Round,pad=0.2")
set_boxstyle("round", pad=0.2)
```

set_height(*h*)

Set the rectangle height.

Parameters

h

[float]

set_mutation_aspect(*aspect*)

Set the aspect ratio of the bbox mutation.

Parameters

aspect

[float]

set_mutation_scale(*scale*)

Set the mutation scale.

Parameters

scale

[float]

set_width(*w*)

Set the rectangle width.

Parameters

w

[float]

set_x(*x*)

Set the left coord of the rectangle.

Parameters

x

[float]

set_y(*y*)

Set the bottom coord of the rectangle.

Parameters

y

[float]

Examples using `matplotlib.patches.FancyBboxPatch`

- *Reference for Matplotlib artists*
- *Drawing fancy boxes*
- *Annotate Text Arrow*

matplotlib.patches.Patch

class matplotlib.patches.**Patch**(*, *edgecolor=None*, *facecolor=None*, *color=None*, *linewidth=None*, *linestyle=None*, *antialiased=None*, *hatch=None*, *fill=True*, *capstyle=None*, *joinstyle=None*, ***kwargs*)

Bases: *Artist*

A patch is a 2D artist with a face color and an edge color.

If any of *edgecolor*, *facecolor*, *linewidth*, or *antialiased* are *None*, they default to their rc params setting.

The following kwarg properties are supported

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) a
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str

Table 91 – continued from previous page

Property	Description
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

contains(*mouseevent*, *radius=None*)

Test whether the mouse event occurred in the patch.

Returns

(bool, empty dict)

contains_point(*point*, *radius=None*)

Return whether the given point is inside the patch.

Parameters

point

[(float, float)] The point (x, y) to check, in target coordinates of `self.get_transform()`. These are display coordinates for patches that are added to a figure or axes.

radius

[float, optional] Additional margin on the patch in target coordinates of `self.get_transform()`. See *Path.contains_point* for further details.

Returns

bool

Notes

The proper use of this method depends on the transform of the patch. Isolated patches do not have a transform. In this case, the patch creation coordinates and the point coordinates match. The following example checks that the center of a circle is within the circle

```
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> c.contains_point(center)
True
```

The convention of checking against the transformed patch stems from the fact that this method is predominantly used to check if display coordinates (e.g. from mouse events) are within the patch. If you want to do the above check with data coordinates, you have to properly transform them first:

```
>>> center = 0, 0
>>> c = Circle(center, radius=3)
>>> plt.gca().add_patch(c)
>>> transformed_interior_point = c.get_data_transform().transform((0,
 ↪ 2))
>>> c.contains_point(transformed_interior_point)
True
```

contains_points(*points*, *radius=None*)

Return whether the given points are inside the patch.

Parameters

points

[(N, 2) array] The points to check, in target coordinates of `self.get_transform()`. These are display coordinates for patches that are added to a figure or axes. Columns contain x and y values.

radius

[float, optional] Additional margin on the patch in target coordinates of `self.get_transform()`. See *Path.contains_point* for further details.

Returns

length-N bool array

Notes

The proper use of this method depends on the transform of the patch. See the notes on *Patch.contains_point*.

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

property fill

Return whether the patch is filled.

get_aa()

Alias for *get_antialiased*.

get_antialiased()

Return whether antialiasing is used for drawing.

get_capstyle()

Return the capstyle.

get_data_transform()

Return the *Transform* mapping data coordinates to physical coordinates.

get_ec()

Alias for *get_edgecolor*.

get_edgecolor()

Return the edge color.

get_extents()

Return the *Patch*'s axis-aligned extents as a *Bbox*.

get_facecolor()

Return the face color.

get_fc()

Alias for *get_facecolor*.

get_fill()

Return whether the patch is filled.

get_hatch()

Return the hatching pattern.

get_joinstyle()

Return the joinstyle.

get_linestyle()

Return the linestyle.

get_linewidth()

Return the line width in points.

get_ls()

Alias for *get_linestyle*.

get_lw()

Alias for *get_linewidth*.

get_patch_transform()

Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path()

Return the path of this patch.

get_transform()

Return the *Transform* applied to the *Patch*.

get_verts()

Return a copy of the vertices used in this patch.

If the patch contains Bézier curves, the curves will be interpolated by line segments. To access the curves as curves, use *get_path*.

get_window_extent(*renderer=None*)

Get the artist's bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m
alpha	unknown
animated	bool
antialiased	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool

color	color
edgecolor	color or None
facecolor	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

set_aa(*aa*)

Alias for *set_antialiased*.

set_alpha(*alpha*)

Set the alpha value used for blending - not supported on all backends.

Parameters

alpha

[scalar or None] *alpha* must be within the 0-1 range, inclusive.

set_antialiased(*aa*)

Set whether to use antialiased rendering.

Parameters

aa

[bool or None]

set_capstyle(*s*)

Set the *CapStyle*.

The default capstyle is 'round' for *FancyArrowPatch* and 'butt' for all other patches.

Parameters

s

[*CapStyle* or {'butt', 'projecting', 'round'}]

set_color(*c*)

Set both the edgecolor and the facecolor.

Parameters

c

[color]

See also:

Patch.set_facecolor*, *Patch.set_edgecolor

For setting the edge or face color individually.

set_ec(*color*)

Alias for *set_edgecolor*.

set_edgecolor(*color*)

Set the patch edge color.

Parameters

color

[color or None]

set_facecolor(*color*)

Set the patch face color.

Parameters

color

[color or None]

set_fc(*color*)

Alias for *set_facecolor*.

set_fill(*b*)

Set whether to fill the patch.

Parameters

b

[bool]

set_hatch(*hatch*)

Set the hatching pattern.

hatch can be one of:

```
/   - diagonal hatching
\   - back diagonal
|   - vertical
-   - horizontal
+   - crossed
x   - crossed diagonal
o   - small circle
O   - large circle
.   - dots
*   - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Parameters

hatch

[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_joinstyle(*s*)

Set the *JoinStyle*.

The default joinstyle is 'round' for *FancyArrowPatch* and 'miter' for all other patches.

Parameters

s

[*JoinStyle* or {'miter', 'round', 'bevel'}]

set_linestyle(*ls*)

Set the patch linestyle.

linestyle	description
`'-'` or `'solid'`	solid line
`'--'` or `'dashed'`	dashed line
`'-.'` or `'dashdot'`	dash-dotted line
`':'` or `'dotted'`	dotted line
`'none'`, `'None'`, `' '`, or `''`	draw nothing

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq)
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters

ls

[{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}] The line style.

set_linewidth(*w*)

Set the patch linewidth in points.

Parameters

w

[float or None]

set_ls(*ls*)

Alias for *set_linestyle*.

set_lw(*w*)

Alias for *set_linewidth*.

update_from(*other*)

Copy properties from *other* to *self*.

zorder = 1

matplotlib.patches.PathPatch

class matplotlib.patches.**PathPatch**(*path*, ***kwargs*)

Bases: `Patch`

A general polycurve path patch.

path is a `Path` object.

Valid keyword arguments are:

Property	Description
`agg_filter`	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n
`alpha`	unknown
`animated`	bool
`antialiased` or aa	bool or None
`capstyle`	`CapStyle` or {'butt', 'projecting', 'round'}
`clip_box`	`BboxBase` or None
`clip_on`	bool
`clip_path`	Patch or (Path, Transform) or None
`color`	color
`edgecolor` or ec	color or None
`facecolor` or fc	color or None

Table 93 – continued from previous page

Property	Description
figure	Figure
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	JoinStyle or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of AbstractPathEffect
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	Transform
url	str
visible	bool
zorder	float

get_path()

Return the path of this patch.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	scalar or None
animated	bool
antialiased or aa	bool or None
capstyle	CapStyle or {'butt', 'projecting', 'round'}
clip_box	BboxBase or None

Table 94 – continued from previous p

Property	Description
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

set_path(*path*)

Examples using `matplotlib.patches.PathPatch`

matplotlib.patches.StepPatch

class matplotlib.patches.**StepPatch**(*values*, *edges*, *, *orientation='vertical'*, *baseline=0*, ***kwargs*)

Bases: `PathPatch`

A path patch describing a stepwise constant function.

By default, the path is not closed and starts and stops at baseline value.

Parameters

values

[array-like] The step heights.

edges

[array-like] The edge positions, with `len(edges) == len(vals) + 1`, between which the curve takes on vals values.

orientation

[{'vertical', 'horizontal'}, default: 'vertical'] The direction of the steps. Vertical means that *values* are along the y-axis, and edges are along the x-axis.

baseline

[float, array-like or None, default: 0] The bottom value of the bounding edges or when `fill=True`, position of lower edge. If *fill* is True or an array is passed to *baseline*, a closed path is drawn.

****kwargs**

`Patch` properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and return
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

get_data()

Get *StepPatch* values, edges and baseline as namedtuple.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *data=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	scalar or None
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
data	1D array-like or None
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

set_data(*values=None*, *edges=None*, *baseline=None*)

Set *StepPatch* values, edges and baseline.

Parameters

values

[1D array-like or None] Will not update values, if passing None

edges

[1D array-like, optional]

baseline

[float, 1D array-like or None]

Examples using `matplotlib.patches.StepPatch`

- *Stairs Demo*

matplotlib.patches.Polygon

class matplotlib.patches.**Polygon**(*xy*, *, *closed=True*, ***kwargs*)

Bases: *Patch*

A general polygon patch.

Parameters

xy

[(N, 2) array]

closed

[bool, default: True] Whether the polygon is closed (i.e., has identical start and end points).

****kwargs**

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object

Table 97 – continued from previc

Property	Description
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

get_closed()

Return whether the polygon is closed.

get_path()

Get the *Path* of the polygon.

get_xy()

Get the vertices of the path.

Returns

(N, 2) array

The coordinates of the vertices.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *closed=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *xy=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (
alpha	scalar or None
animated	bool

Table 98 – continued from previous p

Property	Description
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
closed	bool
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
xy	(N, 2) array-like
zorder	float

set_closed(*closed*)

Set whether the polygon is closed.

Parameters

closed

[bool] True if the polygon is closed

set_xy(*xy*)

Set the vertices of the polygon.

Parameters

xy

[(N, 2) array-like] The coordinates of the vertices.

Notes

Unlike `Path`, we do not ignore the last input vertex. If the polygon is meant to be closed, and the last point of the polygon is not equal to the first, we assume that the user has not explicitly passed a `CLOSEPOLY` vertex, and add it ourselves.

property xy

The vertices of the path as a (N, 2) array.

Examples using `matplotlib.patches.Polygon`

- *Controlling view limits using margins and sticky_edges*
- *Boxplots*
- *Arrow guide*
- *Hatch demo*
- *Circles, Wedges and Polygons*
- *floating_axes features*
- *Integral as the area under a curve*
- *Poly Editor*
- *Trifinder Event Demo*
- *Ishikawa Diagram*
- *Annotations*

matplotlib.patches.Rectangle

class matplotlib.patches.**Rectangle**(*xy*, *width*, *height*, *, *angle=0.0*, *rotation_point='xy'*, ***kwargs*)

Bases: `Patch`

A rectangle defined via an anchor point *xy* and its *width* and *height*.

The rectangle extends from `xy[0]` to `xy[0] + width` in x-direction and from `xy[1]` to `xy[1] + height` in y-direction.

```
:                +------------------+
:                |                  |
:              height               |
```

(continues on next page)

(continued from previous page)

```
:                  |                     |
:                (xy)---- width -----+
```

One may picture *xy* as the bottom left corner, but which corner *xy* is actually depends on the direction of the axis and the sign of *width* and *height*; e.g. *xy* would be the bottom right corner if the x-axis was inverted or if *width* was negative.

Parameters

xy

[(float, float)] The anchor point.

width

[float] Rectangle width.

height

[float] Rectangle height.

angle

[float, default: 0] Rotation in degrees anti-clockwise about the rotation point.

rotation_point

[{'xy', 'center', (number, number)}, default: 'xy'] If `'xy'`, rotate around the anchor point. If `'center'` rotate around the center. If 2-tuple of number, rotate around this coordinate.

Other Parameters

****kwargs**

[*Patch* properties]

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*

Table 99 – continued from previc

Property	Description
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

get_angle()

Get the rotation angle in degrees.

get_bbox()

Return the *Bbox*.

get_center()

Return the centre of the rectangle.

get_corners()

Return the corners of the rectangle, moving anti-clockwise from (x0, y0).

get_height()

Return the height of the rectangle.

get_patch_transform()

Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path()

Return the vertices of the rectangle.

get_width()

Return the width of the rectangle.

get_x()

Return the left coordinate of the rectangle.

get_xy()

Return the left and bottom coords of the rectangle as a tuple.

get_y()

Return the bottom coordinate of the rectangle.

property rotation_point

The rotation point of the patch.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *angle=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *bounds=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *height=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *width=<UNSET>*, *x=<UNSET>*, *xy=<UNSET>*, *y=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	scalar or None
angle	unknown
animated	bool
antialiased or aa	bool or None
bounds	(left, bottom, width, height)
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
height	unknown
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}

Table 100 – continued from previous

Property	Description
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
width	unknown
x	unknown
xy	(float, float)
y	unknown
zorder	float

set_angle(*angle*)

Set the rotation angle in degrees.

The rotation is performed anti-clockwise around *xy*.

set_bounds(**args*)

Set the bounds of the rectangle as *left*, *bottom*, *width*, *height*.

The values may be passed as separate parameters or as a tuple:

```
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```

set_height(*h*)

Set the height of the rectangle.

set_width(*w*)

Set the width of the rectangle.

set_x(*x*)

Set the left coordinate of the rectangle.

set_xy(*xy*)

Set the left and bottom coordinates of the rectangle.

Parameters

xy

[(float, float)]

set_y(*y*)

Set the bottom coordinate of the rectangle.

property xy

Return the left and bottom coords of the rectangle as a tuple.

Examples using `matplotlib.patches.Rectangle`

matplotlib.patches.RegularPolygon

class matplotlib.patches.**RegularPolygon**(*xy*, *numVertices*, *, *radius=5*, *orientation=0*, ***kwargs*)

Bases: *Patch*

A regular polygon patch.

Parameters

xy

[(float, float)] The center position.

numVertices

[int] The number of vertices.

radius

[float] The distance from the center to each of the vertices.

orientation

[float] The polygon rotation angle (in radians).

****kwargs**

Patch properties:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and return
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}

- *Reference for Matplotlib artists*
- *Radar chart (aka spider or star chart)*

matplotlib.patches.Shadow

class matplotlib.patches.**Shadow**(*patch*, *ox*, *oy*, *, *shade=0.7*, ***kwargs*)

Bases: Patch

Create a shadow of the given *patch*.

By default, the shadow will have the same face color as the *patch*, but darkened. The darkness can be controlled by *shade*.

Parameters

patch

[Patch] The patch to create the shadow for.

ox, oy

[float] The shift of the shadow in data coordinates, scaled by a factor of dpi/72.

shade

[float, default: 0.7] How the darkness of the shadow relates to the original color. If 1, the shadow is black, if 0, the shadow has the same color as the *patch*.

New in version 3.8.

****kwargs**

Properties of the shadow patch. Supported keys are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and retur
alpha	unknown
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
color	color
edgecolor or ec	color or None
facecolor or fc	color or None
figure	*Figure*
fill	bool
gid	str
hatch	{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}
in_layout	bool
joinstyle	*JoinStyle* or {'miter', 'round', 'bevel'}
label	object
linestyle or ls	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
linewidth or lw	float or None
mouseover	bool
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
transform	*Transform*
url	str
visible	bool
zorder	float

draw(*renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

Parameters

renderer

[*RendererBase* subclass.]

Notes

This method is overridden in the Artist subclasses.

get_patch_transform()

Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path()

Return the path of this patch.

set(*, *agg_filter=<UNSET>*, *alpha=<UNSET>*, *animated=<UNSET>*, *antialiased=<UNSET>*, *capstyle=<UNSET>*, *clip_box=<UNSET>*, *clip_on=<UNSET>*, *clip_path=<UNSET>*, *color=<UNSET>*, *edgecolor=<UNSET>*, *facecolor=<UNSET>*, *fill=<UNSET>*, *gid=<UNSET>*, *hatch=<UNSET>*, *in_layout=<UNSET>*, *joinstyle=<UNSET>*, *label=<UNSET>*, *linestyle=<UNSET>*, *linewidth=<UNSET>*, *mouseover=<UNSET>*, *path_effects=<UNSET>*, *picker=<UNSET>*, *rasterized=<UNSET>*, *sketch_params=<UNSET>*, *snap=<UNSET>*, *transform=<UNSET>*, *url=<UNSET>*, *visible=<UNSET>*, *zorder=<UNSET>*)

Set multiple properties at once.

Supported properties are

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
alpha	scalar or None
animated	bool
antialiased or aa	bool or None
capstyle	*CapStyle* or {'butt', 'projecting', 'round'}

zorder	float

Examples using `matplotlib.patches.Shadow`

- *Using a text as a Path*
- *SVG filter pie*

matplotlib.patches.Wedge

class matplotlib.patches.**Wedge**(*center*, *r*, *theta1*, *theta2*, *, *width=None*, ***kwargs*)

Bases: *Patch*

Wedge shaped patch.

A wedge centered at *x*, *y* center with radius *r* that sweeps *theta1* to *theta2* (in degrees). If *width* is given, then a partial wedge is drawn from inner radius *r* - *width* to outer radius *r*.

Valid keyword arguments are:

Property	Description
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n
alpha	unknown
animated	bool

Functions

`bbox_artist`(artist, renderer[, props, fill])	A debug function to draw a rectangle around the bounding box returned by an artist's `Artist.get_window_extent` to test whether the artist is returning the correct bbox.
`draw_bbox`(bbox, renderer[, color, trans])	A debug function to draw a rectangle around the bounding box returned by an artist's `Artist.get_window_extent` to test whether the artist is returning the correct bbox.

matplotlib.patches.bbox_artist

matplotlib.patches.**bbox_artist**(*artist*, *renderer*, *props=None*, *fill=True*)

A debug function to draw a rectangle around the bounding box returned by an artist's `Artist.get_window_extent` to test whether the artist is returning the correct bbox.

props is a dict of rectangle props with the additional property 'pad' that sets the padding around the bbox in points.

matplotlib.patches.draw_bbox

matplotlib.patches.**draw_bbox**(*bbox*, *renderer*, *color='k'*, *trans=None*)

A debug function to draw a rectangle around the bounding box returned by an artist's `Artist.get_window_extent` to test whether the artist is returning the correct bbox.

7.2.38 matplotlib.path

A module for dealing with the polylines used throughout Matplotlib.

The primary class for polyline handling in Matplotlib is *Path*. Almost all vector drawing makes use of *Path*s somewhere in the drawing pipeline.

Whilst a *Path* instance itself cannot be drawn, some *Artist* subclasses, such as *PathPatch* and *PathCollection*, can be used for convenient *Path* visualisation.

class matplotlib.path.**Path**(*vertices*, *codes=None*, *_interpolation_steps=1*, *closed=False*, *readonly=False*)

Bases: object

A series of possibly disconnected, possibly closed, line and curve segments.

The underlying storage is made up of two parallel numpy arrays:

- *vertices*: an (N, 2) float array of vertices
- *codes*: an N-length numpy.uint8 array of path codes, or None

These two arrays always have the same length in the first dimension. For example, to represent a cubic curve, you must provide three vertices and three *CURVE4* codes.

The code types are:

- ***STOP***

  [1 vertex (ignored)] A marker for the end of the entire path (currently not required and ignored)

- ***MOVETO***

  [1 vertex] Pick up the pen and move to the given vertex.

- ***LINETO***

  [1 vertex] Draw a line from the current position to the given vertex.

- ***CURVE3***

  [1 control point, 1 endpoint] Draw a quadratic Bézier curve from the current position, with the given control point, to the given end point.

- ***CURVE4***

  [2 control points, 1 endpoint] Draw a cubic Bézier curve from the current position, with the given control points, to the given end point.

- ***CLOSEPOLY***

  [1 vertex (ignored)] Draw a line segment to the start point of the current polyline.

If *codes* is None, it is interpreted as a *MOVETO* followed by a series of *LINETO*.

Users of Path objects should not access the vertices and codes arrays directly. Instead, they should use *iter_segments* or *cleaned* to get the vertex/code pairs. This helps, in particular, to consistently handle the case of *codes* being None.

Some behavior of Path objects can be controlled by rcParams. See the rcParams whose keys start with 'path.'.

Note: The vertices and codes arrays should be treated as immutable -- there are a number of optimizations and assumptions made up front in the constructor that will not change when the data changes.

Create a new path with the given vertices and codes.

Parameters

vertices

[(N, 2) array-like] The path vertices, as an array, masked array or sequence of pairs. Masked values, if any, will be converted to NaNs, which are then handled correctly by the Agg PathIterator and other consumers of path data, such as *iter_segments()*.

codes

[array-like or None, optional] N-length array of integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, *vertices* will be treated as a series of line segments.

_interpolation_steps

[int, optional] Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

closed

[bool, optional] If *codes* is None and closed is True, vertices will be treated as line segments of a closed polygon. Note that the last vertex will then be ignored (as the corresponding code will be set to *CLOSEPOLY*).

readonly

[bool, optional] Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

CLOSEPOLY = 79

CURVE3 = 3

CURVE4 = 4

LINETO = 2

MOVETO = 1

NUM_VERTICES_FOR_CODE = {0: 1, 1: 1, 2: 1, 3: 2, 4: 3, 79: 1}

A dictionary mapping Path codes to the number of vertices that the code expects.

STOP = 0

classmethod arc(*theta1*, *theta2*, *n=None*, *is_wedge=False*)

Return a *Path* for the unit circle arc from angles *theta1* to *theta2* (in degrees).

theta2 is unwrapped to produce the shortest arc within 360 degrees. That is, if *theta2* > *theta1* + 360, the arc will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

Masionobe, L. 2003. Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves.

classmethod circle(*center=(0.0, 0.0)*, *radius=1.0*, *readonly=False*)

Return a *Path* representing a circle of a given radius and center.

Parameters

center

[(float, float), default: (0, 0)] The center of the circle.

radius

[float, default: 1] The radius of the circle.

readonly

[bool] Whether the created path should have the "readonly" argument set when creating the Path instance.

Notes

The circle is approximated using 8 cubic Bézier curves, as described in

Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

cleaned(*transform=None*, *remove_nans=False*, *clip=None*, ***, *simplify=False*, *curves=False*, *stroke_width=1.0*, *snap=False*, *sketch=None*)

Return a new *Path* with vertices and codes cleaned according to the parameters.

See also:

Path.iter_segments

for details of the keyword arguments.

clip_to_bbox(*bbox*, *inside=True*)

Clip the path to the given bounding box.

The path must be made up of one or more closed polygons. This algorithm will not behave correctly for unclosed paths.

If *inside* is `True`, clip to the inside of the box, otherwise to the outside of the box.

code_type

alias of `uint8`

property codes

The list of codes in the *Path* as a 1D array.

Each code is one of *STOP*, *MOVETO*, *LINETO*, *CURVE3*, *CURVE4* or *CLOSEPOLY*. For codes that correspond to more than one vertex (*CURVE3* and *CURVE4*), that code will be repeated so that the length of *vertices* and *codes* is always the same.

contains_path(*path*, *transform=None*)

Return whether this (closed) path completely contains the given path.

If *transform* is not `None`, the path will be transformed before checking for containment.

contains_point(*point*, *transform=None*, *radius=0.0*)

Return whether the area enclosed by the path contains the given point.

The path is always treated as closed; i.e. if the last code is not *CLOSEPOLY* an implicit segment connecting the last vertex to the first vertex is assumed.

Parameters

point

[(float, float)] The point (x, y) to check.

transform

[*Transform*, optional] If not `None`, *point* will be compared to `self` transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *point*.

radius

[float, default: 0] Additional margin on the path in coordinates of *point*. The path is extended tangentially by *radius/2*; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

Returns

bool

Notes

The current algorithm has some limitations:

- The result is undefined for points exactly at the boundary (i.e. at the path shifted by *radius/2*).
- The result is undefined if there is no enclosed area, i.e. all vertices are on a straight line.
- If bounding lines start to cross each other due to *radius* shift, the result is not guaranteed to be correct.

contains_points(*points*, *transform=None*, *radius=0.0*)

Return whether the area enclosed by the path contains the given points.

The path is always treated as closed; i.e. if the last code is not `CLOSEPOLY` an implicit segment connecting the last vertex to the first vertex is assumed.

Parameters

points

[(N, 2) array] The points to check. Columns contain x and y values.

transform

[`Transform`, optional] If not `None`, *points* will be compared to `self` transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *points*.

radius

[float, default: 0] Additional margin on the path in coordinates of *points*. The path is extended tangentially by *radius/2*; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

Returns

length-N bool array

Notes

The current algorithm has some limitations:

- The result is undefined for points exactly at the boundary (i.e. at the path shifted by *radius/2*).
- The result is undefined if there is no enclosed area, i.e. all vertices are on a straight line.
- If bounding lines start to cross each other due to *radius* shift, the result is not guaranteed to be correct.

copy()

Return a shallow copy of the *Path*, which will share the vertices and codes with the source *Path*.

deepcopy(*memo=None*)

Return a deepcopy of the *Path*. The *Path* will not be readonly, even if the source *Path* is.

get_extents(*transform=None*, ***kwargs*)

Get Bbox of the path.

Parameters

transform

[*Transform*, optional] Transform to apply to path before computing extents, if any.

****kwargs**

Forwarded to *iter_bezier*.

Returns

matplotlib.transforms.Bbox

The extents of the path Bbox([[xmin, ymin], [xmax, ymax]])

static hatch(*hatchpattern*, *density=6*)

Given a hatch specifier, *hatchpattern*, generates a *Path* that can be used in a repeated hatching pattern. *density* is the number of lines per unit square.

interpolated(*steps*)

Return a new path resampled to length N x *steps*.

Codes other than *LINETO* are not handled correctly.

intersects_bbox(*bbox*, *filled=True*)

Return whether this path intersects a given *Bbox*.

If *filled* is True, then this also returns True if the path completely encloses the *Bbox* (i.e., the path is treated as filled).

The bounding box is always considered filled.

intersects_path(*other*, *filled=True*)

Return whether if this path intersects another given path.

If *filled* is True, then this also returns True if one path completely encloses the other (i.e., the paths are treated as filled).

iter_bezier(***kwargs*)

Iterate over each Bézier curve (lines included) in a *Path*.

Parameters

****kwargs**

Forwarded to *iter_segments*.

Yields

B

[*BezierSegment*] The Bézier curves that make up the current path. Note in particular that freestanding points are Bézier curves of order 0, and lines are Bézier curves of order 1 (with two control points).

code

[*code_type*] The code describing what kind of curve is being returned. *MOVETO*, *LINETO*, *CURVE3*, and *CURVE4* correspond to Bézier curves with 1, 2, 3, and 4 control points (respectively). *CLOSEPOLY* is a *LINETO* with the control points correctly chosen based on the start/end points of the current stroke.

iter_segments(*transform=None*, *remove_nans=True*, *clip=None*, *snap=False*, *stroke_width=1.0*, *simplify=None*, *curves=True*, *sketch=None*)

Iterate over all curve segments in the path.

Each iteration returns a pair `(vertices, code)`, where `vertices` is a sequence of 1-3 coordinate pairs, and `code` is a *Path* code.

Additionally, this method can provide a number of standard cleanups and conversions to the path.

Parameters

transform

[None or *Transform*] If not None, the given affine transformation will be applied to the path.

remove_nans

[bool, optional] Whether to remove all NaNs from the path and skip over them using MOVETO commands.

clip

[None or (float, float, float, float), optional] If not None, must be a four-tuple (x1, y1, x2, y2) defining a rectangle in which to clip the path.

snap

[None or bool, optional] If True, snap all nodes to pixels; if False, don't snap them. If None, snap if the path contains only segments parallel to the x or y axes, and no more than 1024 of them.

stroke_width

[float, optional] The width of the stroke being drawn (used for path snapping).

simplify

[None or bool, optional] Whether to simplify the path by removing vertices that do not affect its appearance. If None, use the *should_simplify* attribute. See also *rcParams["path.simplify"]* (default: `True`) and *rcParams["path.simplify_threshold"]* (default: `0.111111111111`).

curves

[bool, optional] If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

sketch

[None or sequence, optional] If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.

classmethod make_compound_path(**args*)

Concatenate a list of *Path*s into a single *Path*, removing all *STOP*s.

classmethod make_compound_path_from_polys(*XY*)

Make a compound *Path* object to draw a number of polygons with equal numbers of sides.

Parameters

XY

[(numpolys, numsides, 2) array]

property readonly

`True` if the *Path* is read-only.

property should_simplify

`True` if the vertices array should be simplified.

property simplify_threshold

The fraction of a pixel difference below which vertices will be simplified out.

to_polygons(*transform=None*, *width=0*, *height=0*, *closed_only=True*)

Convert this path to a list of polygons or polylines. Each polygon/polyline is an (N, 2) array of vertices. In other words, each polygon has no *MOVETO* instructions or curves. This is useful for displaying in backends that do not support compound paths or Bézier curves.

If *width* and *height* are both non-zero then the lines will be simplified so that vertices outside of (0, 0), (width, height) will be clipped.

If *closed_only* is `True` (default), only closed polygons, with the last point being the same as the first point, will be returned. Any unclosed polylines in the path will be explicitly closed. If *closed_only* is `False`, any unclosed polygons in the path will be returned as unclosed polygons, and the closed polygons will be returned explicitly closed by setting the last point to the same as the first point.

transformed(*transform*)

Return a transformed copy of the path.

See also:

matplotlib.transforms.TransformedPath

A specialized path class that will cache the transformed result and automatically update when the transform changes.

classmethod unit_circle()

Return the readonly *Path* of the unit circle.

For most cases, *Path.circle()* will be what you want.

classmethod unit_circle_righthalf()

Return a *Path* of the right half of a unit circle.

See *Path.circle* for the reference on the approximation used.

classmethod unit_rectangle()

Return a *Path* instance of the unit rectangle from (0, 0) to (1, 1).

classmethod unit_regular_asterisk(*numVertices*)

Return a *Path* for a unit regular asterisk with the given numVertices and radius of 1.0, centered at (0, 0).

classmethod unit_regular_polygon(*numVertices*)

Return a *Path* instance for a unit regular polygon with the given *numVertices* such that the circumscribing circle has radius 1.0, centered at (0, 0).

classmethod unit_regular_star(*numVertices*, *innerCircle=0.5*)

Return a *Path* for a unit regular star with the given numVertices and radius of 1.0, centered at (0, 0).

property vertices

The vertices of the *Path* as an (N, 2) array.

classmethod wedge(*theta1*, *theta2*, *n=None*)

Return a *Path* for the unit circle wedge from angles *theta1* to *theta2* (in degrees).

theta2 is unwrapped to produce the shortest wedge within 360 degrees. That is, if *theta2* > *theta1* + 360, the wedge will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

See *Path.arc* for the reference on the approximation used.

matplotlib.path.**get_path_collection_extents**(*master_transform*, *paths*, *transforms*, *offsets*, *offset_transform*)

Get bounding box of a *PathCollection*s internal objects.

That is, given a sequence of *Path*s, *Transform*s objects, and offsets, as found in a *PathCollection*, return the bounding box that encapsulates all of them.

Parameters

master_transform

[*Transform*] Global transformation applied to all paths.

paths

[list of *Path*]

transforms

[list of *Affine2DBase*] If non-empty, this overrides *master_transform*.

offsets

[(N, 2) array-like]

offset_transform

[*Affine2DBase*] Transform applied to the offsets before offsetting the path.

Notes

The way that *paths*, *transforms* and *offsets* are combined follows the same method as for collections: each is iterated over independently, so if you have 3 paths (A, B, C), 2 transforms (α, β) and 1 offset (O), their combinations are as follows:

- (A, α, O)
- (B, β, O)
- (C, α, O)

7.2.39 matplotlib.patheffects

Defines classes for path effects. The path effects are supported in *Text*, *Line2D* and *Patch*.

See also:

Path effects guide

class matplotlib.patheffects.**AbstractPathEffect**(*offset=(0.0, 0.0)*)

Bases: object

A base class for path effects.

Subclasses should override the `draw_path` method to add effect functionality.

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, measured in points.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace=None*)

Derived should override this method. The arguments are the same as *matplotlib.backend_bases.RendererBase.draw_path()* except the first argument is a renderer.

class matplotlib.patheffects.**Normal**(*offset=(0.0, 0.0)*)

Bases: *AbstractPathEffect*

The "identity" PathEffect.

The Normal PathEffect's sole purpose is to draw the original artist with no special path effect.

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, measured in points.

class matplotlib.patheffects.**PathEffectRenderer**(*path_effects*, *renderer*)

Bases: *RendererBase*

Implements a Renderer which contains another renderer.

This proxy then intercepts draw calls, calling the appropriate *AbstractPathEffect* draw method.

Note: Not all methods have been overridden on this RendererBase subclass. It may be necessary to add further methods to extend the PathEffects capabilities further.

Parameters

path_effects

[iterable of *AbstractPathEffect*] The path effects which this renderer represents.

renderer

[*RendererBase* subclass]

copy_with_path_effect(*path_effects*)

draw_markers(*gc*, *marker_path*, *marker_trans*, *path*, **args*, ***kwargs*)

Draw a marker at each of *path*'s vertices (excluding control points).

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

[*GraphicsContextBase*] The graphics context.

marker_path

[*Path*] The path for the marker.

marker_trans

[*Transform*] An affine transform applied to the marker.

path

[*Path*] The locations to draw the markers.

trans

[*Transform*] An affine transform applied to the path.

rgbFace

[color, optional]

draw_path(*gc*, *tpath*, *affine*, *rgbFace=None*)

Draw a *Path* instance using the given affine transform.

draw_path_collection(*gc*, *master_transform*, *paths*, **args*, ***kwargs*)

Draw a collection of *paths*.

Each path is first transformed by the corresponding entry in *all_transforms* (a list of (3, 3) matrices) and then by *master_transform*. They are then translated by the corresponding entry in *offsets*, which has been first transformed by *offset_trans*.

facecolors, *edgecolors*, *linewidths*, *linestyles*, and *antialiased* are lists that set the corresponding properties.

offset_position is unused now, but the argument is kept for backwards compatibility.

The base (fallback) implementation makes multiple calls to *draw_path*. Backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths` and `_iter_collection` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of *draw_path_collection* can be made globally.

class matplotlib.patheffects.**PathPatchEffect**(*offset=(0, 0)*, ***kwargs*)

Bases: *AbstractPathEffect*

Draws a *PathPatch* instance whose Path comes from the original PathEffect artist.

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, in points.

****kwargs**

All keyword arguments are passed through to the *PathPatch* constructor. The properties which cannot be overridden are "path", "clip_box" "transform" and "clip_path".

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Derived should override this method. The arguments are the same as *matplotlib.backend_bases.RendererBase.draw_path()* except the first argument is a renderer.

class matplotlib.patheffects.**SimpleLineShadow**(*offset=(2, -2)*, *shadow_color='k'*, *alpha=0.3*, *rho=0.3*, ***kwargs*)

Bases: *AbstractPathEffect*

A simple shadow via a line.

Parameters

offset

[(float, float), default: (2, -2)] The (x, y) offset to apply to the path, in points.

shadow_color

[color, default: 'black'] The shadow color. A value of `None` takes the original artist's color with a scale factor of *rho*.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch.

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if *shadow_color* is `None`.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.**SimplePatchShadow**(*offset=(2, -2)*, *shadow_rgbFace=None*, *alpha=None*, *rho=0.3*, ***kwargs*)

Bases: *AbstractPathEffect*

A simple shadow via a filled patch.

Parameters

offset

[(float, float), default: (2, -2)] The (x, y) offset of the shadow in points.

shadow_rgbFace

[color] The shadow color.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch.

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if *shadow_rgbFace* is not specified.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.**Stroke**(*offset=(0, 0)*, ***kwargs*)

Bases: *AbstractPathEffect*

A line based PathEffect which re-draws a stroke.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Draw the path with updated gc.

class matplotlib.patheffects.**TickedStroke**(*offset=(0, 0)*, *spacing=10.0*, *angle=45.0*, *length=1.4142135623730951*, ***kwargs*)

Bases: *AbstractPathEffect*

A line-based PathEffect which draws a path with a ticked style.

This line style is frequently used to represent constraints in optimization. The ticks may be used to indicate that one side of the line is invalid or to represent a closed boundary of a domain (i.e. a wall or the edge of a pipe).

The spacing, length, and angle of ticks can be controlled.

This line style is sometimes referred to as a hatched line.

See also the *TickedStroke patheffect* example.

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, in points.

spacing

[float, default: 10.0] The spacing between ticks in points.

angle

[float, default: 45.0] The angle between the path and the tick in degrees. The angle is measured as if you were an ant walking along the curve, with zero degrees pointing directly ahead, 90 to your left, -90 to your right, and 180 behind you. To change side of the ticks, change sign of the angle.

length

[float, default: 1.414] The length of the tick relative to spacing. Recommended length = 1.414 (sqrt(2)) when angle=45, length=1.0 when angle=90 and length=2.0 when angle=60.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

Examples

See *TickedStroke patheffect*.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Draw the path with updated gc.

class matplotlib.patheffects.**withSimplePatchShadow**(*offset=(2, -2)*, *shadow_rgbFace=None*, *alpha=None*, *rho=0.3*, ***kwargs*)

Bases: *SimplePatchShadow*

A shortcut PathEffect for applying *SimplePatchShadow* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([patheffects.withSimplePatchShadow()])
```

as a shortcut for

```
artist.set_path_effects([patheffects.SimplePatchShadow(),
                         patheffects.Normal()])
```

Parameters

offset

[(float, float), default: (2, -2)] The (x, y) offset of the shadow in points.

shadow_rgbFace

[color] The shadow color.

alpha

[float, default: 0.3] The alpha transparency of the created shadow patch.

rho

[float, default: 0.3] A scale factor to apply to the rgbFace color if *shadow_rgbFace* is not specified.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.**withStroke**(*offset=(0, 0)*, ***kwargs*)

Bases: *Stroke*

A shortcut PathEffect for applying *Stroke* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([patheffects.withStroke()])
```

as a shortcut for

```
artist.set_path_effects([patheffects.Stroke(),
                         patheffects.Normal()])
```

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Draw the path with updated gc.

class matplotlib.patheffects.**withTickedStroke**(*offset=(0, 0)*, *spacing=10.0*, *angle=45.0*, *length=1.4142135623730951*, ***kwargs*)

Bases: *TickedStroke*

A shortcut PathEffect for applying *TickedStroke* and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([patheffects.withTickedStroke()])
```

as a shortcut for

```
artist.set_path_effects([patheffects.TickedStroke(),
                         patheffects.Normal()])
```

Parameters

offset

[(float, float), default: (0, 0)] The (x, y) offset to apply to the path, in points.

spacing

[float, default: 10.0] The spacing between ticks in points.

angle

[float, default: 45.0] The angle between the path and the tick in degrees. The angle is measured as if you were an ant walking along the curve, with zero degrees pointing directly ahead, 90 to your left, -90 to your right, and 180 behind you. To change side of the ticks, change sign of the angle.

length

[float, default: 1.414] The length of the tick relative to spacing. Recommended length = 1.414 (sqrt(2)) when angle=45, length=1.0 when angle=90 and length=2.0 when angle=60.

****kwargs**

Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

Examples

See *TickedStroke patheffect*.

draw_path(*renderer*, *gc*, *tpath*, *affine*, *rgbFace*)

Draw the path with updated gc.

7.2.40 matplotlib.pyplot

matplotlib.pyplot is a state-based interface to matplotlib. It provides an implicit, MATLAB-like, way of plotting. It also opens figures on your screen, and acts as the figure GUI manager.

pyplot is mainly intended for interactive plots and simple cases of programmatic plot generation:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
y = np.sin(x)
plt.plot(x, y)
```

The explicit object-oriented API is recommended for complex plots, though pyplot is still usually used to create the figure and often the axes in the figure. See *pyplot.figure*, *pyplot.subplots*, and *pyplot.subplot_mosaic* to create figures, and *Axes API* for the plotting methods on an Axes:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)
```

See *Matplotlib Application Interfaces (APIs)* for an explanation of the tradeoffs between the implicit and explicit interfaces.

Managing Figure and Axes

axes	Add an Axes to the current figure and make it the current Axes.
cla	Clear the current axes.
clf	Clear the current figure.
close	Close a figure window.
delaxes	Remove an *Axes* (defaulting to the current axes) from its figure.
fignum_exists	Return whether the figure with the given id exists.
figure	Create a new figure, or activate an existing figure.
gca	Get the current Axes.
gcf	Get the current figure.
get_figlabels	Return a list of existing figure labels.
get_fignums	Return a list of existing figure numbers.
sca	Set the current Axes to *ax* and the current Figure to the parent of *ax*.
subplot	Add an Axes to the current figure or retrieve an existing Axes.
subplot2grid	Create a subplot at a specific location inside a regular grid.
subplot_mosaic	Build a layout of Axes based on ASCII art or nested lists.
subplots	Create a figure and a set of subplots.
twinx	Make and return a second axes that shares the *x*-axis.
twiny	Make and return a second axes that shares the *y*-axis.

matplotlib.pyplot.axes

matplotlib.pyplot.**axes**(*arg=None*, ***kwargs*)

Add an Axes to the current figure and make it the current Axes.

Call signatures:

```
plt.axes()
plt.axes(rect, projection=None, polar=False, **kwargs)
plt.axes(ax)
```

Parameters

arg

[None or 4-tuple] The exact behavior of this function depends on the type:

- *None*: A new full window Axes is added using `subplot(**kwargs)`.
- 4-tuple of floats *rect* = `(left, bottom, width, height)`. A new Axes is added with dimensions *rect* in normalized (0, 1) units using *add_axes* on the current figure.

projection

[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared Axes.

label

[str] A label for the returned Axes.

Returns

Axes*, or a subclass of *Axes

The returned axes class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used.

Other Parameters

****kwargs**

This method also takes the keyword arguments for the returned Axes class. The keyword arguments for the rectilinear Axes class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual Axes class.

Property	Description
adjustable	{'box', 'datalim'}
agg_filter	a filter function, which takes a (m, n, 3) float array and a dpi value, ar
alpha	scalar or None
anchor	(float, float) or {'C', 'SW', 'S', 'SE', 'E', 'NE', ...}
animated	bool
aspect	{'auto', 'equal'} or float
autoscale_on	bool
autoscalex_on	unknown

Table 107 – continued from p

Property	Description
autoscaley_on	unknown
axes_locator	Callable[[Axes, Renderer], Bbox]
axisbelow	bool or 'line'
box_aspect	float or None
clip_box	*BboxBase* or None
clip_on	bool
clip_path	Patch or (Path, Transform) or None
facecolor or fc	color
figure	*Figure*
frame_on	bool
gid	str
in_layout	bool
label	object
mouseover	bool
navigate	bool
navigate_mode	unknown
path_effects	list of *AbstractPathEffect*
picker	None or bool or float or callable
position	[left, bottom, width, height] or *Bbox*
prop_cycle	*Cycler*
rasterization_zorder	float or None
rasterized	bool
sketch_params	(scale: float, length: float, randomness: float)
snap	bool or None
subplotspec	unknown
title	str
transform	*Transform*
url	str
visible	bool
xbound	(lower: float, upper: float)
xlabel	str
xlim	(left: float, right: float)
xmargin	float greater than -0.5
xscale	unknown
xticklabels	unknown
xticks	unknown
ybound	(lower: float, upper: float)
ylabel	str
ylim	(bottom: float, top: float)
ymargin	float greater than -0.5
yscale	unknown
yticklabels	unknown
yticks	unknown
zorder	float

Table 107 – continued from p

Property	Description

Figure.add_axes
pyplot.subplot
Figure.add_subplot
Figure.subplots
pyplot.subplots

Examples

```
# Creating a new full window Axes
plt.axes()

# Creating a new Axes with specified dimensions and a grey background
plt.axes((left, bottom, width, height), facecolor='grey')
```

Examples using `matplotlib.pyplot.axes`

- *Subplots spacings and margins*

matplotlib.pyplot.cla

matplotlib.pyplot.**cla**()

Clear the current axes.

matplotlib.pyplot.clf

matplotlib.pyplot.**clf**()

Clear the current figure.

matplotlib.pyplot.close

matplotlib.pyplot.**close**(*fig=None*)

Close a figure window.

Parameters

fig

[None or int or str or *Figure*] The figure to close. There are a number of ways to specify this:

- *None*: the current figure
- *Figure*: the given *Figure* instance
- `int`: a figure number
- `str`: a figure name
- 'all': all figures

Examples using `matplotlib.pyplot.close`

- *Pong*
- *Multipage PDF*
- *Multiprocessing*
- *Tight layout guide*

matplotlib.pyplot.delaxes

`matplotlib.pyplot.`**`delaxes`**(*ax=None*)

Remove an *Axes* (defaulting to the current axes) from its figure.

matplotlib.pyplot.fignum_exists

`matplotlib.pyplot.`**`fignum_exists`**(*num*)

Return whether the figure with the given id exists.

Parameters

num

[int or str] A figure identifier.

Returns

bool

Whether or not a figure with id *num* exists.

matplotlib.pyplot.figure

matplotlib.pyplot.**figure**(*num=None*, *figsize=None*, *dpi=None*, ***, *facecolor=None*, *edgecolor=None*, *frameon=True*, *FigureClass=<class 'matplotlib.figure.Figure'>*, *clear=False*, ***kwargs*)

Create a new figure, or activate an existing figure.

Parameters

num

[int or str or *Figure* or *SubFigure*, optional] A unique identifier for the figure.

If a figure with that identifier already exists, this figure is made active and returned. An integer refers to the `Figure.number` attribute, a string refers to the figure label.
