In the simplest form, the text is placed at `xy`.

Optionally, the text can be displayed in another position `xytext`. An arrow pointing from the text to the annotated point `xy` can then be added by defining `arrowprops`.

### Parameters

**text** [str] The text of the annotation. `s` is a deprecated synonym for this parameter.

**xy** [(float, float)] The point (x, y) to annotate. The coordinate system is determined by *xycoords*.

**xytext** [(float, float), default: xy] The position (x, y) to place the text at. The coordinate system is determined by *textcoords*.

**xycoords** [str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that xy is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'axes points'	Points from lower left corner of axes
'axes pixels'	Pixels from lower left corner of axes
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	( <i>theta</i> , <i>r</i> ) if not native 'data' coordinates

- An *Artist*: xy is interpreted as a fraction of the artist's *Bbox*. E.g. (0, 0) would be the lower left corner of the bounding box and (0.5, 1) would be the center top of the bounding box.
- A *Transform* to transform xy to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where *renderer* is a *RendererBase* subclass.

The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple (*xcoords*, *ycoords*) specifying separate coordinate systems for x and y. *xcoords* and *ycoords* must each be of one of the above described types.

See [Advanced Annotations](#) for more details.

**textcoords** [str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset (in points) from the xy value
'offset pixels'	Offset (in pixels) from the xy value

**arrowprops** [dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any key to <i>matplotlib.patches.FancyArrowPatch</i>

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

Name	Attrs
'-'	None
'->'	head_length=0.4,head_width=0.2
'-['	widthB=1.0,lengthB=0.2,angleB=None
' - '	widthA=1.0,widthB=1.0
'- >'	head_length=0.4,head_width=0.2
'<-'	head_length=0.4,head_width=0.2
'<->'	head_length=0.4,head_width=0.2
'< -'	head_length=0.4,head_width=0.2
'< ->'	head_length=0.4,head_width=0.2
'fancy'	head_length=0.4,head_width=0.4,tail_width=0.4
'simple'	head_length=0.5,head_width=0.5,tail_width=0.2
'wedge'	tail_width=0.3,shrink_factor=0.5

Valid keys for *FancyArrowPatch* are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for <i>matplotlib.patches.PathPatch</i>

Defaults to None, i.e. no arrow is drawn.

**annotation\_clip** [bool or None, default: None] Whether to draw the annotation when the annotation point *xy* is outside the axes area.

- If *True*, the annotation will only be drawn when *xy* is within the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will only be drawn when *xy* is within the axes and *xycoords* is 'data'.

**\*\*kwargs** Additional kwargs are passed to *Text*.

### Returns

*Annotation*

**See also:**

### matplotlib.axes.Axes.text

`Axes.text(self, x, y, s, fontdict=None, **kwargs)`

Add text to the axes.

Add the text *s* to the axes at location *x*, *y* in data coordinates.

#### Parameters

**x, y** [float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

**s** [str] The text.

**fontdict** [dict, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by *rcParams*.

#### Returns

*Text* The created *Text* instance.

#### Other Parameters

**\*\*kwargs** [*Text* properties.] Other miscellaneous text parameters.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontfamily</i> or <i>family</i>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monosp
<i>fontproperties</i> or <i>font</i> or <i>font_properties</i>	<i>font_manager.FontProperties</i> or <i>str</i> or <i>pathlib.Path</i>

Property	Description
<code>fontsize</code> or <code>size</code>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large'}
<code>fontstretch</code> or <code>stretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-co
<code>fontstyle</code> or <code>style</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code> or <code>variant</code>	{'normal', 'small-caps'}
<code>fontweight</code> or <code>weight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal',
<code>gid</code>	str
<code>horizontalalignment</code> or <code>ha</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>multialignment</code> or <code>ma</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<i>AbstractPathEffect</i>
<code>picker</code>	None or bool or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool or None
<code>rotation</code>	float or {'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>text</code>	object
<code>transform</code>	<i>Transform</i>
<code>url</code>	str
<code>usetex</code>	bool or None
<code>verticalalignment</code> or <code>va</code>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<code>visible</code>	bool
<code>wrap</code>	bool
<code>x</code>	float
<code>y</code>	float
<code>zorder</code>	float

## Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword `bbox`. `bbox` is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

### matplotlib.axes.Axes.table

```
Axes.table(ax, cellText=None, cellColours=None, cellLoc='right', colWidths=None,
            rowLabels=None, rowColours=None, rowLoc='left', colLabels=None, colColours=None, colLoc='center', loc='bottom', bbox=None, edges='closed',
            **kwargs)
```

Add a table to an *Axes*.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the *Table* class and add it to the axes with *Axes.add\_table*.

#### Parameters

**cellText** [2D list of str, optional] The texts to place into the table cells.

*Note:* Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

**cellColours** [2D list of colors, optional] The background colors of the cells.

**cellLoc** [{ 'left', 'center', 'right' }, default: 'right'] The alignment of the text within the cells.

**colWidths** [list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of  $1 / n_{cols}$ .

**rowLabels** [list of str, optional] The text of the row header cells.

**rowColours** [list of colors, optional] The colors of the row header cells.

**rowLoc** [{ 'left', 'center', 'right' }, default: 'left'] The text alignment of the row header cells.

**colLabels** [list of str, optional] The text of the column header cells.

**colColours** [list of colors, optional] The colors of the column header cells.

**colLoc** [{‘left’, ‘center’, ‘right’}, default: ‘left’] The text alignment of the column header cells.

**loc** [str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

**bbox** [*Bbox*, optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

**edges** [substring of ‘BRTL’ or {‘open’, ‘closed’, ‘horizontal’, ‘vertical’}] The cell edges to be drawn with a line. See also *visible\_edges*.

## Returns

*Table* The created table.

## Other Parameters

**\*\*kwargs** *Table* properties.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontsize</i>	float
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

Examples using `matplotlib.axes.Axes.table`

`matplotlib.axes.Axes.arrow`

`Axes.arrow(self, x, y, dx, dy, **kwargs)`

Add an arrow to the axes.

This draws an arrow from (x, y) to (x+dx, y+dy).

## Parameters

**x, y** [float] The x and y coordinates of the arrow base.

**dx, dy** [float] The length of the arrow along x and y direction.

**width: float, default: 0.001** Width of full arrow tail.

**length\_includes\_head: bool, default: False** True if head is to be counted in calculating the length.

**head\_width: float or None, default: 3\*width** Total width of the full arrow head.

**head\_length: float or None, default: 1.5\*head\_width** Length of arrow head.

**shape: ['full', 'left', 'right'], default: 'full'** Draw the left-half, right-half, or full arrow.

**overhang: float, default: 0** Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

**head\_starts\_at\_zero: bool, default: False** If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**\*\*kwargs** *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', ':-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

## Returns

*FancyArrow* The created *FancyArrow* object.

## Notes

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use *annotate()* for example:

```
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...               arrowprops=dict(arrowstyle="->"))
```

## Examples using matplotlib.axes.Axes.arrow

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_arrow\_simple\_demo.py

## matplotlib.axes.Axes.inset\_axes

*Axes.inset\_axes(self, bounds, \*, transform=None, zorder=5, \*\*kwargs)*

Add a child inset axes to this existing axes.

### Parameters

**bounds** [[x0, y0, width, height]] Lower-left corner of inset axes, and its width and height.

**transform** [*Transform*] Defaults to *ax.transAxes*, i.e. the units of *rect* are in axes-relative coordinates.

**zorder** [number] Defaults to 5 (same as *Axes.legend*). Adjust higher or lower to change whether it is above or below data plotted on the parent axes.

**\*\*kwargs** Other keyword arguments are passed on to the child *Axes*.

### Returns

**ax** The created *Axes* instance.

**Warning:** This method is experimental as of 3.0, and the API may change.

## Examples

This example makes two inset axes, the first is in axes-relative coordinates, and the second in data-coordinates:

```
fig, ax = plt.subplots()
ax.plot(range(10))
axin1 = ax.inset_axes([0.8, 0.1, 0.15, 0.15])
axin2 = ax.inset_axes(
    [5, 7, 2.3, 2.3], transform=ax.transData)
```

### Examples using `matplotlib.axes.Axes.inset_axes`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_zoom\_inset\_axes.py

### `matplotlib.axes.Axes.indicate_inset`

```
Axes.indicate_inset(self, bounds, inset_ax=None, *, transform=None, facecolor='none',  
                    edgcolor='0.5', alpha=0.5, zorder=4.99, **kwargs)
```

Add an inset indicator to the axes. This is a rectangle on the plot at the position indicated by *bounds* that optionally has lines that connect the rectangle to an inset axes (*Axes.inset\_axes*).

#### Parameters

**bounds** `[[x0, y0, width, height]]` Lower-left corner of rectangle to be marked, and its width and height.

**inset\_ax** [*Axes*] An optional inset axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset axes on corners chosen so as to not overlap with the indicator box.

**transform** [*Transform*] Transform for the rectangle coordinates. Defaults to `ax.transAxes`, i.e. the units of *rect* are in axes-relative coordinates.

**facecolor** `[color, default: 'none']` Facecolor of the rectangle.

**edgcolor** `[color, default: '0.5']` Color of the rectangle and color of the connecting lines.

**alpha** `[float, default: 0.5]` Transparency of the rectangle and connector lines.

**zorder** `[float, default: 4.99]` Drawing order of the rectangle and connector lines. The default, 4.99, is just below the default level of inset axes.

**\*\*kwargs** Other keyword arguments are passed on to the *Rectangle* patch: `%(Rectangle)s`

#### Returns

**rectangle\_patch** [*patches.Rectangle*] The indicator frame.

**connector\_lines** `[4-tuple of patches.ConnectionPatch]` The four connector lines connecting to (lower\_left, upper\_left, lower\_right, upper\_right) corners of *inset\_ax*. Two lines are set with visibility to *False*, but the user can set the visibility to *True* if the automatic choice is not deemed correct.

**Warning:** This method is experimental as of 3.0, and the API may change.

### Examples using `matplotlib.axes.Axes.indicate_inset`

### `matplotlib.axes.Axes.indicate_inset_zoom`

```
Axes.indicate_inset_zoom(self, inset_ax, **kwargs)
```

Add an inset indicator rectangle to the axes based on the axis limits for an *inset\_ax* and

draw connectors between *inset\_ax* and the rectangle.

### Parameters

**inset\_ax** [*Axes*] Inset axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset axes on corners chosen so as to not overlap with the indicator box.

**\*\*kwargs** Other keyword arguments are passed on to *Axes.indicate\_inset*

### Returns

**rectangle\_patch** [*patches.Rectangle*] Rectangle artist.

**connector\_lines** [4-tuple of *patches.ConnectionPatch*] Each of four connector lines coming from the rectangle drawn on this axis, in the order lower left, upper left, lower right, upper right. Two are set with visibility to *False*, but the user can set the visibility to *True* if the automatic choice is not deemed correct.

**Warning:** This method is experimental as of 3.0, and the API may change.

Examples using `matplotlib.axes.Axes.indicate_inset_zoom`

- `sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py`

`matplotlib.axes.Axes.secondary_xaxis`

`Axes.secondary_xaxis(self, location, *, functions=None, **kwargs)`

Add a second x-axis to this axes.

For example if we want to have a second scale for the data plotted on the xaxis.

### Parameters

**location** [{*'top'*, *'bottom'*, *'left'*, *'right'*] or float] The position to put the secondary axis. Strings can be *'top'* or *'bottom'* for orientation=*'x'* and *'right'* or *'left'* for orientation=*'y'*. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

**functions** [2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2.

The user can also directly supply a subclass of *transforms.Transform* so long as it has an inverse.

See `/gallery/subplots_axes_and_figures/secondary_axis` for examples of making these conversions.

### Returns

**ax** [`axes._secondary_axes.SecondaryAxis`]

### Other Parameters

**\*\*kwargs** [*Axes* properties.] Other miscellaneous axes parameters.

**Warning:** This method is experimental as of 3.1, and the API may change.

### Examples

The main axis shows frequency, and the secondary axis shows period.

### Examples using `matplotlib.axes.Axes.secondary_yaxis`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_secondary\_axis.py

### `matplotlib.axes.Axes.secondary_yaxis`

`Axes.secondary_yaxis(self, location, *, functions=None, **kwargs)`

Add a second y-axis to this axes.

For example if we want to have a second scale for the data plotted on the yaxis.

### Parameters

**location** [{‘top’, ‘bottom’, ‘left’, ‘right’} or float] The position to put the secondary axis. Strings can be ‘top’ or ‘bottom’ for orientation=‘x’ and ‘right’ or ‘left’ for orientation=‘y’. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

**functions** [2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2.

The user can also directly supply a subclass of `transforms.Transform` so long as it has an inverse.

See `/gallery/subplots_axes_and_figures/secondary_axis` for examples of making these conversions.

### Returns

**ax** [`axes._secondary_axes.SecondaryAxis`]

### Other Parameters

**\*\*kwargs** [`Axes` properties.] Other miscellaneous axes parameters.

**Warning:** This method is experimental as of 3.1, and the API may change.

### Examples

Add a secondary axes that converts from radians to degrees

Examples using `matplotlib.axes.Axes.secondary_yaxis`

- `sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py`

### Fields

<code>Axes.barbs</code>	Plot a 2D field of barbs.
<code>Axes.quiver</code>	Plot a 2D field of arrows.
<code>Axes.quiverkey</code>	Add a key to a quiver plot.
<code>Axes.streamplot</code>	Draw streamlines of a vector flow.

### `matplotlib.axes.Axes.barbs`

`Axes.barbs(self, *args, data=None, **kw)`  
Plot a 2D field of barbs.

Call signature:

`barbs([X, Y], U, V, [C], **kw)`

Where *X*, *Y* define the barb locations, *U*, *V* define the barb directions, and *C* optionally

sets the color.

All arguments may be 1D or 2D.  $U$ ,  $V$ ,  $C$  may be masked arrays, but masked  $X$ ,  $Y$  are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also [https://en.wikipedia.org/wiki/Wind\\_barb](https://en.wikipedia.org/wiki/Wind_barb).

### Parameters

**X, Y** [1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `x, y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

**U, V** [1D or 2D array-like] The x and y components of the barb shaft.

**C** [1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

**length** [float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

**pivot** [{‘tip’, ‘middle’} or float, default: ‘tip’] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

**barbcolor** [color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override *facecolor*.

**flagcolor** [color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override *facecolor*. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

**sizes** [dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- ‘spacing’ - space between features (flags, full/half barbs)
- ‘height’ - height (distance from shaft to top) of a flag or full barb
- ‘width’ - width of a flag, twice the width of a full barb
- ‘emptybarb’ - radius of the circle used for low magnitudes

**fill\_empty** [bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding** [bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb\_increments** [dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

**flip\_barb** [bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

## Returns

**barbs** [*Barbs*]

## Other Parameters

**\*\*kwargs** The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None

Table 92 – continued from previous page

Property	Description
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

## Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

## Examples using `matplotlib.axes.Axes.barbs`

- `sphx_glr_gallery_images_contours_and_fields_barb_demo.py`

## `matplotlib.axes.Axes.quiver`

`Axes.quiver(self, *args, data=None, **kw)`

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

*X*, *Y* define the arrow locations, *U*, *V* define the arrow directions, and *C* optionally sets the color.

### Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale\_units* parameters.

### Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave *minshaft* alone.

### Arrow outline

*linewidths* and *edgecolors* can be used to customize the arrow outlines.

### Parameters

**X, Y** [1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using `x, y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

**U, V** [1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. *U* and *V* may be masked. Only locations unmasked in *U*, *V*, and *C* will be drawn.

**C** [1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

**units** [{*'width'*, *'height'*, *'dots'*, *'inches'*, *'x'*, *'y'*, *'xy'*}, default: *'width'*] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- *'width'*, *'height'*: The width or height of the axis.
- *'dots'*, *'inches'*: Pixels or inches based on the figure dpi.
- *'x'*, *'y'*, *'xy'*: *X*, *Y* or  $\sqrt{X^2 + Y^2}$  in data units.

The arrows scale differently depending on the units. For *'x'* or *'y'*, the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For *'width'* or *'height'*, the arrow size increases with the width and height of the axes, respectively, when the window is resized; for *'dots'* or *'inches'*, resizing does not change the arrows.

**angles** [{*'uv'*, *'xy'*} or array-like, default: *'uv'*] Method for determining the angle of the arrows.

- *'uv'*: The arrow axis aspect ratio is 1 so that if  $U == V$  the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on *X*, *Y* data coordinates.

- *'xy'*: Arrows point from (*x*, *y*) to (*x*+*u*, *y*+*v*). Use this for plotting a gradient field, for example.
- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

In this case *U*, *V* is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

**scale** [float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale\_units* parameter.

**scale\_units** [{‘width’, ‘height’, ‘dots’, ‘inches’, ‘x’, ‘y’, ‘xy’}, optional] If the *scale* kwarg is *None*, the arrow length unit. Default is *None*.

e.g. *scale\_units* is ‘inches’, *scale* is 2.0, and  $(u, v) = (1, 0)$ , then the vector will be 0.5 inches long.

If *scale\_units* is ‘width’ or ‘height’, then the vector will be half the width/height of the axes.

If *scale\_units* is ‘x’ then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with *u* and *v* having the same units as *x* and *y*, use *angles*=‘xy’, *scale\_units*=‘xy’, *scale*=1.

**width** [float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth** [float, default: 3] Head width as multiple of shaft width.

**headlength** [float, default: 5] Head length as multiple of shaft width.

**headaxislength** [float, default: 4.5] Head length at shaft intersection.

**minshaft** [float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength** [float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot** [{‘tail’, ‘mid’, ‘middle’, ‘tip’}, default: ‘tail’] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

‘mid’ is a synonym for ‘middle’.

**color** [color or color sequence, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection* *facecolor* parameter.

### Other Parameters

**\*\*kwargs** [*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{‘butt’, ‘round’, ‘projecting’}

Table 93 – continued from previous page

Property	Description
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

**See also:**

*Axes.quiverkey* Add a key to a quiver plot.

**Examples using `matplotlib.axes.Axes.quiver`**

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_quiver\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_quiver\_simple\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_trigradient\_demo.py
- sphx\_glr\_gallery\_mplot3d\_quiver3d.py

**`matplotlib.axes.Axes.quiverkey`**

`Axes.quiverkey(self, Q, X, Y, U, label, **kw)`  
Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

### Parameters

**Q** [*matplotlib.quiver.Quiver*] A *Quiver* object as returned by a call to *quiver()*.

**X, Y** [float] The location of the key.

**U** [float] The length of the key.

**label** [str] The key label (e.g., length and units of the key).

**angle** [float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

**coordinates** [{*'axes'*, *'figure'*, *'data'*, *'inches'*}, default: *'axes'*] Coordinate system and units for *X*, *Y*: *'axes'* and *'figure'* are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; *'data'* are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); *'inches'* is position in the figure in inches, with (0, 0) at the lower left corner.

**color** [color] Overrides face and edge colors from *Q*.

**labelpos** [{*'N'*, *'S'*, *'E'*, *'W'*}] Position the label above, below, to the right, to the left of the arrow, respectively.

**labelsep** [float, default: 0.1] Distance in inches between the arrow and the label.

**labelcolor** [color, default: *rcParams["text.color"]* (default: *'black'*)] Label color.

**fontproperties** [dict, optional] A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family*, *style*, *variant*, *size*, *weight*.

**\*\*kwargs** Any additional keyword arguments are used to override vector properties taken from *Q*.

### Examples using `matplotlib.axes.Axes.quiverkey`

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_quiver\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_quiver\_simple\_demo.py

### `matplotlib.axes.Axes.streamplot`

```
Axes.streamplot(axes, x, y, u, v, density=1, linewidth=None, color=None, cmap=None,
                 norm=None, arrowsize=1, arrowstyle='->', minlength=0.1, transform=None,
                 zorder=None, start_points=None, maxlength=4.0, integration_direction='both', *, data=None)
```

Draw streamlines of a vector flow.

### Parameters

**x, y** [1D arrays] An evenly spaced grid.

**u, v** [2D arrays] x and y-velocities. The number of rows and columns must match the length of y and x, respectively.

**density** [float or (float, float)] Controls the closeness of streamlines. When `density = 1`, the domain is divided into a 30x30 grid. *density* linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (`density_x`, `density_y`).

**linewidth** [float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as *u* and *v*.

**color** [color or 2D array] The streamline color. If given an array, its values are converted to colors using *cmap* and *norm*. The array must have the same shape as *u* and *v*.

**cmap** [*Colormap*] Colormap used to plot streamlines and arrows. This is only used if *color* is an array.

**norm** [*Normalize*] Normalize object used to scale luminance data to 0, 1. If `None`, stretch (min, max) to (0, 1). This is only used if *color* is an array.

**arrowsize** [float] Scaling factor for the arrow size.

**arrowstyle** [str] Arrow style specification. See *FancyArrowPatch*.

**minlength** [float] Minimum length of streamline in axes coordinates.

**start\_points** [Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the *x* and *y* arrays).

**zorder** [int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

**maxlength** [float] Maximum length of streamline in axes coordinates.

**integration\_direction** [{`'forward'`, `'backward'`, `'both'`}, default: `'both'`] Integrate the streamline in forward, backward or both directions.

## Returns

**StreamplotSet** Container object with attributes

- `lines`: *LineCollection* of streamlines
- `arrows`: *PatchCollection* containing *FancyArrowPatch* objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *u*, *v*, *start\_points*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.streamplot`

- `sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py`

18.5.5 Clearing

<i>Axes.cla</i>	Clear the current axes.
<i>Axes.clear</i>	Clear the axes.

`matplotlib.axes.Axes.cla`

`Axes.cla(self)`  
Clear the current axes.

Examples using `matplotlib.axes.Axes.cla`

- `sphx_glr_gallery_animation_animation_demo.py`
- `sphx_glr_gallery_event_handling_data_browser.py`
- `sphx_glr_gallery_misc_custom_projection.py`

`matplotlib.axes.Axes.clear`

`Axes.clear(self)`  
Clear the axes.

Examples using `matplotlib.axes.Axes.clear`

18.5.6 Appearance

<i>Axes.axis</i>	Convenience method to get or set some axis properties.
<i>Axes.set_axis_off</i>	Turn the x- and y-axis off.
<i>Axes.set_axis_on</i>	Turn the x- and y-axis on.
<i>Axes.set_frame_on</i>	Set whether the axes rectangle patch is drawn.
<i>Axes.get_frame_on</i>	Get whether the axes rectangle patch is drawn.
<i>Axes.set_axisbelow</i>	Set whether axis ticks and gridlines are above or below most artists.

Continued on next page

Table 95 – continued from previous page

<code>Axes.get_axisbelow</code>	Get whether axis ticks and gridlines are above or below most artists.
<code>Axes.grid</code>	Configure the grid lines.
<code>Axes.get_facecolor</code>	Get the facecolor of the Axes.
<code>Axes.set_facecolor</code>	Set the facecolor of the Axes.

**matplotlib.axes.Axes.axis**

`Axes.axis(self, *args, emit=True, **kwargs)`

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

**Parameters**

**xmin, xmax, ymin, ymax** [float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

**option** [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as True.
'off'	Turn off axis lines and labels. Same as False.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code> . Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code> . Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing <code>xmax-xmin == ymax-ymin</code> .

**emit** [bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

**xmin, xmax, ymin, ymax** [float] The axis limits.

**See also:**`matplotlib.axes.Axes.set_xlim``matplotlib.axes.Axes.set_ylim`**Examples using `matplotlib.axes.Axes.axis`**

### `matplotlib.axes.Axes.set_axis_on`

`Axes.set_axis_on(self)`

Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

#### Examples using `matplotlib.axes.Axes.set_axis_on`

### `matplotlib.axes.Axes.set_frame_on`

`Axes.set_frame_on(self, b)`

Set whether the axes rectangle patch is drawn.

#### Parameters

**b** [bool]

#### Examples using `matplotlib.axes.Axes.set_frame_on`

### `matplotlib.axes.Axes.get_frame_on`

`Axes.get_frame_on(self)`

Get whether the axes rectangle patch is drawn.

Examples using `matplotlib.axes.Axes.get_frame_on`

`matplotlib.axes.Axes.set_axisbelow`

`Axes.set_axisbelow(self, b)`

Set whether axis ticks and gridlines are above or below most artists.

This controls the zorder of the ticks and gridlines. For more information on the zorder see [/gallery/misc/zorder\\_demo](#).

### Parameters

**b** [bool or 'line'] Possible values:

- *True* (zorder = 0.5): Ticks and gridlines are below all Artists.
- *'line'* (zorder = 1.5): Ticks and gridlines are above patches (e.g. rectangles, with default zorder = 1) but still below lines and markers (with their default zorder = 2).
- *False* (zorder = 2.5): Ticks and gridlines are above patches and lines / markers.

**See also:**

[`get\_axisbelow`](#)

Examples using `matplotlib.axes.Axes.set_axisbelow`

`matplotlib.axes.Axes.get_axisbelow`

`Axes.get_axisbelow(self)`

Get whether axis ticks and gridlines are above or below most artists.

### Returns

**bool or 'line'**

**See also:**

[`set\_axisbelow`](#)

Examples using `matplotlib.axes.Axes.get_axisbelow`

`matplotlib.axes.Axes.grid`

`Axes.grid(self, b=None, which='major', axis='both', **kwargs)`

Configure the grid lines.

### Parameters

- b** [bool or None, optional] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to *True*.  
If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

**which** [{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.

**axis** [{'both', 'x', 'y'}, optional] The axis to apply the changes on.

**\*\*kwargs** [*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', "", (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgewidth</i> or <i>mec</i>	color
<i>markeredgecolor</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[b
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array

Table 96 – continued from previous page

Property	Description
<i>zorder</i>	float

### Notes

The axis is drawn as a unit, so the effective *zorder* for drawing the grid is determined by the *zorder* of each axis, not by the *zorder* of the *Line2D* objects comprising the grid. Therefore, to set grid *zorder*, use *set\_axisbelow* or, for more control, call the *set\_zorder* method of each axis.

#### matplotlib.axes.Axes.get\_facecolor

`Axes.get_facecolor(self)`  
Get the facecolor of the Axes.

Examples using `matplotlib.axes.Axes.get_facecolor`

#### matplotlib.axes.Axes.set\_facecolor

`Axes.set_facecolor(self, color)`  
Set the facecolor of the Axes.

##### Parameters

**color** [color]

Examples using `matplotlib.axes.Axes.set_facecolor`

- sphx\_glr\_gallery\_color\_color\_demo.py
- sphx\_glr\_gallery\_color\_color\_cycle\_default.py

## 18.5.7 Property cycle

---

`Axes.set_prop_cycle`

Set the property cycle of the Axes.

---

#### matplotlib.axes.Axes.set\_prop\_cycle

`Axes.set_prop_cycle(self, *args, **kwargs)`  
Set the property cycle of the Axes.

The property cycle controls the style properties such as color, marker and linestyle of future plot commands. The style properties of data already added to the Axes are not modified.

Call signatures:

```
set_prop_cycle(cycler)
set_prop_cycle(label=values[, label2=values2[, ...]])
set_prop_cycle(label, values)
```

Form 1 sets given `Cycler` object.

Form 2 creates a `Cycler` which cycles over one or more properties simultaneously and set it as the property cycle of the axes. If multiple properties are given, their value lists must

have the same length. This is just a shortcut for explicitly creating a `cycler` and passing it to the function, i.e. it's short for `set_prop_cycle(cycler(label=values label2=values2, ...))`.

Form 3 creates a `Cycler` for a single property and set it as the property cycle of the axes. This form exists for compatibility with the original `cycler.cycler` interface. Its use is discouraged in favor of the kwarg form, i.e. `set_prop_cycle(label=values)`.

### Parameters

**cycler** [`Cycler`] Set the given `Cycler`. *None* resets to the cycle defined by the current style.

**label** [str] The property key. Must be a valid `Artist` property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

**values** [iterable] Finite-length iterable of the property values. These values are validated and will raise a `ValueError` if invalid.

### See also:

`matplotlib.rcsetup.cycler` Convenience function for creating validated cyclers for properties.

`cycler.cycler` The original function for creating unvalidated cyclers.

### Examples

Setting the property cycle for a single property:

```
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'])
```

Setting the property cycle for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'],
...                    marker=['o', '+', 'x'])
```

### Examples using `matplotlib.axes.Axes.set_prop_cycle`

- `sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py`
- *Styling with cycler*

## 18.5.8 Axis / limits

<code>Axes.get_xaxis</code>	Return the <code>XAxis</code> instance.
<code>Axes.get_yaxis</code>	Return the <code>YAxis</code> instance.

**matplotlib.axes.Axes.get\_xaxis**

`Axes.get_xaxis(self)`  
Return the XAxis instance.

**Examples using matplotlib.axes.Axes.get\_xaxis**

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_timeline.py
- sphx\_glr\_gallery\_statistics\_customized\_violin.py
- sphx\_glr\_gallery\_showcase\_bachelors\_degrees\_by\_gender.py

**matplotlib.axes.Axes.get\_yaxis**

`Axes.get_yaxis(self)`  
Return the YAxis instance.

**Examples using matplotlib.axes.Axes.get\_yaxis**

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_timeline.py
- sphx\_glr\_gallery\_showcase\_bachelors\_degrees\_by\_gender.py

**Axis Limits and direction**

<code>Axes.invert_xaxis</code>	Invert the x-axis.
<code>Axes.xaxis_inverted</code>	Return whether the xaxis is oriented in the "inverse" direction.
<code>Axes.invert_yaxis</code>	Invert the y-axis.
<code>Axes.yaxis_inverted</code>	Return whether the yaxis is oriented in the "inverse" direction.
<code>Axes.set_xlim</code>	Set the x-axis view limits.
<code>Axes.get_xlim</code>	Return the x-axis view limits.
<code>Axes.set_ylim</code>	Set the y-axis view limits.
<code>Axes.get_ylim</code>	Return the y-axis view limits.
<code>Axes.update_datalim</code>	Extend the dataLim Bbox to include the given points.
<code>Axes.update_datalim_bounds</code>	[ <i>Deprecated</i> ] Extend the datalim Bbox to include the given <i>Bbox</i> .
<code>Axes.set_xbound</code>	Set the lower and upper numerical bounds of the x-axis.
<code>Axes.get_xbound</code>	Return the lower and upper x-axis bounds, in increasing order.
<code>Axes.set_ybound</code>	Set the lower and upper numerical bounds of the y-axis.
<code>Axes.get_ybound</code>	Return the lower and upper y-axis bounds, in increasing order.

**matplotlib.axes.Axes.invert\_xaxis**

`Axes.invert_xaxis(self)`  
 Invert the x-axis.

**See also:**

`xaxis_inverted`  
`get_xlim, set_xlim`  
`get_xbound, set_xbound`

Examples using `matplotlib.axes.Axes.invert_xaxis`

**matplotlib.axes.Axes.xaxis\_inverted**

`Axes.xaxis_inverted(self)`  
 Return whether the xaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

Examples using `matplotlib.axes.Axes.xaxis_inverted`

**matplotlib.axes.Axes.invert\_yaxis**

`Axes.invert_yaxis(self)`  
 Invert the y-axis.

**See also:**

`yaxis_inverted`  
`get_ylim, set_ylim`  
`get_ybound, set_ybound`

Examples using `matplotlib.axes.Axes.invert_yaxis`

- `sphx_glr_gallery_lines_bars_and_markers_barh.py`
- `sphx_glr_gallery_lines_bars_and_markers_marker_reference.py`

**matplotlib.axes.Axes.yaxis\_inverted**

`Axes.yaxis_inverted(self)`  
 Return whether the yaxis is oriented in the "inverse" direction.

The "normal" direction is increasing to the right for the x-axis and to the top for the y-axis; the "inverse" direction is increasing to the left for the x-axis and to the bottom for the y-axis.

Examples using `matplotlib.axes.Axes.yaxis_inverted`

### `matplotlib.axes.Axes.set_xlim`

`Axes.set_xlim(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)`  
Set the x-axis view limits.

#### Parameters

**left** [float, optional] The left xlim in data coordinates. Passing *None* leaves the limit unchanged.

The left and right xlims may also be passed as the tuple (*left*, *right*) as the first positional argument (or as the *left* keyword argument).

**right** [float, optional] The right xlim in data coordinates. Passing *None* leaves the limit unchanged.

**emit** [bool, default: True] Whether to notify observers of limit change.

**auto** [bool or None, default: False] Whether to turn on autoscaling of the x-axis. True turns on, False turns off, None leaves unchanged.

**xmin, xmax** [float, optional] They are equivalent to left and right respectively, and it is an error to pass both *xmin* and *left* or *xmax* and *right*.

#### Returns

**left, right** [(float, float)] The new x-axis limits in data coordinates.

#### See also:

`get_xlim`

`set_xbound`, `get_xbound`

`invert_xaxis`, `xaxis_inverted`

#### Notes

The *left* value may be greater than the *right* value, in which case the x-axis values will decrease from left to right.

#### Examples

```
>>> set_xlim(left, right)
>>> set_xlim((left, right))
>>> left, right = set_xlim(left, right)
```

One limit may be left unchanged.

```
>>> set_xlim(right=right_lim)
```

Limits may be passed in reverse order to flip the direction of the x-axis. For example, suppose *x* represents the number of years before present. The x-axis limits might be set like the following so 5000 years ago is on the left of the plot and the present is on the right.

```
>>> set_xlim(5000, 0)
```

### matplotlib.axes.Axes.get\_xlim

`Axes.get_xlim(self)`

Return the x-axis view limits.

#### Returns

**left, right** [(float, float)] The current x-axis limits in data coordinates.

#### See also:

`set_xlim`

`set_xbound, get_xbound`

`invert_xaxis, xaxis_inverted`

#### Notes

The x-axis may be inverted, in which case the *left* value will be greater than the *right* value.

### Examples using matplotlib.axes.Axes.get\_xlim

- *Decay*

### matplotlib.axes.Axes.set\_ylim

`Axes.set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)`

Set the y-axis view limits.

#### Parameters

**bottom** [float, optional] The bottom ylim in data coordinates. Passing *None* leaves the limit unchanged.

The bottom and top ylims may also be passed as the tuple (*bottom, top*) as the first positional argument (or as the *bottom* keyword argument).

**top** [float, optional] The top ylim in data coordinates. Passing *None* leaves the limit unchanged.

**emit** [bool, default: True] Whether to notify observers of limit change.

**auto** [bool or None, default: False] Whether to turn on autoscaling of the y-axis. *True* turns on, *False* turns off, *None* leaves unchanged.

**ymin, ymax** [float, optional] They are equivalent to bottom and top respectively, and it is an error to pass both *ymin* and *bottom* or *ymax* and *top*.

### Returns

**bottom, top** [(float, float)] The new y-axis limits in data coordinates.

### See also:

`get_ylim`

`set_ybound, get_ybound`

`invert_yaxis, yaxis_inverted`

### Notes

The *bottom* value may be greater than the *top* value, in which case the y-axis values will decrease from *bottom* to *top*.

### Examples

```
>>> set_ylim(bottom, top)
>>> set_ylim((bottom, top))
>>> bottom, top = set_ylim(bottom, top)
```

One limit may be left unchanged.

```
>>> set_ylim(top=top_lim)
```

Limits may be passed in reverse order to flip the direction of the y-axis. For example, suppose *y* represents depth of the ocean in m. The y-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

```
>>> set_ylim(5000, 0)
```

#### `matplotlib.axes.Axes.get_ylim`

`Axes.get_ylim(self)`

Return the y-axis view limits.

##### **Returns**

**bottom, top** [(float, float)] The current y-axis limits in data coordinates.

**See also:**

```

set_ylim
set_ybound, get_ybound
invert_yaxis, yaxis_inverted

```

### Notes

The y-axis may be inverted, in which case the *bottom* value will be greater than the *top* value.

### Examples using `matplotlib.axes.Axes.get_ylim`

- sphx\_glr\_gallery\_shapes\_and\_collections\_collections.py

### `matplotlib.axes.Axes.update_datalim`

```
Axes.update_datalim(self, xys, updatex=True, updatey=True)
```

Extend the dataLim Bbox to include the given points.

If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of the xydata (xys). Otherwise, it will compute the bounds of the union of its current data and the data in xys.

#### Parameters

- xys** [2D array-like] The points to include in the data limits Bbox. This can be either a list of (x, y) tuples or a Nx2 array.
- updatex, updatey** [bool, default: True] Whether to update the x/y limits.

### Examples using `matplotlib.axes.Axes.update_datalim`

### `matplotlib.axes.Axes.update_datalim_bounds`

```
Axes.update_datalim_bounds(self, bounds)
```

[*Deprecated*] Extend the dataLim Bbox to include the given *Bbox*.

#### Parameters

- bounds** [*Bbox*]

### Notes

Deprecated since version 3.3.

Examples using `matplotlib.axes.Axes.update_datalim_bounds`

### `matplotlib.axes.Axes.set_xbound`

`Axes.set_xbound(self, lower=None, upper=None)`

Set the lower and upper numerical bounds of the x-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (`get_autoscalex_on()`).

#### Parameters

**lower, upper** [float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

#### See also:

`get_xbound`

`get_xlim, set_xlim`

`invert_xaxis, xaxis_inverted`

Examples using `matplotlib.axes.Axes.set_xbound`

### `matplotlib.axes.Axes.get_xbound`

`Axes.get_xbound(self)`

Return the lower and upper x-axis bounds, in increasing order.

#### See also:

`set_xbound`

`get_xlim, set_xlim`

`invert_xaxis, xaxis_inverted`

Examples using `matplotlib.axes.Axes.get_xbound`

### `matplotlib.axes.Axes.set_ybound`

`Axes.set_ybound(self, lower=None, upper=None)`

Set the lower and upper numerical bounds of the y-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (`get_autoscaley_on()`).

#### Parameters

**lower, upper** [float or None] The lower and upper bounds. If *None*, the respective axis bound is not modified.

#### See also:

`get_ybound`

```
get_ylim, set_ylim
invert_yaxis, yaxis_inverted
```

Examples using `matplotlib.axes.Axes.set_ybound`

`matplotlib.axes.Axes.get_ybound`

`Axes.get_ybound(self)`  
Return the lower and upper y-axis bounds, in increasing order.

**See also:**

```
set_ybound
get_ylim, set_ylim
invert_yaxis, yaxis_inverted
```

Examples using `matplotlib.axes.Axes.get_ybound`

Axis Labels, title, and legend

<code>Axes.set_xlabel</code>	Set the label for the x-axis.
<code>Axes.get_xlabel</code>	Get the xlabel text string.
<code>Axes.set_ylabel</code>	Set the label for the y-axis.
<code>Axes.get_ylabel</code>	Get the ylabel text string.
<code>Axes.set_title</code>	Set a title for the axes.
<code>Axes.get_title</code>	Get an axes title.
<code>Axes.legend</code>	Place a legend on the axes.
<code>Axes.get_legend</code>	Return the <i>Legend</i> instance, or None if no legend is defined.
<code>Axes.get_legend_handles_labels</code>	Return handles and labels for legend

`matplotlib.axes.Axes.set_xlabel`

`Axes.set_xlabel(self, xlabel, fontdict=None, labelpad=None, *, loc=None, **kwargs)`  
Set the label for the x-axis.

#### Parameters

**xlabel** [str] The label text.

**labelpad** [float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

**loc** [{ 'left', 'center', 'right' }, default: `rcParams["xaxis.labellocation"]` (default: 'center')] The label position. This is a high-level alternative for passing parameters `x` and `horizontalalignment`.

#### Other Parameters

**\*\*kwargs** [*Text* properties] *Text* properties control the appearance of the label.

**See also:**

`text` Documents the properties supported by `Text`.

#### **matplotlib.axes.Axes.get\_ylabel**

`Axes.get_ylabel(self)`  
Get the ylabel text string.

## Examples using `matplotlib.axes.Axes.get_ylabel`

## `matplotlib.axes.Axes.set_title`

`Axes.set_title(self, label, fontdict=None, loc=None, pad=None, *, y=None, **kwargs)`  
Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

### Parameters

**label** [str] Text to use for the title

**fontdict** [dict] A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

**loc** [{`'center'`, `'left'`, `'right'`}, default: `rcParams["axes.titlelocation"]` (default: `'center'`)] Which title to set.

**y** [float, default: `rcParams["axes.titley"]` (default: `None`)] Vertical axes location for the title (1.0 is the top). If `None` (the default), `y` is determined automatically to avoid decorators on the axes.

**pad** [float, default: `rcParams["axes.titlepad"]` (default: 6.0)] The offset of the title from the top of the axes, in points.

### Returns

*Text* The matplotlib text instance representing the title

### Other Parameters

**\*\*kwargs** [*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

### matplotlib.axes.Axes.get\_title

`Axes.get_title(self, loc='center')`

Get an axes title.

Get one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

#### Parameters

**loc** [{ 'center', 'left', 'right' }, str, default: 'center'] Which title to return.

#### Returns

**str** The title text string.

### Examples using matplotlib.axes.Axes.get\_title

### matplotlib.axes.Axes.legend

`Axes.legend(self, *args, **kwargs)`

Place a legend on the axes.

Call signatures:

```
legend()
legend(labels)
legend(handles, labels)
```

The call signatures correspond to three different ways how to use this method.

#### 1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```
line, = ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Axes.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

## 2. Labeling existing plot elements

To make a legend for lines which already exist on the axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This way of using is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

## 3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
legend((line1, line2, line3), ('label1', 'label2', 'label3'))
```

### Parameters

**handles** [sequence of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

**labels** [list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

### Returns

*Legend*

### Other Parameters

**loc** [str or pair of floats, default: `rcParams["legend.loc"]` (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox\_to\_anchor* will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor** [*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to *axes.bbox* (if called as a method to *Axes.legend*) or *figure.bbox* (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox\_transform*, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol** [int, default: 1] The number of columns that the legend has.

**prop** [None or *matplotlib.font\_manager.FontProperties* or dict] The font

properties of the legend. If `None` (default), the current `matplotlib.rcParams` will be used.

**fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

**labelcolor** [str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints** [int, default: `rcParams["legend.numpoints"]` (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

**scatterpoints** [int, default: `rcParams["legend.scatterpoints"]` (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

**scatteryoffsets** [iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale** [float, default: `rcParams["legend.markerscale"]` (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.

**markerfirst** [bool, default: `True`] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

**frameon** [bool, default: `rcParams["legend.frameon"]` (default: `True`)] Whether the legend should be drawn on a patch (frame).

**fancybox** [bool, default: `rcParams["legend.fancybox"]` (default: `True`)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

**shadow** [bool, default: `rcParams["legend.shadow"]` (default: `False`)] Whether to draw a shadow behind the legend.

**framealpha** [float, default: `rcParams["legend.framealpha"]` (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

**facecolor** ["inherit" or color, default: `rcParams["legend.facecolor"]` (default: 'inherit')] The legend's background color. If "inherit", use `rcParams["axes.facecolor"]` (default: 'white').

**edgecolor** ["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: '0.8')] The legend's background patch edge color. If "inherit", use take `rcParams["axes.edgecolor"]` (default: 'black').

**mode** [{"expand", `None`}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox\_to\_anchor* if defines the legend's size).

**bbox\_transform** [None or `matplotlib.transforms.Transform`] The transform for the bounding box (*bbox\_to\_anchor*). For a value of None (default) the Axes' `transAxes` transform will be used.

**title** [str or None] The legend's title. Default is no title (None).

**title\_fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: None)] The font size of the legend's title.

**borderpad** [float, default: `rcParams["legend.borderpad"]` (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

**labelspacing** [float, default: `rcParams["legend.labelspacing"]` (default: 0.5)] The vertical space between the legend entries, in font-size units.

**handlelength** [float, default: `rcParams["legend.handlelength"]` (default: 2.0)] The length of the legend handles, in font-size units.

**handletextpad** [float, default: `rcParams["legend.handletextpad"]` (default: 0.8)] The pad between the legend handle and text, in font-size units.

**borderaxespad** [float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)] The pad between the axes and legend border, in font-size units.

**columnspacing** [float, default: `rcParams["legend.columnspacing"]` (default: 2.0)] The spacing between columns, in font-size units.

**handler\_map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler\_map* updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

## Notes

Some artists are not supported by this function. See [Legend guide](#) for details.

### matplotlib.axes.Axes.get\_legend

`Axes.get_legend(self)`

Return the *Legend* instance, or None if no legend is defined.

Examples using `matplotlib.axes.Axes.get_legend`

### matplotlib.axes.Axes.get\_legend\_handles\_labels

`Axes.get_legend_handles_labels(self, legend_handler_map=None)`

Return handles and labels for legend

`ax.legend()` is equivalent to

```
h, l = ax.get_legend_handles_labels()
ax.legend(h, l)
```

Examples using `matplotlib.axes.Axes.get_legend_handles_labels`

- *Legend guide*

### Axis scales

<code>Axes.set_xscale</code>	Set the x-axis scale.
<code>Axes.get_xscale</code>	Return the xaxis' scale (as a str).
<code>Axes.set_yscale</code>	Set the y-axis scale.
<code>Axes.get_yscale</code>	Return the yaxis' scale (as a str).

### matplotlib.axes.Axes.set\_xscale

`Axes.set_xscale(self, value, **kwargs)`

Set the x-axis scale.

### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**\*\*kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

### Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

#### Examples using `matplotlib.axes.Axes.set_xscale`

- `sphx_glr_gallery_lines_bars_and_markers_markevery_demo.py`

- `sphx_glr_gallery_scales_scales.py`
- *Transformations Tutorial*

#### `matplotlib.axes.Axes.get_xscale`

`Axes.get_xscale(self)`

Return the xaxis' scale (as a str).

#### Examples using `matplotlib.axes.Axes.get_xscale`

#### `matplotlib.axes.Axes.set_yscale`

`Axes.set_yscale(self, value, **kwargs)`

Set the y-axis scale.

### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**\*\*kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`

- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

## Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

## Examples using `matplotlib.axes.Axes.set_yscale`

- `sphx_glr_gallery_lines_bars_and_markers_markevery_demo.py`

- `sphx_glr_gallery_scales_log_demo.py`
- `sphx_glr_gallery_scales_scales.py`

## `matplotlib.axes.Axes.get_yscale`

`Axes.get_yscale(self)`  
Return the yaxis' scale (as a str).

## Examples using `matplotlib.axes.Axes.get_yscale`

## Autoscaling and margins

<code>Axes.use_sticky_edges</code>	When autoscaling, whether to obey all <code>Artist.sticky_edges</code> .
<code>Axes.margins</code>	Set or retrieve autoscaling margins.
<code>Axes.set_xmargin</code>	Set padding of X data limits prior to autoscaling.
<code>Axes.set_ymargin</code>	Set padding of Y data limits prior to autoscaling.
<code>Axes.relim</code>	Recompute the data limits based on current artists.
<code>Axes.autoscale</code>	Autoscale the axis view to the data (toggle).
<code>Axes.autoscale_view</code>	Autoscale the view limits using the data limits.

Continued on next page

Table 102 – continued from previous page

<code>Axes.set_autoscale_on</code>	Set whether autoscaling is applied on plot commands
<code>Axes.get_autoscale_on</code>	Get whether autoscaling is applied for both axes on plot commands
<code>Axes.set_autoscalex_on</code>	Set whether autoscaling for the x-axis is applied on plot commands
<code>Axes.get_autoscalex_on</code>	Get whether autoscaling for the x-axis is applied on plot commands
<code>Axes.set_autoscaley_on</code>	Set whether autoscaling for the y-axis is applied on plot commands
<code>Axes.get_autoscaley_on</code>	Get whether autoscaling for the y-axis is applied on plot commands

**matplotlib.axes.Axes.use\_sticky\_edges**

property `Axes.use_sticky_edges`

When autoscaling, whether to obey all `Artist.sticky_edges`.

Default is `True`.

Setting this to `False` ensures that the specified margins will be applied, even if the plot includes an image, for example, which would otherwise force a view limit to coincide with its data limit.

The changing this property does not change the plot until `autoscale` or `autoscale_view` is called.

**matplotlib.axes.Axes.margins**

`Axes.margins(self, *margins, x=None, y=None, tight=True)`

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the *margin* times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a `TypeError`. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if *xmargin* is not `None`, then *xmargin* times the X data interval will be added to each end of that interval before it is used in autoscaling.

**Parameters**

**\*margins** [float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as *xmargin*, *ymargin*. If setting the margin on a single axis is desired, use the keyword arguments described below.

**x, y** [float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

**tight** [bool or None, default: `True`] The *tight* parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is `True`, on the assumption that when margins are specified,

no additional padding to match tick marks is usually desired. Set *tight* to *None* will preserve the previous setting.

### Returns

**xmargin, ymargin** [float]

### Notes

If a previously used Axes method such as `pcolor()` has set `use_sticky_edges` to `True`, only the limits not set by the "sticky artists" will be modified. To force all of the margins to be set, set `use_sticky_edges` to `False` before calling `margins()`.

### Examples using `matplotlib.axes.Axes.margins`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_marker\_reference.py
- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_timeline.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_trigradient\_demo.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_margins.py
- sphx\_glr\_gallery\_style\_sheets\_ggplot.py
- sphx\_glr\_gallery\_widgets\_slider\_demo.py

### `matplotlib.axes.Axes.set_xmargin`

`Axes.set_xmargin(self, m)`

Set padding of X data limits prior to autoscaling.

*m* times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of *m* = 0.1 will result in a range [-0.2, 2.2].

Negative values  $-0.5 < m < 0$  will result in clipping of the data range. I.e. for a data range [0, 2], a factor of *m* = -0.1 will result in a range [0.2, 1.8].

### Parameters

**m** [float greater than -0.5]

### Examples using `matplotlib.axes.Axes.set_xmargin`

### `matplotlib.axes.Axes.set_ymargin`

`Axes.set_ymargin(self, m)`

Set padding of Y data limits prior to autoscaling.

*m* times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of *m* = 0.1 will result in a range [-0.2, 2.2].

Negative values  $-0.5 < m < 0$  will result in clipping of the data range. I.e. for a data range [0, 2], a factor of *m* = -0.1 will result in a range [0.2, 1.8].

**Parameters**

**m** [float greater than -0.5]

Examples using `matplotlib.axes.Axes.set_ymargin`

**matplotlib.axes.Axes.relim**

`Axes.relim(self, visible_only=False)`

Recompute the data limits based on current artists.

At present, *Collection* instances are not supported.

**Parameters**

**visible\_only** [bool, default: False] Whether to exclude invisible artists.

Examples using `matplotlib.axes.Axes.relim`

- `sphx_glr_gallery_widgets_textbox.py`

**matplotlib.axes.Axes.autoscale**

`Axes.autoscale(self, enable=True, axis='both', tight=None)`

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

**Parameters**

**enable** [bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

**axis** [{'both', 'x', 'y'}, default: 'both'] Which axis to operate on.

**tight** [bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to *autoscale\_view* (regardless of its value); see the description of its behavior there.

Examples using `matplotlib.axes.Axes.autoscale`

- `sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py`

**matplotlib.axes.Axes.autoscale\_view**

`Axes.autoscale_view(self, tight=None, scalex=True, scaley=True)`

Autoscale the view limits using the data limits.

**Parameters**

**tight** [bool or None] If *True*, only expand the axis limits using the margins. Note that unlike for *autoscale*, *tight=True* does *not* set the margins to zero.

If *False* and `rcParams["axes.autolimit_mode"]` (default: 'data') is 'round\_numbers', then after expansion by the margins, further expand the axis limits using the axis major locator.

If *None* (the default), reuse the value set in the previous call to *autoscale\_view* (the initial value is *False*, but the default style sets `rcParams["axes.autolimit_mode"]` (default: 'data') to 'data', in which case this behaves like *True*).

**scalex** [bool, default: *True*] Whether to autoscale the x axis.

**scaley** [bool, default: *True*] Whether to autoscale the y axis.

### Notes

The autoscaling preserves any preexisting axis direction reversal.

The data limits are not updated automatically when artist data are changed after the artist has been added to an Axes instance. In that case, use `matplotlib.axes.Axes.relim()` prior to calling *autoscale\_view*.

If the views of the axes are fixed, e.g. via *set\_xlim*, they will not be changed by *autoscale\_view()*. See `matplotlib.axes.Axes.autoscale()` for an alternative.

### Examples using `matplotlib.axes.Axes.autoscale_view`

- sphx\_glr\_gallery\_shapes\_and\_collections\_collections.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_compound\_path.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_ellipse\_collection.py
- sphx\_glr\_gallery\_units\_bar\_unit\_demo.py
- sphx\_glr\_gallery\_widgets\_textbox.py

### `matplotlib.axes.Axes.set_autoscale_on`

`Axes.set_autoscale_on(self, b)`

Set whether autoscaling is applied on plot commands

#### Parameters

**b** [bool]

### Examples using `matplotlib.axes.Axes.set_autoscale_on`

- sphx\_glr\_gallery\_event\_handling\_resample.py

### `matplotlib.axes.Axes.get_autoscale_on`

`Axes.get_autoscale_on(self)`

Get whether autoscaling is applied for both axes on plot commands

Examples using `matplotlib.axes.Axes.get_autoscale_on`

### `matplotlib.axes.Axes.set_autoscalex_on`

`Axes.set_autoscalex_on(self, b)`

Set whether autoscaling for the x-axis is applied on plot commands

#### Parameters

**b** [bool]

Examples using `matplotlib.axes.Axes.set_autoscalex_on`

### `matplotlib.axes.Axes.get_autoscalex_on`

`Axes.get_autoscalex_on(self)`

Get whether autoscaling for the x-axis is applied on plot commands

Examples using `matplotlib.axes.Axes.get_autoscalex_on`

### `matplotlib.axes.Axes.set_autoscaley_on`

`Axes.set_autoscaley_on(self, b)`

Set whether autoscaling for the y-axis is applied on plot commands

#### Parameters

**b** [bool]

Examples using `matplotlib.axes.Axes.set_autoscaley_on`

### `matplotlib.axes.Axes.get_autoscaley_on`

`Axes.get_autoscaley_on(self)`

Get whether autoscaling for the y-axis is applied on plot commands

Examples using `matplotlib.axes.Axes.get_autoscaley_on`

### Aspect ratio

<code>Axes.apply_aspect</code>	Adjust the Axes for a specified data aspect ratio.
<code>Axes.set_aspect</code>	Set the aspect of the axis scaling, i.e.
<code>Axes.get_aspect</code>	
<code>Axes.set_box_aspect</code>	Set the axes box aspect.
<code>Axes.get_box_aspect</code>	Get the axes box aspect.
<code>Axes.set_adjustable</code>	Set how the Axes adjusts to achieve the required aspect ratio.
<code>Axes.get_adjustable</code>	Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

### matplotlib.axes.Axes.apply\_aspect

`Axes.apply_aspect(self, position=None)`

Adjust the Axes for a specified data aspect ratio.

Depending on `get_adjustable` this will modify either the Axes box (position) or the view limits. In the former case, `get_anchor` will affect the position.

#### See also:

`matplotlib.axes.Axes.set_aspect` For a description of aspect ratio handling.

`matplotlib.axes.Axes.set_adjustable` Set how the Axes adjusts to achieve the required aspect ratio.

`matplotlib.axes.Axes.set_anchor` Set the position in case of extra space.

#### Notes

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

### Examples using matplotlib.axes.Axes.apply\_aspect

### matplotlib.axes.Axes.set\_aspect

`Axes.set_aspect(self, aspect, adjustable=None, anchor=None, share=False)`

Set the aspect of the axis scaling, i.e. the ratio of y-unit to x-unit.

#### Parameters

**aspect** [{'auto'} or num] Possible values:

value	description
'auto'	automatic; fill the position rectangle with data.
num	a circle will be stretched such that the height is <i>num</i> times the width. 'equal' is a synonym for aspect=1, i.e. same scaling for x and y.

**adjustable** [None or {'box', 'datalim'}, optional] If not None, this defines which parameter will be adjusted to meet the required aspect. See [`set\_adjustable`](#) for further details.

**anchor** [None or str or 2-tuple of float, optional] If not None, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to specify the anchor are abbreviations of cardinal directions:

value	description
'C'	centered
'SW'	lower left corner
'S'	middle of bottom edge
'SE'	lower right corner
etc.	

See [`set\_anchor`](#) for further details.

**share** [bool, default: False] If True, apply the settings to all shared Axes.

**See also:**

[`matplotlib.axes.Axes.set\_adjustable`](#) Set how the Axes adjusts to achieve the required aspect ratio.

[`matplotlib.axes.Axes.set\_anchor`](#) Set the position in case of extra space.

### matplotlib.axes.Axes.get\_aspect

`Axes.get_aspect(self)`

Examples using `matplotlib.axes.Axes.get_aspect`

### matplotlib.axes.Axes.set\_box\_aspect

`Axes.set_box_aspect(self, aspect=None)`

Set the axes box aspect. The box aspect is the ratio of the axes height to the axes width in physical units. This is not to be confused with the data aspect, set via `set_aspect`.

#### Parameters

**aspect** [None, or a number] Changes the physical dimensions of the Axes, such that the ratio of the axes height to the axes width in physical units is equal to *aspect*. If *None*, the axes geometry will not be adjusted.

**Note that calling this function with a number changes the *\*adjustable\****

**to *\*datalim\**.**

**See also:**

`matplotlib.axes.Axes.set_aspect` for a description of aspect handling.

Examples using `matplotlib.axes.Axes.set_box_aspect`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_box\_aspect.py

### matplotlib.axes.Axes.get\_box\_aspect

`Axes.get_box_aspect(self)`

Get the axes box aspect. Will be *None* if not explicitly specified.

**See also:**

`matplotlib.axes.Axes.set_box_aspect` for a description of box aspect.

`matplotlib.axes.Axes.set_aspect` for a description of aspect handling.

Examples using `matplotlib.axes.Axes.get_box_aspect`

`matplotlib.axes.Axes.set_adjustable`

`Axes.set_adjustable(self, adjustable, share=False)`

Set how the Axes adjusts to achieve the required aspect ratio.

**Parameters**

**adjustable** [`'box'`, `'datalim'`] If `'box'`, change the physical dimensions of the Axes. If `'datalim'`, change the x or y data limits.

**share** [bool, default: False] If True, apply the settings to all shared Axes.

**See also:**

`matplotlib.axes.Axes.set_aspect` For a description of aspect handling.

**Notes**

Shared Axes (of which twinned Axes are a special case) impose restrictions on how aspect ratios can be imposed. For twinned Axes, use `'datalim'`. For Axes that share both x and y, use `'box'`. Otherwise, either `'datalim'` or `'box'` may be used. These limitations are partly a requirement to avoid over-specification, and partly a result of the particular implementation we are currently using, in which the adjustments for aspect ratios are done sequentially and independently on each Axes as it is drawn.

Examples using `matplotlib.axes.Axes.set_adjustable`

- `sphx_glr_gallery_scales_aspect_loglog.py`

`matplotlib.axes.Axes.get_adjustable`

`Axes.get_adjustable(self)`

Return whether the Axes will adjust its physical dimension (`'box'`) or its data limits (`'datalim'`) to achieve the desired aspect ratio.

**See also:**

`matplotlib.axes.Axes.set_adjustable` Set how the Axes adjusts to achieve the required aspect ratio.

`matplotlib.axes.Axes.set_aspect` For a description of aspect handling.

Examples using `matplotlib.axes.Axes.get_adjustable`

Ticks and tick labels

---

`Axes.set_xticks`

Set the xaxis' tick locations.

Continued on next page

Table 104 – continued from previous page

<code>Axes.get_xticks</code>	Return the xaxis' tick locations in data coordinates.
<code>Axes.set_xticklabels</code>	Set the xaxis' labels with list of string labels.
<code>Axes.get_xticklabels</code>	Get the xaxis' tick labels.
<code>Axes.get_xmajorticklabels</code>	Return the xaxis' major tick labels, as a list of <i>Text</i> .
<code>Axes.get_xminorticklabels</code>	Return the xaxis' minor tick labels, as a list of <i>Text</i> .
<code>Axes.get_xgridlines</code>	Return the xaxis' grid lines as a list of <i>Line2Ds</i> .
<code>Axes.get_xticklines</code>	Return the xaxis' tick lines as a list of <i>Line2Ds</i> .
<code>Axes.xaxis_date</code>	Sets up axis ticks and labels to treat data along the xaxis as dates.
<code>Axes.set_yticks</code>	Set the yaxis' tick locations.
<code>Axes.get_yticks</code>	Return the yaxis' tick locations in data coordinates.
<code>Axes.set_yticklabels</code>	Set the yaxis' labels with list of string labels.
<code>Axes.get_yticklabels</code>	Get the yaxis' tick labels.
<code>Axes.get_ymajorticklabels</code>	Return the yaxis' major tick labels, as a list of <i>Text</i> .
<code>Axes.get_yminorticklabels</code>	Return the yaxis' minor tick labels, as a list of <i>Text</i> .
<code>Axes.get_ygridlines</code>	Return the yaxis' grid lines as a list of <i>Line2Ds</i> .
<code>Axes.get_yticklines</code>	Return the yaxis' tick lines as a list of <i>Line2Ds</i> .
<code>Axes.yaxis_date</code>	Sets up axis ticks and labels to treat data along the yaxis as dates.
<code>Axes.minorticks_off</code>	Remove minor ticks from the axes.
<code>Axes.minorticks_on</code>	Display minor ticks on the axes.
<code>Axes.ticklabel_format</code>	Configure the <i>ScalarFormatter</i> used by default for linear axes.
<code>Axes.tick_params</code>	Change the appearance of ticks, tick labels, and gridlines.
<code>Axes.locator_params</code>	Control behavior of major tick locators.

**matplotlib.axes.Axes.set\_xticks**

`Axes.set_xticks(self, ticks, *, minor=False)`  
Set the xaxis' tick locations.

**Parameters**

**ticks** [list of floats] List of tick locations.

**minor** [bool, default: False] If False, set the major ticks; if True, the minor ticks.

**Examples using matplotlib.axes.Axes.set\_xticks**

#### **matplotlib.axes.Axes.get\_xticks**

`Axes.get_xticks(self, *, minor=False)`

Return the xaxis' tick locations in data coordinates.

Examples using `matplotlib.axes.Axes.get_xticks`

`matplotlib.axes.Axes.set_xticklabels`

`Axes.set_xticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)`  
 Set the xaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using `Axes.set_xticks`. Otherwise, the labels may end up in unexpected positions.

### Parameters

**labels** [list of str] The label texts.

**fontdict** [dict, optional] A dictionary controlling the appearance of the tick-labels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': 'loc'}
```

**minor** [bool, default: False] Whether to set the minor ticklabels rather than the major ones.

### Returns

**list of *Text*** The labels.

### Other Parameters

**\*\*kwargs** [*Text* properties.]

Examples using `matplotlib.axes.Axes.set_xticklabels`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_barchart.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_annotated\_heatmap.py

### matplotlib.axes.Axes.get\_xticklabels

`Axes.get_xticklabels(self, minor=False, which=None)`  
Get the xaxis' tick labels.

#### Parameters

**minor** [bool] Whether to return the minor or the major ticklabels.

**which** [None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

#### Returns

**list of** *Text*

#### Notes

The tick label strings are not populated until a `draw` method has been called.

See also: *draw* and *draw*.

### Examples using matplotlib.axes.Axes.get\_xticklabels

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_timeline.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_annotated\_heatmap.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_align\_labels\_demo.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_shared\_axis\_demo.py
- sphx\_glr\_gallery\_statistics\_boxplot\_demo.py

- sphx\_glr\_gallery\_units\_evans\_test.py
- *The Lifecycle of a Plot*

### matplotlib.axes.Axes.get\_xmajorticklabels

`Axes.get_xmajorticklabels(self)`  
Return the xaxis' major tick labels, as a list of *Text*.

Examples using `matplotlib.axes.Axes.get_xmajorticklabels`

`matplotlib.axes.Axes.get_xminorticklabels`

`Axes.get_xminorticklabels(self)`

Return the xaxis' minor tick labels, as a list of *Text*.

Examples using `matplotlib.axes.Axes.get_xminorticklabels`

`matplotlib.axes.Axes.get_xgridlines`

`Axes.get_xgridlines(self)`

Return the xaxis' grid lines as a list of *Line2Ds*.

Examples using `matplotlib.axes.Axes.get_xgridlines`

`matplotlib.axes.Axes.get_xticklines`

`Axes.get_xticklines(self, minor=False)`

Return the xaxis' tick lines as a list of *Line2Ds*.

Examples using `matplotlib.axes.Axes.get_xticklines`

`matplotlib.axes.Axes.xaxis_date`

`Axes.xaxis_date(self, tz=None)`

Sets up axis ticks and labels to treat data along the xaxis as dates.

#### Parameters

**tz** [str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: 'UTC')]  
The timezone used to create date labels.

Examples using `matplotlib.axes.Axes.xaxis_date`

`matplotlib.axes.Axes.set_yticks`

`Axes.set_yticks(self, ticks, *, minor=False)`

Set the yaxis' tick locations.

#### Parameters

**ticks** [list of floats] List of tick locations.

**minor** [bool, default: False] If False, set the major ticks; if True, the minor ticks.

**Examples using `matplotlib.axes.Axes.set_yticks`**

- `sphx_glr_gallery_lines_bars_and_markers_barh.py`
- `sphx_glr_gallery_lines_bars_and_markers_broken_barh.py`

- `sphx_glr_gallery_ticks_and_spines_spines_bounds.py`

**`matplotlib.axes.Axes.get_yticks`**

`Axes.get_yticks(self, *, minor=False)`  
Return the yaxis' tick locations in data coordinates.

**Examples using `matplotlib.axes.Axes.get_yticks`****`matplotlib.axes.Axes.set_yticklabels`**

`Axes.set_yticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)`  
Set the yaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using [Axes.set\\_yticks](#). Otherwise, the labels may end up in unexpected positions.

### Parameters

**labels** [list of str] The label texts.

**fontdict** [dict, optional] A dictionary controlling the appearance of the tick-labels. The default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': 'left'}
```

**minor** [bool, default: False] Whether to set the minor ticklabels rather than the major ones.

### Returns

**list of *Text*** The labels.

### Other Parameters

**\*\*kwargs** [*Text* properties.]

### Examples using `matplotlib.axes.Axes.set_yticklabels`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_barh.py
- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_broken\_barh.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_annotated\_heatmap.py
- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_zoom\_inset\_axes.py
- sphx\_glr\_gallery\_statistics\_boxplot.py
- sphx\_glr\_gallery\_statistics\_bxp.py
- sphx\_glr\_gallery\_statistics\_violinplot.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_tex\_demo.py
- sphx\_glr\_gallery\_pyplots\_auto\_subplots\_adjust.py
- sphx\_glr\_gallery\_axes\_grid1\_make\_room\_for\_ylabel\_using\_axesgrid.py
- sphx\_glr\_gallery\_axisartist\_demo\_ticklabel\_alignment.py
- sphx\_glr\_gallery\_specialty\_plots\_mri\_with\_eeg.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_colorbar\_tick\_labelling\_demo.py
- [Constrained Layout Guide](#)

### `matplotlib.axes.Axes.get_yticklabels`

`Axes.get_yticklabels(self, minor=False, which=None)`  
Get the yaxis' tick labels.

**Parameters**

**minor** [bool] Whether to return the minor or the major ticklabels.

**which** [None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

**Returns**

**list of** *Text*

**Notes**

The tick label strings are not populated until a draw method has been called.

See also: *draw* and *draw*.

**Examples using `matplotlib.axes.Axes.get_yticklabels`**

- sphx\_glr\_gallery\_axes\_grid1\_inset\_locator\_demo2.py
- sphx\_glr\_gallery\_recipes\_fill\_between\_alpha.py

**`matplotlib.axes.Axes.get_ymajorticklabels`**

`Axes.get_ymajorticklabels(self)`

Return the yaxis' major tick labels, as a list of *Text*.

**Examples using `matplotlib.axes.Axes.get_ymajorticklabels`****`matplotlib.axes.Axes.get_yminorticklabels`**

`Axes.get_yminorticklabels(self)`

Return the yaxis' minor tick labels, as a list of *Text*.

**Examples using `matplotlib.axes.Axes.get_yminorticklabels`****`matplotlib.axes.Axes.get_ygridlines`**

`Axes.get_ygridlines(self)`

Return the yaxis' grid lines as a list of *Line2Ds*.

**Examples using `matplotlib.axes.Axes.get_ygridlines`****`matplotlib.axes.Axes.get_yticklines`**

`Axes.get_yticklines(self, minor=False)`

Return the yaxis' tick lines as a list of *Line2Ds*.

Examples using `matplotlib.axes.Axes.get_yticklines`

`matplotlib.axes.Axes.yaxis_date`

`Axes.yaxis_date(self, tz=None)`

Sets up axis ticks and labels to treat data along the yaxis as dates.

#### Parameters

**tz** [str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: 'UTC')]  
The timezone used to create date labels.

Examples using `matplotlib.axes.Axes.yaxis_date`

`matplotlib.axes.Axes.minorticks_off`

`Axes.minorticks_off(self)`

Remove minor ticks from the axes.

Examples using `matplotlib.axes.Axes.minorticks_off`

`matplotlib.axes.Axes.minorticks_on`

`Axes.minorticks_on(self)`

Display minor ticks on the axes.

Displaying minor ticks may reduce performance; you may turn them off using `minorticks_off()` if drawing speed is a problem.

Examples using `matplotlib.axes.Axes.minorticks_on`

- `sphx_glr_gallery_specialty_plots_mri_with_eeg.py`

`matplotlib.axes.Axes.ticklabel_format`

`Axes.ticklabel_format(self, *, axis='both', style="", scilimits=None, useOffset=None, useLocale=None, useMathText=None)`

Configure the `ScalarFormatter` used by default for linear axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

#### Parameters

**axis** [{'x', 'y', 'both'}, default: 'both'] The axes to configure. Only major ticks are affected.

**style** [{'sci', 'scientific', 'plain'}] Whether to use scientific notation. The formatter default is to use scientific notation.

**scilimits** [pair of ints (m, n)] Scientific notation is used only for numbers outside the range  $10^m$  to  $10^n$  (and only if the formatter is configured to use scientific notation at all). Use (0, 0) to include all numbers. Use (m, m) where  $m \neq 0$  to fix the order of magnitude to  $10^m$ . The formatter default is `rcParams["axes.formatter.limits"]` (default: [-5, 6]).

**useOffset** [bool or float] If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is `rcParams["axes.formatter.useoffset"]` (default: True).

**useLocale** [bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is `rcParams["axes.formatter.use_locale"]` (default: False).

**useMathText** [bool] Render the offset and scientific notation in mathtext. The formatter default is `rcParams["axes.formatter.use_mathtext"]` (default: False).

### Raises

**AttributeError** If the current formatter is not a *ScalarFormatter*.

### Examples using `matplotlib.axes.Axes.ticklabel_format`

- `sphx_glr_gallery_ticks_and_spines_scalarformatter.py`

### `matplotlib.axes.Axes.tick_params`

`Axes.tick_params(self, axis='both', **kwargs)`

Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless *reset* is True.

#### Parameters

**axis** [{*'x'*, *'y'*, *'both'*}, default: *'both'*] The axis to which the parameters are applied.

**which** [{*'major'*, *'minor'*, *'both'*}, default: *'major'*] The group of ticks to which the parameters are applied.

**reset** [bool, default: False] Whether to reset the ticks to defaults before updating them.

#### Other Parameters

**direction** [{*'in'*, *'out'*, *'inout'*}] Puts ticks inside the axes, outside the axes, or both.

**length** [float] Tick length in points.

**width** [float] Tick width in points.

**color** [color] Tick color.

**pad** [float] Distance in points between tick and label.

**labelsize** [float or str] Tick label font size in points or as a string (e.g., 'large').

**labelcolor** [color] Tick label color.

**colors** [color] Tick color and label color.

**zorder** [float] Tick and label zorder.

**bottom, top, left, right** [bool] Whether to draw the respective ticks.

**labelbottom, labeltop, labelleft, labelright** [bool] Whether to draw the respective tick labels.

**labelrotation** [float] Tick label rotation

**grid\_color** [color] Gridline color.

**grid\_alpha** [float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

**grid\_linewidth** [float] Width of gridlines in points.

**grid\_linestyle** [str] Any valid *Line2D* line style spec.

### Examples

```
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

### matplotlib.axes.Axes.locator\_params

`Axes.locator_params(self, axis='both', tight=None, **kwargs)`

Control behavior of major tick locators.

Because the locator is involved in autoscaling, `autoscale_view` is called automatically after the parameters are changed.

#### Parameters

**axis** [{`'both'`, `'x'`, `'y'`}, default: `'both'`] The axis on which to operate.

**tight** [bool or None, optional] Parameter passed to `autoscale_view`. Default is None, for no change.

#### Other Parameters

**\*\*kwargs** Remaining keyword arguments are passed directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example `set_params` for the `ticker.MaxNLocator` used by default for linear axes.

#### Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```
ax.locator_params(tight=True, nbins=4)
```

### Examples using matplotlib.axes.Axes.locator\_params

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_contourf\_demo.py
- *Constrained Layout Guide*
- *Tight Layout guide*

## 18.5.9 Units

<code>Axes.convert_xunits</code>	Convert <code>x</code> using the unit type of the xaxis.
<code>Axes.convert_yunits</code>	Convert <code>y</code> using the unit type of the yaxis.
<code>Axes.have_units</code>	Return <code>True</code> if units are set on any axis.

### matplotlib.axes.Axes.convert\_xunits

`Axes.convert_xunits(self, x)`

Convert `x` using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, `x` itself is

returned.

Examples using `matplotlib.axes.Axes.convert_xunits`

`matplotlib.axes.Axes.convert_yunits`

`Axes.convert_yunits(self, y)`

Convert `y` using the unit type of the yaxis.

If the artist is not contained in an `Axes` or if the yaxis does not have units, `y` itself is returned.

Examples using `matplotlib.axes.Axes.convert_yunits`

`matplotlib.axes.Axes.have_units`

`Axes.have_units(self)`

Return `True` if units are set on any axis.

Examples using `matplotlib.axes.Axes.have_units`

## 18.5.10 Adding Artists

<code>Axes.add_artist</code>	Add an <i>Artist</i> to the axes, and return the artist.
<code>Axes.add_child_axes</code>	Add an <code>AxesBase</code> to the axes' children; return the child axes.
<code>Axes.add_collection</code>	Add a <i>Collection</i> to the axes' collections; return the collection.
<code>Axes.add_container</code>	Add a <i>Container</i> to the axes' containers; return the container.
<code>Axes.add_image</code>	Add an <i>AxesImage</i> to the axes' images; return the image.
<code>Axes.add_line</code>	Add a <i>Line2D</i> to the axes' lines; return the line.
<code>Axes.add_patch</code>	Add a <i>Patch</i> to the axes' patches; return the patch.
<code>Axes.add_table</code>	Add a <i>Table</i> to the axes' tables; return the table.

`matplotlib.axes.Axes.add_artist`

`Axes.add_artist(self, a)`

Add an *Artist* to the axes, and return the artist.

Use `add_artist` only for artists for which there is no dedicated "add" method; and if necessary, use a method such as `update_dataLim` to manually update the `dataLim` if the artist is to be included in autoscaling.

If no transform has been specified when creating the artist (e.g. `artist.get_transform()`

`== None`) then the transform is set to `ax.transData`.

#### Examples using `matplotlib.axes.Axes.add_artist`

- `sphx_glr_gallery_lines_bars_and_markers_scatter_with_legend.py`
- `sphx_glr_gallery_images_contours_and_fields_demo_bboximage.py`

- `sphx_glr_gallery_userdemo_simple_legend02.py`

#### `matplotlib.axes.Axes.add_child_axes`

`Axes.add_child_axes(self, ax)`

Add an `AxesBase` to the axes' children; return the child axes.

This is the lowlevel version. See `axes.Axes.inset_axes`.

#### Examples using `matplotlib.axes.Axes.add_child_axes`

#### `matplotlib.axes.Axes.add_collection`

`Axes.add_collection(self, collection, autolim=True)`

Add a *Collection* to the axes' collections; return the collection.

**Examples using `matplotlib.axes.Axes.add_collection`**

- `sphx_glr_gallery_lines_bars_and_markers_eventcollection_demo.py`
- `sphx_glr_gallery_lines_bars_and_markers_span_regions.py`
- `sphx_glr_gallery_statistics_errorbars_and_boxes.py`
- `sphx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphx_glr_gallery_shapes_and_collections_collections.py`
- `sphx_glr_gallery_shapes_and_collections_ellipse_collection.py`
- `sphx_glr_gallery_shapes_and_collections_line_collection.py`

- `sphx_glr_gallery_specialty_plots_mri_with_eeg.py`
- `sphx_glr_gallery_units_artist_tests.py`

**`matplotlib.axes.Axes.add_container`**

`Axes.add_container(self, container)`

Add a *Container* to the axes' containers; return the container.

**Examples using `matplotlib.axes.Axes.add_container`****`matplotlib.axes.Axes.add_image`**

`Axes.add_image(self, image)`

Add an *AxesImage* to the axes' images; return the image.

**Examples using `matplotlib.axes.Axes.add_image`****`matplotlib.axes.Axes.add_line`**

`Axes.add_line(self, line)`

Add a *Line2D* to the axes' lines; return the line.

**Examples using `matplotlib.axes.Axes.add_line`**

- `sphx_glr_gallery_text_labels_and_annotations_line_with_text.py`
- `sphx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphx_glr_gallery_units_artist_tests.py`
- *Artist tutorial*

**matplotlib.axes.Axes.add\_patch**

`Axes.add_patch(self, p)`

Add a *Patch* to the axes' patches; return the patch.

**Examples using matplotlib.axes.Axes.add\_patch**

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_curve\_error\_band.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_demo.py

### matplotlib.axes.Axes.add\_table

`Axes.add_table(self, tab)`  
Add a *Table* to the axes' tables; return the table.

Examples using `matplotlib.axes.Axes.add_table`

## 18.5.11 Twinning and sharing

<code>Axes.twinx</code>	Create a twin Axes sharing the xaxis.
<code>Axes.twiny</code>	Create a twin Axes sharing the yaxis.
<code>Axes.sharex</code>	Share the x-axis with <i>other</i> .
<code>Axes.sharey</code>	Share the y-axis with <i>other</i> .
<code>Axes.get_shared_x_axes</code>	Return a reference to the shared axes Grouper object for x axes.
<code>Axes.get_shared_y_axes</code>	Return a reference to the shared axes Grouper object for y axes.

### matplotlib.axes.Axes.twinx

`Axes.twinx(self)`  
Create a twin Axes sharing the xaxis.

Create a new Axes with an invisible x-axis and an independent y-axis positioned opposite to the original one (i.e. at right). The x-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both y-axes align, see *LinearLocator*.

#### Returns

**Axes** The newly created Axes instance

#### Notes

For those who are 'picking' artists while using `twinx`, pick events are only called for the artists in the top-most axes.

Examples using `matplotlib.axes.Axes.twinx`

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_axes\_box\_aspect.py

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_two\_scales.py
- sphx\_glr\_gallery\_statistics\_barchart\_demo.py
- sphx\_glr\_gallery\_axes\_grid1\_parasite\_simple.py
- sphx\_glr\_gallery\_axisartist\_demo\_parasite\_axes2.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_multiple\_yaxis\_with\_spines.py

### matplotlib.axes.Axes.twiny

`Axes.twiny(self)`

Create a twin Axes sharing the yaxis.

Create a new Axes with an invisible y-axis and an independent x-axis positioned opposite to the original one (i.e. at top). The y-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both x-axes align, see [LinearLocator](#).

#### Returns

**Axes** The newly created Axes instance

#### Notes

For those who are 'picking' artists while using twiny, pick events are only called for the artists in the top-most axes.

### Examples using matplotlib.axes.Axes.twiny

- sphx\_glr\_gallery\_subplots\_axes\_and\_figures\_two\_scales.py

### matplotlib.axes.Axes.sharex

`Axes.sharex(self, other)`

Share the x-axis with *other*.

This is equivalent to passing `sharex=other` when constructing the axes, and cannot be used if the x-axis is already being shared with another axes.

### Examples using matplotlib.axes.Axes.sharex

### matplotlib.axes.Axes.sharey

`Axes.sharey(self, other)`

Share the y-axis with *other*.

This is equivalent to passing `sharey=other` when constructing the axes, and cannot be used if the y-axis is already being shared with another axes.

Examples using `matplotlib.axes.Axes.sharey`

`matplotlib.axes.Axes.get_shared_x_axes`

`Axes.get_shared_x_axes(self)`

Return a reference to the shared axes Grouper object for x axes.

Examples using `matplotlib.axes.Axes.get_shared_x_axes`

`matplotlib.axes.Axes.get_shared_y_axes`

`Axes.get_shared_y_axes(self)`

Return a reference to the shared axes Grouper object for y axes.

Examples using `matplotlib.axes.Axes.get_shared_y_axes`

## 18.5.12 Axes Position

<code>Axes.get_anchor</code>	Get the anchor location.
<code>Axes.set_anchor</code>	Define the anchor location.
<code>Axes.get_axes_locator</code>	Return the axes_locator.
<code>Axes.set_axes_locator</code>	Set the axes locator.
<code>Axes.reset_position</code>	Reset the active position to the original position.
<code>Axes.get_position</code>	Get a copy of the axes rectangle as a <a href="#">Bbox</a> .
<code>Axes.set_position</code>	Set the axes position.

`matplotlib.axes.Axes.get_anchor`

`Axes.get_anchor(self)`

Get the anchor location.

**See also:**

`matplotlib.axes.Axes.set_anchor` for a description of the anchor.

`matplotlib.axes.Axes.set_aspect` for a description of aspect handling.

Examples using `matplotlib.axes.Axes.get_anchor`

`matplotlib.axes.Axes.set_anchor`

`Axes.set_anchor(self, anchor, share=False)`

Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

**Parameters**

**anchor** [2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}] The anchor position may be either:

- a sequence (cx, cy). cx and cy may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
- a string using cardinal directions as abbreviation:
  - 'C' for centered
  - 'S' (south) for bottom-center
  - 'SW' (south west) for bottom-left
  - etc.

Here is an overview of the possible positions:

'NW'	'N'	'NE'
'W'	'C'	'E'
'SW'	'S'	'SE'

**share** [bool, default: False] If True, apply the settings to all shared Axes.

**See also:**

`matplotlib.axes.Axes.set_aspect` for a description of aspect handling.

Examples using `matplotlib.axes.Axes.set_anchor`

`matplotlib.axes.Axes.get_axes_locator`

`Axes.get_axes_locator(self)`  
Return the axes\_locator.

Examples using `matplotlib.axes.Axes.get_axes_locator`

`matplotlib.axes.Axes.set_axes_locator`

`Axes.set_axes_locator(self, locator)`  
Set the axes locator.

### Parameters

**locator** [Callable[[Axes, Renderer], Bbox]]

Examples using `matplotlib.axes.Axes.set_axes_locator`

- `sphinx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py`

**matplotlib.axes.Axes.reset\_position**`Axes.reset_position(self)`

Reset the active position to the original position.

This resets the a possible position change due to aspect constraints. For an explanation of the positions see [set\\_position](#).

Examples using `matplotlib.axes.Axes.reset_position`

**matplotlib.axes.Axes.get\_position**`Axes.get_position(self, original=False)`

Get a copy of the axes rectangle as a *Bbox*.

**Parameters**

**original** [bool] If True, return the original position. Otherwise return the active position. For an explanation of the positions see [set\\_position](#).

**Returns**

*Bbox*

Examples using `matplotlib.axes.Axes.get_position`

- `sphx_glr_gallery_images_contours_and_fields_contour_demo.py`
- *Choosing Colormaps in Matplotlib*

**matplotlib.axes.Axes.set\_position**`Axes.set_position(self, pos, which='both')`

Set the axes position.

Axes have two position attributes. The 'original' position is the position allocated for the Axes. The 'active' position is the position the Axes is actually drawn at. These positions are usually the same unless a fixed aspect is set to the Axes. See [set\\_aspect](#) for details.

**Parameters**

**pos** [[left, bottom, width, height] or *Bbox*] The new position of the in *Figure* coordinates.

**which** [{'both', 'active', 'original'}], default: 'both'] Determines which position variables to change.

Examples using `matplotlib.axes.Axes.set_position`

- `sphx_glr_gallery_images_contours_and_fields_contour_demo.py`

### 18.5.13 Async/Event based

<code>Axes.stale</code>	Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.
<code>Axes.pchanged</code>	Call all of the registered callbacks.
<code>Axes.add_callback</code>	Add a callback function that will be called whenever one of the <i>Artist's</i> properties changes.
<code>Axes.remove_callback</code>	Remove a callback based on its observer id.

#### `matplotlib.axes.Axes.stale`

property `Axes.stale`

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

#### `matplotlib.axes.Axes.pchanged`

`Axes.pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`

`remove_callback`

Examples using `matplotlib.axes.Axes.pchanged`

#### `matplotlib.axes.Axes.add_callback`

`Axes.add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist's* properties changes.

##### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

##### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

`remove_callback`

Examples using `matplotlib.axes.Axes.add_callback`

`matplotlib.axes.Axes.remove_callback`

`Axes.remove_callback(self, oid)`  
Remove a callback based on its observer id.

**See also:**

`add_callback`

Examples using `matplotlib.axes.Axes.remove_callback`

### 18.5.14 Interactive

<code>Axes.can_pan</code>	Return <i>True</i> if this axes supports any pan/zoom button functionality.
<code>Axes.can_zoom</code>	Return <i>True</i> if this axes supports the zoom box button functionality.
<code>Axes.get_navigate</code>	Get whether the axes responds to navigation commands
<code>Axes.set_navigate</code>	Set whether the axes responds to navigation toolbar commands
<code>Axes.get_navigate_mode</code>	Get the navigation toolbar button status: 'PAN', 'ZOOM', or None
<code>Axes.set_navigate_mode</code>	Set the navigation toolbar button status;
<code>Axes.start_pan</code>	Called when a pan operation has started.
<code>Axes.drag_pan</code>	Called when the mouse moves during a pan operation.
<code>Axes.end_pan</code>	Called when a pan operation completes (when the mouse button is up.)
<code>Axes.format_coord</code>	Return a format string formatting the x, y coordinates.
<code>Axes.format_cursor_data</code>	Return a string representation of <i>data</i> .
<code>Axes.format_xdata</code>	Return x formatted as an x-value.
<code>Axes.format_ydata</code>	Return y formatted as an y-value.
<code>Axes.mouseover</code>	If this property is set to <i>True</i> , the artist will be queried for custom context information when the mouse cursor moves over it.
<code>Axes.in_axes</code>	Return <i>True</i> if the given <i>mouseevent</i> (in display coords) is in the Axes
<code>Axes.pick</code>	Process a pick event.
<code>Axes.pickable</code>	Return whether the artist is pickable.
<code>Axes.get_picker</code>	Return the picking behavior of the artist.
<code>Axes.set_picker</code>	Define the picking behavior of the artist.
<code>Axes.set_contains</code>	[ <i>Deprecated</i> ] Define a custom contains test for the artist.
<code>Axes.get_contains</code>	[ <i>Deprecated</i> ] Return the custom contains function of the artist if set, or <i>None</i> .

Continued on next page

Table 110 – continued from previous page

<code>Axes.contains</code>	Test whether the artist contains the mouse event.
<code>Axes.contains_point</code>	Return whether <i>point</i> (pair of pixel coordinates) is inside the axes patch.
<code>Axes.get_cursor_data</code>	Return the cursor data for a given event.

**matplotlib.axes.Axes.can\_pan**`Axes.can_pan(self)`Return *True* if this axes supports any pan/zoom button functionality.**Examples using `matplotlib.axes.Axes.can_pan`****matplotlib.axes.Axes.can\_zoom**`Axes.can_zoom(self)`Return *True* if this axes supports the zoom box button functionality.**Examples using `matplotlib.axes.Axes.can_zoom`****matplotlib.axes.Axes.get\_navigate**`Axes.get_navigate(self)`

Get whether the axes responds to navigation commands

**Examples using `matplotlib.axes.Axes.get_navigate`****matplotlib.axes.Axes.set\_navigate**`Axes.set_navigate(self, b)`

Set whether the axes responds to navigation toolbar commands

**Parameters****b** [bool]**Examples using `matplotlib.axes.Axes.set_navigate`****matplotlib.axes.Axes.get\_navigate\_mode**`Axes.get_navigate_mode(self)`

Get the navigation toolbar button status: 'PAN', 'ZOOM', or None

Examples using `matplotlib.axes.Axes.get_navigate_mode`

`matplotlib.axes.Axes.set_navigate_mode`

`Axes.set_navigate_mode(self, b)`  
Set the navigation toolbar button status;

**Warning:** this is not a user-API function.

Examples using `matplotlib.axes.Axes.set_navigate_mode`

`matplotlib.axes.Axes.start_pan`

`Axes.start_pan(self, x, y, button)`  
Called when a pan operation has started.

#### Parameters

**x, y** [float] The mouse coordinates in display coords.  
**button** [*MouseButton*] The pressed mouse button.

#### Notes

This is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.start_pan`

`matplotlib.axes.Axes.drag_pan`

`Axes.drag_pan(self, button, key, x, y)`  
Called when the mouse moves during a pan operation.

#### Parameters

**button** [*MouseButton*] The pressed mouse button.  
**key** [str or None] The pressed key, if any.  
**x, y** [float] The mouse coordinates in display coords.

#### Notes

This is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.drag_pan`

`matplotlib.axes.Axes.end_pan`

`Axes.end_pan(self)`

Called when a pan operation completes (when the mouse button is up.)

#### Notes

This is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.end_pan`

`matplotlib.axes.Axes.format_coord`

`Axes.format_coord(self, x, y)`

Return a format string formatting the *x*, *y* coordinates.

Examples using `matplotlib.axes.Axes.format_coord`

- `sphx_glr_gallery_images_contours_and_fields_image_zcoord.py`

`matplotlib.axes.Axes.format_cursor_data`

`Axes.format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

`get_cursor_data`

Examples using `matplotlib.axes.Axes.format_cursor_data`

`matplotlib.axes.Axes.format_xdata`

`Axes.format_xdata(self, x)`

Return *x* formatted as an x-value.

This function will use the `fmt_xdata` attribute if it is not `None`, else will fall back on the xaxis major formatter.

Examples using `matplotlib.axes.Axes.format_xdata`

`matplotlib.axes.Axes.format_ydata`

`Axes.format_ydata(self, y)`

Return *y* formatted as an y-value.

This function will use the `fmt_ydata` attribute if it is not `None`, else will fall back on the yaxis major formatter.

Examples using `matplotlib.axes.Axes.format_ydata`

`matplotlib.axes.Axes.mouseover`

property `Axes.mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, *ToolCursorPosition* and *NavigationToolbar2*.

`matplotlib.axes.Axes.in_axes`

`Axes.in_axes(self, mouseevent)`

Return *True* if the given *mouseevent* (in display coords) is in the Axes

Examples using `matplotlib.axes.Axes.in_axes`

`matplotlib.axes.Axes.pick`

`Axes.pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

*set\_picker*, *get\_picker*, *pickable*

Examples using `matplotlib.axes.Axes.pick`

`matplotlib.axes.Axes.pickable`

`Axes.pickable(self)`

Return whether the artist is pickable.

**See also:**

*set\_picker*, *get\_picker*, *pick*

Examples using `matplotlib.axes.Axes.pickable`

`matplotlib.axes.Axes.get_picker`

`Axes.get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker`, `pickable`, `pick`

Examples using `matplotlib.axes.Axes.get_picker`

`matplotlib.axes.Axes.set_picker`

`Axes.set_picker(self, picker)`

Define the picking behavior of the artist.

#### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the `PickEvent` attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

Examples using `matplotlib.axes.Axes.set_picker`

`matplotlib.axes.Axes.set_contains`

`Axes.set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

#### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

Examples using `matplotlib.axes.Axes.set_contains`

`matplotlib.axes.Axes.get_contains`

`Axes.get_contains(self)`

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

`set_contains`

### Notes

Deprecated since version 3.3.

Examples using `matplotlib.axes.Axes.get_contains`

`matplotlib.axes.Axes.contains`

`Axes.contains(self, mouseevent)`

Test whether the artist contains the mouse event.

### Parameters

**mouseevent** [`matplotlib.backend_bases.MouseEvent`]

### Returns

**contains** [bool] Whether any values are within the radius.

**details** [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

Examples using `matplotlib.axes.Axes.contains`

`matplotlib.axes.Axes.contains_point`

`Axes.contains_point(self, point)`

Return whether *point* (pair of pixel coordinates) is inside the axes patch.

Examples using `matplotlib.axes.Axes.contains_point`

`matplotlib.axes.Axes.get_cursor_data`

`Axes.get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

#### Parameters

**event** [`matplotlib.backend_bases.MouseEvent`]

**See also:**

`format_cursor_data`

Examples using `matplotlib.axes.Axes.get_cursor_data`

### 18.5.15 Children

<code>Axes.get_children</code>	Return a list of the child <i>Artists</i> of this <i>Artist</i> .
<code>Axes.get_images</code>	Return a list of <i>AxesImages</i> contained by the Axes.
<code>Axes.get_lines</code>	Return a list of lines contained by the Axes.
<code>Axes.findobj</code>	Find artist objects.

`matplotlib.axes.Axes.get_children`

`Axes.get_children(self)`

Return a list of the child *Artists* of this *Artist*.

Examples using `matplotlib.axes.Axes.get_children`

`matplotlib.axes.Axes.get_images`

`Axes.get_images(self)`  
Return a list of *AxesImages* contained by the Axes.

Examples using `matplotlib.axes.Axes.get_images`

`matplotlib.axes.Axes.get_lines`

`Axes.get_lines(self)`  
Return a list of lines contained by the Axes.

Examples using `matplotlib.axes.Axes.get_lines`

`matplotlib.axes.Axes.findobj`

`Axes.findobj(self, match=None, include_self=True)`  
Find artist objects.  
Recursively find all *Artist* instances contained in the artist.

#### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

#### Returns

list of *Artist*

Examples using `matplotlib.axes.Axes.findobj`

## 18.5.16 Drawing

<i>Axes.draw</i>	Draw the Artist (and its children) using the given renderer.
<i>Axes.draw_artist</i>	Efficiently redraw a single artist.
<i>Axes.redraw_in_frame</i>	Efficiently redraw Axes data, but not axis ticks, labels, etc.
<i>Axes.get_renderer_cache</i>	

Continued on next page

Table 112 – continued from previous page

<code>Axes.get_rasterization_zorder</code>	Return the zorder value below which artists will be rasterized.
<code>Axes.set_rasterization_zorder</code>	
<b>Parameters</b>	
<code>Axes.get_window_extent</code>	Return the axes bounding box in display space; <i>args</i> and <i>kwargs</i> are empty.
<code>Axes.get_tightbbox</code>	Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

**matplotlib.axes.Axes.draw**

`Axes.draw(self, renderer=None, inframe=<deprecated parameter>)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters**

**renderer** [`RendererBase` subclass.]

**Notes**

This method is overridden in the Artist subclasses.

**Examples using matplotlib.axes.Axes.draw****matplotlib.axes.Axes.draw\_artist**

`Axes.draw_artist(self, a)`

Efficiently redraw a single artist.

This method can only be used after an initial draw which caches the renderer.

**Examples using matplotlib.axes.Axes.draw\_artist**

- *Blitting tutorial*

**matplotlib.axes.Axes.redraw\_in\_frame**

`Axes.redraw_in_frame(self)`

Efficiently redraw Axes data, but not axis ticks, labels, etc.

This method can only be used after an initial draw which caches the renderer.

Examples using `matplotlib.axes.Axes.redraw_in_frame`

`matplotlib.axes.Axes.get_renderer_cache`

`Axes.get_renderer_cache(self)`

Examples using `matplotlib.axes.Axes.get_renderer_cache`

`matplotlib.axes.Axes.get_rasterization_zorder`

`Axes.get_rasterization_zorder(self)`

Return the zorder value below which artists will be rasterized.

Examples using `matplotlib.axes.Axes.get_rasterization_zorder`

`matplotlib.axes.Axes.set_rasterization_zorder`

`Axes.set_rasterization_zorder(self, z)`

### Parameters

**z** [float or None] zorder below which artists are rasterized. None means that artists do not get rasterized based on zorder.

Examples using `matplotlib.axes.Axes.set_rasterization_zorder`

- `sphx_glr_gallery_misc_rasterization_demo.py`

`matplotlib.axes.Axes.get_window_extent`

`Axes.get_window_extent(self, *args, **kwargs)`

Return the axes bounding box in display space; *args* and *kwargs* are empty.

This bounding box does not include the spines, ticks, ticklables, or other labels. For a bounding box including these elements use `get_tightbbox`.

### See also:

`matplotlib.axes.Axes.get_tightbbox`

`matplotlib.axis.Axis.get_tightbbox`

`matplotlib.spines.get_window_extent`

Examples using `matplotlib.axes.Axes.get_window_extent`

**matplotlib.axes.Axes.get\_tightbbox**

`Axes.get_tightbbox(self, renderer, call_axes_locator=True, bbox_extra_artists=None, *, for_layout_only=False)`

Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

**Parameters**

**renderer** [*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**bbox\_extra\_artists** [list of *Artist* or None] List of artists to include in the tight bounding box. If None (default), then all artist children of the axes are included in the tight bounding box.

**call\_axes\_locator** [bool, default: True] If *call\_axes\_locator* is False, it does not call the `_axes_locator` attribute, which is necessary to get the correct bounding box. `call_axes_locator=False` can be used if the caller is only interested in the relative size of the tightbbox compared to the axes bbox.

**for\_layout\_only** [default: False] The bounding box will *not* include the x-extent of the title and the xlabel, or the y-extent of the ylabel.

**Returns**

*BboxBase* Bounding box in figure pixel coordinates.

**See also:**

`matplotlib.axes.Axes.get_window_extent`

`matplotlib.axis.Axis.get_tightbbox`

`matplotlib.spines.Spine.get_window_extent`

Examples using `matplotlib.axes.Axes.get_tightbbox`

### 18.5.17 Projection

Methods used by *Axis* that must be overridden for non-rectilinear Axes.

---

<i>Axes.name</i>	
<i>Axes.get_xaxis_transform</i>	Get the transformation used for drawing x-axis labels, ticks and gridlines.
<i>Axes.get_yaxis_transform</i>	Get the transformation used for drawing y-axis labels, ticks and gridlines.
<i>Axes.get_data_ratio</i>	Return the aspect ratio of the scaled data.
<i>Axes.get_data_ratio_log</i>	[ <i>Deprecated</i> ] Return the aspect ratio of the raw data in log scale.
<i>Axes.get_xaxis_text1_transform</i>	

---

**Returns**

---

Continued on next page

Table 113 – continued from previous page

---

*Axes.get\_xaxis\_text2\_transform***Returns**

---

*Axes.get\_yaxis\_text1\_transform***Returns**

---

*Axes.get\_yaxis\_text2\_transform***Returns**

---

**matplotlib.axes.Axes.name**

`Axes.name = 'rectilinear'`

**matplotlib.axes.Axes.get\_xaxis\_transform**

`Axes.get_xaxis_transform(self, which='grid')`

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

---

**Note:** This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

**Examples using matplotlib.axes.Axes.get\_xaxis\_transform**

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_fill\_between\_demo.py
- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_vline\_hline\_demo.py
- sphx\_glr\_gallery\_statistics\_boxplot\_demo.py
- sphx\_glr\_gallery\_recipes\_centered\_spines\_with\_arrows.py
- [Transformations Tutorial](#)

**matplotlib.axes.Axes.get\_yaxis\_transform**

`Axes.get_yaxis_transform(self, which='grid')`

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

---

**Note:** This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

Examples using `matplotlib.axes.Axes.get_yaxis_transform`

- `sphx_glr_gallery_recipes_centered_spines_with_arrows.py`
- `sphx_glr_gallery_userdemo_connect_simple01.py`
- *Transformations Tutorial*

`matplotlib.axes.Axes.get_data_ratio`

`Axes.get_data_ratio(self)`  
Return the aspect ratio of the scaled data.

#### Notes

This method is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.get_data_ratio`

`matplotlib.axes.Axes.get_data_ratio_log`

`Axes.get_data_ratio_log(self)`  
[*Deprecated*] Return the aspect ratio of the raw data in log scale.

#### Notes

Will be used when both axis are in log scale.

Deprecated since version 3.2.

Examples using `matplotlib.axes.Axes.get_data_ratio_log`

`matplotlib.axes.Axes.get_xaxis_text1_transform`

`Axes.get_xaxis_text1_transform(self, pad_points)`

#### Returns

**transform** [Transform] The transform used for drawing x-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

**valign** [{*'center'*, *'top'*, *'bottom'*, *'baseline'*, *'center\_baseline'*}] The text vertical alignment.

**halign** [{*'center'*, *'left'*, *'right'*}] The text horizontal alignment.

## Notes

This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_xaxis_text1_transform`

`matplotlib.axes.Axes.get_xaxis_text2_transform`

`Axes.get_xaxis_text2_transform(self, pad_points)`

### Returns

**transform** [Transform] The transform used for drawing secondary x-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

**valign** [{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign** [{'center', 'left', 'right'}] The text horizontal alignment.

## Notes

This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_xaxis_text2_transform`

`matplotlib.axes.Axes.get_yaxis_text1_transform`

`Axes.get_yaxis_text1_transform(self, pad_points)`

### Returns

**transform** [Transform] The transform used for drawing y-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

**valign** [{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign** [{'center', 'left', 'right'}] The text horizontal alignment.

## Notes

This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_yaxis_text1_transform`

`matplotlib.axes.Axes.get_yaxis_text2_transform`

`Axes.get_yaxis_text2_transform(self, pad_points)`

### Returns

**transform** [Transform] The transform used for drawing secondart y-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data corrdinates

**valign** [{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign** [{'center', 'left', 'right'}] The text horizontal alignment.

### Notes

This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_yaxis_text2_transform`

## 18.5.18 Other

---

<code>Axes.zorder</code>	
<code>Axes.get_default_bbox_extra_artists</code>	Return a default list of artists that are used for the bounding box calculation.
<code>Axes.get_transformed_clip_path_and_affine</code>	Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
<code>Axes.has_data</code>	Return <i>True</i> if any artists have been added to axes.

---

`matplotlib.axes.Axes.zorder`

`Axes.zorder = 0`

`matplotlib.axes.Axes.get_default_bbox_extra_artists`

`Axes.get_default_bbox_extra_artists(self)`

Return a default list of artists that are used for the bounding box calculation.

Artists are excluded either by not being visible or `artist.set_in_layout(False)`.

Examples using `matplotlib.axes.Axes.get_default_bbox_extra_artists`

**matplotlib.axes.Axes.get\_transformed\_clip\_path\_and\_affine****Axes.get\_transformed\_clip\_path\_and\_affine(*self*)**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

Examples using `matplotlib.axes.Axes.get_transformed_clip_path_and_affine`

**matplotlib.axes.Axes.has\_data****Axes.has\_data(*self*)**

Return *True* if any artists have been added to axes.

This should not be used to determine whether the *dataLim* need to be updated, and may not actually be useful for anything.

Examples using `matplotlib.axes.Axes.has_data`

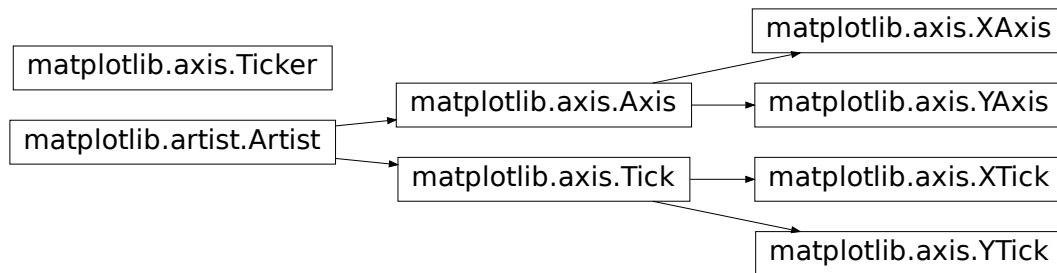

## 18.6 matplotlib.axis

### Table of Contents

- *Inheritance*
- *Axis objects*
  - *Formatters and Locators*
  - *Axis Label*
  - *Ticks, tick labels and Offset text*
  - *Data and view intervals*
  - *Rendering helpers*
  - *Interactive*
  - *Units*
  - *Incremental navigation*
  - *XAxis Specific*
  - *YAxis Specific*
  - *Other*
  - *Discouraged*
- *Tick objects*

Classes for the ticks and x and y axis.

### 18.6.1 Inheritance

### 18.6.2 Axis objects

```
class matplotlib.axis.Axis(axes, pickradius=15)
```

Base class for *XAxis* and *YAxis*.

#### Attributes

**isDefault\_label** [bool]

*axes* [*matplotlib.axes.Axes*] The *Axes* instance the artist resides in, or *None*.

**major** [*matplotlib.axis.Ticker*] Determines the major tick positions and their label format.

**minor** [*matplotlib.axis.Ticker*] Determines the minor tick positions and their label format.

**callbacks** [*matplotlib.cbook.CallbackRegistry*]

**label** [*Text*] The axis label.

**labelpad** [float] The distance between the axis label and the tick labels. Defaults to `rcParams["axes.labelpad"]` (default: 4.0) = 4.

**offsetText** [*Text*] A *Text* object containing the data offset of the ticks (if any).

**pickradius** [float] The acceptance radius for containment tests. See also *Axis.contains*.

**majorTicks** [list of *Tick*] The major ticks.

**minorTicks** [list of *Tick*] The minor ticks.

#### Parameters

**axes** [*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

**pickradius** [float] The acceptance radius for containment tests. See also *Axis.contains*.

```
class matplotlib.axis.XAxis(*args, **kwargs)
```

Parameters

**axes** [*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.  
**pickradius** [float] The acceptance radius for containment tests. See also *Axis.contains*.

class matplotlib.axis.YAxis(\*args, \*\*kwargs)

Parameters

**axes** [*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.  
**pickradius** [float] The acceptance radius for containment tests. See also *Axis.contains*.

class matplotlib.axis.Ticker

A container for the objects defining tick position and format.

Attributes

**locator** [*matplotlib.ticker.Locator* subclass] Determines the positions of the ticks.  
**formatter** [*matplotlib.ticker.Formatter* subclass] Determines the format of the tick labels.

<i>Axis.cla</i>	Clear this axis.
<i>Axis.get_scale</i>	Return this Axis' scale (as a str).

matplotlib.axis.Axis.cla

Axis.cla(*self*)  
Clear this axis.

Examples using matplotlib.axis.Axis.cla

matplotlib.axis.Axis.get\_scale

Axis.get\_scale(*self*)  
Return this Axis' scale (as a str).

Examples using matplotlib.axis.Axis.get\_scale

Formatters and Locators

<i>Axis.get_major_formatter</i>	Get the formatter of the major ticker.
<i>Axis.get_major_locator</i>	Get the locator of the major ticker.
<i>Axis.get_minor_formatter</i>	Get the formatter of the minor ticker.
<i>Axis.get_minor_locator</i>	Get the locator of the minor ticker.
<i>Axis.set_major_formatter</i>	Set the formatter of the major ticker.
<i>Axis.set_major_locator</i>	Set the locator of the major ticker.
<i>Axis.set_minor_formatter</i>	Set the formatter of the minor ticker.

Continued on next page

Table 116 – continued from previous page

<code>Axis.set_minor_locator</code>	Set the locator of the minor ticker.
<code>Axis.remove_overlapping_locs</code>	If minor ticker locations that overlap with major ticker locations should be trimmed.
<code>Axis.get_remove_overlapping_locs</code>	
<code>Axis.set_remove_overlapping_locs</code>	

**matplotlib.axis.Axis.get\_major\_formatter**

`Axis.get_major_formatter(self)`  
Get the formatter of the major ticker.

Examples using `matplotlib.axis.Axis.get_major_formatter`

**matplotlib.axis.Axis.get\_major\_locator**

`Axis.get_major_locator(self)`  
Get the locator of the major ticker.

Examples using `matplotlib.axis.Axis.get_major_locator`

- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`

**matplotlib.axis.Axis.get\_minor\_formatter**

`Axis.get_minor_formatter(self)`  
Get the formatter of the minor ticker.

Examples using `matplotlib.axis.Axis.get_minor_formatter`

**matplotlib.axis.Axis.get\_minor\_locator**

`Axis.get_minor_locator(self)`  
Get the locator of the minor ticker.

Examples using `matplotlib.axis.Axis.get_minor_locator`

**matplotlib.axis.Axis.set\_major\_formatter**

`Axis.set_major_formatter(self, formatter)`  
Set the formatter of the major ticker.

In addition to a *Formatter* instance, this also accepts a str or function.

For a str a *StrMethodFormatter* is used. The field used for the value must be labeled 'x' and the field used for the position must be labeled 'pos'. See the *StrMethodFormatter* documentation for more information.

For a function, a *FuncFormatter* is used. The function must take two inputs (a tick value *x* and a position *pos*), and return a string containing the corresponding tick label. See the *FuncFormatter* documentation for more information.

### Parameters

**formatter** [*Formatter*, str, or function]

#### Examples using `matplotlib.axis.Axis.set_major_formatter`

- sphx\_glr\_gallery\_lines\_bars\_and\_markers\_timeline.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_date.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_date\_index\_formatter.py

- *Text in Matplotlib Plots*

#### `matplotlib.axis.Axis.set_major_locator`

`Axis.set_major_locator(self, locator)`  
Set the locator of the major ticker.

### Parameters

**locator** [*Locator*]

**Examples using `matplotlib.axis.Axis.set_major_locator`**

- `sphx_glr_gallery_lines_bars_and_markers_filled_step.py`
- `sphx_glr_gallery_lines_bars_and_markers_timeline.py`
- `sphx_glr_gallery_text_labels_and_annotations_date.py`
- `sphx_glr_gallery_showcase_anatomy.py`
- `sphx_glr_gallery_mplot3d_surface3d.py`
- `sphx_glr_gallery_mplot3d_surface3d_3.py`
- `sphx_glr_gallery_scales_scales.py`
- `sphx_glr_gallery_specialty_plots_mri_with_eeg.py`
- `sphx_glr_gallery_specialty_plots_skewt.py`
- `sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py`
- `sphx_glr_gallery_ticks_and_spines_date_concise_formatter.py`
- `sphx_glr_gallery_ticks_and_spines_date_demo_convert.py`
- `sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py`
- `sphx_glr_gallery_ticks_and_spines_major_minor_demo.py`
- `sphx_glr_gallery_ticks_and_spines_tick-formatters.py`
- `sphx_glr_gallery_ticks_and_spines_tick_labels_from_values.py`
- *[Choosing Colormaps in Matplotlib](#)*
- *[Text in Matplotlib Plots](#)*

**`matplotlib.axis.Axis.set_minor_formatter`**

`Axis.set_minor_formatter(self, formatter)`  
Set the formatter of the minor ticker.

In addition to a *Formatter* instance, this also accepts a `str` or function. See *Axis.set\_major\_formatter* for more information.

**Parameters**

**formatter** [*Formatter*, `str`, or function]

**Examples using `matplotlib.axis.Axis.set_minor_formatter`**

- `sphx_glr_gallery_showcase_anatomy.py`
- `sphx_glr_gallery_scales_scales.py`
- `sphx_glr_gallery_specialty_plots_skewt.py`
- `sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py`

**matplotlib.axis.Axis.set\_minor\_locator**

`Axis.set_minor_locator(self, locator)`  
 Set the locator of the minor ticker.

**Parameters**

**locator** [*Locator*]

Examples using `matplotlib.axis.Axis.set_minor_locator`

- `sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py`
- `sphx_glr_gallery_text_labels_and_annotations_date.py`
- `sphx_glr_gallery_showcase_anatomy.py`
- `sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py`
- `sphx_glr_gallery_ticks_and_spines_date_demo_convert.py`
- `sphx_glr_gallery_ticks_and_spines_major_minor_demo.py`
- `sphx_glr_gallery_ticks_and_spines_tick-formatters.py`

**matplotlib.axis.Axis.remove\_overlapping\_locs**

property `Axis.remove_overlapping_locs`  
 If minor ticker locations that overlap with major ticker locations should be trimmed.

**matplotlib.axis.Axis.get\_remove\_overlapping\_locs**

`Axis.get_remove_overlapping_locs(self)`

Examples using `matplotlib.axis.Axis.get_remove_overlapping_locs`

**matplotlib.axis.Axis.set\_remove\_overlapping\_locs**

`Axis.set_remove_overlapping_locs(self, val)`

Examples using `matplotlib.axis.Axis.set_remove_overlapping_locs`

**Axis Label**

<code>Axis.set_label_coords</code>	Set the coordinates of the label.
<code>Axis.set_label_position</code>	Set the label position (top or bottom)
<code>Axis.set_label_text</code>	Set the text value of the axis label.
<code>Axis.get_label_position</code>	Return the label position (top or bottom)
<code>Axis.get_label_text</code>	Get the text of the label.

**matplotlib.axis.Axis.set\_label\_coords**

`Axis.set_label_coords(self, x, y, transform=None)`

Set the coordinates of the label.

By default, the x coordinate of the y label and the y coordinate of the x label are determined by the tick label bounding boxes, but this can lead to poor alignment of multiple labels if there are multiple axes.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system: (0, 0) is bottom left, (0.5, 0.5) is center, etc.

**Examples using matplotlib.axis.Axis.set\_label\_coords**

- sphx\_glr\_gallery\_pyplots\_align\_ylabels.py

**matplotlib.axis.Axis.set\_label\_position**

`Axis.set_label_position(self, position)`

Set the label position (top or bottom)

**Parameters**

**position** [{‘top’, ‘bottom’}]

**Examples using matplotlib.axis.Axis.set\_label\_position**

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_titles\_demo.py

**matplotlib.axis.Axis.set\_label\_text**

`Axis.set_label_text(self, label, fontdict=None, **kwargs)`

Set the text value of the axis label.

**Parameters**

**label** [str] Text string.

**fontdict** [dict] Text properties.

**\*\*kwargs** Merged into fontdict.

**Examples using matplotlib.axis.Axis.set\_label\_text****matplotlib.axis.Axis.get\_label\_position**

`Axis.get_label_position(self)`

Return the label position (top or bottom)

Examples using `matplotlib.axis.Axis.get_label_position`

`matplotlib.axis.Axis.get_label_text`

`Axis.get_label_text(self)`  
Get the text of the label.

Examples using `matplotlib.axis.Axis.get_label_text`

Ticks, tick labels and Offset text

<code>Axis.get_major_ticks</code>	Return the list of major <i>Ticks</i> .
<code>Axis.get_majorticklabels</code>	Return this Axis' major tick labels, as a list of <i>Text</i> .
<code>Axis.get_majorticklines</code>	Return this Axis' major tick lines as a list of <i>Line2Ds</i> .
<code>Axis.get_majorticklocs</code>	Return this Axis' major tick locations in data coordinates.
<code>Axis.get_minor_ticks</code>	Return the list of minor <i>Ticks</i> .
<code>Axis.get_minorticklabels</code>	Return this Axis' minor tick labels, as a list of <i>Text</i> .
<code>Axis.get_minorticklines</code>	Return this Axis' minor tick lines as a list of <i>Line2Ds</i> .
<code>Axis.get_minorticklocs</code>	Return this Axis' minor tick locations in data coordinates.
<code>Axis.get_offset_text</code>	Return the axis offsetText as a Text instance.
<code>Axis.get_tick_padding</code>	
<code>Axis.get_ticklabels</code>	Get this Axis' tick labels.
<code>Axis.get_ticklines</code>	Return this Axis' tick lines as a list of <i>Line2Ds</i> .
<code>Axis.get_ticklocs</code>	Return this Axis' tick locations in data coordinates.
<code>Axis.get_gridlines</code>	Return this Axis' grid lines as a list of <i>Line2Ds</i> .
<code>Axis.grid</code>	Configure the grid lines.
<code>Axis.set_tick_params</code>	Set appearance parameters for ticks, ticklabels, and gridlines.
<code>Axis.axis_date</code>	Sets up axis ticks and labels to treat data along this Axis as dates.

`matplotlib.axis.Axis.get_major_ticks`

`Axis.get_major_ticks(self, numticks=None)`  
Return the list of major *Ticks*.

Examples using `matplotlib.axis.Axis.get_major_ticks`

### `matplotlib.axis.Axis.get_majorticklabels`

`Axis.get_majorticklabels(self)`  
Return this Axis' major tick labels, as a list of *Text*.

Examples using `matplotlib.axis.Axis.get_majorticklabels`

- `sphinx_glr_gallery_ticks_and_spines_date_precision_and_epochs.py`

### `matplotlib.axis.Axis.get_majorticklines`

`Axis.get_majorticklines(self)`  
Return this Axis' major tick lines as a list of *Line2Ds*.

Examples using `matplotlib.axis.Axis.get_majorticklines`

### `matplotlib.axis.Axis.get_majorticklocs`

`Axis.get_majorticklocs(self)`  
Return this Axis' major tick locations in data coordinates.

Examples using `matplotlib.axis.Axis.get_majorticklocs`

### `matplotlib.axis.Axis.get_minor_ticks`

`Axis.get_minor_ticks(self, numticks=None)`  
Return the list of minor *Ticks*.

Examples using `matplotlib.axis.Axis.get_minor_ticks`

- `sphinx_glr_gallery_ticks_and_spines_centered_ticklabels.py`

### `matplotlib.axis.Axis.get_minorticklabels`

`Axis.get_minorticklabels(self)`  
Return this Axis' minor tick labels, as a list of *Text*.

Examples using `matplotlib.axis.Axis.get_minorticklabels`

### `matplotlib.axis.Axis.get_minorticklines`

`Axis.get_minorticklines(self)`  
Return this Axis' minor tick lines as a list of *Line2Ds*.

Examples using `matplotlib.axis.Axis.get_minorticklines`

`matplotlib.axis.Axis.get_minorticklocs`

`Axis.get_minorticklocs(self)`

Return this Axis' minor tick locations in data coordinates.

Examples using `matplotlib.axis.Axis.get_minorticklocs`

`matplotlib.axis.Axis.get_offset_text`

`Axis.get_offset_text(self)`

Return the axis offsetText as a Text instance.

Examples using `matplotlib.axis.Axis.get_offset_text`

`matplotlib.axis.Axis.get_tick_padding`

`Axis.get_tick_padding(self)`

Examples using `matplotlib.axis.Axis.get_tick_padding`

`matplotlib.axis.Axis.get_ticklabels`

`Axis.get_ticklabels(self, minor=False, which=None)`

Get this Axis' tick labels.

#### Parameters

**minor** [bool] Whether to return the minor or the major ticklabels.

**which** [None, ('minor', 'major', 'both')] Overrides *minor*.

Selects which ticklabels to return

#### Returns

**list of** *Text*

#### Notes

The tick label strings are not populated until a draw method has been called.

See also: *draw* and *draw*.

Examples using `matplotlib.axis.Axis.get_ticklabels`

- `sphx_glr_gallery_images_contours_and_fields_image_masked.py`
- `sphx_glr_gallery_pyplots_fig_axes_customize_simple.py`

- [Artist tutorial](#)

### `matplotlib.axis.Axis.get_ticklines`

`Axis.get_ticklines(self, minor=False)`  
Return this Axis' tick lines as a list of *Line2Ds*.

Examples using `matplotlib.axis.Axis.get_ticklines`

- `sphx_glr_gallery_pyplots_fig_axes_customize_simple.py`
- [Artist tutorial](#)

### `matplotlib.axis.Axis.get_ticklocs`

`Axis.get_ticklocs(self, *, minor=False)`  
Return this Axis' tick locations in data coordinates.

Examples using `matplotlib.axis.Axis.get_ticklocs`

- [Artist tutorial](#)

### `matplotlib.axis.Axis.get_gridlines`

`Axis.get_gridlines(self)`  
Return this Axis' grid lines as a list of *Line2Ds*.

Examples using `matplotlib.axis.Axis.get_gridlines`

### `matplotlib.axis.Axis.grid`

`Axis.grid(self, b=None, which='major', **kwargs)`  
Configure the grid lines.

#### Parameters

**b** [bool or None] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

**which** [{'major', 'minor', 'both'}] The grid lines to apply the changes on.

**\*\*kwargs** [*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

**Examples using `matplotlib.axis.Axis.grid`**

- `sphx_glr_gallery_statistics_boxplot_color.py`
- `sphx_glr_gallery_statistics_boxplot_demo.py`
- `sphx_glr_gallery_statistics_boxplot_vs_violin.py`

**`matplotlib.axis.Axis.set_tick_params`**

`Axis.set_tick_params(self, which='major', reset=False, **kw)`

Set appearance parameters for ticks, ticklabels, and gridlines.

For documentation of keyword arguments, see `matplotlib.axes.Axes.tick_params()`.

**Examples using `matplotlib.axis.Axis.set_tick_params`**

- `sphx_glr_gallery_pyplots_dollar_ticks.py`
- `sphx_glr_gallery_axes_grid1_scatter_hist_locatable_axes.py`
- `sphx_glr_gallery_misc_pythonic_matplotlib.py`
- `sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py`
- *[Choosing Colormaps in Matplotlib](#)*

**`matplotlib.axis.Axis.axis_date`**

`Axis.axis_date(self, tz=None)`

Sets up axis ticks and labels to treat data along this Axis as dates.

**Parameters**

**tz** [str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: 'UTC')]  
The timezone used to create date labels.

**Examples using `matplotlib.axis.Axis.axis_date`****Data and view intervals**

<code>Axis.get_data_interval</code>	Return the Interval instance for this axis data limits.
<code>Axis.get_view_interval</code>	Return the view limits (min, max) of this axis.
<code>Axis.set_data_interval</code>	Set the axis data limits.
<code>Axis.set_view_interval</code>	Set the axis view limits.

**`matplotlib.axis.Axis.get_data_interval`**

`Axis.get_data_interval(self)`

Return the Interval instance for this axis data limits.

Examples using `matplotlib.axis.Axis.get_data_interval`

`matplotlib.axis.Axis.get_view_interval`

`Axis.get_view_interval(self)`

Return the view limits (min, max) of this axis.

Examples using `matplotlib.axis.Axis.get_view_interval`

`matplotlib.axis.Axis.set_data_interval`

`Axis.set_data_interval(self, vmin, vmax, ignore=False)`

Set the axis data limits. This method is for internal use.

If *ignore* is False (the default), this method will never reduce the preexisting data limits, only expand them if *vmin* or *vmax* are not within them. Moreover, the order of *vmin* and *vmax* does not matter; the orientation of the axis will not change.

If *ignore* is True, the data limits will be set exactly to (*vmin*, *vmax*) in that order.

Examples using `matplotlib.axis.Axis.set_data_interval`

`matplotlib.axis.Axis.set_view_interval`

`Axis.set_view_interval(self, vmin, vmax, ignore=False)`

Set the axis view limits. This method is for internal use; Matplotlib users should typically use e.g. `set_xlim` or `set_ylim`.

If *ignore* is False (the default), this method will never reduce the preexisting view limits, only expand them if *vmin* or *vmax* are not within them. Moreover, the order of *vmin* and *vmax* does not matter; the orientation of the axis will not change.

If *ignore* is True, the view limits will be set exactly to (*vmin*, *vmax*) in that order.

Examples using `matplotlib.axis.Axis.set_view_interval`

## Rendering helpers

---

<code>Axis.get_minpos</code>	
<code>Axis.get_tick_space</code>	Return the estimated number of ticks that can fit on the axis.
<code>Axis.get_ticklabel_extents</code>	Get the extents of the tick labels on either side of the axes.
<code>Axis.get_tightbbox</code>	Return a bounding box that encloses the axis.

---

`matplotlib.axis.Axis.get_minpos`

`Axis.get_minpos(self)`

Examples using `matplotlib.axis.Axis.get_minpos`

`matplotlib.axis.Axis.get_tick_space`

`Axis.get_tick_space(self)`

Return the estimated number of ticks that can fit on the axis.

Examples using `matplotlib.axis.Axis.get_tick_space`

`matplotlib.axis.Axis.get_ticklabel_extents`

`Axis.get_ticklabel_extents(self, renderer)`

Get the extents of the tick labels on either side of the axes.

Examples using `matplotlib.axis.Axis.get_ticklabel_extents`

`matplotlib.axis.Axis.get_tightbbox`

`Axis.get_tightbbox(self, renderer, *, for_layout_only=False)`

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and `offsetText`.

If `for_layout_only` is `True`, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained\_layout to ignore too-long labels when doing their layout.

Examples using `matplotlib.axis.Axis.get_tightbbox`

## Interactive

<code>Axis.contains</code>	Test whether the artist contains the mouse event.
<code>Axis.get_pickradius</code>	Return the depth of the axis used by the picker.
<code>Axis.set_pickradius</code>	Set the depth of the axis used by the picker.

`matplotlib.axis.Axis.contains`

`Axis.contains(self, mouseevent)`

Test whether the artist contains the mouse event.

### Parameters

**mouseevent** [`matplotlib.backend_bases.MouseEvent`]

### Returns

**contains** [bool] Whether any values are within the radius.

**details** [dict] An artist-specific dictionary of details of the event context,

such as which points are contained in the pick radius. See the individual Artist subclasses for details.

Examples using `matplotlib.axis.Axis.contains`

`matplotlib.axis.Axis.get_pickradius`

`Axis.get_pickradius(self)`  
Return the depth of the axis used by the picker.

Examples using `matplotlib.axis.Axis.get_pickradius`

`matplotlib.axis.Axis.set_pickradius`

`Axis.set_pickradius(self, pickradius)`  
Set the depth of the axis used by the picker.

#### Parameters

**pickradius** [float]

Examples using `matplotlib.axis.Axis.set_pickradius`

#### Units

---

<code>Axis.convert_units</code>	
<code>Axis.set_units</code>	Set the units for axis.
<code>Axis.get_units</code>	Return the units for axis.
<code>Axis.update_units</code>	Introspect <i>data</i> for units converter and update the <code>axis.converter</code> instance if necessary.

---

`matplotlib.axis.Axis.convert_units`

`Axis.convert_units(self, x)`

Examples using `matplotlib.axis.Axis.convert_units`

`matplotlib.axis.Axis.set_units`

`Axis.set_units(self, u)`  
Set the units for axis.

#### Parameters

**u** [units tag]

**Examples using `matplotlib.axis.Axis.set_units`**

- `sphx_glr_gallery_units_artist_tests.py`
- `sphx_glr_gallery_units_bar_unit_demo.py`
- `sphx_glr_gallery_units_units_scatter.py`

**`matplotlib.axis.Axis.get_units`**

`Axis.get_units(self)`  
Return the units for axis.

**Examples using `matplotlib.axis.Axis.get_units`****`matplotlib.axis.Axis.update_units`**

`Axis.update_units(self, data)`  
Introspect *data* for units converter and update the `axis.converter` instance if necessary.  
Return *True* if *data* is registered for unit conversion.

**Examples using `matplotlib.axis.Axis.update_units`****Incremental navigation**

<code>Axis.pan</code>	<i>[Deprecated]</i> Pan by <i>numsteps</i> (can be positive or negative).
<code>Axis.zoom</code>	<i>[Deprecated]</i> Zoom in/out on axis; if <i>direction</i> is <i>&gt;0</i> zoom in, else zoom out.

**`matplotlib.axis.Axis.pan`**

`Axis.pan(self, numsteps)`  
*[Deprecated]* Pan by *numsteps* (can be positive or negative).

**Notes**

Deprecated since version 3.3.

**Examples using `matplotlib.axis.Axis.pan`****`matplotlib.axis.Axis.zoom`**

`Axis.zoom(self, direction)`  
*[Deprecated]* Zoom in/out on axis; if *direction* is *>0* zoom in, else zoom out.

## Notes

Deprecated since version 3.3.

Examples using `matplotlib.axis.Axis.zoom`

## XAxis Specific

<code>XAxis.axis_name</code>	Read-only name identifying the axis.
<code>XAxis.get_text_heights</code>	Return how much space should be reserved for text above and below the axes, as a pair of floats.
<code>XAxis.get_ticks_position</code>	Return the ticks position ("top", "bottom", "default", or "unknown").
<code>XAxis.set_ticks_position</code>	Set the ticks position.
<code>XAxis.tick_bottom</code>	Move ticks and ticklabels (if present) to the bottom of the axes.
<code>XAxis.tick_top</code>	Move ticks and ticklabels (if present) to the top of the axes.

### `matplotlib.axis.XAxis.axis_name`

`XAxis.axis_name = 'x'`  
Read-only name identifying the axis.

### `matplotlib.axis.XAxis.get_text_heights`

`XAxis.get_text_heights(self, renderer)`  
Return how much space should be reserved for text above and below the axes, as a pair of floats.

Examples using `matplotlib.axis.XAxis.get_text_heights`

### `matplotlib.axis.XAxis.get_ticks_position`

`XAxis.get_ticks_position(self)`  
Return the ticks position ("top", "bottom", "default", or "unknown").

Examples using `matplotlib.axis.XAxis.get_ticks_position`

### `matplotlib.axis.XAxis.set_ticks_position`

`XAxis.set_ticks_position(self, position)`  
Set the ticks position.

## Parameters

**position** [{‘top’, ‘bottom’, ‘both’, ‘default’, ‘none’}] ‘both’ sets the ticks to appear on both positions, but does not change the tick labels. ‘default’ resets the tick positions to the default: ticks on both positions, labels at bottom. ‘none’ can be used if you don’t want any ticks. ‘none’ and ‘both’ affect only the ticks, not the labels.

#### Examples using `matplotlib.axis.XAxis.set_ticks_position`

- `sphx_glr_gallery_statistics_customized_violin.py`
- `sphx_glr_gallery_pyplots_whats_new_99_spines.py`
- `sphx_glr_gallery_axes_grid1_demo_colorbar_with_axes_divider.py`
- `sphx_glr_gallery_axes_grid1_demo_colorbar_with_inset_locator.py`
- `sphx_glr_gallery_showcase_integral.py`
- `sphx_glr_gallery_showcase_xkcd.py`
- `sphx_glr_gallery_ticks_and_spines_spine_placement_demo.py`
- `sphx_glr_gallery_ticks_and_spines_spines.py`
- `sphx_glr_gallery_ticks_and_spines_spines_bounds.py`
- `sphx_glr_gallery_ticks_and_spines_spines_dropped.py`
- `sphx_glr_gallery_ticks_and_spines_tick-formatters.py`
- *Choosing Colormaps in Matplotlib*

#### `matplotlib.axis.XAxis.tick_bottom`

`XAxis.tick_bottom(self)`

Move ticks and ticklabels (if present) to the bottom of the axes.

#### Examples using `matplotlib.axis.XAxis.tick_bottom`

- `sphx_glr_gallery_subplots_axes_and_figures_broken_axis.py`
- `sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py`

#### `matplotlib.axis.XAxis.tick_top`

`XAxis.tick_top(self)`

Move ticks and ticklabels (if present) to the top of the axes.

#### Examples using `matplotlib.axis.XAxis.tick_top`

- `sphx_glr_gallery_subplots_axes_and_figures_broken_axis.py`
- `sphx_glr_gallery_text_labels_and_annotations_titles_demo.py`

## YAxis Specific

<i>YAxis.axis_name</i>	Read-only name identifying the axis.
<i>YAxis.get_text_widths</i>	
<i>YAxis.get_ticks_position</i>	Return the ticks position ("left", "right", "default", or "unknown").
<i>YAxis.set_offset_position</i>	
<b>Parameters</b>	
<i>YAxis.set_ticks_position</i>	Set the ticks position.
<i>YAxis.tick_left</i>	Move ticks and ticklabels (if present) to the left of the axes.
<i>YAxis.tick_right</i>	Move ticks and ticklabels (if present) to the right of the axes.

### matplotlib.axis.YAxis.axis\_name

```
YAxis.axis_name = 'y'
```

Read-only name identifying the axis.

### matplotlib.axis.YAxis.get\_text\_widths

```
YAxis.get_text_widths(self, renderer)
```

Examples using matplotlib.axis.YAxis.get\_text\_widths

### matplotlib.axis.YAxis.get\_ticks\_position

```
YAxis.get_ticks_position(self)
```

Return the ticks position ("left", "right", "default", or "unknown").

Examples using matplotlib.axis.YAxis.get\_ticks\_position

### matplotlib.axis.YAxis.set\_offset\_position

```
YAxis.set_offset_position(self, position)
```

#### Parameters

**position** [{'left', 'right'}]

Examples using matplotlib.axis.YAxis.set\_offset\_position

### matplotlib.axis.YAxis.set\_ticks\_position

```
YAxis.set_ticks_position(self, position)
```

Set the ticks position.

## Parameters

**position** [{'left', 'right', 'both', 'default', 'none'}] 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at left. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.

### Examples using `matplotlib.axis.YAxis.set_ticks_position`

- sphx\_glr\_gallery\_pyplots\_whats\_new\_99\_spines.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spine\_placement\_demo.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines\_bounds.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_spines\_dropped.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_tick-formatters.py

### `matplotlib.axis.YAxis.tick_left`

`YAxis.tick_left(self)`

Move ticks and ticklabels (if present) to the left of the axes.

### Examples using `matplotlib.axis.YAxis.tick_left`

- sphx\_glr\_gallery\_showcase\_bachelors\_degrees\_by\_gender.py
- sphx\_glr\_gallery\_ticks\_and\_spines\_tick\_label\_right.py

### `matplotlib.axis.YAxis.tick_right`

`YAxis.tick_right(self)`

Move ticks and ticklabels (if present) to the right of the axes.

### Examples using `matplotlib.axis.YAxis.tick_right`

## Other

<code>Axis.OFFSETTEXTPAD</code>	
<code>Axis.axes</code>	The <i>Axes</i> instance the artist resides in, or <i>None</i> .
<code>Axis.limit_range_for_scale</code>	
<code>Axis.reset_ticks</code>	Re-initialize the major and minor Tick lists.

Continued on next page

Table 126 – continued from previous page

<code>Axis.set_default_intervals</code>	Set the default limits for the axis data and view interval if they have not been not mutated yet.
<code>Axis.get_smart_bounds</code>	<i>[Deprecated]</i> Return whether the axis has smart bounds.
<code>Axis.set_smart_bounds</code>	<i>[Deprecated]</i> Set the axis to have smart bounds.

**matplotlib.axis.Axis.OFFSETTEXTPAD**

`Axis.OFFSETTEXTPAD = 3`

**matplotlib.axis.Axis.axes**

property `Axis.axes`

The *Axes* instance the artist resides in, or *None*.

**matplotlib.axis.Axis.limit\_range\_for\_scale**

`Axis.limit_range_for_scale(self, vmin, vmax)`

Examples using `matplotlib.axis.Axis.limit_range_for_scale`

**matplotlib.axis.Axis.reset\_ticks**

`Axis.reset_ticks(self)`

Re-initialize the major and minor Tick lists.

Each list starts with a single fresh Tick.

Examples using `matplotlib.axis.Axis.reset_ticks`

**matplotlib.axis.Axis.set\_default\_intervals**

`Axis.set_default_intervals(self)`

Set the default limits for the axis data and view interval if they have not been not mutated yet.

Examples using `matplotlib.axis.Axis.set_default_intervals`

**matplotlib.axis.Axis.get\_smart\_bounds**

`Axis.get_smart_bounds(self)`

*[Deprecated]* Return whether the axis has smart bounds.

### Notes

Deprecated since version 3.2.

Examples using `matplotlib.axis.Axis.get_smart_bounds`

`matplotlib.axis.Axis.set_smart_bounds`

`Axis.set_smart_bounds(self, value)`  
[*Deprecated*] Set the axis to have smart bounds.

### Notes

Deprecated since version 3.2.

Examples using `matplotlib.axis.Axis.set_smart_bounds`

### Discouraged

These methods should be used together with care, calling `set_ticks` to specify the desired tick locations **before** calling `set_ticklabels` to specify a matching series of labels. Calling `set_ticks` makes a *FixedLocator*; it's list of locations is then used by `set_ticklabels` to make an appropriate *FuncFormatter*.

<code>Axis.set_ticks</code>	Set this Axis' tick locations.
<code>Axis.set_ticklabels</code>	Set the text values of the tick labels.

`matplotlib.axis.Axis.set_ticks`

`Axis.set_ticks(self, ticks, *, minor=False)`  
Set this Axis' tick locations.

#### Parameters

**ticks** [list of floats] List of tick locations.

**minor** [bool, default: False] If False, set the major ticks; if True, the minor ticks.

Examples using `matplotlib.axis.Axis.set_ticks`

- `sphx_glr_gallery_pyplots_whats_new_99_spines.py`
- `sphx_glr_gallery_ticks_and_spines_spine_placement_demo.py`

**matplotlib.axis.Axis.set\_ticklabels**

`Axis.set_ticklabels(self, ticklabels, *, minor=False, **kwargs)`  
Set the text values of the tick labels.

**Warning:** This method should only be used after fixing the tick positions using `Axis.set_ticks`. Otherwise, the labels may end up in unexpected positions.

**Parameters**

**ticklabels** [sequence of str or of `Texts`] Texts for labeling each tick location in the sequence set by `Axis.set_ticks`; the number of labels must match the number of locations.

**minor** [bool] If True, set minor ticks instead of major ticks.

**\*\*kwargs** Text properties.

**Returns**

**list of `Texts`** For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.

Examples using `matplotlib.axis.Axis.set_ticklabels`

### 18.6.3 Tick objects

```
class matplotlib.axis.Tick(axes, loc, label=<deprecated parameter>, size=None,
                           width=None, color=None, tickdir=None, pad=None,
                           labelsz=None, labelcolor=None, zorder=None,
                           gridOn=None, tick1On=True, tick2On=True, la-
                           bel1On=True, label2On=False, major=True, label-
                           rotation=0, grid_color=None, grid_linestyle=None,
                           grid_linewidth=None, grid_alpha=None, **kw)
```

Abstract base class for the axis ticks, grid lines and labels.

Ticks mark a position on an Axis. They contain two lines as markers and two labels; one each for the bottom and top positions (in case of an `XAxis`) or for the left and right positions (in case of a `YAxis`).

**Attributes**

**tick1line** [`Line2D`] The left/bottom tick marker.

**tick2line** [`Line2D`] The right/top tick marker.

**gridline** [`Line2D`] The grid line associated with the label position.

**label1** [`Text`] The left/bottom tick label.

**label2** [`Text`] The right/top tick label.

`bbox` is the `Bound2D` bounding box in display coords of the Axes `loc` is the tick location in data coords `size` is the tick size in points

```
class matplotlib.axis.XTick(*args, **kwargs)
```

Contains all the Artists needed to make an x tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

```
class matplotlib.axis.YTick(*args, **kwargs)
```

Contains all the Artists needed to make a Y tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

<i>Tick.apply_tickdir</i>	Calculate <code>self._pad</code> and <code>self._tickmarkers</code> .
<i>Tick.get_loc</i>	Return the tick location (data coords) as a scalar.
<i>Tick.get_pad</i>	Get the value of the tick label pad in points.
<i>Tick.get_pad_pixels</i>	
<i>Tick.get_tick_padding</i>	Get the length of the tick outside of the axes.
<i>Tick.get_tickdir</i>	
<i>Tick.get_view_interval</i>	Return the view limits (min, max) of the axis the tick belongs to.
<i>Tick.set_label1</i>	Set the label1 text.
<i>Tick.set_label2</i>	Set the label2 text.
<i>Tick.set_pad</i>	Set the tick label pad in points
<i>Tick.update_position</i>	Set the location of tick in data coords with scalar <i>loc</i> .

#### matplotlib.axis.Tick.apply\_tickdir

```
Tick.apply_tickdir(self, tickdir)
```

Calculate `self._pad` and `self._tickmarkers`.

Examples using `matplotlib.axis.Tick.apply_tickdir`

#### matplotlib.axis.Tick.get\_loc

```
Tick.get_loc(self)
```

Return the tick location (data coords) as a scalar.

Examples using `matplotlib.axis.Tick.get_loc`

#### matplotlib.axis.Tick.get\_pad

```
Tick.get_pad(self)
```

Get the value of the tick label pad in points.

Examples using `matplotlib.axis.Tick.get_pad`

#### matplotlib.axis.Tick.get\_pad\_pixels

```
Tick.get_pad_pixels(self)
```

Examples using `matplotlib.axis.Tick.get_pad_pixels`

`matplotlib.axis.Tick.get_tick_padding`

`Tick.get_tick_padding(self)`  
Get the length of the tick outside of the axes.

Examples using `matplotlib.axis.Tick.get_tickdir`

`matplotlib.axis.Tick.get_tickdir`

`Tick.get_tickdir(self)`

Examples using `matplotlib.axis.Tick.get_view_interval`

`matplotlib.axis.Tick.get_view_interval`

`Tick.get_view_interval(self)`  
Return the view limits (min, max) of the axis the tick belongs to.

Examples using `matplotlib.axis.Tick.get_view_interval`

`matplotlib.axis.Tick.set_label1`

`Tick.set_label1(self, s)`  
Set the label1 text.

**Parameters**

**s** [str]

Examples using `matplotlib.axis.Tick.set_label1`

`matplotlib.axis.Tick.set_label2`

`Tick.set_label2(self, s)`  
Set the label2 text.

**Parameters**

**s** [str]

Examples using `matplotlib.axis.Tick.set_label2`

`matplotlib.axis.Tick.set_pad`

`Tick.set_pad(self, val)`  
Set the tick label pad in points

## Parameters

**val** [float]

Examples using `matplotlib.axis.Tick.set_pad`

`matplotlib.axis.Tick.update_position`

`Tick.update_position(self, loc)`

Set the location of tick in data coords with scalar *loc*.

Examples using `matplotlib.axis.Tick.update_position`

## 18.7 matplotlib.backend\_bases

Abstract base classes define the primitives that renderers and graphics contexts must implement to serve as a Matplotlib backend.

*RendererBase* An abstract base class to handle drawing/rendering operations.

*FigureCanvasBase* The abstraction layer that separates the *Figure* from the backend specific details like a user interface drawing area.

*GraphicsContextBase* An abstract base class that provides color, line styles, etc.

*Event* The base class for all of the Matplotlib event handling. Derived classes such as *KeyEvent* and *MouseEvent* store the meta data like keys and buttons pressed, x and y locations in pixel and *Axes* coordinates.

*ShowBase* The base class for the Show class of each interactive backend; the 'show' callable is then set to `Show.__call__`.

*ToolContainerBase* The base class for the Toolbar class of each interactive backend.

`class matplotlib.backend_bases.CloseEvent(name, canvas, guiEvent=None)`

Bases: `matplotlib.backend_bases.Event`

An event triggered by a figure being closed.

`class matplotlib.backend_bases.DrawEvent(name, canvas, renderer)`

Bases: `matplotlib.backend_bases.Event`

An event triggered by a draw operation on the canvas

In most backends callbacks subscribed to this callback will be fired after the rendering is complete but before the screen is updated. Any extra artists drawn to the canvas's renderer will be reflected without an explicit call to `blit`.

**Warning:** Calling `canvas.draw` and `canvas.blit` in these callbacks may not be safe with all backends and may cause infinite recursion.

In addition to the *Event* attributes, the following event attributes are defined:

### Attributes

**renderer** [*RendererBase*] The renderer for the draw event.

```
class matplotlib.backend_bases.Event(name, canvas, guiEvent=None)
```

Bases: `object`

A Matplotlib event. Attach additional attributes as defined in `FigureCanvasBase.mpl_connect()`. The following attributes are defined and shown with their default values

### Attributes

**name** [str] The event name.

**canvas** [`FigureCanvasBase`] The backend-specific canvas instance generating the event.

**guiEvent** The GUI event that triggered the Matplotlib event.

```
class matplotlib.backend_bases.FigureCanvasBase(figure)
```

Bases: `object`

The canvas the figure renders into.

### Attributes

**figure** [`matplotlib.figure.Figure`] A high-level figure instance.

```
blit(self, bbox=None)
```

Blit the canvas in bbox (default entire canvas).

```
button_press_event(self, x, y, button, dblclick=False, guiEvent=None)
```

Callback processing for mouse button press events.

Backend derived classes should call this function on any mouse button press. (x, y) are the canvas coords ((0, 0) is lower left). button and key are as defined in `MouseEvent`.

This method will call all functions connected to the 'button\_press\_event' with a `MouseEvent` instance.

```
button_release_event(self, x, y, button, guiEvent=None)
```

Callback processing for mouse button release events.

Backend derived classes should call this function on any mouse button release.

This method will call all functions connected to the 'button\_release\_event' with a `MouseEvent` instance.

### Parameters

**x** [float] The canvas coordinates where 0=left.

**y** [float] The canvas coordinates where 0=bottom.

**guiEvent** The native UI event that generated the Matplotlib event.

```
close_event(self, guiEvent=None)
```

Pass a `CloseEvent` to all functions connected to close\_event.

```
draw(self, *args, **kwargs)
```

Render the `Figure`.

```
draw_cursor(self, event)
```

[*Deprecated*] Draw a cursor in the event.axes if inaxes is not None. Use native GUI drawing for efficiency if possible

## Notes

Deprecated since version 3.2.

`draw_event(self, renderer)`

Pass a *DrawEvent* to all functions connected to `draw_event`.

`draw_idle(self, *args, **kwargs)`

Request a widget redraw once control returns to the GUI event loop.

Even if multiple calls to *draw\_idle* occur before control returns to the GUI event loop, the figure will only be rendered once.

## Notes

Backends may choose to override the method and implement their own strategy to prevent multiple renderings.

`enter_notify_event(self, guiEvent=None, xy=None)`

Callback processing for the mouse cursor entering the canvas.

Backend derived classes should call this function when entering canvas.

## Parameters

**guiEvent** The native UI event that generated the Matplotlib event.

**xy** [(float, float)] The coordinate location of the pointer when the canvas is entered.

`events = ['resize_event', 'draw_event', 'key_press_event', 'key_release_event', 'button_press_event', 'button_release_event']`

`filetypes = {'eps': 'Encapsulated Postscript', 'jpeg': 'Joint Photographic Experts Group', 'jpg': 'Joint Photographic Experts Group'}`

`fixed_dpi = None`

`flush_events(self)`

Flush the GUI events for the figure.

Interactive backends need to reimplement this method.

`get_default_filename(self)`

Return a string, which includes extension, suitable for use as a default filename.

`classmethod get_default_filetype()`

Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

`classmethod get_supported_filetypes()`

Return dict of savefig file formats supported by this backend.

`classmethod get_supported_filetypes_grouped()`

Return a dict of savefig file formats supported by this backend, where the keys are a file type name, such as 'Joint Photographic Experts Group', and the values are a list of filename extensions used for that filetype, such as ['jpg', 'jpeg'].

`get_width_height(self)`

Return the figure width and height in points or pixels (depending on the backend), truncated to integers.

`get_window_title(self)`

Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).

`grab_mouse(self, ax)`

Set the child *Axes* which is grabbing the mouse events.

Usually called by the widgets themselves. It is an error to call this if the mouse is already grabbed by another axes.

`inaxes(self, xy)`

Return the topmost visible *Axes* containing the point *xy*.

#### Parameters

**xy** [(float, float)] (x, y) pixel positions from left/bottom of the canvas.

#### Returns

*Axes* or None The topmost visible axes containing the point, or None if no axes.

`is_saving(self)`

Return whether the renderer is in the process of saving to a file, rather than rendering for an on-screen buffer.

`key_press_event(self, key, guiEvent=None)`

Pass a *KeyEvent* to all functions connected to `key_press_event`.

`key_release_event(self, key, guiEvent=None)`

Pass a *KeyEvent* to all functions connected to `key_release_event`.

`leave_notify_event(self, guiEvent=None)`

Callback processing for the mouse cursor leaving the canvas.

Backend derived classes should call this function when leaving canvas.

#### Parameters

**guiEvent** The native UI event that generated the Matplotlib event.

`motion_notify_event(self, x, y, guiEvent=None)`

Callback processing for mouse movement events.

Backend derived classes should call this function on any motion-notify-event.

This method will call all functions connected to the 'motion\_notify\_event' with a *MouseEvent* instance.

#### Parameters

**x** [float] The canvas coordinates where 0=left.

**y** [float] The canvas coordinates where 0=bottom.

**guiEvent** The native UI event that generated the Matplotlib event.

`mpl_connect(self, s, func)`

Bind function *func* to event *s*.

#### Parameters

**s** [str] One of the following events ids:

- 'button\_press\_event'
- 'button\_release\_event'

- 'draw\_event'
- 'key\_press\_event'
- 'key\_release\_event'
- 'motion\_notify\_event'
- 'pick\_event'
- 'resize\_event'
- 'scroll\_event'
- 'figure\_enter\_event',
- 'figure\_leave\_event',
- 'axes\_enter\_event',
- 'axes\_leave\_event'
- 'close\_event'.

**func** [callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the axes, the `inaxes` attribute of the event will be set to the [Axes](#) the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See [KeyEvent](#) and [MouseEvent](#) for more info.

### Returns

**cid** A connection id that can be used with [FigureCanvasBase.mpl\\_disconnect](#).

### Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

`mpl_disconnect(self, cid)`  
Disconnect the callback with id `cid`.

### Examples

```
cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)
```

`new_timer(self, interval=None, callbacks=None)`  
Create a new backend-specific subclass of `Timer`.

This is useful for getting periodic events through the backend's native event loop. Implemented only for backends with GUIs.

### Parameters

**interval** [int] Timer interval in milliseconds.

**callbacks** [List[Tuple[callable, Tuple, Dict]]] Sequence of (func, args, kwargs) where func(\*args, \*\*kwargs) will be executed by the timer every *interval*.

Callbacks which return False or 0 will be removed from the timer.

### Examples

```
>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1,), {'a': 3})])
```

`pick(self, mouseevent)`

`pick_event(self, mouseevent, artist, **kwargs)`

Callback processing for pick events.

This method will be called by artists who are picked and will fire off *PickEvent* callbacks registered listeners.

```
print_figure(self, filename, dpi=None, facecolor=None, edgecolor=None,
              orientation='portrait', format=None, *, bbox_inches=None,
              pad_inches=None, bbox_extra_artists=None, backend=None,
              **kwargs)
```

Render the figure to hardcopy. Set the figure patch face and edge colors. This is useful because some of the GUIs have a gray figure face color background and you'll probably want to override this on hardcopy.

### Parameters

**filename** [str or path-like or file-like] The file where the figure is saved.

**dpi** [float, default: `rcParams["savefig.dpi"]` (default: 'figure')] The dots per inch to save the figure in.

**facecolor** [color or 'auto', default: `rcParams["savefig.facecolor"]` (default: 'auto')] The facecolor of the figure. If 'auto', use the current figure facecolor.

**edgecolor** [color or 'auto', default: `rcParams["savefig.edgecolor"]` (default: 'auto')] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

**orientation** [{'landscape', 'portrait'}, default: 'portrait'] Only currently applies to PostScript printing.

**format** [str, optional] Force a specific file format. If not given, the format is inferred from the *filename* extension, and if that fails from `rcParams["savefig.format"]` (default: 'png').

**bbox\_inches** ['tight' or *Bbox*, default: `rcParams["savefig.bbox"]` (default: None)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

**pad\_inches** [float, default: `rcParams["savefig.pad_inches"]` (default: 0.1)] Amount of padding around the figure when *bbox\_inches* is 'tight'.

**bbox\_extra\_artists** [list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

**backend** [str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

`release_mouse(self, ax)`

Release the mouse grab held by the *Axes* *ax*.

Usually called by the widgets. It is ok to call this even if *ax* doesn't have the mouse grab currently.

`required_interactive_framework = None`

`resize(self, w, h)`

Set the canvas size in pixels.

`resize_event(self)`

Pass a *ResizeEvent* to all functions connected to `resize_event`.

`scroll_event(self, x, y, step, guiEvent=None)`

Callback processing for scroll events.

Backend derived classes should call this function on any scroll wheel event. (x, y) are the canvas coords ((0, 0) is lower left). button and key are as defined in *MouseEvent*.

This method will call all functions connected to the 'scroll\_event' with a *MouseEvent* instance.

`set_window_title(self, title)`

Set the title text of the window containing the figure. Note that this has no effect if there is no window (e.g., a PS backend).

`start_event_loop(self, timeout=0)`

Start a blocking event loop.

Such an event loop is used by interactive functions, such as *ginput* and *waitforbuttonpress*, to wait for events.

The event loop blocks until a callback function triggers *stop\_event\_loop*, or *timeout* is reached.

If *timeout* is 0 or negative, never timeout.

Only interactive backends need to reimplement this method and it relies on *flush\_events* being properly implemented.

Interactive backends should implement this in a more native way.

`stop_event_loop(self)`

Stop the current blocking event loop.

Interactive backends need to reimplement this to match *start\_event\_loop*

`supports_blit = False`

`switch_backends(self, FigureCanvasClass)`

Instantiate an instance of *FigureCanvasClass*

This is used for backend switching, e.g., to instantiate a `FigureCanvasPS` from a `FigureCanvasGTK`. Note, deep copying is not done, so any changes to one of the instances (e.g., setting figure size or line props), will be reflected in the other

```
class matplotlib.backend_bases.FigureManagerBase(canvas, num)
    Bases: object
```

A backend-independent abstraction of a figure container and controller.

The figure manager is used by pyplot to interact with the window in a backend-independent way. It's an adapter for the real (GUI) framework that represents the visual figure on screen.

GUI backends define from this class to translate common operations such as *show* or *resize* to the GUI-specific code. Non-GUI backends do not support these operations and can just use the base class.

The following basic operations are accessible:

### Window operations

- *show*
- *destroy*
- *full\_screen\_toggle*
- *resize*
- *get\_window\_title*
- *set\_window\_title*

### Key and mouse button press handling

The figure manager sets up default key and mouse button press handling by hooking up the *key\_press\_handler* to the matplotlib event system. This ensures the same shortcuts and mouse actions across backends.

### Other operations

Subclasses will have additional attributes and functions to access additional functionality. This is of course backend-specific. For example, most GUI backends have `window` and `toolbar` attributes that give access to the native GUI widgets of the respective framework.

### Attributes

**canvas** [*FigureCanvasBase*] The backend-specific canvas instance.

**num** [int or str] The figure number.

**key\_press\_handler\_id** [int] The default key handler cid, when using the toolmanager. To disable the default key press handling use:

```
figure.canvas.mpl_disconnect(
    figure.canvas.manager.key_press_handler_id)
```

**button\_press\_handler\_id** [int] The default mouse button handler cid, when using the toolmanager. To disable the default button press handling use:

```
figure.canvas.mpl_disconnect(
    figure.canvas.manager.button_press_handler_id)
```

`button_press(self, event)`

The default Matplotlib button actions for extra mouse buttons.

`destroy(self)`

`full_screen_toggle(self)`

`get_window_title(self)`

Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).

`key_press(self, event)`

Implement the default Matplotlib key bindings defined at [Navigation Keyboard Shortcuts](#).

`resize(self, w, h)`

For GUI backends, resize the window (in pixels).

`set_window_title(self, title)`

Set the title text of the window containing the figure.

This has no effect for non-GUI (e.g., PS) backends.

`show(self)`

For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in [Figure.show](#).

property `statusbar`

`class matplotlib.backend_bases.GraphicsContextBase`

Bases: `object`

An abstract base class that provides color, line styles, etc.

`copy_properties(self, gc)`

Copy properties from `gc` to self.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_antialiased(self)`

Return whether the object should try to do antialiased rendering.

`get_capstyle(self)`

Return the capstyle as a string in ('butt', 'round', 'projecting').

`get_clip_path(self)`

Return the clip path in the form (path, transform), where path is a [Path](#) instance, and transform is an affine transform to apply to the path before clipping.

`get_clip_rectangle(self)`

Return the clip rectangle as a [Bbox](#) instance.

`get_dashes(self)`

Return the dash style as an (offset, dash-list) pair.

The dash list is a even-length list that gives the ink on, ink off in points. See p. 107 of to PostScript [blue book](#) for more info.

Default value is (None, None).

`get_forced_alpha(self)`  
Return whether the value given by `get_alpha()` should be used to override any other alpha-channel values.

`get_gid(self)`  
Return the object identifier if one is set, `None` otherwise.

`get_hatch(self)`  
Get the current hatch style.

`get_hatch_color(self)`  
Get the hatch color.

`get_hatch_linewidth(self)`  
Get the hatch linewidth.

`get_hatch_path(self, density=6.0)`  
Return a [\*Path\*](#) for the current hatch.

`get_joinstyle(self)`  
Return the line join style as one of ('miter', 'round', 'bevel').

`get_linewidth(self)`  
Return the line width in points.

`get_rgb(self)`  
Return a tuple of three or four floats from 0-1.

`get_sketch_params(self)`  
Return the sketch parameters for the artist.

### Returns

**tuple or `None`** A 3-tuple with the following elements:

- `scale`: The amplitude of the wiggle perpendicular to the source line.
- `length`: The length of the wiggle along the line.
- `randomness`: The scale factor by which the length is shrunk or expanded.

May return `None` if no sketch parameters were set.

`get_snap(self)`  
Return the snap setting, which can be:

- `True`: snap vertices to the nearest pixel center
- `False`: leave vertices as-is
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

`get_url(self)`  
Return a url if one is set, `None` otherwise.

`restore(self)`  
Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack.

`set_alpha(self, alpha)`  
Set the alpha value used for blending - not supported on all backends.

If `alpha=None` (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, alpha will override them.

`set_antialiased(self, b)`  
Set whether object should be drawn with antialiased rendering.

`set_capstyle(self, cs)`  
Set the capstyle to be one of ('butt', 'round', 'projecting').

`set_clip_path(self, path)`  
Set the clip path and transformation.

#### Parameters

**path** [*TransformedPath* or None]

`set_clip_rectangle(self, rectangle)`  
Set the clip rectangle with sequence (left, bottom, width, height)

`set_dashes(self, dash_offset, dash_list)`  
Set the dash style for the gc.

#### Parameters

**dash\_offset** [float or None] The offset (usually 0).

**dash\_list** [array-like or None] The on-off sequence as points.

#### Notes

(None, None) specifies a solid line.

See p. 107 of to PostScript [blue book](#) for more info.

`set_foreground(self, fg, isRGBA=False)`  
Set the foreground color.

#### Parameters

**fg** [color]

**isRGBA** [bool] If *fg* is known to be an (r, g, b, a) tuple, *isRGBA* can be set to True to improve performance.

`set_gid(self, id)`  
Set the id.

`set_hatch(self, hatch)`  
Set the hatch style (for fills).

`set_hatch_color(self, hatch_color)`  
Set the hatch color.

`set_joinstyle(self, js)`  
Set the join style to be one of ('miter', 'round', 'bevel').

`set_linewidth(self, w)`  
Set the linewidth in points.

`set_sketch_params(self, scale=None, length=None, randomness=None)`  
Set the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, default: 128] The length of the wiggle along the line, in pixels.

**randomness** [float, default: 16] The scale factor by which the length is shrunk or expanded.

`set_snap(self, snap)`

Set the snap setting which may be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

`set_url(self, url)`

Set the url for links in compatible backends.

`class matplotlib.backend_bases.KeyEvent(name, canvas, key, x=0, y=0, guiEvent=None)`

Bases: `matplotlib.backend_bases.LocationEvent`

A key event (key press, key release).

Attach additional attributes as defined in `FigureCanvasBase.mpl_connect()`.

In addition to the `Event` and `LocationEvent` attributes, the following attributes are defined:

## Notes

Modifier keys will be prefixed to the pressed key and will be in the order "ctrl", "alt", "super". The exception to this rule is when the pressed key is itself a modifier key, therefore "ctrl+alt" and "alt+control" can both be valid key values.

## Examples

```
def on_key(event):
    print('you pressed', event.key, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('key_press_event', on_key)
```

## Attributes

**key** [None or str] the key(s) pressed. Could be **None**, a single case sensitive ascii character ("g", "G", "#", etc.), a special key ("control", "shift", "f1", "up", etc.) or a combination of the above (e.g., "ctrl+alt+g", "ctrl+alt+G").

(x, y) in figure coords ((0, 0) = bottom left).

`class matplotlib.backend_bases.LocationEvent(name, canvas, x, y, guiEvent=None)`

Bases: `matplotlib.backend_bases.Event`

An event that has a screen location.

The following additional attributes are defined and shown with their default values.

In addition to the *Event* attributes, the following event attributes are defined:

### Attributes

**x** [int] x position - pixels from left of canvas.

**y** [int] y position - pixels from bottom of canvas.

**inaxes** [*Axes* or None] The *Axes* instance over which the mouse is, if any.

**xdata** [float or None] x data coordinate of the mouse.

**ydata** [float or None] y data coordinate of the mouse.

(x, y) in figure coords ((0, 0) = bottom left).

lastevent = None

```
class matplotlib.backend_bases.MouseButton
```

Bases: *enum.IntEnum*

An enumeration.

BACK = 8

FORWARD = 9

LEFT = 1

MIDDLE = 2

RIGHT = 3

```
class matplotlib.backend_bases.MouseEvent(name, canvas, x, y, button=None,
                                         key=None, step=0, dblclick=False,
                                         guiEvent=None)
```

Bases: *matplotlib.backend\_bases.LocationEvent*

**A mouse event ('button\_press\_event', 'button\_release\_event', 'scroll\_event', 'motion\_notify\_event').**

In addition to the *Event* and *LocationEvent* attributes, the following attributes are defined:

### Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('button_press_event', on_press)
```

### Attributes

**button** [None or *MouseButton* or {'up', 'down'}] The button pressed. 'up' and 'down' are used for scroll events. Note that in the nbagg backend, both the middle and right clicks return RIGHT since right clicking will bring up the context menu in some browsers. Note that LEFT and RIGHT actually refer to the "primary" and "secondary" buttons, i.e. if the user inverts their left and right buttons ("left-handed setting") then the LEFT button will be the one physically on the right.

**key** [None or str] The key pressed when the mouse event triggered, e.g. 'shift'. See [KeyEvent](#).

**Warning:** This key is currently obtained from the last 'key\_press\_event' or 'key\_release\_event' that occurred within the canvas. Thus, if the last change of keyboard state occurred while the canvas did not have focus, this attribute will be wrong.

**step** [float] The number of scroll steps (positive for 'up', negative for 'down'). This applies only to 'scroll\_event' and defaults to 0 otherwise.

**dblclick** [bool] Whether the event is a double-click. This applies only to 'button\_press\_event' and is False otherwise. In particular, it's not used in 'button\_release\_event'.

(x, y) in figure coords ((0, 0) = bottom left) button pressed None, 1, 2, 3, 'up', 'down'

```
class matplotlib.backend_bases.NavigationToolbar2(canvas)
```

Bases: [object](#)

Base class for the navigation cursor, version 2.

Backends must implement a canvas that handles connections for 'button\_press\_event' and 'button\_release\_event'. See [FigureCanvasBase.mpl\\_connect\(\)](#) for more information.

They must also define

[save\\_figure\(\)](#) save the current figure

[set\\_cursor\(\)](#) if you want the pointer icon to change

[draw\\_rubberband\(\)](#) **(optional)** draw the zoom to rect "rubberband" rectangle

[set\\_message\(\)](#) **(optional)** display message

[set\\_history\\_buttons\(\)](#) **(optional)** you can change the history back / forward buttons to indicate disabled / enabled state.

and override `__init__` to set up the toolbar - without forgetting to call the base-class `init`. Typically, `__init__` needs to set up toolbar buttons connected to the [home](#), [back](#), [forward](#), [pan](#), [zoom](#), and [save\\_figure](#) methods and using standard icons in the "images" subdirectory of the data path.

That's it, we'll do the rest!

`back(self, *args)`

Move back up the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

`drag_pan(self, event)`

Callback for dragging in pan/zoom mode.

`drag_zoom(self, event)`

Callback for dragging in zoom mode.

`draw(self)`

**[Deprecated]** Redraw the canvases, update the locators.

### Notes

Deprecated since version 3.3.

`draw_rubberband(self, event, x0, y0, x1, y1)`

Draw a rectangle rubberband to indicate zoom limits.

Note that it is not guaranteed that  $x_0 \leq x_1$  and  $y_0 \leq y_1$ .

`forward(self, *args)`

Move forward in the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

`home(self, *args)`

Restore the original view.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

`mouse_move(self, event)`

`pan(self, *args)`

Toggle the pan/zoom tool.

Pan with left button, zoom with right.

`press(self, event)`

[*Deprecated*] Called whenever a mouse button is pressed.

### Notes

Deprecated since version 3.3.

`press_pan(self, event)`

Callback for mouse button press in pan/zoom mode.

`press_zoom(self, event)`

Callback for mouse button press in zoom to rect mode.

`push_current(self)`

Push the current view limits and position onto the stack.

`release(self, event)`

[*Deprecated*] Callback for mouse button release.

### Notes

Deprecated since version 3.3.

`release_pan(self, event)`

Callback for mouse button release in pan/zoom mode.

`release_zoom(self, event)`

Callback for mouse button release in zoom to rect mode.

`remove_rubberband(self)`

Remove the rubberband.

`save_figure(self, *args)`

Save the current figure.

`set_cursor(self, cursor)`

Set the current cursor to one of the `Cursors` enums values.

If required by the backend, this method should trigger an update in the backend event loop after the cursor is set, as this method may be called e.g. before a long-running task during which the GUI is not updated.

`set_history_buttons(self)`

Enable or disable the back/forward button.

`set_message(self, s)`

Display a message on toolbar or in status bar.

`toolitems = (('Home', 'Reset original view', 'home', 'home'), ('Back', 'Back to previous view', 'ba`

`update(self)`

Reset the axes stack.

`zoom(self, *args)`

Toggle zoom to rect mode.

exception `matplotlib.backend_bases.NonGuiException`

Bases: `Exception`

Raised when trying show a figure in a non-GUI backend.

class `matplotlib.backend_bases.PickEvent(name, canvas, mouseevent, artist, guiEvent=None, **kwargs)`

Bases: `matplotlib.backend_bases.Event`

A pick event, fired when the user picks a location on the canvas sufficiently close to an artist.

Attrs: all the `Event` attributes plus

## Examples

Bind a function `on_pick()` to pick events, that prints the coordinates of the picked data point:

```
ax.plot(np.rand(100), 'o', picker=5) # 5 points tolerance

def on_pick(event):
    line = event.artist
    xdata, ydata = line.get_data()
    ind = event.ind
    print('on pick line:', np.array([xdata[ind], ydata[ind]]).T)

cid = fig.canvas.mpl_connect('pick_event', on_pick)
```

## Attributes

**mouseevent** [`MouseEvent`] The mouse event that generated the pick.

**artist** [`matplotlib.artist.Artist`] The picked artist.

**other** Additional attributes may be present depending on the type of the picked object; e.g., a *Line2D* pick may define different extra attributes than a *PatchCollection* pick.

```
class matplotlib.backend_bases.RendererBase
    Bases: object
```

An abstract base class to handle drawing/rendering operations.

The following methods must be implemented in the backend for full functionality (though just implementing *draw\_path()* alone would give a highly capable backend):

- *draw\_path()*
- *draw\_image()*
- *draw\_gouraud\_triangle()*

The following methods *should* be implemented in the backend for optimization reasons:

- *draw\_text()*
- *draw\_markers()*
- *draw\_path\_collection()*
- *draw\_quad\_mesh()*

```
close_group(self, s)
    Close a grouping element with label s.
    Only used by the SVG renderer.
```

```
draw_gouraud_triangle(self, gc, points, colors, transform)
    Draw a Gouraud-shaded triangle.
```

#### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**points** [array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

**colors** [array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```
draw_gouraud_triangles(self, gc, triangles_array, colors_array, transform)
    Draw a series of Gouraud triangles.
```

#### Parameters

**points** [array-like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.

**colors** [array-like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

```
draw_image(self, gc, x, y, im, transform=None)
    Draw an RGBA image.
```

#### Parameters

- gc** [*GraphicsContextBase*] A graphics context with clipping information.
- x** [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- y** [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- im** [array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option\_scale\_image()* returns True, an affine transformation (i.e., an *Affine2DBase*) may be passed to *draw\_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied *before* translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by *transform*).

**draw\_markers**(*self, gc, marker\_path, marker\_trans, path, trans, rgbFace=None*)  
 Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of *draw\_markers* that makes multiple calls to *draw\_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

- gc** [*GraphicsContextBase*] The graphics context.
- marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.
- trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

**draw\_path**(*self, gc, path, transform, rgbFace=None*)  
 Draw a *Path* instance using the given affine transform.

**draw\_path\_collection**(*self, gc, master\_transform, paths, all\_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyle, antialiaseds, urls, offset\_position*)

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyle* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw\_path\_collection()* that makes multiple calls to *draw\_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods *\_iter\_collection\_raw\_paths()* and *\_iter\_collection()* are provided to help with (and standardize) the implementation across backends. It is highly recommended to use

those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

`draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight, coordinates, offsets, offsetTrans, facecolors, antialiased, edgecolors)`

Fallback implementation of `draw_quad_mesh()` that generates paths and then calls `draw_path_collection()`.

`draw_tex(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None)`

`draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)`  
Draw the text instance.

### Parameters

**gc** [`GraphicsContextBase`] The graphics context.

**x** [float] The x location of the text in display coords.

**y** [float] The y location of the text baseline in display coords.

**s** [str] The text string.

**prop** [`matplotlib.font_manager.FontProperties`] The font properties.

**angle** [float] The rotation angle in degrees anti-clockwise.

**mtext** [`matplotlib.text.Text`] The original text object to be rendered.

### Notes

#### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`flipy(self)`

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

`get_canvas_width_height(self)`

Return the canvas width and height in display coords.

`get_image_magnification(self)`

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

`get_texmanager(self)`

Return the `TexManager` instance.

`get_text_width_height_descent(self, s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string `s` with `FontProperties prop`.

`new_gc(self)`

Return an instance of a `GraphicsContextBase`.

`open_group(self, s, gid=None)`

Open a grouping element with label *s* and *gid* (if set) as id.

Only used by the SVG renderer.

`option_image_nocomposite(self)`

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not `rcParams["image.composite_image"]`.

`option_scale_image(self)`

Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

`points_to_pixels(self, points)`

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

$$\text{points to pixels} = \text{points} * \text{pixels\_per\_inch} / 72 * \text{dpi} / 72$$

### Parameters

**points** [float or array-like] a float or a numpy array of float

### Returns

#### Points converted to pixels

`start_filter(self)`

Switch to a temporary renderer for image filtering effects.

Currently only supported by the agg renderer.

`start_rasterizing(self)`

Switch to the raster renderer.

Used by *MixedModeRenderer*.

`stop_filter(self, filter_func)`

Switch back to the original renderer. The contents of the temporary renderer is processed with the *filter\_func* and is drawn on the original renderer as an image.

Currently only supported by the agg renderer.

`stop_rasterizing(self)`

Switch back to the vector renderer and draw the contents of the raster renderer as an image on the vector renderer.

Used by *MixedModeRenderer*.

`class matplotlib.backend_bases.ResizeEvent(name, canvas)`

Bases: *matplotlib.backend\_bases.Event*

An event triggered by a canvas resize

In addition to the *Event* attributes, the following event attributes are defined:

### Attributes

**width** [int] Width of the canvas in pixels.

**height** [int] Height of the canvas in pixels.

```
class matplotlib.backend_bases.ShowBase
```

```
    Bases: matplotlib.backend_bases._Backend
```

Simple base class to generate a `show()` function in backends.

Subclass must override `mainloop()` method.

```
class matplotlib.backend_bases.StatusbarBase(toolmanager)
```

```
    Bases: object
```

[*Deprecated*] Base class for the statusbar.

## Notes

Deprecated since version 3.3.

```
set_message(self, s)
```

Display a message on toolbar or in status bar.

## Parameters

**s** [str] Message text.

```
class matplotlib.backend_bases.TimerBase(interval=None, callbacks=None)
```

```
    Bases: object
```

A base class for providing timer events, useful for things animations. Backends need to implement a few specific methods in order to use their own timing mechanisms so that the timer events are integrated into their event loops.

Subclasses must override the following methods:

- `_timer_start`: Backend-specific code for starting the timer.
- `_timer_stop`: Backend-specific code for stopping the timer.

Subclasses may additionally override the following methods:

- `_timer_set_single_shot`: Code for setting the timer to single shot operating mode, if supported by the timer object. If not, the `Timer` class itself will store the flag and the `_on_timer` method should be overridden to support such behavior.
- `_timer_set_interval`: Code for setting the interval on the timer, if there is a method for doing so on the timer object.
- `_on_timer`: The internal function that any timer object should call, which will handle the task of running all callbacks that have been set.

## Parameters

**interval** [int, default: 1000ms] The time between timer events in milliseconds. Will be stored as `timer.interval`.

**callbacks** [List[Tuple[callable, Tuple, Dict]]] List of (func, args, kwargs) tuples that will be called upon timer events. This list is accessible as `timer.callbacks` and can be manipulated directly, or the functions `add_callback` and `remove_callback` can be used.

`add_callback(self, func, *args, **kwargs)`

Register *func* to be called by timer when the event fires. Any additional arguments provided will be passed to *func*.

This function returns *func*, which makes it possible to use it as a decorator.

property `interval`

The time between timer events, in milliseconds.

`remove_callback(self, func, *args, **kwargs)`

Remove *func* from list of callbacks.

*args* and *kwargs* are optional and used to distinguish between copies of the same function registered to be called with different arguments. This behavior is deprecated. In the future, *\*args*, *\*\*kwargs* won't be considered anymore; to keep a specific callback removable by itself, pass it to `add_callback` as a `functools.partial` object.

property `single_shot`

Whether this timer should stop after a single run.

`start(self, interval=None)`

Start the timer object.

### Parameters

**interval** [int, optional] Timer interval in milliseconds; overrides a previously set interval if provided.

`stop(self)`

Stop the timer.

`class matplotlib.backend_bases.ToolContainerBase(toolmanager)`

Bases: `object`

Base class for all tool containers, e.g. toolbars.

### Attributes

**toolmanager** [`ToolManager`] The tools with which this `ToolContainer` wants to communicate.

`add_tool(self, tool, group, position=-1)`

Add a tool to this container.

### Parameters

**tool** [tool\_like] The tool to add, see `ToolManager.get_tool`.

**group** [str] The name of the group to add this tool to.

**position** [int, default: -1] The position within the group to place this tool.

`add_toolitem(self, name, group, position, image, description, toggle)`

Add a toolitem to the container.

This method must be implemented per backend.

The callback associated with the button click event, must be *exactly* `self.trigger_tool(name)`.

### Parameters

**name** [str] Name of the tool to add, this gets used as the tool's ID and as the default label of the buttons.

**group** [str] Name of the group that this tool belongs to.

**position** [int] Position of the tool within its group, if -1 it goes at the end.

**image\_file** [str] Filename of the image for the button or `None`.

**description** [str] Description of the tool, used for the tooltips.

**toggle** [bool]

- `True` : The button is a toggle (change the pressed/unpressed state between consecutive clicks).
- `False` : The button is a normal button (returns to unpressed state after release).

`remove_toolitem(self, name)`

Remove a toolitem from the ToolContainer.

This method must get implemented per backend.

Called when *ToolManager* emits a `tool_removed_event`.

#### Parameters

**name** [str] Name of the tool to remove.

`set_message(self, s)`

Display a message on the toolbar.

#### Parameters

**s** [str] Message text.

`toggle_toolitem(self, name, toggled)`

Toggle the toolitem without firing event.

#### Parameters

**name** [str] Id of the tool to toggle.

**toggled** [bool] Whether to set this tool as toggled or not.

`trigger_tool(self, name)`

Trigger the tool.

#### Parameters

**name** [str] Name (id) of the tool triggered from within the container.

`matplotlib.backend_bases.button_press_handler(event, canvas=None, toolbar=None)`

The default Matplotlib button actions for extra mouse buttons.

Parameters are as for *key\_press\_handler*, except that *event* is a *MouseEvent*.

`matplotlib.backend_bases.get_registered_canvas_class(format)`

Return the registered default canvas for given file format. Handles deferred import of required backend.

`matplotlib.backend_bases.key_press_handler(event, canvas=None, toolbar=None)`

Implement the default Matplotlib key bindings for the canvas and toolbar described at *Navigation Keyboard Shortcuts*.

#### Parameters

**event** [*KeyEvent*] A key press/release event.

**canvas** [*FigureCanvasBase*, default: `event.canvas`] The backend-specific canvas instance. This parameter is kept for back-compatibility, but, if set, should always be equal to `event.canvas`.

**toolbar** [*NavigationToolbar2*, default: `event.canvas.toolbar`] The navigation cursor toolbar. This parameter is kept for back-compatibility, but, if set, should always be equal to `event.canvas.toolbar`.

`matplotlib.backend_bases.register_backend(format, backend, description=None)`

Register a backend for saving to a given file format.

#### Parameters

**format** [str] File extension

**backend** [module string or canvas class] Backend for handling file output

**description** [str, default: ""] Description of the file type.

## 18.8 matplotlib.backend\_managers

`class matplotlib.backend_managers.ToolEvent(name, sender, tool, data=None)`

Bases: *object*

Event for tool manipulation (add/remove).

`class matplotlib.backend_managers.ToolManager(figure=None)`

Bases: *object*

Manager for actions triggered by user interactions (key press, toolbar clicks, ...) on a Figure.

#### Attributes

*figure* [*Figure*] Figure that holds the canvas.

**keypresslock** [*LockDraw*] *LockDraw* object to know if the *canvas* key\_press\_event is locked.

**messagelock** [*LockDraw*] *LockDraw* object to know if the message is available to write.

property *active\_toggle*

Currently toggled tools.

`add_tool(self, name, tool, *args, **kwargs)`

Add *tool* to *ToolManager*.

If successful, adds a new event `tool_trigger_{name}` where {name} is the *name* of the tool; the event is fired every time the tool is triggered.

#### Parameters

**name** [str] Name of the tool, treated as the ID, has to be unique.

**tool** [class\_like, i.e. str or type] Reference to find the class of the Tool to added.

#### See also:

*matplotlib.backend\_tools.ToolBase* The base class for tools.

## Notes

args and kwargs get passed directly to the tools constructor.

property `canvas`

Canvas managed by FigureManager.

property `figure`

Figure that holds the canvas.

`get_tool(self, name, warn=True)`

Return the tool object with the given name.

For convenience, this passes tool objects through.

### Parameters

**name** [str or *ToolBase*] Name of the tool, or the tool itself.

**warn** [bool, default: True] Whether a warning should be emitted if no tool with the given name exists.

### Returns

*ToolBase* or **None** The tool or None if no tool with the given name exists.

`get_tool_keymap(self, name)`

Return the keymap associated with the specified tool.

### Parameters

**name** [str] Name of the Tool.

### Returns

**list of str** List of keys associated with the tool.

`message_event(self, message, sender=None)`

Emit a *ToolManagerMessageEvent*.

`remove_tool(self, name)`

Remove tool named *name*.

### Parameters

**name** [str] Name of the tool.

`set_figure(self, figure, update_tools=True)`

Bind the given figure to the tools.

### Parameters

**figure** [*Figure*]

**update\_tools** [bool, default: True] Force tools to update figure.

`toolmanager_connect(self, s, func)`

Connect event with string *s* to *func*.

### Parameters

**s** [str] The name of the event. The following events are recognized:

- 'tool\_message\_event'
- 'tool\_removed\_event'
- 'tool\_added\_event'

For every tool added a new event is created

- 'tool\_trigger\_TOOLNAME', where TOOLNAME is the id of the tool.

**func** [callable] Callback function for the toolmanager event with signature:

```
def func(event: ToolEvent) -> Any
```

### Returns

**cid** The callback id for the connection. This can be used in *toolmanager\_disconnect*.

`toolmanager_disconnect(self, cid)`

Disconnect callback id *cid*.

Example usage:

```
cid = toolmanager.toolmanager_connect('tool_trigger_zoom', onpress)
#...later
toolmanager.toolmanager_disconnect(cid)
```

property tools

A dict mapping tool name -> controlled tool.

`trigger_tool(self, name, sender=None, canvasevent=None, data=None)`

Trigger a tool and emit the tool\_trigger\_{name} event.

### Parameters

**name** [str] Name of the tool.

**sender** [object] Object that wishes to trigger the tool.

**canvasevent** [Event] Original Canvas event or None.

**data** [object] Extra data to pass to the tool when triggering.

`update_keymap(self, name, key, *args)`

Set the keymap to associate with the specified tool.

### Parameters

**name** [str] Name of the Tool.

**keys** [str or list of str] Keys to associate with the tool.

`class matplotlib.backend_managers.ToolManagerMessageEvent(name, sender, message)`

Bases: *object*

Event carrying messages from toolmanager.

Messages usually get displayed to the user by the toolbar.

`class matplotlib.backend_managers.ToolTriggerEvent(name, sender, tool, canvasevent=None, data=None)`

Bases: *matplotlib.backend\_managers.ToolEvent*

Event to inform that a tool has been triggered.

## 18.9 matplotlib.backend\_tools

Abstract base classes define the primitives for Tools. These tools are used by `matplotlib.backend_managers.ToolManager`

**ToolBase** Simple stateless tool

**ToolToggleBase** Tool that has two states, only one Toggle tool can be active at any given time for the same `matplotlib.backend_managers.ToolManager`

```
class matplotlib.backend_tools.AxisScaleBase(*args, **kwargs)
```

Bases: `matplotlib.backend_tools.ToolToggleBase`

Base Tool to toggle between linear and logarithmic.

`disable(self, event)`

Disable the toggle tool.

*trigger* call this method when toggled is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to `matplotlib.backend_managers.ToolManager.trigger_tool`.
- Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`).

`enable(self, event)`

Enable the toggle tool.

*trigger* calls this method when toggled is False.

`trigger(self, sender, event, data=None)`

Calls `enable` or `disable` based on toggled value.

```
class matplotlib.backend_tools.ConfigureSubplotsBase(toolmanager, name)
```

Bases: `matplotlib.backend_tools.ToolBase`

Base tool for the configuration of subplots.

`description = 'Configure subplots'`

`image = 'subplots'`

```
class matplotlib.backend_tools.Cursors
```

Bases: `enum.IntEnum`

Backend-independent cursor types.

`HAND = 0`

`MOVE = 3`

`POINTER = 1`

`SELECT_REGION = 2`

`WAIT = 4`

```
class matplotlib.backend_tools.RubberbandBase(toolmanager, name)
```

Bases: `matplotlib.backend_tools.ToolBase`

Draw and remove a rubberband.

`draw_rubberband(self, *data)`  
Draw rubberband.

This method must get implemented per backend.

`remove_rubberband(self)`  
Remove rubberband.

This method should get implemented per backend.

`trigger(self, sender, event, data)`  
Call `draw_rubberband` or `remove_rubberband` based on data.

`class matplotlib.backend_tools.SaveFigureBase(toolmanager, name)`

Bases: `matplotlib.backend_tools.ToolBase`

Base tool for figure saving.

`default_keymap = ['s', 'ctrl+s']`

`description = 'Save the figure'`

`image = 'filesave'`

`class matplotlib.backend_tools.SetCursorBase(*args, **kwargs)`

Bases: `matplotlib.backend_tools.ToolBase`

Change to the current cursor while in axes.

This tool, keeps track of all `ToolToggleBase` derived tools, and calls `set_cursor` when a tool gets triggered.

`set_cursor(self, cursor)`  
Set the cursor.

This method has to be implemented per backend.

`set_figure(self, figure)`  
Assign a figure to the tool.

### Parameters

**figure** [`Figure`]

`class matplotlib.backend_tools.ToolBack(toolmanager, name)`

Bases: `matplotlib.backend_tools.ViewsPositionsBase`

Move back up the view limits stack.

`default_keymap = ['left', 'c', 'backspace', 'MouseButton.BACK']`

`description = 'Back to previous view'`

`image = 'back'`

`class matplotlib.backend_tools.ToolBase(toolmanager, name)`

Bases: `object`

Base tool class.

A base tool, only implements `trigger` method or not method at all. The tool is instantiated by `matplotlib.backend_managers.ToolManager`.

### Attributes

**toolmanager** [`matplotlib.backend_managers.ToolManager`] ToolManager that controls this Tool.

**figure** [FigureCanvas] Figure instance that is affected by this Tool.

**name** [str] Tool Id.

property canvas

default\_keymap = None

Keymap to associate with this tool.

**String:** List of comma separated keys that will be used to call this tool when the keypress event of `self.figure.canvas` is emitted.

description = None

Description of the Tool.

**String:** If the Tool is included in the Toolbar this text is used as a Tooltip.

destroy(*self*)

Destroy the tool.

This method is called when the tool is removed by `matplotlib.backend_managers.ToolManager.remove_tool`.

property figure

image = None

Filename of the image.

**String:** Filename of the image to use in the toolbar. If None, the *name* is used as a label in the toolbar button.

property name

Tool Id.

set\_figure(*self*, *figure*)

Assign a figure to the tool.

### Parameters

**figure** [Figure]

property toolmanager

trigger(*self*, *sender*, *event*, *data*=None)

Called when this tool gets used.

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`.

### Parameters

**event** [Event] The canvas event that caused this tool to be called.

**sender** [object] Object that requested the tool to be triggered.

**data** [object] Extra data.

matplotlib.backend\_tools.ToolCopyToClipboard

alias of `matplotlib.backend_tools.ToolCopyToClipboardBase`

class matplotlib.backend\_tools.ToolCopyToClipboardBase(toolmanager, name)

Bases: `matplotlib.backend_tools.ToolBase`

Tool to copy the figure to the clipboard.

default\_keymap = ['ctrl+c', 'cmd+c']

description = 'Copy the canvas figure to clipboard'

```
trigger(self, *args, **kwargs)
```

Called when this tool gets used.

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`.

### Parameters

**event** [*Event*] The canvas event that caused this tool to be called.

**sender** [object] Object that requested the tool to be triggered.

**data** [object] Extra data.

```
class matplotlib.backend_tools.ToolCursorPosition(*args, **kwargs)
```

Bases: `matplotlib.backend_tools.ToolBase`

Send message with the current pointer position.

This tool runs in the background reporting the position of the cursor.

```
send_message(self, event)
```

Call `matplotlib.backend_managers.ToolManager.message_event`.

```
set_figure(self, figure)
```

Assign a figure to the tool.

### Parameters

**figure** [*Figure*]

```
class matplotlib.backend_tools.ToolEnableAllNavigation(toolmanager, name)
```

Bases: `matplotlib.backend_tools._ToolEnableAllNavigation`

[*Deprecated*]

### Notes

Deprecated since version 3.3:

```
class matplotlib.backend_tools.ToolEnableNavigation(toolmanager, name)
```

Bases: `matplotlib.backend_tools._ToolEnableNavigation`

[*Deprecated*]

### Notes

Deprecated since version 3.3:

```
class matplotlib.backend_tools.ToolForward(toolmanager, name)
```

Bases: `matplotlib.backend_tools.ViewsPositionsBase`

Move forward in the view lim stack.

```
default_keymap = ['right', 'v', 'MouseButton.FORWARD']
```

```
description = 'Forward to next view'
```

```
image = 'forward'
```

```
class matplotlib.backend_tools.ToolFullScreen(*args, **kwargs)
```

Bases: `matplotlib.backend_tools.ToolToggleBase`

Tool to toggle full screen.

```

default_keymap = ['f', 'ctrl+f']
description = 'Toggle fullscreen mode'
disable(self, event)
    Disable the toggle tool.
    trigger call this method when toggled is True.
    This can happen in different circumstances.
        • Click on the toolbar tool button.
        • Call to matplotlib.backend_managers.ToolManager.trigger_tool.
        • Another ToolToggleBase derived tool is triggered (from the same ToolManager).
enable(self, event)
    Enable the toggle tool.
    trigger calls this method when toggled is False.
class matplotlib.backend_tools.ToolGrid(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Tool to toggle the major grids of the figure.
    default_keymap = ['g']
    description = 'Toggle major grids'
    trigger(self, sender, event, data=None)
        Called when this tool gets used.
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool.

```

**Parameters**

- event** [*Event*] The canvas event that caused this tool to be called.
- sender** [object] Object that requested the tool to be triggered.
- data** [object] Extra data.

```

class matplotlib.backend_tools.ToolHelpBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    default_keymap = ['f1']
    description = 'Print tool list, shortcuts and description'
    static format_shortcut(key_sequence)
        Converts a shortcut string from the notation used in rc config to the standard notation for displaying shortcuts, e.g. 'ctrl+a' -> 'Ctrl+A'.
    image = 'help'
class matplotlib.backend_tools.ToolHome(toolmanager, name)
    Bases: matplotlib.backend_tools.ViewsPositionsBase
    Restore the original view limits.
    default_keymap = ['h', 'r', 'home']
    description = 'Reset original view'
    image = 'home'

```

```
class matplotlib.backend_tools.ToolMinorGrid(toolmanager, name)
```

Bases: *matplotlib.backend\_tools.ToolBase*

Tool to toggle the major and minor grids of the figure.

default\_keymap = ['G']

description = 'Toggle major and minor grids'

trigger(*self*, *sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *matplotlib.backend\_managers.ToolManager.trigger\_tool*.

#### Parameters

**event** [*Event*] The canvas event that caused this tool to be called.

**sender** [object] Object that requested the tool to be triggered.

**data** [object] Extra data.

```
class matplotlib.backend_tools.ToolPan(*args)
```

Bases: *matplotlib.backend\_tools.ZoomPanBase*

Pan axes with left mouse, zoom with right.

cursor = 3

default\_keymap = ['p']

description = 'Pan axes with left mouse, zoom with right'

image = 'move'

radio\_group = 'default'

```
class matplotlib.backend_tools.ToolQuit(toolmanager, name)
```

Bases: *matplotlib.backend\_tools.ToolBase*

Tool to call the figure manager destroy method.

default\_keymap = ['ctrl+w', 'cmd+w', 'q']

description = 'Quit the figure'

trigger(*self*, *sender*, *event*, *data=None*)

Called when this tool gets used.

This method is called by *matplotlib.backend\_managers.ToolManager.trigger\_tool*.

#### Parameters

**event** [*Event*] The canvas event that caused this tool to be called.

**sender** [object] Object that requested the tool to be triggered.

**data** [object] Extra data.

```
class matplotlib.backend_tools.ToolQuitAll(toolmanager, name)
```

Bases: *matplotlib.backend\_tools.ToolBase*

Tool to call the figure manager destroy method.

default\_keymap = []

description = 'Quit all figures'

`trigger(self, sender, event, data=None)`

Called when this tool gets used.

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`.

### Parameters

**event** [*Event*] The canvas event that caused this tool to be called.

**sender** [object] Object that requested the tool to be triggered.

**data** [object] Extra data.

`class matplotlib.backend_tools.ToolToggleBase(*args, **kwargs)`

Bases: `matplotlib.backend_tools.ToolBase`

Toggleable tool.

Every time it is triggered, it switches between enable and disable.

### Parameters

**“\*args”** Variable length argument to be used by the Tool.

**“\*\*kwargs”** *toggle*d if present and True, sets the initial state of the Tool  
Arbitrary keyword arguments to be consumed by the Tool

`cursor = None`

Cursor to use when the tool is active.

`default_toggled = False`

Default of toggled state.

`disable(self, event=None)`

Disable the toggle tool.

*trigger* call this method when *toggle*d is True.

This can happen in different circumstances.

- Click on the toolbar tool button.
- Call to `matplotlib.backend_managers.ToolManager.trigger_tool`.
- Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`).

`enable(self, event=None)`

Enable the toggle tool.

*trigger* calls this method when *toggle*d is False.

`radio_group = None`

Attribute to group 'radio' like tools (mutually exclusive).

**String** that identifies the group or **None** if not belonging to a group.

`set_figure(self, figure)`

Assign a figure to the tool.

### Parameters

**figure** [*Figure*]

property *toggle*d

State of the toggled tool.

`trigger(self, sender, event, data=None)`

Calls *enable* or *disable* based on *toggle*d value.

```
class matplotlib.backend_tools.ToolViewsPositions(*args, **kwargs)
```

Bases: *matplotlib.backend\_tools.ToolBase*

Auxiliary Tool to handle changes in views and positions.

Runs in the background and should get used by all the tools that need to access the figure's history of views and positions, e.g.

- *ToolZoom*
- *ToolPan*
- *ToolHome*
- *ToolBack*
- *ToolForward*

```
add_figure(self, figure)
```

Add the current figure to the stack of views and positions.

```
back(self)
```

Back one step in the stack of views and positions.

```
clear(self, figure)
```

Reset the axes stack.

```
forward(self)
```

Forward one step in the stack of views and positions.

```
home(self)
```

Recall the first view and position from the stack.

```
push_current(self, figure=None)
```

Push the current view limits and position onto their respective stacks.

```
refresh_locators(self)
```

[*Deprecated*] Redraw the canvases, update the locators.

### Notes

Deprecated since version 3.3.

```
update_home_views(self, figure=None)
```

Make sure that `self.home_views` has an entry for all axes present in the figure.

```
update_view(self)
```

Update the view limits and position for each axes from the current stack position. If any axes are present in the figure that aren't in the current stack position, use the home view limits for those axes and don't update *any* positions.

```
class matplotlib.backend_tools.ToolXScale(*args, **kwargs)
```

Bases: *matplotlib.backend\_tools.AxisScaleBase*

Tool to toggle between linear and logarithmic scales on the X axis.

```
default_keymap = ['k', 'L']
```

```
description = 'Toggle scale X axis'
```

```
set_scale(self, ax, scale)
```

```
class matplotlib.backend_tools.ToolYScale(*args, **kwargs)
    Bases: matplotlib.backend_tools.AxisScaleBase
    Tool to toggle between linear and logarithmic scales on the Y axis.
    default_keymap = ['l']
    description = 'Toggle scale Y axis'
    set_scale(self, ax, scale)

class matplotlib.backend_tools.ToolZoom(*args)
    Bases: matplotlib.backend_tools.ZoomPanBase
    A Tool for zooming using a rectangle selector.
    cursor = 2
    default_keymap = ['o']
    description = 'Zoom to rectangle'
    image = 'zoom_to_rect'
    radio_group = 'default'

class matplotlib.backend_tools.ViewsPositionsBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Base class for ToolHome, ToolBack and ToolForward.
    trigger(self, sender, event, data=None)
        Called when this tool gets used.
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool.
```

### Parameters

- event** [*Event*] The canvas event that caused this tool to be called.
- sender** [object] Object that requested the tool to be triggered.
- data** [object] Extra data.

```
class matplotlib.backend_tools.ZoomPanBase(*args)
    Bases: matplotlib.backend_tools.ToolToggleBase
    Base class for ToolZoom and ToolPan.
    disable(self, event)
        Release the canvas and disconnect press/release events.
    enable(self, event)
        Connect press/release events and lock the canvas.
    scroll_zoom(self, event)
    trigger(self, sender, event, data=None)
        Calls enable or disable based on toggled value.

matplotlib.backend_tools.add_tools_to_container(container, tools=[['navigation',
    ['home', 'back', 'forward']], ['zoom-pan', ['pan', 'zoom', 'subplots']], ['io',
    ['save', 'help']]])
```

Add multiple tools to the container.

### Parameters

**container** [Container] backend\_bases.ToolContainerBase object that will get the tools added.

**tools** [list, optional] List in the form [[group1, [tool1, tool2 ...]], [group2, [...]]] where the tools [tool1, tool2, ...] will display in group1. See add\_tool for details.

```
matplotlib.backend_tools.add_tools_to_manager(toolmanager, tools={'home': <class
    'matplotlib.backend_tools.ToolHome'>,
    'back': <class 'matplotlib.backend_tools.ToolBack'>,
    'forward': <class 'matplotlib.backend_tools.ToolForward'>,
    'zoom': <class 'matplotlib.backend_tools.ToolZoom'>,
    'pan': <class 'matplotlib.backend_tools.ToolPan'>,
    'subplots': 'ToolConfigureSubplots',
    'save': 'ToolSaveFigure', 'grid': <class
    'matplotlib.backend_tools.ToolGrid'>,
    'grid_minor': <class 'matplotlib.backend_tools.ToolMinorGrid'>,
    'fullscreen': <class 'matplotlib.backend_tools.ToolFullScreen'>,
    'quit': <class 'matplotlib.backend_tools.ToolQuit'>,
    'quit_all': <class 'matplotlib.backend_tools.ToolQuitAll'>,
    'allnav': <class 'matplotlib.backend_tools.ToolEnableAllNavigation'>,
    'nav': <class 'matplotlib.backend_tools.ToolEnableNavigation'>,
    'xscale': <class 'matplotlib.backend_tools.ToolXScale'>,
    'yscale': <class 'matplotlib.backend_tools.ToolYScale'>,
    'position': <class 'matplotlib.backend_tools.ToolCursorPosition'>,
    'viewpos': <class 'matplotlib.backend_tools.ToolViewsPositions'>,
    'cursor': 'ToolSetCursor', 'rubberband':
    'ToolRubberband', 'help': 'ToolHelp',
    'copy': 'ToolCopyToClipboard'})
```

Add multiple tools to a *ToolManager*.

### Parameters

**toolmanager** [*backend\_managers.ToolManager*] Manager to which the tools are added.

**tools** [{str: class\_like}, optional] The tools to add in a {name: tool} dict, see add\_tool for more info.

matplotlib.backend\_tools.cursors  
alias of *matplotlib.backend\_tools.Cursors*

matplotlib.backend\_tools.default\_toolbar\_tools = [['navigation', ['home', 'back', 'forward']], ['zoompan

Default tools in the toolbar

```
matplotlib.backend_tools.default_tools = {'allnav': <class 'matplotlib.backend_tools._ToolEnableAllNav>
Default tools
```

## 18.10 matplotlib.backends

### 18.10.1 matplotlib.backends.backend\_mixed

```
class matplotlib.backends.backend_mixed.MixedModeRenderer(figure, width, height,
                                                         dpi, vector_renderer,
                                                         raster_renderer_class=None,
                                                         bbox_inches_restore=None)
```

Bases: `object`

A helper class to implement a renderer that switches between vector and raster drawing. An example may be a PDF writer, where most things are drawn with PDF vector commands, but some very complex objects, such as quad meshes, are rasterised and then output as images.

#### Parameters

**figure** [`matplotlib.figure.Figure`] The figure instance.

**width** [scalar] The width of the canvas in logical units

**height** [scalar] The height of the canvas in logical units

**dpi** [float] The dpi of the canvas

**vector\_renderer** [`matplotlib.backends.backend_bases.RendererBase`] An instance of a subclass of `RendererBase` that will be used for the vector drawing.

**raster\_renderer\_class** [`matplotlib.backends.backend_bases.RendererBase`] The renderer class to use for the raster drawing. If not provided, this will use the Agg backend (which is currently the only viable option anyway.)

`start_rasterizing(self)`

Enter "raster" mode. All subsequent drawing commands (until `stop_rasterizing` is called) will be drawn with the raster backend.

`stop_rasterizing(self)`

Exit "raster" mode. All of the drawing that was done since the last `start_rasterizing` call will be copied to the vector backend by calling `draw_image`.

If `start_rasterizing` has been called multiple times, `stop_rasterizing` must be called the same number of times before "raster" mode is exited.

### 18.10.2 matplotlib.backends.backend\_template

A fully functional, do-nothing backend intended as a template for backend writers. It is fully functional in that you can select it as a backend e.g. with

```
import matplotlib
matplotlib.use("template")
```

and your program will (should!) run without error, though no output is produced. This provides a starting point for backend writers; you can selectively implement drawing methods (*draw\_path*, *draw\_image*, etc.) and slowly see your figure come to life instead having to have a full blown implementation before getting any results.

Copy this file to a directory outside of the Matplotlib source tree, somewhere where Python can import it (by adding the directory to your `sys.path` or by packaging it as a normal Python package); if the backend is importable as `import my.backend` you can then select it using

```
import matplotlib
matplotlib.use("module://my.backend")
```

If your backend implements support for saving figures (i.e. has a `print_xyz` method), you can register it as the default handler for a given file type:

```
from matplotlib.backend_bases import register_backend
register_backend('xyz', 'my_backend', 'XYZ File Format')
...
plt.savefig("figure.xyz")
```

```
matplotlib.backends.backend_template.FigureCanvas
    alias of matplotlib.backends.backend_template.FigureCanvasTemplate
class matplotlib.backends.backend_template.FigureCanvasTemplate(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase
```

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc.

Note: GUI templates will want to connect events for button presses, mouse movements and key presses to functions that call the base class methods `button_press_event`, `button_release_event`, `motion_notify_event`, `key_press_event`, and `key_release_event`. See the implementations of the interactive backends for examples.

### Attributes

**figure** [*matplotlib.figure.Figure*] A high-level Figure instance

**draw(*self*)**

Draw the figure using the renderer.

**filetypes** = {'eps': 'Encapsulated Postscript', 'foo': 'My magic Foo format', 'jpeg': 'Joint Photog

**get\_default\_filetype(*self*)**

Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

**print\_foo(*self*, *filename*, \**args*, \*\**kwargs*)**

Write out format foo. The dpi, facecolor and edgecolor are restored to their original values after this call, so you don't need to save and restore them.

```
matplotlib.backends.backend_template.FigureManager
    alias of matplotlib.backends.backend_template.FigureManagerTemplate
```

```
class matplotlib.backends.backend_template.FigureManagerTemplate(canvas, num)
    Bases: matplotlib.backend_bases.FigureManagerBase
```

Helper class for pyplot mode, wraps everything up into a neat bundle.

For non-interactive backends, the base class is sufficient.

```
class matplotlib.backends.backend_template.GraphicsContextTemplate
    Bases: matplotlib.backends_bases.GraphicsContextBase
```

The graphics context provides the color, line styles, etc... See the cairo and postscript backends for examples of mapping the graphics context attributes (cap styles, join styles, line widths, colors) to a particular backend. In cairo this is done by wrapping a `cairo.Context` object and forwarding the appropriate calls to it using a dictionary mapping styles to gdk constants. In Postscript, all the work is done by the renderer, mapping line styles to postscript calls.

If it's more appropriate to do the mapping at the renderer level (as in the postscript backend), you don't need to override any of the GC methods. If it's more appropriate to wrap an instance (as in the cairo backend) and do the mapping here, you'll need to override several of the setter methods.

The base `GraphicsContext` stores colors as a RGB tuple on the unit interval, e.g., (0.5, 0.0, 1.0). You may need to map this to colors appropriate for your backend.

```
class matplotlib.backends.backend_template.RendererTemplate(dpi)
    Bases: matplotlib.backends_bases.RendererBase
```

The renderer handles drawing/rendering operations.

This is a minimal do-nothing class that can be used to get started when writing a new backend. Refer to `backend_bases.RendererBase` for documentation of the methods.

```
draw_image(self, gc, x, y, im)
    Draw an RGBA image.
```

#### Parameters

- gc** [*GraphicsContextBase*] A graphics context with clipping information.
- x** [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- y** [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- im** [array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image()` returns `True`, an affine transformation (i.e., an *Affine2DBase*) may be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override `x` and `y`, and has to be applied *before* translating the result by `x` and `y` (this can be accomplished by adding `x` and `y` to the translation vector defined by *transform*).

```
draw_path(self, gc, path, transform, rgbFace=None)
    Draw a Path instance using the given affine transform.
```

```
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
    Draw the text instance.
```

#### Parameters

- gc** [*GraphicsContextBase*] The graphics context.

**x** [float] The x location of the text in display coords.  
**y** [float] The y location of the text baseline in display coords.  
**s** [str] The text string.  
**prop** [*matplotlib.font\_manager.FontProperties*] The font properties.  
**angle** [float] The rotation angle in degrees anti-clockwise.  
**mtext** [*matplotlib.text.Text*] The original text object to be rendered.

## Notes

### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to `if 1`, and then the actual bounding box will be plotted along with your text.

`flipy(self)`

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

`get_canvas_width_height(self)`

Return the canvas width and height in display coords.

`get_text_width_height_descent(self, s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string `s` with *FontProperties* `prop`.

`new_gc(self)`

Return an instance of a *GraphicsContextBase*.

`points_to_pixels(self, points)`

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

## Parameters

**points** [float or array-like] a float or a numpy array of float

## Returns

### Points converted to pixels

`matplotlib.backends.backend_template.draw_if_interactive()`

For image backends - is not required. For GUI backends - this should be overridden if drawing should be done in interactive python mode.

```
matplotlib.backends.backend_template.new_figure_manager(num, *args, Figure-
                                                         Class=<class      'mat-
                                                         plotlib.figure.Figure'>,
                                                         **kwargs)
```

Create a new figure manager instance.

```
matplotlib.backends.backend_template.new_figure_manager_given_figure(num, figure)
```

Create a new figure manager instance for the given figure.

```
matplotlib.backends.backend_template.show(*, block=None)
```

For image backends - is not required. For GUI backends - show() is usually the last line of a pyplot script and tells the backend that it is time to draw. In interactive mode, this should do nothing.

### 18.10.3 matplotlib.backends.backend\_agg

An **agg** backend.

Features that are implemented:

- capstyles and join styles
- dashes
- linewidth
- lines, rectangles, ellipses
- clipping to a rectangle
- output to RGBA and Pillow-supported image formats
- alpha blending
- DPI scaling properly - everything scales properly (dashes, linewidths, etc)
- draw polygon
- freetype2 w/ ft2font

TODO:

- integrate screen dpi w/ ppi and text

```
matplotlib.backends.backend_agg.FigureCanvas
    alias of matplotlib.backends.backend_agg.FigureCanvasAgg
```

```
class matplotlib.backends.backend_agg.FigureCanvasAgg(figure)
```

Bases: `matplotlib.backend_bases.FigureCanvasBase`

```
buffer_rgba(self)
```

Get the image as a `memoryview` to the renderer's buffer.

`draw` must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

```
copy_from_bbox(self, bbox)
```

```
draw(self)
```

Render the *Figure*.

```
get_renderer(self, cleared=False)
```

```
print_jpeg(self, filename_or_obj, *args, dryrun=<deprecated parameter>,
           pil_kwargs=None, **kwargs)
Write the figure to a JPEG file.
```

#### Parameters

**filename\_or\_obj** [str or path-like or file-like] The file to write to.

#### Other Parameters

**quality** [int, default: `rcParams["savefig.jpeg_quality"]` (default: 95)] The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality. This parameter is deprecated.

**optimize** [bool, default: False] Whether the encoder should make an extra pass over the image in order to select optimal encoder settings. This parameter is deprecated.

**progressive** [bool, default: False] Whether the image should be stored as a progressive JPEG file. This parameter is deprecated.

**pil\_kwargs** [dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure. These take precedence over *quality*, *optimize* and *progressive*.

```
print_jpg(self, filename_or_obj, *args, dryrun=<deprecated parameter>,
          pil_kwargs=None, **kwargs)
Write the figure to a JPEG file.
```

#### Parameters

**filename\_or\_obj** [str or path-like or file-like] The file to write to.

#### Other Parameters

**quality** [int, default: `rcParams["savefig.jpeg_quality"]` (default: 95)] The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality. This parameter is deprecated.

**optimize** [bool, default: False] Whether the encoder should make an extra pass over the image in order to select optimal encoder settings. This parameter is deprecated.

**progressive** [bool, default: False] Whether the image should be stored as a progressive JPEG file. This parameter is deprecated.

**pil\_kwargs** [dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure. These take precedence over *quality*, *optimize* and *progressive*.

```
print_png(self, filename_or_obj, *args, metadata=None, pil_kwargs=None)
Write the figure to a PNG file.
```

#### Parameters

**filename\_or\_obj** [str or path-like or file-like] The file to write to.

**metadata** [dict, optional] Metadata in the PNG file as key-value pairs of bytes or latin-1 encodable strings. According to the PNG specification, keys must be shorter than 79 chars.

The [PNG specification](#) defines some common keywords that may be used as appropriate:

- Title: Short (one line) title or caption for image.
- Author: Name of image's creator.
- Description: Description of image (possibly long).
- Copyright: Copyright notice.
- Creation Time: Time of original image creation (usually RFC 1123 format).
- Software: Software used to create the image.
- Disclaimer: Legal disclaimer.
- Warning: Warning of nature of content.
- Source: Device used to create the image.
- Comment: Miscellaneous comment; conversion from other image format.

Other keywords may be invented for other purposes.

If 'Software' is not given, an autogenerated value for Matplotlib will be used. This can be removed by setting it to *None*.

For more details see the [PNG specification](#).

**pil\_kwargs** [dict, optional] Keyword arguments passed to [PIL.Image.Image.save](#).

If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

```
print_raw(self, filename_or_obj, *args)
```

```
print_rgba(self, filename_or_obj, *args)
```

```
print_tif(self, filename_or_obj, *, dryrun=<deprecated parameter>,
          pil_kwargs=None)
```

```
print_tiff(self, filename_or_obj, *, dryrun=<deprecated parameter>,
            pil_kwargs=None)
```

```
print_to_buffer(self)
```

```
restore_region(self, region, bbox=None, xy=None)
```

```
tostring_argb(self)
```

Get the image as ARGB bytes.

*draw* must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

```
tostring_rgb(self)
```

Get the image as RGB bytes.

*draw* must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.

```
class matplotlib.backends.backend_agg.RendererAgg(width, height, dpi)
```

Bases: [matplotlib.backend\\_bases.RendererBase](#)

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles

`buffer_rgba(self)`

`clear(self)`

`draw_mathtext(self, gc, x, y, s, prop, angle)`

Draw mathtext using `matplotlib.mathtext`.

`draw_path(self, gc, path, transform, rgbFace=None)`

Draw a `Path` instance using the given affine transform.

`draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyle, antialiaseds, urls, offset_position)`

Draw a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyle` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied.

`offset_position` may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

`draw_tex(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None)`

`draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)`

Draw the text instance.

### Parameters

**gc** [`GraphicsContextBase`] The graphics context.

**x** [float] The x location of the text in display coords.

**y** [float] The y location of the text baseline in display coords.

**s** [str] The text string.

**prop** [`matplotlib.font_manager.FontProperties`] The font properties.

**angle** [float] The rotation angle in degrees anti-clockwise.

**mtext** [`matplotlib.text.Text`] The original text object to be rendered.

### Notes

#### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`get_canvas_width_height(self)`

Return the canvas width and height in display coords.

`get_text_width_height_descent(self, s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

`lock = <unlocked _thread.RLock object owner=0 count=0>`

`option_image_nocomposite(self)`

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not `rcParams["image.composite_image"]`.

`option_scale_image(self)`

Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

`points_to_pixels(self, points)`

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

## Parameters

**points** [float or array-like] a float or a numpy array of float

## Returns

### Points converted to pixels

`restore_region(self, region, bbox=None, xy=None)`

Restore the saved region. If *bbox* (instance of *BboxBase*, or its extents) is given, only the region specified by the *bbox* will be restored. *xy* (a pair of floats) optionally specifies the new position (the LLC of the original region, not the LLC of the *bbox*) where the region will be restored.

```
>>> region = renderer.copy_from_bbox()
>>> x1, y1, x2, y2 = region.get_extents()
>>> renderer.restore_region(region, bbox=(x1+dx, y1, x2, y2),
...                               xy=(x1-dx, y1))
```

`start_filter(self)`

Start filtering. It simply create a new canvas (the old one is saved).

`stop_filter(self, post_processing)`

Save the plot in the current canvas as a image and apply the *post\_processing* function.

```
def post_processing(image, dpi): # ny, nx, depth = image.shape # image
    (numpy array) has RGBA channels and has a depth of 4. ... # create
```

a new `image` (numpy array of 4 channels, size can be # different). The resulting image may have offsets from # lower-left corner of the original image return `new_image`, `offset_x`, `offset_y`

The saved renderer is restored and the returned image from `post_processing` is plotted (using `draw_image`) on it.

```
tostring_argb(self)
tostring_rgb(self)
tostring_rgba_minimized(self)
matplotlib.backends.backend_agg.get_hinting_flag()
```

### 18.10.4 matplotlib.backends.backend\_cairo

#### A Cairo backend for matplotlib

**Author** Steve Chaplin and others

This backend depends on `cairocffi` or `pycairo`.

```
matplotlib.backends.backend_cairo.FigureCanvas
    alias of matplotlib.backends.backend_cairo.FigureCanvasCairo
class matplotlib.backends.backend_cairo.FigureCanvasCairo(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase
    copy_from_bbox(self, bbox)
    print_pdf(self, fobj, *args, **kwargs)
    print_png(self, fobj)
    print_ps(self, fobj, *args, **kwargs)
    print_raw(self, fobj)
    print_rgba(self, fobj)
    print_svg(self, fobj, *args, **kwargs)
    print_svgz(self, fobj, *args, **kwargs)
    restore_region(self, region)
class matplotlib.backends.backend_cairo.GraphicsContextCairo(renderer)
    Bases: matplotlib.backend_bases.GraphicsContextBase
    get_rgb(self)
        Return a tuple of three or four floats from 0-1.
    restore(self)
        Restore the graphics context from the stack - needed only for backends that save
        graphics contexts on a stack.
    set_alpha(self, alpha)
        Set the alpha value used for blending - not supported on all backends.

        If alpha=None (the default), the alpha components of the foreground and fill colors
        will be used to set their respective transparencies (where applicable); otherwise,
        alpha will override them.
```

`set_capstyle(self, cs)`  
Set the capstyle to be one of ('butt', 'round', 'projecting').

`set_clip_path(self, path)`  
Set the clip path and transformation.

#### Parameters

**path** [*TransformedPath* or None]

`set_clip_rectangle(self, rectangle)`  
Set the clip rectangle with sequence (left, bottom, width, height)

`set_dashes(self, offset, dashes)`  
Set the dash style for the gc.

#### Parameters

**dash\_offset** [float or None] The offset (usually 0).

**dash\_list** [array-like or None] The on-off sequence as points.

#### Notes

(None, None) specifies a solid line.

See p. 107 of to PostScript [blue book](#) for more info.

`set_foreground(self, fg, isRGBA=None)`  
Set the foreground color.

#### Parameters

**fg** [color]

**isRGBA** [bool] If *fg* is known to be an (r, g, b, a) tuple, *isRGBA* can be set to True to improve performance.

`set_joinstyle(self, js)`  
Set the join style to be one of ('miter', 'round', 'bevel').

`set_linewidth(self, w)`  
Set the linewidth in points.

`class matplotlib.backends.backend_cairo.RendererCairo(dpi)`

Bases: *matplotlib.backend\_bases.RendererBase*

`draw_image(self, gc, x, y, im)`  
Draw an RGBA image.

#### Parameters

**gc** [*GraphicsContextBase*] A graphics context with clipping information.

**x** [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y** [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im** [array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

**transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image()` returns `True`, an affine transformation (i.e., an *Affine2DBase*) may be passed to *draw\_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override `x` and `y`, and has to be applied *before* translating the result by `x` and `y` (this can be accomplished by adding `x` and `y` to the translation vector defined by *transform*).

`draw_markers(self, gc, marker_path, marker_trans, path, transform, rgbFace=None)`  
Draw a marker at each of the vertices in *path*.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to *draw\_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

#### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_path(self, gc, path, transform, rgbFace=None)`  
Draw a *Path* instance using the given affine transform.

`draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)`  
Draw the text instance.

#### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**x** [float] The x location of the text in display coords.

**y** [float] The y location of the text baseline in display coords.

**s** [str] The text string.

**prop** [*matplotlib.font\_manager.FontProperties*] The font properties.

**angle** [float] The rotation angle in degrees anti-clockwise.

**mtext** [*matplotlib.text.Text*] The original text object to be rendered.

#### Notes

##### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to `if 1`, and then the actual bounding box will be plotted along with your text.

```

property fontangles
property fontweights
get_canvas_width_height(self)
    Return the canvas width and height in display coords.
get_text_width_height_descent(self, s, prop, ismath)
    Get the width, height, and descent (offset from the bottom to the baseline), in display
    coords, of the string s with FontProperties prop.
new_gc(self)
    Return an instance of a GraphicsContextBase.
points_to_pixels(self, points)
    Convert points to display units.

    You need to override this function (unless your backend doesn't have a dpi, e.g.,
    postscript or svg). Some imaging systems assume some value for pixels per inch:

```

```

points to pixels = points * pixels_per_inch/72 * dpi/72

```

**Parameters**

**points** [float or array-like] a float or a numpy array of float

**Returns**

**Points converted to pixels**

```

set_ctx_from_surface(self, surface)
set_width_height(self, width, height)

```

**18.10.5 matplotlib.backends.backend\_gtk3agg**

**TODO** We'll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

**18.10.6 matplotlib.backends.backend\_gtk3cairo**

**TODO** We'll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

**18.10.7 matplotlib.backends.backend\_nbagg**

Interactive figures in the IPython notebook

```

class matplotlib.backends.backend_nbagg.CommSocket(manager)
    Bases: object

```

Manages the Comm connection between IPython and the browser (client).

Comms are 2 way, with the CommSocket being able to publish a message via the `send_json` method, and handle a message with `on_message`. On the JS side `figure.send_message` and `figure.ws.onmessage` do the sending and receiving respectively.

```
is_open(self)
on_close(self)
on_message(self, message)
send_binary(self, blob)
send_json(self, content)

matplotlib.backends.backend_nbagg.FigureCanvas
    alias of matplotlib.backends.backend_nbagg.FigureCanvasNbAgg

class matplotlib.backends.backend_nbagg.FigureCanvasNbAgg(*args, **kwargs)
    Bases: matplotlib.backends.backend_webagg_core.FigureCanvasWebAggCore

matplotlib.backends.backend_nbagg.FigureManager
    alias of matplotlib.backends.backend_nbagg.FigureManagerNbAgg

class matplotlib.backends.backend_nbagg.FigureManagerNbAgg(canvas, num)
    Bases: matplotlib.backends.backend_webagg_core.FigureManagerWebAgg

    ToolbarCls
        alias of NavigationIPy

    clearup_closed(self)
        Clear up any closed Comms.

    property connected

    destroy(self)

    display_js(self)

    classmethod get_javascript(stream=None)

    remove_comm(self, comm_id)

    reshow(self)
        A special method to re-show the figure in the notebook.

    show(self)
        For GUI backends, show the figure window and redraw. For non-GUI backends,
        raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY);
        this exception is converted to a warning in Figure.show.

class matplotlib.backends.backend_nbagg.NavigationIPy(canvas)
    Bases: matplotlib.backends.backend_webagg_core.NavigationToolbar2WebAgg

    toolitems = [('Home', 'Reset original view', 'fa fa-home icon-home', 'home'), ('Back', 'Back to pre

matplotlib.backends.backend_nbagg.connection_info()
    Return a string showing the figure and connection status for the backend.

    This is intended as a diagnostic tool, and not for general use.

matplotlib.backends.backend_nbagg.new_figure_manager_given_figure(num, figure)
    Create a new figure manager instance for the given figure.

matplotlib.backends.backend_nbagg.show(block=None)
    Show all figures.

    show blocks by calling mainloop if block is True, or if it is None and we are neither in
    IPython's %pylab mode, nor in interactive mode.
```

### 18.10.8 matplotlib.backends.backend\_pdf

A PDF matplotlib backend Author: Jouni K Seppänen <jks@iki.fi>

`matplotlib.backends.backend_pdf.FigureCanvas`  
 alias of `matplotlib.backends.backend_pdf.FigureCanvasPdf`

`class matplotlib.backends.backend_pdf.FigureCanvasPdf(figure)`  
 Bases: `matplotlib.backends.backend_bases.FigureCanvasBase`

The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc...

#### Attributes

**figure** [`matplotlib.figure.Figure`] A high-level Figure instance

`filetypes = {'pdf': 'Portable Document Format'}`

`fixed_dpi = 72`

`get_default_filetype(self)`

Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

`print_pdf(self, filename, *, dpi=72, bbox_inches_restore=None, metadata=None)`

`class matplotlib.backends.backend_pdf.GraphicsContextPdf(file)`

Bases: `matplotlib.backends.backend_bases.GraphicsContextBase`

`alpha_cmd(self, alpha, forced, effective_alphas)`

`capstyle_cmd(self, style)`

`capstyles = {'butt': 0, 'projecting': 2, 'round': 1}`

`clip_cmd(self, cliprect, clippath)`

Set clip rectangle. Calls `pop()` and `push()`.

`commands = (((('_cliprect', '_clippath'), <function GraphicsContextPdf.clip_cmd>), (('alpha', '_for`

`copy_properties(self, other)`

Copy properties of other into self.

`dash_cmd(self, dashes)`

`delta(self, other)`

Copy properties of other into self and return PDF commands needed to transform self into other.

`fill(self, *args)`

Predicate: does the path need to be filled?

An optional argument can be used to specify an alternative `_fillcolor`, as needed by `RendererPdf.draw_markers`.

`fillcolor_cmd(self, rgb)`

`finalize(self)`

Make sure every pushed graphics state is popped.

`hatch_cmd(self, hatch, hatch_color)`

```
joinstyle_cmd(self, style)
joinstyles = {'bevel': 2, 'miter': 0, 'round': 1}
linewidth_cmd(self, width)
paint(self)
    Return the appropriate pdf operator to cause the path to be stroked, filled, or both.
pop(self)
push(self)
rgb_cmd(self, rgb)
stroke(self)
    Predicate: does the path need to be stroked (its outline drawn)? This tests for the
    various conditions that disable stroking the path, in which case it would presumably
    be filled.

class matplotlib.backends.backend_pdf.Name(name)
    Bases: object
    PDF name object.
    static hexify(match)
    name
    pdfRepr(self)

class matplotlib.backends.backend_pdf.Operator(op)
    Bases: object
    PDF operator object.
    op
    pdfRepr(self)

class matplotlib.backends.backend_pdf.PdfFile(filename, metadata=None)
    Bases: object
    PDF file object.
```

### Parameters

**filename** [str or path-like or file-like] Output target; if a string, a file will be opened for writing.

**metadata** [dict from strings to strings and dates] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: {'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

```
addGouraudTriangles(self, points, colors)
    Add a Gouraud triangle shading.
```

### Parameters

**points** [np.ndarray] Triangle vertices, shape (n, 3, 2) where n = number of triangles, 3 = vertices, 2 = x, y.

**colors** [np.ndarray] Vertex colors, shape (n, 3, 1) or (n, 3, 4) as with points, but last dimension is either (gray,) or (r, g, b, alpha).

### Returns

#### Name, Reference

`alphaState(self, alpha)`

Return name of an ExtGState that sets alpha to the given value.

`beginStream(self, id, len, extra=None, png=None)`

`close(self)`

Flush all buffers and free all resources.

`createType1Descriptor(self, t1font, fontfile)`

`dviFontName(self, dvifont)`

Given a dvi font object, return a name suitable for Op.selectfont. This registers the font information in self.dviFontInfo if not yet registered.

`embedTTF(self, filename, characters)`

Embed the TTF font from the named file into the document.

`endStream(self)`

`finalize(self)`

Write out the various deferred objects and the pdf end matter.

`fontName(self, fontprop)`

Select a font based on fontprop and return a name suitable for Op.selectfont. If fontprop is a string, it will be interpreted as the filename of the font.

`hatchPattern(self, hatch_style)`

`imageObject(self, image)`

Return name of an image XObject representing the given image.

`markerObject(self, path, trans, fill, stroke, lw, joinstyle, capstyle)`

Return name of a marker XObject representing the given path.

`newPage(self, width, height)`

`newTextnote(self, text, positionRect=[-100, -100, 0, 0])`

`output(self, *data)`

`pathCollectionObject(self, gc, path, trans, padding, filled, stroked)`

`static pathOperations(path, transform, clip=None, simplify=None, sketch=None)`

`recordXref(self, id)`

`reserveObject(self, name="")`

Reserve an ID for an indirect object.

The name is used for debugging in case we forget to print out the object with writeObject.

`property used_characters`

`write(self, data)`

`writeExtGStates(self)`

```
writeFonts(self)
writeGouraudTriangles(self)
writeHatches(self)
writeImages(self)
writeInfoDict(self)
    Write out the info dictionary, checking it for good form
writeMarkers(self)
writeObject(self, object, contents)
writePath(self, path, transform, clip=False, sketch=None)
writePathCollectionTemplates(self)
writeTrailer(self)
    Write out the PDF trailer.
writeXref(self)
    Write out the xref table.
class matplotlib.backends.backend_pdf.PdfPages(filename, keep_empty=True, meta-
                                             data=None)
    Bases: object
    A multi-page PDF file.
```

### Notes

In reality *PdfPages* is a thin wrapper around *PdfFile*, in order to avoid confusion when using *savefig* and forgetting the format argument.

### Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

#### Parameters

**filename** [str or path-like or file-like] Plots using *PdfPages.savefig* will be written to a file at this location. The file is opened at once and any older file with the same name is overwritten.

**keep\_empty** [bool, optional] If set to False, then empty pdf files will be deleted automatically when closed.

**metadata** [dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: {'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to `None`.

`attach_note(self, text, positionRect=[-100, -100, 0, 0])`

Add a new text note to the page to be saved next. The optional positionRect specifies the position of the new note on the page. It is outside the page per default to make sure it is invisible on printouts.

`close(self)`

Finalize this object, making the underlying file a complete PDF file.

`get_pagecount(self)`

Return the current number of pages in the multipage pdf file.

`infodict(self)`

Return a modifiable information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary').

`keep_empty`

`savefig(self, figure=None, **kwargs)`

Save a *Figure* to this file as a new page.

Any other keyword arguments are passed to `savefig`.

### Parameters

**figure** [*Figure* or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a *Figure* instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

`class matplotlib.backends.backend_pdf.Reference(id)`

Bases: `object`

PDF reference object.

Use PdfFile.reserveObject() to create References.

`pdfRepr(self)`

`write(self, contents, file)`

`class matplotlib.backends.backend_pdf.RendererPdf(file, image_dpi, height, width)`

Bases: `matplotlib.backends._backend_pdf_ps.RendererPDFPSBase`

`check_gc(self, gc, fillcolor=None)`

`draw_gouraud_triangle(self, gc, points, colors, trans)`

Draw a Gouraud-shaded triangle.

### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**points** [array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

**colors** [array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_gouraud_triangles(self, gc, points, colors, trans)`

Draw a series of Gouraud triangles.

#### Parameters

**points** [array-like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.

**colors** [array-like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_image(self, gc, x, y, im, transform=None)`

Draw an RGBA image.

#### Parameters

**gc** [*GraphicsContextBase*] A graphics context with clipping information.

**x** [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y** [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im** [array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

**transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an *Affine2DBase*) may be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied *before* translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by *transform*).

`draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)`

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

#### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_mathtext(self, gc, x, y, s, prop, angle)`

```
draw_path(self, gc, path, transform, rgbFace=None)
```

Draw a [Path](#) instance using the given affine transform.

```
draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyle, antialiaseds, urls, offset_position)
```

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyle* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of [draw\\_path\\_collection\(\)](#) that makes multiple calls to [draw\\_path\(\)](#). Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods [\\_iter\\_collection\\_raw\\_paths\(\)](#) and [\\_iter\\_collection\(\)](#) are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of [draw\\_path\\_collection\(\)](#) can be made globally.

```
draw_tex(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None)
```

```
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
```

Draw the text instance.

### Parameters

**gc** [[GraphicsContextBase](#)] The graphics context.

**x** [float] The x location of the text in display coords.

**y** [float] The y location of the text baseline in display coords.

**s** [str] The text string.

**prop** [[matplotlib.font\\_manager.FontProperties](#)] The font properties.

**angle** [float] The rotation angle in degrees anti-clockwise.

**mtext** [[matplotlib.text.Text](#)] The original text object to be rendered.

### Notes

#### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

```
encode_string(self, s, fonttype)
```

```
finalize(self)
```

`get_image_magnification(self)`

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

`merge_used_characters(self, *args, **kwargs)`  
[*Deprecated*]

### Notes

Deprecated since version 3.3:

`new_gc(self)`

Return an instance of a `GraphicsContextBase`.

`track_characters(self, *args, **kwargs)`

[*Deprecated*] Keep track of which characters are required from each font.

### Notes

Deprecated since version 3.3.

`class matplotlib.backends.backend_pdf.Stream(id, len, file, extra=None, png=None)`

Bases: `object`

PDF stream object.

This has no `pdfRepr` method. Instead, call `begin()`, then output the contents of the stream by calling `write()`, and finally call `end()`.

### Parameters

**id** [int] Object id of the stream.

**len** [Reference or None] An unused Reference object for the length of the stream; None means to use a memory buffer so the length can be inlined.

**file** [PdfFile] The underlying object to write the stream to.

**extra** [dict from Name to anything, or None] Extra key-value pairs to include in the stream header.

**png** [dict or None] If the data is already png encoded, the decode parameters.

`compressobj`

`end(self)`

Finalize stream.

`extra`

`file`

`id`

`len`

`pdfFile`

`pos`

```

    write(self, data)
        Write some data on the stream.

class matplotlib.backends.backend_pdf.Verbatim(x)
    Bases: object

    Store verbatim PDF command content for later inclusion in the stream.

    pdfRepr(self)

matplotlib.backends.backend_pdf.fill(strings, linelen=75)
    Make one string from sequence of strings, with whitespace in between.

    The whitespace is chosen to form lines of at most linelen characters, if possible.

matplotlib.backends.backend_pdf.pdfRepr(obj)
    Map Python objects to PDF syntax.

```

### 18.10.9 matplotlib.backends.backend\_pgf

```

matplotlib.backends.backend_pgf.FigureCanvas
    alias of matplotlib.backends.backend_pgf.FigureCanvasPgf

class matplotlib.backends.backend_pgf.FigureCanvasPgf(figure)
    Bases: matplotlib.backends.backend_bases.FigureCanvasBase

    filetypes = {'pdf': 'LaTeX compiled PGF picture', 'pgf': 'LaTeX PGF picture', 'png': 'Portable Net

    get_default_filetype(self)
        Return the default savefig file format as specified in rcParams["savefig.format"] (de-
        fault: 'png').

        The returned string does not include a period. This method is overridden in back-
        ends that only support a single file type.

    get_renderer(self)

    print_pdf(self, fname_or_fh, *args, **kwargs)
        Use LaTeX to compile a Pgf generated figure to PDF.

    print_pgf(self, fname_or_fh, *args, **kwargs)
        Output pgf macros for drawing the figure so it can be included and rendered in latex
        documents.

    print_png(self, fname_or_fh, *args, **kwargs)
        Use LaTeX to compile a pgf figure to pdf and convert it to png.

class matplotlib.backends.backend_pgf.GraphicsContextPgf
    Bases: matplotlib.backends.backend_bases.GraphicsContextBase

    [Deprecated]

```

#### Notes

Deprecated since version 3.3:

```

exception matplotlib.backends.backend_pgf.LatexError(message, latex_output="")
    Bases: Exception

```

```
class matplotlib.backends.backend_pgf.LatexManager
```

Bases: `object`

The LatexManager opens an instance of the LaTeX application for determining the metrics of text elements. The LaTeX environment can be modified by setting fonts and/or a custom preamble in *rcParams*.

```
get_width_height_descent(self, text, prop)
```

Get the width, total height and descent for a text typeset by the current LaTeX environment.

```
latex_stdin_utf8(self)
```

[*Deprecated*]

### Notes

Deprecated since version 3.3:

```
class matplotlib.backends.backend_pgf.PdfPages(filename, *, keep_empty=True, meta-
                                              data=None)
```

Bases: `object`

A multi-page PDF file using the pgf backend

### Examples

```
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()
```

Create a new PdfPages object.

### Parameters

**filename** [str or path-like] Plots using *PdfPages.savefig* will be written to a file at this location. Any older file with the same name is overwritten.

**keep\_empty** [bool, default: True] If set to False, then empty pdf files will be deleted automatically when closed.

**metadata** [dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: {'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to *None*.

```
close(self)
```

Finalize this object, running LaTeX in a temporary directory and moving the final pdf file to *filename*.

`get_pagecount(self)`

Return the current number of pages in the multipage pdf file.

`keep_empty`

property metadata

`savefig(self, figure=None, **kwargs)`

Save a *Figure* to this file as a new page.

Any other keyword arguments are passed to *savefig*.

### Parameters

**figure** [*Figure* or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a *Figure* instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

`class matplotlib.backends.backend_pgf.RendererPgf (figure, fh, dummy=<deprecated parameter>)`

Bases: *matplotlib.backend\_bases.RendererBase*

Create a new PGF renderer that translates any drawing instruction into text commands to be interpreted in a latex pgfpicture environment.

### Attributes

**figure** [*matplotlib.figure.Figure*] Matplotlib figure to initialize height, width and dpi from.

**fh** [file-like] File handle for the output of the drawing commands.

`draw_image(self, gc, x, y, im, transform=None)`

Draw an RGBA image.

### Parameters

**gc** [*GraphicsContextBase*] A graphics context with clipping information.

**x** [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y** [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im** [array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

**transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option\_scale\_image()* returns True, an affine transformation (i.e., an *Affine2DBase*) may be passed to *draw\_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied *before* translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by *transform*).

`draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)`

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

#### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_path(self, gc, path, transform, rgbFace=None)`

Draw a *Path* instance using the given affine transform.

`draw_text(self, gc, x, y, s, prop, angle, ismath='TeX!', mtext=None)`

`draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)`

Draw the text instance.

#### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**x** [float] The x location of the text in display coords.

**y** [float] The y location of the text baseline in display coords.

**s** [str] The text string.

**prop** [*matplotlib.font\_manager.FontProperties*] The font properties.

**angle** [float] The rotation angle in degrees anti-clockwise.

**mtext** [*matplotlib.text.Text*] The original text object to be rendered.

#### Notes

##### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`flipy(self)`

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

`get_canvas_width_height(self)`

Return the canvas width and height in display coords.

`get_text_width_height_descent(self, s, prop, ismath)`

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string *s* with *FontProperties* *prop*.

property `latexManager`

`option_image_nocomposite(self)`

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not `rcParams["image.composite_image"]`.

`option_scale_image(self)`

Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

`points_to_pixels(self, points)`

Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```
points to pixels = points * pixels_per_inch/72 * dpi/72
```

### Parameters

**points** [float or array-like] a float or a numpy array of float

### Returns

**Points converted to pixels**

`class matplotlib.backends.backend_pgf.TmpDirCleaner`

Bases: `object`

`static add(tmpdir)`

`static cleanup_remaining_tmpdirs()`

`remaining_tmpdirs = {}`

`matplotlib.backends.backend_pgf.common_texification(text)`

Do some necessary and/or useful substitutions for texts to be included in LaTeX documents.

This distinguishes text-mode and math-mode by replacing the math separator `$` with `\(\displaystyle %s\)`. Escaped math separators (`\$`) are ignored.

The following characters are escaped in text segments: `_~$%`

`matplotlib.backends.backend_pgf.get_fontspec()`

Build fontspec preamble from rc.

`matplotlib.backends.backend_pgf.get_preamble()`

Get LaTeX preamble from rc.

`matplotlib.backends.backend_pgf.make_pdf_to_png_converter()`

Return a function that converts a pdf file to a png file.

`matplotlib.backends.backend_pgf.repl_escapetext(m)`

[*Deprecated*]

### Notes

Deprecated since version 3.2:

```
matplotlib.backends.backend_pgf.repl_mathdefault(m)
[Deprecated]
```

### Notes

Deprecated since version 3.2:

```
matplotlib.backends.backend_pgf.writeln(fh, line)
```

## 18.10.10 matplotlib.backends.backend\_ps

A PostScript backend, which can produce both PostScript .ps and .eps.

```
matplotlib.backends.backend_ps.FigureCanvas
    alias of matplotlib.backends.backend_ps.FigureCanvasPS
class matplotlib.backends.backend_ps.FigureCanvasPS(figure)
    Bases: matplotlib.backends.backend_bases.FigureCanvasBase

    filetypes = {'eps': 'Encapsulated Postscript', 'ps': 'Postscript'}
    fixed_dpi = 72

    get_default_filetype(self)
        Return the default savefig file format as specified in rcParams["savefig.format"] (default: 'png').

        The returned string does not include a period. This method is overridden in backends that only support a single file type.

    print_eps(self, outfile, *args, **kwargs)
    print_ps(self, outfile, *args, **kwargs)

class matplotlib.backends.backend_ps.GraphicsContextPS
    Bases: matplotlib.backends.backend_bases.GraphicsContextBase

    get_capstyle(self)
        Return the capstyle as a string in ('butt', 'round', 'projecting').

    get_joinstyle(self)
        Return the line join style as one of ('miter', 'round', 'bevel').

class matplotlib.backends.backend_ps.PsBackendHelper
    Bases: object

class matplotlib.backends.backend_ps.RendererPS(width, height, pswriter, imagedpi=72)
    Bases: matplotlib.backends._backend_pdf_ps.RendererPDFPSBase

    The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles.

    create_hatch(self, hatch)

    draw_gouraud_triangle(self, gc, points, colors, trans)
        Draw a Gouraud-shaded triangle.
```

### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**points** [array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

**colors** [array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_gouraud_triangles(self, gc, points, colors, trans)`  
 Draw a series of Gouraud triangles.

#### Parameters

**points** [array-like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.

**colors** [array-like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.

**transform** [*matplotlib.transforms.Transform*] An affine transform to apply to the points.

`draw_image(self, gc, x, y, im, transform=None)`  
 Draw an RGBA image.

#### Parameters

**gc** [*GraphicsContextBase*] A graphics context with clipping information.

**x** [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y** [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im** [array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

**transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an *Affine2DBase*) may be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied *before* translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by *transform*).

`draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)`  
 Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

#### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

`draw_mathtext(self, gc, x, y, s, prop, angle)`

Draw the math text using `matplotlib.mathtext`.

`draw_path(self, gc, path, transform, rgbFace=None)`

Draw a *Path* instance using the given affine transform.

`draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyle, antialiaseds, urls, offset_position)`

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyle* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

`draw_tex(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None)`

`draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)`

Draw the text instance.

### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**x** [float] The x location of the text in display coords.

**y** [float] The y location of the text baseline in display coords.

**s** [str] The text string.

**prop** [*matplotlib.font\_manager.FontProperties*] The font properties.

**angle** [float] The rotation angle in degrees anti-clockwise.

**mtext** [*matplotlib.text.Text*] The original text object to be rendered.

### Notes

#### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

`get_image_magnification(self)`

Get the factor by which to magnify images passed to `draw_image`. Allows a backend to have images at a different resolution to other artists.

`merge_used_characters(self, *args, **kwargs)`

[Deprecated]

### Notes

Deprecated since version 3.3:

`new_gc(self)`

Return an instance of a `GraphicsContextBase`.

`set_color(self, r, g, b, store=True)`

`set_font(self, fontname, fontsize, store=True)`

`set_linecap(self, linecap, store=True)`

`set_linedash(self, offset, seq, store=True)`

`set_linejoin(self, linejoin, store=True)`

`set_linewidth(self, linewidth, store=True)`

`track_characters(self, *args, **kwargs)`

[Deprecated] Keep track of which characters are required from each font.

### Notes

Deprecated since version 3.3.

property `used_characters`

`matplotlib.backends.backend_ps.convert_psfrags(tmpfile, psfrags, font_preamble, custom_preamble, paper_width, paper_height, orientation)`

When we want to use the LaTeX backend with postscript, we write PSFrag tags to a temporary postscript file, each one marking a position for LaTeX to render some text. `convert_psfrags` generates a LaTeX document containing the commands to convert those tags to text. LaTeX/dvips produces the postscript file that includes the actual text.

`matplotlib.backends.backend_ps.get_bbox_header(lbrt, rotated=False)`

Return a postscript header string for the given bbox `lbrt=(l, b, r, t)`. Optionally, return rotate command.

`matplotlib.backends.backend_ps.gs_distill(tmpfile, eps=False, ptype='letter', bbox=None, rotated=False)`

Use ghostscript's `pswrite` or `epswrite` device to distill a file. This yields smaller files without illegal encapsulated postscript operators. The output is low-level, converting text to outlines.

`matplotlib.backends.backend_ps.pstoeps(tmpfile, bbox=None, rotated=False)`

Convert the postscript to encapsulated postscript. The `bbox` of the eps file will be replaced with the given `bbox` argument. If `None`, original `bbox` will be used.

`matplotlib.backends.backend_ps.quote_ps_string(s)`

Quote dangerous characters of *S* for use in a PostScript string constant.

`matplotlib.backends.backend_ps.xpdf_distill(tmpfile, eps=False, ptype='letter',  
bbox=None, rotated=False)`

Use ghostscript's `ps2pdf` and `xpdf`'s/`poppler`'s `pdftops` to distill a file. This yields smaller files without illegal encapsulated postscript operators. This distiller is preferred, generating high-level postscript output that treats text as text.

#### 18.10.11 `matplotlib.backends.backend_qt4agg`

**NOTE** Not included, to avoid adding a dependency to building the docs.

#### 18.10.12 `matplotlib.backends.backend_qt4cairo`

**NOTE** Not included, to avoid adding a dependency to building the docs.

#### 18.10.13 `matplotlib.backends.backend_qt5agg`

**NOTE** Not included, to avoid adding a dependency to building the docs.

#### 18.10.14 `matplotlib.backends.backend_qt5cairo`

**NOTE** Not included, to avoid adding a dependency to building the docs.

#### 18.10.15 `matplotlib.backends.backend_svg`

`matplotlib.backends.backend_svg.FigureCanvas`

alias of `matplotlib.backends.backend_svg.FigureCanvasSVG`

`class matplotlib.backends.backend_svg.FigureCanvasSVG(figure)`

Bases: `matplotlib.backends.bases.FigureCanvasBase`

`filetypes = {'svg': 'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphics'}`

`fixed_dpi = 72`

`get_default_filetype(self)`

Return the default savefig file format as specified in `rcParams["savefig.format"]` (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

`print_svg(self, filename, *args, **kwargs)`

##### Parameters

**filename** [str or path-like or file-like] Output target; if a string, a file will be opened for writing.

**metadata** [Dict[str, Any], optional] Metadata in the SVG file defined as key-value pairs of strings, datetimes, or lists of strings, e.g., {'Creator': 'My software', 'Contributor': ['Me', 'My Friend'], 'Title': 'Awesome'}.

The standard keys and their value types are:

- **str**: 'Coverage', 'Description', 'Format', 'Identifier', 'Language', 'Relation', 'Source', 'Title', and 'Type'.
- **str or list of str**: 'Contributor', 'Creator', 'Keywords', 'Publisher', and 'Rights'.
- **str, date, datetime, or tuple of same**: 'Date'. If a non-str, then it will be formatted as ISO 8601.

Values have been predefined for 'Creator', 'Date', 'Format', and 'Type'. They can be removed by setting them to `None`.

Information is encoded as [Dublin Core Metadata](#).

```
print_svgz(self, filename, *args, **kwargs)
```

```
class matplotlib.backends.backend_svg.RendererSVG(width, height, svgwriter, base-
                                                    name=None, image_dpi=72, *,
                                                    metadata=None)
```

Bases: `matplotlib.backend_bases.RendererBase`

```
close_group(self, s)
```

Close a grouping element with label *s*.

Only used by the SVG renderer.

```
draw_gouraud_triangle(self, gc, points, colors, trans)
```

Draw a Gouraud-shaded triangle.

#### Parameters

**gc** [`GraphicsContextBase`] The graphics context.

**points** [array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

**colors** [array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

**transform** [`matplotlib.transforms.Transform`] An affine transform to apply to the points.

```
draw_gouraud_triangles(self, gc, triangles_array, colors_array, transform)
```

Draw a series of Gouraud triangles.

#### Parameters

**points** [array-like, shape=(N, 3, 2)] Array of *N* (x, y) points for the triangles.

**colors** [array-like, shape=(N, 3, 4)] Array of *N* RGBA colors for each point of the triangles.

**transform** [`matplotlib.transforms.Transform`] An affine transform to apply to the points.

```
draw_image(self, gc, x, y, im, transform=None)
```

Draw an RGBA image.

#### Parameters

- gc** [*GraphicsContextBase*] A graphics context with clipping information.
- x** [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- y** [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
- im** [array-like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.
- transform** [*matplotlib.transforms.Affine2DBase*] If and only if the concrete backend is written such that *option\_scale\_image()* returns True, an affine transformation (i.e., an *Affine2DBase*) may be passed to *draw\_image()*. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied *before* translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by *transform*).

**draw\_markers**(*self, gc, marker\_path, marker\_trans, path, trans, rgbFace=None*)  
 Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of *draw\_markers* that makes multiple calls to *draw\_path()*. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

- gc** [*GraphicsContextBase*] The graphics context.
- marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.
- trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

**draw\_path**(*self, gc, path, transform, rgbFace=None*)  
 Draw a *Path* instance using the given affine transform.

**draw\_path\_collection**(*self, gc, master\_transform, paths, all\_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset\_position*)

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of *draw\_path\_collection()* that makes multiple calls to *draw\_path()*. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods *\_iter\_collection\_raw\_paths()* and *\_iter\_collection()* are provided to help with (and standardize) the implementation across backends. It is highly recommended to use

those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

```
draw_tex(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>,
         mtext=None)
```

```
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
```

Draw the text instance.

### Parameters

- gc** [*GraphicsContextBase*] The graphics context.
- x** [float] The x location of the text in display coords.
- y** [float] The y location of the text baseline in display coords.
- s** [str] The text string.
- prop** [*matplotlib.font\_manager.FontProperties*] The font properties.
- angle** [float] The rotation angle in degrees anti-clockwise.
- mtext** [*matplotlib.text.Text*] The original text object to be rendered.

### Notes

#### Note for backend implementers:

When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in `text.py`:

```
if 0: bbox_artist(self, renderer)
```

to `if 1`, and then the actual bounding box will be plotted along with your text.

```
finalize(self)
```

```
flipy(self)
```

Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

```
get_canvas_width_height(self)
```

Return the canvas width and height in display coords.

```
get_image_magnification(self)
```

Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.

```
get_text_width_height_descent(self, s, prop, ismath)
```

Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string `s` with *FontProperties* `prop`.

```
open_group(self, s, gid=None)
```

Open a grouping element with label `s` and `gid` (if set) as id.

Only used by the SVG renderer.

```
option_image_nocomposite(self)
```

Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not `rcParams["image.composite_image"]`.

`option_scale_image(self)`

Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

`class matplotlib.backends.backend_svg.XMLWriter(file)`

Bases: `object`

### Parameters

**file** [writable text file-like object]

`close(self, id)`

Close open elements, up to (and including) the element identified by the given identifier.

### Parameters

**id** Element identifier, as returned by the `start()` method.

`comment(self, comment)`

Add a comment to the output stream.

### Parameters

**comment** [str] Comment text.

`data(self, text)`

Add character data to the output stream.

### Parameters

**text** [str] Character data.

`element(self, tag, text=None, attrib={}, **extra)`

Add an entire element. This is the same as calling `start()`, `data()`, and `end()` in sequence. The `text` argument can be omitted.

`end(self, tag=None, indent=True)`

Close the current element (opened by the most recent call to `start()`).

### Parameters

**tag** Element tag. If given, the tag must match the start tag. If omitted, the current element is closed.

`flush(self)`

Flush the output stream.

`start(self, tag, attrib={}, **extra)`

Open a new element. Attributes can be given as keyword arguments, or as a string/string dictionary. The method returns an opaque identifier that can be passed to the `close()` method, to close all open elements up to and including this one.

### Parameters

**tag** Element tag.

**attrib** Attribute dictionary. Alternatively, attributes can be given as keyword arguments.

### Returns

**An element identifier.**

```
matplotlib.backends.backend_svg.escape_attr(S)
```

```
matplotlib.backends.backend_svg.escape_cdata(S)
```

```
matplotlib.backends.backend_svg.escape_comment(S)
```

```
matplotlib.backends.backend_svg.generate_css(attrib={})
```

```
matplotlib.backends.backend_svg.generate_transform(transform_list=[])
```

```
matplotlib.backends.backend_svg.short_float_fmt(x)
```

Create a short string representation of a float, which is %f formatting with trailing zeros and the decimal point removed.

**18.10.16 matplotlib.backends.backend\_tkagg**

```
matplotlib.backends.backend_tkagg.FigureCanvas
```

alias of *matplotlib.backends.backend\_tkagg.FigureCanvasTkAgg*

```
class matplotlib.backends.backend_tkagg.FigureCanvasTkAgg(figure, master=None, resize_callback=None)
```

Bases: *matplotlib.backends.backend\_agg.FigureCanvasAgg*, *matplotlib.backends.\_backend\_tk.FigureCanvasTk*

```
blit(self, bbox=None)
```

Blit the canvas in *bbox* (default entire canvas).

```
draw(self)
```

Render the *Figure*.

**18.10.17 matplotlib.backends.backend\_webagg**

---

**Note:** The WebAgg backend is not documented here, in order to avoid adding Tornado to the doc build requirements.

---

**18.10.18 matplotlib.backends.backend\_wxagg**

**NOTE** Not included, to avoid adding a dependency to building the docs.

**18.11 matplotlib.bezier**

A module providing some utility functions regarding Bezier path manipulation.

```
class matplotlib.bezier.BezierSegment(control_points)
```

Bases: *object*

A d-dimensional Bezier segment.

**Parameters**

**control\_points** [(N, d) array] Location of the *N* control points.

`axis_aligned_extrema(self)`

Return the dimension and location of the curve's interior extrema.

The extrema are the points along the curve where one of its partial derivatives is zero.

### Returns

**dims** [int, array\_like] Index  $i$  of the partial derivative which is zero at each interior extrema.

**dzeros** [float, array\_like] Of same size as **dims**. The  $t$  such that  $d/dx_i B(t) = 0$

property `control_points`

The control points of the curve.

property `degree`

Degree of the polynomial. One less the number of control points.

property `dimension`

The dimension of the curve.

`point_at_t(self, t)`

Evaluate curve at a single point  $t$ . Returns a Tuple[float\*d].

property `polynomial_coefficients`

The polynomial coefficients of the Bezier curve.

**Warning:** Follows opposite convention from `numpy.polyval`.

### Returns

**float, (n+1, d) array\_like** Coefficients after expanding in polynomial basis, where  $n$  is the degree of the bezier curve and  $d$  its dimension. These are the numbers  $(C_j)$  such that the curve can be written  $\sum_{j=0}^n C_j t^j$ .

### Notes

The coefficients are calculated as

$$\binom{n}{j} \sum_{i=0}^j (-1)^{i+j} \binom{j}{i} P_i$$

where  $P_i$  are the control points of the curve.

exception `matplotlib.bezier.NonIntersectingPathException`

Bases: `ValueError`

`matplotlib.bezier.check_if_parallel(dx1, dy1, dx2, dy2, tolerance=1e-05)`

Check if two lines are parallel.

### Parameters

**dx1, dy1, dx2, dy2** [float] The gradients  $dy/dx$  of the two lines.

**tolerance** [float] The angular tolerance in radians up to which the lines are considered parallel.

**Returns****is\_parallel**

- 1 if two lines are parallel in same direction.
- -1 if two lines are parallel in opposite direction.
- False otherwise.

`matplotlib.bezier.concatenate_paths(paths)`

[*Deprecated*] Concatenate a list of paths into a single path.

**Notes**

Deprecated since version 3.3.

`matplotlib.bezier.find_bezier_t_intersecting_with_closedpath(bezier_point_at t, inside_closedpath, t0=0.0, t1=1.0, tolerance=0.01)`

Find the intersection of the Bezier curve with a closed path.

The intersection point  $t$  is approximated by two parameters  $t0, t1$  such that  $t0 \leq t \leq t1$ .

Search starts from  $t0$  and  $t1$  and uses a simple bisecting algorithm therefore one of the end points must be inside the path while the other doesn't. The search stops when the distance of the points parametrized by  $t0$  and  $t1$  gets smaller than the given *tolerance*.

**Parameters**

**bezier\_point\_at\_t** [callable] A function returning x, y coordinates of the Bezier at parameter  $t$ . It must have the signature:

```
bezier_point_at_t(t: float) -> Tuple[float, float]
```

**inside\_closedpath** [callable] A function returning True if a given point (x, y) is inside the closed path. It must have the signature:

```
inside_closedpath(point: Tuple[float, float]) -> bool
```

**t0, t1** [float] Start parameters for the search.

**tolerance** [float] Maximal allowed distance between the final points.

**Returns**

**t0, t1** [float] The Bezier path parameters.

`matplotlib.bezier.find_control_points(c1x, c1y, mmx, mmy, c2x, c2y)`

Find control points of the Bezier curve passing through  $(c1x, c1y)$ ,  $(mmx, mmy)$ , and  $(c2x, c2y)$ , at parametric values 0, 0.5, and 1.

`matplotlib.bezier.get_cos_sin(x0, y0, x1, y1)`

`matplotlib.bezier.get_intersection(cx1, cy1, cos_t1, sin_t1, cx2, cy2, cos_t2, sin_t2)`

Return the intersection between the line through  $(cx1, cy1)$  at angle  $t1$  and the line through  $(cx2, cy2)$  at angle  $t2$ .

`matplotlib.bezier.get_normal_points(cx, cy, cos_t, sin_t, length)`

For a line passing through  $(cx, cy)$  and having an angle  $t$ , return locations of the two points located along its perpendicular line at the distance of *length*.

`matplotlib.bezier.get_parallels(bezier2, width)`

Given the quadratic Bezier control points *bezier2*, returns control points of quadratic Bezier lines roughly parallel to given one separated by *width*.

`matplotlib.bezier.inside_circle(cx, cy, r)`

Return a function that checks whether a point is in a circle with center (*cx*, *cy*) and radius *r*.

The returned function has the signature:

`f(xy: Tuple[float, float]) -> bool`

`matplotlib.bezier.make_path_regular(p)`

[*Deprecated*] If the codes attribute of *Path* *p* is None, return a copy of *p* with codes set to (MOVETO, LINETO, LINETO, ..., LINETO); otherwise return *p* itself.

### Notes

Deprecated since version 3.3.

`matplotlib.bezier.make_wedged_bezier2(bezier2, width, w1=1.0, wm=0.5, w2=0.0)`

Being similar to `get_parallels`, returns control points of two quadratic Bezier lines having a width roughly parallel to given one separated by *width*.

`matplotlib.bezier.split_bezier_intersecting_with_closedpath(bezier, side_closedpath, tolerance=0.01)` *in-tol*

Split a Bezier curve into two at the intersection with a closed path.

### Parameters

**bezier** [array-like(N, 2)] Control points of the Bezier segment. See *BezierSegment*.

**inside\_closedpath** [callable] A function returning True if a given point (x, y) is inside the closed path. See also *find\_bezier\_t\_intersecting\_with\_closedpath*.

**tolerance** [float] The tolerance for the intersection. See also *find\_bezier\_t\_intersecting\_with\_closedpath*.

### Returns

**left, right** Lists of control points for the two Bezier segments.

`matplotlib.bezier.split_de_casteljau(beta, t)`

Split a Bezier segment defined by its control points *beta* into two separate segments divided at *t* and return their control points.

`matplotlib.bezier.split_path_inout(path, inside, tolerance=0.01, reorder_inout=False)`

Divide a path into two segments at the point where `inside(x, y)` becomes False.

## 18.12 matplotlib.blocking\_input

Classes used for blocking interaction with figure windows:

*BlockingInput* Creates a callable object to retrieve events in a blocking way for interactive sessions. Base class of the other classes listed here.

*BlockingKeyMouseInput* Creates a callable object to retrieve key or mouse clicks in a blocking way for interactive sessions. Used by *waitforbuttonpress*.

*BlockingMouseInput* Creates a callable object to retrieve mouse clicks in a blocking way for interactive sessions. Used by *ginput*.

*BlockingContourLabeler* Creates a callable object to retrieve mouse clicks in a blocking way that will then be used to place labels on a *ContourSet*. Used by *clabel*.

```
class matplotlib.blocking_input.BlockingContourLabeler(CS)
```

Bases: *matplotlib.blocking\_input.BlockingMouseInput*

Callable for retrieving mouse clicks and key presses in a blocking way.

Used to place contour labels.

```
add_click(self, event)
```

Add the coordinates of an event to the list of clicks.

#### Parameters

**event** [*MouseEvent*]

```
button1(self, event)
```

Process an button-1 event (add a label to a contour).

#### Parameters

**event** [*MouseEvent*]

```
button3(self, event)
```

Process an button-3 event (remove a label if not in inline mode).

Unfortunately, if one is doing inline labels, then there is currently no way to fix the broken contour - once humpty-dumpty is broken, he can't be put back together. In inline mode, this does nothing.

#### Parameters

**event** [*MouseEvent*]

```
pop_click(self, event, index=-1)
```

Remove a click (by default, the last) from the list of clicks.

#### Parameters

**event** [*MouseEvent*]

```
class matplotlib.blocking_input.BlockingInput(fig, eventslist=())
```

Bases: *object*

Callable for retrieving events in a blocking way.

```
add_event(self, event)
```

For base class, this just appends an event to events.

```
cleanup(self)
```

Disconnect all callbacks.

```
on_event(self, event)
```

Event handler; will be passed to the current figure to retrieve events.

```
pop(self, index=-1)
```

Remove an event from the event list - by default, the last.

Note that this does not check that there are events, much like the normal pop method. If no events exist, this will throw an exception.

`pop_event(self, index=-1)`

Remove an event from the event list - by default, the last.

Note that this does not check that there are events, much like the normal pop method. If no events exist, this will throw an exception.

`post_event(self)`

For baseclass, do nothing but collect events.

`class matplotlib.blocking_input.BlockingKeyMouseInput(fig)`

Bases: `matplotlib.blocking_input.BlockingInput`

Callable for retrieving mouse clicks and key presses in a blocking way.

`post_event(self)`

Determine if it is a key event.

```
class matplotlib.blocking_input.BlockingMouseInput(fig, mouse_add=<MouseButton.LEFT:
                                                    1>, mouse_pop=<MouseButton.RIGHT:
                                                    3>, mouse_stop=<MouseButton.MIDDLE:
                                                    2>)
```

Bases: `matplotlib.blocking_input.BlockingInput`

Callable for retrieving mouse clicks in a blocking way.

This class will also retrieve keypresses and map them to mouse clicks: delete and backspace are a right click, enter is like a middle click, and all others are like a left click.

`add_click(self, event)`

Add the coordinates of an event to the list of clicks.

#### Parameters

**event** [`MouseEvent`]

`button_add = 1`

`button_pop = 3`

`button_stop = 2`

`cleanup(self, event=None)`

#### Parameters

**event** [`MouseEvent`, optional] Not used

`key_event(self)`

Process a key press event, mapping keys to appropriate mouse clicks.

`mouse_event(self)`

Process a mouse click event.

`mouse_event_add(self, event)`

Process an button-1 event (add a click if inside axes).

#### Parameters

**event** [`MouseEvent`]

`mouse_event_pop(self, event)`

Process an button-3 event (remove the last click).

**Parameters****event** [*MouseEvent*]`mouse_event_stop(self, event)`

Process an button-2 event (end blocking input).

**Parameters****event** [*MouseEvent*]`pop(self, event, index=-1)`

Remove a click and the associated event from the list of clicks.

Defaults to the last click.

`pop_click(self, event, index=-1)`

Remove a click (by default, the last) from the list of clicks.

**Parameters****event** [*MouseEvent*]`post_event(self)`

Process an event.

## 18.13 matplotlib.category

Plotting of string "category" data: `plot(['d', 'f', 'a'], [1, 2, 3])` will plot three points with x-axis values of 'd', 'f', 'a'.

See `/gallery/lines_bars_and_markers/categorical_variables` for an example.

The module uses Matplotlib's `matplotlib.units` mechanism to convert from strings to integers and provides a tick locator, a tick formatter, and the `UnitData` class that creates and stores the string-to-integer mapping.

```
class matplotlib.category.StrCategoryConverter
    Bases: matplotlib.units.ConversionInterface
    static axisinfo(unit, axis)
        Set the default axis ticks and labels.
```

**Parameters****unit** [*UnitData*] object string unit information for value**axis** [*Axis*] axis for which information is being set**Returns***AxisInfo* Information to support default tick labeling`static convert(value, unit, axis)`Convert strings in *value* to floats using mapping information stored in the *unit* object.**Parameters****value** [str or iterable] Value or list of values to be converted.**unit** [*UnitData*] An object mapping strings to integers.

**axis** [*Axis*] The axis on which the converted value is plotted.

---

**Note:** *axis* is unused.

---

### Returns

**float or ndarray[float]**

`static default_units(data, axis)`  
Set and update the *Axis* units.

### Parameters

**data** [str or iterable of str]

**axis** [*Axis*] axis on which the data is plotted

### Returns

*UnitData* object storing string to integer mapping

`class matplotlib.category.StrCategoryFormatter(units_mapping)`  
Bases: `matplotlib.ticker.Formatter`

String representation of the data at every tick.

### Parameters

**units\_mapping** [dict] Mapping of category names (str) to indices (int).

`format_ticks(self, values)`  
Return the tick labels for all the ticks at once.

`class matplotlib.category.StrCategoryLocator(units_mapping)`  
Bases: `matplotlib.ticker.Locator`

Tick at every integer mapping of the string data.

### Parameters

**units\_mapping** [dict] Mapping of category names (str) to indices (int).

`tick_values(self, vmin, vmax)`  
Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the *vmin* and *vmax* values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`class matplotlib.category.UnitData(data=None)`  
Bases: `object`

Create mapping between unique categorical values and integer ids.

### Parameters

**data** [iterable] sequence of string values

`update(self, data)`  
 Map new values to integer identifiers.

### Parameters

**data** [iterable of str or bytes]

### Raises

**TypeError** If elements in *data* are neither str nor bytes.

## 18.14 matplotlib.cbook

A collection of utility functions and classes. Originally, many (but not all) were from the Python Cookbook – hence the name cbook.

This module is safe to import from anywhere within Matplotlib; it imports Matplotlib only at runtime.

```
class matplotlib.cbook.CallbackRegistry(exception_handler=<function          _except-
                                     tion_printer>)
```

Bases: `object`

Handle registering and disconnecting for a set of signals and callbacks:

```
>>> def oneat(x):
...     print('eat', x)
>>> def ondrink(x):
...     print('drink', x)
```

```
>>> from matplotlib.cbook import CallbackRegistry
>>> callbacks = CallbackRegistry()
```

```
>>> id_eat = callbacks.connect('eat', oneat)
>>> id_drink = callbacks.connect('drink', ondrink)
```

```
>>> callbacks.process('drink', 123)
drink 123
>>> callbacks.process('eat', 456)
eat 456
>>> callbacks.process('be merry', 456) # nothing will be called
>>> callbacks.disconnect(id_eat)
>>> callbacks.process('eat', 456)      # nothing will be called
```

In practice, one should always disconnect all callbacks when they are no longer needed to avoid dangling references (and thus memory leaks). However, real code in Matplotlib rarely does so, and due to its design, it is rather difficult to place this kind of code. To get around this, and prevent this class of memory leaks, we instead store weak references to bound methods only, so when the destination object needs to die, the CallbackRegistry won't keep it alive.

### Parameters

**exception\_handler** [callable, optional] If provided must have signature

```
def handler(exc: Exception) -> None:
```

If not None this function will be called with any `Exception` subclass raised by the callbacks in `CallbackRegistry.process`. The handler may either consume the exception or re-raise.

The callable must be pickle-able.

The default handler is

```
def h(exc):
    traceback.print_exc()
```

`connect(self, s, func)`

Register `func` to be called when signal `s` is generated.

`disconnect(self, cid)`

Disconnect the callback registered with callback id `cid`.

`process(self, s, *args, **kwargs)`

Process signal `s`.

All of the functions registered to receive callbacks on `s` will be called with `*args` and `**kwargs`.

`class matplotlib.cbook.Grouper(init=())`

Bases: `object`

A disjoint-set data structure.

Objects can be joined using `join()`, tested for connectedness using `joined()`, and all disjoint sets can be retrieved by using the object as an iterator.

The objects being joined must be hashable and weak-referenceable.

## Examples

```
>>> from matplotlib.cbook import Grouper
>>> class Foo:
...     def __init__(self, s):
...         self.s = s
...     def __repr__(self):
...         return self.s
...
>>> a, b, c, d, e, f = [Foo(x) for x in 'abcdef']
>>> grp = Grouper()
>>> grp.join(a, b)
>>> grp.join(b, c)
>>> grp.join(d, e)
>>> sorted(map(tuple, grp))
[(a, b, c), (d, e)]
>>> grp.joined(a, b)
True
>>> grp.joined(a, c)
True
>>> grp.joined(a, d)
False
```

`clean(self)`

Clean dead weak references from the dictionary.

`get_siblings(self, a)`

Return all of the items joined with *a*, including itself.

`join(self, a, *args)`

Join given arguments into the same set. Accepts one or more arguments.

`joined(self, a, b)`

Return whether *a* and *b* are members of the same set.

`remove(self, a)`

`exception matplotlib.cbook.IgnoredKeywordWarning(*args, **kwargs)`

Bases: `UserWarning`

[*Deprecated*] A class for issuing warnings about keyword arguments that will be ignored by Matplotlib.

## Notes

Deprecated since version 3.3.

`class matplotlib.cbook.Stack(default=None)`

Bases: `object`

Stack of elements with a movable cursor.

Mimics home/back/forward in a web browser.

`back(self)`

Move the position back and return the current element.

`bubble(self, o)`

Raise all references of *o* to the top of the stack, and return it.

## Raises

**ValueError** If *o* is not in the stack.

`clear(self)`

Empty the stack.

`empty(self)`

Return whether the stack is empty.

`forward(self)`

Move the position forward and return the current element.

`home(self)`

Push the first element onto the top of the stack.

The first element is returned.

`push(self, o)`

Push *o* to the stack at current position. Discard all later elements.

*o* is returned.

`remove(self, o)`

Remove *o* from the stack.

## Raises

**ValueError** If *o* is not in the stack.

```
matplotlib.cbook.boxplot_stats(X, whis=1.5, bootstrap=None, labels=None, autor-  
ange=False)
```

Return a list of dictionaries of statistics used to draw a series of box and whisker plots using `boxplot`.

### Parameters

**X** [array-like] Data that will be represented in the boxplots. Should have 2 or fewer dimensions.

**whis** [float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above  $Q1 - whis * (Q3 - Q1)$ , and the upper whisker at the highest datum below  $Q3 + whis * (Q3 - Q1)$ , where  $Q1$  and  $Q3$  are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey's original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data. "range" is a deprecated synonym for (0, 100).

In the edge case where  $Q1 == Q3$ , `whis` is automatically set to (0, 100) (cover the whole range of the data) if `autorange` is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

**bootstrap** [int, optional] Number of times the confidence intervals around the median should be bootstrapped (percentile method).

**labels** [array-like, optional] Labels for each dataset. Length must be compatible with dimensions of `X`.

**autorange** [bool, optional (False)] When True and the data are distributed such that the 25th and 75th percentiles are equal, `whis` is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

### Returns

**list of dict** A list of dictionaries containing the results for each column of data. Keys of each dictionary are the following:

Key	Value Description
label	tick label for the boxplot
mean	arithmetic mean value
med	50th percentile
q1	first quartile (25th percentile)
q3	third quartile (75th percentile)
cilo	lower notch around the median
cihi	upper notch around the median
whislo	end of the lower whisker
whishi	end of the upper whisker
fliers	outliers

## Notes

Non-bootstrapping approach to confidence interval uses Gaussian-based asymptotic approximation:

$$\text{med} \pm 1.57 \times \frac{\text{iqr}}{\sqrt{N}}$$

General approach from: McGill, R., Tukey, J.W., and Larsen, W.A. (1978) "Variations of Boxplots", The American Statistician, 32:12-16.

`matplotlib.cbook.contiguous_regions(mask)`

Return a list of (ind0, ind1) such that `mask[ind0:ind1].all()` is True and we cover all such regions.

`matplotlib.cbook.delete_masked_points(*args)`

Find all masked and/or non-finite points in a set of arguments, and return the arguments with only the unmasked points remaining.

Arguments can be in any of 5 categories:

- 1) 1-D masked arrays
- 2) 1-D ndarrays
- 3) ndarrays with more than one dimension
- 4) other non-string iterables
- 5) anything else

The first argument must be in one of the first four categories; any argument with a length differing from that of the first argument (and hence anything in category 5) then will be passed through unchanged.

Masks are obtained from all arguments of the correct length in categories 1, 2, and 4; a point is bad if masked in a masked array or if it is a nan or inf. No attempt is made to extract a mask from categories 2, 3, and 4 if `numpy.isfinite` does not yield a Boolean array.

All input arguments that are not passed unchanged are returned as ndarrays after removing the points or rows corresponding to masks in any of the arguments.

A vastly simpler version of this function was originally written as a helper for `Axes.scatter()`.

`matplotlib.cbook.file_requires_unicode(x)`

Return whether the given writable file-like object requires Unicode to be written to it.

`matplotlib.cbook.flatten(seq, scalarp=<function 0x7f39f9385310> is_scalar_or_string at ...)`

Return a generator of flattened nested containers.

For example:

```
>>> from matplotlib.cbook import flatten
>>> l = (('John', ['Hunter']), (1, 23), [[[42, (5, 23)], ]])
>>> print(list(flatten(l)))
['John', 'Hunter', 1, 23, 42, 5, 23]
```

By: Composite of Holger Krekel and Luther Blissett From: <https://code.activestate.com/recipes/121294/> and Recipe 1.12 in cookbook

`matplotlib.cbook.get_realpath_and_stat(path)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`matplotlib.cbook.get_sample_data(fname, asfileobj=True, *, np_load=False)`  
Return a sample data file. *fname* is a path relative to the `mpl-data/sample_data` directory. If *asfileobj* is `True` return a file object, otherwise just a file path.

Sample data files are stored in the `'mpl-data/sample_data'` directory within the Matplotlib package.

If the filename ends in `.gz`, the file is implicitly unzipped. If the filename ends with `.npz` or `.npz`, *asfileobj* is `True`, and *np\_load* is `True`, the file is loaded with `numpy.load`. *np\_load* currently defaults to `False` but will default to `True` in a future release.

`matplotlib.cbook.index_of(y)`

A helper function to create reasonable x values for the given y.

This is used for plotting (x, y) if x values are not explicitly given.

First try `y.index` (assuming y is a `pandas.Series`), if that fails, use `range(len(y))`.

This will be extended in the future to deal with more types of labeled data.

### Parameters

**y** [float or array-like]

### Returns

**x, y** [ndarray] The x and y values to plot.

`matplotlib.cbook.is_math_text(s)`

Return whether the string *s* contains math expressions.

This is done by checking whether *s* contains an even number of non-escaped dollar signs.

`matplotlib.cbook.is_scalar_or_string(val)`

Return whether the given object is a scalar or string like.

`matplotlib.cbook.is_writable_file_like(obj)`

Return whether *obj* looks like a file object with a `write` method.

`matplotlib.cbook.local_over_kwdict(local_var, kwargs, *keys)`

[Deprecated] Enforces the priority of a local variable over potentially conflicting argument(s) from a `kwargs` dict. The following possible output values are considered in order of priority:

`local_var > kwargs[keys[0]] > ... > kwargs[keys[-1]]`

The first of these whose value is not `None` will be returned. If all are `None` then `None` will be returned. Each key in `keys` will be removed from the `kwargs` dict in place.

### Parameters

**local\_var** [any object] The local variable (highest priority).

**kwargs** [dict] Dictionary of keyword arguments; modified in place.

**keys** [str(s)] Name(s) of keyword arguments to process, in descending order of priority.

### Returns

**any object** Either `local_var` or one of `kwargs[key]` for key in keys.

### Raises

**IgnoredKeywordWarning** For each key in keys that is removed from `kwargs` but not used as the output value.

### Notes

Deprecated since version 3.3.

```
class matplotlib.cbook.maxdict(maxsize)
```

Bases: `dict`

A dictionary with a maximum size.

### Notes

This doesn't override all the relevant methods to constrain the size, just `__setitem__`, so use with caution.

```
matplotlib.cbook.normalize_kwargs(kw, alias_mapping=None, required=<deprecated
                                parameter>, forbidden=<deprecated parameter>,
                                allowed=<deprecated parameter>)
```

Helper function to normalize kwarg inputs.

The order they are resolved are:

1. aliasing
2. required
3. forbidden
4. allowed

This order means that only the canonical names need appear in *allowed*, *forbidden*, *required*.

### Parameters

**kw** [dict] A dict of keyword arguments.

**alias\_mapping** [dict or Artist subclass or Artist instance, optional] A mapping between a canonical name to a list of aliases, in order of precedence from lowest to highest.

If the canonical value is not in the list it is assumed to have the highest priority.

If an Artist subclass or instance is passed, use its properties alias mapping.

**required** [list of str, optional] A list of keys that must be in *kws*. This parameter is deprecated.

**forbidden** [list of str, optional] A list of keys which may not be in *kw*. This parameter is deprecated.

**allowed** [list of str, optional] A list of allowed fields. If this not None, then raise if *kw* contains any keys not in the union of *required* and *allowed*. To allow only the required fields pass in an empty tuple *allowed=()*. This parameter is deprecated.

### Raises

**TypeError** To match what python raises if invalid args/kwargs are passed to a callable.

```
matplotlib.cbook.open_file_cm(path_or_file, mode='r', encoding=None)
```

Pass through file objects and context-manage path-likes.

```
matplotlib.cbook.print_cycles(objects, outstream=<_io.TextIOWrapper
                                name='<stdout>' mode='w' encoding='utf-8'>,
                                show_progress=False)
```

Print loops of cyclic references in the given *objects*.

It is often useful to pass in *gc.garbage* to find the cycles that are preventing some objects from being garbage collected.

### Parameters

**objects** A list of objects to find cycles in.

**outstream** The stream for output.

**show\_progress** [bool] If True, print the number of objects reached as they are found.

```
matplotlib.cbook.pts_to_midstep(x, *args)
```

Convert continuous line to mid-steps.

Given a set of *N* points convert to *2N* points which when connected linearly give a step function which changes values at the middle of the intervals.

### Parameters

**x** [array] The x location of the steps. May be empty.

**y1, ..., yp** [array] y arrays to be turned into steps; all must be the same length as *x*.

### Returns

**array** The x and y values converted to steps in the same order as the input; can be unpacked as *x\_out*, *y1\_out*, ..., *yp\_out*. If the input is length *N*, each of these arrays will be length *2N*.

### Examples

```
>>> x_s, y1_s, y2_s = pts_to_midstep(x, y1, y2)
```

```
matplotlib.cbook.pts_to_poststep(x, *args)
```

Convert continuous line to post-steps.

Given a set of *N* points convert to *2N + 1* points, which when connected linearly give a step function which changes values at the end of the intervals.

**Parameters**

**x** [array] The x location of the steps. May be empty.

**y1, ..., yp** [array] y arrays to be turned into steps; all must be the same length as x.

**Returns**

**array** The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length  $N$ , each of these arrays will be length  $2N + 1$ . For  $N=0$ , the length will be 0.

**Examples**

```
>>> x_s, y1_s, y2_s = pts_to_poststep(x, y1, y2)
```

```
matplotlib.cbook.pts_to_prestep(x, *args)
```

Convert continuous line to pre-steps.

Given a set of  $N$  points, convert to  $2N - 1$  points, which when connected linearly give a step function which changes values at the beginning of the intervals.

**Parameters**

**x** [array] The x location of the steps. May be empty.

**y1, ..., yp** [array] y arrays to be turned into steps; all must be the same length as x.

**Returns**

**array** The x and y values converted to steps in the same order as the input; can be unpacked as `x_out, y1_out, ..., yp_out`. If the input is length  $N$ , each of these arrays will be length  $2N + 1$ . For  $N=0$ , the length will be 0.

**Examples**

```
>>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)
```

```
matplotlib.cbook.report_memory(i=0)
```

Return the memory consumed by the process.

```
matplotlib.cbook.safe_first_element(obj)
```

Return the first element in *obj*.

This is an type-independent way of obtaining the first element, supporting both index access and the iterator protocol.

```
matplotlib.cbook.safe_masked_invalid(x, copy=False)
```

```
matplotlib.cbook.sanitize_sequence(data)
```

Convert dictview objects to list. Other inputs are returned unchanged.

```
class matplotlib.cbook.silent_list(type, seq=None)
```

Bases: `list`

A list with a short `repr()`.

This is meant to be used for a homogeneous list of artists, so that they don't cause long, meaningless output.

Instead of

```
[<matplotlib.lines.Line2D object at 0x7f5749fed3c8>,  
<matplotlib.lines.Line2D object at 0x7f5749fed4e0>,  
<matplotlib.lines.Line2D object at 0x7f5758016550>]
```

one will get

```
<a list of 3 Line2D objects>
```

`matplotlib.cbook.simple_linear_interpolation(a, steps)`

Resample an array with `steps - 1` points between original point pairs.

Along each column of *a*, (`steps - 1`) points are introduced between each original values; the values are linearly interpolated.

#### Parameters

**a** [array, shape (n, ...)]

**steps** [int]

#### Returns

**array** shape ((n - 1) \* steps + 1, ...)

`matplotlib.cbook.strip_math(s)`

Remove latex formatting from `mathtext`.

Only handles fully math and fully non-math strings.

`matplotlib.cbook.to_filehandle(fname, flag='r', return_opened=False, encoding=None)`

Convert a path to an open file handle or pass-through a file-like object.

Consider using `open_file_cm` instead, as it allows one to properly close newly created file objects more easily.

#### Parameters

**fname** [str or path-like or file-like] If `str` or `os.PathLike`, the file is opened using the flags specified by *flag* and *encoding*. If a file-like object, it is passed through.

**flag** [str, default 'r'] Passed as the *mode* argument to `open` when *fname* is `str` or `os.PathLike`; ignored if *fname* is file-like.

**return\_opened** [bool, default False] If True, return both the file object and a boolean indicating whether this was a new file (that the caller needs to close). If False, return only the new file.

**encoding** [str or None, default None] Passed as the *mode* argument to `open` when *fname* is `str` or `os.PathLike`; ignored if *fname* is file-like.

#### Returns

**fh** [file-like]

**opened** [bool] *opened* is only returned if *return\_opened* is True.

```
matplotlib.cbook.violin_stats(X, method, points=100, quantiles=None)
```

Return a list of dictionaries of data which can be used to draw a series of violin plots.

See the Returns section below to view the required keys of the dictionary.

Users can skip this function and pass a user-defined set of dictionaries with the same keys to *violinplot* instead of using Matplotlib to do the calculations. See the *Returns* section below for the keys that must be present in the dictionaries.

### Parameters

**X** [array-like] Sample data that will be used to produce the gaussian kernel density estimates. Must have 2 or fewer dimensions.

**method** [callable] The method used to calculate the kernel density estimate for each column of data. When called via `method(v, coords)`, it should return a vector of the values of the KDE evaluated at the values specified in *coords*.

**points** [int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimates at.

**quantiles** [array-like, default: None] Defines (if not None) a list of floats in interval [0, 1] for each column of data, which represents the quantiles that will be rendered for that column of data. Must have 2 or fewer dimensions. 1D array will be treated as a singleton list containing them.

### Returns

**list of dict** A list of dictionaries containing the results for each column of data. The dictionaries contain at least the following:

- **coords**: A list of scalars containing the coordinates this particular kernel density estimate was evaluated at.
- **vals**: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in *coords*.
- **mean**: The mean value for this column of data.
- **median**: The median value for this column of data.
- **min**: The minimum value for this column of data.
- **max**: The maximum value for this column of data.
- **quantiles**: The quantile values for this column of data.

```
exception matplotlib.cbook.deprecation.MatplotlibDeprecationWarning
```

Bases: [UserWarning](#)

A class for issuing deprecation warnings for Matplotlib users.

In light of the fact that Python builtin `DeprecationWarnings` are ignored by default as of Python 2.7 (see link below), this class was put in to allow for the signaling of deprecation, but via `UserWarnings` which are not ignored by default.

<https://docs.python.org/dev/whatsnew/2.7.html#the-future-for-python-2-x>

```
matplotlib.cbook.deprecation.deprecated(since, *, message="", name="", alternative="",
                                         pending=False, obj_type=None, addendum="", removal="")
```

Decorator to mark a function, a class, or a property as deprecated.

When deprecating a classmethod, a staticmethod, or a property, the `@deprecated` decorator should go *under* `@classmethod` and `@staticmethod` (i.e., *deprecated* should directly decorate the underlying callable), but *over* `@property`.

### Parameters

**since** [str] The release at which this API became deprecated.

**message** [str, optional] Override the default deprecation message. The `%(since)s`, `%(name)s`, `%(alternative)s`, `%(obj_type)s`, `%(addendum)s`, and `%(removal)s` format specifiers will be replaced by the values of the respective arguments passed to this function.

**name** [str, optional] The name used in the deprecation message; if not provided, the name is automatically determined from the deprecated object.

**alternative** [str, optional] An alternative API that the user may use in place of the deprecated API. The deprecation warning will tell the user about this alternative if provided.

**pending** [bool, optional] If True, uses a `PendingDeprecationWarning` instead of a `DeprecationWarning`. Cannot be used together with *removal*.

**obj\_type** [str, optional] The object type being deprecated; by default, 'class' if decorating a class, 'attribute' if decorating a property, 'function' otherwise.

**addendum** [str, optional] Additional text appended directly to the final message.

**removal** [str, optional] The expected removal version. With the default (an empty string), a removal version is automatically computed from *since*. Set to other Falsy values to not schedule a removal date. Cannot be used together with *pending*.

### Examples

Basic example:

```
@deprecated('1.4.0')
def the_function_to_deprecate():
    pass
```

`matplotlib.cbook.deprecation.mplDeprecation`  
alias of `matplotlib.cbook.deprecation.MatplotlibDeprecationWarning`

`matplotlib.cbook.deprecation.warn_deprecated(since, *, message="", name="", alternative="", pending=False, obj_type="", addendum="", removal=")`

Display a standardized deprecation.

### Parameters

**since** [str] The release at which this API became deprecated.

**message** [str, optional] Override the default deprecation message. The `%(since)s`, `%(name)s`, `%(alternative)s`, `%(obj_type)s`, `%(addendum)s`, and `%(removal)s` format specifiers will be replaced by the values of the respective arguments passed to this function.

- name** [str, optional] The name of the deprecated object.
- alternative** [str, optional] An alternative API that the user may use in place of the deprecated API. The deprecation warning will tell the user about this alternative if provided.
- pending** [bool, optional] If True, uses a PendingDeprecationWarning instead of a DeprecationWarning. Cannot be used together with *removal*.
- obj\_type** [str, optional] The object type being deprecated.
- addendum** [str, optional] Additional text appended directly to the final message.
- removal** [str, optional] The expected removal version. With the default (an empty string), a removal version is automatically computed from *since*. Set to other Falsy values to not schedule a removal date. Cannot be used together with *pending*.

### Examples

Basic example:

```
# To warn of the deprecation of "matplotlib.name_of_module"
warn_deprecated('1.4.0', name='matplotlib.name_of_module',
                obj_type='module')
```

## 18.15 matplotlib.cm

Builtin colormaps, colormap handling utilities, and the *ScalarMappable* mixin.

**See also:**

[/gallery/color/colormap\\_reference](#) for a list of builtin colormaps.

[Creating Colormaps in Matplotlib](#) for examples of how to make colormaps.

[Choosing Colormaps in Matplotlib](#) an in-depth discussion of choosing colormaps.

[Colormap Normalization](#) for more details about data normalization.

```
class matplotlib.cm.ScalarMappable(norm=None, cmap=None)
```

Bases: `object`

A mixin class to map scalar data to RGBA.

The `ScalarMappable` applies data normalization before returning RGBA colors from the given colormap.

### Parameters

- norm** [`matplotlib.colors.Normalize` (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If *None*, *norm* defaults to a `colors.Normalize` object which initializes its scaling based on the first data processed.
- cmap** [str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

`add_checker(self, checker)`  
*[Deprecated]*

### Notes

Deprecated since version 3.3:

`autoscale(self)`  
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`  
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`changed(self)`  
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
*[Deprecated]*

### Notes

Deprecated since version 3.3:

`colorbar = None`  
The last colorbar associated with this ScalarMappable. May be None.

`get_alpha(self)`

### Returns

**float** Always returns 1.

`get_array(self)`  
Return the data array.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_cmap(self)`  
Return the *Colormap* instance.

`set_array(self, A)`  
Set the image array from numpy array A.

### Parameters

**A** [ndarray]

`set_clim(self, vmin=None, vmax=None)`  
Set the norm limits for image scaling.

### Parameters

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

### Parameters

**cmap** [*Colormap* or str or None]

`set_norm(self, norm)`

Set the normalization instance.

### Parameters

**norm** [*Normalize* or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this *ScalarMappable*.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a *ValueError* will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A *ValueError* will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

property update\_dict

`matplotlib.cm.get_cmap(name=None, lut=None)`

Get a colormap instance, defaulting to rc values if *name* is None.

Colormaps added with *register\_cmap()* take precedence over built-in colormaps.

### Parameters

**name** [*matplotlib.colors.Colormap* or str or None, default: None] If a *Colormap* instance, it will be returned. Otherwise, the name of a colormap known to Matplotlib, which will be resampled by *lut*. The default, None, means *rcParams["image.cmap"]* (default: 'viridis').

**lut** [int or None, default: None] If *name* is not already a *Colormap* instance and *lut* is not None, the colormap will be resampled to have *lut* entries in the lookup table.

### Notes

Currently, this returns the global colormap object, which is deprecated. In Matplotlib 3.5, you will no longer be able to modify the global colormaps in-place.

`matplotlib.cm.register_cmap(name=None, cmap=None, data=None, lut=None)`

Add a colormap to the set recognized by `get_cmap()`.

It can be used in two ways:

```
register_cmap(name='swirly', cmap=swirly_cmap)

register_cmap(name='choppy', data=choppydata, lut=128)
```

In the first case, *cmap* must be a `matplotlib.colors.Colormap` instance. The *name* is optional; if absent, the name will be the name attribute of the *cmap*.

The second case is deprecated. Here, the three arguments are passed to the `LinearSegmentedColormap` initializer, and the resulting colormap is registered. Instead of this implicit colormap creation, create a `LinearSegmentedColormap` and use the first case: `register_cmap(cmap=LinearSegmentedColormap(name, data, lut))`.

### Notes

Registering a colormap stores a reference to the colormap object which can currently be modified and inadvertently change the global colormap state. This behavior is deprecated and in Matplotlib 3.5 the registered colormap will be immutable.

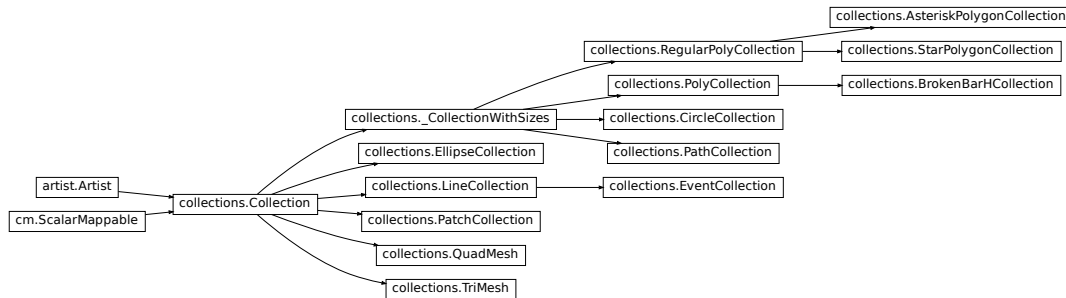

`matplotlib.cm.revcmmap(data)`

[*Deprecated*] Can only handle specification *data* in dictionary format.

### Notes

Deprecated since version 3.2.

## 18.16 matplotlib.collections

Classes for the efficient drawing of large collections of objects that share most properties, e.g., a large number of line segments or polygons.

The classes are not meant to be as flexible as their single element counterparts (e.g., you may not be able to select all line styles) but they are meant to be fast for common use cases (e.g., a large set of solid line segments).

```
class matplotlib.collections.AsteriskPolygonCollection(numsides, rotation=0,
                                                       sizes=(1, ), **kwargs)
```

Bases: `matplotlib.collections.RegularPolyCollection`

Draw a collection of regular asterisks with *numsides* points.

### Parameters

**numsides** [int] The number of sides of the polygon.

**rotation** [float] The rotation of the polygon in radians.

**sizes** [tuple of float] The area of the circle circumscribing the polygon in points<sup>2</sup>.

**\*\*kwargs** Forwarded to `Collection`.

### Examples

See `/gallery/event_handling/lasso_demo` for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)
```

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, `x` itself is returned.

`convert_yunits(self, y)`

Convert `y` using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, `y` itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- `None`: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include `self` in the list to be checked for a match.

### Returns

**list of `Artist`**

`format_cursor_data(self, data)`

Return a string representation of `data`.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_contains(self)`  
[Deprecated] Return the custom contains function of the artist if set, or *None*.

**See also:**

[`set\_contains`](#)

**Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** [`matplotlib.backend_bases.MouseEvent`]

**See also:***format\_cursor\_data*`get_dashes(self)`Alias for *get\_linestyle*.`get_datalim(self, transData)``get_ec(self)`Alias for *get\_edgecolor*.`get_edgecolor(self)``get_edgecolors(self)`Alias for *get\_edgecolor*.`get_facecolor(self)``get_facecolors(self)`Alias for *get\_facecolor*.`get_fc(self)`Alias for *get\_facecolor*.`get_figure(self)`Return the *Figure* instance the artist belongs to.`get_fill(self)`

Return whether fill is set.

`get_gid(self)`

Return the group id.

`get_hatch(self)`

Return the current hatching pattern.

`get_in_layout(self)`

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.`get_joinstyle(self)``get_label(self)`

Return the label used for this artist in the legend.

`get_linestyle(self)``get_linestyles(self)`Alias for *get\_linestyle*.`get_linewidth(self)``get_linewidths(self)`Alias for *get\_linewidth*.`get_ls(self)`Alias for *get\_linestyle*.`get_lw(self)`Alias for *get\_linewidth*.`get_numsides(self)`

`get_offset_position(self)`

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in *set\_picker*.

### See also:

*set\_picker*, *pickable*, *pick*

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_rotation(self)`

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

### Returns

**array** The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See *set\_snap* for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

property `mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`

`remove_callback`

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw\_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for *set\_antialiased*.

`set_agg_filter(self, filter_func)`

Set the agg filter.

### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

**Parameters**

**cs** [{*'butt'*, *'round'*, *'projecting'*}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

**Parameters**

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(self, b)`

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(self, path, transform=None)`

Set the artist's clip path.

### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

### Parameters

**cmap** [*Colormap* or str or *None*]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

### Parameters

**c** [color or list of rgba tuples]

### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default *contains()* implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`  
Alias for `set_linestyle`.

`set_ec(self, c)`  
Alias for `set_edgecolor`.

`set_edgecolor(self, c)`  
Set the edgecolor(s) of the collection.

#### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for `set_edgecolor`.

`set_facecolor(self, c)`  
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [{`'/'`, `'\'`, `'|'`, `'-'`, `'+'`, `'x'`, `'o'`, `'O'`, `'.'`, `'*'`}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

### Parameters

**js** [{`'miter'`, `'round'`, `'bevel'`}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

### Parameters

**s** [object] `s` will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
<code>'-'</code> or <code>'solid'</code>	solid line
<code>'--'</code> or <code>'dashed'</code>	dashed line
<code>'-.'</code> or <code>'dashdot'</code>	dash-dotted line
<code>':'</code> or <code>'dotted'</code>	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include `{'-', '--', '-.', ':', '', (offset, on-off-seq)}`. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`  
Alias for `set_linewidth`.

`set_ls(self, ls)`  
Alias for `set_linestyle`.

`set_lw(self, lw)`  
Alias for `set_linewidth`.

`set_norm(self, norm)`  
Set the normalization instance.

### Parameters

**norm** [*Normalize* or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`  
[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`  
Set the offsets for the collection.

### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`  
Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self)`

`set_picker(self, picker)`  
Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).

- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

#### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float, default: 72] The dpi of the canvas.

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping

will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`  
Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(self, url)`  
Set the url for the artist.

#### Parameters

**url** [str]

`set_urls(self, urls)`

#### Parameters

**urls** [list of str or None]

#### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`  
Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

property `stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property `sticky_edges`  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added-the view limit "sticks" to

the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to `x`.

In the normal case, `x` is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the `norm` and `colormap` set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If `x` is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the `alpha` kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the `alpha` kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if `bytes` is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be `uint8` in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict `props`.

### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from `other` to `self`.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not `None`.

`zorder = 0`

`class matplotlib.collections.BrokenBarHCollection(xranges, yrange, **kwargs)`

Bases: `matplotlib.collections.PolyCollection`

A collection of horizontal bars spanning `yrange` with a sequence of `xranges`.

### Parameters

**xranges** [list of (float, float)] The sequence of (left-edge-position, width) pairs for each bar.

**yrange** [(float, float)] The (lower-edge, height) common to all bars.

**\*\*kwargs** Forwarded to *Collection*.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[*Deprecated*]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
[*Deprecated*]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits(self, y)`

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

#### Parameters

**renderer** [*RendererBase* subclass.]

#### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

#### Returns

**list of** *Artist*

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

*get\_cursor\_data*

`get_agg_filter(self)`  
Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_contains(self)`  
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:***set\_contains***Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** [*matplotlib.backend\_bases.MouseEvent*]

**See also:**

*format\_cursor\_data*

*get\_dashes(self)*

Alias for *get\_linestyle*.

*get\_datalim(self, transData)*

*get\_ec(self)*

Alias for *get\_edgecolor*.

*get\_edgecolor(self)*

*get\_edgecolors(self)*

Alias for *get\_edgecolor*.

*get\_facecolor(self)*

*get\_facecolors(self)*

Alias for *get\_facecolor*.

*get\_fc(self)*

Alias for *get\_facecolor*.

*get\_figure(self)*

Return the *Figure* instance the artist belongs to.

*get\_fill(self)*

Return whether fill is set.

*get\_gid(self)*

Return the group id.

*get\_hatch(self)*

Return the current hatching pattern.

*get\_in\_layout(self)*

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

*get\_joinstyle(self)*

*get\_label(self)*

Return the label used for this artist in the legend.

*get\_linestyle(self)*

*get\_linestyles(self)*

Alias for *get\_linestyle*.

*get\_linewidth(self)*

*get\_linewidths(self)*

Alias for *get\_linewidth*.

*get\_ls(self)*

Alias for *get\_linestyle*.

*get\_lw(self)*

Alias for *get\_linewidth*.

`get_offset_position(self)`

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in *set\_picker*.

### See also:

*set\_picker*, *pickable*, *pick*

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

### Returns

**array** The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See *set\_snap* for details.

`get_tightbbox(self, renderer)`

Like *Artist.get\_window\_extent*, but includes any clipping.

### Parameters

**renderer** [*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after *set\_transform* has been called.

property `mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get\_cursor\_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`  
`remove_callback`

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw\_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for *set\_antialiased*.

`set_agg_filter(self, filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float or None]

`set_animated(self, b)`  
Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(self, aa)`  
Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`  
Alias for `set_antialiased`.

`set_array(self, A)`  
Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`  
Set the capstyle for the collection (for all its elements).

**Parameters**

**cs** [{*'butt'*, *'round'*, *'projecting'*}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`  
Set the norm limits for image scaling.

**Parameters**

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`  
Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(self, b)`  
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(self, path, transform=None)`  
Set the artist's clip path.

**Parameters**

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

### Parameters

**cmap** [*Colormap* or str or None]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

### Parameters

**c** [color or list of rgba tuples]

### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default *contains()* implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for *set\_linestyle*.

`set_ec(self, c)`  
Alias for `set_edgecolor`.

`set_edgecolor(self, c)`  
Set the edgecolor(s) of the collection.

#### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for `set_edgecolor`.

`set_facecolor(self, c)`  
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{`'/'`, `'\'`, `'|'`, `'-'`, `'+'`, `'x'`, `'o'`, `'O'`, `'.'`, `'*'`}]

**set\_in\_layout**(*self*, *in\_layout*)

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and [fig.savefig\(fname, bbox\\_inches='tight'\)](#).

#### Parameters

**in\_layout** [bool]

**set\_joinstyle**(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{`'miter'`, `'round'`, `'bevel'`}] The joinstyle.

**set\_label**(*self*, *s*)

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

**set\_linestyle**(*self*, *ls*)

Set the linestyle(s) for the collection.

linestyle	description
<code>'-'</code> or <code>'solid'</code>	solid line
<code>'--'</code> or <code>'dashed'</code>	dashed line
<code>'-.'</code> or <code>'dashdot'</code>	dash-dotted line
<code>':'</code> or <code>'dotted'</code>	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

#### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include `{'-', '--', '-.', ':', '', (offset, on-off-seq)}`. See [Line2D.set\\_linestyle](#) for a complete description.

**set\_linestyles**(*self*, *ls*)

Alias for [set\\_linestyle](#).

**set\_linewidth**(*self*, *lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`  
Alias for `set_linewidth`.

`set_ls(self, ls)`  
Alias for `set_linestyle`.

`set_lw(self, lw)`  
Alias for `set_linewidth`.

`set_norm(self, norm)`  
Set the normalization instance.

#### Parameters

**norm** [*Normalize* or None]

#### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`  
[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

#### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`  
Set the offsets for the collection.

#### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`  
Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self, verts, closed=True)`  
Set the vertices of the polygons.

#### Parameters

**verts** [list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts<sub>i</sub>* defines the vertices of polygon *i* as a 2D array-like of of shape (M, 2).

**closed** [bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

`set_picker(self, picker)`

Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float, default: 72] The dpi of the canvas.

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(self, url)`

Set the url for the artist.

#### Parameters

**url** [str]

`set_urls(self, urls)`

#### Parameters

**urls** [list of str or None]

#### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_verts(self, verts, closed=True)`

Set the vertices of the polygons.

#### Parameters

**verts** [list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts<sub>i</sub>* defines the vertices of polygon *i* as a 2D array-like of of shape (M, 2).

**closed** [bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

`set_verts_and_codes(self, verts, codes)`

Initialize vertices with path codes.

`set_visible(self, b)`  
Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

`classmethod span_where(x, ymin, ymax, where, **kwargs)`  
Return a [\*BrokenBarHCollection\*](#) that plots horizontal bars from over the regions in `x` where `where` is True. The bars range on the y-axis from `ymin` to `ymax`  
  
`kwargs` are passed on to the collection.

property `stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property `sticky_edges`  
`x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

#### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`  
Return a normalized rgba array corresponding to `x`.

In the normal case, `x` is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the `norm` and `colormap` set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If `x` is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the `alpha` kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the `alpha` kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if `bytes` is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be `uint8` in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict *props*.

#### Parameters

**props** [dict]

property `update_dict`

`update_from(self, other)`

Copy properties from *other* to *self*.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not `None`.

`zorder = 0`

`class matplotlib.collections.CircleCollection(sizes, **kwargs)`

Bases: `matplotlib.collections._CollectionWithSizes`

A collection of circles, drawn using splines.

#### Parameters

**sizes** [float or array-like] The area of each circle in `points^2`.

**\*\*kwargs** Forwarded to *Collection*.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

#### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

#### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

#### See also:

`remove_callback`

`add_checker(self, checker)`

[*Deprecated*]

#### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the *norm* instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The [Axes](#) instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`

[*Deprecated*]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

`convert_yunits(self, y)`

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible ([Artist.get\\_visible](#) returns False).

### Parameters

**renderer** [[RendererBase](#) subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all [Artist](#) instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.

- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

### Returns

list of *Artist*

*format\_cursor\_data(self, data)*

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

*get\_cursor\_data*

*get\_agg\_filter(self)*

Return filter function to be used for agg filter.

*get\_alpha(self)*

Return the alpha value used for blending - not supported on all backends.

*get\_animated(self)*

Return whether the artist is animated.

*get\_array(self)*

Return the data array.

*get\_capstyle(self)*

*get\_children(self)*

Return a list of the child *Artists* of this *Artist*.

*get\_clim(self)*

Return the values (min, max) that are mapped to the colormap limits.

*get\_clip\_box(self)*

Return the clipbox.

*get\_clip\_on(self)*

Return whether the artist uses clipping.

*get\_clip\_path(self)*

Return the clip path.

*get\_cmap(self)*

Return the *Colormap* instance.

*get\_contains(self)*

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

### See also:

*set\_contains*

## Notes

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

## Parameters

**event** [`matplotlib.backend_bases.MouseEvent`]

## See also:

`format_cursor_data`

`get_dashes(self)`  
Alias for `get_linestyle`.

`get_datalim(self, transData)`

`get_ec(self)`  
Alias for `get_edgecolor`.

`get_edgecolor(self)`

`get_edgecolors(self)`  
Alias for `get_edgecolor`.

`get_facecolor(self)`

`get_facecolors(self)`  
Alias for `get_facecolor`.

`get_fc(self)`  
Alias for `get_facecolor`.

`get_figure(self)`  
Return the *Figure* instance the artist belongs to.

`get_fill(self)`  
Return whether fill is set.

`get_gid(self)`  
Return the group id.

`get_hatch(self)`  
Return the current hatching pattern.

`get_in_layout(self)`

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle(self)`

`get_label(self)`

Return the label used for this artist in the legend.

`get_linestyle(self)`

`get_linestyles(self)`

Alias for *get\_linestyle*.

`get_linewidth(self)`

`get_linewidths(self)`

Alias for *get\_linewidth*.

`get_ls(self)`

Alias for *get\_linestyle*.

`get_lw(self)`

Alias for *get\_linewidth*.

`get_offset_position(self)`

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in *set\_picker*.

### See also:

*set\_picker*, *pickable*, *pick*

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

**Returns**

**array** The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

**Returns**

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

`property mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`

`remove_callback`

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for `set_antialiased`.

`set_agg_filter(self, filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

**Parameters**

**cs** [{ 'butt', 'round', 'projecting' }] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

**Parameters**

**vmin, vmax**  [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`  
Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(self, b)`  
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

**b** [bool]

`set_clip_path(self, path, transform=None)`  
Set the artist's clip path.

#### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

#### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`  
Set the colormap for luminance data.

#### Parameters

**cmap** [*Colormap* or str or None]

`set_color(self, c)`  
Set both the edgecolor and the facecolor.

#### Parameters

**c** [color or list of rgba tuples]

#### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for `set_linestyle`.

`set_ec(self, c)`

Alias for `set_edgecolor`.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`

Alias for `set_edgecolor`.

`set_facecolor(self, c)`

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`

Alias for `set_facecolor`.

`set_fc(self, c)`

Alias for `set_facecolor`.

`set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`

Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{*'/'*, *'\'*', *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{*'miter'*, *'round'*, *'bevel'*}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling *str*.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where onoffseq is an even length tuple of on and off ink in points.

### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '-', '-.', ':', ''}, (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for [set\\_linewidth](#).

`set_ls(self, ls)`

Alias for [set\\_linestyle](#).

`set_lw(self, lw)`

Alias for [set\\_linewidth](#).

`set_norm(self, norm)`

Set the normalization instance.

### Parameters

**norm** [[Normalize](#) or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

### Parameters

**path\_effects** [[\*AbstractPathEffect\*](#)]

`set_paths(self)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For [\*Line2D\*](#) only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use [\*Line2D.set\\_pickradius\*](#) instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection.  
The value is the 'area' of the element.

**dpi** [float, default: 72] The dpi of the canvas.

`set_sketch_params(self, scale=None, length=None, randomness=None)`  
Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`  
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`  
Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(self, url)`  
Set the url for the artist.

#### Parameters

**url** [str]

`set_urls(self, urls)`

#### Parameters

**urls** [list of str or None]

### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`  
Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

property `stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property `sticky_edges`  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`  
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict `props`.

### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from `other` to `self`.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not `None`.

`zorder = 0`

```
class matplotlib.collections.Collection(edgecolors=None,          facecolors=None,
                                       linewidths=None,          linestyle='solid',
                                       capstyle=None,             joinstyle=None,   an-
                                       tialiaseds=None,           offsets=None,   transOff-
                                       set=None,                  norm=None,          cmap=None,
                                       pickradius=5.0,             hatch=None,    urls=None,
                                       offset_position=<deprecated parameter>,
                                       zorder=1, **kwargs)
```

Bases: `matplotlib.artist.Artist`, `matplotlib.cm.ScalarMappable`

Base class for Collections. Must be subclassed to be usable.

A Collection represents a sequence of `Patches` that can be drawn more efficiently together than individually. For example, when a single path is being drawn repeatedly at different offsets, the renderer can typically execute a `draw_marker()` call much more efficiently than a series of repeated calls to `draw_path()` with the offsets put in one-by-one.

Most properties of a collection can be configured per-element. Therefore, Collections have "plural" versions of many of the properties of a `Patch` (e.g. `Collection.get_paths` instead of `Patch.get_path`). Exceptions are the `zorder`, `hatch`, `pickradius`, `capstyle` and `joinstyle` properties, which can only be set globally for the whole collection.

Besides these exceptions, all properties can be specified as single values (applying to all elements) or sequences of values. The property of the `i`th element of the collection is:

```
prop[i % len(prop)]
```

Each Collection can optionally be used as its own `ScalarMappable` by passing the `norm` and `cmap` parameters to its constructor. If the Collection's `ScalarMappable` matrix `_A` has been set (via a call to `Collection.set_array`), then at draw time this internal scalar mappable will be used to set the `facecolors` and `edgecolors`, ignoring those that were manually passed in.

### Parameters

**edgecolors** [color or list of colors, default: `rcParams["patch.edgecolor"]` (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

**facecolors** [color or list of colors, default: `rcParams["patch.facecolor"]` (default: 'C0')] Face color for each patch making up the collection.

**linewidths** [float or list of floats, default: `rcParams["patch.linewidth"]` (default: 1.0)] Line width for each patch making up the collection.

**linestyles** [str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '-.', ':']. Dash tuples should be of the form:

(offset, onoffseq),

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see `/gallery/lines_bars_and_markers/linestyles`.

**capstyle** [str, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. See `/gallery/lines_bars_and_markers/joinstyle` for a demonstration of each of the allowed values.

**joinstyle** [str, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. See `/gallery/lines_bars_and_markers/joinstyle` for a demonstration of each of the allowed values.

**antialiaseds** [bool or list of bool, default: `rcParams["patch.antialiased"]` (default: True)] Whether each patch in the collection should be drawn with antialiasing.

**offsets** [(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

**transOffset** [*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

**offset\_position** [{ 'screen' (default), 'data' (deprecated) }] If set to 'data' (deprecated), *offsets* will be treated as if it is in data coordinates instead of in screen coordinates.

**norm** [*Normalize*, optional] Forwarded to *ScalarMappable*. The default of None means that the first draw call will set *vmin* and *vmax* using the minimum and maximum values of the data.

**cmap** [*Colormap*, optional] Forwarded to *ScalarMappable*. The default of None will result in `rcParams["image.cmap"]` (default: 'viridis') being used.

**hatch** [str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/', ' ', '|', '-', '+', 'x', 'o', 'O', '.', '\*']. See `/gallery/shapes_and_collections/hatch_demo` for the meaning of each hatch type.

**pickradius** [float, default: 5.0] If *pickradius* ≤ 0, then *Collection.contains* will return True whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width 2\**pickradius* following any of the Paths in the Collection.

**urls** [list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See `/gallery/misc/hyperlinks_sgskip` for examples.

**zorder** [float, default: 1] The drawing order, shared by all Patches in the Collection. See `/gallery/misc/zorder_demo` for all defaults and examples.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

#### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

#### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

#### See also:

`remove_callback`

`add_checker(self, checker)`

[Deprecated]

#### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`

[Deprecated]

#### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert *x* using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits(self, y)`

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

#### Parameters

**renderer** [*RendererBase* subclass.]

#### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

#### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

#### Returns

**list of** *Artist*

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

*get\_cursor\_data*

`get_agg_filter(self)`  
Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_contains(self)`  
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:***set\_contains***Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** [*matplotlib.backend\_bases.MouseEvent*]

**See also:**

*format\_cursor\_data*

*get\_dashes(self)*

Alias for *get\_linestyle*.

*get\_datalim(self, transData)*

*get\_ec(self)*

Alias for *get\_edgecolor*.

*get\_edgecolor(self)*

*get\_edgecolors(self)*

Alias for *get\_edgecolor*.

*get\_facecolor(self)*

*get\_facecolors(self)*

Alias for *get\_facecolor*.

*get\_fc(self)*

Alias for *get\_facecolor*.

*get\_figure(self)*

Return the *Figure* instance the artist belongs to.

*get\_fill(self)*

Return whether fill is set.

*get\_gid(self)*

Return the group id.

*get\_hatch(self)*

Return the current hatching pattern.

*get\_in\_layout(self)*

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

*get\_joinstyle(self)*

*get\_label(self)*

Return the label used for this artist in the legend.

*get\_linestyle(self)*

*get\_linestyles(self)*

Alias for *get\_linestyle*.

*get\_linewidth(self)*

*get\_linewidths(self)*

Alias for *get\_linewidth*.

*get\_ls(self)*

Alias for *get\_linestyle*.

*get\_lw(self)*

Alias for *get\_linewidth*.

`get_offset_position(self)`

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in *set\_picker*.

### See also:

*set\_picker*, *pickable*, *pick*

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See *set\_snap* for details.

`get_tightbbox(self, renderer)`

Like *Artist.get\_window\_extent*, but includes any clipping.

### Parameters

**renderer** [*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after *set\_transform* has been called.

property *mouseover*

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get\_cursor\_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

*add\_callback*

*remove\_callback*

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for `set_antialiased`.

`set_agg_filter(self, filter_func)`

Set the agg filter.

#### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

#### Parameters

**b** [bool]

`set_antialiased(self, aa)`  
Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`  
Alias for `set_antialiased`.

`set_array(self, A)`  
Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`  
Set the capstyle for the collection (for all its elements).

**Parameters**

**cs** [{*'butt'*, *'round'*, *'projecting'*}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`  
Set the norm limits for image scaling.

**Parameters**

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`  
Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(self, b)`  
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(self, path, transform=None)`  
Set the artist's clip path.

**Parameters**

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

## Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

### Parameters

**cmap** [*Colormap* or str or `None`]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

### Parameters

**c** [color or list of rgba tuples]

### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

## Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for *set\_linestyle*.

`set_ec(self, c)`

Alias for *set\_edgecolor*.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for `set_edgecolor`.

`set_facecolor(self, c)`  
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{*'/'*, *'\'*', *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

#### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ''}, (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for [set\\_linewidth](#).

`set_ls(self, ls)`

Alias for [set\\_linestyle](#).

`set_lw(self, lw)`

Alias for [set\\_linewidth](#).

`set_norm(self, norm)`

Set the normalization instance.

**Parameters**

**norm** [*Normalize* or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

**offset\_position** [{'screen', 'data'}]

**Notes**

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

**Parameters**

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

**Parameters**

**path\_effects** [*AbstractPathEffect*]

`set_paths(self)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

**Parameters**

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the *PickEvent* attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

**Parameters****t** [*Transform*]`set_url(self, url)`

Set the url for the artist.

**Parameters****url** [str]`set_urls(self, urls)`**Parameters****urls** [list of str or None]**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`

Set the artist's visibility.

**Parameters****b** [bool]`set_zorder(self, level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level** [float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky\_edges

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added-the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to x.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict *props*.

#### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from other to self.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

```
class matplotlib.collections.EllipseCollection(widths, heights, angles, units='points',
                                              **kwargs)
```

Bases: `matplotlib.collections.Collection`

A collection of ellipses, drawn using splines.

#### Parameters

**widths** [array-like] The lengths of the first axes (e.g., major axis lengths).

**heights** [array-like] The lengths of second axes.

**angles** [array-like] The angles of the first axes, degrees CCW from the x-axis.

**units** [{*'points'*, *'inches'*, *'dots'*, *'width'*, *'height'*, *'x'*, *'y'*, *'xy'*}] The units in which majors and minors are given; *'width'* and *'height'* refer to the dimensions of the axes, while *'x'* and *'y'* refer to the *offsets* data units. *'xy'* differs from all others in that the angle as plotted varies with the aspect ratio, and equals the specified angle only when the aspect ratio is unity. Hence it behaves the same as the *Ellipse* with `axes.transData` as its transform.

**\*\*kwargs** Forwarded to *Collection*.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, `x` itself is returned.

`convert_yunits(self, y)`

Convert `y` using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, `y` itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- `None`: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include `self` in the list to be checked for a match.

### Returns

**list of `Artist`**

`format_cursor_data(self, data)`

Return a string representation of `data`.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_contains(self)`  
[Deprecated] Return the custom contains function of the artist if set, or *None*.

**See also:**

[`set\_contains`](#)

**Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** [`matplotlib.backend_bases.MouseEvent`]

**See also:***format\_cursor\_data*`get_dashes(self)`Alias for *get\_linestyle*.`get_datalim(self, transData)``get_ec(self)`Alias for *get\_edgecolor*.`get_edgecolor(self)``get_edgecolors(self)`Alias for *get\_edgecolor*.`get_facecolor(self)``get_facecolors(self)`Alias for *get\_facecolor*.`get_fc(self)`Alias for *get\_facecolor*.`get_figure(self)`Return the *Figure* instance the artist belongs to.`get_fill(self)`

Return whether fill is set.

`get_gid(self)`

Return the group id.

`get_hatch(self)`

Return the current hatching pattern.

`get_in_layout(self)`

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.`get_joinstyle(self)``get_label(self)`

Return the label used for this artist in the legend.

`get_linestyle(self)``get_linestyles(self)`Alias for *get\_linestyle*.`get_linewidth(self)``get_linewidths(self)`Alias for *get\_linewidth*.`get_ls(self)`Alias for *get\_linestyle*.`get_lw(self)`Alias for *get\_linewidth*.

`get_offset_position(self)`

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in *set\_picker*.

### See also:

*set\_picker*, *pickable*, *pick*

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See *set\_snap* for details.

`get_tightbbox(self, renderer)`

Like *Artist.get\_window\_extent*, but includes any clipping.

### Parameters

**renderer** [*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after *set\_transform* has been called.

property *mouseover*

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get\_cursor\_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

*add\_callback*

*remove\_callback*

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for `set_antialiased`.

`set_agg_filter(self, filter_func)`

Set the agg filter.

#### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

#### Parameters

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

#### Parameters

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

#### Parameters

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

#### Parameters

**cs** [{*'butt'*, *'round'*, *'projecting'*}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

#### Parameters

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`

Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(self, b)`

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

**b** [bool]

`set_clip_path(self, path, transform=None)`

Set the artist's clip path.

#### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

### Parameters

**cmap** [*Colormap* or str or `None`]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

### Parameters

**c** [color or list of rgba tuples]

### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for *set\_linestyle*.

`set_ec(self, c)`

Alias for *set\_edgecolor*.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for `set_edgecolor`.

`set_facecolor(self, c)`  
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{*'/'*, *'\'*', *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

#### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ''}, (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for [set\\_linewidth](#).

`set_ls(self, ls)`

Alias for [set\\_linestyle](#).

`set_lw(self, lw)`

Alias for [set\\_linewidth](#).

`set_norm(self, norm)`

Set the normalization instance.

#### Parameters

**norm** [*Normalize* or None]

#### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

#### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

#### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

#### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the *PickEvent* attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

**Parameters****t** [*Transform*]`set_url(self, url)`

Set the url for the artist.

**Parameters****url** [str]`set_urls(self, urls)`**Parameters****urls** [list of str or None]**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`

Set the artist's visibility.

**Parameters****b** [bool]`set_zorder(self, level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters****level** [float]property `stale`

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property `sticky_edges`

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to x.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict *props*.

#### Parameters

**props** [dict]

`property update_dict`

`update_from(self, other)`

Copy properties from other to self.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

```
class matplotlib.collections.EventCollection(positions, orientation='horizontal', line-
                                             offset=0, linelength=1, linewidth=None,
                                             color=None, linestyle='solid', an-
                                             tialiased=None, **kwargs)
```

Bases: `matplotlib.collections.LineCollection`

A collection of locations along a single axis at which an "event" occurred.

The events are given by a 1-dimensional array. They do not have an amplitude and are displayed as parallel lines.

#### Parameters

**positions** [1D array-like] Each value is an event.

**orientation** [{*'horizontal'*, *'vertical'*}, default: *'horizontal'*] The sequence of events is plotted along this direction. The marker lines of the single events are along the orthogonal direction.

**lineoffset** [float, default: 0] The offset of the center of the markers from the origin, in the direction orthogonal to *orientation*.

**linelength** [float, default: 1] The total height of the marker (i.e. the marker stretches from *lineoffset* - *linelength*/2 to *lineoffset* + *linelength*/2).

**linewidth** [float or list thereof, default: `rcParams["lines.linewidth"]` (default: 1.5)] The line width of the event lines, in points.

**color** [color or list of colors, default: `rcParams["lines.color"]` (default: 'C0')] The color of the event lines.

**linestyle** [str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

(offset, onoffseq),

where *onoffseq* is an even length tuple of on and off ink in points.

**antialiased** [bool or list thereof, default: `rcParams["lines.antialiased"]` (default: True)] Whether to use antialiasing for drawing the lines.

**\*\*kwargs** Forwarded to *LineCollection*.

### Examples

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

#### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

*add\_checker(self, checker)*  
[Deprecated]

### Notes

Deprecated since version 3.3:

*add\_positions(self, position)*  
Add one or more events at the specified positions.

*append\_positions(self, position)*  
Add one or more events at the specified positions.

*autoscale(self)*  
Autoscale the scalar limits on the norm instance using the current array

*autoscale\_None(self)*  
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property *axes*  
The *Axes* instance the artist resides in, or *None*.

*changed(self)*  
Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

*check\_update(self, checker)*  
[Deprecated]

### Notes

Deprecated since version 3.3:

*contains(self, mouseevent)*  
Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

*convert\_xunits(self, x)*  
Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

`convert_yunits(self, y)`

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`extend_positions(self, position)`

Add one or more events at the specified positions.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

### Returns

**list of `Artist`**

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_color(self)`  
Return the color of the lines used to mark each event.

`get_colors(self)`

`get_contains(self)`  
[Deprecated] Return the custom contains function of the artist if set, or *None*.

**See also:**

[\*set\\_contains\*](#)

**Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

## Parameters

**event** [*matplotlib.backend\_bases.MouseEvent*]

### See also:

*format\_cursor\_data*

*get\_dashes(self)*

Alias for *get\_linestyle*.

*get\_datalim(self, transData)*

*get\_ec(self)*

Alias for *get\_edgecolor*.

*get\_edgecolor(self)*

*get\_edgecolors(self)*

Alias for *get\_edgecolor*.

*get\_facecolor(self)*

*get\_facecolors(self)*

Alias for *get\_facecolor*.

*get\_fc(self)*

Alias for *get\_facecolor*.

*get\_figure(self)*

Return the *Figure* instance the artist belongs to.

*get\_fill(self)*

Return whether fill is set.

*get\_gid(self)*

Return the group id.

*get\_hatch(self)*

Return the current hatching pattern.

*get\_in\_layout(self)*

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

*get\_joinstyle(self)*

*get\_label(self)*

Return the label used for this artist in the legend.

*get\_linelength(self)*

Return the length of the lines used to mark each event.

*get\_lineoffset(self)*

Return the offset of the lines used to mark each event.

*get\_linestyle(self)*

*get\_linestyles(self)*

Alias for *get\_linestyle*.

*get\_linewidth(self)*

Get the width of the lines used to mark each event.

`get_linewidths(self)`  
Alias for `get_linewidth`.

`get_ls(self)`  
Alias for `get_linestyle`.

`get_lw(self)`  
Alias for `get_linewidth`.

`get_offset_position(self)`  
[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`  
Return the offsets for the collection.

`get_orientation(self)`  
Return the orientation of the event line ('horizontal' or 'vertical').

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`  
Return the picking behavior of the artist.

The possible values are described in `set_picker`.

### See also:

`set_picker`, `pickable`, `pick`

`get_pickradius(self)`

`get_positions(self)`  
Return an array containing the floating-point values of the positions.

`get_rasterized(self)`  
Return whether the artist is to be rasterized.

`get_segments(self)`

### Returns

**list** List of segments in the LineCollection. Each list item contains an array of vertices.

`get_sketch_params(self)`  
Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.

- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_horizontal(self)`

True if the eventcollection is horizontal, False if vertical.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after *set\_transform* has been called.

`property mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get\_cursor\_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

*add\_callback*

*remove\_callback*

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

*set\_picker*, *get\_picker*, *pickable*

`pickable(self)`

Return whether the artist is pickable.

**See also:**

*set\_picker*, *get\_picker*, *pick*

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw\_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim = True*.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

*add\_callback*

`set(self, **kwargs)`  
A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`  
Alias for `set_antialiased`.

`set_agg_filter(self, filter_func)`  
Set the agg filter.

#### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`  
Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha** [float or None]

`set_animated(self, b)`  
Set the artist's animation state.

#### Parameters

**b** [bool]

`set_antialiased(self, aa)`  
Set the antialiasing state for rendering.

#### Parameters

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`  
Alias for `set_antialiased`.

`set_array(self, A)`  
Set the image array from numpy array *A*.

#### Parameters

**A** [ndarray]

`set_capstyle(self, cs)`  
Set the capstyle for the collection (for all its elements).

#### Parameters

**cs** [{ 'butt', 'round', 'projecting' }] The capstyle.

`set_clim(self, vmin=None, vmax=None)`  
Set the norm limits for image scaling.

#### Parameters

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`  
Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]**set\_clip\_on**(*self*, *b*)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b** [bool]**set\_clip\_path**(*self*, *path*, *transform=None*)

Set the artist's clip path.

**Parameters**

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_cmap**(*self*, *cmap*)

Set the colormap for luminance data.

**Parameters****cmap** [*Colormap* or str or None]**set\_color**(*self*, *c*)

Set the color(s) of the LineCollection.

**Parameters**

**c** [color or list of colors] Single color (all patches have same color), or a sequence of rgba tuples; if it is a sequence the patches will cycle through the sequence.

**set\_contains**(*self*, *picker*)*[Deprecated]* Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

**Parameters**

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist

- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for `set_linestyle`.

`set_ec(self, c)`

Alias for `set_edgecolor`.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`

Alias for `set_edgecolor`.

`set_facecolor(self, c)`

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`

Alias for `set_facecolor`.

`set_fc(self, c)`

Alias for `set_facecolor`.

`set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`

Set the (group) id for the artist.

### Parameters

**gid** [str]

`set_hatch(self, hatch)`

Set the hatching pattern

*hatch* can be one of:

```

/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '\*}]]

**set\_in\_layout**(*self*, *in\_layout*)

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and [fig.savefig\(fname, bbox\\_inches='tight'\)](#).

### Parameters

**in\_layout** [bool]

**set\_joinstyle**(*self*, *js*)

Set the joinstyle for the collection (for all its elements).

### Parameters

**js** [{'miter', 'round', 'bevel'}]] The joinstyle.

**set\_label**(*self*, *s*)

Set a label that will be displayed in the legend.

### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

**set\_linelength**(*self*, *linelength*)

Set the length of the lines used to mark each event.

**set\_lineoffset**(*self*, *lineoffset*)

Set the offset of the lines used to mark each event.

**set\_linestyle**(*self*, *ls*)

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ' ', (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for [set\\_linewidth](#).

`set_ls(self, ls)`

Alias for [set\\_linestyle](#).

`set_lw(self, lw)`

Alias for [set\\_linewidth](#).

`set_norm(self, norm)`

Set the normalization instance.

### Parameters

**norm** [[Normalize](#) or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_orientation(self, orientation=None)`  
Set the orientation of the event line.

#### Parameters

**orientation** [{'horizontal', 'vertical'}]

`set_path_effects(self, path_effects)`  
Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self, segments)`

`set_picker(self, picker)`  
Define the picking behavior of the artist.

#### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`  
Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_positions(self, positions)`  
Set the positions of the events.

`set_rasterized(self, rasterized)`  
Force rasterized (bitmap) drawing in vector backend output.  
Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_segments(self, segments)`

`set_sketch_params(self, scale=None, length=None, randomness=None)`  
Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

**Parameters**

**t** [*Transform*]

`set_url(self, url)`

Set the url for the artist.

**Parameters**

**url** [str]

`set_urls(self, urls)`

**Parameters**

**urls** [list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_verts(self, segments)`

`set_visible(self, b)`

Set the artist's visibility.

### Parameters

**b** [bool]

`set_zorder(self, level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky\_edges

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky\_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`switch_orientation(self)`

Switch the orientation of the event line, either from vertical to horizontal or vice versus.

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict *props*.

## Parameters

**props** [dict]

property update\_dict

update\_from(*self*, *other*)

Copy properties from other to self.

update\_scalarmappable(*self*)

Update colors from the scalar mappable array, if it is not None.

zorder = 0

```
class matplotlib.collections.LineCollection(segments, linewidths=None, colors=None, antialiaseds=None,
                                             linestyle='solid', offsets=None, transOffset=None, norm=None, cmap=None,
                                             pickradius=5, zorder=2, facecolors='none', **kwargs)
```

Bases: `matplotlib.collections.Collection`

Represents a sequence of *Line2Ds* that should be drawn together.

This class extends *Collection* to represent a sequence of *Line2Ds* instead of just a sequence of *Patches*. Just as in *Collection*, each property of a *LineCollection* may be either a single value or a list of values. This list is then used cyclically for each element of the *LineCollection*, so the property of the *i*th element of the collection is:

```
prop[i % len(prop)]
```

The properties of each member of a *LineCollection* default to their values in `rcParams["lines.*"]` instead of `rcParams["patch.*"]`, and the property *colors* is added in place of *edgecolors*.

## Parameters

**segments:** list of array-like A sequence of (*line0*, *line1*, *line2*), where:

```
linen = (x0, y0), (x1, y1), ... (xm, ym)
```

or the equivalent numpy array with two columns. Each line can have a different number of segments.

**linewidths** [float or list of float, default: `rcParams["lines.linewidth"]` (default: 1.5)] The width of each line in points.

**colors** [color or list of color, default: `rcParams["lines.color"]` (default: 'c')] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

**antialiaseds** [bool or list of bool, default: `rcParams["lines.antialiased"]` (default: True)] Whether to use antialiasing for each line.

**zorder** [int, default: 2] zorder of the lines once drawn.

**facecolors** [color or list of color, default: 'none'] The facecolors of the *LineCollection*. Setting to a value other than 'none' will lead to each line being "filled in" as if there was an implicit line segment joining the last and first points of that line back around to each other. In order to manually specify what should count as the "interior" of each line, please

use *PathCollection* instead, where the “interior” can be specified by appropriate usage of *CLOSEPOLY*.

**\*\*kwargs** Forwarded to *Collection*.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*’s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the ‘changed’ signal.

`check_update(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

`convert_yunits(self, y)`

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

### Returns

**list of** *Artist*

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

*get\_cursor\_data*

`get_agg_filter(self)`  
Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_color(self)`

`get_colors(self)`

`get_contains(self)`  
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

*set\_contains*

**Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

### Parameters

**event** [*matplotlib.backend\_bases.MouseEvent*]

### See also:

*format\_cursor\_data*

*get\_dashes(self)*

Alias for *get\_linestyle*.

*get\_datalim(self, transData)*

*get\_ec(self)*

Alias for *get\_edgecolor*.

*get\_edgecolor(self)*

*get\_edgecolors(self)*

Alias for *get\_edgecolor*.

*get\_facecolor(self)*

*get\_facecolors(self)*

Alias for *get\_facecolor*.

*get\_fc(self)*

Alias for *get\_facecolor*.

*get\_figure(self)*

Return the *Figure* instance the artist belongs to.

*get\_fill(self)*

Return whether fill is set.

*get\_gid(self)*

Return the group id.

*get\_hatch(self)*

Return the current hatching pattern.

*get\_in\_layout(self)*

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

*get\_joinstyle(self)*

*get\_label(self)*

Return the label used for this artist in the legend.

*get\_linestyle(self)*

*get\_linestyles(self)*

Alias for *get\_linestyle*.

*get\_linewidth(self)*

*get\_linewidths(self)*

Alias for *get\_linewidth*.

`get_ls(self)`

Alias for `get_linestyle`.

`get_lw(self)`

Alias for `get_linewidth`.

`get_offset_position(self)`

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

### See also:

`set_picker`, `pickable`, `pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_segments(self)`

### Returns

**list** List of segments in the LineCollection. Each list item contains an array of vertices.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

`property mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`

`remove_callback`

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for `set_antialiased`.

`set_agg_filter(self, filter_func)`

Set the agg filter.

#### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

#### Parameters

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

#### Parameters

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

#### Parameters

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

#### Parameters

**cs** [{ 'butt', 'round', 'projecting' }] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

#### Parameters

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`

Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(self, b)`

Set whether the artist uses clipping.

When `False` artists will be visible outside of the axes which can lead to unexpected results.

### Parameters

**b** [bool]

`set_clip_path(self, path, transform=None)`

Set the artist's clip path.

### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or `None`] The clip path. If given a *Path*, *transform* must be provided as well. If `None`, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

### Parameters

**cmap** [*Colormap* or str or `None`]

`set_color(self, c)`

Set the color(s) of the LineCollection.

### Parameters

**c** [color or list of colors] Single color (all patches have same color), or a sequence of rgba tuples; if it is a sequence the patches will cycle through the sequence.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

`set_dashes(self, ls)`  
Alias for `set_linestyle`.

`set_ec(self, c)`  
Alias for `set_edgecolor`.

`set_edgecolor(self, c)`  
Set the edgecolor(s) of the collection.

**Parameters**

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for `set_edgecolor`.

`set_facecolor(self, c)`  
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters**

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

**Parameters**

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

**Parameters**

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
```

(continues on next page)

(continued from previous page)

```

0 - large circle
. - dots
* - stars

```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [{`'/'`, `'\'`, `'|'`, `'-'`, `'+'`, `'x'`, `'o'`, `'O'`, `'.'`, `'*'`}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

### Parameters

**js** [{`'miter'`, `'round'`, `'bevel'`}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

### Parameters

**s** [object] `s` will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
<code>'-'</code> or <code>'solid'</code>	solid line
<code>'--'</code> or <code>'dashed'</code>	dashed line
<code>'-.'</code> or <code>'dashdot'</code>	dash-dotted line
<code>'.'</code> or <code>'dotted'</code>	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include `{'-', '--', '-.', '.', '', (offset, on-off-seq)}`. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for `set_linewidth`.

`set_ls(self, ls)`

Alias for `set_linestyle`.

`set_lw(self, lw)`

Alias for `set_linewidth`.

`set_norm(self, norm)`

Set the normalization instance.

#### Parameters

**norm** [*Normalize* or None]

#### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

#### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

#### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self, segments)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_segments(self, segments)`

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

### Parameters

**t** [*Transform*]

`set_url(self, url)`

Set the url for the artist.

### Parameters

**url** [str]

`set_urls(self, urls)`

### Parameters

**urls** [list of str or None]

### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_verts(self, segments)`

`set_visible(self, b)`

Set the artist's visibility.

### Parameters

**b** [bool]

`set_zorder(self, level)`

Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

property `stale`

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property `sticky_edges`

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added-the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to `x`.

In the normal case, `x` is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the `norm` and colormap set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If `x` is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the `alpha` kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the `alpha` kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if `bytes` is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be uint8 in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict `props`.

#### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from other to self.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

```
class matplotlib.collections.PatchCollection(patches, match_original=False,
                                             **kwargs)
```

Bases: `matplotlib.collections.Collection`

A generic collection of patches.

This makes it easier to assign a color map to a heterogeneous collection of patches.

This also may improve plotting speed, since `PatchCollection` will draw faster than a large number of patches.

**`patches`** a sequence of Patch objects. This list may include a heterogeneous assortment of different patch types.

***match\_original*** If True, use the colors and linewidths of the original patches. If False, new colors may be assigned by providing the standard collection arguments, facecolor, edgecolor, linewidths, norm or cmap.

If any of *edgecolors*, *facecolors*, *linewidths*, *antialiaseds* are None, they default to their *rcParams* patch setting, in sequence form.

The use of *ScalarMappable* functionality is optional. If the *ScalarMappable* matrix *\_A* has been set (via a call to *set\_array*), at draw time a call to scalar mappable will be made to set the face colors.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property *axes*

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

`convert_yunits(self, y)`

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- `None`: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include `self` in the list to be checked for a match.

### Returns

**list of** `Artist`

`format_cursor_data(self, data)`

Return a string representation of `data`.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

[`get\_cursor\_data`](#)

`get_agg_filter(self)`  
Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child [\*Artists\*](#) of this [\*Artist\*](#).

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the [\*Colormap\*](#) instance.

`get_contains(self)`  
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

[`set\_contains`](#)

**Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

### Parameters

**event** [`matplotlib.backend_bases.MouseEvent`]

### See also:

`format_cursor_data`

`get_dashes(self)`  
Alias for `get_linestyle`.

`get_datalim(self, transData)`

`get_ec(self)`  
Alias for `get_edgecolor`.

`get_edgecolor(self)`

`get_edgecolors(self)`  
Alias for `get_edgecolor`.

`get_facecolor(self)`

`get_facecolors(self)`  
Alias for `get_facecolor`.

`get_fc(self)`  
Alias for `get_facecolor`.

`get_figure(self)`  
Return the `Figure` instance the artist belongs to.

`get_fill(self)`  
Return whether fill is set.

`get_gid(self)`  
Return the group id.

`get_hatch(self)`  
Return the current hatching pattern.

`get_in_layout(self)`  
Return boolean flag, True if artist is included in layout calculations.  
E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle(self)`

`get_label(self)`  
Return the label used for this artist in the legend.

`get_linestyle(self)`

`get_linestyles(self)`  
Alias for `get_linestyle`.

`get_linewidth(self)`

`get_linewidths(self)`  
Alias for `get_linewidth`.

`get_ls(self)`  
Alias for `get_linestyle`.

`get_lw(self)`  
Alias for `get_linewidth`.

`get_offset_position(self)`  
[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`  
Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`  
Return the picking behavior of the artist.

The possible values are described in `set_picker`.

### See also:

`set_picker`, `pickable`, `pick`

`get_pickradius(self)`

`get_rasterized(self)`  
Return whether the artist is to be rasterized.

`get_sketch_params(self)`  
Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`  
Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

#### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

property `mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`

`remove_callback`

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw\_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for *set\_antialiased*.

`set_agg_filter(self, filter_func)`

Set the agg filter.

### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

**Parameters**

**cs** [{*'butt'*, *'round'*, *'projecting'*}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

**Parameters**

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(self, b)`

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(self, path, transform=None)`

Set the artist's clip path.

**Parameters**

**path** [*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

**Parameters**

**cmap** [*Colormap* or str or *None*]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

**Parameters**

**c** [color or list of rgba tuples]

**See also:**

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

**Parameters**

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default *contains()* implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

`set_dashes(self, ls)`  
Alias for `set_linestyle`.

`set_ec(self, c)`  
Alias for `set_edgecolor`.

`set_edgecolor(self, c)`  
Set the edgecolor(s) of the collection.

#### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for `set_edgecolor`.

`set_facecolor(self, c)`  
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{`'/'`, `'\'`, `'|'`, `'-'`, `'+'`, `'x'`, `'o'`, `'O'`, `'.'`, `'*'`}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{`'miter'`, `'round'`, `'bevel'`}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] `s` will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
<code>'-'</code> or <code>'solid'</code>	solid line
<code>'--'</code> or <code>'dashed'</code>	dashed line
<code>'-.'</code> or <code>'dashdot'</code>	dash-dotted line
<code>':'</code> or <code>'dotted'</code>	dotted line

Alternatively a dash tuple of the following form can be provided:

`(offset, onoffseq),`

where `onoffseq` is an even length tuple of on and off ink in points.

#### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include `{'-', '--', '-.', ':', '', (offset, on-off-seq)}`. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`  
Alias for `set_linewidth`.

`set_ls(self, ls)`  
Alias for `set_linestyle`.

`set_lw(self, lw)`  
Alias for `set_linewidth`.

`set_norm(self, norm)`  
Set the normalization instance.

### Parameters

**norm** [*Normalize* or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`  
[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`  
Set the offsets for the collection.

### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`  
Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self, patches)`

`set_picker(self, picker)`  
Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).

- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.

- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`  
Set the artist transform.

**Parameters**

**t** [*Transform*]

`set_url(self, url)`  
Set the url for the artist.

**Parameters**

**url** [str]

`set_urls(self, urls)`

**Parameters**

**urls** [list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`  
Set the artist's visibility.

**Parameters**

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

**property stale**  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky\_edges**  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`  
 Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`  
 Update this artist's properties from the dict *props*.

### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from other to self.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

`class matplotlib.collections.PathCollection(paths, sizes=None, **kwargs)`  
 Bases: `matplotlib.collections._CollectionWithSizes`

A collection of *Paths*, as created by e.g. *scatter*.

### Parameters

**paths** [list of *path.Path*] The paths that will make up the *Collection*.

**sizes** [array-like] The factor by which to scale each drawn *Path*. One unit squared in the Path's data space is scaled to be *sizes\*\*2* points when rendered.

**\*\*kwargs** Forwarded to *Collection*.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

`convert_yunits(self, y)`

Convert *y* using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, *y* itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

### Returns

list of *Artist*

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

*get\_cursor\_data*

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_contains(self)`  
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

*set\_contains*

**Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** [*matplotlib.backend\_bases.MouseEvent*]

**See also:**

*format\_cursor\_data*

```

get_dashes(self)
    Alias for get_linestyle.
get_datalim(self, transData)
get_ec(self)
    Alias for get_edgecolor.
get_edgecolor(self)
get_edgecolors(self)
    Alias for get_edgecolor.
get_facecolor(self)
get_facecolors(self)
    Alias for get_facecolor.
get_fc(self)
    Alias for get_facecolor.
get_figure(self)
    Return the Figure instance the artist belongs to.
get_fill(self)
    Return whether fill is set.
get_gid(self)
    Return the group id.
get_hatch(self)
    Return the current hatching pattern.
get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.

    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is
    'screen', the offset is applied after the master transform has been applied, that is,
    the offsets are in screen coordinates. If offset_position is 'data', the offset is applied
    before the master transform, i.e., the offsets are in data coordinates.

```

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

### See also:

`set_picker`, `pickable`, `pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

### Returns

**array** The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/links\\_sgskip](#) for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after *set\_transform* has been called.

`legend_elements(self, prop='colors', num='auto', fmt=None, func=<function PathCollection.<lambda> at 0x7f39f5177670>, **kwargs)`

Create legend handles and labels for a PathCollection.

Each legend handle is a *Line2D* representing the Path that was drawn, and each label is a string what each Path represents.

This is useful for obtaining a legend for a *scatter* plot; e.g.:

```
scatter = plt.scatter([1, 2, 3], [4, 5, 6], c=[7, 2, 3])
plt.legend(*scatter.legend_elements())
```

creates three legend elements, one for each color with the numerical values passed to *c* as the labels.

Also see the *automatedlegendcreation* example.

### Parameters

**prop** [{"colors", "sizes"}, default: "colors"] If "colors", the legend handles will show the different colors of the collection. If "sizes", the legend will show the different sizes. To set both, use *kwargs* to directly edit the *Line2D* properties.

**num** [int, None, "auto" (default), array-like, or *Locator*,] Target number of elements to create. If None, use all unique elements of the mappable array. If an integer, target to use *num* elements in the normed range. If "auto", try to determine which option better suits the nature of the data. The number of created elements may slightly deviate from *num* due to a *Locator* being used to find useful locations. If a list or array, use exactly those elements for the legend. Finally, a *Locator* can be provided.

**fmt** [str, *Formatter*, or None (default)] The format or formatter to use for the labels. If a string must be a valid input for a *StrMethodFormatter*. If None (the default), use a *ScalarFormatter*.

**func** [function, default *lambda x: x*] Function to calculate the labels. Often the size (or color) argument to *scatter* will have been pre-processed by the user using a function *s = f(x)* to make the markers visible; e.g. *size = np.log10(x)*. Providing the inverse of this function here allows that pre-processing to be inverted, so that the legend labels have the correct values; e.g. *func = lambda x: 10\*\*x*.

**\*\*kwargs** Allowed keyword arguments are *color* and *size*. E.g. it may be useful to set the color of the markers if *prop="sizes"* is used; similarly to set the size of the markers if *prop="colors"* is used. Any further parameters are passed onto the *Line2D* instance. This may be useful to e.g. specify a different *markeredgecolor* or *alpha* for the legend handles.

### Returns

**handles** [list of *Line2D*] Visual representation of each element of the legend.

**labels** [list of str] The string labels for elements of the legend.

**property mouseover**

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get\_cursor\_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

**pchanged(self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

### See also:

*add\_callback*

*remove\_callback*

**pick(self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**`set_picker, get_picker, pickable``pickable(self)`

Return whether the artist is pickable.

**See also:**`set_picker, get_picker, pick``properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**`add_callback``set(self, **kwargs)`A property batch setter. Pass `kwargs` to set properties.`set_aa(self, aa)`Alias for `set_antialiased`.`set_agg_filter(self, filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

**Parameters**

**cs** [{'butt', 'round', 'projecting'}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

**Parameters**

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(self, b)`

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(self, path, transform=None)`

Set the artist's clip path.

**Parameters**

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

#### Parameters

**cmap** [*Colormap* or str or None]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

#### Parameters

**c** [color or list of rgba tuples]

#### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

#### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default *contains()* implementation of the respective artist, but may provide additional information.

#### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for *set\_linestyle*.

`set_ec(self, c)`

Alias for *set\_edgecolor*.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

#### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`

Alias for *set\_edgecolor*.

`set_facecolor(self, c)`

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`

Alias for `set_facecolor`.

`set_fc(self, c)`

Alias for `set_facecolor`.

`set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`

Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{*'/'*, *'\'*', *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

#### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ''}, (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for `set_linestyle`.

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for `set_linewidth`.

`set_ls(self, ls)`

Alias for `set_linestyle`.

`set_lw(self, lw)`

Alias for `set_linewidth`.

`set_norm(self, norm)`

Set the normalization instance.

#### Parameters

**norm** [*Normalize* or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self, paths)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the *PickEvent* attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

**Parameters**

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

**rasterized** [bool or None]

`set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

**Parameters**

**sizes** [ndarray or None] The size to set for each element of the collection.  
The value is the 'area' of the element.

**dpi** [float, default: 72] The dpi of the canvas.

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

**Parameters**

**t** [*Transform*]

`set_url(self, url)`  
Set the url for the artist.

**Parameters**

**url** [str]

`set_urls(self, urls)`

**Parameters**

**urls** [list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`  
Set the artist's visibility.

**Parameters**

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level** [float]

property `stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property `sticky_edges`  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`  
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If `x` is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the `alpha` kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the `alpha` kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if `bytes` is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be uint8 in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict `props`.

### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from other to self.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

```
class matplotlib.collections.PolyCollection(vertices, sizes=None, closed=True,
                                           **kwargs)
```

Bases: `matplotlib.collections._CollectionWithSizes`

### Parameters

**vertices** [list of array-like] The sequence of polygons [`vertices0`, `vertices1`, ...] where each element `vertices_i` defines the vertices of polygon *i* as a 2D array-like of of shape (M, 2).

**sizes** [array-like, default: None] Squared scaling factors for the polygons. The coordinates of each polygon `vertices_i` are multiplied by the square-root of the corresponding entry in `sizes` (i.e., `sizes` specify the scaling of areas). The scaling is applied before the Artist master transform.

**closed** [bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

**\*\*kwargs** Forwarded to `Collection`.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the `Artist`'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

`convert_yunits(self, y)`

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (instance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

### Returns

list of `Artist`

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`

Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`

Return the clipbox.

`get_clip_on(self)`

Return whether the artist uses clipping.

`get_clip_path(self)`

Return the clip path.

`get_cmap(self)`

Return the *Colormap* instance.

`get_contains(self)`

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

*set\_contains*

### Notes

Deprecated since version 3.3.

`get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

### Parameters

**event** [*matplotlib.backend\_bases.MouseEvent*]

**See also:**

*format\_cursor\_data*

`get_dashes(self)`

Alias for *get\_linestyle*.

`get_datalim(self, transData)`

```

get_ec(self)
    Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)
    Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)
    Alias for get_facecolor.

get_fc(self)
    Alias for get_facecolor.

get_figure(self)
    Return the Figure instance the artist belongs to.

get_fill(self)
    Return whether fill is set.

get_gid(self)
    Return the group id.

get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.

    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname,
    bbox_inches='tight').

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)
    Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
    Alias for get_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is
    'screen', the offset is applied after the master transform has been applied, that is,
    the offsets are in screen coordinates. If offset_position is 'data', the offset is applied
    before the master transform, i.e., the offsets are in data coordinates.

```

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

### See also:

`set_picker`, `pickable`, `pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

### Returns

**array** The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`  
Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`  
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`  
Return the url.

`get_urls(self)`  
Return a list of URLs, one for each element of the collection.  
The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

`get_visible(self)`  
Return the visibility.

`get_window_extent(self, renderer)`  
Get the axes bounding box in display space.  
The bounding box' width and height are nonnegative.  
Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.  
Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`  
Return the artist's zorder.

`have_units(self)`  
Return *True* if units are set on any axis.

`is_transform_set(self)`  
Return whether the Artist has an explicitly set transform.  
This is *True* after *set\_transform* has been called.

property `mouseover`  
If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.  
See also *get\_cursor\_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged(self)`  
Call all of the registered callbacks.  
This function is triggered internally when a property is changed.

**See also:**

[\*add\\_callback\*](#)  
[\*remove\\_callback\*](#)

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for `set_antialiased`.

`set_agg_filter(self, filter_func)`

Set the agg filter.

#### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

#### Parameters

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

#### Parameters

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

#### Parameters

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

#### Parameters

**cs** [{*'butt'*, *'round'*, *'projecting'*}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

#### Parameters

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`

Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(self, b)`

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

**b** [bool]

`set_clip_path(self, path, transform=None)`

Set the artist's clip path.

#### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

#### Parameters

**cmap** [*Colormap* or str or `None`]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

#### Parameters

**c** [color or list of rgba tuples]

#### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

#### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for *set\_linestyle*.

`set_ec(self, c)`

Alias for *set\_edgecolor*.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

#### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for `set_edgecolor`.

`set_facecolor(self, c)`  
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{*'/'*, *'\'*, *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

#### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ' ', (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for [set\\_linewidth](#).

`set_ls(self, ls)`

Alias for [set\\_linestyle](#).

`set_lw(self, lw)`

Alias for [set\\_linewidth](#).

`set_norm(self, norm)`

Set the normalization instance.

#### Parameters

**norm** [*Normalize* or None]

#### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

#### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

#### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

#### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self, verts, closed=True)`

Set the vertices of the polygons.

#### Parameters

**verts** [list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts<sub>i</sub>* defines the vertices of polygon *i* as a 2D array-like of shape (M, 2).

**closed** [bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

`set_picker(self, picker)`

Define the picking behavior of the artist.

#### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).

- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

#### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float, default: 72] The dpi of the canvas.

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping

will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`  
Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(self, url)`  
Set the url for the artist.

#### Parameters

**url** [str]

`set_urls(self, urls)`

#### Parameters

**urls** [list of str or None]

#### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_verts(self, verts, closed=True)`  
Set the vertices of the polygons.

#### Parameters

**verts** [list of array-like] The sequence of polygons [*verts0*, *verts1*, ...] where each element *verts<sub>i</sub>* defines the vertices of polygon *i* as a 2D array-like of of shape (M, 2).

**closed** [bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

`set_verts_and_codes(self, verts, codes)`  
Initialize vertices with path codes.

`set_visible(self, b)`  
Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

property *stale*

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property *sticky\_edges*

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding *sticky\_edges* list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

*to\_rgba(self, x, alpha=None, bytes=False, norm=True)*

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the *norm* and *colormap* set for this *ScalarMappable*.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a *ValueError* will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A *ValueError* will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

*update(self, props)*

Update this artist's properties from the dict *props*.

### Parameters

**props** [dict]

property *update\_dict*

*update\_from(self, other)*

Copy properties from other to self.

```
update_scalarmappable(self)
```

Update colors from the scalar mappable array, if it is not None.

```
zorder = 0
```

```
class matplotlib.collections.QuadMesh(meshWidth, meshHeight, coordinates, an-
                                     tialiased=True, shading='flat', **kwargs)
```

Bases: `matplotlib.collections.Collection`

Class for the efficient drawing of a quadrilateral mesh.

A quadrilateral mesh consists of a grid of vertices. The dimensions of this array are  $(meshWidth + 1, meshHeight + 1)$ . Each vertex in the mesh has a different set of "mesh coordinates" representing its position in the topology of the mesh. For any values  $(m, n)$  such that  $0 \leq m \leq meshWidth$  and  $0 \leq n \leq meshHeight$ , the vertices at mesh coordinates  $(m, n)$ ,  $(m, n + 1)$ ,  $(m + 1, n + 1)$ , and  $(m + 1, n)$  form one of the quadrilaterals in the mesh. There are thus  $(meshWidth * meshHeight)$  quadrilaterals in the mesh. The mesh need not be regular and the polygons need not be convex.

A quadrilateral mesh is represented by a  $(2 \times ((meshWidth + 1) * (meshHeight + 1)))$  numpy array *coordinates*, where each row is the *x* and *y* coordinates of one of the vertices. To define the function that maps from a data point to its corresponding color, use the `set_cmap()` method. Each of these arrays is indexed in row-major order by the mesh coordinates of the vertex (or the mesh coordinates of the lower left vertex, in the case of the colors).

For example, the first entry in *coordinates* is the coordinates of the vertex at mesh coordinates  $(0, 0)$ , then the one at  $(0, 1)$ , then at  $(0, 2) \dots (0, meshWidth)$ ,  $(1, 0)$ ,  $(1, 1)$ , and so on.

*shading* may be 'flat', or 'gouraud'

### Parameters

**edgecolors** [color or list of colors, default: `rcParams["patch.edgecolor"]` (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

**facecolors** [color or list of colors, default: `rcParams["patch.facecolor"]` (default: 'c')] Face color for each patch making up the collection.

**linewidths** [float or list of floats, default: `rcParams["patch.linewidth"]` (default: 1.0)] Line width for each patch making up the collection.

**linestyles** [str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see `/gallery/lines_bars_and_markers/linestyles`.

**capstyle** [str, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. See `/gallery/lines_bars_and_markers/joinstyle` for a demonstration of each of the allowed values.

**joinstyle** [str, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. See

/gallery/lines\_bars\_and\_markers/joinstyle for a demonstration of each of the allowed values.

**antialiaseds** [bool or list of bool, default: `rcParams["patch.antialiased"]` (default: `True`)] Whether each patch in the collection should be drawn with antialiasing.

**offsets** [(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

**transOffset** [*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

**offset\_position** [{`'screen'` (default), `'data'` (deprecated)}] If set to `'data'` (deprecated), *offsets* will be treated as if it is in data coordinates instead of in screen coordinates.

**norm** [*Normalize*, optional] Forwarded to *ScalarMappable*. The default of `None` means that the first draw call will set *vmin* and *vmax* using the minimum and maximum values of the data.

**cmap** [*Colormap*, optional] Forwarded to *ScalarMappable*. The default of `None` will result in `rcParams["image.cmap"]` (default: `'viridis'`) being used.

**hatch** [str, optional] Hatching pattern to use in filled paths, if any. Valid strings are [`'/'`, `'\"`, `'|'`, `'-'`, `'+'`, `'x'`, `'o'`, `'O'`, `'.'`, `'*'`]. See /gallery/shapes\_and\_collections/hatch\_demo for the meaning of each hatch type.

**pickradius** [float, default: 5.0] If `pickradius <= 0`, then *Collection.contains* will return `True` whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

**urls** [list of str, default: `None`] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See /gallery/misc/hyperlinks\_sgskip for examples.

**zorder** [float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder\_demo for all defaults and examples.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist's* properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

**See also:**[`remove\_callback`](#)

`add_checker(self, checker)`  
 [Deprecated]

**Notes**

Deprecated since version 3.3:

`autoscale(self)`  
 Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`  
 Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`  
 The [`Axes`](#) instance the artist resides in, or *None*.

`changed(self)`  
 Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
 [Deprecated]

**Notes**

Deprecated since version 3.3:

`contains(self, mouseevent)`  
 Test whether the mouse event occurred in the collection.  
 Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`static convert_mesh_to_paths(meshWidth, meshHeight, coordinates)`  
 Convert a given mesh into a sequence of [`Path`](#) objects.  
 This function is primarily of use to implementers of backends that do not directly support quadmeshes.

`convert_mesh_to_triangles(self, meshWidth, meshHeight, coordinates)`  
 Convert a given mesh into a sequence of triangles, each point with its own color.  
 This is useful for experiments using [`draw\_gouraud\_triangle`](#).

`convert_xunits(self, x)`  
 Convert x using the unit type of the xaxis.  
 If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

`convert_yunits(self, y)`  
 Convert y using the unit type of the yaxis.  
 If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

#### Parameters

**renderer** [`RendererBase` subclass.]

#### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

#### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

#### Returns

**list of `Artist`**

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

#### See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_contains(self)`  
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:***set\_contains***Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** [*matplotlib.backend\_bases.MouseEvent*]

**See also:***format\_cursor\_data*

`get_dashes(self)`  
Alias for *get\_linestyle*.

`get_datalim(self, transData)`

`get_ec(self)`  
Alias for `get_edgecolor`.

`get_edgecolor(self)`

`get_edgecolors(self)`  
Alias for `get_edgecolor`.

`get_facecolor(self)`

`get_facecolors(self)`  
Alias for `get_facecolor`.

`get_fc(self)`  
Alias for `get_facecolor`.

`get_figure(self)`  
Return the *Figure* instance the artist belongs to.

`get_fill(self)`  
Return whether fill is set.

`get_gid(self)`  
Return the group id.

`get_hatch(self)`  
Return the current hatching pattern.

`get_in_layout(self)`  
Return boolean flag, True if artist is included in layout calculations.  
  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle(self)`

`get_label(self)`  
Return the label used for this artist in the legend.

`get_linestyle(self)`

`get_linestyles(self)`  
Alias for `get_linestyle`.

`get_linewidth(self)`

`get_linewidths(self)`  
Alias for `get_linewidth`.

`get_ls(self)`  
Alias for `get_linestyle`.

`get_lw(self)`  
Alias for `get_linewidth`.

`get_offset_position(self)`  
[Deprecated] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

## Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

### See also:

`set_picker`, `pickable`, `pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See [/gallery/misc/hyperlinks\\_sgskip](#) for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after *set\_transform* has been called.

property `mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also [get\\_cursor\\_data\(\)](#), [ToolCursorPosition](#) and [NavigationToolbar2](#).

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

[add\\_callback](#)

[remove\\_callback](#)

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker, get_picker, pickable`

`pickable(self)`  
Return whether the artist is pickable.

**See also:**

`set_picker, get_picker, pick`

`properties(self)`  
Return a dictionary of all the properties of the artist.

`remove(self)`  
Remove the artist from the figure if possible.  
  
The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`  
Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`  
A property batch setter. Pass `kwargs` to set properties.

`set_aa(self, aa)`  
Alias for `set_antialiased`.

`set_agg_filter(self, filter_func)`  
Set the agg filter.

#### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`  
Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha** [float or None]

`set_animated(self, b)`  
Set the artist's animation state.

#### Parameters

**b** [bool]

`set_antialiased(self, aa)`  
Set the antialiasing state for rendering.

#### Parameters

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`  
Alias for `set_antialiased`.

`set_array(self, A)`  
Set the image array from numpy array *A*.

#### Parameters

**A** [ndarray]

`set_capstyle(self, cs)`  
Set the capstyle for the collection (for all its elements).

#### Parameters

**cs** [{'butt', 'round', 'projecting'}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`  
Set the norm limits for image scaling.

#### Parameters

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`  
Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(self, b)`  
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

**b** [bool]

`set_clip_path(self, path, transform=None)`  
Set the artist's clip path.

#### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

#### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of `set`), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`  
Set the colormap for luminance data.

#### Parameters

**cmap** [*Colormap* or str or None]

`set_color(self, c)`  
Set both the edgecolor and the facecolor.

#### Parameters

**c** [color or list of rgba tuples]

#### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`  
[*Deprecated*] Define a custom contains test for the artist.  
The provided callable replaces the default *contains* method of the artist.

#### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

#### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`  
Alias for *set\_linestyle*.

`set_ec(self, c)`  
Alias for *set\_edgecolor*.

`set_edgecolor(self, c)`  
Set the edgecolor(s) of the collection.

#### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for *set\_edgecolor*.

`set_facecolor(self, c)`

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`

Alias for `set_facecolor`.

`set_fc(self, c)`

Alias for `set_facecolor`.

`set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`

Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`

Set the hatching pattern

*hatch* can be one of:

/	- diagonal hatching
\	- back diagonal
	- vertical
-	- horizontal
+	- crossed
x	- crossed diagonal
o	- small circle
O	- large circle
.	- dots
*	- stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{*'/'*, *'\'*', *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{'miter', 'round', 'bevel'}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

#### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ''}, (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for `set_linestyle`.

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

#### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for `set_linewidth`.

`set_ls(self, ls)`

Alias for `set_linestyle`.

`set_lw(self, lw)`

Alias for `set_linewidth`.

`set_norm(self, norm)`

Set the normalization instance.

#### Parameters

**norm** [*Normalize* or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If *picker* is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the *PickEvent* attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

**Parameters**

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

**rasterized** [bool or None]

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters**

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

**Parameters**

**t** [*Transform*]

`set_url(self, url)`

Set the url for the artist.

**Parameters**

**url** [str]

`set_urls(self, urls)`

### Parameters

**urls** [list of str or None]

### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`  
Set the artist's visibility.

### Parameters

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

property `stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property `sticky_edges`  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`  
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg

is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the *rgba* array will be floats in the 0-1 range; if it is *True*, the returned *rgba* array will be *uint8* in the 0 to 255 range.

If *norm* is *False*, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict *props*.

### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from other to self.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not None.

`zorder = 0`

```
class matplotlib.collections.RegularPolyCollection(numsides, rotation=0, sizes=(1, ),
                                                    **kwargs)
```

Bases: `matplotlib.collections._CollectionWithSizes`

A collection of n-sided regular polygons.

### Parameters

**numsides** [int] The number of sides of the polygon.

**rotation** [float] The rotation of the polygon in radians.

**sizes** [tuple of float] The area of the circle circumscribing the polygon in  $\text{points}^2$ .

**\*\*kwargs** Forwarded to *Collection*.

### Examples

See `/gallery/event_handling/lasso_demo` for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)
```

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The *Axes* instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not contained in an Axes or if the xaxis does not have units, `x` itself is returned.

`convert_yunits(self, y)`

Convert `y` using the unit type of the yaxis.

If the artist is not contained in an Axes or if the yaxis does not have units, `y` itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all `Artist` instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- `None`: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include `self` in the list to be checked for a match.

### Returns

**list of `Artist`**

`format_cursor_data(self, data)`

Return a string representation of `data`.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`  
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`  
Return whether the artist is animated.

`get_array(self)`  
Return the data array.

`get_capstyle(self)`

`get_children(self)`  
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`  
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`  
Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_contains(self)`  
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

[\*set\\_contains\*](#)

**Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** [*matplotlib.backend\_bases.MouseEvent*]

**See also:***format\_cursor\_data*`get_dashes(self)`Alias for *get\_linestyle*.`get_datalim(self, transData)``get_ec(self)`Alias for *get\_edgecolor*.`get_edgecolor(self)``get_edgecolors(self)`Alias for *get\_edgecolor*.`get_facecolor(self)``get_facecolors(self)`Alias for *get\_facecolor*.`get_fc(self)`Alias for *get\_facecolor*.`get_figure(self)`Return the *Figure* instance the artist belongs to.`get_fill(self)`

Return whether fill is set.

`get_gid(self)`

Return the group id.

`get_hatch(self)`

Return the current hatching pattern.

`get_in_layout(self)`

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.`get_joinstyle(self)``get_label(self)`

Return the label used for this artist in the legend.

`get_linestyle(self)``get_linestyles(self)`Alias for *get\_linestyle*.`get_linewidth(self)``get_linewidths(self)`Alias for *get\_linewidth*.`get_ls(self)`Alias for *get\_linestyle*.`get_lw(self)`Alias for *get\_linewidth*.`get_numsides(self)`

`get_offset_position(self)`

[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`

Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in *set\_picker*.

### See also:

*set\_picker*, *pickable*, *pick*

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_rotation(self)`

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

### Returns

**array** The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See *set\_snap* for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

property `mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`

`remove_callback`

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw\_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim* = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for *set\_antialiased*.

`set_agg_filter(self, filter_func)`

Set the agg filter.

### Parameters

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

**Parameters**

**cs** [{*'butt'*, *'round'*, *'projecting'*}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

**Parameters**

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`

Set the artist's clip *Bbox*.

**Parameters**

**clipbox** [*Bbox*]

`set_clip_on(self, b)`

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b** [bool]

`set_clip_path(self, path, transform=None)`

Set the artist's clip path.

### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or *None*] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

### Parameters

**cmap** [*Colormap* or str or *None*]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

### Parameters

**c** [color or list of rgba tuples]

### See also:

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default *contains* method of the artist.

### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default *contains()* implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`  
Alias for `set_linestyle`.

`set_ec(self, c)`  
Alias for `set_edgecolor`.

`set_edgecolor(self, c)`  
Set the edgecolor(s) of the collection.

#### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`  
Alias for `set_edgecolor`.

`set_facecolor(self, c)`  
Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

#### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

### Parameters

**hatch** [{`'/'`, `'\'`, `'|'`, `'-'`, `'+'`, `'x'`, `'o'`, `'O'`, `'.'`, `'*'`}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

### Parameters

**js** [{`'miter'`, `'round'`, `'bevel'`}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

### Parameters

**s** [object] `s` will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
<code>'-'</code> or <code>'solid'</code>	solid line
<code>'--'</code> or <code>'dashed'</code>	dashed line
<code>'-.'</code> or <code>'dashdot'</code>	dash-dotted line
<code>':'</code> or <code>'dotted'</code>	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include `{'-', '--', '-.', ':', '', (offset, on-off-seq)}`. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`  
Alias for `set_linewidth`.

`set_ls(self, ls)`  
Alias for `set_linestyle`.

`set_lw(self, lw)`  
Alias for `set_linewidth`.

`set_norm(self, norm)`  
Set the normalization instance.

### Parameters

**norm** [*Normalize* or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`  
[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`  
Set the offsets for the collection.

### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`  
Set the path effects.

### Parameters

**path\_effects** [*AbstractPathEffect*]

`set_paths(self)`

`set_picker(self, picker)`  
Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).

- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set\_pickradius* instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

#### Parameters

**rasterized** [bool or None]

`set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

#### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float, default: 72] The dpi of the canvas.

`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping

will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`  
Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(self, url)`  
Set the url for the artist.

#### Parameters

**url** [str]

`set_urls(self, urls)`

#### Parameters

**urls** [list of str or None]

#### Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`  
Set the artist's visibility.

#### Parameters

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

#### Parameters

**level** [float]

property `stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property `sticky_edges`  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added-the view limit "sticks" to

the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

### Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`

Return a normalized rgba array corresponding to `x`.

In the normal case, `x` is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the `norm` and `colormap` set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If `x` is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the `alpha` kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the `alpha` kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if `bytes` is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be `uint8` in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict `props`.

#### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from `other` to `self`.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not `None`.

`zorder = 0`

```
class matplotlib.collections.StarPolygonCollection(numsides, rotation=0, sizes=(1, ),
                                                    **kwargs)
```

Bases: `matplotlib.collections.RegularPolyCollection`

Draw a collection of regular stars with `numsides` points.

#### Parameters

**numsides** [int] The number of sides of the polygon.

**rotation** [float] The rotation of the polygon in radians.

**sizes** [tuple of float] The area of the circle circumscribing the polygon in points<sup>2</sup>.

**\*\*kwargs** Forwarded to *Collection*.

### Examples

See `/gallery/event_handling/lasso_demo` for a complete example:

```
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors=("black",),
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)
```

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

### See also:

`remove_callback`

`add_checker(self, checker)`  
[Deprecated]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The [Axes](#) instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`

[*Deprecated*]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

`convert_yunits(self, y)`

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible ([Artist.get\\_visible](#) returns False).

### Parameters

**renderer** [[RendererBase](#) subclass.]

### Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all [Artist](#) instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.

- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

### Returns

list of *Artist*

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

*get\_cursor\_data*

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`

Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`

Return the clipbox.

`get_clip_on(self)`

Return whether the artist uses clipping.

`get_clip_path(self)`

Return the clip path.

`get_cmap(self)`

Return the *Colormap* instance.

`get_contains(self)`

[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

### See also:

*set\_contains*

### Notes

Deprecated since version 3.3.

`get_cursor_data(self, event)`

Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

### Parameters

**event** [`matplotlib.backend_bases.MouseEvent`]

### See also:

`format_cursor_data`

`get_dashes(self)`

Alias for `get_linestyle`.

`get_datalim(self, transData)`

`get_ec(self)`

Alias for `get_edgecolor`.

`get_edgecolor(self)`

`get_edgecolors(self)`

Alias for `get_edgecolor`.

`get_facecolor(self)`

`get_facecolors(self)`

Alias for `get_facecolor`.

`get_fc(self)`

Alias for `get_facecolor`.

`get_figure(self)`

Return the *Figure* instance the artist belongs to.

`get_fill(self)`

Return whether fill is set.

`get_gid(self)`

Return the group id.

`get_hatch(self)`

Return the current hatching pattern.

`get_in_layout(self)`  
 Return boolean flag, True if artist is included in layout calculations.  
 E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle(self)`

`get_label(self)`  
 Return the label used for this artist in the legend.

`get_linestyle(self)`

`get_linestyles(self)`  
 Alias for *get\_linestyle*.

`get_linewidth(self)`

`get_linewidths(self)`  
 Alias for *get\_linewidth*.

`get_ls(self)`  
 Alias for *get\_linestyle*.

`get_lw(self)`  
 Alias for *get\_linewidth*.

`get_numsides(self)`

`get_offset_position(self)`  
 [Deprecated] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`  
 Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`  
 Return the picking behavior of the artist.  
 The possible values are described in *set\_picker*.

### See also:

*set\_picker*, *pickable*, *pick*

`get_pickradius(self)`

`get_rasterized(self)`  
 Return whether the artist is to be rasterized.

`get_rotation(self)`

`get_sizes(self)`

Return the sizes ('areas') of the elements in the collection.

**Returns**

**array** The 'area' of each element.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

**Returns**

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after `set_transform` has been called.

property `mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

`add_callback`

`remove_callback`

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

**See also:**

`set_picker`, `get_picker`, `pickable`

`pickable(self)`

Return whether the artist is pickable.

**See also:**

`set_picker`, `get_picker`, `pick`

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for `set_antialiased`.

`set_agg_filter(self, filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for `set_antialiased`.

`set_array(self, A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

**Parameters**

**cs** [{`'butt'`, `'round'`, `'projecting'`}] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

**Parameters****vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`  
Set the artist's clip *Bbox*.

**Parameters****clipbox** [*Bbox*]

`set_clip_on(self, b)`  
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters****b** [bool]

`set_clip_path(self, path, transform=None)`  
Set the artist's clip path.

**Parameters**

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

**Notes**

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`  
Set the colormap for luminance data.

**Parameters****cmap** [*Colormap* or str or None]

`set_color(self, c)`  
Set both the edgecolor and the facecolor.

**Parameters****c** [color or list of rgba tuples]**See also:**

*Collection.set\_facecolor*, *Collection.set\_edgecolor* For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

### Parameters

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

### Notes

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for `set_linestyle`.

`set_ec(self, c)`

Alias for `set_edgecolor`.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

### Parameters

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`

Alias for `set_edgecolor`.

`set_facecolor(self, c)`

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

### Parameters

**c** [color or list of colors]

`set_facecolors(self, c)`

Alias for `set_facecolor`.

`set_fc(self, c)`

Alias for `set_facecolor`.

`set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`

Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{*'/'*, *'\'*', *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*}]

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. [Constrained Layout Guide](#), [Figure.tight\\_layout\(\)](#), and `fig.savefig(fname, bbox_inches='tight')`.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{*'miter'*, *'round'*, *'bevel'*}] The joinstyle.

`set_label(self, s)`

Set a label that will be displayed in the legend.

#### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

### Parameters

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '-', '-.', ':', '', (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for [set\\_linestyle](#).

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

### Parameters

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for [set\\_linewidth](#).

`set_ls(self, ls)`

Alias for [set\\_linestyle](#).

`set_lw(self, lw)`

Alias for [set\\_linewidth](#).

`set_norm(self, norm)`

Set the normalization instance.

### Parameters

**norm** [[Normalize](#) or None]

### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Parameters

**offset\_position** [{'screen', 'data'}]

## Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

### Parameters

**path\_effects** [[\*AbstractPathEffect\*](#)]

`set_paths(self)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

<pre>hit, props = picker(artist, mouseevent)</pre>
--

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For [\*Line2D\*](#) only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use [\*Line2D.set\\_pickradius\*](#) instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

### Parameters

**rasterized** [bool or None]

`set_sizes(self, sizes, dpi=72.0)`

Set the sizes of each member of the collection.

### Parameters

**sizes** [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi** [float, default: 72] The dpi of the canvas.

`set_sketch_params(self, scale=None, length=None, randomness=None)`  
Sets the sketch parameters.

#### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

`set_snap(self, snap)`  
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

#### Parameters

**snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`  
Set the artist transform.

#### Parameters

**t** [*Transform*]

`set_url(self, url)`  
Set the url for the artist.

#### Parameters

**url** [str]

`set_urls(self, urls)`

#### Parameters

**urls** [list of str or None]

## Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`  
Set the artist's visibility.

### Parameters

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

`property stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`  
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be uint8 in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict *props*.

### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from other to self.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not `None`.

`zorder = 0`

`class matplotlib.collections.TriMesh(triangulation, **kwargs)`

Bases: `matplotlib.collections.Collection`

Class for the efficient drawing of a triangular mesh using Gouraud shading.

A triangular mesh is a *Triangulation* object.

### Parameters

**edgecolors** [color or list of colors, default: `rcParams["patch.edgecolor"]` (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

**facecolors** [color or list of colors, default: `rcParams["patch.facecolor"]` (default: 'C0')] Face color for each patch making up the collection.

**linewidths** [float or list of floats, default: `rcParams["patch.linewidth"]` (default: 1.0)] Line width for each patch making up the collection.

**linestyles** [str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '-.', ':']. Dash tuples should be of the form:

(offset, onoffseq),

where *onoffseq* is an even length tuple of on and off ink lengths in points. For examples, see `/gallery/lines_bars_and_markers/linestyles`.

**capstyle** [str, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. See `/gallery/lines_bars_and_markers/joinstyle` for a demonstration of each of the allowed values.

**joinstyle** [str, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. See `/gallery/lines_bars_and_markers/joinstyle` for a demonstration of each of the allowed values.

**antialiaseds** [bool or list of bool, default: `rcParams["patch.antialiased"]` (default: `True`)] Whether each patch in the collection should be drawn with antialiasing.

**offsets** [(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

**transOffset** [*Transform*, default: *IdentityTransform*] A single transform which will be applied to each *offsets* vector before it is used.

**offset\_position** [{*'screen'* (default), *'data'* (deprecated)}] If set to *'data'* (deprecated), *offsets* will be treated as if it is in data coordinates instead of in screen coordinates.

**norm** [*Normalize*, optional] Forwarded to *ScalarMappable*. The default of *None* means that the first draw call will set *vmin* and *vmax* using the minimum and maximum values of the data.

**cmap** [*Colormap*, optional] Forwarded to *ScalarMappable*. The default of *None* will result in `rcParams["image.cmap"]` (default: *'viridis'*) being used.

**hatch** [str, optional] Hatching pattern to use in filled paths, if any. Valid strings are [*'/'*, *' '*, *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*]. See [/gallery/shapes\\_and\\_collections/hatch\\_demo](#) for the meaning of each hatch type.

**pickradius** [float, default: 5.0] If *pickradius*  $\leq 0$ , then *Collection.contains* will return *True* whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width  $2 \times \text{pickradius}$  following any of the Paths in the Collection.

**urls** [list of str, default: *None*] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See [/gallery/misc/hyperlinks\\_skip](#) for examples.

**zorder** [float, default: 1] The drawing order, shared by all Patches in the Collection. See [/gallery/misc/zorder\\_demo](#) for all defaults and examples.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist's* properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with *remove\_callback* later.

### See also:

*remove\_callback*

`add_checker(self, checker)`  
[*Deprecated*]

### Notes

Deprecated since version 3.3:

`autoscale(self)`

Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property `axes`

The [Axes](#) instance the artist resides in, or *None*.

`changed(self)`

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

`check_update(self, checker)`  
[*Deprecated*]

### Notes

Deprecated since version 3.3:

`contains(self, mouseevent)`

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

static `convert_mesh_to_paths(tri)`

Convert a given mesh into a sequence of [Path](#) objects.

This function is primarily of use to implementers of backends that do not directly support meshes.

`convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

`convert_yunits(self, y)`

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible ([Artist.get\\_visible](#) returns False).

### Parameters

**renderer** [[RendererBase](#) subclass.]

## Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

### Parameters

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

### Returns

**list of *Artist***

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

### See also:

*get\_cursor\_data*

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`

Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`

Return the clipbox.

`get_clip_on(self)`  
Return whether the artist uses clipping.

`get_clip_path(self)`  
Return the clip path.

`get_cmap(self)`  
Return the *Colormap* instance.

`get_contains(self)`  
[*Deprecated*] Return the custom contains function of the artist if set, or *None*.

**See also:**

*set\_contains*

**Notes**

Deprecated since version 3.3.

`get_cursor_data(self, event)`  
Return the cursor data for a given event.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that *format\_cursor\_data* can convert the data to a string representation.

The only current use case is displaying the z-value of an *AxesImage* in the status bar of a plot window, while moving the mouse.

**Parameters**

**event** [*matplotlib.backend\_bases.MouseEvent*]

**See also:**

*format\_cursor\_data*

`get_dashes(self)`  
Alias for *get\_linestyle*.

`get_datalim(self, transData)`

`get_ec(self)`  
Alias for *get\_edgecolor*.

`get_edgecolor(self)`

`get_edgecolors(self)`  
Alias for *get\_edgecolor*.

`get_facecolor(self)`

`get_facecolors(self)`  
Alias for `get_facecolor`.

`get_fc(self)`  
Alias for `get_facecolor`.

`get_figure(self)`  
Return the *Figure* instance the artist belongs to.

`get_fill(self)`  
Return whether fill is set.

`get_gid(self)`  
Return the group id.

`get_hatch(self)`  
Return the current hatching pattern.

`get_in_layout(self)`  
Return boolean flag, True if artist is included in layout calculations.  
  
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

`get_joinstyle(self)`

`get_label(self)`  
Return the label used for this artist in the legend.

`get_linestyle(self)`

`get_linestyles(self)`  
Alias for `get_linestyle`.

`get_linewidth(self)`

`get_linewidths(self)`  
Alias for `get_linewidth`.

`get_ls(self)`  
Alias for `get_linestyle`.

`get_lw(self)`  
Alias for `get_linewidth`.

`get_offset_position(self)`  
[*Deprecated*] Return how offsets are applied for the collection. If *offset\_position* is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset\_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

### Notes

Deprecated since version 3.3.

`get_offset_transform(self)`

`get_offsets(self)`  
Return the offsets for the collection.

`get_path_effects(self)`

`get_paths(self)`

`get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker`, `pickable`, `pick`

`get_pickradius(self)`

`get_rasterized(self)`

Return whether the artist is to be rasterized.

`get_sketch_params(self)`

Return the sketch parameters for the artist.

### Returns

**tuple or None** A 3-tuple with the following elements:

- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

`get_snap(self)`

Return the snap setting.

See `set_snap` for details.

`get_tightbbox(self, renderer)`

Like `Artist.get_window_extent`, but includes any clipping.

### Parameters

**renderer** [`RendererBase` subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

### Returns

*Bbox* The enclosing bounding box (in figure pixel coordinates).

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`get_transforms(self)`

`get_url(self)`

Return the url.

`get_urls(self)`

Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See `/gallery/misc/hyperlinks_sgskip` for an example.

`get_visible(self)`

Return the visibility.

`get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`

Return the artist's zorder.

`have_units(self)`

Return *True* if units are set on any axis.

`is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is *True* after *set\_transform* has been called.

`property mouseover`

If this property is set to *True*, the artist will be queried for custom context information when the mouse cursor moves over it.

See also *get\_cursor\_data()*, *ToolCursorPosition* and *NavigationToolbar2*.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

*add\_callback*

*remove\_callback*

`pick(self, mouseevent)`

Process a pick event.

Each child artist will fire a pick event if *mouseevent* is over the artist and the artist has picker set.

**See also:**

*set\_picker*, *get\_picker*, *pickable*

`pickable(self)`

Return whether the artist is pickable.

**See also:**

*set\_picker*, *get\_picker*, *pick*

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw\_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim = True*.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

*add\_callback*

`set(self, **kwargs)`

A property batch setter. Pass *kwargs* to set properties.

`set_aa(self, aa)`

Alias for *set\_antialiased*.

`set_agg_filter(self, filter_func)`

Set the agg filter.

**Parameters**

**filter\_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha** [float or None]

`set_animated(self, b)`

Set the artist's animation state.

**Parameters**

**b** [bool]

`set_antialiased(self, aa)`

Set the antialiasing state for rendering.

**Parameters**

**aa** [bool or list of bools]

`set_antialiaseds(self, aa)`

Alias for *set\_antialiased*.

`set_array(self, A)`

Set the image array from numpy array *A*.

**Parameters**

**A** [ndarray]

`set_capstyle(self, cs)`

Set the capstyle for the collection (for all its elements).

#### Parameters

**cs** [`'butt'`, `'round'`, `'projecting'`] The capstyle.

`set_clim(self, vmin=None, vmax=None)`

Set the norm limits for image scaling.

#### Parameters

**vmin, vmax** [float] The limits.

The limits may also be passed as a tuple (*vmin*, *vmax*) as a single positional argument.

`set_clip_box(self, clipbox)`

Set the artist's clip *Bbox*.

#### Parameters

**clipbox** [*Bbox*]

`set_clip_on(self, b)`

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

#### Parameters

**b** [bool]

`set_clip_path(self, path, transform=None)`

Set the artist's clip path.

#### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

#### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to *None*.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`

Set the colormap for luminance data.

#### Parameters

**cmap** [*Colormap* or str or None]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

**Parameters**

**c** [color or list of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor` For setting the edge or face color individually.

`set_contains(self, picker)`

[*Deprecated*] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters**

**picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

`set_dashes(self, ls)`

Alias for `set_linestyle`.

`set_ec(self, c)`

Alias for `set_edgecolor`.

`set_edgecolor(self, c)`

Set the edgecolor(s) of the collection.

**Parameters**

**c** [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`

Alias for `set_edgecolor`.

`set_facecolor(self, c)`

Set the facecolor(s) of the collection. *c* can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If *c* is 'none', the patch will not be filled.

**Parameters**

**c** [color or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`set_gid(self, gid)`  
Set the (group) id for the artist.

#### Parameters

**gid** [str]

`set_hatch(self, hatch)`  
Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

#### Parameters

**hatch** [{*'/'*, *'\'*', *'|'*, *'-'*, *'+'*, *'x'*, *'o'*, *'O'*, *'.'*, *'\*'*}]

`set_in_layout(self, in_layout)`  
Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight\_layout()*, and *fig.savefig(fname, bbox\_inches='tight')*.

#### Parameters

**in\_layout** [bool]

`set_joinstyle(self, js)`  
Set the joinstyle for the collection (for all its elements).

#### Parameters

**js** [{*'miter'*, *'round'*, *'bevel'*}] The joinstyle.

`set_label(self, s)`  
Set a label that will be displayed in the legend.

**Parameters**

**s** [object] *s* will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

linestyle	description
'-' or 'solid'	solid line
--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

**ls** [str or tuple or list thereof] Valid values for individual linestyles include {'-', '-', '-.', ':', ''}, (offset, on-off-seq)}. See [Line2D.set\\_linestyle](#) for a complete description.

`set_linestyles(self, ls)`

Alias for `set_linestyle`.

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**

**lw** [float or list of floats]

`set_linewidths(self, lw)`

Alias for `set_linewidth`.

`set_ls(self, ls)`

Alias for `set_linestyle`.

`set_lw(self, lw)`

Alias for `set_linewidth`.

`set_norm(self, norm)`

Set the normalization instance.

**Parameters**

**norm** [[Normalize](#) or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`

[*Deprecated*] Set how offsets are applied. If *offset\_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are

in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

#### Parameters

**offset\_position** [{'screen', 'data'}]

#### Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`

Set the offsets for the collection.

#### Parameters

**offsets** [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`

Set the path effects.

#### Parameters

**path\_effects** [[\*AbstractPathEffect\*](#)]

`set_paths(self)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

#### Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the `PickEvent` attributes.

- *deprecated*: For [\*Line2D\*](#) only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use [\*Line2D.set\\_pickradius\*](#) instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

#### Parameters

**d** [float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters****rasterized** [bool or None]`set_sketch_params(self, scale=None, length=None, randomness=None)`

Sets the sketch parameters.

**Parameters****scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.**length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)**randomness** [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)`set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters****snap** [bool or None] Possible values:

- *True*: Snap vertices to the nearest pixel center.
- *False*: Do not modify vertex positions.
- *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

**Parameters****t** [*Transform*]`set_url(self, url)`

Set the url for the artist.

**Parameters****url** [str]`set_urls(self, urls)`**Parameters****urls** [list of str or None]

## Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

`set_visible(self, b)`  
Set the artist's visibility.

### Parameters

**b** [bool]

`set_zorder(self, level)`  
Set the zorder for the artist. Artists with lower zorder values are drawn first.

### Parameters

**level** [float]

`property stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

`property sticky_edges`  
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

## Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

`to_rgba(self, x, alpha=None, bytes=False, norm=True)`  
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the *norm* and *colormap* set for this `ScalarMappable`.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If *x* is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be `uint8`, or it can be floating point with values in the 0-1 range; otherwise a `ValueError` will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the *alpha* kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the *alpha* kwarg is ignored; it does not replace the pre-existing alpha. A `ValueError` will be raised if the third dimension is other than 3 or 4.

In either case, if *bytes* is *False* (default), the rgba array will be floats in the 0-1 range; if it is *True*, the returned rgba array will be `uint8` in the 0 to 255 range.

If `norm` is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

`update(self, props)`

Update this artist's properties from the dict *props*.

### Parameters

**props** [dict]

property update\_dict

`update_from(self, other)`

Copy properties from other to self.

`update_scalarmappable(self)`

Update colors from the scalar mappable array, if it is not `None`.

`zorder = 0`

## 18.17 matplotlib.colorbar

Colorbars are a visualization of the mapping from scalar values to colors. In Matplotlib they are drawn into a dedicated *Axes*.

---

**Note:** Colorbars are typically created through *Figure.colorbar* or its pyplot wrapper *pyplot.colorbar*, which use *make\_axes* and *Colorbar* internally.

As an end-user, you most likely won't have to call the methods or instantiate the classes in this module explicitly.

---

*ColorbarBase* The base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

*Colorbar* On top of *ColorbarBase* this connects the colorbar with a *ScalarMappable* such as an image or contour plot.

*ColorbarPatch* A specialized *Colorbar* to support hatched contour plots.

*make\_axes()* Create an *Axes* suitable for a colorbar. This functions can be used with figures containing a single axes or with freely placed axes.

*make\_axes\_gridspec()* Create a *SubplotBase* suitable for a colorbar. This function should be used for adding a colorbar to a *GridSpec*.

`class matplotlib.colorbar.Colorbar(ax, mappable, **kwargs)`

Bases: *matplotlib.colorbar.ColorbarBase*

This class connects a *ColorbarBase* to a *ScalarMappable* such as an *AxesImage* generated via *imshow*.

---

**Note:** This class is not intended to be instantiated directly; instead, use *Figure.colorbar* or *pyplot.colorbar* to create a colorbar.

---

`add_lines(self, CS, erase=True)`

Add the lines from a non-filled *ContourSet* to the colorbar.

## Parameters

**CS** [*ContourSet*] The line positions are taken from the *ContourSet* levels. The *ContourSet* must not be filled.

**erase** [bool, default: True] Whether to remove any previously added lines.

`on_mappable_changed(self, mappable)`

[*Deprecated*] Update this colorbar to match the mappable's properties.

Typically this is automatically registered as an event handler by `colorbar_factory()` and should not be called manually.

## Notes

Deprecated since version 3.3.

`remove(self)`

Remove this colorbar from the figure.

If the colorbar was created with `use_gridspec=True` the previous gridspec is restored.

`update_bruteforce(self, mappable)`

[*Deprecated*] Destroy and rebuild the colorbar. This is intended to become obsolete, and will probably be deprecated and then removed. It is not called when the `pyplot.colorbar` function or the `Figure.colorbar` method are used to create the colorbar.

## Notes

Deprecated since version 3.3.

`update_normal(self, mappable)`

Update solid patches, lines, etc.

This is meant to be called when the norm of the image or contour plot to which this colorbar belongs changes.

If the norm on the mappable is different than before, this resets the locator and formatter for the axis, so if these have been customized, they will need to be customized again. However, if the norm only changes values of `vmin`, `vmax` or `cmap` then the old formatter and locator will be preserved.

```
class matplotlib.colorbar.ColorbarBase(ax, *, cmap=None, norm=None, alpha=None,
                                       values=None, boundaries=None, orientation='vertical',
                                       ticklocation='auto', extend=None, spacing='uniform',
                                       ticks=None, format=None, drawedges=False, filled=True,
                                       extendfrac=None, extendrect=False, label="")
```

Bases: `object`

Draw a colorbar in an existing axes.

There are only some rare cases in which you would work directly with a *ColorbarBase* as an end-user. Typically, colorbars are used with *ScalarMappables* such as an *AxesImage* generated via `imshow`. For these cases you will use *Colorbar* and likely create it via `pyplot.colorbar` or `Figure.colorbar`.

The main application of using a *ColorbarBase* explicitly is drawing colorbars that are not associated with other elements in the figure, e.g. when showing a colormap by itself.

If the *cmap* kwarg is given but *boundaries* and *values* are left as None, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the *norm* as:

```
norm=colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```
norm=colors.NoNorm()
```

Useful public methods are *set\_label()* and *add\_lines()*.

### Parameters

**ax** [*Axes*] The *Axes* instance in which the colorbar is drawn.

**cmap** [*Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] The colormap to use.

**norm** [*Normalize*]

**alpha** [float] The colorbar transparency between 0 (transparent) and 1 (opaque).

**values**

**boundaries**

**orientation** [{ 'vertical', 'horizontal' }]

**ticklocation** [{ 'auto', 'left', 'right', 'top', 'bottom' }]

**extend** [{ 'neither', 'both', 'min', 'max' }]

**spacing** [{ 'uniform', 'proportional' }]

**ticks** [*Locator* or array-like of float]

**format** [str or *Formatter*]

**drawedges** [bool]

**filled** [bool]

**extendfrac**

**extendrec**

**label** [str]

### Attributes

**ax** [*Axes*] The *Axes* instance in which the colorbar is drawn.

**lines** [list] A list of *LineCollection* if lines were drawn, otherwise an empty list.

**dividers** [*LineCollection*] A *LineCollection* if *drawedges* is True, otherwise None.

`add_lines(self, levels, colors, linewidths, erase=True)`

Draw lines on the colorbar.

The lines are appended to the list *lines*.

**Parameters**

**levels** [array-like] The positions of the lines.

**colors** [color or list of colors] Either a single color applying to all lines or one color value for each line.

**linewidths** [float or array-like] Either a single linewidth applying to all lines or one linewidth for each line.

**erase** [bool, default: True] Whether to remove any previously added lines.

`config_axis(self)`  
[*Deprecated*]

**Notes**

Deprecated since version 3.3:

`draw_all(self)`  
Calculate any free parameters based on the current cmap and norm, and do all the drawing.

`get_ticks(self, minor=False)`  
Return the x ticks as a list of locations.

`minorticks_off(self)`  
Turn the minor ticks of the colorbar off.

`minorticks_on(self)`  
Turn the minor ticks of the colorbar on without extruding into the "extend regions".

`n_rasterize = 50`

`remove(self)`  
Remove this colorbar from the figure.

`set_alpha(self, alpha)`  
Set the transparency between 0 (transparent) and 1 (opaque).

`set_label(self, label, *, loc=None, **kwargs)`  
Add a label to the long axis of the colorbar.

`set_ticklabels(self, ticklabels, update_ticks=True)`  
Set tick labels.

Tick labels are updated immediately unless *update\_ticks* is *False*, in which case one should call `update_ticks` explicitly.

`set_ticks(self, ticks, update_ticks=True)`  
Set tick locations.

**Parameters**

**ticks** [array-like or *Locator* or None] The tick positions can be hard-coded by an array of values; or they can be defined by a *Locator*. Setting to *None* reverts to using a default locator.

**update\_ticks** [bool, default: True] If True, tick locations are updated immediately. If False, the user has to call `update_ticks` later to update the ticks.

`update_ticks(self)`

Force the update of the ticks and ticklabels. This must be called whenever the tick locator and/or tick formatter changes.

`class matplotlib.colorbar.ColorbarPatch(ax, mappable, **kw)`

Bases: `matplotlib.colorbar.Colorbar`

A Colorbar that uses a list of `Patch` instances rather than the default `PatchCollection` created by `pcolor`, because the latter does not allow the hatch pattern to vary among the members of the collection.

`matplotlib.colorbar.colorbar_factory(cax, mappable, **kwargs)`

Create a colorbar on the given axes for the given mappable.

---

**Note:** This is a low-level function to turn an existing axes into a colorbar axes. Typically, you'll want to use `colorbar` instead, which automatically handles creation and placement of a suitable axes as well.

---

### Parameters

**cax** [`Axes`] The `Axes` to turn into a colorbar.

**mappable** [`ScalarMappable`] The mappable to be described by the colorbar.

**\*\*kwargs** Keyword arguments are passed to the respective colorbar class.

### Returns

`Colorbar` or `ColorbarPatch` The created colorbar instance. `ColorbarPatch` is only used if `mappable` is a `ContourSet` with hatches.

`matplotlib.colorbar.make_axes(parents, location=None, orientation=None, fraction=0.15, shrink=1.0, aspect=20, **kw)`

Create an `Axes` suitable for a colorbar.

The axes is placed in the figure of the `parents` axes, by resizing and repositioning `parents`.

### Parameters

**parents** [`Axes` or list of `Axes`] The Axes to use as parents for placing the colorbar.

**location** [None or {'left', 'right', 'top', 'bottom'}] The position, relative to `parents`, where the colorbar axes should be created. If None, the value will either come from the given `orientation`, else it will default to 'right'.

**orientation** [None or {'vertical', 'horizontal'}] The orientation of the colorbar. Typically, this keyword shouldn't be used, as it can be derived from the `location` keyword.

**fraction** [float, default: 0.15] Fraction of original axes to use for colorbar.

**shrink** [float, default: 1.0] Fraction by which to multiply the size of the colorbar.

**aspect** [float, default: 20] Ratio of long to short dimensions.

### Returns

**cax** [`Axes`] The child axes.

**kw** [dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

### Other Parameters

**pad** [float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

**anchor** [(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

**panchor** [(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

```
matplotlib.colorbar.make_axes_gridspec(parent, *, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Create a *SubplotBase* suitable for a colorbar.

The axes is placed in the figure of the *parent* axes, by resizing and repositioning *parent*.

This function is similar to *make\_axes*. Primary differences are

- *make\_axes\_gridspec* only handles the *orientation* keyword and cannot handle the *location* keyword.
- *make\_axes\_gridspec* should only be used with a *SubplotBase* parent.
- *make\_axes* creates an *Axes*; *make\_axes\_gridspec* creates a *SubplotBase*.
- *make\_axes* updates the position of the parent. *make\_axes\_gridspec* replaces the *grid\_spec* attribute of the parent with a new one.

While this function is meant to be compatible with *make\_axes*, there could be some minor differences.

### Parameters

**parent** [*Axes*] The Axes to use as parent for placing the colorbar.

**fraction** [float, default: 0.15] Fraction of original axes to use for colorbar.

**shrink** [float, default: 1.0] Fraction by which to multiply the size of the colorbar.

**aspect** [float, default: 20] Ratio of long to short dimensions.

### Returns

**cax** [*SubplotBase*] The child axes.

**kw** [dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

### Other Parameters

**orientation** [{'vertical', 'horizontal'}, default: 'vertical'] The orientation of the colorbar.

**pad** [float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

**anchor** [(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

**panchor** [(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

## 18.18 matplotlib.colors

The Color [tutorials](#) and examples demonstrate how to set colors and colormaps.

A module for converting numbers or color arguments to *RGB* or *RGBA*.

*RGB* and *RGBA* are sequences of, respectively, 3 or 4 floats in the range 0-1.

This module includes functions and classes for color specification conversions, and for mapping numbers to colors in a 1-D array of colors called a colormap.

Mapping data onto colors using a colormap typically involves two steps: a data array is first mapped onto the range 0-1 using a subclass of *Normalize*, then this number is mapped to a color using a subclass of *Colormap*. Two subclasses of *Colormap* provided here: *LinearSegmentedColormap*, which uses piecewise-linear interpolation to define colormaps, and *ListedColormap*, which makes a colormap from a list of colors.

### See also:

[Creating Colormaps in Matplotlib](#) for examples of how to make colormaps and

[Choosing Colormaps in Matplotlib](#) for a list of built-in colormaps.

[Colormap Normalization](#) for more details about data normalization

More colormaps are available at [palettable](#).

The module also provides functions for checking whether an object can be interpreted as a color (*is\_color\_like*), for converting such an object to an RGBA tuple (*to\_rgba*) or to an HTML-like hex string in the "#rrggbb" format (*to\_hex*), and a sequence of colors to an (n, 4) RGBA array (*to\_rgba\_array*). Caching is used for efficiency.

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA (red, green, blue, alpha) tuple of float values in closed interval [0, 1] (e.g., (0.1, 0.2, 0.5) or (0.1, 0.2, 0.5, 0.3));
- a hex RGB or RGBA string (e.g., '#0f0f0f' or '#0f0f0f80'; case-insensitive);
- a shorthand hex RGB or RGBA string, equivalent to the hex RGB or RGBA string obtained by duplicating each character, (e.g., '#abc', equivalent to '#aabbcc', or '#abcd', equivalent to '#aabbccdd'; case-insensitive);
- a string representation of a float value in [0, 1] inclusive for gray level (e.g., '0.5');
- one of the characters {'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'}, which are short-hand notations for shades of blue, green, red, cyan, magenta, yellow, black, and white. Note that the colors 'g', 'c', 'm', 'y' do not coincide with the X11/CSS4 colors. Their particular shades were chosen for better visibility of colored lines against typical backgrounds.
- a X11/CSS4 color name (case-insensitive);
- a name from the [xkcd color survey](#), prefixed with 'xkcd:' (e.g., 'xkcd:sky blue'; case insensitive);

- one of the Tableau Colors from the 'T10' categorical palette (the default color cycle): {'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab:cyan'} (case-insensitive);
- a "CN" color spec, i.e. 'C' followed by a number, which is an index into the default property cycle (`rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`)); the indexing is intended to occur at rendering time, and defaults to black if the cycle does not include color.

### 18.18.1 Classes

<i>BoundaryNorm</i> (boundaries, ncolors[, clip, extend])	Generate a colormap index based on discrete intervals.
<i>Colormap</i> (name[, N])	Baseclass for all scalar to RGBA mappings.
<i>DivergingNorm</i> (vcenter[, vmin, vmax])	<i>[Deprecated]</i>
<i>LightSource</i> ([azdeg, altdeg, hsv_min_val, ...])	Create a light source coming from the specified azimuth and elevation.
<i>LinearSegmentedColormap</i> (name, segment-data[, ...])	Colormap objects based on lookup tables using linear segments.
<i>ListedColormap</i> (colors[, name, N])	Colormap object generated from a list of colors.
<i>LogNorm</i> ([vmin, vmax, clip])	Normalize a given value to the 0-1 range on a log scale.
<i>NoNorm</i> ([vmin, vmax, clip])	Dummy replacement for <i>Normalize</i> , for the case where we want to use indices directly in a <i>ScalarMappable</i> .
<i>Normalize</i> ([vmin, vmax, clip])	A class which, when called, linearly normalizes data into the [0.0, 1.0] interval.
<i>PowerNorm</i> (gamma[, vmin, vmax, clip])	Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.
<i>SymLogNorm</i> (linthresh[, linscale, vmin, ...])	The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.
<i>TwoSlopeNorm</i> (vcenter[, vmin, vmax])	Normalize data with a set center.

#### matplotlib.colors.BoundaryNorm

```
class matplotlib.colors.BoundaryNorm(boundaries, ncolors, clip=False, *, extend='neither')
```

Bases: *matplotlib.colors.Normalize*

Generate a colormap index based on discrete intervals.

Unlike *Normalize* or *LogNorm*, *BoundaryNorm* maps values to integers instead of to the interval 0-1.

Mapping to the 0-1 interval could have been done via piece-wise linear interpolation, but using integers seems simpler, and reduces the number of conversions back and forth between integer and floating point.

#### Parameters

**boundaries** [array-like] Monotonically increasing sequence of boundaries

**ncolors** [int] Number of colors in the colormap to be used

**clip** [bool, optional] If clip is True, out of range values are mapped to 0 if they are below boundaries[0] or mapped to ncolors - 1 if they are above boundaries[-1].

If clip is False, out of range values are mapped to -1 if they are below boundaries[0] or mapped to ncolors if they are above boundaries[-1]. These are then converted to valid indices by `Colormap.__call__`.

**extend** [{‘neither’, ‘both’, ‘min’, ‘max’}, default: ‘neither’] Extend the number of bins to include one or both of the regions beyond the boundaries. For example, if extend is ‘min’, then the color to which the region between the first pair of boundaries is mapped will be distinct from the first color in the colormap, and by default a `Colorbar` will be drawn with the triangle extension on the left or lower end.

### Returns

**int16 scalar or array**

### Notes

*boundaries* defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins, including any extensions, is less than *ncolors*, the color index is chosen by linear interpolation, mapping the [0, nbins - 1] range onto the [0, ncolors - 1] range.

`__call__(self, value, clip=None)`

Normalize *value* data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.

### Parameters

**value** Data to normalize.

**clip** [bool] If None, defaults to self.clip (which defaults to False).

### Notes

If not already initialized, self.vmin and self.vmax are initialized using self.autoscale\_None(value).

`__init__(self, boundaries, ncolors, clip=False, *, extend=‘neither’)`

### Parameters

**boundaries** [array-like] Monotonically increasing sequence of boundaries

**ncolors** [int] Number of colors in the colormap to be used

**clip** [bool, optional] If clip is True, out of range values are mapped to 0 if they are below boundaries[0] or mapped to ncolors - 1 if they are above boundaries[-1].

If `clip` is `False`, out of range values are mapped to `-1` if they are below `boundaries[0]` or mapped to `ncolors` if they are above `boundaries[-1]`. These are then converted to valid indices by `Colormap.__call__`.

**extend** [{‘neither’, ‘both’, ‘min’, ‘max’}, default: ‘neither’] Extend the number of bins to include one or both of the regions beyond the boundaries. For example, if `extend` is ‘min’, then the color to which the region between the first pair of boundaries is mapped will be distinct from the first color in the colormap, and by default a *Colorbar* will be drawn with the triangle extension on the left or lower end.

### Returns

**int16 scalar or array**

### Notes

*boundaries* defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins, including any extensions, is less than *ncolors*, the color index is chosen by linear interpolation, mapping the `[0, nbins - 1]` range onto the `[0, ncolors - 1]` range.

```
__module__ = 'matplotlib.colors'
```

```
inverse(self, value)
```

### Raises

**ValueError** `BoundaryNorm` is not invertible, so calling this method will always raise an error

### Examples using `matplotlib.colors.BoundaryNorm`

- *Customized Colorbars Tutorial*
- *Colormap Normalization*

### `matplotlib.colors.Colormap`

```
class matplotlib.colors.Colormap(name, N=256)
```

Bases: `object`

Baseclass for all scalar to RGBA mappings.

Typically, Colormap instances are used to convert data values (floats) from the interval [0, 1] to the RGBA color that the respective Colormap represents. For scaling of data into the [0, 1] interval see [matplotlib.colors.Normalize](#). Subclasses of [matplotlib.cm.ScalarMappable](#) make heavy use of this data -> normalize -> map-to-color processing chain.

### Parameters

**name** [str] The name of the colormap.

**N** [int] The number of rgb quantization levels.

`__call__(self, X, alpha=None, bytes=False)`

### Parameters

**X** [float or int, ndarray or scalar] The data value(s) to convert to RGBA. For floats, X should be in the interval [0.0, 1.0] to return the RGBA values X\*100 percent along the Colormap line. For integers, X should be in the interval [0, Colormap.N) to return RGBA values *indexed* from the Colormap with index X.

**alpha** [float, None] Alpha must be a scalar between 0 and 1, or None.

**bytes** [bool] If False (default), the returned RGBA values will be floats in the interval [0, 1] otherwise they will be uint8s in the interval [0, 255].

### Returns

**Tuple of RGBA values if X is scalar, otherwise an array of  
RGBA values with a shape of X.shape + (4, ).**

`__copy__(self)`

`__dict__` = mappingproxy({'\_\_module\_\_': 'matplotlib.colors', '\_\_doc\_\_': '\n Baseclass for all scalar'})

`__init__(self, name, N=256)`

### Parameters

**name** [str] The name of the colormap.

**N** [int] The number of rgb quantization levels.

`__module__` = 'matplotlib.colors'

`__weakref__`

list of weak references to the object (if defined)

`colorbar_extend` = None

When this colormap exists on a scalar mappable and `colorbar_extend` is not False, colorbar creation will pick up `colorbar_extend` as the default value for the `extend` keyword in the [matplotlib.colorbar.Colorbar](#) constructor.

`is_gray(self)`

`reversed(self, name=None)`

Return a reversed instance of the Colormap.

---

**Note:** This function is not implemented for base class.

---

**Parameters**

**name** [str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "\_r".

**See also:**

[\*LinearSegmentedColormap.reversed\*](#)

[\*ListedColormap.reversed\*](#)

`set_bad(self, color='k', alpha=None)`  
Set the color for masked values.

`set_over(self, color='k', alpha=None)`  
Set the color for high out-of-range values when `norm.clip = False`.

`set_under(self, color='k', alpha=None)`  
Set the color for low out-of-range values when `norm.clip = False`.

**Examples using `matplotlib.colors.Colormap`**

- [sphx\\_glr\\_gallery\\_lines\\_bars\\_and\\_markers\\_multicolored\\_line.py](#)

- [Customized Colorbars Tutorial](#)
- [Creating Colormaps in Matplotlib](#)

**matplotlib.colors.DivergingNorm**

`class matplotlib.colors.DivergingNorm(vcenter, vmin=None, vmax=None)`  
Bases: [\*matplotlib.colors.TwoSlopeNorm\*](#)  
[Deprecated]

**Notes**

Deprecated since version 3.2:

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

**Parameters**

**vcenter** [float] The data value that defines 0.5 in the normalization.

**vmin** [float, optional] The data value that defines 0.0 in the normalization.  
Defaults to the min value of the dataset.

**vmax** [float, optional] The data value that defines 1.0 in the normalization.  
Defaults to the the max value of the dataset.

### Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

`__init__(self, vcenter, vmin=None, vmax=None)`  
Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

#### Parameters

**vcenter** [float] The data value that defines 0.5 in the normalization.

**vmin** [float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.

**vmax** [float, optional] The data value that defines 1.0 in the normalization. Defaults to the the max value of the dataset.

### Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

`__module__ = 'matplotlib.colors'`

### Examples using `matplotlib.colors.DivergingNorm`

#### `matplotlib.colors.LightSource`

```
class matplotlib.colors.LightSource(azdeg=315, altdeg=45, hsv_min_val=0,
                                    hsv_max_val=1, hsv_min_sat=1, hsv_max_sat=0)
```

Bases: `object`

Create a light source coming from the specified azimuth and elevation. Angles are in degrees, with the azimuth measured clockwise from north and elevation up from the zero plane of the surface.

`shade` is used to produce "shaded" rgb values for a data array. `shade_rgb` can be used to combine an rgb image with an elevation map. `hillshade` produces an illumination map of a surface.

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

### Parameters

**azdeg** [float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

**altdeg** [float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

### Notes

For backwards compatibility, the parameters *hsv\_min\_val*, *hsv\_max\_val*, *hsv\_min\_sat*, and *hsv\_max\_sat* may be supplied at initialization as well. However, these parameters will only be used if "blend\_mode='hsv'" is passed into *shade* or *shade\_rgb*. See the documentation for *blend\_hsv* for more details.

```
__dict__ = mappingproxy({'__module__': 'matplotlib.colors', '__doc__': '\n Create a light source c
```

```
__init__(self, azdeg=315, altdeg=45, hsv_min_val=0, hsv_max_val=1,
          hsv_min_sat=1, hsv_max_sat=0)
```

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

### Parameters

**azdeg** [float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

**altdeg** [float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

### Notes

For backwards compatibility, the parameters *hsv\_min\_val*, *hsv\_max\_val*, *hsv\_min\_sat*, and *hsv\_max\_sat* may be supplied at initialization as well. However, these parameters will only be used if "blend\_mode='hsv'" is passed into *shade* or *shade\_rgb*. See the documentation for *blend\_hsv* for more details.

```
__module__ = 'matplotlib.colors'
```

```
__weakref__
```

list of weak references to the object (if defined)

```
blend_hsv(self, rgb, intensity, hsv_max_sat=None, hsv_max_val=None,
          hsv_min_val=None, hsv_min_sat=None)
```

Take the input data array, convert to HSV values in the given colormap, then adjust those color values to give the impression of a shaded relief map with a specified light source. RGBA values are returned, which can then be used to plot the shaded image with *imshow*.

The color of the resulting image will be darkened by moving the (s, v) values (in hsv colorspace) toward (hsv\_min\_sat, hsv\_min\_val) in the shaded regions, or lightened by sliding (s, v) toward (hsv\_max\_sat, hsv\_max\_val) in regions that are illuminated. The default extremes are chose so that completely shaded points are nearly black (s = 1, v = 0) and completely illuminated points are nearly white (s = 0, v = 1).

### Parameters

**rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

**hsv\_max\_sat** [number, default: 1] The maximum saturation value that the *intensity* map can shift the output image to.

**hsv\_min\_sat** [number, optional] The minimum saturation value that the *intensity* map can shift the output image to. Defaults to 0.

**hsv\_max\_val** [number, optional] The maximum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 1.

**hsv\_min\_val** [number, optional] The minimum value ("v" in "hsv") that the *intensity* map can shift the output image to. Defaults to 0.

#### Returns

**ndarray** An MxNx3 RGB array representing the combined images.

`blend_overlay(self, rgb, intensity)`

Combines an rgb image with an intensity map using "overlay" blending.

#### Parameters

**rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

#### Returns

**ndarray** An MxNx3 RGB array representing the combined images.

`blend_soft_light(self, rgb, intensity)`

Combine an rgb image with an intensity map using "soft light" blending, using the "pegtop" formula.

#### Parameters

**rgb** [ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity** [ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

#### Returns

**ndarray** An MxNx3 RGB array representing the combined images.

`property direction`

The unit vector direction towards the light source.

`hillshade(self, elevation, vert_exag=1, dx=1, dy=1, fraction=1.0)`

Calculate the illumination intensity for a surface using the defined azimuth and elevation for the light source.

This computes the normal vectors for the surface, and then passes them on to `shade_normals`

#### Parameters

**elevation** [array-like] A 2d array (or equivalent) of the height values used to generate an illumination map

**vert\_exag** [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topographic effects.

**dx** [number, optional] The x-spacing (columns) of the input *elevation* grid.

**dy** [number, optional] The y-spacing (rows) of the input *elevation* grid.

**fraction** [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

### Returns

**ndarray** A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

`shade(self, data, cmap, norm=None, blend_mode='overlay', vmin=None, vmax=None, vert_exag=1, dx=1, dy=1, fraction=1, **kwargs)`  
Combine colormapped data values with an illumination intensity map (a.k.a. "hillshade") of the values.

### Parameters

**data** [array-like] A 2d array (or equivalent) of the height values used to generate a shaded map.

**cmap** [*Colormap*] The colormap used to color the *data* array. Note that this must be a *Colormap* instance. For example, rather than passing in `cmap='gist_earth'`, use `cmap=plt.get_cmap('gist_earth')` instead.

**norm** [*Normalize* instance, optional] The normalization used to scale values before colormapping. If *None*, the input will be linearly scaled between its min and max.

**blend\_mode** [{*'hsv'*, *'overlay'*, *'soft'*} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. Default is "overlay". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an *MxNx3* RGB array of floats (ranging 0 to 1) with an *MxNx1* hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the *blend\_mode* function.

**vmin** [float or *None*, optional] The minimum value used in colormapping *data*. If *None* the minimum value in *data* is used. If *norm* is specified, then this argument will be ignored.

**vmax** [float or *None*, optional] The maximum value used in colormapping *data*. If *None* the maximum value in *data* is used. If *norm* is specified, then this argument will be ignored.

**vert\_exag** [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to

correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

**dx** [number, optional] The x-spacing (columns) of the input *elevation* grid.

**dy** [number, optional] The y-spacing (rows) of the input *elevation* grid.

**fraction** [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

**Additional kwargs are passed on to the *\*blend\_mode\** function.**

### Returns

**ndarray** An MxNx4 array of floats ranging between 0-1.

`shade_normals(self, normals, fraction=1.0)`

Calculate the illumination intensity for the normal vectors of a surface using the defined azimuth and elevation for the light source.

Imagine an artificial sun placed at infinity in some azimuth and elevation position illuminating our surface. The parts of the surface that slope toward the sun should brighten while those sides facing away should become darker.

### Parameters

**fraction** [number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

### Returns

**ndarray** A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

`shade_rgb(self, rgb, elevation, fraction=1.0, blend_mode='hsv', vert_exag=1, dx=1, dy=1, **kwargs)`

Use this light source to adjust the colors of the *rgb* input array to give the impression of a shaded relief map with the given *elevation*.

### Parameters

**rgb** [array-like] An (M, N, 3) RGB array, assumed to be in the range of 0 to 1.

**elevation** [array-like] An (M, N) array of the height values used to generate a shaded map.

**fraction** [number] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

**blend\_mode** [{*'hsv'*, *'overlay'*, *'soft'*} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. For backwards compatibility, this defaults to *"hsv"*.

Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an  $M \times N \times 3$  RGB array of floats (ranging 0 to 1) with an  $M \times N \times 1$  hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the `blend_mode` function.

**vert\_exag** [number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

**dx** [number, optional] The x-spacing (columns) of the input *elevation* grid.

**dy** [number, optional] The y-spacing (rows) of the input *elevation* grid.

**Additional kwargs are passed on to the *\*blend\_mode\** function.**

### Returns

**ndarray** An (m, n, 3) array of floats ranging between 0-1.

### Examples using `matplotlib.colors.LightSource`

- `sphx_glr_gallery_images_contours_and_fields_shading_example.py`
- `sphx_glr_gallery_showcase_mandelbrot.py`
- `sphx_glr_gallery_frontpage_3D.py`
- `sphx_glr_gallery_misc_demo_agg_filter.py`
- `sphx_glr_gallery_mplot3d_custom_shaded_3d_surface.py`
- `sphx_glr_gallery_specialty_plots_advanced_hillshading.py`
- `sphx_glr_gallery_specialty_plots_topographic_hillshading.py`

### `matplotlib.colors.LinearSegmentedColormap`

```
class matplotlib.colors.LinearSegmentedColormap(name, segmentdata, N=256,
                                                gamma=1.0)
```

Bases: `matplotlib.colors.Colormap`

Colormap objects based on lookup tables using linear segments.

The lookup table is generated using linear interpolation for each primary color, with the 0-1 domain divided into any number of segments.

Create color map from linear mapping segments

`segmentdata` argument is a dictionary with a red, green and blue entries. Each entry should be a list of x, y0, y1 tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```

cdict = {'red': [(0.0, 0.0, 0.0),
                 (0.5, 1.0, 1.0),
                 (1.0, 1.0, 1.0)],

         'green': [(0.0, 0.0, 0.0),
                   (0.25, 0.0, 0.0),
                   (0.75, 1.0, 1.0),
                   (1.0, 1.0, 1.0)],

         'blue': [(0.0, 0.0, 0.0),
                  (0.5, 0.0, 0.0),
                  (1.0, 1.0, 1.0)]}

```

Each row in the table for a given color is a sequence of  $x$ ,  $y0$ ,  $y1$  tuples. In each sequence,  $x$  must increase monotonically from 0 to 1. For any input value  $z$  falling between  $x[i]$  and  $x[i+1]$ , the output value of a given color will be linearly interpolated between  $y1[i]$  and  $y0[i+1]$ :

```

row i:   x  y0  y1
         /
         /
row i+1: x  y0  y1

```

Hence  $y0$  in the first row and  $y1$  in the last row are never used.

#### See also:

[`LinearSegmentedColormap.from\_list`](#) Static method; factory function for generating a smoothly-varying `LinearSegmentedColormap`.

[`makeMappingArray`](#) For information about making a mapping array.

```
__module__ = 'matplotlib.colors'
```

```
static from_list(name, colors, N=256, gamma=1.0)
```

Create a [`LinearSegmentedColormap`](#) from a list of colors.

### Parameters

**name** [str] The name of the colormap.

**colors** [array-like of colors or array-like of (value, color)] If only colors are given, they are equidistantly mapped from the range  $[0, 1]$ ; i.e. 0 maps to `colors[0]` and 1 maps to `colors[-1]`. If (value, color) pairs are given, the mapping is from *value* to *color*. This can be used to divide the range unevenly.

**N** [int] The number of rgb quantization levels.

**gamma** [float]

```
reversed(self, name=None)
```

Return a reversed instance of the Colormap.

### Parameters

**name** [str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "\_r".

### Returns

**LinearSegmentedColormap** The reversed colormap.

```
set_gamma(self, gamma)
```

Set a new gamma value and regenerate color map.

### matplotlib.colors.ListedColormap

`class matplotlib.colors.ListedColormap(colors, name='from_list', N=None)`

Bases: `matplotlib.colors.Colormap`

Colormap object generated from a list of colors.

This may be most useful when indexing directly into a colormap, but it can also be used to generate special colormaps for ordinary mapping.

#### Parameters

**colors** [list, array] List of Matplotlib color specifications, or an equivalent Nx3 or Nx4 floating point array (*N* rgb or rgba values).

**name** [str, optional] String to identify the colormap.

**N** [int, optional] Number of entries in the map. The default is *None*, in which case there is one colormap entry for each element in the list of colors. If

$N < \text{len}(\text{colors})$

the list will be truncated at *N*. If

$N > \text{len}(\text{colors})$

the list will be extended by repetition.

#### Parameters

**name** [str] The name of the colormap.

**N** [int] The number of rgb quantization levels.

`__init__(self, colors, name='from_list', N=None)`

#### Parameters

**name** [str] The name of the colormap.

**N** [int] The number of rgb quantization levels.

`__module__` = 'matplotlib.colors'

`reversed(self, name=None)`

Return a reversed instance of the Colormap.

**Parameters**

**name** [str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "\_r".

**Returns**

**ListedColormap** A reversed instance of the colormap.

**Examples using `matplotlib.colors.ListedColormap`**

- `sphx_glr_gallery_lines_bars_and_markers_multicolored_line.py`
- `sphx_glr_gallery_images_contours_and_fields_layer_images.py`
- `sphx_glr_gallery_images_contours_and_fields_quadmesh_demo.py`

- *[Customized Colorbars Tutorial](#)*
- *[Creating Colormaps in Matplotlib](#)*

**`matplotlib.colors.LogNorm`**

`class matplotlib.colors.LogNorm(vmin=None, vmax=None, clip=False)`

Bases: *`matplotlib.colors.Normalize`*

Normalize a given value to the 0-1 range on a log scale.

**Parameters**

**vmin, vmax** [float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

**clip** [bool, default: False] If True values falling outside the range [*vmin*, *vmax*], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

**Notes**

Returns 0 if `vmin == vmax`.

`__call__(self, value, clip=None)`

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

### Parameters

**value** Data to normalize.

**clip** [bool] If `None`, defaults to `self.clip` (which defaults to `False`).

### Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__module__` = 'matplotlib.colors'

`autoscale(self, A)`

Set `vmin`, `vmax` to min, max of *A*.

`autoscale_None(self, A)`

If `vmin` or `vmax` are not set, use the min/max of *A* to set them.

`inverse(self, value)`

### Examples using `matplotlib.colors.LogNorm`

- `sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py`
- `sphx_glr_gallery_statistics_hist.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations.py`
- [Colormap Normalization](#)

### `matplotlib.colors.NoNorm`

`class matplotlib.colors.NoNorm(vmin=None, vmax=None, clip=False)`

Bases: `matplotlib.colors.Normalize`

Dummy replacement for *Normalize*, for the case where we want to use indices directly in a *ScalarMappable*.

### Parameters

**vmin, vmax** [float or `None`] If `vmin` and/or `vmax` is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

**clip** [bool, default: `False`] If `True` values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If `False` masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

### Notes

Returns 0 if `vmin == vmax`.

`__call__(self, value, clip=None)`

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

### Parameters

**value** Data to normalize.

**clip** [bool] If None, defaults to `self.clip` (which defaults to False).

### Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__module__ = 'matplotlib.colors'`

`inverse(self, value)`

Examples using `matplotlib.colors.NoNorm`

`matplotlib.colors.Normalize`

`class matplotlib.colors.Normalize(vmin=None, vmax=None, clip=False)`

Bases: `object`

A class which, when called, linearly normalizes data into the `[0.0, 1.0]` interval.

### Parameters

**vmin, vmax** [float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

**clip** [bool, default: False] If True values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

### Notes

Returns 0 if `vmin == vmax`.

`__call__(self, value, clip=None)`

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

### Parameters

**value** Data to normalize.

**clip** [bool] If None, defaults to `self.clip` (which defaults to False).

### Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

```
__dict__ = mappingproxy({'__module__': 'matplotlib.colors', '__doc__': '\n A class which, when cal
__init__(self, vmin=None, vmax=None, clip=False)
```

### Parameters

**vmin, vmax** [float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

**clip** [bool, default: False] If True values falling outside the range [*vmin*, *vmax*], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

### Notes

Returns 0 if `vmin == vmax`.

```
__module__ = 'matplotlib.colors'
```

```
__weakref__
    list of weak references to the object (if defined)
```

```
autoscale(self, A)
    Set vmin, vmax to min, max of A.
```

```
autoscale_None(self, A)
    If vmin or vmax are not set, use the min/max of A to set them.
```

```
inverse(self, value)
```

```
static process_value(value)
    Homogenize the input value for easy and efficient normalization.
    value can be a scalar or sequence.
```

### Returns

**result** [masked array] Masked array with the same shape as *value*.

**is\_scalar** [bool] Whether *value* is a scalar.

### Notes

Float dtypes are preserved; integer types with two bytes or smaller are converted to `np.float32`, and larger types are converted to `np.float64`. Preserving `float32` when possible, and using in-place operations, greatly improves speed for large arrays.

`scaled(self)`

Return whether vmin and vmax are set.

#### `matplotlib.colors.PowerNorm`

`class matplotlib.colors.PowerNorm(gamma, vmin=None, vmax=None, clip=False)`

Bases: `matplotlib.colors.Normalize`

Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.

##### Parameters

**vmin, vmax** [float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

**clip** [bool, default: False] If True values falling outside the range [*vmin*, *vmax*], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

### Notes

Returns 0 if `vmin == vmax`.

`__call__(self, value, clip=None)`

Normalize *value* data in the `[vmin, vmax]` interval into the `[0.0, 1.0]` interval and return it.

### Parameters

**value** Data to normalize.

**clip** [bool] If None, defaults to `self.clip` (which defaults to False).

### Notes

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

`__init__(self, gamma, vmin=None, vmax=None, clip=False)`

### Parameters

**vmin, vmax** [float or None] If *vmin* and/or *vmax* is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., `__call__(A)` calls `autoscale_None(A)`.

**clip** [bool, default: False] If True values falling outside the range `[vmin, vmax]`, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is `clip=False`.

### Notes

Returns 0 if `vmin == vmax`.

`__module__ = 'matplotlib.colors'`

`inverse(self, value)`

### Examples using `matplotlib.colors.PowerNorm`

- `sphx_glr_gallery_showcase_mandelbrot.py`
- `sphx_glr_gallery_scales_power_norm.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations.py`
- [Colormap Normalization](#)

**matplotlib.colors.SymLogNorm**

```
class matplotlib.colors.SymLogNorm(linthresh, linscale=1.0, vmin=None, vmax=None,
                                   clip=False, *, base=None)
```

Bases: [\*matplotlib.colors.Normalize\*](#)

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter *linthresh* allows the user to specify the size of this range (*-linthresh*, *linthresh*).

**Parameters**

**linthresh** [float] The range within which the plot is linear (to avoid having the plot go to infinity around zero).

**linscale** [float, default: 1] This allows the linear range (*-linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of powers of *base* to use for each half of the linear range.

For example, when *linscale* == 1.0 (the default) and *base*=10, then space used for the positive and negative halves of the linear range will be equal to a decade in the logarithmic.

**base** [float, default: None] If not given, defaults to `np.e` (consistent with prior behavior) and warns.

In v3.3 the default value will change to 10 to be consistent with [\*SymLogNorm\*](#).

To suppress the warning pass *base* as a keyword argument.

```
__call__(self, value, clip=None)
```

Normalize *value* data in the [*vmin*, *vmax*] interval into the [0.0, 1.0] interval and return it.

**Parameters**

**value** Data to normalize.

**clip** [bool] If None, defaults to `self.clip` (which defaults to False).

**Notes**

If not already initialized, `self.vmin` and `self.vmax` are initialized using `self.autoscale_None(value)`.

```
__init__(self, linthresh, linscale=1.0, vmin=None, vmax=None, clip=False, *,
          base=None)
```

**Parameters**

**linthresh** [float] The range within which the plot is linear (to avoid having the plot go to infinity around zero).

**linscale** [float, default: 1] This allows the linear range (*-linthresh* to *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of powers of *base* to use for each half of the linear range.

For example, when *linscale* == 1.0 (the default) and *base*=10, then space used for the positive and negative halves of the linear range will be equal to a decade in the logarithmic.

**base** [float, default: None] If not given, defaults to `np.e` (consistent with prior behavior) and warns.

In v3.3 the default value will change to 10 to be consistent with *SymLogNorm*.

To suppress the warning pass *base* as a keyword argument.

```
__module__ = 'matplotlib.colors'
```

```
autoscale(self, A)
```

Set *vmin*, *vmax* to min, max of *A*.

```
autoscale_None(self, A)
```

If *vmin* or *vmax* are not set, use the min/max of *A* to set them.

```
inverse(self, value)
```

#### Examples using `matplotlib.colors.SymLogNorm`

- `sphx_glr_gallery_userdemo_colormap_normalizations.py`
- `sphx_glr_gallery_userdemo_colormap_normalizations_symlognorm.py`
- *Colormap Normalization*

#### `matplotlib.colors.TwoSlopeNorm`

```
class matplotlib.colors.TwoSlopeNorm(vcenter, vmin=None, vmax=None)
```

Bases: `matplotlib.colors.Normalize`

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

##### Parameters

**vcenter** [float] The data value that defines 0.5 in the normalization.

**vmin** [float, optional] The data value that defines 0.0 in the normalization.  
Defaults to the min value of the dataset.

**vmax** [float, optional] The data value that defines 1.0 in the normalization.  
Defaults to the the max value of the dataset.

##### Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

**\_\_call\_\_(self, value, clip=None)**

Map value to the interval [0, 1]. The clip argument is unused.

**\_\_init\_\_(self, vcenter, vmin=None, vmax=None)**

Normalize data with a set center.

Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

### Parameters

**vcenter** [float] The data value that defines 0.5 in the normalization.

**vmin** [float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.

**vmax** [float, optional] The data value that defines 1.0 in the normalization. Defaults to the the max value of the dataset.

### Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

**\_\_module\_\_** = 'matplotlib.colors'

**autoscale\_None(self, A)**

Get vmin and vmax, and then clip at vcenter

### Examples using matplotlib.colors.TwoSlopeNorm

- *Colormap Normalization*

## 18.18.2 Functions

<code>from_levels_and_colors(levels, colors[, extend])</code>	A helper routine to generate a cmap and a norm instance which behave similar to contourf's levels and colors arguments.
<code>hsv_to_rgb(hsv)</code>	Convert hsv values to rgb.

Continued on next page

Table 130 – continued from previous page

<code>rgb_to_hsv(arr)</code>	Convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.
<code>to_hex(c[, keep_alpha])</code>	Convert <i>c</i> to a hex color.
<code>to_rgb(c)</code>	Convert <i>c</i> to an RGB color, silently dropping the alpha channel.
<code>to_rgba(c[, alpha])</code>	Convert <i>c</i> to an RGBA color.
<code>to_rgba_array(c[, alpha])</code>	Convert <i>c</i> to a (n, 4) array of RGBA colors.
<code>is_color_like(c)</code>	Return whether <i>c</i> can be interpreted as an RGB(A) color.
<code>same_color(c1, c2)</code>	Return whether the colors <i>c1</i> and <i>c2</i> are the same.
<code>makeMappingArray(N, data[, gamma])</code>	<i>[Deprecated]</i> Create an <i>N</i> -element 1-d lookup table.
<code>get_named_colors_mapping()</code>	Return the global mapping of names to named colors.

**matplotlib.colors.from\_levels\_and\_colors**

`matplotlib.colors.from_levels_and_colors(levels, colors, extend='neither')`

A helper routine to generate a `cmap` and a `norm` instance which behave similar to `contourf`'s `levels` and `colors` arguments.

**Parameters**

**levels** [sequence of numbers] The quantization levels used to construct the *BoundaryNorm*. Value *v* is quantized to level *i* if `lev[i] <= v < lev[i+1]`.

**colors** [sequence of colors] The fill color to use for each level. If *extend* is "neither" there must be `n_level - 1` colors. For an *extend* of "min" or "max" add one extra color, and for an *extend* of "both" add two colors.

**extend** [{ 'neither', 'min', 'max', 'both' }, optional] The behaviour when a value falls out of range of the given levels. See *contourf* for details.

**Returns**

**cmap** [*Normalize*]

**norm** [*Colormap*]

**Examples using matplotlib.colors.from\_levels\_and\_colors****matplotlib.colors.hsv\_to\_rgb**

`matplotlib.colors.hsv_to_rgb(hsv)`

Convert hsv values to rgb.

**Parameters**

**hsv** [(..., 3) array-like] All values assumed to be in range [0, 1]

**Returns**

**(..., 3) ndarray** Colors converted to RGB values in range [0, 1]

Examples using `matplotlib.colors.hsv_to_rgb`

- `sphx_glr_gallery_mplot3d_voxels_torus.py`

`matplotlib.colors.rgb_to_hsv`

`matplotlib.colors.rgb_to_hsv(arr)`

Convert float `rgb` values (in the range `[0, 1]`), in a numpy array to `hsv` values.

**Parameters**

**arr** [(..., 3) array-like] All values must be in the range `[0, 1]`

**Returns**

**(..., 3) ndarray** Colors converted to `hsv` values in range `[0, 1]`

Examples using `matplotlib.colors.rgb_to_hsv`

- `sphx_glr_gallery_color_named_colors.py`

`matplotlib.colors.to_hex`

`matplotlib.colors.to_hex(c, keep_alpha=False)`

Convert `c` to a hex color.

Uses the `#rrggbb` format if `keep_alpha` is `False` (the default), `#rrggbbaa` otherwise.

Examples using `matplotlib.colors.to_hex`

`matplotlib.colors.to_rgb`

`matplotlib.colors.to_rgb(c)`

Convert `c` to an RGB color, silently dropping the alpha channel.

Examples using `matplotlib.colors.to_rgb`

- `sphx_glr_gallery_color_named_colors.py`

`matplotlib.colors.to_rgba`

`matplotlib.colors.to_rgba(c, alpha=None)`

Convert `c` to an RGBA color.

**Parameters**

**c** [Matplotlib color or `np.ma.masked`]

**alpha** [float, optional] If `alpha` is not `None`, it forces the alpha value, except if `c` is `"none"` (case-insensitive), which always maps to `(0, 0, 0, 0)`.

**Returns****tuple** Tuple of (r, g, b, a) scalars.**Examples using `matplotlib.colors.to_rgba`**

- sphx\_glr\_gallery\_color\_named\_colors.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_collections.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_line\_collection.py
- sphx\_glr\_gallery\_event\_handling\_lasso\_demo.py
- sphx\_glr\_gallery\_misc\_demo\_ribbon\_box.py
- sphx\_glr\_gallery\_widgets\_menu.py

**`matplotlib.colors.to_rgba_array`**

`matplotlib.colors.to_rgba_array(c, alpha=None)`  
 Convert *c* to a (n, 4) array of RGBA colors.

If *alpha* is not None, it forces the alpha value. If *c* is "none" (case-insensitive) or an empty list, an empty array is returned. If *c* is a masked array, an ndarray is returned with a (0, 0, 0, 0) row for each masked value or row in *c*.

**Examples using `matplotlib.colors.to_rgba_array`****`matplotlib.colors.is_color_like`**

`matplotlib.colors.is_color_like(c)`  
 Return whether *c* can be interpreted as an RGB(A) color.

**Examples using `matplotlib.colors.is_color_like`****`matplotlib.colors.same_color`**

`matplotlib.colors.same_color(c1, c2)`  
 Return whether the colors *c1* and *c2* are the same.  
*c1*, *c2* can be single colors or lists/arrays of colors.

**Examples using `matplotlib.colors.same_color`****`matplotlib.colors.makeMappingArray`**

`matplotlib.colors.makeMappingArray(N, data, gamma=1.0)`  
 [Deprecated] Create an *N*-element 1-d lookup table.

This assumes a mapping  $f : [0, 1] \rightarrow [0, 1]$ . The returned data is an array of *N* values  $y = f(x)$  where *x* is sampled from  $[0, 1]$ .

By default ( $\gamma = 1$ )  $x$  is equidistantly sampled from  $[0, 1]$ . The  $\gamma$  correction factor  $\gamma$  distorts this equidistant sampling by  $x \rightarrow x^\gamma$ .

### Parameters

**N** [int] The number of elements of the created lookup table; at least 1.

**data** [Mx3 array-like or callable] Defines the mapping  $f$ .

If a Mx3 array-like, the rows define values ( $x$ ,  $y_0$ ,  $y_1$ ). The  $x$  values must start with  $x=0$ , end with  $x=1$ , and all  $x$  values be in increasing order.

A value between  $x_i$  and  $x_{i+1}$  is mapped to the range  $y_{i-1}^1 \dots y_i^0$  by linear interpolation.

For the simple case of a  $y$ -continuous mapping,  $y_0$  and  $y_1$  are identical.

The two values of  $y$  are to allow for discontinuous mapping functions. E.g. a sawtooth with a period of 0.2 and an amplitude of 1 would be:

```
[(0, 1, 0), (0.2, 1, 0), (0.4, 1, 0), ..., [(1, 1, 0)]
```

In the special case of  $N == 1$ , by convention the returned value is  $y_0$  for  $x == 1$ .

If *data* is a callable, it must accept and return numpy arrays:

```
data(x : ndarray) -> ndarray
```

and map values between 0 - 1 to 0 - 1.

**gamma** [float] Gamma correction factor for input distribution  $x$  of the mapping.

See also [https://en.wikipedia.org/wiki/Gamma\\_correction](https://en.wikipedia.org/wiki/Gamma_correction).

### Returns

**array** The lookup table where `lut[x * (N-1)]` gives the closest value for values of  $x$  between 0 and 1.

### Notes

This function is internally used for *LinearSegmentedColormap*.

Deprecated since version 3.2.

Examples using `matplotlib.colors.makeMappingArray`

`matplotlib.colors.get_named_colors_mapping`

`matplotlib.colors.get_named_colors_mapping()`

Return the global mapping of names to named colors.

Examples using `matplotlib.colors.get_named_colors_mapping`

## 18.19 matplotlib.container

`class matplotlib.container.BarContainer(patches, errorbar=None, **kwargs)`

Bases: `matplotlib.container.Container`

Container for the artists of bar plots (e.g. created by `Axes.bar`).

The container can be treated as a tuple of the *patches* themselves. Additionally, you can access these and further parameters by the attributes.

### Attributes

**patches** [list of `Rectangle`] The artists of the bars.

**errorbar** [None or `ErrorbarContainer`] A container for the error bar artists if error bars are present. *None* otherwise.

`class matplotlib.container.Container(kl, label=None)`

Bases: `tuple`

Base class for containers.

Containers are classes that collect semantically related Artists such as the bars of a bar plot.

`add_callback(self, func)`

Add a callback function that will be called whenever one of the *Artist*'s properties changes.

### Parameters

**func** [callable] The callback function. It must have the signature:

```
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

### Returns

**int** The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

### See also:

`remove_callback`

`get_children(self)`

`get_label(self)`

Return the label used for this artist in the legend.

`pchanged(self)`

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

### See also:

`add_callback`

`remove_callback`

`remove(self)`

`remove_callback(self, oid)`

Remove a callback based on its observer id.

**See also:**

`add_callback`

`set_label(self, s)`

Set a label that will be displayed in the legend.

### Parameters

**s** [object] *s* will be converted to a string by calling `str`.

`class matplotlib.container.ErrorbarContainer(lines, has_xerr=False, has_yerr=False, **kwargs)`

Bases: `matplotlib.container.Container`

Container for the artists of error bars (e.g. created by `Axes.errorbar`).

The container can be treated as the *lines* tuple itself. Additionally, you can access these and further parameters by the attributes.

### Attributes

**lines** [tuple] Tuple of (data\_line, caplines, barlinecols).

- **data\_line** : `Line2D` instance of x, y plot markers and/or line.
- **caplines** : tuple of `Line2D` instances of the error bar caps.
- **barlinecols** : list of `LineCollection` with the horizontal and vertical error ranges.

**has\_xerr, has\_yerr** [bool] True if the errorbar has x/y errors.

`class matplotlib.container.StemContainer(markerline_stemlines_baseline, **kwargs)`

Bases: `matplotlib.container.Container`

Container for the artists created in a `Axes.stem()` plot.

The container can be treated like a namedtuple (markerline, stemlines, baseline).

### Attributes

**markerline** [`Line2D`] The artist of the markers at the stem heads.

**stemlines** [list of `Line2D`] The artists of the vertical lines for all stems.

**baseline** [`Line2D`] The artist of the horizontal baseline.

### Parameters

**markerline\_stemlines\_baseline** [tuple] Tuple of (markerline, stemlines, baseline). `markerline` contains the `LineCollection` of the markers, `stemlines` is a `LineCollection` of the main lines, `baseline` is the `Line2D` of the baseline.

## 18.20 matplotlib.contour

Classes to support contour plotting and labelling for the Axes class.

```
class matplotlib.contour.ClabelText(x=0, y=0, text="", color=None, verticalalign=
    'baseline', horizontalalignment='left',
    multialignment=None, fontproperties=None,
    rotation=None, linespacing=None, rota-
    tion_mode=None, usetex=None, wrap=False,
    **kwargs)
```

Bases: `matplotlib.text.Text`

Unlike the ordinary text, the `get_rotation` returns an updated angle in the pixel coordinate assuming that the input rotation is an angle in data coordinate (or whatever transform set).

Create a `Text` instance at `x`, `y` with string `text`.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <code>patches.FancyBboxPatch</code>
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>figure</code>	<code>Figure</code>
<code>fontfamily</code> or <code>family</code>	{'FONTNAME', 'serif', 'sans-serif', 'cursive', 'fantasy', 'monosp
<code>fontproperties</code> or <code>font</code> or <code>font_properties</code>	<code>font_manager.FontProperties</code> or <code>str</code> or <code>pathlib.Path</code>
<code>fontsize</code> or <code>size</code>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large
<code>fontstretch</code> or <code>stretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-co
<code>fontstyle</code> or <code>style</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code> or <code>variant</code>	{'normal', 'small-caps'}
<code>fontweight</code> or <code>weight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal'
<code>gid</code>	str
<code>horizontalalignment</code> or <code>ha</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>multialignment</code> or <code>ma</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool or None
<code>rotation</code>	float or {'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None

Property	Description
<i>text</i>	object
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>usetex</i>	bool or None
<i>verticalalignment</i> or <i>va</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

`get_rotation(self)`

Return the text angle in degrees between 0 and 360.

`class matplotlib.contour.ContourLabeler`

Bases: `object`

Mixin to provide labelling capability to `ContourSet`.

`add_label(self, x, y, rotation, lev, cvalue)`

Add contour label using `Text` class.

`add_label_clabeltext(self, x, y, rotation, lev, cvalue)`

Add contour label using `ClabelText` class.

`add_label_near(self, x, y, inline=True, inline_spacing=5, transform=None)`

Add a label near the point (x, y). If transform is None (default), (x, y) is in data coordinates; if transform is False, (x, y) is in display coordinates; otherwise, the specified transform will be used to translate (x, y) into display coordinates.

### Parameters

**x, y** [float] The approximate location of the label.

**inline** [bool, default: True] If `True` remove the segment of the contour beneath the label.

**inline\_spacing** [int, default: 5] Space in pixels to leave on each side of label when placing inline. This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

`calc_label_rot_and_inline(self, slc, ind, lw, lc=None, spacing=5)`

Calculate the appropriate label rotation given the linecontour coordinates in screen units, the index of the label location and the label width.

If `lc` is not None or empty, also break contours and compute inlining.

`spacing` is the empty space to leave around the label, in pixels.

Both tasks are done together to avoid calculating path lengths multiple times, which is relatively costly.

The method used here involves computing the path length along the contour in pixel coordinates and then looking approximately (label width / 2) away from central point to determine rotation and then to break contour if desired.

```
clabel(self, levels=None, *, fontsize=None, inline=True, inline_spacing=5,
       fmt='%1.3f', colors=None, use_clabeltext=False, manual=False, right-
       side_up=True, zorder=None)
```

Label a contour plot.

Adds labels to line contours in this [ContourSet](#) (which inherits from this mixin class).

### Parameters

**levels** [array-like, optional] A list of level values, that should be labeled. The list must be a subset of `cs.levels`. If not given, all levels are labeled.

**fontsize** [str or float, default: `rcParams["font.size"]` (default: 10.0)] Size in points or relative size e.g., 'smaller', 'x-large'. See [Text.set\\_size](#) for accepted string values.

**colors** [color or colors or None, default: None] The label colors:

- If *None*, the color of each label matches the color of the corresponding contour.
- If one string color, e.g., `colors = 'r'` or `colors = 'red'`, all labels will be plotted in this color.
- If a tuple of colors (string, float, rgb, etc), different labels will be plotted in different colors in the order specified.

**inline** [bool, default: True] If True the underlying contour is removed where the label is placed.

**inline\_spacing** [float, default: 5] Space in pixels to leave on each side of label when placing inline.

This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

**fmt** [str or dict, default: '%1.3f'] A format string for the label.

Alternatively, this can be a dictionary matching contour levels with arbitrary strings to use for each contour level (i.e., `fmt[level]=string`), or it can be any callable, such as a [Formatter](#) instance, that returns a string when called with a numeric contour level.

**manual** [bool or iterable, default: False] If True, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).

*manual* can also be an iterable object of (x, y) tuples. Contour labels will be created as if mouse is clicked at each (x, y) position.

**rightside\_up** [bool, default: True] If True, label rotations will always be plus or minus 90 degrees from level.

**use\_clabeltext** [bool, default: False] If True, [ClabelText](#) class (instead of [Text](#)) is used to create labels. [ClabelText](#) recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes.

**zorder** [float or None, default: (2 + contour.get\_zorder())] zorder of the contour labels.

### Returns

**labels** A list of *Text* instances for the labels.

`get_label_coords(self, distances, XX, YY, ysize, lw)`

Return x, y, and the index of a label location.

Labels are plotted at a location with the smallest deviation of the contour from a straight line unless there is another label nearby, in which case the next best place on the contour is picked up. If all such candidates are rejected, the beginning of the contour is chosen.

`get_label_width(self, lev, fmt, fsize)`

Return the width of the label in points.

`get_text(self, lev, fmt)`

Get the text of the label.

`labels(self, inline, inline_spacing)`

`locate_label(self, linecontour, labelwidth)`

Find good place to draw a label (relatively flat part of the contour).

`pop_label(self, index=-1)`

Defaults to removing last label, but any index can be supplied

`print_label(self, linecontour, labelwidth)`

Return whether a contour is long enough to hold a label.

`set_label_props(self, label, text, color)`

Set the label properties - color, fontsize, text.

`too_close(self, x, y, lw)`

Return *True* if a label is already near this location.

```
class matplotlib.contour.ContourSet(ax,      *args,      levels=None,      filled=False,
                                     linewidths=None,      linestyle=None,
                                     hatches=(None, ), alpha=None, origin=None,
                                     extent=None,      cmap=None,      colors=None,
                                     norm=None, vmin=None, vmax=None, extend='neither',
                                     antialiased=None, nchunk=0, locator=None, transform=None, **kwargs)
```

Bases: *matplotlib.cm.ScalarMappable*, *matplotlib.contour.ContourLabeler*

Store a set of contour lines or filled regions.

User-callable method: *clabel*

### Parameters

**ax** [*Axes*]

**levels** [[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

**allsegs** [[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

**allkinds** [None or [level0kinds, level1kinds, ...]] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not None, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not None, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

**\*\*kwargs** Keyword arguments are as described in the docstring of *contour*.

### Attributes

**ax** The axes object in which the contours are drawn.

**collections** A silent\_list of LineCollections or PolyCollections.

**levels** Contour levels.

**layers** Same as levels for line contours; half-way between levels for filled contours. See `_process_colors()`.

Draw contour lines or filled regions, depending on whether keyword arg *filled* is False (default) or True.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

### Parameters

**ax** [*Axes*] The *Axes* object to draw on.

**levels** [[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

**allsegs** [[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

**allkinds** [[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not None, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not *None*, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

**\*\*kwargs** Keyword arguments are as described in the docstring of *contour*.

property *ax*

*changed(self)*

Call this whenever the mappable is changed to notify all the callbackSM listeners to the 'changed' signal.

*find\_nearest\_contour(self, x, y, indices=None, pixel=True)*

Find the point in the contour plot that is closest to (x, y).

#### Parameters

**x, y: float** The reference point.

**indices** [list of int or None, default: None] Indices of contour levels to consider. If None (the default), all levels are considered.

**pixel** [bool, default: True] If *True*, measure distance in pixel (screen) space, which is useful for manual contour labeling; else, measure distance in axes space.

#### Returns

**contour** [*Collection*] The contour that is closest to (x, y).

**segment** [int] The index of the *Path* in *contour* that is closest to (x, y).

**index** [int] The index of the path segment in *segment* that is closest to (x, y).

**xmin, ymin** [float] The point in the contour plot that is closest to (x, y).

**d** [float] The distance from (xmin, ymin) to (x, y).

*get\_alpha(self)*

Return alpha to be applied to all ContourSet artists.

*get\_transform(self)*

Return the *Transform* instance used by this ContourSet.

*legend\_elements(self, variable\_name='x', str\_format=<class 'str'>)*

Return a list of artists and labels suitable for passing through to *legend* which represent this ContourSet.

The labels have the form "*0 < x <= 1*" stating the data ranges which the artists represent.

#### Parameters

**variable\_name** [str] The string used inside the inequality used on the labels.

**str\_format** [function: float -> str] Function used to format the numbers in the labels.

#### Returns

**artists** [List[*Artist*]] A list of the artists.

**labels** [List[str]] A list of the labels.

`set_alpha(self, alpha)`

Set the alpha blending value for all ContourSet artists. *alpha* must be between 0 (transparent) and 1 (opaque).

```
class matplotlib.contour.QuadContourSet(ax, *args, levels=None, filled=False,
                                         linewidths=None, linestyle=None,
                                         hatches=(None, ), alpha=None, origin=None,
                                         extent=None, cmap=None, colors=None,
                                         norm=None, vmin=None, vmax=None, ex-
                                         tend='neither', antialiased=None, nchunk=0,
                                         locator=None, transform=None, **kwargs)
```

Bases: `matplotlib.contour.ContourSet`

Create and store a set of contour lines or filled regions.

User-callable method: `clabel`

### Attributes

**ax** The axes object in which the contours are drawn.

**collections** A silent\_list of LineCollections or PolyCollections.

**levels** Contour levels.

**layers** Same as levels for line contours; half-way between levels for filled contours. See `_process_colors()` method.

Draw contour lines or filled regions, depending on whether keyword arg *filled* is False (default) or True.

Call signature:

```
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

### Parameters

**ax** [*Axes*] The *Axes* object to draw on.

**levels** [[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

**allsegs** [[level0segs, level1segs, ...]] List of all the polygon segments for all the *levels*. For contour lines `len(allsegs) == len(levels)`, and for filled contour regions `len(allsegs) = len(levels)-1`. The lists should look like

```
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

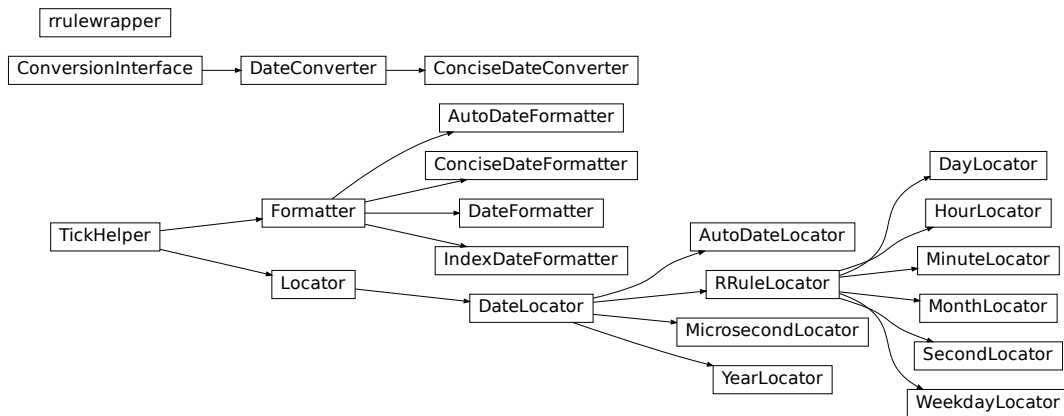

**allkinds** [[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply- connected paths such as holes within filled polygons. If not None, `len(allkinds) == len(allsegs)`. The lists should look like

```
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If *allkinds* is not None, usually all polygons for a particular contour level are grouped together so that `level0segs = [polygon0]` and `level0kinds = [polygon0kinds]`.

**\*\*kwargs** Keyword arguments are as described in the docstring of `contour`.

## 18.21 matplotlib.dates

Matplotlib provides sophisticated date plotting capabilities, standing on the shoulders of python `datetime` and the add-on module `dateutil`.

### 18.21.1 Matplotlib date format

Matplotlib represents dates using floating point numbers specifying the number of days since a default epoch of 1970-01-01 UTC; for example, 1970-01-01, 06:00 is the floating point number 0.25. The formatters and locators require the use of `datetime.datetime` objects, so only dates between year 0001 and 9999 can be represented. Microsecond precision is achievable for (approximately) 70 years on either side of the epoch, and 20 microseconds for the rest of the allowable range of dates (year 0001 to 9999). The epoch can be changed at import time via `dates.set_epoch` or `rcParams["dates.epoch"]` to other dates if necessary; see `/gallery/ticks_and_spines/date_precision_and_epochs` for a discussion.

**Note:** Before Matplotlib 3.3, the epoch was 0000-12-31 which lost modern microsecond precision and also made the default axis limit of 0 an invalid datetime. In 3.3 the epoch was changed as above. To convert old ordinal floats to the new epoch, users can do:

```
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31'))
```

There are a number of helper functions to convert between `datetime` objects and Matplotlib dates:

`datestr2num`

Convert a date string to a datenum using `dateutil.parser.parse`.

Continued on next page

Table 132 – continued from previous page

<code>date2num</code>	Convert <code>datetime</code> objects to Matplotlib dates.
<code>num2date</code>	Convert Matplotlib dates to <code>datetime</code> objects.
<code>num2timedelta</code>	Convert number of days to a <code>timedelta</code> object.
<code>drange</code>	Return a sequence of equally spaced Matplotlib dates.
<code>set_epoch</code>	Set the epoch (origin for dates) for <code>datetime</code> calculations.
<code>get_epoch</code>	Get the epoch used by <code>dates</code> .

**Note:** Like Python’s `datetime.datetime`, Matplotlib uses the Gregorian calendar for all conversions between dates and floating point numbers. This practice is not universal, and calendar differences can cause confusing differences between what Python and Matplotlib give as the number of days since 0001-01-01 and what other software and databases yield. For example, the US Naval Observatory uses a calendar that switches from Julian to Gregorian in October, 1582. Hence, using their calculator, the number of days between 0001-01-01 and 2006-04-01 is 732403, whereas using the Gregorian calendar via the `datetime` module we find:

```
In [1]: date(2006, 4, 1).toordinal() - date(1, 1, 1).toordinal()
Out[1]: 732401
```

All the Matplotlib date converters, tickers and formatters are timezone aware. If no explicit timezone is provided, `rcParams["timezone"]` (default: 'UTC') is assumed. If you want to use a custom time zone, pass a `datetime.tzinfo` instance with the `tz` keyword argument to `num2date`, `plot_date`, and any custom date tickers or locators you create.

A wide range of specific and general purpose date tick locators and formatters are provided in this module. See `matplotlib.ticker` for general information on tick locators and formatters. These are described below.

The `dateutil` module provides additional code to handle date ticking, making it easy to place ticks on any kinds of dates. See examples below.

## 18.21.2 Date tickers

Most of the date tickers can locate single or multiple values. For example:

```
# import constants for the days of the week
from matplotlib.dates import MO, TU, WE, TH, FR, SA, SU

# tick on Mondays every week
loc = WeekdayLocator(byweekday=MO, tz=tz)

# tick on Mondays and Saturdays
loc = WeekdayLocator(byweekday=(MO, SA))
```

In addition, most of the constructors take an interval argument:

```
# tick on Mondays every second week
loc = WeekdayLocator(byweekday=MO, interval=2)
```

The rrule locator allows completely general date ticking:

```
# tick every 5th easter
rule = rrulewrapper(YEARLY, byeaster=1, interval=5)
loc = RRuleLocator(rule)
```

The available date tickers are:

- *MicrosecondLocator*: Locate microseconds.
- *SecondLocator*: Locate seconds.
- *MinuteLocator*: Locate minutes.
- *HourLocator*: Locate hours.
- *DayLocator*: Locate specified days of the month.
- *WeekdayLocator*: Locate days of the week, e.g., MO, TU.
- *MonthLocator*: Locate months, e.g., 7 for July.
- *YearLocator*: Locate years that are multiples of base.
- *RRuleLocator*: Locate using a `matplotlib.dates.rrulewrapper`. `rrulewrapper` is a simple wrapper around `dateutil's dateutil.rrule` which allow almost arbitrary date tick specifications. See `rrule` example.
- *AutoDateLocator*: On autoscale, this class picks the best *DateLocator* (e.g., *RRuleLocator*) to set the view limits and the tick locations. If called with `interval_multiples=True` it will make ticks line up with sensible multiples of the tick intervals. E.g. if the interval is 4 hours, it will pick hours 0, 4, 8, etc as ticks. This behaviour is not guaranteed by default.

### 18.21.3 Date formatters

The available date formatters are:

- *AutoDateFormatter*: attempts to figure out the best format to use. This is most useful when used with the *AutoDateLocator*.
- *ConciseDateFormatter*: also attempts to figure out the best format to use, and to make the format as compact as possible while still having complete date information. This is most useful when used with the *AutoDateLocator*.
- *DateFormatter*: use `strftime` format strings.
- *IndexDateFormatter*: date plots with implicit x indexing.

`matplotlib.dates.datestr2num(d, default=None)`

Convert a date string to a datenum using `dateutil.parser.parse`.

#### Parameters

**d** [str or sequence of str] The dates to convert.

**default** [datetime.datetime, optional] The default date to use when fields are missing in *d*.

`matplotlib.dates.date2num(d)`

Convert datetime objects to Matplotlib dates.

#### Parameters

**d** [datetime.datetime or numpy.datetime64 or sequences of these]

## Returns

**float or sequence of floats** Number of days since the epoch. See `get_epoch` for the epoch, which can be changed by `rcParams["date.epoch"]` (default: '1970-01-01T00:00:00') or `set_epoch`. If the epoch is "1970-01-01T00:00:00" (default) then noon Jan 1 1970 ("1970-01-01T12:00:00") returns 0.5.

## Notes

The Gregorian calendar is assumed; this is not universal practice. For details see the module docstring.

`matplotlib.dates.num2date(x, tz=None)`

Convert Matplotlib dates to `datetime` objects.

## Parameters

- x** [float or sequence of floats] Number of days (fraction part represents hours, minutes, seconds) since the epoch. See `get_epoch` for the epoch, which can be changed by `rcParams["date.epoch"]` (default: '1970-01-01T00:00:00') or `set_epoch`.
- tz** [str, optional] Timezone of x (defaults to `rcParams["timezone"]` (default: 'UTC')).

## Returns

`datetime` or **sequence of `datetime`** Dates are returned in timezone `tz`.

If x is a sequence, a sequence of `datetime` objects will be returned.

## Notes

The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

`matplotlib.dates.num2timedelta(x)`

Convert number of days to a `timedelta` object.

If x is a sequence, a sequence of `timedelta` objects will be returned.

## Parameters

- x** [float, sequence of floats] Number of days. The fraction part represents hours, minutes, seconds.

## Returns

`datetime.timedelta` or **list[`datetime.timedelta`]**

`matplotlib.dates.drange(dstart, dend, delta)`

Return a sequence of equally spaced Matplotlib dates.

The dates start at `dstart` and reach up to, but not including `dend`. They are spaced by `delta`.

## Parameters

- dstart, dend** [`datetime`] The date limits.

**delta** [`datetime.timedelta`] Spacing of the dates.

### Returns

`numpy.array` A list floats representing Matplotlib dates.

`matplotlib.dates.epoch2num(e)`

[*Deprecated*] Convert an epoch or sequence of epochs to the new date format, that is days since 0001.

### Notes

Deprecated since version 3.3.

`matplotlib.dates.num2epoch(d)`

[*Deprecated*] Convert days since 0001 to epoch. *d* can be a number or sequence.

### Notes

Deprecated since version 3.3.

`matplotlib.dates.mx2num(mxdates)`

[*Deprecated*] Convert *mx* `datetime` instance (or sequence of *mx* instances) to the new date format.

### Notes

Deprecated since version 3.2.

`matplotlib.dates.set_epoch(epoch)`

Set the epoch (origin for dates) for `datetime` calculations.

The default epoch is `rcParams["dates.epoch"]` (by default 1970-01-01T00:00).

If microsecond accuracy is desired, the date being plotted needs to be within approximately 70 years of the epoch. Matplotlib internally represents dates as days since the epoch, so floating point dynamic range needs to be within a factor of  $2^{52}$ .

`set_epoch` must be called before any dates are converted (i.e. near the import section) or a `RuntimeError` will be raised.

See also `/gallery/ticks_and_spines/date_precision_and_epochs`.

### Parameters

**epoch** [`str`] valid UTC date parsable by `numpy.datetime64` (do not include timezone).

`matplotlib.dates.get_epoch()`

Get the epoch used by `dates`.

### Returns

**epoch: str** String for the epoch (parsable by `numpy.datetime64`).

`class matplotlib.dates.DateFormatter(fmt, tz=None)`

Bases: `matplotlib.ticker.Formatter`

Format a tick (in days since the epoch) with a `strftime` format string.

## Parameters

**fmt** [str] `strftime` format string

**tz** [`datetime.tzinfo`, default: `rcParams["timezone"]` (default: 'UTC')] Ticks timezone.

property `illegal_s`

`set_tzinfo(self, tz)`

```
class matplotlib.dates.ConciseDateFormatter(locator, tz=None, formats=None, offset_formats=None, zero_formats=None, show_offset=True)
```

Bases: `matplotlib.ticker.Formatter`

A `Formatter` which attempts to figure out the best format to use for the date, and to make it as compact as possible, but still be complete. This is most useful when used with the `AutoDateLocator`:

```
>>> locator = AutoDateLocator()
>>> formatter = ConciseDateFormatter(locator)
```

## Parameters

**locator** [`ticker.Locator`] Locator that this axis is using.

**tz** [str, optional] Passed to `dates.date2num`.

**formats** [list of 6 strings, optional] Format strings for 6 levels of tick labelling: mostly years, months, days, hours, minutes, and seconds. Strings use the same format codes as `strftime`. Default is ['%Y', '%b', '%d', '%H:%M', '%H:%M', '%S.%f']

**zero\_formats** [list of 6 strings, optional] Format strings for tick labels that are "zeros" for a given tick level. For instance, if most ticks are months, ticks around 1 Jan 2005 will be labeled "Dec", "2005", "Feb". The default is ['', '%Y', '%b', '%b-%d', '%H:%M', '%H:%M']

**offset\_formats** [list of 6 strings, optional] Format strings for the 6 levels that is applied to the "offset" string found on the right side of an x-axis, or top of a y-axis. Combined with the tick labels this should completely specify the date. The default is:

```
['', '%Y', '%Y-%b', '%Y-%b-%d', '%Y-%b-%d', '%Y-%b-%d %H:%M']
```

**show\_offset** [bool, default: True] Whether to show the offset or not.

## Examples

See `/gallery/ticks_and_spines/date_concise_formatter`

Autoformat the date labels. The default format is used to form an initial string, and then redundant elements are removed.

`format_data_short(self, value)`

Return a short string version of the tick value.

Defaults to the position-independent long value.

`format_ticks(self, values)`

Return the tick labels for all the ticks at once.

`get_offset(self)`

`class matplotlib.dates.IndexDateFormatter(t, fmt, tz=None)`

Bases: `matplotlib.ticker.Formatter`

[*Deprecated*] Use with `IndexLocator` to cycle format strings by index.

### Notes

Deprecated since version 3.3.

### Parameters

**t** [list of float] A sequence of dates (floating point days).

**fmt** [str] A `strftime` format string.

`class matplotlib.dates.AutoDateFormatter(locator, tz=None, defaultfmt='%Y-%m-%d')`

Bases: `matplotlib.ticker.Formatter`

A `Formatter` which attempts to figure out the best format to use. This is most useful when used with the `AutoDateLocator`.

The `AutoDateFormatter` has a scale dictionary that maps the scale of the tick (the distance in days between one major tick) and a format string. The default looks like this:

```

self.scaled = {
    DAYS_PER_YEAR: rcParams['date.autoformat.year'],
    DAYS_PER_MONTH: rcParams['date.autoformat.month'],
    1.0: rcParams['date.autoformat.day'],
    1. / HOURS_PER_DAY: rcParams['date.autoformat.hour'],
    1. / (MINUTES_PER_DAY): rcParams['date.autoformat.minute'],
    1. / (SEC_PER_DAY): rcParams['date.autoformat.second'],
    1. / (MUSECONDS_PER_DAY): rcParams['date.autoformat.microsecond'],
}

```

The algorithm picks the key in the dictionary that is  $\geq$  the current scale and uses that format string. You can customize this dictionary by doing:

```

>>> locator = AutoDateLocator()
>>> formatter = AutoDateFormatter(locator)
>>> formatter.scaled[1/(24.*60.)] = '%M:%S' # only show min and sec

```

A custom *FuncFormatter* can also be used. The following example shows how to use a custom format function to strip trailing zeros from decimal seconds and adds the date to the first ticklabel:

```

>>> def my_format_function(x, pos=None):
...     x = matplotlib.dates.num2date(x)
...     if pos == 0:
...         fmt = '%D %H:%M:%S.%f'
...     else:
...         fmt = '%H:%M:%S.%f'
...     label = x.strftime(fmt)
...     label = label.rstrip("0")
...     label = label.rstrip(".")
...     return label
>>> from matplotlib.ticker import FuncFormatter
>>> formatter.scaled[1/(24.*60.)] = FuncFormatter(my_format_function)

```

Autoformat the date labels. The default format is the one to use if none of the values in `self.scaled` are greater than the unit returned by `locator._get_unit()`.

```

class matplotlib.dates.DateLocator(tz=None)
    Bases: matplotlib.ticker.Locator

```

Determines the tick locations when plotting dates.

This class is subclassed by other Locators and is not meant to be used on its own.

### Parameters

**tz** [*datetime.tzinfo*]

**datalim\_to\_dt**(*self*)

Convert axis data interval to datetime objects.

**hms0d** = {'byhour': 0, 'byminute': 0, 'bysecond': 0}

**nonsingular**(*self*, *vmin*, *vmax*)

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of  $\sim 0$ ).

**set\_tzinfo**(*self*, *tz*)

Set time zone info.

```
viewlim_to_dt(self)
```

Convert the view interval to datetime objects.

```
class matplotlib.dates.RRuleLocator(o, tz=None)
```

Bases: *matplotlib.dates.DateLocator*

### Parameters

**tz** [*datetime.tzinfo*]

```
autoscale(self)
```

[*Deprecated*] Set the view limits to include the data range.

### Notes

Deprecated since version 3.2.

```
static get_unit_generic(freq)
```

```
tick_values(self, vmin, vmax)
```

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the **vmin** and **vmax** values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

```
class matplotlib.dates.AutoDateLocator(tz=None, minticks=5, maxticks=None, interval_multiples=True)
```

Bases: *matplotlib.dates.DateLocator*

On autoscale, this class picks the best *DateLocator* to set the view limits and the tick locations.

### Attributes

**intervald** [dict] Mapping of tick frequencies to multiples allowed for that ticking. The default is

```
self.intervald = {
    YEARLY : [1, 2, 4, 5, 10, 20, 40, 50, 100, 200, 400, 500,
              1000, 2000, 4000, 5000, 10000],
    MONTHLY : [1, 2, 3, 4, 6],
    DAILY : [1, 2, 3, 7, 14, 21],
    HOURLY : [1, 2, 3, 4, 6, 12],
    MINUTELY : [1, 5, 10, 15, 30],
    SECONDLY : [1, 5, 10, 15, 30],
    MICROSECONDLY : [1, 2, 5, 10, 20, 50, 100, 200, 500,
                     1000, 2000, 5000, 10000, 20000, 50000,
                     100000, 200000, 500000, 1000000],
}
```

where the keys are defined in `dateutil.rrule`.

The interval is used to specify multiples that are appropriate for the frequency of ticking. For instance, every 7 days is sensible for daily ticks, but for minutes/seconds, 15 or 30 make sense.

When customizing, you should only modify the values for the existing keys. You should not add or delete entries.

Example for forcing ticks every 3 hours:

```
locator = AutoDateLocator()
locator.intervald[HOURLY] = [3]  # only show every 3 hours
```

## Parameters

**tz** [`datetime.tzinfo`] Ticks timezone.

**minticks** [int] The minimum number of ticks desired; controls whether ticks occur yearly, monthly, etc.

**maxticks** [int] The maximum number of ticks desired; controls the interval between ticks (ticking every other, every 3, etc.). For fine-grained control, this can be a dictionary mapping individual rrule frequency constants (YEARLY, MONTHLY, etc.) to their own maximum number of ticks. This can be used to keep the number of ticks appropriate to the format chosen in *AutoDateFormatter*. Any frequency not specified in this dictionary is given a default value.

**interval\_multiples** [bool, default: True] Whether ticks should be chosen to be multiple of the interval, locking them to 'nicer' locations. For example, this will force the ticks to be at hours 0, 6, 12, 18 when hourly ticking is done at 6 hour intervals.

`autoscale(self)`

[*Deprecated*] Try to choose the view limits intelligently.

## Notes

Deprecated since version 3.2.

`get_locator(self, dmin, dmax)`

Pick the best locator based on a distance.

`nonsingular(self, vmin, vmax)`

Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of  $\sim 0$ ).

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```
class matplotlib.dates.YearLocator(base=1, month=1, day=1, tz=None)
```

Bases: `matplotlib.dates.DateLocator`

Make ticks on a given day of each year that is a multiple of base.

Examples:

```
# Tick every year on Jan 1st
locator = YearLocator()

# Tick every 5 years on July 4th
locator = YearLocator(5, month=7, day=4)
```

Mark years that are multiple of base on a given month and day (default jan 1).

```
autoscale(self)
```

[*Deprecated*] Set the view limits to include the data range.

### Notes

Deprecated since version 3.2.

```
tick_values(self, vmin, vmax)
```

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

```
class matplotlib.dates.MonthLocator(bymonth=None, bymonthday=1, interval=1,
                                     tz=None)
```

Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurrences of each month, e.g., 1, 3, 12.

Mark every month in *bymonth*; *bymonth* can be an int or sequence. Default is range(1, 13), i.e. every month.

*interval* is the interval between each iteration. For example, if interval=2, mark every second occurrence.

```
class matplotlib.dates.WeekdayLocator(byweekday=1, interval=1, tz=None)
```

Bases: `matplotlib.dates.RRuleLocator`

Make ticks on occurrences of each weekday.

Mark every weekday in *byweekday*; *byweekday* can be a number or sequence.

Elements of *byweekday* must be one of MO, TU, WE, TH, FR, SA, SU, the constants from `dateutil.rrule`, which have been imported into the `matplotlib.dates` namespace.

*interval* specifies the number of weeks to skip. For example, interval=2 plots every second week.

---

```
class matplotlib.dates.DayLocator(bymonthday=None, interval=1, tz=None)
```

Bases: [matplotlib.dates.RRuleLocator](#)

Make ticks on occurrences of each day of the month. For example, 1, 15, 30.

Mark every day in *bymonthday*; *bymonthday* can be an int or sequence.

Default is to tick every day of the month: *bymonthday*=range(1, 32).

```
class matplotlib.dates.HourLocator(byhour=None, interval=1, tz=None)
```

Bases: [matplotlib.dates.RRuleLocator](#)

Make ticks on occurrences of each hour.

Mark every hour in *byhour*; *byhour* can be an int or sequence. Default is to tick every hour: *byhour*=range(24)

*interval* is the interval between each iteration. For example, if *interval*=2, mark every second occurrence.

```
class matplotlib.dates.MinuteLocator(byminute=None, interval=1, tz=None)
```

Bases: [matplotlib.dates.RRuleLocator](#)

Make ticks on occurrences of each minute.

Mark every minute in *byminute*; *byminute* can be an int or sequence. Default is to tick every minute: *byminute*=range(60)

*interval* is the interval between each iteration. For example, if *interval*=2, mark every second occurrence.

```
class matplotlib.dates.SecondLocator(bysecond=None, interval=1, tz=None)
```

Bases: [matplotlib.dates.RRuleLocator](#)

Make ticks on occurrences of each second.

Mark every second in *bysecond*; *bysecond* can be an int or sequence. Default is to tick every second: *bysecond* = range(60)

*interval* is the interval between each iteration. For example, if *interval*=2, mark every second occurrence.

```
class matplotlib.dates.MicrosecondLocator(interval=1, tz=None)
```

Bases: [matplotlib.dates.DateLocator](#)

Make ticks on regular intervals of one or more microsecond(s).

---

**Note:** By default, Matplotlib uses a floating point representation of time in days since the epoch, so plotting data with microsecond time resolution does not work well for dates that are far (about 70 years) from the epoch (check with [get\\_epoch](#)).

If you want sub-microsecond resolution time plots, it is strongly recommended to use floating point seconds, not datetime-like time representation.

If you really must use `datetime.datetime()` or similar and still need microsecond precision, change the time origin via [dates.set\\_epoch](#) to something closer to the dates being plotted. See [/gallery/ticks\\_and\\_spines/date\\_precision\\_and\\_epochs](#).

---

*interval* is the interval between each iteration. For example, if *interval*=2, mark every second microsecond.

`set_axis(self, axis)`

```
set_data_interval(self, vmin, vmax)
```

```
set_view_interval(self, vmin, vmax)
```

```
tick_values(self, vmin, vmax)
```

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

```
class matplotlib.dates.rrule(freq, dtstart=None, interval=1, wkst=None,
                             count=None, until=None, bysetpos=None, by-
                             month=None, bymonthday=None, byyearday=None,
                             byeaster=None, byweekno=None, byweekday=None,
                             byhour=None, byminute=None, bysecond=None,
                             cache=False)
```

Bases: `dateutil.rrule.rrulebase`

That's the base of the `rrule` operation. It accepts all the keywords defined in the RFC as its constructor parameters (except `byday`, which was renamed to `byweekday`) and more. The constructor prototype is:

```
rrule(freq)
```

Where `freq` must be one of `YEARLY`, `MONTHLY`, `WEEKLY`, `DAILY`, `HOURLY`, `MINUTELY`, or `SECONDLY`.

---

**Note:** Per RFC section 3.3.10, recurrence instances falling on invalid dates and times are ignored rather than coerced:

Recurrence rules may generate recurrence instances with an invalid date (e.g., February 30) or nonexistent local time (e.g., 1:30 AM on a day where the local time is moved forward by an hour at 1:00 AM). Such recurrence instances **MUST** be ignored and **MUST NOT** be counted as part of the recurrence set.

This can lead to possibly surprising behavior when, for example, the start date occurs at the end of the month:

```
>>> from dateutil.rrule import rrule, MONTHLY
>>> from datetime import datetime
>>> start_date = datetime(2014, 12, 31)
>>> list(rrule(freq=MONTHLY, count=4, dtstart=start_date))
...
[datetime.datetime(2014, 12, 31, 0, 0),
 datetime.datetime(2015, 1, 31, 0, 0),
 datetime.datetime(2015, 3, 31, 0, 0),
 datetime.datetime(2015, 5, 31, 0, 0)]
```

---

Additionally, it supports the following keyword arguments:

### Parameters

- **dtstart** - The recurrence start. Besides being the base for the recurrence, missing parameters in the final recurrence instances will also be extracted from this date. If not given, `datetime.now()` will be used instead.
- **interval** - The interval between each freq iteration. For example, when using YEARLY, an interval of 2 means once every two years, but with HOURLY, it means once every two hours. The default interval is 1.
- **wkst** - The week start day. Must be one of the MO, TU, WE constants, or an integer, specifying the first day of the week. This will affect recurrences based on weekly periods. The default week start is got from `calendar.firstweekday()`, and may be modified by `calendar.setfirstweekday()`.
- **count** - If given, this determines how many occurrences will be generated.

---

**Note:** As of version 2.5.0, the use of the keyword `until` in conjunction with `count` is deprecated, to make sure `dateutil` is fully compliant with [RFC-5545 Sec. 3.3.10](#). Therefore, `until` and `count` **must not** occur in the same call to `rrule`.

---

- **until** - If given, this must be a datetime instance specifying the upper-bound limit of the recurrence. The last recurrence in the rule is the greatest datetime that is less than or equal to the value specified in the `until` parameter.

---

**Note:** As of version 2.5.0, the use of the keyword `until` in conjunction with `count` is deprecated, to make sure `dateutil` is fully compliant with [RFC-5545 Sec. 3.3.10](#). Therefore, `until` and `count` **must not** occur in the same call to `rrule`.

---

- **bysetpos** - If given, it must be either an integer, or a sequence of integers, positive or negative. Each given integer will specify an occurrence number, corresponding to the nth occurrence of the rule inside the frequency period. For example, a `bysetpos` of -1 if combined with a MONTHLY frequency, and a `byweekday` of (MO, TU, WE, TH, FR), will result in the last work day of every month.
- **bymonth** - If given, it must be either an integer, or a sequence of integers, meaning the months to apply the recurrence to.
- **bymonthday** - If given, it must be either an integer, or a sequence of integers, meaning the month days to apply the recurrence to.
- **byyearday** - If given, it must be either an integer, or a sequence of integers, meaning the year days to apply the recurrence to.
- **byeaster** - If given, it must be either an integer, or a sequence of integers, positive or negative. Each integer will define an offset from the Easter Sunday. Passing the offset 0 to `byeaster` will yield the Easter Sunday itself. This is an extension to the RFC specification.
- **byweekno** - If given, it must be either an integer, or a sequence of integers, meaning the week numbers to apply the recurrence to. Week numbers

have the meaning described in ISO8601, that is, the first week of the year is that containing at least four days of the new year.

- **byweekday** – If given, it must be either an integer (0 == MO), a sequence of integers, one of the weekday constants (MO, TU, etc), or a sequence of these constants. When given, these variables will define the weekdays where the recurrence will be applied. It's also possible to use an argument *n* for the weekday instances, which will mean the *n*th occurrence of this weekday in the period. For example, with MONTHLY, or with YEARLY and BYMONTH, using FR(+1) in byweekday will specify the first friday of the month where the recurrence happens. Notice that in the RFC documentation, this is specified as BYDAY, but was renamed to avoid the ambiguity of that keyword.
- **byhour** – If given, it must be either an integer, or a sequence of integers, meaning the hours to apply the recurrence to.
- **byminute** – If given, it must be either an integer, or a sequence of integers, meaning the minutes to apply the recurrence to.
- **bysecond** – If given, it must be either an integer, or a sequence of integers, meaning the seconds to apply the recurrence to.
- **cache** – If given, it must be a boolean value specifying to enable or disable caching of results. If you will use the same rrule instance multiple times, enabling caching will improve the performance considerably.

`replace(self, **kwargs)`

Return new rrule with same attributes except for those attributes given new values by whichever keyword arguments are specified.

```
class matplotlib.dates.relativedelta(dt1=None, dt2=None, years=0, months=0,
                                     days=0, leapdays=0, weeks=0, hours=0,
                                     minutes=0, seconds=0, microseconds=0,
                                     year=None, month=None, day=None, week-
                                     day=None, yearday=None, nlyearday=None,
                                     hour=None, minute=None, second=None, mi-
                                     crosecond=None)
```

Bases: `object`

The `relativedelta` type is designed to be applied to an existing datetime and can replace specific components of that datetime, or represents an interval of time.

It is based on the specification of the excellent work done by M.-A. Lemburg in his `mx.DateTime` extension. However, notice that this type does *NOT* implement the same algorithm as his work. Do *NOT* expect it to behave like `mx.DateTime`'s counterpart.

There are two different ways to build a `relativedelta` instance. The first one is passing it two date/datetime classes:

```
relativedelta(datetime1, datetime2)
```

The second one is passing it any number of the following keyword arguments:

```
relativedelta(arg1=x, arg2=y, arg3=z...)
```

`year, month, day, hour, minute, second, microsecond:`

Absolute information (argument **is** singular); adding **or** subtracting a `relativedelta` **with** absolute information does **not** perform an arithmetic

(continues on next page)

(continued from previous page)

operation, but rather REPLACES the corresponding value in the original datetime with the value(s) in relativedelta.

years, months, weeks, days, hours, minutes, seconds, microseconds:

Relative information, may be negative (argument is plural); adding or subtracting a relativedelta with relative information performs the corresponding arithmetic operation on the original datetime value with the information in the relativedelta.

weekday:

One of the weekday instances (MO, TU, etc) available in the relativedelta module. These instances may receive a parameter N, specifying the Nth weekday, which could be positive or negative (like MO(+1) or MO(-2)). Not specifying it is the same as specifying +1. You can also use an integer, where 0=MO. This argument is always relative e.g. if the calculated date is already Monday, using MO(1) or MO(-1) won't change the day. To effectively make it absolute, use it in combination with the day argument (e.g. day=1, MO(1) for first Monday of the month).

leapdays:

Will add given days to the date found, if year is a leap year, and the date found is post 28 of february.

yearday, nlyearday:

Set the yearday or the non-leap year day (jump leap days). These are converted to day/month/leapdays information.

There are relative and absolute forms of the keyword arguments. The plural is relative, and the singular is absolute. For each argument in the order below, the absolute form is applied first (by setting each attribute to that value) and then the relative form (by adding the value to the attribute).

The order of attributes considered when this relativedelta is added to a datetime is:

1. Year
2. Month
3. Day
4. Hours
5. Minutes
6. Seconds
7. Microseconds

Finally, weekday is applied, using the rule described above.

For example

```
>>> from datetime import datetime
>>> from dateutil.relativedelta import relativedelta, MO
>>> dt = datetime(2018, 4, 9, 13, 37, 0)
>>> delta = relativedelta(hours=25, day=1, weekday=MO(1))
>>> dt + delta
datetime.datetime(2018, 4, 2, 14, 37)
```

First, the day is set to 1 (the first of the month), then 25 hours are added, to get to the 2nd day and 14th hour, finally the weekday is applied, but since the 2nd is already a Monday there is no effect.

`normalized(self)`

Return a version of this object represented entirely using integer values for the relative attributes.

```
>>> relativedelta(days=1.5, hours=2).normalized()
relativedelta(days=+1, hours=+14)
```

**Returns** Returns a `dateutil.relativedelta.relativedelta` object.

property weeks

`class matplotlib.dates.DateConverter`

Bases: `matplotlib.units.ConversionInterface`

Converter for `datetime.date` and `datetime.datetime` data, or for date/time data represented as it would be converted by `date2num`.

The 'unit' tag for such data is None or a tzinfo instance.

`static axisinfo(unit, axis)`

Return the `AxisInfo` for `unit`.

`unit` is a tzinfo instance or None. The `axis` argument is required but not used.

`static convert(value, unit, axis)`

If `value` is not already a number or sequence of numbers, convert it with `date2num`.

The `unit` and `axis` arguments are not used.

`static default_units(x, axis)`

Return the tzinfo instance of `x` or of its first element, or None

`class matplotlib.dates.ConciseDateConverter(formats=None, zero_formats=None, offset_formats=None, show_offset=True)`

Bases: `matplotlib.dates.DateConverter`

`axisinfo(self, unit, axis)`

Return the `AxisInfo` for `unit`.

`unit` is a tzinfo instance or None. The `axis` argument is required but not used.

## 18.22 matplotlib.dviread

A module for reading dvi files output by TeX. Several limitations make this not (currently) useful as a general-purpose dvi preprocessor, but it is currently used by the pdf backend for processing usetex text.

Interface:

```
with Dvi(filename, 72) as dvi:
    # iterate over pages:
    for page in dvi:
        w, h, d = page.width, page.height, page.descent
        for x, y, font, glyph, width in page.text:
```

(continues on next page)

(continued from previous page)

```

        fontname = font.texname
        pointsize = font.size
        ...
    for x, y, height, width in page.bboxes:
        ...

```

```
class matplotlib.dviread.Dvi(filename, dpi)
```

Bases: `object`

A reader for a dvi ("device-independent") file, as produced by TeX. The current implementation can only iterate through pages in order, and does not even attempt to verify the postamble.

This class can be used as a context manager to close the underlying file upon exit. Pages can be read via iteration. Here is an overly simple way to extract text without trying to detect whitespace:

```

>>> with matplotlib.dviread.Dvi('input.dvi', 72) as dvi:
...     for page in dvi:
...         print(''.join(chr(t.glyph) for t in page.text))

```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use `None` to return TeX's internal units.

```
close(self)
```

Close the underlying file if it is open.

```
class matplotlib.dviread.DviFont(scale, tfm, texname, vf)
```

Bases: `object`

Encapsulation of a font that a DVI file can refer to.

This class holds a font's texname and size, supports comparison, and knows the widths of glyphs in the same units as the AFM file. There are also internal attributes (for use by `dviread.py`) that are *not* used for comparison.

The size is in Adobe points (converted from TeX points).

### Parameters

**scale** [float] Factor by which the font is scaled from its natural size.

**tfm** [Tfm] TeX font metrics for this font

**texname** [bytes] Name of the font as used internally by TeX and friends, as an ASCII bytestring. This is usually very different from any external font names, and `dviread.PsfontsMap` can be used to find the external name of the font.

**vf** [Vf] A TeX "virtual font" file, or `None` if this font is not virtual.

### Attributes

**texname** [bytes]

**size** [float] Size of the font in Adobe points, converted from the slightly smaller TeX points.

**widths** [list] Widths of glyphs in glyph-space units, typically 1/1000ths of the point size.

size  
texname  
widths

```
class matplotlib.dviread.Encoding(filename)
```

Bases: `object`

[*Deprecated*] Parse a \*.enc file referenced from a psfonts.map style file.

The format this class understands is a very limited subset of PostScript.

Usage (subject to change):

```
for name in Encoding(filename):  
    whatever(name)
```

### Parameters

**filename** [str or path-like]

### Notes

Deprecated since version 3.3.

### Attributes

**encoding** [list] List of character names

encoding

```
class matplotlib.dviread.PsFont(texname, psname, effects, encoding, filename)
```

Bases: `tuple`

Create new instance of PsFont(texname, psname, effects, encoding, filename)

effects

Alias for field number 2

encoding

Alias for field number 3

filename

Alias for field number 4

psname

Alias for field number 1

texname

Alias for field number 0

```
class matplotlib.dviread.PsfontsMap
```

Bases: `object`

A psfonts.map formatted file, mapping TeX fonts to PS fonts.

### Parameters

**filename** [str or path-like]

## Notes

For historical reasons, TeX knows many Type-1 fonts by different names than the outside world. (For one thing, the names have to fit in eight characters.) Also, TeX's native fonts are not Type-1 but Metafont, which is nontrivial to convert to PostScript except as a bitmap. While high-quality conversions to Type-1 format exist and are shipped with modern TeX distributions, we need to know which Type-1 fonts are the counterparts of which native fonts. For these reasons a mapping is needed from internal font names to font file names.

A texmf tree typically includes mapping files called e.g. `psfonts.map`, `pdftex.map`, or `dvipdfm.map`. The file `psfonts.map` is used by `dvips`, `pdftex.map` by `pdfTeX`, and `dvipdfm.map` by `dvipdfm`. `psfonts.map` might avoid embedding the 35 PostScript fonts (i.e., have no filename for them, as in the Times-Bold example above), while the pdf-related files perhaps only avoid the "Base 14" pdf fonts. But the user may have configured these files differently.

## Examples

```
>>> map = PsfontsMap(find_tex_file('pdftex.map'))
>>> entry = map[b'ptmbo8r']
>>> entry.texname
b'ptmbo8r'
>>> entry.psname
b'Times-Bold'
>>> entry.encoding
'/usr/local/texlive/2008/texmf-dist/fonts/enc/dvips/base/8r.enc'
>>> entry.effects
{'slant': 0.16700000000000001}
>>> entry.filename
```

```
class matplotlib.dviread.Tfm(filename)
```

Bases: `object`

A TeX Font Metric file.

This implementation covers only the bare minimum needed by the Dvi class.

### Parameters

**filename** [str or path-like]

### Attributes

**checksum** [int] Used for verifying against the dvi file.

**design\_size** [int] Design size of the font (unknown units)

**width, height, depth** [dict] Dimensions of each character, need to be scaled by the factor specified in the dvi file. These are dicts because indexing may not start from 0.

checksum

depth

design\_size

height

width

class matplotlib.dviread.Vf(*filename*)

Bases: *matplotlib.dviread.Dvi*

A virtual font (\*.vf file) containing subroutines for dvi files.

### Parameters

**filename** [str or path-like]

### Notes

The virtual font format is a derivative of dvi: <http://mirrors.ctan.org/info/knuth/virtual-fonts> This class reuses some of the machinery of *Dvi* but replaces the `_read` loop and dispatch mechanism.

### Examples

```
vf = Vf(filename)
glyph = vf[code]
glyph.text, glyph.bboxes, glyph.width
```

Read the data from the file named *filename* and convert TeX's internal units to units of *dpi* per inch. *dpi* only sets the units and does not limit the resolution. Use None to return TeX's internal units.

matplotlib.dviread.find\_tex\_file(*filename*, *format=None*)

Find a file in the texmf tree.

Calls `kpsewhich` which is an interface to the `kpathsea` library [1]. Most existing TeX distributions on Unix-like systems use `kpathsea`. It is also available as part of MikTeX, a popular distribution on Windows.

*If the file is not found, an empty string is returned.*

### Parameters

**filename** [str or path-like]

**format** [str or bytes] Used as the value of the `--format` option to `kpsewhich`. Could be e.g. 'tfm' or 'vf' to limit the search to that type of files.

### References

## 18.23 matplotlib.figure

*matplotlib.figure* implements the following classes:

*Figure* Top level *Artist*, which holds all plot elements.

*SubplotParams* Control the default spacing between subplots.

### 18.23.1 Classes

<i>AxesStack</i>	[ <i>Deprecated</i> ]
<i>Figure</i>	The top level container for all the plot elements.
<i>SubplotParams</i>	A class to hold the parameters for a subplot.

#### matplotlib.figure.AxesStack

```
class matplotlib.figure.AxesStack
    Bases: matplotlib.figure._AxesStack
    [Deprecated]
```

#### Notes

Deprecated since version 3.2:

```
__init__(self)
__module__ = 'matplotlib.figure'
```

#### Examples using matplotlib.figure.AxesStack

#### matplotlib.figure.Figure

```
class matplotlib.figure.Figure(figsize=None, dpi=None, facecolor=None, edge-
                               color=None, linewidth=0.0, frameon=None,
                               subplotpars=None, tight_layout=None, con-
                               strained_layout=None)
    Bases: matplotlib.artist.Artist
```

The top level container for all the plot elements.

The Figure instance supports callbacks through a *callbacks* attribute which is a *CallbackRegistry* instance. The events you can connect to are 'dpi\_changed', and the callback will be called with func(fig) where fig is the *Figure* instance.

#### Attributes

**patch** The *Rectangle* instance representing the figure background patch.

**suppressComposite** For multiple figure images, the figure will make composite images depending on the renderer option *image\_nocomposite* function. If *suppressComposite* is a boolean, this will override the renderer.

#### Parameters

**figsize** [2-tuple of floats, default: `rcParams["figure.figsize"]` (default: [6.4, 4.8])] Figure dimension (width, height) in inches.

**dpi** [float, default: `rcParams["figure.dpi"]` (default: 100.0)] Dots per inch.

**facecolor** [default: `rcParams["figure.facecolor"]` (default: 'white')] The figure patch facecolor.

**edgecolor** [default: `rcParams["figure.edgecolor"]` (default: 'white')] The figure patch edge color.

**linewidth** [float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

**frameon** [bool, default: `rcParams["figure.frameon"]` (default: True)] If False, suppress drawing the figure background patch.

**subplotpars** [*SubplotParams*] Subplot parameters. If not given, the default subplot parameters `rcParams["figure.subplot.*"]` are used.

**tight\_layout** [bool or dict, default: `rcParams["figure.autolayout"]` (default: False)] If False use *subplotpars*. If True adjust subplot parameters using *tight\_layout* with default padding. When providing a dict containing the keys *pad*, *w\_pad*, *h\_pad*, and *rect*, the default *tight\_layout* paddings will be overridden.

**constrained\_layout** [bool, default: `rcParams["figure.constrained_layout.use"]` (default: False)] If True use constrained layout to adjust positioning of plot elements. Like *tight\_layout*, but designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with *add\_subplot* or *subplot2grid*.)

`__getstate__(self)`

`__init__(self, figsize=None, dpi=None, facecolor=None, edgecolor=None, linewidth=0.0, frameon=None, subplotpars=None, tight_layout=None, constrained_layout=None)`

### Parameters

**figsize** [2-tuple of floats, default: `rcParams["figure.figsize"]` (default: [6.4, 4.8])] Figure dimension (width, height) in inches.

**dpi** [float, default: `rcParams["figure.dpi"]` (default: 100.0)] Dots per inch.

**facecolor** [default: `rcParams["figure.facecolor"]` (default: 'white')] The figure patch facecolor.

**edgecolor** [default: `rcParams["figure.edgecolor"]` (default: 'white')] The figure patch edge color.

**linewidth** [float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

**frameon** [bool, default: `rcParams["figure.frameon"]` (default: True)] If False, suppress drawing the figure background patch.

**subplotpars** [*SubplotParams*] Subplot parameters. If not given, the default subplot parameters `rcParams["figure.subplot.*"]` are used.

**tight\_layout** [bool or dict, default: `rcParams["figure.autolayout"]` (default: False)] If False use *subplotpars*. If True adjust subplot parameters using *tight\_layout* with default padding. When providing a dict containing the keys *pad*, *w\_pad*, *h\_pad*, and *rect*, the default *tight\_layout* paddings will be overridden.

**constrained\_layout** [bool, default: `rcParams["figure.constrained_layout.use"]` (default: False)] If True use constrained layout to adjust positioning of plot elements. Like *tight\_layout*, but

designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with `add_subplot` or `subplot2grid`.)

```
__module__ = 'matplotlib.figure'
```

```
__repr__(self)
    Return repr(self).
```

```
__setstate__(self, state)
```

```
__str__(self)
    Return str(self).
```

```
add_artist(self, artist, clip=False)
    Add an Artist to the figure.
```

Usually artists are added to axes objects using `Axes.add_artist`; this method can be used in the rare cases where one needs to add artists directly to the figure instead.

### Parameters

**artist** [*Artist*] The artist to add to the figure. If the added artist has no transform previously set, its transform will be set to `figure.transFigure`.

**clip** [bool, default: False] Whether the added artist should be clipped by the figure patch.

### Returns

*Artist* The added artist.

```
add_axes(self, *args, **kwargs)
    Add an axes to the figure.
```

Call signatures:

```
add_axes(rect, projection=None, polar=False, **kwargs)
add_axes(ax)
```

### Parameters

**rect** [sequence of float] The dimensions [left, bottom, width, height] of the new axes. All quantities are in fractions of figure width and height.

**projection** [{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

**polar** [bool, default: False] If True, equivalent to `projection='polar'`.

**sharex, sharey** [*Axes*, optional] Share the x or y *axis* with `sharex` and/or `sharey`. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label** [str] A label for the returned axes.

### Returns

*Axes*, or a subclass of *Axes* The returned axes class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used.

### Other Parameters

**\*\*kwargs** This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class [Axes](#) can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[Axes, Renderer], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<a href="#">Bbox</a>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color
<i>figure</i>	<a href="#">Figure</a>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<a href="#">AbstractPathEffect</a>
<i>picker</i>	None or bool or callable
<i>position</i>	[left, bottom, width, height] or <a href="#">Bbox</a>
<i>prop_cycle</i>	unknown
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<a href="#">Transform</a>
<i>url</i>	str
<i>visible</i>	bool
<i>xbound</i>	unknown
<i>xlabel</i>	str
<i>xlim</i>	(bottom: float, top: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{'linear', 'log', 'symlog', 'logit', ...}
<i>xticklabels</i>	unknown
<i>xticks</i>	unknown
<i>ybound</i>	unknown

Contin

Table 134 – continued from previous page

Property	Description
<code>ylabel</code>	str
<code>ylim</code>	(bottom: float, top: float)
<code>ymargin</code>	float greater than -0.5
<code>yscale</code>	{"linear", "log", "symlog", "logit", ...}
<code>yticklabels</code>	unknown
<code>yticks</code>	unknown
<code>zorder</code>	float

**See also:**`Figure.add_subplot``pyplot.subplot``pyplot.axes``Figure.subplots``pyplot.subplots`**Notes**

If the figure already has an axes with key (*args*, *kwargs*) then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, `add_axes` may be called with a single argument, a axes instance already created in the present figure but not in the figure's list of axes.

**Examples**

Some simple examples:

```
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect, label=label1)
fig.add_axes(rect, label=label2)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

`add_axobserver(self, func)`

Whenever the axes state change, `func(self)` will be called.

`add_gridspec(self, nrows=1, ncols=1, **kwargs)`

Return a `GridSpec` that has this figure as a parent. This allows complex layout of axes in the figure.

**Parameters**

**nrows** [int, default: 1] Number of rows in grid.

**ncols** [int, default: 1] Number or columns in grid.

### Returns

*GridSpec*

### Other Parameters

**\*\*kwargs** Keyword arguments are passed to *GridSpec*.

### See also:

*matplotlib.pyplot.subplots*

### Examples

Adding a subplot that spans two rows:

```
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

`add_subplot(self, *args, **kwargs)`

Add an *Axes* to the figure as part of a subplot arrangement.

Call signatures:

```
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

### Parameters

**\*args** [int, (int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based, and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

In rare circumstances, *add\_subplot* may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure's list of axes.

**projection** [{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

**polar** [bool, default: False] If True, equivalent to projection='polar'.

**sharex, sharey** [*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label** [str] A label for the returned axes.

### Returns

*axes.SubplotBase*, or another subclass of *Axes* The axes of the subplot. The returned axes base class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used. The returned axes is then a subplot subclass of the base class.

### Other Parameters

**\*\*kwargs** This method also takes the keyword arguments for the returned axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[ <i>Axes</i> , <i>Renderer</i> ], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>

Contin

**See also:***Figure.add\_axes**pyplot.subplot**pyplot.axes**Figure.subplots**pyplot.subplots***Notes**

If the figure already has a subplot with key (*args*, *kwargs*) then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of *args* and *kwargs*. The axes *label* attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

## Examples

```
fig = plt.figure()

fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1) # equivalent but more general

fig.add_subplot(232, frameon=False) # subplot with no frame
fig.add_subplot(233, projection='polar') # polar subplot
fig.add_subplot(234, sharex=ax1) # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor="red") # red subplot

ax1.remove() # delete ax1 from the figure
fig.add_subplot(ax1) # add ax1 back to the figure
```

`align_labels(self, axs=None)`

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

### Parameters

**axs** [list of [Axes](#)] Optional list (or ndarray) of [Axes](#) to align the labels. Default is to align all axes on the figure.

### See also:

`matplotlib.figure.Figure.align_xlabels`

`matplotlib.figure.Figure.align_ylabels`

`align_xlabels(self, axs=None)`

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on axes with the same top-most row.

### Parameters

**axs** [list of [Axes](#)] Optional list of (or ndarray) [Axes](#) to align the xlabels. Default is to align all axes on the figure.

### See also:

`matplotlib.figure.Figure.align_ylabels`

`matplotlib.figure.Figure.align_labels`

## Notes

This assumes that `axs` are from the same [GridSpec](#), so that their [SubplotSpec](#) positions correspond to figure positions.

## Examples

Example with rotated xtick labels:

```
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

`align_ylabels(self, axs=None)`

Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on axes with the same right-most column.

### Parameters

**axs** [list of *Axes*] Optional list (or ndarray) of *Axes* to align the ylabels. Default is to align all axes on the figure.

### See also:

`matplotlib.figure.Figure.align_xlabels`

`matplotlib.figure.Figure.align_labels`

## Notes

This assumes that *axs* are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

## Examples

Example with large yticks labels:

```
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```

`autofmt_xdate(self, bottom=0.2, rotation=30, ha='right', which='major')`

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared xaxes where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

### Parameters

**bottom** [float, default: 0.2] The bottom of the subplots for *subplots\_adjust*.

**rotation** [float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

**ha** [{‘left’, ‘center’, ‘right’}, default: ‘right’] The horizontal alignment of the xticklabels.

**which** [{‘major’, ‘minor’, ‘both’}, default: ‘major’] Selects which ticklabels to rotate.

**property axes**

List of axes in the Figure. You can access and modify the axes in the Figure through this list.

Do not modify the list itself. Instead, use "*add\_axes*, *add\_subplot* or *delaxes* to add or remove an axes.

`clear(self, keep_observers=False)`

Clear the figure - synonym for *clf*.

`clf(self, keep_observers=False)`

Clear the figure.

Set *keep\_observers* to True if, for example, a gui widget is tracking the axes in the figure.

`colorbar(self, mappable, cax=None, ax=None, use_gridspec=True, **kw)`

Create a colorbar for a *ScalarMappable* instance, *mappable*.

Documentation for the pyplot thin wrapper:

Add a colorbar to a plot.

Function signatures for the *pyplot* interface; all but the first are also method signatures for the *colorbar* method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

## Parameters

**mappable** The *matplotlib.cm.ScalarMappable* (i.e., *AxesImage*, *ContourSet*, etc.) described by this colorbar. This argument is mandatory for the *Figure.colorbar* method but optional for the *pyplot.colorbar* function, which sets the default to the current image.

Note that one can create a *ScalarMappable* "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap), ax=ax)
```

**cax** [*Axes*, optional] Axes into which the colorbar will be drawn.

**ax** [*Axes*, list of Axes, optional] Parent axes from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

**use\_gridspec** [bool, optional] If *cax* is None, a new *cax* is created as an instance of Axes. If *ax* is an instance of Subplot and *use\_gridspec* is True, *cax* is created as an instance of Subplot using the *gridspec* module.

**Returns**

**colorbar** [*Colorbar*] See also its base class, *ColorbarBase*.

**Notes**

Additional keyword arguments are of two kinds:

axes properties:

**fraction** [float, default: 0.15] Fraction of original axes to use for colorbar.

**shrink** [float, default: 1.0] Fraction by which to multiply the size of the colorbar.

**aspect** [float, default: 20] Ratio of long to short dimensions.

**pad** [float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

**anchor** [(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

**panchor** [(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

Property	Description
<i>extend</i>	{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap <code>set_under</code> and <code>set_over</code> methods.
<i>extendfrac</i>	{None, 'auto', length, lengths} If set to <i>None</i> , both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when <i>spacing</i> is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when <i>spacing</i> is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
<i>extendrect</i>	bool If <i>False</i> the minimum and maximum colorbar extensions will be triangular (the default). If <i>True</i> the extensions will be rectangular.
<i>spacing</i>	{'uniform', 'proportional'} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<i>ticks</i>	None or list of ticks or Locator If <i>None</i> , ticks are determined automatically from the input.
<i>format</i>	None or str or Formatter If <i>None</i> , <i>ScalarFormatter</i> is used. If a format string is given, e.g., '%.3f', that is used. An alternative <i>Formatter</i> may be given instead.
<i>drawedges</i>	bool Whether to draw lines at color boundaries.
<i>label</i>	str The label on the colorbar's long axis.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has `norm=NoNorm()`), or other unusual circumstances.

Property	Description
<i>boundaries</i>	None or a sequence
<i>values</i>	None or a sequence which must be of length 1 less than the sequence of <i>boundaries</i> . For each region delimited by adjacent entries in <i>boundaries</i> , the color mapped to the corresponding value in <i>values</i> will be used.

If *mappable* is a *ContourSet*, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified, it determines the size of the colorbar and *shrink* and *aspect* kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects

in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images ( $\alpha < 1$ ) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

`contains(self, mouseevent)`

Test whether the mouse event occurred on the figure.

### Returns

**bool, {}**

`delaxes(self, ax)`

Remove the [Axes](#) *ax* from the figure; update the current axes.

property `dpi`

The resolution in dots per inch.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible ([Artist.get\\_visible](#) returns False).

### Parameters

**renderer** [[RendererBase](#) subclass.]

### Notes

This method is overridden in the Artist subclasses.

`draw_artist(self, a)`

Draw [Artist](#) instance *a* only.

This can only be called after the figure has been drawn.

`execute_constrained_layout(self, renderer=None)`

Use layoutbox to determine pos positions within axes.

See also [set\\_constrained\\_layout\\_pads](#).

`figimage(self, X, xo=0, yo=0, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, origin=None, resize=False, **kwargs)`

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on *origin*.

### Parameters

**X** The image data. This is an array of one of the following shapes:

- MxN: luminance (grayscale) values

- MxNx3: RGB values
- MxNx4: RGBA values

**xo, yo** [int] The x/y image offset in pixels.

**alpha** [None or float] The alpha blending value.

**norm** [`matplotlib.colors.Normalize`] A *Normalize* instance to map the luminance to the interval [0, 1].

**cmap** [str or `matplotlib.colors.Colormap`, default: `rcParams["image.cmap"]` (default: 'viridis')] The colormap to use.

**vmin, vmax** [float] If *norm* is not given, these values set the data limits for the colormap.

**origin** [{ 'upper', 'lower' }, default: `rcParams["image.origin"]` (default: 'upper')] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.

**resize** [bool] If *True*, resize the figure to match the given image size.

### Returns

`matplotlib.image.FigureImage`

### Other Parameters

**\*\*kwargs** Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

### Notes

`figimage` complements the axes image (`imshow`) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an *Axes* with extent [0, 0, 1, 1].

### Examples

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

#### property `frameon`

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

#### `gca(self, **kwargs)`

Get the current axes, creating one if necessary.

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[Axes, Renderer], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>prop_cycle</i>	unknown
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xbound</i>	unknown
<i>xlabel</i>	str
<i>xlim</i>	(bottom: float, top: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>xticklabels</i>	unknown
<i>xticks</i>	unknown
<i>ybound</i>	unknown
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	unknown
<i>yticks</i>	unknown

Contin

Table 136 – continued from previous page

Property	Description
<i>zorder</i>	float

`get_axes(self)`

Return a list of axes in the Figure. You can access and modify the axes in the Figure through this list.

Do not modify the list itself. Instead, use `add_axes`, `add_subplot` or `delaxes` to add or remove an axes.

Note: This is equivalent to the property `axes`.

`get_children(self)`

Get a list of artists contained in the figure.

`get_constrained_layout(self)`

Return whether constrained layout is being used.

See [Constrained Layout Guide](#).

`get_constrained_layout_pads(self, relative=False)`

Get padding for constrained layout.

Returns a list of `w_pad`, `h_pad` in inches and `wspace` and `hspace` as fractions of the subplot.

See [Constrained Layout Guide](#).

### Parameters

**relative** [bool] If `True`, then convert from inches to figure relative.

`get_default_bbox_extra_artists(self)`

`get_dpi(self)`

Return the resolution in dots per inch as a float.

`get_edgecolor(self)`

Get the edge color of the Figure rectangle.

`get_facecolor(self)`

Get the face color of the Figure rectangle.

`get_figheight(self)`

Return the figure height in inches.

`get_figwidth(self)`

Return the figure width in inches.

`get_frameon(self)`

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

`get_size_inches(self)`

Return the current size of the figure in inches.

### Returns

**ndarray** The size (width, height) of the figure in inches.

**See also:**

```
matplotlib.figure.Figure.set_size_inches
matplotlib.figure.Figure.get_figwidth
matplotlib.figure.Figure.get_figheight
```

### Notes

The size in pixels can be obtained by multiplying with *Figure.dpi*.

`get_tight_layout(self)`

Return whether *tight\_layout* is called when drawing.

`get_tightbbox(self, renderer, bbox_extra_artists=None)`

Return a (tight) bounding box of the figure in inches.

Artists that have `artist.set_in_layout(False)` are not included in the bbox.

### Parameters

**renderer** [*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**bbox\_extra\_artists** [list of *Artist* or None] List of artists to include in the tight bounding box. If None (default), then all artist children of each axes are included in the tight bounding box.

### Returns

*BboxBase* containing the bounding box (in figure inches).

`get_window_extent(self, *args, **kwargs)`

Return the figure bounding box in display space. Arguments are ignored.

`ginput(self, n=1, timeout=30, show_clicks=True, mouse_add=<MouseButton.LEFT: 1>, mouse_pop=<MouseButton.RIGHT: 3>, mouse_stop=<MouseButton.MIDDLE: 2>)`

Blocking call to interact with a figure.

Wait until the user clicks *n* times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments *mouse\_add*, *mouse\_pop* and *mouse\_stop*.

### Parameters

**n** [int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

**timeout** [float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never timeout.

**show\_clicks** [bool, default: True] If True, show a red cross at the location of each click.

**mouse\_add** [*MouseButton* or None, default: *MouseButton.LEFT*] Mouse button used to add points.

**mouse\_pop** [*MouseButton* or None, default: *MouseButton.RIGHT*] Mouse button used to remove the most recently added point.

**mouse\_stop** [*MouseButton* or None, default: *MouseButton.MIDDLE*] Mouse button used to stop input.

### Returns

**list of tuples** A list of the clicked (x, y) coordinates.

### Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

`init_layoutbox(self)`

Initialize the layoutbox for use in `constrained_layout`.

`legend(self, *args, **kwargs)`

Place a legend on the figure.

To make a legend from existing artists on every axes:

```
legend()
```

To make a legend for a list of lines and labels:

```
legend(
    (line1, line2, line3),
    ('label1', 'label2', 'label3'),
    loc='upper right')
```

These can also be specified by keyword:

```
legend(
    handles=(line1, line2, line3),
    labels=('label1', 'label2', 'label3'),
    loc='upper right')
```

### Parameters

**handles** [list of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

**labels** [list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

## Returns

*Legend*

## Other Parameters

**loc** [str or pair of floats, default: `rcParams["legend.loc"]` (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case `bbox_to_anchor` will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor** [*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (*x*, *y*) places the corner of the legend specified by *loc* at *x*, *y*. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

- ncol** [int, default: 1] The number of columns that the legend has.
- prop** [None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.
- fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.
- labelcolor** [str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').
- numpoints** [int, default: `rcParams["legend.numpoints"]` (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).
- scatterpoints** [int, default: `rcParams["legend.scatterpoints"]` (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).
- scatteryoffsets** [iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].
- markerscale** [float, default: `rcParams["legend.markerscale"]` (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.
- markerfirst** [bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.
- frameon** [bool, default: `rcParams["legend.frameon"]` (default: True)] Whether the legend should be drawn on a patch (frame).
- fancybox** [bool, default: `rcParams["legend.fancybox"]` (default: True)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.
- shadow** [bool, default: `rcParams["legend.shadow"]` (default: False)] Whether to draw a shadow behind the legend.
- framealpha** [float, default: `rcParams["legend.framealpha"]` (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

**facecolor** ["inherit" or color, default: `rcParams["legend.facecolor"]` (default: 'inherit')] The legend's background color. If "inherit", use `rcParams["axes.facecolor"]` (default: 'white').

**edgecolor** ["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: '0.8')] The legend's background patch edge color. If "inherit", use take `rcParams["axes.edgecolor"]` (default: 'black').

**mode** [{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox\_to\_anchor* if defines the legend's size).

**bbox\_transform** [None or `matplotlib.transforms.Transform`] The transform for the bounding box (*bbox\_to\_anchor*). For a value of None (default) the Axes' `transAxes` transform will be used.

**title** [str or None] The legend's title. Default is no title (None).

**title\_fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: None)] The font size of the legend's title.

**borderpad** [float, default: `rcParams["legend.borderpad"]` (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

**labelspacing** [float, default: `rcParams["legend.labelspacing"]` (default: 0.5)] The vertical space between the legend entries, in font-size units.

**handlelength** [float, default: `rcParams["legend.handlelength"]` (default: 2.0)] The length of the legend handles, in font-size units.

**handletextpad** [float, default: `rcParams["legend.handletextpad"]` (default: 0.8)] The pad between the legend handle and text, in font-size units.

**borderaxespad** [float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)] The pad between the axes and legend border, in font-size units.

**columnspacing** [float, default: `rcParams["legend.columnspacing"]` (default: 2.0)] The spacing between columns, in font-size units.

**handler\_map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler\_map* updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

## Notes

Some artists are not supported by this function. See [Legend guide](#) for details.

`savefig(self, fname, *, transparent=None, **kwargs)`

Save the current figure.

Call signature:

```
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The available output formats depend on the backend being used.

### Parameters

**fname** [str or path-like or file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as `matplotlib.backends.backend_pdf.PdfPages`.

If *format* is set, it determines the output format, and the file is saved as *fname*. Note that *fname* is used verbatim, and there is no attempt to make the extension, if any, of *fname* match *format*, and no extension is appended.

If *format* is not set, then the format is inferred from the extension of *fname*, if there is one. If *format* is not set and *fname* has no extension, then the file is saved with `rcParams["savefig.format"]` (default: 'png') and the appropriate extension is appended to *fname*.

### Other Parameters

**dpi** [float or 'figure', default: `rcParams["savefig.dpi"]` (default: 'figure')] The resolution in dots per inch. If 'figure', use the figure's dpi value.

**quality** [int, default: `rcParams["savefig.jpeg_quality"]` (default: 95)] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality.

This parameter is deprecated.

**optimize** [bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the encoder should make an extra pass over the image in order to select optimal encoder settings.

This parameter is deprecated.

**progressive** [bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the image should be stored as a progressive JPEG file.

This parameter is deprecated.

**facecolor** [color or 'auto', default: `rcParams["savefig.facecolor"]` (default: 'auto')] The facecolor of the figure. If 'auto', use the current figure facecolor.

**edgecolor** [color or 'auto', default: `rcParams["savefig.edgecolor"]` (default: 'auto')] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

**orientation** [{ 'landscape', 'portrait' }] Currently only supported by the postscript backend.

**papertype** [str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

**format** [str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

**transparent** [bool] If *True*, the axes patches will all be transparent; the figure patch will also be transparent unless *facecolor* and/or *edgecolor* are specified via *kwargs*. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

**bbox\_inches** [str or *Bbox*, default: `rcParams["savefig.bbox"]` (default: `None`)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

**pad\_inches** [float, default: `rcParams["savefig.pad_inches"]` (default: 0.1)] Amount of padding around the figure when *bbox\_inches* is 'tight'.

**bbox\_extra\_artists** [list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

**backend** [str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

**metadata** [dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter *metadata* of *print\_png*.
- 'pdf' with pdf backend: See the parameter *metadata* of *PdfPages*.
- 'svg' with svg backend: See the parameter *metadata* of *print\_svg*.
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

**pil\_kwargs** [dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure.

`sca(self, a)`

Set the current axes to be *a* and return *a*.

`set_canvas(self, canvas)`

Set the canvas that contains the figure

### Parameters

**canvas** [FigureCanvas]

`set_constrained_layout(self, constrained)`

Set whether *constrained\_layout* is used upon drawing. If `None`, `rcParams["figure.constrained_layout.use"]` (default: `False`) value will be used.

When providing a dict containing the keys *w\_pad*, *h\_pad* the default *constrained\_layout* paddings will be overridden. These pads are in inches and default to 3.0/72.0. *w\_pad* is the width padding and *h\_pad* is the height padding.

See *Constrained Layout Guide*.

### Parameters

**constrained** [bool or dict or None]

`set_constrained_layout_pads(self, **kwargs)`

Set padding for constrained\_layout. Note the kwargs can be passed as a dictionary `fig.set_constrained_layout(**paddict)`.

See [Constrained Layout Guide](#).

#### Parameters

**w\_pad** [float] Width padding in inches. This is the pad around axes and is meant to make sure there is enough room for fonts to look good. Defaults to 3 pts = 0.04167 inches

**h\_pad** [float] Height padding in inches. Defaults to 3 pts.

**wspace** [float] Width padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being `w_pad + wspace`.

**hspace** [float] Height padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being `h_pad + hspace`.

`set_dpi(self, val)`

Set the resolution of the figure in dots-per-inch.

#### Parameters

**val** [float]

`set_edgecolor(self, color)`

Set the edge color of the Figure rectangle.

#### Parameters

**color** [color]

`set_facecolor(self, color)`

Set the face color of the Figure rectangle.

#### Parameters

**color** [color]

`set_figheight(self, val, forward=True)`

Set the height of the figure in inches.

#### Parameters

**val** [float]

**forward** [bool] See [set\\_size\\_inches](#).

**See also:**

`matplotlib.figure.Figure.set_figwidth`

`matplotlib.figure.Figure.set_size_inches`

`set_figwidth(self, val, forward=True)`

Set the width of the figure in inches.

#### Parameters

**val** [float]

**forward** [bool] See [set\\_size\\_inches](#).

**See also:**`matplotlib.figure.Figure.set_figheight``matplotlib.figure.Figure.set_size_inches``set_frameon(self, b)`

Set the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.set_visible()`.

**Parameters****b** [bool]`set_size_inches(self, w, h=None, forward=True)`

Set the figure size in inches.

Call signatures:

```
fig.set_size_inches(w, h)  # OR
fig.set_size_inches((w, h))
```

**Parameters**

**w** [(float, float) or float] Width and height in inches (if height not specified as a separate argument) or width.

**h** [float] Height in inches.

**forward** [bool, default: True] If True, the canvas size is automatically updated, e.g., you can resize the figure window from the shell.

**See also:**`matplotlib.figure.Figure.get_size_inches``matplotlib.figure.Figure.set_figwidth``matplotlib.figure.Figure.set_figheight`**Notes**

To transform from pixels to inches divide by `Figure.dpi`.

`set_tight_layout(self, tight)`

Set whether and how `tight_layout` is called when drawing.

**Parameters**

**tight** [bool or dict with keys "pad", "w\_pad", "h\_pad", "rect" or None]  
If a bool, sets whether to call `tight_layout` upon drawing. If None, use the figure.autolayout rcparam instead. If a dict, pass it as kwargs to `tight_layout`, overriding the default paddings.

`show(self, warn=True)`

If using a GUI backend with pyplot, display the figure window.

If the figure was not created using `figure`, it will lack a `FigureManagerBase`, and this method will raise an `AttributeError`.

**Warning:** This does not manage an GUI event loop. Consequently, the figure may only be shown briefly or not shown at all if you or your environment are not managing an event loop.

Proper use cases for `Figure.show` include running this from a GUI application or an IPython shell.

If you're running a pure python shell or executing a non-GUI python script, you should use `matplotlib.pyplot.show` instead, which takes care of managing the event loop for you.

### Parameters

**warn** [bool, default: True] If True and we are not running headless (i.e. on Linux with an unset DISPLAY), issue warning when called on a non-GUI backend.

`subplot_mosaic(self, layout, *, subplot_kw=None, gridspec_kw=None, empty_sentinel='.')`

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

**Note:** This API is provisional and may be revised in the future based on early user feedback.

### Parameters

**layout** [list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [['A panel', 'A panel', 'edge'],
      ['C panel', '.', 'edge']]
```

Produces 4 axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it must be of the form

```
'''
AAE
C.E
'''
```

where each character is a column and each line is a row. This only allows only single character Axes labels and does not allow nesting but is very terse.

**subplot\_kw** [dict, optional] Dictionary with keywords passed to the `Figure.add_subplot` call used to create each subplot.

**gridspec\_kw** [dict, optional] Dictionary with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**empty\_sentinel** [object, optional] Entry in the layout to mean "leave this space empty". Defaults to ' '. Note, if *layout* is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

### Returns

**dict[label, Axes]** A dictionary mapping the labels to the Axes objects.

`subplots(self, nrows=1, ncols=1, *, sharex=False, sharey=False, squeeze=True, subplot_kw=None, gridspec_kw=None)`

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

### Parameters

**nrows, ncols** [int, default: 1] Number of rows/columns of the subplot grid.

**sharex, sharey** [bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use `tick_params`.

**squeeze** [bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (`nrows=ncols=1`), the resulting single Axes object is returned as a scalar.
  - for `Nx1` or `1xM` subplots, the returned object is a 1D numpy object array of Axes objects.
  - for `NxM`, subplots with `N>1` and `M>1` are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being `1x1`.

**subplot\_kw** [dict, optional] Dict with keywords passed to the `Figure.add_subplot` call used to create each subplot.

**gridspec\_kw** [dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

### Returns

**Axes or array of Axes** Either a single *Axes* object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the *squeeze* keyword, see above.

### See also:

*pyplot.subplots*

*Figure.add\_subplot*

*pyplot.subplot*

### Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
plt.figure()

# Create a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(polar=True))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

`subplots_adjust(self, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)`

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by `rcParams["figure.subplot.[name]"]`.

### Parameters

**left** [float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

**right** [float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

**bottom** [float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

**top** [float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

**wspace** [float, optional] The width of the padding between subplots, as a fraction of the average axes width.

**hspace** [float, optional] The height of the padding between subplots, as a fraction of the average axes height.

`suptitle(self, t, **kwargs)`

Add a centered title to the figure.

### Parameters

**t** [str] The title text.

**x** [float, default 0.5] The x location of the text in figure coordinates.

**y** [float, default 0.98] The y location of the text in figure coordinates.

**horizontalalignment, ha** [{`'center'`, `'left'`, `'right'`}, default: `'center'`] The horizontal alignment of the text relative to (x, y).

**verticalalignment, va** [{`'top'`, `'center'`, `'bottom'`, `'baseline'`}, default: `'top'`] The vertical alignment of the text relative to (x, y).

**fontsize, size** [default: `rcParams["figure.titlesize"]` (default: `'large'`)] The font size of the text. See `Text.set_size` for possible values.

**fontweight, weight** [default: `rcParams["figure.titleweight"]` (default: `'normal'`)] The font weight of the text. See `Text.set_weight` for possible values.

### Returns

**text** The `Text` instance of the title.

### Other Parameters

**fontproperties** [None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: `'large'`) and `rcParams["figure.titleweight"]` (default: `'normal'`) are ignored in this case.

**\*\*kwargs** Additional kwargs are `matplotlib.text.Text` properties.

## Examples

```
>>> fig.suptitle('This is the figure title', fontsize=12)
```

`text(self, x, y, s, fontdict=None, **kwargs)`  
Add text to figure.

## Parameters

**x, y** [float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

**s** [str] The text string.

**fontdict** [dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

## Returns

*Text*

## Other Parameters

**\*\*kwargs** [*Text* properties] Other miscellaneous text parameters.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontfamily</i> or <i>family</i>	{'FONTNAME', 'serif', 'sans-serif', 'cursive', 'fantasy', 'monosp
<i>fontproperties</i> or <i>font</i> or <i>font_properties</i>	<i>font_manager.FontProperties</i> or <i>str</i> or <i>pathlib.Path</i>
<i>fontsize</i> or <i>size</i>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large
<i>fontstretch</i> or <i>stretch</i>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-co
<i>fontstyle</i> or <i>style</i>	{'normal', 'italic', 'oblique'}
<i>fontvariant</i> or <i>variant</i>	{'normal', 'small-caps'}
<i>fontweight</i> or <i>weight</i>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal'
<i>gid</i>	str
<i>horizontalalignment</i> or <i>ha</i>	{'center', 'right', 'left'}
<i>in_layout</i>	bool
<i>label</i>	object
<i>linespacing</i>	float (multiple of font size)
<i>multialignment</i> or <i>ma</i>	{'left', 'right', 'center'}
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable

Property	Description
<i>position</i>	(float, float)
<i>rasterized</i>	bool or None
<i>rotation</i>	float or {'vertical', 'horizontal'}
<i>rotation_mode</i>	{None, 'default', 'anchor'}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	object
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>usetex</i>	bool or None
<i>verticalalignment</i> or <i>va</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

**See also:***Axes.text**pyplot.text*

`tight_layout(self, renderer=<deprecated parameter>, pad=1.08, h_pad=None, w_pad=None, rect=None)`

Adjust the padding between and around subplots.

To exclude an artist on the axes from the bounding box calculation that determines the subplot parameters (i.e. legend, or annotation), set `a.set_in_layout(False)` for that artist.

**Parameters**

**renderer** [subclass of *RendererBase*, optional] Defaults to the renderer for the figure. Deprecated.

**pad** [float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h\_pad, w\_pad** [float, default: *pad*] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.

**rect** [tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.

**See also:***Figure.set\_tight\_layout**pyplot.tight\_layout*

`waitforbuttonpress(self, timeout=-1)`

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within *timeout* seconds. Negative values deactivate *timeout*.

#### Examples using `matplotlib.figure.Figure`

- `sphx_glr_gallery_user_interfaces_embedding_in_gtk3_panzoom_sgskip.py`
- `sphx_glr_gallery_user_interfaces_embedding_in_gtk3_sgskip.py`

- `sphx_glr_gallery_user_interfaces_wxcursor_demo_sgskip.py`

#### `matplotlib.figure.SubplotParams`

```
class matplotlib.figure.SubplotParams(left=None, bottom=None, right=None,
                                     top=None, wspace=None, hspace=None)
```

Bases: `object`

A class to hold the parameters for a subplot.

Defaults are given by `rcParams["figure.subplot.[name]"]`.

##### Parameters

**left** [float] The position of the left edge of the subplots, as a fraction of the figure width.

**right** [float] The position of the right edge of the subplots, as a fraction of the figure width.

**bottom** [float] The position of the bottom edge of the subplots, as a fraction of the figure height.

**top** [float] The position of the top edge of the subplots, as a fraction of the figure height.

**wspace** [float] The width of the padding between subplots, as a fraction of the average axes width.

**hspace** [float] The height of the padding between subplots, as a fraction of the average axes height.

```
__dict__ = mappingproxy({'__module__': 'matplotlib.figure', '__doc__': '\n A class to hold the par
__init__(self, left=None, bottom=None, right=None, top=None, wspace=None,
        hspace=None)
    Defaults are given by rcParams["figure.subplot.[name]"].
```

### Parameters

**left** [float] The position of the left edge of the subplots, as a fraction of the figure width.

**right** [float] The position of the right edge of the subplots, as a fraction of the figure width.

**bottom** [float] The position of the bottom edge of the subplots, as a fraction of the figure height.

**top** [float] The position of the top edge of the subplots, as a fraction of the figure height.

**wspace** [float] The width of the padding between subplots, as a fraction of the average axes width.

**hspace** [float] The height of the padding between subplots, as a fraction of the average axes height.

```
__module__ = 'matplotlib.figure'
```

```
__slotnames__ = []
```

```
__weakref__
```

list of weak references to the object (if defined)

```
update(self, left=None, bottom=None, right=None, top=None, wspace=None,
        hspace=None)
```

Update the dimensions of the passed parameters. *None* means unchanged.

### Examples using `matplotlib.figure.SubplotParams`

- `sphx_glr_gallery_pyplots_auto_subplots_adjust.py`

## 18.23.2 Functions

---

*figaspect*

Calculate the width and height for a figure with a specified aspect ratio.

---

### `matplotlib.figure.figaspect`

```
matplotlib.figure.figaspect(arg)
```

Calculate the width and height for a figure with a specified aspect ratio.

While the height is taken from `rcParams["figure.figsize"]` (default: `[6.4, 4.8]`), the width is adjusted to match the desired aspect ratio. Additionally, it is ensured that the width is in the range `[4., 16.]` and the height is in the range `[2., 16.]`. If necessary, the default height is adjusted to ensure this.

### Parameters

**arg** [float or 2d array] If a float, this defines the aspect ratio (i.e. the ratio height / width). In case of an array the aspect ratio is number of rows / number of columns, so that the array could be fitted in the figure undistorted.

### Returns

**width, height** The figure size in inches.

### Notes

If you want to create an axes within the figure, that still preserves the aspect ratio, be sure to create it with equal width and height. See examples below.

Thanks to Fernando Perez for this function.

### Examples

Make a figure twice as tall as it is wide:

```
w, h = figaspect(2.)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Make a figure with the proper aspect for an array:

```
A = rand(5, 3)
w, h = figaspect(A)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Examples using `matplotlib.figure.figaspect`

## 18.24 matplotlib.font\_manager

A module for finding, managing, and using fonts across platforms.

This module provides a single *FontManager* instance that can be shared across backends and platforms. The *findfont* function returns the best TrueType (TTF) font file in the local or system font path that matches the specified *FontProperties* instance. The *FontManager* also handles Adobe Font Metrics (AFM) font files for use by the PostScript backend.

The design is based on the [W3C Cascading Style Sheet, Level 1 \(CSS1\) font specification](#). Future versions may implement the Level 2 or 2.1 specifications.

```
class matplotlib.font_manager.FontEntry(fname="", name="", style='normal',
                                         variant='normal', weight='normal',
                                         stretch='normal', size='medium')
```

Bases: `object`

A class for storing Font properties. It is used when populating the font lookup dictionary.

```
class matplotlib.font_manager.FontManager(size=None, weight='normal')
```

Bases: `object`

On import, the `FontManager` singleton instance creates a list of ttf and afm fonts and caches their `FontProperties`. The `FontManager.findfont` method does a nearest neighbor search to find the font that most closely matches the specification. If no good enough match is found, the default font is returned.

```
addfont(self, path)
```

Cache the properties of the font at `path` to make it available to the `FontManager`. The type of font is inferred from the path suffix.

### Parameters

**path** [str or path-like]

property `defaultFont`

```
findfont(self, prop, fonttext='ttf', directory=None, fallback_to_default=True, rebuild_if_missing=True)
```

Find a font that most closely matches the given font properties.

### Parameters

**prop** [str or `FontProperties`] The font properties to search for. This can be either a `FontProperties` object or a string defining a `fontconfig patterns`.

**fonttext** [{`'ttf'`, `'afm'`}, default: `'ttf'`] The extension of the font file:

- `'ttf'`: TrueType and OpenType fonts (`.ttf`, `.ttc`, `.otf`)
- `'afm'`: Adobe Font Metrics (`.afm`)

**directory** [str, optional] If given, only search this directory and its sub-directories.

**fallback\_to\_default** [bool] If True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

**rebuild\_if\_missing** [bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).

### Returns

**str** The filename of the best matching font.

### Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the  $O(n)$  nearest neighbor search.

See the [W3C Cascading Style Sheet, Level 1](#) documentation for a description of the font finding algorithm.

```

static get_default_size()
    Return the default font size.

get_default_weight(self)
    Return the default font weight.

score_family(self, families, family2)
    Return a match score between the list of font families in families and the font family
    name family2.

    An exact match at the head of the list returns 0.0.

    A match further down the list will return between 0 and 1.

    No match will return 1.0.

score_size(self, size1, size2)
    Return a match score between size1 and size2.

    If size2 (the size specified in the font file) is 'scalable', this function always returns
    0.0, since any font size can be generated.

    Otherwise, the result is the absolute distance between size1 and size2, normalized
    so that the usual range of font sizes (6pt - 72pt) will lie between 0.0 and 1.0.

score_stretch(self, stretch1, stretch2)
    Return a match score between stretch1 and stretch2.

    The result is the absolute value of the difference between the CSS numeric values
    of stretch1 and stretch2, normalized between 0.0 and 1.0.

score_style(self, style1, style2)
    Return a match score between style1 and style2.

    An exact match returns 0.0.

    A match between 'italic' and 'oblique' returns 0.1.

    No match returns 1.0.

score_variant(self, variant1, variant2)
    Return a match score between variant1 and variant2.

    An exact match returns 0.0, otherwise 1.0.

score_weight(self, weight1, weight2)
    Return a match score between weight1 and weight2.

    The result is 0.0 if both weight1 and weight2 are given as strings and have the
    same value.

    Otherwise, the result is the absolute value of the difference between the CSS nu-
    meric values of weight1 and weight2, normalized between 0.05 and 1.0.

set_default_weight(self, weight)
    Set the default font weight. The initial value is 'normal'.

```

```

class matplotlib.font_manager.FontProperties(family=None, style=None, vari-
                                           ant=None, weight=None, stretch=None,
                                           size=None, fname=None)

```

Bases: `object`

A class for storing and manipulating font properties.

The font properties are those described in the [W3C Cascading Style Sheet, Level 1](#) font specification. The six properties are:

- **family**: A list of font names in decreasing order of priority. The items may include a generic font family name, either 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace'. In that case, the actual font to be used will be looked up from the associated rcParam.
- **style**: Either 'normal', 'italic' or 'oblique'.
- **variant**: Either 'normal' or 'small-caps'.
- **stretch**: A numeric value in the range 0-1000 or one of 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded'.
- **weight**: A numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'.
- **size**: Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

The default font property for TrueType fonts (as specified in the default rcParams) is

`sans-serif, normal, normal, normal, normal, scalable.`

Alternatively, a font may be specified using the absolute path to a font file, by using the *fname* kwarg. However, in this case, it is typically simpler to just pass the path (as a `pathlib.Path`, not a `str`) to the *font* kwarg of the `Text` object.

The preferred usage of font sizes is to use the relative values, e.g., 'large', instead of absolute font sizes, e.g., 12. This approach allows all text sizes to be made larger or smaller based on the font manager's default font size.

This class will also accept a `fontconfig pattern`, if it is the only argument provided. This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

Note that Matplotlib's internal font manager and fontconfig use a different algorithm to lookup fonts, so the results of the same pattern may be different in Matplotlib than in other applications that use fontconfig.

`copy(self)`

Return a copy of self.

`get_family(self)`

Return a list of font names that comprise the font family.

`get_file(self)`

Return the filename of the associated font.

`get_fontconfig_pattern(self)`

Get a `fontconfig pattern` suitable for looking up the font as specified with fontconfig's `fc-match` utility.

This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

`get_name(self)`

Return the name of the font that best matches the font properties.

`get_size(self)`

Return the font size.

`get_size_in_points(self)`

`get_slant(self)`  
Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_stretch(self)`  
Return the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'.

`get_style(self)`  
Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_variant(self)`  
Return the font variant. Values are: 'normal' or 'small-caps'.

`get_weight(self)`  
Set the font weight. Options are: A numeric value in the range 0-1000 or one of 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

`set_family(self, family)`  
Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `rcParams["text.usetex"]` (default: False) is True.

`set_file(self, file)`  
Set the filename of the fontfile to use. In this case, all other properties will be ignored.

`set_fontconfig_pattern(self, pattern)`  
Set the properties by parsing a `fontconfig` pattern.

This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

`set_name(self, family)`  
Change the font family. May be either an alias (generic name is CSS parlance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real font name or a list of real font names. Real font names are not supported when `rcParams["text.usetex"]` (default: False) is True.

`set_size(self, size)`  
Set the font size. Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

`set_slant(self, style)`  
Set the font style. Values are: 'normal', 'italic' or 'oblique'.

`set_stretch(self, stretch)`  
Set the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded', or a numeric value in the range 0-1000.

`set_style(self, style)`  
Set the font style. Values are: 'normal', 'italic' or 'oblique'.

`set_variant(self, variant)`  
Set the font variant. Values are: 'normal' or 'small-caps'.

`set_weight(self, weight)`  
Set the font weight. May be either a numeric value in the range 0-1000 or one of

'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demi-bold', 'demi', 'bold', 'heavy', 'extra bold', 'black'

```
class matplotlib.font_manager.JSONEncoder(*, skipkeys=False, ensure_ascii=True,
                                           check_circular=True, allow_nan=True,
                                           sort_keys=False, indent=None, separa-
                                           tors=None, default=None)
```

Bases: `matplotlib.font_manager._JSONEncoder`

[*Deprecated*]

### Notes

Deprecated since version 3.2:

Constructor for JSONEncoder, with sensible defaults.

If `skipkeys` is false, then it is a `TypeError` to attempt encoding of keys that are not str, int, float or None. If `skipkeys` is True, such items are simply skipped.

If `ensure_ascii` is true, the output is guaranteed to be str objects with all incoming non-ASCII characters escaped. If `ensure_ascii` is false, the output can contain non-ASCII characters.

If `check_circular` is true, then lists, dicts, and custom encoded objects will be checked for circular references during encoding to prevent an infinite recursion (which would cause an `OverflowError`). Otherwise, no such check takes place.

If `allow_nan` is true, then NaN, Infinity, and -Infinity will be encoded as such. This behavior is not JSON specification compliant, but is consistent with most JavaScript based encoders and decoders. Otherwise, it will be a `ValueError` to encode such floats.

If `sort_keys` is true, then the output of dictionaries will be sorted by key; this is useful for regression tests to ensure that JSON serializations can be compared on a day-to-day basis.

If `indent` is a non-negative integer, then JSON array elements and object members will be pretty-printed with that indent level. An indent level of 0 will only insert newlines. None is the most compact representation.

If specified, `separators` should be an (item\_separator, key\_separator) tuple. The default is (', ', ': ') if `indent` is None and (',', ': ') otherwise. To get the most compact JSON representation, you should specify (',', ':') to eliminate whitespace.

If specified, `default` is a function that gets called for objects that can't otherwise be serialized. It should return a JSON encodable version of the object or raise a `TypeError`.

```
matplotlib.font_manager.afmFontProperty(fontpath, font)
```

Extract information from an AFM font file.

### Parameters

**font** [*AFM*] The AFM font file from which information will be extracted.

### Returns

*FontEntry* The extracted font properties.

```
matplotlib.font_manager.createFontList(fontfiles, fontext='ttf')
```

[*Deprecated*] Create a font lookup list. The default is to create a list of TrueType fonts. An AFM font list can optionally be created.

## Notes

Deprecated since version 3.2.

`matplotlib.font_manager.findSystemFonts(fontpaths=None, fonttext='ttf')`

Search for fonts in the specified font paths. If no paths are given, will use a standard set of system paths, as well as the list of fonts tracked by fontconfig if fontconfig is installed and available. A list of TrueType fonts are returned by default with AFM fonts as an option.

`matplotlib.font_manager.findfont(prop, fonttext='ttf', directory=None, fallback_to_default=True, rebuild_if_missing=True)`

Find a font that most closely matches the given font properties.

## Parameters

**prop** [str or *FontProperties*] The font properties to search for. This can be either a *FontProperties* object or a string defining a [fontconfig patterns](#).

**fonttext** [{ 'ttf', 'afm' }, default: 'ttf'] The extension of the font file:

- 'ttf': TrueType and OpenType fonts (.ttf, .ttc, .otf)
- 'afm': Adobe Font Metrics (.afm)

**directory** [str, optional] If given, only search this directory and its subdirectories.

**fallback\_to\_default** [bool] If True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

**rebuild\_if\_missing** [bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexistent font (i.e., the font cache contains outdated entries).

## Returns

**str** The filename of the best matching font.

## Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the [W3C Cascading Style Sheet, Level 1](#) documentation for a description of the font finding algorithm.

`matplotlib.font_manager.get_font(filename, hinting_factor=None)`

`matplotlib.font_manager.get_fontconfig_fonts(fonttext='ttf')`

List font filenames known to fc-list having the given extension.

`matplotlib.font_manager.get_fonttext_synonyms(fonttext)`

Return a list of file extensions extensions that are synonyms for the given file extension *fileext*.

`matplotlib.font_manager.is_opentype_cff_font(filename)`

Return whether the given font is a Postscript Compact Font Format Font embedded in an OpenType wrapper. Used by the PostScript and PDF backends that can not subset these fonts.

`matplotlib.font_manager.json_dump(data, filename)`

Dump *FontManager* data as JSON to the file named *filename*.

**See also:**

[\*json\\_load\*](#)

### Notes

File paths that are children of the Matplotlib data path (typically, fonts shipped with Matplotlib) are stored relative to that data path (to remain valid across virtualenvs).

This function temporarily locks the output file to prevent multiple processes from overwriting one another's output.

`matplotlib.font_manager.json_load(filename)`

Load a *FontManager* from the JSON file named *filename*.

**See also:**

[\*json\\_dump\*](#)

`matplotlib.font_manager.list_fonts(directory, extensions)`

Return a list of all fonts matching any of the extensions, found recursively under the directory.

`matplotlib.font_manager.ttfFontProperty(font)`

Extract information from a TrueType font file.

### Parameters

**font** [FT2Font] The TrueType font file from which information will be extracted.

### Returns

*FontEntry* The extracted font properties.

`matplotlib.font_manager.win32FontDirectory()`

Return the user-specified font directory for Win32. This is looked up from the registry key

`\\HKEY_CURRENT_USER\\Software\\Microsoft\\Windows\\CurrentVersion\\Explorer\\Shell Folders\\Fonts`

If the key is not found, %WINDIR%\Fonts will be returned.

`matplotlib.font_manager.win32InstalledFonts(directory=None, fonttext='ttf')`

Search for fonts in the specified font directory, or use the system directories if none given. Additionally, it is searched for user fonts installed. A list of TrueType font filenames are returned by default, or AFM fonts if *fonttext* == 'afm'.

## 18.25 matplotlib.fontconfig\_pattern

A module for parsing and generating `fontconfig` patterns.

```
class matplotlib.fontconfig_pattern.FontconfigPatternParser
    Bases: object
    A simple pyparsing-based parser for fontconfig patterns.
    parse(self, pattern)
        Parse the given fontconfig pattern and return a dictionary of key/value pairs useful
        for initializing a font_manager.FontProperties object.
matplotlib.fontconfig_pattern.family_escape(repl, string, count=0)
    Return the string obtained by replacing the leftmost non-overlapping occurrences of
    pattern in string by the replacement repl.
matplotlib.fontconfig_pattern.family_unescape(repl, string, count=0)
    Return the string obtained by replacing the leftmost non-overlapping occurrences of
    pattern in string by the replacement repl.
matplotlib.fontconfig_pattern.generate_fontconfig_pattern(d)
    Given a dictionary of key/value pairs, generates a fontconfig pattern string.
matplotlib.fontconfig_pattern.parse_fontconfig_pattern(pattern)
    Parse the given fontconfig pattern and return a dictionary of key/value pairs useful for
    initializing a font_manager.FontProperties object.
matplotlib.fontconfig_pattern.value_escape(repl, string, count=0)
    Return the string obtained by replacing the leftmost non-overlapping occurrences of
    pattern in string by the replacement repl.
matplotlib.fontconfig_pattern.value_unescape(repl, string, count=0)
    Return the string obtained by replacing the leftmost non-overlapping occurrences of
    pattern in string by the replacement repl.
```

## 18.26 matplotlib.gridspec

`gridspec` contains classes that help to layout multiple `Axes` in a grid-like pattern within a figure. The `GridSpec` specifies the overall grid structure. Individual cells within the grid are referenced by `SubplotSpecs`. See the tutorial [Customizing Figure Layouts Using GridSpec and Other Functions](#) for a comprehensive usage guide.

### 18.26.1 Classes

<code>GridSpec(nrows, ncols[, figure, left, ...])</code>	A grid layout to place subplots within a figure.
<code>SubplotSpec(gridspec, num1[, num2])</code>	Specifies the location of a subplot in a <code>GridSpec</code> .

Continued on next page

Table 139 – continued from previous page

<code>GridSpecBase(nrows, ncols[, height_ratios, ...])</code>	A base class of <code>GridSpec</code> that specifies the geometry of the grid that a subplot will be placed.
<code>GridSpecFromSubplotSpec(nrows, ncols, ...[, ...])</code>	<code>GridSpec</code> whose subplot layout parameters are inherited from the location specified by a given <code>SubplotSpec</code> .

**matplotlib.gridspec.GridSpec**

```
class matplotlib.gridspec.GridSpec(nrows, ncols, figure=None, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None, width_ratios=None, height_ratios=None)
```

Bases: `matplotlib.gridspec.GridSpecBase`

A grid layout to place subplots within a figure.

The location of the grid cells is determined in a similar way to `SubplotParams` using `left`, `right`, `top`, `bottom`, `wspace` and `hspace`.

**Parameters**

**nrows, ncols** [int] The number of rows and columns of the grid.

**figure** [`Figure`, optional] Only used for constrained layout to create a proper layoutbox.

**left, right, top, bottom** [float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or `rcParams` at draw time. See also `GridSpec.get_subplot_params`.

**wspace** [float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or `rcParams` when necessary. See also `GridSpec.get_subplot_params`.

**hspace** [float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or `rcParams` when necessary. See also `GridSpec.get_subplot_params`.

**width\_ratios** [array-like of length `ncols`, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

**height\_ratios** [array-like of length `nrows`, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

`__getstate__(self)`

`__init__(self, nrows, ncols, figure=None, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None, width_ratios=None, height_ratios=None)`

## Parameters

**nrows, ncols** [int] The number of rows and columns of the grid.

**figure** [*Figure*, optional] Only used for constrained layout to create a proper layoutbox.

**left, right, top, bottom** [float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or rcParams at draw time. See also *GridSpec.get\_subplot\_params*.

**wspace** [float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or rcParams when necessary. See also *GridSpec.get\_subplot\_params*.

**hspace** [float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or rcParams when necessary. See also *GridSpec.get\_subplot\_params*.

**width\_ratios** [array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of  $\text{width\_ratios}[i] / \text{sum}(\text{width\_ratios})$ . If not given, all columns will have the same width.

**height\_ratios** [array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of  $\text{height\_ratios}[i] / \text{sum}(\text{height\_ratios})$ . If not given, all rows will have the same height.

```
__module__ = 'matplotlib.gridspec'
```

```
get_subplot_params(self, figure=None)
```

Return the *SubplotParams* for the GridSpec.

In order of precedence the values are taken from

- non-None attributes of the GridSpec
- the provided *figure*
- `rcParams["figure.subplot.*"]`

```
locally_modified_subplot_params(self)
```

Return a list of the names of the subplot parameters explicitly set in the GridSpec.

This is a subset of the attributes of *SubplotParams*.

```
tight_layout(self, figure, renderer=None, pad=1.08, h_pad=None, w_pad=None,
             rect=None)
```

Adjust subplot parameters to give specified padding.

## Parameters

**pad** [float] Padding between the figure edge and the edges of subplots, as a fraction of the font-size.

**h\_pad, w\_pad** [float, optional] Padding (height/width) between edges of adjacent subplots. Defaults to *pad*.

**rect** [tuple of 4 floats, default: (0, 0, 1, 1), i.e. the whole figure] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into.

`update(self, **kwargs)`

Update the subplot parameters of the grid.

Parameters that are not explicitly given are not changed. Setting a parameter to *None* resets it to `rcParams["figure.subplot.*"]`.

### Parameters

**left, right, top, bottom** [float or None, optional] Extent of the subplots as a fraction of figure width or height.

**wspace, hspace** [float, optional] Spacing between the subplots as a fraction of the average subplot width / height.

### `matplotlib.gridspec.SubplotSpec`

`class matplotlib.gridspec.SubplotSpec(gridspec, num1, num2=None)`

Bases: `object`

Specifies the location of a subplot in a *GridSpec*.

---

**Note:** Likely, you'll never instantiate a *SubplotSpec* yourself. Instead you will typically obtain one from a *GridSpec* using item-access.

---

## Parameters

**gridspec** [*GridSpec*] The GridSpec, which the subplot is referencing.

**num1, num2** [int] The subplot will occupy the num1-th cell of the given gridspec. If num2 is provided, the subplot will span between num1-th cell and num2-th cell *inclusive*.

The index starts from 0.

```
__dict__ = mappingproxy({'__module__': 'matplotlib.gridspec', '__doc__': "\n Specifies the location of the subplot within the GridSpec."})
```

```
__eq__(self, other)
```

Two SubplotSpecs are considered equal if they refer to the same position(s) in the same *GridSpec*.

```
__getstate__(self)
```

```
__hash__(self)
```

Return hash(self).

```
__init__(self, gridspec, num1, num2=None)
```

Initialize self. See help(type(self)) for accurate signature.

```
__module__ = 'matplotlib.gridspec'
```

```
__repr__(self)
```

Return repr(self).

```
__weakref__
```

list of weak references to the object (if defined)

```
property colspan
```

The columns spanned by this subplot, as a *range* object.

```
get_geometry(self)
```

Return the subplot geometry as tuple (n\_rows, n\_cols, start, stop).

The indices *start* and *stop* define the range of the subplot within the *GridSpec*. *stop* is inclusive (i.e. for a single cell start == stop).

```
get_gridspec(self)
```

```
get_position(self, figure, return_all=False)
```

Update the subplot position from figure.subplotpars.

```
get_rows_columns(self)
```

[*Deprecated*] Return the subplot row and column numbers as a tuple (n\_rows, n\_cols, row\_start, row\_stop, col\_start, col\_stop).

## Notes

Deprecated since version 3.3.

```
get_topmost_subplotspec(self)
```

Return the topmost *SubplotSpec* instance associated with the subplot.

```
property num2
```

```
property rowspan
```

The rows spanned by this subplot, as a *range* object.

`subgridspec(self, nrows, ncols, **kwargs)`  
Create a `GridSpec` within this subplot.

The created `GridSpecFromSubplotSpec` will have this `SubplotSpec` as a parent.

#### Parameters

**nrows** [int] Number of rows in grid.

**ncols** [int] Number or columns in grid.

#### Returns

`GridSpecFromSubplotSpec`

#### Other Parameters

**\*\*kwargs** All other parameters are passed to `GridSpecFromSubplotSpec`.

#### See also:

`matplotlib.pyplot.subplots`

#### Examples

Adding three subplots in the space occupied by a single subplot:

```
fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

#### Examples using `matplotlib.gridspec.SubplotSpec`

- [Customizing Figure Layouts Using GridSpec and Other Functions](#)
- [Constrained Layout Guide](#)
- [Tight Layout guide](#)

#### `matplotlib.gridspec.GridSpecBase`

```
class matplotlib.gridspec.GridSpecBase(nrows,          ncols,          height_ratios=None,
                                       width_ratios=None)
```

Bases: `object`

A base class of `GridSpec` that specifies the geometry of the grid that a subplot will be placed.

#### Parameters

**nrows, ncols** [int] The number of rows and columns of the grid.

**width\_ratios** [array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

**height\_ratios** [array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

```
__dict__ = mappingproxy({'__module__': 'matplotlib.gridspec', '__doc__': '\n A base class of GridS
```

```
__getitem__(self, key)
```

Create and return a *SubplotSpec* instance.

```
__init__(self, nrows, ncols, height_ratios=None, width_ratios=None)
```

### Parameters

**nrows, ncols** [int] The number of rows and columns of the grid.

**width\_ratios** [array-like of length *ncols*, optional] Defines the relative widths of the columns. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`. If not given, all columns will have the same width.

**height\_ratios** [array-like of length *nrows*, optional] Defines the relative heights of the rows. Each column gets a relative height of `height_ratios[i] / sum(height_ratios)`. If not given, all rows will have the same height.

```
__module__ = 'matplotlib.gridspec'
```

```
__repr__(self)
```

Return `repr(self)`.

```
__weakref__
```

list of weak references to the object (if defined)

```
get_geometry(self)
```

Return a tuple containing the number of rows and columns in the grid.

```
get_grid_positions(self, fig, raw=False)
```

Return the positions of the grid cells in figure coordinates.

### Parameters

**fig** [*Figure*] The figure the grid should be applied to. The subplot parameters (margins and spacing between subplots) are taken from *fig*.

**raw** [bool, default: False] If *True*, the subplot parameters of the figure are not taken into account. The grid spans the range [0, 1] in both directions without margins and there is no space between grid cells. This is used for `constrained_layout`.

### Returns

**bottoms, tops, lefts, rights** [array] The bottom, top, left, right positions of the grid cells in figure coordinates.

```
get_height_ratios(self)
```

Return the height ratios.

This is *None* if no height ratios have been set explicitly.

`get_subplot_params(self, figure=None)`

`get_width_ratios(self)`

Return the width ratios.

This is *None* if no width ratios have been set explicitly.

property `ncols`

The number of columns in the grid.

`new_subplotspec(self, loc, rowspan=1, colspan=1)`

Create and return a *SubplotSpec* instance.

### Parameters

**loc** [(int, int)] The position of the subplot in the grid as (row\_index, column\_index).

**rowspan, colspan** [int, default: 1] The number of rows and columns the subplot should span in the grid.

property `nrows`

The number of rows in the grid.

`set_height_ratios(self, height_ratios)`

Set the relative heights of the rows.

*height\_ratios* must be of length *nrows*. Each row gets a relative height of `height_ratios[i] / sum(height_ratios)`.

`set_width_ratios(self, width_ratios)`

Set the relative widths of the columns.

*width\_ratios* must be of length *ncols*. Each column gets a relative width of `width_ratios[i] / sum(width_ratios)`.

`subplots(self, *, sharex=False, sharey=False, squeeze=True, subplot_kw=None)`

Add all subplots specified by this *GridSpec* to its parent figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

### Parameters

**sharex, sharey** [bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick\_params*.

**squeeze** [bool, optional, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (`nrows=ncols=1`), the resulting single Axes object is returned as a scalar.
  - for `Nx1` or `1xM` subplots, the returned object is a 1D numpy object array of Axes objects.
  - for `NxM`, subplots with `N>1` and `M>1` are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being `1x1`.

**subplot\_kw** [dict, optional] Dict with keywords passed to the `add_subplot` call used to create each subplot.

### Returns

**ax** [*Axes* object or array of Axes objects.] *ax* can be either a single *Axes* object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the `squeeze` keyword, see above.

**matplotlib.gridspec.GridSpecFromSubplotSpec**

```
class matplotlib.gridspec.GridSpecFromSubplotSpec(nrows, ncols, subplot_spec, ws-
                                                    pace=None, hspace=None,
                                                    height_ratios=None,
                                                    width_ratios=None)
```

Bases: *matplotlib.gridspec.GridSpecBase*

GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

```
__init__(self, nrows, ncols, subplot_spec, wspace=None, hspace=None,
          height_ratios=None, width_ratios=None)
```

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

```
__module__ = 'matplotlib.gridspec'
```

```
get_subplot_params(self, figure=None)
```

Return a dictionary of subplot layout parameters.

```
get_topmost_subplotspec(self)
```

Return the topmost *SubplotSpec* instance associated with the subplot.

## 18.27 matplotlib.image

The image module supports basic image loading, rescaling and display operations.

```
class matplotlib.image.AxesImage(ax, cmap=None, norm=None, interpolation=None,
                                  origin=None, extent=None, filternorm=True, filter-
                                  rad=4.0, resample=False, **kwargs)
```

Bases: *matplotlib.image.\_ImageBase*

An image attached to an Axes.

**Parameters**

**ax** [*Axes*] The axes the image will belong to.

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] The Colormap instance or registered colormap name used to map scalar data to colors.

**norm** [*Normalize*] Maps luminance to 0-1.

**interpolation** [str, default: `rcParams["image.interpolation"]` (default: 'antialiased')] Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos'.

**origin** [{ 'upper', 'lower' }, default: `rcParams["image.origin"]` (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention 'upper' is typically used for matrices and images.

**extent** [tuple, optional] The data axes (left, right, bottom, top) for making image plots registered with data plots. Default is to label the pixel centers with the zero-based row and column indices.

**filternorm** [bool, default: True] A parameter for the antigrain image re-size filter (see the antigrain documentation). If filternorm is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

**filterrad** [float > 0, default: 4] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

**resample** [bool, default: False] When True, use a full resampling method. When False, only resample when the output image is larger than the input image.

**\*\*kwargs** [*Artist* properties]

## Parameters

**norm** [*matplotlib.colors.Normalize* (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If *None*, *norm* defaults to a *colors.Normalize* object which initializes its scaling based on the first data processed.

**cmap** [str or *Colormap*] The colormap used to map normalized data values to RGBA colors.

`format_cursor_data(self, data)`

Return a string representation of *data*.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

---

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

`get_cursor_data(self, event)`

Return the image value at the event position or *None* if the event is outside the image.

**See also:**

`matplotlib.artist.Artist.get_cursor_data`

`get_extent(self)`

Return the image extent as tuple (left, right, bottom, top).

`get_window_extent(self, renderer=None)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`make_image(self, renderer, magnification=1.0, unsampled=False)`

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

**Returns**

**image** [(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

**x, y** [float] The upper left corner where the image should be drawn, in pixel space.

**trans** [Affine2D] The affine transformation from image to pixel space.

`set_extent(self, extent)`

Set the image extent.

**Parameters**

**extent** [4-tuple of float] The position and size of the image as tuple (left, right, bottom, top) in data coordinates.

**Notes**

This updates `ax.dataLim`, and, if autoscaling, sets `ax.viewLim` to tightly fit the image, regardless of `dataLim`. Autoscaling state is not changed, so following this with `ax.autoscale_view()` will redo the autoscaling in accord with `dataLim`.

```
class matplotlib.image.BboxImage(bbox, cmap=None, norm=None, interpolation=None,
                                origin=None, filternorm=True, filterrad=4.0, resam-
                                ple=False, **kwargs)
```

Bases: `matplotlib.image._ImageBase`

The Image class whose size is determined by the given `bbox`.

`cmap` is a `colors.Colormap` instance `norm` is a `colors.Normalize` instance to map luminance to 0-1

`kwargs` are an optional list of Artist keyword args

`contains(self, mouseevent)`

Test whether the mouse event occurred within the image.

`get_transform(self)`

Return the *Transform* instance used by this artist.

`get_window_extent(self, renderer=None)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`make_image(self, renderer, magnification=1.0, unsampled=False)`

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

### Returns

**image** [(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

**x, y** [float] The upper left corner where the image should be drawn, in pixel space.

**trans** [Affine2D] The affine transformation from image to pixel space.

```
class matplotlib.image.FigureImage(fig, cmap=None, norm=None, offsetx=0, offsety=0,
                                   origin=None, **kwargs)
```

Bases: `matplotlib.image._ImageBase`

An image attached to a figure.

`cmap` is a `colors.Colormap` instance `norm` is a `colors.Normalize` instance to map luminance to 0-1

`kwargs` are an optional list of Artist keyword args

`get_extent(self)`

Return the image extent as tuple (left, right, bottom, top).

`make_image(self, renderer, magnification=1.0, unsampled=False)`

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

#### Returns

**image** [(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

**x, y** [float] The upper left corner where the image should be drawn, in pixel space.

**trans** [Affine2D] The affine transformation from image to pixel space.

`set_data(self, A)`

Set the image array.

`zorder = 0`

`class matplotlib.image.NonUniformImage(ax, *, interpolation='nearest', **kwargs)`

Bases: [`matplotlib.image.AxesImage`](#)

#### Parameters

**interpolation** [{ 'nearest', 'bilinear' }, default: 'nearest']

**\*\*kwargs** All other keyword arguments are identical to those of [`AxesImage`](#).

`get_extent(self)`

Return the image extent as tuple (left, right, bottom, top).

property `is_grayscale`

`make_image(self, renderer, magnification=1.0, unsampled=False)`

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

#### Returns

**image** [(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

**x, y** [float] The upper left corner where the image should be drawn, in pixel space.

**trans** [Affine2D] The affine transformation from image to pixel space.

`set_array(self, *args)`

Retained for backwards compatibility - use `set_data` instead.

#### Parameters

**A** [array-like]

`set_cmap(self, cmap)`

Set the colormap for luminance data.

#### Parameters

**cmap** [[`Colormap`](#) or str or None]

`set_data(self, x, y, A)`

Set the grid for the pixel centers, and the pixel values.

#### Parameters

**x, y** [1D array-like] Monotonic arrays of shapes (N,) and (M,), respectively, specifying pixel centers.

**A** [array-like] (M, N) ndarray or masked array of values to be colormapped, or (M, N, 3) RGB array, or (M, N, 4) RGBA array.

`set_filtnorm(self, s)`

Set whether the resize filter normalizes the weights.

See help for `imshow`.

#### Parameters

**filtnorm** [bool]

`set_filtersad(self, s)`

Set the resize filter radius only applicable to some interpolation schemes – see help for `imshow`

#### Parameters

**filtersad** [positive float]

`set_interpolation(self, s)`

#### Parameters

**s** [{`'nearest'`, `'bilinear'`} or None] If None, use `rcParams["image.interpolation"]` (default: `'antialiased'`).

`set_norm(self, norm)`

Set the normalization instance.

#### Parameters

**norm** [`Normalize` or None]

#### Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```
class matplotlib.image.PcolorImage(ax, x=None, y=None, A=None, cmap=None,
                                     norm=None, **kwargs)
```

Bases: `matplotlib.image.AxesImage`

Make a pcolor-style plot with an irregular rectangular grid.

This uses a variation of the original irregular image code, and it is used by `pcolorfast` for the corresponding grid type.

#### Parameters

**ax** [`Axes`] The axes the image will belong to.

**x, y** [1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to `range(N + 1)` and `range(M + 1)`, respectively.

**A** [array-like] The data to be color-coded. The interpretation depends on the shape:

- (M, N) ndarray or masked array: values to be colormapped
- (M, N, 3): RGB array
- (M, N, 4): RGBA array

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] The Colormap instance or registered colormap name used to map scalar data to colors.

**norm** [*Normalize*] Maps luminance to 0-1.

**\*\*kwargs** [*Artist* properties]

`get_cursor_data(self, event)`

Return the image value at the event position or *None* if the event is outside the image.

**See also:**

`matplotlib.artist.Artist.get_cursor_data`

property `is_grayscale`

`make_image(self, renderer, magnification=1.0, unsampled=False)`

Normalize, rescale, and colormap this image's data for rendering using *renderer*, with the given *magnification*.

If *unsampled* is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

### Returns

**image** [(M, N, 4) uint8 array] The RGBA image, resampled unless *unsampled* is True.

**x, y** [float] The upper left corner where the image should be drawn, in pixel space.

**trans** [Affine2D] The affine transformation from image to pixel space.

`set_array(self, *args)`

Retained for backwards compatibility - use `set_data` instead.

### Parameters

**A** [array-like]

`set_data(self, x, y, A)`

Set the grid for the rectangle boundaries, and the data values.

### Parameters

**x, y** [1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to `range(N + 1)` and `range(M + 1)`, respectively.

**A** [array-like] The data to be color-coded. The interpretation depends on the shape:

- (M, N) ndarray or masked array: values to be colormapped

- (M, N, 3): RGB array
- (M, N, 4): RGBA array

`matplotlib.image.composite_images(images, renderer, magnification=1.0)`

Composite a number of RGBA images into one. The images are composited in the order in which they appear in the *images* list.

#### Parameters

**images** [list of Images] Each must have a `make_image` method. For each image, `can_composite` should return `True`, though this is not enforced by this function. Each image must have a purely affine transformation with no shear.

**renderer** [*RendererBase*]

**magnification** [float, default: 1] The additional magnification to apply for the renderer in use.

#### Returns

**image** [uint8 3d array] The composited RGBA image.

**offset\_x, offset\_y** [float] The (left, bottom) offset where the composited image should be placed in the output figure.

`matplotlib.image.imread(fname, format=None)`

Read an image from a file into an array.

#### Parameters

**fname** [str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

**format** [str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

#### Returns

`numpy.array` The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

`matplotlib.image.imsave(fname, arr, vmin=None, vmax=None, cmap=None, format=None, origin=None, dpi=100, *, metadata=None, pil_kwargs=None)`

Save an array as an image file.

#### Parameters

**fname** [str or path-like or file-like] A path or a file-like object to store the image in. If *format* is not set, then the output format is inferred from the extension of *fname*, if any, and from `rcParams["savefig.format"]` (default: 'png') otherwise. If *format* is set, it determines the output format.

**arr** [array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

**vmin, vmax** [float, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

**format** [str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

**origin** [{ 'upper', 'lower' }, default: `rcParams["image.origin"]` (default: 'upper')] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes.

**dpi** [float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

**metadata** [dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information.

**pil\_kwargs** [dict, optional] Keyword arguments passed to `PIL.Image.Image.save`. If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

`matplotlib.image.pil_to_array(pilImage)`

Load a *PIL image* and return it as a numpy int array.

### Returns

**numpy.array** The array shape depends on the image type:

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

`matplotlib.image.thumbnail(infile, thumbfile, scale=0.1, interpolation='bilinear', preview=False)`

Make a thumbnail of image in *infile* with output filename *thumbfile*.

See `/gallery/misc/image_thumbnail_sgskip`.

### Parameters

**infile** [str or file-like] The image file. Matplotlib relies on *Pillow* for image reading, and thus supports a wide range of file formats, including PNG, JPG, TIFF and others.

**thumbfile** [str or file-like] The thumbnail filename.

**scale** [float, default: 0.1] The scale factor for the thumbnail.

**interpolation** [str, default: 'bilinear'] The interpolation scheme used in the resampling. See the *interpolation* parameter of *imshow* for possible values.

**preview** [bool, default: False] If True, the default backend (presumably a user interface backend) will be used which will cause a figure to

be raised if `show` is called. If it is `False`, the figure is created using `FigureCanvasBase` and the drawing backend is selected as `Figure.savefig` would normally do.

### Returns

*Figure* The figure instance containing the thumbnail.

## 18.28 matplotlib.legend

The legend module defines the `Legend` class, which is responsible for drawing legends associated with axes and/or figures.

---

**Important:** It is unlikely that you would ever create a `Legend` instance manually. Most users would normally create a legend via the `legend` function. For more details on legends there is also a *legend guide*.

---

The *Legend* class is a container of legend handles and legend texts.

The legend handler map specifies how to create legend handles from artists (lines, patches, etc.) in the axes or figures. Default legend handlers are defined in the *legend\_handler* module. While not all artist types are covered by the default legend handlers, custom legend handlers can be defined to support arbitrary objects.

See the *legend guide* for more information.

```
class matplotlib.legend.DraggableLegend(legend, use_blit=False, update='loc')
```

Bases: *matplotlib.offsetbox.DraggableOffsetBox*

Wrapper around a *Legend* to support mouse dragging.

### Parameters

**legend** [*Legend*] The *Legend* instance to wrap.

**use\_blit** [bool, optional] Use blitting for faster image composition. For details see *FuncAnimation*.

**update** [{`'loc'`, `'bbox'`}, optional] If `"loc"`, update the `loc` parameter of the legend upon finalizing. If `"bbox"`, update the `bbox_to_anchor` parameter.

```
finalize_offset(self)
```

```
class matplotlib.legend.Legend(parent, handles, labels, loc=None, numpoints=None,
                               markerscale=None, markerfirst=True, scatter-
                               points=None, scatteryoffsets=None, prop=None,
                               fontsize=None, labelcolor=None, borderpad=None,
                               labelspacing=None, handlelength=None, han-
                               dleheight=None, handletextpad=None, border-
                               axespadd=None, columnspacing=None, ncol=1,
                               mode=None, fancybox=None, shadow=None,
                               title=None, title_fontsize=None, frameal-
                               pha=None, edgecolor=None, facecolor=None,
                               bbox_to_anchor=None, bbox_transform=None,
                               frameon=None, handler_map=None)
```

Bases: *matplotlib.artist.Artist*

Place a legend on the axes at location *loc*.

### Parameters

**parent** [*Axes* or *Figure*] The artist that contains the legend.

**handles** [list of *Artist*] A list of Artists (lines, patches) to be added to the legend.

**labels** [list of str] A list of labels to show next to the artists. The length of handles and labels should be the same. If they are not, they are truncated to the smaller of both lengths.

### Other Parameters

**loc** [str or pair of floats, default: `rcParams["legend.loc"]` (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox\_to\_anchor* will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor** [*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to `axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox\_transform*, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol** [int, default: 1] The number of columns that the legend has.

**prop** [None or *matplotlib.font\_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

**fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

**labelcolor** [str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints** [int, default: *rcParams*["legend.numpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

**scatterpoints** [int, default: *rcParams*["legend.scatterpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

**scatteryoffsets** [iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale** [float, default: *rcParams*["legend.markerscale"] (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.

**markerfirst** [bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

**frameon** [bool, default: *rcParams*["legend.frameon"] (default: True)] Whether the legend should be drawn on a patch (frame).

**fancybox** [bool, default: *rcParams*["legend.fancybox"] (default: True)] Whether round edges should be enabled around the *FancyBboxPatch*

which makes up the legend's background.

**shadow** [bool, default: `rcParams["legend.shadow"]` (default: `False`)] Whether to draw a shadow behind the legend.

**framealpha** [float, default: `rcParams["legend.framealpha"]` (default: `0.8`)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is `None`, the default value is ignored.

**facecolor** ["inherit" or color, default: `rcParams["legend.facecolor"]` (default: 'inherit')] The legend's background color. If "inherit", use `rcParams["axes.facecolor"]` (default: 'white').

**edgecolor** ["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: '0.8')] The legend's background patch edge color. If "inherit", use take `rcParams["axes.edgecolor"]` (default: 'black').

**mode** [{"expand", `None`}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox\_to\_anchor* if defines the legend's size).

**bbox\_transform** [`None` or `matplotlib.transforms.Transform`] The transform for the bounding box (*bbox\_to\_anchor*). For a value of `None` (default) the Axes' `transAxes` transform will be used.

**title** [str or `None`] The legend's title. Default is no title (`None`).

**title\_fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: `None`)] The font size of the legend's title.

**borderpad** [float, default: `rcParams["legend.borderpad"]` (default: `0.4`)] The fractional whitespace inside the legend border, in font-size units.

**labelspacing** [float, default: `rcParams["legend.labelspacing"]` (default: `0.5`)] The vertical space between the legend entries, in font-size units.

**handlelength** [float, default: `rcParams["legend.handlelength"]` (default: `2.0`)] The length of the legend handles, in font-size units.

**handletextpad** [float, default: `rcParams["legend.handletextpad"]` (default: `0.8`)] The pad between the legend handle and text, in font-size units.

**borderaxespad** [float, default: `rcParams["legend.borderaxespad"]` (default: `0.5`)] The pad between the axes and legend border, in font-size units.

**columnspacing** [float, default: `rcParams["legend.columnspacing"]` (default: `2.0`)] The spacing between columns, in font-size units.

**handler\_map** [dict or `None`] The custom dictionary mapping instances or types to a legend handler. This *handler\_map* updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

## Notes

Users can specify any arbitrary location for the legend using the *bbox\_to\_anchor* keyword argument. *bbox\_to\_anchor* can be a *BboxBase* (or derived therefrom) or a tuple of 2 or 4 floats. See `set_bbox_to_anchor` for more detail.

The legend location can be specified by setting *loc* with a tuple of 2 floats, which is interpreted as the lower-left corner of the legend in the normalized axes coordinate.

```
codes = {'best': 0, 'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower
```

```
contains(self, event)
```

Test whether the artist contains the mouse event.

### Parameters

**mouseevent** [*matplotlib.backend\_bases.MouseEvent*]

### Returns

**contains** [bool] Whether any values are within the radius.

**details** [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

```
draw_frame(self, b)
```

Set whether the legend box patch is drawn.

### Parameters

**b** [bool]

```
get_bbox_to_anchor(self)
```

Return the bbox that the legend will be anchored to.

```
get_children(self)
```

Return a list of the child *Artists* of this *Artist*.

```
classmethod get_default_handler_map()
```

A class method that returns the default handler map.

```
get_draggable(self)
```

Return True if the legend is draggable, False otherwise.

```
get_frame(self)
```

Return the *Rectangle* used to frame the legend.

```
get_frame_on(self)
```

Get whether the legend box patch is drawn.

```
static get_legend_handler(legend_handler_map, orig_handler)
```

Return a legend handler from *legend\_handler\_map* that corresponds to *orig\_handler*.

*legend\_handler\_map* should be a dictionary object (that is returned by the *get\_legend\_handler\_map* method).

It first checks if the *orig\_handle* itself is a key in the *legend\_handler\_map* and return the associated value. Otherwise, it checks for each of the classes in its method-resolution-order. If no matching key is found, it returns *None*.

`get_legend_handler_map(self)`  
Return the handler map.

`get_lines(self)`  
Return the list of *Line2Ds* in the legend.

`get_patches(self)`  
Return the list of *Patches* in the legend.

`get_texts(self)`  
Return the list of *Texts* in the legend.

`get_tightbbox(self, renderer)`  
Like *Legend.get\_window\_extent*, but uses the box for the legend.

#### Parameters

**renderer** [*RendererBase* subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

#### Returns

*BboxBase* The bounding box in figure pixel coordinates.

`get_title(self)`  
Return the *Text* instance for the legend title.

`get_window_extent(self, renderer=None)`  
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`set_bbox_to_anchor(self, bbox, transform=None)`  
Set the bbox that the legend will be anchored to.

#### Parameters

**bbox** [*BboxBase* or tuple] The bounding box can be specified in the following ways:

- A *BboxBase* instance
- A tuple of (left, bottom, width, height) in the given transform (normalized axes coordinate if *None*)
- A tuple of (left, bottom) where the width and height will be assumed to be zero.
- *None*, to remove the bbox anchoring, and use the parent bbox.

**transform** [*Transform*, optional] A transform to apply to the bounding box. If not specified, this will use a transform to the bounding box of the parent.

classmethod `set_default_handler_map(handler_map)`

A class method to set the default handler map.

`set_draggable(self, state, use_blit=False, update='loc')`

Enable or disable mouse dragging support of the legend.

### Parameters

**state** [bool] Whether mouse dragging is enabled.

**use\_blit** [bool, optional] Use blitting for faster image composition. For details see [FuncAnimation](#).

**update** [{*'loc'*, *'bbox'*}, optional] The legend parameter to be changed when dragged:

- *'loc'*: update the *loc* parameter of the legend
- *'bbox'*: update the *bbox\_to\_anchor* parameter of the legend

### Returns

*DraggableLegend* or **None** If *state* is True this returns the *DraggableLegend* helper instance. Otherwise this returns *None*.

`set_frame_on(self, b)`

Set whether the legend box patch is drawn.

### Parameters

**b** [bool]

`set_title(self, title, prop=None)`

Set the legend title. Fontproperties can be optionally set with *prop* parameter.

classmethod `update_default_handler_map(handler_map)`

A class method to update the default handler map.

`zorder = 5`

## 18.29 matplotlib.legend\_handler

Default legend handlers.

It is strongly encouraged to have read the [legend guide](#) before this documentation.

Legend handlers are expected to be a callable object with a following signature.

```
legend_handler(legend, orig_handle, fontsize, handlebox)
```

Where *legend* is the legend itself, *orig\_handle* is the original plot, *fontsize* is the fontsize in pixels, and *handlebox* is a `OffsetBox` instance. Within the call, you should create relevant artists (using relevant properties from the *legend* and/or *orig\_handle*) and add them into the *handlebox*. The artists needs to be scaled according to the fontsize (note that the size is in pixel, i.e., this is dpi-scaled value).

This module includes definition of several legend handler classes derived from the base class (`HandlerBase`) with the following method:

```
def legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

```
class matplotlib.legend_handler.HandlerBase(xpad=0.0, ypad=0.0, update_func=None)
```

A Base class for default legend handlers.

The derived classes are meant to override *create\_artists* method, which has a following signature.:

```
def create_artists(self, legend, orig_handle,
                  xdescent, ydescent, width, height, fontsize,
                  trans):
```

The overridden method needs to create artists of the given transform that fits in the given dimension (xdescent, ydescent, width, height) that are scaled by fontsize if necessary.

```
adjust_drawing_area(self, legend, orig_handle, xdescent, ydescent, width, height,
                    fontsize)
```

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-
               size, trans)
```

```
legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

Return the artist that this HandlerBase generates for the given original artist/handle.

#### Parameters

**legend** [*Legend*] The legend for which these legend artists are being created.

**orig\_handle** [*matplotlib.artist.Artist* or similar] The object for which these legend artists are being created.

**fontsize** [int] The fontsize in pixels. The artists being created should be scaled according to the given fontsize.

**handlebox** [*matplotlib.offsetbox.OffsetBox*] The box which has been created to hold this legend entry's artists. Artists created in the *legend\_artist* method must be added to this handlebox inside this method.

```
update_prop(self, legend_handle, orig_handle, legend)
```

```
class matplotlib.legend_handler.HandlerCircleCollection(yoffsets=None, sizes=None,
                                                         **kw)
```

Handler for *CircleCollections*.

#### Parameters

**numpoints** [int] Number of points to show in legend entry.

**yoffsets** [array of floats] Length *numpoints* list of y offsets for each point in legend entry.

#### Notes

Any other keyword arguments are given to *HandlerNpoints*.

```
create_collection(self, orig_handle, sizes, offsets, transOffset)
```

```
class matplotlib.legend_handler.HandlerErrorbar(xerr_size=0.5,      yerr_size=None,
                                                marker_pad=0.3,  numpoints=None,
                                                **kw)
```

Handler for Errorbars.

#### Parameters

**marker\_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.

#### Notes

Any other keyword arguments are given to *HandlerNpoints*.

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-
               size, trans)
```

```
get_err_size(self, legend, xdescent, ydescent, width, height, fontsize)
```

```
class matplotlib.legend_handler.HandlerLine2D(marker_pad=0.3,      numpoints=None,
                                                **kw)
```

Handler for *Line2D* instances.

#### Parameters

**marker\_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.

#### Notes

Any other keyword arguments are given to *HandlerNpoints*.

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-
               size, trans)
```

```
class matplotlib.legend_handler.HandlerLineCollection(marker_pad=0.3,      num-
                                                       points=None, **kw)
```

Handler for *LineCollection* instances.

#### Parameters

**marker\_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.

#### Notes

Any other keyword arguments are given to *HandlerNpoints*.

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-
               size, trans)
```

```
get_numpoints(self, legend)
```

```
class matplotlib.legend_handler.HandlerNpoints(marker_pad=0.3,      numpoints=None,
                                                **kw)
```

A legend handler that shows *numpoints* points in the legend entry.

#### Parameters

**marker\_pad** [float] Padding between points in legend entry.

**numpoints** [int] Number of points to show in legend entry.

### Notes

Any other keyword arguments are given to *HandlerBase*.

`get_numpoints(self, legend)`

`get_xdata(self, legend, xdescent, ydescent, width, height, fontsize)`

```
class matplotlib.legend_handler.HandlerNpointsYoffsets(numpoints=None, yoff-sets=None, **kw)
```

A legend handler that shows *numpoints* in the legend, and allows them to be individually offset in the y-direction.

### Parameters

**numpoints** [int] Number of points to show in legend entry.

**yoffsets** [array of floats] Length *numpoints* list of y offsets for each point in legend entry.

### Notes

Any other keyword arguments are given to *HandlerNpoints*.

`get_ydata(self, legend, xdescent, ydescent, width, height, fontsize)`

```
class matplotlib.legend_handler.HandlerPatch(patch_func=None, **kw)
    Handler for Patch instances.
```

### Parameters

**patch\_func** [callable, optional] The function that creates the legend key artist. *patch\_func* should have the signature:

```
def patch_func(legend=legend, orig_handle=orig_handle,
               xdescent=xdescent, ydescent=ydescent,
               width=width, height=height, fontsize=fontsize)
```

Subsequently the created artist will have its `update_prop` method called and the appropriate transform will be applied.

### Notes

Any other keyword arguments are given to *HandlerBase*.

`create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-size, trans)`

```
class matplotlib.legend_handler.HandlerPathCollection(yoffsets=None, sizes=None, **kw)
```

Handler for *PathCollections*, which are used by *scatter*.

### Parameters

**numpoints** [int] Number of points to show in legend entry.

**yoffsets** [array of floats] Length *numpoints* list of y offsets for each point in legend entry.

### Notes

Any other keyword arguments are given to *HandlerNpoints*.

`create_collection(self, orig_handle, sizes, offsets, transOffset)`

`class matplotlib.legend_handler.HandlerPolyCollection(xpad=0.0, ypad=0.0, update_func=None)`

Handler for *PolyCollection* used in *fill\_between* and *stackplot*.

`create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-size, trans)`

`class matplotlib.legend_handler.HandlerRegularPolyCollection(yoffsets=None, sizes=None, **kw)`

Handler for *RegularPolyCollections*.

### Parameters

**numpoints** [int] Number of points to show in legend entry.

**yoffsets** [array of floats] Length *numpoints* list of y offsets for each point in legend entry.

### Notes

Any other keyword arguments are given to *HandlerNpoints*.

`create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-size, trans)`

`create_collection(self, orig_handle, sizes, offsets, transOffset)`

`get_numpoints(self, legend)`

`get_sizes(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize)`

`update_prop(self, legend_handle, orig_handle, legend)`

`class matplotlib.legend_handler.HandlerStem(marker_pad=0.3, numpoints=None, bottom=None, yoffsets=None, **kw)`

Handler for plots produced by *stem*.

### Parameters

**marker\_pad** [float, default: 0.3] Padding between points in legend entry.

**numpoints** [int, optional] Number of points to show in legend entry.

**bottom** [float, optional]

**yoffsets** [array of floats, optional] Length *numpoints* list of y offsets for each point in legend entry.

## Notes

Any other keyword arguments are given to *HandlerNpointsYoffsets*.

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-
               size, trans)
```

```
get_ydata(self, legend, xdescent, ydescent, width, height, fontsize)
```

```
class matplotlib.legend_handler.HandlerTuple(ndivide=1, pad=None, **kwargs)
    Handler for Tuple.
```

Additional kwargs are passed through to *HandlerBase*.

## Parameters

**ndivide** [int, default: 1] The number of sections to divide the legend area into. If None, use the length of the input tuple.

**pad** [float, default: `rcParams["legend.borderpad"]` (default: 0.4)] Padding in units of fraction of font size.

```
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, font-
               size, trans)
```

```
matplotlib.legend_handler.update_from_first_child(tgt, src)
```

## 18.30 matplotlib.lines

The 2D line class which can draw with a variety of line styles, markers and colors.

### 18.30.1 Classes

---

<i>Line2D</i> (xdata, ydata[, linewidth, linestyle, ...])	A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex.
<i>VertexSelector</i> (line)	Manage the callbacks to maintain a list of selected vertices for <i>Line2D</i> .

---

#### matplotlib.lines.Line2D

```
class matplotlib.lines.Line2D(xdata, ydata, linewidth=None, linestyle=None,
                              color=None, marker=None, markersize=None, mark-
                              eredgewidth=None, markeredgewidth=None, mark-
                              ertextcolor=None, markerfacecoloralt='none', fill-
                              style=None, antialiased=None, dash_capstyle=None,
                              solid_capstyle=None, dash_joinstyle=None,
                              solid_joinstyle=None, pickradius=5, drawstyle=None,
                              markevery=None, **kwargs)
```

Bases: *matplotlib.artist.Artist*

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex. Additionally, the drawing of the solid line is influenced by the drawstyle, e.g., one can create "stepped" lines in various styles.

Create a *Line2D* instance with *x* and *y* data in sequences of *xdata*, *ydata*.

Additional keyword arguments are *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgecolor</i> or <i>mec</i>	color
<i>markeredgewidth</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[b
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

See *set\_linestyle()* for a description of the line styles, *set\_marker()* for a description of the markers, and *set\_drawstyle()* for a description of the draw styles.

```
__init__(self, xdata, ydata, linewidth=None, linestyle=None, color=None,
          marker=None, markersize=None, markeredgewidth=None,
          markeredgewidth=None, markerfacecolor=None, markerfacecoloralt='none',
          fillstyle=None, antialiased=None, dash_capstyle=None, solid_capstyle=None,
          dash_joinstyle=None, solid_joinstyle=None, pickradius=5, drawstyle=None,
          markevery=None, **kwargs)
```

Create a [Line2D](#) instance with x and y data in sequences of *xdata*, *ydata*.

Additional keyword arguments are [Line2D](#) properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<a href="#">Bbox</a>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<a href="#">Figure</a>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool

<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array

Table 142 – continued from previous page

Property	Description
<code>zorder</code>	float

See `set_linestyle()` for a description of the line styles, `set_marker()` for a description of the markers, and `set_drawstyle()` for a description of the draw styles.

`__module__` = 'matplotlib.lines'

`__str__(self)`

Return str(self).

property axes

The *Axes* instance the artist resides in, or *None*.

`contains(self, mouseevent)`

Test whether *mouseevent* occurred on the line.

An event is deemed to have occurred "on" the line if it is less than `self.pickradius` (default: 5 points) away from it. Use `get_pickradius` or `set_pickradius` to get or set the pick radius.

### Parameters

**mouseevent** [*matplotlib.backend\_bases.MouseEvent*]

### Returns

**contains** [bool] Whether any values are within the radius.

**details** [dict] A dictionary {'ind': pointlist}, where *pointlist* is a list of points of the line that are within the `pickradius` around the event position.

TODO: sort returned indices by distance

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

`drawStyleKeys` = ['default', 'steps-mid', 'steps-pre', 'steps-post', 'steps']

`drawStyles` = {'default': '\_draw\_lines', 'steps': '\_draw\_steps\_pre', 'steps-mid': '\_draw\_steps\_mid'

`fillStyles` = ('full', 'left', 'right', 'bottom', 'top', 'none')

`filled_markers` = ('o', 'v', '^', '<', '>', '8', 's', 'p', '\*', 'h', 'H', 'D', 'd', 'P', 'X')

`get_aa(self)`

Alias for `get_antialiased`.

`get_antialiased(self)`

Return whether antialiased rendering is used.

`get_c(self)`  
Alias for `get_color`.

`get_color(self)`  
Return the line color.  
See also `set_color`.

`get_dash_capstyle(self)`  
Return the cap style for dashed lines.  
See also `set_dash_capstyle`.

`get_dash_joinstyle(self)`  
Return the join style for dashed lines.  
See also `set_dash_joinstyle`.

`get_data(self, orig=True)`  
Return the xdata, ydata.  
If `orig` is `True`, return the original data.

`get_drawstyle(self)`  
Return the drawstyle.  
See also `set_drawstyle`.

`get_ds(self)`  
Alias for `get_drawstyle`.

`get_fillstyle(self)`  
Return the marker fill style.  
See also `set_fillstyle`.

`get_linestyle(self)`  
Return the linestyle.  
See also `set_linestyle`.

`get_linewidth(self)`  
Return the linewidth in points.  
See also `set_linewidth`.

`get_ls(self)`  
Alias for `get_linestyle`.

`get_lw(self)`  
Alias for `get_linewidth`.

`get_marker(self)`  
Return the line marker.  
See also `set_marker`.

`get_markedgedgecolor(self)`  
Return the marker edge color.  
See also `set_markedgedgecolor`.

`get_markedgedgewidth(self)`  
Return the marker edge width in points.  
See also `set_markedgedgewidth`.

`get_markerfacecolor(self)`  
 Return the marker face color.  
 See also `set_markerfacecolor`.

`get_markerfacecoloralt(self)`  
 Return the alternate marker face color.  
 See also `set_markerfacecoloralt`.

`get_markersize(self)`  
 Return the marker size in points.  
 See also `set_markersize`.

`get_markevery(self)`  
 Return the markevery setting for marker subsampling.  
 See also `set_markevery`.

`get_mec(self)`  
 Alias for `get_markeredgcolor`.

`get_mew(self)`  
 Alias for `get_markeredgwidth`.

`get_mfc(self)`  
 Alias for `get_markerfacecolor`.

`get_mfcalt(self)`  
 Alias for `get_markerfacecoloralt`.

`get_ms(self)`  
 Alias for `get_markersize`.

`get_path(self)`  
 Return the `Path` object associated with this line.

`get_pickradius(self)`  
 Return the pick radius used for containment tests.  
 See `contains` for more details.

`get_solid_capstyle(self)`  
 Return the cap style for solid lines.  
 See also `set_solid_capstyle`.

`get_solid_joinstyle(self)`  
 Return the join style for solid lines.  
 See also `set_solid_joinstyle`.

`get_window_extent(self, renderer)`  
 Get the axes bounding box in display space.  
 The bounding box' width and height are nonnegative.  
 Subclasses should override for inclusion in the bounding box "tight" calculation.  
 Default is to return an empty bounding box at 0, 0.  
 Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas

used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_xdata(self, orig=True)`

Return the xdata.

If *orig* is *True*, return the original data, else the processed data.

`get_xydata(self)`

Return the xy data as a Nx2 numpy array.

`get_ydata(self, orig=True)`

Return the ydata.

If *orig* is *True*, return the original data, else the processed data.

`is_dashed(self)`

Return whether line has a dashed linestyle.

See also [set\\_linestyle](#).

`lineStyles = {'': '_draw_nothing', ' ': '_draw_nothing', '-': '_draw_solid', '--': '_draw_dashed'`

`markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triangle_up', '`

`property pickradius`

Return the pick radius used for containment tests.

See [contains](#) for more details.

`recache(self, always=False)`

`recache_always(self)`

`set_aa(self, b)`

Alias for [set\\_antialiased](#).

`set_antialiased(self, b)`

Set whether to use antialiased rendering.

### Parameters

**b** [bool]

`set_c(self, color)`

Alias for [set\\_color](#).

`set_color(self, color)`

Set the color of the line.

### Parameters

**color** [color]

`set_dash_capstyle(self, s)`

Set the cap style for dashed lines.

### Parameters

**s** [{'butt', 'round', 'projecting'}] For examples see [/gallery/lines\\_bars\\_and\\_markers/joinstyle](#).

`set_dash_joinstyle(self, s)`

Set the join style for dashed lines.

### Parameters

**s** [{'miter', 'round', 'bevel'}] For examples see [/gallery/lines\\_bars\\_and\\_markers/joinstyle](/gallery/lines_bars_and_markers/joinstyle).

**set\_dashes(self, seq)**

Set the dash sequence.

The dash sequence is a sequence of floats of even length describing the length of dashes and spaces in points.

For example, (5, 2, 1, 2) describes a sequence of 5 point and 1 point dashes separated by 2 point spaces.

#### Parameters

**seq** [sequence of floats (on/off ink in points) or (None, None)] If *seq* is empty or (None, None), the linestyle will be set to solid.

**set\_data(self, \*args)**

Set the x and y data.

#### Parameters

**\*args** [(2, N) array or two 1D arrays]

**set\_drawstyle(self, drawstyle)**

Set the drawstyle of the plot.

The drawstyle determines how the points are connected.

#### Parameters

**drawstyle** [{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'] For 'default', the points are connected with straight lines.

The steps variants connect the points with step-like lines, i.e. horizontal lines with vertical steps. They differ in the location of the step:

- 'steps-pre': The step is at the beginning of the line segment, i.e. the line will be at the y-value of point to the right.
- 'steps-mid': The step is halfway between the points.
- 'steps-post': The step is at the end of the line segment, i.e. the line will be at the y-value of the point to the left.
- 'steps' is equal to 'steps-pre' and is maintained for backward-compatibility.

For examples see [/gallery/lines\\_bars\\_and\\_markers/step\\_demo](/gallery/lines_bars_and_markers/step_demo).

**set\_ds(self, drawstyle)**

Alias for [set\\_drawstyle](#).

**set\_fillstyle(self, fs)**

Set the marker fill style.

#### Parameters

**fs** [{'full', 'left', 'right', 'bottom', 'top', 'none'}] Possible values:

- 'full': Fill the whole marker with the *markerfacecolor*.

- 'left', 'right', 'bottom', 'top': Fill the marker half at the given side with the *markerfacecolor*. The other half of the marker is filled with *markerfacecoloralt*.
- 'none': No filling.

For examples see `marker_fill_styles`.

`set_linestyle(self, ls)`

Set the linestyle of the line.

#### Parameters

**ls** [{ '-', '--', '-.', ':', '', (offset, on-off-seq), ...}] Possible values:

- A string:

Linestyle	Description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line
'None' or ' ' or ''	draw nothing

- Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq)

where *onoffseq* is an even length tuple of on and off ink in points.  
See also `set_dashes()`.

For examples see `/gallery/lines_bars_and_markers/linestyles`.

`set_linewidth(self, w)`

Set the line width in points.

#### Parameters

**w** [float] Line width, in points.

`set_ls(self, ls)`

Alias for `set_linestyle`.

`set_lw(self, w)`

Alias for `set_linewidth`.

`set_marker(self, marker)`

Set the line marker.

#### Parameters

**marker** [marker style string, *Path* or *MarkerStyle*] See *markers* for full description of possible arguments.

`set_markeredgecolor(self, ec)`

Set the marker edge color.

#### Parameters

**ec** [color]

`set_markeredgewidth(self, ew)`

Set the marker edge width in points.

**Parameters**

**ew** [float] Marker edge width, in points.

`set_markerfacecolor(self, fc)`

Set the marker face color.

**Parameters**

**fc** [color]

`set_markerfacecoloralt(self, fc)`

Set the alternate marker face color.

**Parameters**

**fc** [color]

`set_markersize(self, sz)`

Set the marker size in points.

**Parameters**

**sz** [float] Marker size, in points.

`set_markevery(self, every)`

Set the markevery property to subsample the plot when using markers.

e.g., if `every=5`, every 5-th marker will be plotted.

**Parameters**

**every** [None or int or (int, int) or slice or List[int] or float or (float, float) or List[bool]] Which markers to plot.

- `every=None`, every point will be plotted.
- `every=N`, every N-th marker will be plotted starting with marker 0.
- `every=(start, N)`, every N-th marker, starting at point start, will be plotted.
- `every=slice(start, end, N)`, every N-th marker, starting at point start, up to but not including point end, will be plotted.
- `every=[i, j, m, n]`, only markers at points i, j, m, and n will be plotted.
- `every=[True, False, True]`, positions that are True will be plotted.
- `every=0.1`, (i.e. a float) then markers will be spaced at approximately equal distances along the line; the distance along the line between markers is determined by multiplying the display-coordinate distance of the axes bounding-box diagonal by the value of `every`.
- `every=(0.5, 0.1)` (i.e. a length-2 tuple of float), the same functionality as `every=0.1` is exhibited but the first marker will be 0.5 multiplied by the display-coordinate-diagonal-distance along the line.

For examples see `/gallery/lines_bars_and_markers/markevery_demo`.

## Notes

Setting the `markevery` property will only show markers at actual data points. When using float arguments to set the `markevery` property on irregularly spaced data, the markers will likely not appear evenly spaced because the actual data points do not coincide with the theoretical spacing between markers.

When using a start offset to specify the first marker, the offset will be from the first data point which may be different from the first the visible data point if the plot is zoomed in.

If zooming in on a plot when using float arguments then the actual data points that have markers will change because the distance between markers is always determined from the display-coordinates axes-bounding-box-diagonal regardless of the actual axes data limits.

`set_mec(self, ec)`  
Alias for `set_markeredgcolor`.

`set_mew(self, ew)`  
Alias for `set_markeredgewidth`.

`set_mfc(self, fc)`  
Alias for `set_markerfacecolor`.

`set_mfcalt(self, fc)`  
Alias for `set_markerfacecoloralt`.

`set_ms(self, sz)`  
Alias for `set_markersize`.

`set_picker(self, p)`  
Define the picking behavior of the artist.

## Parameters

**picker** [None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the `PickEvent` attributes.

- *deprecated*: For `Line2D` only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use `Line2D.set_pickradius` instead.

`set_pickradius(self, d)`  
Set the pick radius used for containment tests.  
See `contains` for more details.

## Parameters

**d** [float] Pick radius, in points.

`set_solid_capstyle(self, s)`

Set the cap style for solid lines.

#### Parameters

**s** [{'butt', 'round', 'projecting'}] For examples see [/gallery/lines\\_bars\\_and\\_markers/joinstyle](#).

`set_solid_joinstyle(self, s)`

Set the join style for solid lines.

#### Parameters

**s** [{'miter', 'round', 'bevel'}] For examples see [/gallery/lines\\_bars\\_and\\_markers/joinstyle](#).

`set_transform(self, t)`

Set the Transformation instance used by this artist.

#### Parameters

**t** [[matplotlib.transforms.Transform](#)]

`set_xdata(self, x)`

Set the data array for x.

#### Parameters

**x** [1D array]

`set_ydata(self, y)`

Set the data array for y.

#### Parameters

**y** [1D array]

`update_from(self, other)`

Copy properties from *other* to self.

`validCap = ('butt', 'round', 'projecting')`

`validJoin = ('miter', 'round', 'bevel')`

`zorder = 2`

### matplotlib.lines.VertexSelector

class matplotlib.lines.VertexSelector(*line*)

Bases: object

Manage the callbacks to maintain a list of selected vertices for *Line2D*. Derived classes should override *process\_selected()* to do something with the picks.

Here is an example which highlights the selected verts with red circles:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.lines as lines

class HighlightSelected(lines.VertexSelector):
    def __init__(self, line, fmt='ro', **kwargs):
        lines.VertexSelector.__init__(self, line)
        self.markers, = self.axes.plot([], [], fmt, **kwargs)

    def process_selected(self, ind, xs, ys):
        self.markers.set_data(xs, ys)
        self.canvas.draw()

fig, ax = plt.subplots()
x, y = np.random.rand(2, 30)
line, = ax.plot(x, y, 'bs-', picker=5)

selector = HighlightSelected(line)
plt.show()
```

Initialize the class with a *Line2D* instance. The line should already be added to some *matplotlib.axes.Axes* instance and should have the picker property set.

*\_\_dict\_\_* = mappingproxy({'\_\_module\_\_': 'matplotlib.lines', '\_\_doc\_\_': "\n Manage the callbacks to

*\_\_init\_\_(self, line)*

Initialize the class with a *Line2D* instance. The line should already be added to some *matplotlib.axes.Axes* instance and should have the picker property set.

*\_\_module\_\_* = 'matplotlib.lines'

*\_\_weakref\_\_*

list of weak references to the object (if defined)

*onpick(self, event)*

When the line is picked, update the set of selected indices.

```
process_selected(self, ind, xs, ys)
```

Default "do nothing" implementation of the `process_selected()` method.

### Parameters

**ind** [list of int] The indices of the selected vertices.

**xs, ys** [array-like] The coordinates of the selected vertices.

Examples using `matplotlib.lines.VertexSelector`

## 18.30.2 Functions

---

```
segment_hits(cx, cy, x, y, radius)
```

Return the indices of the segments in the polyline with coordinates  $(cx, cy)$  that are within a distance *radius* of the point  $(x, y)$ .

---

`matplotlib.lines.segment_hits`

```
matplotlib.lines.segment_hits(cx, cy, x, y, radius)
```

Return the indices of the segments in the polyline with coordinates  $(cx, cy)$  that are within a distance *radius* of the point  $(x, y)$ .

Examples using `matplotlib.lines.segment_hits`

## 18.31 matplotlib.markers

Functions to handle markers; used by the marker functionality of `plot` and `scatter`.

All possible markers are defined here:

marker	symbol	description
"."		point
","		pixel
"o"		circle
"v"		triangle_down
"^"		triangle_up
"<"		triangle_left
">"		triangle_right
"1"		tri_down
"2"		tri_up
"3"		tri_left
"4"		tri_right
"8"		octagon

Table 144 – continued

marker	symbol	description
"s"		square
"p"		pentagon
"P"		plus (filled)
"*"		star
"h"		hexagon1
"H"		hexagon2
"+"		plus
"x"		x
"X"		x (filled)
"D"		diamond
"d"		thin_diamond
" "		vline
"_"		hline
0 (TICKLEFT)		tickleft
1 (TICKRIGHT)		tickright
2 (TICKUP)		tickup
3 (TICKDOWN)		tickdown
4 (CARETLEFT)		caretleft
5 (CARETRIGHT)		caretright
6 (CARETUP)		caretup
7 (CARETDOWN)		caretdown
8 (CARETLEFTBASE)		caretleft (centered at base)
9 (CARETRIGHTBASE)		caretright (centered at base)
10 (CARETUPBASE)		caretup (centered at base)
11 (CARETDOWNBASE)		caretdown (centered at base)
"None", " " or ""		nothing
'\$...\$'		Render the string using mathtext. E.g "\$f\$" for marker showing the letter
verts		A list of (x, y) pairs used for Path vertices. The center of the marker is loca
path		A <i>Path</i> instance.
(numsides, 0, angle)		A regular polygon with numsides sides, rotated by angle.
(numsides, 1, angle)		A star-like symbol with numsides sides, rotated by angle.
(numsides, 2, angle)		An asterisk with numsides sides, rotated by angle.

None is the default which means 'nothing', however this table is referred to from other docs for the valid inputs from marker inputs and in those cases None still means 'default'.

Note that special symbols can be defined via the [STIX math font](#), e.g. "\$\u266B\$". For an overview over the STIX font symbols refer to the [STIX font table](#). Also see the [/gallery/text\\_labels\\_and\\_annotations/stix\\_fonts\\_demo](#).

Integer numbers from 0 to 11 create lines and triangles. Those are equally accessible via capitalized variables, like CARETDOWNBASE. Hence the following are equivalent:

```
plt.plot([1, 2, 3], marker=11)
plt.plot([1, 2, 3], marker=matplotlib.markers.CARETDOWNBASE)
```

Examples showing the use of markers:

- [/gallery/lines\\_bars\\_and\\_markers/marker\\_reference](#)
- [/gallery/shapes\\_and\\_collections/marker\\_path](#)
- [/gallery/lines\\_bars\\_and\\_markers/scatter\\_star\\_poly](#)

### 18.31.1 Classes

---

<i>MarkerStyle</i> ([marker, fillstyle])	A class representing marker types.
--	------------------------------------

---

#### matplotlib.markers.MarkerStyle

```
class matplotlib.markers.MarkerStyle(marker=None, fillstyle=None)
```

Bases: `object`

A class representing marker types.

#### Attributes

**markers** [list] All known markers.

**filled\_markers** [list] All known filled markers. This is a subset of *markers*.

**fillstyles** [list] The supported fillstyles.

#### Parameters

**marker** [str or array-like or None, default: None] *None* means no marker. For other possible marker values see the module docstring [matplotlib.markers](#).

**fillstyle** [str, default: 'full'] One of 'full', 'left', 'right', 'bottom', 'top', 'none'.

```
__bool__(self)
```

```
__dict__ = mappingproxy({'__module__': 'matplotlib.markers', '__doc__': '\n A class representing m
```

```
__init__(self, marker=None, fillstyle=None)
```

#### Parameters

**marker** [str or array-like or None, default: None] *None* means no marker. For other possible marker values see the module docstring [matplotlib.markers](#).

**fillstyle** [str, default: 'full'] One of 'full', 'left', 'right', 'bottom', 'top', 'none'.

```
__module__ = 'matplotlib.markers'
```

```

__weakref__
    list of weak references to the object (if defined)

filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')

fillstyles = ('full', 'left', 'right', 'bottom', 'top', 'none')

get_alt_path(self)
    Return a Path for the alternate part of the marker.

    For unfilled markers, this is None; for filled markers, this is the area to be drawn
    with markerfacecoloralt.

get_alt_transform(self)
    Return the transform to be applied to the Path from MarkerStyle.get_alt_path().

get_capstyle(self)

get_fillstyle(self)

get_joinstyle(self)

get_marker(self)

get_path(self)
    Return a Path for the primary part of the marker.

    For unfilled markers this is the whole marker, for filled markers, this is the area to
    be drawn with markerfacecolor.

get_snap_threshold(self)

get_transform(self)
    Return the transform to be applied to the Path from MarkerStyle.get_path().

is_filled(self)

markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triangle_up', '
set_fillstyle(self, fillstyle)
    Set the fillstyle.

```

### Parameters

**fillstyle** [*'full', 'left', 'right', 'bottom', 'top', 'none'*] The part of the marker surface that is colored with *markerfacecolor*.

```

set_marker(self, marker)
    Set the marker.

```

### Parameters

**marker** [*str* or array-like or *None*, default: *None*] *None* means no marker. For other possible marker values see the module docstring *matplotlib.markers*.

Examples using `matplotlib.markers.MarkerStyle`

## 18.32 matplotlib.mathtext

A module for parsing a subset of the TeX math syntax and rendering it to a Matplotlib backend. For a tutorial of its usage, see [Writing mathematical expressions](#). This document is primarily concerned with implementation details.

The module uses [pyparsing](#) to parse the TeX expression.

The Bakoma distribution of the TeX Computer Modern fonts, and STIX fonts are supported. There is experimental support for using arbitrary fonts, but results may vary without proper

tweaking and metrics for those fonts.

```
class matplotlib.mathtext.Accent(c, state, math=True)
```

Bases: `matplotlib.mathtext.Char`

The font metrics need to be dealt with differently for accents, since they are already offset correctly from the baseline in TrueType fonts.

```
grow(self)
```

Grows one level larger. There is no limit to how big something can get.

```
render(self, x, y)
```

Render the character to the canvas.

```
shrink(self)
```

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

```
class matplotlib.mathtext.AutoHeightChar(c, height, depth, state, always=False, factor=None)
```

Bases: `matplotlib.mathtext.Hlist`

A character as close to the given height and depth as possible.

When using a font with multiple height versions of some characters (such as the BaKoMa fonts), the correct glyph will be selected, otherwise this will always just return a scaled version of the glyph.

```
class matplotlib.mathtext.AutoWidthChar(c, width, state, always=False, char_class=<class matplotlib.mathtext.Char>)
```

Bases: `matplotlib.mathtext.Hlist`

A character as close to the given width as possible.

When using a font with multiple width versions of some characters (such as the BaKoMa fonts), the correct glyph will be selected, otherwise this will always just return a scaled version of the glyph.

```
class matplotlib.mathtext.BakomaFonts(*args, **kwargs)
```

Bases: `matplotlib.mathtext.TruetypeFonts`

Use the Bakoma TrueType fonts for rendering.

Symbols are strewn about a number of font files, each of which has its own proprietary 8-bit encoding.

### Parameters

**default\_font\_prop:** `'~.font_manager.FontProperties'` The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** `'MathtextBackend'` subclass Backend to which rendering is actually delegated.

```
alias = '\\\]
```

```
get_sized_alternatives_for_symbol(self, fontname, sym)
```

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching `sym` in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

```
target = '\]
```

```
class matplotlib.mathtext.Box(width, height, depth)
    Bases: matplotlib.mathtext.Node
    A node with a physical location.
    grow(self)
        Grows one level larger. There is no limit to how big something can get.
    render(self, x1, y1, x2, y2)
    shrink(self)
        Shrinks one level smaller. There are only three levels of sizes, after which things
        will no longer get smaller.

class matplotlib.mathtext.Char(c, state, math=True)
    Bases: matplotlib.mathtext.Node
    A single character.

    Unlike TeX, the font information and metrics are stored with each Char to make it easier
    to lookup the font metrics when needed. Note that TeX boxes have a width, height,
    and depth, unlike Type1 and TrueType which use a full bounding box and an advance
    in the x-direction. The metrics must be converted to the TeX model, and the advance (if
    different from width) must be converted into a Kern node when the Char is added to its
    parent Hlist.

    get_kerning(self, next)
        Return the amount of kerning between this and the given character.

        This method is called when characters are strung together into Hlist to create Kern
        nodes.

    grow(self)
        Grows one level larger. There is no limit to how big something can get.

    is_slanted(self)
    render(self, x, y)
        Render the character to the canvas

    shrink(self)
        Shrinks one level smaller. There are only three levels of sizes, after which things
        will no longer get smaller.

class matplotlib.mathtext.ComputerModernFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase

    delta = 0.075
    delta_integral = 0.3
    delta_slanted = 0.3
    script_space = 0.075
    sub1 = 0.2
    sub2 = 0.3
    subdrop = 0.2
    sup1 = 0.45

class matplotlib.mathtext.DejaVuFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.UnicodeFonts
```

**Parameters**

**default\_font\_prop:** '~.font\_manager.FontProperties' The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** 'MathtextBackend' subclass Backend to which rendering is actually delegated.

```
use_cmex = False
```

```
class matplotlib.mathtext.DejaVuSansFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase
```

```
class matplotlib.mathtext.DejaVuSansFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.DejaVuFonts
```

A font handling class for the DejaVu Sans fonts

If a glyph is not found it will fallback to Stix Sans

**Parameters**

**default\_font\_prop:** '~.font\_manager.FontProperties' The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** 'MathtextBackend' subclass Backend to which rendering is actually delegated.

```
class matplotlib.mathtext.DejaVuSerifFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase
```

```
class matplotlib.mathtext.DejaVuSerifFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.DejaVuFonts
```

A font handling class for the DejaVu Serif fonts

If a glyph is not found it will fallback to Stix Serif

**Parameters**

**default\_font\_prop:** '~.font\_manager.FontProperties' The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** 'MathtextBackend' subclass Backend to which rendering is actually delegated.

```
matplotlib.mathtext.Error(msg)
    Helper class to raise parser errors.
```

```
class matplotlib.mathtext.Fill
    Bases: matplotlib.mathtext.Glue
    [Deprecated]
```

**Notes**

Deprecated since version 3.3:

```
class matplotlib.mathtext.Fill
    Bases: matplotlib.mathtext.Glue
    [Deprecated]
```

### Notes

Deprecated since version 3.3:

```
class matplotlib.mathtext.Fill11
    Bases: matplotlib.mathtext.Glue
    [Deprecated]
```

### Notes

Deprecated since version 3.3:

```
class matplotlib.mathtext.FontConstantsBase
    Bases: object
```

A set of constants that controls how certain things, such as sub- and superscripts are laid out. These are all metrics that can't be reliably retrieved from the font metrics in the font itself.

```
delta = 0.025
```

```
delta_integral = 0.1
```

```
delta_slanted = 0.2
```

```
script_space = 0.05
```

```
sub1 = 0.3
```

```
sub2 = 0.5
```

```
subdrop = 0.4
```

```
sup1 = 0.7
```

```
class matplotlib.mathtext.Fonts(default_font_prop, mathtext_backend)
    Bases: object
```

An abstract base class for a system of fonts to use for mathtext.

The class must be able to take symbol keys and font file names and return the character metrics. It also delegates to a backend class to do the actual drawing.

### Parameters

**default\_font\_prop:** '*~.font\_manager.FontProperties*' The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** '*MathtextBackend*' subclass Backend to which rendering is actually delegated.

**destroy(*self*)**

Fix any cyclical references before the object is about to be destroyed.

**get\_kern(*self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi*)**

Get the kerning distance for font between *sym1* and *sym2*.

*fontX*: one of the TeX font names:

tt, it, rm, cal, sf, bf or default/regular (non-math)
---

*fontclassX*: TODO

*symX*: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

*fontsizeX*: the fontsize in points

*dpi*: the current dots-per-inch

`get_metrics(self, font, font_class, sym, fontsize, dpi, math=True)`

*font*: one of the TeX font names:

tt, it, rm, cal, sf, bf or default/regular (non-math)

*font\_class*: TODO

*sym*: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

*fontsize*: font size in points

*dpi*: current dots-per-inch

*math*: whether sym is a math character

Returns an object with the following attributes:

- *advance*: The advance distance (in points) of the glyph.
- *height*: The height of the glyph in points.
- *width*: The width of the glyph in points.
- *xmin*, *xmax*, *ymin*, *ymax* - the ink rectangle of the glyph
- *iceberg* - the distance from the baseline to the top of the glyph. This corresponds to TeX's definition of "height".

`get_results(self, box)`

Get the data needed by the backend to render the math expression. The return value is backend-specific.

`get_sized_alternatives_for_symbol(self, fontname, sym)`

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

`get_underline_thickness(self, font, fontsize, dpi)`

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

`get_used_characters(self)`

Get the set of characters that were used in the math expression. Used by backends that need to subset fonts so they know which glyphs to include.

`get_xheight(self, font, fontsize, dpi)`

Get the xheight for the given *font* and *fontsize*.

`render_glyph(self, ox, oy, facename, font_class, sym, fontsize, dpi)`

Draw a glyph at

- *ox*, *oy*: position
- *facename*: One of the TeX face names
- *font\_class*:
- *sym*: TeX symbol name or single character

- *fontsize*: fontsize in points
- *dpi*: The dpi to draw at.

`render_rect_filled(self, x1, y1, x2, y2)`

Draw a filled rectangle from (x1, y1) to (x2, y2).

`set_canvas_size(self, w, h, d)`

Set the size of the buffer used to render the math expression. Only really necessary for the bitmap backends.

`class matplotlib.mathtext.Glue(glue_type, copy=<deprecated parameter>)`

Bases: `matplotlib.mathtext.Node`

Most of the information in this object is stored in the underlying `_GlueSpec` class, which is shared between multiple glue objects. (This is a memory optimization which probably doesn't matter anymore, but it's easier to stick to what TeX does.)

property `glue_subtype`

`grow(self)`

Grows one level larger. There is no limit to how big something can get.

`shrink(self)`

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

`class matplotlib.mathtext.GlueSpec(width=0.0, stretch=0.0, stretch_order=0, shrink=0.0, shrink_order=0)`

Bases: `object`

[*Deprecated*] See `Glue`.

## Notes

Deprecated since version 3.3.

`copy(self)`

classmethod `factory(glue_type)`

`class matplotlib.mathtext.HCentered(elements)`

Bases: `matplotlib.mathtext.Hlist`

A convenience class to create an `Hlist` whose contents are centered within its enclosing box.

`class matplotlib.mathtext.Hbox(width)`

Bases: `matplotlib.mathtext.Box`

A box with only width (zero height and depth).

`class matplotlib.mathtext.Hlist(elements, w=0.0, m='additional', do_kern=True)`

Bases: `matplotlib.mathtext.List`

A horizontal list of boxes.

`hpack(self, w=0.0, m='additional')`

Compute the dimensions of the resulting boxes, and adjust the glue if one of those dimensions is pre-specified. The computed sizes normally enclose all of the material inside the new box; but some items may stick out if negative glue is used, if the box is overfull, or if a `\vbox` includes other boxes that have been shifted left.

### Parameters

**w** [float, default: 0] A width.

**m** [{‘exactly’, ‘additional’}, default: ‘additional’] Whether to produce a box whose width is ‘exactly’ *w*; or a box with the natural width of the contents, plus *w* (‘additional’).

### Notes

The defaults produce a box with the natural width of the contents.

`kern(self)`

Insert *Kern* nodes between *Char* nodes to set kerning.

The *Char* nodes themselves determine the amount of kerning they need (in `get_kerning`), and this function just creates the correct linked list.

```
class matplotlib.mathtext.Hrule(state, thickness=None)
```

Bases: `matplotlib.mathtext.Rule`

Convenience class to create a horizontal rule.

```
class matplotlib.mathtext.Kern(width)
```

Bases: `matplotlib.mathtext.Node`

A *Kern* node has a width field to specify a (normally negative) amount of spacing. This spacing correction appears in horizontal lists between letters like A and V when the font designer said that it looks better to move them closer together or further apart. A kern node can also appear in a vertical list, when its *width* denotes additional spacing in the vertical direction.

`depth = 0`

`grow(self)`

Grows one level larger. There is no limit to how big something can get.

`height = 0`

`shrink(self)`

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

```
class matplotlib.mathtext.List(elements)
```

Bases: `matplotlib.mathtext.Box`

A list of nodes (either horizontal or vertical).

`grow(self)`

Grows one level larger. There is no limit to how big something can get.

`shrink(self)`

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

```
class matplotlib.mathtext.MathTextParser(output)
```

Bases: `object`

Create a *MathTextParser* for the given backend *output*.

`get_depth(self, texstr, dpi=120, fontsize=14)`

### Parameters

**texstr** [str] A valid mathtext string, e.g., `r'IQ: $\sigma_i=15$'`.

**dpi** [float] The dots-per-inch setting used to render the text.

### Returns

**int** Offset of the baseline from the bottom of the image, in pixels.

`parse(self, s, dpi=72, prop=None)`

Parse the given math expression *s* at the given *dpi*. If *prop* is provided, it is a [\*FontProperties\*](#) object specifying the "default" font to use in the math expression, used for all non-math text.

The results are cached, so multiple calls to [\*parse\*](#) with the same expression should be fast.

`to_mask(self, texstr, dpi=120, fontsize=14)`

### Parameters

**texstr** [str] A valid mathtext string, e.g., `r'IQ: $\sigma_i=15$'`.

**dpi** [float] The dots-per-inch setting used to render the text.

**fontsize** [int] The font size in points

### Returns

**array** [2D uint8 alpha] Mask array of rasterized tex.

**depth** [int] Offset of the baseline from the bottom of the image, in pixels.

`to_png(self, filename, texstr, color='black', dpi=120, fontsize=14)`

Render a tex expression to a PNG file.

### Parameters

**filename** A writable filename or fileobject.

**texstr** [str] A valid mathtext string, e.g., `r'IQ: $\sigma_i=15$'`.

**color** [color] The text color.

**dpi** [float] The dots-per-inch setting used to render the text.

**fontsize** [int] The font size in points.

### Returns

**int** Offset of the baseline from the bottom of the image, in pixels.

`to_rgba(self, texstr, color='black', dpi=120, fontsize=14)`

### Parameters

**texstr** [str] A valid mathtext string, e.g., `r'IQ: $\sigma_i=15$'`.

**color** [color] The text color.

**dpi** [float] The dots-per-inch setting used to render the text.

**fontsize** [int] The font size in points.

### Returns

**array** [(M, N, 4) array] RGBA color values of rasterized tex, colorized with *color*.

**depth** [int] Offset of the baseline from the bottom of the image, in pixels.

exception matplotlib.mattext.MathTextWarning

Bases: [Warning](#)

class matplotlib.mattext.MathtextBackend

Bases: [object](#)

The base class for the mattext backend-specific code. [MathtextBackend](#) subclasses interface between mattext and specific Matplotlib graphics backends.

Subclasses need to override the following:

- [render\\_glyph\(\)](#)
- [render\\_rect\\_filled\(\)](#)
- [get\\_results\(\)](#)

And optionally, if you need to use a FreeType hinting style:

- [get\\_hinting\\_type\(\)](#)

[get\\_hinting\\_type\(self\)](#)

Get the FreeType hinting type to use with this particular backend.

[get\\_results\(self, box\)](#)

Return a backend-specific tuple to return to the backend after all processing is done.

[render\\_glyph\(self, ox, oy, info\)](#)

Draw a glyph described by *info* to the reference point (ox, oy).

[render\\_rect\\_filled\(self, x1, y1, x2, y2\)](#)

Draw a filled black rectangle from (x1, y1) to (x2, y2).

[set\\_canvas\\_size\(self, w, h, d\)](#)

Set the dimension of the drawing canvas.

class matplotlib.mattext.MathtextBackendAgg

Bases: [matplotlib.mattext.MathtextBackend](#)

Render glyphs and rectangles to an FTImage buffer, which is later transferred to the Agg image by the Agg backend.

[get\\_hinting\\_type\(self\)](#)

Get the FreeType hinting type to use with this particular backend.

[get\\_results\(self, box, used\\_characters\)](#)

Return a backend-specific tuple to return to the backend after all processing is done.

[render\\_glyph\(self, ox, oy, info\)](#)

Draw a glyph described by *info* to the reference point (ox, oy).

[render\\_rect\\_filled\(self, x1, y1, x2, y2\)](#)

Draw a filled black rectangle from (x1, y1) to (x2, y2).

[set\\_canvas\\_size\(self, w, h, d\)](#)

Set the dimension of the drawing canvas.

class matplotlib.mattext.MathtextBackendBitmap

Bases: [matplotlib.mattext.MathtextBackendAgg](#)

[get\\_results\(self, box, used\\_characters\)](#)

Return a backend-specific tuple to return to the backend after all processing is done.

```
class matplotlib.mathtext.MathtextBackendCairo
    Bases: matplotlib.mathtext.MathtextBackend
    Store information to write a mathtext rendering to the Cairo backend.
    get_results(self, box, used_characters)
        Return a backend-specific tuple to return to the backend after all processing is done.
    render_glyph(self, ox, oy, info)
        Draw a glyph described by info to the reference point (ox, oy).
    render_rect_filled(self, x1, y1, x2, y2)
        Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.MathtextBackendPath
    Bases: matplotlib.mathtext.MathtextBackend
    Store information to write a mathtext rendering to the text path machinery.
    get_results(self, box, used_characters)
        Return a backend-specific tuple to return to the backend after all processing is done.
    render_glyph(self, ox, oy, info)
        Draw a glyph described by info to the reference point (ox, oy).
    render_rect_filled(self, x1, y1, x2, y2)
        Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.MathtextBackendPdf
    Bases: matplotlib.mathtext.MathtextBackend
    Store information to write a mathtext rendering to the PDF backend.
    get_results(self, box, used_characters)
        Return a backend-specific tuple to return to the backend after all processing is done.
    render_glyph(self, ox, oy, info)
        Draw a glyph described by info to the reference point (ox, oy).
    render_rect_filled(self, x1, y1, x2, y2)
        Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.MathtextBackendPs
    Bases: matplotlib.mathtext.MathtextBackend
    Store information to write a mathtext rendering to the PostScript backend.
    get_results(self, box, used_characters)
        Return a backend-specific tuple to return to the backend after all processing is done.
    render_glyph(self, ox, oy, info)
        Draw a glyph described by info to the reference point (ox, oy).
    render_rect_filled(self, x1, y1, x2, y2)
        Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.MathtextBackendSvg
    Bases: matplotlib.mathtext.MathtextBackend
    Store information to write a mathtext rendering to the SVG backend.
    get_results(self, box, used_characters)
        Return a backend-specific tuple to return to the backend after all processing is done.
```

`render_glyph(self, ox, oy, info)`  
 Draw a glyph described by *info* to the reference point (ox, oy).

`render_rect_filled(self, x1, y1, x2, y2)`  
 Draw a filled black rectangle from (x1, y1) to (x2, y2).

```
class matplotlib.mathtext.NegFil
  Bases: matplotlib.mathtext.Glue
  [Deprecated]
```

#### Notes

Deprecated since version 3.3:

```
class matplotlib.mathtext.NegFill
  Bases: matplotlib.mathtext.Glue
  [Deprecated]
```

#### Notes

Deprecated since version 3.3:

```
class matplotlib.mathtext.NegFilll
  Bases: matplotlib.mathtext.Glue
  [Deprecated]
```

#### Notes

Deprecated since version 3.3:

```
class matplotlib.mathtext.Node
  Bases: object

  A node in the TeX box model.

  get_kerning(self, next)

  grow(self)
    Grows one level larger. There is no limit to how big something can get.

  render(self, x, y)

  shrink(self)
    Shrinks one level smaller. There are only three levels of sizes, after which things
    will no longer get smaller.
```

```
class matplotlib.mathtext.Parser
  Bases: object

  A pyparsing-based parser for strings containing math expressions.

  Raw text may also appear outside of pairs of $.

  The grammar is based directly on that in TeX, though it cuts a few corners.
```

```
class State(font_output, font, font_class, fontsize, dpi)
    Bases: object

    Stores the state of the parser.

    States are pushed and popped from a stack as necessary, and the "current" state is
    always at the top of the stack.

    copy(self)

    property font
accent(self, s, loc, toks)
accentprefixed(self, s, loc, toks)
auto_delim(self, s, loc, toks)
binom(self, s, loc, toks)
c_over_c(self, s, loc, toks)
customspace(self, s, loc, toks)
dfrac(self, s, loc, toks)
end_group(self, s, loc, toks)
font(self, s, loc, toks)
frac(self, s, loc, toks)
function(self, s, loc, toks)
genfrac(self, s, loc, toks)
get_state(self)
    Get the current State of the parser.
group(self, s, loc, toks)
is_between_brackets(self, s, loc)
is_dropsup(self, nucleus)
is_overunder(self, nucleus)
is_slanted(self, nucleus)
main(self, s, loc, toks)
math(self, s, loc, toks)
math_string(self, s, loc, toks)
non_math(self, s, loc, toks)
operatorname(self, s, loc, toks)
overline(self, s, loc, toks)
parse(self, s, fonts_object, fontsize, dpi)
    Parse expression s using the given fonts_object for output, at the given fontsize and
    dpi.

    Returns the parse tree of Node instances.
pop_state(self)
    Pop a State off of the stack.
```

```

push_state(self)
    Push a new State onto the stack, copying the current state.
required_group(self, s, loc, toks)
simple_group(self, s, loc, toks)
space(self, s, loc, toks)
sqrt(self, s, loc, toks)
start_group(self, s, loc, toks)
subsuper(self, s, loc, toks)
symbol(self, s, loc, toks)
unknown_symbol(self, s, loc, toks)

```

```
class matplotlib.mathtext.Rule(width, height, depth, state)
```

Bases: *matplotlib.mathtext.Box*

A solid black rectangle.

It has *width*, *depth*, and *height* fields just as in an *Hlist*. However, if any of these dimensions is *inf*, the actual value will be determined by running the rule up to the boundary of the innermost enclosing box. This is called a "running dimension". The width is never running in an *Hlist*; the height and depth are never running in a *Vlist*.

```
render(self, x, y, w, h)
```

```
class matplotlib.mathtext.STIXFontConstants
```

Bases: *matplotlib.mathtext.FontConstantsBase*

```
delta = 0.05
```

```
delta_integral = 0.3
```

```
delta_slanted = 0.3
```

```
script_space = 0.1
```

```
sub2 = 0.6
```

```
sup1 = 0.8
```

```
class matplotlib.mathtext.STIXSansFontConstants
```

Bases: *matplotlib.mathtext.FontConstantsBase*

```
delta_integral = 0.3
```

```
delta_slanted = 0.6
```

```
script_space = 0.05
```

```
sup1 = 0.8
```

```
class matplotlib.mathtext.Ship
```

Bases: *object*

Ship boxes to output once they have been set up, this sends them to output.

Since boxes can be inside of boxes inside of boxes, the main work of *Ship* is done by two mutually recursive routines, *hlist\_out* and *vlist\_out*, which traverse the *Hlist* nodes and *Vlist* nodes inside of horizontal and vertical boxes. The global variables used in TeX to store state as it processes have become member variables here.

```
static clamp(value)
```

```
hlist_out(self, box)
vlist_out(self, box)
class matplotlib.mathtext.SsGlue
    Bases: matplotlib.mathtext.Glue
    [Deprecated]
```

### Notes

Deprecated since version 3.3:

```
class matplotlib.mathtext.StandardPsFonts(default_font_prop)
    Bases: matplotlib.mathtext.Fonts
```

Use the standard postscript fonts for rendering to backend\_ps

Unlike the other font classes, BakomaFont and UnicodeFont, this one requires the Ps backend.

### Parameters

**default\_font\_prop:** ‘~.font\_manager.FontProperties’ The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** ‘MathtextBackend’ subclass Backend to which rendering is actually delegated.

```
basepath = '/usr/local/lib64/python3.8/site-packages/matplotlib/mpl-data/fonts/afm'
```

```
fontmap = {'cal': 'pzcmi8a', 'rm': 'pncr8a', 'tt': 'pcrr8a', 'it': 'pncr8a', 'sf': 'phvr8a', 'bf': 'pncr8a'}
```

```
get_kern(self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)
```

Get the kerning distance for font between *sym1* and *sym2*.

*fontX*: one of the TeX font names:

tt, it, rm, cal, sf, bf or default/regular (non-math)
---

*fontclassX*: TODO

*symX*: a symbol in raw TeX form. e.g., ‘1’, ‘x’ or ‘sigma’

*fontsizeX*: the fontsize in points

*dpi*: the current dots-per-inch

```
get_underline_thickness(self, font, fontsize, dpi)
```

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

```
get_xheight(self, font, fontsize, dpi)
```

Get the xheight for the given *font* and *fontsize*.

```
class matplotlib.mathtext.StixFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.UnicodeFonts
```

A font handling class for the STIX fonts.

In addition to what UnicodeFonts provides, this class:

- supports “virtual fonts” which are complete alpha numeric character sets with different font styles at special Unicode code points, such as “Blackboard”.
- handles sized alternative characters for the STIXSizeX fonts.

### Parameters

**default\_font\_prop:** ‘~.font\_manager.FontProperties’ The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** ‘MathtextBackend’ subclass Backend to which rendering is actually delegated.

```
cm_fallback = False
```

```
get_sized_alternatives_for_symbol(self, fontname, sym)
```

```
use_cmex = False
```

```
class matplotlib.mathtext.StixSansFonts(*args, **kwargs)
```

Bases: `matplotlib.mathtext.StixFonts`

A font handling class for the STIX fonts (that uses sans-serif characters by default).

### Parameters

**default\_font\_prop:** ‘~.font\_manager.FontProperties’ The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** ‘MathtextBackend’ subclass Backend to which rendering is actually delegated.

```
class matplotlib.mathtext.SubSuperCluster
```

Bases: `matplotlib.mathtext.Hlist`

A hack to get around that fact that this code does a two-pass parse like TeX. This lets us store enough information in the hlist itself, namely the nucleus, sub- and super-script, such that if another script follows that needs to be attached, it can be reconfigured on the fly.

```
class matplotlib.mathtext.TruetypeFonts(default_font_prop, mathtext_backend)
```

Bases: `matplotlib.mathtext.Fonts`

A generic base class for all font setups that use Truetype fonts (through FT2Font).

### Parameters

**default\_font\_prop:** ‘~.font\_manager.FontProperties’ The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend:** ‘MathtextBackend’ subclass Backend to which rendering is actually delegated.

```
destroy(self)
```

Fix any cyclical references before the object is about to be destroyed.

```
get_kern(self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)
```

Get the kerning distance for font between *sym1* and *sym2*.

*fontX*: one of the TeX font names:

tt, it, rm, cal, sf, bf or default/regular (non-math)

*fontclassX*: TODO

*symX*: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

*fontsizeX*: the fontsize in points

*dpi*: the current dots-per-inch

`get_underline_thickness(self, font, fontsize, dpi)`

Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

`get_xheight(self, fontname, fontsize, dpi)`

Get the xheight for the given *font* and *fontsize*.

`class matplotlib.mathtext.UnicodeFonts(*args, **kwargs)`

Bases: `matplotlib.mathtext.TruetypeFonts`

An abstract base class for handling Unicode fonts.

While some reasonably complete Unicode fonts (such as DejaVu) may work in some situations, the only Unicode font I'm aware of with a complete set of math symbols is STIX.

This class will "fallback" on the Bakoma fonts when a required symbol can not be found in the font.

### Parameters

**default\_font\_prop**: '~.font\_manager.FontProperties' The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext\_backend**: 'MathtextBackend' subclass Backend to which rendering is actually delegated.

`get_sized_alternatives_for_symbol(self, fontname, sym)`

Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching *sym* in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

`use_cmex = True`

`class matplotlib.mathtext.VCentered(elements)`

Bases: `matplotlib.mathtext.Vlist`

A convenience class to create a *Vlist* whose contents are centered within its enclosing box.

`class matplotlib.mathtext.Vbox(height, depth)`

Bases: `matplotlib.mathtext.Box`

A box with only height (zero width).

`class matplotlib.mathtext.Vlist(elements, h=0.0, m='additional')`

Bases: `matplotlib.mathtext.List`

A vertical list of boxes.

`vpack(self, h=0.0, m='additional', l=inf)`

Compute the dimensions of the resulting boxes, and to adjust the glue if one of those dimensions is pre-specified.

### Parameters

**h** [float, default: 0] A height.

**m** [{‘exactly’, ‘additional’}, default: ‘additional’] Whether to produce a box whose height is ‘exactly’  $w$ ; or a box with the natural height of the contents, plus  $w$  (‘additional’).

**l** [float, default: `np.inf`] The maximum height.

### Notes

The defaults produce a box with the natural height of the contents.

```
class matplotlib.mathtext.Vrule(state)
```

Bases: `matplotlib.mathtext.Rule`

Convenience class to create a vertical rule.

```
matplotlib.mathtext.get_unicode_index(symbol, math=True)
```

Return the integer index (from the Unicode table) of *symbol*.

### Parameters

**symbol** [str] A single unicode character, a TeX command (e.g. `r‘pi’`) or a Type1 symbol name (e.g. `‘phi’`).

**math** [bool, default: `True`] If `False`, always treat as a single unicode character.

```
matplotlib.mathtext.math_to_image(s, filename_or_obj, prop=None, dpi=None, format=None)
```

Given a math expression, renders it in a closely-clipped bounding box to an image file.

### Parameters

**s** [str] A math expression. The math portion must be enclosed in dollar signs.

**filename\_or\_obj** [str or path-like or file-like] Where to write the image data.

**prop** [`FontProperties`, optional] The size and style of the text.

**dpi** [float, optional] The output dpi. If not set, the dpi is determined as for `Figure.savefig`.

**format** [str, optional] The output format, e.g., `‘svg’`, `‘pdf’`, `‘ps’` or `‘png’`. If not set, the format is determined as for `Figure.savefig`.

## 18.33 matplotlib.mlab

Numerical python functions written for compatibility with MATLAB commands with the same names. Most numerical python functions can be found in the `numpy` and `scipy` libraries. What remains here is code for performing spectral computations.

### 18.33.1 Spectral functions

`cohere` Coherence (normalized cross spectral density)

`csd` Cross spectral density using Welch’s average periodogram

*detrend* Remove the mean or best fit line from an array

*psd* Power spectral density using Welch's average periodogram

*specgram* Spectrogram (spectrum over segments of time)

*complex\_spectrum* Return the complex-valued frequency spectrum of a signal

*magnitude\_spectrum* Return the magnitude of the frequency spectrum of a signal

*angle\_spectrum* Return the angle (wrapped phase) of the frequency spectrum of a signal

*phase\_spectrum* Return the phase (unwrapped angle) of the frequency spectrum of a signal

*detrend\_mean* Remove the mean from a line.

*detrend\_linear* Remove the best fit line from a line.

*detrend\_none* Return the original line.

*stride\_windows* Get all windows in an array in a memory-efficient manner

*stride\_repeat* Repeat an array in a memory-efficient manner

*apply\_window* Apply a window along a given axis

`class matplotlib.mlab.GaussianKDE(dataset, bw_method=None)`  
Bases: `object`

Representation of a kernel-density estimate using Gaussian kernels.

### Parameters

**dataset** [array-like] Datapoints to estimate from. In case of univariate data this is a 1-D array, otherwise a 2-D array with shape (# of dims, # of data).

**bw\_method** [str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a *GaussianKDE* instance as only parameter and return a scalar. If None (default), 'scott' is used.

### Attributes

**dataset** [ndarray] The dataset with which `gaussian_kde` was initialized.

**dim** [int] Number of dimensions.

**num\_dp** [int] Number of datapoints.

**factor** [float] The bandwidth factor, obtained from `kde.covariance_factor`, with which the covariance matrix is multiplied.

**covariance** [ndarray] The covariance matrix of *dataset*, scaled by the calculated bandwidth (`kde.factor`).

**inv\_cov** [ndarray] The inverse of *covariance*.

### Methods

<b>kde.evaluate(points)</b>	(ndarray) Evaluate the estimated pdf on a provided set of points.
<b>kde(points)</b>	(ndarray) Same as <code>kde.evaluate(points)</code>

`covariance_factor(self)`

`evaluate(self, points)`

Evaluate the estimated pdf on a set of points.

#### Parameters

**points** [(# of dimensions, # of points)-array] Alternatively, a (# of dimensions,) vector can be passed in and treated as a single point.

#### Returns

**(# of points,)-array** The values at each point.

#### Raises

**ValueError** [if the dimensionality of the input points is different] than the dimensionality of the KDE.

`scotts_factor(self)`

`silverman_factor(self)`

`matplotlib.mlab.angle_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)`

Compute the angle of the frequency spectrum (wrapped phase spectrum) of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

#### Parameters

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

#### Returns

**spectrum** [1-D array] The angle of the frequency spectrum (wrapped phase spectrum).

**freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*.

**See also:**

`psd` Returns the power spectral density.

`complex_spectrum` Returns the complex-valued frequency spectrum.

`magnitude_spectrum` Returns the absolute value of the `complex_spectrum`.

`angle_spectrum` Returns the angle of the `complex_spectrum`.

`phase_spectrum` Returns the phase (unwrapped angle) of the `complex_spectrum`.

`specgram` Can return the complex spectrum of segments within the signal.

`matplotlib.mlab.apply_window(x, window, axis=0, return_window=None)`

[*Deprecated*] Apply the given window to the given 1D or 2D array along the given axis.

**Parameters**

**x** [1D or 2D array or sequence] Array or sequence containing the data.

**window** [function or array.] Either a function to generate a window or an array with length `x.shape[axis]`

**axis** [int] The axis over which to do the repetition. Must be 0 or 1. The default is 0

**return\_window** [bool] If true, also return the 1D values of the window that was applied

**Notes**

Deprecated since version 3.2.

`matplotlib.mlab.cohere(x, y, NFFT=256, Fs=2, detrend=<function detrend_none at 0x7f39f4d34a60>, window=<function window_hanning at 0x7f39f4d343a0>, noverlap=0, pad_to=None, sides='default', scale_by_freq=None)`

The coherence between `x` and `y`. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

**Parameters**

**x, y** Array or sequence containing the data

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: `window_hanning`] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{`'default'`, `'onesided'`, `'twosided'`}, optional] Which sides of the spectrum to return. `'default'` is one-sided for real data and two-sided

for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to *NFFT*

**NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend** [{ 'none', 'mean', 'linear' } or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend\_none*. 'mean' calls *detrend\_mean*. 'linear' calls *detrend\_linear*.

**scale\_by\_freq** [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [int] The number of points of overlap between blocks. The default value is 0 (no overlap).

### Returns

The return value is the tuple  $(C_{xy}, f)$ , where *f* are the frequencies of the coherence vector. For *cohere*, scaling the individual densities by the sampling frequency has no effect, since the factors cancel out.

### See also:

*psd()*, *csd()* For information about the methods used to compute  $P_{xy}$ ,  $P_{xx}$  and  $P_{yy}$ .

```
matplotlib.mlab.complex_spectrum(x, Fs=None, window=None, pad_to=None,
                                sides=None)
```

Compute the complex-valued frequency spectrum of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*,

`window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{`'default'`, `'onesided'`, `'twosided'`}, optional] Which sides of the spectrum to return. `'default'` is one-sided for real data and two-sided for complex data. `'onesided'` forces the return of a one-sided spectrum, while `'twosided'` forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

### Returns

**spectrum** [1-D array] The complex-valued frequency spectrum.

**freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*.

### See also:

*psd* Returns the power spectral density.

*complex\_spectrum* Returns the complex-valued frequency spectrum.

*magnitude\_spectrum* Returns the absolute value of the *complex\_spectrum*.

*angle\_spectrum* Returns the angle of the *complex\_spectrum*.

*phase\_spectrum* Returns the phase (unwrapped angle) of the *complex\_spectrum*.

*specgram* Can return the complex spectrum of segments within the signal.

`matplotlib.mlab.csd(x, y, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None)`

Compute the cross-spectral density.

The cross spectral density  $P_{xy}$  by Welch's average periodogram method. The vectors  $x$  and  $y$  are divided into  $NFFT$  length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of  $x$  and  $y$  are averaged over each segment to compute  $P_{xy}$ , with a scaling to correct for power loss due to windowing.

If  $\text{len}(x) < NFFT$  or  $\text{len}(y) < NFFT$ , they will be zero padded to  $NFFT$ .

### Parameters

**x, y** [1-D arrays or sequences] Arrays or sequences containing the data

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length  $NFFT$ . To create window vectors see *window\_hanning*,

`window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to *NFFT*.

**NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before `fft`-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls *detrend\_none*. ‘mean’ calls *detrend\_mean*. ‘linear’ calls *detrend\_linear*.

**scale\_by\_freq** [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [int] The number of points of overlap between segments. The default value is 0 (no overlap).

## Returns

**Pxy** [1-D array] The values for the cross spectrum  $P_{xy}$  before scaling (real valued)

**freqs** [1-D array] The frequencies corresponding to the elements in *Pxy*

## See also:

*psd* equivalent to setting `y = x`.

## References

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

```
matplotlib.mlab.detrend(x, key=None, axis=None)
Return x with its trend removed.
```

**Parameters**

**x** [array or sequence] Array or sequence containing the data.

**key** [{‘default’, ‘constant’, ‘mean’, ‘linear’, ‘none’} or function] The detrending algorithm to use. ‘default’, ‘mean’, and ‘constant’ are the same as `detrend_mean`. ‘linear’ is the same as `detrend_linear`. ‘none’ is the same as `detrend_none`. The default is ‘mean’. See the corresponding functions for more details regarding the algorithms. Can also be a function that carries out the detrend operation.

**axis** [int] The axis along which to do the detrending.

**See also:**

`detrend_mean` Implementation of the ‘mean’ algorithm.

`detrend_linear` Implementation of the ‘linear’ algorithm.

`detrend_none` Implementation of the ‘none’ algorithm.

`matplotlib.mlab.detrend_linear(y)`  
Return x minus best fit line; ‘linear’ detrending.

**Parameters**

**y** [0-D or 1-D array or sequence] Array or sequence containing the data

**axis** [int] The axis along which to take the mean. See `numpy.mean` for a description of this argument.

**See also:**

`detrend_mean` Another detrend algorithm.

`detrend_none` Another detrend algorithm.

`detrend` A wrapper around all the detrend algorithms.

`matplotlib.mlab.detrend_mean(x, axis=None)`  
Return x minus the mean(x).

**Parameters**

**x** [array or sequence] Array or sequence containing the data Can have any dimensionality

**axis** [int] The axis along which to take the mean. See `numpy.mean` for a description of this argument.

**See also:**

`detrend_linear` Another detrend algorithm.

`detrend_none` Another detrend algorithm.

`detrend` A wrapper around all the detrend algorithms.

`matplotlib.mlab.detrend_none(x, axis=None)`  
Return x: no detrending.

**Parameters**

**x** [any object] An object containing the data

**axis** [int] This parameter is ignored. It is included for compatibility with `detrend_mean`

**See also:**

`detrend_mean` Another detrend algorithm.

`detrend_linear` Another detrend algorithm.

`detrend` A wrapper around all the detrend algorithms.

`matplotlib.mlab.magnitude_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)`

Compute the magnitude (absolute value) of the frequency spectrum of `x`. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

**Parameters**

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

**Returns**

**spectrum** [1-D array] The magnitude (absolute value) of the frequency spectrum.

**freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*.

**See also:**

`psd` Returns the power spectral density.

`complex_spectrum` Returns the complex-valued frequency spectrum.

`magnitude_spectrum` Returns the absolute value of the `complex_spectrum`.

`angle_spectrum` Returns the angle of the `complex_spectrum`.

`phase_spectrum` Returns the phase (unwrapped angle) of the `complex_spectrum`.

*specgram* Can return the complex spectrum of segments within the signal.

```
matplotlib.mlab.phase_spectrum(x, Fs=None, window=None, pad_to=None,
                               sides=None)
```

Compute the phase of the frequency spectrum (unwrapped phase spectrum) of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{*'default'*, *'onesided'*, *'twosided'*}, optional] Which sides of the spectrum to return. *'default'* is one-sided for real data and two-sided for complex data. *'onesided'* forces the return of a one-sided spectrum, while *'twosided'* forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is *None*, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

### Returns

**spectrum** [1-D array] The phase of the frequency spectrum (unwrapped phase spectrum).

**freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*.

### See also:

*psd* Returns the power spectral density.

*complex\_spectrum* Returns the complex-valued frequency spectrum.

*magnitude\_spectrum* Returns the absolute value of the *complex\_spectrum*.

*angle\_spectrum* Returns the angle of the *complex\_spectrum*.

*phase\_spectrum* Returns the phase (unwrapped angle) of the *complex\_spectrum*.

*specgram* Can return the complex spectrum of segments within the signal.

```
matplotlib.mlab.psd(x, NFFT=None, Fs=None, detrend=None, window=None,
                    overlap=None, pad_to=None, sides=None, scale_by_freq=None)
```

Compute the power spectral density.

The power spectral density  $P_{xx}$  by Welch's average periodogram method. The vector  $x$  is divided into  $NFFT$  length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The  $|fft(i)|^2$  of each segment  $i$  are averaged to compute  $P_{xx}$ .

If  $\text{len}(x) < NFFT$ , it will be zero padded to  $NFFT$ .

### Parameters

- x** [1-D array or sequence] Array or sequence containing the data
- Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.
- window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length  $NFFT$ . To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- sides** [{*'default'*, *'onesided'*, *'twosided'*}, optional] Which sides of the spectrum to return. *'default'* is one-sided for real data and two-sided for complex data. *'onesided'* forces the return of a one-sided spectrum, while *'twosided'* forces two-sided.
- pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from  $NFFT$ , which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to *fft()*. The default is *None*, which sets *pad\_to* equal to  $NFFT$
- NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.
- detrend** [{*'none'*, *'mean'*, *'linear'*} or callable, default *'none'*] The function applied to each segment before *fft*-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: *'none'* calls *detrend\_none*. *'mean'* calls *detrend\_mean*. *'linear'* calls *detrend\_linear*.
- scale\_by\_freq** [bool, default: *True*] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is *True* for MATLAB compatibility.
- noverlap** [int] The number of points of overlap between segments. The default value is 0 (no overlap).

### Returns

- Pxx** [1-D array] The values for the power spectrum  $P_{xx}$  (real valued)

**freqs** [1-D array] The frequencies corresponding to the elements in *Pxx*

**See also:**

*specgram* *specgram* differs in the default overlap; in not returning the mean of the segment periodograms; and in returning the times of the segments.

*magnitude\_spectrum* returns the magnitude spectrum.

*csd* returns the spectral density between two signals.

**References**

```
matplotlib.mlab.specgram(x, NFFT=None, Fs=None, detrend=None, win-
                        dow=None, noverlap=None, pad_to=None, sides=None,
                        scale_by_freq=None, mode=None)
```

Compute a spectrogram.

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*.

**Parameters**

**x** [array-like] 1-D array or sequence.

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{*'default'*, *'onesided'*, *'twosided'*}, optional] Which sides of the spectrum to return. *'default'* is one-sided for real data and two-sided for complex data. *'onesided'* forces the return of a one-sided spectrum, while *'twosided'* forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is *None*, which sets *pad\_to* equal to *NFFT*

**NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls *detrend\_none*. ‘mean’ calls *detrend\_mean*. ‘linear’ calls *detrend\_linear*.

**scale\_by\_freq** [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [int, optional] The number of points of overlap between blocks. The default value is 128.

**mode** [str, default: ‘psd’]

#### What sort of spectrum to use:

‘psd’ Returns the power spectral density.

‘complex’ Returns the complex-valued frequency spectrum.

‘magnitude’ Returns the magnitude spectrum.

‘angle’ Returns the phase spectrum without unwrapping.

‘phase’ Returns the phase spectrum with unwrapping.

#### Returns

**spectrum** [array-like] 2-D array, columns are the periodograms of successive segments.

**freqs** [array-like] 1-D array, frequencies corresponding to the rows in *spectrum*.

**t** [array-like] 1-D array, the times corresponding to midpoints of segments (i.e the columns in *spectrum*).

#### See also:

*psd* differs in the overlap and in the return values.

*complex\_spectrum* similar, but with complex valued frequencies.

*magnitude\_spectrum* similar single segment when mode is ‘magnitude’.

*angle\_spectrum* similar to single segment when mode is ‘angle’.

*phase\_spectrum* similar to single segment when mode is ‘phase’.

#### Notes

*detrend* and *scale\_by\_freq* only apply when *mode* is set to ‘psd’.

`matplotlib.mlab.stride_repeat(x, n, axis=0)`

[*Deprecated*] Repeat the values in an array in a memory-efficient manner. Array *x* is stacked vertically *n* times.

**Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

### Parameters

**x** [1D array or sequence] Array or sequence containing the data.

**n** [int] The number of time to repeat the array.

**axis** [int] The axis along which the data will run.

### Notes

Deprecated since version 3.2.

### References

[stackoverflow: Repeat NumPy array without replicating data?](#)

`matplotlib.mlab.stride_windows(x, n, noverlap=None, axis=0)`

Get all windows of x with length n as a single array, using strides to avoid data duplication.

**Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

### Parameters

**x** [1D array or sequence] Array or sequence containing the data.

**n** [int] The number of data points in each window.

**nooverlap** [int] The overlap between adjacent windows. Default is 0 (no overlap)

**axis** [int] The axis along which the windows will run.

### References

[stackoverflow: Rolling window for 1D arrays in Numpy?](#) [stackoverflow: Using strides for an efficient moving average filter](#)

`matplotlib.mlab.window_hanning(x)`

Return x times the hanning window of len(x).

### See also:

[window\\_none](#) Another window algorithm.

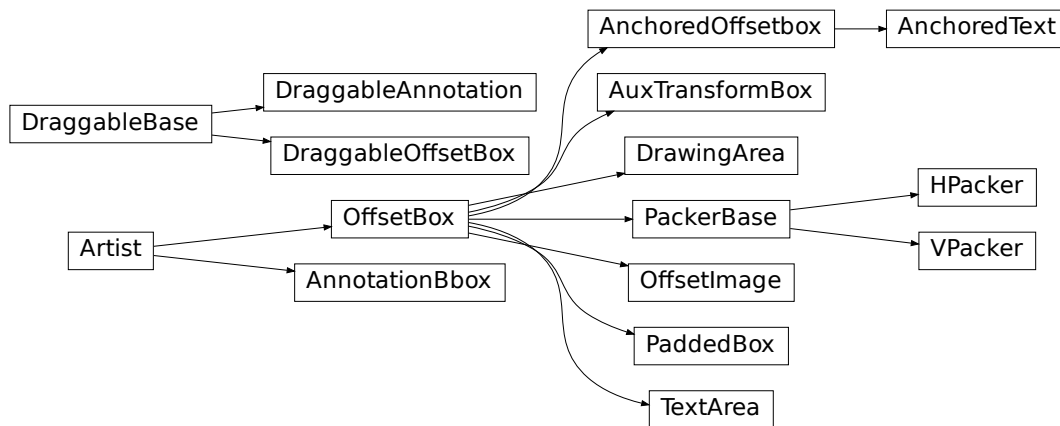

`matplotlib.mlab.window_none(x)`

No window function; simply return x.

### See also:

*window\_hanning* Another window algorithm.

## 18.34 matplotlib.offsetbox

Container classes for *Artists*.

*OffsetBox* The base of all container artists defined in this module.

*AnchoredOffsetbox*, *AnchoredText* Anchor and align an arbitrary *Artist* or a text relative to the parent axes or a specific anchor point.

*DrawingArea* A container with fixed width and height. Children have a fixed position inside the container and may be clipped.

*HPacker*, *VPacker* Containers for layouting their children vertically or horizontally.

*PaddedBox* A container to add a padding around an *Artist*.

*TextArea* Contains a single *Text* instance.

```
class matplotlib.offsetbox.AnchoredOffsetbox(loc, pad=0.4, borderpad=0.5,
                                             child=None, prop=None,
                                             frameon=True, bbox_to_anchor=None,
                                             bbox_transform=None, **kwargs)
```

Bases: *matplotlib.offsetbox.OffsetBox*

An offset box placed according to location *loc*.

*AnchoredOffsetbox* has a single child. When multiple children are needed, use an extra *OffsetBox* to enclose them. By default, the offset box is anchored against its parent axes. You may explicitly specify the *bbox\_to\_anchor*.

### Parameters

**loc** [str] The box location. Supported values:

- 'upper right'
- 'upper left'

- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of [Legend](#) for details.

**pad** [float, default: 0.4] Padding around the child as fraction of the font-size.

**borderpad** [float, default: 0.5] Padding between the offsetbox frame and the *bbox\_to\_anchor*.

**child** [[OffsetBox](#)] The box that will be anchored.

**prop** [[FontProperties](#)] This is only used as a reference for paddings. If not given, `rcParams["legend.fontsize"]` (default: 'medium') is used.

**frameon** [bool] Whether to draw a frame around the box.

**bbox\_to\_anchor** [[BboxBase](#), 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox\_transform** [None or [matplotlib.transforms.Transform](#)] The transform for the bounding box (*bbox\_to\_anchor*).

**\*\*kwargs** All other parameters are passed on to [OffsetBox](#).

## Notes

See [Legend](#) for a detailed description of the anchoring mechanism.

```
codes = {'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower left': 3, 'lower right': 4, 'upper center': 9, 'upper left': 1, 'upper right': 2}
```

```
draw(self, renderer)
```

Update the location of children if necessary and draw them to the given *renderer*.

```
get_bbox_to_anchor(self)
```

Return the *bbox* that the box is anchored to.

```
get_child(self)
```

Return the child.

```
get_children(self)
```

Return the list of children.

```
get_extent(self, renderer)
```

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

```
get_window_extent(self, renderer)
```

Return the bounding box in display space.

```
set_bbox_to_anchor(self, bbox, transform=None)
```

Set the bbox that the box is anchored to.

*bbox* can be a Bbox instance, a list of [left, bottom, width, height], or a list of [left, bottom] where the width and height will be assumed to be zero. The bbox will be transformed to display coordinate by the given transform.

```
set_child(self, child)
```

Set the child to be anchored.

```
update_frame(self, bbox, fontsize=None)
```

```
zorder = 5
```

```
class matplotlib.offsetbox.AnchoredText(s, loc, pad=0.4, borderpad=0.5, prop=None,
                                         **kwargs)
```

Bases: [matplotlib.offsetbox.AnchoredOffsetbox](#)

AnchoredOffsetbox with Text.

### Parameters

**s** [str] Text.

**loc** [str] Location code. See [AnchoredOffsetbox](#).

**pad** [float, default: 0.4] Padding around the text as fraction of the fontsize.

**borderpad** [float, default: 0.5] Spacing between the offsetbox frame and the *bbox\_to\_anchor*.

**prop** [dict, optional] Dictionary of keyword parameters to be passed to the [Text](#) instance contained inside AnchoredText.

**\*\*kwargs** All other parameters are passed to [AnchoredOffsetbox](#).

```
class matplotlib.offsetbox.AnnotationBbox(offsetbox, xy, xybox=None, xycoords='data',
                                         boxcoords=None,
                                         frameon=True, pad=0.4, annotation_clip=None,
                                         box_alignment=(0.5, 0.5),
                                         bboxprops=None, arrowprops=None,
                                         fontsize=None, **kwargs)
```

Bases: [matplotlib.artist.Artist](#), [matplotlib.text.\\_AnnotationBase](#)

Container for an [OffsetBox](#) referring to a specific position *xy*.

Optionally an arrow pointing from the offsetbox to *xy* can be drawn.

This is like [Annotation](#), but with [OffsetBox](#) instead of [Text](#).

### Parameters

**offsetbox** [[OffsetBox](#)]

**xy** [(float, float)] The point (*x*, *y*) to annotate. The coordinate system is determined by *xycoords*.

**xybox** [(float, float), default: *xy*] The position (*x*, *y*) to place the text at. The coordinate system is determined by *boxcoords*.

**xycoords** [str or [Artist](#) or [Transform](#) or callable or (float, float), default: 'data'] The coordinate system that *xy* is given in. See the parameter *xycoords* in [Annotation](#) for a detailed description.

**boxcoords** [str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xybox* is given in. See the parameter *textcoords* in *Annotation* for a detailed description.

**frameon** [bool, default: True] Whether to draw a frame around the box.

**pad** [float, default: 0.4] Padding around the offsetbox.

**box\_alignment** [(float, float)] A tuple of two floats for a vertical and horizontal alignment of the offset box w.r.t. the *boxcoords*. The lower-left corner is (0, 0) and upper-right corner is (1, 1).

**\*\*kwargs** Other parameters are identical to *Annotation*.

property *anncoords*

*contains*(*self*, *mouseevent*)

Test whether the artist contains the mouse event.

#### Parameters

**mouseevent** [*matplotlib.backend\_bases.MouseEvent*]

#### Returns

**contains** [bool] Whether any values are within the radius.

**details** [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

*draw*(*self*, *renderer*)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

#### Parameters

**renderer** [*RendererBase* subclass.]

#### Notes

This method is overridden in the Artist subclasses.

*get\_children*(*self*)

Return a list of the child *Artists* of this *Artist*.

*get\_fontsize*(*self*, *s*=<deprecated parameter>)

Return the fontsize in points.

*get\_tightbbox*(*self*, *renderer*)

get tight bounding box in display space.

*get\_window\_extent*(*self*, *renderer*)

get the bounding box in display space.

*set\_figure*(*self*, *fig*)

Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

```

set_fontsize(self, s=None)
    Set the fontsize in points.

    If s is not given, reset to rcParams["legend.fontsize"] (default: 'medium').

update_positions(self, renderer)
    Update the pixel positions of the annotated point and the text.

property xyann

zorder = 3

```

`class matplotlib.offsetbox.AuxTransformBox(aux_transform)`  
 Bases: `matplotlib.offsetbox.OffsetBox`

Offset Box with the `aux_transform`. Its children will be transformed with the `aux_transform` first then will be offsetted. The absolute coordinate of the `aux_transform` is meaning as it will be automatically adjust so that the left-lower corner of the bounding box of children will be set to (0, 0) before the offset transform.

It is similar to drawing area, except that the extent of the box is not predetermined but calculated from the window extent of its children. Furthermore, the extent of the children will be calculated in the transformed coordinate.

```

add_artist(self, a)
    Add an Artist to the container box.

draw(self, renderer)
    Update the location of children if necessary and draw them to the given renderer.

get_extent(self, renderer)
    Return a tuple width, height, xdescent, ydescent of the box.

get_offset(self)
    Return offset of the container.

get_transform(self)
    Return the Transform applied to the children

get_window_extent(self, renderer)
    Return the bounding box in display space.

set_offset(self, xy)
    Set the offset of the container.

```

### Parameters

**xy** [(float, float)] The (x, y) coordinates of the offset in display units.

```

set_transform(self, t)
    set_transform is ignored.

```

`class matplotlib.offsetbox.DraggableAnnotation(annotation, use_blit=False)`  
 Bases: `matplotlib.offsetbox.DraggableBase`

```

save_offset(self)

update_offset(self, dx, dy)

```

`class matplotlib.offsetbox.DraggableBase(ref_artist, use_blit=False)`  
 Bases: `object`

Helper base class for a draggable artist (legend, offsetbox).

Derived classes must override the following methods:

```
def save_offset(self):
    '''
    Called when the object is picked for dragging; should save the
    reference position of the artist.
    '''

def update_offset(self, dx, dy):
    '''
    Called during the dragging; (*dx*, *dy*) is the pixel offset from
    the point where the mouse drag started.
    '''
```

Optionally, you may override the following method:

```
def finalize_offset(self):
    '''Called when the mouse is released.'''
```

In the current implementation of *DraggableLegend* and *DraggableAnnotation*, *update\_offset* places the artists in display coordinates, and *finalize\_offset* recalculates their position in axes coordinate and set a relevant attribute.

`artist_picker(self, artist, evt)`  
[Deprecated]

#### Notes

Deprecated since version 3.3:

`disconnect(self)`  
Disconnect the callbacks.

`finalize_offset(self)`

`on_motion(self, evt)`

`on_motion_blit(self, evt)`  
[Deprecated]

#### Notes

Deprecated since version 3.3:

`on_pick(self, evt)`

`on_release(self, event)`

`save_offset(self)`

`update_offset(self, dx, dy)`

`class matplotlib.offsetbox.DraggableOffsetBox(ref_artist, offsetbox, use_blit=False)`  
Bases: `matplotlib.offsetbox.DraggableBase`

`get_loc_in_canvas(self)`

`save_offset(self)`

`update_offset(self, dx, dy)`

```
class matplotlib.offsetbox.DrawingArea(width, height, xdescent=0.0, ydescent=0.0,
                                       clip=False)
```

Bases: `matplotlib.offsetbox.OffsetBox`

The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The children can be clipped at the boundaries of the parent.

#### Parameters

**width, height** [float] Width and height of the container box.

**xdescent, ydescent** [float] Descent of the box in x- and y-direction.

**clip** [bool] Whether to clip the children to the box.

```
add_artist(self, a)
```

Add an *Artist* to the container box.

```
property clip_children
```

If the children of this DrawingArea should be clipped by DrawingArea bounding box.

```
draw(self, renderer)
```

Update the location of children if necessary and draw them to the given *renderer*.

```
get_extent(self, renderer)
```

Return width, height, xdescent, ydescent of box.

```
get_offset(self)
```

Return offset of the container.

```
get_transform(self)
```

Return the *Transform* applied to the children.

```
get_window_extent(self, renderer)
```

Return the bounding box in display space.

```
set_offset(self, xy)
```

Set the offset of the container.

#### Parameters

**xy** [(float, float)] The (x, y) coordinates of the offset in display units.

```
set_transform(self, t)
```

set\_transform is ignored.

```
class matplotlib.offsetbox.HPacker(pad=None, sep=None, width=None, height=None,
                                   align='baseline', mode='fixed', children=None)
```

Bases: `matplotlib.offsetbox.PackerBase`

The HPacker has its children packed horizontally. It automatically adjusts the relative positions of children at draw time.

#### Parameters

**pad** [float, optional] The boundary padding in points.

**sep** [float, optional] The spacing between items in points.

**width, height** [float, optional] Width and height of the container box in pixels, calculated if *None*.

**align** [{ 'top', 'bottom', 'left', 'right', 'center', 'baseline' }] Alignment of boxes.

**mode** [{‘fixed’, ‘expand’, ‘equal’}] The packing mode.

- ‘fixed’ packs the given Artists tight with *sep* spacing.
- ‘expand’ uses the maximal available space to distribute the artists with equal spacing in between.
- ‘equal’: Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

**children** [list of *Artist*] The artists to pack.

## Notes

*pad* and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

`get_extent_offsets(self, renderer)`

Update offset of the children and return the extent of the box.

### Parameters

**renderer** [*RendererBase* subclass]

### Returns

**width**

**height**

**xdescent**

**ydescent**

**list of (xoffset, yoffset) pairs**

`class matplotlib.offsetbox.OffsetBox(*args, **kwargs)`

Bases: *matplotlib.artist.Artist*

The OffsetBox is a simple container artist.

The child artists are meant to be drawn at a relative position to its parent.

Being an artist itself, all parameters are passed on to *Artist*.

property *axes*

The *Axes* instance the artist resides in, or *None*.

`contains(self, mouseevent)`

Delegate the mouse event contains-check to the children.

As a container, the *OffsetBox* does not respond itself to mouseevents.

### Parameters

**mouseevent** [*matplotlib.backend\_bases.MouseEvent*]

### Returns

**contains** [bool] Whether any values are within the radius.

**details** [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

**See also:**

*Artist.contains*

`draw(self, renderer)`

Update the location of children if necessary and draw them to the given *renderer*.

`get_children(self)`

Return a list of the child *Artists*.

`get_extent(self, renderer)`

Return a tuple width, height, xdescent, ydescent of the box.

`get_extent_offsets(self, renderer)`

Update offset of the children and return the extent of the box.

#### Parameters

**renderer** [*RendererBase* subclass]

#### Returns

**width**

**height**

**xdescent**

**ydescent**

**list of (xoffset, yoffset) pairs**

`get_offset(self, width, height, xdescent, ydescent, renderer)`

Return the offset as a tuple (x, y).

The extent parameters have to be provided to handle the case where the offset is dynamically determined by a callable (see *set\_offset*).

#### Parameters

**width, height, xdescent, ydescent** Extent parameters.

**renderer** [*RendererBase* subclass]

`get_visible_children(self)`

Return a list of the visible child *Artists*.

`get_window_extent(self, renderer)`

Return the bounding box (*Bbox*) in display space.

`set_figure(self, fig)`

Set the *Figure* for the *OffsetBox* and all its children.

#### Parameters

**fig** [*Figure*]

`set_height(self, height)`

Set the height of the box.

#### Parameters

**height** [float]

`set_offset(self, xy)`

Set the offset.

#### Parameters

**xy** [(float, float) or callable] The (x, y) coordinates of the offset in display units. These can either be given explicitly as a tuple (x, y), or by providing a function that converts the extent into the offset. This function must have the signature:

```
def offset(width, height, xdescent, ydescent, renderer) -> (float, float)
```

`set_width(self, width)`

Set the width of the box.

### Parameters

**width** [float]

```
class matplotlib.offsetbox.OffsetImage(arr, zoom=1, cmap=None, norm=None,
                                       interpolation=None, origin=None, filter-
                                       norm=True, filterrad=4.0, resample=False,
                                       dpi_cor=True, **kwargs)
```

Bases: `matplotlib.offsetbox.OffsetBox`

`draw(self, renderer)`

Update the location of children if necessary and draw them to the given *renderer*.

`get_children(self)`

Return a list of the child *Artists*.

`get_data(self)`

`get_extent(self, renderer)`

Return a tuple width, height, xdescent, ydescent of the box.

`get_offset(self)`

Return offset of the container.

`get_window_extent(self, renderer)`

Return the bounding box in display space.

`get_zoom(self)`

`set_data(self, arr)`

`set_zoom(self, zoom)`

```
class matplotlib.offsetbox.PackerBase(pad=None, sep=None, width=None,
                                       height=None, align=None, mode=None, chil-
                                       dren=None)
```

Bases: `matplotlib.offsetbox.OffsetBox`

### Parameters

**pad** [float, optional] The boundary padding in points.

**sep** [float, optional] The spacing between items in points.

**width, height** [float, optional] Width and height of the container box in pixels, calculated if *None*.

**align** [{'top', 'bottom', 'left', 'right', 'center', 'baseline'}] Alignment of boxes.

**mode** [{'fixed', 'expand', 'equal'}] The packing mode.

- 'fixed' packs the given Artists tight with *sep* spacing.

- 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
- 'equal': Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

**children** [list of *Artist*] The artists to pack.

## Notes

*pad* and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

```
class matplotlib.offsetbox.PaddedBox(child, pad=None, draw_frame=False,
                                     patch_attrs=None)
```

Bases: *matplotlib.offsetbox.OffsetBox*

A container to add a padding around an *Artist*.

The *PaddedBox* contains a *FancyBboxPatch* that is used to visualize it when rendering.

## Parameters

**child** [*Artist*] The contained *Artist*.

**pad** [float] The padding in points. This will be scaled with the renderer dpi. In contrast *width* and *height* are in *pixels* and thus not scaled.

**draw\_frame** [bool] Whether to draw the contained *FancyBboxPatch*.

**patch\_attrs** [dict or None] Additional parameters passed to the contained *FancyBboxPatch*.

*draw(self, renderer)*

Update the location of children if necessary and draw them to the given *renderer*.

*draw\_frame(self, renderer)*

*get\_extent\_offsets(self, renderer)*

Update offset of the children and return the extent of the box.

## Parameters

**renderer** [*RendererBase* subclass]

## Returns

**width**

**height**

**xdescent**

**ydescent**

**list of (xoffset, yoffset) pairs**

*update\_frame(self, bbox, fontsize=None)*

```
class matplotlib.offsetbox.TextArea(s, textprops=None, multilinebaseline=None, minimumdescent=True)
```

Bases: *matplotlib.offsetbox.OffsetBox*

The `TextArea` contains a single `Text` instance. The text is placed at (0, 0) with baseline+left alignment. The width and height of the `TextArea` instance is the width and height of the its child text.

### Parameters

**s** [str] The text to be displayed.

**textprops** [dict, optional] Dictionary of keyword parameters to be passed to the `Text` instance contained inside `TextArea`.

**multilinebaseline** [bool, optional] If `True`, baseline for multiline text is adjusted so that it is (approximately) center-aligned with singleline text.

**minimumdescent** [bool, optional] If `True`, the box has a minimum descent of "p".

`draw(self, renderer)`

Update the location of children if necessary and draw them to the given *renderer*.

`get_extent(self, renderer)`

Return a tuple width, height, xdescent, ydescent of the box.

`get_minimumdescent(self)`

Get minimumdescent.

`get_multilinebaseline(self)`

Get multilinebaseline.

`get_offset(self)`

Return offset of the container.

`get_text(self)`

Return the string representation of this area's text.

`get_window_extent(self, renderer)`

Return the bounding box in display space.

`set_minimumdescent(self, t)`

Set minimumdescent.

If `True`, extent of the single line text is adjusted so that it has minimum descent of "p"

`set_multilinebaseline(self, t)`

Set multilinebaseline.

If `True`, baseline for multiline text is adjusted so that it is (approximately) center-aligned with single-line text.

`set_offset(self, xy)`

Set the offset of the container.

### Parameters

**xy** [(float, float)] The (x, y) coordinates of the offset in display units.

`set_text(self, s)`

Set the text of this area as a string.

`set_transform(self, t)`

set\_transform is ignored.

```
class matplotlib.offsetbox.VPacker(pad=None, sep=None, width=None, height=None,
                                   align='baseline', mode='fixed', children=None)
```

Bases: `matplotlib.offsetbox.PackerBase`

The VPacker has its children packed vertically. It automatically adjusts the relative positions of children at drawing time.

### Parameters

**pad** [float, optional] The boundary padding in points.

**sep** [float, optional] The spacing between items in points.

**width, height** [float, optional] Width and height of the container box in pixels, calculated if *None*.

**align** [{*'top'*, *'bottom'*, *'left'*, *'right'*, *'center'*, *'baseline'*}] Alignment of boxes.

**mode** [{*'fixed'*, *'expand'*, *'equal'*}] The packing mode.

- *'fixed'* packs the given Artists tight with *sep* spacing.
- *'expand'* uses the maximal available space to distribute the artists with equal spacing in between.
- *'equal'*: Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

**children** [list of *Artist*] The artists to pack.

### Notes

*pad* and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in pixels.

`get_extent_offsets(self, renderer)`

Update offset of the children and return the extent of the box.

### Parameters

**renderer** [*RendererBase* subclass]

### Returns

**width**

**height**

**xdescent**

**ydescent**

**list of (xoffset, yoffset) pairs**

```
matplotlib.offsetbox.bbox_artist(*args, **kwargs)
```

## 18.35 matplotlib.patches

### 18.35.1 Classes

<i>Arc</i> (xy, width, height[, angle, theta1, theta2])	An elliptical arc, i.e.
<i>Arrow</i> (x, y, dx, dy[, width])	An arrow patch.
<i>ArrowStyle</i>	<i>ArrowStyle</i> is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path.
<i>BoxStyle</i>	<i>BoxStyle</i> is a container class which defines several boxstyle classes, which are used for <i>FancyBboxPatch</i> .
<i>Circle</i> (xy[, radius])	A circle patch.
<i>CirclePolygon</i> (xy[, radius, resolution])	A polygon-approximation of a circle patch.
<i>ConnectionPatch</i> (xyA, xyB, coordsA[, ...])	A patch that connects two points (possibly in different axes).
<i>ConnectionStyle</i>	<i>ConnectionStyle</i> is a container class which defines several connectionstyle classes, which is used to create a path between two points.
<i>Ellipse</i> (xy, width, height[, angle])	A scale-free ellipse.
<i>FancyArrow</i> (x, y, dx, dy[, width, ...])	Like Arrow, but lets you set head width and head height independently.
<i>FancyArrowPatch</i> ([posA, posB, path, ...])	A fancy arrow patch.
<i>FancyBboxPatch</i> (xy, width, height[, ...])	A fancy box around a rectangle with lower left at xy = (x, y) with specified width and height.
<i>Patch</i> ([edgecolor, facecolor, color, ...])	A patch is a 2D artist with a face color and an edge color.
<i>PathPatch</i> (path, **kwargs)	A general polycurve path patch.
<i>Polygon</i> (xy[, closed])	A general polygon patch.
<i>Rectangle</i> (xy, width, height[, angle])	A rectangle defined via an anchor point xy and its <i>width</i> and <i>height</i> .
<i>RegularPolygon</i> (xy, numVertices[, radius, ...])	A regular polygon patch.
<i>Shadow</i> (patch, ox, oy[, props])	Create a shadow of the given <i>patch</i> .
<i>Wedge</i> (center, r, theta1, theta2[, width])	Wedge shaped patch.

#### matplotlib.patches.Arc

```
class matplotlib.patches.Arc(xy, width, height, angle=0.0, theta1=0.0, theta2=360.0,
                             **kwargs)
```

Bases: *matplotlib.patches.Ellipse*

An elliptical arc, i.e. a segment of an ellipse.

Due to internal optimizations, there are certain restrictions on using Arc:

- The arc cannot be filled.
- The arc must be used in an *Axes* instance. It can not be added directly to a *Figure* because it is optimized to only render the segments that are inside the axes bounding box with high resolution.

## Parameters

**xy** [(float, float)] The center of the ellipse.

**width** [float] The length of the horizontal axis.

**height** [float] The length of the vertical axis.

**angle** [float] Rotation of the ellipse in degrees (counterclockwise).

**theta1, theta2** [float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to *angle*, e.g. if *angle* = 45 and *theta1* = 90 the absolute starting angle is 135. Default *theta1* = 0, *theta2* = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

## Other Parameters

**\*\*kwargs** [*Patch* properties] Most *Patch* properties are supported as keyword arguments, with the exception of *fill* and *facecolor* because filling is not supported.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a bool
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', ':-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, xy, width, height, angle=0.0, theta1=0.0, theta2=360.0, **kwargs)
```

### Parameters

**xy** [(float, float)] The center of the ellipse.

**width** [float] The length of the horizontal axis.

**height** [float] The length of the vertical axis.

**angle** [float] Rotation of the ellipse in degrees (counterclockwise).

**theta1, theta2** [float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to *angle*, e.g. if *angle* = 45 and *theta1* = 90 the absolute starting angle is 135. Default *theta1* = 0, *theta2* = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

### Other Parameters

**\*\*kwargs** [*Patch* properties] Most *Patch* properties are supported as keyword arguments, with the exception of *fill* and *facecolor* because filling is not supported.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a bool
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', ':-', '+', 'x', 'o', 'O', '.,', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool

Continued

Table 148 – continued from previous page

Property	Description
<code>zorder</code>	float

```
__module__ = 'matplotlib.patches'
__str__(self)
    Return str(self).
draw(self, renderer)
    Draw the arc to the given renderer.
```

### Notes

Ellipses are normally drawn using an approximation that uses eight cubic Bezier splines. The error of this approximation is 1.89818e-6, according to this unverified source:

Lancaster, Don. *Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines*.

<https://www.tinaja.com/glib/ellipse4.pdf>

There is a use case where very large ellipses must be drawn with very high accuracy, and it is too expensive to render the entire ellipse with enough segments (either splines or line segments). Therefore, in the case where either radius of the ellipse is large enough that the error of the spline approximation will be visible (greater than one pixel offset from the ideal), a different technique is used.

In that case, only the visible parts of the ellipse are drawn, with each visible arc using a fixed number of spline segments (8). The algorithm proceeds as follows:

1. The points where the ellipse intersects the axes bounding box are located. (This is done by performing an inverse transformation on the axes bbox such that it is relative to the unit circle – this makes the intersection calculation much easier than doing rotated ellipse intersection directly).

This uses the “line intersecting a circle” algorithm from:

Vince, John. *Geometry for Computer Graphics: Formulae, Examples & Proofs*. London: Springer-Verlag, 2005.

2. The angles of each of the intersection points are calculated.
3. Proceeding counterclockwise starting in the positive x-direction, each of the visible arc-segments between the pairs of vertices are drawn using the Bezier arc approximation technique implemented in `Path.arc`.

### Examples using `matplotlib.patches.Arc`

- `sphinx_glr_gallery_units_ellipse_with_units.py`
- *Sample plots in Matplotlib*

**matplotlib.patches.Arrow**

```
class matplotlib.patches.Arrow(x, y, dx, dy, width=1.0, **kwargs)
```

Bases: [\*matplotlib.patches.Patch\*](#)

An arrow patch.

Draws an arrow from (x, y) to (x + dx, y + dy). The width of the arrow is scaled by *width*.

**Parameters**

**x** [float] x coordinate of the arrow tail.

**y** [float] y coordinate of the arrow tail.

**dx** [float] Arrow length in the x direction.

**dy** [float] Arrow length in the y direction.

**width** [float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.

**\*\*kwargs** Keyword arguments control the [\*Patch\*](#) properties:

Property	Description
<a href="#"><i>agg_filter</i></a>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<a href="#"><i>alpha</i></a>	float or None
<a href="#"><i>animated</i></a>	bool
<a href="#"><i>antialiased</i></a> or <a href="#"><i>aa</i></a>	unknown
<a href="#"><i>capstyle</i></a>	{'butt', 'round', 'projecting'}
<a href="#"><i>clip_box</i></a>	<a href="#"><i>Bbox</i></a>
<a href="#"><i>clip_on</i></a>	bool
<a href="#"><i>clip_path</i></a>	Patch or (Path, Transform) or None
<a href="#"><i>color</i></a>	color
<a href="#"><i>contains</i></a>	unknown
<a href="#"><i>edgecolor</i></a> or <a href="#"><i>ec</i></a>	color or None or 'auto'
<a href="#"><i>facecolor</i></a> or <a href="#"><i>fc</i></a>	color or None
<a href="#"><i>figure</i></a>	<a href="#"><i>Figure</i></a>
<a href="#"><i>fill</i></a>	bool
<a href="#"><i>gid</i></a>	str
<a href="#"><i>hatch</i></a>	{'/', '\\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<a href="#"><i>in_layout</i></a>	bool
<a href="#"><i>joinstyle</i></a>	{'miter', 'round', 'bevel'}
<a href="#"><i>label</i></a>	object
<a href="#"><i>linestyle</i></a> or <a href="#"><i>ls</i></a>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<a href="#"><i>linewidth</i></a> or <a href="#"><i>lw</i></a>	float or None
<a href="#"><i>path_effects</i></a>	<a href="#"><i>AbstractPathEffect</i></a>
<a href="#"><i>picker</i></a>	None or bool or callable
<a href="#"><i>rasterized</i></a>	bool or None
<a href="#"><i>sketch_params</i></a>	(scale: float, length: float, randomness: float)
<a href="#"><i>snap</i></a>	bool or None
<a href="#"><i>transform</i></a>	<a href="#"><i>Transform</i></a>
<a href="#"><i>url</i></a>	str
<a href="#"><i>visible</i></a>	bool
<a href="#"><i>zorder</i></a>	float

*FancyArrow* Patch that allows independent control of the head and tail properties.

`--init__(self, x, y, dx, dy, width=1.0, **kwargs)`  
 Draws an arrow from (x, y) to (x + dx, y + dy). The width of the arrow is scaled by *width*.

#### Parameters

- x** [float] x coordinate of the arrow tail.
- y** [float] y coordinate of the arrow tail.
- dx** [float] Arrow length in the x direction.
- dy** [float] Arrow length in the y direction.
- width** [float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.
- \*\*kwargs** Keyword arguments control the *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a bool
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '}', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

#### See also:

*FancyArrow* Patch that allows independent control of the head and tail properties.

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)  
    Return str(self).
```

```
get_patch_transform(self)  
    Return the Transform instance mapping patch coordinates to data coordinates.
```

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

```
get_path(self)  
    Return the path of this patch.
```

### Examples using `matplotlib.patches.Arrow`

- sphx\_glr\_gallery\_shapes\_and\_collections\_arrow\_guide.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_artist\_reference.py

### `matplotlib.patches.ArrowStyle`

```
class matplotlib.patches.ArrowStyle  
    Bases: matplotlib.patches._Style
```

*ArrowStyle* is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path. These are mainly used with *FancyArrowPatch*.

A arrowstyle object can be either created as:

```
ArrowStyle.Fancy(head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4)
```

or:

```
ArrowStyle("Fancy, head_length=.4, head_width=.4, tail_width=.4")
```

The following classes are defined

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	-[	widthB=1.0, lengthB=0.2, angleB=None
Curve-FilledB	- >	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
Curve-FilledA	< -	head_length=0.4, head_width=0.2
Curve-FilledAB	< ->	head_length=0.4, head_width=0.2
BracketA	] -	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	] - [	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	simple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	-	widthA=1.0, angleA=None, widthB=1.0, angleB=None

An instance of any arrow style class is a callable object, whose call signature is:

```
__call__(self, path, mutation_size, linewidth, aspect_ratio=1.)
```

and it returns a tuple of a *Path* instance and a boolean value. *path* is a *Path* instance along which the arrow will be drawn. *mutation\_size* and *aspect\_ratio* have the same meaning as in *BoxStyle*. *linewidth* is a line width to be stroked. This is meant to be used to correct the location of the head so that it does not overshoot the destination point, but not all classes support it.

Return the instance of the subclass with the given style name.

```
class BarAB(widthA=1.0, angleA=None, widthB=1.0, angleB=None)
```

Bases: `matplotlib.patches._Bracket`

An arrow with vertical bars | at both ends.

### Parameters

**widthA** [float, default: 1.0] Width of the bracket.

**angleA** [float, default: None] Angle between the bracket and the line.

**widthB** [float, default: 1.0] Width of the bracket.

**angleB** [float, default: None] Angle between the bracket and the line.

```
__init__(self, widthA=1.0, angleA=None, widthB=1.0, angleB=None)
```

### Parameters

**widthA** [float, default: 1.0] Width of the bracket.

**angleA** [float, default: None] Angle between the bracket and the line.

**widthB** [float, default: 1.0] Width of the bracket.

**angleB** [float, default: None] Angle between the bracket and the line.

```
__module__ = 'matplotlib.patches'

class BracketA(widthA=1.0, lengthA=0.2, angleA=None)
    Bases: matplotlib.patches._Bracket

    An arrow with an outward square bracket at its start.
```

**Parameters**

**widthA** [float, default: 1.0] Width of the bracket.  
**lengthA** [float, default: 0.2] Length of the bracket.  
**angleA** [float, default: None] Angle between the bracket and the line.

```
__init__(self, widthA=1.0, lengthA=0.2, angleA=None)
```

**Parameters**

**widthA** [float, default: 1.0] Width of the bracket.  
**lengthA** [float, default: 0.2] Length of the bracket.  
**angleA** [float, default: None] Angle between the bracket and the line.

```
__module__ = 'matplotlib.patches'

class BracketAB(widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0,
    lengthB=0.2, angleB=None)
    Bases: matplotlib.patches._Bracket
```

An arrow with outward square brackets at both ends.

**Parameters**

**widthA** [float, default: 1.0] Width of the bracket.  
**lengthA** [float, default: 0.2] Length of the bracket.  
**angleA** [float, default: None] Angle between the bracket and the line.  
**widthB** [float, default: 1.0] Width of the bracket.  
**lengthB** [float, default: 0.2] Length of the bracket.  
**angleB** [float, default: None] Angle between the bracket and the line.

```
__init__(self, widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0,
    lengthB=0.2, angleB=None)
```

**Parameters**

**widthA** [float, default: 1.0] Width of the bracket.  
**lengthA** [float, default: 0.2] Length of the bracket.  
**angleA** [float, default: None] Angle between the bracket and the line.  
**widthB** [float, default: 1.0] Width of the bracket.  
**lengthB** [float, default: 0.2] Length of the bracket.  
**angleB** [float, default: None] Angle between the bracket and the line.

```
__module__ = 'matplotlib.patches'
```

```
class BracketB(widthB=1.0, lengthB=0.2, angleB=None)
```

```
Bases: matplotlib.patches._Bracket
```

An arrow with an outward square bracket at its end.

#### Parameters

**widthB** [float, default: 1.0] Width of the bracket.

**lengthB** [float, default: 0.2] Length of the bracket.

**angleB** [float, default: None] Angle between the bracket and the line.

```
__init__(self, widthB=1.0, lengthB=0.2, angleB=None)
```

#### Parameters

**widthB** [float, default: 1.0] Width of the bracket.

**lengthB** [float, default: 0.2] Length of the bracket.

**angleB** [float, default: None] Angle between the bracket and the line.

```
__module__ = 'matplotlib.patches'
```

```
class Curve
```

```
Bases: matplotlib.patches._Curve
```

A simple curve without any arrow head.

The arrows are drawn if *beginarrow* and/or *endarrow* are true. *head\_length* and *head\_width* determines the size of the arrow relative to the *mutation scale*. The arrowhead at the begin (or end) is closed if *fillbegin* (or *fillend*) is True.

```
__init__(self)
```

The arrows are drawn if *beginarrow* and/or *endarrow* are true. *head\_length* and *head\_width* determines the size of the arrow relative to the *mutation scale*. The arrowhead at the begin (or end) is closed if *fillbegin* (or *fillend*) is True.

```
__module__ = 'matplotlib.patches'
```

```
class CurveA(head_length=0.4, head_width=0.2)
```

```
Bases: matplotlib.patches._Curve
```

An arrow with a head at its begin point.

#### Parameters

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__init__(self, head_length=0.4, head_width=0.2)
```

#### Parameters

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__module__ = 'matplotlib.patches'
```

```
class CurveAB(head_length=0.4, head_width=0.2)
```

```
Bases: matplotlib.patches._Curve
```

An arrow with heads both at the begin and the end point.

**Parameters**

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__init__(self, head_length=0.4, head_width=0.2)
```

**Parameters**

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__module__ = 'matplotlib.patches'
```

```
class CurveB(head_length=0.4, head_width=0.2)
```

```
Bases: matplotlib.patches._Curve
```

An arrow with a head at its end point.

**Parameters**

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__init__(self, head_length=0.4, head_width=0.2)
```

**Parameters**

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__module__ = 'matplotlib.patches'
```

```
class CurveFilledA(head_length=0.4, head_width=0.2)
```

```
Bases: matplotlib.patches._Curve
```

An arrow with filled triangle head at the begin.

**Parameters**

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__init__(self, head_length=0.4, head_width=0.2)
```

**Parameters**

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__module__ = 'matplotlib.patches'
```

```
class CurveFilledAB(head_length=0.4, head_width=0.2)
```

```
Bases: matplotlib.patches._Curve
```

An arrow with filled triangle heads at both ends.

**Parameters**

**head\_length** [float, default: 0.4] Length of the arrow head.

**head\_width** [float, default: 0.2] Width of the arrow head.

```
__init__(self, head_length=0.4, head_width=0.2)
```

**Parameters****head\_length** [float, default: 0.4] Length of the arrow head.**head\_width** [float, default: 0.2] Width of the arrow head.`__module__ = 'matplotlib.patches'``class CurveFilledB(head_length=0.4, head_width=0.2)``Bases: matplotlib.patches._Curve`

An arrow with filled triangle head at the end.

**Parameters****head\_length** [float, default: 0.4] Length of the arrow head.**head\_width** [float, default: 0.2] Width of the arrow head.`__init__(self, head_length=0.4, head_width=0.2)`**Parameters****head\_length** [float, default: 0.4] Length of the arrow head.**head\_width** [float, default: 0.2] Width of the arrow head.`__module__ = 'matplotlib.patches'``class Fancy(head_length=0.4, head_width=0.4, tail_width=0.4)``Bases: matplotlib.patches._Base`

A fancy arrow. Only works with a quadratic Bezier curve.

**Parameters****head\_length** [float, default: 0.4] Length of the arrow head.**head\_width** [float, default: 0.4] Width of the arrow head.**tail\_width** [float, default: 0.4] Width of the arrow tail.`__init__(self, head_length=0.4, head_width=0.4, tail_width=0.4)`**Parameters****head\_length** [float, default: 0.4] Length of the arrow head.**head\_width** [float, default: 0.4] Width of the arrow head.**tail\_width** [float, default: 0.4] Width of the arrow tail.`__module__ = 'matplotlib.patches'``transmute(self, path, mutation_size, linewidth)`

The `transmute` method is the very core of the `ArrowStyle` class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the `mutation_size`, with which the arrow head etc. will be scaled. The `linewidth` may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a `Path` instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

`class Simple(head_length=0.5, head_width=0.5, tail_width=0.2)``Bases: matplotlib.patches._Base`

A simple arrow. Only works with a quadratic Bezier curve.

**Parameters**

**head\_length** [float, default: 0.5] Length of the arrow head.

**head\_width** [float, default: 0.5] Width of the arrow head.

**tail\_width** [float, default: 0.2] Width of the arrow tail.

```
__init__(self, head_length=0.5, head_width=0.5, tail_width=0.2)
```

**Parameters**

**head\_length** [float, default: 0.5] Length of the arrow head.

**head\_width** [float, default: 0.5] Width of the arrow head.

**tail\_width** [float, default: 0.2] Width of the arrow tail.

```
__module__ = 'matplotlib.patches'
```

```
transmute(self, path, mutation_size, linewidth)
```

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation\_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

```
class Wedge(tail_width=0.3, shrink_factor=0.5)
```

```
Bases: matplotlib.patches._Base
```

Wedge(?) shape. Only works with a quadratic Bezier curve. The begin point has a width of the tail\_width and the end point has a width of 0. At the middle, the width is shrink\_factor\*tail\_width.

**Parameters**

**tail\_width** [float, default: 0.3] Width of the tail.

**shrink\_factor** [float, default: 0.5] Fraction of the arrow width at the middle point.

```
__init__(self, tail_width=0.3, shrink_factor=0.5)
```

**Parameters**

**tail\_width** [float, default: 0.3] Width of the tail.

**shrink\_factor** [float, default: 0.5] Fraction of the arrow width at the middle point.

```
__module__ = 'matplotlib.patches'
```

```
transmute(self, path, mutation_size, linewidth)
```

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation\_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

```
__module__ = 'matplotlib.patches'
```

Examples using `matplotlib.patches.ArrowStyle`

- `sphx_glr_gallery_text_labels_and_annotations_fancyarrow_demo.py`

`matplotlib.patches.BoxStyle`

```
class matplotlib.patches.BoxStyle
    Bases: matplotlib.patches._Style
```

*BoxStyle* is a container class which defines several boxstyle classes, which are used for *FancyBboxPatch*.

A style object can be created as:

```
BoxStyle.Round(pad=0.2)
```

or:

```
BoxStyle("Round", pad=0.2)
```

or:

```
BoxStyle("Round, pad=0.2")
```

The following boxstyle classes are defined.

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

An instance of any boxstyle class is a callable object, whose call signature is:

```
__call__(self, x0, y0, width, height, mutation_size, aspect_ratio=1.)
```

and returns a *Path* instance. *x0*, *y0*, *width* and *height* specify the location and size of the box to be drawn. *mutation\_scale* determines the overall size of the mutation (by which I mean the transformation of the rectangle to the fancy box). *mutation\_aspect* determines the aspect-ratio of the mutation.

Return the instance of the subclass with the given style name.

```
class Circle(pad=0.3)
    Bases: matplotlib.patches._Base
```

A circular box.

**Parameters**

**pad** [float, default: 0.3] The amount of padding around the original box.

```
__init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.patches'

transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.

class DArrow(pad=0.3)
    Bases: matplotlib.patches._Base
    A box in the shape of a two-way arrow.

    Parameters

        pad [float, default: 0.3] The amount of padding around the original
        box.

__init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.patches'

transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.

class LArrow(pad=0.3)
    Bases: matplotlib.patches._Base
    A box in the shape of a left-pointing arrow.

    Parameters

        pad [float, default: 0.3] The amount of padding around the original
        box.

__init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.patches'

transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.

class RArrow(pad=0.3)
    Bases: matplotlib.patches.LArrow
    A box in the shape of a right-pointing arrow.

    Parameters

        pad [float, default: 0.3] The amount of padding around the original
        box.

__init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.patches'

transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.

class Round(pad=0.3, rounding_size=None)
    Bases: matplotlib.patches._Base
    A box with round corners.
```

**Parameters**

**pad** [float, default: 0.3] The amount of padding around the original box.

**rounding\_size** [float, default: *pad*] Radius of the corners.

`__init__(self, pad=0.3, rounding_size=None)`

Initialize self. See `help(type(self))` for accurate signature.

`__module__` = 'matplotlib.patches'

`transmute(self, x0, y0, width, height, mutation_size)`

Return the [Path](#) outlining the given rectangle.

`class Round4(pad=0.3, rounding_size=None)`

Bases: `matplotlib.patches._Base`

A box with rounded edges.

**Parameters**

**pad** [float, default: 0.3] The amount of padding around the original box.

**rounding\_size** [float, default: *pad*/2] Rounding of edges.

`__init__(self, pad=0.3, rounding_size=None)`

Initialize self. See `help(type(self))` for accurate signature.

`__module__` = 'matplotlib.patches'

`transmute(self, x0, y0, width, height, mutation_size)`

Return the [Path](#) outlining the given rectangle.

`class Roundtooth(pad=0.3, tooth_size=None)`

Bases: `matplotlib.patches.Sawtooth`

A box with a rounded sawtooth outline.

**Parameters**

**pad** [float, default: 0.3] The amount of padding around the original box.

**tooth\_size** [float, default: *pad*/2] Size of the sawtooth.

`__init__(self, pad=0.3, tooth_size=None)`

Initialize self. See `help(type(self))` for accurate signature.

`__module__` = 'matplotlib.patches'

`transmute(self, x0, y0, width, height, mutation_size)`

Return the [Path](#) outlining the given rectangle.

`class Sawtooth(pad=0.3, tooth_size=None)`

Bases: `matplotlib.patches._Base`

A box with a sawtooth outline.

**Parameters**

**pad** [float, default: 0.3] The amount of padding around the original box.

**tooth\_size** [float, default: *pad*/2] Size of the sawtooth.

```

__init__(self, pad=0.3, tooth_size=None)
    Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.patches'

transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.

class Square(pad=0.3)
    Bases: matplotlib.patches._Base
    A square box.

    Parameters

    pad [float, default: 0.3] The amount of padding around the original
    box.

__init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.patches'

transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.

__module__ = 'matplotlib.patches'

```

#### Examples using matplotlib.patches.BoxStyle

- sphx\_glr\_gallery\_shapes\_and\_collections\_artist\_reference.py
- sphx\_glr\_gallery\_shapes\_and\_collections\_fancybox\_demo.py

#### matplotlib.patches.Circle

```

class matplotlib.patches.Circle(xy, radius=5, **kwargs)
    Bases: matplotlib.patches.Ellipse

    A circle patch.

    Create a true circle at center xy = (x, y) with given radius.

    Unlike CirclePolygon which is a polygonal approximation, this uses Bezier splines and is
    much closer to a scale-free circle.

    Valid keyword arguments are:

```

Property	Description
<a href="#">agg_filter</a>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<a href="#">alpha</a>	float or None
<a href="#">animated</a>	bool
<a href="#">antialiased</a> or <a href="#">aa</a>	unknown
<a href="#">capstyle</a>	{'butt', 'round', 'projecting'}
<a href="#">clip_box</a>	<a href="#">Bbox</a>
<a href="#">clip_on</a>	bool
<a href="#">clip_path</a>	Patch or (Path, Transform) or None
<a href="#">color</a>	color

Continued

Table 151 – continued from previous page

Property	Description
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '--', '-.', ':', '', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`__init__(self, xy, radius=5, **kwargs)`

Create a true circle at center  $xy = (x, y)$  with given *radius*.

Unlike *CirclePolygon* which is a polygonal approximation, this uses Bezier splines and is much closer to a scale-free circle.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{ 'butt', 'round', 'projecting' }
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }

Continued

Table 152 – continued from previous page

Property	Description
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '—', '-.', ':', ' ', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

get_radius(self)
    Return the radius of the circle.

property radius
    Return the radius of the circle.

set_radius(self, radius)
    Set the radius of the circle.
```

### Parameters

**radius** [float]

### matplotlib.patches.CirclePolygon

`class matplotlib.patches.CirclePolygon(xy, radius=5, resolution=20, **kwargs)`

Bases: [matplotlib.patches.RegularPolygon](#)

A polygon-approximation of a circle patch.

Create a circle at  $xy = (x, y)$  with given *radius*.

This circle is approximated by a regular polygon with *resolution* sides. For a smoother circle drawn with splines, see [Circle](#).

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a bool
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<a href="#">Bbox</a>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<a href="#">Figure</a>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', ':-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<a href="#">AbstractPathEffect</a>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None

Continued

Table 153 – continued from previous page

Property	Description
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, xy, radius=5, resolution=20, **kwargs)
```

Create a circle at  $xy = (x, y)$  with given *radius*.

This circle is approximated by a regular polygon with *resolution* sides. For a smoother circle drawn with splines, see [Circle](#).

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', '.,', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)
    Return str(self).
```

Examples using `matplotlib.patches.CirclePolygon`

#### `matplotlib.patches.ConnectionPatch`

```
class matplotlib.patches.ConnectionPatch(xyA, xyB, coordsA, coordsB=None, axesA=None, axesB=None, arrowstyle='-', connectionstyle='arc3', patchA=None, patchB=None, shrinkA=0.0, shrinkB=0.0, mutation_scale=10.0, mutation_aspect=None, clip_on=False, dpi_cor=1.0, **kwargs)
```

Bases: `matplotlib.patches.FancyArrowPatch`

A patch that connects two points (possibly in different axes).

Connect point `xyA` in `coordsA` with point `xyB` in `coordsB`.

Valid keys are

Key	Description
<code>arrowstyle</code>	the arrow style
<code>connectionstyle</code>	the connection style
<code>relpos</code>	default is (0.5, 0.5)
<code>patchA</code>	default is bounding box of the text
<code>patchB</code>	default is None
<code>shrinkA</code>	default is 2 points
<code>shrinkB</code>	default is 2 points
<code>mutation_scale</code>	default is text size (in points)
<code>mutation_aspect</code>	default is 1.
<code>?</code>	any key for <code>matplotlib.patches.PathPatch</code>

`coordsA` and `coordsB` are strings that indicate the coordinates of `xyA` and `xyB`.

Property	Description
'figure points'	points from the lower left corner of the figure
'figure pixels'	pixels from the lower left corner of the figure
'figure fraction'	0, 0 is lower left of figure and 1, 1 is upper right
'axes points'	points from lower left corner of axes
'axes pixels'	pixels from lower left corner of axes
'axes fraction'	0, 0 is lower left of axes and 1, 1 is upper right
'data'	use the coordinate system of the object being annotated (default)
'offset points'	offset (in points) from the xy value
'polar'	you can specify <i>theta</i> , <i>r</i> for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native "data" coordinate system.

Alternatively they can be set to any valid *Transform*.

**Note:** Using *ConnectionPatch* across two *Axes* instances is not directly compatible with *constrained layout*. Add the artist directly to the *Figure* instead of adding it to a specific Axes.

```
fig, ax = plt.subplots(1, 2, constrained_layout=True)
con = ConnectionPatch(..., axesA=ax[0], axesB=ax[1])
fig.add_artist(con)
```

```
__init__(self, xyA, xyB, coordsA, coordsB=None, axesA=None, axesB=None,
          arrowstyle='-', connectionstyle='arc3', patchA=None, patchB=None,
          shrinkA=0.0, shrinkB=0.0, mutation_scale=10.0, mutation_aspect=None,
          clip_on=False, dpi_cor=1.0, **kwargs)
```

Connect point *xyA* in *coordsA* with point *xyB* in *coordsB*.

Valid keys are

Key	Description
<code>arrowstyle</code>	the arrow style
<code>connectionstyle</code>	the connection style
<code>relpos</code>	default is (0.5, 0.5)
<code>patchA</code>	default is bounding box of the text
<code>patchB</code>	default is None
<code>shrinkA</code>	default is 2 points
<code>shrinkB</code>	default is 2 points
<code>mutation_scale</code>	default is text size (in points)
<code>mutation_aspect</code>	default is 1.
<code>?</code>	any key for <code>matplotlib.patches.PathPatch</code>

`coordsA` and `coordsB` are strings that indicate the coordinates of `xyA` and `xyB`.

Property	Description

```

(continues on next page)

(continued from previous page)

`fig.add_artist(con)`

---

`__module__ = 'matplotlib.patches'``__str__(self)`Return `str(self)`.`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns `False`).**Parameters****renderer** [`RendererBase` subclass.]**Notes**

This method is overridden in the Artist subclasses.

`get_annotation_clip(self)`

Return the clipping behavior.

See `set_annotation_clip` for the meaning of the return value.`get_path_in_displaycoord(self)`

Return the mutated path of the arrow in display coordinates.

`set_annotation_clip(self, b)`

Set the clipping behavior.

**Parameters****b** [bool or None]

- *False*: The annotation will always be drawn regardless of its position.
- *True*: The annotation will only be drawn if `self.xy` is inside the axes.
- *None*: The annotation will only be drawn if `self.xy` is inside the axes and `self.xycoords == "data"`.

**Examples using `matplotlib.patches.ConnectionPatch`**

- `sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py`
- `sphx_glr_gallery_userdemo_connect_simple01.py`
- *Constrained Layout Guide*

**`matplotlib.patches.ConnectionStyle`**`class matplotlib.patches.ConnectionStyle`Bases: `matplotlib.patches._Style`

*ConnectionStyle* is a container class which defines several connectionstyle classes, which is used to create a path between two points. These are mainly used with *FancyArrowPatch*.

A connectionstyle object can be either created as:

```
ConnectionStyle.Arc3(rad=0.2)
```

or:

```
ConnectionStyle("Arc3", rad=0.2)
```

or:

```
ConnectionStyle("Arc3, rad=0.2")
```

The following classes are defined

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
Angle3	angle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, angle=None

An instance of any connection style class is an callable object, whose call signature is:

```
__call__(self, posA, posB,
          patchA=None, patchB=None,
          shrinkA=2., shrinkB=2.)
```

and it returns a *Path* instance. *posA* and *posB* are tuples of (x, y) coordinates of the two points to be connected. *patchA* (or *patchB*) is given, the returned path is clipped so that it start (or end) from the boundary of the patch. The path is further shrunk by *shrinkA* (or *shrinkB*) which is given in points.

Return the instance of the subclass with the given style name.

```
class Angle(angleA=90, angleB=0, rad=0.0)
```

Bases: matplotlib.patches.\_Base

Creates a piecewise continuous quadratic Bezier path between two points. The path has a one passing-through point placed at the intersecting point of two lines which cross the start and end point, and have a slope of *angleA* and *angleB*, respectively. The connecting edges are rounded with *rad*.

***angleA*** starting angle of the path

***angleB*** ending angle of the path

***rad*** rounding radius of the edge

```
__init__(self, angleA=90, angleB=0, rad=0.0)
```

***angleA*** starting angle of the path

***angleB*** ending angle of the path

***rad*** rounding radius of the edge

```
__module__ = 'matplotlib.patches'
```

```
connect(self, posA, posB)
```

```
class Angle3(angleA=90, angleB=0)
    Bases: matplotlib.patches._Base
```

Creates a simple quadratic Bezier curve between two points. The middle control points is placed at the intersecting point of two lines which cross the start and end point, and have a slope of angleA and angleB, respectively.

**angleA** starting angle of the path

**angleB** ending angle of the path

```
__init__(self, angleA=90, angleB=0)
```

**angleA** starting angle of the path

**angleB** ending angle of the path

```
__module__ = 'matplotlib.patches'
```

```
connect(self, posA, posB)
```

```
class Arc(angleA=0, angleB=0, armA=None, armB=None, rad=0.0)
    Bases: matplotlib.patches._Base
```

Creates a piecewise continuous quadratic Bezier path between two points. The path can have two passing-through points, a point placed at the distance of armA and angle of angleA from point A, another point with respect to point B. The edges are rounded with rad.

**angleA** : starting angle of the path

**angleB** : ending angle of the path

**armA** : length of the starting arm

**armB** : length of the ending arm

**rad** : rounding radius of the edges

```
__init__(self, angleA=0, angleB=0, armA=None, armB=None, rad=0.0)
```

**angleA** : starting angle of the path

**angleB** : ending angle of the path

**armA** : length of the starting arm

**armB** : length of the ending arm

**rad** : rounding radius of the edges

```
__module__ = 'matplotlib.patches'
```

```
connect(self, posA, posB)
```

```
class Arc3(rad=0.0)
    Bases: matplotlib.patches._Base
```

Creates a simple quadratic Bezier curve between two points. The curve is created so that the middle control point (C1) is located at the same distance from the start (C0) and end points(C2) and the distance of the C1 to the line connecting C0-C2 is rad times the distance of C0-C2.

**rad** curvature of the curve.

```
__init__(self, rad=0.0)
```

**rad** curvature of the curve.

```
__module__ = 'matplotlib.patches'
```

```
connect(self, posA, posB)
```

```
class Bar(armA=0.0, armB=0.0, fraction=0.3, angle=None)
```

```
Bases: matplotlib.patches._Base
```

A line with *angle* between A and B with *armA* and *armB*. One of the arms is extended so that they are connected in a right angle. The length of *armA* is determined by (*armA* + *fraction* x AB distance). Same for *armB*.

### Parameters

**armA** [float] minimum length of armA

**armB** [float] minimum length of armB

**fraction** [float] a fraction of the distance between two points that will be added to armA and armB.

**angle** [float or None] angle of the connecting line (if None, parallel to A and B)

```
__init__(self, armA=0.0, armB=0.0, fraction=0.3, angle=None)
```

### Parameters

**armA** [float] minimum length of armA

**armB** [float] minimum length of armB

**fraction** [float] a fraction of the distance between two points that will be added to armA and armB.

**angle** [float or None] angle of the connecting line (if None, parallel to A and B)

```
__module__ = 'matplotlib.patches'
```

```
connect(self, posA, posB)
```

```
__module__ = 'matplotlib.patches'
```

Examples using `matplotlib.patches.ConnectionStyle`

`matplotlib.patches.Ellipse`

```
class matplotlib.patches.Ellipse(xy, width, height, angle=0, **kwargs)
```

```
Bases: matplotlib.patches.Patch
```

A scale-free ellipse.

### Parameters

**xy** [(float, float)] xy coordinates of ellipse centre.

**width** [float] Total length (diameter) of horizontal axis.

**height** [float] Total length (diameter) of vertical axis.

**angle** [float, default: 0] Rotation in degrees anti-clockwise.

## Notes

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', ':-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, xy, width, height, angle=0, **kwargs)
```

### Parameters

**xy** [(float, float)] xy coordinates of ellipse centre.

**width** [float] Total length (diameter) of horizontal axis.

**height** [float] Total length (diameter) of vertical axis.

**angle** [float, default: 0] Rotation in degrees anti-clockwise.

## Notes

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', '., '*'}
<i>in_layout</i>	bool

<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)
    Return str(self).
```

```
property angle
    Return the angle of the ellipse.
```

```
property center
    Return the center of the ellipse.
```

```
get_angle(self)
    Return the angle of the ellipse.
```

```
get_center(self)
    Return the center of the ellipse.
```

```
get_height(self)
    Return the height of the ellipse.
```

```
get_patch_transform(self)
    Return the Transform instance mapping patch coordinates to data coordinates.
```

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path(self)`  
Return the path of the ellipse.

`get_width(self)`  
Return the width of the ellipse.

property `height`  
Return the height of the ellipse.

`set_angle(self, angle)`  
Set the angle of the ellipse.

#### Parameters

**angle** [float]

`set_center(self, xy)`  
Set the center of the ellipse.

#### Parameters

**xy** [(float, float)]

`set_height(self, height)`  
Set the height of the ellipse.

#### Parameters

**height** [float]

`set_width(self, width)`  
Set the width of the ellipse.

#### Parameters

**width** [float]

property `width`  
Return the width of the ellipse.

### matplotlib.patches.FancyArrow

```
class matplotlib.patches.FancyArrow(x, y, dx, dy, width=0.001,
                                     length_includes_head=False, head_width=None,
                                     head_length=None, shape='full', overhang=0,
                                     head_starts_at_zero=False, **kwargs)
```

Bases: [matplotlib.patches.Polygon](#)

Like Arrow, but lets you set head width and head height independently.

#### Parameters

**width: float, default: 0.001** Width of full arrow tail.

**length\_includes\_head: bool, default: False** True if head is to be counted in calculating the length.

**head\_width: float or None, default: 3\*width** Total width of the full arrow head.

**head\_length: float or None, default: 1.5\*head\_width** Length of arrow head.

**shape: ['full', 'left', 'right'], default: 'full'** Draw the left-half, right-half, or full arrow.

**overhang: float, default: 0** Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

**head\_starts\_at\_zero: bool, default: False** If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**\*\*kwargs** *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, x, y, dx, dy, width=0.001, length_includes_head=False,
          head_width=None, head_length=None, shape='full', overhang=0,
          head_starts_at_zero=False, **kwargs)
```

### Parameters

**width: float, default: 0.001** Width of full arrow tail.

**length\_includes\_head: bool, default: False** True if head is to be counted in calculating the length.

**head\_width: float or None, default: 3\*width** Total width of the full arrow head.

**head\_length: float or None, default: 1.5\*head\_width** Length of

arrow head.

**shape:** ['full', 'left', 'right'], **default:** 'full' Draw the left-half, right-half, or full arrow.

**overhang:** float, **default:** 0 Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

**head\_starts\_at\_zero:** bool, **default:** False If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**\*\*kwargs** *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array

<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'
__str__(self)
    Return str(self).
```

Examples using `matplotlib.patches.FancyArrow`

**matplotlib.patches.FancyArrowPatch**

```
class matplotlib.patches.FancyArrowPatch(posA=None, posB=None, path=None, ar-
                                         rowstyle='simple', connectionstyle='arc3',
                                         patchA=None, patchB=None, shrinkA=2,
                                         shrinkB=2, mutation_scale=1, muta-
                                         tion_aspect=None, dpi_cor=1, **kwargs)
```

Bases: `matplotlib.patches.Patch`

A fancy arrow patch. It draws an arrow using the `ArrowStyle`.

The head and tail positions are fixed at the specified start and end points of the arrow, but the size and shape (in display coordinates) of the arrow does not change when the axis is moved or zoomed.

There are two ways for defining an arrow:

- If `posA` and `posB` are given, a path connecting two points is created according to `connectionstyle`. The path will be clipped with `patchA` and `patchB` and further shrunk by `shrinkA` and `shrinkB`. An arrow is drawn along this resulting path using the `arrowstyle` parameter.
- Alternatively if `path` is provided, an arrow is drawn along this path and `patchA`, `patchB`, `shrinkA`, and `shrinkB` are ignored.

**Parameters**

**posA, posB** [(float, float), default: None] (x, y) coordinates of arrow tail and arrow head respectively.

**path** [`Path`, default: None] If provided, an arrow is drawn along this path and `patchA`, `patchB`, `shrinkA`, and `shrinkB` are ignored.

**arrowstyle** [str or `ArrowStyle`, default: 'simple']

The `ArrowStyle` with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional attributes are meant to be scaled with the `mutation_scale`. The following arrow styles are available:

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	-[	widthB=1.0, lengthB=0.2, angleB=None
Curve-FilledB	- >	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
Curve-FilledA	< -	head_length=0.4, head_width=0.2
Curve-FilledAB	< ->	head_length=0.4, head_width=0.2
BracketA	] -	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	] - [	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	simple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	-	widthA=1.0, angleA=None, widthB=1.0, angleB=None

**connectionstyle** [str or *ConnectionStyle* or None, optional, default: 'arc3']

The *ConnectionStyle* with which *posA* and *posB* are connected. If a string, it should be one of the available connectionstyle names, with optional comma-separated attributes. The following connection styles are available:

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
Angle3	angle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, angle=None

**patchA, patchB** [*Patch*, default: None] Head and tail patches, respectively.

**shrinkA, shrinkB** [float, default: 2] Shrinking factor of the tail and head of the arrow respectively.

**mutation\_scale** [float, default: 1] Value with which attributes of *arrowstyle* (e.g., *head\_length*) will be scaled.

**mutation\_aspect** [None or float, default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

**dpi\_cor** [float, default: 1] dpi\_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

### Other Parameters

**\*\*kwargs** [*Patch* properties, optional] Here is a list of available *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	<i>Patch</i> or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

In contrast to other patches, the default *capstyle* and *joinstyle* for *FancyArrowPatch* are set to "round".

```
__init__(self, posA=None, posB=None, path=None, arrowstyle='simple', connectionstyle='arc3', patchA=None, patchB=None, shrinkA=2, shrinkB=2, mutation_scale=1, mutation_aspect=None, dpi_cor=1, **kwargs)
```

There are two ways for defining an arrow:

- If *posA* and *posB* are given, a path connecting two points is created according to *connectionstyle*. The path will be clipped with *patchA* and *patchB* and further shrunk by *shrinkA* and *shrinkB*. An arrow is drawn along this resulting path using the *arrowstyle* parameter.
- Alternatively if *path* is provided, an arrow is drawn along this path and *patchA*,

*patchB*, *shrinkA*, and *shrinkB* are ignored.

### Parameters

**posA, posB** [(float, float), default: None] (x, y) coordinates of arrow tail and arrow head respectively.

**path** [*Path*, default: None] If provided, an arrow is drawn along this path and *patchA*, *patchB*, *shrinkA*, and *shrinkB* are ignored.

**arrowstyle** [str or *ArrowStyle*, default: 'simple']

The *ArrowStyle* with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional attributes are meant to be scaled with the *mutation\_scale*. The following arrow styles are available:

Class	Name	Attrs
Curve	-	None
CurveB	->	head_length=0.4, head_width=0.2
BracketB	-[	widthB=1.0, lengthB=0.2, angleB=None
Curve-FilledB	- >	head_length=0.4, head_width=0.2
CurveA	<-	head_length=0.4, head_width=0.2
CurveAB	<->	head_length=0.4, head_width=0.2
Curve-FilledA	< -	head_length=0.4, head_width=0.2
Curve-FilledAB	< ->	head_length=0.4, head_width=0.2
BracketA	] -	widthA=1.0, lengthA=0.2, angleA=None
BracketAB	] - [	widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None
Fancy	fancy	head_length=0.4, head_width=0.4, tail_width=0.4
Simple	simple	head_length=0.5, head_width=0.5, tail_width=0.2
Wedge	wedge	tail_width=0.3, shrink_factor=0.5
BarAB	-	widthA=1.0, angleA=None, widthB=1.0, angleB=None

**connectionstyle** [str or *ConnectionStyle* or None, optional, default: 'arc3']

The *ConnectionStyle* with which *posA* and *posB* are connected. If a string, it should be one of the available connectionstyle names, with optional comma-separated attributes. The following connection styles are available:

Class	Name	Attrs
Angle	angle	angleA=90, angleB=0, rad=0.0
An- gle3	angle3	angleA=90, angleB=0
Arc	arc	angleA=0, angleB=0, armA=None, armB=None, rad=0.0
Arc3	arc3	rad=0.0
Bar	bar	armA=0.0, armB=0.0, fraction=0.3, an- gle=None

**patchA, patchB** [*Patch*, default: None] Head and tail patches, respectively.

**shrinkA, shrinkB** [float, default: 2] Shrinking factor of the tail and head of the arrow respectively.

**mutation\_scale** [float, default: 1] Value with which attributes of *arrowstyle* (e.g., *head\_length*) will be scaled.

**mutation\_aspect** [None or float, default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

**dpi\_cor** [float, default: 1] *dpi\_cor* is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

### Other Parameters

**\*\*kwargs** [*Patch* properties, optional] Here is a list of available *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None

<i>visible</i>	bool
<i>zorder</i>	float

In contrast to other patches, the default `capstyle` and `joinstyle` for *FancyArrowPatch* are set to "round".

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)  
Return str(self).
```

```
draw(self, renderer)  
Draw the Artist (and its children) using the given renderer.  
This has no effect if the artist is not visible (Artist.get_visible returns False).
```

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

```
get_arrowstyle(self)  
Return the arrowstyle object.
```

```
get_connectionstyle(self)  
Return the ConnectionStyle used.
```

```
get_dpi_cor(self)  
dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.
```

### Returns

**scalar**

```
get_mutation_aspect(self)  
Return the aspect ratio of the bbox mutation.
```

```
get_mutation_scale(self)  
Return the mutation scale.
```

### Returns

**scalar**

```
get_path(self)  
Return the path of the arrow in the data coordinates. Use get_path_in_displaycoord() method to retrieve the arrow path in display coordinates.
```

`get_path_in_displaycoord(self)`

Return the mutated path of the arrow in display coordinates.

`set_arrowstyle(self, arrowstyle=None, **kw)`

Set the arrow style. Old attributes are forgotten. Without arguments (or with `arrowstyle=None`) returns available box styles as a list of strings.

#### Parameters

**arrowstyle** [None or ArrowStyle or str, default: None] Can be a string with arrowstyle name with optional comma-separated attributes, e.g.:

```
set_arrowstyle("Fancy,head_length=0.2")
```

Alternatively attributes can be provided as keywords, e.g.:

```
set_arrowstyle("fancy", head_length=0.2)
```

`set_connectionstyle(self, connectionstyle, **kw)`

Set the connection style. Old attributes are forgotten.

#### Parameters

**connectionstyle** [str or *ConnectionStyle* or None, optional] Can be a string with connectionstyle name with optional comma-separated attributes, e.g.:

```
set_connectionstyle("arc,angleA=0,armA=30,rad=10")
```

Alternatively, the attributes can be provided as keywords, e.g.:

```
set_connectionstyle("arc", angleA=0,armA=30,rad=10)
```

Without any arguments (or with `connectionstyle=None`), return available styles as a list of strings.

`set_dpi_cor(self, dpi_cor)`

`dpi_cor` is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

#### Parameters

**dpi\_cor** [float]

`set_mutation_aspect(self, aspect)`

Set the aspect ratio of the bbox mutation.

#### Parameters

**aspect** [float]

`set_mutation_scale(self, scale)`

Set the mutation scale.

#### Parameters

**scale** [float]

`set_patchA(self, patchA)`

Set the tail patch.

#### Parameters

**patchA** [*patches.Patch*]

`set_patchB(self, patchB)`  
Set the head patch.

#### Parameters

**patchB** [*patches.Patch*]

`set_positions(self, posA, posB)`  
Set the begin and end positions of the connecting path.

#### Parameters

**posA, posB** [None, tuple] (x, y) coordinates of arrow tail and arrow head respectively. If `None` use current value.

#### Examples using `matplotlib.patches.FancyArrowPatch`

- `sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py`
- `sphx_glr_gallery_shapes_and_collections_arrow_guide.py`
- `sphx_glr_gallery_userdemo_connect_simple01.py`
- `sphx_glr_gallery_userdemo_connectionstyle_demo.py`

#### `matplotlib.patches.FancyBboxPatch`

```
class matplotlib.patches.FancyBboxPatch(xy, width, height, boxstyle='round',
                                         bbox_transmuter=None, mutation_scale=1.0,
                                         mutation_aspect=None, **kwargs)
```

Bases: `matplotlib.patches.Patch`

A fancy box around a rectangle with lower left at `xy = (x, y)` with specified width and height.

`FancyBboxPatch` is similar to `Rectangle`, but it draws a fancy box around the rectangle. The transformation of the rectangle box to the fancy box is delegated to the style classes defined in `BoxStyle`.

#### Parameters

**xy** [float, float] The lower left corner of the box.

**width** [float] The width of the box.

**height** [float] The height of the box.

**boxstyle** [str or `matplotlib.patches.BoxStyle`]

The style of the fancy box. This can either be a `BoxStyle` instance or a string of the style name and optionally comma separated attributes (e.g. "Round, pad=0.2"). This string is passed to `BoxStyle` to construct a `BoxStyle` object. See there for a full documentation.

The following box styles are available:

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

**mutation\_scale** [float, default: 1] Scaling factor applied to the attributes of the box style (e.g. pad or rounding\_size).

**mutation\_aspect** [float, optional] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. For example, this allows different horizontal and vertical padding.

### Other Parameters

**\*\*kwargs** [*Patch* properties]

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', ':', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str

Continued

Table 161 – continued from previous page

Property	Description
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, xy, width, height, boxstyle='round', bbox_transmuter=None, mutation_scale=1.0, mutation_aspect=None, **kwargs)
```

### Parameters

**xy** [float, float] The lower left corner of the box.

**width** [float] The width of the box.

**height** [float] The height of the box.

**boxstyle** [str or *matplotlib.patches.BoxStyle*]

The style of the fancy box. This can either be a *BoxStyle* instance or a string of the style name and optionally comma separated attributes (e.g. "Round, pad=0.2"). This string is passed to *BoxStyle* to construct a *BoxStyle* object. See there for a full documentation.

The following box styles are available:

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

**mutation\_scale** [float, default: 1] Scaling factor applied to the attributes of the box style (e.g. pad or rounding\_size).

**mutation\_aspect** [float, optional] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. For example, this allows different horizontal and vertical padding.

### Other Parameters

**\*\*kwargs** [*Patch* properties]

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>

Continued

Table 162 – continued from previous page

Property	Description
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '--', '-.', ':', ' ', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```

__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

get_bbox(self)
    Return the Bbox.

get_boxstyle(self)
    Return the boxstyle object.

get_height(self)
    Return the height of the rectangle.

get_mutation_aspect(self)
    Return the aspect ratio of the bbox mutation.

get_mutation_scale(self)
    Return the mutation scale.

get_path(self)
    Return the mutated path of the rectangle.

get_width(self)
    Return the width of the rectangle.

get_x(self)
    Return the left coord of the rectangle.

get_y(self)
    Return the bottom coord of the rectangle.

```

`set_bounds(self, *args)`  
Set the bounds of the rectangle.

Call signatures:

```
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```

### Parameters

**left, bottom** [float] The coordinates of the bottom left corner of the rectangle.

**width, height** [float] The width/height of the rectangle.

`set_boxstyle(self, boxstyle=None, **kwargs)`  
Set the box style.

Most box styles can be further configured using attributes. Attributes from the previous box style are not reused.

Without argument (or with `boxstyle=None`), the available box styles are returned as a human-readable string.

### Parameters

**boxstyle** [str]

The name of the box style. Optionally, followed by a comma and a comma-separated list of attributes. The attributes may alternatively be passed separately as keyword arguments.

The following box styles are available:

Class	Name	Attrs
Circle	circle	pad=0.3
DArrow	darrow	pad=0.3
LArrow	larrow	pad=0.3
RArrow	rarrow	pad=0.3
Round	round	pad=0.3, rounding_size=None
Round4	round4	pad=0.3, rounding_size=None
Roundtooth	roundtooth	pad=0.3, tooth_size=None
Sawtooth	sawtooth	pad=0.3, tooth_size=None
Square	square	pad=0.3

**\*\*kwargs** Additional attributes for the box style. See the table above for supported parameters.

### Examples

```
set_boxstyle("round,pad=0.2")
set_boxstyle("round", pad=0.2)
```

`set_height(self, h)`  
Set the rectangle height.

**Parameters**

**h** [float]

`set_mutation_aspect(self, aspect)`  
Set the aspect ratio of the bbox mutation.

**Parameters**

**aspect** [float]

`set_mutation_scale(self, scale)`  
Set the mutation scale.

**Parameters**

**scale** [float]

`set_width(self, w)`  
Set the rectangle width.

**Parameters**

**w** [float]

`set_x(self, x)`  
Set the left coord of the rectangle.

**Parameters**

**x** [float]

`set_y(self, y)`  
Set the bottom coord of the rectangle.

**Parameters**

**y** [float]

**Examples using `matplotlib.patches.FancyBboxPatch`**

- `sphx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphx_glr_gallery_shapes_and_collections_fancybox_demo.py`
- `sphx_glr_gallery_userdemo_annotate_text_arrow.py`

**`matplotlib.patches.Patch`**

```
class matplotlib.patches.Patch(edgecolor=None, facecolor=None, color=None,  
                               linewidth=None, linestyle=None, antialiased=None,  
                               hatch=None, fill=True, capstyle=None, join-  
                               style=None, **kwargs)
```

Bases: `matplotlib.artist.Artist`

A patch is a 2D artist with a face color and an edge color.

If any of *edgecolor*, *facecolor*, *linewidth*, or *antialiased* are *None*, they default to their rc params setting.

The following kwarg properties are supported

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, edgecolor=None, facecolor=None, color=None, linewidth=None,
         linestyle=None, antialiased=None, hatch=None, fill=True, cap-
         style=None, joinstyle=None, **kwargs)
```

The following kwarg properties are supported

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'

Continued

Table 164 – continued from previous page

Property	Description
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '-.', '-.:', ':', '', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'
```

```
contains(self, mouseevent, radius=None)
```

Test whether the mouse event occurred in the patch.

### Returns

**(bool, empty dict)**

```
contains_point(self, point, radius=None)
```

Return whether the given point is inside the patch.

### Parameters

**point** [(float, float)] The point (x, y) to check, in target coordinates of `self.get_transform()`. These are display coordinates for patches that are added to a figure or axes.

**radius** [float, optional] Add an additional margin on the patch in target coordinates of `self.get_transform()`. See *Path.contains\_point* for further details.

### Returns

**bool**

### Notes

The proper use of this method depends on the transform of the patch. Isolated patches do not have a transform. In this case, the patch creation coordinates and the point coordinates match. The following example checks that the center of a circle is within the circle

```
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> c.contains_point(center)
True
```

The convention of checking against the transformed patch stems from the fact that this method is predominantly used to check if display coordinates (e.g. from mouse events) are within the patch. If you want to do the above check with data coordinates, you have to properly transform them first:

```
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> plt.gca().add_patch(c)
>>> transformed_center = c.get_transform().transform(center)
>>> c.contains_point(transformed_center)
True
```

`contains_points(self, points, radius=None)`

Return whether the given points are inside the patch.

#### Parameters

**points** [(N, 2) array] The points to check, in target coordinates of `self.get_transform()`. These are display coordinates for patches that are added to a figure or axes. Columns contain x and y values.

**radius** [float, optional] Add an additional margin on the patch in target coordinates of `self.get_transform()`. See [Path.contains\\_point](#) for further details.

#### Returns

**length-N bool array**

#### Notes

The proper use of this method depends on the transform of the patch. See the notes on [Patch.contains\\_point](#).

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible ([Artist.get\\_visible](#) returns False).

#### Parameters

**renderer** [[RendererBase](#) subclass.]

#### Notes

This method is overridden in the Artist subclasses.

`property fill`

Return whether the patch is filled.

`get_aa(self)`

Alias for [get\\_antialiased](#).

`get_antialiased(self)`  
Return whether antialiasing is used for drawing.

`get_capstyle(self)`  
Return the capstyle.

`get_data_transform(self)`  
Return the *Transform* mapping data coordinates to physical coordinates.

`get_ec(self)`  
Alias for *get\_edgecolor*.

`get_edgecolor(self)`  
Return the edge color.

`get_extents(self)`  
Return the *Patch*'s axis-aligned extents as a *Bbox*.

`get_facecolor(self)`  
Return the face color.

`get_fc(self)`  
Alias for *get\_facecolor*.

`get_fill(self)`  
Return whether the patch is filled.

`get_hatch(self)`  
Return the hatching pattern.

`get_joinstyle(self)`  
Return the joinstyle.

`get_linestyle(self)`  
Return the linestyle.

`get_linewidth(self)`  
Return the line width in points.

`get_ls(self)`  
Alias for *get\_linestyle*.

`get_lw(self)`  
Alias for *get\_linewidth*.

`get_patch_transform(self)`  
Return the *Transform* instance mapping patch coordinates to data coordinates.  
  
For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path(self)`  
Return the path of this patch.

`get_transform(self)`  
Return the *Transform* applied to the *Patch*.

`get_verts(self)`  
Return a copy of the vertices used in this patch.  
  
If the patch contains Bezier curves, the curves will be interpolated by line segments. To access the curves as curves, use *get\_path*.

`get_window_extent(self, renderer=None)`

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`set_aa(self, aa)`

Alias for `set_antialiased`.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

#### Parameters

**alpha** [float or None]

`set_antialiased(self, aa)`

Set whether to use antialiased rendering.

#### Parameters

**b** [bool or None]

`set_capstyle(self, s)`

Set the capstyle.

#### Parameters

**s** [{'butt', 'round', 'projecting'}]

`set_color(self, c)`

Set both the edgecolor and the facecolor.

#### Parameters

**c** [color]

#### See also:

`Patch.set_facecolor`, `Patch.set_edgecolor` For setting the edge or face color individually.

`set_ec(self, color)`

Alias for `set_edgecolor`.

`set_edgecolor(self, color)`

Set the patch edge color.

#### Parameters

**color** [color or None or 'auto']

`set_facecolor(self, color)`

Set the patch face color.

#### Parameters

**color** [color or None]

`set_fc(self, color)`  
Alias for `set_facecolor`.

`set_fill(self, b)`  
Set whether to fill the patch.

### Parameters

**b** [bool]

`set_hatch(self, hatch)`  
Set the hatching pattern.

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

### Parameters

**hatch** [{'/', '\', '|', '-.', '+', 'x', 'o', 'O', '.', '\*'}]

`set_joinstyle(self, s)`  
Set the joinstyle.

### Parameters

**s** [{'miter', 'round', 'bevel'}]

`set_linestyle(self, ls)`  
Set the patch linestyle.

linestyle	description
'-' or 'solid'	solid line
'--' or 'dashed'	dashed line
'-.' or 'dashdot'	dash-dotted line
':' or 'dotted'	dotted line

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq)
```

where *onoffseq* is an even length tuple of on and off ink in points.

### Parameters

**ls** [{'-', '-', '-.', ':', ':', (offset, on-off-seq), ...}] The line style.

`set_linewidth(self, w)`  
Set the patch linewidth in points.

### Parameters

**w** [float or None]

`set_ls(self, ls)`  
Alias for `set_linestyle`.

`set_lw(self, w)`  
Alias for `set_linewidth`.

`update_from(self, other)`  
Copy properties from *other* to *self*.

`validCap = ('butt', 'round', 'projecting')`

`validJoin = ('miter', 'round', 'bevel')`

`zorder = 1`

### matplotlib.patches.PathPatch

`class matplotlib.patches.PathPatch(path, **kwargs)`

Bases: `matplotlib.patches.Patch`

A general polycurve path patch.

*path* is a `Path` object.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<code>Bbox</code>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<code>Figure</code>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}

Continued

Table 165 – continued from previous page

Property	Description
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`__init__(self, path, **kwargs)`  
*path* is a *Path* object.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```

__module__ = 'matplotlib.patches'
__str__(self)
    Return str(self).
get_path(self)
    Return the path of this patch.
set_path(self, path)

```

#### `matplotlib.patches.Polygon`

```
class matplotlib.patches.Polygon(xy, closed=True, **kwargs)
```

Bases: *`matplotlib.patches.Patch`*

A general polygon patch.

`xy` is a numpy array with shape `Nx2`.

If `closed` is `True`, the polygon will be closed so the starting and ending points are the same.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', ':', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`__init__(self, xy, closed=True, **kwargs)`  
`xy` is a numpy array with shape Nx2.

If `closed` is `True`, the polygon will be closed so the starting and ending points are the same.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown

Continued

Table 168 – continued from previous page

Property	Description
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '--', '-.', ':', ' ', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)
    Return str(self).
```

```
get_closed(self)
    Return whether the polygon is closed.
```

```
get_path(self)
    Get the Path of the polygon.
```

```
get_xy(self)
    Get the vertices of the path.
```

### Returns

**(N, 2) numpy array** The coordinates of the vertices.

```
set_closed(self, closed)
    Set whether the polygon is closed.
```

### Parameters

**closed** [bool] True if the polygon is closed

```
set_xy(self, xy)
    Set the vertices of the polygon.
```

### Parameters

**xy** [(N, 2) array-like] The coordinates of the vertices.

```
property xy
    The vertices of the path as (N, 2) numpy array.
```

## matplotlib.patches.Rectangle

```
class matplotlib.patches.Rectangle(xy, width, height, angle=0.0, **kwargs)
```

Bases: `matplotlib.patches.Patch`

A rectangle defined via an anchor point `xy` and its *width* and *height*.

The rectangle extends from `xy[0]` to `xy[0] + width` in x-direction and from `xy[1]` to `xy[1] + height` in y-direction.

One may picture `xy` as the bottom left corner, but which corner `xy` is actually depends on the the direction of the axis and the sign of *width* and *height*; e.g. `xy` would be the bottom right corner if the x-axis was inverted or if *width* was negative.

## Parameters

**xy** [(float, float)] The anchor point.

**width** [float] Rectangle width.

**height** [float] Rectangle height.

**angle** [float, default: 0] Rotation in degrees anti-clockwise about xy.

## Other Parameters

**\*\*kwargs** [*Patch* properties]

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}

Continued on next page

Table 169 – continued from previous page

Property	Description
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', ':', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '---', '-.-', ':', '...', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`--init__(self, xy, width, height, angle=0.0, **kwargs)`

### Parameters

**xy** [(float, float)] The anchor point.

**width** [float] Rectangle width.

**height** [float] Rectangle height.

**angle** [float, default: 0] Rotation in degrees anti-clockwise about xy.

### Other Parameters

**\*\*kwargs** [*Patch* properties]

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{ 'butt', 'round', 'projecting' }
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown

Continued

Table 170 – continued from previous page

Property	Description
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '--', '-.', ':', ' ', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)
    Return str(self).
```

```
get_bbox(self)
    Return the Bbox.
```

```
get_height(self)
    Return the height of the rectangle.
```

```
get_patch_transform(self)
    Return the Transform instance mapping patch coordinates to data coordinates.
```

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

```
get_path(self)
    Return the vertices of the rectangle.
```

```
get_width(self)
    Return the width of the rectangle.
```

```
get_x(self)
    Return the left coordinate of the rectangle.
```

```
get_xy(self)
    Return the left and bottom coords of the rectangle as a tuple.
```

```
get_y(self)
    Return the bottom coordinate of the rectangle.
```

```
set_bounds(self, *args)
    Set the bounds of the rectangle as left, bottom, width, height.
```

The values may be passed as separate parameters or as a tuple:

```
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```

`set_height(self, h)`

Set the height of the rectangle.

`set_width(self, w)`

Set the width of the rectangle.

`set_x(self, x)`

Set the left coordinate of the rectangle.

`set_xy(self, xy)`

Set the left and bottom coordinates of the rectangle.

### Parameters

**xy** [(float, float)]

`set_y(self, y)`

Set the bottom coordinate of the rectangle.

property `xy`

Return the left and bottom coords of the rectangle as a tuple.

### matplotlib.patches.RegularPolygon

```
class matplotlib.patches.RegularPolygon(xy, numVertices, radius=5, orientation=0,
                                       **kwargs)
```

Bases: [matplotlib.patches.Patch](#)

A regular polygon patch.

#### Parameters

**xy** [(float, float)] The center position.

**numVertices** [int] The number of vertices.

**radius** [float] The distance from the center to each of the vertices.

**orientation** [float] The polygon rotation angle (in radians).

**\*\*kwargs** [Patch](#) properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}

<i>snap</i>	bool or None
<i>transform</i>	<a href="#">Transform</a>
<i>url</i>	str

Continued

Table 171 – continued from previous page

Property	Description
<i>visible</i>	bool
<i>zorder</i>	float

```
__init__(self, xy, numVertices, radius=5, orientation=0, **kwargs)
```

### Parameters

**xy** [(float, float)] The center position.

**numVertices** [int] The number of vertices.

**radius** [float] The distance from the center to each of the vertices.

**orientation** [float] The polygon rotation angle (in radians).

**\*\*kwargs** *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None

<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)
```

```
Return str(self).
```

`get_patch_transform(self)`

Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

`get_path(self)`

Return the path of this patch.

property `numvertices`

property `orientation`

property `radius`

property `xy`

### Examples using `matplotlib.patches.RegularPolygon`

- `sphx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphx_glr_gallery_specialty_plots_radar_chart.py`

### `matplotlib.patches.Shadow`

`class matplotlib.patches.Shadow(patch, ox, oy, props=<deprecated parameter>, **kwargs)`

Bases: `matplotlib.patches.Patch`

Create a shadow of the given *patch*.

By default, the shadow will have the same face color as the *patch*, but darkened.

#### Parameters

**patch** [*Patch*] The patch to create the shadow for.

**ox, oy** [float] The shift of the shadow in data coordinates, scaled by a factor of dpi/72.

**props** [dict] *deprecated (use kwargs instead)* Properties of the shadow patch.

**\*\*kwargs** Properties of the shadow patch. Supported keys are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown

<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

`--init__(self, patch, ox, oy, props=<deprecated parameter>, **kwargs)`  
 Create a shadow of the given *patch*.

By default, the shadow will have the same face color as the *patch*, but darkened.

### Parameters

**patch** [*Patch*] The patch to create the shadow for.

**ox, oy** [float] The shift of the shadow in data coordinates, scaled by a factor of dpi/72.

**props** [dict] *deprecated (use kwargs instead)* Properties of the shadow patch.

**\*\*kwargs** Properties of the shadow patch. Supported keys are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{ 'butt', 'round', 'projecting' }
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>

Continued

Table 174 – continued from previous page

Property	Description
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '--', '-.', ':', '', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.patches'
```

```
__str__(self)
    Return str(self).
```

```
draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.

    This has no effect if the artist is not visible (Artist.get_visible returns False).
```

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

```
get_patch_transform(self)
    Return the Transform instance mapping patch coordinates to data coordinates.
```

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

```
get_path(self)
    Return the path of this patch.
```

property props

### Examples using matplotlib.patches.Shadow

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_demo\_text\_path.py
- sphx\_glr\_gallery\_misc\_svg\_filter\_pie.py

**matplotlib.patches.Wedge**

```
class matplotlib.patches.Wedge(center, r, theta1, theta2, width=None, **kwargs)
```

Bases: [\*matplotlib.patches.Patch\*](#)

Wedge shaped patch.

A wedge centered at  $x, y$  center with radius  $r$  that sweeps  $\theta_1$  to  $\theta_2$  (in degrees). If  $width$  is given, then a partial wedge is drawn from inner radius  $r - width$  to outer radius  $r$ .

Valid keyword arguments are:

Property	Description
<a href="#"><i>agg_filter</i></a>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<a href="#"><i>alpha</i></a>	float or None
<a href="#"><i>animated</i></a>	bool
<a href="#"><i>antialiased</i></a> or <a href="#"><i>aa</i></a>	unknown
<a href="#"><i>capstyle</i></a>	{'butt', 'round', 'projecting'}
<a href="#"><i>clip_box</i></a>	<a href="#"><i>Bbox</i></a>
<a href="#"><i>clip_on</i></a>	bool
<a href="#"><i>clip_path</i></a>	Patch or (Path, Transform) or None
<a href="#"><i>color</i></a>	color
<a href="#"><i>contains</i></a>	unknown
<a href="#"><i>edgecolor</i></a> or <a href="#"><i>ec</i></a>	color or None or 'auto'
<a href="#"><i>facecolor</i></a> or <a href="#"><i>fc</i></a>	color or None
<a href="#"><i>figure</i></a>	<a href="#"><i>Figure</i></a>
<a href="#"><i>fill</i></a>	bool
<a href="#"><i>gid</i></a>	str
<a href="#"><i>hatch</i></a>	{'/', '\\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<a href="#"><i>in_layout</i></a>	bool
<a href="#"><i>joinstyle</i></a>	{'miter', 'round', 'bevel'}
<a href="#"><i>label</i></a>	object
<a href="#"><i>linestyle</i></a> or <a href="#"><i>ls</i></a>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<a href="#"><i>linewidth</i></a> or <a href="#"><i>lw</i></a>	float or None
<a href="#"><i>path_effects</i></a>	<a href="#"><i>AbstractPathEffect</i></a>
<a href="#"><i>picker</i></a>	None or bool or callable
<a href="#"><i>rasterized</i></a>	bool or None
<a href="#"><i>sketch_params</i></a>	(scale: float, length: float, randomness: float)
<a href="#"><i>snap</i></a>	bool or None
<a href="#"><i>transform</i></a>	<a href="#"><i>Transform</i></a>
<a href="#"><i>url</i></a>	str
<a href="#"><i>visible</i></a>	bool
<a href="#"><i>zorder</i></a>	float

```
__init__(self, center, r, theta1, theta2, width=None, **kwargs)
```

A wedge centered at  $x, y$  center with radius  $r$  that sweeps  $\theta_1$  to  $\theta_2$  (in degrees). If  $width$  is given, then a partial wedge is drawn from inner radius  $r - width$  to outer radius  $r$ .

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', '., '*'}

- sphx\_glr\_gallery\_misc\_svg\_filter\_pie.py

### 18.35.2 Functions

<code>bbox_artist(artist, renderer[, props, fill])</code>	A debug function to draw a rectangle around the bounding box returned by an artist's <code>Artist.get_window_extent</code> to test whether the artist is returning the correct bbox.
<code>draw_bbox(bbox, renderer[, color, trans])</code>	A debug function to draw a rectangle around the bounding box returned by an artist's <code>Artist.get_window_extent</code> to test whether the artist is returning the correct bbox.

#### matplotlib.patches.bbox\_artist

`matplotlib.patches.bbox_artist(artist, renderer, props=None, fill=True)`

A debug function to draw a rectangle around the bounding box returned by an artist's `Artist.get_window_extent` to test whether the artist is returning the correct bbox.

`props` is a dict of rectangle props with the additional property 'pad' that sets the padding around the bbox in points.

#### Examples using matplotlib.patches.bbox\_artist

#### matplotlib.patches.draw\_bbox

`matplotlib.patches.draw_bbox(bbox, renderer, color='k', trans=None)`

A debug function to draw a rectangle around the bounding box returned by an artist's `Artist.get_window_extent` to test whether the artist is returning the correct bbox.

#### Examples using matplotlib.patches.draw\_bbox

## 18.36 matplotlib.path

A module for dealing with the polylines used throughout Matplotlib.

The primary class for polyline handling in Matplotlib is `Path`. Almost all vector drawing makes use of `Paths` somewhere in the drawing pipeline.

Whilst a `Path` instance itself cannot be drawn, some `Artist` subclasses, such as `PathPatch` and `PathCollection`, can be used for convenient `Path` visualisation.

```
class matplotlib.path.Path(vertices, codes=None, _interpolation_steps=1,
                           closed=False, readonly=False)
```

Bases: `object`

A series of possibly disconnected, possibly closed, line and curve segments.

The underlying storage is made up of two parallel numpy arrays:

- *vertices*: an Nx2 float array of vertices
- *codes*: an N-length uint8 array of vertex types, or None

These two arrays always have the same length in the first dimension. For example, to represent a cubic curve, you must provide three vertices as well as three codes CURVE3.

The code types are:

- STOP [1 vertex (ignored)] A marker for the end of the entire path (currently not required and ignored)
- MOVETO [1 vertex] Pick up the pen and move to the given vertex.
- LINETO [1 vertex] Draw a line from the current position to the given vertex.
- CURVE3 [1 control point, 1 endpoint] Draw a quadratic Bezier curve from the current position, with the given control point, to the given end point.
- CURVE4 [2 control points, 1 endpoint] Draw a cubic Bezier curve from the current position, with the given control points, to the given end point.
- CLOSEPOLY [1 vertex (ignored)] Draw a line segment to the start point of the current polyline.

If *codes* is None, it is interpreted as a MOVETO followed by a series of LINETO.

Users of Path objects should not access the vertices and codes arrays directly. Instead, they should use *iter\_segments* or *cleaned* to get the vertex/code pairs. This helps, in particular, to consistently handle the case of *codes* being None.

Some behavior of Path objects can be controlled by rcParams. See the rcParams whose keys start with 'path.'.

---

**Note:** The vertices and codes arrays should be treated as immutable - there are a number of optimizations and assumptions made up front in the constructor that will not change when the data changes.

---

Create a new path with the given vertices and codes.

### Parameters

**vertices** [array-like] The (N, 2) float array, masked array or sequence of pairs representing the vertices of the path.

If *vertices* contains masked values, they will be converted to NaNs which are then handled correctly by the Agg PathIterator and other consumers of path data, such as *iter\_segments()*.

**codes** [array-like or None, optional] n-length array integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, *vertices* will be treated as a series of line segments.

**\_interpolation\_steps** [int, optional] Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

**closed** [bool, optional] If *codes* is None and closed is True, vertices will be treated as line segments of a closed polygon. Note that the last

vertex will then be ignored (as the corresponding code will be set to CLOSEPOLY).

**readonly** [bool, optional] Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

CLOSEPOLY = 79

CURVE3 = 3

CURVE4 = 4

LINETO = 2

MOVETO = 1

NUM\_VERTICES\_FOR\_CODE = {0: 1, 1: 1, 2: 1, 3: 2, 4: 3, 79: 1}

A dictionary mapping Path codes to the number of vertices that the code expects.

STOP = 0

`classmethod arc(theta1, theta2, n=None, is_wedge=False)`

Return the unit circle arc from angles *theta1* to *theta2* (in degrees).

*theta2* is unwrapped to produce the shortest arc within 360 degrees. That is, if *theta2* > *theta1* + 360, the arc will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

Masionobe, L. 2003. [Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves](#).

`classmethod circle(center=(0.0, 0.0), radius=1.0, readonly=False)`

Return a [Path](#) representing a circle of a given radius and center.

### Parameters

**center** [(float, float), default: (0, 0)] The center of the circle.

**radius** [float, default: 1] The radius of the circle.

**readonly** [bool] Whether the created path should have the "readonly" argument set when creating the Path instance.

### Notes

The circle is approximated using 8 cubic Bezier curves, as described in

Lancaster, Don. [Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines](#).

`cleaned(self, transform=None, remove_nans=False, clip=None, quantize=<deprecated parameter>, simplify=False, curves=False, stroke_width=1.0, snap=False, sketch=None)`

Return a new Path with vertices and codes cleaned according to the parameters.

### See also:

[Path.iter\\_segments](#) for details of the keyword arguments.

`clip_to_bbox(self, bbox, inside=True)`

Clip the path to the given bounding box.

The path must be made up of one or more closed polygons. This algorithm will not behave correctly for unclosed paths.

If *inside* is `True`, clip to the inside of the box, otherwise to the outside of the box.

`code_type`

alias of `numpy.uint8`

property codes

The list of codes in the *Path* as a 1-D numpy array. Each code is one of *STOP*, *MOVETO*, *LINETO*, *CURVE3*, *CURVE4* or *CLOSEPOLY*. For codes that correspond to more than one vertex (*CURVE3* and *CURVE4*), that code will be repeated so that the length of `self.vertices` and `self.codes` is always the same.

`contains_path(self, path, transform=None)`

Return whether this (closed) path completely contains the given path.

If *transform* is not `None`, the path will be transformed before checking for containment.

`contains_point(self, point, transform=None, radius=0.0)`

Return whether the (closed) path contains the given point.

#### Parameters

**point** [(float, float)] The point (x, y) to check.

**transform** [`matplotlib.transforms.Transform`, optional] If not `None`, *point* will be compared to `self` transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *point*.

**radius** [float, default: 0] Add an additional margin on the path in coordinates of *point*. The path is extended tangentially by *radius*/2; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

#### Returns

**bool**

`contains_points(self, points, transform=None, radius=0.0)`

Return whether the (closed) path contains the given point.

#### Parameters

**points** [(N, 2) array] The points to check. Columns contain x and y values.

**transform** [`matplotlib.transforms.Transform`, optional] If not `None`, *points* will be compared to `self` transformed by *transform*; i.e. for a correct check, *transform* should transform the path into the coordinate system of *points*.

**radius** [float, default: 0.] Add an additional margin on the path in coordinates of *points*. The path is extended tangentially by *radius*/2; i.e. if you would draw the path with a linewidth of *radius*, all points on the line would still be considered to be contained in the area.

Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

### Returns

**length-N bool array**

`copy(self)`

Return a shallow copy of the *Path*, which will share the vertices and codes with the source *Path*.

`deepcopy(self, memo=None)`

Return a deepcopy of the *Path*. The *Path* will not be readonly, even if the source *Path* is.

`get_extents(self, transform=None, **kwargs)`

Get Bbox of the path.

### Parameters

**transform** [matplotlib.transforms.Transform, optional] Transform to apply to path before computing extents, if any.

**\*\*kwargs** Forwarded to *iter\_bezier*.

### Returns

**matplotlib.transforms.Bbox** The extents of the path Bbox([[xmin, ymin], [xmax, ymax]])

`hatch(hatchpattern, density=6)`

Given a hatch specifier, *hatchpattern*, generates a Path that can be used in a repeated hatching pattern. *density* is the number of lines per unit square.

`interpolated(self, steps)`

Return a new path resampled to length N x steps.

Codes other than LINETO are not handled correctly.

`intersects_bbox(self, bbox, filled=True)`

Return whether this path intersects a given *Bbox*.

If *filled* is True, then this also returns True if the path completely encloses the *Bbox* (i.e., the path is treated as filled).

The bounding box is always considered filled.

`intersects_path(self, other, filled=True)`

Return whether if this path intersects another given path.

If *filled* is True, then this also returns True if one path completely encloses the other (i.e., the paths are treated as filled).

`iter_bezier(self, **kwargs)`

Iterate over each bezier curve (lines included) in a Path.

### Parameters

**\*\*kwargs** Forwarded to *iter\_segments*.

### Yields

**B** [matplotlib.bezier.BezierSegment] The bezier curves that make up the current path. Note in particular that freestanding points are

bezier curves of order 0, and lines are bezier curves of order 1 (with two control points).

**code** [Path.code\_type] The code describing what kind of curve is being returned. Path.MOVETO, Path.LINETO, Path.CURVE3, Path.CURVE4 correspond to bezier curves with 1, 2, 3, and 4 control points (respectively). Path.CLOSEPOLY is a Path.LINETO with the control points correctly chosen based on the start/end points of the current stroke.

`iter_segments(self, transform=None, remove_nans=True, clip=None, snap=False, stroke_width=1.0, simplify=None, curves=True, sketch=None)`  
Iterate over all curve segments in the path.

Each iteration returns a pair (vertices, code), where vertices is a sequence of 1-3 coordinate pairs, and code is a [Path](#) code.

Additionally, this method can provide a number of standard cleanups and conversions to the path.

### Parameters

**transform** [None or [Transform](#)] If not None, the given affine transformation will be applied to the path.

**remove\_nans** [bool, optional] Whether to remove all NaNs from the path and skip over them using MOVETO commands.

**clip** [None or (float, float, float, float), optional] If not None, must be a four-tuple (x1, y1, x2, y2) defining a rectangle in which to clip the path.

**snap** [None or bool, optional] If True, snap all nodes to pixels; if False, don't snap them. If None, snap if the path contains only segments parallel to the x or y axes, and no more than 1024 of them.

**stroke\_width** [float, optional] The width of the stroke being drawn (used for path snapping).

**simplify** [None or bool, optional] Whether to simplify the path by removing vertices that do not affect its appearance. If None, use the `should_simplify` attribute. See also `rcParams["path.simplify"]` (default: True) and `rcParams["path.simplify_threshold"]` (default: 0.111111111111).

**curves** [bool, optional] If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

**sketch** [None or sequence, optional] If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.

`classmethod make_compound_path(*args)`

Make a compound path from a list of Path objects. Blindly removes all Path.STOP control points.

`classmethod make_compound_path_from_polys(XY)`

Make a compound path object to draw a number of polygons with equal numbers of sides XY is a (numpolys x numsides x 2) numpy array of vertices. Return object is a [Path](#)

property readonly

`True` if the *Path* is read-only.

property should\_simplify

`True` if the vertices array should be simplified.

property simplify\_threshold

The fraction of a pixel difference below which vertices will be simplified out.

`to_polygons(self, transform=None, width=0, height=0, closed_only=True)`

Convert this path to a list of polygons or polylines. Each polygon/polyline is an  $N \times 2$  array of vertices. In other words, each polygon has no `MOVETO` instructions or curves. This is useful for displaying in backends that do not support compound paths or Bezier curves.

If *width* and *height* are both non-zero then the lines will be simplified so that vertices outside of  $(0, 0)$ ,  $(width, height)$  will be clipped.

If *closed\_only* is `True` (default), only closed polygons, with the last point being the same as the first point, will be returned. Any unclosed polylines in the path will be explicitly closed. If *closed\_only* is `False`, any unclosed polygons in the path will be returned as unclosed polygons, and the closed polygons will be returned explicitly closed by setting the last point to the same as the first point.

`transformed(self, transform)`

Return a transformed copy of the path.

**See also:**

`matplotlib.transforms.TransformedPath` A specialized path class that will cache the transformed result and automatically update when the transform changes.

`classmethod unit_circle()`

Return the readonly *Path* of the unit circle.

For most cases, *Path.circle()* will be what you want.

`classmethod unit_circle_righthalf()`

Return a *Path* of the right half of a unit circle.

See *Path.circle* for the reference on the approximation used.

`classmethod unit_rectangle()`

Return a *Path* instance of the unit rectangle from (0, 0) to (1, 1).

`classmethod unit_regular_asterisk(numVertices)`

Return a *Path* for a unit regular asterisk with the given *numVertices* and radius of 1.0, centered at (0, 0).

`classmethod unit_regular_polygon(numVertices)`

Return a *Path* instance for a unit regular polygon with the given *numVertices* such that the circumscribing circle has radius 1.0, centered at (0, 0).

`classmethod unit_regular_star(numVertices, innerCircle=0.5)`

Return a *Path* for a unit regular star with the given *numVertices* and radius of 1.0, centered at (0, 0).

property *vertices*

The list of vertices in the *Path* as an Nx2 numpy array.

`classmethod wedge(theta1, theta2, n=None)`

Return the unit circle wedge from angles *theta1* to *theta2* (in degrees).

*theta2* is unwrapped to produce the shortest wedge within 360 degrees. That is, if *theta2* > *theta1* + 360, the wedge will be from *theta1* to *theta2* - 360 and not a full circle plus some extra overlap.

If *n* is provided, it is the number of spline segments to make. If *n* is not provided, the number of spline segments is determined based on the delta between *theta1* and *theta2*.

See *Path.arc* for the reference on the approximation used.

`matplotlib.path.get_path_collection_extents(master_transform, paths, transforms, offsets, offset_transform)`

Given a sequence of *Paths*, *Transforms* objects, and offsets, as found in a *PathCollection*, returns the bounding box that encapsulates all of them.

### Parameters

**master\_transform** [*Transform*] Global transformation applied to all paths.

**paths** [list of *Path*]

**transforms** [list of *Affine2D*]

**offsets** [(N, 2) array-like]

**offset\_transform** [*Affine2D*] Transform applied to the offsets before offsetting the path.

## Notes

The way that *paths*, *transforms* and *offsets* are combined follows the same method as for collections: Each is iterated over independently, so if you have 3 paths, 2 transforms and 1 offset, their combinations are as follows:

(A, A, A), (B, B, A), (C, A, A)

## 18.37 matplotlib.patheffects

Defines classes for path effects. The path effects are supported in *Text*, *Line2D* and *Patch*.

### See also:

*Path effects guide*

```
class matplotlib.patheffects.AbstractPathEffect(offset=(0.0, 0.0))
```

Bases: `object`

A base class for path effects.

Subclasses should override the `draw_path` method to add effect functionality.

### Parameters

**offset** [pair of floats] The offset to apply to the path, measured in points.

```
draw_path(self, renderer, gc, tpath, affine, rgbFace=None)
```

Derived should override this method. The arguments are the same as `matplotlib.backend_bases.RendererBase.draw_path()` except the first argument is a renderer.

```
class matplotlib.patheffects.Normal(offset=(0.0, 0.0))
```

Bases: `matplotlib.patheffects.AbstractPathEffect`

The "identity" PathEffect.

The Normal PathEffect's sole purpose is to draw the original artist with no special path effect.

### Parameters

**offset** [pair of floats] The offset to apply to the path, measured in points.

```
class matplotlib.patheffects.PathEffectRenderer(path_effects, renderer)
```

Bases: `matplotlib.backend_bases.RendererBase`

Implements a Renderer which contains another renderer.

This proxy then intercepts draw calls, calling the appropriate `AbstractPathEffect` draw method.

---

**Note:** Not all methods have been overridden on this `RendererBase` subclass. It may be necessary to add further methods to extend the PathEffects capabilities further.

---

### Parameters

**path\_effects** [iterable of `AbstractPathEffect`] The path effects which this renderer represents.

**renderer** [`matplotlib.backend_bases.RendererBase` subclass]

```
copy_with_path_effect(self, path_effects)
```

```
draw_markers(self, gc, marker_path, marker_trans, path, *args, **kwargs)
```

Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

### Parameters

**gc** [*GraphicsContextBase*] The graphics context.

**marker\_trans** [*matplotlib.transforms.Transform*] An affine transform applied to the marker.

**trans** [*matplotlib.transforms.Transform*] An affine transform applied to the path.

```
draw_path(self, gc, tpath, affine, rgbFace=None)
```

Draw a *Path* instance using the given affine transform.

```
draw_path_collection(self, gc, master_transform, paths, *args, **kwargs)
```

Draw a collection of paths selecting drawing properties from the lists *facecolors*, *edgecolors*, *linewidths*, *linestyles* and *antialiaseds*. *offsets* is a list of offsets to apply to each of the paths. The offsets in *offsets* are first transformed by *offsetTrans* before being applied.

*offset\_position* may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

```
class matplotlib.patheffects.PathPatchEffect(offset=(0, 0), **kwargs)
```

Bases: *matplotlib.patheffects.AbstractPathEffect*

Draws a *PathPatch* instance whose Path comes from the original PathEffect artist.

### Parameters

**offset** [pair of floats] The offset to apply to the path, in points.

**\*\*kwargs** All keyword arguments are passed through to the *PathPatch* constructor. The properties which cannot be overridden are "path", "clip\_box" "transform" and "clip\_path".

```
draw_path(self, renderer, gc, tpath, affine, rgbFace)
```

Derived should override this method. The arguments are the same as *matplotlib.backend\_bases.RendererBase.draw\_path()* except the first argument is a renderer.

```
class matplotlib.patheffects.SimpleLineShadow(offset=(2, -2), shadow_color='k', alpha=0.3, rho=0.3, **kwargs)
```

Bases: *matplotlib.patheffects.AbstractPathEffect*

A simple shadow via a line.

### Parameters

**offset** [pair of floats] The offset to apply to the path, in points.

**shadow\_color** [color, default: 'black'] The shadow color. A value of `None` takes the original artist's color with a scale factor of *rho*.

**alpha** [float, default: 0.3] The alpha transparency of the created shadow patch.

**rho** [float, default: 0.3] A scale factor to apply to the `rgbFace` color if `shadow_rgbFace` is `None`.

**\*\*kwargs** Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path(self, renderer, gc, tpath, affine, rgbFace)`

Overrides the standard `draw_path` to add the shadow offset and necessary color changes for the shadow.

```
class matplotlib.patheffects.SimplePatchShadow(offset=(2, -2), shadow_rgbFace=None,
                                              alpha=None, rho=0.3, **kwargs)
```

Bases: `matplotlib.patheffects.AbstractPathEffect`

A simple shadow via a filled patch.

### Parameters

**offset** [pair of floats] The offset of the shadow in points.

**shadow\_rgbFace** [color] The shadow color.

**alpha** [float, default: 0.3] The alpha transparency of the created shadow patch. <http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html>

**rho** [float, default: 0.3] A scale factor to apply to the `rgbFace` color if `shadow_rgbFace` is not specified.

**\*\*kwargs** Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path(self, renderer, gc, tpath, affine, rgbFace)`

Overrides the standard `draw_path` to add the shadow offset and necessary color changes for the shadow.

```
class matplotlib.patheffects.Stroke(offset=(0, 0), **kwargs)
```

Bases: `matplotlib.patheffects.AbstractPathEffect`

A line based `PathEffect` which re-draws a stroke.

The path will be stroked with its `gc` updated with the given keyword arguments, i.e., the keyword arguments should be valid `gc` parameter values.

`draw_path(self, renderer, gc, tpath, affine, rgbFace)`

Draw the path with updated `gc`.

```
class matplotlib.patheffects.withSimplePatchShadow(offset=(2, -2),
                                                    shadow_rgbFace=None,
                                                    alpha=None, rho=0.3, **kwargs)
```

Bases: `matplotlib.patheffects.SimplePatchShadow`

A shortcut `PathEffect` for applying `SimplePatchShadow` and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([path_effects.withSimplePatchShadow()])
```

as a shortcut for

```
artist.set_path_effects([path_effects.SimplePatchShadow(),  
                        path_effects.Normal()])
```

### Parameters

**offset** [pair of floats] The offset of the shadow in points.

**shadow\_rgbFace** [color] The shadow color.

**alpha** [float, default: 0.3] The alpha transparency of the created shadow patch. <http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html>

**rho** [float, default: 0.3] A scale factor to apply to the rgbFace color if shadow\_rgbFace is not specified.

**\*\*kwargs** Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

`draw_path(self, renderer, gc, tpath, affine, rgbFace)`

Overrides the standard `draw_path` to add the shadow offset and necessary color changes for the shadow.

`class matplotlib.path_effects.withStroke(offset=(0, 0), **kwargs)`

Bases: `matplotlib.path_effects.Stroke`

A shortcut PathEffect for applying `Stroke` and then drawing the original Artist.

With this class you can use

```
artist.set_path_effects([path_effects.withStroke()])
```

as a shortcut for

```
artist.set_path_effects([path_effects.Stroke(),  
                        path_effects.Normal()])
```

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

`draw_path(self, renderer, gc, tpath, affine, rgbFace)`

Draw the path with updated gc.

## 18.38 matplotlib.pyplot

### 18.38.1 Pyplot function overview

*pyplot**matplotlib.pyplot* is a state-based interface to matplotlib.**matplotlib.pyplot**

*matplotlib.pyplot* is a state-based interface to matplotlib. It provides a MATLAB-like way of plotting.

pyplot is mainly intended for interactive plots and simple cases of programmatic plot generation:

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
y = np.sin(x)
plt.plot(x, y)
```

The object-oriented API is recommended for more complex plots.

**Functions**

<i>acorr</i> (x, \*[, data])	Plot the autocorrelation of x.
<i>angle_spectrum</i> (x[, Fs, Fc, window, pad_to, ...])	Plot the angle spectrum.
<i>annotate</i> (text, xy, \*args, \*\*kwargs)	Annotate the point xy with text <i>text</i> .
<i>arrow</i> (x, y, dx, dy, \*\*kwargs)	Add an arrow to the axes.
<i>autoscale</i> ([enable, axis, tight])	Autoscale the axis view to the data (toggle).
<i>autumn</i> ()	Set the colormap to "autumn".
<i>axes</i> ([arg])	Add an axes to the current figure and make it the current axes.
<i>axhline</i> ([y, xmin, xmax])	Add a horizontal line across the axis.
<i>axhspan</i> (ymin, ymax[, xmin, xmax])	Add a horizontal span (rectangle) across the axis.
<i>axis</i> (\*args[, emit])	Convenience method to get or set some axis properties.
<i>axline</i> (xy1[, xy2, slope])	Add an infinitely long straight line.
<i>axvline</i> ([x, ymin, ymax])	Add a vertical line across the axes.
<i>axvspan</i> (xmin, xmax[, ymin, ymax])	Add a vertical span (rectangle) across the axes.
<i>bar</i> (x, height[, width, bottom, align, data])	Make a bar plot.
<i>barbs</i> (\*args[, data])	Plot a 2D field of barbs.
<i>barh</i> (y, width[, height, left, align])	Make a horizontal bar plot.
<i>bone</i> ()	Set the colormap to "bone".
<i>box</i> ([on])	Turn the axes box on or off on the current axes.
<i>boxplot</i> (x[, notch, sym, vert, whis, ...])	Make a box and whisker plot.
<i>broken_barh</i> (xranges, yrange, \*[, data])	Plot a horizontal sequence of rectangles.
<i>cla</i> ()	Clear the current axes.
<i>clabel</i> (CS[, levels])	Label a contour plot.

Continued on next page

Table 179 – continued from previous page

<code>clf()</code>	Clear the current figure.
<code>clim([vmin, vmax])</code>	Set the color limits of the current image.
<code>close([fig])</code>	Close a figure window.
<code>cohere(x, y[, NFFT, Fs, Fc, detrend, ...])</code>	Plot the coherence between <i>x</i> and <i>y</i> .
<code>colorbar([mappable, cax, ax])</code>	Add a colorbar to a plot.
<code>connect(s, func)</code>	Bind function <i>func</i> to event <i>s</i> .
<code>contour(*args[, data])</code>	Plot contours.
<code>contourf(*args[, data])</code>	Plot contours.
<code>cool()</code>	Set the colormap to "cool".
<code>copper()</code>	Set the colormap to "copper".
<code>csd(x, y[, NFFT, Fs, Fc, detrend, window, ...])</code>	Plot the cross-spectral density.
<code>delaxes([ax])</code>	Remove an <i>Axes</i> (defaulting to the current axes) from its figure.
<code>disconnect(cid)</code>	Disconnect the callback with id <i>cid</i> .
<code>draw()</code>	Redraw the current figure.
<code>draw_if_interactive()</code>	
<code>errorbar(x, y[, yerr, xerr, fmt, ecolor, ...])</code>	Plot <i>y</i> versus <i>x</i> as lines and/or markers with attached errorbars.
<code>eventplot(positions[, orientation, ...])</code>	Plot identical parallel lines at the given positions.
<code>figimage(X[, xo, yo, alpha, norm, cmap, ...])</code>	Add a non-resampled image to the figure.
<code>figlegend(*args, **kwargs)</code>	Place a legend on the figure.
<code>fignum_exists(num)</code>	Return whether the figure with the given id exists.
<code>figtext(x, y, s[, fontdict])</code>	Add text to figure.
<code>figure([num, figsize, dpi, facecolor, ...])</code>	Create a new figure, or activate an existing figure.
<code>fill(*args[, data])</code>	Plot filled polygons.
<code>fill_between(x, y1[, y2, where, ...])</code>	Fill the area between two horizontal curves.
<code>fill_betweenx(y, x1[, x2, where, step, ...])</code>	Fill the area between two vertical curves.
<code>findobj([o, match, include_self])</code>	Find artist objects.
<code>flag()</code>	Set the colormap to "flag".
<code>gca(**kwargs)</code>	Get the current axes, creating one if necessary.
<code>gcf()</code>	Get the current figure.
<code>gci()</code>	Get the current colorable artist.
<code>get(obj, *args, **kwargs)</code>	Return the value of an object's <i>property</i> , or print all of them.
<code>get_current_fig_manager()</code>	Return the figure manager of the current figure.
<code>get_figlabels()</code>	Return a list of existing figure labels.
<code>get_fignums()</code>	Return a list of existing figure numbers.
<code>get_plot_commands()</code>	Get a sorted list of all of the plotting commands.
<code>getp(obj, *args, **kwargs)</code>	Return the value of an object's <i>property</i> , or print all of them.
<code>ginput([n, timeout, show_clicks, mouse_add, ...])</code>	Blocking call to interact with a figure.
<code>gray()</code>	Set the colormap to "gray".
<code>grid([b, which, axis])</code>	Configure the grid lines.

Continued on next page

Table 179 – continued from previous page

<code>hexbin(x, y[, C, gridsize, bins, xscale, ...])</code>	Make a 2D hexagonal binning plot of points $x$ , $y$ .
<code>hist(x[, bins, range, density, weights, ...])</code>	Plot a histogram.
<code>hist2d(x, y[, bins, range, density, ...])</code>	Make a 2D histogram plot.
<code>hlines(y, xmin, xmax[, colors, linestyles, ...])</code>	Plot horizontal lines at each $y$ from $xmin$ to $xmax$ .
<code>hot()</code>	Set the colormap to "hot".
<code>hsv()</code>	Set the colormap to "hsv".
<code>imread(fname[, format])</code>	Read an image from a file into an array.
<code>imsave(fname, arr, <i>\**kwargs</i>)</code>	Save an array as an image file.
<code>imshow(X[, cmap, norm, aspect, ...])</code>	Display data as an image, i.e., on a 2D regular raster.
<code>inferno()</code>	Set the colormap to "inferno".
<code>install_repl_displayhook()</code>	Install a repl display hook so that any stale figure are automatically redrawn when control is returned to the repl.
<code>ioff()</code>	Turn the interactive mode off.
<code>ion()</code>	Turn the interactive mode on.
<code>isinteractive()</code>	Return if pyplot is in "interactive mode" or not.
<code>jet()</code>	Set the colormap to "jet".
<code>legend(<i>\*args</i>, <i>\**kwargs</i>)</code>	Place a legend on the axes.
<code>locator_params([axis, tight])</code>	Control behavior of major tick locators.
<code>loglog(<i>\*args</i>, <i>\**kwargs</i>)</code>	Make a plot with log scaling on both the $x$ and $y$ axis.
<code>magma()</code>	Set the colormap to "magma".
<code>magnitude_spectrum(x[, Fs, Fc, window, ...])</code>	Plot the magnitude spectrum.
<code>margins(<i>\*margins</i>[, x, y, tight])</code>	Set or retrieve autoscaling margins.
<code>matshow(A[, fignum])</code>	Display an array as a matrix in a new figure window.
<code>minorticks_off()</code>	Remove minor ticks from the axes.
<code>minorticks_on()</code>	Display minor ticks on the axes.
<code>new_figure_manager(num, <i>\*args</i>, <i>\**kwargs</i>)</code>	Create a new figure manager instance.
<code>nipy_spectral()</code>	Set the colormap to "nipy_spectral".
<code>pause(interval)</code>	Run the GUI event loop for <i>interval</i> seconds.
<code>pcolor(<i>\*args</i>[, shading, alpha, norm, cmap, ...])</code>	Create a pseudocolor plot with a non-regular rectangular grid.
<code>pcolormesh(<i>\*args</i>[, alpha, norm, cmap, ...])</code>	Create a pseudocolor plot with a non-regular rectangular grid.
<code>phase_spectrum(x[, Fs, Fc, window, pad_to, ...])</code>	Plot the phase spectrum.
<code>pie(x[, explode, labels, colors, autopct, ...])</code>	Plot a pie chart.
<code>pink()</code>	Set the colormap to "pink".
<code>plasma()</code>	Set the colormap to "plasma".
<code>plot(<i>\*args</i>[, scalex, scaley, data])</code>	Plot $y$ versus $x$ as lines and/or markers.
<code>plot_date(x, y[, fmt, tz, xdate, ydate, data])</code>	Plot data that contains dates.
<code>polar(<i>\*args</i>, <i>\**kwargs</i>)</code>	Make a polar plot.
<code>prism()</code>	Set the colormap to "prism".
<code>psd(x[, NFFT, Fs, Fc, detrend, window, ...])</code>	Plot the power spectral density.
<code>quiver(<i>\*args</i>[, data])</code>	Plot a 2D field of arrows.
<code>quiverkey(Q, X, Y, U, label, <i>\**kw</i>)</code>	Add a key to a quiver plot.

Continued on next page

Table 179 – continued from previous page

<code>rc(group, \**kwargs)</code>	Set the current <i>rcParams</i> .
<code>rc_context([rc, fname])</code>	Return a context manager for temporarily changing rcParams.
<code>rcdefaults()</code>	Restore the <i>rcParams</i> from Matplotlib’s internal default style.
<code>rgrids([radii, labels, angle, fmt])</code>	Get or set the radial gridlines on the current polar plot.
<code>savefig(*args, \**kwargs)</code>	Save the current figure.
<code>sca(ax)</code>	Set the current Axes to <i>ax</i> and the current Figure to the parent of <i>ax</i> .
<code>scatter(x, y[, s, c, marker, cmap, norm, ...])</code>	A scatter plot of <i>y</i> vs.
<code>sci(im)</code>	Set the current image.
<code>semilogx(*args, \**kwargs)</code>	Make a plot with log scaling on the x axis.
<code>semilogy(*args, \**kwargs)</code>	Make a plot with log scaling on the y axis.
<code>set_cmap(cmap)</code>	Set the default colormap, and applies it to the current image if any.
<code>setp(obj, *args, \**kwargs)</code>	Set a property on an artist object.
<code>show(*[, block])</code>	Display all open figures.
<code>specgram(x[, NFFT, Fs, Fc, detrend, window, ...])</code>	Plot a spectrogram.
<code>spring()</code>	Set the colormap to “spring”.
<code>spy(Z[, precision, marker, markersize, ...])</code>	Plot the sparsity pattern of a 2D array.
<code>stackplot(x, *args[, labels, colors, ...])</code>	Draw a stacked area plot.
<code>stem(*args[, linefmt, markerfmt, basefmt, ...])</code>	Create a stem plot.
<code>step(x, y, *args[, where, data])</code>	Make a step plot.
<code>streamplot(x, y, u, v[, density, linewidth, ...])</code>	Draw streamlines of a vector flow.
<code>subplot(*args, \**kwargs)</code>	Add a subplot to the current figure.
<code>subplot2grid(shape, loc[, rowspan, colspan, fig])</code>	Create a subplot at a specific location inside a regular grid.
<code>subplot_mosaic(layout, *[, subplot_kw, ...])</code>	Build a layout of Axes based on ASCII art or nested lists.
<code>subplot_tool([targetfig])</code>	Launch a subplot tool window for a figure.
<code>subplots([nrows, ncols, sharex, sharey, ...])</code>	Create a figure and a set of subplots.
<code>subplots_adjust([left, bottom, right, top, ...])</code>	Adjust the subplot layout parameters.
<code>summer()</code>	Set the colormap to “summer”.
<code>suptitle(t, \**kwargs)</code>	Add a centered title to the figure.
<code>switch_backend(newbackend)</code>	Close all open figures and set the Matplotlib backend.
<code>table([cellText, cellColours, cellLoc, ...])</code>	Add a table to an <i>Axes</i> .
<code>text(x, y, s[, fontdict])</code>	Add text to the axes.
<code>thetagrids([angles, labels, fmt])</code>	Get or set the theta gridlines on the current polar plot.
<code>tick_params([axis])</code>	Change the appearance of ticks, tick labels, and gridlines.
<code>ticklabel_format(*[, axis, style, ...])</code>	Configure the <i>ScalarFormatter</i> used by default for linear axes.
<code>tight_layout(*[, pad, h_pad, w_pad, rect])</code>	Adjust the padding between and around subplots.
<code>title(label[, fontdict, loc, pad, y])</code>	Set a title for the axes.

Continued on next page

Table 179 – continued from previous page

<code>tricontour(*args, **kwargs)</code>	Draw contour lines on an unstructured triangular grid.
<code>tricontourf(*args, **kwargs)</code>	Draw contour regions on an unstructured triangular grid.
<code>tripcolor(*args[, alpha, norm, cmap, vmin, ...])</code>	Create a pseudocolor plot of an unstructured triangular grid.
<code>tripplot(*args, **kwargs)</code>	Draw a unstructured triangular grid as lines and/or markers.
<code>twinx([ax])</code>	Make and return a second axes that shares the x-axis.
<code>twiny([ax])</code>	Make and return a second axes that shares the y-axis.
<code>uninstall_repl_displayhook()</code>	Uninstall the matplotlib display hook.
<code>violinplot(dataset[, positions, vert, ...])</code>	Make a violin plot.
<code>viridis()</code>	Set the colormap to "viridis".
<code>vlines(x, ymin, ymax[, colors, linestyle, ...])</code>	Plot vertical lines.
<code>waitforbuttonpress([timeout])</code>	Blocking call to interact with the figure.
<code>winter()</code>	Set the colormap to "winter".
<code>xcorr(x, y[, normed, detrend, usevlines, ...])</code>	Plot the cross correlation between x and y.
<code>xkcd([scale, length, randomness])</code>	Turn on <code>xkcd</code> sketch-style drawing mode. This will only have effect on things drawn after this function is called..
<code>xlabel(xlabel[, fontdict, labelpad, loc])</code>	Set the label for the x-axis.
<code>xlim(*args, **kwargs)</code>	Get or set the x limits of the current axes.
<code>xscale(value, **kwargs)</code>	Set the x-axis scale.
<code>xticks([ticks, labels])</code>	Get or set the current tick locations and labels of the x-axis.
<code>ylabel(ylabel[, fontdict, labelpad, loc])</code>	Set the label for the y-axis.
<code>ylim(*args, **kwargs)</code>	Get or set the y-limits of the current axes.
<code>yscale(value, **kwargs)</code>	Set the y-axis scale.
<code>yticks([ticks, labels])</code>	Get or set the current tick locations and labels of the y-axis.

**matplotlib.pyplot.acorr**

`matplotlib.pyplot.acorr(x, *, data=None, **kwargs)`

Plot the autocorrelation of x.

**Parameters**

**x** [array-like]

**detrend** [callable, default: `mlab.detrend_none` (no detrending)] A detrending function applied to x. It must have the signature

```
detrend(x: np.ndarray) -> np.ndarray
```

**normed** [bool, default: True] If True, input vectors are normalised to unit length.

**usevlines** [bool, default: True] Determines the plot style.

If True, vertical lines are plotted from 0 to the `acorr` value using `Axes.vlines`. Additionally, a horizontal line is plotted at `y=0` using `Axes.axhline`.

If False, markers are plotted at the acorr values using `Axes.plot`.

**maxlags** [int, default: 10] Number of lags to show. If None, will return all  $2 * \text{len}(x) - 1$  lags.

### Returns

**lags** [array (length  $2 * \text{maxlags} + 1$ )] The lag vector.

**c** [array (length  $2 * \text{maxlags} + 1$ )] The auto correlation vector.

**line** [`LineCollection` or `Line2D`] *Artist* added to the axes of the correlation:

- `LineCollection` if `usevlines` is True.
- `Line2D` if `usevlines` is False.

**b** [`Line2D` or None] Horizontal line at 0 if `usevlines` is True None `usevlines` is False.

### Other Parameters

**linestyle** [`Line2D` property, optional] The linestyle for plotting the data points. Only used if `usevlines` is False.

**marker** [str, default: 'o'] The marker for plotting the data points. Only used if `usevlines` is False.

**\*\*kwargs** Additional parameters are passed to `Axes.vlines` and `Axes.axhline` if `usevlines` is True; otherwise they are passed to `Axes.plot`.

### Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

### Examples using `matplotlib.pyplot.acorr`

- `sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py`

### `matplotlib.pyplot.angle_spectrum`

`matplotlib.pyplot.angle_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)`

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of `x`. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data.

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).

**Fc** [int, default: 0] The center frequency of *x*, which offsets the *x* extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

### Returns

**spectrum** [1-D array] The values for the angle spectrum in radians (real valued).

**freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*.

**line** [*Line2D*] The line created by this function.

### Other Parameters

**\*\*kwargs** Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{‘butt’, ‘round’, ‘projecting’}
<i>dash_joinstyle</i>	{‘miter’, ‘round’, ‘bevel’}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays

Table 180 – continued from previous page

Property	Description
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgewidth</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[b...]
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

**See also:**

*magnitude\_spectrum* Plots the magnitudes of the corresponding frequencies.

*phase\_spectrum* Plots the unwrapped version of this function.

*specgram* Can plot the angle spectrum of segments within the signal in a colormap.

**Notes**

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

Examples using `matplotlib.pyplot.angle_spectrum``matplotlib.pyplot.annotate`

`matplotlib.pyplot.annotate(text, xy, *args, **kwargs)`

Annotate the point `xy` with text `text`.

In the simplest form, the text is placed at `xy`.

Optionally, the text can be displayed in another position `xytext`. An arrow pointing from the text to the annotated point `xy` can then be added by defining `arrowprops`.

**Parameters**

**text** [str] The text of the annotation. `s` is a deprecated synonym for this parameter.

**xy** [(float, float)] The point (`x`, `y`) to annotate. The coordinate system is determined by `xycoords`.

**xytext** [(float, float), default: `xy`] The position (`x`, `y`) to place the text at. The coordinate system is determined by `textcoords`.

**xycoords** [str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that `xy` is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'axes points'	Points from lower left corner of axes
'axes pixels'	Pixels from lower left corner of axes
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	( <i>theta</i> , <i>r</i> ) if not native 'data' coordinates

- An *Artist*: `xy` is interpreted as a fraction of the artist's *Bbox*. E.g. `(0, 0)` would be the lower left corner of the bounding box and `(0.5, 1)` would be the center top of the bounding box.
- A *Transform* to transform `xy` to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where *renderer* is a *RendererBase* subclass.

The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple (*xcoords*, *ycoords*) specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced Annotations* for more details.

**textcoords** [str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset (in points) from the <i>xy</i> value
'offset pixels'	Offset (in pixels) from the <i>xy</i> value

**arrowprops** [dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any key to <i>matplotlib.patches.FancyArrowPatch</i>

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

Name	Attrs
'-'	None
'->'	head_length=0.4,head_width=0.2
'-['	widthB=1.0,lengthB=0.2,angleB=None
' - '	widthA=1.0,widthB=1.0
'- >'	head_length=0.4,head_width=0.2
'<-'	head_length=0.4,head_width=0.2
'<->'	head_length=0.4,head_width=0.2
'< -'	head_length=0.4,head_width=0.2
'< - >'	head_length=0.4,head_width=0.2
'fancy'	head_length=0.4,head_width=0.4,tail_width=0.4
'simple'	head_length=0.5,head_width=0.5,tail_width=0.2
'wedge'	tail_width=0.3,shrink_factor=0.5

Valid keys for *FancyArrowPatch* are:

Key	Description
<code>arrowstyle</code>	the arrow style
<code>connectionstyle</code>	the connection style
<code>relpos</code>	default is (0.5, 0.5)
<code>patchA</code>	default is bounding box of the text
<code>patchB</code>	default is None
<code>shrinkA</code>	default is 2 points
<code>shrinkB</code>	default is 2 points
<code>mutation_scale</code>	default is text size (in points)
<code>mutation_aspect</code>	default is 1.
<code>?</code>	any key for <i>matplotlib.patches.PathPatch</i>

Defaults to None, i.e. no arrow is drawn.

**annotation\_clip** [bool or None, default: None] Whether to draw the annotation when the annotation point `xy` is outside the axes area.

- If *True*, the annotation will only be drawn when `xy` is within the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will only be drawn when `xy` is within the axes and `xycoords` is 'data'.

**\*\*kwargs** Additional kwargs are passed to *Text*.

### Returns

*Annotation*

### `matplotlib.pyplot.arrow`

`matplotlib.pyplot.arrow(x, y, dx, dy, **kwargs)`  
Add an arrow to the axes.

This draws an arrow from (x, y) to (x+dx, y+dy).

### Parameters

**x, y** [float] The x and y coordinates of the arrow base.

**dx, dy** [float] The length of the arrow along x and y direction.

**width: float, default: 0.001** Width of full arrow tail.

**length\_includes\_head: bool, default: False** True if head is to be counted in calculating the length.

**head\_width: float or None, default: 3\*width** Total width of the full arrow head.

**head\_length: float or None, default: 1.5\*head\_width** Length of arrow head.

**shape: ['full', 'left', 'right'], default: 'full'** Draw the left-half, right-half, or full arrow.

**overhang: float, default: 0** Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

**head\_starts\_at\_zero: bool, default: False** If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**\*\*kwargs** *Patch* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array and a bool
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool

<i>hatch</i>	{'/', '\\', ' ', '-.', '+', 'x', 'o', 'O', '., '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)

Continued

Table 181 – continued from previous page

Property	Description
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

**Returns**

*FancyArrow* The created *FancyArrow* object.

**Notes**

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use *annotate()* for example:

```
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...             arrowprops=dict(arrowstyle="->"))
```

**Examples using `matplotlib.pyplot.arrow`**

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_arrow\_demo.py

**`matplotlib.pyplot.autoscale`**

`matplotlib.pyplot.autoscale(enable=True, axis='both', tight=None)`

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

**Parameters**

**enable** [bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

**axis** [{‘both’, ‘x’, ‘y’}, default: ‘both’] Which axis to operate on.

**tight** [bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to `autoscale_view` (regardless of its value); see the description of its behavior there.

**Examples using `matplotlib.pyplot.autoscale`****`matplotlib.pyplot.autumn`**

`matplotlib.pyplot.autumn()`

Set the colormap to “autumn”.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

### Examples using `matplotlib.pyplot.autumn`

### `matplotlib.pyplot.axes`

`matplotlib.pyplot.axes(arg=None, **kwargs)`

Add an axes to the current figure and make it the current axes.

Call signatures:

```
plt.axes()
plt.axes(rect, projection=None, polar=False, **kwargs)
plt.axes(ax)
```

### Parameters

**arg** [None or 4-tuple] The exact behavior of this function depends on the type:

- *None*: A new full window axes is added using `subplot(111, **kwargs)`.
- 4-tuple of floats *rect* = [left, bottom, width, height]. A new axes is added with dimensions *rect* in normalized (0, 1) units using `add_axes` on the current figure.

**projection** [{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the *Axes*. *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

**polar** [bool, default: False] If True, equivalent to `projection='polar'`.

**sharex, sharey** [*Axes*, optional] Share the x or y *axis* with *sharex* and/or *sharey*. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label** [str] A label for the returned axes.

### Returns

*Axes*, or a subclass of *Axes* The returned axes class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used.

### Other Parameters

**\*\*kwargs** This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

Property	Description
<i>adjustable</i>	{'box', 'datalim'}

**See also:**[\*Figure.add\\_axes\*](#)[\*pyplot.subplot\*](#)[\*Figure.add\\_subplot\*](#)[\*Figure.subplots\*](#)[\*pyplot.subplots\*](#)**Notes**

If the figure already has a axes with key (*args*, *kwargs*) then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.

**Examples**

```
# Creating a new full window axes
plt.axes()

# Creating a new axes with specified dimensions and some kwargs
plt.axes((left, bottom, width, height), facecolor='w')
```

**Examples using matplotlib.pyplot.axes**

- sphx\_glr\_gallery\_widgets\_slider\_demo.py

**matplotlib.pyplot.axhline**

```
matplotlib.pyplot.axhline(y=0, xmin=0, xmax=1, **kwargs)
```

Add a horizontal line across the axis.

**Parameters**

**y** [float, default: 0] y position in data coordinates of the horizontal line.

**xmin** [float, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

**xmax** [float, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

## Returns

*Line2D*

## Other Parameters

**\*\*kwargs** Valid keyword arguments are *Line2D* properties, with the exception of 'transform':

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}

<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}

Table 183 – continued from previous page

Property	Description
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

**See also:**

**hlines** Add horizontal lines in data coordinates.

**axhspan** Add a horizontal span (rectangle) across the axis.

**axline** Add a line with an arbitrary slope.

**Examples**

- draw a thick red hline at 'y' = 0 that spans the xrange:

```
>>> axhline(linewidth=4, color='r')
```

- draw a default hline at 'y' = 1 that spans the xrange:

```
>>> axhline(y=1)
```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:

```
>>> axhline(y=.5, xmin=0.25, xmax=0.75)
```

**Examples using matplotlib.pyplot.axhline**

- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_multiline.py
- sphx\_glr\_gallery\_pyplots\_axline.py
- sphx\_glr\_gallery\_color\_color\_cycle\_default.py
- sphx\_glr\_gallery\_misc\_zorder\_demo.py

**matplotlib.pyplot.axhspan**

`matplotlib.pyplot.axhspan(ymin, ymax, xmin=0, xmax=1, **kwargs)`

Add a horizontal span (rectangle) across the axis.

The rectangle spans from *ymin* to *ymax* vertically, and, by default, the whole x-axis horizontally. The x-span can be set using *xmin* (default: 0) and *xmax* (default: 1) which are in axis units; e.g. *xmin* = 0.5 always refers to the middle of the x-axis regardless of the limits set by *set\_xlim*.

**Parameters**

**ymin** [float] Lower y-coordinate of the span, in data units.

**ymax** [float] Upper y-coordinate of the span, in data units.

**xmin** [float, default: 0] Lower x-coordinate of the span, in x-axis (0-1) units.

**xmax** [float, default: 1] Upper x-coordinate of the span, in x-axis (0-1) units.

### Returns

*Polygon* Horizontal span (rectangle) from (xmin, ymin) to (xmax, ymax).

### Other Parameters

**\*\*kwargs** [*Polygon* properties]

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array

<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

### See also:

*axvspan* Add a vertical span across the axes.

Examples using `matplotlib.pyplot.axhspan`

**matplotlib.pyplot.axis**

`matplotlib.pyplot.axis(*args, emit=True, **kwargs)`

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

**Parameters**

**xmin, xmax, ymin, ymax** [float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

**option** [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

Value	Description
'on'	Turn on axis lines and labels. Same as True.
'off'	Turn off axis lines and labels. Same as False.
'equal'	Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code> . Explicit data limits may not be respected in this case.
'scaled'	Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code> . Additionally, further autoscaling will be disabled.
'tight'	Set limits just large enough to show all data, then disable further autoscaling.
'auto'	Automatic scaling (fill plot box with data).
'image'	'scaled' with axis limits equal to data limits.
'square'	Square plot; similar to 'scaled', but initially forcing <code>xmax-xmin == ymax-ymin</code> .

**emit** [bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

**xmin, xmax, ymin, ymax** [float] The axis limits.

**See also:**

`matplotlib.axes.Axes.set_xlim`

`matplotlib.axes.Axes.set_ylim`

- *[Pyplot tutorial](#)*

**`matplotlib.pyplot.axline`**

`matplotlib.pyplot.axline(xy1, xy2=None, *, slope=None, **kwargs)`

Add an infinitely long straight line.

The line can be defined either by two points `xy1` and `xy2`, or by one point `xy1` and a `slope`.

This draws a straight line "on the screen", regardless of the x and y scales, and is thus also suitable for drawing exponential decays in semilog plots, power laws in loglog plots, etc. However, `slope` should only be used with linear scales; It has no clear meaning for all other scales, and thus the behavior is undefined. Please specify the line using the points `xy1`, `xy2` for non-linear scales.

**Parameters**

**xy1, xy2** [(float, float)] Points for the line to pass through. Either `xy2` or `slope` has to be given.

**slope** [float, optional] The slope of the line. Either `xy2` or `slope` has to be given.

**Returns**

*[Line2D](#)*

**Other Parameters**

**\*\*kwargs** Valid kwargs are *[Line2D](#)* properties, with the exception of 'transform':

Property	Description
<i><code>agg_filter</code></i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n) boolean array

**See also:***axhline* for horizontal lines*axvline* for vertical lines**Examples**

Draw a thick red line passing through (0, 0) and (1, 1):

```
>>> axline((0, 0), (1, 1), linewidth=4, color='r')
```

**Examples using `matplotlib.pyplot.axline`**

- sphx\_glr\_gallery\_pyplots\_axline.py

**matplotlib.pyplot.axvline**

```
matplotlib.pyplot.axvline(x=0, ymin=0, ymax=1, **kwargs)
```

Add a vertical line across the axes.

**Parameters**

**x** [float, default: 0] x position in data coordinates of the vertical line.

**ymin** [float, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

**ymax** [float, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

**Returns**

*Line2D*

**Other Parameters**

**\*\*kwargs** Valid keyword arguments are *Line2D* properties, with the exception of 'transform':

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgewidth</i> or <i>mec</i>	color
<i>markeredgecolor</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[bool]
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown

Table 186 – continued from previous page

Property	Description
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

**See also:**

*vlines* Add vertical lines in data coordinates.

*axvspan* Add a vertical span (rectangle) across the axis.

*axline* Add a line with an arbitrary slope.

**Examples**

- draw a thick red vline at  $x = 0$  that spans the yrange:

```
>>> axvline(linewidth=4, color='r')
```

- draw a default vline at  $x = 1$  that spans the yrange:

```
>>> axvline(x=1)
```

- draw a default vline at  $x = .5$  that spans the middle half of the yrange:

```
>>> axvline(x=.5, ymin=0.25, ymax=0.75)
```

**Examples using `matplotlib.pyplot.axvline`**

- sphx\_glr\_gallery\_pyplots\_axline.py
- sphx\_glr\_gallery\_color\_color\_cycle\_default.py

**`matplotlib.pyplot.axvspan`**

`matplotlib.pyplot.axvspan(xmin, xmax, ymin=0, ymax=1, **kwargs)`

Add a vertical span (rectangle) across the axes.

The rectangle spans from *xmin* to *xmax* horizontally, and, by default, the whole y-axis vertically. The y-span can be set using *ymin* (default: 0) and *ymax* (default: 1) which are in axis units; e.g. *ymin* = 0.5 always refers to the middle of the y-axis regardless of the limits set by *set\_ylim*.

**Parameters**

**xmin** [float] Lower x-coordinate of the span, in data units.

**xmax** [float] Upper x-coordinate of the span, in data units.

**ymin** [float, default: 0] Lower y-coordinate of the span, in y-axis units (0-1).

**ymax** [float, default: 1] Upper y-coordinate of the span, in y-axis units (0-1).

**Returns**

*Polygon* Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

**Other Parameters**

**\*\*kwargs** [*Polygon* properties]

**%(Polygon)s**

**See also:**

*axhspan* Add a horizontal span across the axes.

**Examples**

Draw a vertical, green, translucent rectangle from  $x = 1.25$  to  $x = 1.55$  that spans the yrange of the axes.

```
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

**Examples using matplotlib.pyplot.axvspan****matplotlib.pyplot.bar**

```
matplotlib.pyplot.bar(x, height, width=0.8, bottom=None, *, align='center',
                      data=None, **kwargs)
```

Make a bar plot.

The bars are positioned at  $x$  with the given *alignment*. Their dimensions are given by *height* and *width*. The vertical baseline is *bottom* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

**Parameters**

**x** [float or array-like] The x coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

**height** [float or array-like] The height(s) of the bars.

**width** [float or array-like, default: 0.8] The width(s) of the bars.

**bottom** [float or array-like, default: 0] The y coordinate(s) of the bars bases.

**align** [{`'center'`, `'edge'`}, default: `'center'`] Alignment of the bars to the x coordinates:

- `'center'`: Center the base on the x positions.
- `'edge'`: Align the left edges of the bars with the x positions.

To align the bars on the right edge pass a negative *width* and `align='edge'`.

### Returns

`BarContainer` Container with all the bars and optionally errorbars.

### Other Parameters

**color** [color or list of color, optional] The colors of the bar faces.

**edgecolor** [color or list of color, optional] The colors of the bar edges.

**linewidth** [float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

**tick\_label** [str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

**xerr, yerr** [float or array-like of shape(N,) or shape(2, N), optional] If not *None*, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar. (Default)

See `/gallery/statistics/errorbar_features` for an example on the usage of `xerr` and `yerr`.

**ecolor** [color or list of color, default: `'black'`] The line color of the errorbars.

**capsize** [float, default: `rcParams["errorbar.capsize"]` (default: 0.0)] The length of the error bar caps in points.

**error\_kw** [dict, optional] Dictionary of kwargs to be passed to the `errorbar` method. Values of *ecolor* or *capsize* defined here take precedence over the independent kwargs.

**log** [bool, default: False] If *True*, set the y-axis to be log scale.

**\*\*kwargs** [`Rectangle` properties]

**See also:**

[`barh`](#) Plot a horizontal bar plot.

**Notes**

Stacked bars can be achieved by passing individual *bottom* values per bar. See [/gallery/lines\\_bars\\_and\\_markers/bar\\_stacked](#).

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

## matplotlib.pyplot.barbs

`matplotlib.pyplot.barbs(*args, data=None, **kw)`

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where  $X$ ,  $Y$  define the barb locations,  $U$ ,  $V$  define the barb directions, and  $C$  optionally sets the color.

All arguments may be 1D or 2D.  $U$ ,  $V$ ,  $C$  may be masked arrays, but masked  $X$ ,  $Y$  are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also [https://en.wikipedia.org/wiki/Wind\\_barb](https://en.wikipedia.org/wiki/Wind_barb).

### Parameters

**X, Y** [1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of  $U$  and  $V$ .

If  $X$  and  $Y$  are 1D but  $U$ ,  $V$  are 2D,  $X$ ,  $Y$  are expanded to 2D using  $X, Y = \text{np.meshgrid}(X, Y)$ . In this case  $\text{len}(X)$  and  $\text{len}(Y)$  must match the column and row dimensions of  $U$  and  $V$ .

**U, V** [1D or 2D array-like] The x and y components of the barb shaft.

**C** [1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

**length** [float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

**pivot** [{‘tip’, ‘middle’} or float, default: ‘tip’] The part of the arrow that is anchored to the X, Y grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

**barbcolor** [color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override *facecolor*.

**flagcolor** [color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override *facecolor*. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

**sizes** [dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- ‘spacing’ - space between features (flags, full/half barbs)
- ‘height’ - height (distance from shaft to top) of a flag or full barb
- ‘width’ - width of a flag, twice the width of a full barb
- ‘emptybarb’ - radius of the circle used for low magnitudes

**fill\_empty** [bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding** [bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb\_increments** [dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- ‘half’ - half barbs (Default is 5)
- ‘full’ - full barbs (Default is 10)
- ‘flag’ - flags (default is 50)

**flip\_barb** [bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as  $U$  and  $V$ .

### Returns

**barbs** [*Barbs*]

### Other Parameters

**\*\*kwargs** The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '., '*'}

<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

## Notes

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.barbs`

- `sphx_glr_gallery_images_contours_and_fields_barb_demo.py`

## `matplotlib.pyplot.barh`

`matplotlib.pyplot.barh(y, width, height=0.8, left=None, *, align='center', **kwargs)`

Make a horizontal bar plot.

The bars are positioned at *y* with the given *alignment*. Their dimensions are given by *width* and *height*. The horizontal baseline is *left* (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

### Parameters

**y** [float or array-like] The y coordinates of the bars. See also *align* for the alignment of the bars to the coordinates.

**width** [float or array-like] The width(s) of the bars.

**height** [float or array-like, default: 0.8] The heights of the bars.

**left** [float or array-like, default: 0] The x coordinates of the left sides of the bars.

**align** [{'center', 'edge'}, default: 'center'] Alignment of the base to the y coordinates\*:

- 'center': Center the bars on the y positions.
- 'edge': Align the bottom edges of the bars with the y positions.

To align the bars on the top edge pass a negative *height* and `align='edge'`.

### Returns

*BarContainer* Container with all the bars and optionally errorbars.

### Other Parameters

**color** [color or list of color, optional] The colors of the bar faces.

**edgecolor** [color or list of color, optional] The colors of the bar edges.

**linewidth** [float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

**tick\_label** [str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

**xerr, yerr** [float or array-like of shape(N,) or shape(2, N), optional] If not None, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- None: No errorbar. (default)

See /gallery/statistics/errorbar\_features for an example on the usage of xerr and yerr.

**ecolor** [color or list of color, default: 'black'] The line color of the errorbars.

**capsize** [float, default: rcParams["errorbar.capsize"] (default: 0.0)] The length of the error bar caps in points.

**error\_kw** [dict, optional] Dictionary of kwargs to be passed to the `errorbar` method. Values of *ecolor* or *capsize* defined here take precedence over the independent kwargs.

**log** [bool, default: False] If True, set the x-axis to be log scale.

**\*\*kwargs** [*Rectangle* properties]

[`bar`](#) Plot a vertical bar plot.

**Notes**

Stacked bars can be achieved by passing individual *left* values per bar. See [/gallery/lines\\_bars\\_and\\_markers/horizontal\\_barchart\\_distribution](#) .

**Examples using `matplotlib.pyplot.barh`**

- [sphx\\_glr\\_gallery\\_lines\\_bars\\_and\\_markers\\_horizontal\\_barchart\\_distribution.py](#)

**`matplotlib.pyplot.bone`**

`matplotlib.pyplot.bone()`  
Set the colormap to "bone".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.bone`****`matplotlib.pyplot.box`**

`matplotlib.pyplot.box(on=None)`  
Turn the axes box on or off on the current axes.

**Parameters**

**on** [bool or None] The new [Axes](#) box state. If None, toggle the state.

**See also:**

`matplotlib.axes.Axes.set_frame_on()`  
`matplotlib.axes.Axes.get_frame_on()`

Examples using `matplotlib.pyplot.box``matplotlib.pyplot.boxplot`

```
matplotlib.pyplot.boxplot(x, notch=None, sym=None, vert=None, whis=None, positions=None, widths=None, patch_artist=None, bootstrap=None, usermedians=None, conf_intervals=None, meanline=None, showmeans=None, showcaps=None, showbox=None, showfliers=None, boxprops=None, labels=None, flierprops=None, medianprops=None, meanprops=None, capprops=None, whiskerprops=None, manage_ticks=True, autorange=False, zorder=None, *, data=None)
```

Make a box and whisker plot.

Make a box and whisker plot for each column of `x` or each vector in sequence `x`. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

**Parameters**

**x** [Array or a sequence of vectors.] The input data.

**notch** [bool, default: False] Whether to draw a notched box plot (`True`), or a rectangular box plot (`False`). The notches represent the confidence interval (CI) around the median. The documentation for *bootstrap* describes how the locations of the notches are computed.

---

**Note:** In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive “flipped” appearance. This is expected behavior and consistent with other statistical visualization packages.

---

**sym** [str, optional] The default symbol for flier points. An empty string (“”) hides the fliers. If `None`, then the fliers default to ‘b+’. More control is provided by the *flierprops* parameter.

**vert** [bool, default: True] If `True`, draws vertical boxes. If `False`, draw horizontal boxes.

**whis** [float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above  $Q1 - whis * (Q3 - Q1)$ , and the upper whisker at the highest datum below  $Q3 + whis * (Q3 - Q1)$ , where  $Q1$  and  $Q3$  are the first and third quartiles. The default value of `whis = 1.5` corresponds to Tukey’s original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data. “range” is a deprecated synonym for (0, 100).

In the edge case where  $Q1 == Q3$ , `whis` is automatically set to (0, 100) (cover the whole range of the data) if `autorange` is `True`.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

**bootstrap** [int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If *bootstrap* is `None`, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, *bootstrap* specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

**usermedians** [array-like, optional] A 1D array-like of length `len(x)`. Each entry that is not `None` forces the value of the median for the corresponding dataset. For entries that are `None`, the medians are computed by Matplotlib as normal.

**conf\_intervals** [array-like, optional] A 2D array-like of shape `(len(x), 2)`. Each entry that is not `None` forces the location of the corresponding notch (which is only drawn if *notch* is `True`). For entries that are `None`, the notches are computed by the method specified by the other parameters (e.g., *bootstrap*).

**positions** [array-like, optional] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to `range(1, N+1)` where *N* is the number of boxes to be drawn.

**widths** [float or array-like] Sets the width of each box either with a scalar or a sequence. The default is 0.5, or `0.15*(distance between extreme positions)`, if that is smaller.

**patch\_artist** [bool, default: `False`] If `False` produces boxes with the `Line2D` artist. Otherwise, boxes are drawn with Patch artists.

**labels** [sequence, optional] Labels for each dataset (one per dataset).

**manage\_ticks** [bool, default: `True`] If `True`, the tick locations and labels will be adjusted to match the boxplot positions.

**autorange** [bool, default: `False`] When `True` and the data are distributed such that the 25th and 75th percentiles are equal, *whis* is set to `(0, 100)` such that the whisker ends are at the minimum and maximum of the data.

**meanline** [bool, default: `False`] If `True` (and *showmeans* is `True`), will try to render the mean as a line spanning the full width of the box according to *meanprops* (see below). Not recommended if *shownotches* is also `True`. Otherwise, means will be shown as points.

**zorder** [float, default: `Line2D.zorder = 2`] Sets the zorder of the boxplot.

## Returns

**dict** A dictionary mapping each component of the boxplot to a list of the `Line2D` instances created. That dictionary has the following keys (assuming vertical boxplots):

- **boxes**: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- **medians**: horizontal lines at the median of each box.

- **whiskers**: the vertical lines extending to the most extreme, non-outlier data points.
- **caps**: the horizontal lines at the ends of the whiskers.
- **fliers**: points representing data that extend beyond the whiskers (fliers).
- **means**: points or lines representing the means.

### Other Parameters

**showcaps** [bool, default: True] Show the caps on the ends of whiskers.

**showbox** [bool, default: True] Show the central box.

**showfliers** [bool, default: True] Show the outliers beyond the caps.

**showmeans** [bool, default: False] Show the arithmetic means.

**capprops** [dict, default: None] The style of the caps.

**boxprops** [dict, default: None] The style of the box.

**whiskerprops** [dict, default: None] The style of the whiskers.

**flierprops** [dict, default: None] The style of the fliers.

**medianprops** [dict, default: None] The style of the median.

**meanprops** [dict, default: None] The style of the mean.

### Notes

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

### Examples using `matplotlib.pyplot.boxplot`

- `sphx_glr_gallery_pyplots_boxplot_demo_pyplot.py`

### `matplotlib.pyplot.broken_barh`

`matplotlib.pyplot.broken_barh(xranges, yrange, *, data=None, **kwargs)`

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of *xranges*. All rectangles have the same vertical position and size defined by *yrange*.

This is a convenience function for instantiating a *BrokenBarHCollection*, adding it to the axes and autoscaling the view.

### Parameters

**xranges** [sequence of tuples (*xmin*, *xwidth*)] The x-positions and extends of the rectangles. For each tuple (*xmin*, *xwidth*) a rectangle is drawn from *xmin* to *xmin* + *xwidth*.

**yrange** [(*ymin*, *yheight*)] The y-position and extend for all the rectangles.

## Returns

*BrokenBarHCollection*

## Other Parameters

**\*\*kwargs** [*BrokenBarHCollection* properties] Each *kwarg* can be either a single argument applying to all rectangles, e.g.:

```
facecolors='black'
```

or a sequence of arguments over which is cycled, e.g.:

```
facecolors=('black', 'blue')
```

would create interleaving black and blue rectangles.

Supported keywords:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown

Table 190 – continued from previous page

Property	Description
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

## Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

## Examples using `matplotlib.pyplot.broken_barh`

### `matplotlib.pyplot.cla`

`matplotlib.pyplot.cla()`  
Clear the current axes.

## Examples using `matplotlib.pyplot.cla`

### `matplotlib.pyplot.clabel`

`matplotlib.pyplot.clabel(CS, levels=None, **kwargs)`  
Label a contour plot.

Adds labels to line contours in given *ContourSet*.

### Parameters

**CS** [*ContourSet* instance] Line contours to label.

**levels** [array-like, optional] A list of level values, that should be labeled. The list must be a subset of `CS.levels`. If not given, all levels are labeled.

**\*\*kwargs** All other parameters are documented in *clabel*.

## Examples using `matplotlib.pyplot.clabel`

- `sphx_glr_gallery_event_handling_ginput_manual_clabel_skip.py`

**matplotlib.pyplot.clf**

`matplotlib.pyplot.clf()`  
Clear the current figure.

**Examples using matplotlib.pyplot.clf**

- `sphinx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`

**matplotlib.pyplot.clim**

`matplotlib.pyplot.clim(vmin=None, vmax=None)`  
Set the color limits of the current image.

If either *vmin* or *vmax* is *None*, the image min/max respectively will be used for color scaling.

If you want to set the clim of multiple images, use `set_clim` on every image, for example:

```
for im in gca().get_images():
    im.set_clim(0, 0.5)
```

**Examples using matplotlib.pyplot.clim****matplotlib.pyplot.close**

`matplotlib.pyplot.close(fig=None)`  
Close a figure window.

**Parameters**

**fig** [*None* or *int* or *str* or *Figure*] The figure to close. There are a number of ways to specify this:

- *None*: the current figure
- *Figure*: the given *Figure* instance
- *int*: a figure number
- *str*: a figure name
- 'all': all figures

**Examples using matplotlib.pyplot.close**

- `sphinx_glr_gallery_misc_multiprocess_sgskip.py`

[matplotlib.pyplot.cohere](https://matplotlib.org/3.3.0/api/pyplot_api.html#matplotlib.pyplot.cohere)

```
matplotlib.pyplot.cohere(x, y, NFFT=256, Fs=2, Fc=0, detrend=<function de-  
trend_none at 0x7f39f4d34a60>, window=<function de-  
trend_hanning at 0x7f39f4d34a00>, noverlap=0,  
pad_to=None, sides='default', scale_by_freq=None, *,  
data=None, **kwargs)
```

Plot the coherence between  $x$  and  $y$ .

Plot the coherence between  $x$  and  $y$ . Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

### Parameters

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: `window_hanning`] A function or a vector of length *NFFT*. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{`'default'`, `'onesided'`, `'twosided'`}, optional] Which sides of the spectrum to return. `'default'` is one-sided for real data and two-sided for complex data. `'onesided'` forces the return of a one-sided spectrum, while `'twosided'` forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to *NFFT*.

**NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend** [{`'none'`, `'mean'`, `'linear'`} or callable, default `'none'`] The function applied to each segment before `fft`-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: `'none'` calls `detrend_none`. `'mean'` calls `detrend_mean`. `'linear'` calls `detrend_linear`.

**scale\_by\_freq** [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [int, default: 0 (no overlap)] The number of points of overlap between blocks.

**Fc** [int, default: 0] The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

### Returns

**Cxy** [1-D array] The coherence vector.

**freqs** [1-D array] The frequencies for the elements in Cxy.

### Other Parameters

**\*\*kwargs** Keyword arguments control the [Line2D](#) properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<a href="#">Bbox</a>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<a href="#">Figure</a>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <a href="#">Path</a> or <a href="#">MarkerStyle</a>
<i>markeredgewidth</i> or <i>mec</i>	color
<i>markeredgecolor</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[bo
<i>path_effects</i>	<a href="#">AbstractPathEffect</a>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}

Table 191 – continued from previous page

Property	Description
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

## Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s in data*).

## References

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

## Examples using `matplotlib.pyplot.cohere`

### `matplotlib.pyplot.colorbar`

`matplotlib.pyplot.colorbar(mappable=None, cax=None, ax=None, **kw)`

Add a colorbar to a plot.

Function signatures for the *pyplot* interface; all but the first are also method signatures for the *colorbar* method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

## Parameters

**mappable** The *matplotlib.cm.ScalarMappable* (i.e., *AxesImage*, *ContourSet*, etc.) described by this colorbar. This argument is mandatory for the *Figure.colorbar* method but optional for the *pyplot.colorbar* function, which sets the default to the current image.

Note that one can create a *ScalarMappable* "on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap), ax=ax)
```

**cax** [*Axes*, optional] Axes into which the colorbar will be drawn.

**ax** [*Axes*, list of Axes, optional] Parent axes from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

**use\_gridspec** [bool, optional] If *cax* is *None*, a new *cax* is created as an instance of Axes. If *ax* is an instance of Subplot and *use\_gridspec* is *True*, *cax* is created as an instance of Subplot using the *gridspec* module.

## Returns

**colorbar** [*Colorbar*] See also its base class, *ColorbarBase*.

## Notes

Additional keyword arguments are of two kinds:

axes properties:

**fraction** [float, default: 0.15] Fraction of original axes to use for colorbar.

**shrink** [float, default: 1.0] Fraction by which to multiply the size of the colorbar.

**aspect** [float, default: 20] Ratio of long to short dimensions.

**pad** [float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

**anchor** [(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

**panchor** [(float, float), or *False*, optional] The anchor point of the colorbar parent axes. If *False*, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

Prop- erty	Description
<i>extend</i>	{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap <code>set_under</code> and <code>set_over</code> methods.
<i>extend-frac</i>	{None, 'auto', length, lengths} If set to <i>None</i> , both the minimum and maximum triangular colorbar extensions will have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when <i>spacing</i> is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when <i>spacing</i> is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.
<i>extend-direct</i>	bool If <i>False</i> the minimum and maximum colorbar extensions will be triangular (the default). If <i>True</i> the extensions will be rectangular.
<i>spacing</i>	{'uniform', 'proportional'} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.
<i>ticks</i>	None or list of ticks or Locator If <i>None</i> , ticks are determined automatically from the input.
<i>format</i>	None or str or Formatter If <i>None</i> , <i>ScalarFormatter</i> is used. If a format string is given, e.g., '%.3f', that is used. An alternative <i>Formatter</i> may be given instead.
<i>drawedges</i>	bool Whether to draw lines at color boundaries.
<i>label</i>	str The label on the colorbar's long axis.

The following will probably be useful only in the context of indexed colors (that is, when the mappable has `norm=NoNorm()`), or other unusual circumstances.

Prop- erty	Description
<i>boundaries</i>	None or a sequence
<i>values</i>	None or a sequence which must be of length 1 less than the sequence of <i>boundaries</i> . For each region delimited by adjacent entries in <i>boundaries</i> , the color mapped to the corresponding value in <i>values</i> will be used.

If *mappable* is a *ContourSet*, its *extend* kwarg is included automatically.

The *shrink* kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if *cax* is specified, it determines the size of the colorbar and *shrink* and *aspect* kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects in

which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images ( $\alpha < 1$ ) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

#### `matplotlib.pyplot.connect`

`matplotlib.pyplot.connect(s, func)`  
Bind function *func* to event *s*.

##### Parameters

**s** [str] One of the following events ids:

- 'button\_press\_event'
- 'button\_release\_event'
- 'draw\_event'
- 'key\_press\_event'
- 'key\_release\_event'
- 'motion\_notify\_event'
- 'pick\_event'
- 'resize\_event'
- 'scroll\_event'
- 'figure\_enter\_event',
- 'figure\_leave\_event',
- 'axes\_enter\_event',
- 'axes\_leave\_event'
- 'close\_event'.

**func** [callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the axes, the `inaxes` attribute of the event will be set to the [Axes](#) the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See [KeyEvent](#) and [MouseEvent](#) for more info.

### Returns

**cid** A connection id that can be used with [FigureCanvasBase.mpl\\_disconnect](#).

### Examples

```
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

### Examples using `matplotlib.pyplot.connect`

- `sphx_glr_gallery_event_handling_coords_demo.py`

**matplotlib.pyplot.contour**

matplotlib.pyplot.contour(\*args, data=None, \*\*kwargs)  
 Plot contours.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

**Parameters**

**X, Y** [array-like, optional] The coordinates of the values in Z.

X and Y must both be 2-D with the same shape as Z (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in Z and `len(Y) == N` is the number of rows in Z.

If not given, they are assumed to be integer indices, i.e. `X = range(M)`, `Y = range(N)`.

**Z** [array-like(N, M)] The height values over which the contour is drawn.

**levels** [int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use `MaxNLocator`, which tries to automatically choose no more than *n*+1 "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

**Returns**

`QuadContourSet`

**Other Parameters**

**corner\_mask** [bool, default: `rcParams["contour.corner_mask"]` (default: `True`)] Enable/disable corner masking, which only has an effect if Z is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

**colors** [color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by *cmap* will be used.

**alpha** [float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

**norm** [*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax** [float, optional] If not *None*, either or both of these values will be supplied to the *Normalize* instance, overriding the default color scaling based on *levels*.

**origin** [{*None*, 'upper', 'lower', 'image'}, default: *None*] Determines the orientation and exact position of *Z* by specifying the position of *Z*[0, 0]. This is only relevant, if *X*, *Y* are not given.

- *None*: *Z*[0, 0] is at *X*=0, *Y*=0 in the lower left corner.
- 'lower': *Z*[0, 0] is at *X*=0.5, *Y*=0.5 in the lower left corner.
- 'upper': *Z*[0, 0] is at *X*=*N*+0.5, *Y*=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: 'upper').

**extent** [(*x0*, *x1*, *y0*, *y1*), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of *Z*[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of *Z*[0, 0], and (*x1*, *y1*) is the position of *Z*[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to *contour*.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

**extend** [{ 'neither', 'both', 'min', 'max' }, default: 'neither'] Determines the *contourf*-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set\_under* and *Colormap.set\_over*.

---

**Note:** An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call *QuadContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls *QuadContourSet.changed()*.

---

Example:

```

x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                  colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()

```

**xunits, yunits** [registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

**antialiased** [bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: *True*).

**nchunk** [int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

**linewidths** [float or array-like, default: `rcParams["contour.linewidth"]` (default: *None*)] *Only applies to `contour`.*

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If *None*, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

**linestyles** [{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}], optional] *Only applies to `contour`.*

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: 'dashed') setting.

*linestyles* can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**hatches** [List[str], optional] *Only applies to `contourf`.*

A list of cross hatch patterns to use on the filled areas. If *None*, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

## Notes

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.

2. `contourf` fills intervals that are closed at the top; that is, for boundaries `z1` and `z2`, the filled region is:

$$z1 < Z \leq z2$$

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

#### Examples using `matplotlib.pyplot.contour`

- `sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`

#### `matplotlib.pyplot.contourf`

`matplotlib.pyplot.contourf(*args, data=None, **kwargs)`

Plot contours.

Call signature:

`contour([X, Y], Z, [levels], **kwargs)`

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

#### Parameters

**X, Y** [array-like, optional] The coordinates of the values in `Z`.

`X` and `Y` must both be 2-D with the same shape as `Z` (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in `Z` and `len(Y) == N` is the number of rows in `Z`.

If not given, they are assumed to be integer indices, i.e. `X = range(M)`, `Y = range(N)`.

**Z** [array-like(N, M)] The height values over which the contour is drawn.

**levels** [int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int `n`, use `MaxNLocator`, which tries to automatically choose no more than `n+1` "nice" contour levels between `vmin` and `vmax`.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

#### Returns

`QuadContourSet`

#### Other Parameters

**corner\_mask** [bool, default: `rcParams["contour.corner_mask"]` (default: `True`)] Enable/disable corner masking, which only has an effect if `Z` is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

**colors** [color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by `cmap` will be used.

**alpha** [float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap** [str or `Colormap`, default: `rcParams["image.cmap"]` (default: 'viridis')] A `Colormap` instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

**norm** [`Normalize`, optional] If a colormap is used, the `Normalize` instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax** [float, optional] If not `None`, either or both of these values will be supplied to the `Normalize` instance, overriding the default color scaling based on `levels`.

**origin** [{`None`, 'upper', 'lower', 'image'}, default: `None`] Determines the orientation and exact position of `Z` by specifying the position of `Z[0, 0]`. This is only relevant, if `X`, `Y` are not given.

- `None`: `Z[0, 0]` is at `X=0`, `Y=0` in the lower left corner.
- 'lower': `Z[0, 0]` is at `X=0.5`, `Y=0.5` in the lower left corner.
- 'upper': `Z[0, 0]` is at `X=N+0.5`, `Y=0.5` in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: 'upper').

**extent** [(`x0`, `x1`, `y0`, `y1`), optional] If `origin` is not `None`, then `extent` is interpreted as in `imshow`: it gives the outer pixel boundaries. In this case, the position of `Z[0, 0]` is the center of the pixel, not a corner. If `origin` is `None`, then (`x0`, `y0`) is the position of `Z[0, 0]`, and (`x1`, `y1`) is the position of `Z[-1, -1]`.

This argument is ignored if `X` and `Y` are specified in the call to `contour`.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via `levels`. Defaults to `MaxNLocator`.

**extend** [{ 'neither', 'both', 'min', 'max' }, default: 'neither'] Determines the `contourf`-coloring of values that are outside the `levels` range.

If 'neither', values outside the `levels` range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the `levels` range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set\_under* and *Colormap.set\_over*.

---

**Note:** An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call *QuadContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls *QuadContourSet.changed()*.

---

Example:

```
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                  colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

**xunits, yunits** [registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

**antialiased** [bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from *rcParams["lines.antialiased"]* (default: *True*).

**nchunk** [int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*.

**linewidths** [float or array-like, default: *rcParams["contour.linewidth"]* (default: *None*)] *Only applies to contour.*

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If *None*, this falls back to *rcParams["lines.linewidth"]* (default: 1.5).

**linestyles** [{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] *Only applies to contour.*

If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from *rcParams["contour.negative\_linestyle"]* (default: 'dashed') setting.

*linestyles* can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**hatches** [List[str], optional] *Only applies to `contourf`.*

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

## Notes

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.
2. `contourf` fills intervals that are closed at the top; that is, for boundaries  $z1$  and  $z2$ , the filled region is:

$$z1 < Z \leq z2$$

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

## Examples using `matplotlib.pyplot.contourf`

- `sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py`

## `matplotlib.pyplot.cool`

```
matplotlib.pyplot.cool()
    Set the colormap to "cool".
```

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.cool`

## `matplotlib.pyplot.copper`

```
matplotlib.pyplot.copper()
    Set the colormap to "copper".
```

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

#### Examples using `matplotlib.pyplot.copper`

#### `matplotlib.pyplot.csd`

```
matplotlib.pyplot.csd(x, y, NFFT=None, Fs=None, Fc=None, detrend=None, win-
                      dow=None, noverlap=None, pad_to=None, sides=None,
                      scale_by_freq=None, return_line=None, *, data=None,
                      **kwargs)
```

Plot the cross-spectral density.

The cross spectral density  $P_{xy}$  by Welch's average periodogram method. The vectors  $x$  and  $y$  are divided into  $NFFT$  length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The product of the direct FFTs of  $x$  and  $y$  are averaged over each segment to compute  $P_{xy}$ , with a scaling to correct for power loss due to windowing.

If  $\text{len}(x) < NFFT$  or  $\text{len}(y) < NFFT$ , they will be zero padded to  $NFFT$ .

#### Parameters

- x, y** [1-D arrays or sequences] Arrays or sequences containing the data.
- Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.
- window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length  $NFFT$ . To create window vectors see *window\_hanning*, *window\_none*, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- sides** [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.
- pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from  $NFFT$ , which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to `fft()`. The default is `None`, which sets *pad\_to* equal to  $NFFT$ .
- NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.
- detrend** [{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before `fft`-ing, designed to remove the

mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend\_none*. 'mean' calls *detrend\_mean*. 'linear' calls *detrend\_linear*.

**scale\_by\_freq** [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [int, default: 0 (no overlap)] The number of points of overlap between segments.

**Fc** [int, default: 0] The center frequency of *x*, which offsets the *x* extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**return\_line** [bool, default: False] Whether to include the line object plotted in the returned values.

### Returns

**Pxy** [1-D array] The values for the cross spectrum  $P_{xy}$  before scaling (complex valued).

**freqs** [1-D array] The frequencies corresponding to the elements in *Pxy*.

**line** [*Line2D*] The line created by this function. Only returned if *return\_line* is True.

### Other Parameters

**\*\*kwargs** Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}

Table 192 – continued from previous page

Property	Description
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgewidth</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markerstyle</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[bo
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

**See also:**

*psd* is equivalent to setting  $y = x$ .

**Notes**

For plotting, the power is plotted as  $10 \log_{10}(P_{xy})$  for decibels, though  $P_{xy}$  itself is returned.

**References**

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s in data*).

Examples using `matplotlib.pyplot.csd`

**matplotlib.pyplot.delaxes**

`matplotlib.pyplot.delaxes(ax=None)`

Remove an *Axes* (defaulting to the current axes) from its figure.

**Examples using matplotlib.pyplot.delaxes****matplotlib.pyplot.disconnect**

`matplotlib.pyplot.disconnect(cid)`

Disconnect the callback with id *cid*.

**Examples**

```
cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)
```

**Examples using matplotlib.pyplot.disconnect**

- sphx\_glr\_gallery\_event\_handling\_coords\_demo.py

**matplotlib.pyplot.draw**

`matplotlib.pyplot.draw()`

Redraw the current figure.

This is used to update a figure that has been altered, but not automatically re-drawn. If interactive mode is on (via *ion()*), this should be only rarely needed, but there may be ways to modify the state of a figure without marking it as "stale". Please report these cases as bugs.

This is equivalent to calling `fig.canvas.draw_idle()`, where *fig* is the current figure.

**Examples using matplotlib.pyplot.draw**

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py
- sphx\_glr\_gallery\_mplot3d\_rotate\_axes3d\_sgskip.py

**matplotlib.pyplot.draw\_if\_interactive**

`matplotlib.pyplot.draw_if_interactive()`

Examples using `matplotlib.pyplot.draw_if_interactive`

`matplotlib.pyplot.errorbar`

```
matplotlib.pyplot.errorbar(x, y, yerr=None, xerr=None, fmt="", ecolor=None,
                           elinewidth=None, capsize=None, barsabove=False,
                           lolims=False, uplims=False, xlolims=False, xuplims=False,
                           errorevery=1, capthick=None, *, data=None, **kwargs)
```

Plot *y* versus *x* as lines and/or markers with attached errorbars.

*x*, *y* define the data locations, *xerr*, *yerr* define the errorbar sizes. By default, this draws the data markers/lines as well the errorbars. Use *fmt*='none' to draw errorbars without any data markers.

### Parameters

**x, y** [float or array-like] The data positions.

**xerr, yerr** [float or array-like, shape(N,) or shape(2, N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- *None*: No errorbar.

Note that all error arrays should have *positive* values.

See `/gallery/statistics/errorbar_features` for an example on the usage of *xerr* and *yerr*.

**fmt** [str, default: ""] The format for the data points / data lines. See `plot` for details.

Use 'none' (case insensitive) to plot errorbars without any data markers.

**ecolor** [color, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

**elinewidth** [float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

**capsize** [float, default: `rcParams["errorbar.capsize"]` (default: 0.0)] The length of the error bar caps in points.

**capthick** [float, default: None] An alias to the keyword argument *markedgedewidth* (a.k.a. *mew*). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if *mew* or *markedgedewidth* are given, then they will over-ride *capthick*. This may change in future releases.

**barsabove** [bool, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

**lolims, uplims, xlolims, xuplims** [bool, default: False] These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. *lims*-arguments

may be scalars, or array-likes of the same length as `xerr` and `yerr`. To use limits with inverted axes, `set_xlim` or `set_ylim` must be called before `errorbar()`. Note the tricky parameter names: setting e.g. `lolims` to `True` means that the y-value is a *lower* limit of the True value, so, only an *upward*-pointing arrow will be drawn!

**errorevery** [int or (int, int), default: 1] draws error bars on a subset of the data. `errorevery = N` draws error bars on the points `(x[::N], y[::N])`. `errorevery = (start, N)` draws error bars on the points `(x[start::N], y[start::N])`. e.g. `errorevery=(6, 3)` adds error bars to the data at `(x[6], x[9], x[12], x[15], ...)`. Used to avoid overlapping error bars when two series share x-axis values.

## Returns

`ErrorbarContainer` The container contains:

- `plotline`: `Line2D` instance of x, y plot markers and/or line.
- `caplines`: A tuple of `Line2D` instances of the error bar caps.
- `barlinecols`: A tuple of `LineCollection` with the horizontal and vertical error ranges.

## Other Parameters

**\*\*kwargs** All other keyword arguments are passed on to the `plot` call drawing the markers. For example, this code makes big red squares with thick green edges:

```
x, y, yerr = rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red',
         mec='green', ms=20, mew=4)
```

where `mfc`, `mec`, `ms` and `mew` are aliases for the longer property names, `markerfacecolor`, `markeredgcolor`, `markersize` and `markeredgewidth`.

Valid kwargs for the marker properties are `Line2D` properties:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	bool
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>dash_capstyle</code>	{‘butt’, ‘round’, ‘projecting’}
<code>dash_joinstyle</code>	{‘miter’, ‘round’, ‘bevel’}
<code>dashes</code>	sequence of floats (on/off ink in points) or (None, None)
<code>data</code>	(2, N) array or two 1D arrays
<code>drawstyle</code> or <code>ds</code>	{‘default’, ‘steps’, ‘steps-pre’, ‘steps-mid’, ‘steps-post’}, default: ‘default’

## Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *xerr*, *yerr*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

## Examples using `matplotlib.pyplot.errorbar`

- `sphx_glr_gallery_lines_bars_and_markers_errorbar_limits_simple.py`

**matplotlib.pyplot.eventplot**

```
matplotlib.pyplot.eventplot(positions, orientation='horizontal', lineoffsets=1,
                           linelengths=1, linewidths=None, colors=None,
                           linestyle='solid', *, data=None, **kwargs)
```

Plot identical parallel lines at the given positions.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

**Parameters**

**positions** [array-like or list of array-like] A 1D array-like defines the positions of one sequence of events.

Multiple groups of events may be passed as a list of array-likes. Each group can be styled independently by passing lists of values to *lineoffsets*, *linelengths*, *linewidths*, *colors* and *linestyles*.

Note that *positions* can be a 2D array, but in practice different event groups usually have different counts so that one will use a list of different-length arrays rather than a 2D array.

**orientation** [{'horizontal', 'vertical'}, default: 'horizontal'] The direction of the event sequence:

- 'horizontal': the events are arranged horizontally. The indicator lines are vertical.
- 'vertical': the events are arranged vertically. The indicator lines are horizontal.

**lineoffsets** [float or array-like, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to *orientation*.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**linelengths** [float or array-like, default: 1] The total height of the lines (i.e. the lines stretches from *lineoffset* - *linelength*/2 to *lineoffset* + *linelength*/2).

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**linewidths** [float or array-like, default: `rcParams["lines.linewidth"]` (default: 1.5)] The line width(s) of the event lines, in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**colors** [color or list of colors, default: `rcParams["lines.color"]` (default: 'C0')] The color(s) of the event lines.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**linestyles** [str or tuple or list of such values, default: 'solid'] Default is 'solid'. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

If *positions* is 2D, this can be a sequence with length matching the length of *positions*.

**\*\*kwargs** Other keyword arguments are line collection properties. See [LineCollection](#) for a list of the valid properties.

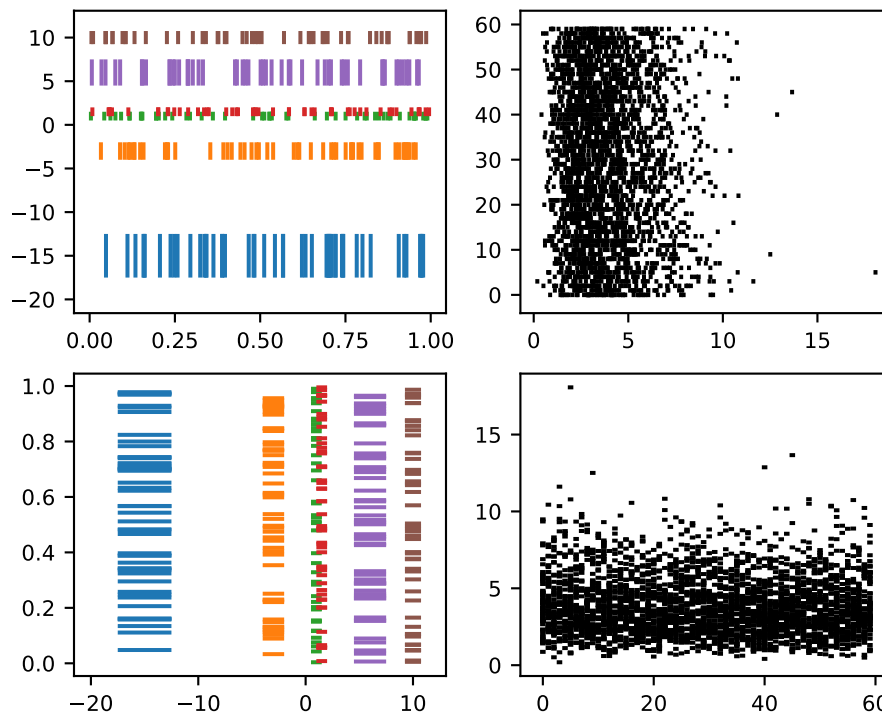

### Returns

**list of [EventCollection](#)** The [EventCollection](#) that were added.

### Notes

For *linelengths*, *linewidths*, *colors*, and *linestyles*, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as *positions*, and each value will be applied to the corresponding row of the array.

### Examples

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *positions*, *lineoffsets*, *linelengths*, *linewidths*, *colors*, *linestyles*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

Examples using `matplotlib.pyplot.eventplot`

`matplotlib.pyplot.figimage`

```
matplotlib.pyplot.figimage(X, xo=0, yo=0, alpha=None, norm=None, cmap=None,
                           vmin=None, vmax=None, origin=None, resize=False,
                           **kwargs)
```

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on *origin*.

### Parameters

**X** The image data. This is an array of one of the following shapes:

- MxN: luminance (grayscale) values
- MxNx3: RGB values
- MxNx4: RGBA values

**xo, yo** [int] The x/y image offset in pixels.

**alpha** [None or float] The alpha blending value.

**norm** [`matplotlib.colors.Normalize`] A *Normalize* instance to map the luminance to the interval [0, 1].

**cmap** [str or `matplotlib.colors.Colormap`, default: `rcParams["image.cmap"]` (default: 'viridis')] The colormap to use.

**vmin, vmax** [float] If *norm* is not given, these values set the data limits for the colormap.

**origin** [{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: 'upper')] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.

**resize** [bool] If *True*, resize the figure to match the given image size.

### Returns

`matplotlib.image.FigureImage`

### Other Parameters

**\*\*kwargs** Additional kwargs are *Artist* kwargs passed on to *FigureImage*.

## Notes

`figimage` complements the axes image (*`imshow`*) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an *`Axes`* with extent `[0, 0, 1, 1]`.

## Examples

```
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

### Examples using `matplotlib.pyplot.figimage`

- `sphx_glr_gallery_images_contours_and_fields_figimage_demo.py`

## `matplotlib.pyplot.figlegend`

`matplotlib.pyplot.figlegend(*args, **kwargs)`

Place a legend on the figure.

To make a legend from existing artists on every axes:

```
figlegend()
```

To make a legend for a list of lines and labels:

```
figlegend(
    (line1, line2, line3),
    ('label1', 'label2', 'label3'),
    loc='upper right')
```

These can also be specified by keyword:

```
figlegend(
    handles=(line1, line2, line3),
    labels=('label1', 'label2', 'label3'),
    loc='upper right')
```

## Parameters

**handles** [list of *`Artist`*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

**labels** [list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

## Returns

*Legend*

## Other Parameters

**loc** [str or pair of floats, default: `rcParams["legend.loc"]` (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox\_to\_anchor* will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor** [*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox\_transform*, with the default transform *Axes* or *Figure* coordinates, depending on which legend is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol** [int, default: 1] The number of columns that the legend has.

**prop** [None or *matplotlib.font\_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

**fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

**labelcolor** [str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints** [int, default: *rcParams*["legend.numpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

**scatterpoints** [int, default: *rcParams*["legend.scatterpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

**scatteryoffsets** [iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale** [float, default: *rcParams*["legend.markerscale"] (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.

**markerfirst** [bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

**frameon** [bool, default: *rcParams*["legend.frameon"] (default: True)] Whether the legend should be drawn on a patch (frame).

**fancybox** [bool, default: *rcParams*["legend.fancybox"] (default: True)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

**shadow** [bool, default: *rcParams*["legend.shadow"] (default: False)] Whether to draw a shadow behind the legend.

**framealpha** [float, default: `rcParams["legend.framealpha"]` (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is *None*, the default value is ignored.

**facecolor** ["inherit" or color, default: `rcParams["legend.facecolor"]` (default: 'inherit')] The legend's background color. If "inherit", use `rcParams["axes.facecolor"]` (default: 'white').

**edgecolor** ["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: '0.8')] The legend's background patch edge color. If "inherit", use take `rcParams["axes.edgecolor"]` (default: 'black').

**mode** [{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox\_to\_anchor* if defines the legend's size).

**bbox\_transform** [None or `matplotlib.transforms.Transform`] The transform for the bounding box (*bbox\_to\_anchor*). For a value of *None* (default) the Axes' `transAxes` transform will be used.

**title** [str or None] The legend's title. Default is no title (*None*).

**title\_fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: *None*)] The font size of the legend's title.

**borderpad** [float, default: `rcParams["legend.borderpad"]` (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

**labelspacing** [float, default: `rcParams["legend.labelspacing"]` (default: 0.5)] The vertical space between the legend entries, in font-size units.

**handlelength** [float, default: `rcParams["legend.handlelength"]` (default: 2.0)] The length of the legend handles, in font-size units.

**handletextpad** [float, default: `rcParams["legend.handletextpad"]` (default: 0.8)] The pad between the legend handle and text, in font-size units.

**borderaxespad** [float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)] The pad between the axes and legend border, in font-size units.

**columnspacing** [float, default: `rcParams["legend.columnspacing"]` (default: 2.0)] The spacing between columns, in font-size units.

**handler\_map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler\_map* updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

## Notes

Some artists are not supported by this function. See [Legend guide](#) for details.

## Examples using `matplotlib.pyplot.figlegend`

**matplotlib.pyplot.figure\_exists**

```
matplotlib.pyplot.figure_exists(num)
```

Return whether the figure with the given id exists.

**Examples using matplotlib.pyplot.figure\_exists****matplotlib.pyplot.figtext**

```
matplotlib.pyplot.figtext(x, y, s, fontdict=None, **kwargs)
```

Add text to figure.

**Parameters**

**x, y** [float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the *transform* keyword.

**s** [str] The text string.

**fontdict** [dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as *kwargs* override the corresponding ones given in *fontdict*.

**Returns**

*Text*

**Other Parameters**

**\*\*kwargs** [*Text* properties] Other miscellaneous text parameters.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontfamily</i> or <i>family</i>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<i>fontproperties</i> or <i>font</i> or <i>font_properties</i>	<i>font_manager.FontProperties</i> or <i>str</i> or <i>pathlib.Path</i>
<i>fontsize</i> or <i>size</i>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large'}
<i>fontstretch</i> or <i>stretch</i>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed'}
<i>fontstyle</i> or <i>style</i>	{'normal', 'italic', 'oblique'}
<i>fontvariant</i> or <i>variant</i>	{'normal', 'small-caps'}
<i>fontweight</i> or <i>weight</i>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'bold', 'extra-bold'}
<i>gid</i>	<i>str</i>
<i>horizontalalignment</i> or <i>ha</i>	{'center', 'right', 'left'}

Property	Description
<i>in_layout</i>	bool
<i>label</i>	object
<i>linespacing</i>	float (multiple of font size)
<i>multialignment</i> or <i>ma</i>	{'left', 'right', 'center'}
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	(float, float)
<i>rasterized</i>	bool or None
<i>rotation</i>	float or {'vertical', 'horizontal'}
<i>rotation_mode</i>	{None, 'default', 'anchor'}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	object
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>usetex</i>	bool or None
<i>verticalalignment</i> or <i>va</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

**See also:***Axes.text**pyplot.text***Examples using `matplotlib.pyplot.figtext`**

- `sphx_glr_gallery_text_labels_and_annotations_fonts_demo.py`
- `sphx_glr_gallery_text_labels_and_annotations_fonts_demo_kw.py`

**`matplotlib.pyplot.figure`**

```
matplotlib.pyplot.figure(num=None, figsize=None, dpi=None, facecolor=None,
                          edgecolor=None, frameon=True, FigureClass=<class 'matplotlib.figure.Figure'>, clear=False, **kwargs)
```

Create a new figure, or activate an existing figure.

**Parameters**

**num** [int or str, optional] A unique identifier for the figure.

If a figure with that identifier already exists, this figure is made active and returned. An integer refers to the `Figure.number` attribute, a string refers to the figure label.

If there is no figure with the identifier or *num* is not given, a new figure is created, made active and returned. If *num* is an int, it will be used

for the `Figure.number` attribute, otherwise, an auto-generated integer value is used (starting at 1 and incremented for each new figure). If `num` is a string, the figure label and the window title is set to this value.

**figsize** [(float, float), default: `rcParams["figure.figsize"]` (default: [6.4, 4.8])] Width, height in inches.

**dpi** [float, default: `rcParams["figure.dpi"]` (default: 100.0)] The resolution of the figure in dots-per-inch.

**facecolor** [color, default: `rcParams["figure.facecolor"]` (default: 'white')] The background color.

**edgecolor** [color, default: `rcParams["figure.edgecolor"]` (default: 'white')] The border color.

**frameon** [bool, default: True] If False, suppress drawing the figure frame.

**FigureClass** [subclass of *Figure*] Optionally use a custom *Figure* instance.

**clear** [bool, default: False] If True and the figure already exists, then it is cleared.

**tight\_layout** [bool or dict, default: `rcParams["figure.autolayout"]` (default: False)] If False use *subplotspars*. If True adjust subplot parameters using *tight\_layout* with default padding. When providing a dict containing the keys `pad`, `w_pad`, `h_pad`, and `rect`, the default *tight\_layout* paddings will be overridden.

**constrained\_layout** [bool, default: `rcParams["figure.constrained_layout.use"]` (default: False)] If True use constrained layout to adjust positioning of plot elements. Like *tight\_layout*, but designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with `add_subplot` or *subplot2grid*.)

**\*\*kwargs : optional** See *Figure* for other possible arguments.

## Returns

*Figure* The *Figure* instance returned will also be passed to `new_figure_manager` in the backends, which allows to hook custom *Figure* classes into the pyplot interface. Additional kwargs will be passed to the *Figure* init function.

## Notes

If you are creating many figures, make sure you explicitly call `pyplot.close` on the figures you are not using, because this will enable pyplot to properly clean up the memory.

*rcParams* defines the default values, which can be modified in the `matplotlibrc` file.

## Examples using `matplotlib.pyplot.figure`

- *Frame grabbing*
- `sphinx_glr_gallery_misc_hyperlinks_sgskip.py`
- `sphinx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py`

- sphx\_glr\_gallery\_user\_interfaces\_svg\_histogram\_sgskip.py
- sphx\_glr\_gallery\_user\_interfaces\_toolmanager\_sgskip.py
- sphx\_glr\_gallery\_userdemo\_pgf\_preamble\_sgskip.py

### matplotlib.pyplot.fill

matplotlib.pyplot.fill(\*args, data=None, \*\*kwargs)  
Plot filled polygons.

#### Parameters

**\*args** [sequence of x, y, [color]] Each polygon is defined by the lists of x and y positions of its nodes, optionally followed by a *color* specifier. See *matplotlib.colors* for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple x, y, [color] groups.

For example, each of the following is legal:

```
ax.fill(x, y)                # a polygon with default color
ax.fill(x, y, "b")           # a blue polygon
ax.fill(x, y, x2, y2)        # two polygons
ax.fill(x, y, "b", x2, y2, "r") # a blue and a red polygon
```

**data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y, e.g.:

```
ax.fill("time", "signal",
        data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

#### Returns

list of *Polygon*

#### Other Parameters

**\*\*kwargs** [*Polygon* properties]

#### Notes

Use *fill\_between()* if you would like to fill the region between two curves.

### Examples using matplotlib.pyplot.fill

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

### matplotlib.pyplot.fill\_between

matplotlib.pyplot.fill\_between(x, y1, y2=0, where=None, interpolate=False, step=None, \*, data=None, \*\*kwargs)  
Fill the area between two horizontal curves.

The curves are defined by the points  $(x, y1)$  and  $(x, y2)$ . This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between  $x$ .

### Parameters

- x** [array (length N)] The  $x$  coordinates of the nodes defining the curves.
  - y1** [array (length N) or scalar] The  $y$  coordinates of the nodes defining the first curve.
  - y2** [array (length N) or scalar, default: 0] The  $y$  coordinates of the nodes defining the second curve.
  - where** [array of bool (length N), optional] Define *where* to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates  $x[where]$ . More precisely, fill between  $x[i]$  and  $x[i+1]$  if  $where[i]$  and  $where[i+1]$ . Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.
  - interpolate** [bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.
- Semantically, *where* is often used for  $y1 > y2$  or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the  $x$  array. Such a polygon cannot describe the above semantics close to the intersection. The  $x$ -sections containing the intersection are simply clipped.
- Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.
- step** [{ 'pre', 'post', 'mid' }, optional] Define *step* if the filling should be a step function, i.e. constant in between  $x$ . The value determines where the step will occur:

- 'pre': The  $y$  value is continued constantly to the left from every  $x$  position, i.e. the interval  $(x[i-1], x[i])$  has the value  $y[i]$ .
- 'post': The  $y$  value is continued constantly to the right from every  $x$  position, i.e. the interval  $[x[i], x[i+1])$  has the value  $y[i]$ .
- 'mid': Steps occur half-way between the  $x$  positions.

### Returns

*PolyCollection* A *PolyCollection* containing the plotted polygons.

### Other Parameters

**\*\*kwargs** All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a $(m, n, 3)$ float array and a dpi value
<i>alpha</i>	float or None

Table 195 – continued from previous page

Property	Description
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

**See also:**

*fill\_between* Fill between two sets of y-values.

*fill\_betweenx* Fill between two sets of x-values.

**Notes**

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *y1*, *y2*, *where*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

#### Examples using `matplotlib.pyplot.fill_between`

- `sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py`
- `sphx_glr_gallery_text_labels_and_annotations_mathtext_examples.py`

#### `matplotlib.pyplot.fill_betweenx`

`matplotlib.pyplot.fill_betweenx(y, x1, x2=0, where=None, step=None, interpolate=False, *, data=None, **kwargs)`

Fill the area between two vertical curves.

The curves are defined by the points  $(y, x1)$  and  $(y, x2)$ . This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using *where*.

By default, the edges connect the given points directly. Use *step* if the filling should be a step function, i.e. constant in between *y*.

##### Parameters

**y** [array (length N)] The y coordinates of the nodes defining the curves.

**x1** [array (length N) or scalar] The x coordinates of the nodes defining the first curve.

**x2** [array (length N) or scalar, default: 0] The x coordinates of the nodes defining the second curve.

**where** [array of bool (length N), optional] Define *where* to exclude some vertical regions from being filled. The filled regions are defined by the coordinates `y[where]`. More precisely, fill between `y[i]` and `y[i+1]` if `where[i]` and `where[i+1]`. Note that this definition implies that an isolated *True* value between two *False* values in *where* will not result in filling. Both sides of the *True* position remain unfilled due to the adjacent *False* values.

**interpolate** [bool, default: False] This option is only relevant if *where* is used and the two curves are crossing each other.

Semantically, *where* is often used for  $x1 > x2$  or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the *y* array. Such a polygon cannot describe the above semantics close to the intersection. The y-sections containing the intersection are simply clipped.

Setting *interpolate* to *True* will calculate the actual intersection point and extend the filled region up to this point.

**step** [{*'pre'*, *'post'*, *'mid'*}, optional] Define *step* if the filling should be a step function, i.e. constant in between *y*. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every x position, i.e. the interval  $(x[i-1], x[i])$  has the value  $y[i]$ .
- 'post': The y value is continued constantly to the right from every x position, i.e. the interval  $[x[i], x[i+1])$  has the value  $y[i]$ .
- 'mid': Steps occur half-way between the x positions.

## Returns

*PolyCollection* A *PolyCollection* containing the plotted polygons.

## Other Parameters

**\*\*kwargs** All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool

Table 196 – continued from previous page

Property	Description
<code>zorder</code>	float

**See also:**

`fill_between` Fill between two sets of y-values.

`fill_betweenx` Fill between two sets of x-values.

**Notes**

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *y*, *x1*, *x2*, *where*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

**Examples using `matplotlib.pyplot.fill_betweenx`****`matplotlib.pyplot.findobj`**

`matplotlib.pyplot.findobj(o=None, match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

**Parameters**

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).

**include\_self** [bool] Include *self* in the list to be checked for a match.

**Returns**

list of *Artist*

**Examples using `matplotlib.pyplot.findobj`****`matplotlib.pyplot.flag`**

`matplotlib.pyplot.flag()`

Set the colormap to "flag".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

### Examples using `matplotlib.pyplot.flag`

#### `matplotlib.pyplot.gca`

`matplotlib.pyplot.gca(**kwargs)`

Get the current axes, creating one if necessary.

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[Axes, Renderer], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>prop_cycle</i>	unknown
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool

Contin

Table 197 – continued from previous page

Property	Description
<i>xbound</i>	unknown
<i>xlabel</i>	str
<i>xlim</i>	(bottom: float, top: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>xticklabels</i>	unknown
<i>xticks</i>	unknown
<i>ybound</i>	unknown
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	unknown
<i>yticks</i>	unknown
<i>zorder</i>	float

#### Examples using `matplotlib.pyplot.gca`

- `sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`

#### `matplotlib.pyplot.gcf`

`matplotlib.pyplot.gcf()`

Get the current figure.

If no current figure exists, a new one is created using `figure()`.

#### Examples using `matplotlib.pyplot.gcf`

- `sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py`
- `sphx_glr_gallery_event_handling_trifinder_event_demo.py`
- `sphx_glr_gallery_misc_agg_buffer.py`
- *Tight Layout guide*

#### `matplotlib.pyplot.gci`

`matplotlib.pyplot.gci()`

Get the current colorable artist.

Specifically, returns the current *ScalarMappable* instance (Image created by *imshow* or *figimage*, *Collection* created by *pcolor* or *scatter*, etc.), or *None* if no such instance has been defined.

The current image is an attribute of the current axes, or the nearest earlier axes in the current figure that contains an image.

## Notes

Historically, the only colorable artists were images; hence the name `gci` (get current image).

### Examples using `matplotlib.pyplot.gci`

#### `matplotlib.pyplot.get`

`matplotlib.pyplot.get(obj, *args, **kwargs)`

Return the value of an object's *property*, or print all of them.

#### Parameters

**obj** [*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

**property** [str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If it is None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

### Examples using `matplotlib.pyplot.get`

#### `matplotlib.pyplot.get_current_fig_manager`

`matplotlib.pyplot.get_current_fig_manager()`

Return the figure manager of the current figure.

The figure manager is a container for the actual backend-dependent window that displays the figure on screen.

If if no current figure exists, a new one is created and its figure manager is returned.

#### Returns

*FigureManagerBase* or backend-dependent subclass thereof

### Examples using `matplotlib.pyplot.get_current_fig_manager`

#### `matplotlib.pyplot.get_figlabels`

`matplotlib.pyplot.get_figlabels()`

Return a list of existing figure labels.

Examples using `matplotlib.pyplot.get_figlabels`

**matplotlib.pyplot.get\_fignums**

`matplotlib.pyplot.get_fignums()`  
Return a list of existing figure numbers.

Examples using `matplotlib.pyplot.get_fignums`

**matplotlib.pyplot.get\_plot\_commands**

`matplotlib.pyplot.get_plot_commands()`  
Get a sorted list of all of the plotting commands.

Examples using `matplotlib.pyplot.get_plot_commands`

**matplotlib.pyplot.getp**

`matplotlib.pyplot.getp(obj, *args, **kwargs)`  
Return the value of an object's *property*, or print all of them.

#### Parameters

**obj** [*Artist*] The queried artist; e.g., a *Line2D*, a *Text*, or an *Axes*.

**property** [str or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`.

If it is None (or unset), it *prints* all gettable properties from *obj*. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

Examples using `matplotlib.pyplot.getp`

- `sphx_glr_gallery_misc_set_and_get.py`
- *Artist tutorial*

**matplotlib.pyplot.ginput**

`matplotlib.pyplot.ginput(n=1, timeout=30, show_clicks=True,  
mouse_add=<MouseButton.LEFT: 1>,  
mouse_pop=<MouseButton.RIGHT: 3>,  
mouse_stop=<MouseButton.MIDDLE: 2>)`  
Blocking call to interact with a figure.

Wait until the user clicks  $n$  times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments *mouse\_add*, *mouse\_pop* and *mouse\_stop*.

#### Parameters

**n** [int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

**timeout** [float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never timeout.

**show\_clicks** [bool, default: True] If True, show a red cross at the location of each click.

**mouse\_add** [*MouseButton* or None, default: *MouseButton.LEFT*] Mouse button used to add points.

**mouse\_pop** [*MouseButton* or None, default: *MouseButton.RIGHT*] Mouse button used to remove the most recently added point.

**mouse\_stop** [*MouseButton* or None, default: *MouseButton.MIDDLE*] Mouse button used to stop input.

#### Returns

**list of tuples** A list of the clicked (x, y) coordinates.

#### Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

#### Examples using `matplotlib.pyplot.ginput`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

#### `matplotlib.pyplot.gray`

`matplotlib.pyplot.gray()`  
Set the colormap to "gray".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.gray``matplotlib.pyplot.grid`

`matplotlib.pyplot.grid(b=None, which='major', axis='both', **kwargs)`

Configure the grid lines.

**Parameters**

**b** [bool or None, optional] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.

If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

**which** [{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.

**axis** [{'both', 'x', 'y'}, optional] The axis to apply the changes on.

**\*\*kwargs** [*Line2D* properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='--', linewidth=2)
```

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgewidth</i> or <i>mec</i>	color
<i>markeredgecolor</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color

Table 198 – continued from previous page

Property	Description
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[bo
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

### Notes

The axis is drawn as a unit, so the effective *zorder* for drawing the grid is determined by the *zorder* of each axis, not by the *zorder* of the *Line2D* objects comprising the grid. Therefore, to set grid *zorder*, use *set\_axisbelow* or, for more control, call the *set\_zorder* method of each axis.

- *Pyplot tutorial*

**matplotlib.pyplot.hexbin**

```
matplotlib.pyplot.hexbin(x, y, C=None, gridsize=100, bins=None, xscale='linear',
                          yscale='linear', extent=None, cmap=None, norm=None,
                          vmin=None, vmax=None, alpha=None, linewidths=None,
                          edgecolors='face', reduce_C_function=<function mean
at 0x7f39f99a09d0>, mincnt=None, marginals=False, *,
                          data=None, **kwargs)
```

Make a 2D hexagonal binning plot of points *x*, *y*.

If *C* is *None*, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, *C* specifies values at the coordinate (*x*[*i*], *y*[*i*]). For each hexagon, these values are reduced using *reduce\_C\_function*.

**Parameters**

**x, y** [array-like] The data positions. *x* and *y* must be of the same length.

**C** [array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as *x* and *y*.

**gridsize** [int or (int, int), default: 100] If a single int, the number of hexagons in the *x*-direction. The number of hexagons in the *y*-direction is chosen such that the hexagons are approximately regular.

Alternatively, if a tuple (*nx*, *ny*), the number of hexagons in the *x*-direction and the *y*-direction.

**bins** ['log' or int or sequence, default: *None*] Discretization of the hexagon values.

- If *None*, no binning is applied; the color of each hexagon directly corresponds to its count value.
- If 'log', use a logarithmic scale for the color map. Internally,  $\log_{10}(i+1)$  is used to determine the hexagon color. This is equivalent to `norm=LogNorm()`.
- If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
- If a sequence of values, the values of the lower bound of the bins to be used.

**xscale** [{ 'linear', 'log' }, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

**yscale** [{ 'linear', 'log' }, default: 'linear'] Use a linear or log10 scale on the vertical axis.

**mincnt** [int > 0, default: *None*] If not *None*, only display cells with more than *mincnt* number of points in the cell.

**marginals** [bool, default: *False*] If *marginals* is *True*, plot the marginal density as colormapped rectangles along the bottom of the *x*-axis and left of the *y*-axis.

**extent** [float, default: *None*] The limits of the bins. The default assigns the limits based on *gridsize*, *x*, *y*, *xscale* and *yscale*.

If *xscale* or *yscale* is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

## Returns

*PolyCollection* A *PolyCollection* defining the hexagonal bins.

- `PolyCollection.get_offset` contains a Mx2 array containing the x, y positions of the M hexagon centers.
- `PolyCollection.get_array` contains the values of the M hexagons.

If *marginals* is *True*, horizontal bar and vertical bar (both *PolyCollection*s) will be attached to the return collection as attributes *hbar* and *vbar*.

## Other Parameters

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] The *Colormap* instance or registered colormap name used to map the bin values to colors.

**norm** [*Normalize*, optional] The *Normalize* instance scales the bin values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax** [float, default: *None*] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of the bins in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

**alpha** [float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

**linewidths** [float, default: *None*] If *None*, defaults to 1.0.

**edgecolors** [{ 'face', 'none', *None* } or color, default: 'face'] The color of the hexagon edges. Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- *None*: Draw outlines in the default color.
- An explicit color.

**reduce\_C\_function** [callable, default: `numpy.mean`] The function to aggregate *C* within the bins. It is ignored if *C* is not given. This must have the signature:

```
def reduce_C_function(C: array) -> float
```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpy.max`: value taken from the largest point

**\*\*kwargs** [*PolyCollection* properties] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools

<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

## Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

Examples using `matplotlib.pyplot.hexbin``matplotlib.pyplot.hist`

```
matplotlib.pyplot.hist(x, bins=None, range=None, density=False, weights=None, cumulative=False, bottom=None, histtype='bar', align='mid', orientation='vertical', rwidth=None, log=False, color=None, label=None, stacked=False, *, data=None, **kwargs)
```

Plot a histogram.

Compute and draw the histogram of `x`. The return value is a tuple `(n, bins, patches)` or `([n0, n1, ...], bins, [patches0, patches1, ...])` if the input contains multiple data. See the documentation of the `weights` parameter to draw a histogram of already-binned data.

Multiple data can be provided via `x` as a list of datasets of potentially different length (`[x0, x1, ...]`), or as a 2-D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported.

The `bins`, `range`, `weights`, and `density` parameters behave as in `numpy.histogram`.

**Parameters**

**x** [(n,) array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

**bins** [int or sequence or str, default: `rcParams["hist.bins"]` (default: 10)] If `bins` is an integer, it defines the number of equal-width bins in the range.

If `bins` is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, bins may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if `bins` is:

```
[1, 2, 3, 4]
```

then the first bin is `[1, 2)` (including 1, but excluding 2) and the second `[2, 3)`. The last bin, however, is `[3, 4]`, which *includes* 4.

If `bins` is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: `'auto'`, `'fd'`, `'doane'`, `'scott'`, `'stone'`, `'rice'`, `'sturges'`, or `'sqrt'`.

**range** [tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, `range` is `(x.min(), x.max())`. Range has no effect if `bins` is a sequence.

If `bins` is a sequence or `range` is specified, autoscaling is based on the specified bin range instead of the range of `x`.

**density** [bool, default: False] If True, draw and return a probability density: each bin will display the bin's raw count divided by the total number of counts *and the bin width* (`density = counts / (sum(counts) * np.diff(bins))`), so that the area under the histogram integrates to 1 (`np.sum(density * np.diff(bins)) == 1`).

If `stacked` is also True, the sum of the histograms is normalized to 1.

**weights** [(n,) array-like or None, default: None] An array of weights, of the same shape as *x*. Each value in *x* only contributes its associated weight towards the bin count (instead of 1). If *density* is True, the weights are normalized, so that the integral of the density over the range remains 1.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using `numpy.histogram` (by treating each bin as a single point with a weight equal to its count)

```
counts, bins = np.histogram(data)
plt.hist(bins[:-1], bins, weights=counts)
```

(or you may alternatively use `bar()`).

**cumulative** [bool or -1, default: False] If True, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If *density* is also True then the histogram is normalized such that the last bin equals 1.

If *cumulative* is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if *density* is also True, then the histogram is normalized such that the first bin equals 1.

**bottom** [array-like, scalar, or None, default: None] Location of the bottom of each bin, ie. bins are drawn from bottom to bottom + hist(*x*, bins) If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

**histtype** [{*'bar'*, *'barstacked'*, *'step'*, *'stepfilled'*}, default: *'bar'*] The type of histogram to draw.

- *'bar'* is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- *'barstacked'* is a bar-type histogram where multiple data are stacked on top of each other.
- *'step'* generates a lineplot that is by default unfilled.
- *'stepfilled'* generates a lineplot that is by default filled.

**align** [{*'left'*, *'mid'*, *'right'*}, default: *'mid'*] The horizontal alignment of the histogram bars.

- *'left'*: bars are centered on the left bin edges.
- *'mid'*: bars are centered between the bin edges.
- *'right'*: bars are centered on the right bin edges.

**orientation** [{*'vertical'*, *'horizontal'*}, default: *'vertical'*] If *'horizontal'*, *barh* will be used for bar-type histograms and the *bottom* kwarg will be the left edges.

**rwidth** [float or None, default: None] The relative width of the bars as a fraction of the bin width. If None, automatically compute the width.

Ignored if *histtype* is *'step'* or *'stepfilled'*.

**log** [bool, default: False] If True, the histogram axis will be set to a log scale. If *log* is True and *x* is a 1D array, empty bins will be filtered out and only the non-empty (*n*, *bins*, *patches*) will be returned.

**color** [color or array-like of colors or None, default: None] Color or sequence of colors, one per dataset. Default (None) uses the standard line color sequence.

**label** [str or None, default: None] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that *legend* will work as expected.

**stacked** [bool, default: False] If True, multiple data are stacked on top of each other. If False multiple data are arranged side by side if *histtype* is 'bar' or on top of each other if *histtype* is 'step'

### Returns

**n** [array or list of arrays] The values of the histogram bins. See *density* and *weights* for a description of the possible semantics. If input *x* is an array, then this is an array of length *nbins*. If input is a sequence of arrays [*data1*, *data2*, ...], then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array *n* (or of its element arrays) will always be float even if no weighting or normalization is used.

**bins** [array] The edges of the bins. Length *nbins* + 1 (*nbins* left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

**patches** [*BarContainer* or list of a single *Polygon* or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.

### Other Parameters

**\*\*kwargs** *Patch* properties

### See also:

*hist2d* 2D histograms

### Notes

For large numbers of bins (>1000), 'step' and 'stepfilled' can be significantly faster than 'bar' and 'barstacked'.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*, *weights*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s in data*).

---

### Examples using `matplotlib.pyplot.hist`

- `sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py`

### `matplotlib.pyplot.hist2d`

```
matplotlib.pyplot.hist2d(x, y, bins=10, range=None, density=False, weights=None,
                        cmin=None, cmax=None, *, data=None, **kwargs)
```

Make a 2D histogram plot.

#### Parameters

**x, y** [array-like, shape (n, )] Input values

**bins** [None or int or [int, int] or array-like or [array, array]] The bin specification:

- If int, the number of bins for the two dimensions ( $n_x=n_y=\text{bins}$ ).
- If [int, int], the number of bins in each dimension ( $n_x, n_y = \text{bins}$ ).
- If array-like, the bin edges for the two dimensions ( $x\_edges=y\_edges=\text{bins}$ ).
- If [array, array], the bin edges in each dimension ( $x\_edges, y\_edges = \text{bins}$ ).

The default value is 10.

**range** [array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): [ $x_{\min}, x_{\max}$ ], [ $y_{\min}, y_{\max}$ ]]. All values outside of this range will be considered outliers and not tallied in the histogram.

**density** [bool, default: False] Normalize histogram. See the documentation for the *density* parameter of [hist](#) for more details.

**weights** [array-like, shape (n, ), optional] An array of values  $w_i$  weighing each sample ( $x_i, y_i$ ).

**cmin, cmax** [float, default: None] All bins that has count less than *cmin* or more than *cmax* will not be displayed (set to NaN before passing to `imshow`) and these count values in the return value `count histogram` will also be set to nan upon return.

#### Returns

**h** [2D array] The bi-dimensional histogram of samples *x* and *y*. Values in *x* are histogrammed along the first dimension and values in *y* are histogrammed along the second dimension.

**xedges** [1D array] The bin edges along the *x* axis.

**yedges** [1D array] The bin edges along the *y* axis.

**image** [[QuadMesh](#)]

#### Other Parameters

**cmap** [Colormap or str, optional] A [colors.Colormap](#) instance. If not set, use rc settings.

**norm** [Normalize, optional] A `colors.Normalize` instance is used to scale luminance data to [0, 1]. If not set, defaults to `colors.Normalize()`.

**vmin/vmax** [None or scalar, optional] Arguments passed to the `Normalize` instance.

**alpha** [0 <= scalar <= 1 or None, optional] The alpha blending value.

**\*\*kwargs** Additional parameters are passed along to the `pcolormesh` method and `QuadMesh` constructor.

#### See also:

`hist` 1D histogram plotting

#### Notes

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.
- Rendering the histogram with a logarithmic color scale is accomplished by passing a `colors.LogNorm` instance to the `norm` keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with `colors.PowerNorm`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `weights`.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

#### Examples using `matplotlib.pyplot.hist2d`

- `sphx_glr_gallery_scales_power_norm.py`

#### `matplotlib.pyplot.hlines`

```
matplotlib.pyplot.hlines(y, xmin, xmax, colors=None, linestyle='solid', label="", *,
                        data=None, **kwargs)
```

Plot horizontal lines at each `y` from `xmin` to `xmax`.

##### Parameters

**y** [float or array-like] y-indexes where to plot the lines.

**xmin, xmax** [float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

**colors** [list of colors, default: `rcParams["lines.color"]` (default: 'C0')]

**linestyle** [{ 'solid', 'dashed', 'dashdot', 'dotted' }, optional]

**label** [str, default: ""]

**Returns***LineCollection***Other Parameters****\*\*kwargs** [*LineCollection* properties.]**See also:***vlines* vertical lines*axhline* horizontal line across the axes**Notes**

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *y*, *xmin*, *xmax*, *colors*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

**Examples using `matplotlib.pyplot.hlines`****`matplotlib.pyplot.hot`**

```
matplotlib.pyplot.hot()
    Set the colormap to "hot".
```

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.hot`****`matplotlib.pyplot.hsv`**

```
matplotlib.pyplot.hsv()
    Set the colormap to "hsv".
```

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.hsv`****`matplotlib.pyplot.imread`**

```
matplotlib.pyplot.imread(fname, format=None)
    Read an image from a file into an array.
```

**Parameters**

**fname** [str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

**format** [str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

**Returns**

`numpy.array` The image data. The returned array has shape

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

**Examples using `matplotlib.pyplot.imread`**

- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_clip\_path.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_demo.py
- sphx\_glr\_gallery\_images\_contours\_and\_fields\_watermark\_image.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_demo\_annotation\_box.py
- sphx\_glr\_gallery\_text\_labels\_and\_annotations\_demo\_text\_path.py
- sphx\_glr\_gallery\_misc\_demo\_ribbon\_box.py

**`matplotlib.pyplot.imsave`**

`matplotlib.pyplot.imsave(fname, arr, **kwargs)`

Save an array as an image file.

**Parameters**

**fname** [str or path-like or file-like] A path or a file-like object to store the image in. If *format* is not set, then the output format is inferred from the extension of *fname*, if any, and from `rcParams["savefig.format"]` (default: 'png') otherwise. If *format* is set, it determines the output format.

**arr** [array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

**vmin, vmax** [float, optional] *vmin* and *vmax* set the color scaling for the image by fixing the values that map to the colormap color limits. If either *vmin* or *vmax* is None, that limit is determined from the *arr* min/max value.

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

**format** [str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

**origin** [{ 'upper', 'lower' }, default: `rcParams["image.origin"]` (default: 'upper')] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes.

**dpi** [float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

**metadata** [dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information.

**pil\_kwargs** [dict, optional] Keyword arguments passed to `PIL.Image.Image.save`. If the 'pnginfo' key is present, it completely overrides *metadata*, including the default 'Software' key.

### Examples using `matplotlib.pyplot.imsave`

#### `matplotlib.pyplot.imshow`

```
matplotlib.pyplot.imshow(X, cmap=None, norm=None, aspect=None, interpolation=None, alpha=None, vmin=None, vmax=None, origin=None, extent=None, *, filternorm=True, filterrad=4.0, resample=None, url=None, data=None, **kwargs)
```

Display data as an image, i.e., on a 2D regular raster.

The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image set up the color mapping using the parameters `cmap='gray'`, `vmin=0`, `vmax=255`.

The number of pixels used to render an image is set by the axes size and the *dpi* of the figure. This can lead to aliasing artifacts when the image is resampled because the displayed image size will usually not match the size of *X* (see [/gallery/images\\_contours\\_and\\_fields/image\\_antialiasing](#)). The resampling can be controlled via the *interpolation* parameter and/or `rcParams["image.interpolation"]` (default: 'antialiased').

#### Parameters

**X** [array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters *norm*, *cmap*, *vmin*, *vmax*.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] The *Colormap* instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data.

**norm** [*Normalize*, optional] The *Normalize* instance used to scale scalar data to the [0, 1] range before mapping to colors using *cmap*. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

**aspect** [{*'equal'*, *'auto'*} or float, default: `rcParams["image.aspect"]` (default: *'equal'*)] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling *Axes.set\_aspect*. See there for further details.

- *'equal'*: Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using *extent*).
- *'auto'*: The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.

**interpolation** [str, default: `rcParams["image.interpolation"]` (default: *'antialiased'*)] The interpolation method used.

Supported values are *'none'*, *'antialiased'*, *'nearest'*, *'bilinear'*, *'bicubic'*, *'spline16'*, *'spline36'*, *'hanning'*, *'hamming'*, *'hermite'*, *'kaiser'*, *'quadric'*, *'catrom'*, *'gaussian'*, *'bessel'*, *'mitchell'*, *'sinc'*, *'lanczos'*.

If *interpolation* is *'none'*, then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to *'nearest'*. Note that most SVG renderers perform interpolation at rendering and that the default interpolation method they implement may differ.

If *interpolation* is the default *'antialiased'*, then *'nearest'* interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller than 3, or the image is downsampled, then *'hanning'* interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See [/gallery/images\\_contours\\_and\\_fields/interpolation\\_methods](#) for an overview of the supported interpolation methods, and [/gallery/images\\_contours\\_and\\_fields/image\\_antialiasing](#) for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

**alpha** [float or array-like, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If *alpha* is an array, the alpha blending values are applied pixel by pixel, and *alpha* must have the same shape as *X*.

**vmin, vmax** [float, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is deprecated to use *vmin/vmax* when *norm* is given.

**origin** [{*'upper'*, *'lower'*}, default: `rcParams["image.origin"]` (default: *'upper'*)] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention (the default) *'upper'* is typically used for matrices and images.

Note that the vertical axes points upward for *'lower'* but downward for *'upper'*.

See the [origin and extent in imshow](#) tutorial for examples and a more detailed description.

**extent** [floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on *origin*:

- For *origin* == *'upper'* the default is (-0.5, numcols-0.5, numrows-0.5, -0.5).
- For *origin* == *'lower'* the default is (-0.5, numcols-0.5, -0.5, numrows-0.5).

See the [origin and extent in imshow](#) tutorial for examples and a more detailed description.

**filternorm** [bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If *filternorm* is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

**filterrad** [float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: *'sinc'*, *'lanczos'* or *'blackman'*.

**resample** [bool, default: `rcParams["image.resample"]` (default: True)] When *True*, use a full resampling method. When *False*, only resample when the output image is larger than the input image.

**url** [str, optional] Set the url of the created *AxesImage*. See *Artist.set\_url*.

## Returns

*AxesImage*

## Other Parameters

**\*\*kwargs** [*Artist* properties] These parameters are passed on to the constructor of the *AxesImage* artist.

**See also:**

*matshow* Plot a matrix or an array as an image.

**Notes**

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

*imshow* expects RGB images adopting the straight (unassociated) alpha representation.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception).

Objects passed as **data** must support item access (*data[s]*) and membership test (*s in data*).

---

**Examples using `matplotlib.pyplot.imshow`**

- sphx\_glr\_gallery\_misc\_hyperlinks\_sgskip.py

**`matplotlib.pyplot.inferno`**

`matplotlib.pyplot.inferno()`  
Set the colormap to "inferno".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.inferno`**

**`matplotlib.pyplot.install_repl_displayhook`**

`matplotlib.pyplot.install_repl_displayhook()`  
Install a repl display hook so that any stale figure are automatically redrawn when control is returned to the repl.

This works both with IPython and with vanilla python shells.

Examples using `matplotlib.pyplot.install_repl_displayhook`

### `matplotlib.pyplot.ioff`

`matplotlib.pyplot.ioff()`

Turn the interactive mode off.

#### **See also:**

`ion` enable interactive mode

`isinteractive` query current state

`show` show windows (and maybe block)

`pause` show windows, run GUI event loop, and block for a time

Examples using `matplotlib.pyplot.ioff`

- *Usage Guide*

### `matplotlib.pyplot.ion`

`matplotlib.pyplot.ion()`

Turn the interactive mode on.

#### **See also:**

`ioff` disable interactive mode

`isinteractive` query current state

`show` show windows (and maybe block)

`pause` show windows, run GUI event loop, and block for a time

Examples using `matplotlib.pyplot.ion`

- *Usage Guide*

### `matplotlib.pyplot.isinteractive`

`matplotlib.pyplot.isinteractive()`

Return if pyplot is in "interactive mode" or not.

If in interactive mode then:

- newly created figures will be shown immediately
- figures will automatically redraw on change
- `pyplot.show` will not block by default

If not in interactive mode then:

- newly created figures and changes to figures will not be reflected until explicitly asked to be
- `pyplot.show` will block by default

**See also:**

`ion` enable interactive mode

`ioff` disable interactive mode

`show` show windows (and maybe block)

`pause` show windows, run GUI event loop, and block for a time

**Examples using `matplotlib.pyplot.isinteractive`****`matplotlib.pyplot.jet`**

```
matplotlib.pyplot.jet()
Set the colormap to "jet".
```

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.jet`****`matplotlib.pyplot.legend`**

```
matplotlib.pyplot.legend(*args, **kwargs)
Place a legend on the axes.
```

Call signatures:

```
legend()
legend(labels)
legend(handles, labels)
```

The call signatures correspond to three different ways how to use this method.

**1. Automatic detection of elements to be shown in the legend**

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```
line, = ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Axes.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

## 2. Labeling existing plot elements

To make a legend for lines which already exist on the axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This way of using is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

## 3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```
legend((line1, line2, line3), ('label1', 'label2', 'label3'))
```

### Parameters

**handles** [sequence of *Artist*, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with *labels*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

**labels** [list of str, optional] A list of labels to show next to the artists. Use this together with *handles*, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

### Returns

*Legend*

### Other Parameters

**loc** [str or pair of floats, default: `rcParams["legend.loc"]` (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case *bbox\_to\_anchor* will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

Location String	Location Code
'best'	0
'upper right'	1
'upper left'	2
'lower left'	3
'lower right'	4
'right'	5
'center left'	6
'center right'	7
'lower center'	8
'upper center'	9
'center'	10

**bbox\_to\_anchor** [*BboxBase*, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*. Defaults to `axes.bbox` (if called as a method to *Axes.legend*) or `figure.bbox` (if *Figure.legend*). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by *bbox\_transform*, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or *BboxBase* is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by *loc* at x, y. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol** [int, default: 1] The number of columns that the legend has.

**prop** [None or *matplotlib.font\_manager.FontProperties* or dict] The font properties of the legend. If None (default), the current *matplotlib.rcParams* will be used.

**fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if *prop* is not specified.

**labelcolor** [str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker

using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints** [int, default: `rcParams["legend.numpoints"]` (default: 1)] The number of marker points in the legend when creating a legend entry for a *Line2D* (line).

**scatterpoints** [int, default: `rcParams["legend.scatterpoints"]` (default: 1)] The number of marker points in the legend when creating a legend entry for a *PathCollection* (scatter plot).

**scatteryoffsets** [iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale** [float, default: `rcParams["legend.markerscale"]` (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.

**markerfirst** [bool, default: True] If *True*, legend marker is placed to the left of the legend label. If *False*, legend marker is placed to the right of the legend label.

**frameon** [bool, default: `rcParams["legend.frameon"]` (default: True)] Whether the legend should be drawn on a patch (frame).

**fancybox** [bool, default: `rcParams["legend.fancybox"]` (default: True)] Whether round edges should be enabled around the *FancyBboxPatch* which makes up the legend's background.

**shadow** [bool, default: `rcParams["legend.shadow"]` (default: False)] Whether to draw a shadow behind the legend.

**framealpha** [float, default: `rcParams["legend.framealpha"]` (default: 0.8)] The alpha transparency of the legend's background. If *shadow* is activated and *framealpha* is None, the default value is ignored.

**facecolor** ["inherit" or color, default: `rcParams["legend.facecolor"]` (default: 'inherit')] The legend's background color. If "inherit", use `rcParams["axes.facecolor"]` (default: 'white').

**edgecolor** ["inherit" or color, default: `rcParams["legend.edgecolor"]` (default: '0.8')] The legend's background patch edge color. If "inherit", use take `rcParams["axes.edgecolor"]` (default: 'black').

**mode** [{"expand", None}] If *mode* is set to "expand" the legend will be horizontally expanded to fill the axes area (or *bbox\_to\_anchor* if defines the legend's size).

**bbox\_transform** [None or *matplotlib.transforms.Transform*] The transform for the bounding box (*bbox\_to\_anchor*). For a value of None (default) the Axes' *transAxes* transform will be used.

**title** [str or None] The legend's title. Default is no title (None).

**title\_fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: `rcParams["legend.title_fontsize"]` (default: None)] The font size of the legend's title.

**borderpad** [float, default: `rcParams["legend.borderpad"]` (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

- labelspacing** [float, default: `rcParams["legend.labelspacing"]` (default: 0.5)] The vertical space between the legend entries, in font-size units.
- handlelength** [float, default: `rcParams["legend.handlelength"]` (default: 2.0)] The length of the legend handles, in font-size units.
- handletextpad** [float, default: `rcParams["legend.handletextpad"]` (default: 0.8)] The pad between the legend handle and text, in font-size units.
- borderaxespad** [float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)] The pad between the axes and legend border, in font-size units.
- columnspacing** [float, default: `rcParams["legend.columnspacing"]` (default: 2.0)] The spacing between columns, in font-size units.
- handler\_map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler\_map* updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

### Notes

Some artists are not supported by this function. See [Legend guide](#) for details.

### Examples

Examples using `matplotlib.pyplot.legend`

- `sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py`
- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

### `matplotlib.pyplot.locator_params`

`matplotlib.pyplot.locator_params(axis='both', tight=None, **kwargs)`

Control behavior of major tick locators.

Because the locator is involved in autoscaling, *autoscale\_view* is called automatically after the parameters are changed.

#### Parameters

- axis** [{`'both'`, `'x'`, `'y'`}, default: `'both'`] The axis on which to operate.
- tight** [bool or None, optional] Parameter passed to *autoscale\_view*. Default is None, for no change.

#### Other Parameters

- \*\*kwargs** Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example *set\_params* for the *ticker*. *MaxNLocator* used by default for linear axes.

### Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```
ax.locator_params(tight=True, nbins=4)
```

### Examples using `matplotlib.pyplot.locator_params`

#### `matplotlib.pyplot.loglog`

`matplotlib.pyplot.loglog(*args, **kwargs)`

Make a plot with log scaling on both the x and y axis.

Call signatures:

```
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes both the x-axis and the y-axis to log scaling. All of the concepts and parameters of `plot` can be used here as well.

The additional parameters `base`, `subs` and `nonpositive` control the x/y-axis properties. They are just forwarded to `Axes.set_xscale` and `Axes.set_yscale`. To use differ-

ent properties on the x-axis and the y-axis, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2)`.

### Parameters

**base** [float, default: 10] Base of the logarithm.

**subs** [sequence, optional] The location of the minor ticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See [Axes.set\\_xscale/Axes.set\\_yscale](#) for details.

**nonpositive** [{‘mask’, ‘clip’}, default: ‘mask’] Non-positive values can be masked as invalid, or clipped to a very small positive number.

### Returns

**lines** A list of [Line2D](#) objects representing the plotted data.

### Other Parameters

**\*\*kwargs** All parameters supported by [plot](#).

Examples using `matplotlib.pyplot.loglog`

- [Sample plots in Matplotlib](#)

`matplotlib.pyplot.magma`

`matplotlib.pyplot.magma()`  
Set the colormap to “magma”.

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.magma`

`matplotlib.pyplot.magnitude_spectrum`

`matplotlib.pyplot.magnitude_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, scale=None, *, data=None, **kwargs)`

Plot the magnitude spectrum.

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

### Parameters

**x** [1-D array or sequence] Array or sequence containing the data.

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: [window\\_hanning](#)] A function or a vector of length *NFFT*. To create window vectors see [window\\_hanning](#),

`window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to `fft()`. The default is `None`, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

**scale** [{‘default’, ‘linear’, ‘dB’}] The scaling of the values in the *spec*. ‘linear’ is no scaling. ‘dB’ returns the values in dB scale, i.e., the dB amplitude ( $20 * \log_{10}$ ). ‘default’ is ‘linear’.

**Fc** [int, default: 0] The center frequency of  $x$ , which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

## Returns

**spectrum** [1-D array] The values for the magnitude spectrum before scaling (real valued).

**freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*.

**line** [*Line2D*] The line created by this function.

## Other Parameters

**\*\*kwargs** Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{‘butt’, ‘round’, ‘projecting’}
<i>dash_joinstyle</i>	{‘miter’, ‘round’, ‘bevel’}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{‘default’, ‘steps’, ‘steps-pre’, ‘steps-mid’, ‘steps-post’}, default: ‘default’
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{‘full’, ‘left’, ‘right’, ‘bottom’, ‘top’, ‘none’}

Table 200 – continued from previous page

Property	Description
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '---', '-.-', ':', ' ', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgewidth</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[bo
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{ 'butt', 'round', 'projecting' }
<i>solid_joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

**See also:**

*psd* Plots the power spectral density.

*angle\_spectrum* Plots the angles of the corresponding frequencies.

*phase\_spectrum* Plots the phase (unwrapped angle) of the corresponding frequencies.

*specgram* Can plot the magnitude spectrum of segments within the signal in a colormap.

**Notes**

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.magnitude_spectrum`

### matplotlib.pyplot.margins

`matplotlib.pyplot.margins(*margins, x=None, y=None, tight=True)`

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the *margin* times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a `TypeError`. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if *xmargin* is not `None`, then *xmargin* times the X data interval will be added to each end of that interval before it is used in autoscaling.

#### Parameters

**\*margins** [float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as *xmargin*, *ymargin*. If setting the margin on a single axis is desired, use the keyword arguments described below.

**x, y** [float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

**tight** [bool or None, default: `True`] The *tight* parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is `True`, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Set *tight* to `None` will preserve the previous setting.

#### Returns

**xmargin, ymargin** [float]

#### Notes

If a previously used Axes method such as `pcolor()` has set `use_sticky_edges` to `True`, only the limits not set by the "sticky artists" will be modified. To force all of the margins to be set, set `use_sticky_edges` to `False` before calling `margins()`.

#### Examples using matplotlib.pyplot.margins

- `sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py`
- `sphx_glr_gallery_ticks_and_spines_ticklabels_rotation.py`

### matplotlib.pyplot.matshow

`matplotlib.pyplot.matshow(A, fignum=None, **kwargs)`

Display an array as a matrix in a new figure window.

The origin is set at the upper left hand corner and rows (first dimension of the array) are displayed horizontally. The aspect ratio of the figure window is that of the array, unless this would make an excessively short or narrow figure.

Tick labels for the xaxis are placed on top.

### Parameters

**A** [array-like(M, N)] The matrix to be displayed.

**fignum** [None or int or False] If *None*, create a new figure window with automatic numbering.

If a nonzero integer, draw into the figure with the given number (create it if it does not exist).

If 0, use the current axes (or create one if it does not exist).

---

**Note:** Because of how `Axes.imshow` tries to set the figure aspect ratio to be the one of the array, strange things may happen if you reuse an existing figure.

---

### Returns

`AxesImage`

### Other Parameters

**\*\*kwargs** [`imshow` arguments]

#### Examples using `matplotlib.pyplot.imshow`

- `sphx_glr_gallery_images_contours_and_fields_matshow.py`

#### `matplotlib.pyplot.minorticks_off`

```
matplotlib.pyplot.minorticks_off()
```

Remove minor ticks from the axes.

#### Examples using `matplotlib.pyplot.minorticks_off`

#### `matplotlib.pyplot.minorticks_on`

```
matplotlib.pyplot.minorticks_on()
```

Display minor ticks on the axes.

Displaying minor ticks may reduce performance; you may turn them off using `minorticks_off()` if drawing speed is a problem.

Examples using `matplotlib.pyplot.minorticks_on`

**`matplotlib.pyplot.new_figure_manager`**

`matplotlib.pyplot.new_figure_manager(num, *args, **kwargs)`  
Create a new figure manager instance.

Examples using `matplotlib.pyplot.new_figure_manager`

**`matplotlib.pyplot.nipy_spectral`**

`matplotlib.pyplot.nipy_spectral()`  
Set the colormap to "nipy\_spectral".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.nipy_spectral`

**`matplotlib.pyplot.pause`**

`matplotlib.pyplot.pause(interval)`  
Run the GUI event loop for *interval* seconds.

If there is an active figure, it will be updated and displayed before the pause, and the GUI event loop (if any) will run during the pause.

This can be used for crude animation. For more complex animation use `matplotlib.animation`.

If there is no active figure, sleep for *interval* seconds instead.

**See also:**

`matplotlib.animation` Complex animation  
`show` show figures and optional block forever

Examples using `matplotlib.pyplot.pause`

- `sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py`
- `sphx_glr_gallery_mplot3d_wire3d_animation_sgskip.py`

**`matplotlib.pyplot.pcolor`**

`matplotlib.pyplot.pcolor(*args, shading=None, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)`

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y,] C, **kwargs)
```

$X$  and  $Y$  can be used to specify the corners of the quadrilaterals.

**Hint:** `pcolor()` can be very slow for large arrays. In most cases you should use the similar but much faster `pcolormesh` instead. See [Differences between `pcolor\(\)` and `pcolormesh\(\)`](#) for a discussion of the differences.

### Parameters

**C** [array-like] A scalar 2-D array. The values will be color-mapped.

**X, Y** [array-like, optional] The coordinates of the corners of quadrilaterals of a `pcolormesh`:

```
(X[i+1, j], Y[i+1, j])      (X[i+1, j+1], Y[i+1, j+1])
      +-----+
      |         |
      +-----+
(X[i, j], Y[i, j])          (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the [Notes](#) section below.

If `shading='flat'` the dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ , and the quadrilateral is colored due to the value at  $C[i, j]$ . If  $X$ ,  $Y$  and  $C$  have equal dimensions, a warning will be raised and the last row and column of  $C$  will be ignored.

If `shading='nearest'`, the dimensions of  $X$  and  $Y$  should be the same as those of  $C$  (if not, a `ValueError` will be raised). The color  $C[i, j]$  will be centered on  $(X[i, j], Y[i, j])$ .

If  $X$  and/or  $Y$  are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

**shading** [{'flat', 'nearest', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: 'flat'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad  $(i, j)$ ,  $(i+1, j)$ ,  $(i, j+1)$ ,  $(i+1, j+1)$  is given by  $C[i, j]$ . The dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ ; if they are the same as  $C$ , then a deprecation warning is raised, and the last row and column of  $C$  are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of  $X$  and  $Y$  must be the same as  $C$ .
- 'auto': Choose 'flat' if dimensions of  $X$  and  $Y$  are one larger than  $C$ . Choose 'nearest' if dimensions are the same.

See [/gallery/images\\_contours\\_and\\_fields/pcolormesh\\_grids](#) for more description.

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] A *Colormap* instance or registered colormap name. The colormap maps the *C* values to colors.

**norm** [*Normalize*, optional] The *Normalize* instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax** [float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of *C* in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

**edgecolors** [{ 'none', None, 'face', color, color sequence }, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.
- *None*: `rcParams["patch.edgecolor"]` (default: 'black') will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: False) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

**alpha** [float, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edgecolor is currently not affected by this.

**snap** [bool, default: False] Whether to snap the mesh to pixel boundaries.

## Returns

`matplotlib.collections.Collection`

## Other Parameters

**antialiaseds** [bool, default: False] The default *antialiaseds* is False if the default *edgecolors*="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If *edgecolors* is not "none", then the default *antialiaseds* is taken from `rcParams["patch.antialiased"]` (default: True). Stroking the edges may be preferred if *alpha* is 1, but will cause artifacts otherwise.

**\*\*kwargs** Additionally, the following arguments are allowed. They are passed along to the *PolyCollection* constructor:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{ 'butt', 'round', 'projecting' }
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>

Table 201 – continued from previous page

Property	Description
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>cmap</code>	<a href="#">Colormap</a> or str or None
<code>color</code>	color or list of rgba tuples
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code> or <code>edgecolors</code>	color or list of colors or 'face'
<code>facecolor</code> or <code>facecolors</code> or <code>fc</code>	color or list of colors
<code>figure</code>	<a href="#">Figure</a>
<code>gid</code>	str
<code>hatch</code>	{ '/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*' }
<code>in_layout</code>	bool
<code>joinstyle</code>	{ 'miter', 'round', 'bevel' }
<code>label</code>	object
<code>linestyle</code> or <code>dashes</code> or <code>linestyles</code> or <code>ls</code>	str or tuple or list thereof
<code>linewidth</code> or <code>linewidths</code> or <code>lw</code>	float or list of floats
<code>norm</code>	<a href="#">Normalize</a> or None
<code>offset_position</code>	unknown

<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

**See also:**

[pcolormesh](#) for an explanation of the differences between `pcolor` and `pcolormesh`.

[imshow](#) If *X* and *Y* are each equidistant, [imshow](#) can be a faster alternative.

**Notes****Masked arrays**

*X*, *Y* and *C* may be masked arrays. If either `C[i, j]`, or one of the vertices surrounding `C[i, j]` (*X* or *Y* at `[i, j]`, `[i+1, j]`, `[i, j+1]`, `[i+1, j+1]`) is masked, nothing is plotted.

**Grid orientation**

The grid orientation follows the standard matrix convention: An array *C* with shape (nrows, ncolumns) is plotted with the column number as *X* and the row number as *Y*.

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

#### Examples using `matplotlib.pyplot.pcolor`

- `sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py`
- `sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py`

#### `matplotlib.pyplot.pcolormesh`

```
matplotlib.pyplot.pcolormesh(*args, alpha=None, norm=None, cmap=None,
                             vmin=None, vmax=None, shading=None, anti-
                             aliased=False, data=None, **kwargs)
```

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolormesh([X, Y], C, **kwargs)
```

`X` and `Y` can be used to specify the corners of the quadrilaterals.

---

**Hint:** `pcolormesh` is similar to `pcolor`. It is much faster and preferred in most cases. For a detailed discussion on the differences see [Differences between `pcolor\(\)` and `pcolormesh\(\)`](#).

---

#### Parameters

**C** [array-like] A scalar 2-D array. The values will be color-mapped.

**X, Y** [array-like, optional] The coordinates of the corners of quadrilaterals of a `pcolormesh`:

```
(X[i+1, j], Y[i+1, j])      (X[i+1, j+1], Y[i+1, j+1])
                        +-----+
                        |       |
                        +-----+
(X[i, j], Y[i, j])        (X[i, j+1], Y[i, j+1])
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the [Notes](#) section below.

If `shading='flat'` the dimensions of `X` and `Y` should be one greater than those of `C`, and the quadrilateral is colored due to the value at `C[i, j]`. If `X`, `Y` and `C` have equal dimensions, a warning will be raised and the last row and column of `C` will be ignored.

If `shading='nearest'` or `'gouraud'`, the dimensions of `X` and `Y` should be the same as those of `C` (if not, a `ValueError` will be raised). For `'nearest'` the color `C[i, j]` is centered on `(X[i, j], Y[i, j])`. For `'gouraud'`, a smooth interpolation is carried out between the quadrilateral corners.

If  $X$  and/or  $Y$  are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] A *Colormap* instance or registered colormap name. The colormap maps the  $C$  values to colors.

**norm** [*Normalize*, optional] The *Normalize* instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax** [float, default: None] The colorbar range. If *None*, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of  $C$  in case of the default linear scaling). It is deprecated to use *vmin/vmax* when *norm* is given.

**edgecolors** [{ 'none', None, 'face', color, color sequence }, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or "": No edge.
- *None*: `rcParams["patch.edgecolor"]` (default: 'black') will be used. Note that currently `rcParams["patch.force_edgecolor"]` (default: False) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form *edgecolor* works as an alias.

**alpha** [float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

**shading** [{ 'flat', 'nearest', 'gouraud', 'auto' }, optional] The fill style for the quadrilateral; defaults to 'flat' or `rcParams["pcolor.shading"]` (default: 'flat'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad ( $i, j$ ), ( $i+1, j$ ), ( $i, j+1$ ), ( $i+1, j+1$ ) is given by  $C[i, j]$ . The dimensions of  $X$  and  $Y$  should be one greater than those of  $C$ ; if they are the same as  $C$ , then a deprecation warning is raised, and the last row and column of  $C$  are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of  $X$  and  $Y$  must be the same as  $C$ .
- 'gouraud': Each quad will be Gouraud shaded: The color of the corners ( $i, j$ ) are given by  $C[i, j]$ . The color values of the area in between is interpolated from the corner values. The dimensions of  $X$  and  $Y$  must be the same as  $C$ . When Gouraud shading is used, *edgecolors* is ignored.
- 'auto': Choose 'flat' if dimensions of  $X$  and  $Y$  are one larger than  $C$ . Choose 'nearest' if dimensions are the same.

See `/gallery/images_contours_and_fields/pcolormesh_grids` for more description.

**snap** [bool, default: False] Whether to snap the mesh to pixel boundaries.

**Returns**`matplotlib.collections.QuadMesh`**Other Parameters**

**\*\*kwargs** Additionally, the following arguments are allowed. They are passed along to the `QuadMesh` constructor:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code> or <code>antialiaseds</code>	bool or list of bools
<code>array</code>	ndarray
<code>capstyle</code>	{'butt', 'round', 'projecting'}
<code>clim</code>	(vmin: float, vmax: float)
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>cmap</code>	<code>Colormap</code> or str or None
<code>color</code>	color or list of rgba tuples
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code> or <code>edgecolors</code>	color or list of colors or 'face'
<code>facecolor</code> or <code>facecolors</code> or <code>fc</code>	color or list of colors
<code>figure</code>	<code>Figure</code>
<code>gid</code>	str
<code>hatch</code>	{'/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	{'miter', 'round', 'bevel'}
<code>label</code>	object
<code>linestyle</code> or <code>dashes</code> or <code>linestyles</code> or <code>ls</code>	str or tuple or list thereof
<code>linewidth</code> or <code>linewidths</code> or <code>lw</code>	float or list of floats
<code>norm</code>	<code>Normalize</code> or None
<code>offset_position</code>	unknown
<code>offsets</code>	array-like (N, 2) or (2,)
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or callable
<code>pickradius</code>	unknown
<code>rasterized</code>	bool or None
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

**See also:**

`pcolor` An alternative implementation with slightly different features. For a detailed discussion on the differences see *Differences between `pcolor()` and `pcolormesh()`*.

`imshow` If X and Y are each equidistant, `imshow` can be a faster alternative.

## Notes

### Masked arrays

$C$  may be a masked array. If  $C[i, j]$  is masked, the corresponding quadrilateral will be transparent. Masking of  $X$  and  $Y$  is not supported. Use `pcolor` if you need this functionality.

### Grid orientation

The grid orientation follows the standard matrix convention: An array  $C$  with shape (nrows, ncolumns) is plotted with the column number as  $X$  and the row number as  $Y$ .

### Differences between `pcolor()` and `pcolormesh()`

Both methods are used to create a pseudocolor plot of a 2-D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While `pcolor` returns a `PolyCollection`, `pcolormesh` returns a `QuadMesh`. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both `pcolor` and `pcolormesh` support masked arrays for  $C$ . However, only `pcolor` supports masked arrays for  $X$  and  $Y$ . The reason lies in the internal handling of the masked values. `pcolor` leaves out the respective polygons from the `PolyCollection`. `pcolormesh` sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a `QuadMesh`, the edge between two adjacent masked quadrilaterals in `pcolor` is not drawn as the corresponding polygons do not exist in the `PolyCollection`.

Another difference is the support of Gouraud shading in `pcolormesh`, which is not available with `pcolor`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

### Examples using `matplotlib.pyplot.pcolormesh`

- `sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_pcolormesh_grids.py`
- `sphx_glr_gallery_images_contours_and_fields_pcolormesh_levels.py`
- `sphx_glr_gallery_images_contours_and_fields_quadmesh_demo.py`
- *Sample plots in Matplotlib*

### `matplotlib.pyplot.phase_spectrum`

```
matplotlib.pyplot.phase_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None,
                                sides=None, *, data=None, **kwargs)
```

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of  $x$ . Data is padded to a length of *pad\_to* and the windowing function *window* is applied to the signal.

### Parameters

- x** [1-D array or sequence] Array or sequence containing the data
- Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.
- window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- sides** [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to the length of the input signal (i.e. no padding).
- Fc** [int, default: 0] The center frequency of  $x$ , which offsets the  $x$  extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

### Returns

- spectrum** [1-D array] The values for the phase spectrum in radians (real valued).
- freqs** [1-D array] The frequencies corresponding to the elements in *spectrum*.
- line** [*Line2D*] The line created by this function.

### Other Parameters

**\*\*kwargs** Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown

Table 203 – continued from previous page

Property	Description
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgecolor</i> or <i>mec</i>	color
<i>markeredgewidth</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[bo
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

**See also:**

*magnitude\_spectrum* Plots the magnitudes of the corresponding frequencies.

*angle\_spectrum* Plots the wrapped version of this function.

*specgram* Can plot the phase spectrum of segments within the signal in a colormap.

**Notes**

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*.

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in

data).

---

### Examples using `matplotlib.pyplot.phase_spectrum`

#### `matplotlib.pyplot.pie`

```
matplotlib.pyplot.pie(x, explode=None, labels=None, colors=None, autopct=None,
                      pctdistance=0.6, shadow=False, labeldistance=1.1, startangle=0, radius=1, counterclock=True, wedgeprops=None,
                      textprops=None, center=(0, 0), frame=False, rotatelabels=False, *, normalize=None, data=None)
```

Plot a pie chart.

Make a pie chart of array `x`. The fractional area of each wedge is given by `x/sum(x)`. If `sum(x) < 1`, then the values of `x` give the fractional area directly and the array will not be normalized. The resulting pie will have an empty wedge of size `1 - sum(x)`.

The wedges are plotted counterclockwise, by default starting from the x-axis.

#### Parameters

**x** [1D array-like] The wedge sizes.

**explode** [array-like, default: *None*] If not *None*, is a `len(x)` array which specifies the fraction of the radius with which to offset each wedge.

**labels** [list, default: *None*] A sequence of strings providing the labels for each wedge

**colors** [array-like, default: *None*] A sequence of colors through which the pie chart will cycle. If *None*, will use the colors in the currently active cycle.

**autopct** [*None* or str or callable, default: *None*] If not *None*, is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If it is a format string, the label will be `fmt % pct`. If it is a function, it will be called.

**pctdistance** [float, default: 0.6] The ratio between the center of each pie slice and the start of the text generated by *autopct*. Ignored if *autopct* is *None*.

**shadow** [bool, default: *False*] Draw a shadow beneath the pie.

**normalize: *None* or bool, default: *None*** When *True*, always make a full pie by normalizing `x` so that `sum(x) == 1`. *False* makes a partial pie if `sum(x) <= 1` and raises a `ValueError` for `sum(x) > 1`.

When *None*, defaults to *True* if `sum(x) >= 1` and *False* if `sum(x) < 1`.

Please note that the previous default value of *None* is now deprecated, and the default will change to *True* in the next release. Please pass `normalize=False` explicitly if you want to draw a partial pie.

**labeldistance** [float or *None*, default: 1.1] The radial distance at which the pie labels are drawn. If set to *None*, labels are not drawn, but are stored for use in `legend()`

**startangle** [float, default: 0 degrees] The angle by which the start of the pie is rotated, counterclockwise from the x-axis.

**radius** [float, default: 1] The radius of the pie.

**counterclock** [bool, default: True] Specify fractions direction, clockwise or counterclockwise.

**wedgeprops** [dict, default: None] Dict of arguments passed to the wedge objects making the pie. For example, you can pass in `wedgeprops = {'linewidth': 3}` to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default `clip_on=False`.

**textprops** [dict, default: None] Dict of arguments to pass to the text objects.

**center** [(float, float), default: (0, 0)] The coordinates of the center of the chart.

**frame** [bool, default: False] Plot axes frame with the chart if true.

**rotatelabels** [bool, default: False] Rotate each label to the angle of the corresponding slice if true.

### Returns

**patches** [list] A sequence of `matplotlib.patches.Wedge` instances

**texts** [list] A list of the label `Text` instances.

**autotexts** [list] A list of `Text` instances for the numeric labels. This will only be returned if the parameter `autopct` is not `None`.

### Notes

The pie chart will probably look best if the figure and axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to "equal". The axes aspect ratio can be controlled with `Axes.set_aspect`.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `explode`, `labels`, `colors`.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

### Examples using `matplotlib.pyplot.pie`

- `sphx_glr_gallery_pie_and_polar_charts_pie_demo2.py`
- `sphx_glr_gallery_pie_and_polar_charts_nested_pie.py`
- `sphx_glr_gallery_pie_and_polar_charts_pie_and_donut_labels.py`

- *Sample plots in Matplotlib*

### matplotlib.pyplot.pink

```
matplotlib.pyplot.pink()
```

Set the colormap to "pink".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

### Examples using matplotlib.pyplot.pink

### matplotlib.pyplot.plasma

```
matplotlib.pyplot.plasma()
```

Set the colormap to "plasma".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

### Examples using matplotlib.pyplot.plasma

### matplotlib.pyplot.plot

```
matplotlib.pyplot.plot(*args, scalex=True, scaley=True, data=None, **kwargs)
```

Plot y versus x as lines and/or markers.

Call signatures:

```
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by *x*, *y*.

The optional parameter *fmt* is a convenient way for defining basic formatting like color, marker and linestyle. It's a shortcut string notation described in the *Notes* section below.

```
>>> plot(x, y)           # plot x and y using default line style and color
>>> plot(x, y, 'bo')     # plot x and y using blue circle markers
>>> plot(y)              # plot y using x as index array 0..N-1
>>> plot(y, 'r+')        # ditto, but with red plusses
```

You can use *Line2D* properties as keyword arguments for more control on the appearance. Line properties and *fmt* can be mixed. The following two calls yield identical results:

```
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',
...      linewidth=2, markersize=12)
```

When conflicting with *fmt*, keyword arguments take precedence.

### Plotting labelled data

There's a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index `obj['y']`). Instead of giving the data in `x` and `y`, you can provide the object in the `data` parameter and just give the labels for `x` and `y`:

```
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a `dict`, a `pandas.DataFrame` or a structured numpy array.

### Plotting multiple sets of data

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call `plot` multiple times. Example:

```
>>> plot(x1, y1, 'bo')
>>> plot(x2, y2, 'go')
```

- Alternatively, if your data is already a 2d array, you can pass it directly to `x`, `y`. A separate data set will be drawn for every column.

Example: an array `a` where the first column represents the `x` values and the other columns are the `y` columns:

```
>>> plot(a[0], a[1:])
```

- The third way is to specify multiple sets of `[x]`, `y`, `[fmt]` groups:

```
>>> plot(x1, y1, 'g^', x2, y2, 'g-')
```

In this case, any additional keyword argument applies to all datasets. Also this syntax cannot be combined with the `data` parameter.

By default, each line is assigned a different style specified by a 'style cycle'. The `fmt` and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

### Parameters

**x, y** [array-like or scalar] The horizontal / vertical coordinates of the data points. `x` values are optional and default to `range(len(y))`.

Commonly, these parameters are 1D arrays.

They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

These arguments cannot be passed as keywords.

**fmt** [str, optional] A format string, e.g. 'ro' for red circles. See the *Notes* section for a full description of the format strings.

Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

**data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in `x` and `y`.

---

**Note:** Technically there's a slight ambiguity in calls where the second label is a valid *fmt*. `plot('n', 'o', data=obj)` could be `plt(x, y)` or `plt(y, fmt)`. In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string `plot('n', 'o', '', data=obj)`.

---

## Returns

**list of [Line2D](#)** A list of lines representing the plotted data.

## Other Parameters

**scalex, scaley** [bool, default: True] These parameters determine if the view limits are adapted to the data limits. The values are passed on to `autoscale_view`.

**\*\*kwargs** [[Line2D](#) properties, optional] *kwargs* are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

```
>>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1', linewidth=2)
>>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')
```

If you make multiple lines with one plot call, the *kwargs* apply to all those lines.

Here is a list of available [Line2D](#) properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<a href="#">Bbox</a>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<a href="#">Figure</a>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '-', '-.', ':', "", (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <a href="#">Path</a> or <a href="#">MarkerStyle</a>
<i>markeredgewidth</i> or <i>mec</i>	color
<i>markeredgewidth</i> or <i>mew</i>	float

Table 204 – continued from previous page

Property	Description
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[b]
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

**See also:**

*scatter* XY scatter plot with markers of varying size and/or color ( sometimes also called bubble chart).

**Notes****Format Strings**

A format string consists of a part for color, marker and line:

```
fmt = '[marker] [line] [color]'
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If line is given, but no marker, the data will be a line without markers.

Other combinations such as [color] [marker] [line] are also supported, but note that their parsing may be ambiguous.

**Markers**

character	description
'.'	point marker
','	pixel marker
'o'	circle marker
'v'	triangle_down marker
'^'	triangle_up marker
'<'	triangle_left marker
'>'	triangle_right marker
'1'	tri_down marker
'2'	tri_up marker
'3'	tri_left marker
'4'	tri_right marker
's'	square marker
'p'	pentagon marker
'*'	star marker
'h'	hexagon1 marker
'H'	hexagon2 marker
'+'	plus marker
'x'	x marker
'D'	diamond marker
'd'	thin_diamond marker
' '	vline marker
'_'	hline marker

## Line Styles

character	description
'-'	solid line style
'--'	dashed line style
'-.'	dash-dot line style
':'	dotted line style

Example format strings:

```
'b'      # blue markers with default shape
'or'     # red circles
'-g'     # green solid line
'--'     # dashed line with default color
'^k:'    # black triangle_up markers connected by a dotted line
```

## Colors

The supported color abbreviations are the single letter codes

character	color
'b'	blue
'g'	green
'r'	red
'c'	cyan
'm'	magenta
'y'	yellow
'k'	black
'w'	white

and the 'CN' colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any *matplotlib.colors* spec, e.g. full names ('green') or hex strings ('#008000').

#### Examples using `matplotlib.pyplot.plot`

- *Frame grabbing*
- `sphx_glr_gallery_misc_print_stdout_sgskip.py`
- `sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py`
- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

#### `matplotlib.pyplot.plot_date`

`matplotlib.pyplot.plot_date(x, y, fmt='o', tz=None, xdate=True, ydate=False, *, data=None, **kwargs)`

Plot data that contains dates.

Similar to `plot`, this plots *y* vs. *x* as lines or markers. However, the axis labels are formatted as dates depending on *xdate* and *ydate*.

##### Parameters

**x, y** [array-like] The coordinates of the data points. If *xdate* or *ydate* is *True*, the respective values *x* or *y* are interpreted as *Matplotlib dates*.

**fmt** [str, optional] The plot format string. For details, see the corresponding parameter in `plot`.

**tz** [timezone string or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: 'UTC')] The time zone to use in labeling dates.

**xdate** [bool, default: *True*] If *True*, the *x*-axis will be interpreted as Matplotlib dates.

**ydate** [bool, default: *False*] If *True*, the *y*-axis will be interpreted as Matplotlib dates.

##### Returns

**lines** A list of *Line2D* objects representing the plotted data.

##### Other Parameters

**\*\*kwargs** Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None

**See also:**

`matplotlib.dates` Helper functions on dates.

`matplotlib.dates.date2num` Convert dates to num.

`matplotlib.dates.num2date` Convert num to dates.

`matplotlib.dates.drange` Create an equally spaced sequence of dates.

**Notes**

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to `plot_date`. `plot_date` will set the default tick locator to `AutoDateLocator` (if the tick locator is not already set to a `DateLocator` instance) and the

default tick formatter to *AutoDateFormatter* (if the tick formatter is not already set to a *DateFormatter* instance).

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

#### Examples using `matplotlib.pyplot.plot_date`

- `sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py`

#### `matplotlib.pyplot.polar`

`matplotlib.pyplot.polar(*args, **kwargs)`

Make a polar plot.

call signature:

```
polar(theta, r, **kwargs)
```

Multiple *theta*, *r* arguments are supported, with format strings, as in *plot*.

#### Examples using `matplotlib.pyplot.polar`

- `sphx_glr_gallery_misc_transoffset.py`
- *Sample plots in Matplotlib*

#### `matplotlib.pyplot.prism`

`matplotlib.pyplot.prism()`

Set the colormap to "prism".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

#### Examples using `matplotlib.pyplot.prism`

#### `matplotlib.pyplot.psd`

`matplotlib.pyplot.psd(x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)`

Plot the power spectral density.

The power spectral density  $P_{xx}$  by Welch's average periodogram method. The vector  $x$  is divided into  $NFFT$  length segments. Each segment is detrended by function *detrend* and windowed by function *window*. *noverlap* gives the length of the overlap between segments. The  $|fft(i)|^2$  of each segment  $i$  are averaged to compute  $P_{xx}$ , with a scaling to correct for power loss due to windowing.

If  $\text{len}(x) < NFFT$ , it will be zero padded to  $NFFT$ .

### Parameters

- x** [1-D array or sequence] Array or sequence containing the data
- Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.
- window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length  $NFFT$ . To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- sides** [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.
- pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from  $NFFT$ , which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the  $n$  parameter in the call to *fft()*. The default is None, which sets *pad\_to* equal to  $NFFT$
- NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.
- detrend** [{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before *fft*-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend\_none*, *detrend\_mean*, and *detrend\_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend\_none*. 'mean' calls *detrend\_mean*. 'linear' calls *detrend\_linear*.
- scale\_by\_freq** [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.
- noverlap** [int, default: 0 (no overlap)] The number of points of overlap between segments.
- Fc** [int, default: 0] The center frequency of  $x$ , which offsets the  $x$  extents of the plot to reflect the frequency range used when a signal is acquired

and then filtered and downsampled to baseband.

**return\_line** [bool, default: False] Whether to include the line object plotted in the returned values.

### Returns

**Pxx** [1-D array] The values for the power spectrum  $P_{xx}$  before scaling (real valued).

**freqs** [1-D array] The frequencies corresponding to the elements in  $P_{xx}$ .

**line** [*Line2D*] The line created by this function. Only returned if *return\_line* is True.

### Other Parameters

**\*\*kwargs** Keyword arguments control the *Line2D* properties:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgecolor</i> or <i>mec</i>	color
<i>markeredgewidth</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[float]
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}

Table 206 – continued from previous page

Property	Description
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

**See also:**

*specgram* Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

*magnitude\_spectrum* Plots the magnitude spectrum.

*csd* Plots the spectral density between two signals.

**Notes**

For plotting, the power is plotted as  $10 \log_{10}(P_{xx})$  for decibels, though  $P_{xx}$  itself is returned.

**References**

Bendat & Piersol – Random Data: Analysis and Measurement Procedures, John Wiley & Sons (1986)

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

**Examples using `matplotlib.pyplot.psd`**

- `sphx_glr_gallery_lines_bars_and_markers_psd_demo.py`

**`matplotlib.pyplot.quiver`**

`matplotlib.pyplot.quiver(*args, data=None, **kw)`

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

$X$ ,  $Y$  define the arrow locations,  $U$ ,  $V$  define the arrow directions, and  $C$  optionally sets the color.

### Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale\_units* parameters.

### Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave *minshaft* alone.

### Arrow outline

*linewidths* and *edgecolors* can be used to customize the arrow outlines.

### Parameters

**X, Y** [1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of  $U$  and  $V$ .

If  $X$  and  $Y$  are 1D but  $U$ ,  $V$  are 2D,  $X$ ,  $Y$  are expanded to 2D using  $X$ ,  $Y = \text{np.meshgrid}(X, Y)$ . In this case  $\text{len}(X)$  and  $\text{len}(Y)$  must match the column and row dimensions of  $U$  and  $V$ .

**U, V** [1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations.  $U$  and  $V$  may be masked. Only locations unmasked in  $U$ ,  $V$ , and  $C$  will be drawn.

**C** [1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of  $C$  must match the number of arrow locations.

**units** [{*'width'*, *'height'*, *'dots'*, *'inches'*, *'x'*, *'y'*, *'xy'*}, default: *'width'*] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- *'width'*, *'height'*: The width or height of the axis.
- *'dots'*, *'inches'*: Pixels or inches based on the figure dpi.
- *'x'*, *'y'*, *'xy'*:  $X$ ,  $Y$  or  $\sqrt{X^2 + Y^2}$  in data units.

The arrows scale differently depending on the units. For *'x'* or *'y'*, the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For *'width'* or *'height'*, the arrow size increases with the width and height of the axes, respectively, when the window is resized; for *'dots'* or *'inches'*, resizing does not change the arrows.

**angles** [{`'uv'`, `'xy'`} or array-like, default: `'uv'`] Method for determining the angle of the arrows.

- `'uv'`: The arrow axis aspect ratio is 1 so that if  $U == V$  the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on  $X$ ,  $Y$  data coordinates.

- `'xy'`: Arrows point from  $(x, y)$  to  $(x+u, y+v)$ . Use this for plotting a gradient field, for example.
- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

In this case  $U$ ,  $V$  is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

**scale** [float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the `scale_units` parameter.

**scale\_units** [{`'width'`, `'height'`, `'dots'`, `'inches'`, `'x'`, `'y'`, `'xy'`}, optional] If the `scale` kwarg is *None*, the arrow length unit. Default is *None*.

e.g. `scale_units` is `'inches'`, `scale` is 2.0, and  $(u, v) = (1, 0)$ , then the vector will be 0.5 inches long.

If `scale_units` is `'width'` or `'height'`, then the vector will be half the width/height of the axes.

If `scale_units` is `'x'` then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with  $u$  and  $v$  having the same units as  $x$  and  $y$ , use `angles='xy'`, `scale_units='xy'`, `scale=1`.

**width** [float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth** [float, default: 3] Head width as multiple of shaft width.

**headlength** [float, default: 5] Head length as multiple of shaft width.

**headaxislength** [float, default: 4.5] Head length at shaft intersection.

**minshaft** [float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength** [float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot** [{`'tail'`, `'mid'`, `'middle'`, `'tip'`}, default: `'tail'`] The part of the arrow that is anchored to the  $X$ ,  $Y$  grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

**color** [color or color sequence, optional] Explicit color(s) for the arrows.  
If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection* *facecolor* parameter.

### Other Parameters

**\*\*kwargs** [*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '., '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

### See also:

*Axes.quiverkey* Add a key to a quiver plot.

### Examples using `matplotlib.pyplot.quiver`

- `sphx_glr_gallery_images_contours_and_fields_quiver_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py`
- [Sample plots in Matplotlib](#)

### `matplotlib.pyplot.quiverkey`

`matplotlib.pyplot.quiverkey(Q, X, Y, U, label, **kw)`

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

#### Parameters

**Q** [`matplotlib.quiver.Quiver`] A *Quiver* object as returned by a call to `quiver()`.

**X, Y** [float] The location of the key.

**U** [float] The length of the key.

**label** [str] The key label (e.g., length and units of the key).

**angle** [float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

**coordinates** [{*'axes'*, *'figure'*, *'data'*, *'inches'*}, default: *'axes'*] Coordinate system and units for *X*, *Y*: *'axes'* and *'figure'* are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; *'data'* are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); *'inches'* is position in the figure in inches, with (0, 0) at the lower left corner.

**color** [color] Overrides face and edge colors from *Q*.

**labelpos** [{*'N'*, *'S'*, *'E'*, *'W'*}] Position the label above, below, to the right, to the left of the arrow, respectively.

**labelsep** [float, default: 0.1] Distance in inches between the arrow and the label.

**labelcolor** [color, default: `rcParams["text.color"]` (default: *'black'*)] Label color.

**fontproperties** [dict, optional] A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family*, *style*, *variant*, *size*, *weight*.

**\*\*kwargs** Any additional keyword arguments are used to override vector properties taken from *Q*.

### Examples using `matplotlib.pyplot.quiverkey`

- `sphx_glr_gallery_images_contours_and_fields_quiver_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py`

### `matplotlib.pyplot.rc`

`matplotlib.pyplot.rc(group, **kwargs)`

Set the current *rcParams*. *group* is the grouping for the rc, e.g., for `lines.linewidth` the group is `lines`, for `axes.facecolor`, the group is `axes`, and so on. Group may also be a list or tuple of group names, e.g., `(xtick, ytick)`. *kwargs* is a dictionary attribute name/value pairs, e.g.,:

```
rc('lines', linewidth=2, color='r')
```

sets the current *rcParams* and is equivalent to:

```
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

Alias	Property
'lw'	'linewidth'
'ls'	'linestyle'
'c'	'color'
'fc'	'facecolor'
'ec'	'edgecolor'
'mew'	'markeredgewidth'
'aa'	'antialiased'

Thus you could abbreviate the above call as:

```
rc('lines', lw=2, c='r')
```

Note you can use python's *kwargs* dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```
font = {'family' : 'monospace',
        'weight' : 'bold',
        'size'   : 'larger'}
rc('font', **font) # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or `rcdefaults()` to restore the default *rcParams* after changes.

### Notes

Similar functionality is available by using the normal dict interface, i.e. `rcParams.update({"lines.linewidth": 2, ...})` (but `rcParams.update` does not support abbreviations or grouping).

### Examples using `matplotlib.pyplot.rc`

- *Styling with `cycler`*

### `matplotlib.pyplot.rc_context`

`matplotlib.pyplot.rc_context(rc=None, fname=None)`

Return a context manager for temporarily changing rcParams.

#### Parameters

**rc** [dict] The rcParams to temporarily set.

**fname** [str or path-like] A file with Matplotlib rc settings. If both *fname* and *rc* are given, settings from *rc* take precedence.

**See also:**

#### *The `matplotlibrc` file*

### Examples

Passing explicit values via a dict:

```
with mpl.rc_context({'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('example.png')
    plt.close(fig)
```

Loading settings from a file:

```
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, y) # uses 'print.rc'
```

### Examples using `matplotlib.pyplot.rc_context`

- `sphx_glr_gallery_text_labels_and_annotations_usetex_baseline_test.py`
- `sphx_glr_gallery_misc_logos2.py`
- `sphx_glr_gallery_ticks_and_spines_auto_ticks.py`

### `matplotlib.pyplot.rcdefaults`

`matplotlib.pyplot.rcdefaults()`

Restore the *rcParams* from Matplotlib's internal default style.

Style-blacklisted *rcParams* (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

**See also:**

`matplotlib.rc_file_defaults` Restore the `rcParams` from the rc file originally loaded by Matplotlib.

`matplotlib.style.use` Use a specific style file. Call `style.use('default')` to restore the default style.

#### Examples using `matplotlib.pyplot.rcdefaults`

- `sphx_glr_gallery_lines_bars_and_markers_barh.py`
- `sphx_glr_gallery_misc_customize_rc.py`

#### `matplotlib.pyplot.rgrids`

`matplotlib.pyplot.rgrids(radii=None, labels=None, angle=None, fmt=None, **kwargs)`

Get or set the radial gridlines on the current polar plot.

Call signatures:

```
lines, labels = rgrids()
lines, labels = rgrids(radii, labels=None, angle=22.5, fmt=None, **kwargs)
```

When called with no arguments, `rgrids` simply returns the tuple *(lines, labels)*. When called with arguments, the labels will appear at the specified radial distances and angle.

#### Parameters

**radii** [tuple with floats] The radii for the radial gridlines

**labels** [tuple with strings or None] The labels to use at each radial gridline. The `matplotlib.ticker.ScalarFormatter` will be used if None.

**angle** [float] The angular position of the radius labels in degrees.

**fmt** [str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example '%f'.

#### Returns

**lines** [list of `lines.Line2D`] The radial gridlines.

**labels** [list of `text.Text`] The tick labels.

#### Other Parameters

**\*\*kwargs** `kwargs` are optional `Text` properties for the labels.

#### See also:

`pyplot.thetagrids`

`projections.polar.PolarAxes.set_rgrids`

`Axis.get_gridlines`

`Axis.get_ticklabels`

## Examples

```
# set the locations of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0) )

# set the locations and labels of the radial gridlines
lines, labels = rgrids( (0.25, 0.5, 1.0), ('Tom', 'Dick', 'Harry' ))
```

## Examples using `matplotlib.pyplot.rgrids`

### `matplotlib.pyplot.savefig`

`matplotlib.pyplot.savefig(*args, **kwargs)`

Save the current figure.

Call signature:

```
savefig(fname, dpi=None, facecolor='w', edgecolor='w',
        orientation='portrait', papertype=None, format=None,
        transparent=False, bbox_inches=None, pad_inches=0.1,
        frameon=None, metadata=None)
```

The available output formats depend on the backend being used.

### Parameters

**fname** [str or path-like or file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as `matplotlib.backends.backend_pdf.PdfPages`.

If *format* is set, it determines the output format, and the file is saved as *fname*. Note that *fname* is used verbatim, and there is no attempt to make the extension, if any, of *fname* match *format*, and no extension is appended.

If *format* is not set, then the format is inferred from the extension of *fname*, if there is one. If *format* is not set and *fname* has no extension, then the file is saved with `rcParams["savefig.format"]` (default: 'png') and the appropriate extension is appended to *fname*.

### Other Parameters

**dpi** [float or 'figure', default: `rcParams["savefig.dpi"]` (default: 'figure')] The resolution in dots per inch. If 'figure', use the figure's dpi value.

**quality** [int, default: `rcParams["savefig.jpeg_quality"]` (default: 95)] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality.

This parameter is deprecated.

**optimize** [bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the encoder should make an extra pass over the image in order to select optimal encoder settings.

This parameter is deprecated.

**progressive** [bool, default: False] Applicable only if *format* is 'jpg' or 'jpeg', ignored otherwise.

Whether the image should be stored as a progressive JPEG file.

This parameter is deprecated.

**facecolor** [color or 'auto', default: `rcParams["savefig.facecolor"]` (default: 'auto')] The facecolor of the figure. If 'auto', use the current figure facecolor.

**edgecolor** [color or 'auto', default: `rcParams["savefig.edgecolor"]` (default: 'auto')] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

**orientation** [{ 'landscape', 'portrait' }] Currently only supported by the postscript backend.

**papertype** [str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

**format** [str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under *fname*.

**transparent** [bool] If *True*, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

**bbox\_inches** [str or *Bbox*, default: `rcParams["savefig.bbox"]` (default: None)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

**pad\_inches** [float, default: `rcParams["savefig.pad_inches"]` (default: 0.1)] Amount of padding around the figure when *bbox\_inches* is 'tight'.

**bbox\_extra\_artists** [list of *Artist*, optional] A list of extra artists that will be considered when the tight bbox is calculated.

**backend** [str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See *The builtin backends* for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

**metadata** [dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter metadata of *print\_png*.
- 'pdf' with pdf backend: See the parameter metadata of *PdfPages*.
- 'svg' with svg backend: See the parameter metadata of *print\_svg*.

- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

**pil\_kwargs** [dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure.

#### Examples using `matplotlib.pyplot.savefig`

- `sphx_glr_gallery_misc_print_stdout_sgskip.py`
- `sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py`
- `sphx_glr_gallery_user_interfaces_svg_tooltip_sgskip.py`
- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

#### `matplotlib.pyplot.sca`

`matplotlib.pyplot.sca(ax)`

Set the current Axes to *ax* and the current Figure to the parent of *ax*.

#### Examples using `matplotlib.pyplot.sca`

#### `matplotlib.pyplot.scatter`

`matplotlib.pyplot.scatter(x, y, s=None, c=None, marker=None, cmap=None, norm=None, vmin=None, vmax=None, alpha=None, linewidths=None, verts=<deprecated parameter>, edgecolors=None, *, plotnonfinite=False, data=None, **kwargs)`

A scatter plot of *y* vs. *x* with varying marker size and/or color.

#### Parameters

- x, y** [float or array-like, shape (n, )] The data positions.
- s** [float or array-like, shape (n, ), optional] The marker size in points\*\*2. Default is `rcParams['lines.markersize'] ** 2`.
- c** [array-like or list of colors or color, optional] The marker colors. Possible values:
- A scalar or sequence of *n* numbers to be mapped to colors using *cmap* and *norm*.
  - A 2-D array in which the rows are RGB or RGBA.
  - A sequence of colors of length *n*.
  - A single color format string.

Note that *c* should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. If you want to specify the same RGB or RGBA value for all points, use a 2-D array with a single row. Otherwise, value- matching will have precedence in case of a size matching with *x* and *y*.

If you wish to specify a single color for all points prefer the *color* keyword argument.

Defaults to `None`. In that case the marker color is determined by the value of `color`, `facecolor` or `facecolors`. In case those are not specified or `None`, the marker color is determined by the next color of the Axes' current "shape and fill" color cycle. This cycle defaults to `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`).

**marker** [*MarkerStyle*, default: `rcParams["scatter.marker"]` (default: `'o'`)] The marker style. *marker* can be either an instance of the class or the text shorthand for a particular marker. See `matplotlib.markers` for more information about marker styles.

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: `'viridis'`)] A *Colormap* instance or registered colormap name. *cmap* is only used if *c* is an array of floats.

**norm** [*Normalize*, default: `None`] If *c* is an array of floats, *norm* is used to scale the color data, *c*, in the range 0 to 1, in order to map into the colormap *cmap*. If `None`, use the default `colors.Normalize`.

**vmin, vmax** [float, default: `None`] *vmin* and *vmax* are used in conjunction with the default norm to map the color array *c* to the colormap *cmap*. If `None`, the respective min and max of the color array is used. It is deprecated to use *vmin/vmax* when *norm* is given.

**alpha** [float, default: `None`] The alpha blending value, between 0 (transparent) and 1 (opaque).

**linewidths** [float or array-like, default: `rcParams["lines.linewidth"]` (default: 1.5)] The linewidth of the marker edges. Note: The default *edgecolors* is `'face'`. You may want to change this as well.

**edgecolors** [{`'face'`, `'none'`, `None`} or color or sequence of color, default: `rcParams["scatter.edgecolors"]` (default: `'face'`)] The edge color of the marker. Possible values:

- `'face'`: The edge color will always be the same as the face color.
- `'none'`: No patch boundary will be drawn.
- A color or sequence of colors.

For non-filled markers, the *edgecolors* kwarg is ignored and forced to `'face'` internally.

**plotnonfinite** [bool, default: `False`] Set to plot points with nonfinite *c*, in conjunction with `set_bad`.

## Returns

*PathCollection*

## Other Parameters

**\*\*kwargs** [*Collection* properties]

## See also:

`plot` To plot scatter plots when markers are identical in size and color.

### Notes

- The `plot` function will be faster for scatterplots where markers don't vary in size or color.
- Any or all of `x`, `y`, `s`, and `c` may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.
- Fundamentally, scatter works with 1-D arrays; `x`, `y`, `s`, and `c` may be input as N-D arrays, but within scatter they will be flattened. The exception is `c`, which will be flattened only if its size matches the size of `x` and `y`.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `s`, `linewidths`, `edgecolors`, `c`, `facecolor`, `facecolors`, `color`.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

### Examples using `matplotlib.pyplot.scatter`

- `sphx_glr_gallery_misc_hyperlinks_sgskip.py`

### `matplotlib.pyplot.sci`

`matplotlib.pyplot.sci(im)`  
Set the current image.

This image will be the target of colormap functions like *viridis*, and other functions such as *clim*. The current image is an attribute of the current axes.

### Examples using `matplotlib.pyplot.sci`

- `sphx_glr_gallery_shapes_and_collections_line_collection.py`

### `matplotlib.pyplot.semilogx`

`matplotlib.pyplot.semilogx(*args, **kwargs)`  
Make a plot with log scaling on the x axis.

Call signatures:

```
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around *plot* which additionally changes the x-axis to log scaling. All of the concepts and parameters of *plot* can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the x-axis properties. They are just forwarded to `Axes.set_xscale`.

### Parameters

**base** [float, default: 10] Base of the x logarithm.

**subs** [array-like, optional] The location of the minor xticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale` for details.

**nonpositive** [{‘mask’, ‘clip’}, default: ‘mask’] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

### Returns

**lines** A list of `Line2D` objects representing the plotted data.

### Other Parameters

**\*\*kwargs** All parameters supported by `plot`.

Examples using `matplotlib.pyplot.semilogx`

- [Sample plots in Matplotlib](#)

### matplotlib.pyplot.semilogy

`matplotlib.pyplot.semilogy(*args, **kwargs)`  
Make a plot with log scaling on the y axis.

Call signatures:

```
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the y-axis to log scaling. All of the concepts and parameters of `plot` can be used here as well.

The additional parameters *base*, *subs*, and *nonpositive* control the y-axis properties. They are just forwarded to `Axes.set_yscale`.

### Parameters

**base** [float, default: 10] Base of the y logarithm.

**subs** [array-like, optional] The location of the minor yticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_yscale` for details.

**nonpositive** [{‘mask’, ‘clip’}, default: ‘mask’] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

### Returns

**lines** A list of `Line2D` objects representing the plotted data.

### Other Parameters

**\*\*kwargs** All parameters supported by `plot`.

### Examples using `matplotlib.pyplot.semilogy`

- *Sample plots in Matplotlib*

### `matplotlib.pyplot.set_cmap`

`matplotlib.pyplot.set_cmap(cmap)`

Set the default colormap, and applies it to the current image if any.

#### Parameters

**cmap** [*Colormap* or str] A colormap instance or the name of a registered colormap.

#### See also:

*colormaps*

*matplotlib.cm.register\_cmap*

*matplotlib.cm.get\_cmap*

### Examples using `matplotlib.pyplot.set_cmap`

### `matplotlib.pyplot.setp`

`matplotlib.pyplot.setp(obj, *args, **kwargs)`

Set a property on an artist object.

matplotlib supports the use of *setp()* ("set property") and *getp()* to set and get object properties, as well as to do introspection on the object. For example, to set the linestyle of a line to be dashed, you can do:

```
>>> line, = plot([1, 2, 3])
>>> setp(line, linestyle='--')
```

If you want to know the valid types of arguments, you can provide the name of the property you want to set without a value:

```
>>> setp(line, 'linestyle')
linestyle: {'-', '--', '-.', ':', '|', (offset, on-off-seq), ...}
```

If you want to see all the properties that can be set, and their possible values, you can do:

```
>>> setp(line)
... long output listing omitted
```

By default *setp* prints to `sys.stdout`, but this can be modified using the *file* keyword-only argument:

```
>>> with fopen('output.log') as f:
>>>     setp(line, file=f)
```

`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. e.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```
>>> setp(lines, 'linewidth', 2, 'color', 'r') # MATLAB style
>>> setp(lines, linewidth=2, color='r')      # python style
```

#### Examples using `matplotlib.pyplot.setp`

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

#### `matplotlib.pyplot.show`

`matplotlib.pyplot.show(*, block=None)`

Display all open figures.

In non-interactive mode, *block* defaults to `True`. All figures will display and `show` will not return until all windows are closed. If there are no figures, return immediately.

In interactive mode *block* defaults to `False`. This will ensure that all of the figures are shown and this function immediately returns.

##### Parameters

**block** [bool, optional] If `True` block and run the GUI main loop until all windows are closed.

If `False` ensure that all windows are displayed and return immediately. In this case, you are responsible for ensuring that the event loop is running to have responsive figures.

##### See also:

`ion` enable interactive mode

`ioff` disable interactive mode

- sphx\_glr\_gallery\_widgets\_lasso\_selector\_demo\_sgskip.py

### matplotlib.pyplot.specgram

```
matplotlib.pyplot.specgram(x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None,
                           noverlap=None, cmap=None, xextent=None, pad_to=None,
                           sides=None, scale_by_freq=None, mode=None, scale=None,
                           vmin=None, vmax=None, *, data=None, **kwargs)
```

Plot a spectrogram.

Compute and plot a spectrogram of data in *x*. Data are split into *NFFT* length segments and the spectrum of each section is computed. The windowing function *window* is applied to each segment, and the amount of overlap of each segment is specified with *noverlap*. The spectrogram is plotted as a colormap (using *imshow*).

#### Parameters

**x** [1-D array or sequence] Array or sequence containing the data.

**Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window** [callable or ndarray, default: *window\_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window\_hanning*, *window\_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get\_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides** [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

**pad\_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft*(). The default is *None*, which sets *pad\_to* equal to *NFFT*.

**NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should *NOT* be used to get zero padding, or the scaling of the result will be incorrect; use *pad\_to* for this instead.

**detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before *fft*-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines

`detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls `detrend_none`. 'mean' calls `detrend_mean`. 'linear' calls `detrend_linear`.

**scale\_by\_freq** [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of  $\text{Hz}^{-1}$ . This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**mode** [{ 'default', 'psd', 'magnitude', 'angle', 'phase' }] What sort of spectrum to use. Default is 'psd', which takes the power spectral density. 'magnitude' returns the magnitude spectrum. 'angle' returns the phase spectrum without unwrapping. 'phase' returns the phase spectrum with unwrapping.

**noverlap** [int] The number of points of overlap between blocks. The default value is 128.

**scale** [{ 'default', 'linear', 'dB' }] The scaling of the values in the *spec*. 'linear' is no scaling. 'dB' returns the values in dB scale. When *mode* is 'psd', this is dB power ( $10 * \log_{10}$ ). Otherwise this is dB amplitude ( $20 * \log_{10}$ ). 'default' is 'dB' if *mode* is 'psd' or 'magnitude' and 'linear' otherwise. This must be 'linear' if *mode* is 'angle' or 'phase'.

**Fc** [int, default: 0] The center frequency of *x*, which offsets the *x* extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**cmap** [*Colormap*, default: `rcParams["image.cmap"]`] (default: 'viridis')

**xextent** [*None* or (*xmin*, *xmax*)] The image extent along the *x*-axis. The default sets *xmin* to the left border of the first bin (*spectrum* column) and *xmax* to the right border of the last bin. Note that for *noverlap* > 0 the width of the bins is smaller than those of the segments.

**\*\*kwargs** Additional keyword arguments are passed on to `imshow` which makes the spectrogram image.

## Returns

**spectrum** [2-D array] Columns are the periodograms of successive segments.

**freqs** [1-D array] The frequencies corresponding to the rows in *spectrum*.

**t** [1-D array] The times corresponding to midpoints of segments (i.e., the columns in *spectrum*).

**im** [*AxesImage*] The image created by `imshow` containing the spectrogram.

## See also:

**psd** Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

**magnitude\_spectrum** A single spectrum, similar to having a single segment when *mode* is 'magnitude'. Plots a line instead of a colormap.

**angle\_spectrum** A single spectrum, similar to having a single segment when *mode* is 'angle'. Plots a line instead of a colormap.

*phase\_spectrum* A single spectrum, similar to having a single segment when *mode* is 'phase'. Plots a line instead of a colormap.

### Notes

The parameters *detrend* and *scale\_by\_freq* do only apply when *mode* is set to 'psd'.

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

### Examples using `matplotlib.pyplot.specgram`

- `sphx_glr_gallery_images_contours_and_fields_specgram_demo.py`
- [Sample plots in Matplotlib](#)

### `matplotlib.pyplot.spring`

`matplotlib.pyplot.spring()`  
Set the colormap to "spring".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

### Examples using `matplotlib.pyplot.spring`

### `matplotlib.pyplot.spy`

`matplotlib.pyplot.spy(Z, precision=0, marker=None, markersize=None, aspect='equal', origin='upper', **kwargs)`

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

#### Image style

If *marker* and *markersize* are *None*, *imshow* is used. Any extra remaining keyword arguments are passed to this method.

#### Marker style

If *Z* is a `scipy.sparse.spmatrix` or *marker* or *markersize* are *None*, a *Line2D* object will be returned with the value of *marker* determining the marker type, and any remaining keyword arguments passed to *plot*.

## Parameters

**Z** [array-like (M, N)] The array to be plotted.

**precision** [float or 'present', default: 0] If *precision* is 0, any non-zero value will be plotted. Otherwise, values of  $|Z| > \textit{precision}$  will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

**aspect** [{ 'equal', 'auto', None } or float, default: 'equal'] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling `Axes.set_aspect`. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square.
- 'auto': The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.
- None: Use `rcParams["image.aspect"]` (default: 'equal').

**origin** [{ 'upper', 'lower' }, default: `rcParams["image.origin"]` (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention 'upper' is typically used for matrices and images.

## Returns

`AxesImage` or `Line2D` The return type depends on the plotting style (see above).

## Other Parameters

**\*\*kwargs** The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of `imshow`:

- *cmap*
- *alpha*
- *url*
- any *Artist* properties (passed on to the `AxesImage`)

For the marker style, you can pass any `Line2D` property except for *linestyle*:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and ret
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool

Table 208 – continued from previous page

Property	Description
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>dash_capstyle</i>	{'butt', 'round', 'projecting'}
<i>dash_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>dashes</i>	sequence of floats (on/off ink in points) or (None, None)
<i>data</i>	(2, N) array or two 1D arrays
<i>drawstyle</i> or <i>ds</i>	{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'
<i>figure</i>	<i>Figure</i>
<i>fillstyle</i>	{'full', 'left', 'right', 'bottom', 'top', 'none'}
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float
<i>marker</i>	marker style string, <i>Path</i> or <i>MarkerStyle</i>
<i>markeredgecolor</i> or <i>mec</i>	color
<i>markeredgewidth</i> or <i>mew</i>	float
<i>markerfacecolor</i> or <i>mfc</i>	color
<i>markerfacecoloralt</i> or <i>mfcalt</i>	color
<i>markersize</i> or <i>ms</i>	float
<i>markevery</i>	None or int or (int, int) or slice or List[int] or float or (float, float) or List[b...]
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	unknown
<i>pickradius</i>	float
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>solid_capstyle</i>	{'butt', 'round', 'projecting'}
<i>solid_joinstyle</i>	{'miter', 'round', 'bevel'}
<i>transform</i>	<i>matplotlib.transforms.Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xdata</i>	1D array
<i>ydata</i>	1D array
<i>zorder</i>	float

### Examples using `matplotlib.pyplot.spy`

- `sphx_glr_gallery_images_contours_and_fields_spy_demos.py`

### `matplotlib.pyplot.stackplot`

```
matplotlib.pyplot.stackplot(x, *args, labels=(), colors=None, baseline='zero',
                           data=None, **kwargs)
```

Draw a stacked area plot.

#### Parameters

**x** [1d array of dimension N]

**y** [2d array (dimension MxN), or sequence of 1d arrays (each dimension 1xN)] The data is assumed to be unstacked. Each of the following calls is legal:

```
stackplot(x, y)           # where y is MxN
stackplot(x, y1, y2, y3, y4) # where y1, y2, y3, y4, are all 1xNm
```

**baseline** [{'zero', 'sym', 'wiggle', 'weighted\_wiggle'}] Method used to calculate the baseline:

- 'zero': Constant zero baseline, i.e. a simple stacked plot.
- 'sym': Symmetric around zero and is sometimes called 'The-meRiver'.
- 'wiggle': Minimizes the sum of the squared slopes.
- 'weighted\_wiggle': Does the same but weights to account for size of each layer. It is also called 'Streamgraph'-layout. More details can be found at <http://leebyron.com/streamgraph/>.

**labels** [Length N sequence of strings] Labels to assign to each data series.

**colors** [Length N sequence of colors] A list or tuple of colors. These will be cycled through and used to colour the stacked areas.

**\*\*kwargs** All other keyword arguments are passed to *Axes.fill\_between*.

### Returns

**list of *PolyCollection*** A list of *PolyCollection* instances, one for each element in the stacked area plot.

### Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception).

Objects passed as **data** must support item access (*data[s]*) and membership test (*s* in *data*).

### Examples using `matplotlib.pyplot.stackplot`

#### `matplotlib.pyplot.stem`

```
matplotlib.pyplot.stem(*args, linefmt=None, markerfmt=None, basefmt=None, bottom=0, label=None, use_line_collection=True, data=None)
```

Create a stem plot.

A stem plot plots vertical lines at each *x* location from the baseline to *y*, and places a marker there.

Call signature:

```
stem([x,] y, linefmt=None, markerfmt=None, basefmt=None)
```

The x-positions are optional. The formats may be provided either as positional or as keyword-arguments.

### Parameters

**x** [array-like, optional] The x-positions of the stems. Default: (0, 1, ..., len(y) - 1).

**y** [array-like] The y-values of the stem heads.

**linefmt** [str, optional] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

Character	Line Style
' - '	solid line
' -- '	dashed line
' - . '	dash-dot line
' : '	dotted line

Default: 'C0-', i.e. solid line with the first color of the color cycle.

Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

**markerfmt** [str, optional] A string defining the properties of the markers at the stem heads. Default: 'C0o', i.e. filled circles with the first color of the color cycle.

**basefmt** [str, default: 'C3-' ('C2-' in classic mode)] A format string defining the properties of the baseline.

**bottom** [float, default: 0] The y-position of the baseline.

**label** [str, default: None] The label to use for the stems in legends.

**use\_line\_collection** [bool, default: True] If True, store and plot the stem lines as a *LineCollection* instead of individual lines, which significantly increases performance. If False, defaults to the old behavior of using a list of *Line2D* objects. This parameter may be deprecated in the future.

### Returns

*StemContainer* The container may be treated like a tuple (*markerline*, *stemlines*, *baseline*)

### Notes

#### See also:

The MATLAB function `stem` which inspired this method.

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

#### Examples using `matplotlib.pyplot.stem`

- `sphx_glr_gallery_lines_bars_and_markers_stem_plot.py`

#### `matplotlib.pyplot.step`

`matplotlib.pyplot.step(x, y, *args, where='pre', data=None, **kwargs)`

Make a step plot.

Call signatures:

```
step(x, y, [fmt], *, data=None, where='pre', **kwargs)
step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)
```

This is just a thin wrapper around `plot` which changes some formatting options. Most of the concepts and parameters of `plot` can be used here as well.

#### Parameters

**x** [array-like] 1-D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.

**y** [array-like] 1-D sequence of y levels.

**fmt** [str, optional] A format string, e.g. 'g' for a green line. See `plot` for a more detailed description.

Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument `linestyle` instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.

**data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.

**where** [{ 'pre', 'post', 'mid' }, default: 'pre'] Define where the steps should be placed:

- 'pre': The y value is continued constantly to the left from every x position, i.e. the interval  $(x[i-1], x[i])$  has the value  $y[i]$ .
- 'post': The y value is continued constantly to the right from every x position, i.e. the interval  $[x[i], x[i+1])$  has the value  $y[i]$ .
- 'mid': Steps occur half-way between the x positions.

#### Returns

**lines** A list of `Line2D` objects representing the plotted data.

#### Other Parameters

**\*\*kwargs** Additional parameters are the same as those for `plot`.

## Notes

### Examples using `matplotlib.pyplot.step`

- `sphx_glr_gallery_lines_bars_and_markers_step_demo.py`

### `matplotlib.pyplot.streamplot`

```
matplotlib.pyplot.streamplot(x, y, u, v, density=1, linewidth=None, color=None,
                             cmap=None, norm=None, arrowsize=1, arrowstyle='->',
                             minlength=0.1, transform=None, zorder=None,
                             start_points=None, maxlength=4.0, integration_direction='both', *, data=None)
```

Draw streamlines of a vector flow.

#### Parameters

**x, y** [1D arrays] An evenly spaced grid.

**u, v** [2D arrays] *x* and *y*-velocities. The number of rows and columns must match the length of *y* and *x*, respectively.

**density** [float or (float, float)] Controls the closeness of streamlines. When `density = 1`, the domain is divided into a 30x30 grid. *density* linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (`density_x`, `density_y`).

**linewidth** [float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as *u* and *v*.

**color** [color or 2D array] The streamline color. If given an array, its values are converted to colors using *cmap* and *norm*. The array must have the same shape as *u* and *v*.

**cmap** [*Colormap*] Colormap used to plot streamlines and arrows. This is only used if *color* is an array.

**norm** [*Normalize*] Normalize object used to scale luminance data to 0, 1. If `None`, stretch (min, max) to (0, 1). This is only used if *color* is an array.

**arrowsize** [float] Scaling factor for the arrow size.

**arrowstyle** [str] Arrow style specification. See *FancyArrowPatch*.

**minlength** [float] Minimum length of streamline in axes coordinates.

**start\_points** [Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the *x* and *y* arrays).

**zorder** [int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

**maxlength** [float] Maximum length of streamline in axes coordinates.

**integration\_direction** [{*'forward'*, *'backward'*, *'both'*}, default: *'both'*] Integrate the streamline in forward, backward or both directions.

## Returns

**StreamplotSet** Container object with attributes

- **lines:** *LineCollection* of streamlines
- **arrows:** *PatchCollection* containing *FancyArrowPatch* objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

## Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*, *u*, *v*, *start\_points*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

## Examples using `matplotlib.pyplot.streamplot`

- `sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py`
- *Sample plots in Matplotlib*

## `matplotlib.pyplot.subplot`

`matplotlib.pyplot.subplot(*args, **kwargs)`

Add a subplot to the current figure.

Wrapper of `Figure.add_subplot` with a difference in behavior explained in the notes section.

Call signatures:

```
subplot(nrows, ncols, index, **kwargs)
subplot(pos, **kwargs)
subplot(**kwargs)
subplot(ax)
```

## Parameters

**\*args** [int, (int, int, int, *index*), or *SubplotSpec*, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (*nrows*, *ncols*, *index*). The subplot will take the *index* position on a grid with *nrows* rows and *ncols* columns. *index* starts at 1 in the upper left corner and increases to the right. *index* can also be a two-tuple specifying the (*first*, *last*) indices (1-based,

and including *last*) of the subplot, e.g., `fig.add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.

- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.
- A *SubplotSpec*.

**projection** [{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', str}, optional] The projection type of the subplot (*Axes*). *str* is the name of a custom projection, see *projections*. The default None results in a 'rectilinear' projection.

**polar** [bool, default: False] If True, equivalent to `projection='polar'`.

**sharex, sharey** [*Axes*, optional] Share the x or y *axis* with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label** [str] A label for the returned axes.

### Returns

*axes.SubplotBase*, or another subclass of *Axes* The axes of the subplot. The returned axes base class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used. The returned axes is then a subplot subclass of the base class.

### Other Parameters

**\*\*kwargs** This method also takes the keyword arguments for the returned axes base class; except for the *figure* argument. The keyword arguments for the rectilinear base class *Axes* can be found in the following table but there might also be other keyword arguments if another projection is used.

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[ <i>Axes</i> , <i>Renderer</i> ], <i>Bbox</i> ]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color

Contin

Table 209 – continued from previous page

Property	Description
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>prop_cycle</i>	unknown
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None

<i>xticklabels</i>	unknown
<i>xticks</i>	unknown
<i>ybound</i>	unknown
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	unknown
<i>yticks</i>	unknown
<i>zorder</i>	float

**See also:***Figure.add\_subplot**pyplot.subplots**pyplot.axes**Figure.subplots***Notes**

Creating a subplot will delete any pre-existing subplot that overlaps with it beyond sharing a boundary:

```
import matplotlib.pyplot as plt
# plot a line, implicitly creating a subplot(111)
plt.plot([1, 2, 3])
# now create a subplot which represents the top plot of a grid
# with 2 rows and 1 column. Since this subplot will overlap the
# first, the plot (and its axes) previously created, will be removed
plt.subplot(211)
```

If you do not want this behavior, use the `Figure.add_subplot` method or the `pyplot.axes` function instead.

If the figure already has a subplot with key (*args*, *kwargs*) then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of args and kwargs. The axes *label* attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, `add_subplot` may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure's list of axes.

### Examples

```
plt.subplot(221)

# equivalent but more general
ax1=plt.subplot(2, 2, 1)

# add a subplot with no frame
ax2=plt.subplot(222, frameon=False)

# add a polar subplot
plt.subplot(223, projection='polar')

# add a red subplot that shares the x-axis with ax1
plt.subplot(224, sharex=ax1, facecolor='red')

# delete ax2 from the figure
plt.delaxes(ax2)

# add ax2 to the figure again
plt.subplot(ax2)
```

### matplotlib.pyplot.subplot2grid

matplotlib.pyplot.subplot2grid(*shape*, *loc*, *rowspan=1*, *colspan=1*, *fig=None*,  
*\*\*kwargs*)

Create a subplot at a specific location inside a regular grid.

#### Parameters

**shape** [(int, int)] Number of rows and of columns of the grid in which to place axis.

**loc** [(int, int)] Row number and column number of the axis location within the grid.

**rowspan** [int, default: 1] Number of rows for the axis to span to the right.

**colspan** [int, default: 1] Number of columns for the axis to span downwards.

**fig** [*Figure*, optional] Figure to place the subplot in. Defaults to the current figure.

**\*\*kwargs** Additional keyword arguments are handed to *add\_subplot*.

### Returns

*axes.SubplotBase*, or another subclass of *Axes* The axes of the subplot. The returned axes base class depends on the projection used. It is *Axes* if rectilinear projection is used and *projections.polar.PolarAxes* if polar projection is used. The returned axes is then a subplot subclass of the base class.

### Notes

The following call

```
ax = subplot2grid((nrows, ncols), (row, col), rowspan, colspan)
```

is identical to

```
fig = gcf()
gs = fig.add_gridspec(nrows, ncols)
ax = fig.add_subplot(gs[row:row+rowspan, col:col+colspan])
```

### Examples using `matplotlib.pyplot.subplot2grid`

- *Tight Layout guide*

### `matplotlib.pyplot.subplot_mosaic`

`matplotlib.pyplot.subplot_mosaic(layout, *, subplot_kw=None, gridspec_kw=None, empty_sentinel='.', **fig_kw)`

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

---

**Note:** This API is provisional and may be revised in the future based on early user feedback.

---

### Parameters

**layout** [list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

```
x = [['A panel', 'A panel', 'edge'],
      ['C panel', '.', 'edge']]
```

Produces 4 axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it must be of the form

```
'''
AAE
C.E
'''
```

where each character is a column and each line is a row. This only allows only single character Axes labels and does not allow nesting but is very terse.

**subplot\_kw** [dict, optional] Dictionary with keywords passed to the *Figure.add\_subplot* call used to create each subplot.

**gridspec\_kw** [dict, optional] Dictionary with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

**empty\_sentinel** [object, optional] Entry in the layout to mean "leave this space empty". Defaults to '.'. Note, if *layout* is a string, it is processed via *inspect.cleandoc* to remove leading white space, which may interfere with using white-space as the empty sentinel.

**\*\*fig\_kw** All additional keyword arguments are passed to the *pyplot.figure* call.

## Returns

**fig** [*Figure*] The new figure

**dict[label, Axes]** A dictionary mapping the labels to the Axes objects.

Examples using `matplotlib.pyplot.subplot_mosaic`

`matplotlib.pyplot.subplot_tool`

`matplotlib.pyplot.subplot_tool(targetfig=None)`

Launch a subplot tool window for a figure.

A *matplotlib.widgets.SubplotTool* instance is returned.

### Examples using `matplotlib.pyplot.subplot_tool`

- `sphinx_glr_gallery_subplots_axes_and_figures_subplot_toolbar.py`

### `matplotlib.pyplot.subplots`

```
matplotlib.pyplot.subplots(nrows=1, ncols=1, *, sharex=False, sharey=False,
                           squeeze=True, subplot_kw=None, gridspec_kw=None,
                           **fig_kw)
```

Create a figure and a set of subplots.

This utility wrapper makes it convenient to create common layouts of subplots, including the enclosing figure object, in a single call.

#### Parameters

**nrows, ncols** [int, default: 1] Number of rows/columns of the subplot grid.

**sharex, sharey** [bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (*sharex*) or y (*sharey*) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
- 'row': each subplot row will share an x- or y-axis.
- 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use *tick\_params*.

**squeeze** [bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of *Axes*:
  - if only one subplot is constructed (`nrows=ncols=1`), the resulting single *Axes* object is returned as a scalar.
  - for `Nx1` or `1xM` subplots, the returned object is a 1D numpy object array of *Axes* objects.
  - for `NxM`, subplots with `N>1` and `M>1` are returned as a 2D array.
- If False, no squeezing at all is done: the returned *Axes* object is always a 2D array containing *Axes* instances, even if it ends up being `1x1`.

**subplot\_kw** [dict, optional] Dict with keywords passed to the *add\_subplot* call used to create each subplot.

**gridspec\_kw** [dict, optional] Dict with keywords passed to the *GridSpec* constructor used to create the grid the subplots are placed on.

**\*\*fig\_kw** All additional keyword arguments are passed to the *pyplot.figure* call.

## Returns

**fig** [*Figure*]

**ax** [*axes.Axes* or array of *Axes*] *ax* can be either a single *Axes* object or an array of *Axes* objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the *squeeze* keyword, see above.

Typical idioms for handling the return value are:

```
# using the variable ax for single a Axes
fig, ax = plt.subplots()

# using the variable axs for multiple Axes
fig, axs = plt.subplots(2, 2)

# using tuple unpacking for multiple Axes
fig, (ax1, ax2) = plt.subplot(1, 2)
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplot(2, 2)
```

The names *ax* and pluralized *axs* are preferred over *axes* because for the latter it's not clear if it refers to a single *Axes* instance or a collection of these.

## See also:

*pyplot.figure*

*pyplot.subplot*

*pyplot.axes*

*Figure.subplots*

*Figure.add\_subplot*

## Examples

```
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create just a figure and only one subplot
fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
f, (ax1, ax2) = plt.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar axes and access them through the returned array
fig, axs = plt.subplots(2, 2, subplot_kw=dict(polar=True))
axs[0, 0].plot(x, y)
axs[1, 1].scatter(x, y)
```

(continues on next page)

(continued from previous page)

```

# Share a X axis with each column of subplots
plt.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
plt.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
plt.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
plt.subplots(2, 2, sharex=True, sharey=True)

# Create figure number 10 with a single subplot
# and clears it if it already exists.
fig, ax = plt.subplots(num=10, clear=True)

```

### Examples using `matplotlib.pyplot.subplots`

- `sphx_glr_gallery_text_labels_and_annotations_font_family_rc_sgskip.py`
- `sphx_glr_gallery_event_handling_pong_sgskip.py`
- `sphx_glr_gallery_misc_multiprocess_sgskip.py`
- `sphx_glr_gallery_user_interfaces_pylab_with_gtk_sgskip.py`
- `sphx_glr_gallery_user_interfaces_svg_tooltip_sgskip.py`
- `sphx_glr_gallery_widgets_lasso_selector_demo_sgskip.py`

### `matplotlib.pyplot.subplots_adjust`

```
matplotlib.pyplot.subplots_adjust(left=None, bottom=None, right=None, top=None,
                                wspace=None, hspace=None)
```

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by `rcParams["figure.subplot.[name]"]`.

#### Parameters

**left** [float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

**right** [float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

**bottom** [float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

**top** [float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

**wspace** [float, optional] The width of the padding between subplots, as a fraction of the average axes width.

**hspace** [float, optional] The height of the padding between subplots, as a fraction of the average axes height.

#### Examples using `matplotlib.pyplot.subplots_adjust`

#### `matplotlib.pyplot.summer`

`matplotlib.pyplot.summer()`  
Set the colormap to "summer".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

#### Examples using `matplotlib.pyplot.summer`

#### `matplotlib.pyplot.suptitle`

`matplotlib.pyplot.suptitle(t, **kwargs)`  
Add a centered title to the figure.

##### Parameters

**t** [str] The title text.

**x** [float, default 0.5] The x location of the text in figure coordinates.

**y** [float, default 0.98] The y location of the text in figure coordinates.

**horizontalalignment, ha** [{‘center’, ‘left’, ‘right’}, default: ‘center’] The horizontal alignment of the text relative to (x, y).

**verticalalignment, va** [{`'top'`, `'center'`, `'bottom'`, `'baseline'`}], default: `'top'`] The vertical alignment of the text relative to (x, y).

**fontsize, size** [default: `rcParams["figure.titlesize"]` (default: `'large'`)] The font size of the text. See `Text.set_size` for possible values.

**fontweight, weight** [default: `rcParams["figure.titleweight"]` (default: `'normal'`)] The font weight of the text. See `Text.set_weight` for possible values.

### Returns

**text** The `Text` instance of the title.

### Other Parameters

**fontproperties** [None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: `'large'`) and `rcParams["figure.titleweight"]` (default: `'normal'`) are ignored in this case.

**\*\*kwargs** Additional kwargs are `matplotlib.text.Text` properties.

### Examples

```
>>> fig.suptitle('This is the figure title', fontsize=12)
```

### Examples using `matplotlib.pyplot.suptitle`

- `sphx_glr_gallery_subplots_axes_and_figures_gridspec_nested.py`
- [Pyplot tutorial](#)

### `matplotlib.pyplot.switch_backend`

`matplotlib.pyplot.switch_backend(newbackend)`

Close all open figures and set the Matplotlib backend.

The argument is case-insensitive. Switching to an interactive backend is possible only if no event loop for another interactive backend has started. Switching to and from non-interactive backends is always possible.

### Parameters

**newbackend** [str] The name of the backend to use.

### Examples using `matplotlib.pyplot.switch_backend`

**matplotlib.pyplot.table**

```
matplotlib.pyplot.table(cellText=None, cellColours=None, cellLoc='right', col-
                        Widths=None, rowLabels=None, rowColours=None,
                        rowLoc='left', colLabels=None, colColours=None, col-
                        Loc='center', loc='bottom', bbox=None, edges='closed',
                        **kwargs)
```

Add a table to an *Axes*.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the *Table* class and add it to the axes with *Axes.add\_table*.

**Parameters**

**cellText** [2D list of str, optional] The texts to place into the table cells.

*Note:* Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

**cellColours** [2D list of colors, optional] The background colors of the cells.

**cellLoc** [{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

**colWidths** [list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of  $1 / n_{cols}$ .

**rowLabels** [list of str, optional] The text of the row header cells.

**rowColours** [list of colors, optional] The colors of the row header cells.

**rowLoc** [{'left', 'center', 'right'}, default: 'left'] The text alignment of the row header cells.

**colLabels** [list of str, optional] The text of the column header cells.

**colColours** [list of colors, optional] The colors of the column header cells.

**colLoc** [{'left', 'center', 'right'}, default: 'left'] The text alignment of the column header cells.

**loc** [str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

**bbox** [*Bbox*, optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

**edges** [substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}] The cell edges to be drawn with a line. See also *visible\_edges*.

**Returns**

*Table* The created table.

**Other Parameters**

**\*\*kwargs** *Table* properties.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontsize</i>	float
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

Examples using `matplotlib.pyplot.table`

- sphx\_glr\_gallery\_misc\_table\_demo.py
- *Sample plots in Matplotlib*

**matplotlib.pyplot.text**

`matplotlib.pyplot.text(x, y, s, fontdict=None, **kwargs)`

Add text to the axes.

Add the text *s* to the axes at location *x*, *y* in data coordinates.

#### Parameters

**x, y** [float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the *transform* parameter.

**s** [str] The text.

**fontdict** [dict, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by *rcParams*.

#### Returns

*Text* The created *Text* instance.

## Other Parameters

**\*\*kwargs** [*Text* properties.] Other miscellaneous text parameters.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontfamily</i> or <i>family</i>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<i>fontproperties</i> or <i>font</i> or <i>font_properties</i>	<i>font_manager.FontProperties</i> or <i>str</i> or <i>pathlib.Path</i>
<i>fontsize</i> or <i>size</i>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large'}
<i>fontstretch</i> or <i>stretch</i>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed'}
<i>fontstyle</i> or <i>style</i>	{'normal', 'italic', 'oblique'}
<i>fontvariant</i> or <i>variant</i>	{'normal', 'small-caps'}
<i>fontweight</i> or <i>weight</i>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'bold', 'extra-bold'}
<i>gid</i>	<i>str</i>
<i>horizontalalignment</i> or <i>ha</i>	{'center', 'right', 'left'}
<i>in_layout</i>	bool
<i>label</i>	object
<i>linespacing</i>	float (multiple of font size)
<i>multialignment</i> or <i>ma</i>	{'left', 'right', 'center'}
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	(float, float)
<i>rasterized</i>	bool or None
<i>rotation</i>	float or {'vertical', 'horizontal'}
<i>rotation_mode</i>	{None, 'default', 'anchor'}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	object
<i>transform</i>	<i>Transform</i>
<i>url</i>	<i>str</i>
<i>usetex</i>	bool or None
<i>verticalalignment</i> or <i>va</i>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

## Examples

Individual keyword arguments can be used to override any given parameter:

```
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',  
...      verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword *bbox*. *bbox* is a dictionary of *Rectangle* properties. For example:

```
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

#### `matplotlib.pyplot.thetagrids`

`matplotlib.pyplot.thetagrids(angles=None, labels=None, fmt=None, **kwargs)`

Get or set the theta gridlines on the current polar plot.

Call signatures:

```
lines, labels = thetagrids()  
lines, labels = thetagrids(angles, labels=None, fmt=None, **kwargs)
```

When called with no arguments, `thetagrids` simply returns the tuple `(lines, labels)`. When called with arguments, the labels will appear at the specified angles.

### Parameters

**angles** [tuple with floats, degrees] The angles of the theta gridlines.

**labels** [tuple with strings or None] The labels to use at each radial gridline. The `projections.polar.ThetaFormatter` will be used if None.

**fmt** [str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example `'%f'`. Note that the angle in radians will be used.

### Returns

**lines** [list of `lines.Line2D`] The theta gridlines.

**labels** [list of `text.Text`] The tick labels.

### Other Parameters

**\*\*kwargs** *kwargs* are optional `Text` properties for the labels.

### See also:

`pyplot.rgrids`

`projections.polar.PolarAxes.set_thetagrids`

`Axis.get_gridlines`

`Axis.get_ticklabels`

### Examples

```
# set the locations of the angular gridlines
lines, labels = thetagrids(range(45, 360, 90))

# set the locations and labels of the angular gridlines
lines, labels = thetagrids(range(45, 360, 90), ('NE', 'NW', 'SW', 'SE'))
```

### Examples using `matplotlib.pyplot.thetagrids`

#### `matplotlib.pyplot.tick_params`

`matplotlib.pyplot.tick_params(axis='both', **kwargs)`

Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless `reset` is True.

### Parameters

**axis** [{`'x'`, `'y'`, `'both'`}, default: `'both'`] The axis to which the parameters are applied.

**which** [{`'major'`, `'minor'`, `'both'`}, default: `'major'`] The group of ticks to which the parameters are applied.

**reset** [bool, default: False] Whether to reset the ticks to defaults before updating them.

#### Other Parameters

**direction** [{‘in’, ‘out’, ‘inout’}] Puts ticks inside the axes, outside the axes, or both.

**length** [float] Tick length in points.

**width** [float] Tick width in points.

**color** [color] Tick color.

**pad** [float] Distance in points between tick and label.

**labelsize** [float or str] Tick label font size in points or as a string (e.g., ‘large’).

**labelcolor** [color] Tick label color.

**colors** [color] Tick color and label color.

**zorder** [float] Tick and label zorder.

**bottom, top, left, right** [bool] Whether to draw the respective ticks.

**labelbottom, labeltop, labelleft, labelright** [bool] Whether to draw the respective tick labels.

**labelrotation** [float] Tick label rotation

**grid\_color** [color] Gridline color.

**grid\_alpha** [float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

**grid\_linewidth** [float] Width of gridlines in points.

**grid\_linestyle** [str] Any valid *Line2D* line style spec.

#### Examples

```
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

#### Examples using `matplotlib.pyplot.tick_params`

##### `matplotlib.pyplot.ticklabel_format`

`matplotlib.pyplot.ticklabel_format(*, axis='both', style="", scilimits=None, useOffset=None, useLocale=None, useMathText=None)`

Configure the *ScalarFormatter* used by default for linear axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

#### Parameters

**axis** [{`'x'`, `'y'`, `'both'`}, default: `'both'`] The axes to configure. Only major ticks are affected.

**style** [{`'sci'`, `'scientific'`, `'plain'`}] Whether to use scientific notation. The formatter default is to use scientific notation.

**scilimits** [pair of ints (m, n)] Scientific notation is used only for numbers outside the range  $10^m$  to  $10^n$  (and only if the formatter is configured to use scientific notation at all). Use (0, 0) to include all numbers. Use (m, m) where  $m \neq 0$  to fix the order of magnitude to  $10^m$ . The formatter default is `rcParams["axes.formatter.limits"]` (default: [-5, 6]).

**useOffset** [bool or float] If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is `rcParams["axes.formatter.useoffset"]` (default: True).

**useLocale** [bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is `rcParams["axes.formatter.use_locale"]` (default: False).

**useMathText** [bool] Render the offset and scientific notation in mathtext. The formatter default is `rcParams["axes.formatter.use_mathtext"]` (default: False).

## Raises

**AttributeError** If the current formatter is not a *ScalarFormatter*.

Examples using `matplotlib.pyplot.ticklabel_format`

`matplotlib.pyplot.tight_layout`

`matplotlib.pyplot.tight_layout(*, pad=1.08, h_pad=None, w_pad=None, rect=None)`

Adjust the padding between and around subplots.

## Parameters

**pad** [float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h\_pad, w\_pad** [float, default: *pad*] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.

**rect** [tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.

Examples using `matplotlib.pyplot.tight_layout`

- `sphinx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

**matplotlib.pyplot.title**

```
matplotlib.pyplot.title(label, fontdict=None, loc=None, pad=None, *, y=None,
                        **kwargs)
```

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

**Parameters**

**label** [str] Text to use for the title

**fontdict** [dict] A dictionary controlling the appearance of the title text, the default *fontdict* is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

**loc** [{*'center'*, *'left'*, *'right'*}, default: `rcParams["axes.titlelocation"]`] (default: *'center'*) Which title to set.

**y** [float, default: `rcParams["axes.titley"]`] (default: *None*) Vertical axes location for the title (1.0 is the top). If *None* (the default), *y* is determined automatically to avoid decorators on the axes.

**pad** [float, default: `rcParams["axes.titlepad"]`] (default: 6.0) The offset of the title from the top of the axes, in points.

**Returns**

*Text* The matplotlib text instance representing the title

**Other Parameters**

**\*\*kwargs** [*Text* properties] Other keyword arguments are text properties, see *Text* for a list of valid text properties.

**Examples using matplotlib.pyplot.title**

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py
- sphx\_glr\_gallery\_user\_interfaces\_svg\_histogram\_sgskip.py

**matplotlib.pyplot.tricontour**

```
matplotlib.pyplot.tricontour(*args, **kwargs)
```

Draw contour lines on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontour(triangulation, ...)
```

where *triangulation* is a *Triangulation* object, or

```

tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)

```

in which case a *Triangulation* object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontour(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontour(..., Z, levels)
```

contour up to *levels*+1 automatically chosen contour levels (*levels* intervals).

```
tricontour(..., Z, levels)
```

draw contour lines at the values specified in sequence *levels*, which must be in increasing order.

```
tricontour(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

### Parameters

**triangulation** [*Triangulation*, optional] The unstructured triangular grid.

If specified, then *x*, *y*, *triangles*, and *mask* are not accepted.

**x, y** [array-like, optional] The coordinates of the values in *Z*.

**triangles** [int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

**mask** [bool array-like of shape (ntri), optional] Which triangles are masked out.

**Z** [array-like(N, M)] The height values over which the contour is drawn.

**levels** [int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n*+1 "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

### Returns

*TriContourSet*

### Other Parameters

**colors** [color string or sequence of colors, optional] The colors of the levels, i.e., the contour lines.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

**alpha** [float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

**norm** [*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**origin** [{*None*, 'upper', 'lower', 'image'}, default: *None*] Determines the orientation and exact position of *Z* by specifying the position of *Z*[0, 0]. This is only relevant, if *X*, *Y* are not given.

- *None*: *Z*[0, 0] is at *X*=0, *Y*=0 in the lower left corner.
- 'lower': *Z*[0, 0] is at *X*=0.5, *Y*=0.5 in the lower left corner.
- 'upper': *Z*[0, 0] is at *X*=*N*+0.5, *Y*=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: 'upper').

**extent** [(*x0*, *x1*, *y0*, *y1*), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of *Z*[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of *Z*[0, 0], and (*x1*, *y1*) is the position of *Z*[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to *contour*.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

**extend** [{ 'neither', 'both', 'min', 'max' }, default: 'neither'] Determines the tricontour-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set\_under* and *Colormap.set\_over*.

---

**Note:** An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

**xunits, yunits** [registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

**linewidths** [float or array-like, default: `rcParams["contour.linewidth"]` (default: None)] The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

**linestyles** [{*None*, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: 'dashed') setting.

*linestyles* can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

#### Examples using `matplotlib.pyplot.tricontour`

- `sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py`
- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py`
- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py`
- `sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py`

#### `matplotlib.pyplot.tricontourf`

`matplotlib.pyplot.tricontourf(*args, **kwargs)`

Draw contour regions on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontourf(triangulation, ...)
```

where *triangulation* is a *Triangulation* object, or

```
tricontourf(x, y, ...)
tricontourf(x, y, triangles, ...)
tricontourf(x, y, triangles=triangles, ...)
tricontourf(x, y, mask=mask, ...)
tricontourf(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontourf(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontourf(..., Z, levels)
```

contour up to *levels+1* automatically chosen contour levels (*levels* intervals).

```
tricontourf(..., Z, levels)
```

draw contour regions at the values specified in sequence *levels*, which must be in increasing order.

```
tricontourf(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

### Parameters

**triangulation** [*Triangulation*, optional] The unstructured triangular grid.

If specified, then *x*, *y*, *triangles*, and *mask* are not accepted.

**x, y** [array-like, optional] The coordinates of the values in *Z*.

**triangles** [int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

**mask** [bool array-like of shape (ntri), optional] Which triangles are masked out.

**Z** [array-like(N, M)] The height values over which the contour is drawn.

**levels** [int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int *n*, use *MaxNLocator*, which tries to automatically choose no more than *n+1* "nice" contour levels between *vmin* and *vmax*.

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

### Returns

*TriContourSet*

### Other Parameters

**colors** [color string or sequence of colors, optional] The colors of the levels, i.e., the contour regions.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

**alpha** [float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap** [str or *Colormap*, default: `rcParams["image.cmap"]` (default: 'viridis')] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

**norm** [*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**origin** [{*None*, 'upper', 'lower', 'image'}, default: *None*] Determines the orientation and exact position of *Z* by specifying the position of *Z*[0, 0]. This is only relevant, if *X*, *Y* are not given.

- *None*: *Z*[0, 0] is at *X*=0, *Y*=0 in the lower left corner.
- 'lower': *Z*[0, 0] is at *X*=0.5, *Y*=0.5 in the lower left corner.
- 'upper': *Z*[0, 0] is at *X*=*N*+0.5, *Y*=0.5 in the upper left corner.
- 'image': Use the value from `rcParams["image.origin"]` (default: 'upper').

**extent** [(*x0*, *x1*, *y0*, *y1*), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of *Z*[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of *Z*[0, 0], and (*x1*, *y1*) is the position of *Z*[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to *contour*.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

**extend** [{ 'neither', 'both', 'min', 'max' }, default: 'neither'] Determines the *tricontourf*-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set\_under* and *Colormap.set\_over*.

---

**Note:** An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call

can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

---

**xunits, yunits** [registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

**antialiased** [bool, default: True] Whether to use antialiasing.

### Notes

*tricontourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

### Examples using `matplotlib.pyplot.tricontourf`

- `sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py`
- `sphx_glr_gallery_images_contours_and_fields_tricontour_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py`
- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py`
- `sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py`

### `matplotlib.pyplot.tripcolor`

`matplotlib.pyplot.tripcolor(*args, alpha=1.0, norm=None, cmap=None, vmin=None, vmax=None, shading='flat', facecolors=None, **kwargs)`

Create a pseudocolor plot of an unstructured triangular grid.

The triangulation can be specified in one of two ways; either:

```
tripcolor(triangulation, ...)
```

where *triangulation* is a *Triangulation* object, or

```
tripcolor(x, y, ...)
tripcolor(x, y, triangles, ...)
tripcolor(x, y, triangles=triangles, ...)
tripcolor(x, y, mask=mask, ...)
tripcolor(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See *Triangulation* for a explanation of these possibilities.

The next argument must be *C*, the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and

triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the kwarg `facecolors=C` instead of just `C`.

*shading* may be 'flat' (the default) or 'gouraud'. If *shading* is 'flat' and `C` values are defined at points, the color values used for each triangle are from the mean `C` of the triangle's three points. If *shading* is 'gouraud' then color values must be defined at points.

The remaining kwargs are the same as for *pcolor*.

#### Examples using `matplotlib.pyplot.tripcolor`

- `sphx_glr_gallery_images_contours_and_fields_tripcolor_demo.py`

#### `matplotlib.pyplot.triplot`

`matplotlib.pyplot.triplot(*args, **kwargs)`

Draw a unstructured triangular grid as lines and/or markers.

The triangulation to plot can be specified in one of two ways; either:

```
triplot(triangulation, ...)
```

where `triangulation` is a *Triangulation* object, or

```
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See *Triangulation* for a explanation of these possibilities.

The remaining args and kwargs are the same as for *plot*.

#### Returns

**lines** [*Line2D*] The drawn triangles edges.

**markers** [*Line2D*] The drawn marker nodes.

#### Examples using `matplotlib.pyplot.triplot`

- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py`
- `sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_triplot_demo.py`
- `sphx_glr_gallery_event_handling_trifinder_event_demo.py`

**matplotlib.pyplot.twinx**

```
matplotlib.pyplot.twinx(ax=None)
```

Make and return a second axes that shares the x-axis. The new axes will overlay *ax* (or the current axes if *ax* is *None*), and its ticks will be on the right.

**Examples**

[/gallery/subplots\\_axes\\_and\\_figures/two\\_scales](#)

**Examples using `matplotlib.pyplot.twinx`**

**matplotlib.pyplot.twinx**

```
matplotlib.pyplot.twinx(ax=None)
```

Make and return a second axes that shares the y-axis. The new axes will overlay *ax* (or the current axes if *ax* is *None*), and its ticks will be on the top.

**Examples**

[/gallery/subplots\\_axes\\_and\\_figures/two\\_scales](#)

**Examples using `matplotlib.pyplot.twinx`**

**matplotlib.pyplot.uninstall\_repl\_displayhook**

```
matplotlib.pyplot.uninstall_repl_displayhook()
```

Uninstall the matplotlib display hook.

**Warning:** Need IPython >= 2 for this to work. For IPython < 2 will raise a `NotImplementedError`

**Warning:** If you are using vanilla python and have installed another display hook this will reset `sys.displayhook` to what ever function was there when matplotlib installed it's displayhook, possibly discarding your changes.

**Examples using `matplotlib.pyplot.uninstall_repl_displayhook`**

**matplotlib.pyplot.violinplot**

```
matplotlib.pyplot.violinplot(dataset, positions=None, vert=True, widths=0.5,
                             showmeans=False, showextrema=True, show-
                             medians=False, quantiles=None, points=100,
                             bw_method=None, *, data=None)
```

Make a violin plot.

Make a violin plot for each column of *dataset* or each vector in sequence *dataset*. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and user-specified quantiles.

**Parameters**

- dataset** [Array or a sequence of vectors.] The input data.
- positions** [array-like, default: [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.
- vert** [bool, default: True.] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.
- widths** [array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.
- showmeans** [bool, default: False] If `True`, will toggle rendering of the means.
- showextrema** [bool, default: True] If `True`, will toggle rendering of the extrema.
- showmedians** [bool, default: False] If `True`, will toggle rendering of the medians.
- quantiles** [array-like, default: None] If not None, set a list of floats in interval [0, 1] for each violin, which stands for the quantiles that will be rendered for that violin.
- points** [int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimations at.
- bw\_method** [str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a `GaussianKDE` instance as its only parameter and return a scalar. If None (default), 'scott' is used.

**Returns**

**dict** A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- **bodies**: A list of the *PolyCollection* instances containing the filled area of each violin.
- **cmeans**: A *LineCollection* instance that marks the mean values of each of the violin's distribution.
- **cmins**: A *LineCollection* instance that marks the bottom of each violin's distribution.

- `cmaxes`: A *LineCollection* instance that marks the top of each violin's distribution.
- `cbars`: A *LineCollection* instance that marks the centers of each violin's distribution.
- `cmedians`: A *LineCollection* instance that marks the median values of each of the violin's distribution.
- `cquantiles`: A *LineCollection* instance created to identify the quantile values of each of the violin's distribution.

## Notes

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *dataset*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

## Examples using `matplotlib.pyplot.violinplot`

### `matplotlib.pyplot.viridis`

```
matplotlib.pyplot.viridis()
```

Set the colormap to "viridis".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.viridis`

### `matplotlib.pyplot.vlines`

```
matplotlib.pyplot.vlines(x, ymin, ymax, colors=None, linestyle='solid', label="", *,
                          data=None, **kwargs)
```

Plot vertical lines.

Plot vertical lines at each *x* from *ymin* to *ymax*.

### Parameters

**x** [float or array-like] x-indexes where to plot the lines.

**ymin, ymax** [float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

**colors** [list of colors, default: `rcParams["lines.color"]` (default: 'C0')]

**linestyle** [{ 'solid', 'dashed', 'dashdot', 'dotted' }, optional]

**label** [str, default: ""]

**Returns***LineCollection***Other Parameters****\*\*kwargs** [*LineCollection* properties.]**See also:***hlines* horizontal lines*axvline* vertical line across the axes**Notes**

---

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*, *ymin*, *ymax*, *colors*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

---

**Examples using `matplotlib.pyplot.vlines`****`matplotlib.pyplot.waitforbuttonpress`**

```
matplotlib.pyplot.waitforbuttonpress(timeout=-1)
```

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within *timeout* seconds. Negative values deactivate *timeout*.

**Examples using `matplotlib.pyplot.waitforbuttonpress`**

- sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

**`matplotlib.pyplot.winter`**

```
matplotlib.pyplot.winter()
```

Set the colormap to "winter".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

## Examples using `matplotlib.pyplot.winter`

### `matplotlib.pyplot.xcorr`

```
matplotlib.pyplot.xcorr(x, y, normed=True, detrend=<function detrend_none
                        at 0x7f39f4d34a60>, usevlines=True, maxlags=10, *,
                        data=None, **kwargs)
```

Plot the cross correlation between `x` and `y`.

The correlation with lag `k` is defined as  $\sum_n x[n+k] \cdot y^*[n]$ , where  $y^*$  is the complex conjugate of  $y$ .

#### Parameters

**x, y** [array-like of length `n`]

**detrend** [callable, default: `mlab.detrend_none` (no detrending)] A detrending function applied to `x` and `y`. It must have the signature

`detrend(x: np.ndarray) -> np.ndarray`

**normed** [bool, default: `True`] If `True`, input vectors are normalised to unit length.

**usevlines** [bool, default: `True`] Determines the plot style.

If `True`, vertical lines are plotted from 0 to the `xcorr` value using `Axes.vlines`. Additionally, a horizontal line is plotted at `y=0` using `Axes.axhline`.

If `False`, markers are plotted at the `xcorr` values using `Axes.plot`.

**maxlags** [int, default: 10] Number of lags to show. If `None`, will return all `2 * len(x) - 1` lags.

#### Returns

**lags** [array (length `2*maxlags+1`)] The lag vector.

**c** [array (length `2*maxlags+1`)] The auto correlation vector.

**line** [`LineCollection` or `Line2D`] *Artist* added to the axes of the correlation:

- `LineCollection` if `usevlines` is `True`.
- `Line2D` if `usevlines` is `False`.

**b** [`Line2D` or `None`] Horizontal line at 0 if `usevlines` is `True` `None` if `usevlines` is `False`.

#### Other Parameters

**linestyle** [`Line2D` property, optional] The linestyle for plotting the data points. Only used if `usevlines` is `False`.

**marker** [str, default: `'o'`] The marker for plotting the data points. Only used if `usevlines` is `False`.

**\*\*kwargs** Additional parameters are passed to `Axes.vlines` and `Axes.axhline` if `usevlines` is `True`; otherwise they are passed to `Axes.plot`.

## Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception): *x*, *y*.

Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

## Examples using `matplotlib.pyplot.xcorr`

- `sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py`

## `matplotlib.pyplot.xkcd`

`matplotlib.pyplot.xkcd(scale=1, length=100, randomness=2)`

Turn on `xkcd` sketch-style drawing mode. This will only have effect on things drawn after this function is called.

For best results, the "Humor Sans" font should be installed: it is not included with Matplotlib.

### Parameters

**scale** [float, optional] The amplitude of the wiggle perpendicular to the source line.

**length** [float, optional] The length of the wiggle along the line.

**randomness** [float, optional] The scale factor by which the length is shrunk or expanded.

## Notes

This function works by a number of rcParams, so it will probably override others you have set before.

If you want the effects of this function to be temporary, it can be used as a context manager, for example:

```
with plt.xkcd():
    # This figure will be in XKCD-style
    fig1 = plt.figure()
    # ...

# This figure will be in regular style
fig2 = plt.figure()
```

**Examples using `matplotlib.pyplot.xkcd`**

- `sphinx_glr_gallery_showcase_xkcd.py`

**`matplotlib.pyplot.xlabel`**

```
matplotlib.pyplot.xlabel(xlabel, fontdict=None, labelpad=None, *, loc=None,
                        **kwargs)
```

Set the label for the x-axis.

**Parameters**

**xlabel** [str] The label text.

**labelpad** [float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

**loc** [{`'left'`, `'center'`, `'right'`}, default: `rcParams["xaxis.labellocation"]` (default: `'center'`)] The label position. This is a high-level alternative for passing parameters `x` and `horizontalalignment`.

**Other Parameters**

**\*\*kwargs** [*Text* properties] *Text* properties control the appearance of the label.

**See also:**

*text* Documents the properties supported by *Text*.

**Examples using `matplotlib.pyplot.xlabel`**

- `sphinx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

**`matplotlib.pyplot.xlim`**

```
matplotlib.pyplot.xlim(*args, **kwargs)
```

Get or set the x limits of the current axes.

Call signatures:

```
left, right = xlim() # return the current xlim
xlim((left, right)) # set the xlim to left, right
xlim(left, right)   # set the xlim to left, right
```

If you do not specify args, you can pass *left* or *right* as kwargs, i.e.:

```
xlim(right=3) # adjust the right leaving left unchanged
xlim(left=1)  # adjust the left leaving right unchanged
```

Setting limits turns autoscaling off for the x-axis.

**Returns**

**left, right** A tuple of the new x-axis limits.

## Notes

Calling this function with no arguments (e.g. `xlim()`) is the pyplot equivalent of calling `get_xlim` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_xlim` on the current axes. All arguments are passed though.

### Examples using `matplotlib.pyplot.xlim`

- *Frame grabbing*
- `sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`

### `matplotlib.pyplot.xscale`

`matplotlib.pyplot.xscale(value, **kwargs)`

Set the x-axis scale.

#### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**\*\*kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

## Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

### Examples using `matplotlib.pyplot.xscale`

- `sphx_glr_gallery_scales_symlog_demo.py`

### `matplotlib.pyplot.xticks`

`matplotlib.pyplot.xticks(ticks=None, labels=None, **kwargs)`

Get or set the current tick locations and labels of the x-axis.

Pass no arguments to return the current values without modifying them.

#### Parameters

**ticks** [array-like, optional] The list of xtick locations. Passing an empty list removes all xticks.

**labels** [array-like, optional] The labels to place at the given *ticks* locations. This argument can only be passed if *ticks* is passed as well.

**\*\*kwargs** *Text* properties can be used to control the appearance of the labels.

### Returns

**locs** The list of xtick locations.

**labels** The list of xlabel *Text* objects.

### Notes

Calling this function with no arguments (e.g. `xticks()`) is the pyplot equivalent of calling `get_xticks` and `get_xticklabels` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_xticks` and `set_xticklabels` on the current axes.

### Examples

```
>>> locs, labels = xticks() # Get the current locations and labels.
>>> xticks(np.arange(0, 1, step=0.2)) # Set label locations.
>>> xticks(np.arange(3), ['Tom', 'Dick', 'Sue']) # Set text labels.
>>> xticks([0, 1, 2], ['January', 'February', 'March'],
...        rotation=20) # Set text labels and properties.
>>> xticks([]) # Disable xticks.
```

### Examples using `matplotlib.pyplot.xticks`

- `sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py`
- `sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py`
- `sphx_glr_gallery_text_labels_and_annotations_multiline.py`
- `sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py`
- `sphx_glr_gallery_misc_table_demo.py`
- `sphx_glr_gallery_ticks_and_spines_ticklabels_rotation.py`

### `matplotlib.pyplot.ylabel`

`matplotlib.pyplot.ylabel(ylabel, fontdict=None, labelpad=None, *, loc=None, **kwargs)`

Set the label for the y-axis.

### Parameters

**ylabel** [str] The label text.

**labelpad** [float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

**loc** [{`'bottom'`, `'center'`, `'top'`}], default: `rcParams["yaxis.labellocation"]` (default: `'center'`) The label position. This is a high-level alternative for passing parameters `y` and `horizontalalignment`.

### Other Parameters

**\*\*kwargs** [*Text* properties] *Text* properties control the appearance of the label.

### See also:

*text* Documents the properties supported by *Text*.

### Examples using `matplotlib.pyplot.ylabel`

- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

### `matplotlib.pyplot.ylim`

`matplotlib.pyplot.ylim(*args, **kwargs)`

Get or set the y-limits of the current axes.

Call signatures:

```
bottom, top = ylim() # return the current ylim
ylim((bottom, top)) # set the ylim to bottom, top
ylim(bottom, top)   # set the ylim to bottom, top
```

If you do not specify args, you can alternatively pass *bottom* or *top* as kwargs, i.e.:

```
ylim(top=3) # adjust the top leaving bottom unchanged
ylim(bottom=1) # adjust the bottom leaving top unchanged
```

Setting limits turns autoscaling off for the y-axis.

### Returns

**bottom, top** A tuple of the new y-axis limits.

### Notes

Calling this function with no arguments (e.g. `ylim()`) is the pyplot equivalent of calling `get_ylim` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_ylim` on the current axes. All arguments are passed though.

### Examples using `matplotlib.pyplot.ylim`

- *Frame grabbing*
- `sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`

### matplotlib.pyplot.yscale

matplotlib.pyplot.yscale(*value*, **\*\*kwargs**)

Set the y-axis scale.

#### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**\*\*kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

#### Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

### Examples using matplotlib.pyplot.yscale

- `sphinx_glr_gallery_scales_symlog_demo.py`
- *Pyplot tutorial*

### matplotlib.pyplot.yticks

matplotlib.pyplot.yticks(*ticks=None*, *labels=None*, **\*\*kwargs**)

Get or set the current tick locations and labels of the y-axis.

Pass no arguments to return the current values without modifying them.

#### Parameters

**ticks** [array-like, optional] The list of ytick locations. Passing an empty list removes all yticks.

**labels** [array-like, optional] The labels to place at the given *ticks* locations. This argument can only be passed if *ticks* is passed as well.

**\*\*kwargs** *Text* properties can be used to control the appearance of the labels.

#### Returns

**locs** The list of ytick locations.

**labels** The list of ylabel *Text* objects.

## Notes

Calling this function with no arguments (e.g. `yticks()`) is the pyplot equivalent of calling `get_yticks` and `get_yticklabels` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_yticks` and `set_yticklabels` on the current axes.

## Examples

```
>>> locs, labels = yticks() # Get the current locations and labels.
>>> yticks(np.arange(0, 1, step=0.2)) # Set label locations.
>>> yticks(np.arange(3), ['Tom', 'Dick', 'Sue']) # Set text labels.
>>> yticks([0, 1, 2], ['January', 'February', 'March'],
...         rotation=45) # Set text labels and properties.
>>> yticks([]) # Disable yticks.
```

### Examples using `matplotlib.pyplot.yticks`

- `sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py`
- `sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py`
- `sphx_glr_gallery_misc_table_demo.py`

`matplotlib.pyplot.plotting()`

Function	Description
<code>acorr</code>	Plot the autocorrelation of $x$ .
<code>angle_spectrum</code>	Plot the angle spectrum.
<code>annotate</code>	Annotate the point $xy$ with text <i>text</i> .
<code>arrow</code>	Add an arrow to the axes.
<code>autoscale</code>	Autoscale the axis view to the data (toggle).
<code>axes</code>	Add an axes to the current figure and make it the current axes.
<code>axhline</code>	Add a horizontal line across the axis.
<code>axhspan</code>	Add a horizontal span (rectangle) across the axis.
<code>axis</code>	Convenience method to get or set some axis properties.
<code>axline</code>	Add an infinitely long straight line.
<code>axvline</code>	Add a vertical line across the axes.
<code>axvspan</code>	Add a vertical span (rectangle) across the axes.
<code>bar</code>	Make a bar plot.
<code>barbs</code>	Plot a 2D field of barbs.
<code>barh</code>	Make a horizontal bar plot.
<code>box</code>	Turn the axes box on or off on the current axes.
<code>boxplot</code>	Make a box and whisker plot.
<code>broken_barh</code>	Plot a horizontal sequence of rectangles.
<code>cla</code>	Clear the current axes.
<code>clabel</code>	Label a contour plot.
<code>clf</code>	Clear the current figure.
<code>clim</code>	Set the color limits of the current image.
<code>close</code>	Close a figure window.
<code>cohere</code>	Plot the coherence between $x$ and $y$ .

Table 211 – continued from previous page

Function	Description
<code>colorbar</code>	Add a colorbar to a plot.
<code>contour</code>	Plot contours.
<code>contourf</code>	Plot contours.
<code>csd</code>	Plot the cross-spectral density.
<code>delaxes</code>	Remove an <i>Axes</i> (defaulting to the current axes) from its figure.
<code>draw</code>	Redraw the current figure.
<code>draw_if_interactive</code>	
<code>errorbar</code>	Plot y versus x as lines and/or markers with attached errorbars.
<code>eventplot</code>	Plot identical parallel lines at the given positions.
<code>figimage</code>	Add a non-resampled image to the figure.
<code>figlegend</code>	Place a legend on the figure.
<code>fignum_exists</code>	Return whether the figure with the given id exists.
<code>figtext</code>	Add text to figure.
<code>figure</code>	Create a new figure, or activate an existing figure.
<code>fill</code>	Plot filled polygons.
<code>fill_between</code>	Fill the area between two horizontal curves.
<code>fill_betweenx</code>	Fill the area between two vertical curves.
<code>findobj</code>	Find artist objects.
<code>gca</code>	Get the current axes, creating one if necessary.
<code>gcf</code>	Get the current figure.
<code>gci</code>	Get the current colorable artist.
<code>get</code>	Return the value of an object's <i>property</i> , or print all of them.
<code>get_figlabels</code>	Return a list of existing figure labels.
<code>get_fignums</code>	Return a list of existing figure numbers.
<code>getp</code>	Return the value of an object's <i>property</i> , or print all of them.
<code>grid</code>	Configure the grid lines.
<code>hexbin</code>	Make a 2D hexagonal binning plot of points x, y.
<code>hist</code>	Plot a histogram.
<code>hist2d</code>	Make a 2D histogram plot.
<code>hlines</code>	Plot horizontal lines at each y from <i>xmin</i> to <i>xmax</i> .
<code>imread</code>	Read an image from a file into an array.
<code>imsave</code>	Save an array as an image file.
<code>imshow</code>	Display data as an image, i.e., on a 2D regular raster.
<code>install_repl_displayhook</code>	Install a repl display hook so that any stale figure are automatically redrawn.
<code>ioff</code>	Turn the interactive mode off.
<code>ion</code>	Turn the interactive mode on.
<code>isinteractive</code>	Return if pyplot is in "interactive mode" or not.
<code>legend</code>	Place a legend on the axes.
<code>locator_params</code>	Control behavior of major tick locators.
<code>loglog</code>	Make a plot with log scaling on both the x and y axis.
<code>magnitude_spectrum</code>	Plot the magnitude spectrum.
<code>margins</code>	Set or retrieve autoscaling margins.
<code>matshow</code>	Display an array as a matrix in a new figure window.
<code>minorticks_off</code>	Remove minor ticks from the axes.
<code>minorticks_on</code>	Display minor ticks on the axes.
<code>new_figure_manager</code>	Create a new figure manager instance.
<code>pause</code>	Run the GUI event loop for <i>interval</i> seconds.
<code>pcolor</code>	Create a pseudocolor plot with a non-regular rectangular grid.
<code>pcolormesh</code>	Create a pseudocolor plot with a non-regular rectangular grid.

Table 211 – continued from previous page

Function	Description
<i>phase_spectrum</i>	Plot the phase spectrum.
<i>pie</i>	Plot a pie chart.
<i>plot</i>	Plot y versus x as lines and/or markers.
<i>plot_date</i>	Plot data that contains dates.
<i>polar</i>	Make a polar plot.
<i>psd</i>	Plot the power spectral density.
<i>quiver</i>	Plot a 2D field of arrows.
<i>quiverkey</i>	Add a key to a quiver plot.
<i>rc</i>	Set the current <i>rcParams</i> .
<i>rc_context</i>	Return a context manager for temporarily changing rcParams.
<i>rcdefaults</i>	Restore the <i>rcParams</i> from Matplotlib's internal default style.
<i>rgrids</i>	Get or set the radial gridlines on the current polar plot.
<i>savefig</i>	Save the current figure.
<i>sca</i>	Set the current Axes to <i>ax</i> and the current Figure to the parent of <i>ax</i> .
<i>scatter</i>	A scatter plot of y vs.
<i>sci</i>	Set the current image.
<i>semilogx</i>	Make a plot with log scaling on the x axis.
<i>semilogy</i>	Make a plot with log scaling on the y axis.
<i>set_cmap</i>	Set the default colormap, and applies it to the current image if any.
<i>setp</i>	Set a property on an artist object.
<i>show</i>	Display all open figures.
<i>specgram</i>	Plot a spectrogram.
<i>spy</i>	Plot the sparsity pattern of a 2D array.
<i>stackplot</i>	Draw a stacked area plot.
<i>stem</i>	Create a stem plot.
<i>step</i>	Make a step plot.
<i>streamplot</i>	Draw streamlines of a vector flow.
<i>subplot</i>	Add a subplot to the current figure.
<i>subplot2grid</i>	Create a subplot at a specific location inside a regular grid.
<i>subplot_mosaic</i>	Build a layout of Axes based on ASCII art or nested lists.
<i>subplot_tool</i>	Launch a subplot tool window for a figure.
<i>subplots</i>	Create a figure and a set of subplots.
<i>subplots_adjust</i>	Adjust the subplot layout parameters.
<i>suptitle</i>	Add a centered title to the figure.
<i>switch_backend</i>	Close all open figures and set the Matplotlib backend.
<i>table</i>	Add a table to an <i>Axes</i> .
<i>text</i>	Add text to the axes.
<i>thetagrids</i>	Get or set the theta gridlines on the current polar plot.
<i>tick_params</i>	Change the appearance of ticks, tick labels, and gridlines.
<i>ticklabel_format</i>	Configure the <i>ScalarFormatter</i> used by default for linear axes.
<i>tight_layout</i>	Adjust the padding between and around subplots.
<i>title</i>	Set a title for the axes.
<i>tricontour</i>	Draw contour lines on an unstructured triangular grid.
<i>tricontourf</i>	Draw contour regions on an unstructured triangular grid.
<i>tripcolor</i>	Create a pseudocolor plot of an unstructured triangular grid.
<i>tripplot</i>	Draw a unstructured triangular grid as lines and/or markers.
<i>twinx</i>	Make and return a second axes that shares the x-axis.
<i>twiny</i>	Make and return a second axes that shares the y-axis.
<i>uninstall_repl_displayhook</i>	Uninstall the matplotlib display hook.

Table 211 – continued from previous page

Function	Description
<code>violinplot</code>	Make a violin plot.
<code>vlines</code>	Plot vertical lines.
<code>xcorr</code>	Plot the cross correlation between $x$ and $y$ .
<code>xkcd</code>	Turn on <code>xkcd</code> sketch-style drawing mode.
<code>xlabel</code>	Set the label for the x-axis.
<code>xlim</code>	Get or set the x limits of the current axes.
<code>xscale</code>	Set the x-axis scale.
<code>xticks</code>	Get or set the current tick locations and labels of the x-axis.
<code>ylabel</code>	Set the label for the y-axis.
<code>ylim</code>	Get or set the y-limits of the current axes.
<code>yscale</code>	Set the y-axis scale.
<code>yticks</code>	Get or set the current tick locations and labels of the y-axis.

### 18.38.2 Colors in Matplotlib

There are many colormaps you can use to map data onto color values. Below we list several ways in which color can be utilized in Matplotlib.

For a more in-depth look at colormaps, see the [Choosing Colormaps in Matplotlib](#) tutorial.

`matplotlib.pyplot.colormaps()`

Matplotlib provides a number of colormaps, and others can be added using `register_cmap()`. This function documents the built-in colormaps, and will also return a list of all registered colormaps if called.

You can set the colormap for an image, pcolor, scatter, etc, using a keyword argument:

```
imshow(X, cmap=cm.hot)
```

or using the `set_cmap()` function:

```
imshow(X)
pyplot.set_cmap('hot')
pyplot.set_cmap('jet')
```

In interactive mode, `set_cmap()` will update the colormap post-hoc, allowing you to see which one works best for your data.

All built-in colormaps can be reversed by appending `_r`: For instance, `gray_r` is the reverse of `gray`.

There are several common color schemes used in visualization:

**Sequential schemes** for unipolar data that progresses from low to high

**Diverging schemes** for bipolar data that emphasizes positive or negative deviations from a central value

**Cyclic schemes** for plotting values that wrap around at the endpoints, such as phase angle, wind direction, or time of day

**Qualitative schemes** for nominal data that has no inherent ordering, where color is used only to distinguish categories

Matplotlib ships with 4 perceptually uniform color maps which are the recommended color maps for sequential data:

Colormap	Description
inferno	perceptually uniform shades of black-red-yellow
magma	perceptually uniform shades of black-red-white
plasma	perceptually uniform shades of blue-red-yellow
viridis	perceptually uniform shades of blue-green-yellow

The following colormaps are based on the [ColorBrewer](#) color specifications and designs developed by Cynthia Brewer:

ColorBrewer Diverging (luminance is highest at the midpoint, and decreases towards differently-colored endpoints):

Colormap	Description
BrBG	brown, white, blue-green
PiYG	pink, white, yellow-green
PRGn	purple, white, green
PuOr	orange, white, purple
RdBu	red, white, blue
RdGy	red, white, gray
RdYlBu	red, yellow, blue
RdYlGn	red, yellow, green
Spectral	red, orange, yellow, green, blue

ColorBrewer Sequential (luminance decreases monotonically):

Colormap	Description
Blues	white to dark blue
BuGn	white, light blue, dark green
BuPu	white, light blue, dark purple
GnBu	white, light green, dark blue
Greens	white to dark green
Greys	white to black (not linear)
Oranges	white, orange, dark brown
OrRd	white, orange, dark red
PuBu	white, light purple, dark blue
PuBuGn	white, light purple, dark green
PuRd	white, light purple, dark red
Purples	white to dark purple
RdPu	white, pink, dark purple
Reds	white to dark red
YlGn	light yellow, dark green
YlGnBu	light yellow, light green, dark blue
YlOrBr	light yellow, orange, dark brown
YlOrRd	light yellow, orange, dark red

ColorBrewer Qualitative:

(For plotting nominal data, *ListedColormap* is used, not *LinearSegmentedColormap*. Different sets of colors are recommended for different numbers of categories.)

- Accent
- Dark2

- Paired
- Pastel1
- Pastel2
- Set1
- Set2
- Set3

A set of colormaps derived from those of the same name provided with Matlab are also included:

Colormap	Description
autumn	sequential linearly-increasing shades of red-orange-yellow
bone	sequential increasing black-white color map with a tinge of blue, to emulate X-ray film
cool	linearly-decreasing shades of cyan-magenta
copper	sequential increasing shades of black-copper
flag	repetitive red-white-blue-black pattern (not cyclic at endpoints)
gray	sequential linearly-increasing black-to-white grayscale
hot	sequential black-red-yellow-white, to emulate blackbody radiation from an object at increasing temperatures
jet	a spectral map with dark endpoints, blue-cyan-yellow-red; based on a fluid-jet simulation by NCSA <sup>1</sup>
pink	sequential increasing pastel black-pink-white, meant for sepia tone colorization of photographs
prism	repetitive red-yellow-green-blue-purple-...-green pattern (not cyclic at endpoints)
spring	linearly-increasing shades of magenta-yellow
summer	sequential linearly-increasing shades of green-yellow
winter	linearly-increasing shades of blue-green

A set of palettes from the [Yorick scientific visualisation package](#), an evolution of the GIST package, both by David H. Munro are included:

---

<sup>1</sup> Rainbow colormaps, `jet` in particular, are considered a poor choice for scientific visualization by many researchers: [Rainbow Color Map \(Still\) Considered Harmful](#)

Colormap	Description
<code>gist_earth</code>	mapmaker's colors from dark blue deep ocean to green lowlands to brown highlands to white mountains
<code>gist_heat</code>	sequential increasing black-red-orange-white, to emulate black-body radiation from an iron bar as it grows hotter
<code>gist_ncar</code>	pseudo-spectral black-blue-green-yellow-red-purple-white colormap from National Center for Atmospheric Research <sup>2</sup>
<code>gist_rainbow</code>	runs through the colors in spectral order from red to violet at full saturation (like <code>hsv</code> but not cyclic)
<code>gist_stern</code>	"Stern special" color table from Interactive Data Language software

A set of cyclic color maps:

Colormap	Description
<code>hsv</code>	red-yellow-green-cyan-blue-magenta-red, formed by changing the hue component in the HSV color space
<code>twilight</code>	perceptually uniform shades of white-blue-black-red-white
<code>twilight_shifted</code>	perceptually uniform shades of black-blue-white-red-black

Other miscellaneous schemes:

---

<sup>2</sup> Resembles "BkBlAqGrYeOrReViWh200" from NCAR Command Language. See [Color Table Gallery](#)

Colormap	Description
afmhot	sequential black-orange-yellow-white blackbody spectrum, commonly used in atomic force microscopy
brg	blue-red-green
bwr	diverging blue-white-red
coolwarm	diverging blue-gray-red, meant to avoid issues with 3D shading, color blindness, and ordering of colors <sup>3</sup>
CMRmap	"Default colormaps on color images often reproduce to confusing grayscale images. The proposed colormap maintains an aesthetically pleasing color image that automatically reproduces to a monotonic grayscale with discrete, quantifiable saturation levels." <sup>4</sup>
cubehelix	Unlike most other color schemes cubehelix was designed by D.A. Green to be monotonically increasing in terms of perceived brightness. Also, when printed on a black and white postscript printer, the scheme results in a greyscale with monotonically increasing brightness. This color scheme is named cubehelix because the (r, g, b) values produced can be visualised as a squashed helix around the diagonal in the (r, g, b) color cube.
gnuplot	gnuplot's traditional pm3d scheme (black-blue-red-yellow)
gnuplot2	sequential color printable as gray (black-blue-violet-yellow-white)
ocean	green-blue-white
rainbow	spectral purple-blue-green-yellow-orange-red colormap with diverging luminance
seismic	diverging blue-white-red
nipy_spectral	spectral purple-blue-green-yellow-red-white spectrum, originally from the Neuroimaging in Python project
terrain	mapmaker's colors, blue-green-yellow-brown-white, originally from IGOR Pro
turbo	Spectral map (purple-blue-green-yellow-orange-red) with a bright center and darker endpoints. A smoother alternative to jet.

The following colormaps are redundant and may be removed in future versions. It's recommended to use the names in the descriptions instead, which produce identical output:

Colormap	Description
gist_gray	identical to <i>gray</i>
gist_yarg	identical to <i>gray_r</i>
binary	identical to <i>gray_r</i>

## 18.39 matplotlib.projections

```
class matplotlib.projections.ProjectionRegistry
    Bases: object
```

<sup>3</sup> See [Diverging Color Maps for Scientific Visualization](#) by Kenneth Moreland.

<sup>4</sup> See [A Color Map for Effective Black-and-White Rendering of Color-Scale Images](#) by Carey Rappaport

A mapping of registered projection names to projection classes.

`get_projection_class(self, name)`  
Get a projection class from its *name*.

`get_projection_names(self)`  
Return the names of all projections currently registered.

`register(self, *projections)`  
Register a new set of projections.

`matplotlib.projections.get_projection_class(projection=None)`  
Get a projection class from its name.

If *projection* is *None*, a standard rectilinear projection is returned.

`matplotlib.projections.get_projection_names()`  
Return the names of all projections currently registered.

`matplotlib.projections.register_projection(cls)`

## 18.40 matplotlib.projections.polar

```
class matplotlib.projections.polar.InvertedPolarTransform(axis=None,
                                                         use_rmin=True, _ap-
                                                         ply_theta_transforms=True)
```

Bases: `matplotlib.transforms.Transform`

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`has_inverse = True`

`input_dims = 2`

`inverted(self)`  
Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`output_dims = 2`

`transform_non_affine(self, xy)`  
Apply only the non-affine part of this transformation.  
`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

```
class matplotlib.projections.polar.PolarAffine(scale_transform, limits)
```

Bases: *matplotlib.transforms.Affine2DBase*

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

*limits* is the view limit of the data. The only part of its bounds that is used is the y limits (for the radius limits). The theta range is handled by the non-affine transform.

```
get_matrix(self)
```

Get the matrix for the affine part of this transform.

```
class matplotlib.projections.polar.PolarAxes(*args, theta_offset=0, theta_direction=1,
                                             rlabel_position=22.5, **kwargs)
```

Bases: *matplotlib.axes.\_axes.Axes*

A polar graph projection, where the input dimensions are *theta*, *r*.

Theta starts pointing east and goes anti-clockwise.

Build an axes in a figure.

### Parameters

**fig** [*Figure*] The axes is build in the *Figure* *fig*.

**rect** [[left, bottom, width, height]] The axes is build in the rectangle *rect*. *rect* is in *Figure* coordinates.

**sharex, sharey** [*Axes*, optional] The x or y *axis* is shared with the x or y axis in the input *Axes*.

**frameon** [bool, default: True] Whether the axes frame is visible.

**box\_aspect** [None, or a number, optional] Sets the aspect of the axes box. See *set\_box\_aspect* for details.

**\*\*kwargs** Other optional keyword arguments:

Property	Description
<i>adjustable</i>	{'box', 'datalim'}
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>anchor</i>	2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}
<i>animated</i>	bool
<i>aspect</i>	{'auto'} or num
<i>autoscale_on</i>	bool
<i>autoscalex_on</i>	bool
<i>autoscaley_on</i>	bool
<i>axes_locator</i>	Callable[[Axes, Renderer], Bbox]
<i>axisbelow</i>	bool or 'line'
<i>box_aspect</i>	None, or a number
<i>clip_box</i>	<i>Bbox</i>

Contin

Table 212 – continued from previous page

Property	Description
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>facecolor</i> or <i>fc</i>	color
<i>figure</i>	<i>Figure</i>
<i>frame_on</i>	bool
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>navigate</i>	bool
<i>navigate_mode</i>	unknown
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	[left, bottom, width, height] or <i>Bbox</i>
<i>prop_cycle</i>	unknown
<i>rasterization_zorder</i>	float or None
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>title</i>	str
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>xbound</i>	unknown
<i>xlabel</i>	str
<i>xlim</i>	(bottom: float, top: float)
<i>xmargin</i>	float greater than -0.5
<i>xscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>xticklabels</i>	unknown
<i>xticks</i>	unknown
<i>ybound</i>	unknown
<i>ylabel</i>	str
<i>ylim</i>	(bottom: float, top: float)
<i>ymargin</i>	float greater than -0.5
<i>yscale</i>	{"linear", "log", "symlog", "logit", ...}
<i>yticklabels</i>	unknown
<i>yticks</i>	unknown
<i>zorder</i>	float

**Returns**

*Axes* The new *Axes* object.

```
class InvertedPolarTransform(axis=None, use_rmin=True, _ap-
                             ply_theta_transforms=True)
```

Bases: *matplotlib.transforms.Transform*

The inverse of the polar transform, mapping Cartesian coordinate space *x* and *y* back to *theta* and *r*.

**Parameters**

**shorthand\_name** [str] A string representing the "name" of the trans-

form. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`has_inverse = True`

`input_dims = 2`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

`output_dims = 2`

`transform_non_affine(self, xy)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`.

In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

### Returns

**array** The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`class PolarAffine(scale_transform, limits)`

Bases: `matplotlib.transforms.Affine2DBase`

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

`limits` is the view limit of the data. The only part of its bounds that is used is the y limits (for the radius limits). The theta range is handled by the non-affine transform.

`get_matrix(self)`

Get the matrix for the affine part of this transform.

`class PolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)`

Bases: `matplotlib.transforms.Transform`

The base polar transform. This handles projection *theta* and *r* into Cartesian coordinate space *x* and *y*, but does not perform the ultimate affine transformation into the correct position.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`has_inverse = True`

`input_dims = 2`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

`output_dims = 2`

`transform_non_affine(self, tr)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`.

In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

### Returns

**array** The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_path_non_affine(self, path)`

Apply the non-affine part of this transform to `Path path`, returning a new `Path`.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`class RadialLocator(base, axes=None)`

Bases: `matplotlib.ticker.Locator`

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base `Locator` (which may be different depending on the scale of the *r*-axis).

`autoscale(self)`

[Deprecated]

### Notes

Deprecated since version 3.2:

`nonsingular(self, vmin, vmax)`

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with (`v0`, `v1`) set to the data limits on the axes if the axes contains any data, or (`-inf`, `+inf`) if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If (`v0`, `v1`) == (`-inf`, `+inf`), this method returns appropriate default view limits.
- Otherwise, (`v0`, `v1`) is returned without modification.

`pan(self, numsteps)`

[Deprecated]

### Notes

Deprecated since version 3.3:

```
refresh(self)  
[Deprecated]
```

### Notes

Deprecated since version 3.3:

```
view_limits(self, vmin, vmax)  
    Select a scale for the range from vmin to vmax.  
  
    Subclasses should override this method to change locator behaviour.  
  
zoom(self, direction)  
[Deprecated]
```

### Notes

Deprecated since version 3.3:

```
class ThetaFormatter  
    Bases: matplotlib.ticker.Formatter  
  
    Used to format the theta tick labels. Converts the native unit of radians into degrees  
    and adds a degree symbol.  
  
class ThetaLocator(base)  
    Bases: matplotlib.ticker.Locator  
  
    Used to locate theta ticks.  
  
    This will work the same as the base locator except in the case that the view spans  
    the entire circle. In such cases, the previously used default locations of every 45  
    degrees are returned.  
  
autoscale(self)  
[Deprecated]
```

### Notes

Deprecated since version 3.2:

```
pan(self, numsteps)  
[Deprecated]
```

### Notes

Deprecated since version 3.3:

```
refresh(self)  
[Deprecated] Refresh internal information based on current limits.
```

### Notes

Deprecated since version 3.3.

`set_axis(self, axis)`

`view_limits(self, vmin, vmax)`

Select a scale for the range from `vmin` to `vmax`.

Subclasses should override this method to change locator behaviour.

`zoom(self, direction)`

[*Deprecated*]

### Notes

Deprecated since version 3.3:

`can_pan(self)`

Return *True* if this axes supports the pan/zoom button functionality.

For polar axes, this is slightly misleading. Both panning and zooming are performed by the same button. Panning is performed in azimuth while zooming is done along the radial.

`can_zoom(self)`

Return *True* if this axes supports the zoom box button functionality.

Polar axes do not support zoom boxes.

`cla(self)`

Clear the current axes.

`drag_pan(self, button, key, x, y)`

Called when the mouse moves during a pan operation.

### Parameters

**button** [*MouseButton*] The pressed mouse button.

**key** [str or None] The pressed key, if any.

**x, y** [float] The mouse coordinates in display coords.

### Notes

This is intended to be overridden by new projection types.

`draw(self, renderer, *args, **kwargs)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

**Notes**

This method is overridden in the Artist subclasses.

`end_pan(self)`

Called when a pan operation completes (when the mouse button is up.)

**Notes**

This is intended to be overridden by new projection types.

`format_coord(self, theta, r)`

Return a format string formatting the x, y coordinates.

`get_data_ratio(self)`

Return the aspect ratio of the data itself. For a polar plot, this should always be 1.0

`get_rlabel_position(self)`

**Returns**

**float** The theta position of the radius labels in degrees.

`get_rmax(self)`

**Returns**

**float** Outer radial limit.

`get_rmin(self)`

**Returns**

**float** The inner radial limit.

`get_rorigin(self)`

**Returns**

**float**

`get_rsign(self)`

`get_theta_direction(self)`

Get the direction in which theta increases.

**-1:** Theta increases in the clockwise direction

**1:** Theta increases in the counterclockwise direction

`get_theta_offset(self)`

Get the offset for the location of 0 in radians.

`get_thetamax(self)`

Return the maximum theta limit in degrees.

`get_thetamin(self)`

Get the minimum theta limit in degrees.

`get_xaxis_text1_transform(self, pad)`

**Returns**

**transform** [Transform] The transform used for drawing x-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

**valign** [{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign** [{'center', 'left', 'right'}] The text horizontal alignment.

#### Notes

This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

`get_xaxis_text2_transform(self, pad)`

#### Returns

**transform** [Transform] The transform used for drawing secondary x-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

**valign** [{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign** [{'center', 'left', 'right'}] The text horizontal alignment.

#### Notes

This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

`get_xaxis_transform(self, which='grid')`

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

---

**Note:** This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

`get_yaxis_text1_transform(self, pad)`

#### Returns

**transform** [Transform] The transform used for drawing y-axis labels, which will add *pad\_points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

**valign** [{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign** [{'center', 'left', 'right'}] The text horizontal alignment.

### Notes

This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

```
get_yaxis_text2_transform(self, pad)
```

### Returns

**transform** [Transform] The transform used for drawing secondart y-axis labels, which will add *pad* *points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data corrdinates

**valign** [{'center', 'top', 'bottom', 'baseline', 'center\_baseline'}] The text vertical alignment.

**halign** [{'center', 'left', 'right'}] The text horizontal alignment.

### Notes

This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

```
get_yaxis_transform(self, which='grid')
```

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

---

**Note:** This transformation is primarily used by the [Axis](#) class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

---

```
name = 'polar'
```

```
set_rgrids(self, radii, labels=None, angle=None, fmt=None, **kwargs)
```

Set the radial gridlines on a polar plot.

### Parameters

**radii** [tuple with floats] The radii for the radial gridlines

**labels** [tuple with strings or None] The labels to use at each radial gridline. The [matplotlib.ticker.ScalarFormatter](#) will be used if None.

**angle** [float] The angular position of the radius labels in degrees.

**fmt** [str or None] Format string used in [matplotlib.ticker.FormatStrFormatter](#). For example '%f'.

### Returns

**lines** [list of [lines.Line2D](#)] The radial gridlines.

**labels** [list of [text.Text](#)] The tick labels.

### Other Parameters

**\*\*kwargs** *kwargs* are optional [Text](#) properties for the labels.

**See also:**`PolarAxes.set_thetagrids``Axis.get_gridlines``Axis.get_ticklabels``set_rlabel_position(self, value)`

Update the theta position of the radius labels.

**Parameters****value** [number] The angular position of the radius labels in degrees.`set_rlim(self, bottom=None, top=None, emit=True, auto=False, **kwargs)`See `set_ylim`.`set_rmax(self, rmax)`

Set the outer radial limit.

**Parameters****rmax** [float]`set_rmin(self, rmin)`

Set the inner radial limit.

**Parameters****rmin** [float]`set_rorigin(self, rorigin)`

Update the radial origin.

**Parameters****rorigin** [float]`set_rscale(self, *args, **kwargs)``set_rticks(self, *args, **kwargs)``set_theta_direction(self, direction)`

Set the direction in which theta increases.

**clockwise, -1:** Theta increases in the clockwise direction**counterclockwise, anticlockwise, 1:** Theta increases in the counterclockwise direction`set_theta_offset(self, offset)`

Set the offset for the location of 0 in radians.

`set_theta_zero_location(self, loc, offset=0.0)`

Set the location of theta's zero.

This simply calls `set_theta_offset` with the correct value in radians.**Parameters****loc** [str] May be one of "N", "NW", "W", "SW", "S", "SE", "E", or "NE".**offset** [float, default: 0] An offset in degrees to apply from the specified *loc*. **Note:** this offset is *always* applied counter-clockwise regardless of the direction setting.

`set_thetagrids(self, angles, labels=None, fmt=None, **kwargs)`  
Set the theta gridlines in a polar plot.

#### Parameters

**angles** [tuple with floats, degrees] The angles of the theta gridlines.

**labels** [tuple with strings or None] The labels to use at each theta gridline. The `projections.polar.ThetaFormatter` will be used if None.

**fmt** [str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example `'%f'`. Note that the angle that is used is in radians.

#### Returns

**lines** [list of `lines.Line2D`] The theta gridlines.

**labels** [list of `text.Text`] The tick labels.

#### Other Parameters

**\*\*kwargs** *kwargs* are optional `Text` properties for the labels.

#### See also:

`PolarAxes.set_rgrids`

`Axis.get_gridlines`

`Axis.get_ticklabels`

`set_thetalim(self, *args, **kwargs)`  
Set the minimum and maximum theta values.

Can take the following signatures:

- `set_thetalim(minval, maxval)`: Set the limits in radians.
- `set_thetalim(thetamin=minval, thetamax=maxval)`: Set the limits in degrees.

where `minval` and `maxval` are the minimum and maximum limits. Values are wrapped in to the range  $[0, 2\pi]$  (in radians), so for example it is possible to do `set_thetalim(-np.pi / 2, np.pi / 2)` to have an axes symmetric around 0. A `ValueError` is raised if the absolute angle difference is larger than  $2\pi$ .

`set_thetamax(self, thetamax)`  
Set the maximum theta limit in degrees.

`set_thetamin(self, thetamin)`  
Set the minimum theta limit in degrees.

`set_xscale(self, scale, *args, **kwargs)`  
Set the x-axis scale.

#### Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**\*\*kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`

- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

## Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

```
set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None,
         ymax=None)
```

Set the data limits for the radial axis.

## Parameters

**bottom** [float, optional] The bottom limit (default: None, which leaves the bottom limit unchanged). The bottom and top ylims may be passed as the tuple (*bottom*, *top*) as the first positional argument (or as the *bottom* keyword argument).

**top** [float, optional] The top limit (default: None, which leaves the top limit unchanged).

**emit** [bool, default: True] Whether to notify observers of limit change.

**auto** [bool or None, default: False] Whether to turn on autoscaling of the y-axis. True turns on, False turns off, None leaves unchanged.

**ymin, ymax** [float, optional] These arguments are deprecated and will be removed in a future version. They are equivalent to *bottom* and *top* respectively, and it is an error to pass both *ymin* and *bottom* or *ymax* and *top*.

## Returns

**bottom, top** [(float, float)] The new y-axis limits in data coordinates.

```
set_yscale(self, *args, **kwargs)
```

Set the y-axis scale.

## Parameters

**value** [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**\*\*kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

### Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

`start_pan(self, x, y, button)`

Called when a pan operation has started.

### Parameters

**x, y** [float] The mouse coordinates in display coords.

**button** [*MouseButton*] The pressed mouse button.

### Notes

This is intended to be overridden by new projection types.

```
class matplotlib.projections.polar.PolarTransform(axis=None, use_rmin=True, _ap-  
ply_theta_transforms=True)
```

Bases: *matplotlib.transforms.Transform*

The base polar transform. This handles projection *theta* and *r* into Cartesian coordinate space *x* and *y*, but does not perform the ultimate affine transformation into the correct position.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`has_inverse = True`

`input_dims = 2`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`output_dims = 2`

`transform_non_affine(self, tr)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

`transform_path_non_affine(self, path)`

Apply the non-affine part of this transform to *Path* *path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`class matplotlib.projections.polar.RadialAxis(*args, **kwargs)`

Bases: *matplotlib.axis.YAxis*

A radial Axis.

This overrides certain properties of a *YAxis* to provide special-casing for a radial axis.

### Parameters

**axes** [*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

**pickradius** [float] The acceptance radius for containment tests. See also *Axis.contains*.

`axis_name = 'radius'`

Read-only name identifying the axis.

`cla(self)`

Clear this axis.

`class matplotlib.projections.polar.RadialLocator(base, axes=None)`

Bases: *matplotlib.ticker.Locator*

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base *Locator* (which may be different depending on the scale of the *r*-axis).

`autoscale(self)`

[*Deprecated*]

### Notes

Deprecated since version 3.2:

`nonsingular(self, vmin, vmax)`

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with (*v0*, *v1*) set to the data limits on the axes if the axes contains any data, or (*-inf*, *+inf*) if not.

- If *v0* == *v1* (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If (*v0*, *v1*) == (*-inf*, *+inf*), this method returns appropriate default view limits.
- Otherwise, (*v0*, *v1*) is returned without modification.

`pan(self, numsteps)`

[*Deprecated*]

### Notes

Deprecated since version 3.3:

```
refresh(self)
[Deprecated]
```

### Notes

Deprecated since version 3.3:

```
view_limits(self, vmin, vmax)
    Select a scale for the range from vmin to vmax.

    Subclasses should override this method to change locator behaviour.

zoom(self, direction)
[Deprecated]
```

### Notes

Deprecated since version 3.3:

```
class matplotlib.projections.polar.RadialTick(*args, **kwargs)
    Bases: matplotlib.axes.YTick
```

A radial-axis tick.

This subclass of *YTick* provides radial ticks with some small modification to their re-positioning such that ticks are rotated based on axes limits. This results in ticks that are correctly perpendicular to the spine. Labels are also rotated to be perpendicular to the spine, when 'auto' rotation is enabled.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

```
update_position(self, loc)
    Set the location of tick in data coords with scalar loc.
```

```
class matplotlib.projections.polar.ThetaAxis(*args, **kwargs)
    Bases: matplotlib.axes.XAxis
```

A theta Axis.

This overrides certain properties of an *XAxis* to provide special-casing for an angular axis.

### Parameters

**axes** [*matplotlib.axes.Axes*] The *Axes* to which the created Axis belongs.

**pickradius** [float] The acceptance radius for containment tests. See also *Axis.contains*.

```
axis_name = 'theta'
    Read-only name identifying the axis.

cla(self)
    Clear this axis.
```

```
class matplotlib.projections.polar.ThetaFormatter
```

Bases: *matplotlib.ticker.Formatter*

Used to format the *theta* tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

```
class matplotlib.projections.polar.ThetaLocator(base)
```

Bases: *matplotlib.ticker.Locator*

Used to locate theta ticks.

This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

```
autoscale(self)
```

[*Deprecated*]

#### Notes

Deprecated since version 3.2:

```
pan(self, numsteps)
```

[*Deprecated*]

#### Notes

Deprecated since version 3.3:

```
refresh(self)
```

[*Deprecated*] Refresh internal information based on current limits.

#### Notes

Deprecated since version 3.3.

```
set_axis(self, axis)
```

```
view_limits(self, vmin, vmax)
```

Select a scale for the range from *vmin* to *vmax*.

Subclasses should override this method to change locator behaviour.

```
zoom(self, direction)
```

[*Deprecated*]

#### Notes

Deprecated since version 3.3:

```
class matplotlib.projections.polar.ThetaTick(axes, *args, **kwargs)
```

Bases: *matplotlib.axis.XTick*

A theta-axis tick.

This subclass of `XTick` provides angular ticks with some small modification to their re-positioning such that ticks are rotated based on tick location. This results in ticks that are correctly perpendicular to the arc spine.

When 'auto' rotation is enabled, labels are also rotated to be parallel to the spine. The label padding is also applied here since it's not possible to use a generic axes transform to produce tick-specific padding.

`bbox` is the `Bound2D` bounding box in display coords of the Axes `loc` is the tick location in data coords `size` is the tick size in points

`update_position(self, loc)`

Set the location of tick in data coords with scalar `loc`.

## 18.41 matplotlib.quiver

Support for plotting vector fields.

Presently this contains `Quiver` and `Barb`. `Quiver` plots an arrow in the direction of the vector, with the size of the arrow related to the magnitude of the vector.

`Barbs` are like `quiver` in that they point along a vector, but the magnitude of the vector is given schematically by the presence of barbs or flags on the barb.

This will also become a home for things such as standard deviation ellipses, which can and will be derived very easily from the `Quiver` code.

### 18.41.1 Classes

<code>Quiver(ax, *args[, scale, headwidth, ...])</code>	Specialized <code>PolyCollection</code> for arrows.
<code>QuiverKey(Q, X, Y, U, label, *[, angle, ...])</code>	Labelled arrow for use as a quiver plot scale key.
<code>Barbs(ax, *args[, pivot, length, barbc, ...])</code>	Specialized <code>PolyCollection</code> for barbs.

#### matplotlib.quiver.Quiver

```
class matplotlib.quiver.Quiver(ax, *args, scale=None, headwidth=3, headlength=5,
                               headaxislength=4.5, minshaft=1, minlength=1,
                               units='width', scale_units=None, angles='uv',
                               width=None, color='k', pivot='tail', **kw)
```

Bases: `matplotlib.collections.PolyCollection`

Specialized `PolyCollection` for arrows.

The only API method is `set_UVC()`, which can be used to change the size, orientation, and color of the arrows; their locations are fixed when the class is instantiated. Possibly this method will be useful in animations.

Much of the work in this class is done in the `draw()` method so that as much information as possible is available about the plot. In subsequent `draw()` calls, recalculation is limited to things that might have changed, so there should be no performance penalty from putting the calculations in the `draw()` method.

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

$X$ ,  $Y$  define the arrow locations,  $U$ ,  $V$  define the arrow directions, and  $C$  optionally sets the color.

### Arrow size

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale\_units* parameters.

### Arrow shape

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave *minshaft* alone.

### Arrow outline

*linewidths* and *edgecolors* can be used to customize the arrow outlines.

### Parameters

**X, Y** [1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of  $U$  and  $V$ .

If  $X$  and  $Y$  are 1D but  $U$ ,  $V$  are 2D,  $X$ ,  $Y$  are expanded to 2D using  $x$ ,  $Y = \text{np.meshgrid}(X, Y)$ . In this case  $\text{len}(X)$  and  $\text{len}(Y)$  must match the column and row dimensions of  $U$  and  $V$ .

**U, V** [1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations.  $U$  and  $V$  may be masked. Only locations unmasked in  $U$ ,  $V$ , and  $C$  will be drawn.

**C** [1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of  $C$  must match the number of arrow locations.

**units** [{ 'width', 'height', 'dots', 'inches', 'x', 'y', 'xy' }, default: 'width'] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy':  $X$ ,  $Y$  or  $\sqrt{X^2 + Y^2}$  in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width' or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

**angles** [{ 'uv', 'xy' } or array-like, default: 'uv'] Method for determining the angle of the arrows.

- 'uv': The arrow axis aspect ratio is 1 so that if  $U == V$  the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on X, Y data coordinates.

- 'xy': Arrows point from (x, y) to (x+u, y+v). Use this for plotting a gradient field, for example.
- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

In this case  $U, V$  is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with `angles='xy'`.

**scale** [float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the `scale_units` parameter.

**scale\_units** [{ 'width', 'height', 'dots', 'inches', 'x', 'y', 'xy' }, optional] If the `scale` kwarg is *None*, the arrow length unit. Default is *None*.

e.g. `scale_units` is 'inches', `scale` is 2.0, and  $(u, v) = (1, 0)$ , then the vector will be 0.5 inches long.

If `scale_units` is 'width' or 'height', then the vector will be half the width/height of the axes.

If `scale_units` is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with  $u$  and  $v$  having the same units as  $x$  and  $y$ , use `angles='xy', scale_units='xy', scale=1`.

**width** [float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth** [float, default: 3] Head width as multiple of shaft width.

**headlength** [float, default: 5] Head length as multiple of shaft width.

**headaxislength** [float, default: 4.5] Head length at shaft intersection.

**minshaft** [float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength** [float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot** [{‘tail’, ‘mid’, ‘middle’, ‘tip’}], default: ‘tail’] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

‘mid’ is a synonym for ‘middle’.

**color** [color or color sequence, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection* *facecolor* parameter.

### Other Parameters

**\*\*kwargs** [*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{‘butt’, ‘round’, ‘projecting’}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or ‘face’
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{‘/’, ‘\’, ‘ ’, ‘-’, ‘+’, ‘x’, ‘o’, ‘O’, ‘.’, ‘*’}
<i>in_layout</i>	bool
<i>joinstyle</i>	{‘miter’, ‘round’, ‘bevel’}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str

Table 214 – continued from previous page

Property	Description
<code>urls</code>	list of str or None
<code>visible</code>	bool
<code>zorder</code>	float

**See also:**

`Axes.quiverkey` Add a key to a quiver plot.

```
__init__(self, ax, *args, scale=None, headwidth=3, headlength=5,
          headaxislength=4.5, minshaft=1, minlength=1, units='width',
          scale_units=None, angles='uv', width=None, color='k', pivot='tail',
          **kw)
```

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

*X, Y* define the arrow locations, *U, V* define the arrow directions, and *C* optionally sets the color.

**Arrow size**

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale\_units* parameters.

**Arrow shape**

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave *minshaft* alone.

**Arrow outline**

*linewidths* and *edgecolors* can be used to customize the arrow outlines.

**Parameters**

**X, Y** [1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U, V* are 2D, *X, Y* are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of *U* and *V*.

**U, V** [1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. *U* and *V* may be masked. Only locations unmasked in *U*, *V*, and *C* will be drawn.

**C** [1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *color* instead. The size of *C* must match the number of arrow locations.

**units** [{*'width'*, *'height'*, *'dots'*, *'inches'*, *'x'*, *'y'*, *'xy'*}, default: *'width'*] The arrow dimensions (except for *length*) are measured in multiples of this unit.

The following values are supported:

- *'width'*, *'height'*: The width or height of the axis.
- *'dots'*, *'inches'*: Pixels or inches based on the figure dpi.
- *'x'*, *'y'*, *'xy'*: *X*, *Y* or  $\sqrt{X^2 + Y^2}$  in data units.

The arrows scale differently depending on the units. For *'x'* or *'y'*, the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For *'width'* or *'height'*, the arrow size increases with the width and height of the axes, respectively, when the window is resized; for *'dots'* or *'inches'*, resizing does not change the arrows.

**angles** [{*'uv'*, *'xy'*} or array-like, default: *'uv'*] Method for determining the angle of the arrows.

- *'uv'*: The arrow axis aspect ratio is 1 so that if  $U == V$  the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on *X*, *Y* data coordinates.

- *'xy'*: Arrows point from (*x*, *y*) to (*x*+*u*, *y*+*v*). Use this for plotting a gradient field, for example.
- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

In this case *U*, *V* is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with *angles='xy'*.

**scale** [float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is *None*.

If *None*, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the *scale\_units* parameter.

**scale\_units** [{*'width'*, *'height'*, *'dots'*, *'inches'*, *'x'*, *'y'*, *'xy'*}, optional] If the *scale* kwarg is *None*, the arrow length unit. Default is *None*.

e.g. *scale\_units* is 'inches', *scale* is 2.0, and  $(u, v) = (1, 0)$ , then the vector will be 0.5 inches long.

If *scale\_units* is 'width' or 'height', then the vector will be half the width/height of the axes.

If *scale\_units* is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with *u* and *v* having the same units as *x* and *y*, use *angles*='xy', *scale\_units*='xy', *scale*=1.

**width** [float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth** [float, default: 3] Head width as multiple of shaft width.

**headlength** [float, default: 5] Head length as multiple of shaft width.

**headaxislength** [float, default: 4.5] Head length at shaft intersection.

**minshaft** [float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength** [float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot** [{ 'tail', 'mid', 'middle', 'tip' }, default: 'tail'] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point. 'mid' is a synonym for 'middle'.

**color** [color or color sequence, optional] Explicit color(s) for the arrows. If *C* has been set, *color* has no effect.

This is a synonym for the *PolyCollection* *facecolor* parameter.

### Other Parameters

**\*\*kwargs** [*PolyCollection* properties, optional] All other keyword arguments are passed on to *PolyCollection*:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{ 'butt', 'round', 'projecting' }
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors

Table 215 – continued from previous page

Property	Description
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{ '/', '\', ' ', '-', '+', 'x', 'o', 'O', '.', '*' }
<i>in_layout</i>	bool
<i>joinstyle</i>	{ 'miter', 'round', 'bevel' }
<i>label</i>	object
<i>linestyle</i> or dashes or linestyles or ls	str or tuple or list thereof
<i>linewidth</i> or linewidths or lw	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str

<i>visible</i>	bool
<i>zorder</i>	float

**See also:**

*Axes.quiverkey* Add a key to a quiver plot.

```
__module__ = 'matplotlib.quiver'
ax(self)
[Deprecated]
```

**Notes**

Deprecated since version 3.3:

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

**Parameters**

**renderer** [*RendererBase* subclass.]

**Notes**

This method is overridden in the Artist subclasses.

```
get_datalim(self, transData)
```

```
quiver_doc = "\nPlot a 2D field of arrows.\n\nCall signature::\n\n quiver([X, Y], U, V, [C], **kw)\n"
```

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`set_UVC(self, U, V, C=None)`

#### Examples using `matplotlib.quiver.Quiver`

- `sphx_glr_gallery_images_contours_and_fields_quiver_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py`

#### `matplotlib.quiver.QuiverKey`

```
class matplotlib.quiver.QuiverKey(Q, X, Y, U, label, *, angle=0, coordinates='axes',
                                   color=None, labelsep=0.1, labelpos='N', label-
                                   color=None, fontproperties=None, **kw)
```

Bases: `matplotlib.artist.Artist`

Labelled arrow for use as a quiver plot scale key.

Add a key to a quiver plot.

The positioning of the key depends on `X`, `Y`, `coordinates`, and `labelpos`. If `labelpos` is 'N' or 'S', `X`, `Y` give the position of the middle of the key arrow. If `labelpos` is 'E', `X`, `Y` positions the head, and if `labelpos` is 'W', `X`, `Y` positions the tail; in either of these two cases, `X`, `Y` is somewhere in the middle of the arrow+label key object.

#### Parameters

**Q** [`matplotlib.quiver.Quiver`] A `Quiver` object as returned by a call to `quiver()`.

**X, Y** [float] The location of the key.

**U** [float] The length of the key.

**label** [str] The key label (e.g., length and units of the key).

**angle** [float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

**coordinates** [{ 'axes', 'figure', 'data', 'inches' }, default: 'axes'] Coordinate system and units for `X`, `Y`: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.

**color** [color] Overrides face and edge colors from `Q`.

**labelpos** [{ 'N', 'S', 'E', 'W' }] Position the label above, below, to the right, to the left of the arrow, respectively.

**labelsep** [float, default: 0.1] Distance in inches between the arrow and the label.

**labelcolor** [color, default: `rcParams["text.color"]` (default: 'black')] Label color.

**fontproperties** [dict, optional] A dictionary with keyword arguments accepted by the `FontProperties` initializer: *family*, *style*, *variant*, *size*, *weight*.

**\*\*kwargs** Any additional keyword arguments are used to override vector properties taken from `Q`.

```
__init__(self, Q, X, Y, U, label, *, angle=0, coordinates='axes', color=None, labelsep=0.1, labelpos='N', labelcolor=None, fontproperties=None, **kw)
```

Add a key to a quiver plot.

The positioning of the key depends on *X*, *Y*, *coordinates*, and *labelpos*. If *labelpos* is 'N' or 'S', *X*, *Y* give the position of the middle of the key arrow. If *labelpos* is 'E', *X*, *Y* positions the head, and if *labelpos* is 'W', *X*, *Y* positions the tail; in either of these two cases, *X*, *Y* is somewhere in the middle of the arrow+label key object.

### Parameters

**Q** [`matplotlib.quiver.Quiver`] A `Quiver` object as returned by a call to `quiver()`.

**X, Y** [float] The location of the key.

**U** [float] The length of the key.

**label** [str] The key label (e.g., length and units of the key).

**angle** [float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

**coordinates** [{*'axes'*, *'figure'*, *'data'*, *'inches'*}, default: *'axes'*] Coordinate system and units for *X*, *Y*: *'axes'* and *'figure'* are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; *'data'* are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); *'inches'* is position in the figure in inches, with (0, 0) at the lower left corner.

**color** [color] Overrides face and edge colors from `Q`.

**labelpos** [{*'N'*, *'S'*, *'E'*, *'W'*}] Position the label above, below, to the right, to the left of the arrow, respectively.

**labelsep** [float, default: 0.1] Distance in inches between the arrow and the label.

**labelcolor** [color, default: `rcParams["text.color"]` (default: 'black')] Label color.

**fontproperties** [dict, optional] A dictionary with keyword arguments accepted by the `FontProperties` initializer: *family*, *style*, *variant*, *size*, *weight*.

**\*\*kwargs** Any additional keyword arguments are used to override vector properties taken from `Q`.

```
__module__ = 'matplotlib.quiver'
```

`contains(self, mouseevent)`

Test whether the artist contains the mouse event.

#### Parameters

**mouseevent** [*matplotlib.backend\_bases.MouseEvent*]

#### Returns

**contains** [bool] Whether any values are within the radius.

**details** [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

#### Parameters

**renderer** [*RendererBase* subclass.]

#### Notes

This method is overridden in the Artist subclasses.

`halign = {'E': 'left', 'N': 'center', 'S': 'center', 'W': 'right'}`

`pivot = {'E': 'tip', 'N': 'middle', 'S': 'middle', 'W': 'tail'}`

`property quiverkey_doc`

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with *FigureCanvasBase.draw\_idle*. Call *relim* to update the axes limits if desired.

Note: *relim* will not see collections even if the collection was added to the axes with *autolim = True*.

Note: there is no support for removing the artist's legend entry.

`set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

#### Parameters

**fig** [*Figure*]

`valign = {'E': 'center', 'N': 'bottom', 'S': 'top', 'W': 'center'}`

#### Examples using `matplotlib.quiver.QuiverKey`

- `sphx_glr_gallery_images_contours_and_fields_quiver_demo.py`

**matplotlib.quiver.Barbs**

```
class matplotlib.quiver.Barbs(ax, *args, pivot='tip', length=7, barbcolor=None,
                             flagcolor=None, sizes=None, fill_empty=False,
                             barb_increments=None, rounding=True,
                             flip_barb=False, **kw)
```

Bases: `matplotlib.collections.PolyCollection`

Specialized PolyCollection for barbs.

The only API method is `set_UVC()`, which can be used to change the size, orientation, and color of the arrows. Locations are changed using the `set_offsets()` collection method. Possibly this method will be useful in animations.

There is one internal function `_find_tails()` which finds exactly what should be put on the barb given the vector magnitude. From there `_make_barbs()` is used to find the vertices of the polygon to represent the barb based on this information.

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where *X*, *Y* define the barb locations, *U*, *V* define the barb directions, and *C* optionally sets the color.

All arguments may be 1D or 2D. *U*, *V*, *C* may be masked arrays, but masked *X*, *Y* are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also [https://en.wikipedia.org/wiki/Wind\\_barb](https://en.wikipedia.org/wiki/Wind_barb).

**Parameters**

**X, Y** [1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If  $X$  and  $Y$  are 1D but  $U$ ,  $V$  are 2D,  $X$ ,  $Y$  are expanded to 2D using  $x$ ,  $Y = \text{np.meshgrid}(X, Y)$ . In this case  $\text{len}(X)$  and  $\text{len}(Y)$  must match the column and row dimensions of  $U$  and  $V$ .

**U, V** [1D or 2D array-like] The  $x$  and  $y$  components of the barb shaft.

**C** [1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

**length** [float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

**pivot** [{*'tip'*, *'middle'*} or float, default: *'tip'*] The part of the arrow that is anchored to the  $X$ ,  $Y$  grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

**barbcolor** [color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override *facecolor*.

**flagcolor** [color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override *facecolor*. If this is not set (and  $C$  has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If  $C$  has been set, *flagcolor* has no effect.

**sizes** [dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- *'spacing'* - space between features (flags, full/half barbs)
- *'height'* - height (distance from shaft to top) of a flag or full barb
- *'width'* - width of a flag, twice the width of a full barb
- *'emptybarb'* - radius of the circle used for low magnitudes

**fill\_empty** [bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding** [bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb\_increments** [dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- *'half'* - half barbs (Default is 5)
- *'full'* - full barbs (Default is 10)
- *'flag'* - flags (default is 50)

**flip\_barb** [bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

### Returns

**barbs** [*Barbs*]

### Other Parameters

**\*\*kwargs** The barbs can further be customized using *PolyCollection* key-word arguments:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None

<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool

Table 216 – continued from previous page

Property	Description
<code>zorder</code>	float

```
__init__(self, ax, *args, pivot='tip', length=7, barbcolor=None, flagcolor=None,
          sizes=None, fill_empty=False, barb_increments=None, rounding=True,
          flip_barb=False, **kw)
```

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where  $X, Y$  define the barb locations,  $U, V$  define the barb directions, and  $C$  optionally sets the color.

All arguments may be 1D or 2D.  $U, V, C$  may be masked arrays, but masked  $X, Y$  are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also [https://en.wikipedia.org/wiki/Wind\\_barb](https://en.wikipedia.org/wiki/Wind_barb).

### Parameters

**X, Y** [1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of  $U$  and  $V$ .

If  $X$  and  $Y$  are 1D but  $U, V$  are 2D,  $X, Y$  are expanded to 2D using  $X, Y = \text{np.meshgrid}(X, Y)$ . In this case  $\text{len}(X)$  and  $\text{len}(Y)$  must match the column and row dimensions of  $U$  and  $V$ .

**U, V** [1D or 2D array-like] The x and y components of the barb shaft.

**C** [1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

**length** [float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

**pivot** [{‘tip’, ‘middle’} or float, default: ‘tip’] The part of the arrow that is anchored to the X, Y grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

**barbcolor** [color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However this parameter will override *facecolor*.

**flagcolor** [color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override *facecolor*. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

**sizes** [dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- ‘spacing’ - space between features (flags, full/half barbs)
- ‘height’ - height (distance from shaft to top) of a flag or full barb
- ‘width’ - width of a flag, twice the width of a full barb
- ‘emptybarb’ - radius of the circle used for low magnitudes

**fill\_empty** [bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding** [bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb\_increments** [dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- ‘half’ - half barbs (Default is 5)
- ‘full’ - full barbs (Default is 10)
- ‘flag’ - flags (default is 50)

**flip\_barb** [bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having

these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as  $U$  and  $V$ .

### Returns

**barbs** [*Barbs*]

### Other Parameters

**\*\*kwargs** The barbs can further be customized using *PolyCollection* keyword arguments:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i> or <i>antialiaseds</i>	bool or list of bools
<i>array</i>	ndarray
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clim</i>	(vmin: float, vmax: float)
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>cmap</i>	<i>Colormap</i> or str or None
<i>color</i>	color or list of rgba tuples
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i> or <i>edgecolors</i>	color or list of colors or 'face'
<i>facecolor</i> or <i>facecolors</i> or <i>fc</i>	color or list of colors
<i>figure</i>	<i>Figure</i>
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', '-.', '+', 'x', 'o', 'O', '..', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>dashes</i> or <i>linestyles</i> or <i>ls</i>	str or tuple or list thereof
<i>linewidth</i> or <i>linewidths</i> or <i>lw</i>	float or list of floats
<i>norm</i>	<i>Normalize</i> or None
<i>offset_position</i>	unknown
<i>offsets</i>	array-like (N, 2) or (2,)
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>pickradius</i>	unknown
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>urls</i>	list of str or None
<i>visible</i>	bool
<i>zorder</i>	float

```
__module__ = 'matplotlib.quiver'
```

```
barbs_doc = '\nPlot a 2D field of barbs.\n\nCall signature::\n\n barbs([X, Y], U, V, [C], **kw)\n\n'
set_UVC(self, U, V, C=None)
set_offsets(self, xy)
    Set the offsets for the barb polygons. This saves the offsets passed in and masks
    them as appropriate for the existing U/V data.
```

### Parameters

**xy** [sequence of pairs of floats]

Examples using `matplotlib.quiver.Barbs`

## 18.42 matplotlib.rcsetup

The `rcsetup` module contains the validation code for customization using Matplotlib's rc settings.

Each rc setting is assigned a function used to validate any attempted changes to that setting. The validation functions are defined in the `rcsetup` module, and are used to construct the `rcParams` global object which stores the settings and is referenced throughout Matplotlib.

The default values of the rc settings are set in the default `matplotlibrc` file. Any additions or deletions to the parameter set listed here should also be propagated to the `matplotlibrc` template in Matplotlib's root source directory.

```
class matplotlib.rcsetup.ValidateInStrings(key, valid, ignorecase=False, *, _depre-
                                         cated_since=None)
```

Bases: `object`

*valid* is a list of legal strings.

```
matplotlib.rcsetup.cycler(*args, **kwargs)
```

Create a `Cycler` object much like `cycler.cycler()`, but includes input validation.

Call signatures:

```
cycler(cycler)
cycler(label=values[, label2=values2[, ...]])
cycler(label, values)
```

Form 1 copies a given `Cycler` object.

Form 2 creates a `Cycler` which cycles over one or more properties simultaneously. If multiple properties are given, their value lists must have the same length.

Form 3 creates a `Cycler` for a single property. This form exists for compatibility with the original `cycler`. Its use is discouraged in favor of the kwarg form, i.e. `cycler(label=values)`.

### Parameters

**cycler** [`Cycler`] Copy constructor for `Cycler`.

**label** [`str`] The property key. Must be a valid `Artist` property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.

**values** [iterable] Finite-length iterable of the property values. These values are validated and will raise a `ValueError` if invalid.

### Returns

**Cycler** A new `Cycler` for the given properties.

### Examples

Creating a cycler for a single property:

```
>>> c = cycler(color=['red', 'green', 'blue'])
```

Creating a cycler for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```
>>> c = cycler(color=['red', 'green', 'blue'],
...            marker=['o', '+', 'x'])
```

`matplotlib.rcsetup.update_savefig_format(value)`  
[*Deprecated*]

### Notes

Deprecated since version 3.2:

`matplotlib.rcsetup.validate_animation_writer_path(p)`  
[*Deprecated*]

### Notes

Deprecated since version 3.2:

`matplotlib.rcsetup.validate_any(s)`  
`matplotlib.rcsetup.validate_anypoint(s)`  
`matplotlib.rcsetup.validate_aspect(s)`  
`matplotlib.rcsetup.validate_axisbelow(s)`  
`matplotlib.rcsetup.validate_backend(s)`  
`matplotlib.rcsetup.validate_bbox(s)`  
`matplotlib.rcsetup.validate_bool(b)`  
Convert `b` to `bool` or raise.  
`matplotlib.rcsetup.validate_bool_maybe_none(b)`  
[*Deprecated*] Convert `b` to `bool` or raise, passing through *None*.

### Notes

Deprecated since version 3.3.

`matplotlib.rcsetup.validate_capstyle(s)`

---

```

matplotlib.rcsetup.validate_capstylelist(S)
matplotlib.rcsetup.validate_color(S)
    Return a valid color arg.
matplotlib.rcsetup.validate_color_for_prop_cycle(S)
matplotlib.rcsetup.validate_color_or_auto(S)
matplotlib.rcsetup.validate_color_or_inherit(S)
    Return a valid color arg.
matplotlib.rcsetup.validate_colorlist(S)
    return a list of colorspecs
matplotlib.rcsetup.validate_cycler(S)
    Return a Cycler object from a string repr or the object itself.
matplotlib.rcsetup.validate_dashlist(S)
    return a list of floats
matplotlib.rcsetup.validate_dpi(S)
    Confirm s is string 'figure' or convert s to float or raise.
matplotlib.rcsetup.validate_fillstylelist(S)
matplotlib.rcsetup.validate_float(S)
matplotlib.rcsetup.validate_float_or_None(S)
matplotlib.rcsetup.validate_floatlist(S)
    return a list of floats
matplotlib.rcsetup.validate_font_properties(S)
matplotlib.rcsetup.validate_fontsize(S)
matplotlib.rcsetup.validate_fontsize_None(S)
matplotlib.rcsetup.validate_fontsizelist(S)
matplotlib.rcsetup.validate_fonttype(S)
    Confirm that this is a Postscript or PDF font type that we know how to convert to.
matplotlib.rcsetup.validate_fontweight(S)
matplotlib.rcsetup.validate_hatch(S)
    Validate a hatch pattern. A hatch pattern string can have any sequence of the following
    characters: \ / | - + * . x o 0.
matplotlib.rcsetup.validate_hatchlist(S)
    Validate a hatch pattern. A hatch pattern string can have any sequence of the following
    characters: \ / | - + * . x o 0.
matplotlib.rcsetup.validate_hinting(S)
    [Deprecated]

```

### Notes

Deprecated since version 3.3:

```

matplotlib.rcsetup.validate_hist_bins(S)
matplotlib.rcsetup.validate_int(S)

```

`matplotlib.rcsetup.validate_int_or_None(s)`

`matplotlib.rcsetup.validate_joinstyle(s)`

`matplotlib.rcsetup.validate_joinstylelist(s)`

`matplotlib.rcsetup.validate_markevery(s)`

Validate the markevery property of a Line2D object.

**Parameters**

**s** [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,  
list of ints

**Returns**

**None, int, float, slice, length-2 tuple of ints,** length-2 tuple of floats,  
list of ints

`matplotlib.rcsetup.validate_markeverylist(s)`

Validate the markevery property of a Line2D object.

**Parameters**

**s** [None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats,  
list of ints

**Returns**

**None, int, float, slice, length-2 tuple of ints,** length-2 tuple of floats,  
list of ints

`matplotlib.rcsetup.validate_movie_writer(s)`

*[Deprecated]*

**Notes**

Deprecated since version 3.3:

`matplotlib.rcsetup.validate_nseq_float(n)`

*[Deprecated]*

**Notes**

Deprecated since version 3.3:

`matplotlib.rcsetup.validate_nseq_int(n)`

*[Deprecated]*

**Notes**

Deprecated since version 3.3:

`matplotlib.rcsetup.validate_path_exists(s)`

*[Deprecated]* If s is a path, return s, else False

## Notes

Deprecated since version 3.2.

```

matplotlib.rcsetup.validate_ps_distiller(s)
matplotlib.rcsetup.validate_sketch(s)
matplotlib.rcsetup.validate_string(s)
matplotlib.rcsetup.validate_string_or_None(s)
matplotlib.rcsetup.validate_stringlist(s)
    return a list of strings
matplotlib.rcsetup.validate_webagg_address(s)
    [Deprecated]

```

## Notes

Deprecated since version 3.3:

```
matplotlib.rcsetup.validate_whiskers(s)
```

## 18.43 matplotlib.sankey

Module for creating Sankey diagrams using Matplotlib.

```

class matplotlib.sankey.Sankey(ax=None,    scale=1.0,    unit="",    format='%G',
                               gap=0.25,  radius=0.1,  shoulder=0.03, offset=0.15,
                               head_angle=100, margin=0.4, tolerance=1e-06,
                               **kwargs)

```

Bases: `object`

Sankey diagram.

Sankey diagrams are a specific type of flow diagram, in which the width of the arrows is shown proportionally to the flow quantity. They are typically used to visualize energy or material or cost transfers between processes. [Wikipedia \(6/1/2011\)](#)

Create a new Sankey instance.

The optional arguments listed below are applied to all subdiagrams so that there is consistent alignment and formatting.

In order to draw a complex Sankey diagram, create an instance of *Sankey* by calling it without any kwargs:

```
sankey = Sankey()
```

Then add simple Sankey sub-diagrams:

```

sankey.add() # 1
sankey.add() # 2
#...
sankey.add() # n

```

Finally, create the full diagram:

```
sankey.finish()
```

Or, instead, simply daisy-chain those calls:

```
Sankey().add().add... .add().finish()
```

### Other Parameters

**ax** [*Axes*] Axes onto which the data should be plotted. If *ax* isn't provided, new Axes will be created.

**scale** [float] Scaling factor for the flows. *scale* sizes the width of the paths in order to maintain proper layout. The same scale is applied to all subdiagrams. The value should be chosen such that the product of the scale and the sum of the inputs is approximately 1.0 (and the product of the scale and the sum of the outputs is approximately -1.0).

**unit** [str] The physical unit associated with the flow quantities. If *unit* is None, then none of the quantities are labeled.

**format** [str] A Python number formatting string to be used in labeling the flow as a quantity (i.e., a number times a unit, where the unit is given).

**gap** [float] Space between paths that break in/break away to/from the top or bottom.

**radius** [float] Inner radius of the vertical paths.

**shoulder** [float] Size of the shoulders of output arrows.

**offset** [float] Text offset (from the dip or tip of the arrow).

**head\_angle** [float] Angle, in degrees, of the arrow heads (and negative of the angle of the tails).

**margin** [float] Minimum space between Sankey outlines and the edge of the plot area.

**tolerance** [float] Acceptable maximum of the magnitude of the sum of flows. The magnitude of the sum of connected flows cannot be greater than *tolerance*.

**\*\*kwargs** Any additional keyword arguments will be passed to *add()*, which will create the first subdiagram.

### See also:

[\*Sankey.add\*](#)

[\*Sankey.finish\*](#)

### Examples

```
add(self, patchlabel="", flows=None, orientations=None, labels="", trunk-
length=1.0, pathlengths=0.25, prior=None, connect=(0, 0), rotation=0,
**kwargs)
```

Add a simple Sankey diagram with flows at the same hierarchical level.

The default settings produce a diagram like this.

### Parameters

**patchlabel** [str] Label to be placed at the center of the diagram. Note that *label* (not *patchlabel*) can be passed as keyword argument to create an entry in the legend.

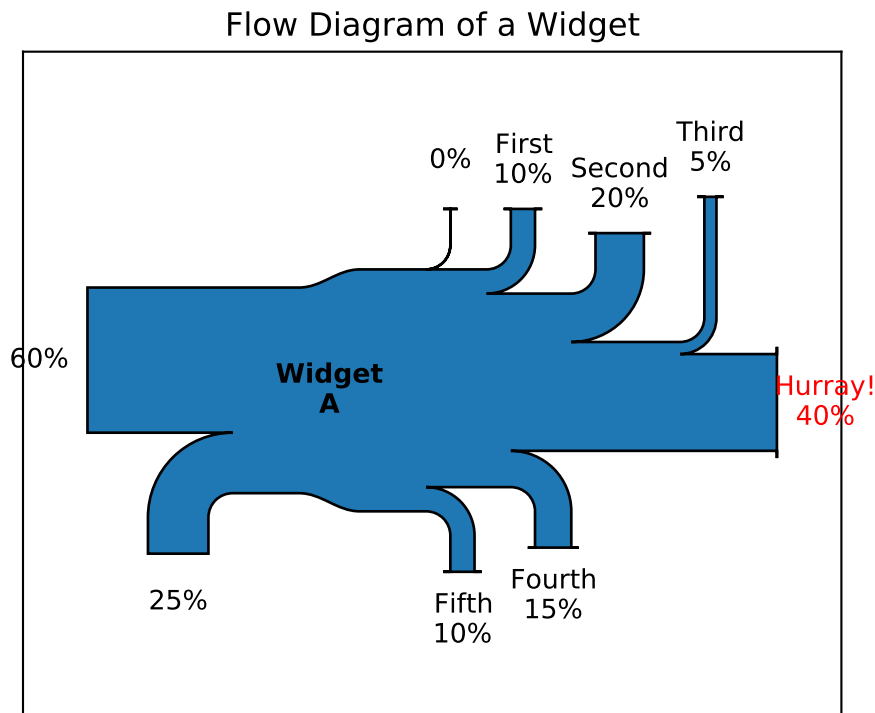

**flows** [list of float] Array of flow values. By convention, inputs are positive and outputs are negative.

Flows are placed along the top of the diagram from the inside out in order of their index within *flows*. They are placed along the sides of the diagram from the top down and along the bottom from the outside in.

If the sum of the inputs and outputs is nonzero, the discrepancy will appear as a cubic Bezier curve along the top and bottom edges of the trunk.

**orientations** [list of {-1, 0, 1}] List of orientations of the flows (or a single orientation to be used for all flows). Valid values are 0 (inputs from the left, outputs to the right), 1 (from and to the top) or -1 (from and to the bottom).

**labels** [list of (str or None)] List of labels for the flows (or a single label to be used for all flows). Each label may be *None* (no label), or a labeling string. If an entry is a (possibly empty) string, then the quantity for the corresponding flow will be shown below the string. However, if the *unit* of the main diagram is *None*, then quantities

are never shown, regardless of the value of this argument.

**trunklength** [float] Length between the bases of the input and output groups (in data-space units).

**pathlengths** [list of float] List of lengths of the vertical arrows before break-in or after break-away. If a single value is given, then it will be applied to the first (inside) paths on the top and bottom, and the length of all other arrows will be justified accordingly. The *pathlengths* are not applied to the horizontal inputs and outputs.

**prior** [int] Index of the prior diagram to which this diagram should be connected.

**connect** [(int, int)] A (prior, this) tuple indexing the flow of the prior diagram and the flow of this diagram which should be connected. If this is the first diagram or *prior* is *None*, *connect* will be ignored.

**rotation** [float] Angle of rotation of the diagram in degrees. The interpretation of the *orientations* argument will be rotated accordingly (e.g., if *rotation* == 90, an *orientations* entry of 1 means to/from the left). *rotation* is ignored if this diagram is connected to an existing one (using *prior* and *connect*).

### Returns

**Sankey** The current *Sankey* instance.

### Other Parameters

**\*\*kwargs** Additional keyword arguments set `matplotlib.patches.PathPatch` properties, listed below. For example, one may want to use `fill=False` or `label="A legend entry"`.

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>antialiased</code> or <code>aa</code>	unknown
<code>capstyle</code>	{'butt', 'round', 'projecting'}
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code>	color
<code>contains</code>	unknown
<code>edgecolor</code> or <code>ec</code>	color or None or 'auto'
<code>facecolor</code> or <code>fc</code>	color or None
<code>figure</code>	<code>Figure</code>
<code>fill</code>	bool
<code>gid</code>	str
<code>hatch</code>	{'/', '\\', ' ', '-', '+', 'x', 'o', 'O', '.', '*'}
<code>in_layout</code>	bool
<code>joinstyle</code>	{'miter', 'round', 'bevel'}

Continued

Table 218 – continued from previous page

Property	Description
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{ '-', '—', '-.', ':', '', (offset, on-off-seq), ... }
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

**See also:***Sankey.finish*`finish(self)`

Adjust the axes and return a list of information about the Sankey subdiagram(s).

Return value is a list of subdiagrams represented with the following fields:

Field	Description
<i>patch</i>	Sankey outline (an instance of <i>PathPatch</i> )
<i>flows</i>	values of the flows (positive for input, negative for output)
<i>angles</i>	list of angles of the arrows [deg/90] For example, if the diagram has not been rotated, an input to the top side will have an angle of 3 (DOWN), and an output from the top side will have an angle of 1 (UP). If a flow has been skipped (because its magnitude is less than <i>tolerance</i> ), then its angle will be <i>None</i> .
<i>tips</i>	array in which each row is an [x, y] pair indicating the positions of the tips (or "dips") of the flow paths If the magnitude of a flow is less the <i>tolerance</i> for the instance of <i>Sankey</i> , the flow is skipped and its tip will be at the center of the diagram.
<i>text</i>	<i>Text</i> instance for the label of the diagram
<i>texts</i>	list of <i>Text</i> instances for the labels of flows

**See also:***Sankey.add*

## 18.44 matplotlib.scale

Scales define the distribution of data values on an axis, e.g. a log scaling.

They are attached to an *Axis* and hold a *Transform*, which is responsible for the actual data transformation.See also *axes.Axes.set\_xscale* and the scales examples in the documentation.

```
class matplotlib.scale.FuncScale(axis, functions)
```

Bases: *matplotlib.scale.ScaleBase*

Provide an arbitrary scale with user-supplied function for the axis.

### Parameters

**axis** [*Axis*] The axis for the scale.

**functions** [(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```
def forward(values: array-like) -> array-like
```

```
get_transform(self)
```

Return the *FuncTransform* associated with this scale.

```
name = 'function'
```

```
set_default_locators_and_formatters(self, axis)
```

Set the locators and formatters of *axis* to instances suitable for this scale.

```
class matplotlib.scale.FuncScaleLog(axis, functions, base=10)
```

Bases: *matplotlib.scale.LogScale*

Provide an arbitrary scale with user-supplied function for the axis and then put on a logarithmic axes.

### Parameters

**axis** [*matplotlib.axis.Axis*] The axis for the scale.

**functions** [(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

Both functions must have the signature:

```
def forward(values: array-like) -> array-like
```

**base** [float, default: 10] Logarithmic base of the scale.

```
property base
```

```
get_transform(self)
```

Return the *Transform* associated with this scale.

```
name = 'functionlog'
```

```
class matplotlib.scale.FuncTransform(forward, inverse)
```

Bases: *matplotlib.transforms.Transform*

A simple transform that takes an arbitrary function for the forward and inverse transform.

### Parameters

**forward** [callable] The forward function for the transform. This function must have an inverse and, for best behavior, be monotonic. It must have the signature:

```
def forward(values: array-like) -> array-like
```

**inverse** [callable] The inverse of the forward function. Signature as forward.

`has_inverse = True`

`input_dims = 1`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = True`

`output_dims = 1`

`transform_non_affine(self, values)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

```
class matplotlib.scale.InvertedLogTransform(base)
```

Bases: *matplotlib.transforms.Transform*

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`has_inverse = True`

`input_dims = 1`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = True`

`output_dims = 1`

`transform_non_affine(self, a)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

```
class matplotlib.scale.InvertedSymmetricalLogTransform(base, linthresh, linscale)
```

Bases: *matplotlib.transforms.Transform*

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
has_inverse = True
```

```
input_dims = 1
```

```
inverted(self)
```

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
is_separable = True
```

```
output_dims = 1
```

```
transform_non_affine(self, a)
```

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

```
class matplotlib.scale.LinearScale(axis, **kwargs)
```

Bases: *matplotlib.scale.ScaleBase*

The default linear scale.

```
get_transform(self)
```

Return the transform for linear scaling, which is just the *IdentityTransform*.

```
name = 'linear'
```

```
set_default_locators_and_formatters(self, axis)
```

Set the locators and formatters of *axis* to instances suitable for this scale.

```
class matplotlib.scale.LogScale(axis, **kwargs)
```

Bases: [\*matplotlib.scale.ScaleBase\*](#)

A standard logarithmic scale. Care is taken to only plot positive values.

### Parameters

**axis** [*Axis*] The axis for the scale.

**base** [float, default: 10] The base of the logarithm.

**nonpositive** [{‘clip’, ‘mask’}, default: ‘clip’] Determines the behavior for non-positive values. They can either be masked as invalid, or clipped to a very small positive number.

**subs** [sequence of int, default: None] Where to place the subticks between each major tick. For example, in a log10 scale, [2, 3, 4, 5, 6, 7, 8, 9] will place 8 logarithmically spaced minor ticks between each major tick.

property *InvertedLogTransform*

property *LogTransform*

property *base*

```
get_transform(self)
```

Return the *LogTransform* associated with this scale.

```
limit_range_for_scale(self, vmin, vmax, minpos)
```

Limit the domain to positive values.

```
name = 'log'
```

```
set_default_locators_and_formatters(self, axis)
```

Set the locators and formatters of *axis* to instances suitable for this scale.

```
class matplotlib.scale.LogTransform(base, nonpositive='clip')
```

Bases: [\*matplotlib.transforms.Transform\*](#)

### Parameters

**shorthand\_name** [str] A string representing the “name” of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
has_inverse = True
```

```
input_dims = 1
```

```
inverted(self)
```

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
is_separable = True
```

```
output_dims = 1
```

`transform_non_affine(self, a)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

`class matplotlib.scale.LogisticTransform(nonpositive='mask')`

Bases: `matplotlib.transforms.Transform`

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`has_inverse = True`

`input_dims = 1`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = True`

`output_dims = 1`

`transform_non_affine(self, a)`

logistic transform (base 10)

`class matplotlib.scale.LogitScale(axis, nonpositive='mask', *, one_half='\\frac{1}{2}', use_overline=False)`

Bases: `matplotlib.scale.ScaleBase`

Logit scale for data between zero and one, both excluded.

This scale is similar to a log scale close to zero and to one, and almost linear around 0.5. It maps the interval `]0, 1[` onto `] -infty, +infty[`.

### Parameters

**axis** [`matplotlib.axis.Axis`] Currently unused.

**nonpositive** [{`'mask'`, `'clip'`}] Determines the behavior for values beyond the open interval `]0, 1[`. They can either be masked as invalid, or clipped to a number very close to 0 or 1.

**use\_overline** [bool, default: False] Indicate the usage of survival notation (`overline{x}`) in place of standard notation `(1-x)` for probability close to one.

**one\_half** [str, default: `r"frac{1}{2}"`] The string used for ticks formatter to represent 1/2.

`get_transform(self)`

Return the *LogitTransform* associated with this scale.

`limit_range_for_scale(self, vmin, vmax, minpos)`

Limit the domain to values between 0 and 1 (excluded).

`name = 'logit'`

`set_default_locators_and_formatters(self, axis)`

Set the locators and formatters of *axis* to instances suitable for this scale.

`class matplotlib.scale.LogitTransform(nonpositive='mask')`

Bases: *matplotlib.transforms.Transform*

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`has_inverse = True`

`input_dims = 1`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

`is_separable = True`

`output_dims = 1`

`transform_non_affine(self, a)`

logit transform (base 10), masked or clipped

`class matplotlib.scale.ScaleBase(axis, **kwargs)`

Bases: *object*

The base class for all scales.

Scales are separable transformations, working on a single dimension.

Any subclasses will want to override:

- `name`
- `get_transform()`
- `set_default_locators_and_formatters()`

And optionally:

- `limit_range_for_scale()`

Construct a new scale.

## Notes

The following note is for scale implementors.

For back-compatibility reasons, scales take an *Axis* object as first argument. However, this argument should not be used: a single scale object should be usable by multiple *Axes* at the same time.

`get_transform(self)`

Return the *Transform* object associated with this scale.

`limit_range_for_scale(self, vmin, vmax, minpos)`

Return the range *vmin*, *vmax*, restricted to the domain supported by this scale (if any).

*minpos* should be the minimum positive value in the data. This is used by log scales to determine a minimum value.

`set_default_locators_and_formatters(self, axis)`

Set the locators and formatters of *axis* to instances suitable for this scale.

`class matplotlib.scale.SymmetricalLogScale(axis, **kwargs)`

Bases: *matplotlib.scale.ScaleBase*

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter *linthresh* allows the user to specify the size of this range (*-linthresh*, *linthresh*).

## Parameters

**base** [float, default: 10] The base of the logarithm.

**linthresh** [float, default: 2] Defines the range (*-x*, *x*), within which the plot is linear. This avoids having the plot go to infinity around zero.

**subs** [sequence of int] Where to place the subticks between each major tick. For example, in a log10 scale: [2, 3, 4, 5, 6, 7, 8, 9] will place 8 logarithmically spaced minor ticks between each major tick.

**linscale** [float, optional] This allows the linear range (*-linthresh*, *linthresh*) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when *linscale* == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

Construct a new scale.

## Notes

The following note is for scale implementors.

For back-compatibility reasons, scales take an *Axis* object as first argument. However, this argument should not be used: a single scale object should be usable by multiple *Axes* at the same time.

property *InvertedSymmetricalLogTransform*

```
property SymmetricalLogTransform
property base
get_transform(self)
    Return the SymmetricalLogTransform associated with this scale.
property linscale
property linthresh
name = 'symlog'
set_default_locators_and_formatters(self, axis)
    Set the locators and formatters of axis to instances suitable for this scale.
```

```
class matplotlib.scale.SymmetricalLogTransform(base, linthresh, linscale)
```

```
    Bases: matplotlib.transforms.Transform
```

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
has_inverse = True
```

```
input_dims = 1
```

```
inverted(self)
```

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
is_separable = True
```

```
output_dims = 1
```

```
transform_non_affine(self, a)
```

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

```
matplotlib.scale.get_scale_names()
```

Return the names of the available scales.

```
matplotlib.scale.register_scale(scale_class)
```

Register a new kind of scale.

### Parameters

**scale\_class** [subclass of *ScaleBase*] The scale to register.

`matplotlib.scale.scale_factory(scale, axis, **kwargs)`  
Return a scale class by name.

#### Parameters

**scale** [{`'function'`, `'functionlog'`, `'linear'`, `'log'`, `'logit'`, `'symlog'`}]

**axis** [*matplotlib.axis.Axis*]

## 18.45 matplotlib.sphinxext.plot\_directive

### 18.45.1 A directive for including a Matplotlib plot in a Sphinx document

By default, in HTML output, `plot` will include a `.png` file with a link to a high-res `.png` and `.pdf`. In LaTeX output, it will include a `.pdf`.

The source code for the plot may be included in one of three ways:

1. **A path to a source file** as the argument to the directive:

```
.. plot:: path/to/plot.py
```

When a path to a source file is given, the content of the directive may optionally contain a caption for the plot:

```
.. plot:: path/to/plot.py

   The plot's caption.
```

Additionally, one may specify the name of a function to call (with no arguments) immediately after importing the module:

```
.. plot:: path/to/plot.py plot_function1
```

2. Included as **inline content** to the directive:

```
.. plot::

    import matplotlib.pyplot as plt
    import matplotlib.image as mpimg
    import numpy as np
    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
```

3. Using **doctest** syntax:

```
.. plot::

    A plotting example:
    >>> import matplotlib.pyplot as plt
    >>> plt.plot([1, 2, 3], [4, 5, 6])
```

## Options

The `plot` directive supports the following options:

**format** [{`'python'`, `'doctest'`}] The format of the input.

**include-source** [bool] Whether to display the source code. The default can be changed using the `plot_include_source` variable in `conf.py`.

**encoding** [str] If this source file is in a non-UTF8 or non-ASCII encoding, the encoding must be specified using the `:encoding:` option. The encoding will not be inferred using the `-*- coding -*-` metacomment.

**context** [bool or str] If provided, the code will be run in the context of all previous plot directives for which the `:context:` option was specified. This only applies to inline code plot directives, not those run from files. If the `:context: reset` option is specified, the context is reset for this and future plots, and previous figures are closed prior to running the code. `:context: close-figs` keeps the context but closes previous figures before running the code.

**nofigs** [bool] If specified, the code block will be run, but no figures will be inserted. This is usually useful with the `:context:` option.

Additionally, this directive supports all of the options of the `image` directive, except for *target* (since plot will add its own target). These include *alt*, *height*, *width*, *scale*, *align* and *class*.

## Configuration options

The plot directive has the following configuration options:

**plot\_include\_source** Default value for the include-source option

**plot\_html\_show\_source\_link** Whether to show a link to the source in HTML.

**plot\_pre\_code** Code that should be executed before each plot. If not specified or None it will default to a string containing:

```
import numpy as np
from matplotlib import pyplot as plt
```

**plot\_basedir** Base directory, to which `plot::` file names are relative to. (If None or empty, file names are relative to the directory where the file containing the directive is.)

**plot\_formats** File formats to generate. List of tuples or strings:

```
[(suffix, dpi), suffix, ...]
```

that determine the file format and the DPI. For entries whose DPI was omitted, sensible defaults are chosen. When passing from the command line through `sphinx_build` the list should be passed as `suffix:dpi,suffix:dpi, ...`

**plot\_html\_show\_formats** Whether to show links to the files in HTML.

**plot\_rcparams** A dictionary containing any non-standard rcParams that should be applied before each plot.

**plot\_apply\_rcparams** By default, rcParams are applied when `:context:` option is not used in a plot directive. This configuration option overrides this behavior and applies rcParams before each plot.

**plot\_working\_directory** By default, the working directory will be changed to the directory of the example, so the code can get at its data files, if any. Also its path will be added to `sys.path` so it can import any helper modules sitting beside it. This configuration option can be used to specify a central directory (also added to `sys.path`) where data files and helper modules for all code are located.

**plot\_template** Provide a customized template for preparing restructured text.

```
class matplotlib.sphinxext.plot_directive.PlotDirective(name, arguments, op-
                                                         tions, content, lineno, con-
                                                         tent_offset, block_text, state,
                                                         state_machine)
```

The `.. plot::` directive, as documented in the module's docstring.

```
run(self)
```

Run the plot directive.

```
exception matplotlib.sphinxext.plot_directive.PlotError
```

```
matplotlib.sphinxext.plot_directive.mark_plot_labels(app, document)
```

To make plots referenceable, we need to move the reference from the "htmlonly" (or "latexonly") node to the actual figure node itself.

```
matplotlib.sphinxext.plot_directive.out_of_date(original, derived)
```

Return whether *derived* is out-of-date relative to *original*, both of which are full file paths.

```
matplotlib.sphinxext.plot_directive.render_figures(code, code_path, output_dir, out-
                                                         put_base, context, function_name,
                                                         config, context_reset=False,
                                                         close_figs=False)
```

Run a pyplot script and save the images in *output\_dir*.

Save the images under *output\_dir* with file names derived from *output\_base*

```
matplotlib.sphinxext.plot_directive.run_code(code, code_path, ns=None, func-
                                                         tion_name=None)
```

Import a Python module from a path, and run the function given by name, if function\_name is not None.

```
matplotlib.sphinxext.plot_directive.split_code_at_show(text)
```

Split code at `plt.show()`.

```
matplotlib.sphinxext.plot_directive.unescape_doctest(text)
```

Extract code from a piece of text, which contains either Python code or doctests.

## 18.46 matplotlib.spines

```
class matplotlib.spines.Spine(axes, spine_type, path, **kwargs)
```

Bases: `matplotlib.patches.Patch`

An axis spine – the line noting the data area boundaries.

Spines are the lines connecting the axis tick marks and noting the boundaries of the data area. They can be placed at arbitrary positions. See `set_position` for more information.

The default position is ('outward', 0).

Spines are subclasses of `Patch`, and inherit much of their behavior.

Spines draw a line, a circle, or an arc depending if `set_patch_line`, `set_patch_circle`, or `set_patch_arc` has been called. Line-like is the default.

### Parameters

**axes** [*Axes*] The *Axes* instance containing the spine.

**spine\_type** [str] The spine type.

**path** [*Path*] The *Path* instance used to draw the spine.

### Other Parameters

**\*\*kwargs** Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>antialiased</i> or <i>aa</i>	unknown
<i>capstyle</i>	{'butt', 'round', 'projecting'}
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i>	color
<i>contains</i>	unknown
<i>edgecolor</i> or <i>ec</i>	color or None or 'auto'
<i>facecolor</i> or <i>fc</i>	color or None
<i>figure</i>	<i>Figure</i>
<i>fill</i>	bool
<i>gid</i>	str
<i>hatch</i>	{'/', '\', ' ', ',-', '+', 'x', 'o', 'O', '.', '*'}
<i>in_layout</i>	bool
<i>joinstyle</i>	{'miter', 'round', 'bevel'}
<i>label</i>	object
<i>linestyle</i> or <i>ls</i>	{'-', '--', '-.', ':', ' ', (offset, on-off-seq), ...}
<i>linewidth</i> or <i>lw</i>	float or None
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

```
classmethod arc_spine(axes, spine_type, center, radius, theta1, theta2, **kwargs)
```

Create and return an arc *Spine*.

```
classmethod circular_spine(axes, center, radius, **kwargs)
```

Create and return a circular *Spine*.

```
cla(self)
```

Clear the current spine.

```
draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

*get\_bounds(self)*

Get the bounds of the spine.

*get\_patch\_transform(self)*

Return the *Transform* instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

*get\_path(self)*

Return the path of this patch.

*get\_position(self)*

Return the spine position.

*get\_smart\_bounds(self)*

[*Deprecated*] Return whether the spine has smart bounds.

### Notes

Deprecated since version 3.2.

*get\_spine\_transform(self)*

Return the spine transform.

*get\_window\_extent(self, renderer=None)*

Return the window extent of the spines in display space, including padding for ticks (but not their labels)

### See also:

*matplotlib.axes.Axes.get\_tightbbox*

*matplotlib.axes.Axes.get\_window\_extent*

*classmethod linear\_spine(axes, spine\_type, \*\*kwargs)*

Create and return a linear *Spine*.

*register\_axis(self, axis)*

Register an axis.

An axis should be registered with its corresponding spine from the Axes instance. This allows the spine to clear any axis properties when needed.

*set\_bounds(self, low=None, high=None)*

Set the spine bounds.

**Parameters**

**low** [float or None, optional] The lower spine bound. Passing *None* leaves the limit unchanged.

The bounds may also be passed as the tuple (*low*, *high*) as the first positional argument.

**high** [float or None, optional] The higher spine bound. Passing *None* leaves the limit unchanged.

`set_color(self, c)`  
Set the edgecolor.

**Parameters**

**c** [color]

**Notes**

This method does not modify the facecolor (which defaults to "none"), unlike the `Patch.set_color` method defined in the parent class. Use `Patch.set_facecolor` to set the facecolor.

`set_patch_arc(self, center, radius, theta1, theta2)`  
Set the spine to be arc-like.

`set_patch_circle(self, center, radius)`  
Set the spine to be circular.

`set_patch_line(self)`  
Set the spine to be linear.

`set_position(self, position)`  
Set the position of the spine.

Spine position is specified by a 2 tuple of (position type, amount). The position types are:

- 'outward': place the spine out from the data area by the specified number of points. (Negative values place the spine inwards.)
- 'axes': place the spine at the specified Axes coordinate (0 to 1).
- 'data': place the spine at the specified data coordinate.

Additionally, shorthand notations define a special positions:

- 'center' -> ('axes', 0.5)
- 'zero' -> ('data', 0.0)

`set_smart_bounds(self, value)`  
[Deprecated] Set the spine and associated axis to have smart bounds.

**Notes**

Deprecated since version 3.2.

## 18.47 matplotlib.style

Styles are predefined sets of *rcParams* that define the visual appearance of a plot.

*Customizing Matplotlib with style sheets and rcParams* describes the mechanism and usage of styles.

The `/gallery/style_sheets/style_sheets_reference` gives an overview of the builtin styles.

`matplotlib.style.context(style, after_reset=False)`

Context manager for using style settings temporarily.

### Parameters

**style** [str, dict, Path or list] A style specification. Valid options are:

str	The name of a style or a path/URL to a style file. For a list of available style names, see <code>style.available</code> .
dict	Dictionary with valid key/value pairs for <i>matplotlib.rcParams</i> .
Path	A path-like object which is a path to a style file.
list	A list of style specifiers (str, Path or dict) applied from first to last in the list.

**after\_reset** [bool] If True, apply style after resetting settings to their defaults; otherwise, apply style on top of the current settings.

`matplotlib.style.reload_library()`

Reload the style library.

`matplotlib.style.use(style)`

Use Matplotlib style settings from a style specification.

The style name of 'default' is reserved for reverting back to the default style settings.

---

**Note:** This updates the *rcParams* with the settings from the style. *rcParams* not defined in the style are kept.

---

### Parameters

**style** [str, dict, Path or list] A style specification. Valid options are:

str	The name of a style or a path/URL to a style file. For a list of available style names, see <code>style.available</code> .
dict	Dictionary with valid key/value pairs for <i>matplotlib.rcParams</i> .
Path	A path-like object which is a path to a style file.
list	A list of style specifiers (str, Path or dict) applied from first to last in the list.

`matplotlib.style.library`

A dict mapping from style name to *RcParams* defining that style.

This is meant to be read-only. Use `reload_library` to update.

`matplotlib.style.available`

List of the names of the available styles.

This is meant to be read-only. Use `reload_library` to update.

## 18.48 matplotlib.table

Tables drawing.

Use the factory function `table` to create a ready-made table from texts. If you need more control, use the `Table` class and its methods.

The table consists of a grid of cells, which are indexed by (row, column). The cell (0, 0) is positioned at the top left.

Thanks to John Gill for providing the class and table.

```
class matplotlib.table.Cell(xy, width, height, edgecolor='k', facecolor='w',
                           fill=True, text="", loc=None, fontproperties=None, *,
                           visible_edges='closed')
```

Bases: `matplotlib.patches.Rectangle`

A cell is a `Rectangle` with some associated `Text`.

As a user, you'll most likely not create cells yourself. Instead, you should use either the `table` factory function or `Table.add_cell`.

### Parameters

**xy** [2-tuple] The position of the bottom left corner of the cell.

**width** [float] The cell width.

**height** [float] The cell height.

**edgecolor** [color] The color of the cell border.

**facecolor** [color] The cell facecolor.

**fill** [bool] Whether the cell background is filled.

**text** [str] The cell text.

**loc** [{ 'left', 'center', 'right' }, default: 'right'] The alignment of the text within the cell.

**fontproperties** [dict] A dict defining the font properties of the text. Supported keys and values are the keyword arguments accepted by `FontProperties`.

**visible\_edges** [str, default: 'closed'] The cell edges to be drawn with a line: a substring of 'BRTL' (bottom, right, top, left), or one of 'open' (no edges drawn), 'closed' (all edges drawn), 'horizontal' (bottom and top), 'vertical' (right and left).

`PAD = 0.1`

Padding between text and rectangle.

`auto_set_font_size(self, renderer)`

Shrink font size until the text fits into the cell width.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters****renderer** [*RendererBase* subclass.]**Notes**

This method is overridden in the Artist subclasses.

`get_fontsize(self)`

Return the cell fontsize.

`get_path(self)`

Return a *Path* for the *visible\_edges*.

`get_required_width(self, renderer)`

Return the minimal required width for the cell.

`get_text(self)`

Return the cell *Text* instance.

`get_text_bounds(self, renderer)`

Return the text bounds as (x, y, width, height) in table coordinates.

`set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

**Parameters****fig** [*Figure*]

`set_fontsize(self, size)`

Set the text fontsize.

`set_text_props(self, **kwargs)`

Update the text properties.

Valid keyword arguments are:

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>backgroundcolor</i>	color
<i>bbox</i>	dict with properties for <i>patches.FancyBboxPatch</i>
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>color</i> or <i>c</i>	color
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontfamily</i> or <i>family</i>	{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monosp
<i>fontproperties</i> or <i>font</i> or <i>font_properties</i>	<i>font_manager.FontProperties</i> or str or <i>pathlib.Path</i>
<i>fontsize</i> or <i>size</i>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large
<i>fontstretch</i> or <i>stretch</i>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-co
<i>fontstyle</i> or <i>style</i>	{'normal', 'italic', 'oblique'}
<i>fontvariant</i> or <i>variant</i>	{'normal', 'small-caps'}
<i>fontweight</i> or <i>weight</i>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal'

Property	Description
<i>gid</i>	str
<i>horizontalalignment</i> or <i>ha</i>	{‘center’, ‘right’, ‘left’}
<i>in_layout</i>	bool
<i>label</i>	object
<i>linespacing</i>	float (multiple of font size)
<i>multialignment</i> or <i>ma</i>	{‘left’, ‘right’, ‘center’}
<i>path_effects</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>position</i>	(float, float)
<i>rasterized</i>	bool or None
<i>rotation</i>	float or {‘vertical’, ‘horizontal’}
<i>rotation_mode</i>	{None, ‘default’, ‘anchor’}
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>text</i>	object
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>usetex</i>	bool or None
<i>verticalalignment</i> or <i>va</i>	{‘center’, ‘top’, ‘bottom’, ‘baseline’, ‘center_baseline’}
<i>visible</i>	bool
<i>wrap</i>	bool
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

`set_transform(self, trans)`  
Set the artist transform.

### Parameters

**t** [*Transform*]

property `visible_edges`  
The cell edges to be drawn with a line.

Reading this property returns a substring of ‘BRTL’ (bottom, right, top, left’).

When setting this property, you can use a substring of ‘BRTL’ or one of {‘open’, ‘closed’, ‘horizontal’, ‘vertical’}.

`matplotlib.table.CustomCell`  
alias of `matplotlib.table.Cell`

`class matplotlib.table.Table(ax, loc=None, bbox=None, **kwargs)`  
Bases: `matplotlib.artist.Artist`

A table of cells.

The table consists of a grid of cells, which are indexed by (row, column).

For a simple table, you’ll have a full grid of cells with indices from (0, 0) to (num\_rows-1, num\_cols-1), in which the cell (0, 0) is positioned at the top left. However, you can also add cells with negative indices. You don’t have to add a cell to every grid position, so you can create tables that have holes.

*Note:* You'll usually not create an empty table from scratch. Instead use `table` to create a table from data.

### Parameters

- ax** [`matplotlib.axes.Axes`] The *Axes* to plot the table into.
- loc** [str] The position of the cell with respect to *ax*. This must be one of the *codes*.
- bbox** [*Bbox* or None] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

### Other Parameters

**\*\*kwargs** *Artist* properties.

`AXESPAD = 0.02`

The border between the Axes and the table edge in Axes units.

`FONTSIZE = 10`

`add_cell(self, row, col, *args, **kwargs)`

Create a cell and add it to the table.

### Parameters

- row** [int] Row index.
- col** [int] Column index.
- \*args, \*\*kwargs** All other parameters are passed on to *Cell*.

### Returns

*Cell* The created cell.

`auto_set_column_width(self, col)`

Automatically set the widths of given columns to optimal sizes.

### Parameters

- col** [int or sequence of ints] The indices of the columns to auto-scale.

`auto_set_font_size(self, value=True)`

Automatically set font size.

`codes = {'best': 0, 'bottom': 17, 'bottom left': 12, 'bottom right': 13, 'center': 9, 'center left': 11, 'center right': 14, 'left': 15, 'right': 16}`

Possible values where to place the table relative to the Axes.

`contains(self, mouseevent)`

Test whether the artist contains the mouse event.

### Parameters

- mouseevent** [`matplotlib.backend_bases.MouseEvent`]

### Returns

- contains** [bool] Whether any values are within the radius.
- details** [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

property edges

The default value of `visible_edges` for newly added cells using `add_cell`.

### Notes

This setting does currently only affect newly created cells using `add_cell`.

To change existing cells, you have to set their edges explicitly:

```
for c in tab.get_celld().values():
    c.visible_edges = 'horizontal'
```

`get_celld(self)`

Return a dict of cells in the table mapping (*row, column*) to *Cells*.

### Notes

You can also directly index into the Table object to access individual cells:

```
cell = table[row, col]
```

`get_children(self)`

Return the Artists contained by the table.

`get_window_extent(self, renderer)`

Return the bounding box of the table in window coords.

`scale(self, xscale, yscale)`

Scale column widths by *xscale* and row heights by *yscale*.

`set_fontsize(self, size)`

Set the font size, in points, of the cell text.

### Parameters

**size** [float]

### Notes

As long as auto font size has not been disabled, the value will be clipped such that the text fits horizontally into the cell.

You can disable this behavior using `auto_set_font_size`.

```
>>> the_table.auto_set_font_size(False)
>>> the_table.set_fontsize(20)
```

However, there is no automatic scaling of the row height so that the text may exceed the cell boundary.

```
matplotlib.table.table(ax, cellText=None, cellColours=None, cellLoc='right',
                       colWidths=None, rowLabels=None, rowColours=None,
                       rowLoc='left', colLabels=None, colColours=None, col-
                       Loc='center', loc='bottom', bbox=None, edges='closed',
                       **kwargs)
```

Add a table to an *Axes*.

At least one of *cellText* or *cellColours* must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using *rowLabels*, *rowColours*, *rowLoc* and *colLabels*, *colColours*, *colLoc* respectively.

For finer grained control over tables, use the *Table* class and add it to the axes with *Axes.add\_table*.

### Parameters

**cellText** [2D list of str, optional] The texts to place into the table cells.

*Note:* Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

**cellColours** [2D list of colors, optional] The background colors of the cells.

**cellLoc** [{*'left'*, *'center'*, *'right'*}, default: *'right'*] The alignment of the text within the cells.

**colWidths** [list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of  $1 / n_{cols}$ .

**rowLabels** [list of str, optional] The text of the row header cells.

**rowColours** [list of colors, optional] The colors of the row header cells.

**rowLoc** [{*'left'*, *'center'*, *'right'*}, default: *'left'*] The text alignment of the row header cells.

**colLabels** [list of str, optional] The text of the column header cells.

**colColours** [list of colors, optional] The colors of the column header cells.

**colLoc** [{*'left'*, *'center'*, *'right'*}, default: *'left'*] The text alignment of the column header cells.

**loc** [str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

**bbox** [*Bbox*, optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

**edges** [substring of *'BRTL'* or {*'open'*, *'closed'*, *'horizontal'*, *'vertical'*}] The cell edges to be drawn with a line. See also *visible\_edges*.

### Returns

*Table* The created table.

### Other Parameters

**\*\*kwargs** *Table* properties.

Property	Description
<i>agg_filter</i>	a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array
<i>alpha</i>	float or None
<i>animated</i>	bool
<i>clip_box</i>	<i>Bbox</i>
<i>clip_on</i>	bool
<i>clip_path</i>	Patch or (Path, Transform) or None
<i>contains</i>	unknown
<i>figure</i>	<i>Figure</i>
<i>fontsize</i>	float
<i>gid</i>	str
<i>in_layout</i>	bool
<i>label</i>	object
<i>path_effect</i>	<i>AbstractPathEffect</i>
<i>picker</i>	None or bool or callable
<i>rasterized</i>	bool or None
<i>sketch_params</i>	(scale: float, length: float, randomness: float)
<i>snap</i>	bool or None
<i>transform</i>	<i>Transform</i>
<i>url</i>	str
<i>visible</i>	bool
<i>zorder</i>	float

## 18.49 matplotlib.testing

### 18.49.1 matplotlib.testing

Helper functions for testing.

`matplotlib.testing.is_called_from_pytest()`  
[*Deprecated*] Whether we are in a pytest run.

#### Notes

Deprecated since version 3.2.

`matplotlib.testing.set_font_settings_for_testing()`  
`matplotlib.testing.set_reproducibility_for_testing()`  
`matplotlib.testing.setup()`

## 18.49.2 matplotlib.testing.compare

Utilities for comparing image results.

`matplotlib.testing.compare.compare_images(expected, actual, tol, in_decorator=False)`

Compare two "image" files checking differences within a tolerance.

The two given filenames may point to files which are convertible to PNG via the converter dictionary. The underlying RMS is calculated with the `calculate_rms` function.

### Parameters

**expected** [str] The filename of the expected image.

**actual** [str] The filename of the actual image.

**tol** [float] The tolerance (a color value difference, where 255 is the maximal difference). The test fails if the average pixel difference is greater than this value.

**in\_decorator** [bool] Determines the output format. If called from `image_comparison` decorator, this should be True. (default=False)

### Returns

**None or dict or str** Return *None* if the images are equal within the given tolerance.

If the images differ, the return value depends on *in\_decorator*. If *in\_decorator* is true, a dict with the following entries is returned:

- *rms*: The RMS of the image difference.
- *expected*: The filename of the expected image.
- *actual*: The filename of the actual image.
- *diff\_image*: The filename of the difference image.
- *tol*: The comparison tolerance.

Otherwise, a human-readable multi-line string representation of this information is returned.

### Examples

```
img1 = "./baseline/plot.png"
img2 = "./output/plot.png"
compare_images(img1, img2, 0.001)
```

`matplotlib.testing.compare.comparable_formats()`

Return the list of file formats that *compare\_images* can compare on this system.

### Returns

**list of str** E.g. ['png', 'pdf', 'svg', 'eps'].

### 18.49.3 matplotlib.testing.decorators

`class matplotlib.testing.decorators.CleanupTestCase(methodName='runTest')`  
 Bases: `unittest.case.TestCase`

A wrapper for `unittest.TestCase` that includes cleanup operations.

Create an instance of the class that will use the named test method when executed. Raises a `ValueError` if the instance does not have a method with the specified name.

`classmethod setUpClass()`

Hook method for setting up class fixture before running tests in the class.

`classmethod tearDownClass()`

Hook method for deconstructing the class fixture after running all tests in the class.

`matplotlib.testing.decorators.check_figures_equal(*, extensions=('png', 'pdf', 'svg'), tol=0)`

Decorator for test cases that generate and compare two figures.

The decorated function must take two keyword arguments, `fig_test` and `fig_ref`, and draw the test and reference images on them. After the function returns, the figures are saved and compared.

This decorator should be preferred over `image_comparison` when possible in order to keep the size of the test suite from ballooning.

#### Parameters

**extensions** [list, default: ["png", "pdf", "svg"]] The extensions to test.

**tol** [float] The RMS threshold above which the test is considered failed.

#### Examples

Check that calling `Axes.plot` with a single argument plots it against [0, 1, 2, ...]:

```
@check_figures_equal()
def test_plot(fig_test, fig_ref):
    fig_test.subplots().plot([1, 3, 5])
    fig_ref.subplots().plot([0, 1, 2], [1, 3, 5])
```

`matplotlib.testing.decorators.check_freetype_version(ver)`

`matplotlib.testing.decorators.cleanup(style=None)`

A decorator to ensure that any global state is reset before running a test.

#### Parameters

**style** [str, dict, or list, optional] The style(s) to apply. Defaults to ["classic", "\_classic\_test\_patch"].

`matplotlib.testing.decorators.image_comparison(baseline_images, extensions=None, tol=0, freetype_version=None, remove_text=False, save_fig_kwarg=None, style=('classic', '_classic_test_patch'))`

Compare images generated by the test with those specified in `baseline_images`, which must correspond, else an `ImageComparisonFailure` exception will be raised.

#### Parameters

**baseline\_images** [list or None] A list of strings specifying the names of the images generated by calls to *Figure.savefig*.

If *None*, the test function must use the `baseline_images` fixture, either as a parameter or with `pytest.mark.usefixtures`. This value is only allowed when using `pytest`.

**extensions** [None or list of str] The list of extensions to test, e.g. ['png', 'pdf'].

If *None*, defaults to all supported extensions: png, pdf, and svg.

When testing a single extension, it can be directly included in the names passed to *baseline\_images*. In that case, *extensions* must not be set.

In order to keep the size of the test suite from ballooning, we only include the *svg* or *pdf* outputs if the test is explicitly exercising a feature dependent on that backend (see also the *check\_figures\_equal* decorator for that purpose).

**tol** [float, default: 0] The RMS threshold above which the test is considered failed.

Due to expected small differences in floating-point calculations, on 32-bit systems an additional 0.06 is added to this threshold.

**freetype\_version** [str or tuple] The expected freetype version or range of versions for this test to pass.

**remove\_text** [bool] Remove the title and tick text from the figure before comparison. This is useful to make the baseline images independent of variations in text rendering between different versions of FreeType.

This does not remove other, more deliberate, text, such as legends and annotations.

**savefig\_kwarg** [dict] Optional arguments that are passed to the *savefig* method.

**style** [str, dict, or list] The optional style(s) to apply to the image test. The test itself can also apply additional styles if desired. Defaults to ["classic", "\_classic\_test\_patch"].

```
matplotlib.testing.decorators.remove_ticks_and_titles(figure)
```

#### 18.49.4 matplotlib.testing.exceptions

```
exception matplotlib.testing.exceptions.ImageComparisonFailure
    Bases: AssertionError
```

Raise this exception to mark a test as a comparison between two images.

#### 18.50 matplotlib.text

Classes for including text in a figure.

```
class matplotlib.text.Annotation(text, xy, xytext=None, xycoords='data',
                                textcoords=None, arrowprops=None, annota-
                                tion_clip=None, **kwargs)
```

Bases: `matplotlib.text.Text`, `matplotlib.text._AnnotationBase`

An *Annotation* is a *Text* that can refer to a specific position *xy*. Optionally an arrow pointing from the text to *xy* can be drawn.

### Attributes

**xy** The annotated position.

**xycoords** The coordinate system for *xy*.

**arrow\_patch** A *FancyArrowPatch* to point from *xytext* to *xy*.

Annotate the point *xy* with text *text*.

In the simplest form, the text is placed at *xy*.

Optionally, the text can be displayed in another position *xytext*. An arrow pointing from the text to the annotated point *xy* can then be added by defining *arrowprops*.

### Parameters

**text** [str] The text of the annotation. *s* is a deprecated synonym for this parameter.

**xy** [(float, float)] The point (*x*, *y*) to annotate. The coordinate system is determined by *xycoords*.

**xytext** [(float, float), default: *xy*] The position (*x*, *y*) to place the text at. The coordinate system is determined by *textcoords*.

**xycoords** [str or *Artist* or *Transform* or callable or (float, float), default: 'data'] The coordinate system that *xy* is given in. The following types of values are supported:

- One of the following strings:

Value	Description
'figure points'	Points from the lower left of the figure
'figure pixels'	Pixels from the lower left of the figure
'figure fraction'	Fraction of figure from lower left
'axes points'	Points from lower left corner of axes
'axes pixels'	Pixels from lower left corner of axes
'axes fraction'	Fraction of axes from lower left
'data'	Use the coordinate system of the object being annotated (default)
'polar'	( <i>theta</i> , <i>r</i> ) if not native 'data' coordinates

- An *Artist*: *xy* is interpreted as a fraction of the artist's *Bbox*. E.g. (0, 0) would be the lower left corner of the bounding box and (0.5, 1) would be the center top of the bounding box.

- A *Transform* to transform *xy* to screen coordinates.
- A function with one of the following signatures:

```
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where *renderer* is a *RendererBase* subclass.

The result of the function is interpreted like the *Artist* and *Transform* cases above.

- A tuple (*xcoords*, *ycoords*) specifying separate coordinate systems for *x* and *y*. *xcoords* and *ycoords* must each be of one of the above described types.

See *Advanced Annotations* for more details.

**textcoords** [str or *Artist* or *Transform* or callable or (float, float), default: value of *xycoords*] The coordinate system that *xytext* is given in.

All *xycoords* values are valid as well as the following strings:

Value	Description
'offset points'	Offset (in points) from the <i>xy</i> value
'offset pixels'	Offset (in pixels) from the <i>xy</i> value

**arrowprops** [dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

Key	Description
width	The width of the arrow in points
headwidth	The width of the base of the arrow head in points
headlength	The length of the arrow head in points
shrink	Fraction of total length to shrink from both ends
?	Any key to <i>matplotlib.patches.FancyArrowPatch</i>

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

Name	Attrs
'-'	None
'->'	head_length=0.4,head_width=0.2
'-['	widthB=1.0,lengthB=0.2,angleB=None
' - '	widthA=1.0,widthB=1.0
'- >'	head_length=0.4,head_width=0.2
'<-'	head_length=0.4,head_width=0.2
'<->'	head_length=0.4,head_width=0.2
'< -'	head_length=0.4,head_width=0.2
'< - >'	head_length=0.4,head_width=0.2
'fancy'	head_length=0.4,head_width=0.4,tail_width=0.4
'simple'	head_length=0.5,head_width=0.5,tail_width=0.2
'wedge'	tail_width=0.3,shrink_factor=0.5

Valid keys for *FancyArrowPatch* are:

Key	Description
arrowstyle	the arrow style
connectionstyle	the connection style
relpos	default is (0.5, 0.5)
patchA	default is bounding box of the text
patchB	default is None
shrinkA	default is 2 points
shrinkB	default is 2 points
mutation_scale	default is text size (in points)
mutation_aspect	default is 1.
?	any key for <i>matplotlib.patches.PathPatch</i>

Defaults to None, i.e. no arrow is drawn.

**annotation\_clip** [bool or None, default: None] Whether to draw the annotation when the annotation point *xy* is outside the axes area.

- If *True*, the annotation will only be drawn when *xy* is within the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will only be drawn when *xy* is within the axes and *xycoords* is 'data'.

**\*\*kwargs** Additional kwargs are passed to *Text*.

### Returns

*Annotation*

### See also:

#### *Advanced Annotations*

property *anncoords*

The coordinate system to use for *Annotation.xyann*.

*contains(self, event)*

Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

*draw(self, renderer)*

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get\_visible* returns False).

### Parameters

**renderer** [*RendererBase* subclass.]

### Notes

This method is overridden in the Artist subclasses.

`get_anncoords(self)`

Return the coordinate system to use for *Annotation.xyann*.

See also *xycoords* in *Annotation*.

`get_window_extent(self, renderer=None)`

Return the *Bbox* bounding the text and arrow, in display units.

### Parameters

**renderer** [Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling *get\_window\_extent* before the first *draw*. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

`set_anncoords(self, coords)`

Set the coordinate system to use for *Annotation.xyann*.

See also *xycoords* in *Annotation*.

`set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

### Parameters

**fig** [*Figure*]

`update_positions(self, renderer)`

Update the pixel positions of the annotation text and the arrow patch.

property *xyann*

The text position.

See also *xytext* in *Annotation*.

property *xycoords*

`class matplotlib.text.OffsetFrom(artist, ref_coord, unit='points')`

Bases: *object*

Callable helper class for working with *Annotation*.

### Parameters

**artist** [*Artist* or *BboxBase* or *Transform*] The object to compute the offset from.

**ref\_coord** [(float, float)] If *artist* is an *Artist* or *BboxBase*, this values is the location to of the offset origin in fractions of the *artist* bounding box.  
If *artist* is a transform, the offset origin is the transform applied to this value.

**unit** [{*'points'*, *'pixels'*}, default: *'points'*] The screen units to use (pixels or points) for the offset input.

`get_unit(self)`

Return the unit for input to the transform used by *\_\_call\_\_*.

`set_unit(self, unit)`

Set the unit for input to the transform used by *\_\_call\_\_*.

### Parameters

**unit** [{*'points'*, *'pixels'*}]

```
class matplotlib.text.Text(x=0, y=0, text="", color=None, verticalalign=
    'baseline', horizontalalignment='left', multialign=
    None, fontproperties=None, rotation=None,
    linespacing=None, rotation_mode=None, usetex=None,
    wrap=False, **kwargs)
```

Bases: `matplotlib.artist.Artist`

Handle storing and drawing of text in window or data coordinates.

Create a `Text` instance at `x`, `y` with string `text`.

Valid keyword arguments are:

Property	Description
<code>agg_filter</code>	a filter function, which takes a (m, n, 3) float array and a dpi value
<code>alpha</code>	float or None
<code>animated</code>	bool
<code>backgroundcolor</code>	color
<code>bbox</code>	dict with properties for <code>patches.FancyBboxPatch</code>
<code>clip_box</code>	<code>Bbox</code>
<code>clip_on</code>	bool
<code>clip_path</code>	Patch or (Path, Transform) or None
<code>color</code> or <code>c</code>	color
<code>contains</code>	unknown
<code>figure</code>	<code>Figure</code>
<code>fontfamily</code> or <code>family</code>	{'FONTNAME', 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}
<code>fontproperties</code> or <code>font</code> or <code>font_properties</code>	<code>font_manager.FontProperties</code> or <code>str</code> or <code>pathlib.Path</code>
<code>fontsize</code> or <code>size</code>	float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large'}
<code>fontstretch</code> or <code>stretch</code>	{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed'}
<code>fontstyle</code> or <code>style</code>	{'normal', 'italic', 'oblique'}
<code>fontvariant</code> or <code>variant</code>	{'normal', 'small-caps'}
<code>fontweight</code> or <code>weight</code>	{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'bold', 'extra-bold'}
<code>gid</code>	str
<code>horizontalalignment</code> or <code>ha</code>	{'center', 'right', 'left'}
<code>in_layout</code>	bool
<code>label</code>	object
<code>linespacing</code>	float (multiple of font size)
<code>multialignment</code> or <code>ma</code>	{'left', 'right', 'center'}
<code>path_effects</code>	<code>AbstractPathEffect</code>
<code>picker</code>	None or bool or callable
<code>position</code>	(float, float)
<code>rasterized</code>	bool or None
<code>rotation</code>	float or {'vertical', 'horizontal'}
<code>rotation_mode</code>	{None, 'default', 'anchor'}
<code>sketch_params</code>	(scale: float, length: float, randomness: float)
<code>snap</code>	bool or None
<code>text</code>	object
<code>transform</code>	<code>Transform</code>
<code>url</code>	str
<code>usetex</code>	bool or None
<code>verticalalignment</code> or <code>va</code>	{'center', 'top', 'bottom', 'baseline', 'center_baseline'}
<code>visible</code>	bool
<code>wrap</code>	bool

Property	Description
<i>x</i>	float
<i>y</i>	float
<i>zorder</i>	float

`contains(self, mouseevent)`

Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

`draw(self, renderer)`

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

### Parameters

**renderer** [`RendererBase` subclass.]

### Notes

This method is overridden in the Artist subclasses.

`get_bbox_patch(self)`

Return the bbox Patch, or None if the `patches.FancyBboxPatch` is not made.

`get_c(self)`

Alias for `get_color`.

`get_color(self)`

Return the color of the text.

`get_family(self)`

Alias for `get_fontfamily`.

`get_font(self)`

Alias for `get_fontproperties`.

`get_font_properties(self)`

Alias for `get_fontproperties`.

`get_fontfamily(self)`

Return the list of font families used for font lookup.

### See also:

`font_manager.FontProperties.get_family`

`get_fontname(self)`

Return the font name as a string.

### See also:

`font_manager.FontProperties.get_name`

`get_fontproperties(self)`

Return the `font_manager.FontProperties`.

`get_fontsize(self)`

Return the font size as an integer.

**See also:**

*font\_manager.FontProperties.get\_size\_in\_points*

`get_fontstyle(self)`

Return the font style as a string.

**See also:**

*font\_manager.FontProperties.get\_style*

`get_fontvariant(self)`

Return the font variant as a string.

**See also:**

*font\_manager.FontProperties.get\_variant*

`get_fontweight(self)`

Return the font weight as a string or a number.

**See also:**

*font\_manager.FontProperties.get\_weight*

`get_ha(self)`

Alias for *get\_horizontalalignment*.

`get_horizontalalignment(self)`

Return the horizontal alignment as a string. Will be one of 'left', 'center' or 'right'.

`get_name(self)`

Alias for *get\_fontname*.

`get_position(self)`

Return the (x, y) position of the text.

`get_prop_tup(self, renderer=None)`

Return a hashable tuple of properties.

Not intended to be human readable, but useful for backends who want to cache derived information about text (e.g., layouts) and need to know if the text has changed.

`get_rotation(self)`

Return the text angle in degrees between 0 and 360.

`get_rotation_mode(self)`

Return the text rotation mode.

`get_size(self)`

Alias for *get\_fontsize*.

`get_stretch(self)`

Return the font stretch as a string or a number.

**See also:**

*font\_manager.FontProperties.get\_stretch*

`get_style(self)`  
Alias for `get_fontstyle`.

`get_text(self)`  
Return the text string.

`get_unitless_position(self)`  
Return the (x, y) unitless position of the text.

`get_usetex(self)`  
Return whether this `Text` object uses TeX for rendering.

`get_va(self)`  
Alias for `get_verticalalignment`.

`get_variant(self)`  
Alias for `get_fontvariant`.

`get_verticalalignment(self)`  
Return the vertical alignment as a string. Will be one of 'top', 'center', 'bottom' or 'baseline'.

`get_weight(self)`  
Alias for `get_fontweight`.

`get_window_extent(self, renderer=None, dpi=None)`  
Return the `Bbox` bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

#### Parameters

**renderer** [Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling `get_window_extent` before the first `draw`. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

**dpi** [float, optional] The dpi value for computing the bbox, defaults to `self.figure.dpi` (*not* the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

`get_wrap(self)`  
Return whether the text can be wrapped.

`set_backgroundcolor(self, color)`  
Set the background color of the text by updating the bbox.

#### Parameters

**color** [color]

#### See also:

`set_bbox` To change the position of the bounding box

`set_bbox(self, rectprops)`  
Draw a bounding box around self.

#### Parameters

**rectprops** [dict with properties for *patches.FancyBboxPatch*] The default boxstyle is 'square'. The mutation scale of the *patches.FancyBboxPatch* is set to the fontsize.

### Examples

```
t.set_bbox(dict(facecolor='red', alpha=0.5))
```

**set\_c**(*self*, *color*)  
Alias for *set\_color*.

**set\_clip\_box**(*self*, *clipbox*)  
Set the artist's clip *Bbox*.

### Parameters

**clipbox** [*Bbox*]

**set\_clip\_on**(*self*, *b*)  
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

### Parameters

**b** [bool]

**set\_clip\_path**(*self*, *path*, *transform=None*)  
Set the artist's clip path.

### Parameters

**path** [*Patch* or *Path* or *TransformedPath* or None] The clip path. If given a *Path*, *transform* must be provided as well. If *None*, a previously set clip path is removed.

**transform** [*Transform*, optional] Only used if *path* is a *Path*, in which case the given *Path* is converted to a *TransformedPath* using *transform*.

### Notes

For efficiency, if *path* is a *Rectangle* this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of *set*), a tuple (*path*, *transform*) is also accepted as a single positional parameter.

**set\_color**(*self*, *color*)  
Set the foreground color of the text

### Parameters

**color** [color]

**set\_family**(*self*, *fontname*)  
Alias for *set\_fontfamily*.

`set_font(self, fp)`  
Alias for `set_fontproperties`.

`set_font_properties(self, fp)`  
Alias for `set_fontproperties`.

`set_fontfamily(self, fontname)`  
Set the font family. May be either a single string, or a list of strings in decreasing priority. Each string may be either a real font name or a generic font class name. If the latter, the specific font names will be looked up in the corresponding rcParams. If a `Text` instance is constructed with `fontfamily=None`, then the font is set to `rcParams["font.family"]` (default: `['sans-serif']`), and the same is done when `set_fontfamily()` is called on an existing `Text` instance.

#### Parameters

**fontname** [{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

#### See also:

`font_manager.FontProperties.set_family`

`set_fontname(self, fontname)`  
Alias for `set_family`.

One-way alias only: the getter differs.

#### Parameters

**fontname** [{FONTNAME, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

#### See also:

`font_manager.FontProperties.set_family`

`set_fontproperties(self, fp)`  
Set the font properties that control the text.

#### Parameters

**fp** [`font_manager.FontProperties` or `str` or `pathlib.Path`] If a `str`, it is interpreted as a fontconfig pattern parsed by `FontProperties`. If a `pathlib.Path`, it is interpreted as the absolute path to a font file.

`set_fontsize(self, fontsize)`  
Set the font size.

#### Parameters

**fontsize** [float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'xx-large'}] If float, the fontsize in points. The string values denote sizes relative to the default font size.

#### See also:

`font_manager.FontProperties.set_size`

`set_fontstretch(self, stretch)`  
Set the font stretch (horizontal condensation or expansion).

**Parameters**

**stretch** [{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'}]

**See also:**

`font_manager.FontProperties.set_stretch`

`set_fontstyle(self, fontstyle)`

Set the font style.

**Parameters**

**fontstyle** [{'normal', 'italic', 'oblique'}]

**See also:**

`font_manager.FontProperties.set_style`

`set_fontvariant(self, variant)`

Set the font variant.

**Parameters**

**variant** [{'normal', 'small-caps'}]

**See also:**

`font_manager.FontProperties.set_variant`

`set_fontweight(self, weight)`

Set the font weight.

**Parameters**

**weight** [{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'}]

**See also:**

`font_manager.FontProperties.set_weight`

`set_ha(self, align)`

Alias for `set_horizontalalignment`.

`set_horizontalalignment(self, align)`

Set the horizontal alignment to one of

**Parameters**

**align** [{'center', 'right', 'left'}]

`set_linespacing(self, spacing)`

Set the line spacing as a multiple of the font size.

The default line spacing is 1.2.

**Parameters**

**spacing** [float (multiple of font size)]

`set_ma(self, align)`  
Alias for `set_multialignment`.

`set_multialignment(self, align)`  
Set the text alignment for multiline texts.

The layout of the bounding box of all the lines is determined by the `horizontalalignment` and `verticalalignment` properties. This property controls the alignment of the text lines within that box.

#### Parameters

**align** [{`'left'`, `'right'`, `'center'`}]

`set_name(self, fontname)`  
Alias for `set_fontname`.

`set_position(self, xy)`  
Set the (x, y) position of the text.

#### Parameters

**xy** [(float, float)]

`set_rotation(self, s)`  
Set the rotation of the text.

#### Parameters

**s** [float or {`'vertical'`, `'horizontal'`}] The rotation angle in degrees in mathematically positive direction (counterclockwise). `'horizontal'` equals 0, `'vertical'` equals 90.

`set_rotation_mode(self, m)`  
Set text rotation mode.

#### Parameters

**m** [{`None`, `'default'`, `'anchor'`}] If `None` or `"default"`, the text will be first rotated, then aligned according to their horizontal and vertical alignments. If `"anchor"`, then alignment occurs before rotation.

`set_size(self, fontsize)`  
Alias for `set_fontsize`.

`set_stretch(self, stretch)`  
Alias for `set_fontstretch`.

`set_style(self, fontstyle)`  
Alias for `set_fontstyle`.

`set_text(self, s)`  
Set the text string s.

It may contain newlines (`\n`) or math in LaTeX syntax.

#### Parameters

**s** [object] Any object gets converted to its `str` representation, except for `None` which is converted to an empty string.

`set_usetex(self, usetex)`

#### Parameters

**usetex** [bool or None] Whether to render using TeX, None means to use `rcParams["text.usetex"]` (default: False).

`set_va(self, align)`  
Alias for `set_verticalalignment`.

`set_variant(self, variant)`  
Alias for `set_fontvariant`.

`set_verticalalignment(self, align)`  
Set the vertical alignment.

#### Parameters

**align** [{ 'center', 'top', 'bottom', 'baseline', 'center\_baseline' }]

`set_weight(self, weight)`  
Alias for `set_fontweight`.

`set_wrap(self, wrap)`  
Set whether the text can be wrapped.

#### Parameters

**wrap** [bool]

`set_x(self, x)`  
Set the x position of the text.

#### Parameters

**x** [float]

`set_y(self, y)`  
Set the y position of the text.

#### Parameters

**y** [float]

`update(self, kwargs)`  
Update this artist's properties from the dict *props*.

#### Parameters

**props** [dict]

`update_bbox_position_size(self, renderer)`  
Update the location and the size of the bbox.

This method should be used when the position and size of the bbox needs to be updated before actually drawing the bbox.

`update_from(self, other)`  
Copy properties from *other* to *self*.

`zorder = 3`

`matplotlib.text.get_rotation(rotation)`  
Return *rotation* normalized to an angle between 0 and 360 degrees.

#### Parameters

**rotation** [float or {None, 'horizontal', 'vertical'}] Rotation angle in degrees. *None* and 'horizontal' equal 0, 'vertical' equals 90.

#### Returns

**float****18.51 matplotlib.texmanager**

Support for embedded TeX expressions in Matplotlib via dvipng and dvips for the raster and PostScript backends. The tex and dvipng/dvips information is cached in `~/.matplotlib/tex.cache` for reuse between sessions.

Requirements:

- latex
- \*Agg backends: dvipng $\geq$ 1.6
- PS backend: psfrag, dvips, and Ghostscript $\geq$ 8.60

Backends:

- \*Agg
- PS
- PDF

For raster output, you can get RGBA numpy arrays from TeX expressions as follows:

```
texmanager = TexManager()
s = ('\\TeX\\ is Number '
     '$\\displaystyle\\sum_{n=1}^{\\infty}\\frac{-e^{i\\pi}}{2^n}$!')
Z = texmanager.get_rgba(s, fontsize=12, dpi=80, rgb=(1, 0, 0))
```

To enable tex rendering of all text in your matplotlib figure, set `rcParams["text.usetex"]` (default: False) to True.

```
class matplotlib.texmanager.TexManager
```

Bases: `object`

Convert strings to dvi files using TeX, caching the results to a directory.

Repeated calls to this constructor always return the same instance.

property `cachedir`

property `cursive`

`font_families = ('serif', 'sans-serif', 'cursive', 'monospace')`

`font_family = 'serif'`

`font_info = {'avant garde': ('pag', '\\usepackage{avant}'), 'bookman': ('pbk', '\\renewcommand{\\r`

`get_basefile(self, tex, fontsize, dpi=None)`

Return a filename based on a hash of the string, fontsize, and dpi.

`get_custom_preamble(self)`

Return a string containing user additions to the tex preamble.

`get_font_config(self)`

`get_font_preamble(self)`

Return a string containing font configuration for the tex preamble.

`get_grey(self, tex, fontsize=None, dpi=None)`

Return the alpha channel.

`get_rgba(self, tex, fontsize=None, dpi=None, rgb=(0, 0, 0))`

Return latex's rendering of the tex string as an rgba array.

`get_text_width_height_descent(self, tex, fontsize, renderer=None)`

Return width, height and descent of the text.

`grey_arrayd = {}`

`make_dvi(self, tex, fontsize)`

Generate a dvi file containing latex's layout of tex string.

Return the file name.

`make_dvi_preview(self, tex, fontsize)`

[*Deprecated*] Generate a dvi file containing latex's layout of tex string.

It calls `make_tex_preview()` method and store the size information (width, height, descent) in a separate file.

Return the file name.

### Notes

Deprecated since version 3.3.

`make_png(self, tex, fontsize, dpi)`

Generate a png file containing latex's rendering of tex string.

Return the file name.

`make_tex(self, tex, fontsize)`

Generate a tex file to render the tex string at a specific font size.

Return the file name.

`make_tex_preview(self, tex, fontsize)`

[*Deprecated*] Generate a tex file to render the tex string at a specific font size.

It uses the `preview.sty` to determine the dimension (width, height, descent) of the output.

Return the file name.

### Notes

Deprecated since version 3.3.

`property monospace`

`property rgba_arrayd`

`property sans_serif`

`property serif`

`texcache = '/root/.cache/matplotlib/tex.cache'`

## 18.52 matplotlib.textpath

```
class matplotlib.textpath.TextPath(xy, s, size=None, prop=None, _interpolation_steps=1, usetex=False)
```

Bases: `matplotlib.path.Path`

Create a path from the text.

Create a path from the text. Note that it simply is a path, not an artist. You need to use the `PathPatch` (or other artists) to draw this path onto the canvas.

### Parameters

**xy** [tuple or array of two float values] Position of the text. For no offset, use `xy=(0, 0)`.

**s** [str] The text to convert to a path.

**size** [float, optional] Font size in points. Defaults to the size specified via the font properties `prop`.

**prop** [`matplotlib.font_manager.FontProperties`, optional] Font property. If not provided, will use a default `FontProperties` with parameters from the `rcParams`.

**\_interpolation\_steps** [int, optional] (Currently ignored)

**usetex** [bool, default: False] Whether to use tex rendering.

### Examples

The following creates a path from the string "ABC" with Helvetica font face; and another path from the latex fraction 1/2:

```
from matplotlib.textpath import TextPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Helvetica", style="italic")
path1 = TextPath((12, 12), "ABC", size=12, prop=fp)
path2 = TextPath((0, 0), r"$\frac{1}{2}$", size=12, usetex=True)
```

Also see `/gallery/text_labels_and_annotations/demo_text_path`.

property codes

Return the codes

`get_size(self)`

Get the text size.

`set_size(self, size)`

Set the text size.

property vertices

Return the cached path after updating it if necessary.

```
class matplotlib.textpath.TextToPath
```

Bases: `object`

A class that converts strings to paths.

DPI = 72

```
FONT_SCALE = 100.0

get_glyphs_mathtext(self, prop, s, glyph_map=None, re-
    turn_new_glyphs_only=False)
    Parse mathtext string s and convert it to a (vertices, codes) pair.

get_glyphs_tex(self, prop, s, glyph_map=None, return_new_glyphs_only=False)
    Convert the string s to vertices and codes using usetex mode.

get_glyphs_with_font(self, font, s, glyph_map=None, re-
    turn_new_glyphs_only=False)
    Convert string s to vertices and codes using the provided ttf font.

get_texmanager(self)
    Return the cached TexManager instance.

get_text_path(self, prop, s, ismath=False)
    Convert text s to path (a tuple of vertices and codes for matplotlib.path.Path).
```

### Parameters

**prop** [*FontProperties*] The font properties for the text.

**s** [str] The text to be converted.

**ismath** [{False, True, "TeX"}] If True, use mathtext parser. If "TeX", use tex for rendering.

### Returns

**verts** [list] A list of numpy arrays containing the x and y coordinates of the vertices.

**codes** [list] A list of path codes.

### Examples

Create a list of vertices and codes from a text, and create a *Path* from those:

```
from matplotlib.path import Path
from matplotlib.textpath import TextToPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Humor Sans", style="italic")
verts, codes = TextToPath().get_text_path(fp, "ABC")
path = Path(verts, codes, closed=False)
```

Also see *TextPath* for a more direct way to create a path from a text.

```
get_text_width_height_descent(self, s, prop, ismath)
```

## 18.53 matplotlib.ticker

### 18.53.1 Tick locating and formatting

This module contains classes for configuring tick locating and formatting. Generic tick locators and formatters are provided, as well as domain specific custom ones.

Although the locators know nothing about major or minor ticks, they are used by the `Axis` class to support major and minor tick locating and formatting.

### Tick locating

The `Locator` class is the base class for all tick locators. The locators handle autoscaling of the view limits based on the data limits, and the choosing of tick locations. A useful semi-automatic tick locator is `MultipleLocator`. It is initialized with a base, e.g., 10, and it picks axis limits and ticks that are multiples of that base.

The `Locator` subclasses defined here are

`AutoLocator` `MaxNLocator` with simple defaults. This is the default tick locator for most plotting.

`MaxNLocator` Finds up to a max number of intervals with ticks at nice locations.

`LinearLocator` Space ticks evenly from min to max.

`LogLocator` Space ticks logarithmically from min to max.

`MultipleLocator` Ticks and range are a multiple of base; either integer or float.

`FixedLocator` Tick locations are fixed.

`IndexLocator` Locator for index plots (e.g., where `x = range(len(y))`).

`NullLocator` No ticks.

`SymmetricalLogLocator` Locator for use with the symlog norm; works like `LogLocator` for the part outside of the threshold and adds 0 if inside the limits.

`LogitLocator` Locator for logit scaling.

`OldAutoLocator` Choose a `MultipleLocator` and dynamically reassign it for intelligent ticking during navigation.

`AutoMinorLocator` Locator for minor ticks when the axis is linear and the major ticks are uniformly spaced. Subdivides the major tick interval into a specified number of minor intervals, defaulting to 4 or 5 depending on the major interval.

There are a number of locators specialized for date locations - see the `dates` module.

You can define your own locator by deriving from `Locator`. You must override the `__call__` method, which returns a sequence of locations, and you will probably want to override the `autoscale` method to set the view limits from the data limits.

If you want to override the default locator, use one of the above or a custom locator and pass it to the x or y axis instance. The relevant methods are:

```
ax.xaxis.set_major_locator(xmajor_locator)
ax.xaxis.set_minor_locator(xminor_locator)
ax.yaxis.set_major_locator(ymajor_locator)
ax.yaxis.set_minor_locator(yminor_locator)
```

The default minor locator is `NullLocator`, i.e., no minor ticks on by default.

### Tick formatting

Tick formatting is controlled by classes derived from `Formatter`. The formatter operates on a single tick value and returns a string to the axis.

*NullFormatter* No labels on the ticks.

*IndexFormatter* Set the strings from a list of labels.

*FixedFormatter* Set the strings manually for the labels.

*FuncFormatter* User defined function sets the labels.

*StrMethodFormatter* Use string `format` method.

*FormatStrFormatter* Use an old-style `sprintf` format string.

*ScalarFormatter* Default formatter for scalars: autopick the format string.

*LogFormatter* Formatter for log axes.

*LogFormatterExponent* Format values for log axis using `exponent = log_base(value)`.

*LogFormatterMathtext* Format values for log axis using `exponent = log_base(value)` using `Math` text.

*LogFormatterSciNotation* Format values for log axis using scientific notation.

*LogitFormatter* Probability formatter.

*EngFormatter* Format labels in engineering notation.

*PercentFormatter* Format labels as a percentage.

You can derive your own formatter from the `Formatter` base class by simply overriding the `__call__` method. The formatter class has access to the axis view and data limits.

To control the major and minor tick label formats, use one of the following methods:

```
ax.xaxis.set_major_formatter(xmajor_formatter)
ax.xaxis.set_minor_formatter(xminor_formatter)
ax.yaxis.set_major_formatter(ymajor_formatter)
ax.yaxis.set_minor_formatter(yminor_formatter)
```

In addition to a *Formatter* instance, *set\_major\_formatter* and *set\_minor\_formatter* also accept a str or function. str input will be internally replaced with an autogenerated *StrMethodFormatter* with the input str. For function input, a *FuncFormatter* with the input function will be generated and used.

See `/gallery/ticks_and_spines/major_minor_demo` for an example of setting major and minor ticks. See the `matplotlib.dates` module for more information and examples of using date locators and formatters.

```
class matplotlib.ticker.TickHelper
    Bases: object
    axis = None
    create_dummy_axis(self, **kwargs)
    set_axis(self, axis)
    set_bounds(self, vmin, vmax)
    set_data_interval(self, vmin, vmax)
    set_view_interval(self, vmin, vmax)
```

```
class matplotlib.ticker.Formatter
    Bases: matplotlib.ticker.TickHelper
    Create a string based on a tick value and location.
```

```
static fix_minus(s)
```

Some classes may want to replace a hyphen for minus with the proper unicode symbol (U+2212) for typographical correctness. This is a helper method to perform such a replacement when it is enabled via `rcParams["axes.unicode_minus"]` (default: True).

```
format_data(self, value)
```

Return the full string representation of the value with the position unspecified.

```
format_data_short(self, value)
```

Return a short string version of the tick value.

Defaults to the position-independent long value.

```
format_ticks(self, values)
```

Return the tick labels for all the ticks at once.

```
get_offset(self)
```

```
locs = []
```

```
set_locs(self, locs)
```

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

```
class matplotlib.ticker.FixedFormatter(seq)
```

Bases: `matplotlib.ticker.Formatter`

Return fixed strings for tick labels based only on position, not value.

---

**Note:** `FixedFormatter` should only be used together with `FixedLocator`. Otherwise, the labels may end up in unexpected positions.

---

Set the sequence `seq` of strings that will be used for labels.

```
get_offset(self)
```

```
set_offset_string(self, ofs)
```

```
class matplotlib.ticker.NullFormatter
```

Bases: `matplotlib.ticker.Formatter`

Always return the empty string.

```
class matplotlib.ticker.FuncFormatter(func)
```

Bases: `matplotlib.ticker.Formatter`

Use a user-defined function for formatting.

The function should take in two inputs (a tick value `x` and a position `pos`), and return a string containing the corresponding tick label.

```
get_offset(self)
```

```
set_offset_string(self, ofs)
```

```
class matplotlib.ticker.FormatStrFormatter(fmt)
```

Bases: `matplotlib.ticker.Formatter`

Use an old-style ('%' operator) format string to format the tick.

The format string should have a single variable format (%) in it. It will be applied to the value (not the position) of the tick.

```
class matplotlib.ticker.StrMethodFormatter(fmt)
```

Bases: `matplotlib.ticker.Formatter`

Use a new-style format string (as used by `str.format`) to format the tick.

The field used for the tick value must be labeled `x` and the field used for the tick position must be labeled `pos`.

```
class matplotlib.ticker.ScalarFormatter(useOffset=None, useMathText=None, useLocale=None)
```

Bases: `matplotlib.ticker.Formatter`

Format tick values as a number.

### Parameters

**useOffset** [bool or float, default: `rcParams["axes.formatter.useoffset"]` (default: `True`)] Whether to use offset notation. See `set_useOffset`.

**useMathText** [bool, default: `rcParams["axes.formatter.use_mathtext"]` (default: `False`)] Whether to use fancy math formatting. See `set_useMathText`.

**useLocale** [bool, default: `rcParams["axes.formatter.use_locale"]` (default: `False`).] Whether to use locale settings for decimal sign and positive sign. See `set_useLocale`.

### Notes

In addition to the parameters above, the formatting of scientific vs. floating point representation can be configured via `set_scientific` and `set_powerlimits`).

### Offset notation and scientific notation

Offset notation and scientific notation look quite similar at first sight. Both split some information from the formatted tick values and display it at the end of the axis.

- The scientific notation splits up the order of magnitude, i.e. a multiplicative scaling factor, e.g. `1e6`.
- The offset notation separates an additive constant, e.g. `+1e6`. The offset notation label is always prefixed with a `+` or `-` sign and is thus distinguishable from the order of magnitude label.

The following plot with `x` limits `1_000_000` to `1_000_010` illustrates the different formatting. Note the labels at the right edge of the `x` axis.

```
format_data(self, value)
```

Return the full string representation of the value with the position unspecified.

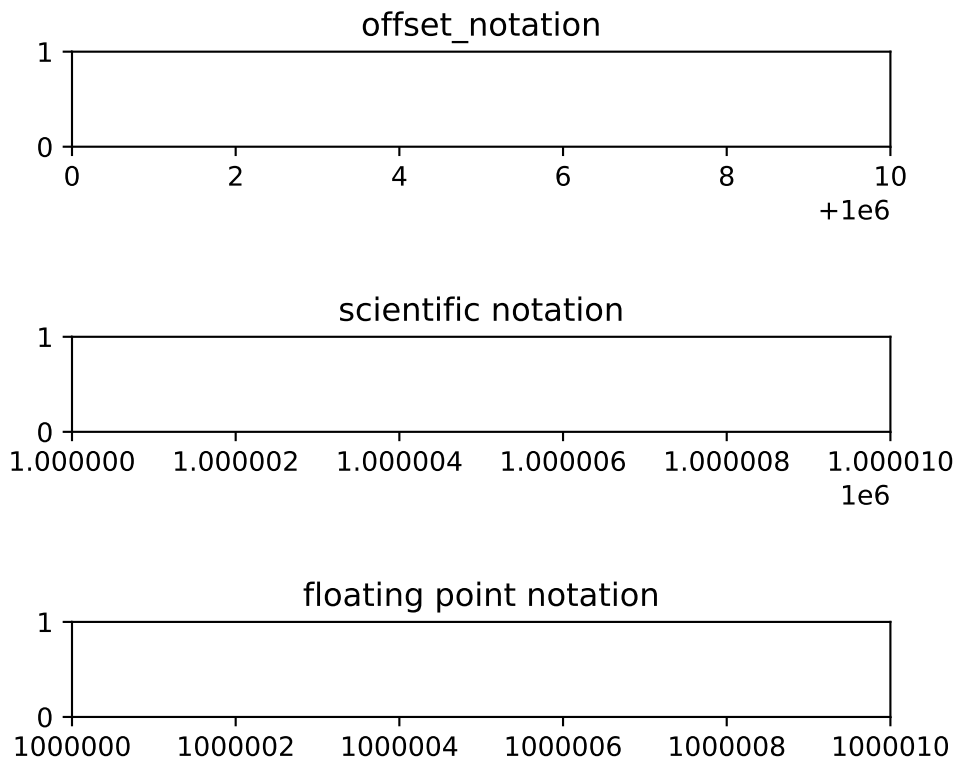

```
format_data_short(self, value)
```

Return a short string version of the tick value.

Defaults to the position-independent long value.

```
get_offset(self)
```

Return scientific notation, plus offset.

`get_useLocale(self)`

Return whether locale settings are used for formatting.

**See also:**

`ScalarFormatter.set_useLocale`

`get_useMathText(self)`

Return whether to use fancy math formatting.

**See also:**

`ScalarFormatter.set_useMathText`

`get_useOffset(self)`

Return whether automatic mode for offset notation is active.

This returns True if `set_useOffset(True)`; it returns False if an explicit offset was set, e.g. `set_useOffset(1000)`.

**See also:**

`ScalarFormatter.set_useOffset`

`set_locs(self, locs)`

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

`set_powerlimits(self, lims)`

Set size thresholds for scientific notation.

#### Parameters

**lims** [(int, int)] A tuple (*min\_exp*, *max\_exp*) containing the powers of 10 that determine the switchover threshold. For a number representable as  $a \times 10^{\text{exp}}$  with  $1 \leq |a| < 10$ , scientific notation will be used if  $\text{exp} \leq \text{min\_exp}$  or  $\text{exp} \geq \text{max\_exp}$ .

The default limits are controlled by `rcParams["axes.formatter.limits"]` (default: [-5, 6]).

In particular numbers with *exp* equal to the thresholds are written in scientific notation.

Typically, *min\_exp* will be negative and *max\_exp* will be positive.

For example, `formatter.set_powerlimits((-3, 4))` will provide the following formatting:  $1 \times 10^{-3}$ ,  $9.9 \times 10^{-3}$ , 0.01, 9999,  $1 \times 10^4$ .

#### See also:

[`ScalarFormatter.set\_scientific`](#)

`set_scientific(self, b)`

Turn scientific notation on or off.

#### See also:

[`ScalarFormatter.set\_powerlimits`](#)

`set_useLocale(self, val)`

Set whether to use locale settings for decimal sign and positive sign.

#### Parameters

**val** [bool or None] *None* resets to `rcParams["axes.formatter.use_locale"]` (default: False).

`set_useMathText(self, val)`

Set whether to use fancy math formatting.

If active, scientific notation is formatted as  $1.2 \times 10^3$ .

#### Parameters

**val** [bool or None] *None* resets to `rcParams["axes.formatter.use_mathtext"]` (default: False).

`set_useOffset(self, val)`

Set whether to use offset notation.

When formatting a set numbers whose value is large compared to their range, the formatter can separate an additive constant. This can shorten the formatted numbers so that they are less likely to overlap when drawn on an axis.

#### Parameters

**val** [bool or float]

- If False, do not use offset notation.
- If True (=automatic mode), use offset notation if it can make the residual numbers significantly shorter. The exact behavior is controlled by `rcParams["axes.formatter.offset_threshold"]` (default: 4).
- If a number, force an offset of the given value.

### Examples

With active offset notation, the values

100\_000, 100\_002, 100\_004, 100\_006, 100\_008

will be formatted as 0, 2, 4, 6, 8 plus an offset +1e5, which is written to the edge of the axis.

property `useLocale`

Return whether locale settings are used for formatting.

**See also:**

`ScalarFormatter.set_useLocale`

property `useMathText`

Return whether to use fancy math formatting.

**See also:**

`ScalarFormatter.set_useMathText`

property `useOffset`

Return whether automatic mode for offset notation is active.

This returns True if `set_useOffset(True)`; it returns False if an explicit offset was set, e.g. `set_useOffset(1000)`.

**See also:**

`ScalarFormatter.set_useOffset`

```
class matplotlib.ticker.LogFormatter(base=10.0, labelOnlyBase=False, mi-
                                   nor_thresholds=None, linthresh=None)
```

Bases: `matplotlib.ticker.Formatter`

Base class for formatting ticks on a log or symlog scale.

It may be instantiated directly, or subclassed.

### Parameters

**base** [float, default: 10.] Base of the logarithm used in all calculations.

**labelOnlyBase** [bool, default: False] If True, label ticks only at integer powers of base. This is normally True for major ticks and False for minor ticks.

**minor\_thresholds** [(subset, all), default: (1, 0.4)] If `labelOnlyBase` is False, these two numbers control the labeling of ticks that are not at integer powers of base; normally these are the minor ticks. The controlling parameter is the log of the axis data range. In the typical case where base is 10 it is the number of decades spanned by the axis, so we can call it 'numdec'. If `numdec <= all`, all minor ticks will be labeled. If `all < numdec <= subset`, then only a subset of minor ticks will be labeled, so as to avoid crowding. If `numdec > subset` then no minor ticks will be labeled.

**linthresh** [None or float, default: None] If a symmetric log scale is in use, its `linthresh` parameter must be supplied here.

### Notes

The `set_locs` method must be called to enable the subsetting logic controlled by the `minor_thresholds` parameter.

In some cases such as the colorbar, there is no distinction between major and minor ticks; the tick locations might be set manually, or by a locator that puts ticks at integer powers of base and at intermediate locations. For this situation, disable the `minor_thresholds` logic by using `minor_thresholds=(np.inf, np.inf)`, so that all ticks will be labeled.

To disable labeling of minor ticks when 'labelOnlyBase' is False, use `minor_thresholds=(0, 0)`. This is the default for the "classic" style.

### Examples

To label a subset of minor ticks when the view limits span up to 2 decades, and all of the ticks when zoomed in to 0.5 decades or less, use `minor_thresholds=(2, 0.5)`.

To label all minor ticks when the view limits span up to 1.5 decades, use `minor_thresholds=(1.5, 1.5)`.

`base(self, base)`

Change the *base* for labeling.

**Warning:** Should always match the base used for *LogLocator*

`format_data(self, value)`

Return the full string representation of the value with the position unspecified.

`format_data_short(self, value)`

Return a short string version of the tick value.

Defaults to the position-independent long value.

`label_minor(self, labelOnlyBase)`

Switch minor tick labeling on or off.

### Parameters

**labelOnlyBase** [bool] If True, label ticks only at integer powers of base.

```
set_locs(self, locs=None)
```

Use axis view limits to control which ticks are labeled.

The *locs* parameter is ignored in the present algorithm.

```
class matplotlib.ticker.LogFormatterExponent(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)
```

Bases: *matplotlib.ticker.LogFormatter*

Format values for log axis using  $\text{exponent} = \log_{\text{base}}(\text{value})$ .

```
class matplotlib.ticker.LogFormatterMathtext(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)
```

Bases: *matplotlib.ticker.LogFormatter*

Format values for log axis using  $\text{exponent} = \log_{\text{base}}(\text{value})$ .

```
class matplotlib.ticker.IndexFormatter(labels)
```

Bases: *matplotlib.ticker.Formatter*

[*Deprecated*] Format the position *x* to the nearest *i*-th label where  $i = \text{int}(x + 0.5)$ . Positions where  $i < 0$  or  $i > \text{len}(\text{list})$  have no tick labels.

### Parameters

**labels** [list] List of labels.

### Notes

Deprecated since version 3.3.

```
class matplotlib.ticker.LogFormatterSciNotation(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)
```

Bases: *matplotlib.ticker.LogFormatterMathtext*

Format values following scientific notation in a logarithmic axis.

```
class matplotlib.ticker.LogitFormatter(*, use_overline=False, one_half='\\frac{1}{2}', minor=False, minor_threshold=25, minor_number=6)
```

Bases: *matplotlib.ticker.Formatter*

Probability formatter (using Math text).

### Parameters

**use\_overline** [bool, default: False] If  $x > 1/2$ , with  $x = 1-v$ , indicate if *x* should be displayed as  $\overline{\$v}$ . The default is to display  $\$1-v$ .

**one\_half** [str, default: `r"frac{1}{2}"`] The string used to represent  $1/2$ .

**minor** [bool, default: False] Indicate if the formatter is formatting minor ticks or not. Basically minor ticks are not labelled, except when only few ticks are provided, ticks with most space with neighbor ticks are labelled. See other parameters to change the default behavior.

**minor\_threshold** [int, default: 25] Maximum number of locs for labelling some minor ticks. This parameter have no effect if *minor* is False.

**minor\_number** [int, default: 6] Number of ticks which are labelled when the number of ticks is below the threshold.

`format_data_short(self, value)`

Return a short string version of the tick value.

Defaults to the position-independent long value.

`set_locs(self, locs)`

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

`set_minor_number(self, minor_number)`

Set the number of minor ticks to label when some minor ticks are labelled.

#### Parameters

**minor\_number** [int] Number of ticks which are labelled when the number of ticks is below the threshold.

`set_minor_threshold(self, minor_threshold)`

Set the threshold for labelling minors ticks.

#### Parameters

**minor\_threshold** [int] Maximum number of locations for labelling some minor ticks. This parameter have no effect if minor is False.

`set_one_half(self, one_half)`

Set the way one half is displayed.

**one\_half** [str, default: `r"frac{1}{2}"`] The string used to represent 1/2.

`use_overline(self, use_overline)`

Switch display mode with overline for labelling  $p > 1/2$ .

#### Parameters

**use\_overline** [bool, default: False] If  $x > 1/2$ , with  $x = 1-v$ , indicate if  $x$  should be displayed as  $\overline{\$v}$ \$. The default is to display  $\$1-v\$$ .

`class matplotlib.ticker.EngFormatter(unit="", places=None, sep=' ', *, usetex=None, useMathText=None)`

Bases: `matplotlib.ticker.Formatter`

Format axis values using engineering prefixes to represent powers of 1000, plus a specified unit, e.g., 10 MHz instead of 1e7.

#### Parameters

**unit** [str, default: `""`] Unit symbol to use, suitable for use with single-letter representations of powers of 1000. For example, 'Hz' or 'm'.

**places** [int, default: None] Precision with which to display the number, specified in digits after the decimal point (there will be between one and three digits before the decimal point). If it is None, the formatting falls back to the floating point format '`%g`', which displays up to 6 *significant* digits, i.e. the equivalent value for *places* varies between 0 and 5 (inclusive).

**sep** [str, default: `" "`] Separator used between the value and the prefix/unit. For example, one get '3.14 mV' if *sep* is `" "` (default) and '3.14mV' if *sep* is `""`. Besides the default behavior, some other useful options may be:

- `sep=""` to append directly the prefix/unit to the value;
- `sep="\N{THIN SPACE}"` (U+2009);
- `sep="\N{NARROW NO-BREAK SPACE}"` (U+202F);
- `sep="\N{NO-BREAK SPACE}"` (U+00A0).

**usetex** [bool, default: `rcParams["text.usetex"]` (default: False)] To enable/disable the use of TeX's math mode for rendering the numbers in the formatter.

**useMathText** [bool, default: `rcParams["axes.formatter.use_mathtext"]` (default: False)] To enable/disable the use mathtext for rendering the numbers in the formatter.

`ENG_PREFIXES = {-24: 'y', -21: 'z', -18: 'a', -15: 'f', -12: 'p', -9: 'n', -6: 'μ', -3: 'm', 0:`

`format_eng(self, num)`

Format a number in engineering notation, appending a letter representing the power of 1000 of the original number. Some examples:

```
>>> format_eng(0)          # for self.places = 0
'0'
```

```
>>> format_eng(1000000) # for self.places = 1
'1.0 M'
```

```
>>> format_eng("-1e-6") # for self.places = 2
'-1.00 μ'
```

`get_useMathText(self)`

`get_usetex(self)`

`set_useMathText(self, val)`

`set_usetex(self, val)`

property `useMathText`

property `usetex`

`class matplotlib.ticker.PercentFormatter(xmax=100, decimals=None, symbol='%', is_latex=False)`

Bases: `matplotlib.ticker.Formatter`

Format numbers as a percentage.

### Parameters

**xmax** [float] Determines how the number is converted into a percentage. `xmax` is the data value that corresponds to 100%. Percentages are computed as  $x / xmax * 100$ . So if the data is already scaled to be percentages, `xmax` will be 100. Another common situation is where `xmax` is 1.0.

**decimals** [None or int] The number of decimal places to place after the point. If `None` (the default), the number will be computed automatically.

**symbol** [str or None] A string that will be appended to the label. It may be *None* or empty to indicate that no symbol should be used. LaTeX special characters are escaped in *symbol* whenever latex mode is enabled, unless *is\_latex* is *True*.

**is\_latex** [bool] If *False*, reserved LaTeX characters in *symbol* will be escaped.

`convert_to_pct(self, x)`

`format_pct(self, x, display_range)`

Format the number as a percentage number with the correct number of decimals and adds the percent symbol, if any.

If `self.decimals` is *None*, the number of digits after the decimal point is set based on the *display\_range* of the axis as follows:

display_range	decimals	sample
>50	0	x = 34.5 => 35%
>5	1	x = 34.5 => 34.5%
>0.5	2	x = 34.5 => 34.50%
...	...	...

This method will not be very good for tiny axis ranges or extremely large ones. It assumes that the values on the chart are percentages displayed on a reasonable scale.

property `symbol`

The configured percent symbol as a string.

If LaTeX is enabled via `rcParams["text.usetex"]` (default: *False*), the special characters {'#', '\$', '%', '&', '~', '\_', '^', '\\', '{', '}' } are automatically escaped in the string.

`class matplotlib.ticker.OldScalarFormatter(*args, **kwargs)`

Bases: *matplotlib.ticker.Formatter*

[*Deprecated*] Tick location is a plain old number.

## Notes

Deprecated since version 3.3.

`class matplotlib.ticker.Locator`

Bases: *matplotlib.ticker.TickHelper*

Determine the tick locations;

Note that the same locator should not be used across multiple *Axis* because the locator stores references to the Axis data and view limits.

`MAXTICKS = 1000`

`autoscale(self)`

[*Deprecated*] Autoscale the view limits.

### Notes

Deprecated since version 3.2.

`nonsingular(self, v0, v1)`

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the axes if the axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

`pan(self, numsteps)`

[*Deprecated*] Pan numticks (can be positive or negative)

### Notes

Deprecated since version 3.3.

`raise_if_exceeds(self, locs)`

Log at WARNING level if `locs` is longer than `Locator.MAXTICKS`.

This is intended to be called immediately before returning `locs` from `__call__` to inform users in case their Locator returns a huge number of ticks, causing Matplotlib to run out of memory.

The "strange" name of this method dates back to when it would raise an exception instead of emitting a log.

`refresh(self)`

[*Deprecated*] Refresh internal information based on current limits.

### Notes

Deprecated since version 3.3.

`set_params(self, **kwargs)`

Do nothing, and raise a warning. Any locator class not supporting the `set_params()` function will call this.

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits(self, vmin, vmax)`

Select a scale for the range from `vmin` to `vmax`.

Subclasses should override this method to change locator behaviour.

`zoom(self, direction)`

[*Deprecated*] Zoom in/out on axis; if `direction` is `>0` zoom in, else zoom out.

### Notes

Deprecated since version 3.3.

`class matplotlib.ticker.IndexLocator(base, offset)`

Bases: `matplotlib.ticker.Locator`

Place a tick on every multiple of some base number of points plotted, e.g., on every 5th point. It is assumed that you are doing index plotting; i.e., the axis is `0, len(data)`. This is mainly useful for x ticks.

Place ticks every *base* data point, starting at *offset*.

`set_params(self, base=None, offset=None)`

Set parameters within this locator

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the `Locator` instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`class matplotlib.ticker.FixedLocator(locs, nbins=None)`

Bases: `matplotlib.ticker.Locator`

Tick locations are fixed. If `nbins` is not `None`, the array of possible positions will be subsampled to keep the number of ticks `<= nbins + 1`. The subsampling will be done so as to include the smallest absolute value; for example, if zero is included in the array of possibilities, then it is guaranteed to be one of the chosen ticks.

`set_params(self, nbins=None)`

Set parameters within this locator.

`tick_values(self, vmin, vmax)`

Return the locations of the ticks.

---

**Note:** Because the values are fixed, `vmin` and `vmax` are not used in this method.

---

`class matplotlib.ticker.NullLocator`

Bases: `matplotlib.ticker.Locator`

No ticks

`tick_values(self, vmin, vmax)`  
Return the locations of the ticks.

---

**Note:** Because the values are Null, `vmin` and `vmax` are not used in this method.

---

`class matplotlib.ticker.LinearLocator(numticks=None, presets=None)`

Bases: `matplotlib.ticker.Locator`

Determine the tick locations

The first time this function is called it will try to set the number of ticks to make a nice tick partitioning. Thereafter the number of ticks will be fixed so that interactive navigation will be nice

Use presets to set locs based on lom. A dict mapping `vmin`, `vmax`->`locs`

property `numticks`

`set_params(self, numticks=None, presets=None)`

Set parameters within this locator.

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **`vmin`** and **`vmax`**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the `Locator` instance:

---

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits(self, vmin, vmax)`

Try to choose the view limits intelligently.

`class matplotlib.ticker.LogLocator(base=10.0, subs=(1.0, ), numdecs=4, numticks=None)`

Bases: `matplotlib.ticker.Locator`

Determine the tick locations for log axes

Place ticks on the locations : `subs[j] * base**i`

### Parameters

**subs** [None or str or sequence of float, default: (1.0,)] Gives the multiples of integer powers of the base at which to place ticks. The default places ticks only at integer powers of the base. The permitted string values are 'auto' and 'all', both of which use an algorithm based on the axis view limits to determine whether and how to put ticks between integer powers of the base. With 'auto', ticks are placed only between integer powers; with 'all', the integer powers are included. A value of None is equivalent to 'auto'.

`base(self, base)`

Set the log base (major tick every `base**i`, `i` integer).

`nonsingular(self, vmin, vmax)`

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with `(v0, v1)` set to the data limits on the axes if the axes contains any data, or `(-inf, +inf)` if not.

- If `v0 == v1` (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If `(v0, v1) == (-inf, +inf)`, this method returns appropriate default view limits.
- Otherwise, `(v0, v1)` is returned without modification.

`set_params(self, base=None, subs=None, numdecs=None, numticks=None)`

Set parameters within this locator.

`subs(self, subs)`

Set the minor ticks for the log scaling every `base**i*subs[j]`.

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`view_limits(self, vmin, vmax)`

Try to choose the view limits intelligently.

`class matplotlib.ticker.AutoLocator`

Bases: `matplotlib.ticker.MaxNLocator`

Dynamically find major tick positions. This is actually a subclass of `MaxNLocator`, with parameters `nbins = 'auto'` and `steps = [1, 2, 2.5, 5, 10]`.

To know the values of the non-public parameters, please have a look to the defaults of `MaxNLocator`.

`class matplotlib.ticker.MultipleLocator(base=1.0)`

Bases: `matplotlib.ticker.Locator`

Set a tick on each integer multiple of a base within the view interval.

`set_params(self, base)`

Set parameters within this locator.

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

```
view_limits(self, dmin, dmax)
```

Set the view limits to the nearest multiples of base that contain the data.

```
class matplotlib.ticker.MaxNLocator(*args, **kwargs)
```

Bases: [matplotlib.ticker.Locator](#)

Find nice tick locations with no more than N being within the view limits. Locations beyond the limits are added to support autoscaling.

### Parameters

**nbins** [int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

**steps** [array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

**integer** [bool, default: False] If True, ticks will take only integer values, provided at least *min\_n\_ticks* integers are found within the view limits.

**symmetric** [bool, default: False] If True, autoscaling will result in a range symmetric about zero.

**prune** [{ 'lower', 'upper', 'both', None }, default: None] Remove edge ticks - useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when `rcParams["axes.autolimit_mode"]` (default: 'data') is 'round\_numbers'. If `prune=='lower'`, the smallest tick will be removed. If `prune == 'upper'`, the largest tick will be removed. If `prune == 'both'`, the largest and smallest ticks will be removed. If *prune* is *None*, no ticks will be removed.

**min\_n\_ticks** [int, default: 2] Relax *nbins* and *integer* constraints if necessary to obtain this minimum number of ticks.

```
default_params = {'integer': False, 'min_n_ticks': 2, 'nbins': 10, 'prune': None, 'steps': None,
```

```
set_params(self, **kwargs)
```

Set parameters for this locator.

### Parameters

**nbins** [int or 'auto', optional] see [MaxNLocator](#)

**steps** [array-like, optional] see [MaxNLocator](#)

**integer** [bool, optional] see [MaxNLocator](#)

**symmetric** [bool, optional] see [MaxNLocator](#)

**prune** [{ 'lower', 'upper', 'both', None }, optional] see [MaxNLocator](#)

**min\_n\_ticks** [int, optional] see [MaxNLocator](#)

```
tick_values(self, vmin, vmax)
```

Return the values of the located ticks given **vmin** and **vmax**.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits(self, dmin, dmax)`

Select a scale for the range from `vmin` to `vmax`.

Subclasses should override this method to change locator behaviour.

`class matplotlib.ticker.AutoMinorLocator(n=None)`

Bases: `matplotlib.ticker.Locator`

Dynamically find minor tick positions based on the positions of major ticks. The scale must be linear with major ticks evenly spaced.

`n` is the number of subdivisions of the interval between major ticks; e.g., `n=2` will place a single minor tick midway between major ticks.

If `n` is omitted or `None`, it will be set to 5 or 4.

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **`vmin`** and **`vmax`**.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`class matplotlib.ticker.SymmetricalLogLocator(transform=None, subs=None, linthresh=None, base=None)`

Bases: `matplotlib.ticker.Locator`

Determine the tick locations for symmetric log axes.

### Parameters

**transform** [`SymmetricalLogTransform`, optional] If set, defines the *base* and *linthresh* of the symlog transform.

**base, linthresh** [float, optional] The *base* and *linthresh* of the symlog transform, as documented for `SymmetricalLogScale`. These parameters are only used if *transform* is not set.

**subs** [sequence of float, default: [1]] The multiples of integer powers of the base where ticks are placed, i.e., ticks are placed at `[sub * base**i for i in ... for sub in subs]`.

## Notes

Either *transform*, or both *base* and *linthresh*, must be given.

`set_params(self, subs=None, numticks=None)`

Set parameters within this locator.

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the *vmin* and *vmax* values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`view_limits(self, vmin, vmax)`

Try to choose the view limits intelligently.

`class matplotlib.ticker.LogitLocator(minor=False, *, nbins='auto')`

Bases: `matplotlib.ticker.MaxNLocator`

Determine the tick locations for logit axes

Place ticks on the logit locations

### Parameters

**nbins** [int or 'auto', optional] Number of ticks. Only used if *minor* is False.

**minor** [bool, default: False] Indicate if this locator is for minor ticks or not.

property *minor*

`nonsingular(self, vmin, vmax)`

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with (*v0*, *v1*) set to the data limits on the axes if the axes contains any data, or (*-inf*, *+inf*) if not.

- If *v0* == *v1* (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If (*v0*, *v1*) == (*-inf*, *+inf*), this method returns appropriate default view limits.
- Otherwise, (*v0*, *v1*) is returned without modification.

`set_params(self, minor=None, **kwargs)`

Set parameters within this locator.

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the *vmin* and *vmax* values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```
class matplotlib.ticker.OldAutoLocator(*args, **kwargs)
```

Bases: *matplotlib.ticker.Locator*

[*Deprecated*] On autoscale this class picks the best MultipleLocator to set the view limits and the tick locs.

### Notes

Deprecated since version 3.3.

`get_locator(self, d)`

Pick the best locator based on a distance *d*.

`tick_values(self, vmin, vmax)`

Return the values of the located ticks given **vmin** and **vmax**.

---

**Note:** To get tick locations with the *vmin* and *vmax* values defined automatically for the associated axis simply call the *Locator* instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

---

`view_limits(self, vmin, vmax)`

Select a scale for the range from *vmin* to *vmax*.

Subclasses should override this method to change locator behaviour.

## 18.54 matplotlib.tight\_layout

Routines to adjust subplot params so that subplots are nicely fit in the figure. In doing so, only axis labels, tick labels, axes titles and offsetboxes that are anchored to axes are currently considered.

Internally, this module assumes that the margins (`left_margin`, etc.) which are differences between `ax.get_tightbbox` and `ax.bbox` are independent of axes position. This may fail if `Axes.adjustable` is `datalim`. Also, This will fail for some cases (for example, left or right margin is affected by `xlabel`).

```
matplotlib.tight_layout.auto_adjust_subplotpars(fig, renderer, nrows_ncols,  
                                              num1num2_list, subplot_list,  
                                              ax_bbox_list=None, pad=1.08,  
                                              h_pad=None, w_pad=None,  
                                              rect=None)
```

Return a dict of subplot parameters to adjust spacing between subplots or `None` if resulting axes would have zero height or width.

Note that this function ignores geometry information of subplot itself, but uses what is given by the *nrows\_ncols* and *num1num2\_list* parameters. Also, the results could be incorrect if some subplots have `adjustable=datalim`.

### Parameters

**nrows\_ncols** [Tuple[int, int]] Number of rows and number of columns of the grid.

**num1num2\_list** [List[int]] List of numbers specifying the area occupied by the subplot

**subplot\_list** [list of subplots] List of subplots that will be used to calculate optimal subplot\_params.

**pad** [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h\_pad, w\_pad** [float] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to *pad*.

**rect** [Tuple[float, float, float, float]] [left, bottom, right, top] in normalized (0, 1) figure coordinates.

```
matplotlib.tight_layout.get_renderer(fig)
```

```
matplotlib.tight_layout.get_subplotspec_list(axes_list, grid_spec=None)
```

Return a list of subplotspec from the given list of axes.

For an instance of axes that does not support subplotspec, `None` is inserted in the list.

If *grid\_spec* is given, `None` is inserted for those not from the given *grid\_spec*.

```
matplotlib.tight_layout.get_tight_layout_figure(fig, axes_list, subplotspec_list, ren-  
                                              derer, pad=1.08, h_pad=None,  
                                              w_pad=None, rect=None)
```

Return subplot parameters for tight-laid-out-figure with specified padding.

### Parameters

**fig** [Figure]

**axes\_list** [list of Axes]

**subplotspec\_list** [list of *SubplotSpec*] The subplotspecs of each axes.

**renderer** [renderer]

**pad** [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h\_pad, w\_pad** [float] Padding (height/width) between edges of adjacent subplots. Defaults to *pad*.

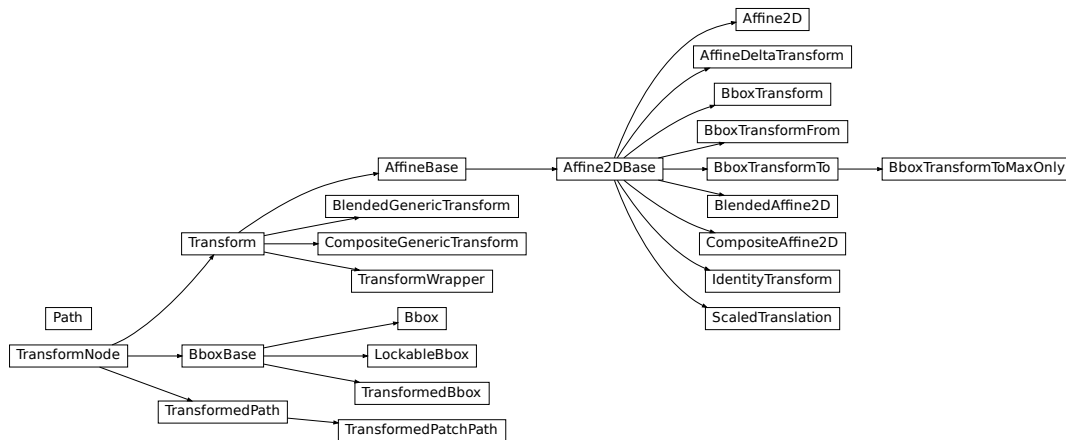

**rect** [Tuple[float, float, float, float], optional] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Defaults to using the entire figure.

## Returns

**subplotspec or None** subplotspec kwargs to be passed to *Figure*.  
*subplots\_adjust* or None if tight\_layout could not be accomplished.

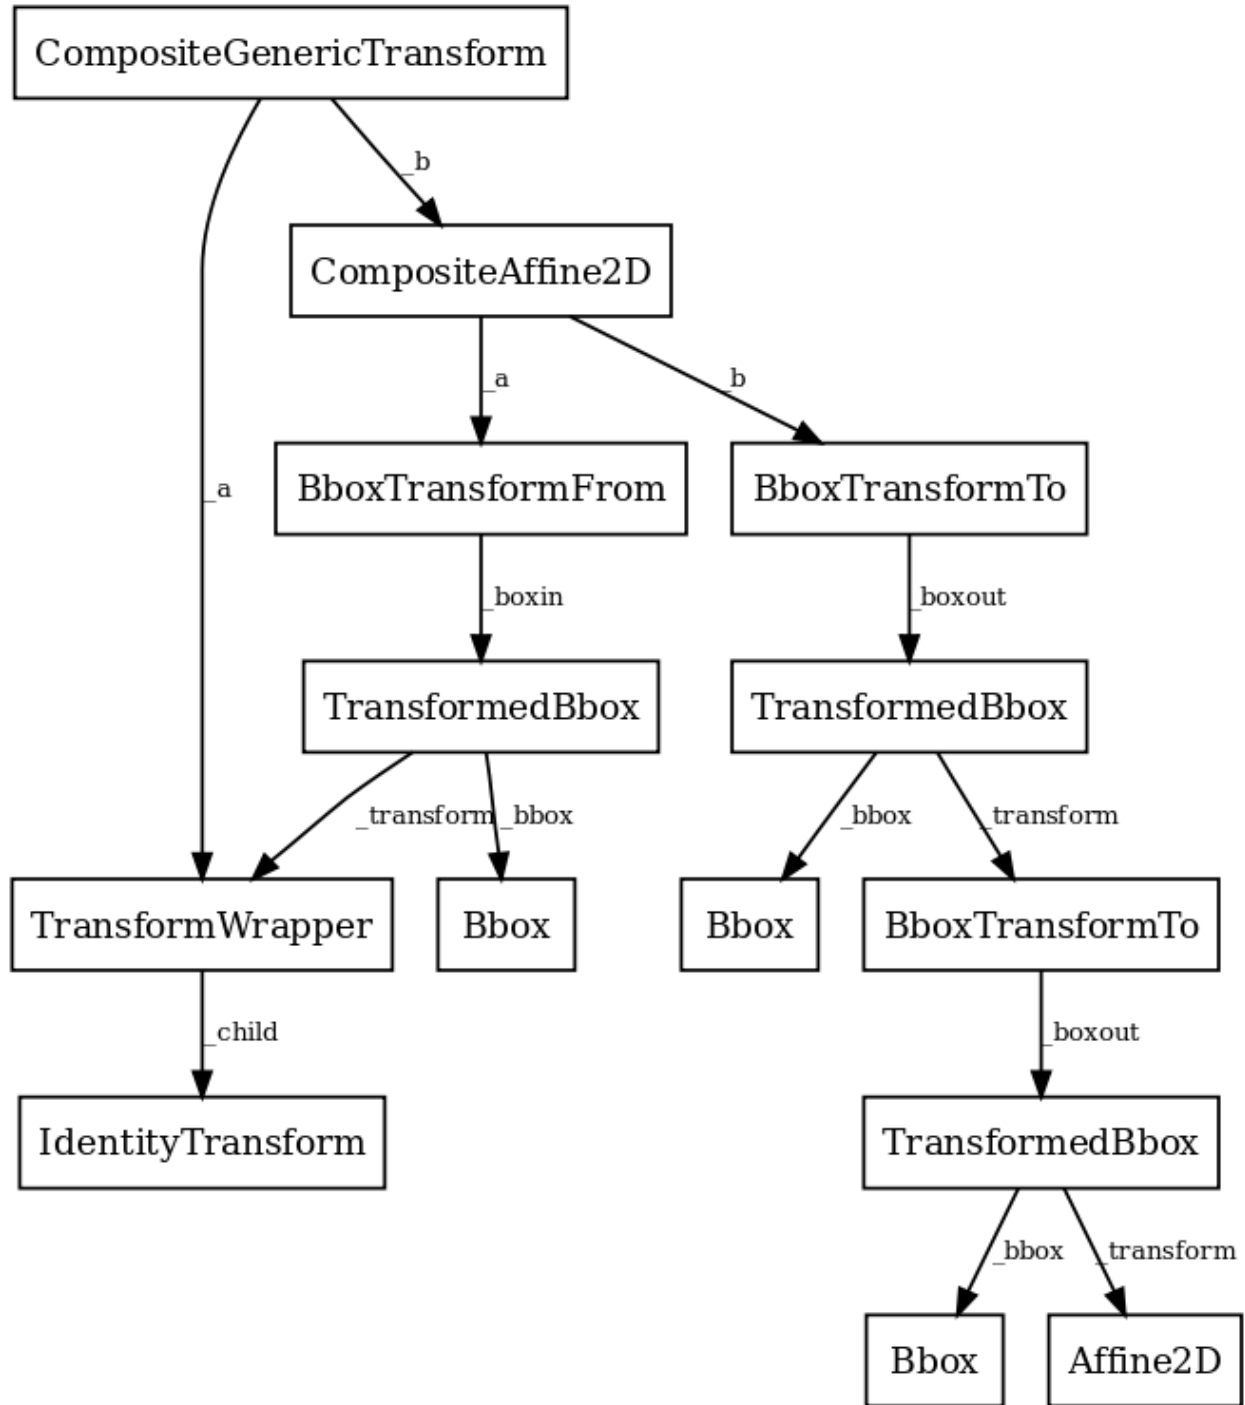

## 18.55 matplotlib.transforms

Matplotlib includes a framework for arbitrary geometric transformations that is used to determine the final position of all elements drawn on the canvas.

Transforms are composed into trees of *TransformNode* objects whose actual value depends on their children. When the contents of children change, their parents are automatically invalidated. The next time an invalidated transform is accessed, it is recomputed to reflect those changes. This invalidation/caching approach prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

For example, here is a graph of the transform tree used to plot data to the graph:

The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

```
full transform == non-affine part + affine part
```

The backends are not expected to handle non-affine transformations themselves.

```
class matplotlib.transforms.Affine2D(matrix=None, **kwargs)
```

Bases: `matplotlib.transforms.Affine2DBase`

A mutable 2D affine transformation.

Initialize an Affine transform from a 3x3 numpy float array:

```
a c e
b d f
0 0 1
```

If *matrix* is None, initialize with the identity transform.

`__init__(self, matrix=None, **kwargs)`

Initialize an Affine transform from a 3x3 numpy float array:

```
a c e
b d f
0 0 1
```

If *matrix* is None, initialize with the identity transform.

`__module__ = 'matplotlib.transforms'`

`__str__(self)`

`clear(self)`

Reset the underlying matrix to the identity transform.

`static from_values(a, b, c, d, e, f)`

Create a new Affine2D instance from the given values:

```
a c e
b d f
0 0 1
```

.

`get_matrix(self)`

Get the underlying transformation matrix as a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

.

`static identity()`

Return a new *Affine2D* object that is the identity transform.

Unless this transform will be mutated later on, consider using the faster *IdentityTransform* class instead.

`rotate(self, theta)`

Add a rotation (in radians) to this transform in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate\_deg()*, *translate()* and *scale()*.

`rotate_around(self, x, y, theta)`

Add a rotation (in radians) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to *rotate()*, *rotate\_deg()*, *translate()* and *scale()*.

`rotate_deg(self, degrees)`

Add a rotation (in degrees) to this transform in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`rotate_deg_around(self, x, y, degrees)`

Add a rotation (in degrees) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`scale(self, sx, sy=None)`

Add a scale in place.

If *sy* is *None*, the same scale is applied in both the x- and y-directions.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`set(self, other)`

Set this transformation from the frozen copy of another *Affine2DBase* object.

`set_matrix(self, mtx)`

Set the underlying transformation matrix from a 3x3 numpy array:

a	c	e
b	d	f
0	0	1

.

`skew(self, xShear, yShear)`

Add a skew in place.

*xShear* and *yShear* are the shear angles along the x- and y-axes, respectively, in radians.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`skew_deg(self, xShear, yShear)`

Add a skew in place.

*xShear* and *yShear* are the shear angles along the x- and y-axes, respectively, in degrees.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`translate(self, tx, ty)`

Add a translation in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

`class matplotlib.transforms.Affine2DBase(*args, **kwargs)`

Bases: `matplotlib.transforms.AffineBase`

The base class of all 2D affine transformations.

2D affine transformations are performed using a 3x3 numpy array:

```
a c e
b d f
0 0 1
```

This class provides the read-only interface. For a mutable 2D affine transformation, use *Affine2D*.

Subclasses of this class will generally only need to override a constructor and `get_matrix()` that generates a custom 3x3 matrix.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__module__ = 'matplotlib.transforms'
```

```
frozen(self)
```

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

```
has_inverse = True
```

```
input_dims = 2
```

```
inverted(self)
```

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
property is_separable
```

```
bool(x) -> bool
```

Returns True when the argument *x* is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

```
static matrix_from_values(a, b, c, d, e, f)
```

[*Deprecated*] Create a new transformation matrix as a 3x3 numpy array of the form:

```
a c e
b d f
0 0 1
```

### Notes

Deprecated since version 3.2.

```
output_dims = 2
```

```
to_values(self)
```

Return the values of the matrix as an (a, b, c, d, e, f) tuple.

```
transform_affine(self, points)
```

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

#### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

#### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

```
class matplotlib.transforms.AffineBase(*args, **kwargs)
```

Bases: *matplotlib.transforms.Transform*

The base class of all affine transformations of any number of dimensions.

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__array__(self, *args, **kwargs)
```

Array interface to get at this Transform's affine matrix.

```
__eq__(self, other)
```

Return `self==value`.

```
__hash__ = None
```

```
__init__(self, *args, **kwargs)
```

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__module__ = 'matplotlib.transforms'
```

```
get_affine(self)
```

Get the affine part of this transform.

```
is_affine = True
```

```
transform(self, values)
```

Apply this transformation on the given array of *values*.

#### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

#### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

```
transform_affine(self, values)
```

Apply only the affine part of this transformation on the given array of *values*.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

#### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

#### Returns

**array** The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

`transform_non_affine(self, points)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

#### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

#### Returns

**array** The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

`transform_path(self, path)`

Apply the transform to *Path* `path`, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine(self, path)`

Apply the affine part of this transform to *Path* `path`, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_path_non_affine(self, path)`

Apply the non-affine part of this transform to *Path* `path`, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`class matplotlib.transforms.AffineDeltaTransform(transform, **kwargs)`

Bases: *matplotlib.transforms.Affine2DBase*

A transform wrapper for transforming displacements between pairs of points.

This class is intended to be used to transform displacements ("position deltas") between pairs of points (e.g., as the `offset_transform` of *Collections*): given a transform `t` such that `t = AffineDeltaTransform(t) + offset`, `AffineDeltaTransform` satisfies `AffineDeltaTransform(a - b) == AffineDeltaTransform(a) - AffineDeltaTransform(b)`.

This is implemented by forcing the offset components of the transform matrix to zero.

This class is experimental as of 3.3, and the API may change.

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__init__(self, transform, **kwargs)
```

### Parameters

**shorthand\_name** [str] A string representing the “name” of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__module__ = 'matplotlib.transforms'
```

```
__str__(self)
```

```
get_matrix(self)
```

Get the matrix for the affine part of this transform.

```
class matplotlib.transforms.Bbox(points, **kwargs)
```

Bases: [matplotlib.transforms.BboxBase](#)

A mutable bounding box.

### Examples

#### Create from known bounds

The default constructor takes the boundary “points” `[[xmin, ymin], [xmax, ymax]]`.

```
>>> Bbox([[1, 1], [3, 7]])
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

Alternatively, a Bbox can be created from the flattened points array, the so-called “extents” `(xmin, ymin, xmax, ymax)`

```
>>> Bbox.from_extents(1, 1, 3, 7)
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

or from the “bounds” `(xmin, ymin, width, height)`.

```
>>> Bbox.from_bounds(1, 1, 2, 6)
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

#### Create from collections of points

The “empty” object for accumulating Bboxes is the null bbox, which is a stand-in for the empty set.

```
>>> Bbox.null()
Bbox([[inf, inf], [-inf, -inf]])
```

Adding points to the null bbox will give you the bbox of those points.

```
>>> box = Bbox.null()
>>> box.update_from_data_xy([[1, 1]])
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
>>> box.update_from_data_xy([[2, 3], [3, 2]], ignore=False)
>>> box
Bbox([[1.0, 1.0], [3.0, 3.0]])
```

Setting `ignore=True` is equivalent to starting over from a null bbox.

```
>>> box.update_from_data_xy([[1, 1]], ignore=True)
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
```

**Warning:** It is recommended to always specify `ignore` explicitly. If not, the default value of `ignore` can be changed at any time by code with access to your `Bbox`, for example using the method `ignore`.

## Properties of the “null” bbox

**Note:** The current behavior of `Bbox.null()` may be surprising as it does not have all of the properties of the “empty set”, and as such does not behave like a “zero” object in the mathematical sense. We may change that in the future (with a deprecation period).

The null bbox is the identity for intersections

```
>>> Bbox.intersection(Bbox([[1, 1], [3, 7]]), Bbox.null())
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

except with itself, where it returns the full space.

```
>>> Bbox.intersection(Bbox.null(), Bbox.null())
Bbox([[-inf, -inf], [inf, inf]])
```

A union containing null will always return the full space (not the other set!)

```
>>> Bbox.union([Bbox([[0, 0], [0, 0]]), Bbox.null())
Bbox([[-inf, -inf], [inf, inf]])
```

## Parameters

**points** [ndarray] A 2x2 numpy array of the form `[[x0, y0], [x1, y1]]`.

`__format__(self, fmt)`

Default object formatter.

`__init__(self, points, **kwargs)`

## Parameters

**points** [ndarray] A 2x2 numpy array of the form `[[x0, y0], [x1, y1]]`.

`__module__` = 'matplotlib.transforms'

`__repr__(self)`

Return `repr(self)`.

`__str__(self)`

Return `str(self)`.

property `bounds`

Return `(x0, y0, width, height)`.

static `from_bounds(x0, y0, width, height)`

Create a new `Bbox` from `x0`, `y0`, `width` and `height`.

*width* and *height* may be negative.

`static from_extents(*args)`

Create a new *Bbox* from *left*, *bottom*, *right* and *top*.

The y-axis increases upwards.

`get_points(self)`

Get the points of the bounding box directly as a numpy array of the form: `[[x0, y0], [x1, y1]]`.

`ignore(self, value)`

Set whether the existing bounds of the box should be ignored by subsequent calls to `update_from_data_xy()`.

**value** [bool]

- When True, subsequent calls to `update_from_data_xy()` will ignore the existing bounds of the *Bbox*.
- When False, subsequent calls to `update_from_data_xy()` will include the existing bounds of the *Bbox*.

`property intervalx`

The pair of x coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

`property intervaly`

The pair of y coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.

`property minpos`

`property minposx`

`property minposy`

`mutated(self)`

Return whether the *bbox* has changed since init.

`mutatedx(self)`

Return whether the x-limits have changed since init.

`mutatedy(self)`

Return whether the y-limits have changed since init.

`static null()`

Create a new null *Bbox* from (inf, inf) to (-inf, -inf).

`property p0`

The first pair of (x, y) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use `min`).

`property p1`

The second pair of (x, y) coordinates that define the bounding box.

This is not guaranteed to be the top-right corner (for that, use `max`).

`set(self, other)`

Set this bounding box from the "frozen" bounds of another *Bbox*.

`set_points(self, points)`

Set the points of the bounding box directly from a numpy array of the form: `[[x0, y0], [x1, y1]]`. No error checking is performed, as this method is mainly for internal use.

`static unit()`

Create a new unit *Bbox* from (0, 0) to (1, 1).

`update_from_data_xy(self, xy, ignore=None, updatex=True, updatey=True)`

Update the bounds of the *Bbox* based on the passed in data. After updating, the bounds will have positive *width* and *height*; *x0* and *y0* will be the minimal values.

### Parameters

**xy** [ndarray] A numpy array of 2D points.

**ignore** [bool, optional]

- When True, ignore the existing bounds of the *Bbox*.
- When False, include the existing bounds of the *Bbox*.
- When None, use the last value passed to *ignore()*.

**updatex, updatey** [bool, default: True] When True, update the x/y values.

`update_from_path(self, path, ignore=None, updatex=True, updatey=True)`

Update the bounds of the *Bbox* to contain the vertices of the provided path. After updating, the bounds will have positive *width* and *height*; *x0* and *y0* will be the minimal values.

### Parameters

**path** [*Path*]

**ignore** [bool, optional]

- when True, ignore the existing bounds of the *Bbox*.
- when False, include the existing bounds of the *Bbox*.
- when None, use the last value passed to *ignore()*.

**updatex, updatey** [bool, default: True] When True, update the x/y values.

`property x0`

The first of the pair of x coordinates that define the bounding box.

This is not guaranteed to be less than *x1* (for that, use *xmin*).

`property x1`

The second of the pair of x coordinates that define the bounding box.

This is not guaranteed to be greater than *x0* (for that, use *xmax*).

`property y0`

The first of the pair of y coordinates that define the bounding box.

This is not guaranteed to be less than *y1* (for that, use *ymin*).

`property y1`

The second of the pair of y coordinates that define the bounding box.

This is not guaranteed to be greater than *y0* (for that, use *ymax*).

```
class matplotlib.transforms.BboxBase(shorthand_name=None)
```

Bases: `matplotlib.transforms.TransformNode`

The base class of all bounding boxes.

This class is immutable; `Bbox` is a mutable subclass.

The canonical representation is as two points, with no restrictions on their ordering. Convenience properties are provided to get the left, bottom, right and top edges and width and height, but these are not stored explicitly.

### Parameters

**shorthand\_name** [str] A string representing the “name” of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__array__(self, *args, **kwargs)
```

```
__module__ = 'matplotlib.transforms'
```

```
anchored(self, c, container=None)
```

Return a copy of the `Bbox` shifted to position `c` within `container`.

### Parameters

**c** [(float, float) or str] May be either:

- A sequence (`cx`, `cy`) where `cx` and `cy` range from 0 to 1, where 0 is left or bottom and 1 is right or top
- a string: - 'C' for centered - 'S' for bottom-center - 'SE' for bottom-left - 'E' for left - etc.

**container** [`Bbox`, optional] The box within which the `Bbox` is positioned; it defaults to the initial `Bbox`.

property bounds

Return (`x0`, `y0`, `width`, `height`).

```
coefs = {'C': (0.5, 0.5), 'E': (1.0, 0.5), 'N': (0.5, 1.0), 'NE': (1.0, 1.0), 'NW': (0, 1.0), 'S':
```

```
contains(self, x, y)
```

Return whether (`x`, `y`) is in the bounding box or on its edge.

```
containsx(self, x)
```

Return whether `x` is in the closed (`x0`, `x1`) interval.

```
containsy(self, y)
```

Return whether `y` is in the closed (`y0`, `y1`) interval.

```
corners(self)
```

Return the corners of this rectangle as an array of points.

Specifically, this returns the array `[[x0, y0], [x0, y1], [x1, y0], [x1, y1]]`.

```
count_contains(self, vertices)
```

Count the number of vertices contained in the `Bbox`. Any vertices with a non-finite `x` or `y` value are ignored.

### Parameters

**vertices** [Nx2 Numpy array.]

```
count_overlaps(self, bboxes)
```

Count the number of bounding boxes that overlap this one.

**Parameters****bboxes** [sequence of *BboxBase*]`expanded(self, sw, sh)`Construct a *Bbox* by expanding this one around its center by the factors *sw* and *sh*.

property extents

Return (*x0*, *y0*, *x1*, *y1*).`frozen(self)`

The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

`fully_contains(self, x, y)`Return whether *x*, *y* is in the bounding box, but not on its edge.`fully_containsx(self, x)`Return whether *x* is in the open (*x0*, *x1*) interval.`fully_containsy(self, y)`Return whether *y* is in the open (*y0*, *y1*) interval.`fully_overlaps(self, other)`

Return whether this bounding box overlaps with the other bounding box, not including the edges.

**Parameters****other** [*BboxBase*]`get_points(self)`

property height

The (signed) height of the bounding box.

`static intersection(bbox1, bbox2)`Return the intersection of *bbox1* and *bbox2* if they intersect, or *None* if they don't.

property intervalx

The pair of *x* coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

property intervaly

The pair of *y* coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.

`inverse_transformed(self, transform)`*[Deprecated]* Construct a *Bbox* by statically transforming this one by the inverse of *transform*.**Notes**

Deprecated since version 3.3.

`is_affine = True``is_bbox = True`

`is_unit(self)`  
[Deprecated] Return whether this is the unit box (from (0, 0) to (1, 1)).

### Notes

Deprecated since version 3.2.

property `max`  
The top-right corner of the bounding box.

property `min`  
The bottom-left corner of the bounding box.

`overlaps(self, other)`  
Return whether this bounding box overlaps with the other bounding box.

### Parameters

**other** [*BboxBase*]

property `p0`  
The first pair of (x, y) coordinates that define the bounding box.  
This is not guaranteed to be the bottom-left corner (for that, use *min*).

property `p1`  
The second pair of (x, y) coordinates that define the bounding box.  
This is not guaranteed to be the top-right corner (for that, use *max*).

`padded(self, p)`  
Construct a *Bbox* by padding this one on all four sides by *p*.

`rotated(self, radians)`  
Return the axes-aligned bounding box that bounds the result of rotating this *Bbox* by an angle of *radians*.

`shrunk(self, mx, my)`  
Return a copy of the *Bbox*, shrunk by the factor *mx* in the x direction and the factor *my* in the y direction. The lower left corner of the box remains unchanged. Normally *mx* and *my* will be less than 1, but this is not enforced.

`shrunk_to_aspect(self, box_aspect, container=None, fig_aspect=1.0)`  
Return a copy of the *Bbox*, shrunk so that it is as large as it can be while having the desired aspect ratio, *box\_aspect*. If the box coordinates are relative (i.e. fractions of a larger box such as a figure) then the physical aspect ratio of that figure is specified with *fig\_aspect*, so that *box\_aspect* can also be given as a ratio of the absolute dimensions, not the relative dimensions.

property `size`  
The (signed) width and height of the bounding box.

`splitx(self, *args)`  
Return a list of new *Bbox* objects formed by splitting the original one with vertical lines at fractional positions given by *args*.

`splity(self, *args)`  
Return a list of new *Bbox* objects formed by splitting the original one with horizontal lines at fractional positions given by *args*.

```

transformed(self, transform)
    Construct a Bbox by statically transforming this one by transform.

translated(self, tx, ty)
    Construct a Bbox by translating this one by tx and ty.

static union(bboxes)
    Return a Bbox that contains all of the given bboxes.

property width
    The (signed) width of the bounding box.

property x0
    The first of the pair of x coordinates that define the bounding box.
    This is not guaranteed to be less than x1 (for that, use xmin).

property x1
    The second of the pair of x coordinates that define the bounding box.
    This is not guaranteed to be greater than x0 (for that, use xmax).

property xmax
    The right edge of the bounding box.

property xmin
    The left edge of the bounding box.

property y0
    The first of the pair of y coordinates that define the bounding box.
    This is not guaranteed to be less than y1 (for that, use ymin).

property y1
    The second of the pair of y coordinates that define the bounding box.
    This is not guaranteed to be greater than y0 (for that, use ymax).

property ymax
    The top edge of the bounding box.

property ymin
    The bottom edge of the bounding box.

class matplotlib.transforms.BboxTransform(boxin, boxout, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

    BboxTransform linearly transforms points from one Bbox to another.
    Create a new BboxTransform that linearly transforms points from boxin to boxout.

    __init__(self, boxin, boxout, **kwargs)
        Create a new BboxTransform that linearly transforms points from boxin to boxout.

    __module__ = 'matplotlib.transforms'

    __str__(self)

    get_matrix(self)
        Get the matrix for the affine part of this transform.

    is_separable = True

class matplotlib.transforms.BboxTransformFrom(boxin, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

```

*BboxTransformFrom* linearly transforms points from a given *Bbox* to the unit bounding box.

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__init__(self, boxin, **kwargs)
```

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__module__ = 'matplotlib.transforms'
```

```
__str__(self)
```

```
get_matrix(self)
```

Get the matrix for the affine part of this transform.

```
is_separable = True
```

```
class matplotlib.transforms.BboxTransformTo(boxout, **kwargs)
```

Bases: *matplotlib.transforms.Affine2DBase*

*BboxTransformTo* is a transformation that linearly transforms points from the unit bounding box to a given *Bbox*.

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

```
__init__(self, boxout, **kwargs)
```

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

```
__module__ = 'matplotlib.transforms'
```

```
__str__(self)
```

```
get_matrix(self)
```

Get the matrix for the affine part of this transform.

```
is_separable = True
```

```
class matplotlib.transforms.BboxTransformToMaxOnly(boxout, **kwargs)
```

Bases: *matplotlib.transforms.BboxTransformTo*

*BboxTransformTo* is a transformation that linearly transforms points from the unit bounding box to a given *Bbox* with a fixed upper left of (0, 0).

Create a new *BboxTransformTo* that linearly transforms points from the unit bounding box to *boxout*.

```
__module__ = 'matplotlib.transforms'
```

```
get_matrix(self)
```

Get the matrix for the affine part of this transform.

```
class matplotlib.transforms.BlendedAffine2D(x_transform, y_transform, **kwargs)
```

Bases: *matplotlib.transforms.\_BlendedMixin*, *matplotlib.transforms.Affine2DBase*

A "blended" transform uses one transform for the x-direction, and another transform for the y-direction.

This version is an optimization for the case where both child transforms are of type *Affine2D*Base.

Create a new "blended" transform using *x\_transform* to transform the x-axis and *y\_transform* to transform the y-axis.

Both *x\_transform* and *y\_transform* must be 2D affine transforms.

You will generally not call this constructor directly but use the *blended\_transform\_factory* function instead, which can determine automatically which kind of blended transform to create.

```
--init__(self, x_transform, y_transform, **kwargs)
```

Create a new "blended" transform using *x\_transform* to transform the x-axis and *y\_transform* to transform the y-axis.

Both *x\_transform* and *y\_transform* must be 2D affine transforms.

You will generally not call this constructor directly but use the *blended\_transform\_factory* function instead, which can determine automatically which kind of blended transform to create.

```
--module__ = 'matplotlib.transforms'
```

```
get_matrix(self)
```

Get the matrix for the affine part of this transform.

```
is_separable = True
```

```
class matplotlib.transforms.BlendedGenericTransform(x_transform, y_transform,
                                                    **kwargs)
```

Bases: matplotlib.transforms.\_BlendedMixin, *matplotlib.transforms.Transform*

A "blended" transform uses one transform for the x-direction, and another transform for the y-direction.

This "generic" version can handle any given child transform in the x- and y-directions.

Create a new "blended" transform using *x\_transform* to transform the x-axis and *y\_transform* to transform the y-axis.

You will generally not call this constructor directly but use the *blended\_transform\_factory* function instead, which can determine automatically which kind of blended transform to create.

```
--init__(self, x_transform, y_transform, **kwargs)
```

Create a new "blended" transform using *x\_transform* to transform the x-axis and *y\_transform* to transform the y-axis.

You will generally not call this constructor directly but use the *blended\_transform\_factory* function instead, which can determine automatically which kind of blended transform to create.

```
--module__ = 'matplotlib.transforms'
```

```
contains_branch(self, other)
```

Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

property `depth`

Return the number of transforms which have been chained together to form this Transform instance.

---

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

---

`frozen(self)`

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`get_affine(self)`

Get the affine part of this transform.

property `has_inverse`

`input_dims = 2`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

property `is_affine`

`is_separable = True`

`output_dims = 2`

`pass_through = True`

`transform_non_affine(self, points)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

`class matplotlib.transforms.CompositeAffine2D(a, b, **kwargs)`

Bases: `matplotlib.transforms.Affine2DBase`

A composite transform formed by applying transform *a* then transform *b*.

This version is an optimization that handles the case where both *a* and *b* are 2D affines.

Create a new composite transform that is the result of applying *Affine2DBase a* then *Affine2DBase b*.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

`__init__(self, a, b, **kwargs)`

Create a new composite transform that is the result of applying *Affine2DBase* `a` then *Affine2DBase* `b`.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

`__module__ = 'matplotlib.transforms'`

`__str__(self)`

property `depth`

Return the number of transforms which have been chained together to form this Transform instance.

---

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

---

`get_matrix(self)`

Get the matrix for the affine part of this transform.

`class matplotlib.transforms.CompositeGenericTransform(a, b, **kwargs)`

Bases: *matplotlib.transforms.Transform*

A composite transform formed by applying transform `a` then transform `b`.

This “generic” version can handle any two arbitrary transformations.

Create a new composite transform that is the result of applying transform `a` then transform `b`.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

`__eq__(self, other)`

Return `self==value`.

`__hash__ = None`

`__init__(self, a, b, **kwargs)`

Create a new composite transform that is the result of applying transform `a` then transform `b`.

You will generally not call this constructor directly but write `a + b` instead, which will automatically choose the best kind of composite transform instance to create.

`__module__ = 'matplotlib.transforms'`

`__str__(self)`

property `depth`

`frozen(self)`

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`get_affine(self)`

Get the affine part of this transform.

property `has_inverse`

`inverted(self)`

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

property `is_affine`

property `is_separable`

`pass_through = True`

`transform_affine(self, points)`

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

#### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

#### Returns

**array** The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_non_affine(self, points)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

#### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

#### Returns

**array** The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_path_non_affine(self, path)`

Apply the non-affine part of this transform to *Path* `path`, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`class matplotlib.transforms.IdentityTransform(*args, **kwargs)`

Bases: *matplotlib.transforms.Affine2DBase*

A special class that does one thing, the identity transform, in a fast way.

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

```
__module__ = 'matplotlib.transforms'
```

```
__str__(self)
```

```
frozen(self)
```

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

```
get_affine(self)
```

Get the affine part of this transform.

```
get_matrix(self)
```

Get the matrix for the affine part of this transform.

```
inverted(self)
```

Return the corresponding inverse transformation.

It holds `x == self.inverted().transform(self.transform(x))`.

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

```
transform(self, points)
```

Apply this transformation on the given array of *values*.

#### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

#### Returns

**array** The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

```
transform_affine(self, points)
```

Apply only the affine part of this transformation on the given array of values.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

#### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

#### Returns

**array** The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

```
transform_non_affine(self, points)
```

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

#### Parameters

**values** [array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

### Returns

**array** The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

`transform_path(self, path)`

Apply the transform to *Path* `path`, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine(self, path)`

Apply the affine part of this transform to *Path* `path`, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_path_non_affine(self, path)`

Apply the non-affine part of this transform to *Path* `path`, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

```
class matplotlib.transforms.LockableBbox(bbox, x0=None, y0=None, x1=None,
                                         y1=None, **kwargs)
```

Bases: *matplotlib.transforms.BboxBase*

A *Bbox* where some elements may be locked at certain values.

When the child bounding box changes, the bounds of this *bbox* will update accordingly with the exception of the locked elements.

### Parameters

**bbox** [*Bbox*] The child bounding box to wrap.

**x0** [float or None] The locked value for `x0`, or `None` to leave unlocked.

**y0** [float or None] The locked value for `y0`, or `None` to leave unlocked.

**x1** [float or None] The locked value for `x1`, or `None` to leave unlocked.

**y1** [float or None] The locked value for `y1`, or `None` to leave unlocked.

```
__init__(self, bbox, x0=None, y0=None, x1=None, y1=None, **kwargs)
```

### Parameters

**bbox** [*Bbox*] The child bounding box to wrap.

**x0** [float or None] The locked value for `x0`, or `None` to leave unlocked.

**y0** [float or None] The locked value for `y0`, or `None` to leave unlocked.

**x1** [float or None] The locked value for `x1`, or `None` to leave unlocked.

**y1** [float or None] The locked value for `y1`, or `None` to leave unlocked.

```
__module__ = 'matplotlib.transforms'
```

```
__str__(self)
```

```
get_points(self)
```

```
property locked_x0
```

float or None: The value used for the locked `x0`.

```
property locked_x1
```

float or None: The value used for the locked `x1`.

property `locked_y0`  
float or None: The value used for the locked y0.

property `locked_y1`  
float or None: The value used for the locked y1.

class `matplotlib.transforms.ScaledTranslation(xt, yt, scale_trans, **kwargs)`

Bases: `matplotlib.transforms.Affine2DBase`

A transformation that translates by `xt` and `yt`, after `xt` and `yt` have been transformed by `scale_trans`.

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`__init__(self, xt, yt, scale_trans, **kwargs)`

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`__module__` = 'matplotlib.transforms'

`__str__(self)`

`get_matrix(self)`

Get the matrix for the affine part of this transform.

class `matplotlib.transforms.Transform(shorthand_name=None)`

Bases: `matplotlib.transforms.TransformNode`

The base class of all `TransformNode` instances that actually perform a transformation.

All non-affine transformations should be subclasses of this class. New affine transformations should be subclasses of `Affine2D`.

Subclasses of this class should override the following members (at minimum):

- `input_dims`
- `output_dims`
- `transform()`
- `inverted()` (if an inverse exists)

The following attributes may be overridden if the default is unsuitable:

- `is_separable` (defaults to True for 1d -> 1d transforms, False otherwise)
- `has_inverse` (defaults to True if `inverted()` is overridden, False otherwise)

If the transform needs to do something non-standard with `matplotlib.path.Path` objects, such as adding curves where there were once line segments, it should override:

- `transform_path()`

#### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`--add__(self, other)`

Compose two transforms together so that *self* is followed by *other*.

$A + B$  returns a transform *C* so that  $C.transform(x) == B.transform(A.transform(x))$ .

`--array__(self, *args, **kwargs)`

Array interface to get at this Transform's affine matrix.

`classmethod __init_subclass__()`

This method is called when a class is subclassed.

The default implementation does nothing. It may be overridden to extend subclasses.

`--module__ = 'matplotlib.transforms'`

`--sub__(self, other)`

Compose *self* with the inverse of *other*, cancelling identical terms if any:

```
# In general:
A - B == A + B.inverted()
# (but see note regarding frozen transforms below).

# If A "ends with" B (i.e. A == A' + B for some A') we can cancel
# out B:
(A' + B) - B == A'

# Likewise, if B "starts with" A (B = A + B'), we can cancel out A:
A - (A + B') == B'.inverted() == B'^-1
```

Cancellation (rather than naively returning  $A + B.inverted()$ ) is important for multiple reasons:

- It avoids floating-point inaccuracies when computing the inverse of *B*:  $B - B$  is guaranteed to cancel out exactly (resulting in the identity transform), whereas  $B + B.inverted()$  may differ by a small epsilon.
- `B.inverted()` always returns a frozen transform: if one computes  $A + B + B.inverted()$  and later mutates *B*, then `B.inverted()` won't be updated and the last two terms won't cancel out anymore; on the other hand,  $A + B - B$  will always be equal to *A* even if *B* is mutated.

`contains_branch(self, other)`

Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.

`contains_branch_seperately(self, other_transform)`

Return whether the given branch is a sub-tree of this transform on each separate dimension.

A common use for this method is to identify if a transform is a blended transform containing an axes' data transform. e.g.:

```
x_isdata, y_isdata = trans.contains_branch_seperately(ax.transData)
```

property depth

Return the number of transforms which have been chained together to form this Transform instance.

---

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

---

get\_affine(*self*)

Get the affine part of this transform.

get\_matrix(*self*)

Get the matrix for the affine part of this transform.

has\_inverse = False

True if this transform has a corresponding inverse transform.

input\_dims = None

The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

inverted(*self*)

Return the corresponding inverse transformation.

It holds  $x == self.inverted().transform(self.transform(x))$ .

The return value of this method should be treated as temporary. An update to *self* does not cause a corresponding update to its inverted copy.

is\_separable = False

True if this transform is separable in the x- and y- dimensions.

output\_dims = None

The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

transform(*self*, *values*)

Apply this transformation on the given array of *values*.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

transform\_affine(*self*, *values*)

Apply only the affine part of this transformation on the given array of values.

transform(*values*) is always equivalent to transform\_affine(transform\_non\_affine(*values*)).

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to transform(*values*).

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

`transform_angles(self, angles, pts, radians=False, pushoff=1e-05)`

Transform a set of angles anchored at specific locations.

### Parameters

**angles** [(N,) array-like] The angles to transform.

**pts** [(N, 2) array-like] The points where the angles are anchored.

**radians** [bool, default: False] Whether *angles* are radians or degrees.

**pushoff** [float] For each point in *pts* and angle in *angles*, the transformed angle is computed by transforming a segment of length *pushoff* starting at that point and making that angle relative to the horizontal axis, and measuring the angle between the horizontal axis and the transformed segment.

### Returns

**(N,) array**

`transform_bbox(self, bbox)`

Transform the given bounding box.

For smarter transforms including caching (a common requirement in Matplotlib), see *TransformedBbox*.

`transform_non_affine(self, values)`

Apply only the non-affine part of this transformation.

`transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

### Parameters

**values** [array] The input values as NumPy array of length *input\_dims* or shape (N x *input\_dims*).

### Returns

**array** The output values as NumPy array of length *input\_dims* or shape (N x *output\_dims*), depending on the input.

`transform_path(self, path)`

Apply the transform to *Path path*, returning a new *Path*.

In some cases, this transform may insert curves into the path that began as line segments.

`transform_path_affine(self, path)`

Apply the affine part of this transform to *Path path*, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_path_non_affine(self, path)`

Apply the non-affine part of this transform to *Path* `path`, returning a new *Path*.

`transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.

`transform_point(self, point)`

Return a transformed point.

This function is only kept for backcompatibility; the more general *transform* method is capable of transforming both a list of points and a single point.

The point is given as a sequence of length *input\_dims*. The transformed point is returned as a sequence of length *output\_dims*.

```
class matplotlib.transforms.TransformNode(shorthand_name=None)
```

Bases: `object`

The base class for anything that participates in the transform tree and needs to invalidate its parents or be invalidated. This includes classes that are not really transforms, such as bounding boxes, since some transforms depend on bounding boxes to compute their values.

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`INVALID = 3`

`INVALID_AFFINE = 2`

`INVALID_NON_AFFINE = 1`

`__copy__(self, *args)`

`__deepcopy__(self, *args)`

`__dict__ = mappingproxy({'__module__': 'matplotlib.transforms', '__doc__': '\n The base class for`

`__getstate__(self)`

`__init__(self, shorthand_name=None)`

### Parameters

**shorthand\_name** [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when `DEBUG=True`.

`__module__ = 'matplotlib.transforms'`

`__setstate__(self, data_dict)`

`__weakref__`

list of weak references to the object (if defined)

`frozen(self)`

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

`invalidate(self)`

Invalidate this *TransformNode* and triggers an invalidation of its ancestors. Should be called any time the transform changes.

```
is_affine = False
```

```
is_bbox = False
```

```
pass_through = False
```

If `pass_through` is `True`, all ancestors will always be invalidated, even if 'self' is already invalid.

```
set_children(self, *children)
```

Set the children of the transform, to let the invalidation system know which transforms can invalidate this transform. Should be called from the constructor of any transforms that depend on other transforms.

```
class matplotlib.transforms.TransformWrapper(child)
```

Bases: *matplotlib.transforms.Transform*

A helper class that holds a single child transform and acts equivalently to it.

This is useful if a node of the transform tree must be replaced at run time with a transform of a different type. This class allows that replacement to correctly trigger invalidation.

*TransformWrapper* instances must have the same input and output dimensions during their entire lifetime, so the child transform may only be replaced with another child transform of the same dimensions.

*child*: A *Transform* instance. This child may later be replaced with *set()*.

```
__eq__(self, other)
```

Return `self==value`.

```
__hash__ = None
```

```
__init__(self, child)
```

*child*: A *Transform* instance. This child may later be replaced with *set()*.

```
__module__ = 'matplotlib.transforms'
```

```
__str__(self)
```

```
frozen(self)
```

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where `copy.deepcopy()` might normally be used.

```
property has_inverse
```

```
property is_affine
```

```
property is_separable
```

```
pass_through = True
```

```
set(self, child)
```

Replace the current child of this transform with another one.

The new child must have the same number of input and output dimensions as the current child.

```
class matplotlib.transforms.TransformBbox(bbox, transform, **kwargs)
```

Bases: *matplotlib.transforms.BboxBase*

A *Bbox* that is automatically transformed by a given transform. When either the child bounding box or transform changes, the bounds of this *bbox* will update accordingly.

### Parameters

---

```

    bbox [Bbox]
    transform [Transform]
    __init__(self, bbox, transform, **kwargs)

    Parameters

        bbox [Bbox]
        transform [Transform]

    __module__ = 'matplotlib.transforms'
    __str__(self)
    get_points(self)

class matplotlib.transforms.TransformPatchPath(patch)
    Bases: matplotlib.transforms.TransformPatch

    A TransformPatchPath caches a non-affine transformed copy of the Patch. This cached
    copy is automatically updated when the non-affine part of the transform or the patch
    changes.

    Parameters

        patch [Patch]

    __init__(self, patch)

    Parameters

        patch [Patch]

    __module__ = 'matplotlib.transforms'

class matplotlib.transforms.TransformPath(path, transform)
    Bases: matplotlib.transforms.TransformNode

    A TransformPath caches a non-affine transformed copy of the Path. This cached copy is
    automatically updated when the non-affine part of the transform changes.

```

---

**Note:** Paths are considered immutable by this class. Any update to the path's vertices/codes will not trigger a transform recomputation.

---

```

    Parameters

        path [Path]
        transform [Transform]

    __init__(self, path, transform)

    Parameters

        path [Path]
        transform [Transform]

    __module__ = 'matplotlib.transforms'
    get_affine(self)

```

`get_fully_transformed_path(self)`

Return a fully-transformed copy of the child path.

`get_transformed_path_and_affine(self)`

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation.

`get_transformed_points_and_affine(self)`

Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation. Unlike `get_transformed_path_and_affine()`, no interpolation will be performed.

`matplotlib.transforms.blended_transform_factory(x_transform, y_transform)`

Create a new “blended” transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

A faster version of the blended transform is returned for the case where both child transforms are affine.

`matplotlib.transforms.composite_transform_factory(a, b)`

Create a new composite transform that is the result of applying transform `a` then transform `b`.

Shortcut versions of the blended transform are provided for the case where both child transforms are affine, or one or the other is the identity transform.

Composite transforms may also be created using the `'+'` operator, e.g.:

`c = a + b`

`matplotlib.transforms.interval_contains(interval, val)`

Check, inclusively, whether an interval includes a given value.

#### Parameters

**interval** [(float, float)] The endpoints of the interval.

**val** [float] Value to check is within interval.

#### Returns

**bool** Whether `val` is within the `interval`.

`matplotlib.transforms.interval_contains_open(interval, val)`

Check, excluding endpoints, whether an interval includes a given value.

#### Parameters

**interval** [(float, float)] The endpoints of the interval.

**val** [float] Value to check is within interval.

#### Returns

**bool** Whether `val` is within the `interval`.

`matplotlib.transforms.nonsingular(vmin, vmax, expander=0.001, tiny=1e-15, increasing=True)`

Modify the endpoints of a range as needed to avoid singularities.

#### Parameters

**vmin, vmax** [float] The initial endpoints.

**expander** [float, default: 0.001] Fractional amount by which *vmin* and *vmax* are expanded if the original interval is too small, based on *tiny*.

**tiny** [float, default: 1e-15] Threshold for the ratio of the interval to the maximum absolute value of its endpoints. If the interval is smaller than this, it will be expanded. This value should be around 1e-15 or larger; otherwise the interval will be approaching the double precision resolution limit.

**increasing** [bool, default: True] If True, swap *vmin*, *vmax* if *vmin* > *vmax*.

#### Returns

**vmin, vmax** [float] Endpoints, expanded and/or swapped if necessary. If either input is inf or NaN, or if both inputs are 0 or very close to zero, it returns *-expander, expander*.

`matplotlib.transforms.offset_copy(trans, fig=None, x=0.0, y=0.0, units='inches')`

Return a new transform with an added offset.

#### Parameters

**trans** [*Transform* subclass] Any transform, to which offset will be applied.

**fig** [*Figure*, default: None] Current figure. It can be None if *units* are 'dots'.

**x, y** [float, default: 0.0] The offset to apply.

**units** [{*'inches'*, *'points'*, *'dots'*}, default: *'inches'*] Units of the offset.

#### Returns

*Transform* subclass Transform with applied offset.

## 18.56 matplotlib.tri

Unstructured triangular grid functions.

`class matplotlib.tri.Triangulation(x, y, triangles=None, mask=None)`

An unstructured triangular grid consisting of *npoints* points and *ntri* triangles. The triangles can either be specified by the user or automatically generated using a Delaunay triangulation.

#### Parameters

**x, y** [array-like of shape (*npoints*)] Coordinates of grid points.

**triangles** [int array-like of shape (*ntri*, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

**mask** [bool array-like of shape (*ntri*), optional] Which triangles are masked out.

## Notes

For a Triangulation to be valid it must not have duplicate points, triangles formed from colinear points, or overlapping triangles.

### Attributes

**edges** [int array of shape (nedges, 2)] Return integer array of shape (nedges, 2) containing all edges of non-masked triangles.

**neighbors** [int array of shape (ntri, 3)] Return integer array of shape (ntri, 3) containing neighbor triangles.

**mask** [bool array of shape (ntri, 3)] Masked out triangles.

**is\_delaunay** [bool] Whether the Triangulation is a calculated Delaunay triangulation (where *triangles* was not specified) or not.

**calculate\_plane\_coefficients**(*self*, *z*)

Calculate plane equation coefficients for all unmasked triangles from the point (x, y) coordinates and specified z-array of shape (npoints). The returned array has shape (npoints, 3) and allows z-value at (x, y) position in triangle tri to be calculated using  $z = \text{array}[\text{tri}, 0] * x + \text{array}[\text{tri}, 1] * y + \text{array}[\text{tri}, 2]$ .

**property edges**

Return integer array of shape (nedges, 2) containing all edges of non-masked triangles.

Each row defines an edge by it's start point index and end point index. Each edge appears only once, i.e. for an edge between points *i* and *j*, there will only be either (*i*, *j*) or (*j*, *i*).

**get\_cpp\_triangulation**(*self*)

Return the underlying C++ Triangulation object, creating it if necessary.

**static get\_from\_args\_and\_kwargs**(*\*args*, *\*\*kwargs*)

Return a Triangulation object from the args and kwargs, and the remaining args and kwargs with the consumed values removed.

There are two alternatives: either the first argument is a Triangulation object, in which case it is returned, or the args and kwargs are sufficient to create a new Triangulation to return. In the latter case, see Triangulation.\_\_init\_\_ for the possible args and kwargs.

**get\_masked\_triangles**(*self*)

Return an array of triangles that are not masked.

**get\_trifinder**(*self*)

Return the default `matplotlib.tri.TriFinder` of this triangulation, creating it if necessary. This allows the same TriFinder object to be easily shared.

**property neighbors**
