Return integer array of shape (ntri, 3) containing neighbor triangles.

For each triangle, the indices of the three triangles that share the same edges, or -1 if there is no such neighboring triangle. `neighbors[i, j]` is the triangle that is the neighbor to the edge from point index `triangles[i, j]` to point index `triangles[i, (j+1)%3]`.

**set\_mask**(*self*, *mask*)

Set or clear the mask array.

## Parameters

**mask** [None or bool array of length ntri]

`class matplotlib.tri.TriContourSet(ax, *args, **kwargs)`

Bases: `matplotlib.contour.ContourSet`

Create and store a set of contour lines or filled regions for a triangular grid.

User-callable method: `clabel`

## Attributes

**ax** The axes object in which the contours are drawn.

**collections** A silent\_list of LineCollections or PolyCollections.

**levels** Contour levels.

**layers** Same as levels for line contours; half-way between levels for filled contours. See `_process_colors()`.

Draw triangular grid contour lines or filled regions, depending on whether keyword arg 'filled' is False (default) or True.

The first argument of the initializer must be an axes object. The remaining arguments and keyword arguments are described in the docstring of `tricontour`.

`class matplotlib.tri.TriFinder(triangulation)`

Abstract base class for classes used to find the triangles of a Triangulation in which (x, y) points lie.

Rather than instantiate an object of a class derived from TriFinder, it is usually better to use the function `Triangulation.get_trifinder`.

Derived classes implement `__call__(x, y)` where x and y are array-like point coordinates of the same shape.

`class matplotlib.tri.TrapezoidMapTriFinder(triangulation)`

Bases: `matplotlib.tri.trifinder.TriFinder`

*TriFinder* class implemented using the trapezoid map algorithm from the book "Computational Geometry, Algorithms and Applications", second edition, by M. de Berg, M. van Kreveld, M. Overmars and O. Schwarzkopf.

The triangulation must be valid, i.e. it must not have duplicate points, triangles formed from colinear points, or overlapping triangles. The algorithm has some tolerance to triangles formed from colinear points, but this should not be relied upon.

`class matplotlib.tri.TriInterpolator(triangulation, z, trifinder=None)`

Abstract base class for classes used to interpolate on a triangular grid.

Derived classes implement the following methods:

- `__call__(x, y)`, where x, y are array-like point coordinates of the same shape, and that returns a masked array of the same shape containing the interpolated z-values.
- `gradient(x, y)`, where x, y are array-like point coordinates of the same shape, and that returns a list of 2 masked arrays of the same shape containing the 2 derivatives of the interpolator (derivatives of interpolated z values with respect to x and y).

`class matplotlib.tri.LinearTriInterpolator(triangulation, z, trifinder=None)`

Bases: `matplotlib.tri.triinterpolate.TriInterpolator`

Linear interpolator on a triangular grid.

Each triangle is represented by a plane so that an interpolated value at point (x, y) lies on the plane of the triangle containing (x, y). Interpolated values are therefore continuous across the triangulation, but their first derivatives are discontinuous at edges between triangles.

### Parameters

- triangulation** [*Triangulation*] The triangulation to interpolate over.
- z** [array-like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.
- trifinder** [*TriFinder*, optional] If this is not specified, the Triangulation's default TriFinder will be used by calling *Triangulation.get\_trifinder*.

### Methods

<b>'__call__'</b> (x, y)	(Returns interpolated values at (x, y) points.)
<b>'gradient'</b> (x, y)	(Returns interpolated derivatives at (x, y) points.)

`gradient(self, x, y)`

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

### Parameters

- x, y** [array-like] x and y coordinates of the same shape and any number of dimensions.

### Returns

- dzdx, dzdy** [np.ma.array] 2 masked arrays of the same shape as x and y; values corresponding to (x, y) points outside of the triangulation are masked out. The first returned array contains the values of  $\frac{\partial z}{\partial x}$  and the second those of  $\frac{\partial z}{\partial y}$ .

```
class matplotlib.tri.CubicTriInterpolator(triangulation, z, kind='min_E',
                                          trifinder=None, dz=None)
```

Bases: matplotlib.tri.triinterpolate.TriInterpolator

Cubic interpolator on a triangular grid.

In one-dimension - on a segment - a cubic interpolating function is defined by the values of the function and its derivative at both ends. This is almost the same in 2-d inside a triangle, except that the values of the function and its 2 derivatives have to be defined at each triangle node.

The CubicTriInterpolator takes the value of the function at each node - provided by the user - and internally computes the value of the derivatives, resulting in a smooth interpolation. (As a special feature, the user can also impose the value of the derivatives at each node, but this is not supposed to be the common usage.)

### Parameters

- triangulation** [*Triangulation*] The triangulation to interpolate over.
- z** [array-like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.

**kind** [{`'min_E'`, `'geom'`, `'user'`}, optional] Choice of the smoothing algorithm, in order to compute the interpolant derivatives (defaults to `'min_E'`):

- if `'min_E'`: (default) The derivatives at each node is computed to minimize a bending energy.
- if `'geom'`: The derivatives at each node is computed as a weighted average of relevant triangle normals. To be used for speed optimization (large grids).
- if `'user'`: The user provides the argument `dz`, no computation is hence needed.

**trifinder** [*TriFinder*, optional] If not specified, the Triangulation's default TriFinder will be used by calling *Triangulation.get\_trifinder*.

**dz** [tuple of array-likes (`dzdx`, `dzdy`), optional] Used only if `kind = 'user'`. In this case `dz` must be provided as (`dzdx`, `dzdy`) where `dzdx`, `dzdy` are arrays of the same shape as `z` and are the interpolant first derivatives at the *triangulation* points.

## Notes

This note is a bit technical and details how the cubic interpolation is computed.

The interpolation is based on a Clough-Tocher subdivision scheme of the *triangulation* mesh (to make it clearer, each triangle of the grid will be divided in 3 child-triangles, and on each child triangle the interpolated function is a cubic polynomial of the 2 coordinates). This technique originates from FEM (Finite Element Method) analysis; the element used is a reduced Hsieh-Clough-Tocher (HCT) element. Its shape functions are described in [R0be0c58fd53f-1]. The assembled function is guaranteed to be C1-smooth, i.e. it is continuous and its first derivatives are also continuous (this is easy to show inside the triangles but is also true when crossing the edges).

In the default case (`kind = 'min_E'`), the interpolant minimizes a curvature energy on the functional space generated by the HCT element shape functions - with imposed values but arbitrary derivatives at each node. The minimized functional is the integral of the so-called total curvature (implementation based on an algorithm from [R0be0c58fd53f-2] - PCG sparse solver):

$$E(z) = \frac{1}{2} \int_{\Omega} \left( \left( \frac{\partial^2 z}{\partial x^2} \right)^2 + \left( \frac{\partial^2 z}{\partial y^2} \right)^2 + 2 \left( \frac{\partial^2 z}{\partial y \partial x} \right)^2 \right) dx dy$$

If the case `kind = 'geom'` is chosen by the user, a simple geometric approximation is used (weighted average of the triangle normal vectors), which could improve speed on very large grids.

## References

[R0be0c58fd53f-1], [R0be0c58fd53f-2]

## Methods

'__call__' (x, y)	(Returns interpolated values at (x, y) points.)
'gradient' (x, y)	(Returns interpolated derivatives at (x, y) points.)

`gradient(self, x, y)`

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

### Parameters

**x, y** [array-like] x and y coordinates of the same shape and any number of dimensions.

### Returns

**dzdx, dzdy** [np.ma.array] 2 masked arrays of the same shape as x and y; values corresponding to (x, y) points outside of the triangulation are masked out. The first returned array contains the values of  $\frac{\partial z}{\partial x}$  and the second those of  $\frac{\partial z}{\partial y}$ .

`class matplotlib.tri.TriRefiner(triangulation)`

Abstract base class for classes implementing mesh refinement.

A TriRefiner encapsulates a Triangulation object and provides tools for mesh refinement and interpolation.

Derived classes must implement:

- `refine_triangulation(return_tri_index=False, **kwargs)` , where the optional keyword arguments *kwargs* are defined in each TriRefiner concrete implementation, and which returns:
  - a refined triangulation,
  - optionally (depending on *return\_tri\_index*), for each point of the refined triangulation: the index of the initial triangulation triangle to which it belongs.
- `refine_field(z, triinterpolator=None, **kwargs)`, where:
  - *z* array of field values (to refine) defined at the base triangulation nodes,
  - *triinterpolator* is an optional *TriInterpolator*,
  - the other optional keyword arguments *kwargs* are defined in each TriRefiner concrete implementation;

and which returns (as a tuple) a refined triangular mesh and the interpolated values of the field at the refined triangulation nodes.

`class matplotlib.tri.UniformTriRefiner(triangulation)`

Bases: `matplotlib.tri.trirefine.TriRefiner`

Uniform mesh refinement by recursive subdivisions.

### Parameters

**triangulation** [*Triangulation*] The encapsulated triangulation (to be refined)

`refine_field(self, z, triinterpolator=None, subdiv=3)`

Refine a field defined on the encapsulated triangulation.

**Parameters**

**z** [1d-array-like of length `n_points`] Values of the field to refine, defined at the nodes of the encapsulated triangulation. (`n_points` is the number of points in the initial triangulation)

**triinterpolator** [*TriInterpolator*, optional] Interpolator used for field interpolation. If not specified, a *CubicTriInterpolator* will be used.

**subdiv** [int, default: 3] Recursion level for the subdivision. Each triangle is divided into  $4^{**}subdiv$  child triangles.

**Returns**

**refi\_tri** [*Triangulation*] The returned refined triangulation.

**refi\_z** [1d array of length: *refi\_tri* node count.] The returned interpolated field (at *refi\_tri* nodes).

```
refine_triangulation(self, return_tri_index=False, subdiv=3)
```

Compute an uniformly refined triangulation *refi\_triangulation* of the encapsulated triangulation.

This function refines the encapsulated triangulation by splitting each father triangle into 4 child sub-triangles built on the edges midside nodes, recursing *subdiv* times. In the end, each triangle is hence divided into  $4^{**}subdiv$  child triangles.

**Parameters**

**return\_tri\_index** [bool, default: False] Whether an index table indicating the father triangle index of each point is returned.

**subdiv** [int, default: 3] Recursion level for the subdivision. Each triangle is divided into  $4^{**}subdiv$  child triangles; hence, the default results in 64 refined subtriangles for each triangle of the initial triangulation.

**Returns**

**refi\_triangulation** [*Triangulation*] The refined triangulation.

**found\_index** [int array] Index of the initial triangulation containing triangle, for each point of *refi\_triangulation*. Returned only if *return\_tri\_index* is set to True.

```
class matplotlib.tri.TriAnalyzer(triangulation)
```

Define basic tools for triangular mesh analysis and improvement.

A TriAnalyzer encapsulates a *Triangulation* object and provides basic tools for mesh analysis and mesh improvement.

**Parameters**

**triangulation** [*Triangulation*] The encapsulated triangulation to analyze.

**Attributes**

*scale\_factors* Factors to rescale the triangulation into a unit square.

```
circle_ratios(self, rescale=True)
```

Return a measure of the triangulation triangles flatness.

The ratio of the incircle radius over the circumcircle radius is a widely used indicator of a triangle flatness. It is always  $\leq 0.5$  and  $= 0.5$  only for equilateral triangles. Circle ratios below 0.01 denote very flat triangles.

To avoid unduly low values due to a difference of scale between the 2 axis, the triangular mesh can first be rescaled to fit inside a unit square with `scale_factors` (Only if `rescale` is True, which is its default value).

### Parameters

**rescale** [bool, default: True] If True, internally rescale (based on `scale_factors`), so that the (unmasked) triangles fit exactly inside a unit square mesh.

### Returns

**masked array** Ratio of the incircle radius over the circumcircle radius, for each 'rescaled' triangle of the encapsulated triangulation. Values corresponding to masked triangles are masked out.

`get_flat_tri_mask(self, min_circle_ratio=0.01, rescale=True)`

Eliminate excessively flat border triangles from the triangulation.

Returns a mask `new_mask` which allows to clean the encapsulated triangulation from its border-located flat triangles (according to their `circle_ratios()`). This mask is meant to be subsequently applied to the triangulation using `Triangulation.set_mask`. `new_mask` is an extension of the initial triangulation mask in the sense that an initially masked triangle will remain masked.

The `new_mask` array is computed recursively; at each step flat triangles are removed only if they share a side with the current mesh border. Thus no new holes in the triangulated domain will be created.

### Parameters

**min\_circle\_ratio** [float, default: 0.01] Border triangles with incircle/circumcircle radii ratio  $r/R$  will be removed if  $r/R < min\_circle\_ratio$ .

**rescale** [bool, default: True] If True, first, internally rescale (based on `scale_factors`) so that the (unmasked) triangles fit exactly inside a unit square mesh. This rescaling accounts for the difference of scale which might exist between the 2 axis.

### Returns

**bool array-like** Mask to apply to encapsulated triangulation. All the initially masked triangles remain masked in the `new_mask`.

### Notes

The rationale behind this function is that a Delaunay triangulation - of an unstructured set of points - sometimes contains almost flat triangles at its border, leading to artifacts in plots (especially for high-resolution contouring). Masked with computed `new_mask`, the encapsulated triangulation would contain no more unmasked border triangles with a circle ratio below `min_circle_ratio`, thus improving the mesh quality for subsequent plots or interpolation.

property `scale_factors`

Factors to rescale the triangulation into a unit square.

### Returns

**(float, float)** Scaling factors (kx, ky) so that the triangulation [triangulation.x \* kx, triangulation.y \* ky] fits exactly inside a unit square.

## 18.57 matplotlib.type1font

A class representing a Type 1 font.

This version reads pfa and pfb files and splits them for embedding in pdf files. It also supports SlantFont and ExtendFont transformations, similarly to pdfTeX and friends. There is no support yet for subsetting.

Usage:

```
>>> font = Type1Font(filename)
>>> clear_part, encrypted_part, finale = font.parts
>>> slanted_font = font.transform({'slant': 0.167})
>>> extended_font = font.transform({'extend': 1.2})
```

Sources:

- Adobe Technical Note #5040, Supporting Downloadable PostScript Language Fonts.
- Adobe Type 1 Font Format, Adobe Systems Incorporated, third printing, v1.1, 1993. ISBN 0-201-57044-0.

```
class matplotlib.type1font.Type1Font(input)
```

Bases: `object`

A class representing a Type-1 font, for use by backends.

### Attributes

**parts** [tuple] A 3-tuple of the cleartext part, the encrypted part, and the finale of zeros.

**prop** [Dict[str, Any]] A dictionary of font properties.

Initialize a Type-1 font.

### Parameters

**input** [str or 3-tuple] Either a pfb file name, or a 3-tuple of already-decoded Type-1 font *parts*.

**parts**

**prop**

**transform(self, effects)**

Return a new font that is slanted and/or extended.

### Parameters

**effects** [dict] A dict with optional entries:

- **'slant'** [float, default: 0] Tangent of the angle that the font is to be slanted to the right. Negative values slant to the left.
- **'extend'** [float, default: 1] Scaling factor for the font width. Values less than 1 condense the glyphs.

## Returns

*Type1Font*

## 18.58 matplotlib.units

The classes here provide support for using custom classes with Matplotlib, e.g., those that do not expose the array interface but know how to convert themselves to arrays. It also supports classes with units and units conversion. Use cases include converters for custom objects, e.g., a list of datetime objects, as well as for objects that are unit aware. We don't assume any particular units implementation; rather a units implementation must provide the register with the Registry converter dictionary and a *ConversionInterface*. For example, here is a complete implementation which supports plotting with native datetime objects:

```
import matplotlib.units as units
import matplotlib.dates as dates
import matplotlib.ticker as ticker
import datetime

class DateConverter(units.ConversionInterface):

    @staticmethod
    def convert(value, unit, axis):
        'Convert a datetime value to a scalar or array'
        return dates.date2num(value)

    @staticmethod
    def axisinfo(unit, axis):
        'Return major and minor tick locators and formatters'
        if unit != 'date': return None
        majloc = dates.AutoDateLocator()
        majfmt = dates.AutoDateFormatter(majloc)
        return AxisInfo(majloc=majloc,
                        majfmt=majfmt,
                        label='date')

    @staticmethod
    def default_units(x, axis):
        'Return the default unit for x or None'
        return 'date'

# Finally we register our object type with the Matplotlib units registry.
units.registry[datetime.date] = DateConverter()
```

```
class matplotlib.units.AxisInfo(majloc=None,      minloc=None,      majfmt=None,
                                minfmt=None, label=None, default_limits=None)
```

Bases: `object`

Information to support default axis labeling, tick labeling, and limits.

An instance of this class must be returned by *ConversionInterface.axisinfo*.

### Parameters

**majloc, minloc** [Locator, optional] Tick locators for the major and minor ticks.

**majfmt, minfmt** [Formatter, optional] Tick formatters for the major and minor ticks.

**label** [str, optional] The default axis label.

**default\_limits** [optional] The default min and max limits of the axis if no data has been plotted.

### Notes

If any of the above are None, the axis will simply use the default value.

exception matplotlib.units.ConversionError

Bases: `TypeError`

class matplotlib.units.ConversionInterface

Bases: `object`

The minimal interface for a converter to take custom data types (or sequences) and convert them to values Matplotlib can use.

static `axisinfo(unit, axis)`

Return an `AxisInfo` for the axis with the specified units.

static `convert(obj, unit, axis)`

Convert `obj` using `unit` for the specified `axis`.

If `obj` is a sequence, return the converted sequence. The output must be a sequence of scalars that can be used by the numpy array layer.

static `default_units(x, axis)`

Return the default unit for `x` or None for the given axis.

static `is_numlike(x)`

The Matplotlib datalim, autoscaling, locators etc work with scalars which are the units converted to floats given the current unit. The converter may be passed these floats, or arrays of them, even when units are set.

class matplotlib.units.DecimalConverter

Bases: `matplotlib.units.ConversionInterface`

Converter for decimal.Decimal data to float.

static `axisinfo(unit, axis)`

Return an `AxisInfo` for the axis with the specified units.

static `convert(value, unit, axis)`

Convert Decimals to floats.

The `unit` and `axis` arguments are not used.

### Parameters

**value** [decimal.Decimal or iterable] Decimal or list of Decimal need to be converted

static `default_units(x, axis)`

Return the default unit for `x` or None for the given axis.

class matplotlib.units.Registry

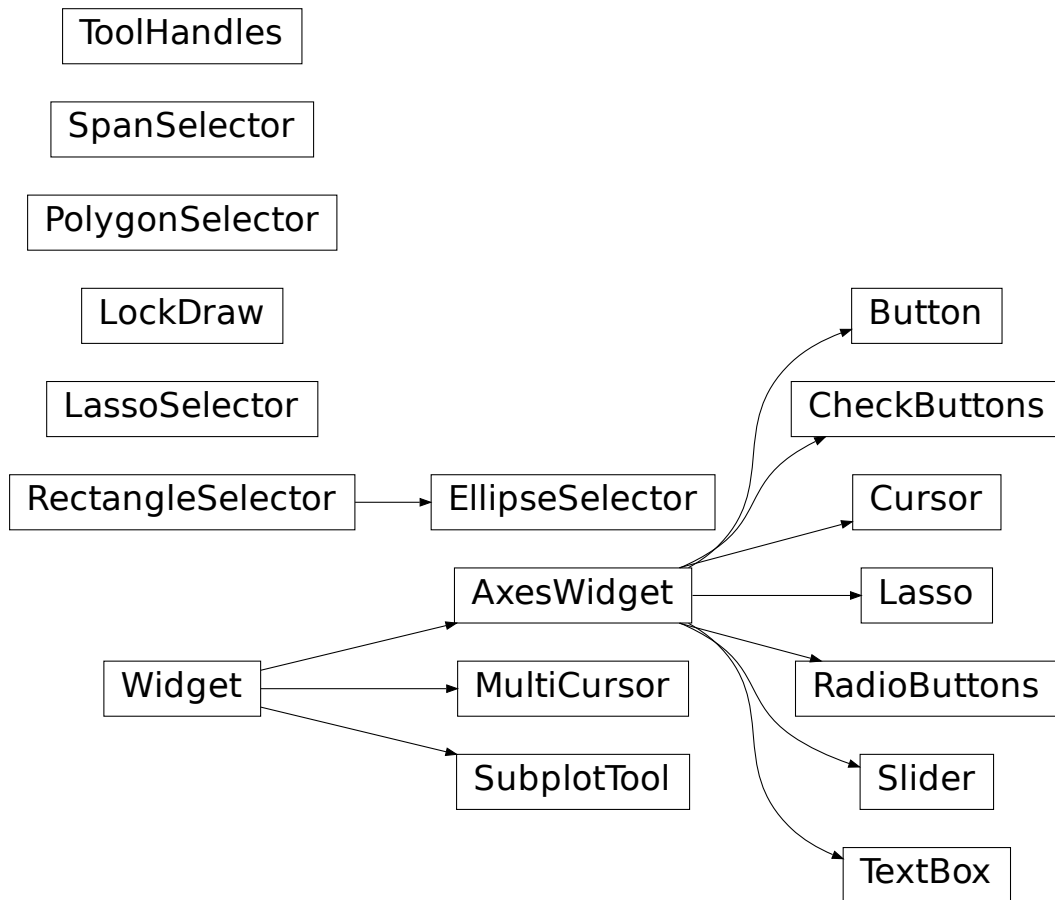

Bases: `dict`

Register types with conversion interface.

```
get_converter(self, x)
```

Get the converter interface instance for *x*, or None.

## 18.59 matplotlib.widgets

### 18.59.1 GUI neutral widgets

Widgets that are designed to work for any of the GUI backends. All of these widgets require you to predefine a `matplotlib.axes.Axes` instance and pass that as the first parameter. Matplotlib doesn't try to be too smart with respect to layout – you will have to figure out how wide and tall you want your Axes to be to accommodate your widget.

```
class matplotlib.widgets.AxesWidget(ax)
```

Bases: `matplotlib.widgets.Widget`

Widget connected to a single *Axes*.

To guarantee that the widget remains responsive and not garbage-collected, a reference to the object should be maintained by the user.

This is necessary because the callback registry maintains only weak-refs to the functions, which are member functions of the widget. If there are no references to the widget object it may be garbage collected which will disconnect the callbacks.

### Attributes

**ax** [*Axes*] The parent axes for the widget.

**canvas** [*FigureCanvasBase*] The parent figure canvas for the widget.

**active** [bool] Is the widget active?

`connect_event(self, event, callback)`  
Connect callback with an event.

This should be used in lieu of `figure.canvas.mpl_connect` since this function stores callback ids for later clean up.

`disconnect_events(self)`  
Disconnect all events created by this widget.

```
class matplotlib.widgets.Button(ax, label, image=None, color='0.85', hover-
                                color='0.95')
```

Bases: *matplotlib.widgets.AxesWidget*

A GUI neutral button.

For the button to remain responsive you must keep a reference to it. Call *on\_clicked* to connect to the button.

### Attributes

**ax** The *matplotlib.axes.Axes* the button renders into.

**label** A *matplotlib.text.Text* instance.

**color** The color of the button when not hovering.

**hovercolor** The color of the button when hovering.

### Parameters

**ax** [*Axes*] The *Axes* instance the button will be placed into.

**label** [str] The button text.

**image** [array-like or PIL Image] The image to place in the button, if not *None*. The parameter is directly forwarded to *imshow*.

**color** [color] The color of the button when not activated.

**hovercolor** [color] The color of the button when the mouse is over it.

`disconnect(self, cid)`  
Remove the callback function with connection id *cid*.

`on_clicked(self, func)`  
Connect the callback function *func* to button click events.

Returns a connection id, which can be used to disconnect the callback.

```
class matplotlib.widgets.CheckButtons(ax, labels, actives=None)
```

Bases: `matplotlib.widgets.AxesWidget`

A GUI neutral set of check buttons.

For the check buttons to remain responsive you must keep a reference to this object.

Connect to the CheckButtons with the `on_clicked` method.

### Attributes

**ax** [`Axes`] The parent axes for the widget.

**labels** [list of `Text`]

**rectangles** [list of `Rectangle`]

**lines** [list of (`Line2D`, `Line2D`) pairs] List of lines for the x's in the check boxes. These lines exist for each box, but have `set_visible(False)` when its box is not checked.

Add check buttons to `matplotlib.axes.Axes` instance `ax`

### Parameters

**ax** [`Axes`] The parent axes for the widget.

**labels** [list of str] The labels of the check buttons.

**actives** [list of bool, optional] The initial check states of the buttons. The list must have the same length as `labels`. If not given, all buttons are unchecked.

`disconnect(self, cid)`

Remove the observer with connection id `cid`.

`get_status(self)`

Return a tuple of the status (True/False) of all of the check buttons.

`on_clicked(self, func)`

Connect the callback function `func` to button click events.

Returns a connection id, which can be used to disconnect the callback.

`set_active(self, index)`

Toggle (activate or deactivate) a check button by index.

Callbacks will be triggered if `eventson` is True.

### Parameters

**index** [int] Index of the check button to toggle.

### Raises

**ValueError** If `index` is invalid.

```
class matplotlib.widgets.Cursor(ax, horizOn=True, vertOn=True, useblit=False, **line-props)
```

Bases: `matplotlib.widgets.AxesWidget`

A crosshair cursor that spans the axes and moves with mouse cursor.

For the cursor to remain responsive you must keep a reference to it.

### Parameters

**ax** [`matplotlib.axes.Axes`] The `Axes` to attach the cursor to.

**horizOn** [bool, default: True] Whether to draw the horizontal line.

**vertOn** [bool, default: True] Whether to draw the vertical line.

**useblit** [bool, default: False] Use blitting for faster drawing if supported by the backend.

### Other Parameters

**\*\*lineprops** *Line2D* properties that control the appearance of the lines.  
See also *axhline*.

### Examples

See /gallery/widgets/cursor.

`clear(self, event)`

Internal event handler to clear the cursor.

`onmove(self, event)`

Internal event handler to draw the cursor when the mouse moves.

```
class matplotlib.widgets.EllipseSelector(ax, onselect, drawtype='box', minspanx=0,
                                         minspany=0, useblit=False, line-
                                         props=None, rectprops=None, spanco-
                                         ords='data', button=None, maxdist=10,
                                         marker_props=None, interactive=False,
                                         state_modifier_keys=None)
```

Bases: *matplotlib.widgets.RectangleSelector*

Select an elliptical region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.widgets import EllipseSelector

def onselect(eclick, erelease):
    "eclick and erelease are matplotlib events at press and release."
    print('startposition: (%f, %f)' % (eclick.xdata, eclick.ydata))
    print('endposition   : (%f, %f)' % (erelease.xdata, erelease.ydata))
    print('used button   : ', eclick.button)

def toggle_selector(event):
    print(' Key pressed.')
    if event.key in ['Q', 'q'] and toggle_selector.ES.active:
        print('EllipseSelector deactivated.')
        toggle_selector.RS.set_active(False)
    if event.key in ['A', 'a'] and not toggle_selector.ES.active:
        print('EllipseSelector activated.')
        toggle_selector.ES.set_active(True)

x = np.arange(100.) / 99
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)
```

(continues on next page)

(continued from previous page)

```
toggle_selector.ES = EllipseSelector(ax, onselect, drawtype='line')
fig.canvas.mpl_connect('key_press_event', toggle_selector)
plt.show()
```

## Parameters

**ax** [*Axes*] The parent axes for the widget.

**onselect** [function] A callback function that is called after a selection is completed. It must have the signature:

```
def onselect(eclick: MouseEvent, erelease: MouseEvent)
```

where *eclick* and *erelease* are the mouse click and release *MouseEvent*s that start and complete the selection.

**drawtype** [{"box", "line", "none"}, default: "box"] Whether to draw the full rectangle box, the diagonal line of the rectangle, or nothing at all.

**minspanx** [float, default: 0] Selections with an x-span less than *minspanx* are ignored.

**minspany** [float, default: 0] Selections with an y-span less than *minspany* are ignored.

**useblit** [bool, default: False] Whether to use blitting for faster drawing (if supported by the backend).

**lineprops** [dict, optional] Properties with which the line is drawn, if *drawtype* == "line". Default:

```
dict(color="black", linestyle="-", linewidth=2, alpha=0.5)
```

**rectprops** [dict, optional] Properties with which the rectangle is drawn, if *drawtype* == "box". Default:

```
dict(facecolor="red", edgecolor="black", alpha=0.2, fill=True)
```

**spancoords** [{"data", "pixels"}, default: "data"] Whether to interpret *minspanx* and *minspany* in data or in pixel coordinates.

**button** [*MouseButton*, list of *MouseButton*, default: all buttons] Button(s) that trigger rectangle selection.

**maxdist** [float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

**marker\_props** [dict] Properties with which the interactive handles are drawn. Currently not implemented and ignored.

**interactive** [bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

**state\_modifier\_keys** [dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults.

- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".

- "square": Makes the shape square, default: "shift".
- "center": Make the initial point the center of the shape, default: "ctrl".

"square" and "center" can be combined.

`draw_shape(self, extents)`

`class matplotlib.widgets.Lasso(ax, xy, callback=None, useblit=True)`

Bases: `matplotlib.widgets.AxesWidget`

Selection curve of an arbitrary shape.

The selected path can be used in conjunction with `contains_point` to select data points from an image.

Unlike `LassoSelector`, this must be initialized with a starting point `xy`, and the `Lasso` events are destroyed upon release.

### Parameters

**ax** [`Axes`] The parent axes for the widget.

**xy** [(float, float)] Coordinates of the start of the lasso.

**callback** [callable] Whenever the lasso is released, the `callback` function is called and passed the vertices of the selected path.

`onmove(self, event)`

`onrelease(self, event)`

`class matplotlib.widgets.LassoSelector(ax, onselect=None, useblit=True, line-props=None, button=None)`

Bases: `matplotlib.widgets._SelectorWidget`

Selection curve of an arbitrary shape.

For the selector to remain responsive you must keep a reference to it.

The selected path can be used in conjunction with `contains_point` to select data points from an image.

In contrast to `Lasso`, `LassoSelector` is written with an interface similar to `RectangleSelector` and `SpanSelector`, and will continue to interact with the axes until disconnected.

Example usage:

```
ax = subplot(111)
ax.plot(x, y)

def onselect(verts):
    print(verts)
lasso = LassoSelector(ax, onselect)
```

### Parameters

**ax** [`Axes`] The parent axes for the widget.

**onselect** [function] Whenever the lasso is released, the `onselect` function is called and passed the vertices of the selected path.

**button** [*MouseButton* or list of *MouseButton*, optional] The mouse buttons used for rectangle selection. Default is `None`, which corresponds to all buttons.

`onpress(self, event)`

`onrelease(self, event)`

`class matplotlib.widgets.LockDraw`

Bases: `object`

Some widgets, like the cursor, draw onto the canvas, and this is not desirable under all circumstances, like when the toolbar is in zoom-to-rect mode and drawing a rectangle. To avoid this, a widget can acquire a canvas' lock with `canvas.widgetlock(widget)` before drawing on the canvas; this will prevent other widgets from doing so at the same time (if they also try to acquire the lock first).

`available(self, o)`

Return whether drawing is available to *o*.

`isowner(self, o)`

Return whether *o* owns this lock.

`locked(self)`

Return whether the lock is currently held by an owner.

`release(self, o)`

Release the lock from *o*.

`class matplotlib.widgets.MultiCursor(canvas, axes, useblit=True, horizOn=False, vertOn=True, **lineprops)`

Bases: `matplotlib.widgets.Widget`

Provide a vertical (default) and/or horizontal line cursor shared between multiple axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```
from matplotlib.widgets import MultiCursor
import matplotlib.pyplot as plt
import numpy as np

fig, (ax1, ax2) = plt.subplots(nrows=2, sharex=True)
t = np.arange(0.0, 2.0, 0.01)
ax1.plot(t, np.sin(2*np.pi*t))
ax2.plot(t, np.sin(4*np.pi*t))

multi = MultiCursor(fig.canvas, (ax1, ax2), color='r', lw=1,
                    horizOn=False, vertOn=True)
plt.show()
```

`clear(self, event)`

Clear the cursor.

`connect(self)`

Connect events.

`disconnect(self)`

Disconnect events.

`onmove(self, event)`

```
class matplotlib.widgets.PolygonSelector(ax,      onselect,      useblit=False,      line-
                                     props=None,      markerprops=None,      ver-
                                     tex_select_radius=15)
```

Bases: `matplotlib.widgets._SelectorWidget`

Select a polygon region of an axes.

Place vertices with each mouse click, and make the selection by completing the polygon (clicking on the first vertex). Hold the *ctrl* key and click and drag a vertex to reposition it (the *ctrl* key is not necessary if the polygon has already been completed). Hold the *shift* key and click and drag anywhere in the axes to move all vertices. Press the *esc* key to start a new polygon.

For the selector to remain responsive you must keep a reference to it.

### Parameters

**ax** [*Axes*] The parent axes for the widget.

**onselect** [function] When a polygon is completed or modified after completion, the *onselect* function is called and passed a list of the vertices as (xdata, ydata) tuples.

**useblit** [bool, default: False]

**lineprops** [dict, default: `dict(color='k', linestyle='--', linewidth=2, alpha=0.5)`.] Artist properties for the line representing the edges of the polygon.

**markerprops** [dict, default: `dict(marker='o', markersize=7, mec='k', mfc='k', alpha=0.5)`.] Artist properties for the markers drawn at the vertices of the polygon.

**vertex\_select\_radius** [float, default: 15px] A vertex is selected (to complete the polygon or to move a vertex) if the mouse click is within *vertex\_select\_radius* pixels of the vertex.

### Examples

`/gallery/widgets/polygon_selector_demo`

`onmove(self, event)`

Cursor move event handler and validator

property `verts`

The polygon vertices, as a list of (x, y) pairs.

```
class matplotlib.widgets.RadioButton(ax, labels, active=0, activecolor='blue')
```

Bases: `matplotlib.widgets.AxesWidget`

A GUI neutral radio button.

For the buttons to remain responsive you must keep a reference to this object.

Connect to the `RadioButton`s with the *on\_clicked* method.

### Attributes

**ax** [*Axes*] The parent axes for the widget.

**activecolor** [color] The color of the selected button.

**labels** [list of *Text*] The button labels.

**circles** [list of *Circle*] The buttons.

**value\_selected** [str] The label text of the currently selected button.

Add radio buttons to an *Axes*.

### Parameters

**ax** [*Axes*] The axes to add the buttons to.

**labels** [list of str] The button labels.

**active** [int] The index of the initially selected button.

**activecolor** [color] The color of the selected button.

`disconnect(self, cid)`

Remove the observer with connection id *cid*.

`on_clicked(self, func)`

Connect the callback function *func* to button click events.

Returns a connection id, which can be used to disconnect the callback.

`set_active(self, index)`

Select button with number *index*.

Callbacks will be triggered if `eventson` is `True`.

```
class matplotlib.widgets.RectangleSelector(ax, onselect, drawtype='box', minspanx=0,
                                           minspany=0, useblit=False, line-
                                           props=None, rectprops=None, spanco-
                                           ords='data', button=None, maxdist=10,
                                           marker_props=None, interactive=False,
                                           state_modifier_keys=None)
```

Bases: `matplotlib.widgets._SelectorWidget`

Select a rectangular region of an axes.

For the cursor to remain responsive you must keep a reference to it.

### Examples

`/gallery/widgets/rectangle_selector`

### Parameters

**ax** [*Axes*] The parent axes for the widget.

**onselect** [function] A callback function that is called after a selection is completed. It must have the signature:

```
def onselect(eclick: MouseEvent, erelease: MouseEvent)
```

where *eclick* and *erelease* are the mouse click and release *MouseEvents* that start and complete the selection.

**drawtype** [{"box", "line", "none"}] default: "box"] Whether to draw the full rectangle box, the diagonal line of the rectangle, or nothing at all.

**minspanx** [float, default: 0] Selections with an x-span less than *minspanx* are ignored.

**minspany** [float, default: 0] Selections with an y-span less than *minspany* are ignored.

**useblit** [bool, default: False] Whether to use blitting for faster drawing (if supported by the backend).

**lineprops** [dict, optional] Properties with which the line is drawn, if `drawtype == "line"`. Default:

```
dict(color="black", linestyle="-", linewidth=2, alpha=0.5)
```

**rectprops** [dict, optional] Properties with which the rectangle is drawn, if `drawtype == "box"`. Default:

```
dict(facecolor="red", edgecolor="black", alpha=0.2, fill=True)
```

**spancoords** [{*"data"*, *"pixels"*}, default: *"data"*] Whether to interpret *minspanx* and *minspany* in data or in pixel coordinates.

**button** [*MouseButton*, list of *MouseButton*, default: all buttons] Button(s) that trigger rectangle selection.

**maxdist** [float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

**marker\_props** [dict] Properties with which the interactive handles are drawn. Currently not implemented and ignored.

**interactive** [bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

**state\_modifier\_keys** [dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults.

- *"move"*: Move the existing shape, default: no modifier.
- *"clear"*: Clear the current shape, default: *"escape"*.
- *"square"*: Makes the shape square, default: *"shift"*.
- *"center"*: Make the initial point the center of the shape, default: *"ctrl"*.

*"square"* and *"center"* can be combined.

property *center*

Center of rectangle

property *corners*

Corners of rectangle from lower left, moving clockwise.

*draw\_shape(self, extents)*

property *edge\_centers*

Midpoint of rectangle edges from left, moving clockwise.

property *extents*

Return (xmin, xmax, ymin, ymax).

property *geometry*

Return an array of shape (2, 5) containing the x (*RectangleSelector.geometry*[1, :]) and y (*RectangleSelector.geometry*[0, :]) coordinates of the four corners of the rectangle starting and ending in the top left corner.

```
class matplotlib.widgets.Slider(ax, label, valmin, valmax, valinit=0.5, valfmt=None,
                                closedmin=True, closedmax=True, slidermin=None,
                                slidermax=None, dragging=True, valstep=None, ori-
                                entation='horizontal', **kwargs)
```

Bases: `matplotlib.widgets.AxesWidget`

A slider representing a floating point range.

Create a slider from *valmin* to *valmax* in axes *ax*. For the slider to remain responsive you must maintain a reference to it. Call `on_changed()` to connect to the slider event.

### Attributes

**val** [float] Slider value.

### Parameters

**ax** [Axes] The Axes to put the slider in.

**label** [str] Slider label.

**valmin** [float] The minimum value of the slider.

**valmax** [float] The maximum value of the slider.

**valinit** [float, default: 0.5] The slider initial position.

**valfmt** [str, default: None] %-format string used to format the slider value. If None, a `ScalarFormatter` is used instead.

**closedmin** [bool, default: True] Whether the slider interval is closed on the bottom.

**closedmax** [bool, default: True] Whether the slider interval is closed on the top.

**slidermin** [Slider, default: None] Do not allow the current slider to have a value less than the value of the Slider *slidermin*.

**slidermax** [Slider, default: None] Do not allow the current slider to have a value greater than the value of the Slider *slidermax*.

**dragging** [bool, default: True] If True the slider can be dragged by the mouse.

**valstep** [float, default: None] If given, the slider will snap to multiples of *valstep*.

**orientation** [{'horizontal', 'vertical'}, default: 'horizontal'] The orientation of the slider.

### Notes

Additional kwargs are passed on to `self.poly` which is the `Rectangle` that draws the slider knob. See the `Rectangle` documentation for valid property names (`facecolor`, `edgecolor`, `alpha`, etc.).

`disconnect(self, cid)`

Remove the observer with connection id *cid*

### Parameters

**cid** [int] Connection id of the observer to be removed

`on_changed(self, func)`

When the slider value is changed call *func* with the new slider value

#### Parameters

**func** [callable] Function to call when slider is changed. The function must accept a single float as its arguments.

#### Returns

**int** Connection id (which can be used to disconnect *func*)

`reset(self)`

Reset the slider to the initial value

`set_val(self, val)`

Set slider value to *val*

#### Parameters

**val** [float]

```
class matplotlib.widgets.SpanSelector(ax, onselect, direction, minspan=None,
                                     useblit=False, rectprops=None, on-
                                     move_callback=None, span_stays=False, but-
                                     ton=None)
```

Bases: `matplotlib.widgets._SelectorWidget`

Visually select a min/max range on a single axis and call a function with those values.

To guarantee that the selector remains responsive, keep a reference to it.

In order to turn off the `SpanSelector`, set `span_selector.active` to `False`. To turn it back on, set it to `True`.

#### Parameters

**ax** [*matplotlib.axes.Axes*]

**onselect** [func(min, max), min/max are floats]

**direction** [{"horizontal", "vertical"}] The direction along which to draw the span selector.

**minspan** [float, default: None] If selection is less than *minspan*, do not call *onselect*.

**useblit** [bool, default: False] If True, use the backend-dependent blitting features for faster canvas updates.

**rectprops** [dict, default: None] Dictionary of *matplotlib.patches.Patch* properties.

**onmove\_callback** [func(min, max), min/max are floats, default: None] Called on mouse move while the span is being selected.

**span\_stays** [bool, default: False] If True, the span stays visible after the mouse is released.

**button** [*MouseButton* or list of *MouseButton*] The mouse buttons which activate the span selector.

## Examples

```
>>> import matplotlib.pyplot as plt
>>> import matplotlib.widgets as mwidgets
>>> fig, ax = plt.subplots()
>>> ax.plot([1, 2, 3], [10, 50, 100])
>>> def onselect(vmin, vmax):
...     print(vmin, vmax)
>>> rectprops = dict(facecolor='blue', alpha=0.5)
>>> span = mwidgets.SpanSelector(ax, onselect, 'horizontal',
...                             rectprops=rectprops)
>>> fig.show()
```

See also: [/gallery/widgets/span\\_selector](#)

`ignore(self, event)`

Return whether *event* should be ignored.

This method should be called at the beginning of any event callback.

`new_axes(self, ax)`

Set SpanSelector to operate on a new Axes.

`class matplotlib.widgets.SubplotTool(targetfig, toolfig)`

Bases: [matplotlib.widgets.Widget](#)

A tool to adjust the subplot params of a [matplotlib.figure.Figure](#).

### Parameters

**targetfig** [[Figure](#)] The figure instance to adjust.

**toolfig** [[Figure](#)] The figure instance to embed the subplot tool into.

property `axbottom`

property `axhspace`

property `axleft`

property `axright`

property `axtop`

property `axwspace`

`funcbottom(self, val)`

[*Deprecated*]

### Notes

Deprecated since version 3.3:

`funcspace(self, val)`

[*Deprecated*]

### Notes

Deprecated since version 3.3:

```
funcleft(self, val)
[Deprecated]
```

#### Notes

Deprecated since version 3.3:

```
funcright(self, val)
[Deprecated]
```

#### Notes

Deprecated since version 3.3:

[Deprecated]
```

#### Notes

Deprecated since version 3.3:

```
class matplotlib.widgets.TextBox(ax, label, initial="", color='.95', hovercolor='1', label_pad=0.01)
```

Bases: *matplotlib.widgets.AxesWidget*

A GUI neutral text input box.

For the text box to remain responsive you must keep a reference to it.

Call *on\_text\_change* to be updated whenever the text changes.

Call *on\_submit* to be updated whenever the user hits enter or leaves the text entry field.

#### Attributes

**ax** [*Axes*] The parent axes for the widget.

**label** [*Text*]

**color** [color] The color of the text box when not hovering.

**hovercolor** [color] The color of the text box when hovering.

#### Parameters

**ax** [*Axes*] The *Axes* instance the button will be placed into.

**label** [str] Label for this text box.

**initial** [str] Initial value in the text box.

**color** [color] The color of the box.

**hovercolor** [color] The color of the box when the mouse is over it.

**label\_pad** [float] The distance between the label and the right side of the textbox.

`begin_typing(self, x)`

`disconnect(self, cid)`

Remove the observer with connection id *cid*.

`on_submit(self, func)`

When the user hits enter or leaves the submission box, call this *func* with event.

A connection id is returned which can be used to disconnect.

`on_text_change(self, func)`

When the text changes, call this *func* with event.

A connection id is returned which can be used to disconnect.

property `params_to_disable`

`position_cursor(self, x)`

`set_val(self, val)`

`stop_typing(self)`

property `text`

```
class matplotlib.widgets.ToolHandles(ax, x, y, marker='o', marker_props=None, use-
                                   blit=True)
```

Bases: `object`

Control handles for canvas tools.

### Parameters

**ax** [*matplotlib.axes.Axes*] Matplotlib axes where tool handles are displayed.

**x, y** [1D arrays] Coordinates of control handles.

**marker** [str] Shape of marker used to display handle. See *matplotlib.pyplot.plot*.

**marker\_props** [dict] Additional marker properties. See *matplotlib.lines.Line2D*.

`closest(self, x, y)`

Return index and pixel distance to closest index.

`set_animated(self, val)`

`set_data(self, pts, y=None)`

Set x and y positions of handles

`set_visible(self, val)`

property `x`

property `y`

```
class matplotlib.widgets.Widget
    Bases: object
    Abstract base class for GUI neutral widgets
    property active
        Is the widget active?
    drawon = True
    eventson = True
    get_active(self)
        Get whether the widget is active.
    ignore(self, event)
        Return whether event should be ignored.
        This method should be called at the beginning of any event callback.
    set_active(self, active)
        Set whether the widget is active.
```

## TOOLKITS

*Toolkits* are collections of application-specific functions that extend Matplotlib. The following toolkits are included:

### 19.1 Toolkits

Toolkits are collections of application-specific functions that extend Matplotlib.

#### 19.1.1 mplot3d

`mpl_toolkits.mplot3d` provides some basic 3D plotting (scatter, surf, line, mesh) tools. Not the fastest or most feature complete 3D library out there, but it ships with Matplotlib and thus may be a lighter weight solution for some use cases. Check out the [mplot3d tutorial](#) for more information.

#### mplot3d

##### Matplotlib mplot3d toolkit

The mplot3d toolkit adds simple 3D plotting capabilities to matplotlib by supplying an axes object that can create a 2D projection of a 3D scene. The resulting graph will have the same look and feel as regular 2D plots.

See the [mplot3d tutorial](#) for more information on how to use this toolkit.

The interactive backends also provide the ability to rotate and zoom the 3D scene. One can rotate the 3D scene by simply clicking-and-dragging the scene. Zooming is done by right-clicking the scene and dragging the mouse up and down. Note that one does not use the zoom button like one would use for regular 2D plots.

### mplot3d FAQ

#### How is mplot3d different from Mayavi?

[Mayavi](#) is a very powerful and featureful 3D graphing library. For advanced 3D scenes and excellent rendering capabilities, it is highly recommended to use Mayavi.

mplot3d was intended to allow users to create simple 3D graphs with the same “look-and-feel” as matplotlib’s 2D plots. Furthermore, users can use the same toolkit that they are already familiar with to generate both their 2D and 3D plots.

#### My 3D plot doesn’t look right at certain viewing angles

This is probably the most commonly reported issue with mplot3d. The problem is that – from some viewing angles – a 3D object would appear in front of another object, even though it is physically behind it. This can result in plots that do not look “physically correct.”

Unfortunately, while some work is being done to reduce the occurrence of this artifact, it is currently an intractable problem, and can not be fully solved until matplotlib supports 3D graphics rendering at its core.

The problem occurs due to the reduction of 3D data down to 2D + z-order scalar. A single value represents the 3rd dimension for all parts of 3D objects in a collection. Therefore, when the bounding boxes of two collections intersect, it becomes possible for this artifact to occur. Furthermore, the intersection of two 3D objects (such as polygons or patches) can not be rendered properly in matplotlib's 2D rendering engine.

This problem will likely not be solved until OpenGL support is added to all of the backends (patches are greatly welcomed). Until then, if you need complex 3D scenes, we recommend using [MayaVi](#).

I don't like how the 3D plot is laid out, how do I change that?

Historically, mplot3d has suffered from a hard-coding of parameters used to control visuals such as label spacing, tick length, and grid line width. Work is being done to eliminate this issue. For matplotlib v1.1.0, there is a semi-official manner to modify these parameters. See the note in the *mplot3d.axis3d* section of the mplot3d API documentation for more information.

19.1.2 Matplotlib axes\_grid1 Toolkit

The matplotlib *mpl\_toolkits.axes\_grid1* toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjust the position of the single axes, axes\_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See [What is axes\\_grid1 toolkit?](#) for a guide on the usage of axes\_grid1.

The submodules of the axes\_grid1 API are:

<code>axes_grid1.anchored_artists</code>	Helper classes to adjust the positions of multiple axes at drawing time.
<code>axes_grid1.axes_divider</code>	
<code>axes_grid1.axes_grid</code>	
<code>axes_grid1.axes_rgb</code>	

Continued on next page

Table 1 – continued from previous page

<code>axes_grid1.axes_size</code>	Provides classes of simple units that will be used with <code>AxesDivider</code> class (or others) to determine the size of each axes.
<code>axes_grid1.colorbar</code>	Colorbar toolkit with two classes and a function:
<code>axes_grid1.inset_locator</code>	A collection of functions and objects for creating or placing inset axes.
<code>axes_grid1.mpl_axes</code>	
<code>axes_grid1.parasite_axes</code>	

**`mpl_toolkits.axes_grid1.anchored_artists`****Classes**

<code>AnchoredAuxTransformBox(transform, loc, ...)</code>	An anchored container with transformed coordinates.
<code>AnchoredDirectionArrows(transform, label_x, ...)</code>	Draw two perpendicular arrows to indicate directions.
<code>AnchoredDrawingArea(width, height, xdescent, ...)</code>	An anchored container with a fixed size and fillable <code>DrawingArea</code> .
<code>AnchoredEllipse(transform, width, height, ...)</code>	Draw an anchored ellipse of a given size.
<code>AnchoredSizeBar(transform, size, label, loc)</code>	Draw a horizontal scale bar with a center-aligned label underneath.

**`mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox`**

```
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox(transform,
                                                                    loc, pad=0.4,
                                                                    border-
                                                                    pad=0.5,
                                                                    prop=None,
                                                                    frameon=True,
                                                                    **kwargs)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

An anchored container with transformed coordinates.

Artists added to the *drawing\_area* are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

**Parameters**

**transform** [`matplotlib.transforms.Transform`] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

**loc** [int] Location of this artist. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
```

(continues on next page)

(continued from previous page)

```
'right'      : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'      : 10
```

**pad** [float, default: 0.4] Padding around the child objects, in fraction of the font size.

**borderpad** [float, default: 0.5] Border padding, in fraction of the font size.

**prop** [*matplotlib.font\_manager.FontProperties*, optional] Font property used as a reference for paddings.

**frameon** [bool, default: True] If True, draw a box around this artists.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

## Attributes

**drawing\_area** [*matplotlib.offsetbox.AuxTransformBox*] A container for artists to display.

**\_\_init\_\_**(self, transform, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, \*\*kwargs)

An anchored container with transformed coordinates.

Artists added to the *drawing\_area* are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

## Parameters

**transform** [*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., *matplotlib.axes.Axes.transData*.

**loc** [int] Location of this artist. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
```

(continues on next page)

(continued from previous page)

```
'right'      : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'      : 10
```

**pad** [float, default: 0.4] Padding around the child objects, in fraction of the font size.

**borderpad** [float, default: 0.5] Border padding, in fraction of the font size.

**prop** [*matplotlib.font\_manager.FontProperties*, optional] Font property used as a reference for paddings.

**frameon** [bool, default: True] If True, draw a box around this artists.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

### Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

### Attributes

**drawing\_area** [*matplotlib.offsetbox.AuxTransformBox*] A container for artists to display.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox`

- `sphx_glr_gallery_userdemo_anchored_box03.py`

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows`

```
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows(transform, label_x, label_y,
length=0.15,
font-
size=0.08,
loc=2, an-
gle=0, as-
pect_ratio=1,
pad=0.4, bor-
derpad=0.4,
frameon=False,
color='w',
alpha=1,
sep_x=0.01,
sep_y=0,
fontprop-
erties=None,
back_length=0.15,
head_width=10,
head_length=15,
tail_width=2,
text_props=None,
ar-
row_props=None,
**kwargs)
```

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

Draw two perpendicular arrows to indicate directions.

**Parameters**

**transform** [`matplotlib.transforms.Transform`] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transAxes`.

**label\_x, label\_y** [str] Label text for the x and y arrows

**length** [float, default: 0.15] Length of the arrow, given in coordinates of *transform*.

**fontsize** [float, default: 0.08] Size of label strings, given in coordinates of *transform*.

**loc** [int, default: 2] Location of the direction arrows. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**angle** [float, default: 0] The angle of the arrows in degrees.

**aspect\_ratio** [float, default: 1] The ratio of the length of `arrow_x` and `arrow_y`. Negative numbers can be used to change the direction.

**pad** [float, default: 0.4] Padding around the labels and arrows, in fraction of the font size.

**borderpad** [float, default: 0.4] Border padding, in fraction of the font size.

**frameon** [bool, default: False] If True, draw a box around the arrows and labels.

**color** [str, default: 'white'] Color for the arrows and labels.

**alpha** [float, default: 1] Alpha values of the arrows and labels

**sep\_x, sep\_y** [float, default: 0.01 and 0 respectively] Separation between the arrows and labels in coordinates of *transform*.

**fontproperties** [*matplotlib.font\_manager.FontProperties*, optional] Font properties for the label text.

**back\_length** [float, default: 0.15] Fraction of the arrow behind the arrow crossing.

**head\_width** [float, default: 10] Width of arrow head, sent to *ArrowStyle*.

**head\_length** [float, default: 15] Length of arrow head, sent to *ArrowStyle*.

**tail\_width** [float, default: 2] Width of arrow tail, sent to *ArrowStyle*.

**text\_props, arrow\_props** [dict] Properties of the text and arrows, passed to *textpath.TextPath* and *patches.FancyArrowPatch*.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Notes

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

## Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredDirectionArrows)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()
```

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
...                                  loc='lower left', color='k',
...                                  aspect_ratio=-1, sep_x=0.02,
...                                  sep_y=-0.01,
...                                  text_props={'ec':'w', 'fc':'k'},
...                                  fontproperties=fontprops)
```

### Attributes

**arrow\_x, arrow\_y** [*matplotlib.patches.FancyArrowPatch*] Arrow x and y

**text\_path\_x, text\_path\_y** [*matplotlib.textpath.TextPath*] Path for arrow labels

**p\_x, p\_y** [*matplotlib.patches.PathPatch*] Patch for arrow labels

**box** [*matplotlib.offsetbox.AuxTransformBox*] Container for the arrows and labels.

```
__init__(self, transform, label_x, label_y, length=0.15, fontsize=0.08, loc=2,
         angle=0, aspect_ratio=1, pad=0.4, borderpad=0.4, frameon=False,
         color='w', alpha=1, sep_x=0.01, sep_y=0, fontproperties=None,
         back_length=0.15, head_width=10, head_length=15, tail_width=2,
         text_props=None, arrow_props=None, **kwargs)
```

Draw two perpendicular arrows to indicate directions.

### Parameters

**transform** [*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., *matplotlib.axes.Axes.transAxes*.

**label\_x, label\_y** [str] Label text for the x and y arrows

**length** [float, default: 0.15] Length of the arrow, given in coordinates of *transform*.

**fontsize** [float, default: 0.08] Size of label strings, given in coordinates of *transform*.

**loc** [int, default: 2] Location of the direction arrows. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**angle** [float, default: 0] The angle of the arrows in degrees.

**aspect\_ratio** [float, default: 1] The ratio of the length of arrow *x* and arrow *y*. Negative numbers can be used to change the direction.

**pad** [float, default: 0.4] Padding around the labels and arrows, in fraction of the font size.

**borderpad** [float, default: 0.4] Border padding, in fraction of the font size.

**frameon** [bool, default: False] If True, draw a box around the arrows and labels.

**color** [str, default: 'white'] Color for the arrows and labels.

**alpha** [float, default: 1] Alpha values of the arrows and labels

**sep\_x, sep\_y** [float, default: 0.01 and 0 respectively] Separation between the arrows and labels in coordinates of *transform*.

**fontproperties** [*matplotlib.font\_manager.FontProperties*, optional] Font properties for the label text.

**back\_length** [float, default: 0.15] Fraction of the arrow behind the arrow crossing.

**head\_width** [float, default: 10] Width of arrow head, sent to *ArrowStyle*.

**head\_length** [float, default: 15] Length of arrow head, sent to *ArrowStyle*.

**tail\_width** [float, default: 2] Width of arrow tail, sent to *ArrowStyle*.

**text\_props, arrow\_props** [dict] Properties of the text and arrows, passed to *textpath.TextPath* and *patches.FancyArrowPatch*.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Notes

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is be assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

## Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredDirectionArrows)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()
```

Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
...                                   loc='lower left', color='k',
...                                   aspect_ratio=-1, sep_x=0.02,
...                                   sep_y=-0.01,
...                                   text_props={'ec':'w', 'fc':'k'},
...                                   fontproperties=fontprops)
```

### Attributes

**arrow\_x, arrow\_y** [*matplotlib.patches.FancyArrowPatch*] Arrow x and y

**text\_path\_x, text\_path\_y** [*matplotlib.textpath.TextPath*] Path for arrow labels

**p\_x, p\_y** [*matplotlib.patches.PathPatch*] Patch for arrow labels

**box** [*matplotlib.offsetbox.AuxTransformBox*] Container for the arrows and labels.

`__module__` = 'mpl\_toolkits.axes\_grid1.anchored\_artists'

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows`

- `sphinx_glr_gallery_axes_grid1_demo_anchored_direction_arrows.py`

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea`

```
class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea(width, height,
                                                                    xdescent, ydescent,
                                                                    loc,
                                                                    pad=0.4, borderpad=0.5,
                                                                    prop=None,
                                                                    frameon=True,
                                                                    **kwargs)
```

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

An anchored container with a fixed size and fillable `DrawingArea`.

Artists added to the *drawing\_area* will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

### Parameters

**width, height** [float] width and height of the container, in pixels.

**xdescent, ydescent** [float] descent of the container in the x- and y- direction, in pixels.

**loc** [int] Location of this artist. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
```

(continues on next page)

(continued from previous page)

```
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**pad** [float, default: 0.4] Padding around the child objects, in fraction of the font size.

**borderpad** [float, default: 0.5] Border padding, in fraction of the font size.

**prop** [*matplotlib.font\_manager.FontProperties*, optional] Font property used as a reference for paddings.

**frameon** [bool, default: True] If True, draw a box around this artists.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Examples

To display blue and red circles of different sizes in the upper right of an axes *ax*:

```
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                           loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

## Attributes

**drawing\_area** [*matplotlib.offsetbox.DrawingArea*] A container for artists to display.

**\_\_init\_\_**(*self, width, height, xdescent, ydescent, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, \*\*kwargs*)

An anchored container with a fixed size and fillable *DrawingArea*.

Artists added to the *drawing\_area* will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

## Parameters

**width, height** [float] width and height of the container, in pixels.

**xdescent, ydescent** [float] descent of the container in the x- and y-direction, in pixels.

**loc** [int] Location of this artist. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
```

(continues on next page)

(continued from previous page)

```

'right'      : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center'      : 10

```

**pad** [float, default: 0.4] Padding around the child objects, in fraction of the font size.

**borderpad** [float, default: 0.5] Border padding, in fraction of the font size.

**prop** [*matplotlib.font\_manager.FontProperties*, optional] Font property used as a reference for paddings.

**frameon** [bool, default: True] If True, draw a box around this artists.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Examples

To display blue and red circles of different sizes in the upper right of an axes *ax*:

```

>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                           loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)

```

## Attributes

**drawing\_area** [*matplotlib.offsetbox.DrawingArea*] A container for artists to display.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using *mpl\_toolkits.axes\_grid1.anchored\_artists.AnchoredDrawingArea*

- sphx\_glr\_gallery\_userdemo\_anchored\_box02.py

*mpl\_toolkits.axes\_grid1.anchored\_artists.AnchoredEllipse*

```

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse(transform,
                                                                width,
                                                                height, angle, loc,
                                                                pad=0.1, border-
                                                                pad=0.1, prop=None,
                                                                frameon=True,
                                                                **kwargs)

```

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

Draw an anchored ellipse of a given size.

### Parameters

**transform** [*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

**width, height** [float] Width and height of the ellipse, given in coordinates of *transform*.

**angle** [float] Rotation of the ellipse, in degrees, anti-clockwise.

**loc** [int] Location of this size bar. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**pad** [float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.

**borderpad** [float, default: 0.1] Border padding, in fraction of the font size.

**frameon** [bool, default: True] If True, draw a box around the ellipse.

**prop** [*matplotlib.font\_manager.FontProperties*, optional] Font property used as a reference for paddings.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

### Attributes

**ellipse** [*matplotlib.patches.Ellipse*] Ellipse patch drawn.

```
__init__(self, transform, width, height, angle, loc, pad=0.1, borderpad=0.1,
          prop=None, frameon=True, **kwargs)
```

Draw an anchored ellipse of a given size.

### Parameters

**transform** [*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

**width, height** [float] Width and height of the ellipse, given in coordinates of *transform*.

**angle** [float] Rotation of the ellipse, in degrees, anti-clockwise.

**loc** [int] Location of this size bar. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
```

(continues on next page)

(continued from previous page)

```

'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10

```

**pad** [float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.

**borderpad** [float, default: 0.1] Border padding, in fraction of the font size.

**frameon** [bool, default: True] If True, draw a box around the ellipse.

**prop** [*matplotlib.font\_manager.FontProperties*, optional] Font property used as a reference for paddings.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

### Attributes

**ellipse** [*matplotlib.patches.Ellipse*] Ellipse patch drawn.

`__module__` = 'mpl\_toolkits.axes\_grid1.anchored\_artists'

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse`

- sphx\_glr\_gallery\_axes\_grid1\_simple\_anchored\_artists.py

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar`

```

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar(transform, size, label,
                                                                loc, pad=0.1, border-
                                                                pad=0.1,      sep=2,
                                                                frameon=True,
                                                                size_vertical=0,
                                                                color='black',    la-
                                                                bel_top=False,  font-
                                                                properties=None,
                                                                fill_bar=None,
                                                                **kwargs)

```

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

Draw a horizontal scale bar with a center-aligned label underneath.

### Parameters

**transform** [*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

**size** [float] Horizontal length of the size bar, given in coordinates of *transform*.

**label** [str] Label to display.

**loc** [int] Location of this size bar. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**pad** [float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

**borderpad** [float, default: 0.1] Border padding, in fraction of the font size.

**sep** [float, default: 2] Separation between the label and the size bar, in points.

**frameon** [bool, default: True] If True, draw a box around the horizontal bar and label.

**size\_vertical** [float, default: 0] Vertical length of the size bar, given in coordinates of *transform*.

**color** [str, default: 'black'] Color for the size bar and label.

**label\_top** [bool, default: False] If True, the label will be over the size bar.

**fontproperties** [*matplotlib.font\_manager.FontProperties*, optional] Font properties for the label text.

**fill\_bar** [bool, optional] If True and if *size\_vertical* is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if *size\_vertical* is greater than zero and False otherwise.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Notes

If *prop* is passed as a keyworded argument, but *fontproperties* is not, then *prop* is be assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

## Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
```

(continues on next page)

(continued from previous page)

```
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
...                       sep=5, borderpad=0.5, frameon=False,
...                       size_vertical=0.5, color='white',
...                       fontproperties=fontprops)
```

### Attributes

**size\_bar** [*matplotlib.offsetbox.AuxTransformBox*] Container for the size bar.

**txt\_label** [*matplotlib.offsetbox.TextArea*] Container for the label of the size bar.

```
__init__(self, transform, size, label, loc, pad=0.1, borderpad=0.1, sep=2,
         frameon=True, size_vertical=0, color='black', label_top=False, fontprop-
         erties=None, fill_bar=None, **kwargs)
```

Draw a horizontal scale bar with a center-aligned label underneath.

### Parameters

**transform** [*matplotlib.transforms.Transform*] The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

**size** [float] Horizontal length of the size bar, given in coordinates of *transform*.

**label** [str] Label to display.

**loc** [int] Location of this size bar. Valid location codes are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**pad** [float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

**borderpad** [float, default: 0.1] Border padding, in fraction of the font size.

**sep** [float, default: 2] Separation between the label and the size bar, in points.

**frameon** [bool, default: True] If True, draw a box around the horizontal bar and label.

**size\_vertical** [float, default: 0] Vertical length of the size bar, given in coordinates of *transform*.

**color** [str, default: 'black'] Color for the size bar and label.

**label\_top** [bool, default: False] If True, the label will be over the size bar.

**fontproperties** [*matplotlib.font\_manager.FontProperties*, optional] Font properties for the label text.

**fill\_bar** [bool, optional] If True and if *size\_vertical* is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if *size\_vertical* is greater than zero and False otherwise.

**\*\*kwargs** Keyworded arguments to pass to *matplotlib.offsetbox.AnchoredOffsetbox*.

## Notes

If *prop* is passed as a keyworded argument, but *fontproperties* is not, then *prop* is assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

## Examples

```
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (
...     AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
...                       sep=5, borderpad=0.5, frameon=False,
...                       size_vertical=0.5, color='white',
...                       fontproperties=fontprops)
```

## Attributes

**size\_bar** [*matplotlib.offsetbox.AuxTransformBox*] Container for the size bar.

**txt\_label** [*matplotlib.offsetbox.TextArea*] Container for the label of the size bar.

`__module__` = 'mpl\_toolkits.axes\_grid1.anchored\_artists'

Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar`

- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`
- `sphx_glr_gallery_axes_grid1_simple_anchored_artists.py`

`mpl_toolkits.axes_grid1.axes_divider`

Helper classes to adjust the positions of multiple axes at drawing time.

Classes

<code><i>AxesDivider</i>(axes[, xref, yref])</code>	Divider based on the pre-existing axes.
<code><i>AxesLocator</i>(axes_divider, nx, ny[, nx1, ny1])</code>	A simple callable object, initialized with <i>AxesDivider</i> class, returns the position and size of the given cell.
<code><i>Divider</i>(fig, pos, horizontal, vertical[, ...])</code>	An Axes positioning class.
<code><i>HBoxDivider</i>(fig, *args[, horizontal, ...])</code>	
<b>Parameters</b>	
<code><i>SubplotDivider</i>(fig, *args[, horizontal, ...])</code>	The <i>Divider</i> class whose rectangle area is specified as a subplot geometry.
<code><i>VBoxDivider</i>(fig, *args[, horizontal, ...])</code>	The <i>Divider</i> class whose rectangle area is specified as a subplot geometry.

`mpl_toolkits.axes_grid1.axes_divider.AxesDivider`

```
class mpl_toolkits.axes_grid1.axes_divider.AxesDivider(axes, xref=None, yref=None)
    Bases: mpl_toolkits.axes_grid1.axes_divider.Divider
    Divider based on the pre-existing axes.

    Parameters
        axes [Axes]
        xref
        yref
    __init__(self, axes, xref=None, yref=None)

    Parameters
        axes [Axes]
        xref
        yref
    __module__ = 'mpl_toolkits.axes_grid1.axes_divider'
    append_axes(self, position, size, pad=None, add_to_figure=True, **kwargs)
        Create an axes at the given position with the same height (or width) of the main
        axes.
```

**position** ["left"|"right"|"bottom"|"top"]

*size* and *pad* should be `axes_grid.axes_size` compatible.

`get_anchor(self)`

Return the anchor.

`get_aspect(self)`

Return aspect.

`get_position(self)`

Return the position of the rectangle.

`get_subplotspec(self)`

`new_horizontal(self, size, pad=None, pack_start=False, **kwargs)`

Add a new axes on the right (or left) side of the main axes.

### Parameters

**size** [`axes_size` or float or str] A width of the axes. If float or string is given, *from\_any* function is used to create the size, with *ref\_size* set to AxesX instance of the current axes.

**pad** [`axes_size` or float or str] Pad between the axes. It takes same argument as *size*.

**pack\_start** [bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

**\*\*kwargs** All extra keywords arguments are passed to the created axes. If *axes\_class* is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

`new_vertical(self, size, pad=None, pack_start=False, **kwargs)`

Add a new axes on the top (or bottom) side of the main axes.

### Parameters

**size** [`axes_size` or float or str] A height of the axes. If float or string is given, *from\_any* function is used to create the size, with *ref\_size* set to AxesX instance of the current axes.

**pad** [`axes_size` or float or str] Pad between the axes. It takes same argument as *size*.

**pack\_start** [bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

**\*\*kwargs** All extra keywords arguments are passed to the created axes. If *axes\_class* is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

Examples using `mpl_toolkits.axes_grid1.axes_divider.AxesDivider`

- `sphx_glr_gallery_axes_grid1_demo_colorbar_with_axes_divider.py`
- `sphx_glr_gallery_axes_grid1_make_room_for_ylabel_using_axesgrid.py`

- sphx\_glr\_gallery\_axes\_grid1\_scatter\_hist\_locatable\_axes.py
- sphx\_glr\_gallery\_axes\_grid1\_simple\_colorbar.py
- *Tight Layout guide*

#### `mpl_toolkits.axes_grid1.axes_divider.AxesLocator`

```
class mpl_toolkits.axes_grid1.axes_divider.AxesLocator(axes_divider, nx, ny,
                                                    nx1=None, ny1=None)
```

Bases: `object`

A simple callable object, initialized with AxesDivider class, returns the position and size of the given cell.

##### Parameters

**axes\_divider** [AxesDivider]

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

`__call__(self, axes, renderer)`

Call self as a function.

`__dict__` = mappingproxy({'\_\_module\_\_': 'mpl\_toolkits.axes\_grid1.axes\_divider', '\_\_doc\_\_': '\n A si

`__init__(self, axes_divider, nx, ny, nx1=None, ny1=None)`

##### Parameters

**axes\_divider** [AxesDivider]

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

`__module__` = 'mpl\_toolkits.axes\_grid1.axes\_divider'

`__weakref__`

list of weak references to the object (if defined)

`get_subplotspec(self)`

#### Examples using `mpl_toolkits.axes_grid1.axes_divider.AxesLocator`

#### `mpl_toolkits.axes_grid1.axes_divider.Divider`

```
class mpl_toolkits.axes_grid1.axes_divider.Divider(fig, pos, horizontal, vertical, as-
                                                    pect=None, anchor='C')
```

Bases: `object`

An Axes positioning class.

The divider is initialized with lists of horizontal and vertical sizes (`mpl_toolkits.axes_grid1.axes_size`) based on which a given rectangular area will be divided.

The `new_locator` method then creates a callable object that can be used as the `axes_locator` of the axes.

#### Parameters

**fig** [Figure]

**pos** [tuple of 4 floats] Position of the rectangle that will be divided.

**horizontal** [list of `axes_size`] Sizes for horizontal division.

**vertical** [list of `axes_size`] Sizes for vertical division.

**aspect** [bool] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

**anchor** [{`'C'`, `'SW'`, `'S'`, `'SE'`, `'E'`, `'NE'`, `'N'`, `'NW'`, `'W'`}] Placement of the reduced rectangle, when `aspect` is True.

```
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_divider', '__doc__': '\n An A
__init__(self, fig, pos, horizontal, vertical, aspect=None, anchor='C')
```

#### Parameters

**fig** [Figure]

**pos** [tuple of 4 floats] Position of the rectangle that will be divided.

**horizontal** [list of `axes_size`] Sizes for horizontal division.

**vertical** [list of `axes_size`] Sizes for vertical division.

**aspect** [bool] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

**anchor** [{`'C'`, `'SW'`, `'S'`, `'SE'`, `'E'`, `'NE'`, `'N'`, `'NW'`, `'W'`}] Placement of the reduced rectangle, when `aspect` is True.

```
__module__ = 'mpl_toolkits.axes_grid1.axes_divider'
__weakref__
    list of weak references to the object (if defined)
add_auto_adjustable_area(self, use_axes, pad=0.1, adjust_dirs=None)
append_size(self, position, size)
get_anchor(self)
    Return the anchor.
get_aspect(self)
    Return aspect.
get_horizontal(self)
    Return horizontal sizes.
get_horizontal_sizes(self, renderer)
get_locator(self)
get_position(self)
    Return the position of the rectangle.
```

`get_position_runtime(self, ax, renderer)`

`get_vertical(self)`  
Return vertical sizes.

`get_vertical_sizes(self, renderer)`

`get_vsize_hsize(self)`

`locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)`

#### Parameters

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

**axes**

**renderer**

`new_locator(self, nx, ny, nx1=None, ny1=None)`

Return a new *AxesLocator* for the specified cell.

#### Parameters

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

`set_anchor(self, anchor)`

#### Parameters

**anchor** [{*'C'*, *'SW'*, *'S'*, *'SE'*, *'E'*, *'NE'*, *'N'*, *'NW'*, *'W'*}]

anchor position

value	description
<i>'C'</i>	Center
<i>'SW'</i>	bottom left
<i>'S'</i>	bottom
<i>'SE'</i>	bottom right
<i>'E'</i>	right
<i>'NE'</i>	top right
<i>'N'</i>	top
<i>'NW'</i>	top left
<i>'W'</i>	left

`set_aspect(self, aspect=False)`

#### Parameters

**aspect** [bool]

`set_horizontal(self, h)`

#### Parameters

**h** [list of *axes\_size*] sizes for horizontal division

`set_locator(self, _locator)`

`set_position(self, pos)`

Set the position of the rectangle.

#### Parameters

**pos** [tuple of 4 floats] position of the rectangle that will be divided

`set_vertical(self, v)`

#### Parameters

**v** [list of *axes\_size*] sizes for vertical division

Examples using `mpl_toolkits.axes_grid1.axes_divider.Divider`

`mpl_toolkits.axes_grid1.axes_divider.HBoxDivider`

```
class mpl_toolkits.axes_grid1.axes_divider.HBoxDivider(fig, *args, horizontal=None,
                                                         vertical=None, aspect=None,
                                                         anchor='C')
```

Bases: `mpl_toolkits.axes_grid1.axes_divider.SubplotDivider`

#### Parameters

**fig** [`matplotlib.figure.Figure`]

**\*args** [tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions (*nrows*, *ncols*), and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

`__module__` = `'mpl_toolkits.axes_grid1.axes_divider'`

`locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)`

#### Parameters

**axes\_divider** [`AxesDivider`]

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

**axes**

**renderer**

`new_locator(self, nx, nx1=None)`

Create a new `AxesLocator` for the specified cell.

#### Parameters

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

Examples using `mpl_toolkits.axes_grid1.axes_divider.HBoxDivider`

- `sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py`

`mpl_toolkits.axes_grid1.axes_divider.SubplotDivider`

```
class mpl_toolkits.axes_grid1.axes_divider.SubplotDivider(fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')
```

Bases: `mpl_toolkits.axes_grid1.axes_divider.Divider`

The Divider class whose rectangle area is specified as a subplot geometry.

#### Parameters

**fig** [`matplotlib.figure.Figure`]

**\*args** [tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions (*nrows*, *ncols*), and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

```
__init__(self, fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')
```

#### Parameters

**fig** [`matplotlib.figure.Figure`]

**\*args** [tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions (*nrows*, *ncols*), and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

```
__module__ = 'mpl_toolkits.axes_grid1.axes_divider'
```

```
change_geometry(self, numrows, numcols, num)
```

Change subplot geometry, e.g., from (1, 1, 1) to (2, 2, 3).

```
get_geometry(self)
```

Get the subplot geometry, e.g., (2, 2, 3).

```
get_position(self)
```

Return the bounds of the subplot box.

```
get_subplotspec(self)
```

Get the SubplotSpec instance.

```
set_subplotspec(self, subplotspec)
    Set the SubplotSpec instance.

update_params(self)
    Update the subplot position from fig.subplotspars.
```

Examples using `mpl_toolkits.axes_grid1.axes_divider.SubplotDivider`

`mpl_toolkits.axes_grid1.axes_divider.VBoxDivider`

```
class mpl_toolkits.axes_grid1.axes_divider.VBoxDivider(fig, *args, horizontal=None,
                                                         vertical=None, aspect=None,
                                                         anchor='C')
```

Bases: `mpl_toolkits.axes_grid1.axes_divider.HBoxDivider`

The Divider class whose rectangle area is specified as a subplot geometry.

### Parameters

**fig** [`matplotlib.figure.Figure`]

**\*args** [tuple (*nrows*, *ncols*, *index*) or int] The array of subplots in the figure has dimensions (*nrows*, *ncols*), and *index* is the index of the subplot being created. *index* starts at 1 in the upper left corner and increases to the right.

If *nrows*, *ncols*, and *index* are all single digit numbers, then *args* can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

```
__module__ = 'mpl_toolkits.axes_grid1.axes_divider'
```

```
locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)
```

### Parameters

**axes\_divider** [`AxesDivider`]

**nx, nx1** [int] Integers specifying the column-position of the cell. When *nx1* is None, a single *nx*-th column is specified. Otherwise location of columns spanning between *nx* to *nx1* (but excluding *nx1*-th column) is specified.

**ny, ny1** [int] Same as *nx* and *nx1*, but for row positions.

**axes**

**renderer**

```
new_locator(self, ny, ny1=None)
```

Create a new `AxesLocator` for the specified cell.

### Parameters

**ny, ny1** [int] Integers specifying the row-position of the cell. When *ny1* is None, a single *ny*-th row is specified. Otherwise location of rows spanning between *ny* to *ny1* (but excluding *ny1*-th row) is specified.

Examples using `mpl_toolkits.axes_grid1.axes_divider.VBoxDivider`

## Functions

---

`make_axes_area_auto_adjustable(ax[, ...])`

---

`make_axes_locatable(axes)`

---

`mpl_toolkits.axes_grid1.axes_divider.make_axes_area_auto_adjustable`

```
mpl_toolkits.axes_grid1.axes_divider.make_axes_area_auto_adjustable(ax,
                                                                    use_axes=None,
                                                                    pad=0.1,    ad-
                                                                    just_dirs=None)
```

Examples using `mpl_toolkits.axes_grid1.axes_divider.make_axes_area_auto_adjustable`

- `sphx_glr_gallery_axes_grid1_make_room_for_ylabel_using_axesgrid.py`

`mpl_toolkits.axes_grid1.axes_divider.make_axes_locatable`

```
mpl_toolkits.axes_grid1.axes_divider.make_axes_locatable(axes)
```

Examples using `mpl_toolkits.axes_grid1.axes_divider.make_axes_locatable`

`mpl_toolkits.axes_grid1.axes_grid`

## Classes

<code>AxesGrid</code>	alias of <code>mpl_toolkits.axes_grid1.axes_grid.ImageGrid</code>
-----------------------	---

<code>CbarAxes(*args, orientation, **kwargs)</code>
---

<code>CbarAxesBase(*args, orientation, **kwargs)</code>
---

<code>Grid(fig, rect, nrows_ncols[, ngrids, ...])</code>	A grid of Axes.
--	-----------------

<code>ImageGrid(fig, rect, nrows_ncols[, ngrids, ...])</code>
---

## Parameters

`mpl_toolkits.axes_grid1.axes_grid.AxesGrid`

```
mpl_toolkits.axes_grid1.axes_grid.AxesGrid
    alias of mpl_toolkits.axes_grid1.axes_grid.ImageGrid
```

**mpl\_toolkits.axes\_grid1.axes\_grid.CbarAxes**

```
class mpl_toolkits.axes_grid1.axes_grid.CbarAxes(*args, orientation, **kwargs)
    Bases: mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase, mpl_toolkits.axes_grid1.
            mpl_axes.Axes
    __module__ = 'mpl_toolkits.axes_grid1.axes_grid'
```

**Examples using *mpl\_toolkits.axes\_grid1.axes\_grid.CbarAxes*****mpl\_toolkits.axes\_grid1.axes\_grid.CbarAxesBase**

```
class mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase(*args, orientation, **kwargs)
    Bases: object
    __dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_grid', '__init__': <function
    __init__(self, *args, orientation, **kwargs)
        Initialize self. See help(type(self)) for accurate signature.
    __module__ = 'mpl_toolkits.axes_grid1.axes_grid'
    __weakref__
        list of weak references to the object (if defined)
    property cbid
    cla(self)
    colorbar(self, mappable, *, ticks=None, **kwargs)
    property locator
    toggle_label(self, b)
```

**Examples using *mpl\_toolkits.axes\_grid1.axes\_grid.CbarAxesBase*****mpl\_toolkits.axes\_grid1.axes\_grid.Grid**

```
class mpl_toolkits.axes_grid1.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None,
                                              direction='row', axes_pad=0.02,
                                              add_all=<deprecated parameter>,
                                              share_all=False, share_x=True,
                                              share_y=True, label_mode='L',
                                              axes_class=None, *, aspect=False)
```

Bases: *object*

A grid of Axes.

In Matplotlib, the axes location (and size) is specified in normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio; for example, it is difficult to display multiple images of a same size with some fixed padding between them. AxesGrid can be used in such case.

**Parameters**

**fig** [*Figure*] The parent figure.

**rect** [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

**nrows\_ncols** [(int, int)] Number of rows and columns in the grid.

**ngrids** [int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

**direction** [{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column").

**axes\_pad** [float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add\_all** [bool, default: True] Whether to add the axes to the figure using *Figure.add\_axes*. This parameter is deprecated.

**share\_all** [bool, default: False] Whether all axes share their x- and y-axis. Overrides *share\_x* and *share\_y*.

**share\_x** [bool, default: True] Whether all axes of a column share their x-axis.

**share\_y** [bool, default: True] Whether all axes of a row share their y-axis.

**label\_mode** [{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**axes\_class** [subclass of *matplotlib.axes.Axes*, default: None]

**aspect** [bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

```
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_grid', '__doc__': '\n A grid\n',
    '__getitem__': (self, i)
```

```
__init__(self, fig, rect, nrows_ncols, ngrids=None, direction='row',
    axes_pad=0.02, add_all=<deprecated parameter>, share_all=False,
    share_x=True, share_y=True, label_mode='L', axes_class=None, *,
    aspect=False)
```

### Parameters

**fig** [*Figure*] The parent figure.

**rect** [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

**nrows\_ncols** [(int, int)] Number of rows and columns in the grid.

**ngrids** [int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

**direction** [{*"row"*, *"column"*}, default: *"row"*] Whether axes are created in row-major (*"row by row"*) or column-major order (*"column by column"*).

**axes\_pad** [float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add\_all** [bool, default: True] Whether to add the axes to the figure using *Figure.add\_axes*. This parameter is deprecated.

**share\_all** [bool, default: False] Whether all axes share their x- and y-axis. Overrides *share\_x* and *share\_y*.

**share\_x** [bool, default: True] Whether all axes of a column share their x-axis.

**share\_y** [bool, default: True] Whether all axes of a row share their y-axis.

**label\_mode** [{*"L"*, *"1"*, *"all"*}, default: *"L"*] Determines which axes will get tick labels:

- *"L"*: All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- *"1"*: Only the bottom left axes is labelled.
- *"all"*: all axes are labelled.

**axes\_class** [subclass of *matplotlib.axes.Axes*, default: None]

**aspect** [bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

`__len__(self)`

`__module__` = *'mpl\_toolkits.axes\_grid1.axes\_grid'*

`__weakref__`

list of weak references to the object (if defined)

`get_aspect(self)`

Return the aspect of the SubplotDivider.

`get_axes_locator(self)`

`get_axes_pad(self)`

Return the axes padding.

### Returns

**hpad, vpad** Padding (horizontal pad, vertical pad) in inches.

`get_divider(self)`

`get_geometry(self)`

Return the number of rows and columns of the grid as (nrows, ncols).

`get_vsize_hsize(self)`

`set_aspect(self, aspect)`

Set the aspect of the SubplotDivider.

`set_axes_locator(self, locator)`

`set_axes_pad(self, axes_pad)`  
Set the padding between the axes.

#### Parameters

**axes\_pad** [(float, float)] The padding (horizontal pad, vertical pad) in inches.

`set_label_mode(self, mode)`  
Define which axes have tick labels.

#### Parameters

**mode** [{"L", "1", "all"}] The label mode:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

Examples using `mpl_toolkits.axes_grid1.axes_grid.Grid`

`mpl_toolkits.axes_grid1.axes_grid.ImageGrid`

```
class mpl_toolkits.axes_grid1.axes_grid.ImageGrid(fig, rect, nrows_ncols,
                                                    ngrids=None, direction='row',
                                                    axes_pad=0.02,
                                                    add_all=<deprecated parameter>,
                                                    share_all=False, aspect=True, label_mode='L',
                                                    cbar_mode=None, cbar_location='right',
                                                    cbar_pad=None, cbar_size='5%',
                                                    cbar_set_cax=True,
                                                    axes_class=None)
```

Bases: `mpl_toolkits.axes_grid1.axes_grid.Grid`

#### Parameters

**fig** [*Figure*] The parent figure.

**rect** [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

**nrows\_ncols** [(int, int)] Number of rows and columns in the grid.

**ngrids** [int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

**direction** [{"row", "column"}], default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (`grid[index]`).

**axes\_pad** [float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add\_all** [bool, default: True] Whether to add the axes to the figure using *Figure.add\_axes*. This parameter is deprecated.

**share\_all** [bool, default: False] Whether all axes share their x- and y-axis.

**aspect** [bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

**label\_mode** [{"L", "1", "all"}], default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**cbar\_mode** [{"each", "single", "edge", None}], default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by *cbar\_location*, or no colorbars. The colorbars are stored in the *cbar\_axes* attribute.

**cbar\_location** [{"left", "right", "bottom", "top"}], default: "right"]

**cbar\_pad** [float, default: None] Padding between the image axes and the colorbar axes.

**cbar\_size** [size specification (see *Size.from\_any*), default: "5%"] Colorbar size.

**cbar\_set\_cax** [bool, default: True] If True, each axes in the grid has a *cax* attribute that is bound to associated *cbar\_axes*.

**axes\_class** [subclass of *matplotlib.axes.Axes*, default: None]

```
__init__(self, fig, rect, nrows_ncols, ngrids=None, direction='row',
         axes_pad=0.02, add_all=<deprecated parameter>, share_all=False,
         aspect=True, label_mode='L', cbar_mode=None, cbar_location='right',
         cbar_pad=None, cbar_size='5%', cbar_set_cax=True, axes_class=None)
```

### Parameters

**fig** [*Figure*] The parent figure.

**rect** [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

**nrows\_ncols** [(int, int)] Number of rows and columns in the grid.

**ngrids** [int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

**direction** [{"row", "column"}], default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (*grid[index]*).

**axes\_pad** [float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add\_all** [bool, default: True] Whether to add the axes to the figure using *Figure.add\_axes*. This parameter is deprecated.

**share\_all** [bool, default: False] Whether all axes share their x- and y-axis.

**aspect** [bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

**label\_mode** [{"L", "1", "all"}], default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**cbar\_mode** [{"each", "single", "edge", None}], default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by *cbar\_location*, or no colorbars. The colorbars are stored in the *cbar\_axes* attribute.

**cbar\_location** [{"left", "right", "bottom", "top"}], default: "right"]

**cbar\_pad** [float, default: None] Padding between the image axes and the colorbar axes.

**cbar\_size** [size specification (see *Size.from\_any*), default: "5%"] Colorbar size.

**cbar\_set\_cax** [bool, default: True] If True, each axes in the grid has a *cax* attribute that is bound to associated *cbar\_axes*.

**axes\_class** [subclass of *matplotlib.axes.Axes*, default: None]

`__module__ = 'mpl_toolkits.axes_grid1.axes_grid'`

Examples using `mpl_toolkits.axes_grid1.axes_grid.ImageGrid`

`mpl_toolkits.axes_grid1.axes_rgb`

## Classes

<code>RGBAxes(*args[, pad, add_all])</code>	4-panel imshow (RGB, R, G, B).
<code>RGBAxesBase(*args[, pad, add_all])</code>	<i>[Deprecated]</i>

`mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

`class mpl_toolkits.axes_grid1.axes_rgb.RGBAxes(*args, pad=0, add_all=<deprecated parameter>, **kwargs)`

Bases: `object`

4-panel imshow (RGB, R, G, B).

Layout: +-----+--+ || R | + +--+ | RGB | G | + +--+ || B | +-----+--+

Subclasses can override the `_defaultAxesClass` attribute.

### Attributes

**RGB** [`_defaultAxesClass`] The axes object for the three-channel imshow.

**R** [`_defaultAxesClass`] The axes object for the red channel imshow.

**G** [`_defaultAxesClass`] The axes object for the green channel imshow.

**B** [`_defaultAxesClass`] The axes object for the blue channel imshow.

### Parameters

**pad** [float, default: 0] fraction of the axes height to put as padding.

**add\_all** [bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

**axes\_class** [matplotlib.axes.Axes]

**\*args** Unpacked into `axes_class()` init for RGB

**\*\*kwargs** Unpacked into `axes_class()` init for RGB, R, G, B axes

```
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_rgb', '__doc__': '\n 4-panel\n__init__(self, *args, pad=0, add_all=<deprecated parameter>, **kwargs)
```

### Parameters

**pad** [float, default: 0] fraction of the axes height to put as padding.

**add\_all** [bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

**axes\_class** [matplotlib.axes.Axes]

**\*args** Unpacked into `axes_class()` init for RGB

**\*\*kwargs** Unpacked into `axes_class()` init for RGB, R, G, B axes

```
__module__ = 'mpl_toolkits.axes_grid1.axes_rgb'
```

```
__weakref__  
list of weak references to the object (if defined)
```

```
add_RGB_to_figure(self)
```

[*Deprecated*] Add red, green and blue axes to the RGB composite's axes figure.

### Notes

Deprecated since version 3.3.

```
imshow_rgb(self, r, g, b, **kwargs)
```

Create the four images {rgb, r, g, b}.

### Parameters

**r** [array-like] The red array

**g** [array-like] The green array

**b** [array-like] The blue array

**kwargs** [imshow kwargs] kwargs get unpacked into the imshow calls for the four images

### Returns

**rgb** [matplotlib.image.AxesImage]

**r** [matplotlib.image.AxesImage]

**g** [matplotlib.image.AxesImage]

**b** [matplotlib.image.AxesImage]

Examples using `mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

- `sphx_glr_gallery_pyplots_whats_new_99_axes_grid.py`
- `sphx_glr_gallery_axes_grid1_demo_axes_rgb.py`

`mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase`

```
class mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase(*args,          pad=0,
                                                    add_all=<deprecated parameter>, **kwargs)
```

Bases: `mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

[Deprecated]

### Notes

Deprecated since version 3.3:

#### Parameters

**pad** [float, default: 0] fraction of the axes height to put as padding.

**add\_all** [bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

<code>imshow_rgb(ax, r, g, b, **kwargs)</code>	<i>[Deprecated]</i>
<code>make_rgb_axes(ax[, pad, axes_class, add_all])</code>	
<b>Parameters</b>	

---

`mpl_toolkits.axes_grid1.axes_rgb.imshow_rgb`

`mpl_toolkits.axes_grid1.axes_rgb.imshow_rgb(ax, r, g, b, **kwargs)`  
*[Deprecated]*

## Notes

Deprecated since version 3.3:

Examples using `mpl_toolkits.axes_grid1.axes_rgb.imshow_rgb`

`mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes`

`mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes(ax, pad=0.01, axes_class=None,  
 add_all=<deprecated parameter>,  
 **kwargs)`

## Parameters

**pad** [float] Fraction of the axes height.

Examples using `mpl_toolkits.axes_grid1.axes_rgb.make_rgb_axes`

- `sphx_glr_gallery_axes_grid1_demo_axes_rgb.py`

`mpl_toolkits.axes_grid1.axes_size`

Provides classes of simple units that will be used with `AxesDivider` class (or others) to determine the size of each axes. The unit classes define `get_size` method that returns a tuple of two floats, meaning relative and absolute sizes, respectively.

Note that this class is nothing more than a simple tuple of two floats. Take a look at the `Divider` class to see how these two values are used.

## Classes

<code>Add(a, b)</code>	
<code>AddList(add_list)</code>	
<code>AxesX(axes[, aspect, ref_ax])</code>	Scaled size whose relative part corresponds to the data width of the <i>axes</i> multiplied by the <i>aspect</i> .
<code>AxesY(axes[, aspect, ref_ax])</code>	Scaled size whose relative part corresponds to the data height of the <i>axes</i> multiplied by the <i>aspect</i> .
<code>Fixed(fixed_size)</code>	Simple fixed size with absolute part = <i>fixed_size</i> and relative part = 0.
<code>Fraction(fraction, ref_size)</code>	An instance whose size is a <i>fraction</i> of the <i>ref_size</i> .
<code>GetExtentHelper(ax, direction)</code>	
<code>MaxExtent(artist_list, w_or_h)</code>	Size whose absolute part is either the largest width or the largest height of the given <i>artist_list</i> .
<code>MaxHeight(artist_list)</code>	Size whose absolute part is the largest height of the given <i>artist_list</i> .
<code>MaxWidth(artist_list)</code>	Size whose absolute part is the largest width of the given <i>artist_list</i> .
<code>Padded(size, pad)</code>	Return a instance where the absolute part of <i>size</i> is increase by the amount of <i>pad</i> .
<code>Scalable</code>	alias of <code>mpl_toolkits.axes_grid1.axes_size.Scaled</code>
<code>Scaled(scalable_size)</code>	Simple scaled(?) size with absolute part = 0 and relative part = <i>scalable_size</i> .
<code>SizeFromFunc(func)</code>	

### `mpl_toolkits.axes_grid1.axes_size.Add`

```
class mpl_toolkits.axes_grid1.axes_size.Add(a, b)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    __init__(self, a, b)
        Initialize self. See help(type(self)) for accurate signature.
    __module__ = 'mpl_toolkits.axes_grid1.axes_size'
    get_size(self, renderer)
```

### Examples using `mpl_toolkits.axes_grid1.axes_size.Add`

### `mpl_toolkits.axes_grid1.axes_size.AddList`

```

Examples using `mpl_toolkits.axes_grid1.axes_size.MaxExtent`

`mpl_toolkits.axes_grid1.axes_size.MaxHeight`

```
class mpl_toolkits.axes_grid1.axes_size.MaxHeight(artist_list)
    Bases: mpl_toolkits.axes_grid1.axes_size.MaxExtent

    Size whose absolute part is the largest height of the given artist_list.

    __init__(self, artist_list)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axes_grid1.axes_size'
```

Examples using `mpl_toolkits.axes_grid1.axes_size.MaxHeight`

`mpl_toolkits.axes_grid1.axes_size.MaxWidth`

```
class mpl_toolkits.axes_grid1.axes_size.MaxWidth(artist_list)
    Bases: mpl_toolkits.axes_grid1.axes_size.MaxExtent

    Size whose absolute part is the largest width of the given artist_list.

    __init__(self, artist_list)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axes_grid1.axes_size'
```

Examples using `mpl_toolkits.axes_grid1.axes_size.MaxWidth`

`mpl_toolkits.axes_grid1.axes_size.Padded`

```
class mpl_toolkits.axes_grid1.axes_size.Padded(size, pad)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base

    Return a instance where the absolute part of size is increase by the amount of pad.

    __init__(self, size, pad)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axes_grid1.axes_size'
    get_size(self, renderer)
```

Examples using `mpl_toolkits.axes_grid1.axes_size.Padded`

`mpl_toolkits.axes_grid1.axes_size.Scalable`

`mpl_toolkits.axes_grid1.axes_size.Scalable`  
 alias of `mpl_toolkits.axes_grid1.axes_size.Scaled`

`mpl_toolkits.axes_grid1.axes_size.Scaled`

```
class mpl_toolkits.axes_grid1.axes_size.Scaled(scalable_size)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    Simple scaled(?) size with absolute part = 0 and relative part = scalable_size.
    __init__(self, scalable_size)
        Initialize self. See help(type(self)) for accurate signature.
    __module__ = 'mpl_toolkits.axes_grid1.axes_size'
    get_size(self, renderer)
```

Examples using `mpl_toolkits.axes_grid1.axes_size.Scaled`

- `sphinx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py`
- `sphinx_glr_gallery_axes_grid1_demo_fixed_size_axes.py`
- `sphinx_glr_gallery_axes_grid1_simple_axes_divider1.py`

`mpl_toolkits.axes_grid1.axes_size.SizeFromFunc`

```
class mpl_toolkits.axes_grid1.axes_size.SizeFromFunc(func)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    __init__(self, func)
        Initialize self. See help(type(self)) for accurate signature.
    __module__ = 'mpl_toolkits.axes_grid1.axes_size'
    get_size(self, renderer)
```

Examples using `mpl_toolkits.axes_grid1.axes_size.SizeFromFunc`

## Functions

---

<code>from_any(size[, fraction_ref])</code>	Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %.
---	--

---

**mpl\_toolkits.axes\_grid1.axes\_size.from\_any**

`mpl_toolkits.axes_grid1.axes_size.from_any(size, fraction_ref=None)`

Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %. The second argument is only meaningful when Fraction unit is created.

```
>>> a = Size.from_any(1.2) # => Size.Fixed(1.2)
>>> Size.from_any("50%", a) # => Size.Fraction(0.5, a)
```

**Examples using `mpl_toolkits.axes_grid1.axes_size.from_any`****mpl\_toolkits.axes\_grid1.colorbar**

Colorbar toolkit with two classes and a function:

*ColorbarBase* the base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

*Colorbar* the derived class for use with images or contour plots.

*make\_axes()* a function for resizing an axes and adding a second axes suitable for a colorbar

The *colorbar()* method uses *make\_axes()* and *Colorbar*; the *colorbar()* function is a thin wrapper over *colorbar()*.

```
class mpl_toolkits.axes_grid1.colorbar.CbarAxesLocator(locator=None,          ex-
                                                         tend='neither',      orienta-
                                                         tion='vertical')
```

CbarAxesLocator is a *axes\_locator* for colorbar axes. It adjust the position of the axes to make a room for extended ends, i.e., the extended ends are located outside the axes area.

**locator** [the *bbox* returned from the locator is used as a] initial axes location. If *None*, *axes.bbox* is used.

*extend* : same as in *ColorbarBase* *orientation* : same as in *ColorbarBase*

*get\_end\_vertices(self)*

Return a tuple of two vertices for the colorbar extended ends.

The first vertices is for the minimum end, and the second is for the maximum end.

*get\_original\_position(self, axes, renderer)*

Return the original position of the axes.

*get\_path\_ends(self)*

Return the paths for extended ends.

*get\_path\_patch(self)*

Return the path for axes patch.

```
class mpl_toolkits.axes_grid1.colorbar.Colorbar(ax, mappable, **kw)
```

**Parameters**

**norm** [*matplotlib.colors.Normalize* (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If *None*,

*norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

**cmap** [str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

`add_lines(self, CS)`

Add the lines from a non-filled *ContourSet* to the colorbar.

`update_bruteforce(self, mappable)`

Update the colorbar artists to reflect the change of the associated mappable.

`update_normal(self, mappable)`

Update solid patches, lines, etc.

This is meant to be called when the norm of the image or contour plot to which this colorbar belongs changes.

If the norm on the mappable is different than before, this resets the locator and formatter for the axis, so if these have been customized, they will need to be customized again. However, if the norm only changes values of *vmin*, *vmax* or *cmap* then the old formatter and locator will be preserved.

```
class mpl_toolkits.axes_grid1.colorbar.ColorbarBase(ax, cmap=None, norm=None,
                                                    alpha=1.0, values=None,
                                                    boundaries=None, orienta-
                                                    tion='vertical', extend='neither',
                                                    spacing='uniform', ticks=None,
                                                    format=None, drawedges=False,
                                                    filled=True)
```

Draw a colorbar in an existing axes.

This is a base class for the *Colorbar* class, which is the basis for the *colorbar()* method and *pyplot* function.

It is also useful by itself for showing a colormap. If the *cmap* kwarg is given but *boundaries* and *values* are left as *None*, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the *norm* as:

```
colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```
norm=colors.NoNorm.
```

Useful attributes:

*ax* the Axes instance in which the colorbar is drawn

*lines* a LineCollection if lines were drawn, otherwise *None*

*dividers* a LineCollection if *drawedges* is *True*, otherwise *None*

Useful public methods are *set\_label()* and *add\_lines()*.

### Parameters

**norm** [*matplotlib.colors.Normalize* (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

**cmap** [str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

`add_lines(self, levels, colors, linewidths)`

Draw lines on the colorbar. It deletes preexisting lines.

`set_alpha(self, alpha)`

Set the alpha value for transparency.

`set_label_text(self, label, **kw)`

Label the long axis of the colorbar.

`update_artists(self)`

Update the colorbar associated artists, *filled* and *ends*. Note that *lines* are not updated. This needs to be called whenever *clim* of associated image changes.

`mpl_toolkits.axes_grid1.colorbar.colorbar(mappable, cax=None, ax=None, **kw)`

Create a colorbar for a *ScalarMappable* instance.

Documentation for the *pyplot* thin wrapper:

Add a colorbar to a plot.

Function signatures for the *pyplot* interface; all but the first are also method signatures for the *colorbar()* method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

arguments:

**mappable** the *Image*, *ContourSet*, etc. to which the colorbar applies; this argument is mandatory for the *colorbar()* method but optional for the *colorbar()* function, which sets the default to the current image.

keyword arguments:

**cax** None | axes object into which the colorbar will be drawn

**ax** None | parent axes object from which space for a new colorbar axes will be stolen

Additional keyword arguments are of two kinds:

axes properties:

Prop-erty	Description
<i>orien-tation</i>	vertical or horizontal
<i>frac-tion</i>	0.15; fraction of original axes to use for colorbar
<i>pad</i>	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
<i>shrink</i>	1.0; fraction by which to shrink the colorbar
<i>aspect</i>	20; ratio of long to short dimensions

colorbar properties:

Prop-erty	Description
<i>extend</i>	[ 'neither'   'both'   'min'   'max' ] If not 'neither', make pointed end(s) for out-of- range values. These are set for a given colormap using the colormap <code>set_under</code> and <code>set_over</code> methods.
<i>spacing</i>	[ 'uniform'   'proportional' ] Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<i>ticks</i>	[ None   list of ticks   Locator object ] If None, ticks are determined automatically from the input.
<i>format</i>	[ None   format string   Formatter object ] If None, the <i>ScalarFormatter</i> is used. If a format string is given, e.g., '%.3f', that is used. An alternative <i>Formatter</i> object may be given instead.
<i>drawedges</i>	Whether to draw lines at color boundaries.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has `norm=NoNorm()`), or other unusual circumstances.

Prop-erty	Description
<i>boundaries</i>	None or a sequence
<i>values</i>	None or a sequence which must be of length 1 less than the sequence of <i>boundaries</i> . For each region delimited by adjacent entries in <i>boundaries</i> , the color mapped to the corresponding value in <i>values</i> will be used.

If *mappable* is a `ContourSet`, its *extend* kwarg is included automatically.

Note that the *shrink* kwarg provides a simple way to keep a vertical colorbar, for example, from being taller than the axes of the mappable to which the colorbar is attached; but it is a manual method requiring some trial and error. If the colorbar is too tall (or a horizontal colorbar is too wide) use a smaller value of *shrink*.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewer (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers not matplotlib. As a workaround the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances. Particularly with semi transparent images (`alpha < 1`) and colorbar extensions and is not enabled by default see (issue #1188).

**returns:** *Colorbar* instance; see also its base class, *ColorbarBase*. Call the *set\_label()* method to label the colorbar.

The *transData* of the *cax* is adjusted so that the limits in the longest axis actually corresponds to the limits in colorbar range. On the other hand, the shortest axis has a data limits of [1,2], whose unconventional value is to prevent underflow when log scale is used.

```
mpl_toolkits.axes_grid1.colorbar.make_axes(parent, *, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Resize and reposition a parent axes, and return a child axes suitable for a colorbar

```
cax, kw = make_axes(parent, **kw)
```

Keyword arguments may include the following (with defaults):

**orientation** 'vertical' or 'horizontal'

Property	Description
<i>orientation</i>	vertical or horizontal
<i>fraction</i>	0.15; fraction of original axes to use for colorbar
<i>pad</i>	0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes
<i>shrink</i>	1.0; fraction by which to shrink the colorbar
<i>aspect</i>	20; ratio of long to short dimensions

All but the first of these are stripped from the input kw set.

Returns (cax, kw), the child axes and the reduced kw dictionary.

**mpl\_toolkits.axes\_grid1.inset\_locator**

A collection of functions and objects for creating or placing inset axes.

## Classes

<i>AnchoredLocatorBase</i> (bbox_to_anchor, ...[, ...])	<b>Parameters</b>
<i>AnchoredSizeLocator</i> (bbox_to_anchor, x_size, ...)	<b>Parameters</b>
<i>AnchoredZoomLocator</i> (parent_axes, zoom, loc)	<b>Parameters</b>
<i>BboxConnector</i> (bbox1, bbox2, loc1[, loc2])	Connect two bboxes with a straight line.
<i>BboxConnectorPatch</i> (bbox1, bbox2, loc1a, ...)	Connect two bboxes with a quadrilateral.
<i>BboxPatch</i> (bbox, **kwargs)	Patch showing the shape bounded by a Bbox.
<i>InsetPosition</i> (parent, lbwh)	An object for positioning an inset axes.

**mpl\_toolkits.axes\_grid1.inset\_locator.AnchoredLocatorBase**

```
class mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase(bbox_to_anchor,
                                                                offsetbox,      loc,
                                                                borderpad=0.5,
                                                                bbox_transform=None)
```

Bases: *matplotlib.offsetbox.AnchoredOffsetbox*

**Parameters**

**loc** [str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

**pad** [float, default: 0.4] Padding around the child as fraction of the font-size.

**borderpad** [float, default: 0.5] Padding between the offsetbox frame and the *bbox\_to\_anchor*.

**child** [*OffsetBox*] The box that will be anchored.

**prop** [*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

**frameon** [bool] Whether to draw a frame around the box.

**bbox\_to\_anchor** [*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox\_transform** [None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox\_to\_anchor*).

**\*\*kwargs** All other parameters are passed on to *OffsetBox*.

**Notes**

See *Legend* for a detailed description of the anchoring mechanism.

`__call__(self, ax, renderer)`  
Call self as a function.

`__init__(self, bbox_to_anchor, offsetbox, loc, borderpad=0.5,
 bbox_transform=None)`

### Parameters

**loc** [str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of [Legend](#) for details.

**pad** [float, default: 0.4] Padding around the child as fraction of the fontsize.

**borderpad** [float, default: 0.5] Padding between the offsetbox frame and the *bbox\_to\_anchor*.

**child** [[OffsetBox](#)] The box that will be anchored.

**prop** [[FontProperties](#)] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

**frameon** [bool] Whether to draw a frame around the box.

**bbox\_to\_anchor** [[BboxBase](#), 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox\_transform** [None or [matplotlib.transforms.Transform](#)] The transform for the bounding box (*bbox\_to\_anchor*).

**\*\*kwargs** All other parameters are passed on to [OffsetBox](#).

### Notes

See [Legend](#) for a detailed description of the anchoring mechanism.

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'
```

```
draw(self, renderer)
```

Update the location of children if necessary and draw them to the given *renderer*.

Examples using `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`

**mpl\_toolkits.axes\_grid1.inset\_locator.AnchoredSizeLocator**

```
class mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator(bbox_to_anchor,
                                                                x_size, y_size, loc,
                                                                borderpad=0.5,
                                                                bbox_transform=None)
```

Bases: `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`

**Parameters**

**loc** [str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of [Legend](#) for details.

**pad** [float, default: 0.4] Padding around the child as fraction of the font-size.

**borderpad** [float, default: 0.5] Padding between the offsetbox frame and the *bbox\_to\_anchor*.

**child** [[OffsetBox](#)] The box that will be anchored.

**prop** [[FontProperties](#)] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

**frameon** [bool] Whether to draw a frame around the box.

**bbox\_to\_anchor** [[BboxBase](#), 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox\_transform** [None or `matplotlib.transforms.Transform`] The transform for the bounding box (*bbox\_to\_anchor*).

**\*\*kwargs** All other parameters are passed on to [OffsetBox](#).

**Notes**

See [Legend](#) for a detailed description of the anchoring mechanism.

```
__init__(self, bbox_to_anchor, x_size, y_size, loc, borderpad=0.5,
          bbox_transform=None)
```

**Parameters**

**loc** [str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of [Legend](#) for details.

**pad** [float, default: 0.4] Padding around the child as fraction of the fontsize.

**borderpad** [float, default: 0.5] Padding between the offsetbox frame and the *bbox\_to\_anchor*.

**child** [[OffsetBox](#)] The box that will be anchored.

**prop** [[FontProperties](#)] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

**frameon** [bool] Whether to draw a frame around the box.

**bbox\_to\_anchor** [[BboxBase](#), 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox\_transform** [None or [matplotlib.transforms.Transform](#)] The transform for the bounding box (*bbox\_to\_anchor*).

**\*\*kwargs** All other parameters are passed on to [OffsetBox](#).

## Notes

See [Legend](#) for a detailed description of the anchoring mechanism.

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'
```

```
get_extent(self, renderer)
```

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

Examples using `mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator`

`mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator`

```
class mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator(parent_axes, zoom,
                                                                loc, borderpad=0.5,
                                                                bbox_to_anchor=None,
                                                                bbox_transform=None)
```

Bases: `mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase`

## Parameters

**loc** [str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of [Legend](#) for details.

**pad** [float, default: 0.4] Padding around the child as fraction of the font-size.

**borderpad** [float, default: 0.5] Padding between the offsetbox frame and the *bbox\_to\_anchor*.

**child** [[OffsetBox](#)] The box that will be anchored.

**prop** [[FontProperties](#)] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

**frameon** [bool] Whether to draw a frame around the box.

**bbox\_to\_anchor** [[BboxBase](#), 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox\_transform** [None or [matplotlib.transforms.Transform](#)] The transform for the bounding box (*bbox\_to\_anchor*).

**\*\*kwargs** All other parameters are passed on to [OffsetBox](#).

## Notes

See [Legend](#) for a detailed description of the anchoring mechanism.

```
__init__(self, parent_axes, zoom, loc, borderpad=0.5, bbox_to_anchor=None,
         bbox_transform=None)
```

## Parameters

**loc** [str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'

- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

**pad** [float, default: 0.4] Padding around the child as fraction of the fontsize.

**borderpad** [float, default: 0.5] Padding between the offsetbox frame and the *bbox\_to\_anchor*.

**child** [*OffsetBox*] The box that will be anchored.

**prop** [*FontProperties*] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

**frameon** [bool] Whether to draw a frame around the box.

**bbox\_to\_anchor** [*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox\_transform** [None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox\_to\_anchor*).

**\*\*kwargs** All other parameters are passed on to *OffsetBox*.

## Notes

See *Legend* for a detailed description of the anchoring mechanism.

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'
```

```
get_extent(self, renderer)
```

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

Examples using `mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator`

`mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

```
class mpl_toolkits.axes_grid1.inset_locator.BboxConnector(bbox1,    bbox2,    loc1,
                                                         loc2=None, **kwargs)
```

Bases: *matplotlib.patches.Patch*

Connect two bboxes with a straight line.

## Parameters

**bbox1, bbox2** [*matplotlib.transforms.Bbox*] Bounding boxes to connect.

**loc1** [{1, 2, 3, 4}] Corner of *bbox1* to draw the line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**loc2** [{1, 2, 3, 4}, optional] Corner of *bbox2* to draw the line. If None, defaults to *loc1*. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**\*\*kwargs** Patch properties for the line drawn. Valid arguments include:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, bbox1, bbox2, loc1, loc2=None, **kwargs)
```

Connect two bboxes with a straight line.

### Parameters

**bbox1, bbox2** [*matplotlib.transforms.Bbox*] Bounding boxes to connect.

**loc1** [{1, 2, 3, 4}] Corner of *bbox1* to draw the line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**loc2** [{1, 2, 3, 4}, optional] Corner of *bbox2* to draw the line. If None, defaults to *loc1*. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**\*\*kwargs** Patch properties for the line drawn. Valid arguments include:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None

<i>zorder</i>	float

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'
```

```
static connect_bbox(bbox1, bbox2, loc1, loc2=None)
```

Helper function to obtain a Path from one bbox to another.

**Parameters**

**bbox1, bbox2** [*matplotlib.transforms.Bbox*] Bounding boxes to connect.

**loc1** [{1, 2, 3, 4}] Corner of *bbox1* to use. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**loc2** [{1, 2, 3, 4}, optional] Corner of *bbox2* to use. If None, defaults to *loc1*. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**Returns**

**path** [*matplotlib.path.Path*] A line segment from the *loc1* corner of *bbox1* to the *loc2* corner of *bbox2*.

`static get_bbox_edge_pos(bbox, loc)`

Helper function to obtain the location of a corner of a bbox

**Parameters**

**bbox** [*matplotlib.transforms.Bbox*]

**loc** [{1, 2, 3, 4}] Corner of *bbox*. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**Returns**

**x, y** [float] Coordinates of the corner specified by *loc*.

`get_path(self)`

Return the path of this patch.

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

- `sphinx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py`

`mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch`

```
class mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch(bbox1, bbox2, loc1a,
                                                                loc2a, loc1b, loc2b,
                                                                **kwargs)
```

Bases: `mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in *bbox1* and the line between the two corners specified in *bbox2*.

### Parameters

**bbox1, bbox2** [*matplotlib.transforms.Bbox*] Bounding boxes to connect.

**loc1a, loc2a** [{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the first line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**loc1b, loc2b** [{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the second line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**\*\*kwargs** Patch properties for the line drawn:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None

<i>visible</i>	bool
<i>zorder</i>	float

**\_\_init\_\_**(*self*, *bbox1*, *bbox2*, *loc1a*, *loc2a*, *loc1b*, *loc2b*, **\*\*kwargs**)  
 Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in *bbox1* and the line between the two corners specified in *bbox2*.

### Parameters

**bbox1**, **bbox2** [*matplotlib.transforms.Bbox*] Bounding boxes to connect.

**loc1a**, **loc2a** [{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the first line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**loc1b**, **loc2b** [{1, 2, 3, 4}] Corners of *bbox1* and *bbox2* to draw the second line. Valid values are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4
```

**\*\*kwargs** Patch properties for the line drawn:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'
```

```
get_path(self)
```

Return the path of this patch.

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxPatch`

- `sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py`

`mpl_toolkits.axes_grid1.inset_locator.InsetPosition`

```
class mpl_toolkits.axes_grid1.inset_locator.InsetPosition(parent, lbwh)
```

Bases: `object`

An object for positioning an inset axes.

This is created by specifying the normalized coordinates in the axes, instead of the figure.

#### Parameters

**parent** [`matplotlib.axes.Axes`] Axes to use for normalizing coordinates.

**lbwh** [iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the *parent* axes.

#### See also:

`matplotlib.axes.Axes.set_axes_locator()`

#### Examples

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ([0, 0, 1, 1]) ensures that the axes completely fills the bounding box:

```
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

`__call__(self, ax, renderer)`  
 Call self as a function.

`__dict__` = mappingproxy({'\_\_module\_\_': 'mpl\_toolkits.axes\_grid1.inset\_locator', '\_\_init\_\_': <funct

`__init__(self, parent, lbwh)`

An object for positioning an inset axes.

This is created by specifying the normalized coordinates in the axes, instead of the figure.

### Parameters

**parent** [*matplotlib.axes.Axes*] Axes to use for normalizing coordinates.

**lbwh** [iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the *parent* axes.

### See also:

*matplotlib.axes.Axes.set\_axes\_locator()*

### Examples

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ([0, 0, 1, 1]) ensures that the axes completely fills the bounding box:

```
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

`__module__` = 'mpl\_toolkits.axes\_grid1.inset\_locator'

`__weakref__`

list of weak references to the object (if defined)

### Examples using `mpl_toolkits.axes_grid1.inset_locator.InsetPosition`

### Functions

<i>inset_axes</i> (parent_axes, width, height[, ...])	Create an inset axes with a given width and height.
<i>mark_inset</i> (parent_axes, inset_axes, loc1, ...)	Draw a box to mark the location of an area represented by an inset axes.
<i>zoomed_inset_axes</i> (parent_axes, zoom[, loc, ...])	Create an anchored inset axes by scaling a parent axes.

`mpl_toolkits.axes_grid1.inset_locator.inset_axes`

```
mpl_toolkits.axes_grid1.inset_locator.inset_axes(parent_axes,          width,
                                                  height,      loc='upper    right',
                                                  bbox_to_anchor=None,
                                                  bbox_transform=None,
                                                  axes_class=None,
                                                  axes_kwargs=None,      border-
                                                  pad=0.5)
```

Create an inset axes with a given width and height.

Both sizes used can be specified either in inches or percentage. For example,:

```
inset_axes(parent_axes, width='40%', height='30%', loc=3)
```

creates an inset axes in the lower left corner of *parent\_axes* which spans over 30% in height and 40% in width of the *parent\_axes*. Since the usage of *inset\_axes* may become slightly tricky when exceeding such standard cases, it is recommended to read the examples.

### Parameters

**parent\_axes** [*matplotlib.axes.Axes*] Axes to place the inset axes.

**width, height** [float or str] Size of the inset axes to create. If a float is provided, it is the size in inches, e.g. *width=1.3*. If a string is provided, it is the size in relative units, e.g. *width='40%'*. By default, i.e. if neither *bbox\_to\_anchor* nor *bbox\_transform* are specified, those are relative to the *parent\_axes*. Otherwise they are to be understood relative to the bounding box provided via *bbox\_to\_anchor*.

**loc** [int or str, default: 1] Location to place the inset axes. The valid locations are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**bbox\_to\_anchor** [tuple or *matplotlib.transforms.BboxBase*, optional] Bbox that the inset axes will be anchored to. If None, a tuple of (0, 0, 1, 1) is used if *bbox\_transform* is set to *parent\_axes.transAxes* or *parent\_axes.figure.transFigure*. Otherwise, *parent\_axes.bbox* is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs *width* and/or *height* are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that, unless *bbox\_transform* is set, the units of the bounding box are interpreted in the pixel coordinate. When using *bbox\_to\_anchor* with tuple, it almost always makes sense to also specify a *bbox\_transform*. This might often be the axes transform *parent\_axes.transAxes*.

**bbox\_transform** [*matplotlib.transforms.Transform*, optional] Transformation for the bbox that contains the inset axes. If None, a *transforms.IdentityTransform* is used. The value of *bbox\_to\_anchor* (or the return value of its *get\_points* method) is transformed by the *bbox\_transform* and then interpreted as points in the pixel coordinate (which is dpi dependent). You may provide *bbox\_to\_anchor* in some normalized coordinate, and give an appropriate transform (e.g., *parent\_axes.transAxes*).

**axes\_class** [*matplotlib.axes.Axes* type, optional] If specified, the inset axes created will be created with this class's constructor.

**axes\_kwargs** [dict, optional] Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[Axes, Renderer], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>prop_cycle</i>	unknown
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xbound</i>	unknown

Contin

Table 18 – continued from previous page

Property	Description
<i>xlabel</i>	str
<i>xlim</i>	(bottom: float, top: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>xticklabels</i>	unknown
<i>xticks</i>	unknown
<i>ybound</i>	unknown
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	unknown
<i>yticks</i>	unknown
<i>zorder</i>	float

**borderpad** [float, default: 0.5] Padding between inset axes and the `bbox_to_anchor`. The units are axes font size, i.e. for a default font size of 10 points `borderpad = 0.5` is equivalent to a padding of 5 points.

### Returns

**inset\_axes** [*axes\_class*] Inset axes object created.

### Notes

The meaning of `bbox_to_anchor` and `bbox_to_transform` is interpreted differently from that of `legend`. The value of `bbox_to_anchor` (or the return value of its `get_points` method; the default is `parent_axes.bbox`) is transformed by the `bbox_transform` (the default is Identity transform) and then interpreted as points in the pixel coordinate (which is dpi dependent).

Thus, following three calls are identical and creates an inset axes with respect to the `parent_axes`:

```
axins = inset_axes(parent_axes, "30%", "40%")
axins = inset_axes(parent_axes, "30%", "40%",
                    bbox_to_anchor=parent_axes.bbox)
axins = inset_axes(parent_axes, "30%", "40%",
                    bbox_to_anchor=(0, 0, 1, 1),
                    bbox_transform=parent_axes.transAxes)
```

### Examples using `mpl_toolkits.axes_grid1.inset_locator.inset_axes`

- [Overview of `axes\_grid1` toolkit](#)

**mpl\_toolkits.axes\_grid1.inset\_locator.mark\_inset**

```
mpl_toolkits.axes_grid1.inset_locator.mark_inset(parent_axes, inset_axes, loc1, loc2,
                                                  **kwargs)
```

Draw a box to mark the location of an area represented by an inset axes.

This function draws a box in *parent\_axes* at the bounding box of *inset\_axes*, and shows a connection with the inset axes by drawing lines at the corners, giving a "zoomed in" effect.

**Parameters**

**parent\_axes** [*matplotlib.axes.Axes*] Axes which contains the area of the inset axes.

**inset\_axes** [*matplotlib.axes.Axes*] The inset axes.

**loc1, loc2** [{1, 2, 3, 4}] Corners to use for connecting the inset axes and the area in the parent axes.

**\*\*kwargs** Patch properties for the lines and box drawn:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

**Returns**

**pp** [*matplotlib.patches.Patch*] The patch drawn to represent the area of the inset axes.

**p1, p2** [*matplotlib.patches.Patch*] The patches connecting two corners of the inset axes and its area.

Examples using `mpl_toolkits.axes_grid1.inset_locator.mark_inset`

- sphx\_glr\_gallery\_axes\_grid1\_inset\_locator\_demo2.py

`mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

```
mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes(parent_axes,          zoom,
                                                         loc='upper      right',
                                                         bbox_to_anchor=None,
                                                         bbox_transform=None,
                                                         axes_class=None,
                                                         axes_kwargs=None,      borderpad=0.5)
```

Create an anchored inset axes by scaling a parent axes. For usage, also see the examples.

### Parameters

**parent\_axes** [*matplotlib.axes.Axes*] Axes to place the inset axes.

**zoom** [float] Scaling factor of the data axes. *zoom* > 1 will enlarge the coordinates (i.e., "zoomed in"), while *zoom* < 1 will shrink the coordinates (i.e., "zoomed out").

**loc** [int or str, default: 'upper right'] Location to place the inset axes. The valid locations are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**bbox\_to\_anchor** [tuple or *matplotlib.transforms.BboxBase*, optional] Bbox that the inset axes will be anchored to. If *None*, *parent\_axes.bbox* is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs *width* and/or *height* are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that the units of the bounding box are determined through the transform in use. When using *bbox\_to\_anchor* it almost always makes sense to also specify a *bbox\_transform*. This might often be the axes transform *parent\_axes.transAxes*.

**bbox\_transform** [*matplotlib.transforms.Transform*, optional] Transformation for the bbox that contains the inset axes. If *None*, a *transforms.IdentityTransform* is used (i.e. pixel coordinates). This is useful

when not providing any argument to `bbox_to_anchor`. When using `bbox_to_anchor` it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`. Inversely, when specifying the axes- or figure-transform here, be aware that not specifying `bbox_to_anchor` will use `parent_axes.bbox`, the units of which are in display (pixel) coordinates.

**axes\_class** [`matplotlib.axes.Axes` type, optional] If specified, the inset axes created will be created with this class's constructor.

**axes\_kwargs** [dict, optional] Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a
<code>alpha</code>	float or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool
<code>aspect</code>	{'auto'} or num
<code>autoscale_on</code>	bool
<code>autoscalex_on</code>	bool
<code>autoscaley_on</code>	bool
<code>axes_locator</code>	Callable[[Axes, Renderer], Bbox]
<code>axisbelow</code>	bool or 'line'
<code>box_aspect</code>	None, or a number
<code>clip_box</code>	<i>Bbox</i>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>contains</code>	unknown
<code>facecolor</code> or <code>fc</code>	color
<code>figure</code>	<i>Figure</i>
<code>frame_on</code>	bool
<code>gid</code>	str
<code>in_layout</code>	bool
<code>label</code>	object
<code>navigate</code>	bool
<code>navigate_mode</code>	unknown
<code>path_effects</code>	<i>AbstractPathEffect</i>
<code>picker</code>	None or bool or callable
<code>position</code>	[left, bottom, width, height] or <i>Bbox</i>
<code>prop_cycle</code>	unknown
<code>rasterization_zorder</code>	float or None
<code>rasterized</code>	bool or None
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>title</code>	str
<code>transform</code>	<i>Transform</i>
<code>url</code>	str
<code>visible</code>	bool
<code>xbound</code>	unknown
<code>xlabel</code>	str

Contin

Table 20 – continued from previous page

Property	Description
<i>xlim</i>	(bottom: float, top: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>xticklabels</i>	unknown
<i>xticks</i>	unknown
<i>ybound</i>	unknown
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	unknown
<i>yticks</i>	unknown
<i>zorder</i>	float

**borderpad** [float, default: 0.5] Padding between inset axes and the `bbox_to_anchor`. The units are axes font size, i.e. for a default font size of 10 points `borderpad = 0.5` is equivalent to a padding of 5 points.

### Returns

**inset\_axes** [*axes\_class*] Inset axes object created.

Examples using `mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

- `sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py`
- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`

`mpl_toolkits.axes_grid1.mpl_axes`

### Classes

<code>Axes</code> ( <i>fig</i> , <i>rect</i> [, <i>facecolor</i> , <i>frameon</i> , ...])	Build an axes in a figure.
<code>SimpleAxisArtist</code> ( <i>axis</i> , <i>axisnum</i> , <i>spine</i> )	
<code>SimpleChainedObjects</code> ( <i>objects</i> )	

`mpl_toolkits.axes_grid1.mpl_axes.Axes`

```
class mpl_toolkits.axes_grid1.mpl_axes.Axes(fig, rect, facecolor=None, frameon=True,
                                             sharex=None, sharey=None, label=",
                                             xscale=None, yscale=None,
                                             box_aspect=None, **kwargs)
```

Bases: `matplotlib.axes._axes.Axes`

Build an axes in a figure.

### Parameters

**fig** [*Figure*] The axes is build in the *Figure* *fig*.

**rect** [[left, bottom, width, height]] The axes is build in the rectangle *rect*.

*rect* is in *Figure* coordinates.

**sharex, sharey** [*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

**frameon** [bool, default: True] Whether the axes frame is visible.

**box\_aspect** [None, or a number, optional] Sets the aspect of the axes box. See *set\_box\_aspect* for details.

**\*\*kwargs** Other optional keyword arguments:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[ <i>Axes</i> , <i>Renderer</i> ], <i>Bbox</i> ]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>prop_cycle</i>	unknown
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xbound</i>	unknown
<i>xlabel</i>	str
<i>xlim</i>	(bottom: float, top: float)
<i>xmargin</i>	float greater than -0.5

## Returns

*Axes* The new *Axes* object.

```
class AxisDict() -> new empty dictionary dict(mapping) -> new dictionary initial-
    ized from a mapping object's (key, value) pairs dict(iterable) -> new
    dictionary initialized as if via: d = {} for k, v in iterable: d[k] = v
    dict(**kwargs) -> new dictionary initialized with the name=value
    pairs in the keyword argument list. For example: dict(one=1,
    two=2)
```

Bases: `dict`

```
__call__(self, *v, **kwargs)
```

Call self as a function.

```
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.mpl_axes', '__init__': <funct
```

```
__getitem__(self, k)
```

`x.__getitem__(y) <==> x[y]`

```
__init__(self, axes)
```

Initialize self. See `help(type(self))` for accurate signature.

```
__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'
```

```
__weakref__
```

list of weak references to the object (if defined)

```
__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'
```

property `axis`

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

## Parameters

**xmin, xmax, ymin, ymax** [float, optional] The axis limits to be set.  
This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

**option** [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as True.
'off'	Turn off axis lines and labels. Same as False.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code> . Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code> . Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing <code>xmax-xmin == ymax-ymin</code> .

**emit** [bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

### Returns

**xmin, xmax, ymin, ymax** [float] The axis limits.

### See also:

`matplotlib.axes.Axes.set_xlim`

`matplotlib.axes.Axes.set_ylim`

`cla(self)`

Clear the current axes.

**mpl\_toolkits.axes\_grid1.mpl\_axes.SimpleAxisArtist**

```
class mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist(axis, axisnum, spine)
```

```
    Bases: matplotlib.artist.Artist
```

```
    __init__(self, axis, axisnum, spine)
```

```
        Initialize self. See help(type(self)) for accurate signature.
```

```
    __module__ = 'mpl_toolkits.axes_grid1.mpl_axes'
```

```
    property label
```

```
    property major_ticklabels
```

```
    property major_ticks
```

```
    set_label(self, txt)
```

```
        Set a label that will be displayed in the legend.
```

**Parameters**

**s** [object] s will be converted to a string by calling `str`.

```
    set_visible(self, b)
```

```
        Set the artist's visibility.
```

**Parameters**

**b** [bool]

```
    toggle(self, all=None, ticks=None, ticklabels=None, label=None)
```

**Examples using `mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist`****mpl\_toolkits.axes\_grid1.mpl\_axes.SimpleChainedObjects**

```
class mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects(objects)
```

```
    Bases: object
```

```

    get_tightbbox(self, renderer, call_axes_locator=True, bbox_extra_artists=None)
    pick(self, mouseevent)
    twin(self, aux_trans=None, axes_class=None)
        Create a twin of Axes with no shared axis.

        While self will have ticks on the left and bottom axis, the returned axes will have
        ticks on the top and right axis.
    twinx(self, axes_class=None)
        Create a twin of Axes with a shared x-axis but independent y-axis.

        The y-axis of self will have ticks on the left and the returned axes will have ticks on
        the right.
```

```
twiny(self, axes_class=None)
```

Create a twin of Axes with a shared y-axis but independent x-axis.

The x-axis of self will have ticks on the bottom and the returned axes will have ticks on the top.

## Functions

<code>host_axes(*args[, axes_class, figure])</code>	Create axes that can act as a hosts to parasitic axes.
<code>host_subplot(*args[, axes_class, figure])</code>	Create a subplot that can act as a host to parasitic axes.
<code>host_subplot_class_factory(axes_class)</code>	

`mpl_toolkits.axes_grid1.parasite_axes.host_axes`

```
mpl_toolkits.axes_grid1.parasite_axes.host_axes(*args, axes_class=<class
'mpl_toolkits.axes_grid1.mpl_axes.Axes'>,
figure=None, **kwargs)
    Create axes that can act as a hosts to parasitic axes.
```

### Parameters

**figure** [`matplotlib.figure.Figure`] Figure to which the axes will be added.

Defaults to the current figure `pyplot.gcf()`.

**\*args, \*\*kwargs** Will be passed on to the underlying Axes object creation.

Examples using `mpl_toolkits.axes_grid1.parasite_axes.host_axes`

`mpl_toolkits.axes_grid1.parasite_axes.host_subplot`

```
mpl_toolkits.axes_grid1.parasite_axes.host_subplot(*args, axes_class=<class
'mpl_toolkits.axes_grid1.mpl_axes.Axes'>,
figure=None, **kwargs)
```

Create a subplot that can act as a host to parasitic axes.

#### Parameters

**figure** [`matplotlib.figure.Figure`] Figure to which the subplot will be added. Defaults to the current figure `pyplot.gcf()`.

**\*args, \*\*kwargs** Will be passed on to the underlying Axes object creation.

Examples using `mpl_toolkits.axes_grid1.parasite_axes.host_subplot`

`mpl_toolkits.axes_grid1.parasite_axes.host_subplot_class_factory`

```
mpl_toolkits.axes_grid1.parasite_axes.host_subplot_class_factory(axes_class)
```

Examples using `mpl_toolkits.axes_grid1.parasite_axes.host_subplot_class_factory`

### 19.1.3 Matplotlib axisartist Toolkit

The *axisartist* namespace includes a derived Axes implementation (`mpl_toolkits.axisartist.Axes`). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the [axisartist](#) user guide.

The submodules of the axisartist API are:

<code>axisartist.angle_helper</code>	
<code>axisartist.axes_divider</code>	
<code>axisartist.axes_grid</code>	
<code>axisartist.axes_rgb</code>	
<code>axisartist.axis_artist</code>	axis_artist.py module provides axis-related artists.
<code>axisartist.axisline_style</code>	
<code>axisartist.axislines</code>	Axislines includes modified implementation of the Axes class.
<code>axisartist.clip_path</code>	
<code>axisartist.floating_axes</code>	An experimental support for curvilinear grid.
<code>axisartist.grid_finder</code>	
<code>axisartist.grid_helper_curvilinear</code>	An experimental support for curvilinear grid.
<code>axisartist.parasite_axes</code>	

## `mpl_toolkits.axisartist.angle_helper`

### Classes

<code>ExtremeFinderCycle(nx, ny[, lon_cycle, ...])</code>	This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.
<code>FormatterDMS</code>	
<code>FormatterHMS</code>	
<code>LocatorBase(nbins[, include_last])</code>	
<code>LocatorD(nbins[, include_last])</code>	
<code>LocatorDM(nbins[, include_last])</code>	
<code>LocatorDMS(nbins[, include_last])</code>	
<code>LocatorH(nbins[, include_last])</code>	
<code>LocatorHM(nbins[, include_last])</code>	
<code>LocatorHMS(nbins[, include_last])</code>	

## `mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle`

```
class mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle(nx, ny,
                                                              lon_cycle=360.0,
                                                              lat_cycle=None,
                                                              lon_minmax=None,
                                                              lat_minmax=(-90, 90))
```

Bases: `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

### Parameters

**nx, ny** [int] The number of samples in each direction.

**lon\_cycle, lat\_cycle** [360 or None] If not None, values in the corresponding direction are taken modulo *lon\_cycle* or *lat\_cycle*; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results.

This is done by “unwrapping” the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].

**lon\_minmax, lat\_minmax** [(float, float) or None] If not None, the computed bounding box is clipped to the given range in the corresponding direction.

**\_\_call\_\_**(self, transform\_xy, x1, y1, x2, y2)

Compute an approximation of the bounding box obtained by applying *transform\_xy* to the box delimited by (x1, y1, x2, y2).

The intended use is to have (x1, y1, x2, y2) in axes coordinates, and have *transform\_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling  $n_x * n_y$  equispaced points in the (x1, y1, x2, y2) box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of  $1/n_x$  or  $1/n_y$ , the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

**\_\_init\_\_**(self, nx, ny, lon\_cycle=360.0, lat\_cycle=None, lon\_minmax=None, lat\_minmax=(-90, 90))

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

### Parameters

**nx, ny** [int] The number of samples in each direction.

**lon\_cycle, lat\_cycle** [360 or None] If not None, values in the corresponding direction are taken modulo *lon\_cycle* or *lat\_cycle*; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results.

This is done by “unwrapping” the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].

**lon\_minmax, lat\_minmax** [(float, float) or None] If not None, the computed bounding box is clipped to the given range in the corresponding direction.

```
class mpl_toolkits.axisartist.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None,
                                             direction='row', axes_pad=0.02,
                                             add_all=<deprecated parameter>,
                                             share_all=False, share_x=True,
                                             share_y=True, label_mode='L',
                                             axes_class=None, *, aspect=False)
    Bases: mpl_toolkits.axes_grid1.axes_grid.Grid
```

**Parameters**

**fig** [*Figure*] The parent figure.

**rect** [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

**nrows\_ncols** [(int, int)] Number of rows and columns in the grid.

**ngrids** [int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

**direction** [{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column").

**axes\_pad** [float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add\_all** [bool, default: True] Whether to add the axes to the figure using *Figure.add\_axes*. This parameter is deprecated.

**share\_all** [bool, default: False] Whether all axes share their x- and y-axis. Overrides *share\_x* and *share\_y*.

**share\_x** [bool, default: True] Whether all axes of a column share their x-axis.

**share\_y** [bool, default: True] Whether all axes of a row share their y-axis.

**label\_mode** [{"L", "1", "all"}], default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**axes\_class** [subclass of *matplotlib.axes.Axes*, default: None]

**aspect** [bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

```
__module__ = 'mpl_toolkits.axisartist.axes_grid'
```

Examples using *mpl\_toolkits.axisartist.axes\_grid.Grid*

*mpl\_toolkits.axisartist.axes\_grid.ImageGrid*

```
class mpl_toolkits.axisartist.axes_grid.ImageGrid(fig,          rect,          nrows_ncols,
                                                    ngrids=None,          direc-
                                                    tion='row',          axes_pad=0.02,
                                                    add_all=<deprecated parameter>,
                                                    share_all=False, aspect=True, la-
                                                    bel_mode='L',  cbar_mode=None,
                                                    cbar_location='right',
                                                    cbar_pad=None,  cbar_size='5%',
                                                    cbar_set_cax=True,
                                                    axes_class=None)
```

Bases: *mpl\_toolkits.axes\_grid1.axes\_grid.ImageGrid*

### Parameters

**fig** [*Figure*] The parent figure.

**rect** [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

**nrows\_ncols** [(int, int)] Number of rows and columns in the grid.

**ngrids** [int or None, default: None] If not None, only the first *ngrids* axes in the grid are created.

**direction** [{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (`grid[index]`).

**axes\_pad** [float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add\_all** [bool, default: True] Whether to add the axes to the figure using *Figure.add\_axes*. This parameter is deprecated.

**share\_all** [bool, default: False] Whether all axes share their x- and y-axis.

**aspect** [bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

**label\_mode** [{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**cbar\_mode** [{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by *cbar\_location*, or no colorbars. The colorbars are stored in the *cbar\_axes* attribute.

**cbar\_location** [{"left", "right", "bottom", "top"}, default: "right"]

**cbar\_pad** [float, default: None] Padding between the image axes and the colorbar axes.

**cbar\_size** [size specification (see *Size.from\_any*), default: "5%"] Colorbar size.

**cbar\_set\_cax** [bool, default: True] If True, each axes in the grid has a *cax* attribute that is bound to associated *cbar\_axes*.

**axes\_class** [subclass of *matplotlib.axes.Axes*, default: None]

`__module__ = 'mpl_toolkits.axisartist.axes_grid'`

Examples using `mpl_toolkits.axisartist.axes_grid.ImageGrid`

`mpl_toolkits.axisartist.axes_rgb`

Classes

---

*RGBAxes*(\*args[, pad, add\_all])

### Parameters

---

**mpl\_toolkits.axisartist.axes\_rgb.RGBAxes**

```
class mpl_toolkits.axisartist.axes_rgb.RGBAxes(*args, pad=0, add_all=<deprecated
parameter>, **kwargs)
```

Bases: `mpl_toolkits.axes_grid1.axes_rgb.RGBAxes`

**Parameters**

**pad** [float, default: 0] fraction of the axes height to put as padding.

**add\_all** [bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

**axes\_class** [matplotlib.axes.Axes]

**\*args** Unpacked into axes\_class() init for RGB

**\*\*kwargs** Unpacked into axes\_class() init for RGB, R, G, B axes

```
__module__ = 'mpl_toolkits.axisartist.axes_rgb'
```

**Examples using mpl\_toolkits.axisartist.axes\_rgb.RGBAxes****mpl\_toolkits.axisartist.axis\_artist**

axis\_artist.py module provides axis-related artists. They are

- axis line
- tick lines
- tick labels
- axis label
- grid lines

The main artist classes are *AxisArtist* and *GridlinesCollection*. While *GridlinesCollection* is responsible for drawing grid lines, *AxisArtist* is responsible for all other artists. *AxisArtist* has attributes that are associated with each type of artists:

- line: axis line
- major\_ticks: major tick lines
- major\_ticklabels: major tick labels
- minor\_ticks: minor tick lines
- minor\_ticklabels: minor tick labels
- label: axis label

Typically, the *AxisArtist* associated with an axes will be accessed with the *axis* dictionary of the axes, i.e., the *AxisArtist* for the bottom axis is

```
ax.axis["bottom"]
```

where *ax* is an instance of `mpl_toolkits.axislines.Axes`. Thus, `ax.axis["bottom"].line` is an artist associated with the axis line, and `ax.axis["bottom"].major_ticks` is an artist associated with the major tick lines.

You can change the colors, fonts, line widths, etc. of these artists by calling suitable set method. For example, to change the color of the major ticks of the bottom axis to red, use

```
ax.axis["bottom"].major_ticks.set_color("r")
```

However, things like the locations of ticks, and their ticklabels need to be changed from the side of the grid\_helper.

axis\_direction

*AxisArtist*, *AxisLabel*, *TickLabels* have an *axis\_direction* attribute, which adjusts the location, angle, etc. The *axis\_direction* must be one of "left", "right", "bottom", "top", and follows the Matplotlib convention for rectangular axis.

For example, for the *bottom* axis (the left and right is relative to the direction of the increasing coordinate),

- ticklabels and axislabel are on the right
- ticklabels and axislabel have text angle of 0
- ticklabels are baseline, center-aligned
- axislabel is top, center-aligned

The text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

Parameter	left	bottom	right	top
ticklabels location	left	right	right	left
axislabel location	left	right	right	left
ticklabels angle	90	0	-90	180
axislabel angle	180	0	0	180
ticklabel va	center	baseline	center	baseline
axislabel va	center	top	center	bottom
ticklabel ha	right	center	right	center
axislabel ha	right	center	right	center

Ticks are by default direct opposite side of the ticklabels. To make ticks to the same side of the ticklabels,

```
ax.axis["bottom"].major_ticks.set_ticks_out(True)
```

The following attributes can be customized (use the set\_xxx methods):

- *Ticks*: ticksize, tick\_out
- *TickLabels*: pad
- *AxisLabel*: pad

Classes

<i>AttributeCopier</i> (ref_artist[, klass])	[Deprecated]
--	--------------

Continued on next page

Table 30 – continued from previous page

<i>AxisArtist</i> (axes, helper[, offset, ...])	An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.
<i>AxisLabel</i> (*args[, axis_direction, axis])	Axis Label.
<i>BezierPath</i> (path, *args, **kwargs)	[ <i>Deprecated</i> ]
<i>GridlinesCollection</i> (*args[, which, axis])	
<b>Parameters</b>	
<i>LabelBase</i> (*args, **kwargs)	A base class for AxisLabel and TickLabels.
<i>TickLabels</i> (*[, axis_direction])	Tick Labels.
<i>Ticks</i> (ticksize[, tick_out, axis])	Ticks are derived from Line2D, and note that ticks themselves are markers.

**mpl\_toolkits.axisartist.axis\_artist.AttributeCopier**

```
class mpl_toolkits.axisartist.axis_artist.AttributeCopier(ref_artist,      klass=<class
                                                         'matplotlib.artist.Artist'>)
```

Bases: `object`

[*Deprecated*]

**Notes**

Deprecated since version 3.2:

```
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.axis_artist', '__init__': <function
__init__(self, ref_artist, klass=<class 'matplotlib.artist.Artist'>)>
[Deprecated]
```

**Notes**

Deprecated since version 3.2:

```
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

```
__weakref__
```

list of weak references to the object (if defined)

```
get_attribute_from_ref_artist(self, attr_name, default_value=<deprecated parameter>)
```

```
get_ref_artist(self)
```

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

```
set_ref_artist(self, artist)
```

[*Deprecated*]

**Notes**

Deprecated since version 3.2:

Examples using `mpl_toolkits.axisartist.axis_artist.AttributeCopier`

`mpl_toolkits.axisartist.axis_artist.AxisArtist`

```
class mpl_toolkits.axisartist.axis_artist.AxisArtist(axes, helper, offset=None,  
                                                    axis_direction='bottom',  
                                                    **kwargs)
```

Bases: `matplotlib.artist.Artist`

An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.

### Parameters

**axes** [`mpl_toolkits.axisartist.axislines.Axes`]

**helper** [`AxisArtistHelper`]

property LABELPAD

ZORDER = 2.5

`__init__`(*self, axes, helper, offset=None, axis\_direction='bottom', \*\*kwargs*)

### Parameters

**axes** [`mpl_toolkits.axisartist.axislines.Axes`]

**helper** [`AxisArtistHelper`]

`__module__` = 'mpl\_toolkits.axisartist.axis\_artist'

property dpi\_transform

`draw`(*self, renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`get_axisline_style`(*self*)

Return the current axisline style.

`get_helper`(*self*)

Return axis artist helper instance.

`get_tightbbox`(*self, renderer*)

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

`Bbox` The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`invert_ticklabel_direction(self)`

`set_axis_direction(self, axis_direction)`

Adjust the direction, text angle, text alignment of ticklabels, labels following the matplotlib convention for the rectangle axes.

The *axis\_direction* must be one of [left, right, bottom, top].

property	left	bottom	right	top
ticklabels location	"-"	"+"	"+"	"-"
axislabel location	"-"	"+"	"+"	"-"
ticklabels angle	90	0	-90	180
ticklabel va	center	baseline	center	baseline
ticklabel ha	right	center	right	center
axislabel angle	180	0	0	180
axislabel va	center	top	center	bottom
axislabel ha	right	center	right	center

Note that the direction "+" and "-" are relative to the direction of the increasing coordinate. Also, the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_axislabel_direction(self, label_direction)`

Adjust the direction of the axislabel.

Note that the *label\_directions* '+' and '-' are relative to the direction of the increasing coordinate.

### Parameters

**tick\_direction** [{"+", "-"}]

`set_axisline_style(self, axisline_style=None, **kwargs)`

Set the axisline style.

The new style is completely defined by the passed attributes. Existing style attributes are forgotten.

### Parameters

**axisline\_style** [str or None] The line style, e.g. '->', optionally followed by a comma-separated list of attributes. Alternatively, the attributes can be provided as keywords.

If *None* this returns a string containing the available styles.

### Examples

The following two commands are equal: `>>> set_axisline_style("->,size=1.5")`  
`>>> set_axisline_style("->", size=1.5)`

`set_label(self, s)`

Set a label that will be displayed in the legend.

### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

```
set_ticklabel_direction(self, tick_direction)
```

Adjust the direction of the ticklabel.

Note that the *label\_directions* '+' and '-' are relative to the direction of the increasing coordinate.

### Parameters

**tick\_direction** [{"+", "-"}]

```
toggle(self, all=None, ticks=None, ticklabels=None, label=None)
```

Toggle visibility of ticks, ticklabels, and (axis) label. To turn all off,

```
axis.toggle(all=False)
```

To turn all off but ticks on

```
axis.toggle(all=False, ticks=True)
```

To turn all on but (axis) label off

```
axis.toggle(all=True, label=False))
```

```
zorder = 2.5
```

Examples using `mpl_toolkits.axisartist.axis_artist.AxisArtist`

`mpl_toolkits.axisartist.axis_artist.AxisLabel`

```
class mpl_toolkits.axisartist.axis_artist.AxisLabel(*args, axis_direction='bottom',
                                                    axis=None, **kwargs)
```

Bases: `mpl_toolkits.axisartist.axis_artist.AttributeCopier`, `mpl_toolkits.axisartist.axis_artist.LabelBase`

Axis Label. Derived from Text. The position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text.

To change the pad between ticklabels and axis label, use `set_pad`.

[*Deprecated*]

### Notes

Deprecated since version 3.2:

```
__init__(self, *args, axis_direction='bottom', axis=None, **kwargs)
[Deprecated]
```

### Notes

Deprecated since version 3.2:

```
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`get_color(self)`

Return the color of the text.

`get_pad(self)`

Return the internal pad in points.

See `set_pad` for more details.

`get_ref_artist(self)`

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

`get_text(self)`

Return the text string.

`get_window_extent(self, renderer)`

Return the `Bbox` bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

### Parameters

**renderer** [Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling `get_window_extent` before the first `draw`. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

**dpi** [float, optional] The dpi value for computing the bbox, defaults to `self.figure.dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

`set_axis_direction(self, d)`

Adjust the text angle and text alignment of axis label according to the matplotlib convention.

property	left	bottom	right	top
axislabel angle	180	0	0	180
axislabel va	center	top	center	bottom
axislabel ha	right	center	right	center

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_default_alignment(self, d)`

```
set_default_angle(self, d)
```

```
set_pad(self, pad)
```

Set the internal pad in points.

The actual pad will be the sum of the internal pad and the external pad (the latter is set automatically by the `AxisArtist`).

Examples using `mpl_toolkits.axisartist.axis_artist.AxisLabel`

`mpl_toolkits.axisartist.axis_artist.BezierPath`

```
class mpl_toolkits.axisartist.axis_artist.BezierPath(path, *args, **kwargs)
```

Bases: `matplotlib.lines.Line2D`

[*Deprecated*]

### Notes

Deprecated since version 3.2:

#### Parameters

**path** [*Path*] The path to draw.

**\*\*kwargs** All remaining keyword arguments are passed to `Line2D`.

```
__init__(self, path, *args, **kwargs)
```

#### Parameters

**path** [*Path*] The path to draw.

**\*\*kwargs** All remaining keyword arguments are passed to `Line2D`.

```
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

#### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

```
recache(self)
```

```
set_path(self, path)
```

Examples using `mpl_toolkits.axisartist.axis_artist.BezierPath`

`mpl_toolkits.axisartist.axis_artist.GridlinesCollection`

```
class mpl_toolkits.axisartist.axis_artist.GridlinesCollection(*args, which='major',
                                                            axis='both', **kwargs)
```

Bases: `matplotlib.collections.LineCollection`

#### Parameters

**which** [{"major", "minor"}]

**axis** [{"both", "x", "y"}]

```
__init__(self, *args, which='major', axis='both', **kwargs)
```

#### Parameters

**which** [{"major", "minor"}]

**axis** [{"both", "x", "y"}]

```
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

#### Parameters

**renderer** [`RendererBase` subclass.]

#### Notes

This method is overridden in the Artist subclasses.

```
set_axis(self, axis)
```

```
set_grid_helper(self, grid_helper)
```

```
set_which(self, which)
```

Examples using `mpl_toolkits.axisartist.axis_artist.GridlinesCollection`

`mpl_toolkits.axisartist.axis_artist.LabelBase`

```
class mpl_toolkits.axisartist.axis_artist.LabelBase(*args, **kwargs)
```

Bases: `matplotlib.text.Text`

A base class for `AxisLabel` and `TickLabels`. The position and angle of the text are calculated by `offset_ref_angle`, `text_ref_angle`, and `offset_radius` attributes.

Create a `Text` instance at `x`, `y` with string `text`.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontfamily</i> or <i>family</i>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<i>fontproperties</i> or <i>font</i> or <i>font_properties</i>	<i>font_manager.FontProperties</i> or <i>str</i> or <i>pathlib.Path</i>
<i>fontsize</i> or <i>size</i>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large'}
<i>fontstretch</i> or <i>stretch</i>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed'}
<i>fontstyle</i> or <i>style</i>	{'normal', 'italic', 'oblique'}
<i>fontvariant</i> or <i>variant</i>	{'normal', 'small-caps'}
<i>fontweight</i> or <i>weight</i>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'bold', 'extra-bold'}
<i>gid</i>	<i>str</i>
<i>horizontalalignment</i> or <i>ha</i>	{'center', 'right', 'left'}
<i>in_layout</i>	bool
<i>label</i>	object
<i>linespacing</i>	float (multiple of font size)
<i>multialignment</i> or <i>ma</i>	{'left', 'right', 'center'}
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	(float, float)
<i>rasterized</i>	bool or None
<i>rotation</i>	float or {'vertical', 'horizontal'}
<i>rotation_mode</i>	{None, 'default', 'anchor'}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	object
<i>transform</i>	<i>Transform</i>
<i>url</i>	<i>str</i>
<i>usetex</i>	bool or None
<i>verticalalignment</i> or <i>va</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

```
__init__(self, *args, **kwargs)
```

Create a *Text* instance at *x*, *y* with string *text*.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color

<i>picker</i>	None or bool or callable
<i>position</i>	(float, float)
<i>rasterized</i>	bool or None
<i>rotation</i>	float or {'vertical', 'horizontal'}
<i>rotation_mode</i>	{None, 'default', 'anchor'}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	object
<i>transform</i>	<i>Transform</i>
<i>url</i>	<i>str</i>
<i>usetex</i>	bool or None
<i>verticalalignment</i> or <i>va</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

```
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

`get_window_extent(self, renderer)`

Return the *Bbox* bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

### Parameters

**renderer** [Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling `get_window_extent` before the first *draw*. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

**dpi** [float, optional] The dpi value for computing the bbox, defaults to `self.figure.dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

Examples using `mpl_toolkits.axisartist.axis_artist.LabelBase`

`mpl_toolkits.axisartist.axis_artist.TickLabels`

```
class mpl_toolkits.axisartist.axis_artist.TickLabels(*, axis_direction='bottom',
**kwargs)
```

Bases: `mpl_toolkits.axisartist.axis_artist.AxisLabel`

Tick Labels. While derived from Text, this single artist draws all ticklabels. As in AxisLabel, the position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text. Unlike the ticklabels of the mainline matplotlib, properties of single ticklabel alone cannot be modified.

To change the pad between ticks and ticklabels, use `set_pad`.

[*Deprecated*]

### Notes

Deprecated since version 3.2:

```
__init__(self, *, axis_direction='bottom', **kwargs)
[Deprecated]
```

### Notes

Deprecated since version 3.2:

```
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`get_ref_artist(self)`

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

`get_texts_widths_heights_descents(self, renderer)`

Return a list of (width, height, descent) tuples for ticklabels.

Empty labels are left out.

`get_window_extents(self, renderer)`

`invert_axis_direction(self)`

`set_axis_direction(self, label_direction)`

Adjust the text angle and text alignment of ticklabels according to the matplotlib convention.

The `label_direction` must be one of [left, right, bottom, top].

property	left	bottom	right	top
ticklabels angle	90	0	-90	180
ticklabel va	center	baseline	center	baseline
ticklabel ha	right	center	right	center

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

`set_locs_angles_labels(self, locs_angles_labels)`

Examples using `mpl_toolkits.axisartist.axis_artist.TickLabels`

`mpl_toolkits.axisartist.axis_artist.Ticks`

```
class mpl_toolkits.axisartist.axis_artist.Ticks(ticksizes, tick_out=False, *,
                                                axis=None, **kwargs)
```

Bases: `mpl_toolkits.axisartist.axis_artist.AttributeCopier`, `matplotlib.lines.Line2D`

Ticks are derived from Line2D, and note that ticks themselves are markers. Thus, you should use `set_mec`, `set_mew`, etc.

To change the tick size (length), you need to use `set_ticksizes`. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use `set_tick_out(False)`.

[*Deprecated*]

### Notes

Deprecated since version 3.2:

```
__init__(self, ticksize, tick_out=False, *, axis=None, **kwargs)
[Deprecated]
```

### Notes

Deprecated since version 3.2:

```
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

```
get_color(self)
```

Return the line color.

See also *set\_color*.

```
get_markedgedcolor(self)
```

Return the marker edge color.

See also *set\_markedgedcolor*.

```
get_markedgedwidth(self)
```

Return the marker edge width in points.

See also *set\_markedgedwidth*.

```
get_ref_artist(self)
```

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

```
get_tick_out(self)
```

Return whether ticks are drawn inside or outside the axes.

```
get_ticksize(self)
```

Return length of the ticks in points.

```
set_locs_angles(self, locs_angles)
```

```
set_tick_out(self, b)
```

Set whether ticks are drawn inside or outside the axes.

```
set_ticksize(self, ticksize)
```

Set length of the ticks in points.

Examples using `mpl_toolkits.axisartist.axis_artist.Ticks`

`mpl_toolkits.axisartist.axisline_style`

Classes

---

*AxislineStyle*

A container class which defines style classes for AxisArtists.

---

`mpl_toolkits.axisartist.axisline_style.AxislineStyle`

`class mpl_toolkits.axisartist.axisline_style.AxislineStyle`

Bases: `matplotlib.patches._Style`

A container class which defines style classes for AxisArtists.

An instance of any axisline style class is an callable object, whose call signature is

```
__call__(self, axis_artist, path, transform)
```

When called, this should return an *Artist* with the following methods:

```
def set_path(self, path):
    # set the path for axisline.

def set_line_mutation_scale(self, scale):
    # set the scale

def draw(self, renderer):
    # draw
```

Return the instance of the subclass with the given style name.

`class FilledArrow(size=1)`

Bases: `mpl_toolkits.axisartist.axisline_style.SimpleArrow`

#### Parameters

**size** [float] Size of the arrow as a fraction of the ticklabel size.

ArrowAxisClass

alias of `_FancyAxislineStyle.FilledArrow`

`__module__ = 'mpl_toolkits.axisartist.axisline_style'`

`class SimpleArrow(size=1)`

Bases: `mpl_toolkits.axisartist.axisline_style._Base`

A simple arrow.

#### Parameters

**size** [float] Size of the arrow as a fraction of the ticklabel size.

ArrowAxisClass

alias of `_FancyAxislineStyle.SimpleArrow`

`__init__(self, size=1)`

#### Parameters

**size** [float] Size of the arrow as a fraction of the ticklabel size.

```
__module__ = 'mpl_toolkits.axisartist.axisline_style'
new_line(self, axis_artist, transform)
__module__ = 'mpl_toolkits.axisartist.axisline_style'
```

### Examples using `mpl_toolkits.axisartist.axisline_style.AxislineStyle`

#### `mpl_toolkits.axisartist.axislines`

Axislines includes modified implementation of the Axes class. The biggest difference is that the artists responsible for drawing the axis spine, ticks, ticklabels and axis labels are separated out from Matplotlib's Axis class. Originally, this change was motivated to support curvilinear grid. Here are a few reasons that I came up with a new axes class:

- "top" and "bottom" x-axis (or "left" and "right" y-axis) can have different ticks (tick locations and labels). This is not possible with the current Matplotlib, although some twin axes trick can help.
- Curvilinear grid.
- angled ticks.

In the new axes class, xaxis and yaxis is set to not visible by default, and new set of artist (AxisArtist) are defined to draw axis line, ticks, ticklabels and axis label. Axes.axis attribute serves as a dictionary of these artists, i.e., `ax.axis["left"]` is a AxisArtist instance responsible to draw left y-axis. The default Axes.axis contains "bottom", "left", "top" and "right".

AxisArtist can be considered as a container artist and has following children artists which will draw ticks, labels, etc.

- line
- major\_ticks, major\_ticklabels
- minor\_ticks, minor\_ticklabels
- offsetText
- label

Note that these are separate artists from `matplotlib.axis.Axes`, thus most tick-related functions in Matplotlib won't work. For example, `color` and `markerwidth` of the `ax.axis["bottom"].major_ticks` will follow those of `Axes.xaxis` unless explicitly specified.

In addition to AxisArtist, the Axes will have *gridlines* attribute, which obviously draws grid lines. The gridlines needs to be separated from the axis as some gridlines can never pass any axis.

### Classes

<code>Axes(*args[, grid_helper])</code>	Build an axes in a figure.
<code>AxesZero(*args[, grid_helper])</code>	Build an axes in a figure.
<code>AxisArtistHelper</code>	AxisArtistHelper should define following method with given APIs.

Continued on next page

Table 34 – continued from previous page

<i>AxisArtistHelperRectilinear</i>
<i>GridHelperBase</i> ()
<i>GridHelperRectilinear</i> (axes)

**mpl\_toolkits.axisartist.axislines.Axes**

class mpl\_toolkits.axisartist.axislines.Axes(\*args, grid\_helper=None, \*\*kwargs)

Bases: matplotlib.axes.\_axes.Axes

Build an axes in a figure.

**Parameters**

**fig** [*Figure*] The axes is build in the *Figure* *fig*.

**rect** [[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

**sharex, sharey** [*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

**frameon** [bool, default: True] Whether the axes frame is visible.

**box\_aspect** [None, or a number, optional] Sets the aspect of the axes box. See *set\_box\_aspect* for details.

**\*\*kwargs** Other optional keyword arguments:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[Axes, Renderer], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>

## Returns

*Axes* The new *Axes* object.

`--call__(self, *args, **kwargs)`

Call self as a function.

`--init__(self, *args, grid_helper=None, **kwargs)`

Build an axes in a figure.

## Parameters

**fig** [*Figure*] The axes is build in the *Figure* *fig*.

**rect** [[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

**sharex, sharey** [*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

**frameon** [bool, default: True] Whether the axes frame is visible.

**box\_aspect** [None, or a number, optional] Sets the aspect of the axes box. See *set\_box\_aspect* for details.

**\*\*kwargs** Other optional keyword arguments:

Property	Description

Table 36 – continued from previous page

Property	Description
<i>zorder</i>	float

## Returns

*Axes* The new *Axes* object.

```
__module__ = 'mpl_toolkits.axisartist.axislines'
```

property *axis*

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

## Parameters

**xmin, xmax, ymin, ymax** [float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

**option** [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as True.
'off'	Turn off axis lines and labels. Same as False.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code> . Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code> . Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing <code>xmax-xmin == ymax-ymin</code> .

**emit** [bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

## Returns

**xmin, xmax, ymin, ymax** [float] The axis limits.

See also:

```

matplotlib.axes.Axes.set_xlim
matplotlib.axes.Axes.set_ylim

cla(self)
    Clear the current axes.

get_children(self)
    Return a list of the child Artists of this Artist.

get_grid_helper(self)

grid(self, b=None, which='major', axis='both', **kwargs)
    Toggle the gridlines, and optionally set the properties of the lines.

invalidate_grid_helper(self)

new_fixed_axis(self, loc, offset=None)

new_floating_axis(self, nth_coord, value, axis_direction='bottom')

new_gridlines(self, grid_helper=None)
    Create and return a new GridlineCollection instance.

    which : "major" or "minor" axis : "both", "x" or "y"

toggle_axisline(self, b=None)

```

Examples using `mpl_toolkits.axisartist.axislines.Axes`

`mpl_toolkits.axisartist.axislines.AxesZero`

```

class mpl_toolkits.axisartist.axislines.AxesZero(*args, grid_helper=None, **kwargs)
    Bases: mpl_toolkits.axisartist.axislines.Axes

```

Build an axes in a figure.

### Parameters

**fig** [*Figure*] The axes is build in the *Figure* *fig*.

**rect** [[left, bottom, width, height]] The axes is build in the rectangle *rect*.  
*rect* is in *Figure* coordinates.

**sharex, sharey** [*Axes*, optional] The x or y *axis* is shared with the x or y  
axis in the input *Axes*.

**frameon** [bool, default: True] Whether the axes frame is visible.

**box\_aspect** [None, or a number, optional] Sets the aspect of the axes box.  
See `set_box_aspect` for details.

**\*\*kwargs** Other optional keyword arguments:

Property	Description
<code>adjustable</code>	{'box', 'datalim'}
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	float or None
<code>anchor</code>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<code>animated</code>	bool

**Returns**

*Axes* The new *Axes* object.

```
__module__ = 'mpl_toolkits.axisartist.axislines'
```

Examples using `mpl_toolkits.axisartist.axislines.AxesZero`

`mpl_toolkits.axisartist.axislines.AxisArtistHelper`

```
class mpl_toolkits.axisartist.axislines.AxisArtistHelper
    Bases: object
```

AxisArtistHelper should define following method with given APIs. Note that the first axes argument will be axes attribute of the caller artist.:

```
# LINE (spinal line?)

def get_line(self, axes):
    # path : Path
    return path

def get_line_transform(self, axes):
    # ...
    # trans : transform
    return trans

# LABEL

def get_label_pos(self, axes):
    # x, y : position
    return (x, y), trans

def get_label_offset_transform(self,
    axes,
    pad_points, fontprops, renderer,
    bboxes,
    ):
    # va : vertical alignment
    # ha : horizontal alignment
    # a : angle
    return trans, va, ha, a

# TICK

def get_tick_transform(self, axes):
    return trans

def get_tick_iterators(self, axes):
    # iter : iterable object that yields (c, angle, l) where
    # c, angle, l is position, tick angle, and label

    return iter_major, iter_minor
```

```
class Fixed(loc, nth_coord=None)
```

```
    Bases: mpl_toolkits.axisartist.axislines._Base
```

Helper class for a fixed (in the axes coordinate) axis.

`nth_coord` = along which coordinate value varies in 2d, `nth_coord = 0` -> x axis,  
`nth_coord = 1` -> y axis

```
__init__(self, loc, nth_coord=None)
    nth_coord = along which coordinate value varies in 2d, nth_coord = 0 -> x axis,
    nth_coord = 1 -> y axis

__module__ = 'mpl_toolkits.axisartist.axislines'

get_axislabel_pos_angle(self, axes)
    Return the label reference position in transAxes.

    get_label_transform() returns a transform of (transAxes+offset)

get_axislabel_transform(self, axes)

get_line(self, axes)

get_line_transform(self, axes)

Examples using `mpl_toolkits.axisartist.clip_path.clip_line_to_rect`

`mpl_toolkits.axisartist.floating_axes`

An experimental support for curvilinear grid.

## Classes

<i>ExtremeFinderFixed</i> ( <i>extremes</i> )	This subclass always returns the same bounding box.
<i>FixedAxisArtistHelper</i> ( <i>grid_helper</i> , <i>side</i> [, <i>nth_coord</i> = along which coordinate value varies. ...])	
<i>FloatingAxes</i>	alias of <code>mpl_toolkits.axisartist.floating_axes.Floating AxesHostAxes</code>
<i>FloatingAxesBase</i> (*args, **kwargs)	
<i>FloatingAxisArtistHelper</i> ( <i>grid_helper</i> , ...[, <i>nth_coord</i> = along which coordinate value varies. ...])	
<i>GridHelperCurveLinear</i> ( <i>aux_trans</i> , <i>extremes</i> [, ...])	<i>aux_trans</i> : a transform from the source (curved) coordinate to target (rectilinear) coordinate.

`mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed`

`class mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed(extremes)`

Bases: `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

This subclass always returns the same bounding box.

### Parameters

**extremes** [(float, float, float, float)] The bounding box that this helper always returns.

`--call--(self, transform_xy, x1, y1, x2, y2)`

Compute an approximation of the bounding box obtained by applying *transform\_xy* to the box delimited by (x1, y1, x2, y2).

The intended use is to have (x1, y1, x2, y2) in axes coordinates, and have *transform\_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling  $n_x * n_y$  equispaced points in the (x1, y1, x2, y2) box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of  $1/n_x$  or  $1/n_y$ , the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

`--init--(self, extremes)`

This subclass always returns the same bounding box.

### Parameters

**extremes** [(float, float, float, float)] The bounding box that this helper always returns.

```
__module__ = 'mpl_toolkits.axisartist.floating_axes'
```

Examples using `mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed`

`mpl_toolkits.axisartist.floating_axes.FixedAxisArtistHelper`

```
class mpl_toolkits.axisartist.floating_axes.FixedAxisArtistHelper(grid_helper, side,

                                                                    grid_locator1=None,
                                                                    grid_locator2=None,
                                                                    tick_formatter1=None,
                                                                    tick_formatter2=None)
    Bases: mpl_toolkits.axisartist.grid_helper_curvelinear.GridHelperCurveLinear
    aux_trans : a transform from the source (curved) coordinate to target (rectilinear) co-
    ordinate. An instance of MPL's Transform (inverse transform should be defined) or a
    tuple of two callable objects which defines the transform and its inverse. The callables
    need take two arguments of array of source coordinates and should return two target
    coordinates.
    e.g., x2, y2 = trans(x1, y1)
    __init__(self, aux_trans, extremes, grid_locator1=None, grid_locator2=None,
              tick_formatter1=None, tick_formatter2=None)
        aux_trans : a transform from the source (curved) coordinate to target (rectilinear)
        coordinate. An instance of MPL's Transform (inverse transform should be defined)
        or a tuple of two callable objects which defines the transform and its inverse. The
        callables need take two arguments of array of source coordinates and should return
        two target coordinates.
        e.g., x2, y2 = trans(x1, y1)
    __module__ = 'mpl_toolkits.axisartist.floating_axes'
    get_boundary(self)
        Return (N, 2) array of (x, y) coordinate of the boundary.
    get_data_boundary(self, side)
        Return v=0, nth=1.
```

```

get_gridlines(self, which='major', axis='both')
    Return list of grid lines as a list of paths (list of points).

    which : "major" or "minor" axis : "both", "x" or "y"

new_fixed_axis(self, loc, nth_coord=None, axis_direction=None, offset=None,
               axes=None)

```

Examples using `mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear`

`mpl_toolkits.axisartist.grid_finder`

Classes

<code>DictFormatter(format_dict[, formatter])</code>	<code>format_dict</code> : dictionary for format strings to be used.
<code>ExtremeFinderSimple(nx, ny)</code>	A helper class to figure out the range of grid lines that need to be drawn.
<code>FixedLocator(locs)</code>	
<code>FormatterPrettyPrint([useMathText])</code>	
<code>GridFinder(transform[, extreme_finder, ...])</code>	<code>transform</code> : transform from the image coordinate (which will be the <code>transData</code> of the axes) to the world coordinate.
<code>GridFinderBase(extreme_finder[, ...])</code>	[ <i>Deprecated</i> ]
<code>MaxNLocator([nbins, steps, trim, integer, ...])</code>	
<b>Parameters</b>	

`mpl_toolkits.axisartist.grid_finder.DictFormatter`

```

class mpl_toolkits.axisartist.grid_finder.DictFormatter(format_dict,
                                                         formatter=None)
    Bases: object
    format_dict : dictionary for format strings to be used. formatter : fall-back formatter
    __call__(self, direction, factor, values)
        factor is ignored if value is found in the dictionary
    __dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__init__': <function
    __init__(self, format_dict, formatter=None)
        format_dict : dictionary for format strings to be used. formatter : fall-back formatter
    __module__ = 'mpl_toolkits.axisartist.grid_finder'
    __weakref__
        list of weak references to the object (if defined)

```

Examples using `mpl_toolkits.axisartist.grid_finder.DictFormatter`

- `sphx_glr_gallery_axisartist_demo_floating_axes.py`

`mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

```
class mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple(nx, ny)
```

Bases: `object`

A helper class to figure out the range of grid lines that need to be drawn.

### Parameters

**nx, ny** [int] The number of samples in each direction.

```
__call__(self, transform_xy, x1, y1, x2, y2)
```

Compute an approximation of the bounding box obtained by applying *transform\_xy* to the box delimited by (x1, y1, x2, y2).

The intended use is to have (x1, y1, x2, y2) in axes coordinates, and have *transform\_xy* be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling `nx * ny` equispaced points in the (x1, y1, x2, y2) box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of  $1/nx$  or  $1/ny$ , the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

```
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__doc__': '\n A hel
```

```
__init__(self, nx, ny)
```

### Parameters

**nx, ny** [int] The number of samples in each direction.

```
__module__ = 'mpl_toolkits.axisartist.grid_finder'
```

```
__weakref__
```

list of weak references to the object (if defined)

or transform = (transform\_xy, inv\_transform\_xy)

locator1, locator2 : grid locator for 1st and 2nd axis.

```
__module__ = 'mpl_toolkits.axisartist.grid_finder'
```

Examples using `mpl_toolkits.axisartist.grid_finder.GridFinderBase`

`mpl_toolkits.axisartist.grid_finder.MaxNLocator`

```
class mpl_toolkits.axisartist.grid_finder.MaxNLocator(nbins=10, steps=None,
                                                       trim=True, integer=False, symmetric=False, prune=None)
```

Bases: `matplotlib.ticker.MaxNLocator`

### Parameters

**nbins** [int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

**steps** [array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

**integer** [bool, default: False] If True, ticks will take only integer values, provided at least *min\_n\_ticks* integers are found within the view limits.

**symmetric** [bool, default: False] If True, autoscaling will result in a range symmetric about zero.

**prune** [{'lower', 'upper', 'both', None}, default: None] Remove edge ticks - useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when `rcParams["axes.autolimit_mode"]` (default: 'data') is 'round\_numbers'. If `prune=='lower'`, the smallest tick will be removed. If `prune == 'upper'`, the largest tick will be removed. If `prune == 'both'`, the largest and smallest ticks will be removed. If *prune* is *None*, no ticks will be removed.

**min\_n\_ticks** [int, default: 2] Relax *nbins* and *integer* constraints if necessary to obtain this minimum number of ticks.

```
__call__(self, v1, v2)
```

Return the locations of the ticks.

```
__init__(self, nbins=10, steps=None, trim=True, integer=False, symmetric=False, prune=None)
```

### Parameters

**nbins** [int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

## 19.1.4 Matplotlib axes\_grid Toolkit

**Note:** AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of `axes_grid`. In more recent version, the toolkit has divided into two separate namespace (`axes_grid1` and `axisartist`). While `axes_grid` namespace is maintained for the backward compatibility, use of `axes_grid1` and `axisartist` is recommended. For the documentation on `axes_grid`, see the [previous version of the docs](#).

### Matplotlib axes\_grid1 Toolkit

The matplotlib `mpl_toolkits.axes_grid1` toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the `aspect` parameter in matplotlib adjust the position of the single axes, `axes_grid1` toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See [What is axes\\_grid1 toolkit?](#) for a guide on the usage of `axes_grid1`.

The submodules of the `axes_grid1` API are:

<code>axes_grid1.anchored_artists</code>	
<code>axes_grid1.axes_divider</code>	Helper classes to adjust the positions of multiple axes at drawing time.
<code>axes_grid1.axes_grid</code>	
<code>axes_grid1.axes_rgb</code>	
<code>axes_grid1.axes_size</code>	Provides classes of simple units that will be used with <code>AxesDivider</code> class (or others) to determine the size of each axes.
<code>axes_grid1.colorbar</code>	Colorbar toolkit with two classes and a function:

Continued on next page

Table 42 – continued from previous page

<code>axes_grid1.inset_locator</code>	A collection of functions and objects for creating or placing inset axes.
<code>axes_grid1.mpl_axes</code>	
<code>axes_grid1.parasite_axes</code>	

Matplotlib axisartist Toolkit

The *axisartist* namespace includes a derived Axes implementation (`mpl_toolkits.axisartist.Axes`). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's `Axis` class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of *axisartist* at the [axisartist](#) user guide.

The submodules of the axisartist API are:

<code>axisartist.angle_helper</code>	
<code>axisartist.axes_divider</code>	
<code>axisartist.axes_grid</code>	
<code>axisartist.axes_rgb</code>	
<code>axisartist.axis_artist</code>	<code>axis_artist.py</code> module provides axis-related artists.
<code>axisartist.axisline_style</code>	
<code>axisartist.axislines</code>	<code>Axislines</code> includes modified implementation of the <code>Axes</code> class.
<code>axisartist.clip_path</code>	
<code>axisartist.floating_axes</code>	An experimental support for curvilinear grid.
<code>axisartist.grid_finder</code>	
<code>axisartist.grid_helper_curvilinear</code>	An experimental support for curvilinear grid.
<code>axisartist.parasite_axes</code>	

19.2 mplot3d API

- *mplot3d API*
  - axes3d
  - axis3d
  - art3d
  - proj3d

**19.2.1 axes3d**

**Note:** Significant effort went into bringing axes3d to feature-parity with regular axes objects for version 1.1.0. However, more work remains. Please report any functions that do not behave as expected as a bug. In addition, help and patches would be greatly appreciated!

---

<i>axes3d.Axes3D</i> (fig[, rect, azimuth, elev, ...])	3D axes object.
--	-----------------

---

**mpl\_toolkits.mplot3d.axes3d.Axes3D**

```
class mpl_toolkits.mplot3d.axes3d.Axes3D(fig, rect=None, *args, azimuth=-60,
                                         elev=30, sharez=None, proj_type='persp',
                                         box_aspect=None, **kwargs)
```

Bases: matplotlib.axes.\_axes.Axes

3D axes object.

**Parameters**

**fig** [Figure] The parent figure.

**rect** [(float, float, float, float)] The (left, bottom, width, height) axes position.

**azim** [float, default: -60] Azimuthal viewing angle.

**elev** [float, default: 30] Elevation viewing angle.

**sharez** [Axes3D, optional] Other axes to share z-limits with.

**proj\_type** [{'persp', 'ortho'}] The projection type, default 'persp'.

**\*\*kwargs** Other optional keyword arguments:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'}

## Notes

New in version 1.2.1: The *sharez* parameter.

```
--init__(self, fig, rect=None, *args, azimuth=-60, elev=30, sharez=None,
          proj_type='persp', box_aspect=None, **kwargs)
```

## Parameters

**fig** [Figure] The parent figure.

**rect** [(float, float, float, float)] The (left, bottom, width, height) axes position.

**azim** [float, default: -60] Azimuthal viewing angle.

**elev** [float, default: 30] Elevation viewing angle.

**sharez** [Axes3D, optional] Other axes to share z-limits with.

**proj\_type** [{'persp', 'ortho'}] The projection type, default 'persp'.

**\*\*kwargs** Other optional keyword arguments:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool

## Notes

New in version 1.2.1: The *sharez* parameter.

```
__module__ = 'mpl_toolkits.mplot3d.axes3d'
```

```
add_collection3d(self, col, zs=0, zdir='z')
```

Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

**Supported are:**

- PolyCollection
- LineCollection
- PatchCollection

`add_contour_set(self, cset, extend3d=False, stride=5, zdir='z', offset=None)`

`add_contourf_set(self, cset, zdir='z', offset=None)`

`apply_aspect(self, position=None)`

Adjust the Axes for a specified data aspect ratio.

Depending on `get_adjustable` this will modify either the Axes box (position) or the view limits. In the former case, `get_anchor` will affect the position.

**See also:**

`matplotlib.axes.Axes.set_aspect` For a description of aspect ratio handling.

`matplotlib.axes.Axes.set_adjustable` Set how the Axes adjusts to achieve the required aspect ratio.

`matplotlib.axes.Axes.set_anchor` Set the position in case of extra space.

**Notes**

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

`auto_scale_xyz(self, X, Y, Z=None, had_data=None)`

`autoscale(self, enable=True, axis='both', tight=None)`

Convenience method for simple axis view autoscaling. See `matplotlib.axes.Axes.autoscale()` for full explanation. Note that this function behaves the same, but for all three axes. Therefore, 'z' can be passed for *axis*, and 'both' applies to all three axes.

New in version 1.1.0.

`autoscale_view(self, tight=None, scalex=True, scaley=True, scalez=True)`

Autoscale the view limits using the data limits. See `matplotlib.axes.Axes.autoscale_view()` for documentation. Note that this function applies to the 3D axes, and as such adds the *scalez* to the function arguments.

Changed in version 1.1.0: Function signature was changed to better match the 2D version. *tight* is now explicitly a kwarg and placed first.

Changed in version 1.2.1: This is now fully functional.

`bar(self, left, height, zs=0, zdir='z', *args, **kwargs)`

Add 2D bar(s).

**Parameters**

**left** [1D array-like] The x coordinates of the left sides of the bars.

**height** [1D array-like] The height of the bars.

**zs** [float or 1D array-like] Z coordinate of bars; if a single value is specified, it will be used for all bars.

**zdir** [{*'x'*, *'y'*, *'z'*}, default: *'z'*] When plotting 2D data, the direction to use as z (*'x'*, *'y'* or *'z'*).

**\*\*kwargs** Other arguments are forwarded to `matplotlib.axes.Axes.bar`.

## Returns

**mpl\_toolkits.mplot3d.art3d.Patch3DCollection**

`bar3d(self, x, y, z, dx, dy, dz, color=None, zsort='average', shade=True, lightsource=None, *args, **kwargs)`  
Generate a 3D barplot.

This method creates three dimensional barplot where the width, depth, height, and color of the bars can all be uniquely set.

## Parameters

**x, y, z** [array-like] The coordinates of the anchor point of the bars.

**dx, dy, dz** [float or array-like] The width, depth, and height of the bars, respectively.

**color** [sequence of colors, optional] The color of the bars can be specified globally or individually. This parameter can be:

- A single color, to color all bars the same color.
- An array of colors of length N bars, to color each bar independently.
- An array of colors of length 6, to color the faces of the bars similarly.
- An array of colors of length 6 \* N bars, to color each face independently.

When coloring the faces of the boxes specifically, this is the order of the coloring:

1. -Z (bottom of box)
2. +Z (top of box)
3. -Y
4. +Y
5. -X
6. +X

**zsort** [str, optional] The z-axis sorting scheme passed onto `Poly3DCollection`

**shade** [bool, default: True] When true, this shades the dark sides of the bars (relative to the plot's source of light).

**lightsource** [`LightSource`] The lightsource to use when *shade* is True.

**\*\*kwargs** Any additional keyword arguments are passed onto `Poly3DCollection`.

**Returns**

**collection** [*Poly3DCollection*] A collection of three dimensional polygons representing the bars.

`can_pan(self)`

Return *True* if this axes supports the pan/zoom button functionality.

3D axes objects do not use the pan/zoom button.

`can_zoom(self)`

Return *True* if this axes supports the zoom box button functionality.

3D axes objects do not use the zoom box button.

`cla(self)`

Clear the current axes.

`clabel(self, *args, **kwargs)`

Currently not implemented for 3D axes, and returns *None*.

`contour(self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)`

Create a 3D contour plot.

**Parameters**

**X, Y, Z** [array-like] Input data.

**extend3d** [bool, default: False] Whether to extend contour in 3D.

**stride** [int] Step size for extending contour.

**zdir** [{'x', 'y', 'z'}], default: 'z'] The direction to use.

**offset** [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**\*args, \*\*kwargs** Other arguments are forwarded to *matplotlib.axes.Axes.contour*.

**Returns**

**matplotlib.contour.QuadContourSet**

`contour3D(self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)`

Create a 3D contour plot.

**Parameters**

**X, Y, Z** [array-like] Input data.

**extend3d** [bool, default: False] Whether to extend contour in 3D.

**stride** [int] Step size for extending contour.

**zdir** [{'x', 'y', 'z'}], default: 'z'] The direction to use.

**offset** [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**\*args, \*\*kwargs** Other arguments are forwarded to *matplotlib.axes.Axes.contour*.

**Returns**

**matplotlib.contour.QuadContourSet**

`contourf(self, X, Y, Z, *args, zdir='z', offset=None, **kwargs)`  
 Create a 3D filled contour plot.

#### Parameters

**X, Y, Z** [array-like] Input data.

**zdir** [{'x', 'y', 'z'}, default: 'z'] The direction to use.

**offset** [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**\*args, \*\*kwargs** Other arguments are forwarded to `matplotlib.axes.Axes.contourf`.

#### Returns

**matplotlib.contour.QuadContourSet**

#### Notes

New in version 1.1.0: The *zdir* and *offset* parameters.

`contourf3D(self, X, Y, Z, *args, zdir='z', offset=None, **kwargs)`  
 Create a 3D filled contour plot.

#### Parameters

**X, Y, Z** [array-like] Input data.

**zdir** [{'x', 'y', 'z'}, default: 'z'] The direction to use.

**offset** [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**\*args, \*\*kwargs** Other arguments are forwarded to `matplotlib.axes.Axes.contourf`.

#### Returns

**matplotlib.contour.QuadContourSet**

#### Notes

New in version 1.1.0: The *zdir* and *offset* parameters.

`convert_zunits(self, z)`  
 For artists in an axes, if the zaxis has units support, convert z using zaxis unit type

New in version 1.2.1.

`disable_mouse_rotation(self)`  
 Disable mouse buttons for 3D rotation and zooming.

`draw(self, renderer)`  
 Draw the Artist (and its children) using the given renderer.  
 This has no effect if the artist is not visible (`Artist.get_visible` returns False).

#### Parameters

**renderer** [`RendererBase` subclass.]

## Notes

This method is overridden in the Artist subclasses.

`format_coord(self, xd, yd)`

Given the 2D view coordinates attempt to guess a 3D coordinate. Looks for the nearest edge to the point and then assumes that the point is at the same z location as the nearest point on the edge.

`format_zdata(self, z)`

Return z string formatted. This function will use the `fmt_zdata` attribute if it is callable, else will fall back on the zaxis major formatter

`get_autoscale_on(self)`

Get whether autoscaling is applied for all axes on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_autoscalez_on(self)`

Get whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_axis_position(self)`

`get_frame_on(self)`

Get whether the 3D axes panels are drawn.

`get_proj(self)`

Create the projection matrix from the current viewing position.

`get_tightbbox(self, renderer, call_axes_locator=True, bbox_extra_artists=None, *, for_layout_only=False)`

Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

## Parameters

**renderer** [*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**bbox\_extra\_artists** [list of *Artist* or None] List of artists to include in the tight bounding box. If None (default), then all artist children of the axes are included in the tight bounding box.

**call\_axes\_locator** [bool, default: True] If *call\_axes\_locator* is False, it does not call the `_axes_locator` attribute, which is necessary to get the correct bounding box. `call_axes_locator=False` can be used if the caller is only interested in the relative size of the tightbbox compared to the axes bbox.

**for\_layout\_only** [default: False] The bounding box will *not* include the x-extent of the title and the xlabel, or the y-extent of the ylabel.

## Returns

*BboxBase* Bounding box in figure pixel coordinates.

**See also:**

```
matplotlib.axes.Axes.get_window_extent
matplotlib.axis.Axis.get_tightbbox
matplotlib.spines.Spine.get_window_extent
```

`get_w_lims(self)`  
Get 3D world limits.

`get_xlim(self)`  
Alias for `get_xlim3d`.

`get_xlim3d(self)`  
Return the x-axis view limits.

### Returns

**left, right** [(float, float)] The current x-axis limits in data coordinates.

### See also:

```
set_xlim
set_xbound, get_xbound
invert_xaxis, xaxis_inverted
```

### Notes

The x-axis may be inverted, in which case the *left* value will be greater than the *right* value.

Changed in version 1.1.0: This function now correctly refers to the 3D x-limits

`get_ylim(self)`  
Alias for `get_ylim3d`.

`get_ylim3d(self)`  
Return the y-axis view limits.

### Returns

**bottom, top** [(float, float)] The current y-axis limits in data coordinates.

### See also:

```
set_ylim
set_ybound, get_ybound
invert_yaxis, yaxis_inverted
```

### Notes

The y-axis may be inverted, in which case the *bottom* value will be greater than the *top* value.

Changed in version 1.1.0: This function now correctly refers to the 3D y-limits.

`get_zaxis(self)`  
Return the ZAxis (*Axis*) instance.

`get_zbound(self)`  
Return the lower and upper z-axis bounds, in increasing order.  
New in version 1.1.0.

`get_zgridlines(self)`  
Return the zaxis' grid lines as a list of *Line2Ds*.

`get_zlabel(self)`  
Get the z-label text string.  
New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`get_zlim(self)`  
Alias for `get_zlim3d`.

`get_zlim3d(self)`  
Get 3D z limits.

`get_zmajorticklabels(self)`  
Return the zaxis' major tick labels, as a list of *Text*.

`get_zminorticklabels(self)`  
Return the zaxis' minor tick labels, as a list of *Text*.

`get_zscale(self)`

`get_zticklabels(self, minor=False, which=None)`  
Get the zaxis' tick labels.

#### Parameters

**minor** [bool] Whether to return the minor or the major ticklabels.

**which** [None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

#### Returns

list of *Text*

#### Notes

The tick label strings are not populated until a draw method has been called.

See also: `draw` and `draw`.

`get_zticklines(self, minor=False)`  
Return the zaxis' tick lines as a list of *Line2Ds*.

`get_zticks(self, *, minor=False)`  
Return the zaxis' tick locations in data coordinates.

`grid(self, b=True, **kwargs)`  
Set / unset 3D grid.

---

**Note:** Currently, this function does not behave the same as `matplotlib.axes.Axes.grid()`, but it is intended to eventually support that behavior.

---

New in version 1.1.0.

`invert_zaxis(self)`  
Invert the z-axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`locator_params(self, axis='both', tight=None, **kwargs)`  
Convenience method for controlling tick locators.

See `matplotlib.axes.Axes.locator_params()` for full documentation. Note that this is for Axes3D objects, therefore, setting `axis` to 'both' will result in the parameters being set for all three axes. Also, `axis` can also take a value of 'z' to apply parameters to the z axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`margins(self, *margins, x=None, y=None, z=None, tight=True)`  
Convenience method to set or retrieve autoscaling margins.

Call signatures:

```
margins()
```

returns `xmargin`, `ymargin`, `zmargin`

```
margins(margin)

margins(xmargin, ymargin, zmargin)

margins(x=xmargin, y=ymargin, z=zmargin)

margins(..., tight=False)
```

All forms above set the `xmargin`, `ymargin` and `zmargin` parameters. All keyword parameters are optional. A single positional argument specifies `xmargin`, `ymargin` and `zmargin`. Passing both positional and keyword arguments for `xmargin`, `ymargin`, and/or `zmargin` is invalid.

The `tight` parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is `True`, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting `tight` to `None` will preserve the previous setting.

Specifying any margin changes only the autoscaling; for example, if `xmargin` is not `None`, then `xmargin` times the X data interval will be added to each end of that interval before it is used in autoscaling.

New in version 1.1.0.

`mouse_init(self, rotate_btn=1, zoom_btn=3)`  
Set the mouse buttons for 3D rotation and zooming.

### Parameters

**rotate\_btn** [int or list of int, default: 1] The mouse button or buttons to use for 3D rotation of the axes.

**zoom\_btn** [int or list of int, default: 3] The mouse button or buttons to use to zoom the 3D axes.

`name = '3d'`

`plot(self, xs, ys, *args, zdir='z', **kwargs)`

Plot 2D or 3D data.

#### Parameters

**xs** [1D array-like] x coordinates of vertices.

**ys** [1D array-like] y coordinates of vertices.

**zs** [float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

**zdir** [{`'x'`, `'y'`, `'z'`}, default: `'z'`] When plotting 2D data, the direction to use as z (`'x'`, `'y'` or `'z'`).

**\*\*kwargs** Other arguments are forwarded to `matplotlib.axes.Axes.plot`.

`plot3D(self, xs, ys, *args, zdir='z', **kwargs)`

Plot 2D or 3D data.

#### Parameters

**xs** [1D array-like] x coordinates of vertices.

**ys** [1D array-like] y coordinates of vertices.

**zs** [float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

**zdir** [{`'x'`, `'y'`, `'z'`}, default: `'z'`] When plotting 2D data, the direction to use as z (`'x'`, `'y'` or `'z'`).

**\*\*kwargs** Other arguments are forwarded to `matplotlib.axes.Axes.plot`.

`plot_surface(self, X, Y, Z, *args, norm=None, vmin=None, vmax=None, light-source=None, **kwargs)`

Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports color mapping by supplying the `cmap` argument.

---

**Note:** The `rcount` and `ccount` kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

---

---

**Note:** To maximize rendering speed consider setting `rstride` and `cstride` to divisors of the number of rows minus 1 and columns minus 1 respectively. For example, given 51 rows `rstride` can be any of the divisors of 50.

---

Similarly, a setting of *rstride* and *cstride* equal to 1 (or *rcount* and *ccount* equal the number of rows and columns) can use the optimized path.

### Parameters

**X, Y, Z** [2d arrays] Data values.

**rcount, ccount** [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.

New in version 2.0.

**rstride, cstride** [int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 10.

'classic' mode uses a default of *rstride* = *cstride* = 10 instead of the new default of *rcount* = *ccount* = 50.

**color** [color-like] Color of the surface patches.

**cmap** [Colormap] Colormap of the surface patches.

**facecolors** [array-like of colors.] Colors of each individual patch.

**norm** [Normalize] Normalization for the colormap.

**vmin, vmax** [float] Bounds for the normalization.

**shade** [bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

**lightsource** [[LightSource](#)] The lightsource to use when *shade* is True.

**\*\*kwargs** Other arguments are forwarded to [Poly3DCollection](#).

```
plot_trisurf(self, *args, color=None, norm=None, vmin=None, vmax=None, light-
              source=None, **kwargs)
```

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```
plot_trisurf(triangulation, ...)
```

where *triangulation* is a [Triangulation](#) object, or:

```
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a *Triangulation* object will be created. See [Triangulation](#) for a explanation of these possibilities.

The remaining arguments are:

```
plot_trisurf(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation.

### Parameters

**X, Y, Z** [array-like] Data values as 1D arrays.

**color** Color of the surface patches.

**cmap** A colormap for the surface patches.

**norm** [Normalize] An instance of Normalize to map values to colors.

**vmin, vmax** [float, default: None] Minimum and maximum value to map.

**shade** [bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

**lightsource** [*LightSource*] The lightsource to use when *shade* is True.

**\*\*kwargs** All other arguments are passed on to *Poly3DCollection*

### Examples

New in version 1.2.0.

```
plot_wireframe(self, X, Y, Z, *args, **kwargs)
```

Plot a 3D wireframe.

---

**Note:** The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

---

### Parameters

**X, Y, Z** [2d arrays] Data values.

**rcount, ccount** [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.

New in version 2.0.

**rstride, cstride** [int] Downsampling stride in each direction. These arguments are mutually exclusive with *rcount* and *ccount*. If only one of *rstride* or *cstride* is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

'classic' mode uses a default of *rstride* = *cstride* = 1 instead of the new default of *rcount* = *ccount* = 50.

**\*\*kwargs** Other arguments are forwarded to [Line3DCollection](#).

`quiver(X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=.3, pivot='tail', normalize=False, **kwargs)`

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

### Parameters

**X, Y, Z** [array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg).

**U, V, W** [array-like] The x, y and z components of the arrow vectors.

**length** [float, default: 1] The length of each quiver.

**arrow\_length\_ratio** [float, default: 0.3] The ratio of the arrow head with respect to the quiver.

**pivot** [{'tail', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*.

**normalize** [bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by *u*, *v*, and *w*.

**\*\*kwargs** Any additional keyword arguments are delegated to *LineCollection*

`quiver3D(X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=.3, pivot='tail', normalize=False, **kwargs)`  
Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

#### Parameters

**X, Y, Z** [array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see *pivot* kwarg).

**U, V, W** [array-like] The x, y and z components of the arrow vectors.

**length** [float, default: 1] The length of each quiver.

**arrow\_length\_ratio** [float, default: 0.3] The ratio of the arrow head with respect to the quiver.

**pivot** [{'tail', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*.

**normalize** [bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by *u*, *v*, and *w*.

**\*\*kwargs** Any additional keyword arguments are delegated to *LineCollection*

`scatter(self, xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args, **kwargs)`  
Create a scatter plot.

#### Parameters

**xs, ys** [array-like] The data positions.

**zs** [float or array-like, default: 0] The z-positions. Either an array of the same length as *xs* and *ys* or a single value to place all points in the same plane.

**zdir** [{'x', 'y', 'z', '-x', '-y', '-z'}, default: 'z'] The axis direction for the *zs*. This is useful when plotting 2D data on a 3D Axes. The data must be passed as *xs*, *ys*. Setting *zdir* to 'y' then plots the data to the x-z-plane.

See also `/gallery/mplot3d/2dcollections3d`.

**s** [float or array-like, default: 20] The marker size in points\*\*2. Either an array of the same length as *xs* and *ys* or a single value to make all markers the same size.

**c** [color, sequence, or sequence of colors, optional] The marker color. Possible values:

- A single color format string.
- A sequence of colors of length *n*.
- A sequence of *n* numbers to be mapped to colors using *cmap* and *norm*.
- A 2-D array in which the rows are RGB or RGBA.

For more details see the *c* argument of [scatter](#).

**depthshade** [bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to `scatter()` will perform its depthshading independently.

**\*\*kwargs** All other arguments are passed on to [scatter](#).

### Returns

**paths** [[PathCollection](#)]

```
scatter3D(self, xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args,
          **kwargs)
```

Create a scatter plot.

### Parameters

**xs, ys** [array-like] The data positions.

**zs** [float or array-like, default: 0] The z-positions. Either an array of the same length as *xs* and *ys* or a single value to place all points in the same plane.

**zdir** [{*'x'*, *'y'*, *'z'*, *'-x'*, *'-y'*, *'-z'*}, default: *'z'*] The axis direction for the *zs*. This is useful when plotting 2D data on a 3D Axes. The data must be passed as *xs*, *ys*. Setting *zdir* to *'y'* then plots the data to the x-z-plane.

See also [/gallery/mplot3d/2dcollections3d](#).

**s** [float or array-like, default: 20] The marker size in points\*\*2. Either an array of the same length as *xs* and *ys* or a single value to make all markers the same size.

**c** [color, sequence, or sequence of colors, optional] The marker color. Possible values:

- A single color format string.
- A sequence of colors of length *n*.
- A sequence of *n* numbers to be mapped to colors using *cmap* and *norm*.
- A 2-D array in which the rows are RGB or RGBA.

For more details see the *c* argument of [scatter](#).

**depthshade** [bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to `scatter()` will perform its depthshading independently.

**\*\*kwargs** All other arguments are passed on to `scatter`.

### Returns

**paths** [*PathCollection*]

`set_anchor(self, anchor, share=False)`  
Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

### Parameters

**anchor** [2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}] The anchor position may be either:

- a sequence (cx, cy). cx and cy may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
- a string using cardinal directions as abbreviation:
  - 'C' for centered
  - 'S' (south) for bottom-center
  - 'SW' (south west) for bottom-left
  - etc.

Here is an overview of the possible positions:

'NW'	'N'	'NE'
'W'	'C'	'E'
'SW'	'S'	'SE'

**share** [bool, default: False] If True, apply the settings to all shared Axes.

### See also:

`matplotlib.axes.Axes.set_aspect` for a description of aspect handling.

`set_aspect(self, aspect, adjustable=None, anchor=None, share=False)`  
Set the aspect ratios.

Axes 3D does not current support any aspect but 'auto' which fills the axes with the data limits.

To simulate having equal aspect in data space, set the ratio of your data limits to match the value of `get_box_aspect`. To control box aspect ratios use `set_box_aspect`.

### Parameters

**aspect** [{'auto'}] Possible values:

value	description
'auto'	automatic; fill the position rectangle with data.

**adjustable** [None] Currently ignored by Axes3D

If not *None*, this defines which parameter will be adjusted to meet the required aspect. See `set_adjustable` for further details.

**anchor** [None or str or 2-tuple of float, optional] If not *None*, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to specify the anchor are abbreviations of cardinal directions:

value	description
'C'	centered
'SW'	lower left corner
'S'	middle of bottom edge
'SE'	lower right corner
etc.	

See `set_anchor` for further details.

**share** [bool, default: False] If True, apply the settings to all shared Axes.

**See also:**

`mpl_toolkits.mplot3d.axes3d.Axes3D.set_box_aspect`

`set_autoscale_on(self, b)`

Set whether autoscaling is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

#### Parameters

**b** [bool]

`set_autoscalez_on(self, b)`

Set whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0.

#### Parameters

**b** [bool]

`set_axis_off(self)`

Turn the x- and y-axis off.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

`set_axis_on(self)`

Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

`set_box_aspect(self, aspect, *, zoom=1)`

Set the axes box aspect.

The box aspect is the ratio of height to width in display units for each face of the box when viewed perpendicular to that face. This is not to be confused with the data aspect (which for Axes3D is always 'auto'). The default ratios are 4:4:3 (x:y:z).

To simulate having equal aspect in data space, set the box aspect to match your data range in each dimension.

*zoom* controls the overall size of the Axes3D in the figure.

#### Parameters

**aspect** [3-tuple of floats or None] Changes the physical dimensions of the Axes3D, such that the ratio of the axis lengths in display units is x:y:z.

If None, defaults to 4:4:3

**zoom** [float] Control overall size of the Axes3D in the figure.

`set_frame_on(self, b)`

Set whether the 3D axes panels are drawn.

#### Parameters

**b** [bool]

`set_proj_type(self, proj_type)`

Set the projection type.

#### Parameters

**proj\_type** [{'persp', 'ortho'}]

`set_title(self, label, fontdict=None, loc='center', **kwargs)`

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

#### Parameters

**label** [str] Text to use for the title

**fontdict** [dict] A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

**loc** [{'center', 'left', 'right'}], default: `rcParams["axes.titlelocation"]` (default: 'center') Which title to set.

**y** [float, default: `rcParams["axes.titley"]` (default: None)] Vertical axes location for the title (1.0 is the top). If None (the default), y is determined automatically to avoid decorators on the axes.

**pad** [float, default: `rcParams["axes.titlepad"]` (default: 6.0)] The offset of the title from the top of the axes, in points.

#### Returns

*Text* The matplotlib text instance representing the title

#### Other Parameters

**\*\*kwargs** [*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

```

set_top_view(self)

set_xlim(self, left=None, right=None, emit=True, auto=False, *, xmin=None,
          xmax=None)
    Alias for set_xlim3d.

set_xlim3d(self, left=None, right=None, emit=True, auto=False, *, xmin=None,
            xmax=None)
    Set 3D x limits.

    See matplotlib.axes.Axes.set_xlim() for full documentation.

set_xscale(self, value, **kwargs)
    Set the x-axis scale.

```

#### Parameters

**value** [{"linear"}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**\*\*kwargs** Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

```

set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None,
          ymax=None)
    Alias for set_ylim3d.

set_ylim3d(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None,
            ymax=None)
    Set 3D y limits.

    See matplotlib.axes.Axes.set_ylim() for full documentation.

set_yscale(self, value, **kwargs)
    Set the y-axis scale.

```

#### Parameters

**value** [{"linear"}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**\*\*kwargs** Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

```

set_zbound(self, lower=None, upper=None)
    Set the lower and upper numerical bounds of the z-axis.

    This method will honor axes inversion regardless of parameter order. It will not
    change the autoscaling setting (get_autoscalez_on()).

    New in version 1.1.0.

set_zlabel(self, zlabel, fontdict=None, labelpad=None, **kwargs)
    Set zlabel. See doc for set_ylabel for description.

set_zlim(self, bottom=None, top=None, emit=True, auto=False, *, zmin=None,
          zmax=None)
    Alias for set_zlim3d.

set_zlim3d(self, bottom=None, top=None, emit=True, auto=False, *, zmin=None,
            zmax=None)
    Set 3D z limits.

    See matplotlib.axes.Axes.set_ylim() for full documentation

```

`set_zmargin(self, m)`

Set padding of Z data limits prior to autoscaling.

*m* times the data interval will be added to each end of that interval before it is used in autoscaling.

accepts: float in range 0 to 1

New in version 1.1.0.

`set_zscale(self, value, **kwargs)`

Set the z-axis scale.

### Parameters

**value** [{"linear"}] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**\*\*kwargs** Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

`set_zticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)`

Set the zaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using `Axes3D.set_zticks`. Otherwise, the labels may end up in unexpected positions.

### Parameters

**labels** [list of str] The label texts.

**fontdict** [dict, optional] A dictionary controlling the appearance of the ticklabels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],  
 'fontweight': rcParams['axes.titleweight'],  
 'verticalalignment': 'baseline',  
 'horizontalalignment': 'loc'}
```

**minor** [bool, default: False] Whether to set the minor ticklabels rather than the major ones.

### Returns

**list of *Text*** The labels.

### Other Parameters

**\*\*kwargs** [*Text* properties.]

`set_zticks(self, ticks, *, minor=False)`

Set the zaxis' tick locations.

### Parameters

**ticks** [list of floats] List of tick locations.

**minor** [bool, default: False] If False, set the major ticks; if True, the minor ticks.

`text(self, x, y, z, s, zdir=None, **kwargs)`

Add text to the plot. `kwargs` will be passed on to `Axes.text`, except for the `zdir` keyword, which sets the direction to be used as the `z` direction.

`text2D(self, x, y, s, fontdict=None, **kwargs)`

Add text to the axes.

Add the text `s` to the axes at location `x, y` in data coordinates.

### Parameters

**x, y** [float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

**s** [str] The text.

**fontdict** [dict, default: None] A dictionary to override the default text properties. If `fontdict` is None, the defaults are determined by *rcParams*.

### Returns

*Text* The created *Text* instance.

### Other Parameters

**\*\*kwargs** [*Text* properties.] Other miscellaneous text parameters.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontfamily</i> or <i>family</i>	{'FONTNAME', 'serif', 'sans-serif', 'cursive', 'fantasy', 'monosp
<i>fontproperties</i> or <i>font</i> or <i>font_properties</i>	<i>font_manager.FontProperties</i> or str or <i>pathlib.Path</i>
<i>fontsize</i> or <i>size</i>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large
<i>fontstretch</i> or <i>stretch</i>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-co
<i>fontstyle</i> or <i>style</i>	{'normal', 'italic', 'oblique'}
<i>fontvariant</i> or <i>variant</i>	{'normal', 'small-caps'}
<i>fontweight</i> or <i>weight</i>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal'
<i>gid</i>	str
<i>horizontalalignment</i> or <i>ha</i>	{'center', 'right', 'left'}
<i>in_layout</i>	bool
<i>label</i>	object
<i>linespacing</i>	float (multiple of font size)
<i>multialignment</i> or <i>ma</i>	{'left', 'right', 'center'}
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	(float, float)

Property	Description
<i>rasterized</i>	bool or None
<i>rotation</i>	float or {'vertical', 'horizontal'}
<i>rotation_mode</i>	{None, 'default', 'anchor'}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	object
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>usetex</i>	bool or None
<i>verticalalignment</i> or <i>va</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

### Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

**text3D**(*self*, *x*, *y*, *z*, *s*, *zdir=None*, *\*\*kwargs*)

Add text to the plot. *kwargs* will be passed on to *Axes.text*, except for the *zdir* keyword, which sets the direction to be used as the z direction.

**tick\_params**(*self*, *axis='both'*, *\*\*kwargs*)

Convenience method for changing the appearance of ticks and tick labels.

See *matplotlib.axes.Axes.tick\_params()* for more complete documentation.

The only difference is that setting *axis* to 'both' will mean that the settings are applied to all three axes. Also, the *axis* parameter also accepts a value of 'z', which would mean to apply to only the z-axis.

Also, because of how *Axes3D* objects are drawn very differently from regular 2D axes, some of these settings may have ambiguous meaning. For simplicity, the 'z' axis will accept settings as if it was like the 'y' axis.

---

**Note:** Axes3D currently ignores some of these settings.

---

New in version 1.1.0.

`tricontour(self, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)`  
 Create a 3D contour plot.

Changed in version 1.3.0: Added support for custom triangulations

---

**Note:** This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

---

### Parameters

**X, Y, Z** [array-like] Input data.

**extend3d** [bool, default: False] Whether to extend contour in 3D.

**stride** [int] Step size for extending contour.

**zdir** [{ 'x', 'y', 'z' }, default: 'z'] The direction to use.

**offset** [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**\*args, \*\*kwargs** Other arguments are forwarded to `matplotlib.axes.Axes.tricontour`.

### Returns

`matplotlib.tri.tricontour.TriContourSet`

`tricontourf(self, *args, zdir='z', offset=None, **kwargs)`  
 Create a 3D filled contour plot.

---

**Note:** This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

---

### Parameters

**X, Y, Z** [array-like] Input data.

**zdir** [{ 'x', 'y', 'z' }, default: 'z'] The direction to use.

**offset** [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**\*args, \*\*kwargs** Other arguments are forwarded to `matplotlib.axes.Axes.tricontourf`.

### Returns

`matplotlib.tri.tricontour.TriContourSet`

## Notes

New in version 1.1.0: The *zdir* and *offset* parameters.

Changed in version 1.3.0: Added support for custom triangulations

`tunit_cube(self, vals=None, M=None)`

`tunit_edges(self, vals=None, M=None)`

`unit_cube(self, vals=None)`

`update_dataLim(self, xys, **kwargs)`

Extend the dataLim Bbox to include the given points.

If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of the xydata (*xys*). Otherwise, it will compute the bounds of the union of its current data and the data in *xys*.

## Parameters

**xys** [2D array-like] The points to include in the data limits Bbox. This can be either a list of (x, y) tuples or a Nx2 array.

**updatex, updatey** [bool, default: True] Whether to update the x/y limits.

`view_init(self, elev=None, azim=None)`

Set the elevation and azimuth of the axes in degrees (not radians).

This can be used to rotate the axes programmatically.

'elev' stores the elevation angle in the z plane (in degrees). 'azim' stores the azimuth angle in the (x, y) plane (in degrees).

if 'elev' or 'azim' are None (default), then the initial value is used which was specified in the [Axes3D](#) constructor.

`voxels([x, y, z], /, filled, facecolors=None, edgecolors=None, **kwargs)`

Plot a set of filled voxels

All voxels are plotted as 1x1x1 cubes on the axis, with `filled[0, 0, 0]` placed with its lower corner at the origin. Occluded faces are not plotted.

New in version 2.1.

## Parameters

**filled** [3D np.array of bool] A 3d array of values, with truthy values indicating which voxels to fill

**x, y, z** [3D np.array, optional] The coordinates of the corners of the voxels. This should broadcast to a shape one larger in every dimension than the shape of *filled*. These can be used to plot non-cubic voxels.

If not specified, defaults to increasing integers along each axis, like those returned by `indices()`. As indicated by the / in the function signature, these arguments can only be passed positionally.

**facecolors, edgecolors** [array-like, optional] The color to draw the faces and edges of the voxels. Can only be passed as keyword arguments. This parameter can be:

- A single color value, to color all voxels the same color. This can be either a string, or a 1D rgb/rgba array

- None, the default, to use a single color for the faces, and the style default for the edges.
- A 3D ndarray of color names, with each item the color for the corresponding voxel. The size must match the voxels.
- A 4D ndarray of rgb/rgba data, with the components along the last axis.

**shade** [bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

New in version 3.1.

**lightsource** [*LightSource*] The lightsource to use when *shade* is True.

New in version 3.1.

**\*\*kwargs** Additional keyword arguments to pass onto *Poly3DCollection*.

### Returns

**faces** [dict] A dictionary indexed by coordinate, where `faces[i, j, k]` is a *Poly3DCollection* of the faces drawn for the voxel filled[i, j, k]. If no faces were drawn for a given voxel, either because it was not asked to be drawn, or it is fully occluded, then (i, j, k) not in faces.

### Examples

```
property w_xaxis
```

```
property w_yaxis
```

```
property w_zaxis
```

```
zaxis_date(self, tz=None)
```

Sets up axis ticks and labels to treat data along the zaxis as dates.

### Parameters

**tz** [str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: 'UTC')] The timezone used to create date labels.

```
zaxis_inverted(self)
```

Returns True if the z-axis is inverted.

New in version 1.1.0.

Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D`

## 19.2.2 axis3d

**Note:** See `mpl_toolkits.mplot3d.axis3d._axinfo` for a dictionary containing constants that may be modified for controlling the look and feel of mplot3d axes (e.g., label spacing, font colors and panel colors). Historically, axis3d has suffered from having hard-coded constants

that precluded user adjustments, and this dictionary was implemented in version 1.1 as a stop-gap measure.

---

`axis3d.Axis`(*adir*, *v\_intervalx*, *d\_intervalx*, ...)  
 An Axis class for the 3D plots.

---

#### `mpl_toolkits.mplot3d.axis3d.Axis`

`class mpl_toolkits.mplot3d.axis3d.Axis(adir, v_intervalx, d_intervalx, axes, *args, rotate_label=None, **kwargs)`

Bases: `matplotlib.axes.XAxis`

An Axis class for the 3D plots.

#### Parameters

**axes** [`matplotlib.axes.Axes`] The *Axes* to which the created Axis belongs.

**pickradius** [float] The acceptance radius for containment tests. See also `Axis.contains`.

`__init__`(*self*, *adir*, *v\_intervalx*, *d\_intervalx*, *axes*, \**args*, *rotate\_label*=None, \*\**kwargs*)

#### Parameters

**axes** [`matplotlib.axes.Axes`] The *Axes* to which the created Axis belongs.

**pickradius** [float] The acceptance radius for containment tests. See also `Axis.contains`.

2410

`__module__` = 'mpl\_toolkits.mplot3d.axis3d'

`__new__` = `mpl_toolkits.mplot3d.axis3d.Axis.__new__`

Chapter 19. Toolkits

`get_tightbbox(self, renderer, *, for_layout_only=False)`

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and `offsetText`.

If `for_layout_only` is `True`, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows `tight/constrained_layout` to ignore too-long labels when doing their layout.

`init3d(self)`

`set_pane_color(self, color)`

Set pane color to a RGBA tuple.

`set_pane_pos(self, xys)`

`set_rotate_label(self, val)`

Whether to rotate the axis label: `True`, `False` or `None`. If set to `None` the label will be rotated if longer than 4 chars.

property `v_interval`

Examples using `mpl_toolkits.mplot3d.axis3d.Axis`

### 19.2.3 art3d

<code>art3d.Line3D(xs, ys, zs, *args, **kwargs)</code>	3D line object.
<code>art3d.Line3DCollection(segments[, ...])</code>	A collection of 3D lines.
<code>art3d.Patch3D(*args[, zs, zdir])</code>	3D patch object.
<code>art3d.Patch3DCollection(*args[, zs, zdir, ...])</code>	A collection of 3D patches.
<code>art3d.Path3DCollection(*args[, zs, zdir, ...])</code>	A collection of 3D paths.
<code>art3d.PathPatch3D(path, *[, zs, zdir])</code>	3D PathPatch object.
<code>art3d.Poly3DCollection(verts, *args[, zsort])</code>	A collection of 3D polygons.
<code>art3d.Text3D([x, y, z, text, zdir])</code>	Text object with 3D position and direction.
<code>art3d.get_dir_vector(zdir)</code>	Return a direction vector.
<code>art3d.juggle_axes(xs, ys, zs, zdir)</code>	Reorder coordinates so that 2D xs, ys can be plotted in the plane orthogonal to zdir.
<code>art3d.line_2d_to_3d(line[, zs, zdir])</code>	Convert a 2D line to 3D.
<code>art3d.line_collection_2d_to_3d(col[, zs, zdir])</code>	Convert a LineCollection to a Line3DCollection object.
<code>art3d.patch_2d_to_3d(patch[, z, zdir])</code>	Convert a Patch to a Patch3D object.
<code>art3d.patch_collection_2d_to_3d(col[, zs, ...])</code>	Convert a <i>PatchCollection</i> into a Patch3DCollection object (or a <i>PathCollection</i> into a Path3DCollection object).
<code>art3d.pathpatch_2d_to_3d(pathpatch[, z, zdir])</code>	Convert a PathPatch to a PathPatch3D object.
<code>art3d.poly_collection_2d_to_3d(col[, zs, zdir])</code>	Convert a PolyCollection to a Poly3DCollection object.

Continued on next page

Table 49 – continued from previous page

<code>art3d.rotate_axes(xs, ys, zs, zdir)</code>	Reorder coordinates so that the axes are rotated with <code>zdir</code> along the original <code>z</code> axis.
<code>art3d.text_2d_to_3d(obj[, z, zdir])</code>	Convert a Text to a Text3D object.

**mpl\_toolkits.mplot3d.art3d.Line3D**

`class mpl_toolkits.mplot3d.art3d.Line3D(xs, ys, zs, *args, **kwargs)`

Bases: `matplotlib.lines.Line2D`

3D line object.

Keyword arguments are passed onto `Line2D()`.

`__init__(self, xs, ys, zs, *args, **kwargs)`

Keyword arguments are passed onto `Line2D()`.

`__module__` = 'mpl\_toolkits.mplot3d.art3d'

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters**

**renderer** [`RendererBase` subclass.]

**Notes**

This method is overridden in the Artist subclasses.

`get_data_3d(self)`

Get the current data

**Returns**

**verts3d** [length-3 tuple or array-like] The current data as a tuple or array-like.

`set_3d_properties(self, zs=0, zdir='z')`

`set_data_3d(self, *args)`

Set the x, y and z data

**Parameters**

**x** [array-like] The x-data to be plotted.

**y** [array-like] The y-data to be plotted.

**z** [array-like] The z-data to be plotted.

**Notes**

Accepts x, y, z arguments or a single array-like (x, y, z)

Examples using `mpl_toolkits.mplot3d.art3d.Line3D`

`mpl_toolkits.mplot3d.art3d.Line3DCollection`

```
class mpl_toolkits.mplot3d.art3d.Line3DCollection(segments, linewidths=None, colors=None, antialiaseds=None,
linestyles='solid', offsets=None, transOffset=None, norm=None,
cmap=None, pickradius=5, zorder=2, facecolors='none',
**kwargs)
```

Bases: `matplotlib.collections.LineCollection`

A collection of 3D lines.

### Parameters

**segments:** **list of array-like** A sequence of (*line0*, *line1*, *line2*), where:

```
linen = (x0, y0), (x1, y1), ... (xm, ym)
```

or the equivalent numpy array with two columns. Each line can have a different number of segments.

**linewidths** [float or list of float, default: `rcParams["lines.linewidth"]` (default: 1.5)] The width of each line in points.

**colors** [color or list of color, default: `rcParams["lines.color"]` (default: 'C0')] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

**antialiaseds** [bool or list of bool, default: `rcParams["lines.antialiased"]` (default: True)] Whether to use antialiasing for each line.

**zorder** [int, default: 2] zorder of the lines once drawn.

**facecolors** [color or list of color, default: 'none'] The facecolors of the LineCollection. Setting to a value other than 'none' will lead to each line being "filled in" as if there was an implicit line segment joining the last and first points of that line back around to each other. In order to manually specify what should count as the "interior" of each line, please use *PathCollection* instead, where the "interior" can be specified by appropriate usage of *CLOSEPOLY*.

**\*\*kwargs** Forwarded to *Collection*.

```
__module__ = 'mpl_toolkits.mplot3d.art3d'
```

```
do_3d_projection(self, renderer)
```

Project the points according to renderer matrix.

```
draw(self, renderer, project=False)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

```
set_segments(self, segments)
```

Set 3D segments.

```
set_sort_zpos(self, val)
```

Set the position to use for z-sorting.

Examples using `mpl_toolkits.mplot3d.art3d.Line3DCollection`

`mpl_toolkits.mplot3d.art3d.Patch3D`

```
class mpl_toolkits.mplot3d.art3d.Patch3D(*args, zs=(), zdir='z', **kwargs)
```

Bases: *matplotlib.patches.Patch*

3D patch object.

The following kwarg properties are supported

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a bool
<i>alpha</i>	float or None

Continued

Table 50 – continued from previous page

Property	Description
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, *args, zs=(), zdir='z', **kwargs)
```

The following kwarg properties are supported

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown

<i>visible</i>	bool
<i>zorder</i>	float

```

__module__ = 'mpl_toolkits.mplot3d.art3d'

do_3d_projection(self, renderer)

get_facecolor(self)
    Return the face color.

get_path(self)
    Return the path of this patch.

set_3d_properties(self, verts, zs=0, zdir='z')

```

Examples using `mpl_toolkits.mplot3d.art3d.Patch3D`

#### `mpl_toolkits.mplot3d.art3d.Patch3DCollection`

```

class mpl_toolkits.mplot3d.art3d.Patch3DCollection(*args, zs=0, zdir='z',
                                                    depthshade=True, **kwargs)

```

Bases: `matplotlib.collections.PatchCollection`

A collection of 3D patches.

Create a collection of flat 3D patches with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for `PatchCollection`. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

```

__init__(self, *args, zs=0, zdir='z', depthshade=True, **kwargs)

```

Create a collection of flat 3D patches with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for `PatchCollection`. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

```
__module__ = 'mpl_toolkits.mplot3d.art3d'
do_3d_projection(self, renderer)
set_3d_properties(self, zs, zdir)
set_sort_zpos(self, val)
    Set the position to use for z-sorting.
```

Examples using `mpl_toolkits.mplot3d.art3d.Patch3DCollection`

`mpl_toolkits.mplot3d.art3d.Path3DCollection`

```
class mpl_toolkits.mplot3d.art3d.Path3DCollection(*args, zs=0, zdir='z',
                                                  depthshade=True, **kwargs)
```

Bases: `matplotlib.collections.PathCollection`

A collection of 3D paths.

Create a collection of flat 3D paths with its normal vector pointed in *zdir* direction, and located at *zs* on the *zdir* axis. 'zs' can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for `PathCollection`. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

```
__init__(self, *args, zs=0, zdir='z', depthshade=True, **kwargs)
    Create a collection of flat 3D paths with its normal vector pointed in zdir direction,
    and located at zs on the zdir axis. 'zs' can be a scalar or an array-like of the same
    length as the number of paths in the collection.
```

Constructor arguments are the same as for `PathCollection`. In addition, keywords *zs=0* and *zdir='z'* are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is *True*). This is typically desired in scatter plots.

```
__module__ = 'mpl_toolkits.mplot3d.art3d'
do_3d_projection(self, renderer)
set_3d_properties(self, zs, zdir)
set_sort_zpos(self, val)
    Set the position to use for z-sorting.
```

Examples using `mpl_toolkits.mplot3d.art3d.Path3DCollection`

**mpl\_toolkits.mplot3d.art3d.PathPatch3D**

```
class mpl_toolkits.mplot3d.art3d.PathPatch3D(path, *, zs=(), zdir='z', **kwargs)
```

Bases: *mpl\_toolkits.mplot3d.art3d.Patch3D*

3D PathPatch object.

The following kwarg properties are supported

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '., '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>

<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```

__module__ = 'mpl_toolkits.mplot3d.art3d'
do_3d_projection(self, renderer)
set_3d_properties(self, path, zs=0, zdir='z')

```

Examples using `mpl_toolkits.mplot3d.art3d.PathPatch3D`

- `sphx_glr_gallery_mplot3d_pathpatch3d.py`

`mpl_toolkits.mplot3d.art3d.Poly3DCollection`

```

class mpl_toolkits.mplot3d.art3d.Poly3DCollection(verts, *args, zsort='average',
**kwargs)

```

Bases: `matplotlib.collections.PolyCollection`

A collection of 3D polygons.

---

### Note: Filling of 3D polygons

There is no simple definition of the enclosed surface of a 3D polygon unless the polygon is planar.

In practice, Matplotlib fills the 2D projection of the polygon. This gives a correct filling appearance only for planar polygons. For all other polygons, you'll find orientations in which the edges of the polygon intersect in the projection. This will lead to an incorrect visualization of the 3D area.

If you need filled areas, it is recommended to create them via `plot_trisurf`, which creates a triangulation and thus generates consistent surfaces.

### Parameters

**verts** [list of array-like Nx3] Each element describes a polygon as a sequence of  $N_i$  points (x, y, z).

**zsort** [{‘average’, ‘min’, ‘max’}, default: ‘average’] The calculation method for the z-order. See `set_zsort` for details.

**\*args, \*\*kwargs** All other parameters are forwarded to `PolyCollection`.

### Notes

Note that this class does a bit of magic with the `_facecolors` and `_edgecolors` properties.

```
__init__(self, verts, *args, zsort='average', **kwargs)
```

### Parameters

**verts** [list of array-like Nx3] Each element describes a polygon as a sequence of  $N_i$  points (x, y, z).

**zsort** [{‘average’, ‘min’, ‘max’}, default: ‘average’] The calculation method for the z-order. See `set_zsort` for details.

**\*args, \*\*kwargs** All other parameters are forwarded to `PolyCollection`.

### Notes

Note that this class does a bit of magic with the `_facecolors` and `_edgecolors` properties.

```
__module__ = 'mpl_toolkits.mplot3d.art3d'
```

```
do_3d_projection(self, renderer)  
Perform the 3D projection for this object.
```

```
get_edgecolor(self)
```

```
get_facecolor(self)
```

```
get_vector(self, segments3d)  
Optimize points for projection.
```

```
set_3d_properties(self)
```

```
set_alpha(self, alpha)  
Set the alpha value used for blending - not supported on all backends.
```

### Parameters

**alpha** [float or None]

```
set_edgecolor(self, colors)  
Set the edgecolor(s) of the collection.
```

**Parameters**

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_facecolor(self, colors)`

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters**

**c** [color or list of colors]

`set_sort_zpos(self, val)`

Set the position to use for z-sorting.

`set_verts(self, verts, closed=True)`

Set 3D vertices.

`set_verts_and_codes(self, verts, codes)`

Set 3D vertices with path codes.

`set_zsort(self, zsort)`

Set the calculation method for the z-order.

**Parameters**

**zsort** [{ 'average', 'min', 'max' }] The function applied on the z-coordinates of the vertices in the viewer's coordinate system, to determine the z-order.

**Examples using `mpl_toolkits.mplot3d.art3d.Poly3DCollection`**

- `sphx_glr_gallery_pyplots_whats_new_1_subplot3d.py`
- `sphx_glr_gallery_frontpage_3D.py`
- `sphx_glr_gallery_mplot3d_custom_shaded_3d_surface.py`
- `sphx_glr_gallery_mplot3d_mixed_subplots.py`
- `sphx_glr_gallery_mplot3d_polys3d.py`
- `sphx_glr_gallery_mplot3d_subplot3d.py`
- `sphx_glr_gallery_mplot3d_surface3d.py`
- `sphx_glr_gallery_mplot3d_surface3d_3.py`

**`mpl_toolkits.mplot3d.art3d.Text3D`**

`class mpl_toolkits.mplot3d.art3d.Text3D(x=0, y=0, z=0, text="", zdir='z', **kwargs)`

Bases: `matplotlib.text.Text`

Text object with 3D position and direction.

**Parameters**

**x, y, z** The position of the text.

**text** [str] The text string to display.

**zdir** [{‘x’, ‘y’, ‘z’, None, 3-tuple}] The direction of the text. See [get\\_dir\\_vector](#) for a description of the values.

### Other Parameters

**\*\*kwargs** All other parameters are passed on to [Text](#).

Create a [Text](#) instance at x, y with string *text*.

Valid keyword arguments are:

Property	Description
<a href="#">agg_filter</a>	a filter function, which takes a (m, n, 3) float array and a dpi value
<a href="#">alpha</a>	float or None
<a href="#">animated</a>	bool

<i>y</i>	float
<i>zorder</i>	float

```
__module__ = 'mpl_toolkits.mplot3d.art3d'
```

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

```
get_tightbbox(self, renderer)
```

Like *Artist.get\_window\_extent*, but includes any clipping.

### Parameters

**renderer** [*RendererBase* subclass] renderer that will be used to draw the figures (i.e. *fig.canvas.get\_renderer()*)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

```
set_3d_properties(self, z=0, zdir='z')
```

Examples using *mpl\_toolkits.mplot3d.art3d.Text3D*

*mpl\_toolkits.mplot3d.art3d.get\_dir\_vector*

```
mpl_toolkits.mplot3d.art3d.get_dir_vector(zdir)
```

Return a direction vector.

### Parameters

**zdir** [{*'x'*, *'y'*, *'z'*, None, 3-tuple}] The direction. Possible values are: - *'x'*: equivalent to (1, 0, 0) - *'y'*: equivalent to (0, 1, 0) - *'z'*: equivalent to (0, 0, 1) - *None*: equivalent to (0, 0, 0) - an iterable (x, y, z) is returned unchanged.

### Returns

**x, y, z** [array-like] The direction vector. This is either a *numpy.array* or *zdir* itself if *zdir* is already a length-3 iterable.

Examples using `mpl_toolkits.mplot3d.art3d.get_dir_vector`

`mpl_toolkits.mplot3d.art3d.juggle_axes`

`mpl_toolkits.mplot3d.art3d.juggle_axes(xs, ys, zs, zdir)`

Reorder coordinates so that 2D `xs`, `ys` can be plotted in the plane orthogonal to `zdir`. `zdir` is normally `x`, `y` or `z`. However, if `zdir` starts with a `'-'` it is interpreted as a compensation for `rotate_axes`.

Examples using `mpl_toolkits.mplot3d.art3d.juggle_axes`

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d(line, zs=0, zdir='z')`

Convert a 2D line to 3D.

Examples using `mpl_toolkits.mplot3d.art3d.line_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d(col, zs=0, zdir='z')`

Convert a `LineCollection` to a `Line3DCollection` object.

Examples using `mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_2d_to_3d(patch, z=0, zdir='z')`

Convert a `Patch` to a `Patch3D` object.

Examples using `mpl_toolkits.mplot3d.art3d.patch_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d(col, zs=0, zdir='z', depthshade=True)`

Convert a *PatchCollection* into a *Patch3DCollection* object (or a *PathCollection* into a *Path3DCollection* object).

### Parameters

**za** The location or locations to place the patches in the collection along the *zdir* axis. Default: 0.

**zdir** The axis in which to place the patches. Default: "z".

**depthshade** Whether to shade the patches to give a sense of depth. Default: *True*.

Examples using `mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d(pathpatch, z=0, zdir='z')`  
Convert a PathPatch to a PathPatch3D object.

Examples using `mpl_toolkits.mplot3d.art3d.pathpatch_2d_to_3d`

- `sphx_glr_gallery_mplot3d_pathpatch3d.py`

`mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d(col, zs=0, zdir='z')`  
Convert a PolyCollection to a Poly3DCollection object.

Examples using `mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.rotate_axes`

`mpl_toolkits.mplot3d.art3d.rotate_axes(xs, ys, zs, zdir)`  
Reorder coordinates so that the axes are rotated with zdir along the original z axis.  
Prepending the axis with a '-' does the inverse transform, so zdir can be x, -x, y, -y, z or -z

Examples using `mpl_toolkits.mplot3d.art3d.rotate_axes`

`mpl_toolkits.mplot3d.art3d.text_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.text_2d_to_3d(obj, z=0, zdir='z')`  
Convert a Text to a Text3D object.

Examples using `mpl_toolkits.mplot3d.art3d.text_2d_to_3d`

## 19.2.4 proj3d

<code>proj3d.inv_transform(xs, ys, zs, M)</code>	
<code>proj3d.persp_transformation(zfront, zback)</code>	
<code>proj3d.proj_points(points, M)</code>	
<code>proj3d.proj_trans_points(points, M)</code>	
<code>proj3d.proj_transform(xs, ys, zs, M)</code>	Transform the points by the projection matrix
<code>proj3d.proj_transform_clip(xs, ys, zs, M)</code>	Transform the points by the projection matrix and return the clipping result returns txs, tys, tzs, tis

Continued on next page

Table 56 – continued from previous page

<code>proj3d.rot_x(V, alpha)</code>	
<code>proj3d.transform(xs, ys, zs, M)</code>	Transform the points by the projection matrix
<code>proj3d.view_transformation(E, R, V)</code>	
<code>proj3d.world_transformation(xmin, xmax, ...)</code>	Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb_aspect[i]] if the plotbox aspect ratio is specified.

**`mpl_toolkits.mplot3d.proj3d.inv_transform`**

`mpl_toolkits.mplot3d.proj3d.inv_transform(xs, ys, zs, M)`

Examples using `mpl_toolkits.mplot3d.proj3d.inv_transform`

**`mpl_toolkits.mplot3d.proj3d.persp_transformation`**

`mpl_toolkits.mplot3d.proj3d.persp_transformation(zfront, zback)`

Examples using `mpl_toolkits.mplot3d.proj3d.persp_transformation`

**`mpl_toolkits.mplot3d.proj3d.proj_points`**

`mpl_toolkits.mplot3d.proj3d.proj_points(points, M)`

Examples using `mpl_toolkits.mplot3d.proj3d.proj_points`

**`mpl_toolkits.mplot3d.proj3d.proj_trans_points`**

`mpl_toolkits.mplot3d.proj3d.proj_trans_points(points, M)`

Examples using `mpl_toolkits.mplot3d.proj3d.proj_trans_points`

**`mpl_toolkits.mplot3d.proj3d.proj_transform`**

`mpl_toolkits.mplot3d.proj3d.proj_transform(xs, ys, zs, M)`  
Transform the points by the projection matrix

Examples using `mpl_toolkits.mplot3d.proj3d.proj_transform`

**`mpl_toolkits.mplot3d.proj3d.proj_transform_clip`**

`mpl_toolkits.mplot3d.proj3d.proj_transform_clip(xs, ys, zs, M)`  
Transform the points by the projection matrix and return the clipping result returns txs, tys, tzs, tis

Examples using `mpl_toolkits.mplot3d.proj3d.proj_transform_clip`

`mpl_toolkits.mplot3d.proj3d.rot_x`

`mpl_toolkits.mplot3d.proj3d.rot_x(V, alpha)`

Examples using `mpl_toolkits.mplot3d.proj3d.rot_x`

`mpl_toolkits.mplot3d.proj3d.transform`

`mpl_toolkits.mplot3d.proj3d.transform(xs, ys, zs, M)`

Transform the points by the projection matrix

Examples using `mpl_toolkits.mplot3d.proj3d.transform`

`mpl_toolkits.mplot3d.proj3d.view_transformation`

`mpl_toolkits.mplot3d.proj3d.view_transformation(E, R, V)`

Examples using `mpl_toolkits.mplot3d.proj3d.view_transformation`

`mpl_toolkits.mplot3d.proj3d.world_transformation`

`mpl_toolkits.mplot3d.proj3d.world_transformation(xmin, xmax, ymin, ymax, zmin, zmax,  
pb_aspect=None)`

Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb\_aspect[i]] if the plotbox aspect ratio is specified.

Examples using `mpl_toolkits.mplot3d.proj3d.world_transformation`

## 19.3 Matplotlib axes\_grid Toolkit

---

**Note:** AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of `axes_grid`. In more recent version, the toolkit has divided into two separate namespace (`axes_grid1` and `axisartist`). While `axes_grid` namespace is maintained for the backward compatibility, use of `axes_grid1` and `axisartist` is recommended. For the documentation on `axes_grid`, see the [previous version of the docs](#).

---

## **Part V**

# **Third party packages**

Several external packages that extend or build on Matplotlib functionality are listed below. They are maintained and distributed separately from Matplotlib and thus need to be installed individually.

Please submit an issue or pull request on GitHub if you have created a package that you would like to have included. We are also happy to host third party packages within the [Matplotlib GitHub Organization](#).

## MAPPING TOOLKITS

### 23.1 Basemap

`Basemap` plots data on map projections, with continental and political boundaries.

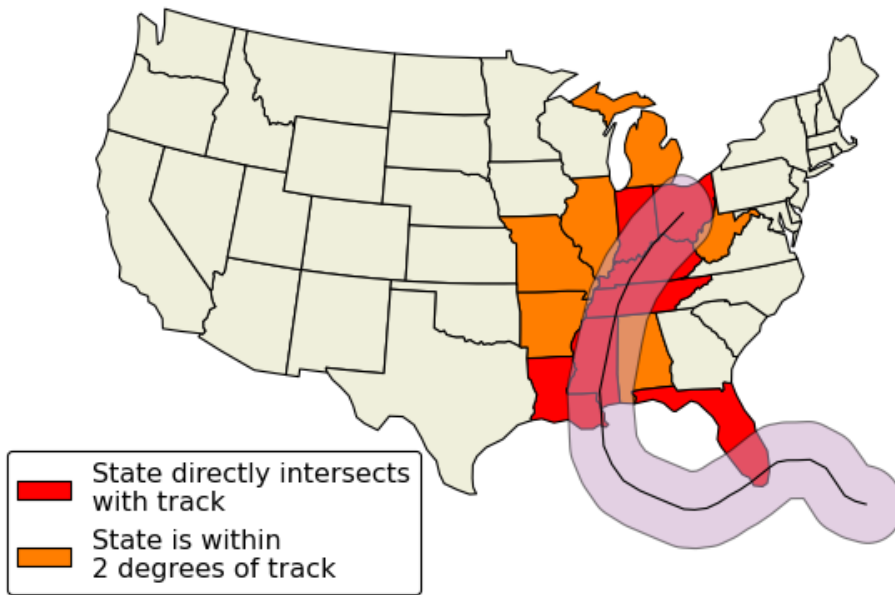

contour lines over filled continent background

### 23.2 Cartopy

`Cartopy` builds on top of Matplotlib to provide object oriented map projection definitions and close integration with Shapely for powerful yet easy-to-use vector data processing tools. An example plot from the `Cartopy` gallery:

US States which intersect the track of Hurricane Katrina (2005)

## 23.3 Geoplot

[Geoplot](#) builds on top of Matplotlib and Cartopy to provide a “standard library” of simple, powerful, and customizable plot types. An example plot from the [Geoplot gallery](#):

## 23.4 Ridge Map

`ridge_map` uses Matplotlib, SRTM.py, NumPy, and scikit-image to make ridge plots of your favorite ridges.

## DECLARATIVE LIBRARIES

### 24.1 ggplot

`ggplot` is a port of the R `ggplot2` package to python based on Matplotlib.

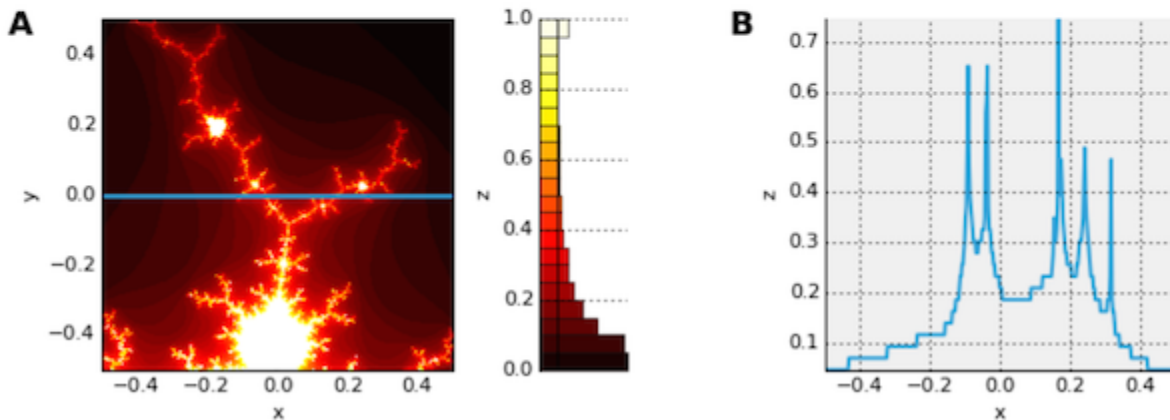

### 24.2 holoviews

`holoviews` makes it easier to visualize data interactively, especially in a `Jupyter notebook`, by providing a set of declarative plotting objects that store your data and associated meta-data. Your data is then immediately visualizable alongside or overlaid with other data, either statically or with automatically provided widgets for parameter exploration.

```
import numpy as np
import holoviews as hv
hv.notebook_extension('matplotlib')
fractal = hv.Image(np.load('mandelbrot.npy'))

((fractal * hv.HLine(y=0)).hist() + fractal.sample(y=0))
```

## 24.3 plotnine

[plotnine](#) implements a grammar of graphics, similar to R's [ggplot2](#). The grammar allows users to compose plots by explicitly mapping data to the visual objects that make up the plot.

## SPECIALTY PLOTS

### 25.1 Broken Axes

`brokenaxes` supplies an axes class that can have a visual break to indicate a discontinuous range.

### 25.2 DeCiDa

`DeCiDa` is a library of functions and classes for electron device characterization, electronic circuit design and general data visualization and analysis.

### 25.3 matplotlib-scalebar

`matplotlib-scalebar` provides a new artist to display a scale bar, aka micron bar. It is particularly useful when displaying calibrated images plotted using `plt.imshow(...)`.

## 25.4 Matplotlib-Venn

`Matplotlib-Venn` provides a set of functions for plotting 2- and 3-set area-weighted (or un-weighted) Venn diagrams.

## 25.5 mpl-probscale

`mpl-probscale` is a small extension that allows Matplotlib users to specify probability scales. Simply importing the `probscale` module registers the scale with Matplotlib, making it accessible via e.g., `ax.set_xscale('prob')` or `plt.yscale('prob')`.

## 25.6 mpl-scatter-density

`mpl-scatter-density` is a small package that makes it easy to make scatter plots of large numbers of points using a density map. The following example contains around 13 million points and the plotting (excluding reading in the data) took less than a second on an average laptop:

When used in interactive mode, the density map is downsampled on-the-fly while panning/zooming in order to provide a smooth interactive experience.

## 25.7 mplstereonet

`mplstereonet` provides stereonets for plotting and analyzing orientation data in Matplotlib.

## 25.8 Natgrid

`mpl_toolkits.natgrid` is an interface to the natgrid C library for gridding irregularly spaced data.

## 25.9 pyUpSet

`pyUpSet` is a static Python implementation of the `UpSet` suite by Lex et al. to explore complex intersections of sets and data frames.

## 25.10 seaborn

`seaborn` is a high level interface for drawing statistical graphics with Matplotlib. It aims to

make visualization a central part of exploring and understanding complex datasets.

## 25.11 WCSAxes

The [Astropy](#) core package includes a submodule called `WCSAxes` (available at [astropy.visualization.wcsaxes](#)) which adds Matplotlib projections for Astronomical image data. The following is an example of a plot made with `WCSAxes` which includes the original coordinate system of the image and an overlay of a different coordinate system:

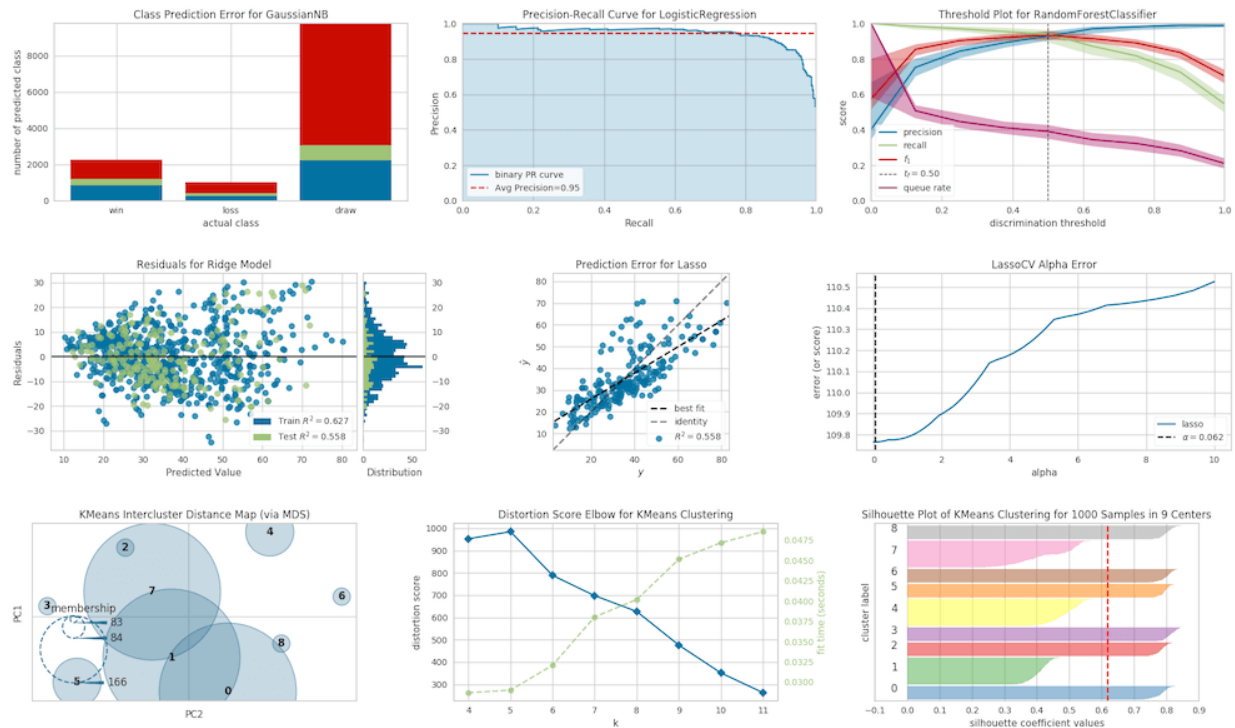

## 25.12 Windrose

[Windrose](#) is a Python Matplotlib, Numpy library to manage wind data, draw windroses (also known as polar rose plots), draw probability density functions and fit Weibull distributions.

## 25.13 Yellowbrick

**Yellowbrick** is a suite of visual diagnostic tools for machine learning that enables human steering of the model selection process. Yellowbrick combines scikit-learn with matplotlib using an estimator-based API called the *Visualizer*, which wraps both sklearn models and matplotlib Axes. *Visualizer* objects fit neatly into the machine learning workflow allowing data scientists to integrate visual diagnostic and model interpretation tools into experimentation without extra steps.

## ANIMATIONS

### 26.1 animatplot

`animatplot` is a library for producing interactive animated plots with the goal of making production of animated plots almost as easy as static ones.

Animatplot

For an animated version of the above picture and more examples, see the [animatplot gallery](#).

## 26.2 gif

`gif` is an ultra lightweight animated gif API.

## 26.3 numpngw

`numpngw` provides functions for writing NumPy arrays to PNG and animated PNG files. It also includes the class `AnimatedPNGWriter` that can be used to save a Matplotlib animation as an animated PNG file. See the example on the PyPI page or at the `numpngw` [github repository](#).

## INTERACTIVITY

### 27.1 `mplcursors`

`mplcursors` provides interactive data cursors for Matplotlib.

### 27.2 `MplDataCursor`

`MplDataCursor` is a toolkit written by Joe Kington to provide interactive “data cursors” (clickable annotation boxes) for Matplotlib.

## RENDERING BACKENDS

### 28.1 `mplcairo`

`mplcairo` is a cairo backend for Matplotlib, with faster and more accurate marker drawing, support for a wider selection of font formats and complex text layout, and various other features.

### 28.2 `gr`

`gr` is a framework for cross-platform visualisation applications, which can be used as a high-performance Matplotlib backend.

## MISCELLANEOUS

### 29.1 `adjustText`

`adjustText` is a small library for automatically adjusting text position in Matplotlib plots to minimize overlaps between them, specified points and other objects.

## 29.2 iTerm2 terminal backend

`matplotlib_itterm2` is an external Matplotlib backend using the iTerm2 nightly build inline image display feature.

## 29.3 mpl-template

`mpl-template` provides a customizable way to add engineering figure elements such as a title block, border, and logo.

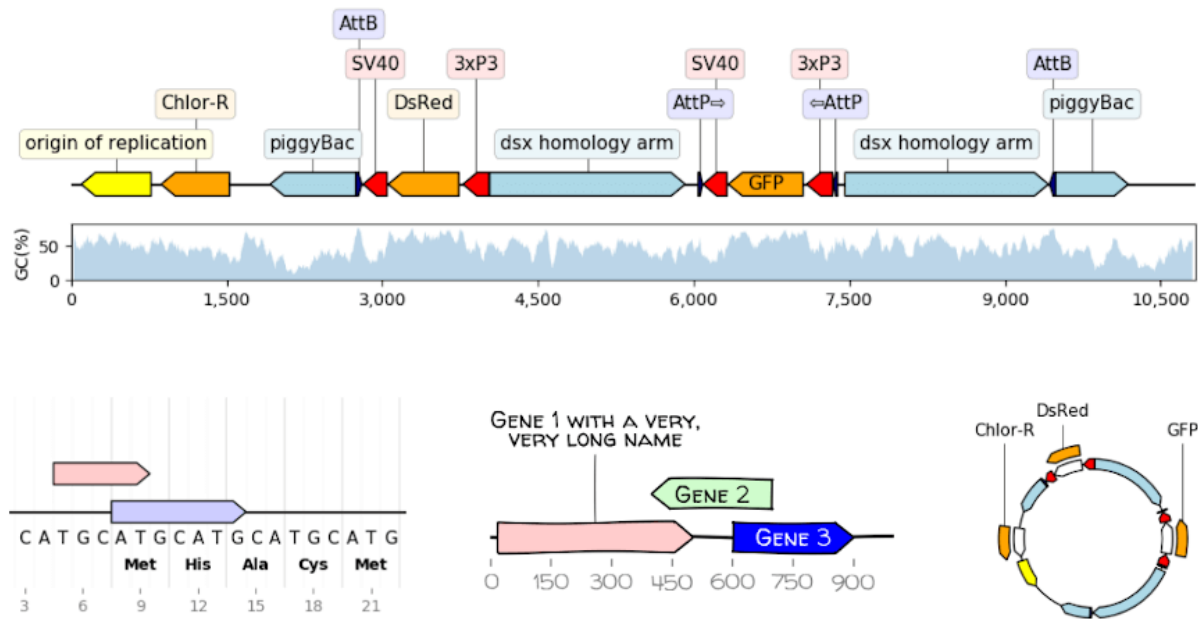

## 29.4 blume

`blume` provides a replacement for the Matplotlib `table` module. It fixes a number of issues with the existing table. See the [blume github repository](#) for more details.

## 29.5 DNA Features Viewer

[DNA Features Viewer](#) provides methods to plot annotated DNA sequence maps (possibly along other Matplotlib plots) for Bioinformatics and Synthetic Biology applications.

## GUI APPLICATIONS

### 30.1 svviewgui

**svviewgui** is a PyQt-based GUI for visualisation of data from csv files or `pandas.DataFrame`s. Main features:

- Scatter, line, density, histogram, and box plot types
- Settings for the marker size, line width, number of bins of histogram, color map (from cmocool)
- Save figure as editable PDF
- Code of the plotted graph is available so that it can be reused and modified outside of svviewgui

## **Part VI**

# **The Matplotlib Developers' Guide**

## CONTRIBUTING

This project is a community effort, and everyone is welcome to contribute. We follow the [Python Software Foundation Code of Conduct](#) in everything we do.

The project is hosted on <https://github.com/matplotlib/matplotlib>

### 31.1 Submitting a bug report

If you find a bug in the code or documentation, do not hesitate to submit a ticket to the [Bug Tracker](#). You are also welcome to post feature requests or pull requests.

If you are reporting a bug, please do your best to include the following:

1. A short, top-level summary of the bug. In most cases, this should be 1-2 sentences.
2. A short, self-contained code snippet to reproduce the bug, ideally allowing a simple copy and paste to reproduce. Please do your best to reduce the code snippet to the minimum required.
3. The actual outcome of the code snippet.
4. The expected outcome of the code snippet.
5. The Matplotlib version, Python version and platform that you are using. You can grab the version with the following commands:

```
>>> import matplotlib
>>> matplotlib.__version__
'1.5.3'
>>> import platform
>>> platform.python_version()
'2.7.12'
```

We have preloaded the issue creation page with a Markdown template that you can use to organize this information.

Thank you for your help in keeping bug reports complete, targeted and descriptive.

### 31.2 Retrieving and installing the latest version of the code

When developing Matplotlib, sources must be downloaded, built, and installed into a local environment on your machine.

We use [Git](#) for version control and [GitHub](#) for hosting our main repository.

You can check out the latest sources with the command (see [Set up your fork](#) for more details):

```
git clone https://github.com/matplotlib/matplotlib.git
```

and navigate to the matplotlib directory. If you have the proper privileges, you can use `git@` instead of `https://`, which works through the ssh protocol and might be easier to use if you are using 2-factor authentication.

### 31.2.1 Installing Matplotlib in developer mode

It is strongly recommended to set up a clean [virtual environment](#). Do not use on a preexisting environment!

A new environment can be set up with

```
python3 -mvenv /path/to/devel/env
```

and activated with one of the following:

```
source /path/to/devel/env/bin/activate # Linux/macOS
/path/to/devel/env/Scripts/activate.bat # Windows cmd.exe
/path/to/devel/env/Scripts/Activate.ps1 # Windows PowerShell
```

Whenever you plan to work on Matplotlib, remember to activate the development environment in your shell!

To install Matplotlib (and compile the C-extensions) run the following command from the top-level directory

```
python -mpip install -ve .
```

This installs Matplotlib in 'editable/develop mode', i.e., builds everything and places the correct link entries in the install directory so that python will be able to import Matplotlib from the source directory. Thus, any changes to the \*.py files will be reflected the next time you import the library. If you change the C-extension source (which might happen if you change branches) you will need to run

```
python setup.py build_ext --inplace
```

or re-run `python -mpip install -ve ..`

You can then run the tests to check your work environment is set up properly:

```
python -mpytest
```

---

**Note:** **Additional dependencies for testing:** [pytest](#) (version 3.6 or later), [Ghostscript](#), [Inkscape](#)

---

**See also:**

- [Developer's tips for testing](#)

## 31.3 Contributing code

### 31.3.1 How to contribute

The preferred way to contribute to Matplotlib is to fork the [main repository](#) on GitHub, then submit a “pull request” (PR).

The best practices for using GitHub to make PRs to Matplotlib are documented in the [Development workflow](#) section.

A brief overview is:

1. [Create an account](#) on GitHub if you do not already have one.
2. Fork the [project repository](#): click on the ‘Fork’ button near the top of the page. This creates a copy of the code under your account on the GitHub server.
3. Clone this copy to your local disk:

```
$ git clone https://github.com/YourLogin/matplotlib.git
```

4. Create a branch to hold your changes:

```
$ git checkout -b my-feature origin/master
```

and start making changes. Never work in the master branch!

5. Work on this copy, on your computer, using Git to do the version control. When you’re done editing e.g., `lib/matplotlib/collections.py`, do:

```
$ git add lib/matplotlib/collections.py
$ git commit
```

to record your changes in Git, then push them to GitHub with:

```
$ git push -u origin my-feature
```

Finally, go to the web page of your fork of the Matplotlib repo, and click ‘Pull request’ to send your changes to the maintainers for review. You may want to consider sending an email to the mailing list for more visibility.

**See also:**

- [Git documentation](#)
- [Git-Contributing to a Project](#)
- [Introduction to GitHub](#)
- [Development workflow](#)
- [Working with Matplotlib source code](#)

### 31.3.2 Contributing pull requests

It is recommended to check that your contribution complies with the following rules before submitting a pull request:

- If your pull request addresses an issue, please use the title to describe the issue and mention the issue number in the pull request description to ensure that a link is created to the original issue.
- All public methods should have informative docstrings with sample usage when appropriate. Use the [numpy docstring standard](#).
- Formatting should follow the recommendations of [PEP8](#). You should consider installing/enabling automatic PEP8 checking in your editor. Part of the test suite is checking PEP8 compliance, things go smoother if the code is mostly PEP8 compliant to begin with.
- Each high-level plotting function should have a simple example in the Example section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go in the examples tree.
- Changes (both new features and bugfixes) should be tested. See [Developer's tips for testing](#) for more details.
- Import the following modules using the standard scipy conventions:

```
import numpy as np
import numpy.ma as ma
import matplotlib as mpl
import matplotlib.pyplot as plt
import matplotlib.cbook as cbook
import matplotlib.patches as mpatches
```

In general, Matplotlib modules should **not** import `rcParams` using `from matplotlib import rcParams`, but rather access it as `mpl.rcParams`. This is because some modules are imported very early, before the `rcParams` singleton is constructed.

- If your change is a major new feature, add an entry to the What's new section by adding a new file in `doc/users/next_whats_new` (see `doc/users/next_whats_new/README.rst` for more information).
- If you change the API in a backward-incompatible way, please document it in `doc/api/api_changes`, by adding to the relevant file (see `doc/api/api_changes.rst` for more information)
- See below for additional points about [Keyword argument processing](#), if applicable for your pull request.

In addition, you can check for common programming errors with the following tools:

- Code with a good unittest coverage (at least 70%, better 100%), check with:

```
python -mpip install coverage
python -mpytest --cov=matplotlib --showlocals -v
```

- No pyflakes warnings, check with:

```
python -mpip install pyflakes
pyflakes path/to/module.py
```

---

**Note:** The current state of the Matplotlib code base is not compliant with all of those guidelines, but we expect that enforcing those constraints on all new contributions will move the overall code base quality in the right direction.

---

**See also:**

- [Coding guidelines](#)
- [Developer's tips for testing](#)
- [Writing documentation](#)

### 31.3.3 Issues for New Contributors

New contributors should look for the following tags when looking for issues. We strongly recommend that new contributors tackle issues labeled [good first issue](#) as they are easy, well documented issues, that do not require an understanding of the different submodules of Matplotlib. This helps the contributor become familiar with the contribution workflow, and for the core devs to become acquainted with the contributor; besides which, we frequently underestimate how easy an issue is to solve!

## 31.4 Contributing documentation

Code is not the only way to contribute to Matplotlib. For instance, documentation is also a very important part of the project and often doesn't get as much attention as it deserves. If you find a typo in the documentation, or have made improvements, do not hesitate to send an email to the mailing list or submit a GitHub pull request. To make a pull request, refer to the guidelines outlined in [How to contribute](#).

Full documentation can be found under the `doc/`, `tutorials/`, and `examples/` directories.

**See also:**

- [Writing documentation](#)

## 31.5 Other ways to contribute

It also helps us if you spread the word: reference the project from your blog and articles or link to it from your website! If Matplotlib contributes to a project that leads to a scientific publication, please follow the [Citing Matplotlib](#) guidelines.

## 31.6 Coding guidelines

### 31.6.1 API changes

Changes to the public API must follow a standard deprecation procedure to prevent unexpected breaking of code that uses Matplotlib.

- Deprecations must be announced via an entry in the most recent `doc/api/api_changes_X.Y`
- Deprecations are targeted at the next point-release (i.e. 3.x.0).

- The deprecated API should, to the maximum extent possible, remain fully functional during the deprecation period. In cases where this is not possible, the deprecation must never make a given piece of code do something different than it was before; at least an exception should be raised.
- If possible, usage of an deprecated API should emit a *MatplotlibDeprecationWarning*. There are a number of helper tools for this:
  - Use `cbook.warn_deprecated()` for general deprecation warnings.
  - Use the decorator `@cbook.deprecated` to deprecate classes, functions, methods, or properties.
  - To warn on changes of the function signature, use the decorators `@cbook._delete_parameter`, `@cbook._rename_parameter`, and `@cbook._make_keyword_only`.
- Deprecated API may be removed two point-releases after they were deprecated.

### 31.6.2 Adding new API

Every new function, parameter and attribute that is not explicitly marked as private (i.e., starts with an underscore) becomes part of Matplotlib's public API. As discussed above, changing the existing API is cumbersome. Therefore, take particular care when adding new API:

- Mark helper functions and internal attributes as private by prefixing them with an underscore.
- Carefully think about good names for your functions and variables.
- Try to adopt patterns and naming conventions from existing parts of the Matplotlib API.
- Consider making as many arguments keyword-only as possible. See also [API Evolution the Right Way - Add Parameters Compatibly](#).

### 31.6.3 New modules and files: installation

- If you have added new files or directories, or reorganized existing ones, make sure the new files are included in the match patterns in `MANIFEST.in`, and/or in `package_data` in `setup.py`.

### 31.6.4 C/C++ extensions

- Extensions may be written in C or C++.
- Code style should conform to PEP7 (understanding that PEP7 doesn't address C++, but most of its admonitions still apply).
- Python/C interface code should be kept separate from the core C/C++ code. The interface code should be named `F00_wrap.cpp` or `F00_wrapper.cpp`.
- Header file documentation (aka docstrings) should be in Numpydoc format. We don't plan on using automated tools for these docstrings, and the Numpydoc format is well understood in the scientific Python community.

### 31.6.5 Keyword argument processing

Matplotlib makes extensive use of `**kwargs` for pass-through customizations from one function to another. A typical example is in `matplotlib.pyplot.text()`. The definition of the pylab text function is a simple pass-through to `matplotlib.axes.Axes.text()`:

```
# in pylab.py
def text(*args, **kwargs):
    ret = gca().text(*args, **kwargs)
    draw_if_interactive()
    return ret
```

`text()` in simplified form looks like this, i.e., it just passes all args and kwargs on to matplotlib.  
`text.Text.__init__()`:

```
# in axes/_axes.py
def text(self, x, y, s, fontdict=None, withdash=False, **kwargs):
    t = Text(x=x, y=y, text=s, **kwargs)
```

and `__init__()` (again with liberties for illustration) just passes them on to the `matplotlib.artist.Artist.update()` method:

```
# in text.py
def __init__(self, x=0, y=0, text='', **kwargs):
    Artist.__init__(self)
    self.update(kwargs)
```

`update` does the work looking for methods named like `set_property` if `property` is a keyword argument. i.e., no one looks at the keywords, they just get passed through the API to the artist constructor which looks for suitably named methods and calls them with the value.

As a general rule, the use of `**kwargs` should be reserved for pass-through keyword arguments, as in the example above. If all the keyword args are to be used in the function, and not passed on, use the key/value keyword args in the function definition rather than the `**kwargs` idiom.

In some cases, you may want to consume some keys in the local function, and let others pass through. Instead of popping arguments to use off `**kwargs`, specify them as keyword-only arguments to the local function. This makes it obvious at a glance which arguments will be consumed in the function. For example, in `plot()`, `scalex` and `scaley` are local arguments and the rest are passed on as `Line2D()` keyword arguments:

```
# in axes/_axes.py
def plot(self, *args, scalex=True, scaley=True, **kwargs):
    lines = []
    for line in self._get_lines(*args, **kwargs):
        self.add_line(line)
        lines.append(line)
```

### 31.6.6 Using logging for debug messages

Matplotlib uses the standard python `logging` library to write verbose warnings, information, and debug messages. Please use it! In all those places you write `print()` statements to do your debugging, try using `log.debug()` instead!

To include `logging` in your module, at the top of the module, you need to import `logging`. Then calls in your code like:

```
_log = logging.getLogger(__name__) # right after the imports

# code
# more code
_log.info('Here is some information')
_log.debug('Here is some more detailed information')
```

will log to a logger named `matplotlib.yourmodulename`.

If an end-user of Matplotlib sets up `logging` to display at levels more verbose than `logging.WARNING` in their code with the Matplotlib-provided helper:

```
plt.set_loglevel("debug")
```

or manually with

```
import logging
logging.basicConfig(level=logging.DEBUG)
import matplotlib.pyplot as plt
```

Then they will receive messages like:

```
DEBUG:matplotlib.backends:backend MacOSX version unknown
DEBUG:matplotlib.yourmodulename:Here is some information
DEBUG:matplotlib.yourmodulename:Here is some more detailed information
```

### Which logging level to use?

There are five levels at which you can emit messages.

- `logging.critical` and `logging.error` are really only there for errors that will end the use of the library but not kill the interpreter.
- `logging.warning` and `cbook._warn_external` are used to warn the user, see below.
- `logging.info` is for information that the user may want to know if the program behaves oddly. They are not displayed by default. For instance, if an object isn't drawn because its position is NaN, that can usually be ignored, but a mystified user could call `logging.basicConfig(level=logging.INFO)` and get an error message that says why.
- `logging.debug` is the least likely to be displayed, and hence can be the most verbose. "Expected" code paths (e.g., reporting normal intermediate steps of layouting or rendering) should only log at this level.

By default, `logging` displays all log messages at levels higher than `logging.WARNING` to `sys.stderr`.

The [logging tutorial](#) suggests that the difference between `logging.warning` and `cbook._warn_external` (which uses `warnings.warn`) is that `cbook._warn_external` should be used for things the user must change to stop the warning (typically in the source), whereas `logging.warning` can be more persistent. Moreover, note that `cbook._warn_external` will by default only emit a given warning *once* for each line of user code, whereas `logging.warning` will display the message every time it is called.

By default, `warnings.warn` displays the line of code that has the `warn` call. This usually isn't more informative than the warning message itself. Therefore, Matplotlib uses `cbook._warn_external` which uses `warnings.warn`, but goes up the stack and displays the first line of code outside of Matplotlib. For example, for the module:

```
# in my_matplotlib_module.py
import warnings

def set_range(bottom, top):
    if bottom == top:
        warnings.warn('Attempting to set identical bottom==top')
```

running the script:

```
from matplotlib import my_matplotlib_module
my_matplotlib_module.set_range(0, 0) #set range
```

will display:

```
UserWarning: Attempting to set identical bottom==top
warnings.warn('Attempting to set identical bottom==top')
```

Modifying the module to use `cbook._warn_external`:

```
from matplotlib import cbook

def set_range(bottom, top):
    if bottom == top:
        cbook._warn_external('Attempting to set identical bottom==top')
```

and running the same script will display:

```
UserWarning: Attempting to set identical bottom==top
my_matplotlib_module.set_range(0, 0) #set range
```

### 31.6.7 Writing examples

We have hundreds of examples in subdirectories of `matplotlib/examples`, and these are automatically generated when the website is built to show up in the `examples` section of the website.

Any sample data that the example uses should be kept small and distributed with Matplotlib in the `lib/matplotlib/mpl-data/sample_data/` directory. Then in your example code you can load it into a file handle with:

```
import matplotlib.cbook as cbook
fh = cbook.get_sample_data('mydata.dat')
```

## DEVELOPER'S TIPS FOR TESTING

Matplotlib's testing infrastructure depends on `pytest`. The tests are in `lib/matplotlib/tests`, and customizations to the `pytest` testing infrastructure are in `matplotlib.testing`.

### 32.1 Requirements

Install the latest version of Matplotlib as documented in *Retrieving and installing the latest version of the code*.

The following software is required to run the tests:

- `pytest` ( $\geq 3.6$ )
- `Ghostscript` ( $\geq 9.0$ , to render PDF files)
- `Inkscape` (to render SVG files)

Optionally you can install:

- `pytest-cov` ( $\geq 2.3.1$ ) to collect coverage information
- `pytest-flake8` to test coding standards using `flake8`
- `pytest-timeout` to limit runtime in case of stuck tests
- `pytest-xdist` to run tests in parallel

### 32.2 Running the tests

Running the tests is simple. Make sure you have `pytest` installed and run:

```
pytest
```

in the root directory of the repository.

`pytest` can be configured via a lot of [command-line parameters](#). Some particularly useful ones are:

<code>-v</code> OR <code>--verbose</code>	Be more verbose
<code>-n NUM</code>	Run tests in parallel over NUM processes (requires <code>pytest-xdist</code> )
<code>--timeout=SECONDS</code>	Set timeout for results from each test process (requires <code>pytest-timeout</code> )
<code>--capture=no</code> OR <code>-s</code>	Do not capture stdout
<code>--flake8</code>	Check coding standards using <code>flake8</code> (requires <code>pytest-flake8</code> )

To run a single test from the command line, you can provide a file path, optionally followed by the function separated by two colons, e.g., (tests do not need to be installed, but Matplotlib should be):

```
pytest lib/matplotlib/tests/test_simplification.py::test_clipping
```

or, if tests are installed, a dot-separated path to the module, optionally followed by the function separated by two colons, such as:

```
pytest --pyargs matplotlib.tests.test_simplification::test_clipping
```

If you want to run the full test suite, but want to save wall time try running the tests in parallel:

```
pytest --verbose -n 5
```

An alternative implementation that does not look at command line arguments and works from within Python is to run the tests from the Matplotlib library function `matplotlib.test()`:

```
import matplotlib
matplotlib.test()
```

## 32.3 Writing a simple test

Many elements of Matplotlib can be tested using standard tests. For example, here is a test from `matplotlib.tests.test_basic`:

```
def test_simple():
    """
    very simple example test
    """
    assert 1 + 1 == 2
```

Pytest determines which functions are tests by searching for files whose names begin with "test\_" and then within those files for functions beginning with "test" or classes beginning with "Test".

Some tests have internal side effects that need to be cleaned up after their execution (such as created figures or modified `rcParams`). The pytest fixture `mpl_test_settings()` will automatically clean these up; there is no need to do anything further.

## 32.4 Random data in tests

Random data is a very convenient way to generate data for examples, however the randomness is problematic for testing (as the tests must be deterministic!). To work around this set the seed in each test. For numpy use:

```
import numpy as np
np.random.seed(19680801)
```

and Python's random number generator:

```
import random
random.seed(19680801)
```

The seed is John Hunter’s birthday.

## 32.5 Writing an image comparison test

Writing an image-based test is only slightly more difficult than a simple test. The main consideration is that you must specify the “baseline”, or expected, images in the `image_comparison` decorator. For example, this test generates a single image and automatically tests it:

```
from matplotlib.testing.decorators import image_comparison
import matplotlib.pyplot as plt

@image_comparison(baseline_images=['line_dashes'], remove_text=True,
                  extensions=['png'])
def test_line_dashes():
    fig, ax = plt.subplots()
    ax.plot(range(10), linestyle=(0, (3, 3)), lw=5)
```

The first time this test is run, there will be no baseline image to compare against, so the test will fail. Copy the output images (in this case `result_images/test_lines/test_line_dashes.png`) to the correct subdirectory of `baseline_images` tree in the source directory (in this case `lib/matplotlib/tests/baseline_images/test_lines`). Put this new file under source code revision control (with `git add`). When rerunning the tests, they should now pass.

Baseline images take a lot of space in the Matplotlib repository. An alternative approach for image comparison tests is to use the `check_figures_equal` decorator, which should be used to decorate a function taking two `Figure` parameters and draws the same images on the figures using two different methods (the tested method and the baseline method). The decorator will arrange for setting up the figures and then collect the drawn results and compare them.

See the documentation of `image_comparison` and `check_figures_equal` for additional information about their use.

## 32.6 Known failing tests

If you’re writing a test, you may mark it as a known failing test with the `pytest.mark.xfail()` decorator. This allows the test to be added to the test suite and run on the buildbots without causing undue alarm. For example, although the following test will fail, it is an expected failure:

```
import pytest

@pytest.mark.xfail
def test_simple_fail():
    '''very simple example test that should fail'''
    assert 1 + 1 == 3
```

Note that the first argument to the `xfail()` decorator is a fail condition, which can be a value such as `True`, `False`, or may be a dynamically evaluated expression. If a condition is supplied, then a reason must also be supplied with the `reason='message'` keyword argument.

## 32.7 Creating a new module in matplotlib.tests

We try to keep the tests categorized by the primary module they are testing. For example, the tests related to the `matplotlib.mathtext.py` module are in `test_mathtext.py`.

## 32.8 Using Travis CI

Travis CI is a hosted CI system “in the cloud”.

Travis is configured to receive notifications of new commits to GitHub repos (via GitHub “service hooks”) and to run builds or tests when it sees these new commits. It looks for a YAML file called `.travis.yml` in the root of the repository to see how to test the project.

Travis CI is already enabled for the [main Matplotlib GitHub repository](#) – for example, see [its Travis page](#).

If you want to enable Travis CI for your personal Matplotlib GitHub repo, simply enable the repo to use Travis CI in either the Travis CI UI or the GitHub UI (Admin | Service Hooks). For details, see [the Travis CI Getting Started page](#). This generally isn’t necessary, since any pull request submitted against the main Matplotlib repository will be tested.

Once this is configured, you can see the Travis CI results at [https://travis-ci.org/your\\_GitHub\\_user\\_name/matplotlib](https://travis-ci.org/your_GitHub_user_name/matplotlib) – here’s [an example](#).

## 32.9 Using tox

Tox is a tool for running tests against multiple Python environments, including multiple versions of Python (e.g., 3.6, 3.7) and even different Python implementations altogether (e.g., CPython, PyPy, Jython, etc.), as long as all these versions are available on your system’s `$PATH` (consider using your system package manager, e.g. `apt-get`, `yum`, or Homebrew, to install them).

tox makes it easy to determine if your working copy introduced any regressions before submitting a pull request. Here’s how to use it:

```
$ pip install tox
$ tox
```

You can also run tox on a subset of environments:

```
$ tox -e py36,py37
```

Tox processes everything serially so it can take a long time to test several environments. To speed it up, you might try using a new, parallelized version of tox called `detox`. Give this a try:

```
$ pip install -U -i http://pypi.testrun.org detox
$ detox
```

Tox is configured using a file called `tox.ini`. You may need to edit this file if you want to add new environments to test (e.g., `py33`) or if you want to tweak the dependencies or the way the tests are run. For more info on the `tox.ini` file, see the [Tox Configuration Specification](#).

## 32.10 Building old versions of Matplotlib

When running a `git bisect` to see which commit introduced a certain bug, you may (rarely) need to build very old versions of Matplotlib. The following constraints need to be taken into account:

- Matplotlib 1.3 (or earlier) requires numpy 1.8 (or earlier).

## 33.1 Getting started

### 33.1.1 General file structure

All documentation is built from the `doc/`, `tutorials/`, and `examples/` directories. The `doc/` directory contains configuration files for Sphinx and reStructuredText (ReST; `.rst`) files that are rendered to documentation pages.

The main entry point is `doc/index.rst`, which pulls in the `index.rst` file for the users guide (`doc/users`), developers guide (`doc/devel`), api reference (`doc/api`), and FAQs (`doc/faq`). The documentation suite is built as a single document in order to make the most effective use of cross referencing.

Sphinx also creates `.rst` files that are staged in `doc/api` from the docstrings of the classes in the Matplotlib library. Except for `doc/api/api_changes/`, these `.rst` files are created when the documentation is built.

Similarly, the contents of `doc/gallery` and `doc/tutorials` are generated by the [Sphinx Gallery](#) from the sources in `examples/` and `tutorials/`. These sources consist of python scripts that have ReST documentation built into their comments.

---

**Note:** Don't directly edit the `.rst` files in `doc/gallery`, `doc/tutorials`, and `doc/api` (excepting `doc/api/api_changes/`). Sphinx regenerates files in these directories when building documentation.

---

### 33.1.2 Installing dependencies

The documentation for Matplotlib is generated from reStructuredText (ReST) using the [Sphinx](#) documentation generation tool. To build the documentation you will need to (1) set up an appropriate Python environment and (2) separately install LaTeX and Graphviz.

To (1) set up an appropriate Python environment for building the documentation, you should:

- create a clean virtual environment with no existing Matplotlib installation
- install the Python packages required for Matplotlib
- install the additional Python packages required to build the documentation

There are several extra python packages that are needed to build the documentation. They are listed in `doc-requirements.txt`, which is shown below:

```
# Requirements for building docs
#
# You will first need a matching Matplotlib installation
# e.g (from the Matplotlib root directory)
#     pip install -e .
#
# Install the documentation requirements with:
#     pip install -r requirements/doc/doc-requirements.txt
#
sphinx>=1.8.1,!2.0.0
colorspacious
ipython
ipywidgets
numpydoc>=0.8
sphinxcontrib-svg2pdfconverter>=1.1.0
sphinx-gallery>=0.7
sphinx-copybutton
scipy
```

To (2) set up LaTeX and Graphviz dependencies you should:

- install a minimal working LaTeX distribution
- install the LaTeX packages `cm-super` and `dvipng`
- install [Graphviz](#)

**Note:** The documentation will not build without LaTeX and Graphviz. These are not Python packages and must be installed separately.

### 33.1.3 Building the docs

The documentation sources are found in the `doc/` directory in the trunk. The configuration file for Sphinx is `doc/conf.py`. It controls which directories Sphinx parses, how the docs are built, and how the extensions are used. To build the documentation in html format, `cd` into `doc/` and run:

```
make html
```

Other useful invocations include

```
# Delete built files. May help if you get errors about missing paths or
# broken links.
make clean

# Build pdf docs.
make latexpdf
```

The `SPHINXOPTS` variable is set to `-W --keep-going` by default to build the complete docs but exit with exit status 1 if there are warnings. To unset it, use

```
make SPHINXOPTS= html
```

On Windows the arguments must be at the end of the statement:

```
make html SPHINXOPTS=
```

You can use the `O` variable to set additional options:

- `make O=-j4 html` runs a parallel build with 4 processes.
- `make O=-Dplot_formats=png:100 html` saves figures in low resolution.
- `make O=-Dplot_gallery=0 html` skips the gallery build.

Multiple options can be combined using e.g. `make O='-j4 -Dplot_gallery=0' html`.

On Windows, either use the format shown above or set options as environment variables, e.g.:

```
set O=-W --keep-going -j4
make html
```

## 33.2 Writing ReST pages

Most documentation is either in the docstring of individual classes and methods, in explicit `.rst` files, or in examples and tutorials. All of these use the [ReST](#) syntax. Users should look at the [ReST](#) documentation for a full description. But some specific hints and conventions Matplotlib uses are useful for creating documentation.

### 33.2.1 Formatting and style conventions

It is useful to strive for consistency in the Matplotlib documentation. Here are some formatting and style conventions that are used.

#### Section name formatting

For everything but top-level chapters, use Upper lower for section titles, e.g., Possible hangups rather than Possible Hangups

#### Function arguments

Function arguments and keywords within docstrings should be referred to using the *\*emphasis\** role. This will keep Matplotlib's documentation consistent with Python's documentation:

```
Here is a description of *argument*
```

Do not use the ``default role``:

```
Do not describe `argument` like this. As per the next section,
this syntax will (unsuccessfully) attempt to resolve the argument as a
link to a class or method in the library.
```

nor the ```literal``` role:

Do not describe ``argument`` like this.

### 33.2.2 Referring to other documents and sections

Sphinx allows internal references between documents.

Documents can be linked with the `:doc:` directive:

```
See the :doc:`/faq/installing_faq`

See the tutorial :doc:`/tutorials/introductory/sample_plots`

See the example :doc:`/gallery/lines_bars_and_markers/simple_plot`
```

will render as:

See the *Installation*

See the tutorial *Sample plots in Matplotlib*

See the example */gallery/lines\_bars\_and\_markers/simple\_plot*

Sections can also be given reference names. For instance from the *Installation* link:

```
.. _clean-install:

How to completely remove Matplotlib
=====

Occasionally, problems with Matplotlib can be solved with a clean...
```

and refer to it using the standard reference syntax:

```
See :ref:`clean-install`
```

will give the following link: *How to completely remove Matplotlib*

To maximize internal consistency in section labeling and references, use hyphen separated, descriptive labels for section references. Keep in mind that contents may be reorganized later, so avoid top level names in references like `user` or `devel` or `faq` unless necessary, because for example the FAQ "what is a backend?" could later become part of the users guide, so the label:

```
.. _what-is-a-backend:
```

is better than:

```
.. _faq-backend:
```

In addition, since underscores are widely used by Sphinx itself, use hyphens to separate words.

### 33.2.3 Referring to other code

To link to other methods, classes, or modules in Matplotlib you can use back ticks, for example:

```
`matplotlib.collections.LineCollection`
```

generates a link like this: *matplotlib.collections.LineCollection*.

*Note:* We use the sphinx setting `default_role = 'obj'` so that you don't have to use qualifiers like `:class:`, `:func:`, `:meth:` and the likes.

Often, you don't want to show the full package and module name. As long as the target is unambiguous you can simply leave them out:

```
`LineCollection`
```

and the link still works: *LineCollection*.

If there are multiple code elements with the same name (e.g. `plot()` is a method in multiple classes), you'll have to extend the definition:

```
`pyplot.plot` or `Axes.plot`
```

These will show up as *pyplot.plot* or *Axes.plot*. To still show only the last segment you can add a tilde as prefix:

```
`~.pyplot.plot` or `~.Axes.plot`
```

will render as *plot* or *plot*.

Other packages can also be linked via [intersphinx](#):

```
`numpy.mean`
```

will return this link: *numpy.mean*. This works for Python, Numpy, Scipy, and Pandas (full list is in `doc/conf.py`). If external linking fails, you can check the full list of referenceable objects with the following commands:

```
python -m sphinx.ext.intersphinx 'https://docs.python.org/3/objects.inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/numpy/objects.inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/scipy/reference/objects.inv'
python -m sphinx.ext.intersphinx 'https://pandas.pydata.org/pandas-docs/stable/objects.inv'
```

### 33.2.4 Including figures and files

Image files can directly included in pages with the `image::` directive. e.g., `thirdpartypackages/index.rst` displays the images for the third-party packages as static images:

```
.. image:: ../_static/toolbar.png
```

as rendered on the page: *Third party packages*.

Files can be included verbatim. For instance the `matplotlibrc` file is important for customizing Matplotlib, and is included verbatim in the tutorial in *Customizing Matplotlib with style sheets and rcParams*:

```
.. literalinclude:: ../_static/matplotlibrc
```

This is rendered at the bottom of *Customizing Matplotlib with style sheets and rcParams*. Note that this is in a tutorial; see *Writing examples and tutorials* below.

The examples directory is also copied to `doc/gallery` by sphinx-gallery, so plots from the examples directory can be included using

```
.. plot:: gallery/lines_bars_and_markers/simple_plot.py
```

Note that the python script that generates the plot is referred to, rather than any plot that is created. Sphinx-gallery will provide the correct reference when the documentation is built.

## 33.3 Writing docstrings

Most of the API documentation is written in docstrings. These are comment blocks in source code that explain how the code works.

**Note:** Some parts of the documentation do not yet conform to the current documentation style. If in doubt, follow the rules given here and not what you may see in the source code. Pull requests updating docstrings to the current style are very welcome.

All new or edited docstrings should conform to the [numpydoc docstring guide](#). Much of the ReST syntax discussed above ([Writing ReST pages](#)) can be used for links and references. These docstrings eventually populate the `doc/api` directory and form the reference documentation for the library.

### 33.3.1 Example docstring

An example docstring looks like:

```
def hlines(self, y, xmin, xmax, colors='k', linestyle='solid',
            label='', **kwargs):
    """
    Plot horizontal lines at each *y* from *xmin* to *xmax*.

    Parameters
    -----
    y : float or array-like
        y-indexes where to plot the lines.

    xmin, xmax : float or array-like
        Respective beginning and end of each line. If scalars are
        provided, all lines will have the same length.

    colors : array-like of colors, default: 'k'

    linestyle : {'solid', 'dashed', 'dashdot', 'dotted'}, default: 'solid'

    label : str, default: ''

    Returns
    -----
    lines : ~matplotlib.collections.LineCollection`

    Other Parameters
```

(continues on next page)

(continued from previous page)

```
-----  
**kwargs : ~matplotlib.collections.LineCollection` properties  
  
See also  
-----  
vlines : vertical lines  
axhline: horizontal line across the axes  
"""
```

See the *hlines* documentation for how this renders.

The [Sphinx](#) website also contains plenty of [documentation](#) concerning ReST markup and working with Sphinx in general.

### 33.3.2 Formatting conventions

The basic docstring conventions are covered in the [numpydoc docstring guide](#) and the [Sphinx](#) documentation. Some Matplotlib-specific formatting conventions to keep in mind:

#### Quote positions

The quotes for single line docstrings are on the same line (pydocstyle D200):

```
def get_linewidth(self):  
    """Return the line width in points."""
```

The quotes for multi-line docstrings are on separate lines (pydocstyle D213):

```
def set_linestyle(self, ls):  
    """  
    Set the linestyle of the line.  
  
    [...]  
    """
```

#### Function arguments

Function arguments and keywords within docstrings should be referred to using the *\*emphasis\** role. This will keep Matplotlib’s documentation consistent with Python’s documentation:

```
If *linestyles* is *None*, the default is 'solid'.
```

Do not use the ``default`` role or the ```literal``` role:

```
Neither `argument` nor ``argument`` should be used.
```

### Quotes for strings

Matplotlib does not have a convention whether to use single-quotes or double-quotes. There is a mixture of both in the current code.

Use simple single or double quotes when giving string values, e.g.

If 'tight', try to figure out the tight bbox of the figure.

No ``'extra'`` literal quotes.

The use of extra literal quotes around the text is discouraged. While they slightly improve the rendered docs, they are cumbersome to type and difficult to read in plain-text docs.

### Parameter type descriptions

The main goal for parameter type descriptions is to be readable and understandable by humans. If the possible types are too complex use a simplification for the type description and explain the type more precisely in the text.

Generally, the [numpydoc docstring guide](#) conventions apply. The following rules expand on them where the numpydoc conventions are not specific.

Use float for a type that can be any number.

Use (float, float) to describe a 2D position. The parentheses should be included to make the tuple-ness more obvious.

Use array-like for homogeneous numeric sequences, which could typically be a `numpy.array`. Dimensionality may be specified using 2D, 3D, n-dimensional. If you need to have variables denoting the sizes of the dimensions, use capital letters in brackets (array-like (M, N)). When referring to them in the text they are easier read and no special formatting is needed.

float is the implicit default dtype for array-likes. For other dtypes use array-like of int.

Some possible uses:

```
2D array-like
array-like (N)
array-like (M, N)
array-like (M, N, 3)
array-like of int
```

Non-numeric homogeneous sequences are described as lists, e.g.:

```
list of str
list of `Artist`
```

### Referencing types

Generally, the rules from [referring-to-other-code](#) apply. More specifically:

Use full references `~matplotlib.colors.Normalize`` with an abbreviation tilde in parameter types. While the full name helps the reader of plain text docstrings, the HTML does not need to show the full name as it links to it. Hence, the `~shortening` keeps it more readable.

Use abbreviated links ``.Normalize`` in the text.

```
norm : ~matplotlib.colors.Normalize, optional
    A ~matplotlib.colors.Normalize instance is used to scale luminance data to 0, 1.
```

## Default values

As opposed to the numpydoc guide, parameters need not be marked as *optional* if they have a simple default:

- use {name} : {type}, default: {val} when possible.
- use {name} : {type}, optional and describe the default in the text if it cannot be explained sufficiently in the recommended manner.

The default value should provide semantic information targeted at a human reader. In simple cases, it restates the value in the function signature. If applicable, units should be added.

```
Prefer:
    interval : int, default: 1000ms
over:
    interval : int, default: 1000
```

If *None* is only used as a sentinel value for “parameter not specified”, do not document it as the default. Depending on the context, give the actual default, or mark the parameter as optional if not specifying has no particular effect.

```
Prefer:
    dpi : float, default: :rc:figure.dpi
over:
    dpi : float, default: None

Prefer:
    textprops : dict, optional
        Dictionary of keyword parameters to be passed to the
        ~matplotlib.text.Text instance contained inside TextArea.
over:
    textprops : dict, default: None
        Dictionary of keyword parameters to be passed to the
        ~matplotlib.text.Text instance contained inside TextArea.
```

## See also sections

Sphinx automatically links code elements in the definition blocks of See also sections. No need to use backticks there:

```
See also
-----
vlines : vertical lines
axhline: horizontal line across the axes
```

## Wrapping parameter lists

Long parameter lists should be wrapped using a \ for continuation and starting on the new line without any indent (no indent because pydoc will parse the docstring and strip the line

continuation so that indent would result in a lot of whitespace within the line):

```
def add_axes(self, *args, **kwargs):
    """
    ...

    Parameters
    -----
    projection : {'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', \
'rectilinear'}, optional
        The projection type of the axes.

    ...
    """
```

Alternatively, you can describe the valid parameter values in a dedicated section of the docstring.

### rcParams

rcParams can be referenced with the custom `:rc:` role: `:rc:`foo`` yields `rcParams["foo"] = 'default'`, which is a link to the `matplotlibrc` file description.

### 33.3.3 Setters and getters

Artist properties are implemented using setter and getter methods (because Matplotlib predates the introductions of the `property` decorator in Python). By convention, these setters and getters are named `set_PROPERTYNAME` and `get_PROPERTYNAME`; the list of properties thusly defined on an artist and their values can be listed by the `setp` and `getp` functions.

The Parameters block of property setter methods is parsed to document the accepted values, e.g. the docstring of `Line2D.set_linestyle` starts with

```
def set_linestyle(self, ls):
    """
    Set the linestyle of the line.

    Parameters
    -----
    ls : {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
        etc.
    """
```

which results in the following line in the output of `plt.setp(line)` or `plt.setp(line, "linestyle")`:

```
linestyle or ls: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

In some rare cases (mostly, setters which accept both a single tuple and an unpacked tuple), the accepted values cannot be documented in such a fashion; in that case, they can be documented as an `.. ACCEPTS:` block, e.g. for `axes.Axes.set_xlim`:

```
def set_xlim(self, ...):
    """
```

(continues on next page)

(continued from previous page)

```

Set the x-axis view limits.

Parameters
-----
left : float, optional
    The left xlim in data coordinates. Passing *None* leaves the
    limit unchanged.

    The left and right xlims may also be passed as the tuple
    (*left*, *right*) as the first positional argument (or as
    the *left* keyword argument).

    .. ACCEPTS: (bottom: float, top: float)

right : float, optional
    etc.
"""

```

Note that the leading `..` makes the `.. ACCEPTS:` block a reST comment, hiding it from the rendered docs.

### 33.3.4 Keyword arguments

**Note:** The information in this section is being actively discussed by the development team, so use the docstring interpolation only if necessary. This section has been left in place for now because this interpolation is part of the existing documentation.

Since Matplotlib uses a lot of pass-through kwargs, e.g., in every function that creates a line (*plot*, *semilogx*, *semilogy*, etc...), it can be difficult for the new user to know which kwargs are supported. Matplotlib uses a docstring interpolation scheme to support documentation of every function that takes a *\*\*kwargs*. The requirements are:

1. single point of configuration so changes to the properties don't require multiple docstring edits.
2. as automated as possible so that as properties change, the docs are updated automatically.

The function `matplotlib.artist.kwdoc` and the decorator `matplotlib.docstring.dedent_interpd` facilitate this. They combine Python string interpolation in the docstring with the Matplotlib artist introspection facility that underlies `setp` and `getp`. The `kwdoc` function gives the list of properties as a docstring. In order to use this in another docstring, first update the `matplotlib.docstring.interpd` object, as seen in this example from `matplotlib.lines`:

```

# in lines.py
docstring.interpd.update(Line2D=artist.kwdoc(Line2D))

```

Then in any function accepting *Line2D* pass-through kwargs, e.g., `matplotlib.axes.Axes.plot`:

```

# in axes.py
@docstring.dedent_interpd
def plot(self, *args, **kwargs):
    """

```

(continues on next page)

(continued from previous page)

```

Some stuff omitted

The kwargs are Line2D properties:
%(Line2D_docstr)s

kwargs scalex and scaley, if defined, are passed on
to autoscale_view to determine whether the x and y axes are
autoscaled; default True. See Axes.autoscale_view for more
information
"""

```

Note there is a problem for *Artist* `__init__` methods, e.g., `matplotlib.patches.Patch.__init__`, which supports Patch kwargs, since the artist inspector cannot work until the class is fully defined and we can't modify the `Patch.__init__.__doc__` docstring outside the class definition. There are some manual hacks in this case, violating the "single entry point" requirement above - see the `docstring.interpd.update` calls in `matplotlib.patches`.

### 33.3.5 Inheriting docstrings

If a subclass overrides a method but does not change the semantics, we can reuse the parent docstring for the method of the child class. Python does this automatically, if the subclass method does not have a docstring.

Use a plain comment `# docstring inherited` to denote the intention to reuse the parent docstring. That way we do not accidentally create a docstring in the future:

```

class A:
    def foo():
        """The parent docstring."""
        pass

class B(A):
    def foo():
        # docstring inherited
        pass

```

### 33.3.6 Adding figures

As above (see *Including figures and files*), figures in the examples gallery can be referenced with a `:plot:` directive pointing to the python script that created the figure. For instance the *legend* docstring references the file `examples/text_labels_and_annotations/legend.py`:

```

"""
...

Examples
-----

.. plot:: gallery/text_labels_and_annotations/legend.py
"""

```

Note that `examples/text_labels_and_annotations/legend.py` has been mapped to `gallery/text_labels_and_annotations/legend.py`, a redirection that may be fixed in future re-organization of the docs.

Plots can also be directly placed inside docstrings. Details are in [\*matplotlib.sphinxext.plot\\_directive\*](#). A short example is:

```
"""
...

Examples
-----

.. plot::
    import matplotlib.image as mpimg
    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
"""
```

An advantage of this style over referencing an example script is that the code will also appear in interactive docstrings.

## 33.4 Writing examples and tutorials

Examples and tutorials are python scripts that are run by [Sphinx Gallery](#) to create a gallery of images in the `/doc/gallery` and `/doc/tutorials` directories respectively. To exclude an example from having an plot generated insert “sgskip” somewhere in the filename.

The format of these files is relatively straightforward. Properly formatted comment blocks are treated as [ReST](#) text, the code is displayed, and figures are put into the built page.

For instance the example `/gallery/lines_bars_and_markers/simple_plot` example is generated from `/examples/lines_bars_and_markers/simple_plot.py`, which looks like:

```
"""
=====
Simple Plot
=====

Create a simple plot.
"""
import matplotlib.pyplot as plt
import numpy as np

# Data for plotting
t = np.arange(0.0, 2.0, 0.01)
s = 1 + np.sin(2 * np.pi * t)

# Note that using plt.subplots below is equivalent to using
# fig = plt.figure and then ax = fig.add_subplot(111)
fig, ax = plt.subplots()
ax.plot(t, s)

ax.set(xlabel='time (s)', ylabel='voltage (mV)',
       title='About as simple as it gets, folks')
```

(continues on next page)

(continued from previous page)

```
ax.grid()
plt.show()
```

The first comment block is treated as [ReST](#) text. The other comment blocks render as comments in `/gallery/lines_bars_and_markers/simple_plot`.

Tutorials are made with the exact same mechanism, except they are longer, and typically have more than one comment block (i.e. [Usage Guide](#)). The first comment block can be the same as the example above. Subsequent blocks of ReST text are delimited by a line of `###` characters:

```
"""
=====
Simple Plot
=====

Create a simple plot.
"""
...
ax.grid()
plt.show()

#####
# Second plot
# =====
#
# This is a second plot that is very nice

fig, ax = plt.subplots()
ax.plot(np.sin(range(50)))
```

In this way text, code, and figures are output in a “notebook” style.

### 33.4.1 Order of examples in the gallery

The order of the sections of the [Tutorials](#) and the gallery, as well as the order of the examples within each section are determined in a two step process from within the `/doc/sphinxext/gallery_order.py`:

- *Explicit order*: This file contains a list of folders for the section order and a list of examples for the subsection order. The order of the items shown in the doc pages is the order those items appear in those lists.
- *Implicit order*: If a folder or example is not in those lists, it will be appended after the explicitly ordered items and all of those additional items will be ordered by pathname (for the sections) or by filename (for the subsections).

As a consequence, if you want to let your example appear in a certain position in the gallery, extend those lists with your example. In case no explicit order is desired or necessary, still make sure to name your example consistently, i.e. use the main function or subject of the example as first word in the filename; e.g. an image example should ideally be named similar to `imshow_mynewexample.py`.

## 33.5 Miscellaneous

### 33.5.1 Adding animations

Animations are scraped automatically by Sphinx-gallery. If this is not desired, there is also a Matplotlib Google/Gmail account with username `mplgithub` which was used to setup the github account but can be used for other purposes, like hosting Google docs or Youtube videos. You can embed a Matplotlib animation in the docs by first saving the animation as a movie using `matplotlib.animation.Animation.save()`, and then uploading to [Matplotlib's Youtube channel](#) and inserting the embedding string youtube provides like:

```
.. raw:: html

    <iframe width="420" height="315"
      src="http://www.youtube.com/embed/32cjc6V00ZY"
      frameborder="0" allowfullscreen>
    </iframe>
```

An example save command to generate a movie looks like this

```
ani = animation.FuncAnimation(fig, animate, np.arange(1, len(y)),
    interval=25, blit=True, init_func=init)

ani.save('double_pendulum.mp4', fps=15)
```

Contact Michael Droettboom for the login password to upload youtube videos of google docs to the mplgithub account.

### 33.5.2 Generating inheritance diagrams

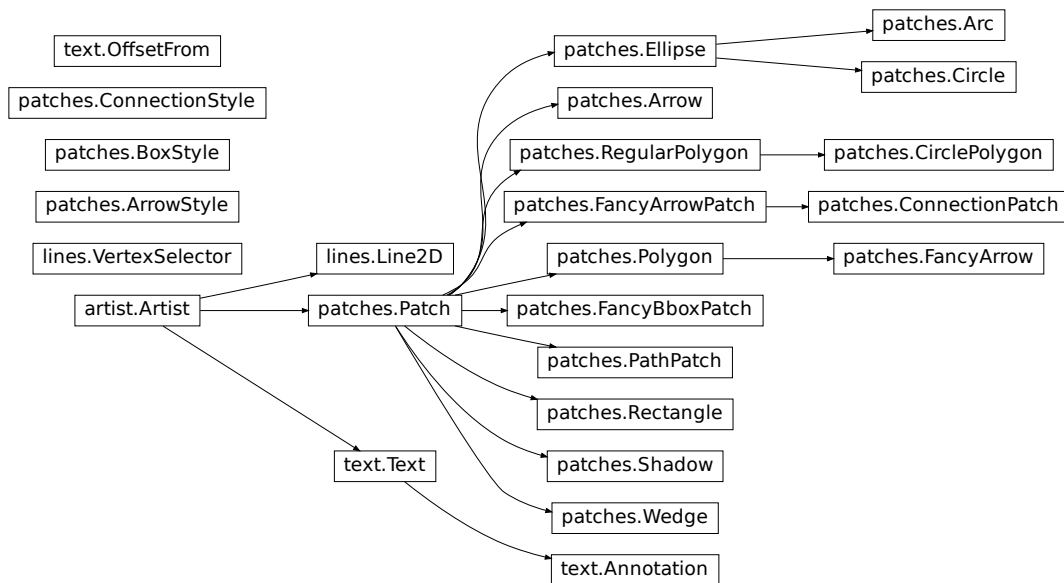

Class inheritance diagrams can be generated with the `inheritance-diagram` directive. To use it, provide the directive with a number of class or module names (separated by whitespace). If a module name is provided, all classes in that module will be used. All of the ancestors of these classes will be included in the inheritance diagram.

A single option is available: `parts` controls how many of parts in the path to the class are shown. For example, if `parts == 1`, the class `matplotlib.patches.Patch` is shown as `Patch`. If `parts == 2`, it is shown as `patches.Patch`. If `parts == 0`, the full path is shown.

Example:

```
.. inheritance-diagram:: matplotlib.patches matplotlib.lines matplotlib.text
   :parts: 2
```

### 33.5.3 Emacs helpers

There is an emacs mode `rst.el` which automates many important ReST tasks like building and updating table-of-contents, and promoting or demoting section headings. Here is the basic `.emacs` configuration:

```
(require 'rst)
(setq auto-mode-alist
      (append '(("\\.txt$" . rst-mode)
                ("\\.rst$" . rst-mode)
                ("\\.rest$" . rst-mode)) auto-mode-alist))
```

Some helpful functions:

```
C-c TAB - rst-toc-insert

  Insert table of contents at point

C-c C-u - rst-toc-update

  Update the table of contents at point

C-c C-l rst-shift-region-left

  Shift region to the left

C-c C-r rst-shift-region-right

  Shift region to the right
```

## DEVELOPER'S GUIDE FOR CREATING SCALES AND TRANSFORMATIONS

Matplotlib supports the addition of custom procedures that transform the data before it is displayed.

There is an important distinction between two kinds of transformations. Separable transformations, working on a single dimension, are called "scales", and non-separable transformations, that handle data in two or more dimensions at a time, are called "projections".

From the user's perspective, the scale of a plot can be set with `Axes.set_xscale` and `Axes.set_yscale`. Projections can be chosen using the *projection* keyword argument of functions that create Axes, such as `pyplot.subplot` or `pyplot.axes`, e.g.

```
plt.subplot(projection="custom")
```

This document is intended for developers and advanced users who need to create new scales and projections for Matplotlib. The necessary code for scales and projections can be included anywhere: directly within a plot script, in third-party code, or in the Matplotlib source tree itself.

### 34.1 Creating a new scale

Adding a new scale consists of defining a subclass of `matplotlib.scale.ScaleBase`, that includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- A function to limit the range of the axis to acceptable values (`limit_range_for_scale()`). A log scale, for instance, would prevent the range from including values less than or equal to zero.
- Locators (major and minor) that determine where to place ticks in the plot, and optionally, how to adjust the limits of the plot to some "good" values. Unlike `limit_range_for_scale()`, which is always enforced, the range setting here is only used when automatically setting the range of the plot.
- Formatters (major and minor) that specify how the tick labels should be drawn.

Once the class is defined, it must be registered with Matplotlib so that the user can select it.

A full-fledged and heavily annotated example is in `/gallery/scales/custom_scale`. There are also some classes in `matplotlib.scale` that may be used as starting points.

## 34.2 Creating a new projection

Adding a new projection consists of defining a projection axes which subclasses `matplotlib.axes.Axes` and includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- Transformations for the gridlines, ticks and ticklabels. Custom projections will often need to place these elements in special locations, and Matplotlib has a facility to help with doing so.
- Setting up default values (overriding `cla()`), since the defaults for a rectilinear axes may not be appropriate.
- Defining the shape of the axes, for example, an elliptical axes, that will be used to draw the background of the plot and for clipping any data elements.
- Defining custom locators and formatters for the projection. For example, in a geographic projection, it may be more convenient to display the grid in degrees, even if the data is in radians.
- Set up interactive panning and zooming. This is left as an "advanced" feature left to the reader, but there is an example of this for polar plots in `matplotlib.projections.polar`.
- Any additional methods for additional convenience or features.

Once the projection axes is defined, it can be used in one of two ways:

- By defining the class attribute `name`, the projection axes can be registered with `matplotlib.projections.register_projection()` and subsequently simply invoked by name:

```
plt.axes(projection='my_proj_name')
```

- For more complex, parameterisable projections, a generic "projection" object may be defined which includes the method `_as_mpl_axes`. `_as_mpl_axes` should take no arguments and return the projection's axes subclass and a dictionary of additional arguments to pass to the subclass' `__init__` method. Subsequently a parameterised projection can be initialised with:

```
plt.axes(projection=MyProjection(param1=param1_value))
```

where `MyProjection` is an object which implements a `_as_mpl_axes` method.

A full-fledged and heavily annotated example is in `/gallery/misc/custom_projection`. The polar plot functionality in `matplotlib.projections.polar` may also be of interest.

## 34.3 API documentation

- `matplotlib.scale`

- *matplotlib.projections*
- *matplotlib.projections.polar*

## WORKING WITH *MATPLOTLIB* SOURCE CODE

Contents:

### 35.1 Introduction

These pages describe a [git](#) and [github](#) workflow for the [Matplotlib](#) project.

There are several different workflows here, for different ways of working with *Matplotlib*.

This is not a comprehensive git reference, it's just a workflow for our own project. It's tailored to the github hosting service. You may well find better or quicker ways of getting stuff done with git, but these should get you started.

For general resources for learning git, see [git resources](#).

### 35.2 Install git

#### 35.2.1 Overview

Debian / Ubuntu	<code>sudo apt-get install git</code>
Fedora	<code>sudo yum install git</code>
Windows	Download and install <a href="#">msysGit</a>
OS X	Use the <a href="#">git-osx-installer</a>

#### 35.2.2 In detail

See the git page for the most recent information.

Have a look at the github install help pages available from [github help](#)

There are good instructions here: <https://git-scm.com/book/en/v2/Getting-Started-Installing-Git>

## 35.3 Following the latest source

These are the instructions if you just want to follow the latest *Matplotlib* source, but you don't need to do any development for now.

The steps are:

- *Install git*
- get local copy of the [Matplotlib github](#) git repository
- update local copy from time to time

### 35.3.1 Get the local copy of the code

From the command line:

```
git clone git://github.com/matplotlib/matplotlib.git
```

You now have a copy of the code tree in the new `matplotlib` directory.

### 35.3.2 Updating the code

From time to time you may want to pull down the latest code. Do this with:

```
cd matplotlib
git pull
```

The tree in `matplotlib` will now have the latest changes from the initial repository.

## 35.4 Making a patch

You've discovered a bug or something else you want to change in [Matplotlib](#) .. — excellent!

You've worked out a way to fix it — even better!

You want to tell us about it — best of all!

The easiest way is to make a *patch* or set of patches. Here we explain how. Making a patch is the simplest and quickest, but if you're going to be doing anything more than simple quick things, please consider following the [Git for development](#) model instead.

### 35.4.1 Making patches

#### Overview

```
# tell git who you are
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
# get the repository if you don't have it
```

(continues on next page)

(continued from previous page)

```
git clone git://github.com/matplotlib/matplotlib.git
# make a branch for your patching
cd matplotlib
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
# hack hack, hack
git commit -am 'BF - added fix for Funny bug'
# make the patch files
git format-patch -M -C master
```

Then, send the generated patch files to the [Matplotlib mailing list](#) — where we will thank you warmly.

### In detail

1. Tell git who you are so it can label the commits you've made:

```
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
```

2. If you don't already have one, clone a copy of the [Matplotlib](#) repository:

```
git clone git://github.com/matplotlib/matplotlib.git
cd matplotlib
```

3. Make a 'feature branch'. This will be where you work on your bug fix. It's nice and safe and leaves you with access to an unmodified copy of the code in the main branch:

```
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
```

4. Do some edits, and commit them as you go:

```
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
# hack hack, hack
git commit -am 'BF - added fix for Funny bug'
```

Note the `-am` options to `commit`. The `m` flag just signals that you're going to type a message on the command line. The `a` flag — you can just take on faith — or see [why the -a flag?](#).

5. When you have finished, check you have committed all your changes:

```
git status
```

6. Finally, make your commits into patches. You want all the commits since you branched from the master branch:

```
git format-patch -M -C master
```

You will now have several files named for the commits:

```
0001-BF-added-tests-for-Funny-bug.patch
0002-BF-added-fix-for-Funny-bug.patch
```

Send these files to the [Matplotlib mailing list](#).

When you are done, to switch back to the main copy of the code, just return to the master branch:

```
git checkout master
```

### 35.4.2 Moving from patching to development

If you find you have done some patches, and you have one or more feature branches, you will probably want to switch to development mode. You can do this with the repository you have.

Fork the [Matplotlib repository](#) on github — *Making your own copy (fork) of Matplotlib*. Then:

```
# checkout and refresh master branch from main repo
git checkout master
git pull origin master
# rename pointer to main repository to 'upstream'
git remote rename origin upstream
# point your repo to default read / write to your fork on github
git remote add origin git@github.com:your-user-name/matplotlib.git
# push up any branches you've made and want to keep
git push origin the-fix-im-thinking-of
```

Then you can, if you want, follow the *Development workflow*.

## 35.5 Git for development

Contents:

### 35.5.1 Making your own copy (fork) of Matplotlib

You need to do this only once. The instructions here are very similar to the instructions at <https://help.github.com/forking/> — please see that page for more detail. We’re repeating some of it here just to give the specifics for the [Matplotlib](#) project, and to suggest some default names.

#### Set up and configure a github account

If you don’t have a github account, go to the github page, and make one.

You then need to configure your account to allow write access — see the [Generating SSH keys help](#) on [github help](#).

### Create your own forked copy of Matplotlib

1. Log into your github account.
2. Go to the [Matplotlib github](#) home at [Matplotlib github](#).
3. Click on the *fork* button:

Now, after a short pause, you should find yourself at the home page for your own forked copy of [Matplotlib](#).

### 35.5.2 Set up your fork

First you follow the instructions for *[Making your own copy \(fork\) of Matplotlib](#)*.

#### Overview

```
git clone https://github.com/your-user-name/matplotlib.git
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

#### In detail

##### Clone your fork

1. Clone your fork to the local computer with `git clone https://github.com/your-user-name/matplotlib.git`
2. Investigate. Change directory to your new repo: `cd matplotlib`. Then `git branch -a` to show you all branches. You'll get something like:

```
* master
remotes/origin/master
```

This tells you that you are currently on the `master` branch, and that you also have a remote connection to `origin/master`. What remote repository is `remote/origin`? Try `git remote -v` to see the URLs for the remote. They will point to your github fork.

Now you want to connect to the upstream [Matplotlib github](#) repository, so you can merge in changes from trunk.

## Linking your repository to the upstream repo

```
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

upstream here is just the arbitrary name we're using to refer to the main [Matplotlib](#) repository at [Matplotlib github](#).

Note that we've used `git://` for the URL rather than `https://` or `git@`. The `git://` URL is read only. This means that we can't accidentally (or deliberately) write to the upstream repo, and we are only going to use it to merge into our own code.

Just for your own satisfaction, show yourself that you now have a new 'remote', with `git remote -v show`, giving you something like:

```
upstream      git://github.com/matplotlib/matplotlib.git (fetch)
upstream      git://github.com/matplotlib/matplotlib.git (push)
origin        https://github.com/your-user-name/matplotlib.git (fetch)
origin        https://github.com/your-user-name/matplotlib.git (push)
```

## 35.5.3 Configure git

### Overview

Your personal git configurations are saved in the `.gitconfig` file in your home directory.

Here is an example `.gitconfig` file:

```
[user]
    name = Your Name
    email = you@yourdomain.example.com

[alias]
    ci = commit -a
    co = checkout
    st = status
    stat = status
    br = branch
    wdiff = diff --color-words

[core]
    editor = vim

[merge]
    summary = true
```

You can check what is already in your config file using the `git config --list` command. You can edit the `.gitconfig` file directly or you can use the `git config --global` command.:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
```

(continues on next page)

(continued from previous page)

```
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"
git config --global core.editor vim
git config --global merge.summary true
```

To set up on another computer, you can copy your `~/.gitconfig` file, or run the commands above.

## In detail

### user.name and user.email

It is good practice to tell `git` who you are, for labeling any changes you make to the code. The simplest way to do this is from the command line:

```
git config --global user.name "Your Name"
git config --global user.email you@yourdomain.example.com
```

This will write the settings into your `git` configuration file, which should now contain a user section with your name and email:

```
[user]
  name = Your Name
  email = you@yourdomain.example.com
```

You'll need to replace `Your Name` and `you@yourdomain.example.com` with your actual name and email address.

## Aliases

You might well benefit from some aliases to common commands.

For example, you might well want to be able to shorten `git checkout` to `git co`. Or you may want to alias `git diff --color-words` (which gives a nicely formatted output of the diff) to `git wdiff`

The following `git config --global` commands:

```
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"
```

will create an alias section in your `.gitconfig` file with contents like this:

```
[alias]
  ci = commit -a
  co = checkout
  st = status -a
  stat = status -a
```

(continues on next page)

(continued from previous page)

```
br = branch
wdiff = diff --color-words
```

## Editor

You may also want to make sure that your editor of choice is used

```
git config --global core.editor vim
```

## Merging

To enforce summaries when doing merges (~/ .gitconfig file again):

```
[merge]
  log = true
```

Or from the command line:

```
git config --global merge.log true
```

## Fancy log output

This is a very nice alias to get a fancy log output; it should go in the alias section of your .gitconfig file:

```
lg = log --graph --pretty=format:'%Cred%h%Creset -%C(yellow)%d%Creset %s %Cgreen(%cr) %C(bold↵
↵blue)[%an]%Creset' --abbrev-commit --date=relative
```

You use the alias with:

```
git lg
```

and it gives graph / text output something like this (but with color!):

```
* 6d8e1ee - (HEAD, origin/my-fancy-feature, my-fancy-feature) NF - a fancy file (45 minutes ago)↵
↵[Matthew Brett]
* d304a73 - (origin/placeholder, placeholder) Merge pull request #48 from hhuuggoo/master (2↵
↵weeks ago) [Jonathan Terhorst]
|\
| * 4aff2a8 - fixed bug 35, and added a test in test_bugfixes (2 weeks ago) [Hugo]
|/
* a7ff2e5 - Added notes on discussion/proposal made during Data Array Summit. (2 weeks ago)↵
↵[Corran Webster]
* 68f6752 - Initial implementation of AxisIndexer - uses 'index_by' which needs to be changed to a↵
↵call on an Axes object - this is all very sketchy right now. (2 weeks ago) [Corr
* 376adbd - Merge pull request #46 from terhorst/master (2 weeks ago) [Jonathan Terhorst]
|\
| * b605216 - updated joshu example to current api (3 weeks ago) [Jonathan Terhorst]
| * 2e991e8 - add testing for outer ufunc (3 weeks ago) [Jonathan Terhorst]
| * 7beda5a - prevent axis from throwing an exception if testing equality with non-axis object (3↵
↵weeks ago) [Jonathan Terhorst]
```

(continues on next page)

(continued from previous page)

```
| * 65af65e - convert unit testing code to assertions (3 weeks ago) [Jonathan Terhorst]
| * 956fbab - Merge remote-tracking branch 'upstream/master' (3 weeks ago) [Jonathan Terhorst]
| |\
| |/
```

Thanks to Yury V. Zaytsev for posting it.

### 35.5.4 Development workflow

You already have your own forked copy of the [Matplotlib](#) repository, by following [Making your own copy \(fork\) of Matplotlib](#). You have [Set up your fork](#). You have configured git by following [Configure git](#). Now you are ready for some real work.

#### Workflow summary

In what follows we'll refer to the upstream Matplotlib master branch, as "trunk".

- Don't use your master branch for anything. Consider deleting it.
- When you are starting a new set of changes, fetch any changes from trunk, and start a new *feature branch* from that.
- Make a new branch for each separable set of changes — "one task, one branch" ([ipython git workflow](#)).
- Name your branch for the purpose of the changes - e.g. `bugfix-for-issue-14` or `refactor-database-code`.
- If you can possibly avoid it, avoid merging trunk or any other branches into your feature branch while you are working.
- If you do find yourself merging from trunk, consider [Rebasing on trunk](#)
- Ask on the [Matplotlib mailing list](#) if you get stuck.
- Ask for code review!

This way of working helps to keep work well organized, with readable history. This in turn makes it easier for project maintainers (that might be you) to see what you've done, and why you did it.

See [linux git workflow](#) and [ipython git workflow](#) for some explanation.

#### Consider deleting your master branch

It may sound strange, but deleting your own master branch can help reduce confusion about which branch you are on. See [deleting master on github](#) for details.

#### Update the mirror of trunk

First make sure you have done [Linking your repository to the upstream repo](#).

From time to time you should fetch the upstream (trunk) changes from github:

```
git fetch upstream
```

This will pull down any commits you don't have, and set the remote branches to point to the right commit. For example, 'trunk' is the branch referred to by (remote/branchname) upstream/master - and if there have been commits since you last checked, upstream/master will change after you do the fetch.

### Make a new feature branch

When you are ready to make some changes to the code, you should start a new branch. Branches that are for a collection of related edits are often called 'feature branches'.

Making an new branch for each set of related changes will make it easier for someone reviewing your branch to see what you are doing.

Choose an informative name for the branch to remind yourself and the rest of us what the changes in the branch are for. For example add-ability-to-fly, or buxfix-for-issue-42.

```
# Update the mirror of trunk
git fetch upstream
# Make new feature branch starting at current trunk
git branch my-new-feature upstream/master
git checkout my-new-feature
```

Generally, you will want to keep your feature branches on your public [github](#) fork of [Matplotlib](#). To do this, you [git push](#) this new branch up to your github repo. Generally (if you followed the instructions in these pages, and by default), git will have a link to your github repo, called origin. You push up to your own repo on github with:

```
git push origin my-new-feature
```

In git  $\geq$  1.7 you can ensure that the link is correctly set by using the `--set-upstream` option:

```
git push --set-upstream origin my-new-feature
```

From now on git will know that my-new-feature is related to the my-new-feature branch in the github repo.

## The editing workflow

### Overview

```
# hack hack
git add my_new_file
git commit -am 'NF - some message'
git push
```

### In more detail

1. Make some changes

2. See which files have changed with `git status` (see [git status](#)). You'll see a listing like this one:

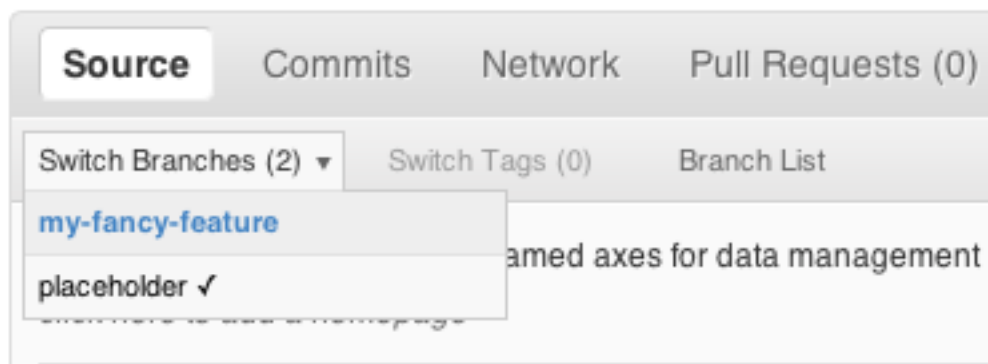

```
# On branch ny-new-feature
# Changed but not updated:
#   (use "git add <file>..." to update what will be committed)
#   (use "git checkout -- <file>..." to discard changes in working directory)
#
#   modified:   README
#
# Untracked files:
#   (use "git add <file>..." to include in what will be committed)
#
#   INSTALL
no changes added to commit (use "git add" and/or "git commit -a")
```

3. Check what the actual changes are with `git diff` ([git diff](#)).
4. Add any new files to version control `git add new_file_name` (see [git add](#)).
5. To commit all modified files into the local copy of your repo,, do `git commit -am 'A commit message'`. Note the `-am` options to `commit`. The `m` flag just signals that you're going to type a message on the command line. The `a` flag — you can just take on faith — or see [why the -a flag?](#) — and the helpful use-case description in the [tangled working copy problem](#). The [git commit](#) manual page might also be useful.
6. To push the changes up to your forked repo on github, do a `git push` (see [git push](#)).

#### Ask for your changes to be reviewed or merged

When you are ready to ask for someone to review your code and consider a merge:

1. Go to the URL of your forked repo, say <https://github.com/your-user-name/matplotlib>.
2. Use the 'Switch Branches' dropdown menu near the top left of the page to select the branch with your changes:

3. Click on the 'Pull request' button:

Enter a title for the set of changes, and some explanation of what you've done. Say if there is anything you'd like particular attention for - like a complicated change or some code you are not happy with.

If you don't think your request is ready to be merged, just say so in your pull request message. This is still a good way of getting some preliminary code review.

### Some other things you might want to do

#### Delete a branch on github

```
git checkout master
# delete branch locally
git branch -D my-unwanted-branch
# delete branch on github
git push origin :my-unwanted-branch
```

Note the colon : before my-unwanted-branch. See also: <https://help.github.com/articles/pushing-to-a-remote/#deleting-a-remote-branch-or-tag>

#### Several people sharing a single repository

If you want to work on some stuff with other people, where you are all committing into the same repository, or even the same branch, then just share it via github.

First fork Matplotlib into your account, as from *[Making your own copy \(fork\) of Matplotlib](#)*.

Then, go to your forked repository github page, say <https://github.com/your-user-name/matplotlib>

Click on the 'Admin' button, and add anyone else to the repo as a collaborator:

Now all those people can do:

```
git clone https://github.com/your-user-name/matplotlib.git
```

Remember that links starting with `https` or `git@` are read-write, and that `git@` uses the `ssh` protocol; links starting with `git://` are read-only.

Your collaborators can then commit directly into that repo with the usual:

```
git commit -am 'ENH - much better code'
git push origin master # pushes directly into your repo
```

### Explore your repository

To see a graphical representation of the repository branches and commits:

```
gitk --all
```

To see a linear list of commits for this branch:

```
git log
```

You can also look at the [network graph visualizer](#) for your github repo.

Finally the *Fancy log output* `lg` alias will give you a reasonable text-based graph of the repository.

### Rebasing on trunk

Let's say you thought of some work you'd like to do. You *Update the mirror of trunk* and *Make a new feature branch* called `cool-feature`. At this stage trunk is at some commit, let's call it E. Now you make some new commits on your `cool-feature` branch, let's call them A, B, C. Maybe your changes take a while, or you come back to them after a while. In the meantime, trunk has progressed from commit E to commit (say) G:

```

      A---B---C cool-feature
      /
D---E---F---G trunk
```

At this stage you consider merging trunk into your feature branch, and you remember that this here page sternly advises you not to do that, because the history will get messy. Most of the time you can just ask for a review, and not worry that trunk has got a little ahead. But sometimes, the changes in trunk might affect your changes, and you need to harmonize them. In this situation you may prefer to do a rebase.

rebase takes your changes (A, B, C) and replays them as if they had been made to the current state of trunk. In other words, in this case, it takes the changes represented by A, B, C and replays them on top of G. After the rebase, your history will look like this:

```

      A'---B'---C' cool-feature
      /
D---E---F---G trunk
```

See [rebase without tears](#) for more detail.

To do a rebase on trunk:

```
# Update the mirror of trunk
git fetch upstream
# go to the feature branch
git checkout cool-feature
# make a backup in case you mess up
git branch tmp cool-feature
# rebase cool-feature onto trunk
git rebase --onto upstream/master upstream/master cool-feature
```

In this situation, where you are already on branch `cool-feature`, the last command can be written more succinctly as:

```
git rebase upstream/master
```

When all looks good you can delete your backup branch:

```
git branch -D tmp
```

If it doesn't look good you may need to have a look at [Recovering from mess-ups](#).

If you have made changes to files that have also changed in trunk, this may generate merge conflicts that you need to resolve - see the [git rebase](#) man page for some instructions at the end of the "Description" section. There is some related help on merging in the git user manual - see [resolving a merge](#).

### Recovering from mess-ups

Sometimes, you mess up merges or rebases. Luckily, in git it is relatively straightforward to recover from such mistakes.

If you mess up during a rebase:

```
git rebase --abort
```

If you notice you messed up after the rebase:

```
# reset branch back to the saved point
git reset --hard tmp
```

If you forgot to make a backup branch:

```
# look at the reflog of the branch
git reflog show cool-feature

8630830 cool-feature@{0}: commit: BUG: io: close file handles immediately
278dd2a cool-feature@{1}: rebase finished: refs/heads/my-feature-branch onto 11ee694744f2552d
26aa21a cool-feature@{2}: commit: BUG: lib: make seek_gzip_factory not leak gzip obj
...

# reset the branch to where it was before the botched rebase
git reset --hard cool-feature@{2}
```

## Rewriting commit history

**Note:** Do this only for your own feature branches.

There's an embarrassing typo in a commit you made? Or perhaps the you made several false starts you would like the posterity not to see.

This can be done via *interactive rebasing*.

Suppose that the commit history looks like this:

```
git log --oneline
eadc391 Fix some remaining bugs
a815645 Modify it so that it works
2dec1ac Fix a few bugs + disable
13d7934 First implementation
6ad92e5 * masked is now an instance of a new object, MaskedConstant
29001ed Add pre-nep for a copule of structured_array_extensions.
...
```

and 6ad92e5 is the last commit in the cool-feature branch. Suppose we want to make the following changes:

- Rewrite the commit message for 13d7934 to something more sensible.
- Combine the commits 2dec1ac, a815645, eadc391 into a single one.

We do as follows:

```
# make a backup of the current state
git branch tmp HEAD
# interactive rebase
git rebase -i 6ad92e5
```

This will open an editor with the following text in it:

```
pick 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
pick a815645 Modify it so that it works
pick eadc391 Fix some remaining bugs

# Rebase 6ad92e5..eadc391 onto 6ad92e5
#
# Commands:
# p, pick = use commit
# r, reword = use commit, but edit the commit message
# e, edit = use commit, but stop for amending
# s, squash = use commit, but meld into previous commit
# f, fixup = like "squash", but discard this commit's log message
#
# If you remove a line here THAT COMMIT WILL BE LOST.
# However, if you remove everything, the rebase will be aborted.
#
```

To achieve what we want, we will make the following changes to it:

```
r 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
f a815645 Modify it so that it works
f eadc391 Fix some remaining bugs
```

This means that (i) we want to edit the commit message for 13d7934, and (ii) collapse the last three commits into one. Now we save and quit the editor.

Git will then immediately bring up an editor for editing the commit message. After revising it, we get the output:

```
[detached HEAD 721fc64] F00: First implementation
 2 files changed, 199 insertions(+), 66 deletions(-)
[detached HEAD 0f22701] Fix a few bugs + disable
 1 files changed, 79 insertions(+), 61 deletions(-)
Successfully rebased and updated refs/heads/my-feature-branch.
```

and the history looks now like this:

```
0f22701 Fix a few bugs + disable
721fc64 ENH: Sophisticated feature
6ad92e5 * masked is now an instance of a new object, MaskedConstant
```

If it went wrong, recovery is again possible as explained [above](#).

### 35.5.5 Maintainer workflow

This page is for maintainers — those of us who merge our own or other peoples' changes into the upstream repository.

Being as how you're a maintainer, you are completely on top of the basic stuff in [Development workflow](#).

The instructions in [Linking your repository to the upstream repo](#) add a remote that has read-only access to the upstream repo. Being a maintainer, you've got read-write access.

It's good to have your upstream remote have a scary name, to remind you that it's a read-write remote:

```
git remote add upstream-rw git@github.com:matplotlib/matplotlib.git
git fetch upstream-rw
```

#### Integrating changes

Let's say you have some changes that need to go into trunk (upstream-rw/master).

The changes are in some branch that you are currently on. For example, you are looking at someone's changes like this:

```
git remote add someone git://github.com/someone/matplotlib.git
git fetch someone
git branch cool-feature --track someone/cool-feature
git checkout cool-feature
```

So now you are on the branch with the changes to be incorporated upstream. The rest of this section assumes you are on this branch.

### A few commits

If there are only a few commits, consider rebasing to upstream:

```
# Fetch upstream changes
git fetch upstream-rw
# rebase
git rebase upstream-rw/master
```

Remember that, if you do a rebase, and push that, you'll have to close any github pull requests manually, because github will not be able to detect the changes have already been merged.

### A long series of commits

If there are a longer series of related commits, consider a merge instead:

```
git fetch upstream-rw
git merge --no-ff upstream-rw/master
```

The merge will be detected by github, and should close any related pull requests automatically.

Note the `--no-ff` above. This forces git to make a merge commit, rather than doing a fast-forward, so that these set of commits branch off trunk then rejoin the main history with a merge, rather than appearing to have been made directly on top of trunk.

### Check the history

Now, in either case, you should check that the history is sensible and you have the right commits:

```
git log --oneline --graph
git log -p upstream-rw/master..
```

The first line above just shows the history in a compact way, with a text representation of the history graph. The second line shows the log of commits excluding those that can be reached from trunk (`upstream-rw/master`), and including those that can be reached from current HEAD (implied with the `..` at the end). So, it shows the commits unique to this branch compared to trunk. The `-p` option shows the diff for these commits in patch form.

### Push to trunk

```
git push upstream-rw my-new-feature:master
```

This pushes the `my-new-feature` branch in this repository to the `master` branch in the `upstream-rw` repository.

## 35.6 git resources

### 35.6.1 Tutorials and summaries

- [github help](#) has an excellent series of how-to guides.
- The [pro git book](#) is a good in-depth book on git.
- A [git cheat sheet](#) is a page giving summaries of common commands.
- The [git user manual](#)
- The [git tutorial](#)
- The [git community book](#)
- [git ready](#) — a nice series of tutorials
- [git magic](#) — extended introduction with intermediate detail
- The [git parable](#) is an easy read explaining the concepts behind git.
- [git foundation](#) expands on the [git parable](#).
- Fernando Perez' git page — [Fernando's git page](#) — many links and tips
- A good but technical page on [git concepts](#)
- [git svn crash course](#): git for those of us used to [subversion](#)

### 35.6.2 Advanced git workflow

There are many ways of working with git; here are some posts on the rules of thumb that other projects have come up with:

- Linus Torvalds on [git management](#)
- Linus Torvalds on [linux git workflow](#) . Summary; use the git tools to make the history of your edits as clean as possible; merge from upstream edits as little as possible in branches where you are doing active development.

### 35.6.3 Manual pages online

You can get these on your own machine with (e.g) `git help push` or (same thing) `git push --help`, but, for convenience, here are the online manual pages for some common commands:

- [git add](#)
- [git branch](#)
- [git checkout](#)
- [git clone](#)
- [git commit](#)
- [git config](#)
- [git diff](#)
- [git log](#)

- `git pull`
- `git push`
- `git remote`
- `git status`

## 35.7 Two and three dots in difference specs

Thanks to Yarik Halchenko for this explanation.

Imagine a series of commits A, B, C, D... Imagine that there are two branches, *topic* and *master*. You branched *topic* off *master* when *master* was at commit 'E'. The graph of the commits looks like this:

```

  A---B---C topic
  /
D---E---F---G master

```

Then:

```
git diff master..topic
```

will output the difference from G to C (i.e. with effects of F and G), while:

```
git diff master...topic
```

would output just differences in the topic branch (i.e. only A, B, and C).

## PULL REQUEST GUIDELINES

Pull requests (PRs) are the mechanism for contributing to Matplotlibs code and documentation.

### 36.1 Summary for PR authors

---

**Note:**

- We value contributions from people with all levels of experience. In particular if this is your first PR not everything has to be perfect. We'll guide you through the PR process.
  - Nevertheless, try to follow the guidelines below as well as you can to help make the PR process quick and smooth.
  - Be patient with reviewers. We try our best to respond quickly, but we have limited bandwidth. If there is no feedback within a couple of days, please ping us by posting a comment to your PR.
- 

When making a PR, pay attention to:

- *Target the master branch.*
- Adhere to the *Coding guidelines*.
- Update the *documentation* if necessary.
- Aim at making the PR as "ready-to-go" as you can. This helps to speed up the review process.
- It is ok to open incomplete or work-in-progress PRs if you need help or feedback from the developers. You may mark these as *draft pull requests* on GitHub.
- When updating your PR, instead of adding new commits to fix something, please consider amending your initial commit(s) to keep the history clean. You can achieve this using:

```
git commit --amend --no-edit
git push [your-remote-repo] [your-branch] --force-with-lease
```

See also *Contributing* for how to make a PR.

## 36.2 Summary for PR reviewers

---

### Note:

- If you have commit rights, then you are trusted to use them. **Please help review and merge PRs!**
  - Be patient and [kind](#) with contributors.
- 

### Content topics:

- Is the feature / bugfix reasonable?
- Does the PR conform with the [Coding guidelines](#)?
- Is the [documentation](#) (docstrings, examples, what's new, API changes) updated?

### Organizational topics:

- Make sure all [automated tests](#) pass.
- The PR should [target the master branch](#).
- Tag with descriptive [labels](#).
- Set the [milestone](#).
- Keep an eye on the [number of commits](#).
- Approve if all of the above topics handled.
- [Merge](#) if a sufficient number of approvals is reached.

## 36.3 Detailed Guidelines

### 36.3.1 Documentation

- Every new feature should be documented. If it's a new module, don't forget to add a new rst file to the API docs.
- Each high-level plotting function should have a small example in the Examples section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go into a dedicated example file in the `examples` directory, which will be rendered to the examples gallery in the documentation.
- Build the docs and make sure all formatting warnings are addressed.
- See [Writing documentation](#) for our documentation style guide.
- If your change is a major new feature, add an entry to `doc/users/whats_new.rst`.
- If you change the API in a backward-incompatible way, please document it in the relevant file in most recent `doc/api/api_changes_X.Y`.

### 36.3.2 Labels

- If you have the rights to set labels, tag the PR with descriptive labels. See the [list of labels](#).

### 36.3.3 Milestones

- Set the milestone according to these rules:
  - *New features and API changes* are milestone for the next minor release v3.X.0.
  - *Bugfixes and docstring changes* are milestone for the next patch release v3.X.Y
  - *Documentation changes* (all .rst files and examples) are milestone v3.X-doc

If multiple rules apply, choose the first matching from the above list.

Setting a milestone does not imply or guarantee that a PR will be merged for that release, but if it were to be merged what release it would be in.

All of these PRs should target the master branch. The milestone tag triggers an *automatic backport* for milestones which have a corresponding branch.

### 36.3.4 Merging

- Documentation and examples may be merged by the first reviewer. Use the threshold "is this better than it was?" as the review criteria.
- For code changes (anything in `src` or `lib`) at least two core developers (those with commit rights) should review all pull requests. If you are the first to review a PR and approve of the changes use the GitHub '[approve review](#)' tool to mark it as such. If you are a subsequent reviewer please approve the review and if you think no more review is needed, merge the PR.

Ensure that all API changes are documented in the relevant file in the most recent `doc/api/api_changes_X.Y` and significant new features have an entry in `doc/user/whats_new`.

- If a PR already has a positive review, a core developer (e.g. the first reviewer, but not necessarily) may champion that PR for merging. In order to do so, they should ping all core devs both on GitHub and on the dev mailing list, and label the PR with the "Merge with single review?" label. Other core devs can then either review the PR and merge or reject it, or simply request that it gets a second review before being merged. If no one asks for such a second review within a week, the PR can then be merged on the basis of that single review.

A core dev should only champion one PR at a time and we should try to keep the flow of championed PRs reasonable.

- Do not self merge, except for 'small' patches to un-break the CI or when another reviewer explicitly allows it (ex, "Approve modulo CI passing, may self merge when green").

### 36.3.5 Automated tests

Whenever a pull request is created or updated, various automated test tools will run on all supported platforms and versions of Python.

- Make sure the Linting, Travis, AppVeyor, CircleCI, and Azure pipelines are passing before merging (All checks are listed at the bottom of the GitHub page of your pull request). Here are some tips for finding the cause of the test failure:
  - If *Linting* fails, you have a code style issue, which will be listed as annotations on the pull request's diff.
  - If a Travis or AppVeyor run fails, search the log for `FAILURES`. The subsequent section will contain information on the failed tests.
  - If CircleCI fails, likely you have some `reStructuredText` style issue in the docs. Search the CircleCI log for `WARNING`.
  - If Azure pipelines fail with an image comparison error, you can find the images as *artifacts* of the Azure job:
    - \* Click *Details* on the check on the GitHub PR page.
    - \* Click *View more details on Azure Pipelines* to go to Azure.
    - \* On the overview page *artifacts* are listed in the section *Related*.
- Codecov and LGTM are currently for information only. Their failure is not necessarily a blocker.
- `tox` is not used in the automated testing. It is supported for testing locally.

### 36.3.6 Number of commits and squashing

- Squashing is case-by-case. The balance is between burden on the contributor, keeping a relatively clean history, and keeping a history usable for bisecting. The only time we are really strict about it is to eliminate binary files (ex multiple test image re-generations) and to remove upstream merges.
- Do not let perfect be the enemy of the good, particularly for documentation or example PRs. If you find yourself making many small suggestions, either open a PR against the original branch, push changes to the contributor branch, or merge the PR and then open a new PR against upstream.
- If you push to a contributor branch leave a comment explaining what you did, ex "I took the liberty of pushing a small clean-up PR to your branch, thanks for your work.". If you are going to make substantial changes to the code or intent of the PR please check with the contributor first.

## 36.4 Branches and Backports

### 36.4.1 Current branches

The current active branches are

**master** The current development version. Future minor releases (v3.N.0) will be branched from this. Supports Python 3.6+.

**v3.N.x** Maintenance branch for Matplotlib 3.N. Future patch releases will be branched from this. Supports Python 3.6+.

**v3.N.M-doc** Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.

**v2.2.x** Maintenance branch for Matplotlib 2.2 LTS. Supports Python 2.7, 3.4+.

**v2.2.N-doc** Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.

### 36.4.2 Branch selection for pull requests

Generally, all pull requests should target the master branch.

Other branches are fed through *automatic* or *manual*. Directly targeting other branches is only rarely necessary for special maintenance work.

### 36.4.3 Backport strategy

We will always backport to the patch release branch (v3.N.x):

- critical bug fixes (segfault, failure to import, things that the user can not work around)
- fixes for regressions against the last two releases.

Everything else (regressions against older releases, bugs/api inconsistencies the user can work around in their code) are on a case-by-case basis, should be low-risk, and need someone to advocate for and shepherd through the backport.

The only changes to be backported to the documentation branch (v3.N.M-doc) are changes to doc, examples, or tutorials. Any changes to lib or src including docstring-only changes should not be backported to this branch.

### 36.4.4 Automated backports

We use meeseeksdev bot to automatically backport merges to the correct maintenance branch base on the milestone. To work properly the milestone must be set before merging. If you have commit rights, the bot can also be manually triggered after a merge by leaving a message @meeseeksdev backport to BRANCH on the PR. If there are conflicts meeseeksdevs will inform you that the backport needs to be done manually.

The target branch is configured by putting on-merge: backport to TARGETBRANCH in the milestone description on it's own line.

If the bot is not working as expected, please report issues to [Meeseeksdev](#).

### 36.4.5 Manual backports

When doing backports please copy the form used by meeseeksdev, Backport PR #XXXX: TITLE OF PR. If you need to manually resolve conflicts make note of them and how you resolved them in the commit message.

We do a backport from master to v2.2.x assuming:

- matplotlib is a read-only remote branch of the matplotlib/matplotlib repo

The `TARGET_SHA` is the hash of the merge commit you would like to backport. This can be read off of the GitHub PR page (in the UI with the merge notification) or through the git CLI tools.

Assuming that you already have a local branch `v2.2.x` (if not, then `git checkout -b v2.2.x`), and that your remote pointing to `https://github.com/matplotlib/matplotlib` is called `upstream`:

```
git fetch upstream
git checkout v2.2.x # or include -b if you don't already have this.
git reset --hard upstream/v2.2.x
git cherry-pick -m 1 TARGET_SHA
# resolve conflicts and commit if required
```

Files with conflicts can be listed by `git status`, and will have to be fixed by hand (search on >>>>). Once the conflict is resolved, you will have to re-add the file(s) to the branch and then continue the cherry pick:

```
git add lib/matplotlib/conflicted_file.py
git add lib/matplotlib/conflicted_file2.py
git cherry-pick --continue
```

Use your discretion to push directly to upstream or to open a PR; be sure to push or PR against the `v2.2.x` upstream branch, not `master`!

## RELEASE GUIDE

---

**This document is only relevant for Matplotlib release managers.**

A guide for developers who are doing a Matplotlib release.

---

---

**Note:** This assumes that a read-only remote for the canonical repository is `remote` and a read/write remote is `DANGER`

---

### 37.1 All Releases

#### 37.1.1 Testing

We use [Travis CI](#) for continuous integration. When preparing for a release, the final tagged commit should be tested locally before it is uploaded:

```
pytest -n 8 .
```

In addition the following test should be run and manually inspected:

```
python tools/memleak.py agg 1000 agg.pdf
```

In addition the following should be run and manually inspected, but is currently broken:

```
pushd examples/tests/  
python backend_driver_sgskip.py  
popd
```

#### 37.1.2 GitHub Stats

We automatically extract GitHub issue, PRs, and authors from GitHub via the API. Copy the current `doc/users/github_stats.rst` to `doc/users/prev_whats_new/github_stats_X.Y.Z.rst`, changing the link target at the top of the file, and removing the "Previous GitHub Stats" section at the end.

For example, when updating from v3.2.0 to v3.2.1:

```
cp doc/users/github_stats.rst doc/users/prev_whats_new/github_stats_3.2.0.rst
$EDITOR doc/users/prev_whats_new/github_stats_3.2.0.rst
# Change contents as noted above.
git add doc/users/prev_whats_new/github_stats_3.2.0.rst
```

Then re-generate the updated stats:

```
python tools/github_stats.py --since-tag v3.2.0 --milestone=v3.2.1 --project 'matplotlib/matplotlib'
↪ --links > doc/users/github_stats.rst
```

Review and commit changes. Some issue/PR titles may not be valid reST (the most common issue is `*` which is interpreted as unclosed markup).

---

**Note:** Make sure you authenticate against the GitHub API. If you do not you will get blocked by GitHub for going over the API rate limits. You can authenticate in one of two ways:

- using the keyring package; `pip install keyring` and then when running the stats script, you will be prompted for user name and password, that will be stored in your system keyring, or,
  - using a personal access token; generate a new token [on this GitHub page](#) with the `repo:public_repo` scope and place the token in `~/.ghoauth`.
- 

### 37.1.3 Update and Validate the Docs

#### Merge `*-doc` branch

Merge the most recent ‘doc’ branch (e.g., `v3.2.0-doc`) into the branch you are going to tag on and delete the doc branch on GitHub.

#### Update “What’s New” and “API changes”

Before tagging major and minor releases, the “what’s new” and “API changes” listings should be updated. This is not needed for micro releases.

For the “what’s new”,

1. copy the current content to a file in `doc/users/prev_whats_new`
2. merge all of the files in `doc/users/next_whats_new/` into `doc/users/whats_new.rst` and delete the individual files
3. comment out the next what’s new glob at the top

Similarly for the “API changes”,

1. copy the current api changes to a file is `doc/api/prev_api_changes`
2. merge all of the files in the most recent `doc/api/api_changes_X.Y` into `doc/api/api_changes.rst`
3. comment out the most recent API changes at the top.

In both cases step 3 will have to be un-done right after the release.

## Verify that docs build

Finally, make sure that the docs build cleanly

```
make -C doc 0=-j$(nproc) html latexpdf
```

After the docs are built, check that all of the links, internal and external, are still valid. We use `linkchecker` for this, which has not been ported to Python3 yet. You will need to create a Python2 environment with `requests==2.9.0` and `linkchecker`

```
conda create -p /tmp/lnkchk python=2 requests==2.9.0
source activate /tmp/lnkchk
pip install linkchecker
pushd doc/build/html
linkchecker index.html --check-extern
popd
```

Address any issues which may arise. The internal links are checked on Circle CI, this should only flag failed external links.

### 37.1.4 Create release commit and tag

To create the tag, first create an empty commit with a very terse set of the release notes in the commit message

```
git commit --allow-empty
```

and then create a signed, annotated tag with the same text in the body message

```
git tag -a -s v2.0.0
```

which will prompt you for your GPG key password and an annotation. For pre releases it is important to follow **PEP 440** so that the build artifacts will sort correctly in PyPI.

To prevent issues with any down-stream builders which download the tarball from GitHub it is important to move all branches away from the commit with the tag<sup>1</sup>:

```
git commit --allow-empty
```

Finally, push the tag to GitHub:

```
git push DANGER master v2.0.0
```

Congratulations, the scariest part is done!

If this is a final release, also create a 'doc' branch (this is not done for pre-releases):

<sup>1</sup> The tarball that is provided by GitHub is produced using `git archive`. We use `versioneer` which uses a format string in `lib/matplotlib/_version.py` to have git insert a list of references to exported commit (see `.gitattributes` for the configuration). This string is then used by `versioneer` to produce the correct version, based on the git tag, when users install from the tarball. However, if there is a branch pointed at the tagged commit, then the branch name will also be included in the tarball. When the branch eventually moves, anyone how checked the hash of the tarball before the branch moved will have an incorrect hash.

To generate the file that GitHub does use

```
git archive v2.0.0 -o matplotlib-2.0.0.tar.gz --prefix=matplotlib-2.0.0/
```

```
git branch v2.0.0-doc
git push DANGER v2.0.0-doc
```

and if this is a major or minor release, also create a bug-fix branch (a micro release will be cut from this branch):

```
git branch v2.0.x
```

On this branch un-comment the globs from *Update and Validate the Docs*. And then

```
git push DANGER v2.0.x
```

### 37.1.5 Release Management / DOI

Via the [GitHub UI](#), turn the newly pushed tag into a release. If this is a pre-release remember to mark it as such.

For final releases, also get the DOI from [zenodo](#) (which will automatically produce one once the tag is pushed). Add the doi post-fix and version to the dictionary in `tools/cache_zenodo_svg.py` and run the script.

This will download the new svg to the `_static` directory in the docs and edit `doc/citing.rst`. Commit the new svg, the change to `tools/cache_zenodo_svg.py`, and the changes to `doc/citing.rst` to the `VER-doc` branch and push to GitHub.

```
git checkout v2.0.0-doc
$EDITOR tools/cache_zenodo_svg.py
python tools/cache_zenodo_svg.py
$EDITOR doc/citing.html
git commit -a
git push DANGER v2.0.0-doc:v2.0.0-doc
```

### 37.1.6 Building binaries

We distribute macOS, Windows, and many Linux wheels as well as a source tarball via PyPI. Most builders should trigger automatically once the tag is pushed to GitHub:

- Mac and manylinux wheels are built on Travis CI. Builds are triggered by the GitHub Action defined in `.github/workflows/wheels.yml`, and wheels will be available at the site defined in the [matplotlib-wheels repo](#).
- Windows wheels are built by Christoph Gohlke automatically and will be [available at his site](#) once built.
- The auto-tick bot should open a pull request into the [conda-forge feedstock](#). Review and merge (if you have the power to).

**Warning:** Because this is automated, it is extremely important to bump all branches away from the tag as discussed in *Create release commit and tag*.

If this is a final release the following downstream packagers should be contacted:

- Debian

- Fedora
- Arch
- Gentoo
- Macports
- Homebrew
- Continuum
- Enthought

This can be done ahead of collecting all of the binaries and uploading to pypi.

### 37.1.7 Make distribution and upload to PyPI

Once you have collected all of the wheels (expect this to take about a day), generate the tarball

```
git checkout v2.0.0
git clean -xfd
python setup.py sdist
```

and copy all of the wheels into dist directory. First, check that the dist files are OK

```
twine check dist/*
```

and then use twine to upload all of the files to pypi

```
twine upload -s dist/matplotlib*tar.gz
twine upload dist/*whl
```

Congratulations, you have now done the second scariest part!

### 37.1.8 Build and Deploy Documentation

To build the documentation you must have the tagged version installed, but build the docs from the ver-doc branch. An easy way to arrange this is:

```
pip install matplotlib
pip install -r requirements/doc/doc-requirements.txt
git checkout v2.0.0-doc
git clean -xfd
make -Cdoc 0=-j$(nproc) html latexpdf LATEXMKOPTS="-silent -f"
```

which will build both the html and pdf version of the documentation.

The built documentation exists in the [matplotlib.github.com](https://matplotlib.github.com) repository. Pushing changes to master automatically updates the website.

The documentation is organized by version. At the root of the tree is always the documentation for the latest stable release. Under that, there are directories containing the documentation for older versions. The documentation for current master is built on Circle CI and pushed to the [devdocs](https://matplotlib.org/devdocs) repository. These are available at [matplotlib.org/devdocs](https://matplotlib.org/devdocs).

Assuming you have this repository checked out in the same directory as matplotlib

```
cd ../matplotlib.github.com
mkdir 2.0.0
rsync -a ../matplotlib/doc/build/html/* 2.0.0
cp ../matplotlib/doc/build/latex/Matplotlib.pdf 2.0.0
```

which will copy the built docs over. If this is a final release, also replace the top-level docs

```
rsync -a 2.0.0/* ./
```

You will need to manually edit `versions.html` to show the last 3 tagged versions. Now commit and push everything to GitHub

```
git add *
git commit -a -m 'Updating docs for v2.0.0'
git push DANGER master
```

Congratulations you have now done the third scariest part!

If you have access, clear the Cloudflare caches.

It typically takes about 5-10 minutes for GitHub to process the push and update the live web page (remember to clear your browser cache).

### 37.1.9 Announcing

The final step is to announce the release to the world. A short version of the release notes along with acknowledgments should be sent to

- [matplotlib-users@python.org](mailto:matplotlib-users@python.org)
- [matplotlib-devel@python.org](mailto:matplotlib-devel@python.org)
- [matplotlib-announce@python.org](mailto:matplotlib-announce@python.org)

For final releases announcements should also be sent to the numpy/scipy/scikit-image mailing lists.

In addition, announcements should be made on social networks (twitter via the @matplotlib account, any other via personal accounts). NumFOCUS should be contacted for inclusion in their newsletter.

## MINIMUM VERSION OF DEPENDENCIES POLICY

For the purpose of this document, 'minor version' is in the sense of SemVer (major, minor, patch) and includes both major and minor releases. For projects that use date-based versioning, every release is a 'minor version'.

Matplotlib follows [NEP 29](#).

### 38.1 Python and NumPy

Matplotlib supports:

- All minor versions of Python released 42 months prior to the project, and at minimum the two latest minor versions.
- All minor versions of `numpy` released in the 24 months prior to the project, and at minimum the last three minor versions.

In `setup.py`, the `python_requires` variable should be set to the minimum supported version of Python. All supported minor versions of Python should be in the test matrix and have binary artifacts built for the release.

Minimum Python and NumPy version support should be adjusted upward on every major and minor release, but never on a patch release.

See also the [List of dependency versions](#).

### 38.2 Python Dependencies

For Python dependencies we should support at least:

**with compiled extensions** minor versions initially released in the 24 months prior to our planned release date or the oldest that support our minimum Python + NumPy

**without complied extensions** minor versions initially released in the 12 months prior to our planned release date or the oldest that supports our minimum Python.

We will only bump these dependencies as we need new features or the old versions no longer support our minimum NumPy or Python.

## 38.3 Test and Documentation Dependencies

As these packages are only needed for testing or building the docs and not needed by end-users, we can be more aggressive about dropping support for old versions. However, we need to be careful to not over-run what down-stream packagers support (as most of the run the tests and build the documentation as part of the packaging process).

We will support at least minor versions of the development dependencies released in the 12 months prior to our planned release.

We will only bump these as needed or versions no longer support our minimum Python and numpy.

## 38.4 System and C-dependencies

For system or C-dependencies (FreeType, GUI frameworks, LaTeX, Ghostscript, FFmpeg) support as old as practical. These can be difficult to install for end-users and we want to be usable on as many systems as possible. We will bump these on a case-by-case basis.

## 38.5 List of dependency versions

The following list shows the minimal versions of Python and NumPy dependencies for different versions of Matplotlib. Follow the links for the full specification of the dependencies.

Matplotlib	Python	NumPy
<a href="#">3.3</a>	3.6	1.15.0
<a href="#">3.2</a>	3.6	1.11.0
<a href="#">3.1</a>	3.6	1.11.0
<a href="#">3.0</a>	3.5	1.10.0
<a href="#">2.2</a>	2.7, 3.4	1.7.1
<a href="#">2.1</a>	2.7, 3.4	1.7.1
<a href="#">2.0</a>	2.7, 3.4	1.7.1
<a href="#">1.5</a>	2.7, 3.4	1.6
<a href="#">1.4</a>	2.6, 3.3	1.6
<a href="#">1.3</a>	2.6, 3.3	1.5
<a href="#">1.2</a>	2.6, 3.1	1.4
<a href="#">1.1</a>	2.4	1.1
<a href="#">1.0</a>	2.4	1.1

## MATPLOTLIB ENHANCEMENT PROPOSALS

Matplotlib Enhancement Proposals (MEP), inspired by cpython's [PEP's](#) but less formal, are design documents for large or controversial changes to Matplotlib. These documents should provide a discussion of both why and how the changes should be made.

To create a new MEP open a pull request (PR) adding a file based on [the template](#) to this the MEP directory. For the initial PR only a rough description is required and it should be merged quickly. Further detailed discussion can happen in follow on PRs.

### 39.1 MEP Template

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

This MEP template is a guideline of the sections that a MEP should contain. Extra sections may be added if appropriate, and unnecessary sections may be noted as such.

#### 39.1.1 Status

MEPs go through a number of phases in their lifetime:

- **Discussion:** The MEP is being actively discussed on the mailing list and it is being improved by its author. The mailing list discussion of the MEP should include the MEP number (MEPxxx) in the subject line so they can be easily related to the MEP.
- **Progress:** Consensus was reached and implementation work has begun.
- **Completed:** The implementation has been merged into master.
- **Superseded:** This MEP has been abandoned in favor of another approach.
- **Rejected:** There are currently no plans to implement the proposal.

### 39.1.2 Branches and Pull requests

All development branches containing work on this MEP should be linked to from here.

All pull requests submitted relating to this MEP should be linked to from here. (A MEP does not need to be implemented in a single pull request if it makes sense to implement it in discrete phases).

### 39.1.3 Abstract

The abstract should be a short description of what the MEP will achieve.

### 39.1.4 Detailed description

This section describes the need for the MEP. It should describe the existing problem that it is trying to solve and why this MEP makes the situation better. It should include examples of how the new functionality would be used and perhaps some use cases.

### 39.1.5 Implementation

This section lists the major steps required to implement the MEP. Where possible, it should be noted where one step is dependent on another, and which steps may be optionally omitted. Where it makes sense, each step should include a link related pull requests as the implementation progresses.

### 39.1.6 Backward compatibility

This section describes the ways in which the MEP breaks backward incompatibility.

### 39.1.7 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

## 39.2 MEP8: PEP8

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*

- *Backward compatibility*
- *Alternatives*

### 39.2.1 Status

#### Completed

We are currently enforcing a sub-set of pep8 on new code contributions.

### 39.2.2 Branches and Pull requests

None so far.

### 39.2.3 Abstract

The matplotlib codebase predates PEP8, and therefore is less than consistent style-wise in some areas. Bringing the codebase into compliance with PEP8 would go a long way to improving its legibility.

### 39.2.4 Detailed description

Some files use four space indentation, some use three. Some use different levels in the same file.

For the most part, class/function/variable naming follows PEP8, but it wouldn't hurt to fix where necessary.

### 39.2.5 Implementation

The implementation should be fairly mechanical: running the pep8 tool over the code and fixing where appropriate.

This should be merged in after the 2.0 release, since the changes will likely make merging any pending pull requests more difficult.

Additionally, and optionally, PEP8 compliance could be tracked by an automated build system.

### 39.2.6 Backward compatibility

Public names of classes and functions that require change (there shouldn't be many of these) should first be deprecated and then removed in the next release cycle.

### 39.2.7 Alternatives

PEP8 is a popular standard for Python code style, blessed by the Python core developers, making any alternatives less desirable.

## 39.3 MEP9: Global interaction manager

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Current summary of the mixin*
- *Backward compatibility*
- *Alternatives*

Add a global manager for all user interactivity with artists; make any artist resizable, moveable, highlightable, and selectable as desired by the user.

### 39.3.1 Status

#### Discussion

### 39.3.2 Branches and Pull requests

<https://github.com/dhyams/matplotlib/tree/MEP9>

### 39.3.3 Abstract

The goal is to be able to interact with matplotlib artists in a very similar way as drawing programs do. When appropriate, the user should be able to move, resize, or select an artist that is already on the canvas. Of course, the script writer is ultimately in control of whether an artist is able to be interacted with, or whether it is static.

This code to do this has already been privately implemented and tested, and would need to be migrated from its current "mixin" implementation, to a bona-fide part of matplotlib.

The end result would be to have four new keywords available to `matplotlib.artist.Artist`: `_moveable_`, `_resizeable_`, `_selectable_`, and `_highlightable_`. Setting any one of these keywords to `True` would activate interactivity for that artist.

In effect, this MEP is a logical extension of event handling in matplotlib; matplotlib already supports "low level" interactions like left mouse presses, a key press, or similar. The MEP extends the support to the logical level, where callbacks are performed on the artists when certain interactive gestures from the user are detected.

### 39.3.4 Detailed description

This new functionality would be used to allow the end-user to better interact with the graph. Many times, a graph is almost what the user wants, but a small repositioning and/or resizing

of components is necessary. Rather than force the user to go back to the script to trial-and-error the location, and simple drag and drop would be appropriate.

Also, this would better support applications that use matplotlib; here, the end-user has no reasonable access or desire to edit the underlying source in order to fine-tune a plot. Here, if matplotlib offered the capability, one could move or resize artists on the canvas to suit their needs. Also, the user should be able to highlight (with a mouse over) an artist, and select it with a double-click, if the application supports that sort of thing. In this MEP, we also want to support the highlighting and selection natively; it is up to application to handle what happens when the artist is selected. A typical handling would be to display a dialog to edit the properties of the artist.

In the future, as well (this is not part of this MEP), matplotlib could offer backend-specific property dialogs for each artist, which are raised on artist selection. This MEP would be a necessary stepping stone for that sort of capability.

There are currently a few interactive capabilities in matplotlib (e.g. `legend.draggable()`), but they tend to be scattered and are not available for all artists. This MEP seeks to unify the interactive interface and make it work for all artists.

The current MEP also includes grab handles for resizing artists, and appropriate boxes drawn when artists are moved or resized.

### 39.3.5 Implementation

- Add appropriate methods to the "tree" of artists so that the interactivity manager has a consistent interface for the interactivity manager to deal with. The proposed methods to add to the artists, if they are to support interactivity, are:
  - `get_pixel_position_ll(self)`: get the pixel position of the lower left corner of the artist's bounding box
  - `get_pixel_size(self)`: get the size of the artist's bounding box, in pixels
  - `set_pixel_position_and_size(self,x,y,dx,dy)`: set the new size of the artist, such that it fits within the specified bounding box.
- add capability to the backends to 1) provide cursors, since these are needed for visual indication of moving/resizing, and 2) provide a function that gets the current mouse position
- Implement the manager. This has already been done privately (by dhyams) as a mixin, and has been tested quite a bit. The goal would be to move the functionality of the manager into the artists so that it is in matplotlib properly, and not as a "monkey patch" as I currently have it coded.

### 39.3.6 Current summary of the mixin

(Note that this mixin is for now just private code, but can be added to a branch obviously)

InteractiveArtistMixin:

Mixin class to make any generic object that is drawn on a matplotlib canvas moveable and possibly resizeable. The Powerpoint model is followed as closely as possible; not because I'm enamoured with Powerpoint, but because that's what most people understand. An artist can also be selectable, which means that the artist will receive the `on_activated()` callback when double clicked. Finally, an artist can be highlightable, which means that a highlight is drawn

on the artist whenever the mouse passes over. Typically, highlightable artists will also be selectable, but that is left up to the user. So, basically there are four attributes that can be set by the user on a per-artist basis:

- highlightable
- selectable
- moveable
- resizable

To be moveable (draggable) or resizable, the object that is the target of the mixin must support the following protocols:

- `get_pixel_position_ll(self)`
- `get_pixel_size(self)`
- `set_pixel_position_and_size(self,x,y,sx,sy)`

Note that nonresizable objects are free to ignore the `sx` and `sy` parameters. To be highlightable, the object that is the target of the mixin must also support the following protocol:

- `get_highlight(self)`

Which returns a list of artists that will be used to draw the highlight.

If the object that is the target of the mixin is not an matplotlib artist, the following protocols must also be implemented. Doing so is usually fairly trivial, as there has to be an artist *somewhere* that is being drawn. Typically your object would just route these calls to that artist.

- `get_figure(self)`
- `get_axes(self)`
- `contains(self,event)`
- `set_animated(self,flag)`
- `draw(self,renderer)`
- `get_visible(self)`

The following notifications are called on the artist, and the artist can optionally implement these.

- `on_select_begin(self)`
- `on_select_end(self)`
- `on_drag_begin(self)`
- `on_drag_end(self)`
- `on_activated(self)`
- `on_highlight(self)`
- `on_right_click(self,event)`
- `on_left_click(self,event)`
- `on_middle_click(self,event)`
- `on_context_click(self,event)`
- `on_key_up(self,event)`

- `on_key_down(self,event)`

The following notifications are called on the canvas, if no interactive artist handles the event:

- `on_press(self,event)`
- `on_left_click(self,event)`
- `on_middle_click(self,event)`
- `on_right_click(self,event)`
- `on_context_click(self,event)`
- `on_key_up(self,event)`
- `on_key_down(self,event)`

The following functions, if present, can be used to modify the behavior of the interactive object:

- `press_filter(self,event)` # determines if the object wants to have the press event routed to it
- `handle_unpicked_cursor()` # can be used by the object to set a cursor as the cursor passes over the object when it is unpicked.

Supports multiple canvases, maintaining a drag lock, motion notifier, and a global "enabled" flag per canvas. Supports fixed aspect ratio resizings by holding the shift key during the resize.

Known problems:

- Zorder is not obeyed during the selection/drag operations. Because of the blit technique used, I do not believe this can be fixed. The only way I can think of is to search for all artists that have a zorder greater than me, set them all to animated, and then redraw them all on top during each drag refresh. This might be very slow; need to try.
- the mixin only works for wx backends because of two things: 1) the cursors are hard-coded, and 2) there is a call to `wx.GetMousePosition()` Both of these shortcomings are reasonably fixed by having each backend supply these things.

### 39.3.7 Backward compatibility

No problems with backward compatibility, although once this is in place, it would be appropriate to obsolete some of the existing interactive functions (like `legend.draggable()`)

### 39.3.8 Alternatives

None that I know of.

## 39.4 MEP10: Docstring consistency

- *Status*

- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
  - *Numpy docstring format*
  - *Cross references*
  - *Overriding signatures*
  - *Linking rather than duplicating*
  - *autosummary extension*
  - *Examples linking to relevant documentation*
  - *Documentation using help() vs. a browser*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### 39.4.1 Status

#### Progress

This is still an on-going effort

### 39.4.2 Branches and Pull requests

### 39.4.3 Abstract

matplotlib has a great deal of inconsistency between docstrings. This not only makes the docs harder to read, but it is harder on contributors, because they don't know which specifications to follow. There should be a clear docstring convention that is followed consistently.

The organization of the API documentation is difficult to follow. Some pages, such as pyplot and axes, are enormous and hard to browse. There should instead be short summary tables that link to detailed documentation. In addition, some of the docstrings themselves are quite long and contain redundant information.

Building the documentation takes a long time and uses a `make.py` script rather than a Makefile.

### 39.4.4 Detailed description

There are number of new tools and conventions available since matplotlib started using Sphinx that make life easier. The following is a list of proposed changes to docstrings, most of which involve these new features.

## Numpy docstring format

**Numpy docstring format:** This format divides the docstring into clear sections, each having different parsing rules that make the docstring easy to read both as raw text and as HTML. We could consider alternatives, or invent our own, but this is a strong choice, as it's well used and understood in the Numpy/Scipy community.

## Cross references

Most of the docstrings in matplotlib use explicit "roles" when linking to other items, for example: `:func:`myfunction``. As of Sphinx 0.4, there is a "default\_role" that can be set to "obj", which will polymorphically link to a Python object of any type. This allows one to write ``myfunction`` instead. This makes docstrings much easier to read and edit as raw text. Additionally, Sphinx allows for setting a current module, so links like ``~matplotlib.axes.Axes.set_xlim`` could be written as ``~axes.Axes.set_xlim``.

## Overriding signatures

Many methods in matplotlib use the `*args` and `**kwargs` syntax to dynamically handle the keyword arguments that are accepted by the function, or to delegate on to another function. This, however, is often not useful as a signature in the documentation. For this reason, many matplotlib methods include something like:

```
def annotate(self, *args, **kwargs):
    """
    Create an annotation: a piece of text referring to a data
    point.

    Call signature::

        annotate(s, xy, xytext=None, xycoords='data',
                textcoords='data', arrowprops=None, **kwargs)
    """
```

This can't be parsed by Sphinx, and is rather verbose in raw text. As of Sphinx 1.1, if the `autodoc_docstring_signature` config value is set to True, Sphinx will extract a replacement signature from the first line of the docstring, allowing this:

```
def annotate(self, *args, **kwargs):
    """
    annotate(s, xy, xytext=None, xycoords='data',
            textcoords='data', arrowprops=None, **kwargs)

    Create an annotation: a piece of text referring to a data
    point.
    """
```

The explicit signature will replace the actual Python one in the generated documentation.

## Linking rather than duplicating

Many of the docstrings include long lists of accepted keywords by interpolating things into the docstring at load time. This makes the docstrings very long. Also, since these tables

are the same across many docstrings, it inserts a lot of redundant information in the docs – particularly a problem in the printed version.

These tables should be moved to docstrings on functions whose only purpose is for help. The docstrings that refer to these tables should link to them, rather than including them verbatim.

#### autosummary extension

The Sphinx autosummary extension should be used to generate summary tables, that link to separate pages of documentation. Some classes that have many methods (e.g. *Axes*) should be documented with one method per page, whereas smaller classes should have all of their methods together.

#### Examples linking to relevant documentation

The examples, while helpful at illustrating how to use a feature, do not link back to the relevant docstrings. This could be addressed by adding module-level docstrings to the examples, and then including that docstring in the parsed content on the example page. These docstrings could easily include references to any other part of the documentation.

#### Documentation using `help()` vs. a browser

Using Sphinx markup in the source allows for good-looking docs in your browser, but the markup also makes the raw text returned using `help()` look terrible. One of the aims of improving the docstrings should be to make both methods of accessing the docs look good.

### 39.4.5 Implementation

1. The numpydoc extensions should be turned on for matplotlib. There is an important question as to whether these should be included in the matplotlib source tree, or used as a dependency. Installing Numpy is not sufficient to get the numpydoc extensions – it's a separate install procedure. In any case, to the extent that they require customization for our needs, we should endeavor to submit those changes upstream and not fork them.
2. Manually go through all of the docstrings and update them to the new format and conventions. Updating the cross references (from ``:func: myfunc`` to ``func``) may be able to be semi-automated. This is a lot of busy work, and perhaps this labor should be divided on a per-module basis so no single developer is over-burdened by it.
3. Reorganize the API docs using autosummary and sphinx-autogen. This should hopefully have minimal impact on the narrative documentation.
4. Modify the example page generator (`gen_rst.py`) so that it extracts the module docstring from the example and includes it in a non-literal part of the example page.
5. Use sphinx-quickstart to generate a new-style Sphinx Makefile. The following features in the current `make.py` will have to be addressed in some other way:
  - Copying of some static content
  - Specifying a "small" build (only low-resolution PNG files for examples)

Steps 1, 2, and 3 are interdependent. 4 and 5 may be done independently, though 5 has some dependency on 3.

### 39.4.6 Backward compatibility

As this mainly involves docstrings, there should be minimal impact on backward compatibility.

### 39.4.7 Alternatives

None yet discussed.

## 39.5 MEP11: Third-party dependencies

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
  - *Current behavior*
  - *Desired behavior*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

This MEP attempts to improve the way in which third-party dependencies in matplotlib are handled.

### 39.5.1 Status

**Completed** - needs to be merged

### 39.5.2 Branches and Pull requests

#1157: Use automatic dependency resolution

#1290: Debundle pyparsing

#1261: Update six to 1.2

### 39.5.3 Abstract

One of the goals of matplotlib has been to keep it as easy to install as possible. To that end, some third-party dependencies are included in the source tree and, under certain circumstances, installed alongside matplotlib. This MEP aims to resolve some problems with that approach, bring some consistency, while continuing to make installation convenient.

At the time that was initially done, [setuptools](#), [easy\\_install](#) and [PyPI](#) were not mature enough to be relied on. However, at present, we should be able to safely leverage the “modern” versions of those tools, [distribute](#) and [pip](#).

While matplotlib has dependencies on both Python libraries and C/C++ libraries, this MEP addresses only the Python libraries so as to not confuse the issue. C libraries represent a larger and mostly orthogonal set of problems.

### 39.5.4 Detailed description

matplotlib depends on the following third-party Python libraries:

- Numpy
- dateutil (pure Python)
- pytz (pure Python)
- six – required by dateutil (pure Python)
- pyparsing (pure Python)
- PIL (optional)
- GUI frameworks: pygtk, gobject, tkinter, PySide, PyQt4, wx (all optional, but one is required for an interactive GUI)

#### Current behavior

When installing from source, a [git](#) checkout or [pip](#):

- `setup.py` attempts to import `numpy`. If this fails, the installation fails.
- For each of [dateutil](#), [pytz](#) and [six](#), `setup.py` attempts to import them (from the top-level namespace). If that fails, matplotlib installs its local copy of the library into the top-level namespace.
- [pyparsing](#) is always installed inside of the matplotlib namespace.

This behavior is most surprising when used with [pip](#), because no [pip](#) dependency resolution is performed, even though it is likely to work for all of these packages.

The fact that [pyparsing](#) is installed in the matplotlib namespace has reportedly (#1290) confused some users into thinking it is a matplotlib-related module and import it from there rather than the top-level.

When installing using the Windows installer, [dateutil](#), [pytz](#) and [six](#) are installed at the top-level *always*, potentially overwriting already installed copies of those libraries.

TODO: Describe behavior with the OS-X installer.

When installing using a package manager (Debian, RedHat, MacPorts etc.), this behavior actually does the right thing, and there are no special patches in the matplotlib packages to deal with the fact that we handle [dateutil](#), [pytz](#) and [six](#) in this way. However, care should be taken that whatever approach we move to continues to work in that context.

Maintaining these packages in the matplotlib tree and making sure they are up-to-date is a maintenance burden. Advanced new features that may require a third-party pure Python library have a higher barrier to inclusion because of this burden.

### Desired behavior

Third-party dependencies are downloaded and installed from their canonical locations by leveraging `pip`, `distribute` and `PyPI`.

`dateutil`, `pytz`, and `pyparsing` should be made into optional dependencies – though obviously some features would fail if they aren’t installed. This will allow the user to decide whether they want to bother installing a particular feature.

### 39.5.5 Implementation

For installing from source, and assuming the user has all of the C-level compilers and dependencies, this can be accomplished fairly easily using `distribute` and following the instructions [here](#). The only anticipated change to the matplotlib library code will be to import `pyparsing` from the top-level namespace rather than from within matplotlib. Note that `distribute` will also allow us to remove the direct dependency on `six`, since it is, strictly speaking, only a direct dependency of `dateutil`.

For binary installations, there are a number of alternatives (here ordered from best/hardest to worst/easiest):

1. The distutils wininst installer allows a post-install script to run. It might be possible to get this script to run `pip` to install the other dependencies. (See [this thread](#) for someone who has trod that ground before).
2. Continue to ship `dateutil`, `pytz`, `six` and `pyparsing` in our installer, but use the post-install-script to install them *only* if they can not already be found.
3. Move all of these packages inside a (new) `matplotlib.extern` namespace so it is clear for outside users that these are external packages. Add some conditional imports in the core matplotlib codebase so `dateutil` (at the top-level) is tried first, and failing that `matplotlib.extern.dateutil` is used.

2 and 3 are undesirable as they still require maintaining copies of these packages in our tree – and this is exacerbated by the fact that they are used less – only in the binary installers. None of these 3 approaches address Numpy, which will still have to be manually installed using an installer.

TODO: How does this relate to the Mac OS-X installer?

### 39.5.6 Backward compatibility

At present, matplotlib can be installed from source on a machine without the third party dependencies and without an internet connection. After this change, an internet connection (and a working PyPI) will be required to install matplotlib for the first time. (Subsequent matplotlib updates or development work will run without accessing the network).

### 39.5.7 Alternatives

Distributing binary eggs doesn’t feel like a usable solution. That requires getting `easy_install` installed first, and Windows users generally prefer the well known `.exe` or `.msi` installer that works out of the box.

## 39.6 MEP12: Improve Gallery and Examples

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
  - *Gallery sections*
  - *Clean up guidelines*
    - \* *Additional suggestions*
- *Backward compatibility*
- *Alternatives*
  - *Tags*

### 39.6.1 Status

#### Progress

Initial changes added in 1.3. Conversion of the gallery is on-going. 29 September 2015 - The last `pylab_examples` where `pylab` is imported has been converted over to use `matplotlib.pyplot` and `numpy`.

### 39.6.2 Branches and Pull requests

#1623, #1924, #2181

PR #2474 demonstrates a single example being cleaned up and moved to the appropriate section.

### 39.6.3 Abstract

Reorganizing the matplotlib plot gallery would greatly simplify navigation of the gallery. In addition, examples should be cleaned-up and simplified for clarity.

### 39.6.4 Detailed description

The matplotlib gallery was recently set up to split examples up into sections. As discussed in that PR<sup>1</sup>, the current example sections (`api`, `pylab_examples`) aren't terribly useful to users: New sections in the gallery would help users find relevant examples.

---

<sup>1</sup> <https://github.com/matplotlib/matplotlib/pull/714>

These sections would also guide a cleanup of the examples: Initially, all the current examples would remain and be listed under their current directories. Over time, these examples could be cleaned up and moved into one of the new sections.

This process allows users to easily identify examples that need to be cleaned up; i.e. anything in the `api` and `pylab_examples` directories.

### 39.6.5 Implementation

1. Create new gallery sections. [Done]
2. Clean up examples and move them to the new gallery sections (over the course of many PRs and with the help of many users/developers). [In progress]

#### Gallery sections

The naming of sections is critical and will guide the clean-up effort. The current sections are:

- Lines, bars, and markers (more-or-less 1D data)
- Shapes and collections
- Statistical plots
- Images, contours, and fields
- Pie and polar charts: Round things
- Color
- Text, labels, and annotations
- Ticks and spines
- Subplots, axes, and figures
- Specialty plots (e.g., sankey, radar, tornado)
- Showcase (plots with tweaks to make them publication-quality)
- separate sections for toolboxes (already exists: `'mplot3d'`, `'axes_grid'`, `'units'`, `'widgets'`)

These names are certainly up for debate. As these sections grow, we should reevaluate them and split them up as necessary.

#### Clean up guidelines

The current examples in the `api` and `pylab_examples` sections of the gallery would remain in those directories until they are cleaned up. After clean-up, they would be moved to one of the new gallery sections described above. "Clean-up" should involve:

- **sphinx-gallery docstrings**: a title and a description of the example formatted as follows, at the top of the example:

```
"""
=====
Colormaps alter your perception
=====
```

(continues on next page)

(continued from previous page)

```
Here I plot the function

.. math:: f(x, y) = \sin(x) + \cos(y)

with different colormaps. Look at how colormaps alter your perception!
"""
```

- PEP8 clean-ups (running [flake8](#), or a similar checker, is highly recommended)
- Commented-out code should be removed.
- Replace uses of *pylab* interface with *pyplot* (+ *numpy*, etc.). See [c25ef1e](#)
- Remove shebang line, e.g.:

```
#!/usr/bin/env python
```

- Use consistent imports. In particular:

```
import numpy as np
```

```
import matplotlib.pyplot as plt
```

Avoid importing specific functions from these modules (e.g. from `numpy import sin`)

- Each example should focus on a specific feature (excluding *showcase* examples, which will show more “polished” plots). Tweaking unrelated to that feature should be removed. See [f7b2217](#), [e57b5fc](#), and [1458aa8](#)

Use of *pylab* should be demonstrated/discussed on a dedicated help page instead of the gallery examples.

**Note:** When moving an existing example, you should search for references to that example. For example, the API documentation for `axes.py` and `pyplot.py` may use these examples to generate plots. Use your favorite search tool (e.g., `grep`, `ack`, [grin](#), [pss](#)) to search the matplotlib package. See [2dc9a46](#) and [aa6b410](#)

### Additional suggestions

- Provide links (both ways) between examples and API docs for the methods/objects used. (issue [#2222](#))
- Use `plt.subplots` (note trailing “s”) in preference over `plt.subplot`.
- Rename the example to clarify its purpose. For example, the most basic demo of `imshow` might be `imshow_demo.py`, and one demonstrating different interpolation settings would be `imshow_demo_interpolation.py` (*not* `imshow_demo2.py`).
- Split up examples that try to do too much. See [5099675](#) and [fc2ab07](#)
- Delete examples that don’t show anything new.
- Some examples exercise esoteric features for unit testing. These tweaks should be moved out of the gallery to an example in the `unit` directory located in the root directory of the package.
- Add plot titles to clarify intent of the example. See [bd2b13c](#)

### 39.6.6 Backward compatibility

The website for each Matplotlib version is readily accessible, so users who want to refer to old examples can still do so.

### 39.6.7 Alternatives

#### Tags

Tagging examples will also help users search the example gallery. Although tags would be a big win for users with specific goals, the plot gallery will remain the entry point to these examples, and sections could really help users navigate the gallery. Thus, tags are complementary to this reorganization.

## 39.7 MEP13: Use properties for Artists

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Examples*
  - `axes.Axes.set_axis_off/set_axis_on`
  - `axes.Axes.get_xlim/set_xlim` and `get_autoscalex_on/set_autoscalex_on`
  - `axes.Axes.get_title/set_title`
  - `axes.Axes.get_xticklabels/set_xticklabels`
- *Alternatives*

### 39.7.1 Status

- **Discussion**

### 39.7.2 Branches and Pull requests

None

### 39.7.3 Abstract

Wrap all of the matplotlib getter and setter methods with python `properties`, allowing them to be read and written like class attributes.

### 39.7.4 Detailed description

Currently matplotlib uses getter and setter functions (usually prefixed with `get_` and `set_`, respectively) for reading and writing data related to classes. However, since 2.6 python supports properties, which allow such setter and getter functions to be accessed as though they were attributes. This proposal would implement all existing setter and getter methods as properties.

### 39.7.5 Implementation

1. All existing getter and setter methods will need to have two aliases, one with the `get_` or `set_` prefix and one without. Getter methods that currently lack prefixes should be recording in a text file.
2. Classes should be reorganized so setter and getter methods are sequential in the code, with getter methods first.
3. Getter and setter methods the provide additional optional optional arguments should have those arguments accessible in another manner, either as additional getter or setter methods or attributes of other classes. If those classes are not accessible, getters for them should be added.
4. Property decorators will be added to the setter and getter methods without the prefix. Those with the prefix will be marked as deprecated.
5. Docstrings will need to be rewritten so the getter with the prefix has the current docstring and the getter without the prefix has a generic docstring appropriate for an attribute.
6. Automatic alias generation will need to be modified so it will also create aliases for the properties.
7. All instances of getter and setter method calls will need to be changed to attribute access.
8. All setter and getter aliases with prefixes will be removed

The following steps can be done simultaneously: 1, 2, and 3; 4 and 5; 6 and 7.

Only the following steps must be done in the same release: 4, 5, and 6. All other changes can be done in separate releases. 8 should be done several major releases after everything else.

### 39.7.6 Backward compatibility

All existing getter methods that do not have a prefix (such as `get_`) will need to be changed from function calls to attribute access. In most cases this will only require removing the parenthesis.

setter and getter methods that have additional optional arguments will need to have those arguments implemented in another way, either as a separate property in the same class or as attributes or properties of another class.

Cases where the setter returns a value will need to be changed to using the setter followed by the getter.

Cases where there are `set_ATTR_on()` and `set_ATTR_off()` methods will be changed to `ATTR_on` properties.

### 39.7.7 Examples

#### `axes.Axes.set_axis_off/set_axis_on`

Current implementation:

```
axes.Axes.set_axis_off()
axes.Axes.set_axis_on()
```

New implementation:

```
True = axes.Axes.axis_on
False = axes.Axes.axis_off
axes.Axes.axis_on = True
axes.Axes.axis_off = False
```

#### `axes.Axes.get_xlim/set_xlim` and `get_autoscalex_on/set_autoscalex_on`

Current implementation:

```
[left, right] = axes.Axes.get_xlim()
auto = axes.Axes.get_autoscalex_on()

[left, right] = axes.Axes.set_xlim(left=left, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, right=None, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=None, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(right=right, emit=emit, auto=auto)

axes.Axes.set_autoscalex_on(auto)
```

New implementation:

```
[left, right] = axes.Axes.axes_xlim
auto = axes.Axes.autoscalex_on

axes.Axes.axes_xlim = [left, right]
axes.Axes.axes_xlim = [left, None]
axes.Axes.axes_xlim = [None, right]
axes.Axes.axes_xlim[0] = left
axes.Axes.axes_xlim[1] = right

axes.Axes.autoscalex_on = auto

axes.Axes.emit_xlim = emit
```

### axes.Axes.get\_title/set\_title

Current implementation:

```
string = axes.Axes.get_title()
axes.Axes.set_title(string, fontdict=fontdict, **kwargs)
```

New implementation:

```
string = axes.Axes.title
string = axes.Axes.title_text.text

text.Text = axes.Axes.title_text
text.Text.<attribute> = attribute
text.Text.fontdict = fontdict

axes.Axes.title = string
axes.Axes.title = text.Text
axes.Axes.title_text = string
axes.Axes.title_text = text.Text
```

### axes.Axes.get\_xticklabels/set\_xticklabels

Current implementation:

```
[text.Text] = axes.Axes.get_xticklabels()
[text.Text] = axes.Axes.get_xticklabels(minor=False)
[text.Text] = axes.Axes.get_xticklabels(minor=True)
[text.Text] = axes.Axes.([string], fontdict=None, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=False, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=True, **kwargs)
```

New implementation:

```
[text.Text] = axes.Axes.xticklabels
[text.Text] = axes.Axes.xminorticklabels
axes.Axes.xticklabels = [string]
axes.Axes.xminorticklabels = [string]
axes.Axes.xticklabels = [text.Text]
axes.Axes.xminorticklabels = [text.Text]
```

## 39.7.8 Alternatives

Instead of using decorators, it is also possible to use the property function. This would change the procedure so that all getter methods that lack a prefix will need to be renamed or removed. This makes handling docstrings more difficult and harder to read.

It is not necessary to deprecate the setter and getter methods, but leaving them in will complicate the code.

This could also serve as an opportunity to rewrite or even remove automatic alias generation.

Another alternate proposal:

Convert `set_xlim`, `set_xlabel`, `set_title`, etc. to `xlim`, `xlabel`, `title`,... to make the transition from `plt` functions to axes methods significantly simpler. These would still be methods, not properties, but it's still a great usability enhancement while retaining the interface.

## 39.8 MEP14: Text handling

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### 39.8.1 Status

- **Discussion**

### 39.8.2 Branches and Pull requests

Issue #253 demonstrates a bug where using the bounding box rather than the advance width of text results in misaligned text. This is a minor point in the grand scheme of things, but it should be addressed as part of this MEP.

### 39.8.3 Abstract

By reorganizing how text is handled, this MEP aims to:

- improve support for Unicode and non-ltr languages
- improve text layout (especially multi-line text)
- allow support for more fonts, especially non-Apple-format TrueType fonts and OpenType fonts.
- make the font configuration easier and more transparent

### 39.8.4 Detailed description

#### Text layout

At present, matplotlib has two different ways to render text: "built-in" (based on FreeType and our own Python code), and "usetex" (based on calling out to a TeX installation). Adjunct to the "built-in" renderer there is also the Python-based "mathtext" system for rendering

mathematical equations using a subset of the TeX language without having a TeX installation available. Support for these two engines is strewn about many source files, including every backend, where one finds clauses like

```
if rcParams['text.usetex']: # do one thing else: # do another
```

Adding a third text rendering approach (more on that later) would require editing all of these places as well, and therefore doesn't scale.

Instead, this MEP proposes adding a concept of "text engines", where the user could select one of many different approaches for rendering text. The implementations of each of these would be localized to their own set of modules, and not have little pieces around the whole source tree.

Why add more text rendering engines? The "built-in" text rendering has a number of shortcomings.

- It only handles right-to-left languages, and doesn't handle many special features of Unicode, such as combining diacriticals.
- The multiline support is imperfect and only supports manual line-breaking – it can not break up a paragraph into lines of a certain length.
- It also does not handle inline formatting changes in order to support something like Markdown, reStructuredText or HTML. (Though rich-text formatting is contemplated in this MEP, since we want to make sure this design allows it, the specifics of a rich-text formatting implementation is outside of the scope of this MEP.)

Supporting these things is difficult, and is the "full-time job" of a number of other projects:

- [pango/harfbuzz](#)
- [QtTextLayout](#)
- [Microsoft DirectWrite](#)
- [Apple Core Text](#)

Of the above options, it should be noted that [harfbuzz](#) is designed from the start as a cross platform option with minimal dependencies, so therefore is a good candidate for a single option to support.

Additionally, for supporting rich text, we could consider using [WebKit](#), and possibly whether that represents a good single cross-platform option. Again, however, rich text formatting is outside of the scope of this project.

Rather than trying to reinvent the wheel and add these features to matplotlib's "built-in" text renderer, we should provide a way to leverage these projects to get more powerful text layout. The "built-in" renderer will still need to exist for reasons of ease of installation, but its feature set will be more limited compared to the others. [TODO: This MEP should clearly decide what those limited features are, and fix any bugs to bring the implementation into a state of working correctly in all cases that we want it to work. I know @leejjoon has some thoughts on this.]

## Font selection

Going from an abstract description of a font to a file on disk is the task of the font selection algorithm – it turns out to be much more complicated than it seems at first.

The "built-in" and "usetex" renderers have very different ways of handling font selection, given their different technologies. TeX requires the installation of TeX-specific font packages, for example, and can not use TrueType fonts directly. Unfortunately, despite the different

semantics for font selection, the same set of font properties are used for each. This is true of both the `FontProperties` class and the font-related `rcParams` (which basically share the same code underneath). Instead, we should define a core set of font selection parameters that will work across all text engines, and have engine-specific configuration to allow the user to do engine-specific things when required. For example, it is possible to directly select a font by name in the “built-in” using `rcParams["font.family"]` (default: `['sans-serif']`), but the same is not possible with “`usetex`”. It may be possible to make it easier to use TrueType fonts by using XeTeX, but users will still want to use the traditional metafonts through TeX font packages. So the issue still stands that different text engines will need engine-specific configuration, and it should be more obvious to the user which configuration will work across text engines and which are engine-specific.

Note that even excluding “`usetex`”, there are different ways to find fonts. The default is to use the font list cache in `font_manager` which matches fonts using our own algorithm based on the `CSS font matching algorithm`. It doesn’t always do the same thing as the native font selection algorithms on Linux (`fontconfig`), Mac and Windows, and it doesn’t always find all of the fonts on the system that the OS would normally pick up. However, it is cross-platform, and always finds the fonts that ship with matplotlib. The Cairo and MacOSX backends (and presumably a future HTML5-based backend) currently bypass this mechanism and use the OS-native ones. The same is true when not embedding fonts in SVG, PS or PDF files and opening them in a third-party viewer. A downside there is that (at least with Cairo, need to confirm with MacOSX) they don’t always find the fonts we ship with matplotlib. (It may be possible to add the fonts to their search path, though, or we may need to find a way to install our fonts to a location the OS expects to find them).

There are also special modes in the PS and PDF to only use the core fonts that are always available to those formats. There, the font lookup mechanism must only match against those fonts. It is unclear whether the OS-native font lookup systems can handle this case.

There is also experimental support for using `fontconfig` for font selection in matplotlib, turned off by default. `fontconfig` is the native font selection algorithm on Linux, but is also cross platform and works well on the other platforms (though obviously is an additional dependency there).

Many of the text layout libraries proposed above (pango, QtTextLayout, DirectWrite and Core-Text etc.) insist on using the font selection library from their own ecosystem.

All of the above seems to suggest that we should move away from our self-written font selection algorithm and use the native APIs where possible. That’s what Cairo and MacOSX backends already want to use, and it will be a requirement of any complex text layout library. On Linux, we already have the bones of a `fontconfig` implementation (which could also be accessed through pango). On Windows and Mac we may need to write custom wrappers. The nice thing is that the API for font lookup is relatively small, and essentially consist of “given a dictionary of font properties, give me a matching font file”.

### Font subsetting

Font subsetting is currently handled using `ttconv`. `ttconv` was a standalone commandline utility for converting TrueType fonts to subsetting Type 3 fonts (among other features) written in 1995, which matplotlib (well, I) forked in order to make it work as a library. It only handles Apple-style TrueType fonts, not ones with the Microsoft (or other vendor) encodings. It doesn’t handle OpenType fonts at all. This means that even though the STIX fonts come as .otf files, we have to convert them to .ttf files to ship them with matplotlib. The Linux packagers hate this – they’d rather just depend on the upstream STIX fonts. `ttconv` has also been shown to have a few bugs that have been difficult to fix over time.

Instead, we should be able to use FreeType to get the font outlines and write our own code (probably in Python) to output subsetting fonts (Type 3 on PS and PDF and paths on SVG).

Freetype, as a popular and well-maintained project, handles a wide variety of fonts in the wild. This would remove a lot of custom C code, and remove some code duplication between backends.

Note that subsetting fonts this way, while the easiest route, does lose the hinting in the font, so we will need to continue, as we do now, provide a way to embed the entire font in the file where possible.

Alternative font subsetting options include using the subsetting built-in to Cairo (not clear if it can be used without the rest of Cairo), or using [fontforge](#) (which is a heavy and not terribly cross-platform dependency).

### Freetype wrappers

Our FreeType wrapper could really use a reworking. It defines its own image buffer class (when a Numpy array would be easier). While FreeType can handle a huge diversity of font files, there are limitations to our wrapper that make it much harder to support non-Apple-vendor TrueType files, and certain features of OpenType files. (See #2088 for a terrible result of this, just to support the fonts that ship with Windows 7 and 8). I think a fresh rewrite of this wrapper would go a long way.

### Text anchoring and alignment and rotation

The handling of baselines was changed in 1.3.0 such that the backends are now given the location of the baseline of the text, not the bottom of the text. This is probably the correct behavior, and the MEP refactoring should also follow this convention.

In order to support alignment on multi-line text, it should be the responsibility of the (proposed) text engine to handle text alignment. For a given chunk of text, each engine calculates a bounding box for that text and the offset of the anchor point within that box. Therefore, if the va of a block was "top", the anchor point would be at the top of the box.

Rotating of text should always be around the anchor point. I'm not sure that lines up with current behavior in matplotlib, but it seems like the sanest/least surprising choice. [This could be revisited once we have something working]. Rotation of text should not be handled by the text engine - that should be handled by a layer between the text engine and the rendering backend so it can be handled in a uniform way. [I don't see any advantage to rotation being handled by the text engines individually...]

There are other problems with text alignment and anchoring that should be resolved as part of this work. [TODO: enumerate these].

### Other minor problems to fix

The mathtext code has backend-specific code - it should instead provide its output as just another text engine. However, it's still desirable to have mathtext layout inserted as part of a larger layout performed by another text engine, so it should be possible to do this. It's an open question whether embedding the text layout of an arbitrary text engine in another should be possible.

The text mode is currently set by a global rcParam ("text.usetex") so it's either all on or all off. We should continue to have a global rcParam to choose the text engine ("text.layout\_engine"), but it should under the hood be an overridable property on the [Text](#) object, so the same figure can combine the results of multiple text layout engines if necessary.

## 39.8.5 Implementation

A concept of a "text engine" will be introduced. Each text engine will implement a number of abstract classes. The `TextFont` interface will represent text for a given set of font properties.

It isn't necessarily limited to a single font file – if the layout engine supports rich text, it may handle a number of font files in a family. Given a `TextFont` instance, the user can get a `TextLayout` instance, which represents the layout for a given string of text in a given font. From a `TextLayout`, an iterator over `TextSpans` is returned so the engine can output raw editable text using as few spans as possible. If the engine would rather get individual characters, they can be obtained from the `TextSpan` instance:

```
class TextFont(TextFontBase):
    def __init__(self, font_properties):
        """
        Create a new object for rendering text using the given font properties.
        """
        pass

    def get_layout(self, s, ha, va):
        """
        Get the TextLayout for the given string in the given font and
        the horizontal (left, center, right) and verticalalignment (top,
        center, baseline, bottom)
        """
        pass

class TextLayout(TextLayoutBase):
    def get_metrics(self):
        """
        Return the bounding box of the layout, anchored at (0, 0).
        """
        pass

    def get_spans(self):
        """
        Returns an iterator over the spans of different in the layout.
        This is useful for backends that want to editable raw text as
        individual lines. For rich text where the font may change,
        each span of different font type will have its own span.
        """
        pass

    def get_image(self):
        """
        Returns a rasterized image of the text. Useful for raster backends,
        like Agg.

        In all likelihood, this will be overridden in the backend, as it can
        be created from get_layout(), but certain backends may want to
        override it if their library provides it (as freetype does).
        """
        pass

    def get_rectangles(self):
        """
        Returns an iterator over the filled black rectangles in the layout.
        Used by TeX and mathtext for drawing, for example, fraction lines.
        """
        pass

    def get_path(self):
```

(continues on next page)

(continued from previous page)

```

    """
    Returns a single Path object of the entire laid out text.

    [Not strictly necessary, but might be useful for textpath
    functionality]
    """
    pass

class TextSpan(TextSpanBase):
    x, y      # Position of the span -- relative to the text layout as a whole
              # where (0, 0) is the anchor. y is the baseline of the span.
    fontfile  # The font file to use for the span
    text      # The text content of the span

    def get_path(self):
        pass # See TextLayout.get_path

    def get_chars(self):
        """
        Returns an iterator over the characters in the span.
        """
        pass

class TextChar(TextCharBase):
    x, y      # Position of the character -- relative to the text layout as
              # a whole, where (0, 0) is the anchor. y is in the baseline
              # of the character.
    codepoint # The unicode code point of the character -- only for informational
              # purposes, since the mapping of codepoint to glyph_id may have been
              # handled in a complex way by the layout engine. This is an int
              # to avoid problems on narrow Unicode builds.
    glyph_id  # The index of the glyph within the font
    fontfile  # The font file to use for the char

    def get_path(self):
        """
        Get the path for the character.
        """
        pass

```

Graphic backends that want to output subset of fonts would likely build up a file-global dictionary of characters where the keys are (fontname, glyph\_id) and the values are the paths so that only one copy of the path for each character will be stored in the file.

Special casing: The “usetex” functionality currently is able to get Postscript directly from TeX to insert directly in a Postscript file, but for other backends, parses a DVI file and generates something more abstract. For a case like this, TextLayout would implement `get_spans` for most backends, but add `get_ps` for the Postscript backend, which would look for the presence of this method and use it if available, or fall back to `get_spans`. This kind of special casing may also be necessary, for example, when the graphics backend and text engine belong to the same ecosystem, e.g. Cairo and Pango, or MacOSX and CoreText.

There are three main pieces to the implementation:

- 1) Rewriting the freetype wrapper, and removing ttconv.
  - a) Once (1) is done, as a proof of concept, we can move to the upstream STIX .otf fonts

- b) Add support for web fonts loaded from a remote URL. (Enabled by using freetype for font subsetting).
  - 2) Refactoring the existing "builtin" and "usetex" code into separate text engines and to follow the API outlined above.
  - 3) Implementing support for advanced text layout libraries.
- (1) and (2) are fairly independent, though having (1) done first will allow (2) to be simpler. (3) is dependent on (1) and (2), but even if it doesn't get done (or is postponed), completing (1) and (2) will make it easier to move forward with improving the "builtin" text engine.

### 39.8.6 Backward compatibility

The layout of text with respect to its anchor and rotation will change in hopefully small, but improved, ways. The layout of multiline text will be much better, as it will respect horizontal alignment. The layout of bidirectional text or other advanced Unicode features will now work inherently, which may break some things if users are currently using their own workarounds.

Fonts will be selected differently. Hacks that used to sort of work between the "builtin" and "usetex" text rendering engines may no longer work. Fonts found by the OS that weren't previously found by matplotlib may be selected.

### 39.8.7 Alternatives

TBD

## 39.9 MEP15 - Fix axis autoscaling when limits are specified for one axis only

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### 39.9.1 Status

#### Discussion

### 39.9.2 Branches and Pull requests

None so far.

### 39.9.3 Abstract

When one axis of a 2-dimensional plot is overridden via `set_xlim` or `set_ylim`, automatic scaling of the remaining axis should be based on the data that falls within the specified limits of the first axis.

### 39.9.4 Detailed description

When axis limits for a 2-D plot are specified for one axis only (via `set_xlim` or `set_ylim`), matplotlib currently does not currently rescale the other axis. The result is that the displayed curves or symbols may be compressed into a tiny portion of the available area, so that the final plot conveys much less information than it would with appropriate axis scaling.

The proposed change of behavior would make matplotlib choose the scale for the remaining axis using only the data that falls within the limits for the axis where limits were specified.

### 39.9.5 Implementation

I don't know enough about the internals of matplotlib to be able to suggest an implementation.

### 39.9.6 Backward compatibility

From the standpoint of software interfaces, there would be no break in backward compatibility. Some outputs would be different, but if the user truly desires the previous behavior, he/she can achieve this by overriding the axis scaling for both axes.

### 39.9.7 Alternatives

The only alternative that I can see is to maintain the status quo.

## 39.10 MEP19: Continuous Integration

### 39.10.1 Status

**Completed**

### 39.10.2 Branches and Pull requests

### 39.10.3 Abstract

matplotlib could benefit from better and more reliable continuous integration, both for testing and building installers and documentation.

### 39.10.4 Detailed description

#### Current state-of-the-art

#### Testing

matplotlib currently uses Travis-CI for automated tests. While Travis-CI should be praised for how much it does as a free service, it has a number of shortcomings:

- It often fails due to network timeouts when installing dependencies.
- It often fails for inexplicable reasons.
- build or test products can only be saved from build off of branches on the main repo, not pull requests, so it is often difficult to “post mortem” analyse what went wrong. This is particularly frustrating when the failure can not be subsequently reproduced locally.
- It is not extremely fast. matplotlib’s cpu and memory requirements for testing are much higher than the average Python project.
- It only tests on Ubuntu Linux, and we have only minimal control over the specifics of the platform. It can be upgraded at any time outside of our control, causing unexpected delays at times that may not be convenient in our release schedule.

On the plus side, Travis-CI’s integration with github – automatically testing all pending pull requests – is exceptional.

#### Builds

There is no centralized effort for automated binary builds for matplotlib. However, the following disparate things are being done [If the authors mentioned here could fill in detail, that would be great!]:

- @sandrotosi: builds Debian packages
- @takluyver: Has automated Ubuntu builds on Launchpad
- @cgohlke: Makes Windows builds (don’t know how automated that is)
- @r-owen: Makes OS-X builds (don’t know how automated that is)

#### Documentation

Documentation of master is now built by travis and uploaded to <http://matplotlib.org/devdocs/index.html>

@NelleV, I believe, generates the docs automatically and posts them on the web to chart MEP10 progress.

### Peculiarities of matplotlib

matplotlib has complex requirements that make testing and building more taxing than many other Python projects.

- The CPU time to run the tests is quite high. It puts us beyond the free accounts of many CI services (e.g. ShiningPanda)
- It has a large number of dependencies, and testing the full matrix of all combinations is impractical. We need to be clever about what space we test and guarantee to support.

### Requirements

This section outlines the requirements that we would like to have.

1. Testing all pull requests by hooking into the GitHub API, as Travis-CI does
2. Testing on all major platforms: Linux, Mac OS-X, MS Windows (in that order of priority, based on user survey)
3. Retain the last n days worth of build and test products, to aid in post-mortem debugging.
4. Automated nightly binary builds, so that users can test the bleeding edge without installing a complete compilation environment.
5. Automated benchmarking. It would be nice to have a standard benchmark suite (separate from the tests) whose performance could be tracked over time, in different backends and platforms. While this is separate from building and testing, ideally it would run on the same infrastructure.
6. Automated nightly building and publishing of documentation (or as part of testing, to ensure PRs don't introduce documentation bugs). (This would not replace the static documentation for stable releases as a default).
7. The test systems should be manageable by multiple developers, so that no single person becomes a bottleneck. (Travis-CI's design does this well – storing build configuration in the git repository, rather than elsewhere, is a very good design.)
8. Make it easy to test a large but sparse matrix of different versions of matplotlib's dependencies. The matplotlib user survey provides some good data as to where to focus our efforts: <https://docs.google.com/spreadsheet/ccc?key=0AjrpJlTMRTwTdHpQS25pcTZIRWdqX0pNckNSU01sMHc>
9. Nice to have: A decentralized design so that those with more obscure platforms can publish build results to a central dashboard.

### 39.10.5 Implementation

This part is yet-to-be-written.

However, ideally, the implementation would be a third-party service, to avoid adding system administration to our already stretched time. As we have some donated funds, this service may be a paid one if it offers significant time-saving advantages over free offerings.

### 39.10.6 Backward compatibility

Backward compatibility is not a major concern for this MEP. We will replace current tools and procedures with something better and throw out the old.

### 39.10.7 Alternatives

### 39.10.8 Hangout Notes

#### CI Infrastructure

- We like Travis and it will probably remain part of our arsenal in any event. The reliability issues are being looked into.
- Enable Amazon S3 uploads of testing products on Travis. This will help with post-mortem of failures (@mdboom is looking into this now).
- We want Mac coverage. The best bet is probably to push Travis to enable it for our project by paying them for a Pro account (since they don't otherwise allow testing on both Linux and Mac).
- We want Windows coverage. Shining Panda is an option there.
- Investigate finding or building a tool that would collect and synthesize test results from a number of sources and post it to GitHub using the GitHub API. This may be of general use to the Scipy community.
- For both Windows and Mac, we should document (or better yet, script) the process of setting up the machine for a build, and how to build binaries and installers. This may require getting information from Russel Owen and Christoph Gohlke. This is a necessary step for doing automated builds, but would also be valuable for a number of other reasons.

#### The test framework itself

- We should investigate ways to make it take less time
  - Eliminating redundant tests, if possible
  - General performance improvements to matplotlib will help
- We should be covering more things, particularly more backends
- We should have more unit tests, fewer integration tests, if possible

## 39.11 MEP21: color and cm refactor

- *Status*
- *Branches and Pull requests*
- *Abstract*

- *Detailed description*
- *Implementation*
- *Backward compatibility*
- *Alternatives*

### 39.11.1 Status

- **Discussion:** This MEP has not commenced yet, but here are some ongoing ideas which may become a part of this MEP:

### 39.11.2 Branches and Pull requests

### 39.11.3 Abstract

- color
  - tidy up the namespace
  - Define a "Color" class
  - make it easy to convert from one color type to another ``hex` -> RGB`, `RGB` -> hex`, `HSV` -> RGB` etc.`
  - improve the construction of a colormap - the dictionary approach is archaic and overly complex (though incredibly powerful)
  - make it possible to interpolate between two or more color types in different modes, especially useful for construction of colormaps in HSV space for instance
- cm
  - rename the module to something more descriptive - mappables?

Overall, there are a lot of improvements that can be made with matplotlib color handling - managing backwards compatibility will be difficult as there are some badly named variables/modules which really shouldn't exist - but a clear path and message for migration should be available, with a large amount of focus on this in the API changes documentation.

- Removing the NavigationToolbar classes <https://github.com/matplotlib/matplotlib/pull/2740> **CLOSED**
- Keeping the NavigationToolbar classes <https://github.com/matplotlib/matplotlib/pull/2759> **CLOSED**
- Navigation by events: <https://github.com/matplotlib/matplotlib/pull/3652>

### 39.12.3 Abstract

The main goal of this MEP is to make it easier to modify (add, change, remove) the way the user interacts with the figures.

The user interaction with the figure is deeply integrated within the Canvas and Toolbar. Making extremely difficult to do any modification.

This MEP proposes the separation of this interaction into Toolbar, Navigation and Tools to provide independent access and reconfiguration.

This approach will make easier to create and share tools among users. In the far future, we can even foresee a kind of Marketplace for Tools where the most popular can be added into the main distribution.

### 39.12.4 Detailed description

The reconfiguration of the Toolbar is complex, most of the time it requires a custom backend.

The creation of custom Tools sometimes interferes with the Toolbar, as example see <https://github.com/matplotlib/matplotlib/issues/2694> also the shortcuts are hardcoded and again not easily modifiable <https://github.com/matplotlib/matplotlib/issues/2699>

The proposed solution is to take the actions out of the Toolbar and the shortcuts out of the Canvas. This actions and shortcuts will be in the form of Tools.

A new class `Navigation` will be the bridge between the events from the Canvas and Toolbar and redirect them to the appropriate Tool.

At the end the user interaction will be divided into three classes:

- `NavigationBase`: This class is instantiated for each `FigureManager` and connect the all user interactions with the Tools
- `ToolbarBase`: This existing class is relegated only as a GUI access to Tools.
- `ToolBase`: Is the basic definition of Tools.

### 39.12.5 Implementation

#### `ToolBase(object)`

Tools can have a graphical representation as the `SubplotTool` or not even be present in the Toolbar as `Quit`

The `ToolBase` has the following class attributes for configuration at definition time

- `keymap = None`: Key(s) to be used to trigger the tool
- `description = ''`: Small description of the tool
- `image = None`: Image that is used in the toolbar

**The following instance attributes are set at instantiation:**

- `name`
- `navigation`

#### **Methods**

- `trigger(self, event)`: This is the main method of the Tool, it is called when the Tool is triggered by: \* Toolbar button click \* keypress associated with the Tool Keymap \* Call to `navigation.trigger_tool(name)`
- `set_figure(self, figure)`: Set the figure and navigation attributes
- `destroy(self, *args)`: Destroy the Tool graphical interface (if exists)

#### **Available Tools**

- `ToolQuit`
- `ToolEnableAllNavigation`
- `ToolEnableNavigation`
- `ToolToggleGrid`

- ToolToggleFullScreen
- ToolToggleYScale
- ToolToggleXScale
- ToolHome
- ToolBack
- ToolForward
- SaveFigureBase
- ConfigureSubplotsBase

### ToolToggleBase(ToolBase)

The *ToolToggleBase* has the following class attributes for configuration at definition time

- radio\_group = None: Attribute to group 'radio' like tools (mutually exclusive)
- cursor = None: Cursor to use when the tool is active

The **Toggleable** Tools, can capture keypress, mouse moves, and mouse button press

#### It defines the following methods

- enable(self, event): Called by *ToolToggleBase.trigger* method
- disable(self, event): Called when the tool is untoggled
- toggled : **Property** True or False

#### Available Tools

- ToolZoom
- ToolPan

### NavigationBase

#### Defines the following attributes

- canvas:
- **keypresslock: Lock to know if the canvas key\_press\_event' is available** and process it
- messagelock: Lock to know if the message is available to write

#### Public methods for User use:

- nav\_connect(self, s, func): Connect to to navigation for events
- nav\_disconnect(self, cid): Disconnect from navigation event
- message\_event(self, message, sender=None): Emit a tool\_message\_event event
- active\_toggle(self): **Property** The currently toggled tools or None
- get\_tool\_keymap(self, name): Return a list of keys that are associated with the tool
- set\_tool\_keymap(self, name, \*keys): Set the keys for the given tool
- remove\_tool(self, name): Removes tool from the navigation control.

- `add_tools(self, tools)`: Add multiple tools to `Navigation`
- `add_tool(self, name, tool, group=None, position=None)`: Add a tool to the `Navigation`
- `tool_trigger_event(self, name, sender=None, canvasevent=None, data=None)`: Trigger a tool and fire the event
- `tools(self)` **Property**: Return a dict with available tools with corresponding keymaps, descriptions and objects
- `get_tool(self, name)`: Return the tool object

## ToolbarBase

### Methods for Backend implementation

- `add_toolitem(self, name, group, position, image, description, toggle)`: Add a toolitem to the toolbar. This method is a callback from `tool_added_event` (emitted by `navigation`)
- `set_message(self, s)`: Display a message on toolbar or in status bar
- `toggle_toolitem(self, name)`: Toggle the toolitem without firing event.
- `remove_toolitem(self, name)`: Remove a toolitem from the `Toolbar`

### 39.12.6 Backward compatibility

For backward compatibility added 'navigation' to the list of values supported by `rcParams["toolbar"]` (default: 'toolbar2'), that is used for `Navigation` classes instantiation instead of the `NavigationToolbar` classes

With this parameter, it makes it transparent to anyone using the existing backends.

[@pelson comment: This also gives us an opportunity to avoid needing to implement all of this in the same PR - some backends can potentially exist without the new functionality for a short while (but it must be done at some point).]

## 39.13 MEP23: Multiple Figures per GUI window

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
  - `FigureManagerBase`
  - `new_figure_manager`
  - `new_figure_manager_given_figure`

- *NavigationBase*

- *Backward compatibility*
- *Alternatives*

### 39.13.1 Status

#### Discussion

### 39.13.2 Branches and Pull requests

**Previous work** - <https://github.com/matplotlib/matplotlib/pull/2465> **To-delete**

### 39.13.3 Abstract

Add the possibility to have multiple figures grouped under the same `FigureManager`

### 39.13.4 Detailed description

Under the current structure, every canvas has its own window.

This is and may continue to be the desired method of operation for most use cases.

Sometimes when there are too many figures open at the same time, it is desirable to be able to group these under the same window [see](<https://github.com/matplotlib/matplotlib/issues/2194>).

The proposed solution modifies *FigureManagerBase* to contain and manage more than one canvas. The settings parameter `rcParams["backend.multifigure"]` control when the **MultiFigure** behaviour is desired.

#### Note

It is important to note, that the proposed solution, assumes that the [MEP22](<https://github.com/matplotlib/matplotlib/wiki/Mep22>) is already in place. This is simply because the actual implementation of the `Toolbar` makes it pretty hard to switch between canvases.

### 39.13.5 Implementation

The first implementation will be done in GTK3 using a `Notebook` as canvas container.

#### `FigureManagerBase`

will add the following new methods

- `add_canvas`: To add a canvas to an existing `FigureManager` object
- `remove_canvas`: To remove a canvas from a `FigureManager` object, if it is the last one, it will be destroyed

- `move_canvas`: To move a canvas from one `FigureManager` to another.
- `set_canvas_title`: To change the title associated with a specific canvas container
- `get_canvas_title`: To get the title associated with a specific canvas container
- `get_active_canvas`: To get the canvas that is in the foreground and is subject to the gui events. There is no `set_active_canvas` because the active canvas, is defined when `show` is called on a `Canvas` object.

#### `new_figure_manager`

To control which `FigureManager` will contain the new figures, an extra optional parameter `figuremanager` will be added, this parameter value will be passed to `new_figure_manager_given_figure`

#### `new_figure_manager_given_figure`

- If `figuremanager` parameter is given, this `FigureManager` object will be used instead of creating a new one.
- If `rcParams['backend.multifigure']` is `True`: The last `FigureManager` object will be used instead of creating a new one.

#### `NavigationBase`

Modifies the `NavigationBase` to keep a list of canvases, directing the actions to the active one

### 39.13.6 Backward compatibility

For the **MultiFigure** properties to be visible, the user has to activate them directly setting `rcParams['backend.multifigure'] = True`

It should be backwards compatible for backends that adhere to the current `FigureManagerBase` structure even if they have not implemented the **MultiFigure** magic yet.

### 39.13.7 Alternatives

Instead of modifying the `FigureManagerBase` it could be possible to add a parallel class, that handles the cases where `rcParams['backend.multifigure'] = True`. This will warranty that there won't be any problems with custom made backends, but also makes bigger the code, and more things to maintain.

## 39.14 MEP24: negative radius in polar plots

### 39.14.1 Status

*Discussion*

### 39.14.2 Branches and Pull requests

None

### 39.14.3 Abstract

It is clear that polar plots need to be able to gracefully handle negative  $r$  values (not by clipping or reflection).

### 39.14.4 Detailed description

One obvious application that we should support is bB plots (see <https://github.com/matplotlib/matplotlib/issues/1730#issuecomment-40815837>), but this seems more generally useful (for example growth rate as a function of angle). The assumption in the current code (as I understand it) is that the center of the graph is  $r=0$ , however it would be good to be able to set the center to be at any  $r$  (with any value less than the offset clipped).

### 39.15.1 Status

#### Rejected

This work is important, but this particular effort has stalled.

### 39.15.2 Branches and Pull requests

- development branches:
- related pull requests:

### 39.15.3 Abstract

This MEP aims at adding a serializable Controller objects to act as an Artist managers. Users would then communicate changes to an Artist via a Controller. In this way, functionality of the Controller objects may be added incrementally since each Artist is still responsible for drawing everything. The goal is to create an API that is usable both by graphing libraries requiring high-level descriptions of figures and libraries requiring low-level interpretations.

### 39.15.4 Detailed description

Matplotlib is a core plotting engine with an API that many users already understand. It's difficult/impossible for other graphing libraries to (1) get a complete figure description, (2) output raw data from the figure object as the user has provided it, (3) understand the semantics of the figure objects without heuristics, and (4) give matplotlib a complete figure description to visualize. In addition, because an Artist has no conception of its own semantics within the figure, it's difficult to interact with them in a natural way.

In this sense, matplotlib will adopt a standard Model-View-Controller (MVC) framework. The *Model* will be the user defined data, style, and semantics. The *Views* are the ensemble of each individual Artist, which are responsible for producing the final image based on the *model*. The *Controller* will be the Controller object managing its set of Artist objects.

The Controller must be able to export the information that it's carrying about the figure on command, perhaps via a `to_json` method or similar. Because it would be extremely extraneous to duplicate all of the information in the model with the controller, only user-specified information (data + style) are explicitly kept. If a user wants more information (defaults) from the view/model, it should be able to query for it.

- This might be annoying to do, non-specified kwargs are pulled from the `rcParams` object which is in turn created from reading a user specified file and can be dynamically changed at run time. I suppose we could keep a dict of default defaults and compare against that. Not clear how this will interact with the style sheet [[MEP26]] - @tacaswell

Additional Notes:

- The "raw data" does not necessarily need to be a list, ndarray, etc. Rather, it can more abstractly just have a method to yield data when needed.
- Because the Controller will contain extra information that users may not want to keep around, it should *not* be created by default. You should be able to both (a) instantiate a Controller with a figure and (b) build a figure with a Controller.

Use Cases:

- Export all necessary informat
- Serializing a matplotlib figure, saving it, and being able to rerun later.
- Any other source sending an appropriately formatted representation to matplotlib to open

### 39.15.5 Examples

Here are some examples of what the controllers should be able to do.

1. Instantiate a matplotlib figure from a serialized representation (e.g., JSON):

```
import json
from matplotlib.controllers import Controller
with open('my_figure') as f:
    o = json.load(f)
    c = Controller(o)
    fig = c.figure
```

2. Manage artists from the controller (e.g., Line2D):

```
# not really sure how this should look
c.axes[0].lines[0].color = 'b'
# ?
```

3. Export serializable figure representation:

```
o = c.to_json()
# or... we should be able to throw a figure object in there too
o = Controller.to_json(mpl_fig)
```

### 39.15.6 Implementation

1. Create base Controller objects that are able to manage Artist objects (e.g., Hist)

Comments:

- initialization should happen via unpacking \*\*, so we need a copy of call signature parameter for the Artist we're ultimately trying to control. Unfortunate hard-coded repetition...
- should the additional \*\*kwargs accepted by each Artist be tracked at the Controller
- how does a Controller know which artist belongs where? E.g., do we need to pass axes references?

Progress:

- A simple NB demonstrating some functionality for Line2DController objects: <https://nbviewer.jupyter.org/gist/theengineear/f0aa8d79f64325e767c0>

2. Write in protocols for the Controller to *update* the model.

Comments:

- how should containers be dealt with? E.g., what happens to old patches when we re-bin a histogram?
- in the link from (1), the old line is completely destroyed and redrawn, what if something is referencing it?

3. Create method by which a json object can be assembled from the Controllers
4. Deal with serializing the unserializable aspects of a figure (e.g., non-affine transforms?)
5. Be able to instantiate from a serialized representation
6. Reimplement the existing pyplot and Axes method, e.g. `pyplot.hist` and `Axes.hist` in terms of the new controller class.

> @theengineer: in #2 above, what do you mean by *get updates* from each Artist?

^ Yup. The Controller *shouldn't* need to get updated. This just happens in #3. Delete comments when you see this.

### 39.15.7 Backward compatibility

- pickling will change
- non-affine transformations will require a defined pickling method

### 39.15.8 Alternatives

PR #3150 suggested adding semantics by parasitically attaching extra containers to axes objects. This is a more complete solution with what should be a more developed/flexible/powerful framework.

### 39.16.1 Status

**Rejected**

### 39.16.2 Branches and Pull requests

### 39.16.3 Abstract

This MEP proposes a new stylesheet implementation to allow more comprehensive and dynamic styling of artists.

The current version of matplotlib (1.4.0) allows stylesheets based on the rcParams syntax to be applied before creation of a plot. The methodology below proposes a new syntax, based on CSS, which would allow styling of individual artists and properties, which can be applied dynamically to existing objects.

This is related to (and makes steps toward) the overall goal of moving to a DOM/tree-like architecture.

### 39.16.4 Detailed description

Currently, the look and appearance of existing artist objects (figure, axes, `Line2D` etc...) can only be updated via `set_` and `get_` methods on the artist object, which is quite laborious, especially if no reference to the artist(s) has been stored. The new style sheets introduced in 1.4 allow styling before a plot is created, but do not offer any means to dynamically update plots or distinguish between artists of the same type (i.e. to specify the line color and line style separately for differing `Line2D` objects).

The initial development should concentrate on allowing styling of artist primitives (those *Artists* that do not contain other *Artists*), and further development could expand the CSS syntax rules and parser to allow more complex styling. See the appendix for a list of primitives.

The new methodology would require development of a number of steps:

- A new stylesheet syntax (likely based on CSS) to allow selection of artists by type, class, id etc...
- A mechanism by which to parse a stylesheet into a tree
- A mechanism by which to translate the parse-tree into something which can be used to update the properties of relevant artists. Ideally this would implement a method by which to traverse the artists in a tree-like structure.
- A mechanism by which to generate a stylesheet from existing artist properties. This would be useful to allow a user to export a stylesheet from an existing figure (where the appearance may have been set using the matplotlib API)...

### 39.16.5 Implementation

It will be easiest to allow a '3rd party' to modify/set the style of an artist if the 'style' is created as a separate class and store against the artist as a property. The `GraphicsContext` class already provides a the basis of a `Style` class and an artist's `draw` method can be refactored to use the `Style` class rather than setting up it's own `GraphicsContext` and transferring it's style-related properties to it. A minimal example of how this could be implemented is shown here: [https://github.com/JamesRamm/mpl\\_experiment](https://github.com/JamesRamm/mpl_experiment)

IMO, this will also make the API and code base much neater as individual get/set methods for artist style properties are now redundant... Indirectly related would be a general drive to replace get/set methods with properties. Implementing the style class with properties would be a big stride toward this...

For initial development, I suggest developing a syntax based on a much (much much) simplified version of CSS. I am in favour of dubbing this Artist Style Sheets :+1: :

#### BNF Grammar

I propose a very simple syntax to implement initially (like a proof of concept), which can be expanded upon in the future. The BNF form of the syntax is given below and then explained

```
RuleSet ::= SelectorSequence "{"Declaration"}"
SelectorSequence ::= Selector {"," Selector}
```

(continues on next page)

(continued from previous page)

```

Declaration ::= propName":" propValue";"
Selector ::= ArtistIdent{"#"Ident}

propName ::= Ident
propValue ::= Ident | Number | Colour | "None"

```

ArtistIdent, Ident, Number and Colour are tokens (the basic building blocks of the expression) which are defined by regular expressions.

## Syntax

A CSS stylesheet consists of a series of **rule sets** in hierarchical order (rules are applied from top to bottom). Each rule follows the syntax

```
selector {attribute: value;}
```

Each rule can have any number of attribute: value pairs, and a stylesheet can have any number of rules.

The initial syntax is designed only for *Artist* primitives. It does not address the question of how to set properties on *Container* types (whose properties may themselves be *Artists* with settable properties), however, a future solution to this could simply be nested RuleSets

## Selectors

Selectors define the object to which the attribute updates should be applied. As a starting point, I propose just 2 selectors to use in initial development:

### Artist Type Selector

Select an *Artist* by it's type. E.g *Line2D* or *Text*:

```
Line2D {attribute: value}
```

The regex for matching the artist type selector (ArtistIdent in the BNF grammar) would be:

```
ArtistIdent = r'(?P<ArtistIdent>\bLine2D\b|\bText\b|\bAxesImage\b|\bFigureImage\b|\bPatch\b)'
```

### GID selector

Select an *Artist* by its gid:

```
Line2D#myGID {attribute: value}
```

A gid can be any string, so the regex could be as follows:

```
Ident = r'(?P<Ident>[a-zA-Z_][a-zA-Z_0-9]*)'
```

The above selectors roughly correspond to their CSS counterparts (<http://www.w3.org/TR/CSS21/selector.html>)

### Attributes and values

- Attributes are any valid (settable) property for the *Artist* in question.
- Values are any valid value for the property (Usually a string, or number).

### Parsing

Parsing would consist of breaking the stylesheet into tokens (the python cookbook gives a nice tokenizing recipe on page 66), applying the syntax rules and constructing a Tree. This requires defining the grammar of the stylesheet (again, we can borrow from CSS) and writing a parser. Happily, there is a recipe for this in the python cookbook as well.

### Visitor pattern for matplotlib figure

In order to apply the stylesheet rules to the relevant artists, we need to 'visit' each artist in a figure and apply the relevant rule. Here is a visitor class (again, thanks to python cookbook), where each node would be an artist in the figure. A `visit_` method would need to be implemented for each mpl artist, to handle the different properties for each

```
class Visitor:
    def visit(self, node):
        name = 'visit_' + type(node).__name__
        meth = getattr(self, name, None)
        if meth is None:
            raise NotImplementedError
        return meth(node)
```

An evaluator class would then take the stylesheet rules and implement the visitor on each one of them.

### 39.16.6 Backward compatibility

Implementing a separate Style class would break backward compatibility as many get/set methods on an artist would become redundant. While it would be possible to alter these methods to hook into the Style class (stored as a property against the artist), I would be in favor of simply removing them to both neaten/simplify the codebase and to provide a simple, uncluttered API...

### 39.16.7 Alternatives

No alternatives, but some of the ground covered here overlaps with MEP25, which may assist in this development

### 39.16.8 Appendix

#### Matplotlib primitives

This will form the initial selectors which stylesheets can use.

- Line2D
- Text
- AxesImage
- FigureImage

## 39.17 MEP27: decouple pyplot from backends

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*
- *Implementation*
- *Future compatibility*
- *Backward compatibility*
- *Alternatives*
- *Questions*

### 39.17.1 Status

#### Progress

### 39.17.2 Branches and Pull requests

Main PR (including GTK3): + <https://github.com/matplotlib/matplotlib/pull/4143>

Backend specific branch diffs: + <https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-tkagg> + <https://github.com/OceanWolf/matplotlib/compare/backend-refactor...OceanWolf:backend-refactor-qt> + <https://github.com/OceanWolf/matplotlib/compare/backend-refactor...backend-refactor-wx>

### 39.17.3 Abstract

This MEP refactors the backends to give a more structured and consistent API, removing generic code and consolidate existing code. To do this we propose splitting:

1. FigureManagerBase and its derived classes into the core functionality class FigureManager and a backend specific class WindowBase and
2. ShowBase and its derived classes into Gcf.show\_all and MainLoopBase.

### 39.17.4 Detailed description

This MEP aims to consolidate the backends API into one single uniform API, removing generic code out of the backend (which includes `_pylab_helpers` and `Gcf`), and push code to a more appropriate level in `matplotlib`. With this we automatically remove inconsistencies that appear in the backends, such as `FigureManagerBase.resize(w, h)` which sometimes sets the canvas, and other times set the entire window to the dimensions given, depending on the backend.

Two main places for generic code appear in the classes derived from `FigureManagerBase` and `ShowBase`.

1. `FigureManagerBase` has **three** jobs at the moment:
  1. The documentation describes it as a *“Helper class for pyplot mode, wraps everything up into a neat bundle”*
  2. But it doesn’t just wrap the canvas and toolbar, it also does all of the windowing tasks itself. The conflation of these two tasks gets seen the best in the following line: ``python self.set_window_title("Figure %d" % num) `` This combines backend specific code `self.set_window_title(title)` with `matplotlib` generic code `title = "Figure %d" % num`.
  3. Currently the backend specific subclass of `FigureManager` decides when to end the mainloop. This also seems very wrong as the figure should have no control over the other figures.
2. `ShowBase` has two jobs:
  1. It has the job of going through all figure managers registered in `_pylab_helpers.Gcf` and telling them to show themselves.
  2. And secondly it has the job of performing the backend specific mainloop to block the main programme and thus keep the figures from dying.

### 39.17.5 Implementation

The description of this MEP gives us most of the solution:

1. To remove the windowing aspect out of `FigureManagerBase` letting it simply wrap this new class along with the other backend classes. Create a new `WindowBase` class that can handle this functionality, with pass-through methods (`:arrow_right:`) to `WindowBase`. Classes that subclass `WindowBase` should also subclass the GUI specific window class to ensure backward compatibility (`manager.window == manager.window`).
2. Refactor the mainloop of `ShowBase` into `MainLoopBase`, which encapsulates the end of the loop as well. We give an instance of `MainLoop` to `FigureManager` as a key unlock the exit method (requiring all keys returned before the loop can die). Note this opens the possibility for multiple backends to run concurrently.
3. Now that `FigureManagerBase` has no backend specifics in it, to rename it to `FigureManager`, and move to a new file `backend_managers.py` noting that:
  1. This allows us to break up the conversion of backends into separate PRs as we can keep the existing `FigureManagerBase` class and its dependencies intact.
  2. and this also anticipates MEP22 where the new `NavigationBase` has morphed into a backend independent `ToolManager`.

FigureManager-Base(canvas, num)	FigureManager(fig, num)	WindowBase(title)	Notes
show		show	
destroy	calls destroy on all components	destroy	
full_screen_toggle	handles logic	set_fullscreen	
resize		resize	
key_press	key_press		
get_window_title		get_window_title	
set_window_title		set_window_title	
	_get_toolbar		A common method to all subclasses of FigureManagerBase
		set_default_size	
		add_element_to_window	

ShowBase	MainLoop-Base	Notes
main-loop	begin	
	end	Gets called automatically when no more instances of the subclass exist
__call__		Method moved to Gcf.show_all

### 39.17.6 Future compatibility

As eluded to above when discussing MEP 22, this refactor makes it easy to add in new generic features. At the moment, MEP 22 has to make ugly hacks to each class extending from `FigureManagerBase`. With this code, this only needs to get made in the single `FigureManager` class. This also makes the later deprecation of `NavigationToolbar2` very straightforward, only needing to touch the single `FigureManager` class

MEP 23 makes for another use case where this refactored code will come in very handy.

### 39.17.7 Backward compatibility

As we leave all backend code intact, only adding missing methods to existing classes, this should work seamlessly for all use cases. The only difference will lie for backends that used `FigureManager.resize` to resize the canvas and not the window, due to the standardisation of the API.

I would envision that the classes made obsolete by this refactor get deprecated and removed on the same timetable as `NavigationToolbar2`, also note that the change in call signature to the `FigureCanvasWx` constructor, while backward compatible, I think the old (imho ugly style) signature should get deprecated and removed in the same manner as everything else.

back-end	manager.resize(w,h)	Extra
gtk3	window	
Tk	canvas	
Qt	window	
Wx	canvas	FigureManagerWx had frame as an alias to window, so this also breaks BC.

### 39.17.8 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

### 39.17.9 Questions

Mdehoon: Can you elaborate on how to run multiple backends concurrently?

OceanWolf: @mdehoon, as I say, not for this MEP, but I see this MEP opens it up as a future possibility. Basically the `MainLoopBase` class acts a per backend Gcf, in this MEP it tracks the number of figures open per backend, and manages the mainloops for those backends. It closes the backend specific mainloop when it detects that no figures remain open for that backend. Because of this I imagine that with only a small amount of tweaking that we can do full-multi-backend matplotlib. No idea yet why one would want to, but I leave the possibility there in `MainLoopBase`. With all the backend-code specifics refactored out of `FigureManager` also aids in this, one manager to rule them (the backends) all.

Mdehoon: @OceanWolf, OK, thanks for the explanation. Having a uniform API for the backends is very important for the maintainability of matplotlib. I think this MEP is a step in the right direction.

### 39.18.1 Status

#### Discussion

### 39.18.2 Branches and Pull requests

The following lists any open PRs or branches related to this MEP:

1. Deprecate redundant statistical kwargs in `Axes.boxplot`: <https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations>
2. Deprecate redundant style options in `Axes.boxplot`: <https://github.com/phobson/matplotlib/tree/MEP28-initial-deprecations>
3. Deprecate passings 2D NumPy arrays as input: None
4. Add pre- & post-processing options to `cbook.boxplot_stats`: <https://github.com/phobson/matplotlib/tree/boxplot-stat-transforms>
5. Exposing `cbook.boxplot_stats` through `Axes.boxplot` kwargs: None
6. Remove redundant statistical kwargs in `Axes.boxplot`: None
7. Remove redundant style options in `Axes.boxplot`: None
8. Remaining items that arise through discussion: None

### 39.18.3 Abstract

Over the past few releases, the `Axes.boxplot` method has grown in complexity to support fully customizable artist styling and statistical computation. This lead to `Axes.boxplot` being split off into multiple parts. The statistics needed to draw a boxplot are computed in `cbook.boxplot_stats`, while the actual artists are drawn by `Axes.bxp`. The original method, `Axes.boxplot` remains as the most public API that handles passing the user-supplied data to `cbook.boxplot_stats`, feeding the results to `Axes.bxp`, and pre-processing style information for each facet of the boxplot plots.

This MEP will outline a path forward to rollback the added complexity and simplify the API while maintaining reasonable backwards compatibility.

### 39.18.4 Detailed description

Currently, the `Axes.boxplot` method accepts parameters that allow the users to specify medians and confidence intervals for each box that will be drawn in the plot. These were provided so that advanced users could provide statistics computed in a different fashion than the simple method provided by matplotlib. However, handling this input requires complex logic to make sure that the forms of the data structure match what needs to be drawn. At the moment, that logic contains 9 separate if/else statements nested up to 5 levels deep with a for loop, and may raise up to 2 errors. These parameters were added prior to the creation of the `Axes.bxp` method, which draws boxplots from a list of dictionaries containing the relevant statistics. Matplotlib also provides a function that computes these statistics via `cbook.boxplot_stats`. Note that advanced users can now either a) write their own function to compute the stats required by `Axes.bxp`, or b) modify the output returned by `cbook.boxplots_stats` to fully customize the position of the artists of the plots. With this flexibility, the parameters to manually specify only the medians and their confidence intervals remain for backwards compatibility.

Around the same time that the two roles of `Axes.boxplot` were split into `cbook.boxplot_stats` for computation and `Axes.bxp` for drawing, both `Axes.boxplot` and `Axes.bxp` were written to accept parameters that individually toggle the drawing of all components of the boxplots, and parameters that individually configure the style of those artists. However, to maintain backwards compatibility, the `sym` parameter (previously used to specify the symbol of the fliers) was retained. This parameter itself requires fairly complex logic to reconcile the `sym` parameters with the newer `flierprops` parameter at the default style specified by `matplotlibrc`.

This MEP seeks to dramatically simplify the creation of boxplots for novice and advanced users alike. Importantly, the changes proposed here will also be available to downstream packages like seaborn, as seaborn smartly allows users to pass arbitrary dictionaries of parameters through the seaborn API to the underlying matplotlib functions.

This will be achieved in the following way:

1. `cbook.boxplot_stats` will be modified to allow pre- and post- computation transformation functions to be passed in (e.g., `np.log` and `np.exp` for lognormally distributed data)
2. `Axes.boxplot` will be modified to also accept and naïvely pass them to `cbook.boxplots_stats` (Alt: pass the stat function and a dict of its optional parameters).
3. Outdated parameters from `Axes.boxplot` will be deprecated and later removed.

#### Importance

Since the limits of the whiskers are computed arithmetically, there is an implicit assumption of normality in box and whisker plots. This primarily affects which data points are classified as outliers.

Allowing transformations to the data and the results used to draw boxplots will allow users to opt-out of that assumption if the data are known to not fit a normal distribution.

Below is an example of how `Axes.boxplot` classifies outliers of lognormal data differently depending on these types of transforms.

```
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cbook
np.random.seed(0)

fig, ax = plt.subplots(figsize=(4, 6))
```

(continues on next page)

(continued from previous page)

```

ax.set_yscale('log')
data = np.random.lognormal(-1.75, 2.75, size=37)

stats = cbook.boxplot_stats(data, labels=['arithmetic'])
logstats = cbook.boxplot_stats(np.log(data), labels=['log-transformed'])

for lsdict in logstats:
    for key, value in lsdict.items():
        if key != 'label':
            lsdict[key] = np.exp(value)

stats.extend(logstats)
ax.bxp(stats)
fig.show()

```

### 39.18.5 Implementation

#### Passing transform functions to `cbook.boxplots_stats`

This MEP proposes that two parameters (e.g., `transform_in` and `transform_out`) be added to the `cookbook` function that computes the statistics for the `boxplot` function. These will be optional keyword-only arguments and can easily be set to `lambda x: x` as a no-op when omitted by the user. The `transform_in` function will be applied to the data as the `boxplot_stats` function loops through each subset of the data passed to it. After the list of statistics dictionaries are computed the `transform_out` function is applied to each value in the dictionaries.

These transformations can then be added to the call signature of `Axes.boxplot` with little impact to that method's complexity. This is because they can be directly passed to `cbook.boxplot_stats`. Alternatively, `Axes.boxplot` could be modified to accept an optional statistical function kwarg and a dictionary of parameters to be directly passed to it.

At this point in the implementation users and external libraries like `seaborn` would have complete control via the `Axes.boxplot` method. More importantly, at the very least, `seaborn` would require no changes to its API to allow users to take advantage of these new options.

#### Simplifications to the `Axes.boxplot` API and other functions

Simplifying the `boxplot` method consists primarily of deprecating and then removing the redundant parameters. Optionally, a next step would include rectifying minor terminological inconsistencies between `Axes.boxplot` and `Axes.bxp`.

The parameters to be deprecated and removed include:

1. `usermedians` - processed by 10 SLOC, 3 if blocks, a for loop
2. `conf_intervals` - handled by 15 SLOC, 6 if blocks, a for loop
3. `sym` - processed by 12 SLOC, 4 if blocks

Removing the `sym` option allows all code in handling the remaining styling parameters to be moved to `Axes.bxp`. This doesn't remove any complexity, but does reinforce the single responsibility principle among `Axes.bxp`, `cbook.boxplot_stats`, and `Axes.boxplot`.

Additionally, the `notch` parameter could be renamed `shownotches` to be consistent with `Axes.bxp`. This kind of cleanup could be taken a step further and the `whis`, `bootstrap`, `autorange` could be rolled into the kwargs passed to the new `statfxn` parameter.

### 39.18.6 Backward compatibility

Implementation of this MEP would eventually result in the backwards incompatible deprecation and then removal of the keyword parameters `usermedians`, `conf_intervals`, and `sym`. cursory searches on GitHub indicated that `usermedians`, `conf_intervals` are used by few users, who all seem to have a very strong knowledge of `matplotlib`. A robust deprecation cycle should provide sufficient time for these users to migrate to a new API.

Deprecation of `sym` however, may have a much broader reach into the `matplotlib` userbase.

#### Schedule

An accelerated timeline could look like the following:

1. v2.0.1 add transforms to `cbook.boxplots_stats`, expose in `Axes.boxplot`
2. v2.1.0 Initial Deprecations , and using 2D NumPy arrays as input
  - a. Using 2D NumPy arrays as input. The semantics around 2D arrays are generally confusing.
  - b. `usermedians`, `conf_intervals`, `sym` parameters
3. v2.2.0
  - a. remove `usermedians`, `conf_intervals`, `sym` parameters
  - b. deprecate `notch` in favor of `shownotches` to be consistent with other parameters and `Axes.bxp`
4. **v2.3.0**
  - a. remove `notch` parameter
  - b. move all style and artist toggling logic to `Axes.bxp` such `Axes.boxplot` is little more than a broker between `Axes.bxp` and `cbook.boxplots_stats`

### Anticipated Impacts to Users

As described above deprecating `usermedians` and `conf_intervals` will likely impact few users. Those who will be impacted are almost certainly advanced users who will be able to adapt to the change.

Deprecating the `sym` option may import more users and effort should be taken to collect community feedback on this.

### Anticipated Impacts to Downstream Libraries

The source code (GitHub master as of 2016-10-17) was inspected for `seaborn` and `python-ggplot` to see if these changes would impact their use. None of the parameters nominated for removal in this MEP are used by `seaborn`. The `seaborn` APIs that use matplotlib's `boxplot` function allow user's to pass arbitrary `**kwargs` through to matplotlib's API. Thus `seaborn` users with modern matplotlib installations will be able to take full advantage of any new features added as a result of this MEP.

`Python-ggplot` has implemented its own function to draw boxplots. Therefore, no impact can come to it as a result of implementing this MEP.

## 39.18.7 Alternatives

### Variations on the theme

This MEP can be divided into a few loosely coupled components:

1. Allowing pre- and post-computation transformation function in `cbook.boxplot_stats`
2. Exposing that transformation in the `Axes.boxplot` API
3. Removing redundant statistical options in `Axes.boxplot`
4. Shifting all styling parameter processing from `Axes.boxplot` to `Axes.bxp`.

With this approach, #2 depends on #1, and #4 depends on #3.

There are two possible approaches to #2. The first and most direct would be to mirror the new `transform_in` and `transform_out` parameters of `cbook.boxplot_stats` in `Axes.boxplot` and pass them directly.

The second approach would be to add `statfxn` and `statfxn_args` parameters to `Axes.boxplot`. Under this implementation, the default value of `statfxn` would be `cbook.boxplot_stats`, but users could pass their own function. Then `transform_in` and `transform_out` would then be passed as elements of the `statfxn_args` parameter.

```
def boxplot_stats(data, ..., transform_in=None, transform_out=None):
    if transform_in is None:
        transform_in = lambda x: x

    if transform_out is None:
        transform_out = lambda x: x

    output = []
    for _d in data:
        d = transform_in(_d)
        stat_dict = do_stats(d)
        for key, value in stat_dict.item():
            if key != 'label':
                stat_dict[key] = transform_out(value)
        output.append(d)
    return output

class Axes(...):
    def boxplot_option1(data, ..., transform_in=None, transform_out=None):
        stats = cbook.boxplot_stats(data, ...,
                                    transform_in=transform_in,
                                    transform_out=transform_out)
        return self.bxp(stats, ...)

    def boxplot_option2(data, ..., statfxn=None, **statopts):
        if statfxn is None:
            statfxn = boxplot_stats
        stats = statfxn(data, **statopts)
        return self.bxp(stats, ...)
```

Both cases would allow users to do the following:

```
fig, ax1 = plt.subplots()
artists1 = ax1.boxplot_optionX(data, transform_in=np.log,
                              transform_out=np.exp)
```

But Option Two lets a user write a completely custom stat function (e.g., `my_box_stats`) with fancy BCA confidence intervals and the whiskers set differently depending on some attribute of the data.

This is available under the current API:

```
fig, ax1 = plt.subplots()
my_stats = my_box_stats(data, bootstrap_method='BCA',
                       whisker_method='dynamic')
ax1.bxp(my_stats)
```

And would be more concise with Option Two

```
fig, ax = plt.subplots()
statopts = dict(transform_in=np.log, transform_out=np.exp)
ax.boxplot(data, ..., **statopts)
```

Users could also pass their own function to compute the stats:

```
fig, ax1 = plt.subplots()
ax1.boxplot(data, statfxn=my_box_stats, bootstrap_method='BCA',
            whisker_method='dynamic')
```

From the examples above, Option Two seems to have only marginal benefit, but in the context of downstream libraries like seaborn, its advantage is more apparent as the following would be possible without any patches to seaborn:

```
import seaborn
tips = seaborn.load_data('tips')
g = seaborn.factorplot(x="day", y="total_bill", hue="sex", data=tips,
                      kind='box', palette="PRGn", shownotches=True,
                      statfxn=my_box_stats, bootstrap_method='BCA',
                      whisker_method='dynamic')
```

This type of flexibility was the intention behind splitting the overall boxplot API in the current three functions. In practice however, downstream libraries like seaborn support versions of matplotlib dating back well before the split. Thus, adding just a bit more flexibility to the `Axes`.`boxplot` could expose all the functionality to users of the downstream libraries with modern matplotlib installation without intervention from the downstream library maintainers.

### Doing less

Another obvious alternative would be to omit the added pre- and post- computation transform functionality in `cbook.boxplot_stats` and `Axes.boxplot`, and simply remove the redundant statistical and style parameters as described above.

### Doing nothing

As with many things in life, doing nothing is an option here. This means we simply advocate for users and downstream libraries to take advantage of the split between `cbook.boxplot_stats` and `Axes.bxp` and let them decide how to provide an interface to that.

## 39.19 MEP29: Text light markup

- *Status*
- *Branches and Pull requests*
- *Abstract*
- *Detailed description*

- *Implementation*
  - *Improvements*
  - *Problems*
- *Backward compatibility*
- *Alternatives*

### 39.19.1 Status

Discussion

### 39.19.2 Branches and Pull requests

None at the moment, proof of concept only.

### 39.19.3 Abstract

This MEP proposes to add lightweight markup to the text artist.

### 39.19.4 Detailed description

Using different size/color/family in a text annotation is difficult because the `text` method accepts argument for size/color/family/weight/etc. that are used for the whole text. But, if one wants, for example, to have different colors, one has to look at the gallery where one such example is provided: [http://matplotlib.org/examples/text\\_labels\\_and\\_annotations/rainbow\\_text.html](http://matplotlib.org/examples/text_labels_and_annotations/rainbow_text.html)

This example takes a list of strings as well as a list of colors which makes it cumbersome to use. An alternative would be to use a restricted set of `pango`-like markup and to interpret this markup.

Some markup examples:

```
Hello <b>world!</b>`  
Hello <span color="blue">world!</span>
```

### 39.19.5 Implementation

A proof of concept is provided in `markup_example.py` but it currently only handles the horizontal direction.

#### Improvements

- This proof of concept uses regex to parse the text but it may be better to use the `html.parser` from the standard library.

- Computation of text fragment positions could benefit from the `OffsetFrom` class. See for example item 5 in [Using Complex Coordinates with Annotations](#)

### Problems

- One serious problem is how to deal with text having both latex and html-like tags. For example, consider the following:

```
$<b>Bold$</b>
```

Recommendation would be to have mutual exclusion.

### 39.19.6 Backward compatibility

None at the moment since it is only a proof of concept

### 39.19.7 Alternatives

As proposed by @anntzer, this could be also implemented as improvements to `mathtext`. For example:

```
r"$\text{Hello \textbf{world}}$"
r"$\text{Hello \textcolor{blue}{world}}$"
r"$\text{Hello \textsf{\small world}}$"

```

## LICENSES

Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative [licenses page](#) for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in Matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

### 40.1 Why BSD compatible?

The two dominant license variants in the wild are GPL-style and BSD-style. There are countless other licenses that place specific restrictions on code reuse, but there is an important difference to be considered in the GPL and BSD variants. The best known and perhaps most widely used license is the GPL, which in addition to granting you full rights to the source code including redistribution, carries with it an extra obligation. If you use GPL code in your own code, or link with it, your product must be released under a GPL compatible license. i.e., you are required to give the source code to other people and give them the right to redistribute it as well. Many of the most famous and widely used open source projects are released under the GPL, including linux, gcc, emacs and sage.

The second major class are the BSD-style licenses (which includes MIT and the python PSF license). These basically allow you to do whatever you want with the code: ignore it, include it in your own open source project, include it in your proprietary product, sell it, whatever. python itself is released under a BSD compatible license, in the sense that, quoting from the PSF license page:

There **is** no GPL-like "**copyleft**" restriction. Distributing binary-only versions of Python, modified **or not**, **is** allowed. There **is** no requirement to release **any** of your source code. You can also write extension modules **for** Python **and** provide them only **in** binary form.

Famous projects released under a BSD-style license in the permissive sense of the last paragraph are the BSD operating system, python and TeX.

There are several reasons why early Matplotlib developers selected a BSD compatible license. Matplotlib is a python extension, and we choose a license that was based on the python license (BSD compatible). Also, we wanted to attract as many users and developers as possible, and

many software companies will not use GPL code in software they plan to distribute, even those that are highly committed to open source development, such as [enthought](#), out of legitimate concern that use of the GPL will “infect” their code base by its viral nature. In effect, they want to retain the right to release some proprietary code. Companies and institutions who use Matplotlib often make significant contributions, because they have the resources to get a job done, even a boring one. Two of the Matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.

## DEFAULT COLOR CHANGES

As discussed at length elsewhere [insert links], `jet` is an empirically bad color map and should not be the default color map. Due to the position that changing the appearance of the plot breaks backward compatibility, this change has been put off for far longer than it should have been. In addition to changing the default color map we plan to take the chance to change the default color-cycle on plots and to adopt a different color map for filled plots (`imshow`, `pcolor`, `contourf`, etc) and for scatter like plots.

### 41.1 Default Heat Map Colormap

The choice of a new color map is fertile ground to bike-shedding (“No, it should be `_this_color_`”) so we have a proposed set criteria (via Nathaniel Smith) to evaluate proposed color maps.

- it should be a sequential colormap, because diverging colormaps are really misleading unless you know where the “center” of the data is, and for a default colormap we generally won’t.
- it should be perceptually uniform, i.e., human subjective judgments of how far apart nearby colors are should correspond as linearly as possible to the difference between the numerical values they represent, at least locally.
- it should have a perceptually uniform luminance ramp, i.e. if you convert to greyscale it should still be uniform. This is useful both in practical terms (greyscale printers are still a thing!) and because luminance is a very strong and natural cue to magnitude.
- it should also have some kind of variation in hue, because hue variation is a really helpful additional cue to perception, having two cues is better than one, and there’s no reason not to do it.
- the hue variation should be chosen to produce reasonable results even for viewers with the more common types of colorblindness. (Which rules out things like red-to-green.)
- For bonus points, it would be nice to choose a hue ramp that still works if you throw away the luminance variation, because then we could use the version with varying luminance for 2d plots, and the version with just hue variation for 3d plots. (In 3d plots you really want to reserve the luminance channel for lighting/shading, because your brain is *really* good at extracting 3d shape from luminance variation. If the 3d surface itself has massively varying luminance then this screws up the ability to see shape.)
- Not infringe any existing IP

### 41.1.1 Example script

### 41.1.2 Proposed Colormaps

## 41.2 Default Scatter Colormap

For heat-map like applications it can be desirable to cover as much of the luminance scale as possible, however when color mapping markers, having markers too close to white can be a problem. For that reason we propose using a different (but maybe related) color map to the heat map for marker-based. The design parameters are the same as above, only with a more limited luminance variation.

### 41.2.1 Example script

```
import numpy as np
import matplotlib.pyplot as plt

np.random.seed(1234)

fig, (ax1, ax2) = plt.subplots(1, 2)

N = 50
x = np.random.rand(N)
y = np.random.rand(N)
colors = np.random.rand(N)
area = np.pi * (15 * np.random.rand(N))**2 # 0 to 15 point radiuses

ax1.scatter(x, y, s=area, c=colors, alpha=0.5)

X,Y = np.meshgrid(np.arange(0, 2*np.pi, .2),
                  np.arange(0, 2*np.pi, .2))
U = np.cos(X)
V = np.sin(Y)
Q = ax2.quiver(X, Y, U, V, units='width')
qd = np.random.rand(np.prod(X.shape))
Q.set_array(qd)
```

### 41.2.2 Proposed Colormaps

## 41.3 Color Cycle / Qualitative color map

When plotting lines it is frequently desirable to plot multiple lines or artists which need to be distinguishable, but there is no inherent ordering.

### 41.3.1 Example script

```
import numpy as np
import matplotlib.pyplot as plt

fig, (ax1, ax2) = plt.subplots(1, 2)

x = np.linspace(0, 1, 10)

for j in range(10):
    ax1.plot(x, x * j)

th = np.linspace(0, 2*np.pi, 1024)
for j in np.linspace(0, np.pi, 10):
    ax2.plot(th, np.sin(th + j))

ax2.set_xlim(0, 2*np.pi)
```

### 41.3.2 Proposed Color cycle

# **Part VII**

## **Glossary**

**AGG** The Anti-Grain Geometry ([Agg](#)) rendering engine, capable of rendering high-quality images

**Cairo** The [Cairo](#) graphics engine

**FreeType** [FreeType](#) is a font rasterization library used by matplotlib which supports TrueType, Type 1, and OpenType fonts.

**GTK** The GIMP Toolkit ([GTK](#)) graphical user interface library

**PyGObject** [PyGObject](#) provides Python wrappers for the [GTK](#) widgets library

**pyqt** [pyqt](#) provides python wrappers for the [Qt](#) widgets library and is required by the matplotlib Qt5Agg and Qt4Agg backends. Widely used on linux and windows; many linux distributions package this as 'python-qt5' or 'python-qt4'.

**Qt** [Qt](#) is a cross-platform application framework for desktop and embedded development.

**Qt4** [Qt4](#) is the previous, but most widely used, version of Qt cross-platform application framework for desktop and embedded development.

**Qt5** [Qt5](#) is the current version of Qt cross-platform application framework for desktop and embedded development.

**Tk** [Tk](#) is a graphical user interface for Tcl and many other dynamic languages. It can produce rich, native applications that run unchanged across Windows, Mac OS X, Linux and more.

**wxpython** [wxpython](#) provides python wrappers for the [wxWidgets](#) library for use with the WX and WXAgg backends. Widely used on linux, OS-X and windows, it is often packaged by linux distributions as 'python-wxgtk'

**wxWidgets** [WX](#) is cross-platform GUI and tools library for GTK, MS Windows, and MacOS. It uses native widgets for each operating system, so applications will have the look-and-feel that users on that operating system expect.
