User’s Guide
Note: If you wish to contribute to the project, it’s recommended you install the latest development version.

Contents

• Installation Guide
  - Installing an official release
    * Test data
  - Third-party distributions of Matplotlib
    * Scientific Python Distributions
    * Linux: using your package manager
  - Installing from source
    * Dependencies
    * FreeType and Qhull
    * Building on Windows
    * Conda packages

1.1 Installing an official release

Matplotlib and its dependencies are available as wheel packages for macOS, Windows and Linux distributions:

```bash
python -m pip install -U pip
python -m pip install -U matplotlib
```

If this command results in Matplotlib being compiled from source and there’s trouble with the compilation, you can add --prefer-binary to select the newest version of Matplotlib for which there is a precompiled wheel for your OS and Python.

Note: The following backends work out of the box: Agg, ps, pdf, svg
Python is typically shipped with tk bindings which are used by TkAgg.

For support of other GUI frameworks, LaTeX rendering, saving animations and a larger selection of file formats, you need to install additional dependencies.

Although not required, we suggest also installing IPython for interactive use. To easily install a complete Scientific Python stack, see Scientific Python Distributions below.

### 1.1.1 Test data

The wheels (*.whl) on the PyPI download page do not contain test data or example code.

If you want to try the many demos that come in the Matplotlib source distribution, download the *.tar.gz file and look in the examples subdirectory.

To run the test suite:

- extract the lib/matplotlib/tests or lib/mpl_toolkits/tests directories from the source distribution.
- install test dependencies: pytest, MiKTeX, GhostScript, ffmpeg, avconv, ImageMagick, and Inkscape.
- run python -mpytest.

### 1.2 Third-party distributions of Matplotlib

#### 1.2.1 Scientific Python Distributions

Anaconda and ActiveState are excellent choices that “just work” out of the box for Windows, macOS and common Linux platforms. WinPython is an option for Windows users. All of these distributions include Matplotlib and lots of other useful (data) science tools.

#### 1.2.2 Linux: using your package manager

If you are on Linux, you might prefer to use your package manager. Matplotlib is packaged for almost every major Linux distribution.

- Debian / Ubuntu: sudo apt-get install python3-matplotlib
- Fedora: sudo dnf install python3-matplotlib
- Red Hat: sudo yum install python3-matplotlib
- Arch: sudo pacman -S python-matplotlib

### 1.3 Installing from source

If you are interested in contributing to Matplotlib development, running the latest source code, or just like to build everything yourself, it is not difficult to build Matplotlib from source.
Grab the latest tar.gz release file from the PyPI files page, or if you want to develop Matplotlib or just need the latest bugfixed version, grab the latest git version, and see Install from source. Matplotlib can be installed from the source directory with a simple `python -m pip install .`

We provide a setup.cfg file which you can use to customize the build process. For example, which default backend to use, whether some of the optional libraries that Matplotlib ships with are installed, and so on. This file will be particularly useful to those packaging Matplotlib.

### 1.3.1 Dependencies

Matplotlib requires the following dependencies:

- **Python** (>= 3.6)
- **NumPy** (>= 1.15)
- **setuptools**
- **cycler** (>= 0.10.0)
- **dateutil** (>= 2.1)
- **kiwisolver** (>= 1.0.0)
- **Pillow** (>= 6.2)
- **pyparsing** (>= 2.0.3)

Optionally, you can also install a number of packages to enable better user interface toolkits. See What is a backend? for more details on the optional Matplotlib backends and the capabilities they provide.

- **Tk** (>= 8.3, != 8.6.0 or 8.6.1): for the Tk-based backends.
- **PyQt4** (>= 4.6) or **PySide** (>= 1.0.3)\(^1\): for the Qt4-based backends.
- **PyQt5** or **PySide2**: for the Qt5-based backends.
- **PyGObject**: for the GTK3-based backends\(^2\).
- **wxPython** (>= 4)\(^3\): for the wx-based backends.
- **pycairo** (>= 1.11.0) or **cairocffi** (>= 0.8): for the GTK3 and/or cairo-based backends.
- **Tornado**: for the WebAgg backend.

For better support of animation output format and image file formats, LaTeX, etc., you can install the following:

- **ffmpeg**: for saving movies.
- **ImageMagick**: for saving animated gifs.
- **LaTeX** (with **cm-super**) and **GhostScript** (>= 9.0): for rendering text with LaTeX.
- **fontconfig** (>= 2.7): for detection of system fonts on Linux.

---

\(^1\) PySide cannot be pip-installed on Linux (but can be conda-installed).

\(^2\) If using pip (and not conda), PyGObject must be built from source; see https://pygobject.readthedocs.io/en/latest/devguide/dev_environ.html.

\(^3\) If using pip (and not conda) on Linux, wxPython wheels must be manually downloaded from https://wxpython.org/pages/downloads/.
1.3.2 FreeType and Qhull

Matplotlib depends on FreeType (>= 2.3), a font rendering library, and on Qhull (>= 2015.2), a library for computing triangulations. By default (except on AIX) Matplotlib downloads and builds its own copy of FreeType (this is necessary to run the test suite, because different versions of FreeType rasterize characters differently), and uses its own copy of Qhull.

To force Matplotlib to use a copy of FreeType or Qhull already installed in your system, create a `setup.cfg` file with the following contents:

```ini
[libs]
system_freetype = true
system_qhull = true
```

before running `python -m pip install .`.

In this case, you need to install the FreeType and Qhull library and headers. This can be achieved using a package manager, e.g. for FreeType:

```
# Pick ONE of the following:
sudo apt install libfreetype6-dev  # Debian/Ubuntu
sudo dnf install freetype-devel     # Fedora
brew install freetype               # macOS with Homebrew
conda install freetype             # conda, any OS
```

(adapt accordingly for Qhull).

On Linux and macOS, it is also recommended to install `pkg-config`, a helper tool for locating FreeType:

```
# Pick ONE of the following:
sudo apt install pkg-config         # Debian/Ubuntu
sudo dnf install pkconfig          # Fedora
brew install pkg-config             # macOS with Homebrew
conda install pkg-config            # conda
# Or point the PKG_CONFIG environment variable to the path to pkg-config:
export PKG_CONFIG=
```

If not using pkg-config (in particular on Windows), you may need to set the include path (to the library headers) and link path (to the libraries) explicitly, if they are not in standard locations. This can be done using standard environment variables – on Linux and OSX:

```
export CFLAGS='-I/directory/containing/ft2build.h'
export LDFLAGS='-L/directory/containing/libfreetype.so'
```

and on Windows:

```
set CL=/IC:\directory\containing\ft2build.h
set LINK=/LIBPATH:C:\directory\containing\freetype.lib
```

**Note:** Matplotlib always uses its own copies of the following libraries:

- **Agg**: the Anti-Grain Geometry C++ rendering engine;
- **ttconv**: a TrueType font utility.
1.3.3 Building on Windows

Compiling Matplotlib (or any other extension module, for that matter) requires Visual Studio 2015 or later.

If you are building your own Matplotlib wheels (or sdists), note that any DLLs that you copy into the source tree will be packaged too.

1.3.4 Conda packages

The conda packaging scripts for Matplotlib are available at https://github.com/conda-forge/matplotlib-feedstock.
This page contains more in-depth guides for using Matplotlib. It is broken up into beginner, intermediate, and advanced sections, as well as sections covering specific topics.

For shorter examples, see our examples page. You can also find external resources and a FAQ in our user guide.

2.1 Introductory

These tutorials cover the basics of creating visualizations with Matplotlib, as well as some best-practices in using the package effectively.

2.1.1 Usage Guide

This tutorial covers some basic usage patterns and best-practices to help you get started with Matplotlib.

```python
import matplotlib.pyplot as plt
import numpy as np

A simple example

Matplotlib graphs your data on Figures (i.e., windows, Jupyter widgets, etc.), each of which can contain one or more Axes (i.e., an area where points can be specified in terms of x-y coordinates (or theta-r in a polar plot, or x-y-z in a 3D plot, etc.). The most simple way of creating a figure with an axes is using `pyplot.subplots`. We can then use `Axes.plot` to draw some data on the axes:

```
Many other plotting libraries or languages do not require you to explicitly create an axes. For example, in MATLAB, one can just do

```matlab
plot([1, 2, 3, 4], [1, 4, 2, 3]) % MATLAB plot.
```

and get the desired graph.

In fact, you can do the same in Matplotlib: for each Axes graphing method, there is a corresponding function in the `matplotlib.pyplot` module that performs that plot on the “current” axes, creating that axes (and its parent figure) if they don’t exist yet. So the previous example can be written more shortly as

```python
plt.plot([1, 2, 3, 4], [1, 4, 2, 3]) # Matplotlib plot.
```
Out:

[[<matplotlib.lines.Line2D object at 0x7f08b4e81220>]]

**Parts of a Figure**

Now, let's have a deeper look at the components of a Matplotlib figure.
The whole figure. The figure keeps track of all the child Axes, a smattering of ‘special’ artists (titles, figure legends, etc), and the canvas. (Don’t worry too much about the canvas, it is crucial as it is the object that actually does the drawing to get you your plot, but as the user it is more-or-less invisible to you). A figure can contain any number of Axes, but will typically have at least one.

The easiest way to create a new figure is with pyplot:

```python
fig = plt.figure()  # an empty figure with no Axes
fig, ax = plt.subplots()  # a figure with a single Axes
fig, axs = plt.subplots(2, 2)  # a figure with a 2x2 grid of Axes
```
It’s convenient to create the axes together with the figure, but you can also add axes later on, allowing for more complex axes layouts.

**Axes**

This is what you think of as ‘a plot’, it is the region of the image with the data space. A given figure can contain many Axes, but a given Axes object can only be in one Figure. The Axes contains two (or three in the case of 3D) Axis objects (be aware of the difference between Axes and Axis) which take care of the data limits (the data limits can also be controlled via the axes.Axes.set_xlim() and axes.Axes.set_ylim() methods). Each Axes has a title (set via set_title()), an x-label (set via set_xlabel()), and a y-label set via set_ylabel()).

The Axes class and its member functions are the primary entry point to working with the OO interface.

**Axis**

These are the number-line-like objects. They take care of setting the graph limits and generating the ticks (the marks on the axis) and ticklabels (strings labeling the ticks). The location of the ticks is determined by a Locator object and the ticklabel strings are formatted by a Formatter. The combination of the correct Locator and Formatter gives very fine control over the tick locations and labels.

**Artist**

Basically everything you can see on the figure is an artist (even the Figure, Axes, and Axis objects). This includes Text objects, Line2D objects, collections objects, Patch objects ... (you get the idea). When the figure is rendered, all of the artists are drawn to the canvas. Most Artists are tied to an Axes; such an Artist cannot be shared by multiple Axes, or moved from one to another.

**Types of inputs to plotting functions**

All of plotting functions expect numpy.array or numpy.ma.masked_array as input. Classes that are ‘array-like’ such as pandas data objects and numpy.matrix may or may not work as intended. It is best to convert these to numpy.array objects prior to plotting.

For example, to convert a pandas.DataFrame

```python
a = pandas.DataFrame(np.random.rand(4, 5), columns = list('abcde'))
a_asarray = a.values
```

and to convert a numpy.matrix

```python
b = np.matrix([[1, 2], [3, 4]])
b_asarray = np.asarray(b)
```
The object-oriented interface and the pyplot interface

As noted above, there are essentially two ways to use Matplotlib:

- Explicitly create figures and axes, and call methods on them (the “object-oriented (OO) style”).
- Rely on pyplot to automatically create and manage the figures and axes, and use pyplot functions for plotting.

So one can do (OO-style)

```python
x = np.linspace(0, 2, 100)

# Note that even in the OO-style, we use `.pyplot.figure` to create the figure.
fig, ax = plt.subplots()  # Create a figure and an axes.
ax.plot(x, x, label='linear')  # Plot some data on the axes.
ax.plot(x, x**2, label='quadratic')  # Plot more data on the axes...
ax.plot(x, x**3, label='cubic')  # ... and some more.
ax.set_xlabel('x label')  # Add an x-label to the axes.
ax.set_ylabel('y label')  # Add a y-label to the axes.
ax.set_title("Simple Plot")  # Add a title to the axes.
ax.legend()  # Add a legend.
```

Out:
or (pyplot-style)

```python
x = np.linspace(0, 2, 100)
plt.plot(x, x, label='linear')  # Plot some data on the (implicit) axes.
plt.plot(x, x**2, label='quadratic')  # etc.
plt.plot(x, x**3, label='cubic')
plt.xlabel('x label')
plt.ylabel('y label')
plt.title("Simple Plot")
plt.legend()
```

Out:

```
<matplotlib.legend.Legend object at 0x7f08b45e1760>
```

Actually there is a third approach, for the case where you are embedding Matplotlib in a GUI application, which completely drops pyplot, even for figure creation. We won’t discuss it here; see the corresponding section in the gallery for more info (user_interfaces).

Matplotlib’s documentation and examples use both the OO and the pyplot approaches (which are equally powerful), and you should feel free to use either (however, it is preferable pick one of them and stick to it, instead of mixing them). In general, we suggest to restrict pyplot to...
interactive plotting (e.g., in a Jupyter notebook), and to prefer the OO-style for non-interactive plotting (in functions and scripts that are intended to be reused as part of a larger project).

**Note:** In older examples, you may find examples that instead used the so-called *pylab* interface, via from *pylab* import *. This star-import imports everything both from *pyplot* and from *numpy*, so that one could do

```python
x = linspace(0, 2, 100)
plot(x, x, label='linear')
...
```

for an even more MATLAB-like style. This approach is strongly discouraged nowadays and deprecated; it is only mentioned here because you may still encounter it in the wild.

Typically one finds oneself making the same plots over and over again, but with different data sets, which leads to needing to write specialized functions to do the plotting. The recommended function signature is something like:

```python
def my_plotter(ax, data1, data2, param_dict):
    """
    A helper function to make a graph

    Parameters
    -----------
    ax : Axes
        The axes to draw to
    data1 : array
        The x data
    data2 : array
        The y data
    param_dict : dict
        Dictionary of kwargs to pass to ax.plot

    Returns
    -------
    out : list
        list of artists added
    """
    out = ax.plot(data1, data2, **param_dict)
    return out
```

which you would then use as:

```python
data1, data2, data3, data4 = np.random.randn(4, 100)
fig, ax = plt.subplots(1, 1)
my_plotter(ax, data1, data2, {'marker': 'x'})
```
or if you wanted to have 2 sub-plots:

```python
fig, (ax1, ax2) = plt.subplots(1, 2)
my_plotter(ax1, data1, data2, {'marker': 'x'})
my_plotter(ax2, data3, data4, {'marker': 'o'})
```
For these simple examples this style seems like overkill, however once the graphs get slightly more complex it pays off.

**Backends**

**What is a backend?**

A lot of documentation on the website and in the mailing lists refers to the “backend” and many new users are confused by this term. matplotlib targets many different use cases and output formats. Some people use matplotlib interactively from the python shell and have plotting windows pop up when they type commands. Some people run Jupyter notebooks and draw inline plots for quick data analysis. Others embed matplotlib into graphical user interfaces like wxpython or pygtk to build rich applications. Some people use matplotlib in batch scripts to generate postscript images from numerical simulations, and still others run web application servers to dynamically serve up graphs.

To support all of these use cases, matplotlib can target different outputs, and each of these capabilities is called a backend; the “frontend” is the user facing code, i.e., the plotting code, whereas the “backend” does all the hard work behind-the-scenes to make the figure. There are two types of backends: user interface backends (for use in pygtk, wxpython, tkinter, qt4,
or macosx; also referred to as “interactive backends”) and hardcopy backends to make image
files (PNG, SVG, PDF, PS; also referred to as “non-interactive backends”).

Selecting a backend

There are three ways to configure your backend:

1. The rcParams["backend"] (default: 'agg') parameter in your matplotlibrc file
2. The MPLBACKEND environment variable
3. The function matplotlib.use()

A more detailed description is given below.

If multiple of these are configurations are present, the last one from the list takes precedence;
e.g. calling matplotlib.use() will override the setting in your matplotlibrc.

If no backend is explicitly set, Matplotlib automatically detects a usable backend based on
what is available on your system and on whether a GUI event loop is already running. On
Linux, if the environment variable DISPLAY is unset, the “event loop” is identified as “headless”,
which causes a fallback to a noninteractive backend (agg).

Here is a detailed description of the configuration methods:

1. Setting rcParams["backend"] (default: 'agg') in your matplotlibrc file:

```plaintext
backend : qt5agg  # use pyqt5 with antigrain (agg) rendering
```

See also Customizing Matplotlib with style sheets and rcParams.

2. Setting the MPLBACKEND environment variable:

You can set the environment variable either for your current shell or for a single script.

On Unix:

```plaintext
> export MPLBACKEND=qt5agg
> python simple_plot.py
> MPLBACKEND=qt5agg python simple_plot.py
```

On Windows, only the former is possible:

```plaintext
> set MPLBACKEND=qt5agg
> python simple_plot.py
```

Setting this environment variable will override the backend parameter in any
matplotlibrc, even if there is a matplotlibrc in your current working directory. Therefore,
setting MPLBACKEND globally, e.g. in your .bashrc or .profile, is discouraged as it
might lead to counter-intuitive behavior.

3. If your script depends on a specific backend you can use the function matplotlib.use():

```python
import matplotlib
matplotlib.use('qt5agg')
```

This should be done before any figure is created; otherwise Matplotlib may fail to switch
the backend and raise an ImportError.
Using \texttt{use} will require changes in your code if users want to use a different backend. Therefore, you should avoid explicitly calling \texttt{use} unless absolutely necessary.

The builtin backends

By default, Matplotlib should automatically select a default backend which allows both interactive work and plotting from scripts, with output to the screen and/or to a file, so at least initially you will not need to worry about the backend. The most common exception is if your Python distribution comes without \texttt{tkinter} and you have no other GUI toolkit installed; this happens on certain Linux distributions, where you need to install a Linux package named \texttt{python-tk} (or similar).

If, however, you want to write graphical user interfaces, or a web application server (\textit{How to use Matplotlib in a web application server}), or need a better understanding of what is going on, read on. To make things a little more customizable for graphical user interfaces, matplotlib separates the concept of the renderer (the thing that actually does the drawing) from the canvas (the place where the drawing goes). The canonical renderer for user interfaces is Agg which uses the \textit{Anti-Grain Geometry} C++ library to make a raster (pixel) image of the figure; it is used by the Qt5Agg, Qt4Agg, GTK3Agg, wxAgg, TkAgg, and macosx backends. An alternative renderer is based on the Cairo library, used by Qt5Cairo, Qt4Cairo, etc.

For the rendering engines, one can also distinguish between \textit{vector} or \textit{raster} renderers. Vector graphics languages issue drawing commands like “draw a line from this point to this point” and hence are scale free, and raster backends generate a pixel representation of the line whose accuracy depends on a DPI setting.

Here is a summary of the matplotlib renderers (there is an eponymous backend for each; these are \textit{non-interactive backends}, capable of writing to a file):

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Filetypes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGG</td>
<td>png</td>
<td>raster graphics – high quality images using the \textit{Anti-Grain Geometry} engine</td>
</tr>
<tr>
<td>PDF</td>
<td>pdf</td>
<td>vector graphics – Portable Document Format</td>
</tr>
<tr>
<td>PS</td>
<td>ps, eps</td>
<td>vector graphics – Postscript output</td>
</tr>
<tr>
<td>SVG</td>
<td>svg</td>
<td>vector graphics – Scalable Vector Graphics</td>
</tr>
<tr>
<td>PGF</td>
<td>pgt, pdf</td>
<td>vector graphics – using the \textit{pgf} package</td>
</tr>
<tr>
<td>Cairo</td>
<td>png, ps, pdf, svg</td>
<td>raster or vector graphics – using the \textit{Cairo} library</td>
</tr>
</tbody>
</table>

To save plots using the non-interactive backends, use the \texttt{matplotlib.pyplot.savefig} method.

And here are the user interfaces and renderer combinations supported; these are \textit{interactive backends}, capable of displaying to the screen and of using appropriate renderers from the table above to write to a file:
<table>
<thead>
<tr>
<th>Backend</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Qt5Agg</td>
<td>Agg rendering in a Qt5 canvas (requires PyQt5). This backend can be activated in IPython with %matplotlib qt5.</td>
</tr>
<tr>
<td>ipympl</td>
<td>Agg rendering embedded in a Jupyter widget. (requires ipympl). This backend can be enabled in a Jupyter notebook with %matplotlib ipympl.</td>
</tr>
<tr>
<td>GTK3Agg</td>
<td>Agg rendering to a GTK 3.x canvas (requires PyGObject, and pycairo or cairocffi). This backend can be activated in IPython with %matplotlib gtk3.</td>
</tr>
<tr>
<td>macosx</td>
<td>Agg rendering into a Cocoa canvas in OSX. This backend can be activated in IPython with %matplotlib osx.</td>
</tr>
<tr>
<td>TK-Agg</td>
<td>Agg rendering to a Tk canvas (requires TkInter). This backend can be activated in IPython with %matplotlib tk.</td>
</tr>
<tr>
<td>nbAgg</td>
<td>Embed an interactive figure in a Jupyter classic notebook. This backend can be enabled in Jupyter notebooks via %matplotlib notebook.</td>
</tr>
<tr>
<td>WebAgg</td>
<td>On <code>show()</code> will start a tornado server with an interactive figure.</td>
</tr>
<tr>
<td>GTK3Cairo</td>
<td>Cairo rendering to a GTK 3.x canvas (requires PyGObject, and pycairo or cairocffi).</td>
</tr>
<tr>
<td>Qt4Agg</td>
<td>Agg rendering to a Qt4 canvas (requires PyQt4 or pyside). This backend can be activated in IPython with %matplotlib qt4.</td>
</tr>
<tr>
<td>wx-Agg</td>
<td>Agg rendering to a wxWidgets canvas (requires wxPython 4). This backend can be activated in IPython with %matplotlib wx.</td>
</tr>
</tbody>
</table>

**Note:** The names of builtin backends case-insensitive; e.g., ‘Qt5Agg’ and ‘qt5agg’ are equivalent.

**ipympl**

The Jupyter widget ecosystem is moving too fast to support directly in Matplotlib. To install ipympl:

```
pip install ipympl
jupyter nbextension enable --py --sys-prefix ipympl
```

or

```
conda install ipympl -c conda-forge
```

See `jupyter-matplotlib` for more details.

**How do I select PyQt4 or PySide?**

The `QT_API` environment variable can be set to either pyqt or pyside to use PyQt4 or PySide, respectively.

Since the default value for the bindings to be used is PyQt4, Matplotlib first tries to import it, if the import fails, it tries to import PySide.
Using non-builtin backends

More generally, any importable backend can be selected by using any of the methods above. If `name.of.the.backend` is the module containing the backend, use `module://name.of.the.backend` as the backend name, e.g. `matplotlib.use('module://name.of.the.backend')`.

What is interactive mode?

Use of an interactive backend (see What is a backend?) permits—but does not by itself require or ensure—plotting to the screen. Whether and when plotting to the screen occurs, and whether a script or shell session continues after a plot is drawn on the screen, depends on the functions and methods that are called, and on a state variable that determines whether matplotlib is in “interactive mode”. The default Boolean value is set by the `matplotlibrc` file, and may be customized like any other configuration parameter (see Customizing Matplotlib with style sheets and rcParams). It may also be set via `matplotlib.interactive()`, and its value may be queried via `matplotlib.is_interactive()`. Turning interactive mode on and off in the middle of a stream of plotting commands, whether in a script or in a shell, is rarely needed and potentially confusing, so in the following we will assume all plotting is done with interactive mode either on or off.

**Note:** Major changes related to interactivity, and in particular the role and behavior of `show()`, were made in the transition to matplotlib version 1.0, and bugs were fixed in 1.0.1. Here we describe the version 1.0.1 behavior for the primary interactive backends, with the partial exception of `macosx`.

Interactive mode may also be turned on via `matplotlib.pyplot.ion()`, and turned off via `matplotlib.pyplot.ioff()`.

**Note:** Interactive mode works with suitable backends in ipython and in the ordinary python shell, but it does not work in the IDLE IDE. If the default backend does not support interactivity, an interactive backend can be explicitly activated using any of the methods discussed in What is a backend?.

Interactive example

From an ordinary python prompt, or after invoking ipython with no options, try this:

```python
import matplotlib.pyplot as plt
plt.ion()
plt.plot([1.6, 2.7])
```

This will pop up a plot window. Your terminal prompt will remain active, so that you can type additional commands such as:

```python
plt.title("interactive test")
plt.xlabel("index")
```

On most interactive backends, the figure window will also be updated if you change it via the object-oriented interface. E.g. get a reference to the `Axes` instance, and call a method of that instance:
```python
ax = plt.gca()
ax.plot([3.1, 2.2])
```

If you are using certain backends (like `macosx`), or an older version of matplotlib, you may not see the new line added to the plot immediately. In this case, you need to explicitly call `draw()` in order to update the plot:

```python
plt.draw()
```

**Non-interactive example**

Start a fresh session as in the previous example, but now turn interactive mode off:

```python
import matplotlib.pyplot as plt
plt.ioff()
plt.plot([1.6, 2.7])
```

Nothing happened–or at least nothing has shown up on the screen (unless you are using `macosx` backend, which is anomalous). To make the plot appear, you need to do this:

```python
plt.show()
```

Now you see the plot, but your terminal command line is unresponsive; `pyplot.show()` blocks the input of additional commands until you manually kill the plot window.

What good is this–being forced to use a blocking function? Suppose you need a script that plots the contents of a file to the screen. You want to look at that plot, and then end the script. Without some blocking command such as `show()`, the script would flash up the plot and then end immediately, leaving nothing on the screen.

In addition, non-interactive mode delays all drawing until `show()` is called; this is more efficient than redrawing the plot each time a line in the script adds a new feature.

Prior to version 1.0, `show()` generally could not be called more than once in a single script (although sometimes one could get away with it); for version 1.0.1 and above, this restriction is lifted, so one can write a script like this:

```python
import numpy as np
import matplotlib.pyplot as plt

plt.ioff()
for i in range(3):
    plt.plot(np.random.rand(10))
plt.show()
```

which makes three plots, one at a time. I.e. the second plot will show up, once the first plot is closed.

**Summary**

In interactive mode, `pyplot` functions automatically draw to the screen.

When plotting interactively, if using object method calls in addition to `pyplot` functions, then call `draw()` whenever you want to refresh the plot.
Use non-interactive mode in scripts in which you want to generate one or more figures and display them before ending or generating a new set of figures. In that case, use `show()` to display the figure(s) and to block execution until you have manually destroyed them.

**Performance**

Whether exploring data in interactive mode or programmatically saving lots of plots, rendering performance can be a painful bottleneck in your pipeline. Matplotlib provides a couple ways to greatly reduce rendering time at the cost of a slight change (to a settable tolerance) in your plot’s appearance. The methods available to reduce rendering time depend on the type of plot that is being created.

**Line segment simplification**

For plots that have line segments (e.g. typical line plots, outlines of polygons, etc.), rendering performance can be controlled by `rcParams['path.simplify']` (default: True) and `rcParams['path.simplify_threshold']` (default: 0.111111111111), which can be defined e.g. in the `matplotlibrc` file (see *Customizing Matplotlib with style sheets and rcParams* for more information about the `matplotlibrc` file). `rcParams['path.simplify']` (default: True) is a boolean indicating whether or not line segments are simplified at all. `rcParams['path.simplify_threshold']` (default: 0.111111111111) controls how much line segments are simplified; higher thresholds result in quicker rendering.

The following script will first display the data without any simplification, and then display the same data with simplification. Try interacting with both of them:

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl

# Setup, and create the data to plot
y = np.random.rand(100000)
y[50000] *= 2
y[np.geomspace(10, 50000, 400).astype(int)] = -1
mpl.rcParams['path.simplify'] = True

mpl.rcParams['path.simplify_threshold'] = 0.0
plt.plot(y)
plt.show()

mpl.rcParams['path.simplify_threshold'] = 1.0
plt.plot(y)
plt.show()
```

Matplotlib currently defaults to a conservative simplification threshold of 1/9. If you want to change your default settings to use a different value, you can change your `matplotlibrc` file. Alternatively, you could create a new style for interactive plotting (with maximal simplification) and another style for publication quality plotting (with minimal simplification) and activate them as necessary. See *Customizing Matplotlib with style sheets and rcParams* for instructions on how to perform these actions.

The simplification works by iteratively merging line segments into a single vector until the next line segment’s perpendicular distance to the vector (measured in display-coordinate space) is greater than the `path.simplify_threshold` parameter.
**Note:** Changes related to how line segments are simplified were made in version 2.1. Rendering time will still be improved by these parameters prior to 2.1, but rendering time for some kinds of data will be vastly improved in versions 2.1 and greater.

**Marker simplification**

Markers can also be simplified, albeit less robustly than line segments. Marker simplification is only available to `Line2D` objects (through the `markevery` property). Wherever `Line2D` construction parameters are passed through, such as `matplotlib.pyplot.plot()` and `matplotlib.axes.Axes.plot()`, the `markevery` parameter can be used:

```python
plt.plot(x, y, markevery=10)
```

The `markevery` argument allows for naive subsampling, or an attempt at evenly spaced (along the x axis) sampling. See the `/gallery/lines_bars_and_markers/markevery_demo` for more information.

**Splitting lines into smaller chunks**

If you are using the Agg backend (see *What is a backend?*), then you can make use of `rcParams['agg.path.chunksize']` (default: 0) This allows you to specify a chunk size, and any lines with greater than that many vertices will be split into multiple lines, each of which has no more than `agg.path.chunksize` many vertices. (Unless `agg.path.chunksize` is zero, in which case there is no chunking.) For some kind of data, chunking the line up into reasonable sizes can greatly decrease rendering time.

The following script will first display the data without any chunk size restriction, and then display the same data with a chunk size of 10,000. The difference can best be seen when the figures are large, try maximizing the GUI and then interacting with them:

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl
mpl.rcParams['path.simplify_threshold'] = 1.0

# Setup, and create the data to plot
y = np.random.rand(100000)
y[5000:] *= 2
y[np.geomspace(10, 50000, 400).astype(int)] = -1
mpl.rcParams['path.simplify'] = True
mpl.rcParams['agg.path.chunksize'] = 0
plt.plot(y)
plt.show()

mpl.rcParams['agg.path.chunksize'] = 10000
plt.plot(y)
plt.show()
```
Legends

The default legend behavior for axes attempts to find the location that covers the fewest data points (`loc='best'`). This can be a very expensive computation if there are lots of data points. In this case, you may want to provide a specific location.

Using the fast style

The fast style can be used to automatically set simplification and chunking parameters to reasonable settings to speed up plotting large amounts of data. It can be used simply by running:

```python
import matplotlib.style as mplstyle
mplstyle.use('fast')
```

It is very light weight, so it plays nicely with other styles, just make sure the fast style is applied last so that other styles do not overwrite the settings:

```python
mplstyle.use(['dark_background', 'ggplot', 'fast'])
```

**Total running time of the script:** (0 minutes 2.189 seconds)

2.1.2 Pyplot tutorial

An introduction to the pyplot interface.

Intro to pyplot

`matplotlib.pyplot` is a collection of functions that make matplotlib work like MATLAB. Each pyplot function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc.

In `matplotlib.pyplot` various states are preserved across function calls, so that it keeps track of things like the current figure and plotting area, and the plotting functions are directed to the current axes (please note that “axes” here and in most places in the documentation refers to the axes part of a figure and not the strict mathematical term for more than one axis).

**Note:** the pyplot API is generally less-flexible than the object-oriented API. Most of the function calls you see here can also be called as methods from an `Axes` object. We recommend browsing the tutorials and examples to see how this works.

Generating visualizations with pyplot is very quick:

```python
import matplotlib.pyplot as plt
plt.plot([1, 2, 3, 4])
plt.ylabel('some numbers')
plt.show()
```
You may be wondering why the x-axis ranges from 0-3 and the y-axis from 1-4. If you provide a single list or array to `plot`, matplotlib assumes it is a sequence of y values, and automatically generates the x values for you. Since python ranges start with 0, the default x vector has the same length as y but starts with 0. Hence the x data are [0, 1, 2, 3].

`plot` is a versatile function, and will take an arbitrary number of arguments. For example, to plot x versus y, you can write:

```python
plt.plot([1, 2, 3, 4], [1, 4, 9, 16])
```
Formatting the style of your plot

For every x, y pair of arguments, there is an optional third argument which is the format string that indicates the color and line type of the plot. The letters and symbols of the format string are from MATLAB, and you concatenate a color string with a line style string. The default format string is ‘b-’, which is a solid blue line. For example, to plot the above with red circles, you would issue

```python
plt.plot([1, 2, 3, 4], [1, 4, 9, 16], 'ro')
plt.axis([0, 6, 0, 20])
plt.show()
```
See the `plot` documentation for a complete list of line styles and format strings. The `axis` function in the example above takes a list of `[xmin, xmax, ymin, ymax]` and specifies the viewport of the axes.

If matplotlib were limited to working with lists, it would be fairly useless for numeric processing. Generally, you will use `numpy` arrays. In fact, all sequences are converted to `numpy` arrays internally. The example below illustrates plotting several lines with different format styles in one function call using arrays.

```python
import numpy as np

# evenly sampled time at 200ms intervals
T = np.arange(0., 5., 0.2)

# red dashes, blue squares and green triangles
plt.plot(T, T, 'r--', T, T**2, 'bs', T, T**3, 'g^')
plt.show()
```
Matplotlib, Release 3.3.0

Plotting with keyword strings

There are some instances where you have data in a format that lets you access particular variables with strings. For example, with `numpy.recarray` or `pandas.DataFrame`.

Matplotlib allows you to provide such an object with the `data` keyword argument. If provided, then you may generate plots with the strings corresponding to these variables.

```python
import numpy as np
import matplotlib.pyplot as plt
import pandas as pd

data = {'a': np.arange(50),
        'c': np.random.randint(0, 50, 50),
        'd': np.random.randn(50)}
data['b'] = data['a'] + 10 * np.random.randn(50)
data['d'] = np.abs(data['d']) * 100
plt.scatter('a', 'b', c='c', s='d', data=data)
plt.xlabel('entry a')
plt.ylabel('entry b')
plt.show()
```
Plotting with categorical variables

It is also possible to create a plot using categorical variables. Matplotlib allows you to pass categorical variables directly to many plotting functions. For example:

```python
names = ['group_a', 'group_b', 'group_c']
values = [1, 10, 100]

plt.figure(figsize=(9, 3))

plt.subplot(131)
plt.bar(names, values)
plt.subplot(132)
plt.scatter(names, values)
plt.subplot(133)
plt.plot(names, values)
plt.suptitle('Categorical Plotting')
plt.show()
```
Controlling line properties

Lines have many attributes that you can set: linewidth, dash style, antialiased, etc; see `matplotlib.lines.Line2D`. There are several ways to set line properties

- Use keyword args:

  ```python
  plt.plot(x, y, linewidth=2.0)
  ```

- Use the setter methods of a `Line2D` instance. `plot` returns a list of `Line2D` objects; e.g., `line1, line2 = plot(x1, y1, x2, y2)`. In the code below we will suppose that we have only one line so that the list returned is of length 1. We use tuple unpacking with `line`, to get the first element of that list:

  ```python
  line, = plt.plot(x, y, '-
  line.set_antialiased(False)  # turn off antialiasing
  ```

- Use `setp`. The example below uses a MATLAB-style function to set multiple properties on a list of lines. `setp` works transparently with a list of objects or a single object. You can either use python keyword arguments or MATLAB-style string/value pairs:

  ```python
  lines = plt.plot(x1, y1, x2, y2)
  # use keyword args
  plt.setp(lines, color='r', linewidth=2.0)
  # or MATLAB style string value pairs
  plt.setp(lines, 'color', 'r', 'linewidth', 2.0)
  ```

Here are the available `Line2D` properties.

<table>
<thead>
<tr>
<th>Property</th>
<th>Value Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha</td>
<td>float</td>
</tr>
<tr>
<td>animated</td>
<td>[True</td>
</tr>
<tr>
<td>antialiased or aa</td>
<td>[True</td>
</tr>
<tr>
<td>clip_box</td>
<td>a matplotlib.transform.Bbox instance</td>
</tr>
<tr>
<td>clip_on</td>
<td>[True</td>
</tr>
<tr>
<td>clip_path</td>
<td>a Path instance and a Transform instance, a Patch</td>
</tr>
<tr>
<td>color or c</td>
<td>any matplotlib color</td>
</tr>
<tr>
<td>contains</td>
<td>the hit testing function</td>
</tr>
<tr>
<td>dash_capstyle</td>
<td>['butt'</td>
</tr>
</tbody>
</table>

Continued on next page
To get a list of settable line properties, call the `setp` function with a line or lines as argument

```
In [69]: lines = plt.plot([1, 2, 3])

In [70]: plt.setp(lines)
```

### Working with multiple figures and axes

MATLAB, and `pyplot`, have the concept of the current figure and the current axes. All plotting functions apply to the current axes. The function `gca` returns the current axes (a `matplotlib.axes.Axes` instance), and `gcf` returns the current figure (a `matplotlib.figure.Figure` instance). Normally, you don’t have to worry about this, because it is all taken care of behind the scenes. Below is a script to create two subplots.

```
def f(t):
    return np.exp(-t) * np.cos(2*np.pi*t)

t1 = np.arange(0.0, 5.0, 0.1)
t2 = np.arange(0.0, 5.0, 0.02)

plt.figure()
plt.subplot(211)
plt.plot(t1, f(t1), 'bo', t2, f(t2), 'k')
```
```python
plt.subplot(212)
plt.plot(t2, np.cos(2*np.pi*t2), 'r--')
plt.show()
```

The `figure` call here is optional because `figure(1)` will be created by default, just as a `subplot(111)` will be created by default if you don’t manually specify any axes. The `subplot` call specifies `numrows, numcols, plot_number` where `plot_number` ranges from 1 to `numrows*numcols`. The commas in the `subplot` call are optional if `numrows*numcols<10`. So `subplot(211)` is identical to `subplot(2, 1, 1)`.

You can create an arbitrary number of subplots and axes. If you want to place an axes manually, i.e., not on a rectangular grid, use `axes`, which allows you to specify the location as `axes([left, bottom, width, height])` where all values are in fractional (0 to 1) coordinates. See /gallery/subplots_axes_and_figures/axes_demo for an example of placing axes manually and /gallery/subplots_axes_and_figures/subplot_demo for an example with lots of subplots.

You can create multiple figures by using multiple `figure` calls with an increasing figure number. Of course, each figure can contain as many axes and subplots as your heart desires:

```python
import matplotlib.pyplot as plt
plt.figure(1)  # the first figure
plt.subplot(211)  # the first subplot in the first figure
plt.plot([1, 2, 3])
```
plt.subplot(212)  # the second subplot in the first figure
plt.plot([4, 5, 6])

plt.figure(2)  # a second figure
plt.plot([4, 5, 6])  # creates a subplot(111) by default

plt.title('Easy as 1, 2, 3')  # subplot 211 title

You can clear the current figure with clf and the current axes with cla. If you find it annoying that states (specifically the current image, figure and axes) are being maintained for you behind the scenes, don’t despair: this is just a thin stateful wrapper around an object oriented API, which you can use instead (see Artist tutorial)

If you are making lots of figures, you need to be aware of one more thing: the memory required for a figure is not completely released until the figure is explicitly closed with close. Deleting all references to the figure, and/or using the window manager to kill the window in which the figure appears on the screen, is not enough, because pyplot maintains internal references until close is called.

Working with text

_text_ can be used to add text in an arbitrary location, and _xlabel, ylabel_ and _title_ are used to add text in the indicated locations (see Text in Matplotlib Plots for a more detailed example)
All of the `text` functions return a `matplotlib.text.Text` instance. Just as with lines above, you can customize the properties by passing keyword arguments into the text functions or using `setp`:

```python
t = plt.xlabel('my data', fontsize=14, color='red')
```

These properties are covered in more detail in *Text properties and layout*.

**Using mathematical expressions in text**

`matplotlib` accepts TeX equation expressions in any text expression. For example to write the expression $\sigma_i = 15$ in the title, you can write a TeX expression surrounded by dollar signs:

```python
plt.title(r'$\sigma_i=15$')
```

The `r` preceding the title string is important - it signifies that the string is a raw string and not to treat backslashes as python escapes. `matplotlib` has a built-in TeX expression parser and layout engine, and ships its own math fonts - for details see *Writing mathematical expressions*. Thus you can use mathematical text across platforms without requiring a TeX installation. For those who have LaTeX and dvipng installed, you can also use LaTeX to format your text and incorporate the output directly into your display figures or saved postscript - see *Text rendering With LaTeX*.
Annotating text

The uses of the basic `text` function above place text at an arbitrary position on the Axes. A common use for text is to annotate some feature of the plot, and the `annotate` method provides helper functionality to make annotations easy. In an annotation, there are two points to consider: the location being annotated represented by the argument `xy` and the location of the text `xytext`. Both of these arguments are (x, y) tuples.

```python
ax = plt.subplot(111)

t = np.arange(0.0, 5.0, 0.01)
s = np.cos(2*np.pi*t)
line, = plt.plot(t, s, lw=2)

plt.annotate('local max', xy=(2, 1), xytext=(3, 1.5),
             arrowprops=dict(facecolor='black', shrink=0.05),
            )

plt.ylim(-2, 2)
plt.show()
```

In this basic example, both the `xy` (arrow tip) and `xytext` locations (text location) are in data coordinates. There are a variety of other coordinate systems one can choose – see Basic annotation and Advanced Annotations for details. More examples can be found in /gallery/text_labels_and_annotations/annotation_demo.
Logarithmic and other nonlinear axes

`matplotlib.pyplot` supports not only linear axis scales, but also logarithmic and logit scales. This is commonly used if data spans many orders of magnitude. Changing the scale of an axis is easy:

```python
plt.xscale('log')
```

An example of four plots with the same data and different scales for the y axis is shown below.

```python
# Fixing random state for reproducibility
np.random.seed(19680801)

# make up some data in the open interval (0, 1)
y = np.random.normal(loc=0.5, scale=0.4, size=1000)
y = y[(y > 0) & (y < 1)]
y.sort()
x = np.arange(len(y))

# plot with various axes scales
plt.figure()

# linear
plt.subplot(221)
plt.plot(x, y)
plt.yscale('linear')
plt.title('linear')
plt.grid(True)

# log
plt.subplot(222)
plt.plot(x, y)
plt.yscale('log')
plt.title('log')
plt.grid(True)

# symmetric log
plt.subplot(223)
plt.plot(x, y - y.mean())
plt.yscale('symlog', linthresh=0.01)
plt.title('symlog')
plt.grid(True)

# logit
plt.subplot(224)
plt.plot(x, y)
plt.yscale('logit')
plt.title('logit')
plt.grid(True)

# Adjust the subplot layout, because the logit one may take more space
# than usual, due to y-tick labels like "1 - 10^{-3}"
plt.subplots_adjust(top=0.92, bottom=0.08, left=0.10, right=0.95, hspace=0.25, wspace=0.35)

plt.show()
```
It is also possible to add your own scale, see *Developer’s guide for creating scales and transformations* for details.

**Total running time of the script:** ( 0 minutes 3.387 seconds)

### 2.1.3 Sample plots in Matplotlib

Here you’ll find a host of example plots with the code that generated them.

**Line Plot**

Here’s how to create a line plot with text labels using `plot()`.

**Multiple subplots in one figure**

Multiple axes (i.e. subplots) are created with the `subplot()` function:

**Images**

Matplotlib can display images (assuming equally spaced horizontal dimensions) using the `imshow()` function.
Fig. 1: Simple Plot

Fig. 2: Subplot

Fig. 3: Example of using `imshow()` to display a CT scan
Contouring and pseudocolor

The `pcolormesh()` function can make a colored representation of a two-dimensional array, even if the horizontal dimensions are unevenly spaced. The `contour()` function is another way to represent the same data:

![Image of pcolormesh and contour examples]

Fig. 4: Example comparing `pcolormesh()` and `contour()` for plotting two-dimensional data

Histograms

The `hist()` function automatically generates histograms and returns the bin counts or probabilities:

![Image of histogram]

Fig. 5: Histogram Features

Paths

You can add arbitrary paths in Matplotlib using the `matplotlib.path` module:
Three-dimensional plotting

The mplot3d toolkit (see *Getting started* and mplot3d-examples-index) has support for simple 3d graphs including surface, wireframe, scatter, and bar charts.

Streamplot

The `streamplot()` function plots the streamlines of a vector field. In addition to simply plotting the streamlines, it allows you to map the colors and/or line widths of streamlines to a separate parameter, such as the speed or local intensity of the vector field.

This feature complements the `quiver()` function for plotting vector fields. Thanks to Tom Flannaghan and Tony Yu for adding the streamplot function.
Fig. 8: Streamplot with various plotting options.
Ellipses

In support of the Phoenix mission to Mars (which used Matplotlib to display ground tracking of spacecraft), Michael Droettboom built on work by Charlie Moad to provide an extremely accurate 8-spline approximation to elliptical arcs (see Arc), which are insensitive to zoom level.

Fig. 9: Ellipse Demo

Bar charts

Use the bar() function to make bar charts, which includes customizations such as error bars:

Fig. 10: Barchart Demo
You can also create stacked bars (bar_stacked.py), or horizontal bar charts (barh.py).

Pie charts

The `pie()` function allows you to create pie charts. Optional features include auto-labeling the percentage of area, exploding one or more wedges from the center of the pie, and a shadow effect. Take a close look at the attached code, which generates this figure in just a few lines of code.

![Fig. 11: Pie Features](image1.jpg)

Tables

The `table()` function adds a text table to an axes.

![Fig. 12: Table Demo](image2.jpg)
Scatter plots

The `scatter()` function makes a scatter plot with (optional) size and color arguments. This example plots changes in Google’s stock price, with marker sizes reflecting the trading volume and colors varying with time. Here, the alpha attribute is used to make semitransparent circle markers.

![Scatter Demo2](image)

**Fig. 13: Scatter Demo2**

GUI widgets

Matplotlib has basic GUI widgets that are independent of the graphical user interface you are using, allowing you to write cross GUI figures and widgets. See `matplotlib.widgets` and the widget examples.

![Slider and radio-button GUI](image)

**Fig. 14: Slider and radio-button GUI.**

Filled curves

The `fill()` function lets you plot filled curves and polygons:
Fig. 15: Fill

Thanks to Andrew Straw for adding this function.

**Date handling**

You can plot timeseries data with major and minor ticks and custom tick formatters for both. See `matplotlib.ticker` and `matplotlib.dates` for details and usage.

**Log plots**

The `semilogx()`, `semilogy()` and `loglog()` functions simplify the creation of logarithmic plots. Thanks to Andrew Straw, Darren Dale and Gregory Lielens for contributions log-scaling infrastructure.

**Polar plots**

The `polar()` function generates polar plots.

**Legends**

The `legend()` function automatically generates figure legends, with MATLAB-compatible legend-placement functions.
Fig. 16: Date

Fig. 17: Log Demo

Fig. 18: Polar Demo
Thanks to Charles Twardy for input on the legend function.

TeX-notation for text objects

Below is a sampling of the many TeX expressions now supported by Matplotlib’s internal mathtext engine. The mathtext module provides TeX style mathematical expressions using FreeType and the DejaVu, BaKoMa computer modern, or STIX fonts. See the `matplotlib.mathtext` module for additional details.

Matplotlib’s math rendering engine

\[ W_{\omega_1, \omega_2}^{2\beta} = U_{\omega_1, \omega_2}^{2\beta} + \frac{1}{\sin 2} \int_{\omega_2}^{\alpha_2} d\alpha_2 \left[ \frac{U_{\omega_1, \omega_2}^{2\beta} - \alpha^2 U_{\omega_1, \omega_2}^{2\beta}}{U_{\omega_1, \omega_2}^{2\beta}} \right] \]

Subscripts and superscripts:
\( \alpha_i, \alpha_i^{1,2} = \sin(2\pi t_i) e^{-\gamma t_i}, \ldots \)

Fractions, binomials and stacked numbers:
\( \frac{a}{b}, \binom{a}{b}, \left( \frac{a^2}{b^2} \right), \ldots \)

Radicals:
\( \sqrt{2}, \sqrt{x}, \ldots \)

Fonts:
Roman, Italic, Typewriter or Calligraphic

Accents:
\( \ddot{a}, \dot{a}, \dddot{a}, \dot{a}, \dddot{a}, \ddot{a}, \dddot{a}, \dot{x}y, \dddot{x}y, \dddot{x}y, \ldots \)

Greek, Hebrew:
\( \alpha, \beta, \chi, \delta, \lambda, \mu, \Delta, \Gamma, \Omega, \Phi, \Pi, Y, \nabla, \Xi, \nabla, \ldots \)

Delimiters, functions and symbols:
\( \cup, \int, \in, \sum, \log, \sin, \approx, \oplus, \ast, \otimes, \varphi, \exists, \\exists, \ldots \)

Matplotlib’s mathtext infrastructure is an independent implementation and does not require
TeX or any external packages installed on your computer. See the tutorial at *Writing mathematical expressions*.

**Native TeX rendering**

Although Matplotlib’s internal math rendering engine is quite powerful, sometimes you need TeX. Matplotlib supports external TeX rendering of strings with the `usetex` option.

![Tex Demo](image)

**Fig. 21: Tex Demo**

**EEG GUI**

You can embed Matplotlib into pygtk, wx, Tk, or Qt applications. Here is a screenshot of an EEG viewer called `pbrain`. 
The lower axes uses `specgram()` to plot the spectrogram of one of the EEG channels.

For examples of how to embed Matplotlib in different toolkits, see:

- `/gallery/user_interfaces/embedding_in_gtk3_sgskip`
- `/gallery/user_interfaces/embedding_in_wx2_sgskip`
- `/gallery/user_interfaces/mpl_with_glade3_sgskip`
- `/gallery/user_interfaces/embedding_in_qt_sgskip`
- `/gallery/user_interfaces/embedding_in_tk_sgskip`

**XKCD-style sketch plots**

Just for fun, Matplotlib supports plotting in the style of [xkcd](https://xkcd.com).
Subplot example

Many plot types can be combined in one figure to create powerful and flexible representations of data.
import matplotlib.pyplot as plt
import numpy as np

np.random.seed(19680801)
data = np.random.randn(2, 100)

fig, axs = plt.subplots(2, 2, figsize=(5, 5))
axs[0, 0].hist(data[0])
axs[1, 0].scatter(data[0], data[1])
axs[0, 1].plot(data[0], data[1])
axs[1, 1].hist2d(data[0], data[1])
plt.show()

2.1.4 Image tutorial

A short tutorial on plotting images with Matplotlib.

Startup commands

First, let’s start IPython. It is a most excellent enhancement to the standard Python prompt, and it ties in especially well with Matplotlib. Start IPython either directly at a shell, or with the Jupyter Notebook (where IPython as a running kernel).

With IPython started, we now need to connect to a GUI event loop. This tells IPython where (and how) to display plots. To connect to a GUI loop, execute the %matplotlib magic at your IPython prompt. There’s more detail on exactly what this does at IPython’s documentation on GUI event loops.

If you’re using Jupyter Notebook, the same commands are available, but people commonly use a specific argument to the %matplotlib magic:

```
In [1]: %matplotlib inline
```

This turns on inline plotting, where plot graphics will appear in your notebook. This has important implications for interactivity. For inline plotting, commands in cells below the cell that outputs a plot will not affect the plot. For example, changing the color map is not possible from cells below the cell that creates a plot. However, for other backends, such as Qt5, that open a separate window, cells below those that create the plot will change the plot - it is a live object in memory.

This tutorial will use Matplotlib’s imperative-style plotting interface, pyplot. This interface maintains global state, and is very useful for quickly and easily experimenting with various plot settings. The alternative is the object-oriented interface, which is also very powerful, and generally more suitable for large application development. If you’d like to learn about the object-oriented interface, a great place to start is our Usage guide. For now, let’s get on with the imperative-style approach:

```
import matplotlib.pyplot as plt
import matplotlib.image as mpimg
```
Importing image data into Numpy arrays

Matplotlib relies on the Pillow library to load image data.

Here’s the image we’re going to play with:

![Stinkbug](../../doc/_static/stinkbug.png)

It’s a 24-bit RGB PNG image (8 bits for each of R, G, B). Depending on where you get your data, the other kinds of image that you’ll most likely encounter are RGBA images, which allow for transparency, or single-channel grayscale (luminosity) images. You can right click on it and choose “Save image as” to download it to your computer for the rest of this tutorial.

And here we go...

```python
img = mpimg.imread('..../doc/_static/stinkbug.png')
print(img)
```

Out:

```python
[[0.40784314 0.40784314 0.40784314]
 [0.40784314 0.40784314 0.40784314]
 [0.40784314 0.40784314 0.40784314]
 ...
 [0.42745098 0.42745098 0.42745098]
 [0.42745098 0.42745098 0.42745098]
 [0.42745098 0.42745098 0.42745098]]
```
Note the dtype there - float32. Matplotlib has rescaled the 8 bit data from each channel to floating point data between 0.0 and 1.0. As a side note, the only datatype that Pillow can work with is uint8. Matplotlib plotting can handle float32 and uint8, but image reading/writing for any format other than PNG is limited to uint8 data. Why 8 bits? Most displays can only render 8 bits per channel worth of color gradation. Why can they only render 8 bits/channel? Because that’s about all the human eye can see. More here (from a photography standpoint): Luminous Landscape bit depth tutorial.

Each inner list represents a pixel. Here, with an RGB image, there are 3 values. Since it’s a black and white image, R, G, and B are all similar. An RGBA (where A is alpha, or transparency), has 4 values per inner list, and a simple luminance image just has one value (and is thus only a 2-D array, not a 3-D array). For RGB and RGBA images, Matplotlib supports float32 and uint8 data types. For grayscale, Matplotlib supports only float32. If your array data does not meet one of these descriptions, you need to rescale it.
Plotting numpy arrays as images

So, you have your data in a numpy array (either by importing it, or by generating it). Let’s render it. In Matplotlib, this is performed using the `imshow()` function. Here we’ll grab the plot object. This object gives you an easy way to manipulate the plot from the prompt.

```python
imgplot = plt.imshow(img)
```

You can also plot any numpy array.

**Applying pseudocolor schemes to image plots**

Pseudocolor can be a useful tool for enhancing contrast and visualizing your data more easily. This is especially useful when making presentations of your data using projectors - their contrast is typically quite poor.

Pseudocolor is only relevant to single-channel, grayscale, luminosity images. We currently have an RGB image. Since R, G, and B are all similar (see for yourself above or in your data), we can just pick one channel of our data:

```python
lum_img = img[:, :, 0]
# This is array slicing. You can read more in the Numpy tutorial
```

(continues on next page)
# <https://docs.scipy.org/doc/numpy/user/quickstart.html>.

plt.imshow(lum_img)

Out:

<matplotlib.image.AxesImage object at 0x7f08b468d7c0>

Now, with a luminosity (2D, no color) image, the default colormap (aka lookup table, LUT), is applied. The default is called viridis. There are plenty of others to choose from.

plt.imshow(lum_img, cmap="hot")
Note that you can also change colormaps on existing plot objects using the `set_cmap()` method:

```python
imgplot = plt.imshow(lum_img)
imgplot.set_cmap('nipy_spectral')
```
Note: However, remember that in the Jupyter Notebook with the inline backend, you can’t make changes to plots that have already been rendered. If you create imgplot here in one cell, you cannot call set_cmap() on it in a later cell and expect the earlier plot to change. Make sure that you enter these commands together in one cell. plt commands will not change plots from earlier cells.

There are many other colormap schemes available. See the list and images of the colormaps.

Color scale reference

It’s helpful to have an idea of what value a color represents. We can do that by adding a color bar to your figure:

```python
imgplot = plt.imshow(lum_img)
plt.colorbar()
```
Examining a specific data range

Sometimes you want to enhance the contrast in your image, or expand the contrast in a particular region while sacrificing the detail in colors that don’t vary much, or don’t matter. A good tool to find interesting regions is the histogram. To create a histogram of our image data, we use the `hist()` function.

```python
plt.hist(lum_img.ravel(), bins=256, range=(0.0, 1.0), fc='k', ec='k')
```
Out:

[array([2.000e+00, 2.000e+00, 3.000e+00, 3.000e+00, 2.000e+00, 2.000e+00,
         3.000e+00, 1.000e+00, 7.000e+00, 9.000e+00, 7.000e+00, 2.000e+00,
         7.000e+00, 1.000e+01, 1.100e+01, 1.500e+01, 1.400e+01, 2.700e+01,

         (continues on next page)
]

2.1. Introductory

61
Most often, the “interesting” part of the image is around the peak, and you can get extra contrast by clipping the regions above and/or below the peak. In our histogram, it looks like there’s not much useful information in the high end (not many white things in the image). Let’s adjust the upper limit, so that we effectively “zoom in” part of the histogram. We do this by passing the clim argument to imshow. You could also do this by calling the set_clim() method of the image plot object, but make sure that you do so in the same cell as your plot command when working with the Jupyter Notebook - it will not change plots from earlier cells.

You can specify the clim in the call to plot.

```python
imgplot = plt.imshow(lum_img, clim=(0.0, 0.7))
```
You can also specify the clim using the returned object

```python
fig = plt.figure()
ax = fig.add_subplot(1, 2, 1)
imgplot = plt.imshow(lum_img)
ax.set_title('Before')
plt.colorbar(ticks=[0.1, 0.3, 0.5, 0.7], orientation='horizontal')
ax = fig.add_subplot(1, 2, 2)
imgplot = plt.imshow(lum_img)
imgplot.set_clim(0.0, 0.7)
ax.set_title('After')
plt.colorbar(ticks=[0.1, 0.3, 0.5, 0.7], orientation='horizontal')
```
Array Interpolation schemes

Interpolation calculates what the color or value of a pixel “should” be, according to different mathematical schemes. One common place that this happens is when you resize an image. The number of pixels change, but you want the same information. Since pixels are discrete, there’s missing space. Interpolation is how you fill that space. This is why your images sometimes come out looking pixelated when you blow them up. The effect is more pronounced when the difference between the original image and the expanded image is greater. Let’s take our image and shrink it. We’re effectively discarding pixels, only keeping a select few. Now when we plot it, that data gets blown up to the size on your screen. The old pixels aren’t there anymore, and the computer has to draw in pixels to fill that space.

We’ll use the Pillow library that we used to load the image also to resize the image.

```python
from PIL import Image

img = Image.open('..../doc/_static/stinkbug.png')
img.thumbnail((64, 64), Image.ANTIALIAS)  # resizes image in-place
imgplot = plt.imshow(img)
```
Here we have the default interpolation, bilinear, since we did not give `imshow()` any interpolation argument.

Let’s try some others. Here’s “nearest”, which does no interpolation.

```python
imgplot = plt.imshow(img, interpolation="nearest")
```
and bicubic:

```python
imgplot = plt.imshow(img, interpolation="bicubic")
```
Bicubic interpolation is often used when blowing up photos - people tend to prefer blurry over pixelated.

**Total running time of the script:** (0 minutes 6.795 seconds)

### 2.1.5 The Lifecycle of a Plot

This tutorial aims to show the beginning, middle, and end of a single visualization using Matplotlib. We'll begin with some raw data and end by saving a figure of a customized visualization. Along the way we try to highlight some neat features and best-practices using Matplotlib.

**Note:** This tutorial is based on this excellent blog post by Chris Moffitt. It was transformed into this tutorial by Chris Holdgraf.

---

**A note on the Object-Oriented API vs. Pyplot**

Matplotlib has two interfaces. The first is an object-oriented (OO) interface. In this case, we utilize an instance of `axes.Axes` in order to render visualizations on an instance of `figure.Figure`. 
The second is based on MATLAB and uses a state-based interface. This is encapsulated in the *pyplot* module. See the *pyplot tutorials* for a more in-depth look at the pyplot interface.

Most of the terms are straightforward but the main thing to remember is that:

- The Figure is the final image that may contain 1 or more Axes.
- The Axes represent an individual plot (don’t confuse this with the word “axis”, which refers to the x/y axis of a plot).

We call methods that do the plotting directly from the Axes, which gives us much more flexibility and power in customizing our plot.

**Note:** In general, try to use the object-oriented interface over the pyplot interface.

---

### Our data

We’ll use the data from the post from which this tutorial was derived. It contains sales information for a number of companies.

```python
import numpy as np
import matplotlib.pyplot as plt

data = {
    'Barton LLC': 109438.50,
    'Frami, Hills and Schmidt': 103569.59,
    'Fritsch, Russel and Anderson': 112214.71,
    'Jerde-Hilpert': 112591.43,
    'Keeling LLC': 100934.30,
    'Koepp Ltd': 103660.54,
    'Kulas Inc': 137351.96,
    'Trantow-Barrows': 123381.38,
    'White-Trantow': 135841.99,
    'Will LLC': 104437.60
}
group_data = list(data.values())
group_names = list(data.keys())
group_mean = np.mean(group_data)
```

### Getting started

This data is naturally visualized as a barplot, with one bar per group. To do this with the object-oriented approach, we first generate an instance of `figure.Figure` and `axes.Axes`. The Figure is like a canvas, and the Axes is a part of that canvas on which we will make a particular visualization.

**Note:** Figures can have multiple axes on them. For information on how to do this, see the *Tight Layout tutorial*.

```python
fig, ax = plt.subplots()
```
Now that we have an Axes instance, we can plot on top of it.

```python
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
```
Controlling the style

There are many styles available in Matplotlib in order to let you tailor your visualization to your needs. To see a list of styles, we can use `style`.

```
print(plt.style.available)
```

```python
['Solarize_Light2', '_classic_test_patch', 'bmh', 'classic', 'dark_background', 'fast',
 'fivethirtyeight', 'ggplot', 'grayscale', 'seaborn', 'seaborn-bright', 'seaborn-colorblind',
 'seaborn-dark', 'seaborn-dark-palette', 'seaborn-darkgrid', 'seaborn-deep', 'seaborn-muted',
 'seaborn-notebook', 'seaborn-paper', 'seaborn-pastel', 'seaborn-poster', 'seaborn-talk',
 'seaborn-ticks', 'seaborn-white', 'seaborn-whitegrid', 'tableau-colorblind10']
```

You can activate a style with the following:

```
plt.style.use('fivethirtyeight')
```

Now let’s remake the above plot to see how it looks:
Customizing the plot

Now we’ve got a plot with the general look that we want, so let’s fine-tune it so that it’s ready for print. First let’s rotate the labels on the x-axis so that they show up more clearly. We can gain access to these labels with the `axes.Axes.get_xticklabels()` method:

```python
defin, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
for label in labels:
    label.set_rotation(90)
```

The style controls many things, such as color, linewidths, backgrounds, etc.
If we’d like to set the property of many items at once, it’s useful to use the `pyplot.setp()` function. This will take a list (or many lists) of Matplotlib objects, and attempt to set some style element of each one.

```python
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
```
It looks like this cut off some of the labels on the bottom. We can tell Matplotlib to automatically make room for elements in the figures that we create. To do this we set the `autolayout` value of our `rcParams`. For more information on controlling the style, layout, and other features of plots with `rcParams`, see *Customizing Matplotlib with stylesheets and rcParams*.

```python
plt.rcParams.update({'figure.autolayout': True})

fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
```
Next, we add labels to the plot. To do this with the OO interface, we can use the `Artist.set()` method to set properties of this Axes object.

```python
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
```
We can also adjust the size of this plot using the `pyplot.subplots()` function. We can do this with the `figsize` kwarg.

**Note:** While indexing in NumPy follows the form (row, column), the `figsize` kwarg follows the form (width, height). This follows conventions in visualization, which unfortunately are different from those of linear algebra.
For labels, we can specify custom formatting guidelines in the form of functions. Below we define a function that takes an integer as input, and returns a string as an output. When used with `Axes.set_major_formatter` or `Axes.set_minor_formatter`, they will automatically create and use a `ticker.FuncFormatter` class.

For this function, the `x` argument is the original tick label and `pos` is the tick position. We will only use `x` here but both arguments are needed.

```python
def currency(x, pos):
    """The two args are the value and tick position""
    if x >= 1e6:
        s = '${:1.1f}M'.format(x*1e-6)
    else:
        s = '${:1.0f}K'.format(x*1e-3)
    return s
```

We can then apply this function to the labels on our plot. To do this, we use the `xaxis` attribute of our axes. This lets you perform actions on a specific axis on our plot.

```python
fig, ax = plt.subplots(figsize=(6, 8))
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')

ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
ax.xaxis.set_major_formatter(currency)
```
Combining multiple visualizations

It is possible to draw multiple plot elements on the same instance of `Axes`. To do this we simply need to call another one of the plot methods on that axes object.
fig, ax = plt.subplots(figsize=(8, 8))
ax.bart(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')

# Add a vertical line, here we set the style in the function call
ax.axvline(group_mean, ls='--', color='r')

# Annotate new companies
for group in [3, 5, 8]:
    ax.text(145000, group, "New Company", fontsize=10,
            verticalalignment="center")

# Now we move our title up since it's getting a little cramped
ax.title.set(y=1.05)

ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
ax.xaxis.set_major_formatter(currency)
ax.set_xticks([0, 25e3, 50e3, 75e3, 100e3, 125e3])
fig.subplots_adjust(right=.1)

plt.show()
Saving our plot

Now that we’re happy with the outcome of our plot, we want to save it to disk. There are many file formats we can save to in Matplotlib. To see a list of available options, use:

```python
print(fig.canvas.get_supported_filetypes())
```

Out:

```python
```
We can then use the `figure.Figure.savefig()` in order to save the figure to disk. Note that there are several useful flags we show below:

- `transparent=True` makes the background of the saved figure transparent if the format supports it.
- `dpi=80` controls the resolution (dots per square inch) of the output.
- `bbox_inches="tight"` fits the bounds of the figure to our plot.

```python
# Uncomment this line to save the figure.
# fig.savefig('sales.png', transparent=False, dpi=80, bbox_inches="tight")
```

**Total running time of the script:** (0 minutes 2.892 seconds)

### 2.1.6 Customizing Matplotlib with style sheets and rcParams

Tips for customizing the properties and default styles of Matplotlib.

#### Using style sheets

The `style` package adds support for easy-to-switch plotting “styles” with the same parameters as a `matplotlib` rc file (which is read at startup to configure Matplotlib).

There are a number of pre-defined styles provided by Matplotlib. For example, there’s a pre-defined style called “ggplot”, which emulates the aesthetics of ggplot (a popular plotting package for R). To use this style, just add:

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl
from cycler import cycler
plt.style.use('ggplot')
data = np.random.randn(50)
```

To list all available styles, use:

```python
print(plt.style.available)
```

Out:

```
['Solarize_Light2', '_classic_test_patch', 'bmh', 'classic', 'dark_background', 'fast',
 'fivethirtyeight', 'ggplot', 'grayscale', 'seaborn', 'seaborn-bright', 'seaborn-colorblind',
 'seaborn-dark', 'seaborn-dark-palette', 'seaborn-darkgrid', 'seaborn-deep', 'seaborn-muted',
 'seaborn-notebook', 'seaborn-paper', 'seaborn-pastel', 'seaborn-poster', 'seaborn-talk',
 'seaborn-ticks', 'seaborn-white', 'seaborn-whitegrid', 'tableau-colorblind10']
```

#### Defining your own style

You can create custom styles and use them by calling `style.use` with the path or URL to the style sheet.
For example, you might want to create `./images/presentation.mplstyle` with the following:

```plaintext
axes.titlesize : 24
axes.labelsize : 20
lines.linewidth : 3
lines.markersize : 10
xtick.labelsize : 16
ytick.labelsize : 16
```

Then, when you want to adapt a plot designed for a paper to one that looks good in a presentation, you can just add:

```python
>>> import matplotlib.pyplot as plt
>>> plt.style.use('./images/presentation.mplstyle')
```

Alternatively, you can make your style known to Matplotlib by placing your `<style-name>.mplstyle` file into `mpl_configdir/stylelib`. You can then load your custom style sheet with a call to `style.use('<style-name>')`. By default `mpl_configdir` should be `~/.config/matplotlib`, but you can check where yours is with `matplotlib.get_configdir()`; you may need to create this directory. You also can change the directory where Matplotlib looks for the `stylelib` folder by setting the `MPLCONFIGDIR` environment variable, see `matplotlib configuration and cache directory locations`.

Note that a custom style sheet in `mpl_configdir/stylelib` will override a style sheet defined by Matplotlib if the styles have the same name.

Once your `<style-name>.mplstyle` file is in the appropriate `mpl_configdir` you can specify your style with:

```python
>>> import matplotlib.pyplot as plt
>>> plt.style.use('<style-name>')
```

**Composing styles**

Style sheets are designed to be composed together. So you can have a style sheet that customizes colors and a separate style sheet that alters element sizes for presentations. These styles can easily be combined by passing a list of styles:

```python
>>> import matplotlib.pyplot as plt
>>> plt.style.use(['dark_background', 'presentation'])
```

Note that styles further to the right will overwrite values that are already defined by styles on the left.

**Temporary styling**

If you only want to use a style for a specific block of code but don’t want to change the global styling, the style package provides a context manager for limiting your changes to a specific scope. To isolate your styling changes, you can write something like the following:

```python
with plt.style.context('dark_background'):
    plt.plot(np.sin(np.linspace(0, 2 * np.pi)), 'r-o')
plt.show()
```
2.1.7 Matplotlib rcParams

Dynamic rc settings

You can also dynamically change the default rc settings in a python script or interactively from the python shell. All of the rc settings are stored in a dictionary-like variable called `matplotlib.rcParams`, which is global to the matplotlib package. rcParams can be modified directly, for example:

```python
mpl.rcParams['lines.linewidth'] = 2
mpl.rcParams['lines.linestyle'] = '--'
plt.plot(data)
```
Note, that in order to change the usual `plot` color you have to change the `prop_cycle` property of `axes`:

```python
mpl.rcParams['axes.prop_cycle'] = cycler(color=['r', 'g', 'b', 'y'])
plt.plot(data)  # first color is red
```
Matplotlib, Release 3.3.0

Matplotlib also provides a couple of convenience functions for modifying rc settings. `matplotlib.rc` can be used to modify multiple settings in a single group at once, using keyword arguments:

```python
mpl.rc('lines', linewidth=4, linestyle='-')
plt.plot(data)
```

Out:

```
[<matplotlib.lines.Line2D object at 0x7f08b58d9bb0>]
```
Out:

```python
[<matplotlib.lines.Line2D object at 0x7f08b5961730>]
```

`matplotlib.rcdefaults` will restore the standard Matplotlib default settings.

There is some degree of validation when setting the values of rcParams, see `matplotlib.rcsetup` for details.

The `matplotlibrc` file

Matplotlib uses `matplotlibrc` configuration files to customize all kinds of properties, which we call ‘rc settings’ or ‘rc parameters’. You can control the defaults of almost every property in Matplotlib: figure size and DPI, line width, color and style, axes, axis and grid properties, text and font properties and so on. When a URL or path is not specified with a call to `style.use('<path>/<style-name>.mplstyle')`, Matplotlib looks for `matplotlibrc` in four locations, in the following order:

1. `matplotlibrc` in the current working directory, usually used for specific customizations that you do not want to apply elsewhere.

2. `$MATPLOTLIBRC` if it is a file, else `$MATPLOTLIBRC/matplotlibrc`.

3. It next looks in a user-specific place, depending on your platform:
• On Linux and FreeBSD, it looks in .config/matplotlib/matplotlibrc (or
$XDG_CONFIG_HOME/matplotlib/matplotlibrc) if you’ve customized your environment.
• On other platforms, it looks in .matplotlib/matplotlibrc.

See matplotlib configuration and cache directory locations.

4. INSTALL/matplotlib/mpl-data/matplotlibrc, where INSTALL is something like /usr/lib/
python3.7/site-packages on Linux, and maybe C:\Python37\Lib\site-packages on Win-
dows. Every time you install matplotlib, this file will be overwritten, so if you want
your customizations to be saved, please move this file to your user-specific matplotlib
directory.

Once a matplotlibrc file has been found, it will not search any of the other paths.

To display where the currently active matplotlibrc file was loaded from, one can do the fol-
lowing:

```
>>> import matplotlib
>>> matplotlib.matplotlib_fname()
'/home/foo/.config/matplotlib/matplotlibrc'
```

See below for a sample matplotlibrc file.

A sample matplotlibrc file

```
### MATPLOTLIBRC FORMAT
### NOTE FOR END USERS: DO NOT EDIT THIS FILE!
###
### This is a sample matplotlib configuration file - you can find a copy
### of it on your system in site-packages/matplotlib/mpl-data/matplotlibrc
### (which related to your Python installation location).
###
### You should find a copy of it on your system at
### site-packages/matplotlib/mpl-data/matplotlibrc (relative to your Python
### installation location). DO NOT EDIT IT!
###
### If you wish to change your default style, copy this file to one of the
### following locations
### unix/linux:
###   $HOME/.config/matplotlib/matplotlibrc OR
###   $XDG_CONFIG_HOME/matplotlib/matplotlibrc (if $XDG_CONFIG_HOME is set)
### other platforms:
###   $HOME/.matplotlib/matplotlibrc
### and edit that copy.
###
### See https://matplotlib.org/users/customizing.html#the-matplotlibrc-file
### for more details on the paths which are checked for the configuration file.
###
### Blank lines, or lines starting with a comment symbol, are ignored, as are
### trailing comments. Other lines must have the format:
###   key: val # optional comment
###
### Formatting: Use PEP8-like style (as enforced in the rest of the codebase).
### All lines start with an additional '#', so that removing all leading '#'s
### yields a valid style file.
```

(continues on next page)
## Colors: for the color values below, you can either use
## - a matplotlib color string, such as r, k, or b
## - an rgb tuple, such as (1.0, 0.5, 0.0)
## - a hex string, such as ff00ff
## - a scalar grayscale intensity such as 0.75
## - a legal html color name, e.g., red, blue, darkslategrey

## Matplotlib configuration are currently divided into following parts:
## - BACKENDS
## - LINES
## - PATCHES
## - HATCHES
## - BOXPLOT
## - FONT
## - TEXT
## - LaTeX
## - AXES
## - DATES
## - TICKS
## - GRIDS
## - LEGEND
## - FIGURE
## - IMAGES
## - CONTOUR PLOTS
## - ERRORBAR PLOTS
## - HISTOGRAM PLOTS
## - SCATTER PLOTS
## - AGG RENDERING
## - PATHS
## - SAVING FIGURES
## - INTERACTIVE KEYS
## - ANIMATION

##### CONFIGURATION BEGINS HERE

```
#***************************************************************************
## BACKENDS
#***************************************************************************
# The default backend. If you omit this parameter, the first working
# backend from the following list is used:
# MacOSX Qt5Agg Gtk3Agg TkAgg WxAgg Agg
# Other choices include:
# Qt5Cairo GTK3Cairo TkCairo Wxcairo Cairo
# Qt4Agg Qt4Cairo Wx # deprecated.
# PS PDF SVG Template
# You can also deploy your own backend outside of matplotlib by referring to
# the module name (which must be in the PYTHONPATH) as 'module://my_backend'.
#backend: Agg

# The port to use for the web server in the WebAgg backend.
#webagg.port: 8988

# The address on which the WebAgg web server should be reachable
#webagg.address: 127.0.0.1
```

(continues on next page)
## If webagg.port is unavailable, a number of other random ports will
## be tried until one that is available is found.
#webagg.port_retries: 50

## When True, open the webbrowser to the plot that is shown
#webagg.open_in_browser: True

## If you are running pyplot inside a GUI and your backend choice
## conflicts, we will automatically try to find a compatible one for
## you if backend_fallback is True
#backend_fallback: True
#interactive: False
#toolbar: toolbar2  # {None, toolbar2, toolmanager}
#timezone: UTC  # a pytz timezone string, e.g., US/Central or Europe/Paris

## **************************************************************************
## * LINES *
## **************************************************************************
## See https://matplotlib.org/api/artist_api.html#module-matplotlib.lines
## for more information on line properties.
#lines.linewidth: 1.5  # line width in points
#lines.linestyle: -  # solid line
#lines.color: C0  # has no effect on plot(); see axes.prop_cycle
#lines.marker: None  # the default marker
#lines.markerfacecolor: auto  # the default marker face color
#lines.markeredgcolor: auto  # the default marker edge color
#lines.markeredgewidth: 1.0  # the line width around the marker symbol
#lines.markersize: 6  # marker size, in points
#lines.dash_joinstyle: round  # {miter, round, bevel}
#lines.dashcapstyle: butt  # {butt, round, projecting}
#lines.solid_joinstyle: round  # {miter, round, bevel}
#lines.solid_capstyle: projecting  # {butt, round, projecting}
#lines.antialiased: True  # render lines in anti-aliased (no jaggies)

## The three standard dash patterns. These are scaled by the linewidth.
#lines.dashed_pattern: 3.7, 1.6
#lines.dashdot_pattern: 6.4, 1.6, 1, 1.6
#lines.dotted_pattern: 1, 1.65
#lines.scale_dashes: True

#markers.fillstyle: full  # {full, left, right, bottom, top, none}

#pcolor.shading : flat

## **************************************************************************
## * PATCHES *
## **************************************************************************
## Patches are graphical objects that fill 2D space, like polygons or circles.
## See https://matplotlib.org/api/artist_api.html#module-matplotlib.patches
## for more information on patch properties.
#patch.linewidth: 1  # edge width in points.
#patch.facecolor: C0
#patch.edgecolor: black  # if forced, or patch is not filled

(continues on next page)
#patch.force_edgecolor: False  # True to always use edgecolor
#patch.antialiased: True  # render patches in antialiased (no jaggies)

#boxplot.meanprops.markerfacecolor: C2
#boxplot.meanprops.markeredgecolor: C2
#boxplot.meanprops.markersize: 6
#boxplot.meanprops.markersize: --
#boxplot.meanprops.linewidth: 1.0

```python
#boxplot.meanprops.linewidth: 1.0
```

## FONT

The font properties used by `text.Text`.

See https://matplotlib.org/api/font_manager_api.html for more information on font properties. The 6 font properties used for font matching are given below with their default values.

## The font.family property has five values:
## - 'serif' (e.g., Times),
## - 'sans-serif' (e.g., Helvetica),
## - 'cursive' (e.g., Zapf-Chancery),
## - 'fantasy' (e.g., Western), and
## - 'monospace' (e.g., Courier).
## Each of these font families has a default list of font names in decreasing order of priority associated with them. When text.usetex is False, font.family may also be one or more concrete font names.

## The font.style property has three values: normal (or roman), italic or oblique. The oblique style will be used for italic, if it is not present.

## The font.variant property has two values: normal or small-caps. For TrueType fonts, which are scalable fonts, small-caps is equivalent to using a font size of 'smaller', or about 83% of the current font size.

## The font.weight property has effectively 13 values: normal, bold, bolder, lighter, 100, 200, 300, ..., 900. Normal is the same as 400, and bold is 700. bolder and lighter are relative values with respect to the current weight.

## The font.stretch property has 11 values: ultra-condensed, extra-condensed, condensed, semi-condensed, normal, semi-expanded, expanded, extra-expanded, ultra-expanded, wider, and narrower. This property is not currently implemented.

## The font.size property is the default font size for text, given in pts. 10 pt is the standard value.

Note that font.size controls default text sizes. To configure special text sizes tick labels, axes, labels, title, etc, see the rc settings for axes and ticks. Special text sizes can be defined relative to font.size, using the following values: xx-small, x-small, small, medium, large, x-large, xx-large, larger, or smaller

```python
#font.family: sans-serif
#font.style: normal
#font.variant: normal
#font.weight: normal
#font.stretch: normal
#font.size: 10.0
```
#font.serif: DejaVu Serif, Bitstream Vera Serif, Computer Modern Roman, New Century Schoolbook, Century Schoolbook L, Utopia, ITC Bookman, Bookman, Nimbus Roman No9 L, Times New Roman, Times, Palatino, Charter, serif

#font.sans-serif: DejaVu Sans, Bitstream Vera Sans, Computer Modern Sans Serif, Lucida Grande, Verdana, Geneva, Lucid, Arial, Helvetica, Avant Garde, sans-serif

#font.cursive: Apple Chancery, Textile, Zapf Chancery, Sand, Script MT, Felipa, cursive

#font.fantasy: Comic Neue, Comic Sans MS, Chicago, Charcoal, Impact Western, Humor Sans, zkd, fantasy

#font.monospace: DejaVu Sans Mono, Bitstream Vera Sans Mono, Computer Modern Typewriter, Andale Mono, Nimbus Mono L, Courier New, Courier, Fized, Terminal, monospace

## **************************************************************************
## * TEXT *
## **************************************************************************
## The text properties used by `text.Text`.
## See https://matplotlib.org/api/artist_api.html#module-matplotlib.text
## for more information on text properties
## text.color: black

## **************************************************************************
## * LaTeX *
## **************************************************************************
## For more information on LaTex properties, see
## https://matplotlib.org/tutorials/text/usetex.html
## text.usetex: False
## # use latex for all text handling. The following fonts are supported through the usual rc parameter settings:
## new century schoolbook, bookman, times, palatino,
## zapf chancery, charter, serif, sans-serif, helvetica,
## avant garde, courier, monospace, computer modern roman,
## computer modern sans serif, computer modern typewriter
## If another font is desired which can loaded using the LaTeX \usepackage command, please inquire at the matplotlib mailing list

## FreeType hinting flag ("foo" corresponds to FT_LOAD_FOO); may be one of the following (Proprietary Matplotlib-specific synonyms are given in parentheses, but their use is discouraged):
## - default: Use the font's native hinter if possible, else FreeType's auto-hinter.
## (*either* is a synonym).
## - no_autohint: Use the font’s native hinter if possible, else don’t hint.
## - force_autohint: Use FreeType’s auto-hinter. ("auto" is a synonym.)
## - no_hinting: Disable hinting. ("none" is a synonym.)
#text.hinting: force_autohint

#text.hinting_factor: 8 # Specifies the amount of softness for hinting in the
# horizontal direction. A value of 1 will hint to full
# pixels. A value of 2 will hint to half pixels etc.
#text.kerning_factor : 0 # Specifies the scaling factor for kerning values. This
# is provided solely to allow old test images to remain
# unchanged. Set to 6 to obtain previous behavior. Values
# other than 0 or 6 have no defined meaning.
#text.antialiased: True # If True (default), the text will be antialiased.
# This only affects the Agg backend.

## The following settings allow you to select the fonts in math mode.
#mathtext.fontset: dejavusans # Should be 'dejavusans' (default),
# 'dejavuserif', 'cm' (Computer Modern), 'stix',
# 'stixsans' or 'custom' (unsupported, may go
# away in the future)

## "mathtext.fontset: custom" is defined by the mathtext.bf, .cal, .it, ...
## settings which map a TeX font name to a fontconfig font pattern. (These
## settings are not used for other font sets.)
#mathtext.bf: sans:bold
#mathtext.cal: cursive
#mathtext.it: sans:italic
#mathtext.rm: sans
#mathtext.sf: sans
#mathtext.tt: monospace
#mathtext.fallback: cm # Select fallback font from ['cm' (Computer Modern), 'stix'
# 'stixsans'] when a symbol can not be found in one of the
# custom math fonts. Select 'None' to not perform fallback
# and replace the missing character by a dummy symbol.

#mathtext.default: it # The default font to use for math.
# Can be any of the LaTeX font names, including
# the special name "regular" for the same font
# used in regular text.

## ***************************************************************************
## * AXES *
## ***************************************************************************

## Following are default face and edge colors, default tick sizes, 
## default font sizes for ticklabels, and so on. See 
## https://matplotlib.org/api/axes_api.html#module-matplotlib.axes
#axes.facecolor: white # axes background color
#axes.edgecolor: black # axes edge color
#axes.linewidth: 0.8 # edge linewidth
#axes.grid: False # display grid or not
#axes.grid.axis: both # which axis the grid should apply to
#axes.grid.which: major # gridlines at {major, minor, both} ticks
#axes.titlelocation: center # alignment of the title: {left, right, center}
#axes.titlesize: large # fontsize of the axes title
#axes.titleweight: normal # font weight of title
#axes.titlecolor: auto # color of the axes title, auto falls back to

(continues on next page)
# text.color as default value
#axes.title: None # position title (axes relative units). None implies auto
#axes.titlepad: 6.0 # pad between axes and title in points
#axes.labelsize: medium # fontsize of the x and y labels
#axes.labelpad: 4.0 # space between label and axis
#axes.labelweight: normal # weight of the x and y labels
#axes.labelcolor: black
#axes.azisbelow: line # draw axis gridlines and ticks:
# - below patches (True)
# - above patches but below lines ('line')
# - above all (False)

#axes.formatter.limits: -5, 6 # use scientific notation if log10
# of the axis range is smaller than the
# first or larger than the second
#axes.formatter.use_locale: False # When True, format tick labels
# according to the user's locale.
# For example, use ',' as a decimal
# separator in the fr_FR locale.
#axes.formatter.use_mathtext: False # When True, use mathtext for scientific
# notation.
#axes.formatter.min_exponent: 0 # minimum exponent to format in scientific notation
#axes.formatter.useoffset: True # If True, the tick label formatter
# will default to labeling ticks relative
# to an offset when the data range is
# small compared to the minimum absolute
# value of the data.
#axes.formatter.offset_threshold: 4 # When useoffset is True, the offset
# will be used when it can remove
# at least this number of significant
# digits from tick labels.

#axes.spines.left: True # display axis spines
#axes.spines.bottom: True
#axes.spines.top: True
#axes.spines.right: True

#axes.unicode_minus: True # use Unicode for the minus symbol rather than hyphen. See
# https://en.wikipedia.org/wiki/Plus_and_minus_signs#Character_codes

## * FIGURE *
## **************************************************************************
## See https://matplotlib.org/api/figure_api.html#matplotlib.figure.Figure
#figure.titlesize: large # size of the figure title (`Figure.suptitle()`)  
#figure.titleweight: normal # weight of the figure title  
#figure.figsize: 6.4, 4.8 # figure size in inches  
#figure.dpi: 100 # figure dots per inch  
#figure.facecolor: white # figure facecolor  
#figure.edgecolor: white # figure edgecolor  
#figure.frameon: True # enable figure frame  
#figure.max_open_warning: 20 # The maximum number of figures to open through  
# the pyplot interface before emitting a warning.  
# If less than one this feature is disabled.  
#figure.raise_window : True # Raise the GUI window to front when show() is called.

## The figure subplot parameters. All dimensions are a fraction of the figure width and height.
#figure.subplot.left: 0.125 # the left side of the subplots of the figure  
#figure.subplot.right: 0.9 # the right side of the subplots of the figure  
#figure.subplot.bottom: 0.11 # the bottom of the subplots of the figure  
#figure.subplot.top: 0.88 # the top of the subplots of the figure  
#figure.subplot.wspace: 0.2 # the amount of width reserved for space between subplots,  
# expressed as a fraction of the average axis width  
#figure.subplot.hspace: 0.2 # the amount of height reserved for space between subplots,  
# expressed as a fraction of the average axis height

## Figure layout  
#figure.autolayout: False # When True, automatically adjust subplot  
# parameters to make the plot fit the figure using `tight_layout`  
#figure.constrained_layout.use: False # When True, automatically make plot  
# elements fit on the figure. (Not compatible with `autolayout`, above).  
#figure.constrained_layout.h_pad: 0.04167 # Padding around axes objects. Float representing  
# inches. Default is 3./72. inches (3 pts)  
#figure.constrained_layout.w_pad: 0.04167 # inches. Default is 3./72. inches (3 pts)  
#figure.constrained_layout.hspace: 0.02 # Space between subplot groups. Float representing  
#figure.constrained_layout.wspace: 0.02 # a fraction of the subplot widths being separated.

(continues on next page)
## CONTOUR PLOTS

- `contour.negative_linestyle`: string or on-off ink sequence (default: dashed)
- `contour.corner_mask`: {True, False, legacy} (default: True)
- `contour.linewidth`: {float, None} Size of the contour linewidths. If set to None, it falls back to `line.linewidth`.

## ERRORBAR PLOTS

- `errorbar.capsize`: length of end cap on error bars in pixels (default: 0)

## HISTOGRAM PLOTS

- `hist.bins`: default number of histogram bins or 'auto' (default: 10)

## SCATTER PLOTS

- `scatter.marker`: default marker type for scatter plots (default: o)
- `scatter.edgecolors`: default edge colors for scatter plots (default: face)

## AGG RENDERING

- `agg.path.chunksize`: 0 to disable; values in the range 10000 to 100000 can improve speed slightly and prevent an Agg rendering failure when plotting very large data sets, especially if they are very gappy. It may cause minor artifacts, though. A value of 20000 is probably a good starting point.

## PATHS

- `path.simplify`: True when True, simplify paths by removing "invisible" points to reduce file size and increase rendering speed
- `path.simplify_threshold`: 0.111111111111 the threshold of similarity below which vertices will be removed in the simplification process
- `path.snap`: True when True, rectilinear axis-aligned paths will be snapped to the nearest pixel when certain criteria are met. When False, paths will never be snapped
- `path.sketch`: None May be None, or a 3-tuple of the form: (scale, length, randomness)
Matplotlib, Release 3.3.0

(continued from previous page)

# - *scale* is the amplitude of the wiggle
#     perpendicular to the line (in pixels).
# - *length* is the length of the wiggle along the
#     line (in pixels).
# - *randomness* is the factor by which the length is
#     randomly scaled.

These tutorials cover some of the more complicated classes and functions in Matplotlib. They can be useful for particular custom and complex visualizations.

2.2.1 Artist tutorial

Using Artist objects to render on the canvas.

There are three layers to the matplotlib API.

- the matplotlib.backend_bases.FigureCanvas is the area onto which the figure is drawn
- the matplotlib.backend_bases.Renderer is the object which knows how to draw on the FigureCanvas
- and the matplotlib.artist.Artist is the object that knows how to use a renderer to paint onto the canvas.

The FigureCanvas and Renderer handle all the details of talking to user interface toolkits like wxPython or drawing languages like PostScript®, and the Artist handles all the high level constructs like representing and laying out the figure, text, and lines. The typical user will spend 95% of their time working with the Artists.

There are two types of Artists: primitives and containers. The primitives represent the standard graphical objects we want to paint onto our canvas: Line2D, Rectangle, Text, AxesImage, etc., and the containers are places to put them (Axes, Axes and Figure). The standard use is to create a Figure instance, use the Figure to create one or more Axes or Subplot instances, and use the Axes instance helper methods to create the primitives. In the example below, we create a Figure instance using matplotlib.pyplot.figure(), which is a convenience method for instantiating Figure instances and connecting them with your user interface or drawing toolkit FigureCanvas. As we will discuss below, this is not necessary – you can work directly with PostScript, PDF Gtk+, or wxPython FigureCanvas instances, instantiate your Figures directly and connect them yourselves – but since we are focusing here on the Artist API we’ll let pyplot handle some of those details for us:

```python
import matplotlib.pyplot as plt
fig = plt.figure()
ax = fig.add_subplot(2, 1, 1) # two rows, one column, first plot
```

The Axes is probably the most important class in the matplotlib API, and the one you will be working with most of the time. This is because the Axes is the plotting area into which most of the objects go, and the Axes has many special helper methods (plot(), text(), hist(), imshow()) to create the most common graphics primitives (Line2D, Text, Rectangle, AxesImage, respectively). These helper methods will take your data (e.g., numpy arrays and strings) and create primitive Artist instances as needed (e.g., Line2D), add them to the relevant containers,
and draw them when requested. Most of you are probably familiar with the Subplot, which is just a special case of an Axes that lives on a regular rows by columns grid of Subplot instances. If you want to create an Axes at an arbitrary location, simply use the add_axes() method which takes a list of [left, bottom, width, height] values in 0-1 relative figure coordinates:

```python
fig2 = plt.figure()
ax2 = fig2.add_axes([0.15, 0.1, 0.7, 0.3])
```

Continuing with our example:

```python
import numpy as np
t = np.arange(0.0, 1.0, 0.01)
s = np.sin(2*np.pi*t)
line, = ax.plot(t, s, color='blue', lw=2)
```

In this example, `ax` is the Axes instance created by the `fig.add_subplot` call above (remember Subplot is just a subclass of Axes) and when you call `ax.plot`, it creates a Line2D instance and adds it to the Axes.lines list. In the interactive ipython session below, you can see that the Axes.lines list is length one and contains the same line that was returned by the `line, = ax.plot...` call:

```
In [101]: ax.lines[0]
Out[101]: <matplotlib.lines.Line2D instance at 0x19a95710>
```

```python
In [102]: line
Out[102]: <matplotlib.lines.Line2D instance at 0x19a95710>
```

If you make subsequent calls to `ax.plot` (and the hold state is “on” which is the default) then additional lines will be added to the list. You can remove lines later simply by calling the list methods; either of these will work:

```python
del ax.lines[0]
ax.lines.remove(line)  # one or the other, not both!
```

The Axes also has helper methods to configure and decorate the x-axis and y-axis tick, tick labels and axis labels:

```python
xtext = ax.set_xlabel('my xdata')  # returns a Text instance
ytext = ax.set_ylabel('my ydata')
```

When you call `ax.set_xlabel`, it passes the information on the Text instance of the XAxis. Each Axes instance contains an XAxis and a YAxis instance, which handle the layout and drawing of the ticks, tick labels and axis labels.

Try creating the figure below.
line, = ax1.plot(t, s, color='blue', lw=2)

# Fixing random state for reproducibility
np.random.seed(19680801)

ax2 = fig.add_axes([0.15, 0.1, 0.7, 0.3])
n, bins, patches = ax2.hist(np.random.randn(1000), 50,
                           facecolor='yellow', edgecolor='yellow')
ax2.set_xlabel('time (s)')
plt.show()

Customizing your objects

Every element in the figure is represented by a matplotlib Artist, and each has an extensive list of properties to configure its appearance. The figure itself contains a Rectangle exactly the size of the figure, which you can use to set the background color and transparency of the figures. Likewise, each Axes bounding box (the standard white box with black edges in the typical matplotlib plot, has a Rectangle instance that determines the color, transparency, and other properties of the Axes. These instances are stored as member variables Figure.patch and Axes.patch (“Patch” is a name inherited from MATLAB, and is a 2D “patch” of color on the figure, e.g., rectangles, circles and polygons). Every matplotlib Artist has the following properties
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha</td>
<td>The transparency - a scalar from 0-1</td>
</tr>
<tr>
<td>animated</td>
<td>A boolean that is used to facilitate animated drawing</td>
</tr>
<tr>
<td>axes</td>
<td>The axes that the Artist lives in, possibly None</td>
</tr>
<tr>
<td>clip_box</td>
<td>The bounding box that clips the Artist</td>
</tr>
<tr>
<td>clip_on</td>
<td>Whether clipping is enabled</td>
</tr>
<tr>
<td>clip_path</td>
<td>The path the artist is clipped to</td>
</tr>
<tr>
<td>contains</td>
<td>A picking function to test whether the artist contains the pick point</td>
</tr>
<tr>
<td>figure</td>
<td>The figure instance the artist lives in, possibly None</td>
</tr>
<tr>
<td>label</td>
<td>A text label (e.g., for auto-labeling)</td>
</tr>
<tr>
<td>picker</td>
<td>A python object that controls object picking</td>
</tr>
<tr>
<td>transform</td>
<td>The transformation</td>
</tr>
<tr>
<td>visible</td>
<td>A boolean whether the artist should be drawn</td>
</tr>
<tr>
<td>zorder</td>
<td>A number which determines the drawing order</td>
</tr>
<tr>
<td>rasterized</td>
<td>Boolean; Turns vectors into raster graphics (for compression &amp; eps transparency)</td>
</tr>
</tbody>
</table>

Each of the properties is accessed with an old-fashioned setter or getter (yes we know this irritates Pythonistas and we plan to support direct access via properties or traits but it hasn’t been done yet). For example, to multiply the current alpha by a half:

```python
a = o.get_alpha()
o.set_alpha(0.5*a)
```

If you want to set a number of properties at once, you can also use the `set` method with keyword arguments. For example:

```python
o.set(alpha=0.5, zorder=2)
```

If you are working interactively at the python shell, a handy way to inspect the Artist properties is to use the `matplotlib.artist.getp()` function (simply `getp()` in pyplot), which lists the properties and their values. This works for classes derived from Artist as well, e.g., `Figure` and `Rectangle`. Here are the `Figure` rectangle properties mentioned above:

```python
In [149]: matplotlib.artist.getp(fig.patch)
    alpha = 1.0
    animated = False
    antialiased or aa = True
    axes = None
    clip_box = None
    clip_on = False
    clip_path = None
    contains = None
    edgecolor or ec = w
    facecolor or fc = 0.75
    figure = Figure(8.125x6.125)
    fill = 1
    hatch = None
    height = 1
    label =
    linewidth or lw = 1.0
    picker = None
    transform = <Affine object at 0x134cca84>
```

(continues on next page)
verts = ((0, 0), (0, 1), (1, 1), (1, 0))
visible = True
width = 1
window_extent = <Bbox object at 0x134acbcc>
x = 0
y = 0
zorder = 1

The docstrings for all of the classes also contain the Artist properties, so you can consult the interactive “help” or the matplotlib.artist for a listing of properties for a given object.

Object containers

Now that we know how to inspect and set the properties of a given object we want to configure, we need to know how to get at that object. As mentioned in the introduction, there are two kinds of objects: primitives and containers. The primitives are usually the things you want to configure (the font of a Text instance, the width of a Line2D) although the containers also have some properties as well - for example the AxesArtist is a container that contains many of the primitives in your plot, but it also has properties like the xscale to control whether the xaxis is 'linear' or 'log'. In this section we’ll review where the various container objects store the Artists that you want to get at.

Figure container

The top level container Artist is the matplotlib.figure.Figure, and it contains everything in the figure. The background of the figure is a Rectangle which is stored in Figure.patch. As you add subplots (add_subplot()) and axes (add_axes()) to the figure these will be appended to the Figure.axes. These are also returned by the methods that create them:

```
In [156]: fig = plt.figure()
In [157]: ax1 = fig.add_subplot(211)
In [158]: ax2 = fig.add_axes([0.1, 0.1, 0.7, 0.3])
In [159]: ax1
Out[159]: <matplotlib.axes.Subplot instance at 0xd54b26c>
```

```
In [160]: print(fig.axes)
[[<matplotlib.axes.Subplot instance at 0xd54b26c>,
  <matplotlib.axes.Axes instance at 0xd3f0b2c>]]
```

Because the figure maintains the concept of the "current axes" (see Figure.gca and Figure.sca) to support the pylab/pyplot state machine, you should not insert or remove axes directly from the axes list, but rather use the add_subplot() and add_axes() methods to insert, and the delaxes() method to delete. You are free however, to iterate over the list of axes or index into it to get access to Axes instances you want to customize. Here is an example which turns all the axes grids on:

```
for ax in fig.axes:
    ax.grid(True)
```
The figure also has its own text, lines, patches and images, which you can use to add primitives directly. The default coordinate system for the Figure will simply be in pixels (which is not usually what you want) but you can control this by setting the transform property of the Artist you are adding to the figure.

More useful is “figure coordinates” where (0, 0) is the bottom-left of the figure and (1, 1) is the top-right of the figure which you can obtain by setting the Artist transform to `fig.transFigure`:

```python
import matplotlib.lines as lines

fig = plt.figure()

l1 = lines.Line2D([0, 1], [0, 1], transform=fig.transFigure, figure=fig)
l2 = lines.Line2D([0, 1], [1, 0], transform=fig.transFigure, figure=fig)
fig.lines.extend([l1, l2])

plt.show()
```

Here is a summary of the Artists the figure contains
<table>
<thead>
<tr>
<th>Figure attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>axes</td>
<td>A list of Axes instances (includes Subplot)</td>
</tr>
<tr>
<td>patch</td>
<td>The Rectangle background</td>
</tr>
<tr>
<td>images</td>
<td>A list of FigureImage patches - useful for raw pixel display</td>
</tr>
<tr>
<td>legends</td>
<td>A list of Figure Legend instances (different from Axes.legends)</td>
</tr>
<tr>
<td>lines</td>
<td>A list of Figure Line2D instances (rarely used, see Axes.lines)</td>
</tr>
<tr>
<td>patches</td>
<td>A list of Figure patches (rarely used, see Axes.patches)</td>
</tr>
<tr>
<td>texts</td>
<td>A list Figure Text instances</td>
</tr>
</tbody>
</table>

**Axes container**

The `matplotlib.axes.Axes` is the center of the matplotlib universe – it contains the vast majority of all the Artists used in a figure with many helper methods to create and add these Artists to itself, as well as helper methods to access and customize the Artists it contains. Like the `Figure`, it contains a `Patch` patch which is a `Rectangle` for Cartesian coordinates and a `Circle` for polar coordinates; this patch determines the shape, background and border of the plotting region:

```python
ax = fig.add_subplot(111)
rect = ax.patch  # a Rectangle instance
rect.set_facecolor('green')
```

When you call a plotting method, e.g., the canonical `plot()` and pass in arrays or lists of values, the method will create a `matplotlib.lines.Line2D()` instance, update the line with all the Line2D properties passed as keyword arguments, add the line to the `Axes.lines` container, and returns it to you:

```python
In [213]: x, y = np.random.rand(2, 100)
In [214]: line, = ax.plot(x, y, '-', color='blue', linewidth=2)
```

`plot` returns a list of lines because you can pass in multiple x, y pairs to plot, and we are unpacking the first element of the length one list into the line variable. The line has been added to the `Axes.lines` list:

```python
In [229]: print(ax.lines)
[<matplotlib.lines.Line2D instance at 0xd378b0c>]
```

Similarly, methods that create patches, like `bar()` creates a list of rectangles, will add the patches to the `Axes.patches` list:

```python
In [233]: n, bins, rectangles = ax.hist(np.random.randn(1000), 50)
In [234]: rectangles
Out[234]: <a list of 50 Patch objects>
In [235]: print(len(ax.patches))
```

You should not add objects directly to the `Axes.lines` or `Axes.patches` lists unless you know exactly what you are doing, because the `Axes` needs to do a few things when it creates and adds an object. It sets the figure and axes property of the `Artist`, as well as the default `Axes` transformation (unless a transformation is set). It also inspects the data contained in the `Artist` to update the data structures controlling auto-scaling, so that the view limits can be
adjusted to contain the plotted data. You can, nonetheless, create objects yourself and add them directly to the Axes using helper methods like `add_line()` and `add_patch()`. Here is an annotated interactive session illustrating what is going on:

```python
In [262]: fig, ax = plt.subplots()

# create a rectangle instance
In [263]: rect = matplotlib.patches.Rectangle((1, 1), width=5, height=12)

# by default the axes instance is None
In [264]: print(rect.axes)
None

# and the transformation instance is set to the "identity transform"
In [265]: print(rect.get_transform())
<Affine object at 0x13695544>

# now we add the Rectangle to the Axes
In [266]: ax.add_patch(rect)

# and notice that the ax.add_patch method has set the axes
# instance
In [267]: print(rect.axes)
Axes(0.125,0.1;0.775x0.8)

# and the transformation has been set too
In [268]: print(rect.get_transform())
<Affine object at 0x15009ca4>

# the default axes transformation is ax.transData
In [269]: print(ax.transData)
<Affine object at 0x15009ca4>

# notice that the xlims of the Axes have not been changed
In [270]: print(ax.get_xlim())
(0.0, 1.0)

# but the data limits have been updated to encompass the rectangle
In [271]: print(ax.dataLim.bounds)
(1.0, 1.0, 5.0, 12.0)

# we can manually invoke the auto-scaling machinery
In [272]: ax.autoscale_view()

# and now the xlim are updated to encompass the rectangle
In [273]: print(ax.get_xlim())
(1.0, 6.0)

# we have to manually force a figure draw
In [274]: ax.figure.canvas.draw()
```

There are many, many Axes helper methods for creating primitive Artists and adding them to their respective containers. The table below summarizes a small sampling of them, the kinds of Artist they create, and where they store them.
In addition to all of these Artists, the Axes contains two important Artist containers: the XAxis and YAxis, which handle the drawing of the ticks and labels. These are stored as instance variables xaxis and yaxis. The XAxis and YAxis containers will be detailed below, but note that the Axes contains many helper methods which forward calls on to the Axis instances so you often do not need to work with them directly unless you want to. For example, you can set the font color of the XAxis ticklabels using the Axes helper method:

```python
for label in ax.get_xticklabels():
    label.set_color('orange')
```

Below is a summary of the Artists that the Axes contains

<table>
<thead>
<tr>
<th>Axes attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>artists</td>
<td>A list of Artist instances</td>
</tr>
<tr>
<td>patch</td>
<td>Rectangle instance for Axes background</td>
</tr>

<tr>
<td>yaxis</td>
<td>matplotlib.axis.YAxis instance</td>
</tr>
</tbody>
</table>

**Axis containers**

The matplotlib.axis.Axis instances handle the drawing of the tick lines, the grid lines, the tick labels and the axis label. You can configure the left and right ticks separately for the y-axis, and the upper and lower ticks separately for the x-axis. The Axis also stores the data and view intervals used in auto-scaling, panning and zooming, as well as the Locator and Formatter instances which control where the ticks are placed and how they are represented as strings.

Each Axis object contains a label attribute (this is what pyplot modifies in calls to xlabel and ylabel) as well as a list of major and minor ticks. The ticks are axis.XTick and axis.YTick instances, which contain the actual line and text primitives that render the ticks and ticklabels. Because the ticks are dynamically created as needed (e.g., when panning and zooming), you should access the lists of major and minor ticks through their accessor methods axis.Axis.get_major_ticks and axis.Axis.get_minor_ticks. Although the ticks contain all the
primitives and will be covered below, Axis instances have accessor methods that return the tick lines, tick labels, tick locations etc.:

```python
fig, ax = plt.subplots()
axis = ax.xaxis
axis.get_ticklocs()
```

Out:

```python
array([0. , 0.2, 0.4, 0.6, 0.8, 1.])
```

```python
axis.get_ticklabels()
```

Out:

```python
[Text(0.0, 0, '0.0'), Text(0.2, 0, '0.2'), Text(0.4, 0, '0.4'), Text(0.6000000000000001, 0, '0.6'), Text(0.8, 0, '0.8'), Text(1.0, 0, '1.0')]
```

note there are twice as many ticklines as labels because by default there are tick lines at the top and bottom but only tick labels below the xaxis; however, this can be customized.

```python
axis.get_ticklines()
```

Out:
And with the above methods, you only get lists of major ticks back by default, but you can also ask for the minor ticks:

```python
axis.get_ticklabels(minor=True)
axis.get_ticklines(minor=True)
```

Out:

```python
<a list of 0 Line2D ticklines objects>
```

Here is a summary of some of the useful accessor methods of the `Axis` (these have corresponding setters where useful, such as `set_major_formatter()`):

<table>
<thead>
<tr>
<th>Accessor method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>get_scale</code></td>
<td>The scale of the axis, e.g., 'log' or 'linear'</td>
</tr>
<tr>
<td><code>get_view_interval</code></td>
<td>The interval instance of the axis view limits</td>
</tr>
<tr>
<td><code>get_data_interval</code></td>
<td>The interval instance of the axis data limits</td>
</tr>
<tr>
<td><code>get_gridlines</code></td>
<td>A list of grid lines for the <code>Axis</code></td>
</tr>
<tr>
<td><code>get_label</code></td>
<td>The axis label - a <code>Text</code> instance</td>
</tr>
<tr>
<td><code>get_ticklabels</code></td>
<td>A list of <code>Text</code> instances - keyword minor=True</td>
</tr>
<tr>
<td><code>get_ticklines</code></td>
<td>A list of <code>Line2D</code> instances - keyword minor=True</td>
</tr>
<tr>
<td><code>get_ticklocs</code></td>
<td>A list of <code>Tick</code> locations - keyword minor=True</td>
</tr>
<tr>
<td><code>get_major_locator</code></td>
<td>The <code>ticker.Locator</code> instance for major ticks</td>

<tr>
<td><code>get_minor_ticks</code></td>
<td>A list of <code>Tick</code> instances for minor ticks</td>
</tr>
<tr>
<td><code>grid</code></td>
<td>Turn the grid on or off for the major or minor ticks</td>
</tr>
</tbody>
</table>

Here is an example, not recommended for its beauty, which customizes the axes and tick properties:

```python
# plt.figure creates a matplotlib.figure.Figure instance
fig = plt.figure()
rect = fig.patch  # a rectangle instance
rect.set_facecolor('lightgoldenrodyellow')

ax1 = fig.add_axes([0.1, 0.3, 0.4, 0.4])
rect = ax1.patch
rect.set_facecolor('lightslategray')

for label in ax1.xaxis.get_ticklabels():
    # label is a Text instance
    label.set_color('red')
    label.set_rotation(45)
    label.set_fontsize(16)

for line in ax1.yaxis.get_ticklines():
    # line is a Line2D instance
    line.set_color('green')
```

(continues on next page)
line.set_markersize(25)
line.set_markeredgewidth(3)

plt.show()

Tick containers

The `matplotlib.axis.Tick` is the final container object in our descent from the `Figure` to the `Axes` to the `Axis` to the `Tick`. The `Tick` contains the tick and grid line instances, as well as the label instances for the upper and lower ticks. Each of these is accessible directly as an attribute of the `Tick`.

<table>
<thead>
<tr>
<th>Tick attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>tick1line</td>
<td>Line2D instance</td>
</tr>
<tr>
<td>tick2line</td>
<td>Line2D instance</td>
</tr>
<tr>
<td>gridline</td>
<td>Line2D instance</td>
</tr>
<tr>
<td>label1</td>
<td>Text instance</td>
</tr>
<tr>
<td>label2</td>
<td>Text instance</td>
</tr>
</tbody>
</table>

Here is an example which sets the formatter for the right side ticks with dollar signs and colors them green on the right side of the yaxis.
import numpy as np
import matplotlib.pyplot as plt

# Fixing random state for reproducibility
np.random.seed(19680801)

fig, ax = plt.subplots()
ax.plot(100*np.random.rand(20))

# Use automatic StrMethodFormatter
ax.yaxis.set_major_formatter('${x:1.2f}')

ax.yaxis.set_tick_params(which='major', labelcolor='green', labelleft=False, labelright=True)

plt.show()

2.2.2 Legend guide

Generating legends flexibly in Matplotlib.

This legend guide is an extension of the documentation available at `legend()` - please ensure you are familiar with contents of that documentation before proceeding with this guide.

This guide makes use of some common terms, which are documented here for clarity:
**legend entry** A legend is made up of one or more legend entries. An entry is made up of exactly one key and one label.

**legend key** The colored/patterned marker to the left of each legend label.

**legend label** The text which describes the handle represented by the key.

**legend handle** The original object which is used to generate an appropriate entry in the legend.

### Controlling the legend entries

Calling `legend()` with no arguments automatically fetches the legend handles and their associated labels. This functionality is equivalent to:

```python
handles, labels = ax.get_legend_handles_labels()
ax.legend(handles, labels)
```

The `get_legend_handles_labels()` function returns a list of handles/artists which exist on the Axes which can be used to generate entries for the resulting legend - it is worth noting however that not all artists can be added to a legend, at which point a "proxy" will have to be created (see Creating artists specifically for adding to the legend (aka. Proxy artists) for further details).

Those artists with an empty string as label or with a label starting with "_" will be ignored.

For full control of what is being added to the legend, it is common to pass the appropriate handles directly to `legend()`:

```python
line_up, = plt.plot([1, 2, 3], label='Line 2')
line_down, = plt.plot([3, 2, 1], label='Line 1')
plt.legend(handles=[line_up, line_down])
```

In some cases, it is not possible to set the label of the handle, so it is possible to pass through the list of labels to `legend()`:

```python
line_up, = plt.plot([1, 2, 3], label='Line 2')
line_down, = plt.plot([3, 2, 1], label='Line 1')
plt.legend([line_up, line_down], ['Line Up', 'Line Down'])
```

### Creating artists specifically for adding to the legend (aka. Proxy artists)

Not all handles can be turned into legend entries automatically, so it is often necessary to create an artist which can. Legend handles don’t have to exist on the Figure or Axes in order to be used.

Suppose we wanted to create a legend which has an entry for some data which is represented by a red color:

```python
import matplotlib.patches as mpatches
import matplotlib.pyplot as plt

red_patch = mpatches.Patch(color='red', label='The red data')
plt.legend(handles=[red_patch])
plt.show()
```
There are many supported legend handles. Instead of creating a patch of color we could have created a line with a marker:

```python
import matplotlib.pyplot as plt

# Make example data
import numpy as np
x = np.random.randn(10)

# Two different sets of data, that could come from different experiments.
ys1 = np.random.randn(10)
ys2 = np.random.randn(10)

# Plot the data
plt.plot(x, ys1, 'bo', label='data1')
plt.plot(x, ys2, 'g^', label='data2')

# Create a legend with the created handles
plt.legend(loc='upper left')
plt.show()
```

```python
import matplotlib.lines as mlines

blue_line = mlines.Line2D([], [], color='blue', marker='*',
                          markersize=15, label='Blue stars')

plt.legend(handles=[blue_line])

plt.show()
```
Legend location

The location of the legend can be specified by the keyword argument `loc`. Please see the documentation at `legend()` for more details.

The `bbox_to_anchor` keyword gives a great degree of control for manual legend placement. For example, if you want your axes legend located at the figure's top right-hand corner instead of the axes' corner, simply specify the corner's location and the coordinate system of that location:

```python
plt.legend(bbox_to_anchor=(1, 1),
           bbox_transform=plt.gcf().transFigure)
```

More examples of custom legend placement:

```python
plt.subplot(211)
plt.plot([1, 2, 3], label="test1")
plt.plot([3, 2, 1], label="test2")

# Place a legend above this subplot, expanding itself to
# fully use the given bounding box.
plt.legend(bbox_to_anchor=(0., 1.02, 1., .102), loc='lower left',
           ncol=2, mode="expand", borderaxespad=0.)
```

(continues on next page)
plt.subplot(223)
plt.plot([1, 2, 3], label="test1")
plt.plot([3, 2, 1], label="test2")
# Place a legend to the right of this smaller subplot.
plt.legend(bbox_to_anchor=(1.05, 1), loc='upper left', borderaxespad=0.)
plt.show()

Multiple legends on the same Axes

Sometimes it is more clear to split legend entries across multiple legends. Whilst the instinctive approach to doing this might be to call the `legend()` function multiple times, you will find that only one legend ever exists on the Axes. This has been done so that it is possible to call `legend()` repeatedly to update the legend to the latest handles on the Axes. To keep old legend instances, we must add them manually to the Axes:

```python
line1, = plt.plot([1, 2, 3], label="Line 1", linestyle='--')
line2, = plt.plot([3, 2, 1], label="Line 2", linewidth=4)

# Create a legend for the first line.
first_legend = plt.legend(handles=[line1], loc='upper right')
```

(continues on next page)
# Add the legend manually to the current Axes.
ax = plt.gca().add_artist(first_legend)

# Create another legend for the second line.
plt.legend(handles=[line2], loc='lower right')
plt.show()

## Legend Handlers

In order to create legend entries, handles are given as an argument to an appropriate `HandlerBase` subclass. The choice of handler subclass is determined by the following rules:

1. Update `get_legend_handler_map()` with the value in the `handler_map` keyword.
2. Check if the handle is in the newly created `handler_map`.
3. Check if the type of handle is in the newly created `handler_map`.
4. Check if any of the types in the handle’s mro is in the newly created `handler_map`.

For completeness, this logic is mostly implemented in `get_legend_handler()`. All of this flexibility means that we have the necessary hooks to implement custom handlers for our own type of legend key.
The simplest example of using custom handlers is to instantiate one of the existing `legend_handler.HandlerBase` subclasses. For the sake of simplicity, let’s choose `legend_handler.HandlerLine2D` which accepts a `numpoints` argument (numpoints is also a keyword on the `legend()` function for convenience). We can then pass the mapping of instance to Handler as a keyword to legend.

```python
from matplotlib.legend_handler import HandlerLine2D

line1, = plt.plot([3, 2, 1], marker='o', label='Line 1')
line2, = plt.plot([1, 2, 3], marker='o', label='Line 2')

plt.legend(handler_map={line1: HandlerLine2D(numpoints=4)})
```

As you can see, “Line 1” now has 4 marker points, where “Line 2” has 2 (the default). Try the above code, only change the map’s key from `line1` to `type(line1)`. Notice how now both `Line2D` instances get 4 markers.

Along with handlers for complex plot types such as errorbars, stem plots and histograms, the default `handler_map` has a special tuple handler (`legend_handler.HandlerTuple`) which simply plots the handles on top of one another for each item in the given tuple. The following example demonstrates combining two legend keys on top of one another:

```
from matplotlib.legend_handler import HandlerLine2D

line1, = plt.plot([3, 2, 1], marker='o', label='Line 1')
line2, = plt.plot([1, 2, 3], marker='o', label='Line 2')

plt.legend(handler_map={line1: HandlerLine2D(numpoints=4), line2: HandlerLine2D(numpoints=4)})
```
```python
from numpy.random import randn

z = randn(10)

red_dot, = plt.plot(z, "ro", markersize=15)
# Put a white cross over some of the data.
white_cross, = plt.plot(z[:5], "w+", markeredgewidth=3, markersize=15)

plt.legend([red_dot, (red_dot, white_cross)], ["Attr A", "Attr A+B"])
```

Out:

```
<matplotlib.legend.Legend object at 0x7f08b5991220>
```

The `legend_handler.HandlerTuple` class can also be used to assign several legend keys to the same entry:

```python
from matplotlib.legend_handler import HandlerLine2D, HandlerTuple

p1, = plt.plot([1, 2.5, 3], 'r-d')
p2, = plt.plot([3, 2, 1], 'k-o')

l = plt.legend([p1, p2], ['Two keys'], numpoints=1,
               handler_map={tuple: HandlerTuple(ndivide=None)})
```
Implementing a custom legend handler

A custom handler can be implemented to turn any handle into a legend key (handles don’t necessarily need to be matplotlib artists). The handler must implement a `legend_artist` method which returns a single artist for the legend to use. The required signature for `legend_artist` is documented at `legend_artist`.

```python
import matplotlib.patches as mpatches

class AnyObject:
    pass

class AnyObjectHandler:
    def legend_artist(self, legend, orig_handle, fontsize, handlebox):
        x0, y0 = handlebox.xdescent, handlebox.ydescent
        width, height = handlebox.width, handlebox.height
        patch = mpatches.Rectangle([x0, y0], width, height, facecolor='red',
                                   edgecolor='black', hatch='xx', lw=3,
                                   transform=handlebox.get_transform())
        handlebox.add_artist(patch)
        return patch
```

(continues on next page)
```
plt.legend([AnyObject()], ['My first handler'],
handler_map={AnyObject: AnyObjectHandler()})
```

Out:

```
<matplotlib.legend.Legend object at 0x7f08b482bc70>
```

Alternatively, had we wanted to globally accept `AnyObject` instances without needing to manually set the `handler_map` keyword all the time, we could have registered the new handler with:

```
from matplotlib.legend import Legend
Legend.update_default_handler_map({AnyObject: AnyObjectHandler()})
```

Whilst the power here is clear, remember that there are already many handlers implemented and what you want to achieve may already be easily possible with existing classes. For example, to produce elliptical legend keys, rather than rectangular ones:

```
from matplotlib.legend_handler import HandlerPatch

class HandlerEllipse(HandlerPatch):
```

(continues on next page)
def create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans):
    center = 0.5 * width - 0.5 * xdescent, 0.5 * height - 0.5 * ydescent
    p = mpatches.Ellipse(xy=center, width=width + xdescent,
                          height=height + ydescent)
    self.update_prop(p, orig_handle, legend)
    p.set_transform(trans)
    return [p]

c = mpatches.Circle((0.5, 0.5), 0.25, facecolor="green",
                      edgecolor="red", linewidth=3)
plt.gca().add_patch(c)
plt.legend([c], ["An ellipse, not a rectangle"],
           handler_map={mpatches.Circle: HandlerEllipse()})

Out:
<matplotlib.legend.Legend object at 0x7f08b309d250>

Total running time of the script: ( 0 minutes 2.738 seconds)
2.2.3 Styling with cycler

Demo of custom property-cycle settings to control colors and other style properties for multi-line plots.

**Note:** More complete documentation of the `cycler` API can be found here.

This example demonstrates two different APIs:

1. Setting the rc parameter specifying the default property cycle. This affects all subsequent axes (but not axes already created).
2. Setting the property cycle for a single pair of axes.

```
from cycler import cycler
import numpy as np
import matplotlib.pyplot as plt

First we'll generate some sample data, in this case, four offset sine curves.
```

```python
x = np.linspace(0, 2 * np.pi, 50)
offsets = np.linspace(0, 2 * np.pi, 4, endpoint=False)
yy = np.transpose([np.sin(x + phi) for phi in offsets])
```

Now `yy` has shape

```
print(yy.shape)
```

Out:

```
(50, 4)
```

So `yy[:, i]` will give you the `i`-th offset sine curve. Let’s set the default `prop_cycle` using `matplotlib.pyplot.rc()`. We’ll combine a color cycler and a linestyle cycler by adding (+) two cycler’s together. See the bottom of this tutorial for more information about combining different cyclers.

```
default_cycler = (cycler(color=['r', 'g', 'b', 'y']) +
                 cycler(linestyle=['-', '--', ':', '-.']))
plt.rc('lines', linewidth=4)
plt.rc('axes', prop_cycle=default_cycler)
```

Now we’ll generate a figure with two axes, one on top of the other. On the first axis, we’ll plot with the default cycler. On the second axis, we’ll set the `prop_cycle` using `matplotlib.axes.Axes.set_prop_cycle()`, which will only set the `prop_cycle` for this `matplotlib.axes.Axes` instance. We’ll use a second cycler that combines a color cycler and a linewidth cycler.

```
custom_cycler = (cycler(color=['c', 'm', 'y', 'k']) +
                 cycler(lw=[1, 2, 3, 4]))
```

```
fig, (ax0, ax1) = plt.subplots(nrows=2)
ax0.plot(yy)
ax0.set_title('Set default color cycle to rgbby')
ax1.set_prop_cycle(custom_cycler)
ax1.plot(yy)
```

(continues on next page)
ax1.set_title('Set axes color cycle to cmyk')

# Add a bit more space between the two plots.
fig.subplots_adjust(hspace=0.3)
plt.show()

Setting prop_cycle in the matplotlibrc file or style files

Remember, a custom cycler can be set in your matplotlibrc file or a style file (style.mplstyle) under axes.prop_cycle:

axes.prop_cycle : cycler(color='bgrcmyk')

Cycling through multiple properties

You can add cyclers:

from cycler import cycler
c = (cycler(color=list('rgb')) +
    cycler(linestyle=['-', '--', '-.']))

(continues on next page)
for d in cc:
    print(d)

Results in:

{'color': 'r', 'linestyle': '-'}
{'color': 'g', 'linestyle': '--'}
{'color': 'b', 'linestyle': '-.'}

You can multiply cyclers:

```python
from cycler import cycler
cc = (cycler(color=list('rgb')) *
    cycler(linestyle=['-', '--', '-.']))
for d in cc:
    print(d)
```

Results in:

```python
dict
{'color': 'r', 'linestyle': '-'}
dict
{'color': 'r', 'linestyle': '--'}
dict
{'color': 'r', 'linestyle': '-.'}
dict
{'color': 'g', 'linestyle': '-'}
dict
{'color': 'g', 'linestyle': '--'}
dict
{'color': 'g', 'linestyle': '-.'}
dict
{'color': 'b', 'linestyle': '-'}
dict
{'color': 'b', 'linestyle': '--'}
dict
{'color': 'b', 'linestyle': '-.'}
```

### 2.2.4 Customizing Figure Layouts Using GridSpec and Other Functions

How to create grid-shaped combinations of axes.

- **subplots()** Perhaps the primary function used to create figures and axes. It’s also similar to `matplotlib.pyplot.subplot()`, but creates and places all axes on the figure at once. See also `matplotlib.figure.Figure.subplots`.

- **GridSpec** Specifies the geometry of the grid that a subplot will be placed. The number of rows and number of columns of the grid need to be set. Optionally, the subplot layout parameters (e.g., left, right, etc.) can be tuned.

- **SubplotSpec** Specifies the location of the subplot in the given GridSpec.

- **subplot2grid()** A helper function that is similar to `subplot()`, but uses 0-based indexing and let subplot to occupy multiple cells. This function is not covered in this tutorial.

```python
import matplotlib
import matplotlib.pyplot as plt
import matplotlib.gridspec as gridspec
```
Basic Quickstart Guide

These first two examples show how to create a basic 2-by-2 grid using both `subplots()` and `gridspec`.

Using `subplots()` is quite simple. It returns a `Figure` instance and an array of `Axes` objects.

```python
fig1, f1_axes = plt.subplots(nrows=2, ncols=2, constrained_layout=True)
```

For a simple use case such as this, `gridspec` is perhaps overly verbose. You have to create the figure and `GridSpec` instance separately, then pass elements of gridspec instance to the `add_subplot()` method to create the axes objects. The elements of the gridspec are accessed in generally the same manner as numpy arrays.

```python
fig2 = plt.figure(constrained_layout=True)
spec2 = gridspec.GridSpec(nrows=2, ncols=2, figure=fig2)
f2_ax1 = fig2.add_subplot(spec2[0, 0])
f2_ax2 = fig2.add_subplot(spec2[0, 1])
f2_ax3 = fig2.add_subplot(spec2[1, 0])
f2_ax4 = fig2.add_subplot(spec2[1, 1])
```
The power of gridspec comes in being able to create subplots that span rows and columns. Note the NumPy slice syntax for selecting the part of the gridspec each subplot will occupy.

Note that we have also used the convenience method `Figure.add_gridspec` instead of `gridspec.GridSpec`, potentially saving the user an import, and keeping the namespace cleaner.

```python
def3 = plt.figure(constrained_layout=True)
gs = fig3.add_gridspec(3, 3)
f3_ax1 = fig3.add_subplot(gs[0, :])
f3_ax1.set_title('gs[0, :]')
f3_ax2 = fig3.add_subplot(gs[1, :-1])
f3_ax2.set_title('gs[1, :-1]')
f3_ax3 = fig3.add_subplot(gs[1:, -1])
f3_ax3.set_title('gs[1:, -1]')
f3_ax4 = fig3.add_subplot(gs[-1, 0])
f3_ax4.set_title('gs[-1, 0]')
f3_ax5 = fig3.add_subplot(gs[-1, -2])
f3_ax5.set_title('gs[-1, -2]')```
gridspec is also indispensable for creating subplots of different widths via a couple of methods.

The method shown here is similar to the one above and initializes a uniform grid specification, and then uses numpy indexing and slices to allocate multiple "cells" for a given subplot.

```python
fig4 = plt.figure(constrained_layout=True)
spec4 = fig4.add_gridspec(ncols=2, nrows=2)
anno_opts = dict(xy=(0.5, 0.5), xycoords='axes fraction', va='center', ha='center')

f4_ax1 = fig4.add_subplot(spec4[0, 0])
f4_ax1.annotate('GridSpec[0, 0]', **anno_opts)
fig4.add_subplot(spec4[0, 1]).annotate('GridSpec[0, 1:]', **anno_opts)
fig4.add_subplot(spec4[1, 0]).annotate('GridSpec[1:, 0]', **anno_opts)
fig4.add_subplot(spec4[1, 1]).annotate('GridSpec[1:, 1]', **anno_opts)
```
Another option is to use the $\text{width\_ratios}$ and $\text{height\_ratios}$ parameters. These keyword arguments are lists of numbers. Note that absolute values are meaningless, only their relative ratios matter. That means that $\text{width\_ratios}=[2, 4, 8]$ is equivalent to $\text{width\_ratios}=[1, 2, 4]$ within equally wide figures. For the sake of demonstration, we’ll blindly create the axes within for loops since we won’t need them later.

```python
fig5 = plt.figure(constrained_layout=True)
widths = [2, 3, 1.5]
heights = [1, 3, 2]
spec5 = fig5.add_gridspec(ncols=3, nrows=3, width_ratios=widths,
                           height_ratios=heights)
for row in range(3):
    for col in range(3):
        ax = fig5.add_subplot(spec5[row, col])
        label = 'Width: {}
               Height: {}'.format(widths[col], heights[row])
        ax.annotate(label, (0.1, 0.5), xycoords='axes fraction', va='center')
```
Learning to use `width_ratios` and `height_ratios` is particularly useful since the top-level function `subplots()` accepts them within the `gridspec_kw` parameter. For that matter, any parameter accepted by `GridSpec` can be passed to `subplots()` via the `gridspec_kw` parameter. This example recreates the previous figure without directly using a gridspec instance.

```python
gs_kw = dict(width_ratios=widths, height_ratios=heights)
fig6, f6_axes = plt.subplots(ncols=3, nrows=3, constrained_layout=True, gridspec_kw=gs_kw)
for r, row in enumerate(f6_axes):
    for c, ax in enumerate(row):
        label = 'Width: {}
Height: {}'.format(widths[c], heights[r])
        ax.annotate(label, (0.1, 0.5), xycoords='axes fraction', va='center')
```
The `subplots` and `get_gridspec` methods can be combined since it is sometimes more convenient to make most of the subplots using `subplots` and then remove some and combine them. Here we create a layout with the bottom two axes in the last column combined.

```python
fig7, f7_axs = plt.subplots(ncols=3, nrows=3)
gs = f7_axs[1, 2].get_gridspec()
# remove the underlying axes
for ax in f7_axs[1:, -1]:
    ax.remove()
axbig = fig7.add_subplot(gs[1:, -1])
axbig.annotate('Big Axes
GridSpec[1:, -1]', (0.1, 0.5),
               xycoords='axes fraction', va='center')
fig7.tight_layout()
```
Fine Adjustments to a Gridspec Layout

When a GridSpec is explicitly used, you can adjust the layout parameters of subplots that are created from the GridSpec. Note this option is not compatible with `constrained_layout` or `Figure.tight_layout` which both adjust subplot sizes to fill the figure.

```python
fig8 = plt.figure(constrained_layout=False)
gs1 = fig8.add_gridspec(nrows=3, ncols=3, left=0.05, right=0.48, wspace=0.05)
f8_ax1 = fig8.add_subplot(gs1[:-1, :])
f8_ax2 = fig8.add_subplot(gs1[-1, :-1])
f8_ax3 = fig8.add_subplot(gs1[-1, -1])
```
This is similar to \texttt{subplots_adjust()}, but it only affects the subplots that are created from the given GridSpec.

For example, compare the left and right sides of this figure:

```python
fig9 = plt.figure(constrained_layout=False)
gs1 = fig9.add_gridspec(nrows=3, ncols=3, left=0.05, right=0.48, wspace=0.05)
f9_ax1 = fig9.add_subplot(gs1[:, :])
f9_ax2 = fig9.add_subplot(gs1[-1, :-1])
f9_ax3 = fig9.add_subplot(gs1[-1, -1])

fig9 = plt.figure(constrained_layout=False)
gs2 = fig9.add_gridspec(nrows=3, ncols=3, left=0.55, right=0.98, hspace=0.05)
f9_ax4 = fig9.add_subplot(gs2[:, :-1])
f9_ax5 = fig9.add_subplot(gs2[-1, :-1])
f9_ax6 = fig9.add_subplot(gs2[-1, -1])
```
GridSpec using SubplotSpec

You can create GridSpec from the `SubplotSpec`, in which case its layout parameters are set to that of the location of the given SubplotSpec.

Note this is also available from the more verbose `gridspec.GridSpecFromSubplotSpec`.

```python
fig10 = plt.figure(constrained_layout=True)
gs0 = fig10.add_gridspec(1, 2)

gs00 = gs0[0].subgridspec(2, 3)
gs01 = gs0[1].subgridspec(3, 2)

for a in range(2):
    for b in range(3):
        fig10.add_subplot(gs00[a, b])
        fig10.add_subplot(gs01[b, a])
```
A Complex Nested GridSpec using SubplotSpec

Here's a more sophisticated example of nested GridSpec where we put a box around each cell of the outer 4x4 grid, by hiding appropriate spines in each of the inner 3x3 grids.

```python
import numpy as np

def squiggle_xy(a, b, c, d, i=np.arange(0.0, 2*np.pi, 0.05)):
    return np.sin(i*a)*np.cos(i*b), np.sin(i*c)*np.cos(i*d)

fig11 = plt.figure(figsize=(8, 8), constrained_layout=False)
outer_grid = fig11.add_gridspec(4, 4, wspace=0, hspace=0)

for a in range(4):
    for b in range(4):
        inner_grid = outer_grid[a, b].subgridspec(3, 3, wspace=0, hspace=0)
        axs = inner_grid.subplots()  # Create all subplots for the inner grid.
        for (c, d), ax in np.ndenumerate(axs):
            ax.plot(*squiggle_xy(a + 1, b + 1, c + 1, d + 1))
            ax.set(xticks=[], yticks=[])  # (continues on next page)
```

(continues on next page)
# show only the outside spines
for ax in fig11.get_axes():
    ax.spines['top'].set_visible(ax.is_first_row())
    ax.spines['bottom'].set_visible(ax.is_last_row())
    ax.spines['left'].set_visible(ax.is_first_col())
    ax.spines['right'].set_visible(ax.is_last_col())

plt.show()

### 2.2.5 Constrained Layout Guide

How to use constrained-layout to fit plots within your figure cleanly.

*constrained_layout* automatically adjusts subplots and decorations like legends and colorbars so that they fit in the figure window while still preserving, as best they can, the logical layout requested by the user.

*constrained_layout* is similar to *tight_layout*, but uses a constraint solver to determine the size of axes that allows them to fit.

*constrained_layout* needs to be activated before any axes are added to a figure. Two ways of doing so are

- using the respective argument to *subplots() or figure*, e.g.:
  ```python
  plt.subplots(constrained_layout=True)
  ```
- activate it via *rcParams*, like:
  ```python
  plt.rcParams['figure.constrained_layout.use'] = True
  ```

Those are described in detail throughout the following sections.

**Warning:** Currently Constrained Layout is experimental. The behaviour and API are subject to change, or the whole functionality may be removed without a deprecation period. If you require your plots to be absolutely reproducible, get the Axes positions after running Constrained Layout and use `ax.set_position()` in your code with constrained_layout=False.

**Simple Example**

In Matplotlib, the location of axes (including subplots) are specified in normalized figure coordinates. It can happen that your axis labels or titles (or sometimes even ticklabels) go outside the figure area, and are thus clipped.

```
import matplotlib.pyplot as plt
import matplotlib.colors as mcolors
import matplotlib.gridspec as gridspec
import numpy as np
```
plt.rcParams['savefig.facecolor'] = "0.8"
plt.rcParams['figure.figsize'] = 4.5, 4.
plt.rcParams['figure.max_open_warning'] = 50

def example_plot(ax, fontsize=12, hide_labels=False):
    ax.plot([1, 2])
    axlocator_params(nbins=3)
    if hide_labels:
        ax.set_xticklabels([])
        ax.set_yticklabels([])
    else:
        ax.set_xlabel('x-label', fontsize=fontsize)
        ax.set_ylabel('y-label', fontsize=fontsize)
        ax.set_title('Title', fontsize=fontsize)

fig, ax = plt.subplots()
example_plot(ax)

To prevent this, the location of axes needs to be adjusted. For subplots, this can be done
by adjusting the subplot params *(Move the edge of an axes to make room for tick labels)*.
However, specifying your figure with the *constrained_layout=True* kwarg will do the adjusting
automatically:

fig, ax = plt.subplots(constrained_layout=True)
example_plot(ax, fontsize=24)
When you have multiple subplots, often you see labels of different axes overlapping each other.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=False)
for ax in axs.flat:
    example_plot(ax)
```
Specifying `constrained_layout=True` in the call to `plt.subplots` causes the layout to be properly constrained.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax)
```
Colorbars

If you create a colorbar with `Figure.colorbar`, you need to make room for it. `constrained_layout` does this automatically. Note that if you specify `use_gridspec=True` it will be ignored because this option is made for improving the layout via `tight_layout`.

**Note:** For the `pcolormesh` kwargs (`pc_kwargs`) we use a dictionary. Below we will assign one colorbar to a number of axes each containing a `ScalarMappable`; specifying the norm and colormap ensures the colorbar is accurate for all the axes.

```python
arr = np.arange(100).reshape((10, 10))
norm = mcolors.Normalize(vmin=0., vmax=100.)
# see note above: this makes all pcolormesh calls consistent:
pc_kwargs = {'rasterized': True, 'cmap': 'viridis', 'norm': norm}
fig, ax = plt.subplots(figsize=(4, 4), constrained_layout=True)
im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=ax, shrink=0.6)
```
If you specify a list of axes (or other iterable container) to the `ax` argument of `colorbar`, `constrained_layout` will take space from the specified axes.

```python
fig, axs = plt.subplots(2, 2, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
```
If you specify a list of axes from inside a grid of axes, the colorbar will steal space appropriately, and leave a gap, but all subplots will still be the same size.

```python
fig, axs = plt.subplots(3, 3, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[:, 1], shrink=0.8)
fig.colorbar(im, ax=axs[:, -1], shrink=0.6)
```
Note that there is a bit of a subtlety when specifying a single axes as the parent. In the following, it might be desirable and expected for the colorbars to line up, but they don’t because the colorbar paired with the bottom axes is tied to the subplotspec of the axes, and hence shrinks when the gridspec-level colorbar is added.

```python
fig, axs = plt.subplots(3, 1, figsize=(4, 4), constrained_layout=True)
for ax in axs[:2]:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[:2], shrink=0.6)
im = axs[2].pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[2], shrink=0.6)
```
The API to make a single-axes behave like a list of axes is to specify it as a list (or other iterable container), as below:

```python
fig, axs = plt.subplots(3, 1, figsize=(4, 4), constrained_layout=True)
for ax in axs[:2]:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[:2], shrink=0.6)
im = axs[2].pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=[axs[2]], shrink=0.6)
```
constrained_layout can also make room for `suptitle`.

```python
fig, axs = plt.subplots(2, 2, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
fig.suptitle('Big Suptitle')
```
Legends

Legends can be placed outside of their parent axis. Constrained-layout is designed to handle this for `Axes.legend()`. However, constrained-layout does not handle legends being created via `Figure.legend()` (yet).

```python
fig, ax = plt.subplots(constrained_layout=True)
ax.plot(np.arange(10), label='This is a plot')
ax.legend(loc='center left', bbox_to_anchor=(0.8, 0.5))
```
However, this will steal space from a subplot layout:

```python
def plot():
    fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)
    axs[0].plot(np.arange(10))
    axs[1].plot(np.arange(10), label='This is a plot')
    axs[1].legend(loc='center left', bbox_to_anchor=(0.8, 0.5))

plot()
```

In order for a legend or other artist to not steal space from the subplot layout, we can use `leg.set_in_layout(False)`. Of course this can mean the legend ends up cropped, but can be useful if the plot is subsequently called with `fig.savefig('outname.png', bbox_inches='tight')`. Note,
however, that the legend’s `get_in_layout` status will have to be toggled again to make the saved file work, and we must manually trigger a draw if we want `constrained_layout` to adjust the size of the axes before printing.

```python
fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)
axs[0].plot(np.arange(10))
axs[1].plot(np.arange(10), label='This is a plot')
leg = axs[1].legend(loc='center left', bbox_to_anchor=(0.8, 0.5))
leg.set_in_layout(False)
# before we turn it off when printing....
fig.canvas.draw()
# we want the legend included in the bbox_inches='tight' calcs.
leg.set_in_layout(True)
# we don’t want the layout to change at this point.
fig.set_constrained_layout(False)
fig.savefig('CL01.png', bbox_inches='tight', dpi=100)
```

The saved file looks like:

A better way to get around this awkwardness is to simply use the legend method provided by `Figure.legend`:

```python
fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)
axs[0].plot(np.arange(10))
lines = axs[1].plot(np.arange(10), label='This is a plot')
labels = [l.get_label() for l in lines]
leg = fig.legend(lines, labels, loc='center left',
```
bbox_to_anchor=(0.8, 0.5), bbox_transform=axs[1].transAxes)
fig.savefig('CL02.png', bbox_inches='tight', dpi=100)

The saved file looks like:

Padding and Spacing

For constrained_layout, we have implemented a padding around the edge of each axes. This padding sets the distance from the edge of the plot, and the minimum distance between adjacent plots. It is specified in inches by the keyword arguments w_pad and h_pad to the function `set_constrained_layout_pads`:

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax, hide_labels=True)
fig.set_constrained_layout_pads(w_pad=4/72, h_pad=4/72, hspace=0, wspace=0)
```

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax, hide_labels=True)
fig.set_constrained_layout_pads(w_pad=2/72, h_pad=2/72, hspace=0, wspace=0)
```
Spacing between subplots is set by `wspace` and `hspace`. There are specified as a fraction of the size of the subplot group as a whole. If the size of the figure is changed, then these spaces change in proportion. Note in the below how the space at the edges doesn’t change from the above, but the space between subplots does.
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax, hide_labels=True)
fig.set_constrained_layout_pads(w_pad=2/72, h_pad=2/72, hspace=0.2, wspace=0.2)

Spacing with colorbars

Colorbars will be placed `wspace` and `hsapce` apart from other subplots. The padding between the colorbar and the axis it is attached to will never be less than `w_pad` (for a vertical colorbar) or `h_pad` (for a horizontal colorbar). Note the use of the `pad` kwarg here in the `colorbar` call. It defaults to 0.02 of the size of the axis it is attached to.

fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    pc = ax.pcolormesh(arr, **pc_kwargs)
    fig.colorbar(pc, ax=ax, shrink=0.6, pad=0)
    ax.set_xticklabels('')
    ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=2/72, h_pad=2/72, hspace=0.2, wspace=0.2)
In the above example, the colorbar will not ever be closer than 2 pts to the plot, but if we want it a bit further away, we can specify its value for pad to be non-zero.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    pc = ax.pcolormesh(arr, **pc_kwargs)
    fig.colorbar(pc, ax=ax, shrink=0.6, pad=0.05)
    ax.set_xticklabels('')
    ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=2/72, h_pad=2/72, hspace=0.2, wspace=0.2)
```
There are five `rcParams` that can be set, either in a script or in the `matplotlibrc` file. They all have the prefix `figure.constrained_layout`:

- **use**: Whether to use constrained_layout. Default is False
- **w_pad, h_pad**: Padding around axes objects. Float representing inches. Default is $3/72$. inches (3 pts)
- **wspace, hspace**: Space between subplot groups. Float representing a fraction of the subplot widths being separated. Default is 0.02.

```python
plt.rcParams['figure.constrained_layout.use'] = True
fig, axs = plt.subplots(2, 2, figsize=(3, 3))
for ax in axs.flat:
    example_plot(ax)
```
Use with GridSpec

constrained_layout is meant to be used with `subplots()` or `GridSpec()` and `add_subplot()`. Note that in what follows `constrained_layout=True`

```python
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1, figure=fig)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

text = example_plot(ax1)
text = example_plot(ax2)
```
More complicated gridspec layouts are possible. Note here we use the convenience functions `add_gridspec` and `subgridspec`.

```python
fig = plt.figure()

# First grid spec
gs0 = fig.add_gridspec(1, 2)

# First subplot of the first grid spec
gs1 = gs0[0].subgridspec(2, 1)
ax1 = fig.add_subplot(gs1[0])
example_plot(ax1)

# Second subplot of the first grid spec
ax2 = fig.add_subplot(gs1[1])
example_plot(ax2)

# Second grid spec
gs2 = gs0[1].subgridspec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
    example_plot(ax)
    ax.set_title("")
    ax.set_xlabel("x-label", fontsize=12)
```
Note that in the above the left and columns don’t have the same vertical extent. If we want the top and bottom of the two grids to line up then they need to be in the same gridspec:

```python
fig = plt.figure()
gs0 = fig.add_gridspec(6, 2)
ax1 = fig.add_subplot(gs0[:3, 0])
ax2 = fig.add_subplot(gs0[3:, 0])

example_plot(ax1)
example_plot(ax2)

ax = fig.add_subplot(gs0[0:2, 1])
example_plot(ax)
ax = fig.add_subplot(gs0[2:4, 1])
example_plot(ax)
ax = fig.add_subplot(gs0[4:, 1])
example_plot(ax)
```
This example uses two gridspecs to have the colorbar only pertain to one set of pcolors. Note how the left column is wider than the two right-hand columns because of this. Of course, if you wanted the subplots to be the same size you only needed one gridspec.

```python
def docomplicated(suptitle=None):
    fig = plt.figure()
    gs0 = fig.add_gridspec(1, 2, figure=fig, width_ratios=[1., 2.])
    gsl = gs0[0].subgridspec(2, 1)
    gsr = gs0[1].subgridspec(2, 2)

    for gs in gsl:
        ax = fig.add_subplot(gs)
        example_plot(ax)
        axs = []
    for gs in gsr:
        ax = fig.add_subplot(gs)
        pcm = ax.pcolormesh(arr, **pc_kwargs)
        ax.set_xlabel('x-label')
        ax.set_ylabel('y-label')
        ax.set_title('title')

        axs += [ax]
    fig.colorbar(pcm, ax=axs)

    if suptitle is not None:
        fig.suptitle(suptitle)

docomplicated()
```

2.2. Intermediate
Manually setting axes positions

There can be good reasons to manually set an axes position. A manual call to `set_position` will set the axes so `constrained_layout` has no effect on it anymore. (Note that `constrained_layout` still leaves the space for the axes that is moved).

```python
fig, axs = plt.subplots(1, 2)
example_plot(axs[0], fontsize=12)
axs[1].set_position([0.2, 0.2, 0.4, 0.4])
```
If you want an inset axes in data-space, you need to manually execute the layout using `fig.execute_constrained_layout()` call. The inset figure will then be properly positioned. However, it will not be properly positioned if the size of the figure is subsequently changed. Similarly, if the figure is printed to another backend, there may be slight changes of location due to small differences in how the backends render fonts.

```python
from matplotlib.transforms import Bbox

fig, axs = plt.subplots(1, 2)
e.example_plot(axs[0], fontsize=12)
fig.execute_constrained_layout()

# put into data-space:
bb_data_ax2 = Bbox.from_bounds(0.5, 1., 0.2, 0.4)
disp_coords = axs[0].transData.transform(bb_data_ax2)
fig_coords_ax2 = fig.transFigure.inverted().transform(disp_coords)
bb_ax2 = Bbox(fig_coords_ax2)
ax2 = fig.add_axes(bb_ax2)
```
Manually turning off `constrained_layout`

`constrained_layout` usually adjusts the axes positions on each draw of the figure. If you want to get the spacing provided by `constrained_layout` but not have it update, then do the initial draw and then call `fig.set_constrained_layout(False)`. This is potentially useful for animations where the tick labels may change length.

Note that `constrained_layout` is turned off for `ZOOM` and `PAN` GUI events for the backends that use the toolbar. This prevents the axes from changing position during zooming and panning.

Limitations

Incompatible functions

`constrained_layout` will not work on subplots created via `pyplot.subplot`. The reason is that each call to `pyplot.subplot` creates a separate `GridSpec` instance and `constrained_layout` uses (nested) gridspecs to carry out the layout. So the following fails to yield a nice layout:

```python
fig = plt.figure()
ax1 = plt.subplot(221)
ax2 = plt.subplot(223)
ax3 = plt.subplot(122)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
```
Of course that layout is possible using a gridspec:

```python
fig = plt.figure()
gs = fig.add_gridspec(2, 2)

ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
ax3 = fig.add_subplot(gs[:, 1])

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
```
Similarly, `subplot2grid()` doesn’t work for the same reason: each call creates a different parent gridspec.

```python
fig = plt.figure()

ax1 = plt.subplot2grid((3, 3), (0, 0))
ax2 = plt.subplot2grid((3, 3), (0, 1), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 0), colspan=2, rowspan=2)
ax4 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
```
The way to make this plot compatible with `constrained_layout` is again to use `gridspec` directly.

```python
fig = plt.figure()
gs = fig.add_gridspec(3, 3)

ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[0, 1:])
ax3 = fig.add_subplot(gs[1:, 0:2])
ax4 = fig.add_subplot(gs[1:, -1])

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
```
Other Caveats

- `constrained_layout` only considers ticklabels, axis labels, titles, and legends. Thus, other artists may be clipped and also may overlap.

- It assumes that the extra space needed for ticklabels, axis labels, and titles is independent of original location of axes. This is often true, but there are rare cases where it is not.

- There are small differences in how the backends handle rendering fonts, so the results will not be pixel-identical.

- An artist using axes coordinates that extend beyond the axes boundary will result in unusual layouts when added to an axes. This can be avoided by adding the artist directly to the Figure using `add_artist()`. See `ConnectionPatch` for an example.

Debugging

Constrained-layout can fail in somewhat unexpected ways. Because it uses a constraint solver the solver can find solutions that are mathematically correct, but that aren’t at all what the user wants. The usual failure mode is for all sizes to collapse to their smallest allowable value. If this happens, it is for one of two reasons:

1. There was not enough room for the elements you were requesting to draw.
2. There is a bug - in which case open an issue at https://github.com/matplotlib/matplotlib/issues.
If there is a bug, please report with a self-contained example that does not require outside data or dependencies (other than numpy).

Notes on the algorithm

The algorithm for the constraint is relatively straightforward, but has some complexity due to the complex ways we can layout a figure.

Figure layout

Figures are laid out in a hierarchy:

1. Figure: \( \text{fig} = \text{plt.figure()} \)
   a. Gridspec \( \text{gs0} = \text{gridspec.GridSpec}(1, 2, \text{figure=fig}) \)
      i. Subplotspec: \( \text{ss} = \text{gs}[0, 0] \)
         1. Axes: \( \text{ax0} = \text{fig.add_subplot(ss)} \)
      ii. Subplotspec: \( \text{ss} = \text{gs}[0, 1] \)
         1. Gridspec: \( \text{gsR} = \text{gridspec.GridSpecFromSubplotSpec}(2, 1, \text{ss}) \)
            • Subplotspec: \( \text{ss} = \text{gsR}[0, 0] \)
               - Axes: \( \text{axR0} = \text{fig.add_subplot(ss)} \)
            • Subplotspec: \( \text{ss} = \text{gsR}[1, 0] \)
               - Axes: \( \text{axR1} = \text{fig.add_subplot(ss)} \)

Each item has a layoutbox associated with it. The nesting of gridspecs created with `GridSpecFromSubplotSpec` can be arbitrarily deep.

Each Axes has two layoutboxes. The first one, ax._layoutbox represents the outside of the Axes and all its decorations (i.e. ticklabels, axis labels, etc.). The second layoutbox corresponds to the Axes’ ax.position, which sets where in the figure the spines are placed.

Why so many stacked containers? Ideally, all that would be needed are the Axes layout boxes. For the Gridspec case, a container is needed if the Gridspec is nested via `GridSpecFromSubplotSpec`. At the top level, it is desirable for symmetry, but it also makes room for `suptitle`.

For the Subplotspec/Axes case, Axes often have colorbars or other annotations that need to be packaged inside the Subplotspec, hence the need for the outer layer.

Simple case: one Axes

For a single Axes the layout is straight forward. The Figure and outer Gridspec layoutboxes coincide. The Subplotspec and Axes boxes also coincide because the Axes has no colorbar. Note the difference between the red pos box and the green ax box is set by the size of the decorations around the Axes.

In the code, this is accomplished by the entries in `do_constrained_layout()` like:

```python
ax._poslayoutbox.edit_left_margin_min(-bbox.x0 + pos.x0 + w_pad)
```
from matplotlib._layoutbox import plot_children

fig, ax = plt.subplots(constrained_layout=True)
example_plot(ax, fontsize=24)
plot_children(fig, fig._layoutbox, printit=False)

**Simple case: two Axes**

For this case, the Axes layoutboxes and the Subplotspec boxes still co-incide. However, because the decorations in the right-hand plot are so much smaller than the left-hand, so the right-hand layoutboxes are smaller.

The Subplotspec boxes are laid out in the code in the subroutine `arange_subplotspecs()`, which simply checks the subplotspecs in the code against one another and stacks them appropriately.

The two pos axes are lined up. Because they have the same minimum row, they are lined up at the top. Because they have the same maximum row they are lined up at the bottom. In the code this is accomplished via the calls to `layoutbox.align`. If there was more than one row, then the same horizontal alignment would occur between the rows.

The two pos axes are given the same width because the subplotspecs occupy the same number of columns. This is accomplished in the code where `dcols0` is compared to `dcolsC`. If they are equal, then their widths are constrained to be equal.

While it is a bit subtle in this case, note that the division between the Subplotspecs is *not* centered, but has been moved to the right to make space for the larger labels on the left-hand plot.
Two Axes and colorbar

Adding a colorbar makes it clear why the Subplotspec layoutboxes must be different from the axes layoutboxes. Here we see the left-hand subplotspec has more room to accommodate the colorbar, and that there are two green ax boxes inside the ss box.

Note that the width of the pos boxes is still the same because of the constraint on their widths because their subplotspecs occupy the same number of columns (one in this example).

The colorbar layout logic is contained in `make_axes` which calls `_constrained_layout. layoutcolorbarsingle()` for cbars attached to a single axes, and `_constrained_layout. layoutcolorbargridspec()` if the colorbar is associated with a gridspec.
This example shows the Subplotspec layoutboxes being made smaller by a colorbar layoutbox. The size of the colorbar layoutbox is set to be `shrink` smaller than the vertical extent of the `pos` layoutboxes in the gridspec, and it is made to be centered between those two points.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
plot_children(fig, fig._layoutbox, printit=False)
```
Uneven sized Axes

There are two ways to make axes have an uneven size in a Gridspec layout, either by specifying them to cross Gridspecs rows or columns, or by specifying width and height ratios.

The first method is used here. The constraint that makes the heights be correct is in the code where \texttt{drowsC < drows0} which in this case would be 1 is less than 2. So we constrain the height of the 1-row Axes to be less than half the height of the 2-row Axes.

\textbf{Note:} This algorithm can be wrong if the decorations attached to the smaller axes are very large, so there is an unaccounted-for edge case.

```python
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(2, 2, figure=fig)
ax = fig.add_subplot(gs[:, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[0, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[1, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
```
Height and width ratios are accommodated with the same part of the code with the smaller axes always constrained to be less in size than the larger.

```python
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(3, 2, figure=fig,
                      height_ratios=[1., 0.5, 1.5], width_ratios=[1.2, 0.8])
ax = fig.add_subplot(gs[:, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[2, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[0, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[1:, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
```
Empty gridspec slots

The final piece of the code that has not been explained is what happens if there is an empty gridspec opening. In that case a fake invisible axes is added and we proceed as before. The empty gridspec has no decorations, but the axes position in made the same size as the occupied Axes positions.

This is done at the start of `_constrained_layout.do_constrained_layout()` (hassubplotspec).

```python
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(1, 3, figure=fig)
ax = fig.add_subplot(gs[0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[-1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
plt.show()
```
Other notes

The layout is called only once. This is OK if the original layout was pretty close (which it should be in most cases). However, if the layout changes a lot from the default layout then the decorators can change size. In particular the x and ytick labels can change. If this happens, then we should probably call the whole routine twice.

**Total running time of the script:** (0 minutes 14.779 seconds)

2.2.6 Tight Layout guide

How to use tight-layout to fit plots within your figure cleanly.

*tight_layout* automatically adjusts subplot params so that the subplot(s) fits in to the figure area. This is an experimental feature and may not work for some cases. It only checks the extents of ticklabels, axis labels, and titles.

An alternative to *tight_layout* is *constrained_layout*.

Simple Example

In matplotlib, the location of axes (including subplots) are specified in normalized figure coordinates. It can happen that your axis labels or titles (or sometimes even ticklabels) go outside the figure area, and are thus clipped.
To prevent this, the location of axes needs to be adjusted. For subplots, this can be done by adjusting the subplot params (Move the edge of an axes to make room for tick labels). Matplotlib v1.1 introduced `Figure.tight_layout` that does this automatically for you.
Note that `matplotlib.pyplot.tight_layout()` will only adjust the subplot params when it is called. In order to perform this adjustment each time the figure is redrawn, you can call `fig.set_tight_layout(True)`, or, equivalently, set `rcParams["figure.autolayout"]` (default: False) to `True`.

When you have multiple subplots, often you see labels of different axes overlapping each other.

```python
plt.close('all')

fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
exmpole_plot(ax1)
exmpole_plot(ax2)
exmpole_plot(ax3)
exmpole_plot(ax4)
```
`tight_layout()` will also adjust spacing between subplots to minimize the overlaps.

```python
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
plt.tight_layout()
```
tight_layout() can take keyword arguments of pad, w_pad and h_pad. These control the extra padding around the figure border and between subplots. The pads are specified in fraction of fontsize.

```
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
plt.tight_layout(pad=0.4, w_pad=0.5, h_pad=1.0)
```
tight_layout() will work even if the sizes of subplots are different as far as their grid specification is compatible. In the example below, ax1 and ax2 are subplots of a 2x2 grid, while ax3 is of a 1x2 grid.

```python
plt.close('all')
fig = plt.figure()

ax1 = plt.subplot(221)
ax2 = plt.subplot(223)
ax3 = plt.subplot(122)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)

plt.tight_layout()
```
It works with subplots created with `subplot2grid()`. In general, subplots created from the gridspec (Customizing Figure Layouts Using GridSpec and Other Functions) will work.

```python
plt.close('all')
fig = plt.figure()

ax1 = plt.subplot2grid((3, 3), (0, 0))
ax2 = plt.subplot2grid((3, 3), (0, 1), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 0), colspan=2, rowspan=2)
ax4 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)

plt.tight_layout()
```
Although not thoroughly tested, it seems to work for subplots with aspect !="auto" (e.g., axes with images).

```python
arr = np.arange(100).reshape((10, 10))
plt.close('all')
fig = plt.figure(figsize=(5, 4))
ax = plt.subplot(111)
im = ax.imshow(arr, interpolation="none")
plt.tight_layout()
```
Caveats

- `tight_layout()` only considers ticklabels, axis labels, and titles. Thus, other artists may be clipped and also may overlap.
- It assumes that the extra space needed for ticklabels, axis labels, and titles is independent of original location of axes. This is often true, but there are rare cases where it is not.
- `pad=0` clips some of the texts by a few pixels. This may be a bug or a limitation of the current algorithm and it is not clear why it happens. Meanwhile, use of pad at least larger than 0.3 is recommended.

Use with GridSpec

GridSpec has its own `GridSpec.tight_layout` method (the pyplot api `pyplot.tight_layout` also works).

```python
import matplotlib.gridspec as gridspec

plt.close('all')
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
```

(continues on next page)
You may provide an optional `rect` parameter, which specifies the bounding box that the subplots will be fit inside. The coordinates must be in normalized figure coordinates and the default is (0, 0, 1, 1).

```python
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
example_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])
```
For example, this can be used for a figure with multiple gridspecs.

```python
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

dx = example_plot(ax1)
dx = example_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])

gs2 = gridspec.GridSpec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
    example_plot(ax)
    ax.set_title"
    ax.set_xlabel("x-label", fontsize=12)

ax.set_xlabel("x-label", fontsize=12)

gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)

# We may try to match the top and bottom of two grids ::
```
(continued from previous page)

top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.update(top=top, bottom=bottom)
gs2.update(top=top, bottom=bottom)
plt.show()

Out:

/root/matplotlib/tutorials/intermediate/tight_layout_guide.py:228: UserWarning: This figure includes Axes that are not compatible with tight_layout, so results might be incorrect.

While this should be mostly good enough, adjusting top and bottom may require adjustment of hspace also. To update hspace & vspace, we call GridSpec.tight_layout again with updated rect argument. Note that the rect argument specifies the area including the ticklabels, etc. Thus, we will increase the bottom (which is 0 for the normal case) by the difference between the bottom from above and the bottom of each gridspec. Same thing for the top.

fig = plt.gcf()
gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

(continues on next page)
example_plot(ax1)
example_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])

gs2 = gridspec.GridSpec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
    example_plot(ax)
    ax.set_title('"
    ax.set_xlabel('"

    ax.set_xlabel("x-label", fontsize=12)

gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)

top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.update(top=top, bottom=bottom)
gs2.update(top=top, bottom=bottom)

top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.tight_layout(fig, rect=[None, 0 + (bottom-gs1.bottom),
                           0.5, 1 - (gs1.top-top)])
gs2.tight_layout(fig, rect=[0.5, 0 + (bottom-gs2.bottom),
                           None, 1 - (gs2.top-top)],
                           h_pad=0.5)
Legends and Annotations

Pre Matplotlib 2.2, legends and annotations were excluded from the bounding box calculations that decide the layout. Subsequently these artists were added to the calculation, but sometimes it is undesirable to include them. For instance in this case it might be good to have the axes shring a bit to make room for the legend:

```python
fig, ax = plt.subplots(figsize=(4, 3))
lines = ax.plot(range(10), label='A simple plot')
ax.legend(bbox_to_anchor=(0.7, 0.5), loc='center left',)
fig.tight_layout()
plt.show()
```
However, sometimes this is not desired (quite often when using `fig.savefig('outname.png', bbox_inches='tight')`). In order to remove the legend from the bounding box calculation, we simply set its bounding box calculation, we simply set its bounding box:

```python
fig, ax = plt.subplots(figsize=(4, 3))
lines = ax.plot(range(10), label='B simple plot')
leg = ax.legend(bbox_to_anchor=(0.7, 0.5), loc='center left',)
leg.set_in_layout(False)
fig.tight_layout()
plt.show()
```

Use with AxesGrid1

While limited, `mpl_toolkits.axes_grid1` is also supported.
from mpl_toolkits.axes_grid1 import Grid

plt.close('all')
fig = plt.figure()
grid = Grid(fig, rect=111, nrows_ncols=(2, 2),
            axes_pad=0.25, label_mode='L',
)

for ax in grid:
    example_plot(ax)
ax.title.set_visible(False)
plt.tight_layout()

Colorbar

If you create a colorbar with `Figure.colorbar`, the created colorbar is drawn in a Subplot as long as the parent axes is also a Subplot, so `Figure.tight_layout` will work.

plt.close('all')
arr = np.arange(100).reshape((10, 10))
fig = plt.figure(figsize=(4, 4))
im = plt.imshow(arr, interpolation="none")

(continues on next page)
Another option is to use AxesGrid1 toolkit to explicitly create an axes for colorbar.

```python
from mpl_toolkits.axes_grid1 import make_axes_locatable

plt.close('all')
arr = np.arange(100).reshape((10, 10))
fig = plt.figure(figsize=(4, 4))
im = plt.imshow(arr, interpolation="none")

divider = make_axes_locatable(plt.gca())
cax = divider.append_axes("right", "5%", pad="3%")
plt.colorbar(im, cax=cax)
plt.tight_layout()
```

**2.2.7 origin and extent in imshow**

`imshow()` allows you to render an image (either a 2D array which will be color-mapped (based on `norm` and `cmap`) or a 3D RGB(A) array which will be used as-is) to a rectangular region in dataspace. The orientation of the image in the final rendering is controlled by the `origin` and `extent` kwargs (and attributes on the resulting `AxesImage` instance) and the data limits of the axes.

The `extent` kwarg controls the bounding box in data coordinates that the image will fill specified as `(left, right, bottom, top)` in **data coordinates**, the `origin` kwarg controls how the image fills that bounding box, and the orientation in the final rendered image is also affected by the axes limits.

**Hint:** Most of the code below is used for adding labels and informative text to the plots. The described effects of `origin` and `extent` can be seen in the plots without the need to follow all code details.

For a quick understanding, you may want to skip the code details below and directly continue with the discussion of the results.

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.gridspec import GridSpec
```

(continues on next page)
def index_to_coordinate(index, extent, origin):
    """Return the pixel center of an index.""
    left, right, bottom, top = extent

    hshift = 0.5 * np.sign(right - left)
    left, right = left + hshift, right - hshift
    vshift = 0.5 * np.sign(top - bottom)
    bottom, top = bottom + vshift, top - vshift

    if origin == 'upper':
        bottom, top = top, bottom

    return {
        "[0, 0]": (left, bottom),
        "[M', 0]": (left, top),
        "[0, N']": (right, bottom),
        "[M', N']": (right, top),
    }[index]

def get_index_label_pos(index, extent, origin, inverted_xindex):
    """Return the desired position and horizontal alignment of an index label.""
    if extent is None:
        extent = lookup_extent(origin)
    x, y = index_to_coordinate(index, extent, origin)

    is_x0 = index[-2:] == "0"
    halign = 'left' if is_x0 ^ inverted_xindex else 'right'
    hshift = 0.5 * np.sign(left - right)
    x += hshift * (1 if is_x0 else -1)
    return x, y, halign

x, y = np.ogrid[0:6, 0:7]
data = x + y

for origin in ['upper', 'lower']:
    for ax, extent in zip(columns[origin], extents):
        plot_imshow_with_labels(ax, data, extent, origin, xlim, ylim)

columns['label'][0].set_title('extent=
for ax, extent in zip(columns['label'], extents):
    if extent is None:
        text = 'None'
    else:
        left, right, bottom, top = extent
        text = (f'left: {left:.1f}
right: {right:.1f}
bottom: {bottom:.1f}
top: {top:.1f}
')
ax.text(1., .5, text, transform=ax.transAxes, ha='right', va='center')
ax.axis('off')
return columns

Default extent

First, let’s have a look at the default extent=None

generate_imshow_demo_grid(extents=[None])

Out:

{'label': [<AxesSubplot:title={'center':'extent='}]}, 'upper': [<AxesSubplot:title={'center': 'origin: upper'}>], 'lower': [<AxesSubplot:title={'center': 'origin: lower'}>]

Generally, for an array of shape (M, N), the first index runs along the vertical, the second index runs along the horizontal. The pixel centers are at integer positions ranging from 0 to \( N' = N - 1 \) horizontally and from 0 to \( M' = M - 1 \) vertically. origin determines how to the data is filled in the bounding box.

For origin='lower':

- [0, 0] is at (left, bottom)
• \([M', 0]\) is at (left, top)
• \([0, N']\) is at (right, bottom)
• \([M', N']\) is at (right, top)

`origin='upper'` reverses the vertical axes direction and filling:
• \([0, 0]\) is at (left, top)
• \([M', 0]\) is at (left, bottom)
• \([0, N']\) is at (right, top)
• \([M', N']\) is at (right, bottom)

In summary, the position of the \([0, 0]\) index as well as the extent are influenced by `origin`:

<table>
<thead>
<tr>
<th>origin</th>
<th>([0, 0]) position</th>
<th>extent</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper</td>
<td>top left</td>
<td>((-0.5, \text{numcols-0.5, numrows-0.5, -0.5}))</td>
</tr>
<tr>
<td>lower</td>
<td>bottom left</td>
<td>((-0.5, \text{numcols-0.5, -0.5, numrows-0.5}))</td>
</tr>
</tbody>
</table>

The default value of `origin` is set by `rcParams["image.origin"]` (default: ‘upper’) which defaults to ‘upper’ to match the matrix indexing conventions in math and computer graphics image indexing conventions.

**Explicit extent**

By setting `extent` we define the coordinates of the image area. The underlying image data is interpolated/resampled to fill that area.

If the axes is set to autoscale, then the view limits of the axes are set to match the `extent` which ensures that the coordinate set by \((\text{left}, \text{bottom})\) is at the bottom left of the axes! However, this may invert the axis so they do not increase in the ‘natural’ direction.

```plaintext
extents = [(-0.5, 6.5, -0.5, 5.5),
           (-0.5, 6.5, 5.5, -0.5),
           (6.5, -0.5, -0.5, 5.5),
           (6.5, -0.5, 5.5, -0.5)]
columns = generate_imshow_demo_grid(extents)
set_extent_None_text(columns['upper'][1])
set_extent_None_text(columns['lower'][0])
```
Matplotlib, Release 3.3.0

Chapter 2. Tutorials
Explicit extent and axes limits

If we fix the axes limits by explicitly setting `set_xlim` / `set_ylim`, we force a certain size and orientation of the axes. This can decouple the 'left-right' and 'top-bottom' sense of the image from the orientation on the screen.

In the example below we have chosen the limits slightly larger than the extent (note the white areas within the Axes).

While we keep the extents as in the examples before, the coordinate (0, 0) is now explicitly put at the bottom left and values increase to up and to the right (from the viewer point of view). We can see that:

- The coordinate (left, bottom) anchors the image which then fills the box going towards the (right, top) point in data space.
- The first column is always closest to the 'left'.
- `origin` controls if the first row is closest to 'top' or 'bottom'.
- The image may be inverted along either direction.
- The 'left-right' and 'top-bottom' sense of the image may be uncoupled from the orientation on the screen.

```python
generate_imshow_demo_grid(extents=None + extents,
                           xlim=(-2, 8), ylim=(-1, 6))
plt.show()
```
Total running time of the script:  (0 minutes 2.489 seconds)

2.3 Advanced

These tutorials cover advanced topics for experienced Matplotlib users and developers.

2.3.1 Blitting tutorial

'Blitting' is a standard technique in raster graphics that, in the context of Matplotlib, can be used to (drastically) improve performance of interactive figures. For example, the animation and widgets modules use blitting internally. Here, we demonstrate how to implement your own blitting, outside of these classes.

The source of the performance gains is simply not re-doing work we do not have to. If the limits of an Axes have not changed, then there is no need to re-draw all of the ticks and tick-labels (particularly because text is one of the more expensive things to render).

The procedure to save our work is roughly:

- draw the figure, but exclude any artists marked as 'animated'
- save a copy of the RBGA buffer

In the future, to update the 'animated' artists we

- restore our copy of the RGBA buffer
- redraw only the animated artists
- show the resulting image on the screen

thus saving us from having to re-draw everything which is not animated. One consequence of this procedure is that your animated artists are always drawn at a higher z-order than the static artists.

Not all backends support blitting. You can check if a given canvas does via the FigureCanvasBase.supports_blit property.

**Warning:** This code does not work with the OSX backend (but does work with other GUI backends on mac).

Minimal example

We can use the FigureCanvasAgg methods copy_from_bbox and restore_region in conjunction with setting animated=True on our artist to implement a minimal example that uses blitting to accelerate rendering

```python
import matplotlib.pyplot as plt
import numpy as np

x = np.linspace(0, 2 * np.pi, 100)

fig, ax = plt.subplots()
```

(continues on next page)
# animated=True tells matplotlib to only draw the artist when we
# explicitly request it
(ln,) = ax.plot(x, np.sin(x), animated=True)

# make sure the window is raised, but the script keeps going
plt.show(block=False)

# stop to admire our empty window axes and ensure it is rendered at
# least once.
# We need to fully draw the figure at its final size on the screen
# before we continue on so that:
# a) we have the correctly sized and drawn background to grab
# b) we have a cached renderer so that `ax.draw_artist` works
# so we spin the event loop to let the backend process any pending operations
plt.pause(0.1)

# get copy of entire figure (everything inside fig.bbox) sans animated artist
bg = fig.canvas.copy_from_bbox(fig.bbox)
# draw the animated artist, this uses a cached renderer
ax.draw_artist(ln)
# show the result to the screen, this pushes the updated RGBA buffer from the
# renderer to the GUI framework so you can see it
fig.canvas.blit(fig.bbox)

for j in range(100):
    # reset the background back in the canvas state, screen unchanged
    fig.canvas.restore_region(bg)
    # update the artist, neither the canvas state nor the screen have changed
    ln.set_ydata(np.sin(x + (j / 100) * np.pi))
    # re-render the artist, updating the canvas state, but not the screen
    ax.draw_artist(ln)
    # copy the image to the GUI state, but screen might not changed yet
    fig.canvas.blit(fig.bbox)
    # flush any pending GUI events, re-painting the screen if needed
    fig.canvas.flush_events()
    # you can put a pause in if you want to slow things down
    # plt.pause(.1)
This example works and shows a simple animation, however because we are only grabbing the background once, if the size of the figure in pixels changes (due to either the size or dpi of the figure changing), the background will be invalid and result in incorrect (but sometimes cool looking!) images. There is also a global variable and a fair amount of boiler plate which suggests we should wrap this in a class.

**Class-based example**

We can use a class to encapsulate the boilerplate logic and state of restoring the background, drawing the artists, and then blitting the result to the screen. Additionally, we can use the `draw_event` callback to capture a new background whenever a full re-draw happens to handle resizes correctly.

```python
class BlitManager:
    def __init__(self, canvas, animated_artists=()):
        """
        Parameters
        ----------
        canvas : FigureCanvasAgg
            The canvas to work with, this only works for sub-classes of the Agg canvas which have the `~FigureCanvasAgg.copy_from_bbox` and `~FigureCanvasAgg.restore_region` methods.

        animated_artists : Iterable[Artist]
        """
```

(continues on next page)
List of the artists to manage

```python
self.canvas = canvas
self._bg = None
self._artists = []

for a in animated_artists:
    self.add_artist(a)
# grab the background on every draw
self.cid = canvas.mpl_connect("draw_event", self.on_draw)
```

```python
def on_draw(self, event):
    """Callback to register with 'draw_event'.""
    cv = self.canvas
    if event is not None:
        if event.canvas != cv:
            raise RuntimeError
    self._bg = cv.copy_from_bbox(cv.figure.bbox)
    self._draw_animated()

def add_artist(self, art):
    """
    Add an artist to be managed.
    
    Parameters
    ----------
    art : Artist
        The artist to be added. Will be set to 'animated' (just to be safe). *art* must be in the figure associated with the canvas this class is managing.
    """
    if art.figure != self.canvas.figure:
        raise RuntimeError
    art.set_animated(True)
    self._artists.append(art)

def _draw_animated(self):
    """Draw all of the animated artists.""
    fig = self.canvas.figure
    for a in self._artists:
        fig.draw_artist(a)

def update(self):
    """Update the screen with animated artists.""
    cv = self.canvas
    fig = cv.figure
    # paranoia in case we missed the draw event,
    if self._bg is None:
        self.on_draw(None)
    else:
        # restore the background
        cv.restore_region(self._bg)
        # draw all of the animated artists
        self._draw_animated()
```

(continues on next page)
Here is how we would use our class. This is a slightly more complicated example than the first case as we add a text frame counter as well.

```python
# make a new figure
fig, ax = plt.subplots()
# add a line
(ln,) = ax.plot(x, np.sin(x), animated=True)
# add a frame number
fr_number = ax.annotate(
    "0",
    (0, 1),
    xycoords="axes fraction",
    xytext=(10, -10),
    textcoords="offset points",
    ha="left",
    va="top",
    animated=True,
)

bm = BlitManager(fig.canvas, [ln, fr_number])

for j in range(100):
    # update the artists
    ln.set_ydata(np.sin(x + (j / 100) * np.pi))
    fr_number.set_text("frame: {j}".format(j=j))
    # tell the blitting manager to do it's thing
    bm.update()
```
This class does not depend on pyplot and is suitable to embed into larger GUI application.

**Total running time of the script:** ( 0 minutes 1.113 seconds)

### 2.3.2 Path Tutorial

Defining paths in your Matplotlib visualization.

The object underlying all of the `matplotlib.patches` objects is the `Path`, which supports the standard set of moveto, lineto, curveto commands to draw simple and compound outlines consisting of line segments and splines. The `Path` is instantiated with a (N, 2) array of (x, y) vertices, and a N-length array of path codes. For example to draw the unit rectangle from (0, 0) to (1, 1), we could use this code:

```python
import matplotlib.pyplot as plt
from matplotlib.path import Path
import matplotlib.patches as patches

verts = [
    (0., 0.),  # left, bottom
    (0., 1.),  # left, top
    (1., 1.),  # right, top
    (1., 0.),  # right, bottom
    (0., 0.),  # ignored
]  
```
The following path codes are recognized
<table>
<thead>
<tr>
<th>Code</th>
<th>Vertices</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STOP</td>
<td>1 (ignored)</td>
<td>A marker for the end of the entire path (currently not required and ignored).</td>
</tr>
<tr>
<td>MOVETO</td>
<td>1</td>
<td>Pick up the pen and move to the given vertex.</td>
</tr>
<tr>
<td>LINETO</td>
<td>1</td>
<td>Draw a line from the current position to the given vertex.</td>
</tr>
<tr>
<td>CURVE3</td>
<td>2: 1 control point, 1 end point</td>
<td>Draw a quadratic Bézier curve from the current position, with the given control point, to the given end point.</td>
</tr>
<tr>
<td>CURVE4</td>
<td>3: 2 control points, 1 end point</td>
<td>Draw a cubic Bézier curve from the current position, with the given control points, to the given end point.</td>
</tr>
<tr>
<td>CLOSEPOLY</td>
<td>1 (the point is ignored)</td>
<td>Draw a line segment to the start point of the current polyline.</td>
</tr>
</tbody>
</table>

**Bézier example**

Some of the path components require multiple vertices to specify them: for example CURVE 3 is a Bézier curve with one control point and one end point, and CURVE 4 has three vertices for the two control points and the end point. The example below shows a CURVE 4 Bézier spline – the Bézier curve will be contained in the convex hull of the start point, the two control points, and the end point.

```python
verts = [
    (0., 0.),  # P0
    (0.2, 1.),  # P1
    (1., 0.8),  # P2
    (0.8, 0.),  # P3
]
codes = [
    Path.MOVETO,
    Path.CURVE4,
    Path.CURVE4,
    Path.CURVE4,
]
path = Path(verts, codes)
fig, ax = plt.subplots()
patch = patches.PathPatch(path, facecolor='none', lw=2)
ax.add_patch(patch)
xs, ys = zip(*verts)
ax.plot(xs, ys, 'x--', lw=2, color='black', ms=10)
ax.text(-0.05, -0.05, 'P0')
ax.text(0.15, 1.05, 'P1')
ax.text(1.05, 0.85, 'P2')
ax.text(0.85, -0.05, 'P3')
ax.set_xlim(-0.1, 1.1)
ax.set_ylim(-0.1, 1.1)
plt.show()
```
Compound paths

All of the simple patch primitives in matplotlib, Rectangle, Circle, Polygon, etc, are implemented with simple path. Plotting functions like `hist()` and `bar()`, which create a number of primitives, e.g., a bunch of Rectangles, can usually be implemented more efficiently using a compound path. The reason `bar` creates a list of rectangles and not a compound path is largely historical: the `Path` code is comparatively new and `bar` predates it. While we could change it now, it would break old code, so here we will cover how to create compound paths, replacing the functionality in `bar`, in case you need to do so in your own code for efficiency reasons, e.g., you are creating an animated bar plot.

We will make the histogram chart by creating a series of rectangles for each histogram bar: the rectangle width is the bin width and the rectangle height is the number of datapoints in that bin. First we’ll create some random normally distributed data and compute the histogram. Because numpy returns the bin edges and not centers, the length of `bins` is 1 greater than the length of `n` in the example below:

```python
# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)
```

We’ll now extract the corners of the rectangles. Each of the `left`, `bottom`, etc, arrays below is `len(n)`, where `n` is the array of counts for each histogram bar:
Now we have to construct our compound path, which will consist of a series of **MOVETO**, **LINETO** and **CLOSEPOLY** for each rectangle. For each rectangle, we need 5 vertices: 1 for the **MOVETO**, 3 for the **LINETO**, and 1 for the **CLOSEPOLY**. As indicated in the table above, the vertex for the closepoly is ignored but we still need it to keep the codes aligned with the vertices:

```python
nverts = nrects*(1+3+1)
verts = np.zeros((nverts, 2))
codes = np.ones(nverts, int) * path.Path.LINETO
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5, 0] = left
verts[0::5, 1] = bottom
verts[1::5, 0] = left
verts[1::5, 1] = top
verts[2::5, 0] = right
verts[2::5, 1] = top
verts[3::5, 0] = right
verts[3::5, 1] = bottom
```

All that remains is to create the path, attach it to a **PathPatch**, and add it to our axes:

```python
barpath = path.Path(verts, codes)
patch = patches.PathPatch(barpath, facecolor='green',
edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)
```

---

(continues on next page)
verts[0::5, 1] = bottom
verts[1::5, 0] = left
verts[1::5, 1] = top
verts[2::5, 0] = right
verts[2::5, 1] = top
verts[3::5, 0] = right
verts[3::5, 1] = bottom

barpath = path.Path(verts, codes)
patch = patches.PathPatch(barpath, facecolor='green',
                          edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)

ax.set_xlim(left[0], right[-1])
ax.set_ylim(bottom.min(), top.max())

plt.show()

2.3.3 Path effects guide

Defining paths that objects follow on a canvas.

Matplotlib’s patheffects module provides functionality to apply a multiple draw stage to any
Artist which can be rendered via a *path.Path*.

Artists which can have a path effect applied to them include *patches.Patch*, *lines.Line2D*, *collections.Collection* and even *text.Text*. Each artist's path effects can be controlled via the *Artist.set_path_effects* method, which takes an iterable of *AbstractPathEffect* instances.

The simplest path effect is the *Normal* effect, which simply draws the artist without any effect:

```python
import matplotlib.pyplot as plt
import matplotlib.patheffects as path_effects

fig = plt.figure(figsize=(5, 1.5))
text = fig.text(0.5, 0.5, 'Hello path effects world!
This is the normal ' 'path effect.
Pretty dull, huh?'
    ha='center', va='center', size=20)
text.set_path_effects([path_effects.Normal()])
plt.show()
```

**Hello path effects world!**
This is the normal path effect.
Pretty dull, huh?

Whilst the plot doesn’t look any different to what you would expect without any path effects, the drawing of the text has now been changed to use the path effects framework, opening up the possibilities for more interesting examples.

**Adding a shadow**

A far more interesting path effect than *Normal* is the drop-shadow, which we can apply to any of our path based artists. The classes *SimplePatchShadow* and *SimpleLineShadow* do precisely this by drawing either a filled patch or a line patch below the original artist:

```python
import matplotlib.pathEffects as path_effects

text = plt.text(0.5, 0.5, 'Hello path effects world!',
    path_effects=[path_effects.withSimplePatchShadow()])

plt.plot([0, 3, 2, 5], linewidth=5, color='blue',
    path_effects=[path_effects.SimpleLineShadow(),
        path_effects.Normal()])
plt.show()
```
Notice the two approaches to setting the path effects in this example. The first uses the *with* classes to include the desired functionality automatically followed with the “normal” effect, whereas the latter explicitly defines the two path effects to draw.

**Making an artist stand out**

One nice way of making artists visually stand out is to draw an outline in a bold color below the actual artist. The *Stroke* path effect makes this a relatively simple task:

```python
fig = plt.figure(figsize=(7, 1))
text = fig.text(0.5, 0.5, 'This text stands out because of
  its black border.', color='white',
    ha='center', va='center', size=30)
text.set_path_effects([path_effects.Stroke(linewidth=3, foreground='black'),
                   path_effects.Normal()])
plt.show()
```

This text stands out because of its black border.
It is important to note that this effect only works because we have drawn the text path twice; once with a thick black line, and then once with the original text path on top.

You may have noticed that the keywords to `Stroke` and `SimplePatchShadow` and `SimpleLineShadow` are not the usual Artist keywords (`facecolor`, `edgecolor`, etc.). This is because with these path effects we are operating at lower level of Matplotlib. In fact, the keywords which are accepted are those for a `matplotlib.backend_bases.GraphicsContextBase` instance, which have been designed for making it easy to create new backends - and not for its user interface.

**Greater control of the path effect artist**

As already mentioned, some of the path effects operate at a lower level than most users will be used to, meaning that setting keywords such as `facecolor` and `edgecolor` raise an AttributeError. Luckily there is a generic `PathPatchEffect` path effect which creates a `patches.PathPatch` class with the original path. The keywords to this effect are identical to those of `patches.PathPatch`:

```python
fig = plt.figure(figsize=(8, 1))
t = fig.text(0.02, 0.5, 'Hatch shadow', fontsize=75, weight=1000, va='center')
t.set_path_effects([path_effects.PathPatchEffect(
    offset=(4, -4), hatch='xxxx', facecolor='gray'),
    path_effects.PathPatchEffect(
        edgetolor='white', linewidth=1.1, facecolor='black'))]
plt.show()
```

### 2.3.4 Transformations Tutorial

Like any graphics packages, Matplotlib is built on top of a transformation framework to easily move between coordinate systems, the userland `data` coordinate system, the `axes` coordinate system, the `figure` coordinate system, and the `display` coordinate system. In 95% of your plotting, you won’t need to think about this, as it happens under the hood, but as you push the limits of custom figure generation, it helps to have an understanding of these objects so you can reuse the existing transformations Matplotlib makes available to you, or create your own (see `matplotlib.transforms`). The table below summarizes the some useful coordinate systems, the transformation object you should use to work in that coordinate system, and the description of that system. In the Transformation Object Column, `ax` is a `Axes` instance, and `fig` is a `Figure` instance.
### Coordinatem
<table>
<thead>
<tr>
<th>Coordinates</th>
<th>Transformation object</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;data&quot;</td>
<td>ax.transData</td>
<td>The coordinate system for the data, controlled by xlim and ylim.</td>
</tr>
<tr>
<td>&quot;axes&quot;</td>
<td>ax.transAxes</td>
<td>The coordinate system of the Axes; (0, 0) is bottom left of the axes, and (1, 1) is top right of the axes.</td>
</tr>
<tr>
<td>&quot;figure&quot;</td>
<td>fig.transFigure</td>
<td>The coordinate system of the Figure; (0, 0) is bottom left of the figure, and (1, 1) is top right of the figure.</td>
</tr>
<tr>
<td>&quot;figure-inches&quot;</td>
<td>fig.dpi_scale_trans</td>
<td>The coordinate system of the Figure in inches; (0, 0) is bottom left of the figure, and (width, height) is the top right of the figure in inches.</td>
</tr>
<tr>
<td>&quot;display&quot;</td>
<td>None, or IdentityTransform()</td>
<td>The pixel coordinate system of the display window; (0, 0) is bottom left of the window, and (width, height) is top right of the display window in pixels.</td>
</tr>
<tr>
<td>&quot;xaxis&quot;</td>
<td>ax.get_xaxis_transform()</td>
<td>Blended coordinate systems; use data coordinates on one of the axis and axes coordinates on the other.</td>
</tr>
<tr>
<td>&quot;yaxis&quot;</td>
<td>ax.get_yaxis_transform()</td>
<td></td>
</tr>
</tbody>
</table>

All of the transformation objects in the table above take inputs in their coordinate system, and transform the input to the display coordinate system. That is why the display coordinate system has None for the Transformation Object column – it already is in display coordinates. The transformations also know how to invert themselves, to go from display back to the native coordinate system. This is particularly useful when processing events from the user interface, which typically occur in display space, and you want to know where the mouse click or key-press occurred in your data coordinate system.

Note that specifying objects in display coordinates will change their location if the dpi of the figure changes. This can cause confusion when printing or changing screen resolution, because the object can change location and size. Therefore it is most common for artists placed in an axes or figure to have their transform set to something other than the IdentityTransform(); the default when an artist is placed on an axes using add_artist is for the transform to be ax.transData.

### Data coordinates

Let’s start with the most commonly used coordinate, the data coordinate system. Whenever you add data to the axes, Matplotlib updates the datalimits, most commonly updated with the set_xlim() and set_ylim() methods. For example, in the figure below, the data limits stretch from 0 to 10 on the x-axis, and -1 to 1 on the y-axis.

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.patches as mpatches

x = np.arange(0, 10, 0.005)
y = np.exp(-x/2.) + np.sin(2*np.pi*x)

fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_xlim(0, 10)
ax.set_ylim(-1, 1)
```

(continues on next page)
You can use the `ax.transData` instance to transform from your `data` to your `display` coordinate system, either a single point or a sequence of points as shown below:

```python
In [14]: type(ax.transData)
Out[14]: <class 'matplotlib.transforms.CompositeGenericTransform'>

In [15]: ax.transData.transform((5, 0))
Out[15]: array([ 335.175,  247. ])  

In [16]: ax.transData.transform([(5, 0), (1, 2)])
Out[16]: array([[ 335.175,  247. ],
                   [ 132.435,  642.2 ]])
```

You can use the `inverted()` method to create a transform which will take you from `display` to `data` coordinates:

```python
In [41]: inv = ax.transData.inverted()

In [42]: type(inv)
Out[42]: <class 'matplotlib.transforms.CompositeGenericTransform'>
```
In [43]: inv.transform((335.175, 247.))
Out[43]: array([ 5., 0.])

If you are typing along with this tutorial, the exact values of the display coordinates may differ if you have a different window size or dpi setting. Likewise, in the figure below, the display labeled points are probably not the same as in the ipython session because the documentation figure size defaults are different.

```python
x = np.arange(0, 10, 0.005)
y = np.exp(-x/2.) * np.sin(2*np.pi*x)

fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_xlim(0, 10)
ax.set_ylim(-1, 1)

xdata, ydata = 5, 0
xdisplay, ydisplay = ax.transData.transform((xdata, ydata))

bbox = dict(boxstyle="round", fc="0.8")
arrowprops = dict(
    arrowstyle="->",
    connectionstyle="angle,angleA=0,angleB=90,rad=10")

offset = 72
ax.annotate("data = (%.1f, %.1f)
            " % (xdata, ydata),
            (xdata, ydata), xytext=(-2*offset, offset),
            textcoords='offset points',
            bbox=bbox, arrowprops=arrowprops)

disp = ax.annotate("display = (%.1f, %.1f)
                    " % (xdisplay, ydisplay),
                    (xdisplay, ydisplay), xytext=(0.5*offset, -offset),
                    xycoords='figure pixels',
                    textcoords='offset points',
                    bbox=bbox, arrowprops=arrowprops)

plt.show()
```
Note: If you run the source code in the example above in a GUI backend, you may also find that the two arrows for the data and display annotations do not point to exactly the same point. This is because the display point was computed before the figure was displayed, and the GUI backend may slightly resize the figure when it is created. The effect is more pronounced if you resize the figure yourself. This is one good reason why you rarely want to work in display space, but you can connect to the 'on_draw' Event to update figure coordinates on figure draws; see Event handling and picking.

When you change the x or y limits of your axes, the data limits are updated so the transformation yields a new display point. Note that when we just change the ylim, only the y-display coordinate is altered, and when we change the xlim too, both are altered. More on this later when we talk about the Bbox.

```
In [54]: ax.transData.transform((5, 0))
Out[54]: array([ 335.175, 247. ,  ])

In [55]: ax.set_ylim(-1, 2)
Out[55]: (-1, 2)

In [56]: ax.transData.transform((5, 0))
Out[56]: array([ 335.175 , 181.13333333])

In [57]: ax.set_xlim(10, 20)
```

(continues on next page)
Axes coordinates

After the *data* coordinate system, *axes* is probably the second most useful coordinate system. Here the point (0, 0) is the bottom left of your axes or subplot, (0.5, 0.5) is the center, and (1.0, 1.0) is the top right. You can also refer to points outside the range, so (-0.1, 1.1) is to the left and above your axes. This coordinate system is extremely useful when placing text in your axes, because you often want a text bubble in a fixed, location, e.g., the upper left of the axes pane, and have that location remain fixed when you pan or zoom. Here is a simple example that creates four panels and labels them ‘A’, ‘B’, ‘C’, ‘D’ as you often see in journals.

```python
fig = plt.figure()
for i, label in enumerate(('A', 'B', 'C', 'D')):
    ax = fig.add_subplot(2, 2, i+1)
    ax.text(0.05, 0.95, label, transform=ax.transAxes,
            fontsize=16, fontweight='bold', va='top')
plt.show()
```
You can also make lines or patches in the *axes* coordinate system, but this is less useful in my experience than using `ax.transAxes` for placing text. Nonetheless, here is a silly example which plots some random dots in data space, and overlays a semi-transparent *Circle* centered in the middle of the axes with a radius one quarter of the axes – if your axes does not preserve aspect ratio (see `set_aspect()`), this will look like an ellipse. Use the pan/zoom tool to move around, or manually change the data xlim and ylim, and you will see the data move, but the circle will remain fixed because it is not in *data* coordinates and will always remain at the center of the axes.

```python
fig, ax = plt.subplots()
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y, 'go', alpha=0.2)  # plot some data in data coordinates
circ = mpatches.Circle((0.5, 0.5), 0.25, transform=ax.transAxes,
                        facecolor='blue', alpha=0.75)
ax.add_patch(circ)
plt.show()
```

**Blended transformations**

Drawing in *blended* coordinate spaces which mix *axes* with *data* coordinates is extremely useful, for example to create a horizontal span which highlights some region of the y-data but spans across the x-axis regardless of the data limits, pan or zoom level, etc. In fact these blended lines and spans are so useful, we have built in functions to make them easy to plot.
(see `axhline()`, `axvline()`, `axhspan()`, `axvspan()`), but for didactic purposes we will implement the horizontal span here using a blended transformation. This trick only works for separable transformations, like you see in normal Cartesian coordinate systems, but not on inseparable transformations like the `PolarTransform`.

```python
import matplotlib.transforms as transforms

fig, ax = plt.subplots()
x = np.random.randn(1000)

ax.hist(x, 30)
ax.set_title(r'$\sigma=1$ \backslashdots \backslashdots \sigma=2$', fontsize=16)

# the x coords of this transformation are data, and the y coord are axes
trans = transforms.blended_transform_factory(
    ax.transData, ax.transAxes)
# highlight the 1..2 stddev region with a span.
# We want x to be in data coordinates and y to span from 0..1 in axes coords.
rect = mpatches.Rectangle((1, 0), width=1, height=1, transform=trans,
    color='yellow', alpha=0.5)

ax.add_patch(rect)

plt.show()
```

![Histogram with span](image)

**σ = 1 \ldots σ = 2**

**Note:** The blended transformations where x is in data coords and y in axes coordinates is
so useful that we have helper methods to return the versions Matplotlib uses internally for
drawing ticks, ticklabels, etc. The methods are `matplotlib.axes.Axes.get_xaxis_transform()`
and `matplotlib.axes.Axes.get_yaxis_transform()`. So in the example above, the call to
`blended_transform_factory()` can be replaced by `get_xaxis_transform`:

```python
trans = ax.get_xaxis_transform()
```

### Plotting in physical coordinates

Sometimes we want an object to be a certain physical size on the plot. Here we draw the same
circle as above, but in physical coordinates. If done interactively, you can see that changing
the size of the figure does not change the offset of the circle from the lower-left corner, does
not change its size, and the circle remains a circle regardless of the aspect ratio of the axes.

```python
fig, ax = plt.subplots(figsize=(5, 4))
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y*10, 'go', alpha=0.2)  # plot some data in data coordinates
# add a circle in fixed-coordinates
circ = mpatches.Circle((2.5, 2), 1.0, transform=ax.figure.dpi_scale_trans,
                        facecolor='blue', alpha=0.75)
ax.add_patch(circ)
plt.show()
```

If we change the figure size, the circle does not change its absolute position and is cropped.

```python
fig, ax = plt.subplots(figsize=(7, 2))
x, y = 10*np.random.rand(2, 1000)
```
Another use is putting a patch with a set physical dimension around a data point on the axes. Here we add together two transforms. The first sets the scaling of how large the ellipse should be and the second sets its position. The ellipse is then placed at the origin, and then we use the helper transform `ScaledTranslation` to move it to the right place in the `ax.transData` coordinate system. This helper is instantiated with:

```
trans = ScaledTranslation(xt, yt, scale_trans)
```

where `xt` and `yt` are the translation offsets, and `scale_trans` is a transformation which scales `xt` and `yt` at transformation time before applying the offsets.

Note the use of the plus operator on the transforms below. This code says: first apply the scale transformation `fig.dpi_scale_trans` to make the ellipse the proper size, but still centered at `(0, 0)`, and then translate the data to `xdata[0]` and `ydata[0]` in data space.

In interactive use, the ellipse stays the same size even if the axes limits are changed via zoom.
Note: The order of transformation matters. Here the ellipse is given the right dimensions in display space first and then moved in data space to the correct spot. If we had done the ScaledTranslation first, then xdata[0] and ydata[0] would first be transformed to display coordinates ([ 358.4 475.2] on a 200-dpi monitor) and then those coordinates would be scaled by fig.dpi_scale_trans pushing the center of the ellipse well off the screen (i.e. [ 71680.95040.]).

Using offset transforms to create a shadow effect

Another use of ScaledTranslation is to create a new transformation that is offset from another transformation, e.g., to place one object shifted a bit relative to another object. Typically you want the shift to be in some physical dimension, like points or inches rather than in data coordinates, so that the shift effect is constant at different zoom levels and dpi settings.

One use for an offset is to create a shadow effect, where you draw one object identical to the first just to the right of it, and just below it, adjusting the zorder to make sure the shadow is drawn first and then the object it is shadowing above it.

Here we apply the transforms in the opposite order to the use of ScaledTranslation above. The plot is first made in data coordinates (ax.transData) and then shifted by dx and dy points using fig.dpi_scale_trans. (In typography, a point is 1/72 inches, and by specifying your offsets in points, your figure will look the same regardless of the dpi resolution it is saved in.)
```python
fig, ax = plt.subplots()

# make a simple sine wave
x = np.arange(0., 2., 0.01)
y = np.sin(2*np.pi*x)
line, = ax.plot(x, y, lw=3, color='blue')

# shift the object over 2 points, and down 2 points
dx, dy = 2./72., -2./72.
od = transforms.ScaledTranslation(dx, dy, fig.dpi_scale_trans)
shadow_transform = ax.transData + offset

# now plot the same data with our offset transform;
# use the zorder to make sure we are below the line
ax.plot(x, y, lw=3, color='gray',
        transform=shadow_transform,
        zorder=0.5*line.get_zorder())

ax.set_title('creating a shadow effect with an offset transform')
plt.show()
```

**Note:** The dpi and inches offset is a common-enough use case that we have a special helper function to create it in `matplotlib.transforms.offset_copy()`, which returns a new transform with an added offset. So above we could have done:
The transformation pipeline

The `ax.transData` transform we have been working with in this tutorial is a composite of three different transformations that comprise the transformation pipeline from data -> display coordinates. Michael Droettboom implemented the transformations framework, taking care to provide a clean API that segregated the nonlinear projections and scales that happen in polar and logarithmic plots, from the linear affine transformations that happen when you pan and zoom. There is an efficiency here, because you can pan and zoom in your axes which affects the affine transformation, but you may not need to compute the potentially expensive nonlinear scales or projections on simple navigation events. It is also possible to multiply affine transformation matrices together, and then apply them to coordinates in one step. This is not true of all possible transformations.

Here is how the `ax.transData` instance is defined in the basic separable axis `Axes` class:

```python
self.transData = self.transScale + (self.transLimits + self.transAxes)
```

We’ve been introduced to the `transAxes` instance above in `Axes coordinates`, which maps the (0, 0), (1, 1) corners of the axes or subplot bounding box to display space, so let’s look at these other two pieces.

`s��TRANSes` is the transformation that takes you from data to axes coordinates; i.e., it maps your view xlim and ylim to the unit space of the axes (and `transAxes` then takes that unit space to display space). We can see this in action here

```python
In [80]: ax = subplot(111)
In [81]: ax.set_xlim(0, 10)
Out[81]: (0, 10)
In [82]: ax.set_ylim(-1, 1)
Out[82]: (-1, 1)
In [84]: ax.transLimits.transform((0, -1))
Out[84]: array([ 0., 0.])
In [85]: ax.transLimits.transform((10, -1))
Out[85]: array([1., 0.])
In [86]: ax.transLimits.transform((10, 1))
Out[86]: array([ 1., 1.])
In [87]: ax.transLimits.transform((5, 0))
Out[87]: array([0.5, 0.5])
```

and we can use this same inverted transformation to go from the unit axes coordinates back to data coordinates.

```python
In [90]: inv.transform((0.25, 0.25))
Out[90]: array([2.5, -0.5])
```
The final piece is the self.transScale attribute, which is responsible for the optional non-linear scaling of the data, e.g., for logarithmic axes. When an Axes is initially setup, this is just set to the identity transform, since the basic Matplotlib axes has linear scale, but when you call a logarithmic scaling function like `semilogx()` or explicitly set the scale to logarithmic with `set_zscale()`, then the ax.transScale attribute is set to handle the nonlinear projection. The scales transforms are properties of the respective xaxis and yaxis Axis instances. For example, when you call ax.set_xscale('log'), the xaxis updates its scale to a `matplotlib.scale.LogScale` instance.

For non-separable axes the PolarAxes, there is one more piece to consider, the projection transformation. The transData `matplotlib.projections.polar.PolarAxes` is similar to that for the typical separable matplotlib Axes, with one additional piece transProjection:

```python
self.transData = self.transScale + self.transProjection + \
    (self.transProjectionAffine + self.transAxes)
```

transProjection handles the projection from the space, e.g., latitude and longitude for map data, or radius and theta for polar data, to a separable Cartesian coordinate system. There are several projection examples in the `matplotlib.projections` package, and the best way to learn more is to open the source for those packages and see how to make your own, since Matplotlib supports extensible axes and projections. Michael Droettboom has provided a nice tutorial example of creating a Hammer projection axes; see /gallery/misc/custom_projection.

**Total running time of the script:** ( 0 minutes 2.763 seconds)

## 2.4 Colors

Matplotlib has support for visualizing information with a wide array of colors and colormaps. These tutorials cover the basics of how these colormaps look, how you can create your own, and how you can customize colormaps for your use case.

For even more information see the examples page.

### 2.4.1 Specifying Colors

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA (red, green, blue, alpha) tuple of float values in closed interval [0, 1] (e.g., (0.1, 0.2, 0.5) or (0.1, 0.2, 0.5, 0.3));
- a hex RGB or RGBA string (e.g., '#0f0f0f' or '#0f0f0f80'; case-insensitive);
- a shorthand hex RGB or RGBA string, equivalent to the hex RGB or RGBA string obtained by duplicating each character, (e.g., '#abc', equivalent to '#aabbcc', or '#abcd', equivalent to '#aabbccccdd'; case-insensitive);
- a string representation of a float value in [0, 1] inclusive for gray level (e.g., '0.5');
- one of the characters {'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'}, which are short-hand notations for shades of blue, green, red, cyan, magenta, yellow, black, and white. Note that the colors 'g', 'c', 'm', 'y' do not coincide with the X11/CSS4 colors. Their particular shades were chosen for better visibility of colored lines against typical backgrounds.
- a X11/CSS4 color name (case-insensitive);
• a name from the xkcd color survey, prefixed with 'xkcd:' (e.g., 'xkcd:sky blue'; case insensitive);

• one of the Tableau Colors from the 'T10' categorical palette (the default color cycle): {'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab:cyana'} (case-insensitive);

• a “CN” color spec, i.e. ‘C’ followed by a number, which is an index into the default property cycle (rcParams['axes.prop_cycle']) (default: cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])); the indexing is intended to occur at rendering time, and defaults to black if the cycle does not include color.

"Red", "Green", and "Blue" are the intensities of those colors, the combination of which span the colorspace.

How "Alpha" behaves depends on the zorder of the Artist. Higher zorder Artists are drawn on top of lower Artists, and "Alpha" determines whether the lower artist is covered by the higher. If the old RGB of a pixel is RGBold and the RGB of the pixel of the Artist being added is RGBnew with Alpha alpha, then the RGB of the pixel is updated to: RGB = RGBold * (1 - Alpha) + RGBnew * Alpha. Alpha of 1 means the old color is completely covered by the new Artist, Alpha of 0 means that pixel of the Artist is transparent.

For more information on colors in matplotlib see

• the /gallery/color/color_demo example;

• the matplotlib.colors API;

• the /gallery/color/named_colors example.

"CN" color selection

"CN" colors are converted to RGBA as soon as the artist is created. For example,

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl

th = np.linspace(0, 2*np.pi, 128)

def demo(sty):
    mpl.style.use(sty)
    fig, ax = plt.subplots(figsize=(3, 3))

    ax.set_title('style: {!r}'.format(sty), color='C0')

    ax.plot(th, np.cos(th), 'C1', label='C1')
    ax.plot(th, np.sin(th), 'C2', label='C2')
    ax.legend()

demo('default')
demo('seaborn')
```
will use the first color for the title and then plot using the second and third colors of each style's `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`.

### xkcd v X11/CSS4

The xkcd colors are derived from a user survey conducted by the webcomic xkcd. Details of the survey are available on the xkcd blog.

Out of 148 colors in the CSS color list, there are 95 name collisions between the X11/CSS4 names and the xkcd names, all but 3 of which have different hex values. For example, 'blue' maps to '#0000FF' where as 'xkcd:blue' maps to '#0343DF'. Due to these name collisions all of the xkcd colors have 'xkcd:' prefixed. As noted in the blog post, while it might be interesting to re-define the X11/CSS4 names based on such a survey, we do not do so unilaterally.

The name collisions are shown in the table below; the color names where the hex values agree are shown in bold.
import matplotlib._color_data as mcd
import matplotlib.patches as mpatch

overlap = {name for name in mcd.CSS4_COLORS
            if "xkcd:" + name in mcd.XKCD_COLORS}

fig = plt.figure(figsize=[4.8, 16])
ax = fig.add_axes([0, 0, 1, 1])

for j, n in enumerate(sorted(overlap, reverse=True)):
    weight = None
    cn = mcd.CSS4_COLORS[n]
xkcd = mcd.XKCD_COLORS["xkcd:" + n].upper()
    if cn == xkcd:
        weight = 'bold'

    r1 = mpatch.Rectangle((0, j), 1, 1, color=cn)
r2 = mpatch.Rectangle((1, j), 1, 1, color=xkcd)
    txt = ax.text(2, j+.5, ' ' + n, va='center', fontsize=10,
                  weight=weight)
    ax.add_patch(r1)
    ax.add_patch(r2)
    ax.axhline(j, color='k')

ax.text(.5, j + 1.5, 'X11', ha='center', va='center')
ax.text(1.5, j + 1.5, 'xkcd', ha='center', va='center')
ax.set_xlim(0, 3)
ax.set_ylim(0, j + 2)
ax.axis('off')

### 2.4.2 Customized Colorbars Tutorial

This tutorial shows how to build and customize standalone colorbars, i.e. without an attached plot.

**Customized Colorbars**

A colorbar needs a "mappable" (**matplotlib.cm.ScalarMappable**) object (typically, an image) which indicates the colormap and the norm to be used. In order to create a colorbar without an attached image, one can instead use a **ScalarMappable** with no associated data.

**Basic continuous colorbar**

Here we create a basic continuous colorbar with ticks and labels.

The arguments to the `colorbar` call are the **ScalarMappable** (constructed using the `norm` and `cmap` arguments), the axes where the colorbar should be drawn, and the colorbar's orientation.

For more information see the **colorbar** API.

```python
import matplotlib.pyplot as plt
import matplotlib as mpl

fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.cm.cool
norm = mpl.colors.Normalize(vmin=5, vmax=10)

fig.colorbar(mpl.cm.ScalarMappable(norm=norm, cmap=cmap),
            cax=ax, orientation='horizontal', label='Some Units')
```

Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f08b3746070>
```
Extended colorbar with continuous colorscale

The second example shows how to make a discrete colorbar based on a continuous cmap. With the "extend" keyword argument the appropriate colors are chosen to fill the colorspace, including the extensions:

```python
fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.cm.viridis
bounds = [-1, 2, 5, 7, 12, 15]
norm = mpl.colors.BoundaryNorm(bounds, cmap.N, extend='both')

cb2 = mpl.colorbar.ColorbarBase(ax, cmap=cmap,
                                 norm=norm,
                                 orientation='horizontal')

cb2.set_label("Discrete intervals with extend='both' keyword")
fig.show()
```

Discrete intervals colorbar

The third example illustrates the use of a `ListedColormap` which generates a colormap from a set of listed colors, `colors.BoundaryNorm` which generates a colormap index based on discrete intervals and extended ends to show the "over" and "under" value colors. Over and under are used to display data outside of the normalized [0, 1] range. Here we pass colors as gray shades as a string encoding a float in the 0-1 range.

If a `ListedColormap` is used, the length of the bounds array must be one greater than the length of the color list. The bounds must be monotonically increasing.

This time we pass additional arguments to `colorbar`. For the out-of-range values to display on the colorbar without using the `extend` keyword with `colors.BoundaryNorm`, we have to use the `extend` keyword argument directly in the colorbar call, and supply an additional boundary on each end of the range. Here we also use the spacing argument to make the length of each colorbar segment proportional to its corresponding interval.

```python
fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.colors.ListedColormap(["red", "green", "blue", "cyan")
cmap.set_over("0.25")
cmap.set_under("0.75")

bounds = [1, 2, 4, 7, 8]
norm = mpl.colors.BoundaryNorm(bounds, cmap.N)
fig.colorbar(
    mpl.cm.ScalarMappable(cmap=cmap, norm=norm),
    cax=ax,
    boundaries=[0] + bounds + [13],
    # Adding values for extensions.
)
```

(continues on next page)
Colorbar with custom extension lengths

Here we illustrate the use of custom length colorbar extensions, on a colorbar with discrete intervals. To make the length of each extension the same as the length of the interior colors, use `extendfrac='auto'`.

```python
fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.colors.ListedColormap(['royalblue', 'cyan',
                                    'yellow', 'orange'])
cmap.set_over('red')
cmap.set_under('blue')

bounds = [-1.0, -0.5, 0.0, 0.5, 1.0]
norm = mpl.colors.BoundaryNorm(bounds, cmap.N)
fig.colorbar(mpl.cm.ScalarMappable(cmap=cmap, norm=norm),
            cax=ax,
            boundaries=[-10] + bounds + [10],
            extend='both',
            extendfrac='auto',
            ticks=bounds,
            spacing='uniform',
            orientation='horizontal',
            label='Custom extension lengths, some other units',
            )

plt.show()
```

Out:

```
<matplotlib.colorbar.Colorbar object at 0x7f08b473c850>
```
2.4.3 Creating Colormaps in Matplotlib

Matplotlib has a number of built-in colormaps accessible via `matplotlib.cm.get_cmap`. There are also external libraries like `palettable` that have many extra colormaps.

However, we often want to create or manipulate colormaps in Matplotlib. This can be done using the class `ListedColormap` or `LinearSegmentedColormap`. Seen from the outside, both colormap classes map values between 0 and 1 to a bunch of colors. There are, however, slight differences, some of which are shown in the following.

Before manually creating or manipulating colormaps, let us first see how we can obtain colormaps and their colors from existing colormap classes.

Getting colormaps and accessing their values

First, getting a named colormap, most of which are listed in *Choosing Colormaps in Matplotlib*, may be done using `matplotlib.cm.get_cmap`, which returns a colormap object. The second argument gives the size of the list of colors used to define the colormap, and below we use a modest value of 8 so there are not a lot of values to look at.

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cm
from matplotlib.colors import ListedColormap, LinearSegmentedColormap

viridis = cm.get_cmap('viridis', 8)
```

The object `viridis` is a callable, that when passed a float between 0 and 1 returns an RGBA value from the colormap:

```python
print(viridis(0.56))
```

Out:

```
(0.122312, 0.633153, 0.530398, 1.0)
```

**ListedColormap**

`ListedColormap` s store their color values in a `.colors` attribute. The list of colors that comprise the colormap can be directly accessed using the `.colors` property, or it can be accessed indirectly by calling `viridis` with an array of values matching the length of the colormap. Note that the returned list is in the form of an RGBA Nx4 array, where N is the length of the colormap.

```python
print('viridis.colors', viridis.colors)
print('viridis(range(8))', viridis(range(8)))
print('viridis(np.linspace(0, 1, 8))', viridis(np.linspace(0, 1, 8)))
```

Out:

```
viridis.colors [[0.267004 0.004874 0.329415 1. ]
[0.275191 0.194905 0.496005 1. ]
[0.212395 0.359683 0.55171 1. ]
(continues on next page)
```
The colormap is a lookup table, so “oversampling” the colormap returns nearest-neighbor interpolation (note the repeated colors in the list below)

```
print('viridis(np.linspace(0, 1, 12))', viridis(np.linspace(0, 1, 12)))
```

Out:

```
viridis(np.linspace(0, 1, 12)) [[0.267004 0.004874 0.329415 1. ]
  [0.275191 0.194905 0.496005 1. ]
  [0.212395 0.359683 0.55171 1. ]
  [0.153364 0.497 0.557724 1. ]
  [0.122312 0.633153 0.530398 1. ]
  [0.288921 0.758394 0.428426 1. ]
  [0.626579 0.854645 0.223353 1. ]
  [0.993248 0.906157 0.143936 1. ]]
```

**LinearSegmentedColormap**

*LinearSegmentedColormap* s do not have a *colors* attribute. However, one may still call the colormap with an integer array, or with a float array between 0 and 1.

```
copper = cm.get_cmap('copper', 8)
print('copper(range(8))', copper(range(8)))
print('copper(np.linspace(0, 1, 8))', copper(np.linspace(0, 1, 8)))
```

Out:
Creating listed colormaps

Creating a colormap is essentially the inverse operation of the above where we supply a list or array of color specifications to `ListedColormap` to make a new colormap.

Before continuing with the tutorial, let us define a helper function that takes one of more colormaps as input, creates some random data and applies the colormap(s) to an image plot of that dataset.

```python
def plot_examples(colormaps):
    
    """
    Helper function to plot data with associated colormap.
    """
    np.random.seed(19680801)
    data = np.random.randn(30, 30)
    n = len(colormaps)
    fig, axs = plt.subplots(1, n, figsize=(n * 2 + 2, 3),
                           constrained_layout=True, squeeze=False)
    for [ax, cmap] in zip(axs.flat, colormaps):
        psm = ax.pcolormesh(data, cmap=cmap, rasterized=True, vmin=-4, vmax=4)
        fig.colorbar(psm, ax=ax)
    plt.show()
```

In the simplest case we might type in a list of color names to create a colormap from those.

```python
import matplotlib.pyplot as plt
import numpy as np

cmap = ListedColormap(['darkorange', 'gold', 'lawngreen', 'lightseagreen'])
plot_examples([cmap])
```
In fact, that list may contain any valid *matplotlib color specification*. Particularly useful for creating custom colormaps are Nx4 numpy arrays. Because with the variety of numpy operations that we can do on such an array, carpentry of new colormaps from existing colormaps become quite straightforward.

For example, suppose we want to make the first 25 entries of a 256-length “viridis” colormap pink for some reason:

```python
viridis = cm.get_cmap('viridis', 256)
newcolors = viridis(np.linspace(0, 1, 256))
pink = np.array([248/256, 24/256, 148/256, 1])
newcolors[:25, :] = pink
newcmp = ListedColormap(newcolors)
plot_examples([viridis, newcmp])
```

We can easily reduce the dynamic range of a colormap; here we choose the middle 0.5 of the colormap. However, we need to interpolate from a larger colormap, otherwise the new
colormap will have repeated values.

```python
viridis_big = cm.get_cmap('viridis', 512)
newcmp = ListedColormap(viridis_big(np.linspace(0.25, 0.75, 256)))
plot_examples([viridis, newcmp])
```

and we can easily concatenate two colormaps:

```python
top = cm.get_cmap('Oranges_r', 128)
bottom = cm.get_cmap('Blues', 128)
newcolors = np.vstack((top(np.linspace(0, 1, 128)),
                       bottom(np.linspace(0, 1, 128))))
newcmp = ListedColormap(newcolors, name='OrangeBlue')
plot_examples([viridis, newcmp])
```

Of course we need not start from a named colormap, we just need to create the Nx4 array to pass to `ListedColormap`. Here we create a colormap that goes from brown (RGB: 90, 40, 40)
to white (RGB: 255, 255, 255).

```python
N = 256
text = np.ones((N, 4))
text[:, 0] = np.linspace(90/256, 1, N)
text[:, 1] = np.linspace(40/256, 1, N)
text[:, 2] = np.linspace(40/256, 1, N)
newcmp = ListedColormap(text)
plot_examples([viridis, newcmp])
```

Creating linear segmented colormaps

`LinearSegmentedColormap` class specifies colormaps using anchor points between which RGBA values are interpolated.

The format to specify these colormaps allows discontinuities at the anchor points. Each anchor point is specified as a row in a matrix of the form `[x[i] yleft[i] yright[i]]`, where `x[i]` is the anchor, and `yleft[i]` and `yright[i]` are the values of the color on either side of the anchor point.

If there are no discontinuities, then `yleft[i]=yright[i]`:

```python
cdict = {'red': [[0.0, 0.0, 0.0],
                [0.5, 1.0, 1.0],
                [1.0, 1.0, 1.0]],
             'green': [[0.0, 0.0, 0.0],
                      [0.25, 0.0, 0.0],
                      [0.75, 1.0, 1.0],
                      [1.0, 1.0, 1.0]],
             'blue': [[0.0, 0.0, 0.0],
                      [0.5, 0.0, 0.0],
                      [1.0, 1.0, 1.0]]}

def plot_linearmap(cdict):
    newcmp = LinearSegmentedColormap('testCmap', segmentdata=cdict, N=256)
```

(continues on next page)
In order to make a discontinuity at an anchor point, the third column is different than the second. The matrix for each of "red", "green", "blue", and optionally "alpha" is set up as:

```
cdict['red'] = [[x[i] yleft[i] yright[i]],
                [x[i+1] yleft[i+1] yright[i+1]],
                ...
```

and for values passed to the colormap between \(x[i]\) and \(x[i+1]\), the interpolation is between \(yright[i]\) and \(yleft[i+1]\).

In the example below there is a discontinuity in red at 0.5. The interpolation between 0 and 0.5 goes from 0.3 to 1, and between 0.5 and 1 it goes from 0.9 to 1. Note that red[0, 1], and red[2, 2] are both superfluous to the interpolation because red[0, 1] is the value to the left of 0, and red[2, 2] is the value to the right of 1.0.

```
cdict['red'] = [[0.0, 0.0, 0.3],
                [0.5, 1.0, 0.9],
                [1.0, 1.0, 1.0]]
```

plot_linearmap(cdict)
Directly creating a segmented colormap from a list

The above described is a very versatile approach, but admittedly a bit cumbersome to implement. For some basic cases, the use of `LinearSegmentedColormap.from_list` may be easier. This creates a segmented colormap with equal spacings from a supplied list of colors.

```python
colors = ['darkorange', 'gold', 'lawngreen', 'lightseagreen']
cmap1 = LinearSegmentedColormap.from_list("mycmap", colors)
```

If desired, the nodes of the colormap can be given as numbers between 0 and 1. E.g. one could have the reddish part take more space in the colormap.

```python
nodes = [0.0, 0.4, 0.8, 1.0]
cmap2 = LinearSegmentedColormap.from_list("mycmap", list(zip(nodes, colors)))
```

```
plot_examples([cmap1, cmap2])
```
References

The use of the following functions, methods, classes and modules is shown in this example:

```python
import matplotlib
matplotlib.axes.Axes.pcolormesh
matplotlib.figure.Figure.colorbar
matplotlib.colors
matplotlib.colors.LinearSegmentedColormap
matplotlib.colors.ListedColormap
matplotlib.cm
matplotlib.cm.get_cmap
```

Out:

**Total running time of the script:** ( 0 minutes 2.805 seconds)

### 2.4.4 Colormap Normalization

Objects that use colormaps by default linearly map the colors in the colormap from data values \( v_{min} \) to \( v_{max} \). For example:

```python
pcm = ax.pcolormesh(x, y, Z, vmin=-1., vmax=1., cmap='RdBu_r')
```

will map the data in \( Z \) linearly from -1 to +1, so \( Z=0 \) will give a color at the center of the colormap \( RdBu_r \) (white in this case).

Matplotlib does this mapping in two steps, with a normalization from the input data to \([0, 1]\) occurring first, and then mapping onto the indices in the colormap. Normalizations are classes defined in the `matplotlib.colors()` module. The default, linear normalization is `matplotlib.colors.Normalize()`.

2.4. Colors
Artists that map data to color pass the arguments \texttt{vmin} and \texttt{vmax} to construct a \texttt{matplotlib.colors.Normalize()} instance, then call it:

```python
In [1]: import matplotlib as mpl
In [2]: norm = mpl.colors.Normalize(vmin=-1, vmax=1)
In [3]: norm(0)
Out[3]: 0.5
```

However, there are sometimes cases where it is useful to map data to colormaps in a non-linear fashion.

**Logarithmic**

One of the most common transformations is to plot data by taking its logarithm (to the base-10). This transformation is useful to display changes across disparate scales. Using \texttt{colors.LogNorm} normalizes the data via $\log_{10}$. In the example below, there are two bumps, one much smaller than the other. Using \texttt{colors.LogNorm}, the shape and location of each bump can clearly be seen:

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.colors as colors
import matplotlib.cbook as cbook

N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]

# A low hump with a spike coming out of the top right. Needs to have
# z/colour axis on a log scale so we see both hump and spike. linear
# scale only shows the spike.
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-((X * 10)**2 + (Y * 10)**2)
Z = Z1 + 50 * Z2

fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolor(X, Y, Z,
    norm=colors.LogNorm(vmin=Z.min(), vmax=Z.max()),
    cmap='PuBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[0], extend='max')

pcm = ax[1].pcolor(X, Y, Z, cmap='PuBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[1], extend='max')
plt.show()
```
Symmetric logarithmic

Similarly, it sometimes happens that there is data that is positive and negative, but we would still like a logarithmic scaling applied to both. In this case, the negative numbers are also scaled logarithmically, and mapped to smaller numbers; e.g., if $v_{\text{min}}=-v_{\text{max}}$, then the negative numbers are mapped from 0 to 0.5 and the positive from 0.5 to 1.

Since the logarithm of values close to zero tends toward infinity, a small range around zero needs to be mapped linearly. The parameter \textit{linthresh} allows the user to specify the size of this range (-\textit{linthresh}, \textit{linthresh}). The size of this range in the colormap is set by \textit{linscale}. When \textit{linscale} == 1.0 (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

```python
N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-(X - 1)**2 - (Y - 1)**2)
Z = (Z1 - Z2) * 2

fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolormesh(X, Y, Z,
                       norm=colors.SymLogNorm(linthresh=0.03, linscale=0.03,
                                               vmin=-1.0, vmax=1.0, base=10),
```
cmap='RdBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[0], extend='both')

pcm = ax[1].pcolormesh(X, Y, Z, cmap='RdBu_r', vmin=-np.max(Z), shading='auto')
fig.colorbar(pcm, ax=ax[1], extend='both')
plt.show()

Power-law

Sometimes it is useful to remap the colors onto a power-law relationship (i.e. $y = x^\gamma$, where $\gamma$ is the power). For this we use the `colors.PowerNorm`. It takes as an argument `gamma` (`gamma` == 1.0 will just yield the default linear normalization):

**Note:** There should probably be a good reason for plotting the data using this type of transformation. Technical viewers are used to linear and logarithmic axes and data transformations. Power laws are less common, and viewers should explicitly be made aware that they have been used.

```
N = 100
X, Y = np.mgrid[0:3:complex(0, N), 0:2:complex(0, N)]
```
```
Z1 = (1 + np.sin(Y * 10.)) * X**2

fig, ax = plt.subplots(2, 1)

pcm = ax[0].pcolormesh(X, Y, Z1, norm=colors.PowerNorm(gamma=0.5),
                        cmap='PuBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[0], extend='max')

pcm = ax[1].pcolormesh(X, Y, Z1, cmap='PuBu_r', shading='auto')
fig.colorbar(pcm, ax=ax[1], extend='max')

plt.show()
```

**Discrete bounds**

Another normalization that comes with Matplotlib is `colors.BoundaryNorm`. In addition to `vmin` and `vmax`, this takes as arguments boundaries between which data is to be mapped. The colors are then linearly distributed between these "bounds". It can also take an `extend` argument to add upper and/or lower out-of-bounds values to the range over which the colors are distributed. For instance:

```python
In [4]: import matplotlib.colors as colors
```
In [5]: `bounds = np.array([-0.25, -0.125, 0, 0.5, 1])`

In [6]: `norm = colors.BoundaryNorm(boundaries=bounds, ncolors=4)`

In [7]: `print(norm([-0.2, -0.15, -0.02, 0.3, 0.8, 0.99]))`
   : [0 0 1 2 3 3]

Note: Unlike the other norms, this norm returns values from 0 to ncolors-1.

```python
N = 100
X, Y = np.meshgrid(np.linspace(-3, 3, N), np.linspace(-2, 2, N))
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-((X - 1)**2 - (Y - 1)**2))
Z = ((Z1 - Z2) * 2)[:1, :1]

fig, ax = plt.subplots(2, 2, figsize=(8, 6), constrained_layout=True)
ax = ax.flatten()

# Default norm:
pcm = ax[0].pcolormesh(X, Y, Z, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[0], orientation='vertical')
ax[0].set_title('Default norm')

# Even bounds give a contour-like effect:
boundaries = np.linspace(-1.5, 1.5, 7)
norm = colors.BoundaryNorm(boundaries=boundaries, ncolors=256)
pcm = ax[1].pcolormesh(X, Y, Z, norm=norm, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[1], extend='both', orientation='vertical')
ax[1].set_title('BoundaryNorm: 7 boundaries')

# Bounds may be unevenly spaced:
boundaries = np.array([-0.2, -0.1, 0, 0.5, 1])
norm = colors.BoundaryNorm(boundaries=boundaries, ncolors=256)
pcm = ax[2].pcolormesh(X, Y, Z, norm=norm, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[2], extend='both', orientation='vertical')
ax[2].set_title('BoundaryNorm: nonuniform')

# With out-of-bounds colors:
boundaries = np.linspace(-1.5, 1.5, 7)
norm = colors.BoundaryNorm(boundaries=boundaries, ncolors=256, extend='both')
pcm = ax[3].pcolormesh(X, Y, Z, norm=norm, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[3], orientation='vertical')
ax[3].set_title('BoundaryNorm: extend="both"')
plt.show()
```
TwoSlopeNorm: Different mapping on either side of a center

Sometimes we want to have a different colormap on either side of a conceptual center point, and we want those two colormaps to have different linear scales. An example is a topographic map where the land and ocean have a center at zero, but land typically has a greater elevation range than the water has depth range, and they are often represented by a different colormap.

dem = cbook.get_sample_data('topobathy.npz', np_load=True)
topo = dem['topo']
longitude = dem['longitude']
latitude = dem['latitude']

fig, ax = plt.subplots()
# make a colormap that has land and ocean clearly delineated and of the
# same length (256 + 256)
colors_undersea = plt.cm.terrain(np.linspace(0, 0.17, 256))
colors_land = plt.cm.terrain(np.linspace(0.25, 1, 256))
all_colors = np.vstack((colors_undersea, colors_land))
terrain_map = colors.LinearSegmentedColormap.from_list(
    'terrain_map', all_colors)

# make the norm: Note the center is offset so that the land has more
# dynamic range:
Custom normalization: Manually implement two linear ranges

The `TwoSlopeNorm` described above makes a useful example for defining your own norm.

```python
class MidpointNormalize(colors.Normalize):
    def __init__(self, vmin=None, vmax=None, vcenter=None, clip=False):
        self.vcenter = vcenter
        colors.Normalize.__init__(self, vmin, vmax, clip)

    def __call__(self, value, clip=None):
        # I'm ignoring masked values and all kinds of edge cases to make a
        # simple example...
```

(continues on next page)
x, y = [self.vmin, self.vcenter, self.vmax], [0, 0.5, 1]
return np.ma.masked_array(np.interp(value, x, y))

fig, ax = plt.subplots()
midnorm = MidpointNormalize(vmin=-500., vcenter=0, vmax=4000)
pcm = ax.pcolormesh(longitude, latitude, topo, rasterized=True, norm=midnorm,
cmap=terrain_map, shading='auto')
ax.set_aspect(1 / np.cos(np.deg2rad(49)))
fig.colorbar(pcm, shrink=0.6, extend='both')
plt.show()
Overview

The idea behind choosing a good colormap is to find a good representation in 3D colorspace for your data set. The best colormap for any given data set depends on many things including:

- Whether representing form or metric data ([Ware])
- Your knowledge of the data set (e.g., is there a critical value from which the other values deviate?)
- If there is an intuitive color scheme for the parameter you are plotting
- If there is a standard in the field the audience may be expecting

For many applications, a perceptually uniform colormap is the best choice; i.e. a colormap in which equal steps in data are perceived as equal steps in the color space. Researchers have found that the human brain perceives changes in the lightness parameter as changes in the data much better than, for example, changes in hue. Therefore, colormaps which have monotonically increasing lightness through the colormap will be better interpreted by the viewer. A wonderful example of perceptually uniform colormaps is [colorcet].

Color can be represented in 3D space in various ways. One way to represent color is using CIELAB. In CIELAB, color space is represented by lightness, $L^*$; red-green, $a^*$; and yellow-blue, $b^*$. The lightness parameter $L^*$ can then be used to learn more about how the matplotlib colormaps will be perceived by viewers.

An excellent starting resource for learning about human perception of colormaps is from [IBM].

Classes of colormaps

Colormaps are often split into several categories based on their function (see, e.g., [Moreland]):

1. Sequential: change in lightness and often saturation of color incrementally, often using a single hue; should be used for representing information that has ordering.

2. Diverging: change in lightness and possibly saturation of two different colors that meet in the middle at an unsaturated color; should be used when the information being plotted has a critical middle value, such as topography or when the data deviates around zero.

3. Cyclic: change in lightness of two different colors that meet in the middle and begin/end at an unsaturated color; should be used for values that wrap around at the endpoints, such as phase angle, wind direction, or time of day.

4. Qualitative: often are miscellaneous colors; should be used to represent information which does not have ordering or relationships.
Sequential

For the Sequential plots, the lightness value increases monotonically through the colormaps. This is good. Some of the $L^*$ values in the colormaps span from 0 to 100 (binary and the other grayscale), and others start around $L^* = 20$. Those that have a smaller range of $L^*$ will accordingly have a smaller perceptual range. Note also that the $L^*$ function varies amongst the colormaps: some are approximately linear in $L^*$ and others are more curved.

```python
cmaps['Perceptually Uniform Sequential'] = [
    'viridis', 'plasma', 'inferno', 'magma', 'cividis']
cmaps['Sequential'] = [
    'Greys', 'Purples', 'Blues', 'Greens', 'Oranges', 'Reds',
    'YlOrBr', 'YlOrRd', 'OrRd', 'PuRd', 'RdPu', 'BuPu',
    'GnBu', 'PuBu', 'YlGnBu', 'PuBuGn', 'BuGn', 'YlGn']
```

Sequential2

Many of the $L^*$ values from the Sequential2 plots are monotonically increasing, but some (autumn, cool, spring, and winter) plateau or even go both up and down in $L^*$ space. Others (afmhot, copper, gist_heat, and hot) have kinks in the $L^*$ functions. Data that is being represented in a region of the colormap that is at a plateau or kink will lead to a perception of banding of the data in those values in the colormap (see [mycarta-banding] for an excellent example of this).

```python
cmaps['Sequential (2)'] = [
    'binary', 'gist_yarg', 'gist_gray', 'gray', 'bone', 'pink',
    'spring', 'summer', 'autumn', 'winter', 'cool', 'Wistia',
    'hot', 'afmhot', 'gist_heat', 'copper']
```

Diverging

For the Diverging maps, we want to have monotonically increasing $L^*$ values up to a maximum, which should be close to $L^* = 100$, followed by monotonically decreasing $L^*$ values. We are looking for approximately equal minimum $L^*$ values at opposite ends of the colormap. By these measures, BrBG and RdBu are good options. coolwarm is a good option, but it doesn’t span a wide range of $L^*$ values (see grayscale section below).

```python
cmaps['Diverging'] = [
    'PiYG', 'PRGn', 'BrBG', 'PuOr', 'RdGy', 'RdBu',
    'RdYlBu', 'RdYlGn', 'Spectral', 'coolwarm', 'bwr', 'seismic']
```

Cyclic

For Cyclic maps, we want to start and end on the same color, and meet a symmetric center point in the middle. $L^*$ should change monotonically from start to middle, and inversely from middle to end. It should be symmetric on the increasing and decreasing side, and only differ in hue. At the ends and middle, $L^*$ will reverse direction, which should be smoothed in $L^*$ space to reduce artifacts. See [kovesi-colormaps] for more information on the design of cyclic maps.
The often-used HSV colormap is included in this set of colormaps, although it is not symmetric to a center point. Additionally, the $L^*$ values vary widely throughout the colormap, making it a poor choice for representing data for viewers to see perceptually. See an extension on this idea at [mycarta-jet].

```
cmaps['Cyclic'] = ['twilight', 'twilight_shifted', 'hsv']
```

**Qualitative**

Qualitative colormaps are not aimed at being perceptual maps, but looking at the lightness parameter can verify that for us. The $L^*$ values move all over the place throughout the colormap, and are clearly not monotonically increasing. These would not be good options for use as perceptual colormaps.

```
cmaps['Qualitative'] = ['Pastel1', 'Pastel2', 'Paired', 'Accent', 'Dark2', 'Set1', 'Set2', 'Set3', 'tab10', 'tab20', 'tab20b', 'tab20c']
```

**Miscellaneous**

Some of the miscellaneous colormaps have particular uses for which they have been created. For example, gist earth, ocean, and terrain all seem to be created for plotting topography (green/brown) and water depths (blue) together. We would expect to see a divergence in these colormaps, then, but multiple kinks may not be ideal, such as in gist earth and terrain. CMRmap was created to convert well to grayscale, though it does appear to have some small kinks in $L^*$. cubehelix was created to vary smoothly in both lightness and hue, but appears to have a small hump in the green hue area. turbo was created to display depth and disparity data.

The often-used jet colormap is included in this set of colormaps. We can see that the $L^*$ values vary widely throughout the colormap, making it a poor choice for representing data for viewers to see perceptually. See an extension on this idea at [mycarta-jet] and [turbo].

```
cmaps['Miscellaneous'] = [
    'flag', 'prism', 'ocean', 'gist_earth', 'terrain', 'gist_stern',
    'gnuplot', 'gnuplot2', 'CMRmap', 'cubehelix', 'brg',

Grayscale conversion

It is important to pay attention to conversion to grayscale for color plots, since they may be printed on black and white printers. If not carefully considered, your readers may end up with indecipherable plots because the grayscale changes unpredictably through the colormap.

Conversion to grayscale is done in many different ways [bw]. Some of the better ones use a linear combination of the rgb values of a pixel, but weighted according to how we perceive color intensity. A nonlinear method of conversion to grayscale is to use the $L^*$ values of the pixels. In general, similar principles apply for this question as they do for presenting one’s information perceptually; that is, if a colormap is chosen that is monotonically increasing in
L* values, it will print in a reasonable manner to grayscale.

With this in mind, we see that the Sequential colormaps have reasonable representations in grayscale. Some of the Sequential2 colormaps have decent enough grayscale representations, though some (autumn, spring, summer, winter) have very little grayscale change. If a colormap like this was used in a plot and then the plot was printed to grayscale, a lot of the information may map to the same gray values. The Diverging colormaps mostly vary from darker gray on the outer edges to white in the middle. Some (PuOr and seismic) have noticeably darker gray on one side than the other and therefore are not very symmetric. coolwarm has little range of gray scale and would print to a more uniform plot, losing a lot of detail. Note that overlaid, labeled contours could help differentiate between one side of the colormap vs. the other since color cannot be used once a plot is printed to grayscale. Many of the Qualitative and Miscellaneous colormaps, such as Accent, hsv, jet and turbo, change from darker to lighter and back to darker grey throughout the colormap. This would make it impossible for a viewer to interpret the information in a plot once it is printed in grayscale.

```python
mpl.rcParams.update({'font.size': 14})

# Indices to step through colormap.
x = np.linspace(0.0, 1.0, 100)
gradient = np.linspace(0, 1, 256)
gradient = np.vstack((gradient, gradient))

def plot_color_gradients(cmap_category, cmap_list):
    fig, axes = plt.subplots(nrows=len(cmap_list), ncols=2)

There is a lot of information available about color blindness (e.g., [colorblindness]). Additionally, there are tools available to convert images to how they look for different types of color vision deficiencies.

The most common form of color vision deficiency involves differentiating between red and green. Thus, avoiding colormaps with both red and green will avoid many problems in general.

2.5 Provisional

These tutorials cover proposed APIs of any complexity. These are here to document features that we have released, but want to get user feedback on before committing to them. Please have a look, try them out and give us feedback on [gitter], [discourse], or the [mailing list]! But, be aware that we may change the APIs without warning in subsequent versions.
2.5.1 Complex and semantic figure composition

**Warning:** This tutorial documents experimental / provisional API. We are releasing this in v3.3 to get user feedback. We may make breaking changes in future versions with no warning.

Laying out Axes in a Figure in a non uniform grid can be both tedious and verbose. For dense, even grids we have `Figure.subplots` but for more complex layouts, such as Axes that span multiple columns / rows of the layout or leave some areas of the Figure blank, you can use `gridspec.GridSpec` (see Customizing Figure Layouts Using GridSpec and Other Functions) or manually place your axes. `Figure.subplot_mosaic` aims to provide an interface to visually lay out your axes (as either ASCII art or nested lists) to streamline this process.

This interface naturally supports naming your axes. `Figure.subplot_mosaic` returns a dictionary keyed on the labels used to lay out the Figure. By returning data structures with names, it is easier to write plotting code that is independent of the Figure layout.

This is inspired by a proposed MEP and the `patchwork` library for R. While we do not implement the operator overloading style, we do provide a Pythonic API for specifying (nested) Axes layouts.

```python
import matplotlib.pyplot as plt
import numpy as np

# Helper function used for visualization in the following examples
def identify_axes(ax_dict, fontsize=48):
    """
    Helper to identify the Axes in the examples below.
    Draws the label in a large font in the center of the Axes.
    Parameters
    --------
    ax_dict : Dict[str, Axes]
        Mapping between the title / label and the Axes.
    fontsize : int, optional
        How big the label should be
    """
    kw = dict(ha="center", va="center", fontsize=fontsize, color="darkgrey")
    for k, ax in ax_dict.items():
        ax.text(0.5, 0.5, k, transform=ax.transAxes, **kw)
```

If we want a 2x2 grid we can use `Figure.subplots` which returns a 2D array of `axes.Axes` which we can index into to do our plotting.

```python
np.random.seed(19680801)
hist_data = np.random.randn(1500)

fig = plt.figure(constrained_layout=True)
ax_array = fig.subplots(2, 2, squeeze=False)
ax_array[0, 0].bar(['a', 'b', 'c'], [5, 7, 9])
```

(continues on next page)
Using `Figure.subplot_mosaic` we can produce the same layout but give the axes semantic names.

```python
fig = plt.figure(constrained_layout=True)
ax_dict = fig.subplot_mosaic(
    [['bar', 'plot'],
     ['hist', 'image']])
ax_dict['bar'].bar(['a', 'b', 'c'], [5, 7, 9])
ax_dict['plot'].plot([1, 2, 3])
ax_dict['hist'].hist(hist_data)
ax_dict['image'].imshow([[1, 2], [2, 1]])
identify_axes(ax_dict)
```
A key difference between `Figure.subplots` and `Figure.subplot_mosaic` is the return value. While the former returns an array for index access, the latter returns a dictionary mapping the labels to the `axes.Axes` instances created.

```python
print(ax_dict)
```

Out:

```python
{'plot': <AxesSubplot:label='plot'>, 'bar': <AxesSubplot:label='bar'>, 'hist': <AxesSubplot:label='hist'>, 'image': <AxesSubplot:label='image'>}
```

**String short-hand**

By restricting our axes labels to single characters we can use `Using` we can “draw” the Axes we want as “ASCII art”. The following

```python
layout = "AB
      CD"
```

will give us 4 Axes laid out in a 2x2 grid and generates the same figure layout as above (but now labeled with{"A", "B", "C", "D"} rather than{"bar", "plot", "hist", "image"}).
Something we can do with `Figure.subplot_mosaic` that you can not do with `Figure.subplots` is specify that an Axes should span several rows or columns.

If we want to re-arrange our four Axes to have C be a horizontal span on the bottom and D be a vertical span on the right we would do

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    "ABD
    CCD
    
"
)
identify_axes(axd)
```
If we do not want to fill in all the spaces in the Figure with Axes, we can specify some spaces in the grid to be blank.

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    "A.C
    BBB
    .D.
    ""
)
identify_axes(axd)
```
If we prefer to use another character (rather than a period ".") to mark the empty space, we can use `empty_sentinel` to specify the character to use.

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic("aX
   "Xb
   "b"
   empty_sentinel="X",
)
identify_axes(axd)
```
Internally there is no meaning attached to the letters we use, any Unicode code point is valid!

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    "ab"
)
identify_axes(axd)
```
It is not recommended to use white space as either a label or an empty sentinel with the string shorthand because it may be stripped while processing the input.

**Controlling layout and subplot creation**

This feature is built on top of `gridspec` and you can pass the keyword arguments through to the underlying `gridspec.GridSpec` (the same as `Figure.subplots`).

In this case we want to use the input to specify the arrangement, but set the relative widths of the rows / columns via `gridspec_kw`.

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic("a.bAc
bAc
d.d",
gridspec_kw={
    # set the height ratios between the rows
    "height_ratios": [1, 3.5, 1],
    # set the width ratios between the columns
    "width_ratios": [1, 3.5, 1],
},
)
identify_axes(axd)
```
Or use the \{left, right, bottom, top\} keyword arguments to position the overall layout to put multiple versions of the same layout in a figure.

```python
layout = """AA
       BC"
fig = plt.figure()
axd = fig.subplot_mosaic(
    layout,
    gridspec_kw={
        "bottom": 0.25,
        "top": 0.95,
        "left": 0.1,
        "right": 0.5,
        "wspace": 0.5,
        "hspace": 0.5,
    },
)
identify_axes(axd)

axd = fig.subplot_mosaic(
    layout,
    gridspec_kw={
        "bottom": 0.05,
        "top": 0.75,
        "left": 0.6,
        "right": 0.95,
    }
)
```

(continues on next page)
We can also pass through arguments used to create the subplots (again, the same as `Figure.subplots`).

```python
taxd = plt.figure(constrained_layout=True).subplot_mosaic("AB", subplot_kw={"projection": "polar"})
identify_axes(axd)
```
Nested List input

Everything we can do with the string short-hand we can also do when passing in a list (internally we convert the string shorthand to a nested list), for example using spans, blanks, and `gridspec_kw`:

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    [['main', 'zoom'],
     ['main', 'BLANK'],
    ],
    empty_sentinel="BLANK",
    gridspec_kw={"width_ratios": [2, 1]}
)
identify_axes(axd)
```
In addition, using the list input we can specify nested layouts. Any element of the inner list can be another set of nested lists:

```python
inner = [
    ['inner A'],
    ['inner B'],
]
outer_nested_layout = [
    ['main', inner],
    ['bottom', 'bottom'],
]
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    outer_nested_layout, empty_sentinel=None
)
identify_axes(axd, fontsize=36)
```
We can also pass in a 2D NumPy array to do things like

```python
layout = np.zeros((4, 4), dtype=int)
for j in range(4):
    layout[j, j] = j + 1
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    layout, empty_sentinel=0
)
identify_axes(axd)
```
matplotlib has extensive text support, including support for mathematical expressions, true-type support for raster and vector outputs, newline separated text with arbitrary rotations, and unicode support. These tutorials cover the basics of working with text in Matplotlib.

2.6.1 Text in Matplotlib Plots

Introduction to plotting and working with text in Matplotlib.

Matplotlib has extensive text support, including support for mathematical expressions, true-type support for raster and vector outputs, newline separated text with arbitrary rotations, and unicode support.

Because it embeds fonts directly in output documents, e.g., for postscript or PDF, what you see on the screen is what you get in the hardcopy. **FreeType** support produces very nice, antialiased fonts, that look good even at small raster sizes. Matplotlib includes its own `matplotlib.font_manager` (thanks to Paul Barrett), which implements a cross platform, **W3C** compliant font finding algorithm.
The user has a great deal of control over text properties (font size, font weight, text location and color, etc.) with sensible defaults set in the rc file. And significantly, for those interested in mathematical or scientific figures, Matplotlib implements a large number of TeX math symbols and commands, supporting mathematical expressions anywhere in your figure.

## Basic text commands

The following commands are used to create text in the pyplot interface and the object-oriented API:

<table>
<thead>
<tr>
<th>pyplot API</th>
<th>OO API</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>text</td>
<td>Add text at an arbitrary location of the Axes.</td>
</tr>
<tr>
<td>annotate</td>
<td>annotate</td>
<td>Add an annotation, with an optional arrow, at an arbitrary location of the Axes.</td>
</tr>
<tr>
<td>xlabel</td>
<td>set_xlabel</td>
<td>Add a label to the Axes’s x-axis.</td>
</tr>
<tr>
<td>ylabel</td>
<td>set_ylabel</td>
<td>Add a label to the Axes’s y-axis.</td>
</tr>
<tr>
<td>title</td>
<td>set_title</td>
<td>Add a title to the Axes.</td>
</tr>
<tr>
<td>figtext</td>
<td>text</td>
<td>Add text at an arbitrary location of the Figure.</td>
</tr>
<tr>
<td>suptitle</td>
<td>suptitle</td>
<td>Add a title to the Figure.</td>
</tr>
</tbody>
</table>

All of these functions create and return a Text instance, which can be configured with a variety of font and other properties. The example below shows all of these commands in action, and more detail is provided in the sections that follow.

```python
import matplotlib
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111)
fig.subplots_adjust(top=0.85)

# Set titles for the figure and the subplot respectively
fig.suptitle('bold figure suptitle', fontsize=14, fontweight='bold')
ax.set_title('axes title')

ax.set_xlabel('xlabel')
ax.set_ylabel('ylabel')

# Set both x- and y-axis limits to [0, 10] instead of default [0, 1]
ax.axis([0, 10, 0, 10])

ax.text(3, 8, 'boxed italics text in data coords', style='italic',
        bbox={'facecolor': 'red', 'alpha': 0.5, 'pad': 10})

ax.text(2, 6, r'an equation: $E=mc^2$', fontsize=15)

ax.text(3, 2, 'unicode: Institut für Festkörperphysik')

ax.text(0.95, 0.01, 'colored text in axes coords',
        verticalalignment='bottom', horizontalalignment='right',
        transform=ax.transAxes,
        color='green', fontsize=15)
```

(continues on next page)
ax.plot([2], [1], 'o')
ax.annotate('annotate', xy=(2, 1), xytext=(3, 4),
            arrowprops=dict(facecolor='black', shrink=0.05))
plt.show()

**Labels for x- and y-axis**

Specifying the labels for the x- and y-axis is straightforward, via the `set_xlabel` and `set_ylabel` methods.

```python
import matplotlib.pyplot as plt
import numpy as np

x1 = np.linspace(0.0, 5.0, 100)
y1 = np.cos(2 * np.pi * x1) * np.exp(-x1)

fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1)
ax.set_xlabel('time [s]')
ax.set_ylabel('Damped oscillation [V]')
```
The x- and y-labels are automatically placed so that they clear the x- and y-ticklabels. Compare the plot below with that above, and note the y-label is to the left of the one above.

```python
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1*10000)
ax.set_xlabel('time [s]')
ax.set_ylabel('Damped oscillation [V]')
plt.show()
```

If you want to move the labels, you can specify the `labelpad` keyword argument, where the value is points (1/72", the same unit used to specify fontsizes).

2.6. Text
Or, the labels accept all the *Text* keyword arguments, including *position*, via which we can manually specify the label positions. Here we put the xlabel to the far left of the axis. Note, that the y-coordinate of this position has no effect - to adjust the y-position we need to use the *labelpad* kwarg.
All the labelling in this tutorial can be changed by manipulating the `matplotlib.font_manager.FontProperties` method, or by named kwargs to `set_xlabel`

```python
from matplotlib.font_manager import FontProperties

font = FontProperties()
font.set_family('serif')
font.set_name('Times New Roman')
font.set_style('italic')

fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1)
ax.set_xlabel('time [s]', fontsize='large', fontweight='bold')
ax.set_ylabel('Damped oscillation [V]', fontproperties=font)

plt.show()
```
Finally, we can use native TeX rendering in all text objects and have multiple lines:

```python
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.2, left=0.2)
ax.plot(x1, np.cumsum(y1**2))
ax.set_xlabel('time [s] 
This was a long experiment')
ax.set_ylabel(r'$\int Y^2 \ dt \ [V^2 \ s]$')
plt.show()
```

![Graph showing integrated squared displacement over time.

This was a long experiment](image)

**Titles**

Subplot titles are set in much the same way as labels, but there is the `loc` keyword arguments that can change the position and justification from the default value of `loc=center`.

```python
fig, axs = plt.subplots(3, 1, figsize=(5, 6), tight_layout=True)
locs = ['center', 'left', 'right']
for ax, loc in zip(axs, locs):
    ax.plot(x1, y1)
    ax.set_title('Title with loc at ' + loc, loc=loc)
plt.show()
```
Vertical spacing for titles is controlled via `rcParams["axes.titlepad"]` (default: 6.0), which defaults to 5 points. Setting to a different value moves the title.

```python
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(top=0.8)
ax.plot(x1, y1)
ax.set_title('Vertically offset title', pad=30)
plt.show()
```
Ticks and ticklabels

Placing ticks and ticklabels is a very tricky aspect of making a figure. Matplotlib does its best to accomplish the task automatically, but it also offers a very flexible framework for determining the choices for tick locations, and how they are labelled.

Terminology

Axes have an `matplotlib.axes.Axes` object for the `ax.xaxis` and `ax.yaxis` that contain the information about how the labels in the axis are laid out.

The axis API is explained in detail in the documentation to `axis`.

An Axis object has major and minor ticks. The Axis has `Axis.set_major_locator` and `Axis.set_minor_locator` methods that use the data being plotted to determine the location of major and minor ticks. There are also `Axis.set_major_formatter` and `Axis.set_minor_formatter` methods that format the tick labels.

Simple ticks

It often is convenient to simply define the tick values, and sometimes the tick labels, overriding the default locators and formatters. This is discouraged because it breaks interactive navigation of the plot. It also can reset the axis limits: note that the second plot has the ticks we asked for, including ones that are well outside the automatic view limits.

```python
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
axs[1].xaxis.set_ticks(np.arange(0., 8.1, 2.))
plt.show()
```
We can of course fix this after the fact, but it does highlight a weakness of hard-coding the ticks. This example also changes the format of the ticks:

```python
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
ticks = np.arange(0., 8.1, 2.)
# list comprehension to get all tick labels...
tickla = [f'{tick:.2f}' for tick in ticks]
axs[1].xaxis.set_ticks(ticks)
axs[1].xaxis.set_ticklabels(tickla)
axs[1].set_xlim(axs[0].get_xlim())
plt.show()
```
Tick Locators and Formatters

Instead of making a list of all the tickalbels, we could have used `matplotlib.ticker.StrMethodFormatter` (new-style `str.format()` format string) or `matplotlib.ticker.FormatStrFormatter` (old-style `%` format string) and passed it to the `ax.xaxis`. A `matplotlib.ticker.StrMethodFormatter` can also be created by passing a `str` without having to explicitly create the formatter.

```python
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
ticks = np.arange(0., 8.1, 2.)
axs[1].xaxis.set_ticks(ticks)
axs[1].xaxis.set_major_formatter('{x:1.1f}')
axs[1].set_xlim(axs[0].get_xlim())
plt.show()
```

And of course we could have used a non-default locator to set the tick locations. Note we still pass in the tick values, but the x-limit fix used above is *not* needed.

```python
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
locator = matplotlib.ticker.FixedLocator(ticks)
axs[1].xaxis.set_major_locator(locator)
axs[1].xaxis.set_major_formatter('{±x:1.1f}')
plt.show()
```
The default formatter is the `matplotlib.ticker.MaxNLocator` called as `ticker.MaxNLocator(self, nbins='auto', steps=[1, 2, 2.5, 5, 10])` The `steps` keyword contains a list of multiples that can be used for tick values. i.e. in this case, 2, 4, 6 would be acceptable ticks, as would 20, 40, 60 or 0.2, 0.4, 0.6. However, 3, 6, 9 would not be acceptable because 3 doesn’t appear in the list of steps.

`nbins=auto` uses an algorithm to determine how many ticks will be acceptable based on how long the axis is. The fontsize of the ticklabel is taken into account, but the length of the tick string is not (because its not yet known.) In the bottom row, the ticklabels are quite large, so we set `nbins=4` to make the labels fit in the right-hand plot.

```python
fig, axs = plt.subplots(2, 2, figsize=(8, 5), tight_layout=True)
for n, ax in enumerate(axs.flat):
    ax.plot(x1*10., y1)

formatter = matplotlib.ticker.FormatStrFormatter('%1.1f')
locator = matplotlib.ticker.MaxNLocator(nbins='auto', steps=[1, 4, 10])
axs[0, 1].xaxis.set_major_locator(locator)
axs[0, 1].xaxis.set_major_formatter(formatter)

formatter = matplotlib.ticker.FormatStrFormatter('%1.5f')
locator = matplotlib.ticker.AutoLocator()
axs[1, 0].xaxis.set_major_formatter(formatter)
axs[1, 0].xaxis.set_major_locator(locator)

formatter = matplotlib.ticker.FormatStrFormatter('%1.5f')
locator = matplotlib.ticker.MaxNLocator(nbins=4)
axs[1, 1].xaxis.set_major_formatter(formatter)
axs[1, 1].xaxis.set_major_locator(locator)

plt.show()
```
Finally, we can specify functions for the formatter using `matplotlib.ticker.FuncFormatter`. Further, like `matplotlib.ticker.StrMethodFormatter`, passing a function will automatically create a `matplotlib.ticker.FuncFormatter`.

```python
def formatoddticks(x, pos):
    # "Format odd tick positions."
    if x % 2:
        return f'{x:1.2f}'
    else:
        return ''

fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
ax.plot(x1, y1)
locator = matplotlib.ticker.MaxNLocator(nbins=6)
ax.xaxis.set_major_formatter(formatoddticks)
ax.xaxis.set_major_locator(locator)
plt.show()
```
Dateticks

Matplotlib can accept `datetime.datetime` and `numpy.datetime64` objects as plotting arguments. Dates and times require special formatting, which can often benefit from manual intervention. In order to help, dates have special Locators and Formatters, defined in the `matplotlib.dates` module.

A simple example is as follows. Note how we have to rotate the tick labels so that they don’t over-run each other.

```python
import datetime

fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
base = datetime.datetime(2017, 1, 1, 0, 0, 1)
time = [base + datetime.timedelta(days=x) for x in range(len(x1))]

ax.plot(time, y1)
ax.tick_params(axis='x', rotation=70)
plt.show()
```
We can pass a format to `matplotlib.dates.DateFormatter`. Also note that the 29th and the next month are very close together. We can fix this by using the `dates.DayLocator` class, which allows us to specify a list of days of the month to use. Similar formatters are listed in the `matplotlib.dates` module.

```python
import matplotlib.dates as mdates

locator = mdates.DayLocator(bymonthday=[1, 15])
formatter = mdates.DateFormatter('%b %d')

fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
ax.xaxis.set_major_locator(locator)
ax.xaxis.set_major_formatter(formatter)
ax.plot(time, y1)
ax.tick_params(axis='x', rotation=70)
plt.show()
```
2.6.2 Text properties and layout

Controlling properties of text and its layout with Matplotlib.

```
matplotlib.text.Text
```
instances have a variety of properties which can be configured via keyword arguments to `set_title`, `set_xlabel`, `text`, etc.

<table>
<thead>

</tr>
</tbody>
</table>

You can lay out text with the alignment arguments `horizontalalignment`, `verticalalignment`, and `multialignment`. `horizontalalignment` controls whether the x positional argument for the text indicates the left, center or right side of the text bounding box. `verticalalignment` controls whether the y positional argument for the text indicates the bottom, center or top side of the text bounding box. `multialignment`, for newline separated strings only, controls whether the...
different lines are left, center or right justified. Here is an example which uses the `text()` command to show the various alignment possibilities. The use of `transform=ax.transAxes` throughout the code indicates that the coordinates are given relative to the axes bounding box, with (0, 0) being the lower left of the axes and (1, 1) the upper right.

```python
import matplotlib.pyplot as plt
import matplotlib.patches as patches

# build a rectangle in axes coords
left, width = .25, .5
bottom, height = .25, .5
right = left + width
top = bottom + height

fig = plt.figure()
ax = fig.add_axes([0, 0, 1, 1])

# axes coordinates: (0, 0) is bottom left and (1, 1) is upper right
p = patches.Rectangle(
    (left, bottom), width, height,
    fill=False, transform=ax.transAxes, clip_on=False
)

ax.add_patch(p)

ax.text(left, bottom, 'left top',
        horizontalalignment='left',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(left, bottom, 'left bottom',
        horizontalalignment='left',
        verticalalignment='bottom',
        transform=ax.transAxes)

ax.text(right, top, 'right bottom',
        horizontalalignment='right',
        verticalalignment='bottom',
        transform=ax.transAxes)

ax.text(right, top, 'right top',
        horizontalalignment='right',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(right, bottom, 'center top',
        horizontalalignment='center',
        verticalalignment='top',
        transform=ax.transAxes)

ax.text(left, 0.5*(bottom+top), 'right center',
        horizontalalignment='right',
        verticalalignment='center',
        rotation='vertical',
        transform=ax.transAxes)

ax.text(left, 0.5*(bottom+top), 'left center',
        horizontalalignment='left',

(continues on next page)
verticalalignment='center',
rotation='vertical',
transform=ax.transAxes)

ax.text(0.5*(left+right), 0.5*(bottom+top), 'middle',
horizontalalignment='center',
verticalalignment='center',
fontsize=20, color='red',
transform=ax.transAxes)

ax.text(right, 0.5*(bottom+top), 'centered',
horizontalalignment='center',
verticalalignment='center',
rotation='vertical',
transform=ax.transAxes)

ax.text(left, top, 'rotated\nwith newlines',
horizontalalignment='center',
verticalalignment='center',
rotation=45,
transform=ax.transAxes)

ax.set_axis_off()
plt.show()
2.6.3 Default Font

The base default font is controlled by a set of rcParams. To set the font for mathematical expressions, use the rcParams beginning with `mathtext` (see `mathtext`).

<table>
<thead>
<tr>
<th>rcParam</th>
<th>usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>'font.family'</td>
<td>List of either names of font or {'cursive', 'fantasy', 'monospace', 'sans', 'sans serif', 'sans-serif', 'serif'}.</td>
</tr>
<tr>
<td>'font.style'</td>
<td>The default style, ex 'normal', 'italic'.</td>
</tr>
<tr>
<td>'font.variant'</td>
<td>Default variant, ex 'normal', 'small-caps' (untested)</td>
</tr>
<tr>
<td>'font.stretch'</td>
<td>Default stretch, ex 'normal', 'condensed' (incomplete)</td>
</tr>
<tr>
<td>'font.weight'</td>
<td>Default weight. Either string or integer</td>
</tr>
<tr>
<td>'font.size'</td>
<td>Default font size in points. Relative font sizes ('large', 'x-small') are computed against this size.</td>
</tr>
</tbody>
</table>

The mapping between the family aliases ({'cursive', 'fantasy', 'monospace', 'sans', 'sans serif', 'sans-serif', 'serif'}) and actual font names is controlled by the following rcParams:

<table>
<thead>
<tr>
<th>family alias</th>
<th>rcParam with mappings</th>
</tr>
</thead>
<tbody>
<tr>
<td>'serif'</td>
<td>'font.serif'</td>
</tr>
<tr>
<td>'monospace'</td>
<td>'font.monospace'</td>
</tr>
<tr>
<td>'fantasy'</td>
<td>'font.fantasy'</td>
</tr>
<tr>
<td>'cursive'</td>
<td>'font.cursive'</td>
</tr>
<tr>
<td>{'sans', 'sans serif', 'sans-serif'}</td>
<td>'font.sans-serif'</td>
</tr>
</tbody>
</table>

which are lists of font names.

Text with non-latin glyphs

As of v2.0 the default font, DejaVu, contains glyphs for many western alphabets, but not other scripts, such as Chinese, Korean, or Japanese.

To set the default font to be one that supports the code points you need, prepend the font name to `font.family` or the desired alias lists

```python
matplotlib.rcParams['font.sans-serif'] = ['Source Han Sans TW', 'sans-serif']
```

or set it in your `.matplotlibrc` file:

```python
font.sans-serif: Source Han Sans TW, Arial, sans-serif
```

To control the font used on per-artist basis use the `'name'`, `'fontname'` or `'fontproperties'` kwargs documented *above*.

On linux, `fc-list` can be a useful tool to discover the font name; for example
lists all of the fonts that support Chinese.

## 2.6.4 Annotations

Annotating text with Matplotlib.

    * Using ConnectionPatch
  - Advanced Topics
    * Zoom effect between Axes
    * Define Custom BoxStyle

### Basic annotation

The uses of the basic `text()` will place text at an arbitrary position on the Axes. A common use case of text is to annotate some feature of the plot, and the `annotate()` method provides helper functionality to make annotations easy. In an annotation, there are two points to consider: the location being annotated represented by the argument `xy` and the location of the text `xytext`. Both of these arguments are \((x, y)\) tuples.

In this example, both the `xy` (arrow tip) and `xytext` locations (text location) are in data coordinates. There are a variety of other coordinate systems one can choose – you can specify the coordinate system of `xy` and `xytext` with one of the following strings for `xycoords` and `textcoords` (default is ‘data’).
Fig. 23: Annotation Basic

<table>
<thead>
<tr>
<th>argument</th>
<th>coordinate system</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>points from the lower left corner of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>points from the lower left corner of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>(0, 0) is lower left of figure and (1, 1) is upper right</td>
</tr>
<tr>
<td>'axes points'</td>
<td>points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>(0, 0) is lower left of axes and (1, 1) is upper right</td>
</tr>
<tr>
<td>'data'</td>
<td>use the axes data coordinate system</td>
</tr>
</tbody>
</table>

For example to place the text coordinates in fractional axes coordinates, one could do:

```python
ax.annotate('local max', xy=(3, 1), xycoords='data',
            xytext=(0.8, 0.95), textcoords='axes fraction',
            arrowprops=dict(facecolor='black', shrink=0.05),
            horizontalalignment='right', verticalalignment='top',
            )
```

For physical coordinate systems (points or pixels) the origin is the bottom-left of the figure or axes.

Optionally, you can enable drawing of an arrow from the text to the annotated point by giving a dictionary of arrow properties in the optional keyword argument `arrowprops`.

<table>
<thead>
<tr>
<th>arrowprops key</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>the width of the arrow in points</td>
</tr>
<tr>
<td>frac</td>
<td>the fraction of the arrow length occupied by the head</td>
</tr>
<tr>
<td>headwidth</td>
<td>the width of the base of the arrow head in points</td>
</tr>
<tr>
<td>shrink</td>
<td>move the tip and base some percent away from the annotated point and text</td>
</tr>
<tr>
<td>**kwargs</td>
<td>any key for <code>matplotlib.patches.Polygon</code>, e.g., <code>facecolor</code></td>
</tr>
</tbody>
</table>

In the example below, the xy point is in native coordinates (`xycoords` defaults to ‘data’). For a polar axes, this is in (theta, radius) space. The text in this example is placed in the fractional figure coordinate system. `matplotlib.text.Text` keyword arguments like `horizontalalignment`, `verticalalignment` and `fontsize` are passed from `annotate` to the `Text` instance.
For more on all the wild and wonderful things you can do with annotations, including fancy arrows, see Advanced Annotations and /gallery/text_labels_and_annotations/annotation_demo. Do not proceed unless you have already read Basic annotation, text() and annotate()!

Advanced Annotations

Annotating with Text with Box

Let’s start with a simple example.

```python
t = ax.text(  
    0, 0, "Direction", ha="center", va="center", rotation=45, size=15,  
    bbox=dict(boxstyle="rarrow,pad=0.3", fc="cyan", ec="b", lw=2))
```

The patch object associated with the text can be accessed by:
bb = t.get_bbox_patch()

The return value is a `FancyBboxPatch`; patch properties (facecolor, edgewidth, etc.) can be accessed and modified as usual. `FancyBboxPatch.set_boxstyle` sets the box shape:

```
bb.set_boxstyle("rarrow", pad=0.6)
```

The arguments are the name of the box style with its attributes as keyword arguments. Currently, following box styles are implemented.

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circle</td>
<td>circle</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>DAArrow</td>
<td>darrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>LAArrow</td>
<td>larrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>RAArrow</td>
<td>rarrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>Round</td>
<td>round</td>
<td>pad=0.3,pad=0.3,rounding_size=None</td>
</tr>
<tr>
<td>Round4</td>
<td>round4</td>
<td>pad=0.3,pad=0.3,rounding_size=None</td>
</tr>
<tr>
<td>Roundtooth</td>
<td>roundtooth</td>
<td>pad=0.3,pad=0.3,rounding_size=None</td>
</tr>
<tr>
<td>Sawtooth</td>
<td>sawtooth</td>
<td>pad=0.3,pad=0.3,rounding_size=None</td>
</tr>
<tr>
<td>Square</td>
<td>square</td>
<td>pad=0.3</td>
</tr>
</tbody>
</table>

![Fancybox Demo](image)

Fig. 26: Fancybox Demo

Note that the attribute arguments can be specified within the style name with separating comma (this form can be used as “boxstyle” value of bbox argument when initializing the text instance)

```
bb.set_boxstyle("rarrow,pad=0.6")
```
Annotating with Arrow

`annotate` draws an arrow connecting two points in an axes:

```python
ax.annotate("Annotation",
    xy=(x1, y1), xycoords='data',
    xytext=(x2, y2), textcoords='offset points',
)
```

This annotates a point at `xy` in the given coordinate (`xycoords`) with the text at `xytext` given in `textcoords`. Often, the annotated point is specified in the `data` coordinate and the annotating text in `offset points`. See `annotate` for available coordinate systems.

An arrow connecting `xy` to `xytext` can be optionally drawn by specifying the `arrowprops` argument. To draw only an arrow, use empty string as the first argument.

```python
ax.annotate("",
    xy=(0.2, 0.2), xycoords='data',
    xytext=(0.8, 0.8), textcoords='data',
    arrowprops=dict(arrowstyle="->",
                    connectionstyle="arc3"),
)
```

![Fig. 27: Annotate Simple01](image)

The arrow is drawn as follows:

1. A path connecting the two points is created, as specified by the `connectionstyle` parameter.
2. The path is clipped to avoid patches `patchA` and `patchB`, if these are set.
3. The path is further shrunk by `shrinkA` and `shrinkB` (in pixels).
4. The path is transmuted to an arrow patch, as specified by the `arrowstyle` parameter.

The creation of the connecting path between two points is controlled by `connectionstyle` key and the following styles are available.

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>angle</td>
<td>angleA=90,angleB=0,rad=0.0</td>
</tr>
<tr>
<td>angle3</td>
<td>angleA=90,angleB=0</td>
</tr>
<tr>
<td>arc</td>
<td>angleA=0,angleB=0,armA=None,armB=None,rad=0.0</td>
</tr>
<tr>
<td>arc3</td>
<td>rad=0.0</td>
</tr>
<tr>
<td>bar</td>
<td>armA=0.0,armB=0.0,fraction=0.3,angle=None</td>
</tr>
</tbody>
</table>
Note that "3" in `angle3` and `arc3` is meant to indicate that the resulting path is a quadratic spline segment (three control points). As will be discussed below, some arrow style options can only be used when the connecting path is a quadratic spline.

The behavior of each connection style is (limitedly) demonstrated in the example below. (Warning: The behavior of the `bar` style is currently not well defined, it may be changed in the future).

The connecting path (after clipping and shrinking) is then mutated to an arrow patch, according to the given `arrowstyle`. 
<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>None</td>
</tr>
<tr>
<td>-&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>[-</td>
<td>widthB=1.0, lengthB=0.2, angleB=None</td>
</tr>
<tr>
<td>|&gt;</td>
<td>widthA=1.0, widthB=1.0</td>
</tr>
<tr>
<td>&lt;-</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>&lt;&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>&lt;|&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>&lt;|&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>fancy</td>
<td>head_length=0.4, head_width=0.4, tail_width=0.4</td>
</tr>
<tr>
<td>simple</td>
<td>head_length=0.5, head_width=0.5, tail_width=0.2</td>
</tr>
<tr>
<td>wedge</td>
<td>tail_width=0.3, shrink_factor=0.5</td>
</tr>
</tbody>
</table>

Fig. 30: Fancyarrow Demo

Some arrowstyles only work with connection styles that generate a quadratic-spline segment. They are fancy, simple, and wedge. For these arrow styles, you must use the “angle3“ or “arc3“ connection style.

If the annotation string is given, the patchA is set to the bbox patch of the text by default.

Fig. 31: Annotate Simple02

As with text, a box around the text can be drawn using the bbox argument.

By default, the starting point is set to the center of the text extent. This can be adjusted with
relpos key value. The values are normalized to the extent of the text. For example, (0, 0) means lower-left corner and (1, 1) means top-right.

### Placing Artist at the anchored location of the Axes

There are classes of artists that can be placed at an anchored location in the Axes. A common example is the legend. This type of artist can be created by using the `OffsetBox` class. A few predefined classes are available in `matplotlib.offsetbox` and in `mpl_toolkits.axes_grid1.anchored_artists`.

```python
from matplotlib.offsetbox import AnchoredText
at = AnchoredText("Figure 1a",
    prop=dict(size=15), frameon=True,
    loc='upper left',
)
at.patch.set_boxstyle("round,pad=0.,rounding_size=0.2")
ax.add_artist(at)
```

The `loc` keyword has same meaning as in the legend command.

A simple application is when the size of the artist (or collection of artists) is known in pixel size during the time of creation. For example, If you want to draw a circle with fixed size of 20 pixel x 20 pixel (radius = 10 pixel), you can utilize `AnchoredDrawingArea`. The instance is created with a size of the drawing area (in pixels), and arbitrary artists can added to the drawing area. Note that the extents of the artists that are added to the drawing area are not related to the placement of the drawing area itself. Only the initial size matters.
from mpl_toolkits.axes_grid1.anchored_artists import AnchoredDrawingArea

ada = AnchoredDrawingArea(20, 20, 0, 0,
                            loc='upper right', pad=0., frameon=False)
p1 = Circle((10, 10), 10)
ada.drawing_area.add_artist(p1)
p2 = Circle((30, 10), 5, fc="r")
ada.drawing_area.add_artist(p2)

The artists that are added to the drawing area should not have a transform set (it will be overridden) and the dimensions of those artists are interpreted as a pixel coordinate, i.e., the radius of the circles in above example are 10 pixels and 5 pixels, respectively.

Sometimes, you want your artists to scale with the data coordinate (or coordinates other than canvas pixels). You can use AnchoredAuxTransformBox class. This is similar to AnchoredDrawingArea except that the extent of the artist is determined during the drawing time respecting the specified transform.

from mpl_toolkits.axes_grid1.anchored_artists import AnchoredAuxTransformBox

box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)  # in data coordinates!
box.drawing_area.add_artist(el)

The ellipse in the above example will have width and height corresponding to 0.1 and 0.4 in data coordinates and will be automatically scaled when the view limits of the axes change.

As in the legend, the bbox_to_anchor argument can be set. Using the HPacker and VPacker, you can have an arrangement(?) of artist as in the legend (as a matter of fact, this is how the legend is created).
Fig. 36: Anchored Box03

Fig. 37: Anchored Box04

Note that unlike the legend, the bbox_transform is set to IdentityTransform by default.

Using Complex Coordinates with Annotations

The Annotation in matplotlib supports several types of coordinates as described in Basic annotation. For an advanced user who wants more control, it supports a few other options.

1. A Transform instance. For example,

```python
ax.annotate("Test", xy=(0.5, 0.5), xycoords=ax.transAxes)
```

is identical to

```python
ax.annotate("Test", xy=(0.5, 0.5), xycoords="axes fraction")
```

This allows annotating a point in another axes:

```python
ax1, ax2 = subplot(121), subplot(122)
ax2.annotate("Test", xy=(0.5, 0.5), xycoords=ax1.transData,
                   xytext=(0.5, 0.5), textcoords=ax2.transData,
                   arrowprops=dict(arrowstyle="->"))
```

2. An Artist instance. The xy value (or xytext) is interpreted as a fractional coordinate of the bbox (return value of get_window_extent) of the artist:

```python
an1 = ax.annotate("Test 1", xy=(0.5, 0.5), xycoords="data",
                   va="center", ha="center",
                   bbox=dict(boxstyle="round", fc="w"))
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1,
                   # (1, 0.5) of the an1's bbox
                   (continues on next page)
```
Note that you must ensure that the extent of the coordinate artist (\texttt{an1} in above example) is determined before \texttt{an2} gets drawn. Usually, this means that \texttt{an2} needs to be drawn after \texttt{an1}.

3. A callable object that takes the renderer instance as single argument, and returns either a \texttt{Transform} or a \texttt{BboxBase}. The return value is then handled as in (1), for transforms, or in (2), for bboxes. For example,

\begin{verbatim}
  an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1,
          xytext=(30, 0), textcoords="offset points")
\end{verbatim}

is identical to:

\begin{verbatim}
  an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1.get_window_extent,
          xytext=(30, 0), textcoords="offset points")
\end{verbatim}

4. A pair of coordinate specifications – the first for the x-coordinate, and the second is for the y-coordinate; e.g.

\begin{verbatim}
  annotate("Test", xy=(0.5, 1), xycoords=("data", "axes fraction"))
\end{verbatim}

Here, 0.5 is in data coordinates, and 1 is in normalized axes coordinates. Each of the coordinate specifications can also be an artist or a transform. For example,

\begin{verbatim}
  an2 = ax.annotate("Test", xy=(0.5, 1), xycoords=("data", "axes fraction"),
          xytext=(30, 0), textcoords="offset points")
\end{verbatim}

5. Sometimes, you want your annotation with some "offset points", not from the annotated point but from some other point. \texttt{text.OffsetFrom} is a helper for such cases.

You may take a look at this example /gallery/text_labels_and_annotations/annotation_demo.

Fig. 38: Annotation with Simple Coordinates

Fig. 39: Annotation with Simple Coordinates 2
Using ConnectionPatch

ConnectionPatch is like an annotation without text. While annotate is sufficient in most situations, ConnectionPatch is useful when you want to connect points in different axes.

```python
from matplotlib.patches import ConnectionPatch
xy = (0.2, 0.2)
con = ConnectionPatch(xyA=xy, coordsA=ax1.transData,
                     xyB=xy, coordsB=ax2.transData)
fig.add_artist(con)
```

The above code connects point `xy` in the data coordinates of `ax1` to point `xy` in the data coordinates of `ax2`. Here is a simple example.

```
Fig. 41: Connect Simple01
```

Here, we added the ConnectionPatch to the figure (with `add_artist`) rather than to either axes: this ensures that it is drawn on top of both axes, and is also necessary if using `constrained_layout` for positioning the axes.

Advanced Topics

Zoom effect between Axes

`mpl_toolkits.axes_grid1.inset_locator` defines some patch classes useful for interconnecting two axes. Understanding the code requires some knowledge of Matplotlib’s transform system.

Define Custom BoxStyle

You can use a custom box style. The value for the `boxstyle` can be a callable object in the following forms.:
def __call__(self, x0, y0, width, height, mutation_size,
             aspect_ratio=1.):
    
    Given the location and size of the box, return the path of
    the box around it.

    - *x0*, *y0*, *width*, *height*: location and size of the box
    - *mutation_size*: a reference scale for the mutation.
    - *aspect_ratio*: aspect-ratio for the mutation.
    
    path = ...
    return path

Here is a complete example.

Similarly, you can define a custom ConnectionStyle and a custom ArrowStyle. See the source
code of lib/matplotlib/patches.py and check how each style class is defined.

### 2.6.5 Writing mathematical expressions

An introduction to writing mathematical expressions in Matplotlib.
You can use a subset TeX markup in any matplotlib text string by placing it inside a pair of dollar signs ($).

Note that you do not need to have TeX installed, since Matplotlib ships its own TeX expression parser, layout engine, and fonts. The layout engine is a fairly direct adaptation of the layout algorithms in Donald Knuth’s TeX, so the quality is quite good (matplotlib also provides a `usetex` option for those who do want to call out to TeX to generate their text (see Text rendering With LaTeX).

Any text element can use math text. You should use raw strings (precede the quotes with an 'r'), and surround the math text with dollar signs ($), as in TeX. Regular text and mathtext can be interleaved within the same string. Mathtext can use DejaVu Sans (default), DejaVu Serif, the Computer Modern fonts (from (La)TeX), STIX fonts (with are designed to blend well with Times), or a Unicode font that you provide. The mathtext font can be selected with the customization variable `mathtext.fontset` (see Customizing Matplotlib with style sheets and rcParams).

Here is a simple example:

```python
# plain text
plt.title('alpha > beta')
```

produces “alpha > beta”.

Whereas this:

```python
# math text
plt.title(r'\alpha > \beta')
```

produces “$\alpha > \beta$”.

**Note:** Mathtext should be placed between a pair of dollar signs ($). To make it easy to display monetary values, e.g., “$100.00”, if a single dollar sign is present in the entire string, it will be displayed verbatim as a dollar sign. This is a small change from regular TeX, where the dollar sign in non-math text would have to be escaped (‘\$’).

**Note:** While the syntax inside the pair of dollar signs ($) aims to be TeX-like, the text outside does not. In particular, characters such as:

```python
# $ % & _ \ { } ( ) \[ \]
```

have special meaning outside of math mode in TeX. Therefore, these characters will behave differently depending on `rcParams["text.usetex"]` (default: False). See the use\text{t}ex tutorial for more information.

### Subscripts and superscripts

To make subscripts and superscripts, use the ‘_’ and ‘^’ symbols:

```python
r'\alpha_i > \beta_i$
```

$\alpha_i > \beta_i$
To display multi-letter subscripts or superscripts correctly, you should put them in curly braces (\{}\):  
\[
\alpha^{ic} > \beta_{ic}
\]

Some symbols automatically put their sub/superscripts under and over the operator. For example, to write the sum of $x_i$ from 0 to $\infty$, you could do:

\[
\sum_{i=0}^{\infty} x_i
\]

Fractions, binomials, and stacked numbers

Fractions, binomials, and stacked numbers can be created with the $\frac{}{}$, $\binom{}{}$ and $\genfrac{}{}{}{}{}$ commands, respectively:

\[
\frac{3}{4} \binom{3}{4} \genfrac{}{}{}{}{}{3}{4}
\]

produces

\[
\frac{3}{4} \binom{3}{4} \genfrac{}{}{}{}{}{3}{4}
\]

Fractions can be arbitrarily nested:

\[
\frac{5 - \frac{1}{x}}{4}
\]

Note that special care needs to be taken to place parentheses and brackets around fractions. Doing things the obvious way produces brackets that are too small:

\[
(5 - \frac{1}{x})
\]

The solution is to precede the bracket with $\left$ and $\right$ to inform the parser that those brackets encompass the entire object:

\[
\left(\frac{5 - \frac{1}{x}}{4}\right)
\]

Radicals

Radicals can be produced with the $\sqrt{}$ command. For example:
\[ \sqrt{2} \]

Any base can (optionally) be provided inside square brackets. Note that the base must be a simple expression, and can not contain layout commands such as fractions or sub/superscripts:

\[ \sqrt[x]{x} \]

**Fonts**

The default font is *italics* for mathematical symbols.

*Note:* This default can be changed using `rcParams["mathtext.default"]` (default: `'it'`). This is useful, for example, to use the same font as regular non-math text for math text, by setting it to regular.

To change fonts, e.g., to write “sin” in a Roman font, enclose the text in a font command:

\[ s(t) = A \sin(2 \omega t) \]

More conveniently, many commonly used function names that are typeset in a Roman font have shortcuts. So the expression above could be written as follows:

\[ s(t) = A \sin(2 \omega t) \]

Here “s” and “t” are variable in italics font (default), “sin” is in Roman font, and the amplitude “A” is in calligraphy font. Note in the example above the calligraphy \( A \) is squished into the \( \sin \). You can use a spacing command to add a little whitespace between them:

\[ s(t) = A \, \sin(2 \omega t) \]

The choices available with all fonts are:

<table>
<thead>
<tr>
<th>Command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>\texttt{Roman}</td>
<td>Roman</td>
</tr>
<tr>
<td>\texttt{Italic}</td>
<td><em>Italic</em></td>
</tr>
<tr>
<td>\texttt{Typewriter}</td>
<td><em>Typewriter</em></td>
</tr>
<tr>
<td>\texttt{CALLIGRAPHY}</td>
<td><em>CALLIGRAPHY</em></td>
</tr>
</tbody>
</table>

When using the STIX fonts, you also have the choice of:
There are also five global "font sets" to choose from, which are selected using the `mathtext.fontset` parameter in `matplotlibrc`.

dejavusans: DejaVu Sans

\[
\mathcal{R} \prod_{i=\alpha}^{\infty} a_i \sin(2\pi f x_i)
\]

(2.1)

dejavuserif: DejaVu Serif

\[
\mathcal{R} \prod_{i=\alpha}^{\infty} a_i \sin(2\pi f x_i)
\]

(2.2)

cm: Computer Modern (TeX)

\[
\mathcal{R} \prod_{i=\alpha}^{\infty} a_i \sin(2\pi f x_i)
\]

(2.3)

stix: STIX (designed to blend well with Times)

\[
\mathcal{R} \prod_{i=\alpha}^{\infty} a_i \sin(2\pi f x_i)
\]

(2.4)

stixsans: STIX sans-serif

\[
\mathcal{R} \prod_{i=\alpha}^{\infty} a_i \sin(2\pi f x_i)
\]

(2.5)

Additionally, you can use `\mathdefault{...}` or its alias `\mathregular{...}` to use the font used for regular text outside of mathtext. There are a number of limitations to this approach, most notably that far fewer symbols will be available, but it can be useful to make math expressions blend well with other text in the plot.

**Custom fonts**

`mathtext` also provides a way to use custom fonts for math. This method is fairly tricky to use, and should be considered an experimental feature for patient users only. By setting `rcParams["mathtext.fontset"]` (default: `dejavusans`) to `custom`, you can then set the following parameters, which control which font file to use for a particular set of math characters.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Corresponds to</th>
</tr>
</thead>
<tbody>
<tr>
<td>mathtext.it</td>
<td>\textit{} or default italic</td>
</tr>
<tr>
<td>mathtext.rm</td>
<td>\texttt{} Roman (upright)</td>
</tr>
<tr>
<td>mathtext.tt</td>
<td>\texttt{} Typewriter (monospace)</td>
</tr>
<tr>
<td>mathtext.bf</td>
<td>\textbf{} bold italic</td>
</tr>
<tr>
<td>mathtext.cal</td>
<td>\textcal{} calligraphic</td>
</tr>
<tr>
<td>mathtext.sf</td>
<td>\textsf{} sans-serif</td>
</tr>
</tbody>
</table>

Each parameter should be set to a fontconfig font descriptor (as defined in the yet-to-be-written font chapter).

The fonts used should have a Unicode mapping in order to find any non-Latin characters, such as Greek. If you want to use a math symbol that is not contained in your custom fonts, you can set `rcParams["mathtext.fallback"]` (default: 'cm') to either 'cm', 'stix' or 'stixsans' which will cause the mathtext system to use characters from an alternative font whenever a particular character can not be found in the custom font.

Note that the math glyphs specified in Unicode have evolved over time, and many fonts may not have glyphs in the correct place for mathtext.

**Accents**

An accent command may precede any symbol to add an accent above it. There are long and short forms for some of them.

<table>
<thead>
<tr>
<th>Command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>\acute a</td>
<td>á</td>
</tr>
<tr>
<td>\bar a</td>
<td>à</td>
</tr>
<tr>
<td>\breve a</td>
<td>ã</td>
</tr>
<tr>
<td>\ddot a</td>
<td>ã̈</td>
</tr>
<tr>
<td>\dot a</td>
<td>ȧ</td>
</tr>
<tr>
<td>\grave a</td>
<td>ą</td>
</tr>
<tr>
<td>\hat a</td>
<td>ā</td>
</tr>
<tr>
<td>\tilde a</td>
<td>ą̃</td>
</tr>
<tr>
<td>\vec a</td>
<td>⃗a</td>
</tr>
<tr>
<td>\overline{abc}</td>
<td>abc</td>
</tr>
</tbody>
</table>

In addition, there are two special accents that automatically adjust to the width of the symbols below:

<table>
<thead>
<tr>
<th>Command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>\widehat{xyz}</td>
<td>ħxyz</td>
</tr>
<tr>
<td>\widetilde{xyz}</td>
<td>ſxyz</td>
</tr>
</tbody>
</table>

Care should be taken when putting accents on lower-case i's and j's. Note that in the following \imath is used to avoid the extra dot over the i:

$r"\hat i\ \hat \imath$"
Symbols

You can also use a large number of the TeX symbols, as in \
\infty, \leftarrow, \sum, \int.

**Lower-case Greek**

<table>
<thead>
<tr>
<th>α</th>
<th>\alpha</th>
<th>β</th>
<th>\beta</th>
<th>χ</th>
<th>\chi</th>
<th>δ</th>

If a particular symbol does not have a name (as is true of many of the more obscure symbols in the STIX fonts), Unicode characters can also be used:

```
$\text{r'\$\text{u23ce}$'}$
```

#### Example

Here is an example illustrating many of these features in context.

![Graph](image)

Fig. 44: Pyplot Mathtext

### 2.6.6 Typesetting With XeLaTeX/LuaLaTeX

How to typeset text with the pgf backend in Matplotlib.

Using the pgf backend, Matplotlib can export figures as pgf drawing commands that can be processed with pdflatex, xelatex or lualatex. XeLaTeX and LuaLaTeX have full Unicode
support and can use any font that is installed in the operating system, making use of advanced typographic features of OpenType, AAT and Graphite. Pgf pictures created by `plt.savefig('figure.pgf')` can be embedded as raw commands in LaTeX documents. Figures can also be directly compiled and saved to PDF with `plt.savefig('figure.pdf')` by switching the backend

```
matplotlib.use('pgf')
```

or by explicitly requesting the use of the `pgf` backend

```
plt.savefig('figure.pdf', backend='pgf')
```

or by registering it for handling pdf output

```
from matplotlib.backends.backend_pgf import FigureCanvasPgf
matplotlib.backend_bases.register_backend('pdf', FigureCanvasPgf)
```

The last method allows you to keep using regular interactive backends and to save xelatex, lualatex or pdflatex compiled PDF files from the graphical user interface.

Matplotlib’s pgf support requires a recent LaTeX installation that includes the TikZ/PGF packages (such as TeXLive), preferably with XeLaTeX or LuaLaTeX installed. If either pdftocairo or ghostscript is present on your system, figures can optionally be saved to PNG images as well. The executables for all applications must be located on your PATH.

**rcParams** that control the behavior of the pgf backend:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgf.preamble</td>
<td>Lines to be included in the LaTeX preamble</td>
</tr>
<tr>
<td>pgf.rcfonts</td>
<td>Setup fonts from rc params using the fontspec package</td>
</tr>
<tr>
<td>pgf.texsystem</td>
<td>Either “xelatex” (default), “lualatex” or “pdflatex”</td>
</tr>
</tbody>
</table>

**Note:** TeX defines a set of special characters, such as:

```
# $ % & ~ _ ^ \ { }
```

Generally, these characters must be escaped correctly. For convenience, some characters (\_, ^, %) are automatically escaped outside of math environments.

### Multi-Page PDF Files

The pgf backend also supports multipage pdf files using *PdfPages*

```
from matplotlib.backends.backend_pgf import PdfPages
import matplotlib.pyplot as plt

with PdfPages('multipage.pdf', metadata={'author': 'Me'}) as pdf:

    fig1, ax1 = plt.subplots()
    ax1.plot([1, 5, 3])
    pdf.savefig(fig1)

    fig2, ax2 = plt.subplots()
```

(continues on next page)
Font specification

The fonts used for obtaining the size of text elements or when compiling figures to PDF are usually defined in the rcParams. You can also use the LaTeX default Computer Modern fonts by clearing the lists for rcParams["font.serif"] (default: ['DejaVu Serif', 'Bitstream Vera Serif', 'Computer Modern Roman', 'New Century Schoolbook', 'Century Schoolbook L', 'Utopia', 'ITC Bookman', 'Bookman', 'Nimbus Roman No9 L', 'Times New Roman', 'Times', 'Palatino', 'Charter', 'serif']), rcParams["font.sans-serif"] (default: ['DejaVu Sans', 'Bitstream Vera Sans', 'Computer Modern Sans Serif', 'Lucida Grande', 'Verdana', 'Geneva', 'Lucid', 'Arial', 'Helvetica', 'Avant Garde', 'sans-serif']) or rcParams["font.monospace"] (default: ['DejaVu Sans Mono', 'Bitstream Vera Sans Mono', 'Computer Modern Typewriter', 'Andale Mono', 'Nimbus Mono L', 'Courier New', 'Courier', 'Fixed', 'Terminal', 'monospace']). Please note that the glyph coverage of these fonts is very limited. If you want to keep the Computer Modern font face but require extended Unicode support, consider installing the Computer Modern Unicode fonts CMU Serif, CMU Sans Serif, etc.

When saving to .pgf, the font configuration Matplotlib used for the layout of the figure is included in the header of the text file.

```python
import matplotlib.pyplot as plt
plt.rcParams.update({
    "font.family": "serif",
    "font.serif": [], # use latex default serif font
    "font.sans-serif": ["DejaVu Sans"], # use a specific sans-serif font
})
plt.figure(figsize=(4.5, 2.5))
plt.plot(range(5))
plt.text(0.5, 3., "serif")
plt.text(0.5, 2., "monospace", family="monospace")
plt.text(2.5, 2., "sans-serif", family="sans-serif")
plt.text(2.5, 1., "comic sans", family="Comic Sans MS")
plt.xlabel("µ is not $\\mu$")
plt.tight_layout(.5)
```

Custom preamble

Full customization is possible by adding your own commands to the preamble. Use rcParams["pgf.preamble"] (default: ‘’) if you want to configure the math fonts, using unicode-math for example, or for loading additional packages. Also, if you want to do the
font configuration yourself instead of using the fonts specified in the rc parameters, make
sure to disable rcParams["pgf.rcfonts"] (default: True).

```
```"

---

**Pgf Preamble**
---

```
```"

```python
import matplotlib as mpl
mpl.use("pgf")
```

### Choosing the TeX system

The TeX system to be used by Matplotlib is chosen by rcParams["pgf.texsystem"] (default: 'xelatex'). Possible values are 'xelatex' (default), 'lualatex' and 'pdflatex'. Please note that when selecting pdflatex, the fonts and Unicode handling must be configured in the preamble.

```
```"

---

**Pgf Texsystem**
---

```
```"

```python
import matplotlib.pyplot as plt
plt.rcParams.update({
    "pgf.texsystem": "pdflatex",
    "pgf.preamble": "\n\nusepackage[utf8x]{inputenc},
usepackage[T1]{fontenc},
usepackage{cmbright},
",
})
plt.figure(figsize=(4.5, 2.5))
plt.plot(range(5))
plt.text(0.5, 3., "serif", family="serif")
plt.text(0.5, 2., "monospace", family="monospace")
plt.text(2.5, 2., "sans-serif", family="sans-serif")
plt.xlabel(r"\(\mu\) is not $\mu$")
plt.tight_layout(0.5)
```

### Troubleshooting

- Please note that the TeX packages found in some Linux distributions and MiKTeX installa-
tions are dramatically outdated. Make sure to update your package catalog and upgrade or install a recent TeX distribution.

- On Windows, the *PATH* environment variable may need to be modified to include the
directories containing the latex, dvipng and ghostscript executables. See *Environment Variables* and *Setting environment variables in Windows* for details.
• A limitation on Windows causes the backend to keep file handles that have been opened by your application open. As a result, it may not be possible to delete the corresponding files until the application closes (see #1324).

• Sometimes the font rendering in figures that are saved to png images is very bad. This happens when the pdftocairo tool is not available and ghostscript is used for the pdf to png conversion.

• Make sure what you are trying to do is possible in a LaTeX document, that your LaTeX syntax is valid and that you are using raw strings if necessary to avoid unintended escape sequences.

• `rcParams["pgf.preamble"]` (default: ‘’) provides lots of flexibility, and lots of ways to cause problems. When experiencing problems, try to minimalize or disable the custom preamble.

• Configuring an `unicode-math` environment can be a bit tricky. The TeXLive distribution for example provides a set of math fonts which are usually not installed system-wide. XeTeX, unlike LuaLatex, cannot find these fonts by their name, which is why you might have to specify `\setmathfont{xits-math.otf}` instead of `\setmathfont{XITS Math}` or alternatively make the fonts available to your OS. See this tex.stackexchange.com question for more details.

• If the font configuration used by Matplotlib differs from the font setting in your LaTeX document, the alignment of text elements in imported figures may be off. Check the header of your .pgf file if you are unsure about the fonts Matplotlib used for the layout.

• Vector images and hence .pgf files can become bloated if there are a lot of objects in the graph. This can be the case for image processing or very big scatter graphs. In an extreme case this can cause TeX to run out of memory: “TeX capacity exceeded, sorry” You can configure latex to increase the amount of memory available to generate the .pdf image as discussed on tex.stackexchange.com. Another way would be to “rasterize” parts of the graph causing problems using either the `rasterized=True` keyword, or `.set_rasterized(True)` as per this example.

• If you still need help, please see Getting help

### 2.6.7 Text rendering With LaTeX

Rendering text with LaTeX in Matplotlib.

Matplotlib has the option to use LaTeX to manage all text layout. This option is available with the following backends:

• Agg
• PS
• PDF

The LaTeX option is activated by setting `text.usetex : True` in your rc settings. Text handling with matplotlib’s LaTeX support is slower than matplotlib’s very capable `mathtext`, but is more flexible, since different LaTeX packages (font packages, math packages, etc.) can be used. The results can be striking, especially when you take care to use the same fonts in your figures as in the main document.

Matplotlib’s LaTeX support requires a working LaTeX installation, dvi2png (which may be included with your LaTeX installation), and Ghostscript (GPL Ghostscript 9.0 or later is required). The executables for these external dependencies must all be located on your $PATH$. 

---

332 Chapter 2. Tutorials
There are a couple of options to mention, which can be changed using \textit{rc settings}. Here is an example matplotlibrc file:

```python
font.family : serif
font.serif : Times, Palatino, New Century Schoolbook, Bookman, Computer Modern Roman
font.sans-serif : Helvetica, Avant Garde, Computer Modern Sans serif
font.cursive : Zapf Chancery
font.monospace : Courier, Computer Modern Typewriter
text.usetex : true
```

The first valid font in each family is the one that will be loaded. If the fonts are not specified, the Computer Modern fonts are used by default. All of the other fonts are Adobe fonts. Times and Palatino each have their own accompanying math fonts, while the other Adobe serif fonts make use of the Computer Modern math fonts. See the \texttt{PSNFSS} documentation for more details.

To use LaTeX and select Helvetica as the default font, without editing matplotlibrc use:

```python
import matplotlib as mpl
plt.rcParams.update({
    "text.usetex": True,
    "font.family": "sans-serif",
    "font.sans-serif": ["Helvetica"]})
```

Here is the standard example, \texttt{/gallery/text_labels_and_annotations/tex_demo}:

![Fig. 45: TeX Demo](image)

Note that display math mode ($$ e=mc^2 $$) is not supported, but adding the command `\displaystyle`, as in the above demo, will produce the same results.

\textbf{Note:} Certain characters require special escaping in TeX, such as:

```
# $ \% \& \_ \{ \} \( \) \[ \]
```
Therefore, these characters will behave differently depending on `rcParams["text.usetex"]` (default: False).

**usetex with unicode**

It is also possible to use unicode strings with the LaTeX text manager, here is an example taken from `/gallery/text_labels_and_annotations/tex_demo`. The axis labels include Unicode text:

![Figure 46: TeX Unicode Demo](image)

**Postscript options**

In order to produce encapsulated postscript files that can be embedded in a new LaTeX document, the default behavior of matplotlib is to distill the output, which removes some postscript operators used by LaTeX that are illegal in an eps file. This step produces results which may be unacceptable to some users, because the text is coarsely rasterized and converted to bitmaps, which are not scalable like standard postscript, and the text is not searchable. One workaround is to set `ps.distiller.res` to a higher value (perhaps 6000) in your rc settings, which will produce larger files but may look better and scale reasonably. A better workaround, which requires Poppler or Xpdf, can be activated by changing the `ps.usedistiller` rc setting to `xpdf`. This alternative produces postscript without rasterizing text, so it scales properly, can be edited in Adobe Illustrator, and searched text in pdf documents.

**Possible hangups**

- On Windows, the `PATH` environment variable may need to be modified to include the directories containing the latex, dvipng and ghostscript executables. See Environment Variables and Setting environment variables in Windows for details.
- Using MiKTeX with Computer Modern fonts, if you get odd *Agg and PNG results, go to MiKTeX/Options and update your format files.
- On Ubuntu and Gentoo, the base texlive install does not ship with the type1cm package. You may need to install some of the extra packages to get all the goodies that come bundled with other latex distributions.
• Some progress has been made so matplotlib uses the dvi files directly for text layout. This allows LaTeX to be used for text layout with the pdf and svg backends, as well as the *Agg and PS backends. In the future, a LaTeX installation may be the only external dependency.

Troubleshooting

• Try deleting your .matplotlib/tex.cache directory. If you don’t know where to find .matplotlib, see matplotlib configuration and cache directory locations.
• Make sure LaTeX, dvipng and ghostscript are each working and on your PATH.
• Make sure what you are trying to do is possible in a LaTeX document, that your LaTeX syntax is valid and that you are using raw strings if necessary to avoid unintended escape sequences.
• Most problems reported on the mailing list have been cleared up by upgrading Ghostscript. If possible, please try upgrading to the latest release before reporting problems to the list.
• The text.latex.preamble rc setting is not officially supported. This option provides lots of flexibility, and lots of ways to cause problems. Please disable this option before reporting problems to the mailing list.
• If you still need help, please see Getting help

2.7 Toolkits

These tutorials cover toolkits designed to extend the functionality of Matplotlib in order to accomplish specific goals.

2.7.1 Overview of axes_grid1 toolkit

Controlling the layout of plots with the mpl_toolkits.axes_grid1 toolkit.

What is axes_grid1 toolkit?

mpl_toolkits.axes_grid1 is a collection of helper classes to ease displaying (multiple) images with matplotlib. In matplotlib, the axes location (and size) is specified in the normalized figure coordinates, which may not be ideal for displaying images that needs to have a given aspect ratio. For example, it helps if you have a colorbar whose height always matches that of the image. ImageGrid, RGB Axes and AxesDivider are helper classes that deal with adjusting the location of (multiple) Axes. They provides a framework to adjust the position of multiple axes at the drawing time. ParasiteAxes provides twinx(or twiny)-like features so that you can plot different data (e.g., different y-scale) in a same Axes. AnchoredArtists includes custom artists which are placed at some anchored position, like the legend.
A grid of Axes.

In Matplotlib, the axes location (and size) is specified in normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio; for example, it is difficult to display multiple images of a same size with some fixed padding between them. ImageGrid can be used in such a case; see its docs for a detailed list of the parameters it accepts.

The examples below show what you can do with ImageGrid.

- The position of each axes is determined at the drawing time (see AxesDivider), so that the size of the entire grid fits in the given rectangle (like the aspect of axes). Note that in this example, the paddings between axes are fixed even if you changes the figure size.
- axes in the same column has a same axes width (in figure coordinate), and similarly, axes in the same row has a same height. The widths (height) of the axes in the same row (column) are scaled according to their view limits (xlim or ylim).
- xaxis are shared among axes in a same column. Similarly, yaxis are shared among axes in a same row. Therefore, changing axis properties (view limits, tick location, etc. either by plot commands or using your mouse in interactive backends) of one axes will affect all other shared axes.

The examples below show what you can do with ImageGrid.
AxesDivider Class

Behind the scene, the ImageGrid class and the RGBAxes class utilize the `AxesDivider` class, whose role is to calculate the location of the axes at drawing time. Direct use of the AxesDivider class will not be necessary for most users. The axes_divider module provides a helper function `make_axes_locatable`, which can be useful. It takes a existing axes instance and create a divider for it.

```python
ax = subplot(1, 1, 1)
divider = make_axes_locatable(ax)
```

`make_axes_locatable` returns an instance of the `AxesDivider` class. It provides an `append_axes` method that creates a new axes on the given side of ("top", "right", "bottom" and "left") of the original axes.

```
colorbar whose height (or width) in sync with the master axes

scatter_hist.py with AxesDivider

The /gallery/lines_bars_and_markers/scatter_hist example can be rewritten using `make_axes_locatable`:
```
axScatter = subplot(111)
axScatter.scatter(x, y)
axScatter.set_aspect(1.)
# create new axes on the right and on the top of the current axes.
```
```
Fig. 51: Simple Colorbar

```
divider = make_axes_locatable(axScatter)
axHistx = divider.append_axes("top", size=1.2, pad=0.1, sharex=axScatter)
axHisty = divider.append_axes("right", size=1.2, pad=0.1, sharey=axScatter)

# the scatter plot:
# histograms
bins = np.arange(-lim, lim + binwidth, binwidth)
axHistx.hist(x, bins=bins)
axHisty.hist(y, bins=bins, orientation='horizontal')
```

See the full source code below.

Fig. 52: Scatter Hist

The /gallery/axes_grid1/scatter_hist_locatable_axes using the AxesDivider has some advantage over the original /gallery/lines_bars_and_markers/scatter_hist in Matplotlib. For example, you can set the aspect ratio of the scatter plot, even with the x-axis or y-axis is shared accordingly.
ParasiteAxes

The ParasiteAxes is an axes whose location is identical to its host axes. The location is adjusted in the drawing time, thus it works even if the host change its location (e.g., images).

In most cases, you first create a host axes, which provides a few method that can be used to create parasite axes. They are `twinx`, `twiny` (which are similar to `twinx` and `twiny` in the `matplotlib`) and `twin`. `twin` takes an arbitrary transformation that maps between the data coordinates of the host axes and the parasite axes. `draw` method of the parasite axes are never called. Instead, host axes collects artists in parasite axes and draw them as if they belong to the host axes, i.e., artists in parasite axes are merged to those of the host axes and then drawn according to their zorder. The host and parasite axes modifies some of the axes behavior. For example, color cycle for plot lines are shared between host and parasites. Also, the legend command in host, creates a legend that includes lines in the parasite axes. To create a host axes, you may use `host_subplot` or `host_axes` command.

Example 1. `twinx`

```python
ax2 = ax.twin()  # now, ax2 is responsible for "top" axis and "right" axis
ax2.set_xticks([0., .5*np.pi, np.pi, 1.5*np.pi, 2*np.pi])
ax2.set_xticklabels(['0', r'$\frac{1}{2}\pi$', r'$\pi$', r'$\frac{3}{2}\pi$', r'2$\pi$'])
```

Fig. 53: Parasite Simple

Example 2. `twin`

`twin` without a transform argument assumes that the parasite axes has the same data transform as the host. This can be useful when you want the top(or right)-axis to have different tick-locations, tick-labels, or tick-formatter for bottom(or left)-axis.

```python
ax2 = ax.twin()  # now, ax2 is responsible for "top" axis and "right" axis
ax2.set_xticks([0., .5*np.pi, np.pi, 1.5*np.pi, 2*np.pi])
ax2.set_xticklabels(['0', r'$\frac{1}{2}\pi$', r'$\pi$', r'$\frac{3}{2}\pi$', r'2$\pi$'])
```

A more sophisticated example using `twin`. Note that if you change the x-limit in the host axes, the x-limit of the parasite axes will change accordingly.
Fig. 54: Simple Axisline4

Fig. 55: Parasite Simple2
AnchoredArtists

It’s a collection of artists whose location is anchored to the (axes) bbox, like the legend. It is derived from OffsetBox in Matplotlib, and artist need to be drawn in the canvas coordinate. But, there is a limited support for an arbitrary transform. For example, the ellipse in the example below will have width and height in the data coordinate.

![Fig. 56: Simple Anchored Artists]

InsetLocator

mpl_toolkits.axes_grid1.inset_locator provides helper classes and functions to place your (inset) axes at the anchored position of the parent axes, similarly to AnchoredArtist.

Using mpl_toolkits.axes_grid1.inset_locator.inset_axes(), you can have inset axes whose size is either fixed, or a fixed proportion of the parent axes:

```python
inset_axes = inset_axes(parent_axes,
        width="30%",  # width = 30% of parent_bbox
        height=1.,  # height : 1 inch
        loc='lower left')
```

creates an inset axes whose width is 30% of the parent axes and whose height is fixed at 1 inch.

You may creates your inset whose size is determined so that the data scale of the inset axes to be that of the parent axes multiplied by some factor. For example,

```python
inset_axes = zoomed_inset_axes(ax,
        0.5,  # zoom = 0.5
        loc='upper right')
```

creates an inset axes whose data scale is half of the parent axes. Here is complete examples.

For example, zoomed_inset_axes() can be used when you want the inset represents the zoom-up of the small portion in the parent axes. And inset_locator provides a helper function mark_inset() to mark the location of the area represented by the inset axes.
RGB Axes

RGBAxes is a helper class to conveniently show RGB composite images. Like ImageGrid, the location of axes are adjusted so that the area occupied by them fits in a given rectangle. Also, the xaxis and yaxis of each axes are shared.

```python
from mpl_toolkits.axes_grid1.axes_rgb import RGBAxes

fig = plt.figure()
ax = RGBAxes(fig, [0.1, 0.1, 0.8, 0.8], pad=0.0)
r, g, b = get_rgb()  # r, g, b are 2D images.
ax.imshow_rgb(r, g, b)
```

Fig. 57: Inset Locator Demo

Fig. 58: Inset Locator Demo2
AxesDivider

The `mpl_toolkits.axes_grid1.axes_divider` module provides helper classes to adjust the axes positions of a set of images at drawing time.

- `axes_size` provides a class of units that are used to determine the size of each axes. For example, you can specify a fixed size.

- `Divider` is the class that calculates the axes position. It divides the given rectangular area into several areas. The divider is initialized by setting the lists of horizontal and vertical sizes on which the division will be based. Then use `new_locator()`, which returns a callable object that can be used to set the axes_locator of the axes.

Here, we demonstrate how to achieve the following layout: we want to position axes in a 3x4 grid (note that `Divider` makes row indices start from the bottom(!) of the grid):

```
+--------+--------+--------+--------+
| (2, 0) | (2, 1) | (2, 2) | (2, 3) |
+--------+--------+--------+--------+
| (1, 0) | (1, 1) | (1, 2) | (1, 3) |
+--------+--------+--------+--------+
| (0, 0) | (0, 1) | (0, 2) | (0, 3) |
+--------+--------+--------+--------+
```

such that the bottom row has a fixed height of 2 (inches) and the top two rows have a height ratio of 2 (middle) to 3 (top). (For example, if the grid has a size of 7 inches, the bottom row will be 2 inches, the middle row also 2 inches, and the top row 3 inches.)

These constraints are specified using classes from the `axes_size` module, namely:

```
from mpl_toolkits.axes_grid1.axes_size import Fixed, Scaled
vert = [Fixed(2), Scaled(2), Scaled(3)]
```

(More generally, `axes_size` classes define a `get_size(renderer)` method that returns a pair of floats - a relative size, and an absolute size. `Fixed(2).get_size(renderer)` returns `(0, 2)`, `Scaled(2).get_size(renderer)` returns `(2, 0)`.)

We use these constraints to initialize a `Divider` object:

```
rect = [0.2, 0.2, 0.6, 0.6]  # Position of the grid in the figure.
vert = [Fixed(2), Scaled(2), Scaled(3)]  # As above.
horiz = [...]  # Some other horizontal constraints.
divider = Divider(fig, rect, horiz, vert)
```

then use `Divider.new_locator` to create an `AxesLocator` instance for a given grid entry:

```
locator = divider.new_locator(nx=0, ny=1)  # Grid entry (1, 0).
```

and make it responsible for locating the axes:

```
ax.set_axes_locator(locator)
```

The `AxesLocator` is a callable object that returns the location and size of the cell at the first column and the second row.

Locators that spans over multiple cells can be created with, e.g.:

```
# Columns #0 and #1 ("0-2 range"), row #1.
locator = divider.new_locator(nx=0, nx1=2, ny=1)
```
See the example,

![Example Diagram](image)

You can also adjust the size of each axes according to its x or y data limits (AxesX and AxesY).

![Adjusted Axes Diagram](image)

### 2.7.2 Overview of axisartist toolkit

The axisartist toolkit tutorial.

**Warning:** *axisartist* uses a custom Axes class (derived from the Matplotlib’s original Axes class). As a side effect, some commands (mostly tick-related) do not work.

The *axisartist* contains a custom Axes class that is meant to support curvilinear grids (e.g., the world coordinate system in astronomy). Unlike Matplotlib’s original Axes class which uses Axes.xaxis and Axes.yaxis to draw ticks, ticklines, etc., axisartist uses a special artist (AxisArtist) that can handle ticks, ticklines, etc. for curved coordinate systems.

Since it uses special artists, some Matplotlib commands that work on Axes.xaxis and Axes.yaxis may not work.
The `axisartist` module provides a custom (and very experimental) Axes class, where each axis (left, right, top, and bottom) have a separate associated artist which is responsible for drawing the axis-line, ticks, ticklabels, and labels. You can also create your own axis, which can pass through a fixed position in the axes coordinate, or a fixed position in the data coordinate (i.e., the axis floats around when viewlimit changes).

The axes class, by default, has its xaxis and yaxis invisible, and has 4 additional artists which are responsible for drawing the 4 axis spines in “left”, “right”, “bottom”, and “top”. They are accessed as `ax.axis[“left”]`, `ax.axis[“right”]`, and so on, i.e., `ax.axis` is a dictionary that contains artists (note that `ax.axis` is still a callable method and it behaves as an original Axes.axis method in Matplotlib).

To create an axes,

```python
import mpl_toolkits.axisartist as AA
fig = plt.figure()
ax = AA.Axes(fig, [0.1, 0.1, 0.8, 0.8])
fig.add_axes(ax)
```

or to create a subplot

```python
ax = AA.Subplot(fig, 111)
fig.add_subplot(ax)
```

For example, you can hide the right and top spines using:

```python
ax.axis["right"].set_visible(False)
ax.axis["top"].set_visible(False)
```

It is also possible to add a horizontal axis. For example, you may have an horizontal axis at $y=0$ (in data coordinate).

```python
ax.axis["y=0"] = ax.new_floating_axis(nth_coord=0, value=0)
```

Or a fixed axis with some offset

---

**Fig. 59: Demo Floating Axis**
Fig. 60: Simple Axisline3

Fig. 61: Simple Axisartist1
# make new (right-side) yaxis, but with some offset
ax.axis["right2"] = ax.new_fixed_axis(loc="right", offset=(20, 0))

axisartist with ParasiteAxes

Most commands in the axes_grid1 toolkit can take an axes_class keyword argument, and the commands create an axes of the given class. For example, to create a host subplot with axisartist.Axes,

```python
import mpl_toolkits.axisartist as AA
from mpl_toolkits.axes_grid1 import host_subplot

host = host_subplot(111, axes_class=AA.Axes)
```

Here is an example that uses ParasiteAxes.

![Fig. 62: Demo Parasite Axes2](image)

Curvilinear Grid

The motivation behind the AxisArtist module is to support a curvilinear grid and ticks.

Floating Axes

AxisArtist also supports a Floating Axes whose outer axes are defined as floating axis.

axisartist namespace

The axisartist namespace includes a derived Axes implementation. The biggest difference is that the artists responsible to draw axis line, ticks, ticklabel and axis labels are separated out from the Matplotlib’s Axis class, which are much more than artists in the original Matplotlib. This change was strongly motivated to support curvilinear grid. Here are a few things that mpl_toolkits.axisartist.Axes is different from original Axes from Matplotlib.
Fig. 63: Demo Curvelinear Grid

Fig. 64: Demo Floating Axes
• Axis elements (axis line(spine), ticks, ticklabel and axis labels) are drawn by a AxisArtist instance. Unlike Axis, left, right, top and bottom axis are drawn by separate artists. And each of them may have different tick location and different tick labels.

• gridlines are drawn by a Gridlines instance. The change was motivated that in curvilinear coordinate, a gridline may not cross axis-lines (i.e., no associated ticks). In the original Axes class, gridlines are tied to ticks.

• ticklines can be rotated if necessary (i.e, along the gridlines)

In summary, all these changes was to support

• a curvilinear grid.
• a floating axis

![Fig. 65: Demo Floating Axis](image)

```python
mpl_toolkits.axisartist.Axes
```
class defines a axis attribute, which is a dictionary of AxisArtist instances. By default, the dictionary has 4 AxisArtist instances, responsible for drawing of left, right, bottom and top axis.

xaxis and yaxis attributes are still available, however they are set to not visible. As separate artists are used for rendering axis, some axis-related method in Matplotlib may have no effect. In addition to AxisArtist instances, the mpl_toolkits.axisartist.Axes will have gridlines attribute (Gridlines), which obviously draws grid lines.

In both AxisArtist and Gridlines, the calculation of tick and grid location is delegated to an instance of GridHelper class. mpl_toolkits.axisartist.Axes class uses GridHelperRectlinear as a grid helper. The GridHelperRectlinear class is a wrapper around the xaxis and yaxis of Matplotlib’s original Axes, and it was meant to work as the way how Matplotlib’s original axes works. For example, tick location changes using set_ticks method and etc. should work as expected. But change in artist properties (e.g., color) will not work in general, although some effort has been made so that some often-change attributes (color, etc.) are respected.

**AxisArtist**

AxisArtist can be considered as a container artist with following attributes which will draw ticks, labels, etc.

• line
• major_ticks, major_ticklabels
• minor_ticks, minor_ticklabels
• offsetText
• label

line

Derived from Line2D class. Responsible for drawing a spinal(?) line.

major_ticks, minor_ticks

Derived from Line2D class. Note that ticks are markers.

major_ticklabels, minor_ticklabels

Derived from Text. Note that it is not a list of Text artist, but a single artist (similar to a collection).

axislabel

Derived from Text.

Default AxisArtists

By default, following for axis artists are defined:

```
ax.axis["left"], ax.axis["bottom"], ax.axis["right"], ax.axis["top"]
```

The ticklabels and axislabel of the top and the right axis are set to not visible.

For example, if you want to change the color attributes of major_ticklabels of the bottom x-axis

```
ax.axis["bottom"].major_ticklabels.set_color("b")
```

Similarly, to make ticklabels invisible

```
ax.axis["bottom"].major_ticklabels.set_visible(False)
```

AxisArtist provides a helper method to control the visibility of ticks, ticklabels, and label. To make ticklabel invisible,

```
ax.axis["bottom"].toggle(ticklabels=False)
```

To make all of ticks, ticklabels, and (axis) label invisible

```
ax.axis["bottom"].toggle(all=False)
```

To turn all off but ticks on

350 Chapter 2. Tutorials
To turn all on but (axis) label off

```python
ax.axis["bottom"].toggle(all=False, ticks=True)
```

ax.axis’s __getitem__ method can take multiple axis names. For example, to turn ticklabels of “top” and “right” axis on,

```python
ax.axis["top", "right"].toggle(ticklabels=True)
```

Note that `ax.axis["top", "right"]` returns a simple proxy object that translate above code to something like below.

```python
for n in ["top", "right"]:
    ax.axis[n].toggle(ticklabels=True)
```

So, any return values in the for loop are ignored. And you should not use it anything more than a simple method.

Like the list indexing “:” means all items, i.e.,

```python
ax.axis[:].major_ticks.set_color("r")
```

changes tick color in all axis.

**HowTo**

1. Changing tick locations and label.
   
   Same as the original Matplotlib’s axes:
   
   ```python
   ax.set_xticks([1, 2, 3])
   ```

2. Changing axis properties like color, etc.
   
   Change the properties of appropriate artists. For example, to change the color of the ticklabels:

   ```python
   ax.axis["left"].major_ticklabels.set_color("r")
   ```

3. To change the attributes of multiple axis:

   ```python
   ax.axis["left", "bottom"].major_ticklabels.set_color("r")
   ```

   or to change the attributes of all axis:

   ```python
   ax.axis[:].major_ticklabels.set_color("r")
   ```

4. To change the tick size (length), you need to use `axis.major_ticks.set_ticksize` method. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use `axis.major_ticks.set_tick_out` method.

   To change the pad between ticks and ticklabels, use `axis.major_ticklabels.set_pad` method.

   To change the pad between ticklabels and axis label, `axis.label.set_pad` method.
Rotation and Alignment of TickLabels

This is also quite different from standard Matplotlib and can be confusing. When you want to rotate the ticklabels, first consider using “set_axis_direction” method.

```python
ax1.axis["left"]["major_ticklabels"].set_axis_direction("top")
ax1.axis["right"]["label"].set_axis_direction("left")
```

Fig. 66: Simple Axis Direction01

The parameter for set_axis_direction is one of ["left", "right", "bottom", "top"].

You must understand some underlying concept of directions.

1. There is a reference direction which is defined as the direction of the axis line with increasing coordinate. For example, the reference direction of the left x-axis is from bottom to top.

Fig. 67: Axis Direction Demo - Step 01

The direction, text angle, and alignments of the ticks, ticklabels and axis-label is determined with respect to the reference direction

2. `ticklabel_direction` is either the right-hand side (+) of the reference direction or the left-hand side (-).

Fig. 68: Axis Direction Demo - Step 02

3. same for the `label_direction`
4. ticks are by default drawn toward the opposite direction of the ticklabels.
5. text rotation of ticklabels and label is determined in reference to the `ticklabel_direction` or `label_direction`, respectively. The rotation of ticklabels and label is anchored.

On the other hand, there is a concept of “axis_direction”. This is a default setting of above properties for each, “bottom”, “left”, “top”, and “right” axis.

<table>
<thead>
<tr>
<th></th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>axislabel</code> direction</td>
<td>–</td>
<td>‘+’</td>
<td>‘+’</td>
<td>‘−’</td>
</tr>
<tr>
<td><code>axislabel</code> rotation</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
</tr>
<tr>
<td><code>axislabel</code> va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
</tr>
<tr>
<td><code>axislabel</code> ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
<tr>
<td><code>ticklabel</code> direction</td>
<td>‘−’</td>
<td>‘+’</td>
<td>‘+’</td>
<td>‘−’</td>
</tr>
<tr>
<td><code>ticklabels</code> rotation</td>
<td>90</td>
<td>0</td>
<td>-90</td>
<td>180</td>
</tr>
<tr>
<td><code>ticklabel</code> ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
<tr>
<td><code>ticklabel</code> va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
</tr>
</tbody>
</table>

And, `'set_axis_direction("top")' means to adjust the text rotation etc, for settings suitable for “top” axis. The concept of axis direction can be more clear with curved axis.

The axis_direction can be adjusted in the AxisArtist level, or in the level of its child artists, i.e., ticks, ticklabels, and axis-label.

```
ax1.axis["left"].set_axis_direction("top")
```

changes axis_direction of all the associated artist with the “left” axis, while

```
ax1.axis["left"].major_ticklabels.set_axis_direction("top")
```

changes the axis direction of only the major_ticklabels. Note that set_axis_direction in the AxisArtist level changes the ticklabel direction and label_direction, while changing the axis_direction of ticks, ticklabels, and axis-label does not affect them.
If you want to make ticks outward and ticklabels inside the axes, use `invert_ticklabel_direction` method.

```
ax.axis[:].invert_ticklabel_direction()
```

A related method is “set_tick_out”. It makes ticks outward (as a matter of fact, it makes ticks toward the opposite direction of the default direction).

```
ax.axis[:].major_ticks.set_tick_out(True)
```

So, in summary,

- **AxisArtist’s methods**
  - `set_axis_direction`: “left”, “right”, “bottom”, or “top”
  - `set_ticklabel_direction`: “+” or “-”
  - `set_axislabel_direction`: “+” or “-”
    - `invert_ticklabel_direction`
- **Ticks’ methods (major_ticks and minor_ticks)**
  - `set_tick_out`: True or False
  - `set_ticksize`: size in points
- **TickLabels’ methods (major_ticklabels and minor_ticklabels)**
  - `set_axis_direction`: “left”, “right”, “bottom”, or “top”
  - `set_rotation`: angle with respect to the reference direction
  - `set ha` and `set va`: see below
• AxisLabels’ methods (label)
  - set_axis_direction: “left”, “right”, ”bottom”, or “top”
  - set_rotation: angle with respect to the reference direction
  - set_ha and set_va

Adjusting ticklabels alignment

Alignment of TickLabels are treated specially. See below

![Demo Ticklabel Alignment](image)

Fig. 73: Demo Ticklabel Alignment

Adjusting pad

To change the pad between ticks and ticklabels

```python
ax.axis["left"].major_ticklabels.set_pad(10)
```

Or ticklabels and axis-label

```python
ax.axis["left"].label.set_pad(10)
```

![Simple Axis Pad](image)

Fig. 74: Simple Axis Pad
GridHelper

To actually define a curvilinear coordinate, you have to use your own grid helper. A generalised version of grid helper class is supplied and this class should suffice in most of cases. A user may provide two functions which defines a transformation (and its inverse pair) from the curved coordinate to (rectilinear) image coordinate. Note that while ticks and grids are drawn for curved coordinate, the data transform of the axes itself (ax.transData) is still rectilinear (image) coordinate.

```python
from mpl_toolkits.axisartist.grid_helper_curvelinear 
    import GridHelperCurveLinear
from mpl_toolkits.axisartist import Subplot

# from curved coordinate to rectlinear coordinate.
def tr(x, y):
x, y = np.asarray(x), np.asarray(y)
return x, y-x

# from rectlinear coordinate to curved coordinate.
def inv_tr(x, y):
x, y = np.asarray(x), np.asarray(y)
return x, y+x

grid_helper = GridHelperCurveLinear((tr, inv_tr))
ax1 = Subplot(fig, 1, 1, 1, grid_helper=grid_helper)
fig.add_subplot(ax1)
```

You may use Matplotlib's Transform instance instead (but a inverse transformation must be defined). Often, coordinate range in a curved coordinate system may have a limited range, or may have cycles. In those cases, a more customized version of grid helper is required.

```python
import mpl_toolkits.axisartist.angle_helper as angle_helper

# PolarAxes.PolarTransform takes radian. However, we want our coordinate
# system in degree
tr = Affine2D().scale(np.pi/180., 1.) + PolarAxes.PolarTransform()

# extreme finder: find a range of coordinate.
# 20, 20: number of sampling points along x, y direction
# The first coordinate (longitude, but theta in polar)
# has a cycle of 360 degree.
# The second coordinate (latitude, but radius in polar) has a minimum of 0
extreme_finder = angle_helper.ExtremeFinderCycle(20, 20,
    lon_cycle = 360,
    lat_cycle = None,
    lon_minmax = None,
    lat_minmax = (0, np.inf),
)

# Find a grid values appropriate for the coordinate (degree,
# minute, second). The argument is a approximate number of grids.
grid_locator1 = angle_helper.LocatorDMS(12)
```

(continues on next page)
# cannot directly use Matplotlib’s Locator and Formatter here (but may be
# possible in the future).
tick_formatter1 = angle_helper.FormatterDMS()

grid_helper = GridHelperCurveLinear(tr,
    extreme_finder=extreme_finder,
    grid_locator1=grid_locator1,
    tick_formatter1=tick_formatter1
    )

Again, the transData of the axes is still a rectilinear coordinate (image coordinate). You may
manually do conversion between two coordinates, or you may use Parasite Axes for conve-
nience.:

ax1 = SubplotHost(fig, 1, 2, 2, grid_helper=grid_helper)

# A parasite axes with given transform
ax2 = ParasiteAxesAuxTrans(ax1, tr, “equal”)
# note that ax2.transData == tr + ax1.transData
# Anything you draw in ax2 will match the ticks and grids of ax1.
ax1.parasites.append(ax2)

Fig. 75: Demo Curvelinear Grid

FloatingAxis

A floating axis is an axis one of whose data coordinate is fixed, i.e, its location is not fixed in
Axes coordinate but changes as axes data limits changes. A floating axis can be created using
new_floating_axis method. However, it is your responsibility that the resulting AxisArtist
is properly added to the axes. A recommended way is to add it as an item of Axes’s axis
attribute.:

# floating axis whose first (index starts from 0) coordinate
# (theta) is fixed at 60
ax1.axis[“lat”] = axis = ax1.new_floating_axis(0, 60)
axis.label.set_text(r“$\theta = 60^\circ$”)
axis.label.set_visible(True)

See the first example of this page.
Current Limitations and TODO’s

The code need more refinement. Here is a incomplete list of issues and TODO’s

• No easy way to support a user customized tick location (for curvilinear grid). A new Locator class needs to be created.

• FloatingAxis may have coordinate limits, e.g., a floating axis of x = 0, but y only spans from 0 to 1.

• The location of axislabel of FloatingAxis needs to be optionally given as a coordinate value. ex, a floating axis of x=0 with label at y=1

2.7.3 The mplot3d Toolkit

Generating 3D plots using the mplot3d toolkit.

3D Axes (of class Axes3D) are created by passing the projection="3d" keyword argument to Figure.add_subplot:

```python
import matplotlib.pyplot as plt
fig = plt.figure()
ax = fig.add_subplot(111, projection='3d')
```
Changed in version 1.0.0: Prior to Matplotlib 1.0.0, `Axes3D` needed to be directly instantiated with `from mpl_toolkits.mplot3d import Axes3D; ax = Axes3D(fig)`.

Changed in version 3.2.0: Prior to Matplotlib 3.2.0, it was necessary to explicitly import the `mpl_toolkits.mplot3d` module to make the ‘3d’ projection to `Figure.add_subplot`.

See the `mplot3d FAQ` for more information about the mplot3d toolkit.

**Line plots**

```python
Axes3D.plot(self, xs, ys, *args, zdir=’z’, **kwargs)
```

Plot 2D or 3D data.

**Parameters**

- `xs` [1D array-like] x coordinates of vertices.
- `ys` [1D array-like] y coordinates of vertices.
- `zs` [float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.
- `zdir` [{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z (‘x’, ‘y’ or ‘z’).
- **kwargs Other arguments are forwarded to `matplotlib.axes.Axes.plot`.

![Fig. 76: Lines3d](image)

**Scatter plots**

```python
Axes3D.scatter(self, xs, ys, zs=0, zdir=’z’, s=20, c=None, depthshade=True, *args, **kwargs)
```

Create a scatter plot.

**Parameters**

- `xs, ys` [array-like] The data positions.
zs [float or array-like, default: 0] The z-positions. Either an array of the same length as xs and ys or a single value to place all points in the same plane.

zdir [{’x’, ’y’, ’z’, ’-x’, ’-y’, ’-z’}, default: ’z’] The axis direction for the zs. This is useful when plotting 2D data on a 3D Axes. The data must be passed as xs, ys. Setting zdir to ’y’ then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.

s [float or array-like, default: 20] The marker size in points**2. Either an array of the same length as xs and ys or a single value to make all markers the same size.

c [color, sequence, or sequence of colors, optional] The marker color. Possible values:

• A single color format string.
• A sequence of colors of length n.
• A sequence of n numbers to be mapped to colors using cmap and norm.
• A 2-D array in which the rows are RGB or RGBA.

For more details see the c argument of scatter.

depthshade [bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to scatter() will perform its depthshading independently.

**kwargs All other arguments are passed on to scatter.

Returns

paths [PathCollection]

Fig. 77: Scatter3d

Wireframe plots

Axes3D.plot_wireframe(self, X, Y, Z, *args, **kwargs)
Plot a 3D wireframe.
Note: The \textit{rcount} and \textit{ccount} kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

Parameters

\textbf{X, Y, Z [2d arrays]} Data values.

\textbf{rcount, ccount [int]} Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.

New in version 2.0.

\textbf{rstride, cstride [int]} Downsampling stride in each direction. These arguments are mutually exclusive with \textit{rcount} and \textit{ccount}. If only one of \textit{rstride} or \textit{cstride} is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

‘classic’ mode uses a default of \textit{rstride} = \textit{cstride} = 1 instead of the new default of \textit{rcount} = \textit{ccount} = 50.

\textbf{**kwargs} Other arguments are forwarded to \textit{Line3DCollection}.

![Fig. 78: Wire3d](image)

Surface plots

\texttt{Axes3D.plot_surface(self, X, Y, Z, *args, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)}

Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports color mapping by supplying the \textit{cmap} argument.
Note: The `rcount` and `ccount` kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

Note: To maximize rendering speed consider setting `rstride` and `cstride` to divisors of the number of rows minus 1 and columns minus 1 respectively. For example, given 51 rows `rstride` can be any of the divisors of 50.

Similarly, a setting of `rstride` and `cstride` equal to 1 (or `rcount` and `ccount` equal the number of rows and columns) can use the optimized path.

Parameters

- **X, Y, Z** [2d arrays] Data values.
- **rcount, ccount** [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50. New in version 2.0.
- **rstride, cstride** [int] Downsampling stride in each direction. These arguments are mutually exclusive with `rcount` and `ccount`. If only one of `rstride` or `cstride` is set, the other defaults to 10.
- `‘classic’` mode uses a default of `rstride = cstride = 10` instead of the new default of `rcount = ccount = 50`.
- **color** [color-like] Color of the surface patches.
- **cmap** [Colormap] Colormap of the surface patches.
- **facecolors** [array-like of colors.] Colors of each individual patch.
- **norm** [Normalize] Normalization for the colormap.
- **vmin, vmax** [float] Bounds for the normalization.
- **shade** [bool, default: True] Whether to shade the facecolors. Shading is always disabled when `cmap` is specified.
- **lightsource** [LightSource] The lightsource to use when `shade` is True.
- ****kwargs** Other arguments are forwarded to `Poly3DCollection`.

Tri-Surface plots

```python
Axes3D.plot_trisurf(self, *args, color=None, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)
```

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```python
plot_trisurf(triangulation, ...)
```

where triangulation is a `Triangulation` object, or:
Fig. 79: Surface3d
Surface3d 2
Surface3d 3

\begin{verbatim}
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
\end{verbatim}

in which case a Triangulation object will be created. See \texttt{Triangulation} for a explanation of these possibilities.

The remaining arguments are:

\begin{verbatim}
plot_trisurf(..., Z)
\end{verbatim}

where \(Z\) is the array of values to contour, one per point in the triangulation.

**Parameters**

- \(X, Y, Z\) [array-like] Data values as 1D arrays.
- \texttt{color} Color of the surface patches.
- \texttt{cmap} A colormap for the surface patches.
- \texttt{norm} [Normalize] An instance of Normalize to map values to colors.
- \texttt{vmin, vmax} [float, default: None] Minimum and maximum value to map.
- \texttt{shade} [bool, default: True] Whether to shade the facecolors. Shading is always disabled when \texttt{cmap} is specified.
- \texttt{lightsource} [LightSource] The lightsource to use when \texttt{shade} is True.
- **\texttt{kwargs}** All other arguments are passed on to \texttt{Poly3DCollection}

**Examples**

New in version 1.2.0.
Contour plots

`Axes3D.contour(self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)`
Create a 3D contour plot.

**Parameters**

- **X, Y, Z** [array-like] Input data.
- **extend3d** [bool, default: False] Whether to extend contour in 3D.
- **stride** [int] Step size for extending contour.
- **zdir** [{‘x’, ‘y’, ‘z’}, default: ‘z’] The direction to use.
- **offset** [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**kargs, **kwargs** Other arguments are forwarded to `matplotlib.axes.Axes.contour`.

**Returns**

`matplotlib.contour.QuadContourSet`

Filled contour plots

`Axes3D.contourf(self, X, Y, Z, *args, zdir='z', offset=None, **kwargs)`
Create a 3D filled contour plot.

**Parameters**

- **X, Y, Z** [array-like] Input data.
- **zdir** [{‘x’, ‘y’, ‘z’}, default: ‘z’] The direction to use.
- **offset** [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.
*args, **kwargs  Other arguments are forwarded to `matplotlib.axes.Axes.contourf`.

Returns

`matplotlib.contour.QuadContourSet`

Notes

New in version 1.1.0: The `zdir` and `offset` parameters.

New in version 1.1.0: The feature demoed in the second contourf3d example was enabled as a result of a bugfix for version 1.1.0.
Polygon plots

Axes3D.add_collection3d(self, col, zs=0, zdir='z')
Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

**Supported are:**
- PolyCollection
- LineCollection
- PatchCollection

![Fig. 83: Polys3d](image)

Bar plots

Axes3D.bar(self, left, height, zs=0, zdir='z', *args, **kwargs)
Add 2D bar(s).

**Parameters**
- `left` [1D array-like] The x coordinates of the left sides of the bars.
- `zs` [float or 1D array-like] Z coordinate of bars; if a single value is specified, it will be used for all bars.
- `zdir` [{`'x'`, `'y'`, `'z'`}, default: `'z'] When plotting 2D data, the direction to use as z (`'x'`, `'y'` or `'z'`).

**kwargs Other arguments are forwarded to `matplotlib.axes.Axes.bar`.

**Returns**
- `mpl_toolkits.mplot3d.art3d.Patch3DCollection`
Fig. 84: Bars3d

**Quiver**

```python
Axes3D.quiver(X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=.3, pivot='tail', normalize=False, **kwargs)
```

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

**Parameters**

- **X, Y, Z** [array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see `pivot` kwarg).
- **U, V, W** [array-like] The x, y and z components of the arrow vectors.
- **length** [float, default: 1] The length of each quiver.
- **arrow_length_ratio** [float, default: 0.3] The ratio of the arrow head with respect to the quiver.
- **pivot** [‘tail’, ‘middle’, ‘tip’], default: ‘tail’] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name `pivot`.
- **normalize** [bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by `u`, `v`, and `w`.
- ****kwargs** Any additional keyword arguments are delegated to `LineCollection`.

**2D plots in 3D**

**Text**

```python
Axes3D.text(self, x, y, z, s, zdir=None, **kwargs)
```

Add text to the plot. kwarg will be passed on to Axes.text, except for the `zdir` keyword, which sets the direction to be used as the z direction.
Fig. 85: Quiver3d

Fig. 86: 2dcollections3d

Fig. 87: Text3d
Subplotting

Having multiple 3D plots in a single figure is the same as it is for 2D plots. Also, you can have both 2D and 3D plots in the same figure.

New in version 1.0.0: Subplotting 3D plots was added in v1.0.0. Earlier version can not do this.

Fig. 88: Subplot3d
   Mixed Subplots
When working with data, interactivity can be invaluable. The pan/zoom and mouse-location tools built into the Matplotlib GUI windows are often sufficient, but you can also use the event system to build customized data exploration tools.

Matplotlib ships with backends binding to several GUI toolkits (Qt, Tk, Wx, GTK, macOS, JavaScript) and third party packages provide bindings to kivy and Jupyter Lab. For the figures to be responsive to mouse, keyboard, and paint events, the GUI event loop needs to be integrated with an interactive prompt. We recommend using IPython (see below).

The pyplot module provides functions for explicitly creating figures that include interactive tools, a toolbar, a tool-tip, and key bindings:

- `pyplot.figure` Creates a new empty `figure.Figure` or selects an existing figure
- `pyplot.subplots` Creates a new `figure.Figure` and fills it with a grid of `axes.Axes`

Matplotlib keeps a reference to all of the open figures created via `pyplot.figure` or `pyplot.subplots` so that the figures will not be garbage collected. Figures can be closed and deregistered from pyplot individually via `pyplot.close`; all open Figures can be closed via `plt.close('all')`.

For more discussion of Matplotlib’s event system and integrated event loops, please read:

### 3.1 Interactive Figures and Asynchronous Programming

Matplotlib supports rich interactive figures by embedding figures into a GUI window. The basic interactions of panning and zooming in an Axes to inspect your data is ‘baked in’ to Matplotlib. This is supported by a full mouse and keyboard event handling system that you can use to build sophisticated interactive graphs.

This guide is meant to be an introduction to the low-level details of how Matplotlib integration with a GUI event loop works. For a more practical introduction to the Matplotlib event API see event handling system, Interactive Tutorial, and Interactive Applications using Matplotlib.

#### 3.1.1 Event Loops

Fundamentally, all user interaction (and networking) is implemented as an infinite loop waiting for events from the user (via the OS) and then doing something about it. For example, a
minimal Read Evaluate Print Loop (REPL) is

```
exec_count = 0
while True:
    inp = input(f"[{exec_count}] > ") # Read
    ret = eval(inp) # Evaluate
    print(ret) # Print
    exec_count += 1 # Loop
```

This is missing many niceties (for example, it exits on the first exception!), but is representative of the event loops that underlie all terminals, GUIs, and servers. In general the Read step is waiting on some sort of I/O - be it user input or the network - while the Evaluate and Print are responsible for interpreting the input and then doing something about it.

In practice we interact with a framework that provides a mechanism to register callbacks to be run in response to specific events rather than directly implement the I/O loop. For example “when the user clicks on this button, please run this function” or “when the user hits the ‘z’ key, please run this other function”. This allows users to write reactive, event-driven, programs without having to delve into the nitty-gritty details of I/O. The core event loop is sometimes referred to as “the main loop” and is typically started, depending on the library, by methods with names like _exec, run, or start.

All GUI frameworks (Qt, Wx, Gtk, tk, OSX, or web) have some method of capturing user interactions and passing them back to the application (for example Signal/Slot framework in Qt) but the exact details depend on the toolkit. Matplotlib has a backend for each GUI toolkit we support which uses the toolkit API to bridge the toolkit UI events into Matplotlib’s event handling system. You can then use FigureCanvasBase.mpl_connect to connect your function to Matplotlib’s event handling system. This allows you to directly interact with your data and write GUI toolkit agnostic user interfaces.

### 3.1.2 Command Prompt Integration

So far, so good. We have the REPL (like the IPython terminal) that lets us interactively send code to the interpreter and get results back. We also have the GUI toolkit that runs an event loop waiting for user input and lets us register functions to be run when that happens. However, if we want to do both we have a problem: the prompt and the GUI event loop are both infinite loops that each think they are in charge! In order for both the prompt and the GUI windows to be responsive we need a method to allow the loops to ‘timeshare’:

1. let the GUI main loop block the python process when you want interactive windows
2. let the CLI main loop block the python process and intermittently run the GUI loop
3. fully embed python in the GUI (but this is basically writing a full application)

---

1 A limitation of this design is that you can only wait for one input, if there is a need to multiplex between multiple sources then the loop would look something like

```
fds = [...]  # Loop
while True: # Loop
    inp = select(fds).read() # Read
    eval(inp) # Evaluate / Print
```

2 Or you can write your own if you must.

3 These examples are aggressively dropping many of the complexities that must be dealt with in the real world such as keyboard interrupts, timeouts, bad input, resource allocation and cleanup, etc.
Blocking the Prompt

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>pyplot.show</code></td>
<td>Display all open figures.</td>
</tr>
<tr>
<td><code>pyplot.pause(interval)</code></td>
<td>Run the GUI event loop for interval seconds.</td>
</tr>
<tr>
<td><code>backend_bases.FigureCanvasBase.start_event_loop()</code></td>
<td>Start a blocking event loop.</td>
</tr>
<tr>
<td><code>backend_bases.FigureCanvasBase.stop_event_loop()</code></td>
<td>Stop the current blocking event loop.</td>
</tr>
</tbody>
</table>

The simplest “integration” is to start the GUI event loop in ‘blocking’ mode and take over the CLI. While the GUI event loop is running you can not enter new commands into the prompt (your terminal may echo the characters typed into the terminal, but they will not be sent to the Python interpreter because it is busy running the GUI event loop), but the figure windows will be responsive. Once the event loop is stopped (leaving any still open figure windows non-responsive) you will be able to use the prompt again. Re-starting the event loop will make any open figure responsive again (and will process any queued up user interaction).

To start the event loop until all open figures are closed use `pyplot.show` as

```python
pyplot.show(block=True)
```

To start the event loop for a fixed amount of time (in seconds) use `pyplot.pause`.

If you are not using `pyplot` you can start and stop the event loops via `FigureCanvasBase.start_event_loop` and `FigureCanvasBase.stop_event_loop`. However, in most contexts where you would not be using `pyplot` you are embedding Matplotlib in a large GUI application and the GUI event loop should already be running for the application.

Away from the prompt, this technique can be very useful if you want to write a script that pauses for user interaction, or displays a figure between polling for additional data. See Scripts and functions for more details.

Input Hook integration

While running the GUI event loop in a blocking mode or explicitly handling UI events is useful, we can do better! We really want to be able to have a usable prompt and interactive figure windows.

We can do this using the ‘input hook’ feature of the interactive prompt. This hook is called by the prompt as it waits for the user to type (even for a fast typist the prompt is mostly waiting for the human to think and move their fingers). Although the details vary between prompts the logic is roughly

1. start to wait for keyboard input
2. start the GUI event loop
3. as soon as the user hits a key, exit the GUI event loop and handle the key
4. repeat

This gives us the illusion of simultaneously having interactive GUI windows and an interactive prompt. Most of the time the GUI event loop is running, but as soon as the user starts typing the prompt takes over again.

This time-share technique only allows the event loop to run while python is otherwise idle and waiting for user input. If you want the GUI to be responsive during long running code it is

3.1. Interactive Figures and Asynchronous Programming
necessary to periodically flush the GUI event queue as described above. In this case it is your code, not the REPL, which is blocking the process so you need to handle the “time-share” manually. Conversely, a very slow figure draw will block the prompt until it finishes drawing.

3.1.3 Full embedding

It is also possible to go the other direction and fully embed figures (and a Python interpreter) in a rich native application. Matplotlib provides classes for each toolkit which can be directly embedded in GUI applications (this is how the built-in windows are implemented!). See user_interfaces for more details.

3.1.4 Scripts and functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>backend_bases.FigureCanvasBase.flush_events</code></td>
<td>Flush the GUI events for the figure.</td>
</tr>
<tr>
<td><code>backend_bases.FigureCanvasBase.draw_idle</code></td>
<td>Request a widget redraw once control returns to the GUI event loop.</td>
</tr>
<tr>
<td><code>figure.Figure.ginput</code></td>
<td>Blocking call to interact with a figure.</td>
</tr>
<tr>
<td><code>pyplot.ginput</code></td>
<td>Blocking call to interact with a figure.</td>
</tr>
<tr>
<td><code>pyplot.show</code></td>
<td>Display all open figures.</td>
</tr>
<tr>
<td><code>pyplot.pause</code></td>
<td>Run the GUI event loop for interval seconds.</td>
</tr>
</tbody>
</table>

There are several use-cases for using interactive figures in scripts:

- capture user input to steer the script
- progress updates as a long running script progresses
- streaming updates from a data source

Blocking functions

If you only need to collect points in an Axes you can use `figure.Figure.ginput` or more generally the tools from blocking_input the tools will take care of starting and stopping the event loop for you. However if you have written some custom event handling or are using widgets you will need to manually run the GUI event loop using the methods described above.

You can also use the methods described in Blocking the Prompt to suspend run the GUI event loop. Once the loop exits your code will resume. In general, any place you would use `time.sleep` you can use `pyplot.pause` instead with the added benefit of interactive figures.

For example, if you want to poll for data you could use something like

```python
fig, ax = plt.subplots()
ln, = ax.plot([], [])

while True:
    x, y = get_new_data()
    ln.set_data(x, y)
    plt.pause(1)
```

which would poll for new data and update the figure at 1Hz.
Explicitly spinning the Event Loop

| backend_bases.FigureCanvasBase.flush_events | Flush the GUI events for the figure. |
| backend_bases.FigureCanvasBase.draw_idle   | Request a widget redraw once control returns to the GUI event loop. |

If you have open windows that have pending UI events (mouse clicks, button presses, or draws) you can explicitly process those events by calling `FigureCanvasBase.flush_events`. This will run the GUI event loop until all UI events currently waiting have been processed. The exact behavior is backend-dependent but typically events on all figure are processed and only events waiting to be processed (not those added during processing) will be handled.

For example

```python
import time
import matplotlib.pyplot as plt
import numpy as np

plt.ion()

fig, ax = plt.subplots()
th = np.linspace(0, 2*np.pi, 512)
ax.set_ylim(-1.5, 1.5)

ln, = ax.plot(th, np.sin(th))

def slow_loop(N, ln):
    for j in range(N):
        time.sleep(.1)  # to simulate some work
        ln.figure.canvas.flush_events()

slow_loop(100, ln)
```

While this will feel a bit laggy (as we are only processing user input every 100ms whereas 20-30ms is what feels “responsive”) it will respond.

If you make changes to the plot and want it re-rendered you will need to call `draw_idle` to request that the canvas be re-drawn. This method can be thought of `draw_soon` in analogy to `asyncio.loop.call_soon`.

We can add this our example above as

```python
def slow_loop(N, ln):
    for j in range(N):
        time.sleep(.1)  # to simulate some work
        if j % 10:
            ln.set_ydata(np.sin(((j // 10) % 5) * th))
            ln.figure.canvas.draw_idle()
            ln.figure.canvas.flush_events()

slow_loop(100, ln)
```

The more frequently you call `FigureCanvasBase.flush_events` the more responsive your figure will feel but at the cost of spending more resources on the visualization and less on your computation.
3.1.5 Stale Artists

Artists (as of Matplotlib 1.5) have a **stale** attribute which is **True** if the internal state of the artist has changed since the last time it was rendered. By default the stale state is propagated up to the Artists parents in the draw tree, e.g., if the color of a `Line2D` instance is changed, the `axes.Axes` and `figure.Figure` that contain it will also be marked as "stale". Thus, `fig.stale` will report if any artist in the figure has been modified and is out of sync with what is displayed on the screen. This is intended to be used to determine if `draw_idle` should be called to schedule a re-rendering of the figure.

Each artist has a `Artist.stale_callback` attribute which holds a callback with the signature

```python
def callback(self: Artist, val: bool) -> None:
    ...
```

which by default is set to a function that forwards the stale state to the artist’s parent. If you wish to suppress a given artist from propagating set this attribute to `None`.

`figure.Figure` instances do not have a containing artist and their default callback is `None`. If you call `pyplot.ion` and are not in IPython we will install a callback to invoke `draw_idle` whenever the `figure.Figure` becomes stale. In IPython we use the 'post_execute' hook to invoke `draw_idle` on any stale figures after having executed the user’s input, but before returning the prompt to the user. If you are not using `pyplot` you can use the callback `Figure.stale_callback` attribute to be notified when a figure has become stale.

3.1.6 Draw Idle

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>backend_bases.FigureCanvasBase.draw</code></td>
<td>Render the <code>Figure</code>.</td>
</tr>
<tr>
<td><code>backend_bases.FigureCanvasBase.draw_idle</code></td>
<td>Request a widget redraw once control returns to the GUI event loop.</td>
</tr>
<tr>
<td><code>backend_bases.FigureCanvasBase.flush_events</code></td>
<td>Flush the GUI events for the figure.</td>
</tr>
</tbody>
</table>

In almost all cases, we recommend using `backend_bases.FigureCanvasBase.draw_idle` over `backend_bases.FigureCanvasBase.draw`. `draw` forces a rendering of the figure whereas `draw_idle` schedules a rendering the next time the GUI window is going to re-paint the screen. This improves performance by only rendering pixels that will be shown on the screen. If you want to be sure that the screen is updated as soon as possible do

```python
fig.canvas.draw_idle()
fig.canvas.flush_events()
```

3.1.7 Threading

Most GUI frameworks require that all updates to the screen, and hence their main event loop, run on the main thread. This makes pushing periodic updates of a plot to a background thread impossible. Although it seems backwards, it is typically easier to push your computations to a background thread and periodically update the figure on the main thread.

In general Matplotlib is not thread safe. If you are going to update `Artist` objects in one thread and draw from another you should make sure that you are locking in the critical sections.
3.1.8 Eventloop integration mechanism

CPython / readline

The Python C API provides a hook, `PyOS_InputHook`, to register a function to be run “The function will be called when Python’s interpreter prompt is about to become idle and wait for user input from the terminal.”. This hook can be used to integrate a second event loop (the GUI event loop) with the python input prompt loop. The hook functions typically exhaust all pending events on the GUI event queue, run the main loop for a short fixed amount of time, or run the event loop until a key is pressed on stdin.

Matplotlib does not currently do any management of `PyOS_InputHook` due to the wide range of ways that Matplotlib is used. This management is left to downstream libraries – either user code or the shell. Interactive figures, even with matplotlib in ‘interactive mode’, may not work in the vanilla python repl if an appropriate `PyOS_InputHook` is not registered.

Input hooks, and helpers to install them, are usually included with the python bindings for GUI toolkits and may be registered on import. IPython also ships input hook functions for all of the GUI frameworks Matplotlib supports which can be installed via `%matplotlib`. This is the recommended method of integrating Matplotlib and a prompt.

IPython / prompt toolkit

With IPython >= 5.0 IPython has changed from using cpython’s readline based prompt to a `prompt_toolkit` based prompt. `prompt_toolkit` has the same conceptual input hook, which is fed into `prompt_toolkit` via the `IPython.terminal.interactiveshell.TerminalInteractiveShell.inputhook()` method. The source for the `prompt_toolkit` input hooks lives at `IPython.terminal.pt_inputhooks`.

3.2 Event handling and picking

Matplotlib works with a number of user interface toolkits (wxpython, tkinter, qt4, gtk, and macosx) and in order to support features like interactive panning and zooming of figures, it is helpful to the developers to have an API for interacting with the figure via key presses and mouse movements that is “GUI neutral” so we don’t have to repeat a lot of code across the different user interfaces. Although the event handling API is GUI neutral, it is based on the GTK model, which was the first user interface matplotlib supported. The events that are triggered are also a bit richer vis-a-vis matplotlib than standard GUI events, including information like which `matplotlib.axes.Axes` the event occurred in. The events also understand the matplotlib coordinate system, and report event locations in both pixel and data coordinates.

3.2.1 Event connections

To receive events, you need to write a callback function and then connect your function to the event manager, which is part of the `FigureCanvasBase`. Here is a simple example that prints the location of the mouse click and which button was pressed:

```python
fig, ax = plt.subplots()
ax.plot(np.random.rand(10))
```

(continues on next page)
def onclick(event):
    print('%s click: button=%d, x=%d, y=%d, xdata=%f, ydata=%f'
          % ('double' if event.dblclick else 'single', event.button, 
              event.x, event.y, event.xdata, event.ydata))

cid = fig.canvas.mpl_connect('button_press_event', onclick)

The FigureCanvas method `mpl_connect()` returns a connection id which is simply an integer. When you want to disconnect the callback, just call:

```python
fig.canvas.mpl_disconnect(cid)
```

**Note:** The canvas retains only weak references to instance methods used as callbacks. Therefore, you need to retain a reference to instances owning such methods. Otherwise the instance will be garbage-collected and the callback will vanish.

This does not affect free functions used as callbacks.

Here are the events that you can connect to, the class instances that are sent back to you when the event occurs, and the event descriptions:

<table>
<thead>
<tr>
<th>Event name</th>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'button_press_event'</td>
<td>MouseEvent</td>
<td>mouse button is pressed</td>
</tr>
<tr>
<td>'button_release_event'</td>
<td>MouseEvent</td>
<td>mouse button is released</td>
</tr>
<tr>
<td>'close_event'</td>
<td>CloseEvent</td>
<td>figure is closed</td>
</tr>
<tr>
<td>'draw_event'</td>
<td>DrawEvent</td>
<td>canvas has been drawn (but screen widget not updated yet)</td>
</tr>
<tr>
<td>'key_press_event'</td>
<td>KeyEvent</td>
<td>key is pressed</td>
</tr>
<tr>
<td>'key_release_event'</td>
<td>KeyEvent</td>
<td>key is released</td>
</tr>
<tr>
<td>'motion_notify_event'</td>
<td>MouseEvent</td>
<td>mouse moves</td>
</tr>
<tr>
<td>'pick_event'</td>
<td>PickEvent</td>
<td>artist in the canvas is selected</td>
</tr>
<tr>
<td>'resize_event'</td>
<td>ResizeEvent</td>
<td>figure canvas is resized</td>
</tr>
<tr>
<td>'scroll_event'</td>
<td>MouseEvent</td>
<td>mouse scroll wheel is rolled</td>
</tr>
<tr>
<td>'figure_enter_event'</td>
<td>LocationEvent</td>
<td>mouse enters a new figure</td>
</tr>
<tr>
<td>'figure_leave_event'</td>
<td>LocationEvent</td>
<td>mouse leaves a figure</td>
</tr>
<tr>
<td>'axes_enter_event'</td>
<td>LocationEvent</td>
<td>mouse enters a new axes</td>
</tr>
<tr>
<td>'axes_leave_event'</td>
<td>LocationEvent</td>
<td>mouse leaves an axes</td>
</tr>
</tbody>
</table>

### 3.2.2 Event attributes

All matplotlib events inherit from the base class `matplotlib.backend_bases.Event`, which store the attributes:

- `name` the event name
- `canvas` the FigureCanvas instance generating the event
- `guiEvent` the GUI event that triggered the matplotlib event
The most common events that are the bread and butter of event handling are key press/release events and mouse press/release and movement events. The `KeyEvent` and `MouseEvent` classes that handle these events are both derived from the `LocationEvent`, which has the following attributes:

- **x** x position - pixels from left of canvas
- **y** y position - pixels from bottom of canvas
- **inaxes** the `Axes` instance if mouse is over axes
- **xdata** x coord of mouse in data coords
- **ydata** y coord of mouse in data coords

Let’s look a simple example of a canvas, where a simple line segment is created every time a mouse is pressed:

```python
from matplotlib import pyplot as plt

class LineBuilder:
    def __init__(self, line):
        self.line = line
        self.xs = list(line.get_xdata())
        self.ys = list(line.get_ydata())
        self.cid = line.figure.canvas.mpl_connect('button_press_event', self)

    def __call__(self, event):
        print('click', event)
        if event.inaxes != self.line.axes: return
        self.xs.append(event.xdata)
        self.ys.append(event.ydata)
        self.line.set_data(self.xs, self.ys)
        self.line.figure.canvas.draw()

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click to build line segments')
line, = ax.plot([0], [0])  # empty line
linebuilder = LineBuilder(line)

plt.show()
```

The `MouseEvent` that we just used is a `LocationEvent`, so we have access to the data and pixel coordinates in `event.x` and `event.xdata`. In addition to the `LocationEvent` attributes, it has:

- **button** button pressed None, 1, 2, 3, ‘up’, ‘down’ (up and down are used for scroll events)
- **key** the key pressed: None, any character, ‘shift’, ‘win’, or ‘control’

**Draggable rectangle exercise**

Write draggable rectangle class that is initialized with a `Rectangle` instance but will move its x,y location when dragged. Hint: you will need to store the original xy location of the rectangle which is stored as `rect.xy` and connect to the press, motion and release mouse events. When the mouse is pressed, check to see if the click occurs over your rectangle (see `matplotlib.patches.Rectangle.contains()`) and if it does, store the rectangle xy and the location of the mouse click in data coords. In the motion event callback, compute the deltax and deltay of
the mouse movement, and add those deltas to the origin of the rectangle you stored. The
redraw the figure. On the button release event, just reset all the button press data you stored
as None.

Here is the solution:

```python
import numpy as np
import matplotlib.pyplot as plt

class DraggableRectangle:
    def __init__(self, rect):
        self.rect = rect
        self.press = None

    def connect(self):
        'connect to all the events we need'
        self.cidpress = self.rect.figure.canvas.mpl_connect('button_press_event', self.on_press)
        self.cidrelease = self.rect.figure.canvas.mpl_connect('button_release_event', self.on_release)
        self.cidmotion = self.rect.figure.canvas.mpl_connect('motion_notify_event', self.on_motion)

    def on_press(self, event):
        'on button press we will see if the mouse is over us and store some data'
        if event.inaxes != self.rect.axes: return

        contains, attrd = self.rect.contains(event)
        if not contains: return
        print('event contains', self.rect.xy)
        x0, y0 = self.rect.xy
        self.press = x0, y0, event.xdata, event.ydata

    def on_motion(self, event):
        'on motion we will move the rect if the mouse is over us'
        if self.press is None: return
        if event.inaxes != self.rect.axes: return

        x0, y0, xpress, ypress = self.press
        dx = event.xdata - xpress
        dy = event.ydata - ypress
        #print('x0=%f, xpress=%f, event.xdata=%f, dx=%f, x0+dx=%f' %
        # (x0, xpress, event.xdata, dx, x0+dx))
        self.rect.set_x(x0+dx)
        self.rect.set_y(y0+dy)

        self.rect.figure.canvas.draw()

    def on_release(self, event):
        'on release we reset the press data'
        self.press = None
        self.rect.figure.canvas.draw()

    def disconnect(self):
        'disconnect all the stored connection ids'
        self.rect.figure.canvas.mpl_disconnect(self.cidpress)
        self.rect.figure.canvas.mpl_disconnect(self.cidrelease)
        self.rect.figure.canvas.mpl_disconnect(self.cidmotion)
```

(continues on next page)
fig = plt.figure()
ax = fig.add_subplot(111)
rects = ax.bar(range(10), 20*np.random.rand(10))
drs = []
for rect in rects:
    dr = DraggableRectangle(rect)
    dr.connect()
    drs.append(dr)

plt.show()

Extra credit: Use blitting to make the animated drawing faster and smoother.

Extra credit solution:

# Draggable rectangle with blitting.
import numpy as np
import matplotlib.pyplot as plt
class DraggableRectangle:
    lock = None  # only one can be animated at a time
    def __init__(self, rect):
        self.rect = rect
        self.press = None
        self.background = None

def connect(self):
    'connect to all the events we need'
    self.cidpress = self.rect.figure.canvas.mpl_connect('button_press_event', self.on_press)
    self.cidrelease = self.rect.figure.canvas.mpl_connect('button_release_event', self.on_release)
    self.cidmotion = self.rect.figure.canvas.mpl_connect('motion_notify_event', self.on_motion)

def on_press(self, event):
    'on button press we will see if the mouse is over us and store some data'
    if event.inaxes != self.rect.axes: return
    if DraggableRectangle.lock is not None: return
    contains, attrd = self.rect.contains(event)
    if not contains: return
    print('event contains', self.rect.xy)
    x0, y0 = self.rect.xy
    self.press = x0, y0, event.xdata, event.ydata
    DraggableRectangle.lock = self

    # draw everything but the selected rectangle and store the pixel buffer
    canvas = self.rect.figure.canvas
    axes = self.rect.axes
    self.rect.set_animated(True)
    canvas.draw()
    self.background = canvas.copy_from_bbox(self.rect.axes.bbox)

    # now redraw just the rectangle
    axes.draw_artist(self.rect)

    # turn off interaction
    self.press = None

    def on_release(self, event):
        self.press = None
        if DraggableRectangle.lock:
            DraggableRectangle.lock = None
            self.press = None
            self.background = canvas.restore_region(self.background)

            # draw everything but the selected rectangle
            canvas.blit(self.rect.axes.bbox)

    def on_motion(self, event):
        'motion_notify_event is called whenever the mouse is moved while a press event is active'
        if self.background is None: return
        if DraggableRectangle.lock:
            return

        if event.inaxes != self.rect.axes: return
        contains, attrd = self.rect.contains(event)
        if not contains: return

        x0, y0, x1, y1 = self.rect.xy
        self.rect.set_xy((event.xdata - x0, event.ydata - y0))

        canvas.blit(self.rect.axes.bbox)
# and blit just the redrawn area
canvas.blit(axes.bbox)

def on_motion(self, event):
    # on motion we will move the rect if the mouse is over us
    if DraggableRectangle.lock is not self:
        return

    if event.inaxes != self.rect.axes: return

    x0, y0, xpress, ypress = self.press
    dx = event.xdata - xpress
    dy = event.ydata - ypress
    self.rect.set_x(x0 + dx)
    self.rect.set_y(y0 + dy)

    canvas = self.rect.figure.canvas
    axes = self.rect.axes
    # restore the background region
    canvas.restore_region(self.background)

    # redraw just the current rectangle
    axes.draw_artist(self.rect)

    # blit just the redrawn area
    canvas.blit(axes.bbox)

def on_release(self, event):
    # on release we reset the press data
    if DraggableRectangle.lock is not self:
        return

    self.press = None
    DraggableRectangle.lock = None

    # turn off the rect animation property and reset the background
    self.rect.set_animated(False)
    self.background = None

    # redraw the full figure
    self.rect.figure.canvas.draw()

def disconnect(self):
    # disconnect all the stored connection ids'
    self.rect.figure.canvas.mpl_disconnect(self.cidpress)
    self.rect.figure.canvas.mpl_disconnect(self.cidrelease)
    self.rect.figure.canvas.mpl_disconnect(self.cidmotion)

fig = plt.figure()
ax = fig.add_subplot(111)
rects = ax.bar(range(10), 20*np.random.rand(10))
drs = []
for rect in rects:
    dr = DraggableRectangle(rect)
    dr.connect()
    drs.append(dr)

plt.show()
3.2.3 Mouse enter and leave

If you want to be notified when the mouse enters or leaves a figure or axes, you can connect to the figure/axes enter/leave events. Here is a simple example that changes the colors of the axes and figure background that the mouse is over:

```
""
Illustrate the figure and axes enter and leave events by changing the frame colors on enter and leave
""
import matplotlib.pyplot as plt

def enter_axes(event):
    print('enter_axes', event.inaxes)
    event.inaxes.patch.set_facecolor('yellow')
    event.canvas.draw()

def leave_axes(event):
    print('leave_axes', event.inaxes)
    event.inaxes.patch.set_facecolor('white')
    event.canvas.draw()

def enter_figure(event):
    print('enter_figure', event.canvas.figure)
    event.canvas.figure.patch.set_facecolor('red')
    event.canvas.draw()

def leave_figure(event):
    print('leave_figure', event.canvas.figure)
    event.canvas.figure.patch.set_facecolor('grey')
    event.canvas.draw()

fig1 = plt.figure()
fig1.suptitle('mouse hover over figure or axes to trigger events')
ax1 = fig1.add_subplot(211)
ax2 = fig1.add_subplot(212)

fig1.canvas.mpl_connect('figure_enter_event', enter_figure)
fig1.canvas.mpl_connect('figure_leave_event', leave_figure)
fig1.canvas.mpl_connect('axes_enter_event', enter_axes)
fig1.canvas.mpl_connect('axes_leave_event', leave_axes)

fig2 = plt.figure()
fig2.suptitle('mouse hover over figure or axes to trigger events')
ax1 = fig2.add_subplot(211)
ax2 = fig2.add_subplot(212)

fig2.canvas.mpl_connect('figure_enter_event', enter_figure)
fig2.canvas.mpl_connect('figure_leave_event', leave_figure)
fig2.canvas.mpl_connect('axes_enter_event', enter_axes)
fig2.canvas.mpl_connect('axes_leave_event', leave_axes)

plt.show()
```
3.2.4 Object picking

You can enable picking by setting the `picker` property of an `Artist` (e.g., a matplotlib `Line2D`, `Text`, `Patch`, `Polygon`, `AxesImage`, etc...)

There are a variety of meanings of the `picker` property:

- **None**: picking is disabled for this artist (default)
- **boolean**: if True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- **float**: if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.
- **function**: if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event. The signature is `hit, props = picker(artist, mouseevent)` to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the `PickEvent` attributes

After you have enabled an artist for picking by setting the `picker` property, you need to connect to the figure canvas pick_event to get pick callbacks on mouse press events. e.g.:

```python
def pick_handler(event):
    mouseevent = event.mouseevent
    artist = event.artist
    # now do something with this...
```

The `PickEvent` which is passed to your callback is always fired with two attributes:

- **mouseevent**: the mouse event that generate the pick event. The mouse event in turn has attributes like `x` and `y` (the coords in display space, e.g., pixels from left, bottom) and `xdata`, `ydata` (the coords in data space). Additionally, you can get information about which buttons were pressed, which keys were pressed, which `Axes` the mouse is over, etc. See `matplotlib.backend_bases.MouseEvent` for details.

- **artist**: the `Artist` that generated the pick event.

Additionally, certain artists like `Line2D` and `PatchCollection` may attach additional meta data like the indices into the data that meet the picker criteria (e.g., all the points in the line that are within the specified epsilon tolerance)

Simple picking example

In the example below, we set the line picker property to a scalar, so it represents a tolerance in points (72 points per inch). The onpick callback function will be called when the pick event it within the tolerance distance from the line, and has the indices of the data vertices that are within the pick distance tolerance. Our onpick callback function simply prints the data that are under the pick location. Different matplotlib Artists can attach different data to the PickEvent. For example, `Line2D` attaches the `ind` property, which are the indices into the line data under the pick point. See `pick()` for details on the `PickEvent` properties of the line. Here is the code:
```python
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click on points')

line, = ax.plot(np.random.rand(100), 'o', picker=5)  # 5 points tolerance

def onpick(event):
    if event.artist != line:
        return True

N = len(event.ind)
```

**Picking exercise**

Create a data set of 100 arrays of 1000 Gaussian random numbers and compute the sample mean and standard deviation of each of them (hint: NumPy arrays have a mean and std method) and make a xy marker plot of the 100 means vs. the 100 standard deviations. Connect the line created by the plot command to the pick event, and plot the original time series of the data that generated the clicked on points. If more than one point is within the tolerance of the clicked on point, you can use multiple subplots to plot the multiple time series.

**Exercise solution:**

```python
""
compe the mean and stddev of 100 data sets and plot mean vs. stddev. When you click on one of the mu, sigma points, plot the raw data from the dataset that generated the mean and stddev
""

import numpy as np
import matplotlib.pyplot as plt

X = np.random.rand(100, 1000)
x = np.mean(X, axis=1)
y = np.std(X, axis=1)

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click on point to plot time series')
line, = ax.plot(xs, ys, 'o', picker=5)  # 5 points tolerance

def onpick(event):
    if event.artist != line:
        return True

N = len(event.ind)
```

(continues on next page)
if not N: return True

figi = plt.figure()
for subplotnum, dataind in enumerate(event.ind):
    ax = figi.add_subplot(N,1,subplotnum+1)
    ax.plot(X[dataind])
    ax.text(0.05, 0.9, 'mu=%1.3f
          sigma=%1.3f' % (xs[dataind], ys[dataind]),
            transform=ax.transAxes, va='top')
    ax.set_ylim(-0.5, 1.5)
figi.show()
return True

fig.canvas.mpl_connect('pick_event', onpick)
plt.show()

### 3.3 IPython integration

We recommend using IPython for an interactive shell. In addition to all of its features (improved tab-completion, magics, multiline editing, etc), it also ensures that the GUI toolkit event loop is properly integrated with the command line (see [Command Prompt Integration](#)).

In this example, we create and modify a figure via an IPython prompt. The figure displays in a Qt5Agg GUI window. To configure the integration and enable interactive mode use the `%matplotlib` magic:

```bash
:: In [1]: %matplotlib Using matplotlib backend: Qt5Agg
```

In [2]: import matplotlib.pyplot as plt

Create a new figure window:

```python
In [3]: fig, ax = plt.subplots()
```

Add a line plot of the data to the window:

```python
In [4]: ln, = ax.plot(range(5))
```

Change the color of the line from blue to orange:

```python
In [5]: ln.set_color('orange')
```

If you wish to disable automatic redrawing of the plot:

```python
In [6]: plt.ioff()
```

If you wish to re-enable automatic redrawing of the plot:

```python
In [7]: plt.ion()
```

In recent versions of Matplotlib and IPython, it is sufficient to import `matplotlib.pyplot` and call `pyplot.ion`. Using the `%` magic is guaranteed to work in all versions of Matplotlib and IPython.
3.4 Interactive mode

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>pyplot.ion</td>
<td>Turn the interactive mode on.</td>
</tr>
<tr>
<td>pyplot.ioff</td>
<td>Turn the interactive mode off.</td>
</tr>
<tr>
<td>pyplot.isinteractive</td>
<td>Return if pyplot is in “interactive mode” or not.</td>
</tr>
<tr>
<td>pyplot.show</td>
<td>Display all open figures.</td>
</tr>
<tr>
<td>pyplot.pause</td>
<td>Run the GUI event loop for interval seconds.</td>
</tr>
</tbody>
</table>

Interactive mode controls:

- whether created figures are automatically shown
- whether changes to artists automatically trigger re-drawing existing figures
- when pyplot.show() returns if given no arguments: immediately, or after all of the figures have been closed

If in interactive mode:

- newly created figures will be displayed immediately
- figures will automatically redraw when elements are changed
- pyplot.show() displays the figures and immediately returns

If not in interactive mode:

- newly created figures and changes to figures are not displayed until
  - pyplot.show() is called
  - pyplot.pause() is called
  - FigureCanvasBase.flush_events() is called
- pyplot.show() runs the GUI event loop and does not return until all the plot windows are closed

If you are in non-interactive mode (or created figures while in non-interactive mode) you may need to explicitly call pyplot.show to display the windows on your screen. If you only want to run the GUI event loop for a fixed amount of time, you can use pyplot.pause. This will block the progress of your code as if you had called time.sleep, ensure the current window is shown and re-drawn if needed, and run the GUI event loop for the specified period of time.

The GUI event loop being integrated with your command prompt and the figures being in interactive mode are independent of each other. If you use pyplot.ion but have not arranged for the event loop integration, your figures will appear but will not be interactive while the prompt is waiting for input. You will not be able to pan/zoom and the figure may not even render (the window might appear black, transparent, or as a snapshot of the desktop under it). Conversely, if you configure the event loop integration, displayed figures will be responsive while waiting for input at the prompt, regardless of pyplot’s “interactive mode”.

No matter what combination of interactive mode setting and event loop integration, figures will be responsive if you use pyplot.show(block=True), pyplot.pause, or run the GUI main loop in some other way.
**Warning:** Using `figure.Figure.show` it is possible to display a figure on the screen without starting the event loop and without being in interactive mode. This may work (depending on the GUI toolkit) but will likely result in a non-responsive figure.

### 3.5 Default UI

The windows created by `pyplot` have an interactive toolbar with navigation buttons and a readout of the data values the cursor is pointing at. A number of helpful keybindings are registered by default.

#### 3.5.1 Navigation Keyboard Shortcuts

The following table holds all the default keys, which can be overwritten by use of your `matplotlibrc`.

<table>
<thead>
<tr>
<th>Command</th>
<th>Default key binding and rcParam</th>
</tr>
</thead>
<tbody>
<tr>
<td>Home/Reset</td>
<td><code>rcParams[“keymap.home”]</code> (default: <code>['h', 'r', 'home']</code>)</td>
</tr>
<tr>
<td>Back</td>
<td><code>rcParams[“keymap.back”]</code> (default: <code>['left', 'c', 'backspace', 'MouseButton.BACK']</code>)</td>
</tr>
<tr>
<td>Forward</td>
<td><code>rcParams[“keymap.forward”]</code> (default: <code>['right', 'v', 'MouseButton.FORWARD']</code>)</td>
</tr>
<tr>
<td>Pan/Zoom</td>
<td><code>rcParams[“keymap.pan”]</code> (default: <code>['p']</code>)</td>
</tr>
<tr>
<td>Zoom-to-rect</td>
<td><code>rcParams[“keymap.zoom”]</code> (default: <code>['o']</code>)</td>
</tr>
<tr>
<td>Save</td>
<td><code>rcParams[“keymap.save”]</code> (default: <code>['s', 'ctrl+s']</code>)</td>
</tr>
<tr>
<td>Toggle fullscreen</td>
<td><code>rcParams[“keymap.fullscreen”]</code> (default: <code>['f', 'ctrl+f']</code>)</td>
</tr>
<tr>
<td>Toggle major grids</td>
<td><code>rcParams[“keymap.grid”]</code> (default: <code>['g']</code>)</td>
</tr>
<tr>
<td>Toggle minor grids</td>
<td><code>rcParams[“keymap.grid_minor”]</code> (default: <code>['G']</code>)</td>
</tr>
<tr>
<td>Toggle x axis scale</td>
<td><code>rcParams[“keymap.xscale”]</code> (default: <code>['k', 'L']</code>)</td>
</tr>
<tr>
<td>(log/linear)</td>
<td></td>
</tr>
<tr>
<td>Toggle y axis scale</td>
<td><code>rcParams[“keymap.yscale”]</code> (default: <code>['l']</code>)</td>
</tr>
<tr>
<td>(log/linear)</td>
<td></td>
</tr>
<tr>
<td>Close Figure</td>
<td><code>rcParams[“keymap.quit”]</code> (default: <code>['ctrl+w', 'cmd+w', 'q']</code>)</td>
</tr>
<tr>
<td>Constrain pan/zoom to x</td>
<td><code>hold x when panning/zooming with mouse</code></td>
</tr>
<tr>
<td>axis</td>
<td></td>
</tr>
<tr>
<td>Constrain pan/zoom to y</td>
<td><code>hold y when panning/zooming with mouse</code></td>
</tr>
<tr>
<td>axis</td>
<td></td>
</tr>
<tr>
<td>Preserve aspect ratio</td>
<td><code>hold CONTROL when panning/zooming with mouse</code></td>
</tr>
</tbody>
</table>

### 3.6 Other Python prompts

Interactive mode works in the default Python prompt:

```python
>>> import matplotlib.pyplot as plt
>>> plt.ion()
>>>
```
however this does not ensure that the event hook is properly installed and your figures may not be responsive. Please consult the documentation of your GUI toolkit for details.

3.6.1 Jupyter Notebooks / Lab

**Note:** To get the interactive functionality described here, you must be using an interactive backend. The default backend in notebooks, the inline backend, is not. `backend_inline` renders the figure once and inserts a static image into the notebook when the cell is executed. Because the images are static, they can not be panned / zoomed, take user input, or be updated from other cells.

To get interactive figures in the ‘classic’ notebook or Jupyter lab, use the `ipymp1` backend (must be installed separately) which uses the `ipywidge`t framework. If `ipymp1` is installed use the magic:

```
%matplotlib widget
```

to select and enable it.

If you only need to use the classic notebook, you can use

```
%matplotlib notebook
```

which uses the `backend_nbagg` backend provided by Matplotlib; however, `nbagg` does not work in Jupyter Lab.

**GUIs + Jupyter**

You can also use one of the non-`ipymp1` GUI backends in a Jupyter Notebook. If you are running your Jupyter kernel locally, the GUI window will spawn on your desktop adjacent to your web browser. If you run your notebook on a remote server, the kernel will try to open the GUI window on the remote computer. Unless you have arranged to forward the xserver back to your desktop, you will not be able to see or interact with the window. It may also raise an exception.

3.6.2 PyCharm, Spyder, and VSCode

Many IDEs have built-in integration with Matplotlib, please consult their documentation for configuration details.

WHAT'S NEW?
## WHAT'S NEW IN MATPLOTLIB 3.3.0

For a list of all of the issues and pull requests since the last revision, see the [GitHub Stats](#).

### Table of Contents

- **What’s new?**
- **What’s new in Matplotlib 3.3.0**
  - **Figure and Axes creation / management**
    * Provisional API for composing semantic axes layouts from text or nested lists
    * `GridSpec.subplots()`
    * `Axes.sharex`, `Axes.sharey` methods
    * `tight_layout` now supports `suptitle`
    * Setting axes box aspect
  - **Colors and colormaps**
    * Turbo colormap
    * `colors.BoundaryNorm` supports extend keyword argument
    * Text color for legend labels
    * `Pcolor` and `Pcolormesh` now accept `shading='nearest'` and `auto`
  - **Titles, ticks, and labels**
    * Align labels to Axes edges
    * Allow tick formatters to be set with str or function inputs
    * `Axes.set_title` gains a `y` keyword argument to control auto positioning
    * Offset text is now set to the top when using `axis.tick_top()`
    * Set zorder of contour labels
  - **Other changes**
    * New `Axes.azline` method
    * `imshow` now coerces 3D arrays with depth 1 to 2D
    * Better control of `Axes.pie` normalization
    * Dates use a modern epoch
- Lines now accept MarkerStyle instances as input

- Fonts
  * Simple syntax to select fonts by absolute path
  * Improved font weight detection

- rcParams improvements
  * matplotlib.rc_context can be used as a decorator
  * rcParams for controlling default “raise window” behavior
  * Add generalized mathtext.fallback to rcParams
  * Add contour.linewidth to rcParams

- 3D Axes improvements
  * Axes3D no longer distorts the 3D plot to match the 2D aspect ratio
  * 3D axes now support minor ticks
  * Home/Forward/Backward buttons now work with 3D axes

- Interactive tool improvements
  * More consistent toolbar behavior across backends
  * Toolbar icons are now styled for dark themes
  * Cursor text now uses a number of significant digits matching pointing precision
  * GTK / Qt zoom rectangle now black and white
  * Event handler simplifications

- Functions to compute a Path’s size
  * Better interface for Path segment iteration
  * Fixed bug that computed a Path’s Bbox incorrectly

- Backend-specific improvements
  * savefig() gained a backend keyword argument
  * The SVG backend can now render hatches with transparency
  * SVG supports URLs on more artists
  * Images in SVG will no longer be blurred in some viewers
  * Saving SVG now supports adding metadata
  * Saving PDF metadata via PGF now consistent with PDF backend
  * NbAgg and WebAgg no longer use jQuery & jQuery UI
5.1 Figure and Axes creation / management

5.1.1 Provisional API for composing semantic axes layouts from text or nested lists

The `Figure` class has a provisional method to generate complex grids of named `Axes` based on nested list input or ASCII art:

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    [['.', 'histx'],
     ['histy', 'scat']]
)
for k, ax in axd.items():
    ax.text(0.5, 0.5, k,
        ha='center', va='center', fontsize=36,
        color='darkgrey')
```

or as a string (with single-character Axes labels):

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic("
    "TTE
    "L.E
"
)
for k, ax in axd.items():
    ax.text(0.5, 0.5, k,
```

(continues on next page)
See *Complex and semantic figure composition* for more details and examples.

### 5.1.2 GridSpec.subplots()

The `GridSpec` class gained a `subplots` method, so that one can write

```python
fig.add_gridspec(2, 2, height_ratios=[3, 1]).subplots()
```

as an alternative to

```python
fig.subplots(2, 2, gridspec_kw={"height_ratios": [3, 1]})
```

### 5.1.3 New Axes.sharex, Axes.sharey methods

These new methods allow sharing axes *immediately* after creating them. Note that behavior is indeterminate if axes are not shared immediately after creation.

For example, they can be used to selectively link some axes created all together using `subplot_mosaic`:
5.1.4 **tight_layout now supports suptitle**

Previous versions did not consider `Figure.suptitle`, so it may overlap with other artists after calling `tight_layout`:

From now on, the `suptitle` will be considered:

5.1.5 **Setting axes box aspect**

It is now possible to set the aspect of an axes box directly via `set_box_aspect`. The box aspect is the ratio between axes height and axes width in physical units, independent of the data limits. This is useful to, e.g., produce a square plot, independent of the data it contains, or to have a non-image plot with the same axes dimensions next to an image plot with fixed (data-)aspect.

For use cases check out the Axes box aspect example.
5.2 Colors and colormaps

5.2.1 Turbo colormap

Turbo is an improved rainbow colormap for visualization, created by the Google AI team for computer visualization and machine learning. Its purpose is to display depth and disparity data. Please see the Google AI Blog for further details.

5.2.2 `colors.BoundaryNorm` supports `extend` keyword argument

`BoundaryNorm` now has an `extend` keyword argument, analogous to `extend` in `contourf`. When set to 'both', 'min', or 'max', it maps the corresponding out-of-range values to `Colormap` lookup-table indices near the appropriate ends of their range so that the colors for out-of-range values are adjacent to, but distinct from, their in-range neighbors. The colorbar inherits the `extend` argument from the norm, so with `extend='both'`, for example, the colorbar will have triangular extensions for out-of-range values with colors that differ from adjacent in-range colors.
5.2.3 Text color for legend labels

The text color of legend labels can now be set by passing a parameter `labelcolor` to `legend`. The `labelcolor` keyword can be:

- A single color (either a string or RGBA tuple), which adjusts the text color of all the labels.
- A list or tuple, allowing the text color of each label to be set individually.
- `linecolor`, which sets the text color of each label to match the corresponding line color.
- `markerfacecolor`, which sets the text color of each label to match the corresponding marker face color.
- `markeredgecolor`, which sets the text color of each label to match the corresponding marker edge color.

5.2.4 Pcolor and Pcolormesh now accept `shading='nearest' and 'auto'`

Previously `axes.Axes.pcolor` and `axes.Axes.pcolormesh` handled the situation where `x` and `y` have the same (respective) size as `C` by dropping the last row and column of `C`, and `x` and `y` are regarded as the edges of the remaining rows and columns in `C`. However, many users want `x` and `y` centered on the rows and columns of `C`.

To accommodate this, `shading='nearest'` and `shading='auto'` are new allowed strings for the `shading` keyword argument. `'nearest'` will center the color on `x` and `y` if `x` and `y` have the
same dimensions as $C$ (otherwise an error will be thrown). `shading='auto'` will choose ‘flat’ or ‘nearest’ based on the size of $X$, $Y$, $C$.

If `shading='flat'` then $X$, and $Y$ should have dimensions one larger than $C$. If $X$ and $Y$ have the same dimensions as $C$, then the previous behavior is used and the last row and column of $C$ are dropped, and a DeprecationWarning is emitted.

Users can also specify this by the new `rcParams["pcolor.shading"]` (default: ‘flat’) in their `.matplotlibrc` or via `rcParams`.

See `pcolormesh` for examples.

### 5.3 Titles, ticks, and labels

#### 5.3.1 Align labels to Axes edges

`set_xlabel`, `set_ylabel` and `ColorbarBase.set_label` support a parameter `loc` for simplified positioning. For the xlabel, the supported values are ‘left’, ‘center’, or ‘right’. For the ylabel, the supported values are ‘bottom’, ‘center’, or ‘top’.

The default is controlled via `rcParams["xaxis.labelposition"]` and `rcParams["yaxis.labelposition"]`; the Colorbar label takes the rcParam based on its orientation.
5.3.2 Allow tick formatters to be set with str or function inputs

`set_major_formatter` and `set_minor_formatter` now accept `str` or function inputs in addition to `Formatter` instances. For a `str` a `StrMethodFormatter` is automatically generated and used. For a function a `FuncFormatter` is automatically generated and used. In other words,

```python
ax.xaxis.set_major_formatter(r'$\{x\}$ km')
ax.xaxis.set_minor_formatter(lambda x, pos: str(x-5))
```

are shortcuts for:

```python
import matplotlib.ticker as mticker

ax.xaxis.set_major_formatter(mticker.StrMethodFormatter(r'$\{x\}$ km'))
ax.xaxis.set_minor_formatter(
    mticker.FuncFormatter(lambda x, pos: str(x-5)))
```

5.3.3 Axes.set_title gains a `y` keyword argument to control auto-positioning

`set_title` tries to auto-position the title to avoid any decorators on the top x-axis. This is not always desirable so now `y` is an explicit keyword argument of `set_title`. It defaults to `None` which means to use auto-positioning. If a value is supplied (i.e. the pre-3.0 default was `y=1.0`) then auto-positioning is turned off. This can also be set with the new rcParameter `rcParams["axes.titley"]` (default: `None`).
5.3.4 Offset text is now set to the top when using `axis.tick_top()`

Solves the issue that the power indicator (e.g., 1e4) stayed on the bottom, even if the ticks were on the top.

5.3.5 Set zorder of contour labels

`clabel` now accepts a `zorder` keyword argument making it easier to set the `zorder` of contour labels. If not specified, the default `zorder` of clabels used to always be 3 (i.e. the default `zorder` of `Text`) irrespective of the `zorder` passed to `contour/contourf`. The new default `zorder` for clabels has been changed to \((2 + zorder \text{ passed to } \text{contour/contourf})\).

5.4 Other changes

5.4.1 New `Axes.axline` method

A new `axline` method has been added to draw infinitely long lines that pass through two points.

```python
fig, ax = plt.subplots()
ax.axline((.1, .1), slope=5, color='C0', label='by slope')
```

(continues on next page)
5.4.2 *imshow* now coerces 3D arrays with depth 1 to 2D

Starting from this version arrays of size MxNx1 will be coerced into MxN for displaying. This means commands like `plt.imshow(np.random.rand(3, 3, 1))` will no longer return an error message that the image shape is invalid.

5.4.3 Better control of *Axes.pie* normalization

Previously, *Axes.pie* would normalize its input x if \(\sum(x) > 1\), but would do nothing if the sum were less than 1. This can be confusing, so an explicit keyword argument *normalize* has been added. By default, the old behavior is preserved.

By passing *normalize*, one can explicitly control whether any rescaling takes place or whether partial pies should be created. If normalization is disabled, and \(\sum(x) > 1\), then an error is raised.
ax.xaxis.set_major_formatter('{x} km')

ax.xaxis.set_major_formatter(lambda x, pos: str(x-5))

\[
\sum_{j} x_j
\]

y=None

\[
y=0.7
\]
5.4.4 Dates use a modern epoch

Matplotlib converts dates to days since an epoch using `dates.date2num` (via `matplotlib.units`). Previously, an epoch of 0000-12-31T00:00:00 was used so that 0001-01-01 was converted to 1.0. An epoch so distant in the past meant that a modern date was not able to preserve microseconds because 2000 years times the $2^{(-52)}$ resolution of a 64-bit float gives 14 microseconds.

Here we change the default epoch to the more reasonable UNIX default of 1970-01-01T00:00:00 which for a modern date has 0.35 microsecond resolution. (Finer resolution is not possible because we rely on `datetime.datetime` for the date locators). Access to the epoch is provided by `get_epoch`, and there is a new `rcParams["date.epoch"]` (default: '1970-01-01T00:00:00') rc-Param. The user may also call `set_epoch`, but it must be set before any date conversion or plotting is used.

If you have data stored as ordinal floats in the old epoch, you can convert them to the new ordinal using the following formula:

```python
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31'))
```

5.4.5 Lines now accept MarkerStyle instances as input

Similar to `scatter`, `plot` and `Line2D` now accept `MarkerStyle` instances as input for the `marker` parameter:
5.5 Fonts

5.5.1 Simple syntax to select fonts by absolute path

Fonts can now be selected by passing an absolute `pathlib.Path` to the `font` keyword argument of `Text`.

5.5.2 Improved font weight detection

Matplotlib is now better able to determine the weight of fonts from their metadata, allowing to differentiate between fonts within the same family more accurately.
5.6 rcParams improvements

5.6.1 matplotlib.rc_context can be used as a decorator

`matplotlib.rc_context` can now be used as a decorator (technically, it is now implemented as a `contextlib.contextmanager`), e.g.,

```python
@rc_context({'lines.linewidth': 2})
def some_function(...):
    ...
```

5.6.2 rcParams for controlling default "raise window" behavior

The new config option `rcParams['figure.raise_window']` (default: `True`) allows disabling of the raising of the plot window when calling `show` or `pause`. The MacOSX backend is currently not supported.

5.6.3 Add generalized mathtext.fallback to rcParams

New `rcParams['mathtext.fallback']` (default: 'cm') `rcParam`. Takes "cm", "stix", "stixsans" or "none" to turn fallback off. The `rcParam mathtext.fallback_to_cm` is deprecated, but if used, will override new fallback.

5.6.4 Add contour.linewidth to rcParams

The new config option `rcParams['contour.linewidth']` (default: `None`) allows to control the default line width of contours as a float. When set to `None`, the line widths fall back to `rcParams['lines.linewidth']` (default: `1.5`). The config value is overridden as usual by the `linewdths` argument passed to `contour` when it is not set to `None`.

5.7 3D Axes improvements

5.7.1 Axes3D no longer distorts the 3D plot to match the 2D aspect ratio

Plots made with `Axes3D` were previously stretched to fit a square bounding box. As this stretching was done after the projection from 3D to 2D, it resulted in distorted images if non-square bounding boxes were used. As of 3.3, this no longer occurs.

Currently, modes of setting the aspect (via `set_aspect`) in data space are not supported for Axes3D but may be in the future. If you want to simulate having equal aspect in data space, set the ratio of your data limits to match the value of `get_box_aspect`. To control these ratios use the `set_box_aspect` method which accepts the ratios as a 3-tuple of X:Y:Z. The default aspect ratio is 4:4:3.
5.7.2 3D axes now support minor ticks

```python
ax = plt.figure().add_subplot(projection='3d')
ax.scatter([0, 1, 2], [1, 3, 5], [30, 50, 70])
ax.set_xticks([0.25, 0.75, 1.25, 1.75], minor=True)
ax.set_xticklabels(['a', 'b', 'c', 'd'], minor=True)
ax.set_yticks([1.5, 2.5, 3.5, 4.5], minor=True)
ax.set_yticklabels(['A', 'B', 'C', 'D'], minor=True)
ax.set_zticks([35, 45, 55, 65], minor=True)
ax.set_zticklabels([r'$\alpha$', r'$\beta$', r'$\delta$', r'$\gamma$'], minor=True)
ax.tick_params(which='major', color='C0', labelcolor='C0', width=5)
ax.tick_params(which='minor', color='C1', labelcolor='C1', width=3)
```
5.7.3 Home/Forward/Backward buttons now work with 3D axes

5.8 Interactive tool improvements

5.8.1 More consistent toolbar behavior across backends

Toolbar features are now more consistent across backends. The history buttons will auto-disable when there is no further action in a direction. The pan and zoom buttons will be marked active when they are in use.

In NbAgg and WebAgg, the toolbar buttons are now grouped similarly to other backends. The WebAgg toolbar now uses the same icons as other backends.

5.8.2 Toolbar icons are now styled for dark themes

On dark themes, toolbar icons will now be inverted. When using the GTK3Agg backend, toolbar icons are now symbolic, and both foreground and background colors will follow the theme. Tooltips should also behave correctly.

5.8.3 Cursor text now uses a number of significant digits matching pointing precision

Previously, the x/y position displayed by the cursor text would usually include far more significant digits than the mouse pointing precision (typically one pixel). This is now fixed for linear scales.

5.8.4 GTK / Qt zoom rectangle now black and white

This makes it visible even over a dark background.

5.8.5 Event handler simplifications

The backend_bases.key_press_handler and backend_bases.button_press_handler event handlers can now be directly connected to a canvas with canvas.mpl_connect("key_press_event", key_press_handler) and canvas.mpl_connect("button_press_event", button_press_handler), rather than having to write wrapper functions that fill in the (now optional) canvas and toolbar parameters.

5.9 Functions to compute a Path's size

Various functions were added to BezierSegment and Path to allow computation of the shape/size of a Path and its composite Bezier curves.

In addition to the fixes below, BezierSegment has gained more documentation and usability improvements, including properties that contain its dimension, degree, control_points, and more.
5.9.1 Better interface for Path segment iteration

`iter_bezier` iterates through the `BezierSegment`'s that make up the Path. This is much more useful typically than the existing `iter_segments` function, which returns the absolute minimum amount of information possible to reconstruct the Path.

5.9.2 Fixed bug that computed a Path’s Bbox incorrectly

Historically, `get_extents` has always simply returned the Bbox of a curve’s control points, instead of the Bbox of the curve itself. While this is a correct upper bound for the path’s extents, it can differ dramatically from the Path’s actual extents for non-linear Bezier curves.

5.10 Backend-specific improvements

5.10.1 `savefig()` gained a `backend` keyword argument

The `backend` keyword argument to `savefig` can now be used to pick the rendering backend without having to globally set the backend; e.g., one can save PDFs using the pgf backend with `savefig("file.pdf", backend="pgf")`.

5.10.2 The SVG backend can now render hatches with transparency

The SVG backend now respects the hatch stroke alpha. Useful applications are, among others, semi-transparent hatches as a subtle way to differentiate columns in bar plots.

5.10.3 SVG supports URLs on more artists

URLs on more artists (i.e., from `Artist.set_url`) will now be saved in SVG files, namely, Ticks and Line2Ds are now supported.

5.10.4 Images in SVG will no longer be blurred in some viewers

A style is now supplied to images without interpolation (`imshow(..., interpolation='none')`) so that SVG image viewers will no longer perform interpolation when rendering themselves.

5.10.5 Saving SVG now supports adding metadata

When saving SVG files, metadata can now be passed which will be saved in the file using Dublin Core and RDF. A list of valid metadata can be found in the documentation for `FigureCanvasSVG.print_svg`. 
5.10.6 Saving PDF metadata via PGF now consistent with PDF backend

When saving PDF files using the PGF backend, passed metadata will be interpreted in the same way as with the PDF backend. Previously, this metadata was only accepted by the PGF backend when saving a multi-page PDF with `backend_pgf.PdfPages`, but is now allowed when saving a single figure, as well.

5.10.7 NbAgg and WebAgg no longer use jQuery & jQuery UI

Instead, they are implemented using vanilla JavaScript. Please report any issues with browsers.
Matplotlib is a library for making 2D plots of arrays in Python. Although it has its origins in emulating the MATLAB graphics commands, it is independent of MATLAB, and can be used in a Pythonic, object oriented way. Although Matplotlib is written primarily in pure Python, it makes heavy use of NumPy and other extension code to provide good performance even for large arrays.

Matplotlib is designed with the philosophy that you should be able to create simple plots with just a few commands, or just one! If you want to see a histogram of your data, you shouldn’t need to instantiate objects, call methods, set properties, and so on; it should just work.

For years, I used to use MATLAB exclusively for data analysis and visualization. MATLAB excels at making nice looking plots easy. When I began working with EEG data, I found that I needed to write applications to interact with my data, and developed an EEG analysis application in MATLAB. As the application grew in complexity, interacting with databases, http servers, manipulating complex data structures, I began to strain against the limitations of MATLAB as a programming language, and decided to start over in Python. Python more than makes up for all of MATLAB’s deficiencies as a programming language, but I was having difficulty finding a 2D plotting package (for 3D VTK more than exceeds all of my needs).

When I went searching for a Python plotting package, I had several requirements:

- Plots should look great - publication quality. One important requirement for me is that the text looks good (antialiased, etc.)
- Postscript output for inclusion with TeX documents
- Embeddable in a graphical user interface for application development
- Code should be easy enough that I can understand it and extend it
- Making plots should be easy

Finding no package that suited me just right, I did what any self-respecting Python programmer would do: rolled up my sleeves and dived in. Not having any real experience with computer graphics, I decided to emulate MATLAB’s plotting capabilities because that is something MATLAB does very well. This had the added advantage that many people have a lot of MATLAB experience, and thus they can quickly get up to steam plotting in python. From a developer’s perspective, having a fixed user interface (the pylab interface) has been very useful, because the guts of the code base can be redesigned without affecting user code.
The Matplotlib code is conceptually divided into three parts: the *pylab interface* is the set of functions provided by *pylab* which allow the user to create plots with code quite similar to MATLAB figure generating code (*Pyplot tutorial*). The Matplotlib frontend or Matplotlib API is the set of classes that do the heavy lifting, creating and managing figures, text, lines, plots and so on (*Artist tutorial*). This is an abstract interface that knows nothing about output. The *backends* are device-dependent drawing devices, aka renderers, that transform the frontend representation to hardcopy or a display device (*What is a backend?*). Example backends: PS creates PostScript® hardcopy, SVG creates Scalable Vector Graphics hardcopy, Agg creates PNG output using the high quality Anti-Grain Geometry library that ships with Matplotlib, GTK embeds Matplotlib in a Gtk+ application, GTKAgg uses the Anti-Grain renderer to create a figure and embed it in a Gtk+ application, and so on for PDF, WxWidgets, Tkinter, etc.

Matplotlib is used by many people in many different contexts. Some people want to automatically generate PostScript files to send to a printer or publishers. Others deploy Matplotlib on a web application server to generate PNG output for inclusion in dynamically-generated web pages. Some use Matplotlib interactively from the Python shell in Tkinter on Windows. My primary use is to embed Matplotlib in a Gtk+ EEG application that runs on Windows, Linux and Macintosh OS X.

• PR #17734: Oversample thumbnail x2
• PR #17738: Backport PR #17729 on branch v3.3.x (Fix type doc for scroll event “step” attribute.)
• PR #17729: Fix type doc for scroll event “step” attribute.
• PR #17724: Backport PR #17720 on branch v3.3.x (Fix check for manager = None.)
• PR #17720: Fix check for manager = None.
• PR #17719: Backport PR #17693 on branch v3.3.x (DOC: Add svg2pdf converter for generating PDF docs.)
• PR #17693: DOC: Add svg2pdf converter for generating PDF docs.
• PR #17718: Backport PR #17715 on branch v3.3.x (Clarify gridspec error message for non-integer inputs.)
• PR #17717: Backport PR #17705 on branch v3.3.x (Keep cachedRenderer as None when pickling Figure.)
• PR #17715: Clarify gridspec error message for non-integer inputs.
• PR #17705: Keep cachedRenderer as None when pickling Figure.
• PR #17701: Backport PR #17687 on branch v3.3.x (Mention keyboard modifiers in toolbar tooltip texts.)
• PR #17687: Mention keyboard modifiers in toolbar tooltip texts.
• PR #17698: Backport PR #17686 on branch v3.3.x (Fix tooltip for wx toolbar.)
• PR #17686: Fix tooltip for wx toolbar.
• PR #17692: Backport PR #17680 on branch v3.3.x (MNT: migrate away from deprecated c-api)
• PR #17680: MNT: migrate away from deprecated c-api
• PR #17688: Backport PR #17676 on branch v3.3.x (FIX: correctly process the tick label size)
• PR #17676: FIX: correctly process the tick label size
• PR #17677: Backport PR #17664 on branch v3.3.x (Clarify docs of AutoDateLocator.intervalvald)
• PR #17678: Backport PR #17665 on branch v3.3.x (Document that some single char colors are shaded)
• PR #17679: Backport PR #17675 on branch v3.3.x (DOC: specify that the LaTeX installation needs to include cm-super)
• PR #17675: DOC: specify that the LaTeX installation needs to include cm-super
• PR #17665: Document that some single char colors are shaded
• PR #17664: Clarify docs of AutoDateLocator.interval
• PR #17672: Backport PR #17668 on branch v3.3.x (Don’t pass "wrong" indent=False in SVG generation.)
• PR #17671: Backport PR #17667 on branch v3.3.x (Don’t linewrap css in svg header.)
• PR #17668: Don’t pass "wrong" indent=False in SVG generation.
• PR #17667: Don’t linewrap css in svg header.
• PR #17666: Prepare for 3.3.0 rc1
• PR #17663: DOC: update the gh stats for v3.3.0
• PR #17656: Fix default colouring of Shadows
• PR #17657: V3.2.x mergeup
• PR #17623: Add a flag for disabling LTO.
• PR #17569: Delay usepackage{textcomp} until after the custom tex preamble.
• PR #17416: Reorder NavigationToolbar2 methods.
• PR #17604: DOC: Clarify offset notation and scientific notation
• PR #17617: Rewrite pdf test to use check_figures_equal.
• PR #17654: Small fixes to recent What’s New
• PR #17649: MNT: make _setattr_cm more forgiving
• PR #17644: Doc 33 whats new consolidation
• PR #17647: Fix example in docstring of cbook._unfold.
• PR #10187: DOC: add a blitting tutorial
• PR #17471: Removed idiomatic constructs from interactive figures docs
• PR #17639: DOC: Update colormap deprecation warning to use Python’s copy function.
• PR #17223: Warn on invalid savefig keyword arguments
• PR #17625: Give _DummyAxis instances a __name__
• PR #17636: Fix image vlim clipping again
• PR #17635: Fix autoscaling with tiny sticky values.
• PR #17620: MNT: make _setattr_cm more conservative
• PR #17621: FIX: restore ability to pass a tuple to axes_class in axes_grid
• PR #16603: axes collage
• PR #17622: Fix typo in description of savefig.bbox.
• PR #17619: Skip test_tmpconfigdir_warning when running as root.
• PR #17610: MNT: allow 0 sized figures
• PR #17163: Fix clipping of markers in PDF backend.
• PR #17556: DOC: Update contributor listing in credits
• PR #17221: Add metadata saving support to SVG.
• PR #17603: Replace image comparison in test_axes_grid1 by geometry checks.
• PR #17428: Doc start 33 merges
• PR #17607: Convert adjust_bbox to use ExitStack.
• PR #17575: DOCS: update collections.py docstrings to current doc conventions
• PR #15826: Fix bar3d bug with matching color string and array x lengths
• PR #14507: Simplify handling of Qt modifier keys.
• PR #17589: Fix doc build with Sphinx < 3.
• PR #17590: Clarify docs of set_powerlimits()
• PR #17597: MNT: cleanup minor style issues
• PR #17183: Update configuration of CircleCI builds
• PR #17592: Improve docstrings of ScalarFormatter
• PR #17456: Improve stackplot example
• PR #17545: Improve docs of markers
• PR #17233: Improve PDF metadata support in PGF
• PR #17086: Remove jQuery & jQuery UI
• PR #17580: Fix same_color() for ‘none’ color
• PR #17582: Fix link in doc
• PR #17491: DOC: Only link to overall Zenodo DOI.
• PR #17515: FIX: add set_box_aspect, improve tight bounding box for Axes3D + fix bbox_inches support with fixed box_aspect
• PR #17581: DOC: Remove duplicate Returns in subplot2grid.
• PR #17550: Update subplot2grid doc to use Figure.add_gridspec, not GridSpec.
• PR #17544: markerfacecolor should not override fillstyle=’none’ in plot()
• PR #15672: Remove mention that tkagg was derived from PIL.
• PR #17573: Examples: fix formatting issue in ‘Errorbar limit selection’
• PR #17543: Fix linewidt hs and colors for scatter() with unfilled markers
• PR #17448: Add example for drawing an error band around a curve
• PR #17572: Examples: clarity for ‘set and get’ example page
• PR #17276: Allow numpy arrays in markevery
• PR #17536: Consolidate some tests and fix a couple typos
• PR #17558: Simplify plot_date()
• PR #17534: Fmaussion extended boundary norm
• PR #17540: Fix help window on GTK.
• PR #17535: Update docs on subplot2grid / SubplotBase
• PR #17510: Fix exception handling in FT2Font init.
• PR #16953: Changed ‘colors’ parameter in PyPlot vlines/hlines and Axes vlines/hlines to default to configured rcParams ‘lines.color’ option
• PR #17459: Use light icons on dark themes for wx and gtk, too.
• PR #17539: Use symbolic icons for buttons in GTK toolbar.
• PR #15435: Reuse png metadata handling of imsave() in FigureCanvasAgg.print_png().
• PR #5034: New “extend” keyword to colors.BoundaryNorm
• PR #17532: DOC: correct legend.title_fontsize docstring
• PR #17531: Remove unneeded check/comment re: multiprocessing in setup.py.
• PR #17522: Privatize ttconv module.
• PR #17517: Make sure _parent is in sync with Qt parent in NavigationToolbar2QT
• PR #17525: DOC/API: set __qualname__ when using class factory
• PR #17511: Fix offset legend tightbbox
• PR #16203: Port fontconfig’s font weight detection to font_manager.
• PR #17485: Support marking a single artist as not-use_tex.
• PR #17338: Support url on more Artists in svg
• PR #17519: Prefer demo’ing rcParams rather than rc in examples.
• PR #13457: Give AnnotationBbox an opinion about its extent
• PR #15037: Simplifications to errorbar().
• PR #17493: Update SVGs that use interpolation='none'.
• PR #15221: Don’t fallback to agg in tight_layout.get_renderer.
• PR #17512: DOC: remove inkscape restriction in doc
• PR #17484: Deprecate ismath parameter to draw_tex and ismath=“TeX!”.  
• PR #17492: Correctly set default linewidth for unfilled markers.
• PR #16908: Adding 2d support to quadmesh set_array
• PR #17506: Fix dicts unpacking for .plot
• PR #17496: Fix some incorrect image clipping
• PR #17340: convert some sample plots to use plt.subplots() instead of other methods
• PR #17504: Undocument parameter orientation of bar()
• PR #13884: Add some documentation for axisartist’s ExtremeFinder, plus some cleanups.
• PR #17495: Fix Pillow import in testing.
• PR #17462: Inline FigureCanvasGtkFoo._render_figure.
• PR #17474: Numpydocify RectangleSelector docstring.
• PR #17003: Optimize extensions with LTO and hidden visibility
• PR #17489: BUG: Picking vertical line broken
• PR #17486: Simplify handling of fontproperties=None.
• PR #17478: Add support for blitting in qt5cairo.
• PR #15641: Make get_sample_data autoload npy/npz files.
• PR #17481: Fix LightSource.shade on fully unmasked array.
• PR #17289: Prepare for ragged array warnings in NumPy 1.19
• PR #17358: Fix masked CubicTrInterpolator
• PR #17477: DOC: Use Sphinx-gallery animation capture
• PR #17482: Shorten RectangleSelector._release.
• PR #17475: Cleanup RectangleSelector example.
• PR #17461: Deprecate the private FigureCanvasGTK3._renderer_init.
• PR #17464: Fold _make_nseq_validator into _listify_validator.
• PR #17469: Use qVersion, not QT_VERSION_STR – the latter doesn’t exist in PySide2.
• PR #4779: DOC: Start to document interactive figures
• PR #17458: Cleanup C++ code
• PR #17466: DOC: clarify that milestones are intentions not approvals
• PR #17062: Fix to “exported SVG files blurred in viewers”
• PR #17443: Fix rcParams validator for dashes.
• PR #17350: Move integerness checks to SubplotSpec._from_subplot_args.
• PR #17444: Support odd-length dash patterns in Agg.
• PR #17405: Show the failing line in bad-rcparams warnings.
• PR #17452: Make validate_date throw ValueError, not RuntimeException.
• PR #17439: Remove comment re: validation of datetime format strings.
• PR #17438: Discourage use of proprietary Matplotlib names for freetype hinting
• PR #16990: update testing helpers
• PR #16340: Make set_x/ymargin() update axes limits, just like margins().
• PR #15029: Get default params from matplotlibrc.template.
• PR #17363: Fix toolbar separators in wx+toolmanager.
• PR #17348: Avoid creating a Tick in Axis.get_tick_space.
• PR #15725: Changed line color of boxplot for dark_background
• PR #17362: Remove status bars in toolmanager mode as well.
• PR #16551: DOC: be more opinionated about flags passed to pip
• PR #17328: Fixes icon clipping issue with WxAgg NavigationToolbar2 for wxpython 4.1.0
• PR #17425: fix typo in stem doc
• PR #17415: Cygwin fixes
• PR #17401: FIX: Fix for FFmpeg + GIF
• PR #16569: MNT: improve the error message in Path init
• PR #17404: Don’t forget to dlclose() main_program in tkagg init.
• PR #17414: Keep validate_date private.
• PR #17413: Revert “DOC: drop the experimental tag constrained_layout and tight_layout”
• PR #17394: Deprecate passing keys to update_keymap as single comma-separated string
• PR #17395: TexManager fixes.
• PR #17399: Remove qt4 backends from backend fallback candidates.
• PR #17392: Clarify deprecation message re: tex/pgf preambles as list-of-strings.
• PR #17400: Cleanup wx examples.
• PR #17378: Fix marker overlap
• PR #17351: Fix running the test suite with inkscape>=1.
• PR #17382: FIX: properly check figure on gridspec
• PR #17390: Small updates to troubleshooting guide.
• PR #15104: Simplify file handling in ft2font.
• PR #17380: Support standard names for freetype hinting flags.
• PR #15594: Fix marker overlap
• PR #17372: Auto-set artist.mouseover based on if get_cursor_data is overridden.
• PR #17377: Remove code for sphinx < 1.8
• PR #17266: Keep explicit ticklabels in sync with ticks from FixedLocator
• PR #17359: Fix running test_internal_cpp_api directly.
• PR #17355: Change subprocess for inkscape version detection
• PR #17369: CI: Add eslint for JS linting
• PR #17226: Replace backend_driver by new example runner.
• PR #17365: Also use light color tool buttons in qt+toolmanager+dark theme.
• PR #17366: Restrict Qt toolbars to top/bottom of canvas.
• PR #17361: Remove randomness from test_colorbar_get_ticks_2.
• PR #17151: Cleanup colors.py docstrings.
• PR #17287: Make API of get_tightbbox more consistent between Axes and Axis.
• PR #17092: Don’t create a statusbar in Qt, wx backends.
• PR #17220: Simplify Annotation and Text bbox drawing.
• PR #17353: Make zooming work in qt-embedding example.
• PR #16727: Update xtick.alignment parameter in rcsetup to validate against correct values
• PR #17236: Add the “contour.linewidths” configuration option
• PR #16328: Make Artist.set() apply properties in the order in which they are given.
• PR #9696: FIX: set_url() without effect in the plot for instances of Tick
• PR #17002: Fix AnnotationBbox picking and a bit of cleanup
• PR #17256: Improve ps handling of individual usetex strings.
• PR #17267: Improve image comparison decorator
• PR #17332: Cleanup docstring of subplots().
• PR #16843: Deprecate is_pyqt5.
• PR #15898: New textcolor kwarg for legend
• PR #17333: Make sharex, etc. args of subplots() keyword-only.
• PR #17329: Improve docs of eventplot()
• PR #17330: Remove pnpoly license.
• PR #13656: For single datasets, don’t wrap artist added by Axes.hist in silent_list
• PR #16247: DOC added kwargs and tight_layout description in plt.figure
• PR #16992: Implement FigureManager.resize for macosx backend
• PR #17324: DOC: add offset axes to secondary_axes
• PR #17311: Make pyplot signatures of rgrids() and thetagrids() explicit
• PR #17302: Fix alignment of offset text on top axis.
• PR #14421: Add GridSpec.subplots()
• PR #15111: By default, don’t change the figure face/edgecolor on savefig().
• PR #17318: both x and y should multiply the radius
• PR #17309: Cleanup parameter types in docstrings
• PR #17308: Improve docs of bar() and barh()
• PR #17312: changed axis to axes in lifecycle tutorial
• PR #16715: Automatically create tick formatters for str and callable inputs.
• PR #16959: Simplify and robustify ConnectionPatch coordinates conversion.
• PR #17306: FIX: CL more stable
• PR #17301: Use deprecate_privatize_attribute more.
• PR #16985: Adds normalize kwarg to pie function
• PR #5243: Enhancement of tick label offset text positioning
• PR #17292: Deprecate various wx Toolbar attributes.
• PR #17297: Simplify pickling support.
• PR #17298: Fix rubberband in tk.
• PR #17299: Avoid “dash motion” in qt zoom box.
• PR #17200: Implement set_history_buttons for Tk toolbar.
• PR #16798: Make the Qt interactive zoom rectangle black & white.
• PR #17296: Fix doc wording
- PR #17282: Don’t divide by zero in Line2D.segment_hits.
- PR #17293: Fix incorrect deprecation.
- PR #17285: V32 mergeup
- PR #15933: Warn if a temporary config/cache dir must be created.
- PR #15911: Use os.getpid() in configdir, to avoid multiprocess concurrency issues
- PR #17277: Move slow FontManager warning to FontManager constructor.
- PR #17222: FIX: long titles x/ylabel layout
- PR #14960: Don’t generate individual doc entries for inherited Axes/Axis/Tick methods
- PR #17175: Further sync axes_grid colorbars with standard colorbars.
- PR #17030: Move widget functions into matplotlib.testing.widgets.
- PR #16975: Fix “out of bounds” undefined behavior
- PR #17111: Deprecate NavigationToolbar2._init_toolbar.
- PR #15275: adds turbo colormap
- PR #1714: Inline RGBAaxes._config_axes to its only call site.
- PR #17156: Deprecate text.latex.preview rcParam.
- PR #17242: Make deprecations versions explicit
- PR #17165: Small optimizations to scale and translate of Affine2D
- PR #17181: Inline some private helper methods in ColorbarBase + small refactors.
- PR #17264: Don’t trigger save when gtk save dialog is closed by escape.
- PR #17262: fix typo in set_clip_on doc
- PR #17234: Shorten and privatize qt’s UiSubplotTool.
- PR #17137: Deprecate Toolbar.press/release; add helper to find overridden methods.
- PR #17245: Improve error handling in _parse_scatter_color_args
- PR #15008: ENH: add variable epoch
- PR #17260: Text Rotation Example: Correct rotation_mode typo
- PR #17258: Improve info logged by tex subsystem.
- PR #17211: Deprecate support for running svg converter from path containing newline.
- PR #17078: Improve nbAgg & WebAgg toolbars
- PR #17191: Inline unsampled-image path; remove renderer kwarg from _check_unsampled_image.
- PR #17213: Replace use of Bbox.bounds by appropriate properties.
- PR #17219: Add support for suptitle() in tight_layout().
- PR #17235: More axisartist cleanups
- PR #17239: Remove deprecations that expire in 3.3
- PR #13696: Deprecate offset_position=“data”.
- PR #16991: Begin warning on modifying global state of colormaps
• PR #17053: Replace most jQuery with vanilla JavaScript
• PR #17228: Make params to pyplot.tight_layout keyword-only.
• PR #17225: Remove Patch visibility tracking by Legend & OffsetBox.
• PR #17027: Fix saving nbAgg figure after a partial blit
• PR #16847: Ticks are not markers
• PR #17229: Autogenerate subplots_adjust with boilerplate.py.
• PR #17209: Simplify some axisartist code.
• PR #17204: Draw unfilled hist()s with the zorder of lines.
• PR #17205: Shorten tight_layout code.
• PR #17218: Document Transform.__add__ and __sub__.
• PR #17215: Small cleanups.
• PR #17212: Cleanup text.py.
• PR #17196: Move polar tests to their own module.
• PR #14747: Deprecate AxisArtist.dpi_transform.
• PR #13144: Deprecate NavigationToolbar2GTK3.ctx.
• PR #17202: DOC: Remove extra word
• PR #17194: Small simplifications/fixes to pie().
• PR #17102: Switch tk pan/zoom to use togglable buttons.
• PR #16832: Correctly compute path extents
• PR #17193: Document docstring quote convention
• PR #17195: Fix polar tests.
• PR #17189: Make all parameters of ColorbarBase, except ax, keyword-only.
• PR #16717: Bugfix for issue 16501 raised ValueError polar subplot with (thetamax - thetamin) > 2pi
• PR #17180: Doc: spines arrows example
• PR #17184: Fix various small typos.
• PR #17143: Move linting to GitHub Actions with reviewdog.
• PR #17160: Correctly go through property setter when init’ing Timer interval.
• PR #17166: Deprecate ScalarMappable.check_update and associated machinery.
• PR #17177: Manually linewrap PS hexlines. Fixes #17176
• PR #17162: Update docs of rc_context()
• PR #17170: Convert SubplotZero example into centered-spines-with-arrows recipe.
• PR #17164: Fix Figure.add_axes(rect=...).
• PR #17154: DOC: Fix some warning and unreproducibility
• PR #17169: Clarify that draw_event occurs after the canvas draw.
• PR #17089: Cleanup some imports in tests
- PR #17040: Improve docs on automated tests
- PR #17145: CI: run pydocstyle with our custom options
- PR #16864: Check parameter type for legend(labels)
- PR #17146: FigureManager/NavigationToolBar2 cleanups.
- PR #16933: Add tests for toolmanager.
- PR #17127: ENH: allow title autolocating to be turned off
- PR #17150: Many docstring cleanups.
- PR #17148: Fix most instances of D404 (“docstring should not start with ‘this’”).
- PR #17142: BUGFIX: conditional for add_axes arg deprecation
- PR #17117: TextBox improvements.
- PR #17108: Make widgets.TextBox work also when embedding.
- PR #17135: Simplify pan/zoom toggling.
- PR #17134: Don’t override update() in NavigationToolBar2Tk.
- PR #17129: In docs remove ‘optional’ if ‘default’ can be given
- PR #16963: Deprecate Locator.refresh and associated helpers.
- PR #17133: Fix Button widget motion callback.
- PR #17125: Make multiline docstrings start with a newline.
- PR #17124: Widgets cleanup.
- PR #17123: Cleanup/Simplify Cell._set_text_position.
- PR #16862: FIX: turn off title autoloc if pad is set
- PR #15214: Inline wx icon loading.
- PR #16831: Simplify interactive zoom handling.
- PR #17094: DOC: drop the experimental tag constrained_layout and tight_layout
- PR #17101: Avoid “wrapped C/C++ object has been deleted” when closing wx window.
- PR #17028: Changed return type of get_{x,y}ticklabels to plain list
- PR #16058: Deprecate {ContourSet,Quiver}.ax in favor of .axes.
- PR #15349: Use checkboxes as bullet points for the PR review checklists
- PR #17112: Fix some link redirects in docs
- PR #17090: DOCS: add examples of how one “should” use Bbox
- PR #17110: Simplify connection of the default key_press and button_press handlers.
- PR #17070: Cleanups to Qt backend.
- PR #16776: Make cursor text precision actually correspond to pointing precision.
- PR #17026: Add eslint & prettier, and re-format JS
- PR #17091: Make sure slider uses “x” sign before multiplicative factor.
- PR #17082: Cleanup TextBox implementation.
- PR #17067: Simplify and generalize _set_view_from_bbox.
- PR #17081: Update animation_api.rst
- PR #17077: Improve default formatter for Slider values.
- PR #17079: Use True instead of 1 for boolean parameters.
- PR #17074: Fixed a typo in Lifecycle of a Plot
- PR #17072: Cleanup multi_image example.
- PR #15287: Allow sharex/y after axes creation.
- PR #16987: Deprecate case-insensitive properties.
- PR #17059: More missing refs fixes, and associated doc rewordings.
- PR #17057: Simplify subgridspec example/tutorial.
- PR #17058: Fix minor doc typos.
- PR #17024: Clarify docs of Rectangle
- PR #17043: Avoid spurious deprecation warning in TextBox.
- PR #17047: Highlighted .cbook.warn_deprecated() in contributing.rst
- PR #17054: Use slope in axline example
- PR #17048: More missing refs fixes.
- PR #17021: File name made more understandable
- PR #16903: Shorten implementation of Axes methods that just wrap Axis methods.
- PR #17039: Cleanups to contour docs.
- PR #17011: ci: Publish result images as Azure artifacts.
- PR #17038: Improve readability of documenting_mpl.rst
- PR #16996: Clean up get_proj() docstring (used view_init docstring as reference)
- PR #17019: Add return field to documentation of ‘get_major_ticks’
- PR #16999: Add section on artifacts to imshow docs
- PR #17025: Fix RecursionError when closing nbAgg figures.
- PR #16971: Don’t change Figure DPI if value unchanged
- PR #16972: Fix resize bugs in GTK
- PR #17008: Change the description of Rectangle’s xy parameter
- PR #16337: Create axline() using slope
- PR #16947: Fix missing parameter initialization in Axes.specgram()
- PR #17001: Cleanup imshow_extent tutorial.
- PR #17000: More stringent eventplot orientations.
- PR #16771: Deprecate non-string values as legend labels
- PR #15910: Simplify init of EventCollection.
- PR #16998: Made INSTALL.rst consistent
• PR #15393: Cleanup shape manipulations.
• PR #10924: Clear() methods to Radio and CheckButtons and other improvements
• PR #16988: Make plt.{r,theta}grids act as setters even when all args are kwargs.
• PR #16986: update tox.ini to match pythons supported and allow flags for pytest
• PR #16111: Move locking of fontlist.json into json_dump.
• PR #13110: Slightly tighten the Bbox/Transform API.
• PR #16973: TST: don’t actually render 1k+ date ticks
• PR #16967: Simplify animation writer fallback.
• PR #16812: Bezier/Path API Cleanup: fix circular import issue
• PR #16968: Add link to 3.2 min-supported-requirements.
• PR #16957: Remove unused, private aliases Polygon._{get,set}_xy.
• PR #16960: Improve error for quoted values in matplotlibrc.
• PR #16530: Fix violinplot support list of pandas.Series
• PR #16939: Cleanup/tighten axes_grid.
• PR #16942: Cleanup and avoid refleaks OSX Timer__timer_start.
• PR #16944: TST: update default junit_family
• PR #16823: Dedupe implementation of axes grid switching in toolmanager.
• PR #16951: Cleanup dates docstrings.
• PR #16769: Fix some small style issues
• PR #16936: FIX: Plot is now rendered with correct initial value
• PR #16937: Making sure to keep over/under/bad in cmap resample/reverse.
• PR #16915: Tighten/cleanup wx backend.
• PR #16923: Test the macosx backend on Travis.
• PR #15369: Update style docs
• PR #16893: Robustify AffineBase.__eq__ against comparing to other classes.
• PR #16904: Turn fontdict & minor into kwonly parameters for set_{x,y}ticklabels.
• PR #16917: Add test for close_event.
• PR #16920: Remove unused _read_ppm_image from macosx.m.
• PR #16877: Cleanup new_fixed_axis examples.
• PR #15049: Annotate argument in axes class match upstream
• PR #16774: Cleanup demo_axes_hbox_divider.
• PR #16873: More fixes to pydocstyle D403 (First word capitalization)
• PR #16896: set_tick_params(label1On=False) should also make offset text invisible.
• PR #16907: Fix typo in implementation of quit_all_keys.
• PR #16900: Document and test common_texification()
• PR #16902: Remove dot from suffix in testing.compare.
• PR #16828: Use more _setattr_cm, thus fix Text().get_window_extent(dpi=...)  
• PR #16901: Cleanup many docstrings.  
• PR #16840: Deprecate support for Qt4.  
• PR #16899: Remove optional returns from TriAnalyzer.get_compressed_triangulation.  
• PR #16618: Use SubplotSpec row/colspans more, and deprecate get_rows_columns.  
• PR #15392: Autoscale for ax.arrow()  
• PR #14626: Add support for minor ticks in 3d axes.  
• PR #16897: Add back missing import.  
• PR #14725: Move the debug-mode TransformNode.write_graphviz out.  
• PR #15437: Improve handling of alpha when saving to jpeg.  
• PR #15606: Simplify OldAutoLocator and AutoDateLocator.  
• PR #16633: Shortcut for closing all figures  
• PR #16876: Small cleanups to dviread.  
• PR #15680: Use more kwonly arguments, less manual kwargs-popping.  
• PR #15318: Deprecate unused rcParams[“animation.html_args”].  
• PR #15303: Make it possible to use rc_context as a decorator.  
• PR #16890: Enables hatch alpha on SVG  
• PR #16887: Shorter event mocking in tests.  
• PR #16881: Validate tickdir strings  
• PR #16846: Disconnect manager when resizing figure for animation saving.  
• PR #16871: Shorter Path import in setupext.  
• PR #16892: Warn in the docs that MouseEvent.key can be wrong.  
• PR #16209: Dedupe boilerplate for “adoption” of figure into pyplot.  
• PR #16098: Deprecate parameter props of Shadow  
• PR #15747: Move Text init to end of Annotation init.  
• PR #15679: np.concatenate cleanups.  
• PR #16778: Remove more API deprecated in 3.1(part 7)  
• PR #16886: Finish removing mentions of idle_event.  
• PR #16882: Fix trivial docstring typos.  
• PR #1674: Fix pydocstyle D209 (Multi-line docstring closing separate line)  
• PR #14044: Remove font preamble caching in TexManager.  
• PR #16724: Fixed incorrect colour in ErrorBar when Nan value is presented  
• PR #15254: Propagate signature-modifying decorators to pyplot wrappers.  
• PR #16868: Update release guide  
• PR #14442: In the build, declare all (compulsory) extension modules together.  
• PR #16866: Cleanup/update deprecations.
• PR #16850: use validate_[cap/join]style
• PR #16858: Fix various numpydoc style issues
• PR #16848: Cleanup CI setup
• PR #16845: Fix checking of X11 builds with PySide2.
• PR #14199: Deprecate Path helpers in bezier.py
• PR #16838: Inline some more kwargs into setup.py’s setup() call.
• PR #16841: Cleanup errorbar subsampling example
• PR #16839: spines doc cleanup
• PR #16844: fix example hist(density=...)
• PR #16827: Fix warnings in doc examples
• PR #16772: Remove more API deprecated in 3.1
• PR #16822: fix bug where make_compound_path kept all STOPs
• PR #16819: Destroy figures by manager instance, not by number.
• PR #16824: Deprecate NavigationToolbar2QT.parent.
• PR #16825: Don’t use deprecated Gtk add_with_viewport.
• PR #16816: Merge v3.2.x into master
• PR #16786: Simple cleanups to formatters.
• PR #16807: Update barchart_demo.
• PR #16804: Deprecate some mathtext glue helper classes.
• PR #16808: One more instance of check_in_list.
• PR #16802: Fix incorrect super class of VCentered.
• PR #16789: Update markup for collections docstrings.
• PR #16781: Update image tutorial wrt. removal of native png handler.
• PR #16787: Avoid vstack() when possible.
• PR #16689: Add a fast path for NumPy arrays to Collection.set_verts
• PR #15373: Further shorten quiver3d computation...
• PR #16780: Don’t import rcParams but rather use mpl.rcParams (part 3)
• PR #16775: Cleanup axes_divider examples.
• PR #15949: Simplify implementation of SubplotTool.
• PR #14869: Deduplicate code for text-to-path conversion in svg backend.
• PR #16527: Validate positional parameters of add_subplot()
• PR #15622: Cleanup mpl_toolkits locators.
• PR #16744: Reword axes_divider tutorial.
• PR #16746: Reword colorbar-with-axes-divider example.
• PR #15211: Various backend cleanups.
• PR #15890: Remove API deprecated in 3.1 (part 2)
• PR #16757: Simplify interactive zoom handling.
• PR #15515: Combine withEffect PathEffect definitions.
• PR #15977: pgf backend cleanups.
• PR #15981: Reuse colorbar outline and patch when updating the colorbar.
• PR #14852: Use Path.arc() to interpolate polar arcs.
• PR #16686: Deprecate Substitution.from_params.
• PR #16675: Vectorize patch extraction in Axes3D.plot_surface
• PR #15846: Standardize signature mismatch error messages.
• PR #16740: Fix type of dpi in docstrings.
• PR #16741: Dedupe RGBAxes examples.
• PR #16755: Reword docstring of panning callbacks, and pass them a MouseButton.
• PR #16749: Document behavior of savefig("extensionless-name").
• PR #16754: Cleanup image.py.
• PR #14606: Generic cleanup to hist().
• PR #16692: Allow MarkerStyle instances as input for lines
• PR #15479: Cleanup axes_rgb.
• PR #16617: Use Path(..., closed=True) more.
• PR #16710: Make format_coord messagebox resize with the window and the content in osx backend
• PR #16681: Simplify docstring interpolation for Box/Arrow/ConnectionStyles.
• PR #16576: Deprecate arg-less calls to subplot_class_factory (and similar factories)
• PR #16652: Deprecate {Locator,Axis}.{pan,zoom}.
• PR #16596: Deprecate dviread.Encoding.
• PR #16231: Deprecate JPEG-specific kwargs and rcParams to savefig.
• PR #16636: Deprecate autofmt_xdate(which=None) to mean which="major".
• PR #16644: Deprecate validate_webagg_address.
• PR #16619: Fix overindented lines.
• PR #15233: backend_ps cleanup.
• PR #16604: Deprecate more rc validators.
• PR #16601: Small unrelated cleanups.
• PR #16584: Rename font_bunch to psfont in textpath.
• PR #16023: Dedupe implementations of fill_between & fill_betweenx.
• PR #16485: Simplify validate_color_for_prop_cycle.
• PR #16285: Deprecate RendererCairo.font{weights,angles}
• PR #16410: Fix support for empty usetex strings.
• PR #11644: Add feature to fallback to stix font in mathtext
• PR #16537: Delay checking for existence of postscript distillers.
• PR #16351: Group all init of Legend.legendPatch together.
• PR #15988: Refactor Annotation properties.
• PR #16421: Shorten the type1-to-unicode name table.
• PR #16200: Deprecate Artist.{set, get}_contains.
• PR #15828: Deprecate support for dash-offset = None.
• PR #16338: Document SymmetricalLogLocator parameters.
• PR #16504: DOC: more pcolor fixes
• PR #15996: Cleanup axes_size.
• PR #16108: Deprecate DraggableBase.on_motion_blit.
• PR #16706: Fix exception causes all over the codebase
• PR #15855: Simplify 3d axes callback setup.
• PR #16219: Simplify CallbackRegistry pickling.
• PR #16002: relax two test tolerances on x86_64
• PR #16063: Make the signature of Axes.draw() consistent with Artist.draw().
• PR #16177: Further simplify setupext.
• PR #16191: Make Figure._axobservers a CallbackRegistry.
• PR #16698: Small edits to toolkits docs.
• PR #15430: Simplify setupext.download_or_cache.
• PR #16694: Lower Text's FontProperties priority when updating
• PR #16511: Add more detailed kwargs docstrings to Axes methods.
• PR #16653: Tutorials: make path/URL option clearer in matplotlibrc tutorial
• PR #16697: Update docstrings for plot_directive.
• PR #16684: Fix exception causes in 19 modules
• PR #16674: Docstring + import cleanups to legend.py.
• PR #16683: Turn mathtext.GlueSpec into a (private) namedtuple.
• PR #16660: Cleanup fancybox_demo.
• PR #16691: Clarify tiny comment re: AnnotationBbox constructor.
• PR #16676: Cleanup animation docstrings.
• PR #16673: DOC: correct title_fontsize docstring
• PR #16669: DOC: update doc release guide
• PR #16563: Parametrize imshow antialiased tests.
• PR #16658: In docs, add multi-axes connectionpatches to Figure, not Axes.
• PR #16647: Update annotation tutorial.
• PR #16638: Remove unused, outdated division operators on jpl_units.
• PR #16509: Add custom math fallback
• PR #16609: Fix exception causes in rcsetup.py
• PR #16637: Update docstrings in figure.py.
• PR #16534: DOC: MaxNLocator and contour/contourf doc update (replaces #16428)
• PR #16597: close #16593: setting ecolor turns off color cycling
• PR #16615: Update custom boxstyles example.
• PR #16610: Added graphviz_docs to conf.py
• PR #16608: Stricter validation of rcParams["axes.axisbelow"].
• PR #16614: Cleanup quiver3d examples.
• PR #16556: Make backend_ps test robust against timestamp changes in ghostscript.
• PR #16602: Cleanup testing.compare.
• PR #16575: Style fix for dynamic axes subclass generation in mpl_toolkits.
• PR #16587: Remove warnings control from tests.py.
• PR #16599: Cleanup dolphin example.
• PR #16586: Deprecate recursionlimit kwarg to matplotlib.test().
• PR #16595: Minor docstring/references update.
• PR #16579: Update usetex_fonteffects example.
• PR #16578: Use rc() less often in examples/tutorials.
• PR #16572: Remove some remnants of hist{,2d}(normed=...).
• PR #16491: Expire the _rename_parameters API changes.
• PR #14592: In SecondaryAxis.set_functions, reuse _set_scale’s parent scale caching.
• PR #16279: STY: Fix underindented continuation lines.
• PR #16549: Improve documentation for examples/widgets/textbox.py
• PR #16560: Update URL to pyparsing.
• PR #16292: More edits to Normalize docstrings.
• PR #16536: API/TST: minimum versions
• PR #16559: 3D example avoid using statefull .gca()
• PR #16553: DOC: clarify the expected shapes of eventplot input
• PR #16535: Clarify docs of num parameter of plt.figure()
• PR #16547: Reformat/reword mathtext docstrings.
• PR #16545: Add a smoketest for ps.usedistiller="xpdf".
• PR #16529: Deprecate toggling axes navigatability using the keyboard.
• PR #16521: Remove more API deprecated in 3.1.
• PR #16481: Update set_thetalim documentation
• PR #16524: Cleanup docstrings
• PR #16540: Cleanup imports
• PR #16429: CI: update codecov
• PR #16533: Recommend to amend pull requests
• PR #16531: Also deprecate ignorecase ValidateInStrings.
• PR #16428: DOC: MaxNLocator and contour/contourf doc update
• PR #16525: Don’t import rcParams but rather use mpl.rcParams (part 2)
• PR #16528: Improve test failure messages on warnings.
• PR #16393: Shorten PyFT2Font_get_charmap.
• PR #16483: Deprecate most ValidateInStrings validators.
• PR #16523: Reorder mathtext rcparams in matplotlibrc template.
• PR #16520: Update a comment re: minimum version of numpy working around bug.
• PR #16522: Fix deprecation warning
• PR #16515: Fix doc for set_{x,y}label, and then some more.
• PR #16516: Fixes to boxplot() docstring & error messages.
• PR #16508: Multi-dim transforms are non-separable by default.
• PR #16507: Factor out common parts of __str__ for Transform subclasses.
• PR #16514: Various delayed PR reviews
• PR #16512: Fix a bunch of random typos.
• PR #16510: Doc markup cleanups.
• PR #16500: Dedupe timer attribute docs.
• PR #16503: DOC: suppress warning on pcolor demo
• PR #16495: Deemphasize basemap in user-facing docs.
• PR #16484: Don’t forget to set stretch when exporting font as svg reference.
• PR #16486: Simplify validate_color, and make it slightly stricter.
• PR #16246: Avoid using FontProperties when not needed.
• PR #16432: Prefer geomspace() to logspace().
• PR #16099: Consistently name callback arguments event instead of evt
• PR #16477: Remove some APIs deprecated in mpl3.1.
• PR #16475: Use vlines() and plot(), not stem(), in timeline example.
• PR #16474: Switch default of stem(use_line_collection=...) to True.
• PR #16467: Convert named_colors example to use Rectangle
• PR #16047: Remove more API deprecated in 3.1
• PR #16373: Fix usetexBaseline_test.
• PR #16433: Simplify demo_curvelinear_grid2.
• PR #16472: Fix mplot3d projection
• PR #16092: Deprecate clear_temp param/attr of FileMovieWriter.
• PR #15504: Warn when trying to start a GUI event loop out of the main thread.
• PR #15023: Simplify formatting of matplotlibrc.template.
• PR #13535: Validate inputs to ScalarMappable constructor
• PR #16469: FIX: colorbar minorticks when rcParams['x/ytick.minor.visible'] = True
• PR #16401: BLD: Auto-detect PlatformToolset
• PR #16024: Keep parameter names in preprocess_data.
• PR #13390: Make sure that scatter3d copies its inputs.
• PR #16107: Deprecate DraggableBase.artist_picker.
• PR #16455: Update some docstrings in colors.py
• PR #16456: Enable more font_manager tests to be run locally.
• PR #16459: Update backend dependency docs.
• PR #16444: Dedupe spectral plotting tests.
• PR #16460: Remove some mentions of avconv, following its deprecation.
• PR #16443: Parametrize some spectral tests.
• PR #16204: Expire depreciation of mathcircled
• PR #16446: Replace matshow baseline test by check_figures_equal.
• PR #16418: Backend timer simplifications.
• PR #16454: Use pytest.raises(match=...)
• PR #14916: Make kwargs names in scale.py not include the axis direction.
• PR #16258: ENH: add shading='nearest' and 'auto' to pcolormesh
• PR #16228: Allow directly passing explicit font paths.
• PR #16445: Remove a bunch of imports-within-tests.
• PR #16440: Expire deprecation of stackrel.
• PR #16439: Rework pylab docstring.
• PR #16441: Rework pylab docstring.
• PR #16442: Expire deprecation of stackrel.
• PR #16365: TST: test_acorr (replaced image comparison with figure comparison)
• PR #16206: Expire deprecation of stackrel
• PR #16437: Rework pylab docstring.
• PR #8896: Fix mplot3d projection
• PR #16430: Remove unnecessary calls to np.array in examples.
• PR #16407: Remove outdated comment re: PYTHONHASHSEED and pytest.
• PR #16225: Cleanup animation examples.
• PR #16336: Include axline() in infinite lines example
• PR #16395: Add set/get for ellipse width/height
• PR #16431: CI: add py38 to azure matrix
• PR #16415: Expire some APIs deprecated in mpl3.1.
• PR #16425: MNT: rename internal variable
- PR #16427: Style-fix some examples and update .flake8 per-file-ignores.
- PR #16423: Slightly improve streamplot code legibility.
- PR #16414: DOC: Fix axes:plot method docstring verb tense
- PR #16408: Deprecate avconv animation writers.
- PR #16406: Don’t import rcParams but rather use mpl.rcParams.
- PR #16326: Cleanup stack
- PR #16193: Catch shadowed imports in style checks.
- PR #16374: Log about font manager generation beforehand.
- PR #16372: Dedupe ImageGrid doc from tutorial and docstring.
- PR #16380: “gif” third-party package added to the extension page
- PR #16327: Cleanup list copying
- PR #16366: Special-case usetex minus to zero depth.
- PR #16350: TST: Improved test (getting rid of image comparison test for test_titletwiny)
- PR #16359: Make Text.update_from copy usetex state.
- PR #16355: typo in ticker.ScalarFormatter doc
- PR #15440: Use rcParams to control default “raise window” behavior (Qt,Gtk,Tk,Wx)
- PR #16302: Cleanup Legend._auto_legend_data.
- PR #16329: ENH: add zorder kwarg to contour clabel (and a better default value for zorder)
- PR #16341: Remove mention of now-removed –verbose-foo flags.
- PR #16265: Fix spy(..., marker=<not-None>, origin="lower")
- PR #16333: Document animation HTML writer.
- PR #16334: Fix doc regarding deprecation of properties.
- PR #16335: Fix some more missing references.
- PR #16304: Simplify Legend.get_children.
- PR #16309: Remove duplicated computations in Axes.get_tightbbox.
- PR #16314: Avoid repeatedly warning about too many figures open.
- PR #16319: Put doc for XAxis before YAxis and likewise for XTick, YTick.
- PR #16313: Cleanup constrainedlayout_guide.
- PR #16312: Remove unnecessary Legend._approx_text_height.
- PR #16307: Cleanup axes_demo.
- PR #16303: Dedupe Legend.draw_frame which is the same as set_frame_on.
- PR #16261: TST: move the Qt-specific handling to conftest
- PR #16297: DOC: fix description of vmin/vmax in scatter
- PR #16288: Remove the private, unused _csv2rec.
- PR #16281: Update/cleanup pgf tutorial.
• PR #16283: Cleanup backend_agg docstrings.
• PR #16282: Replace “unicode” by “str” in docs, messages when referring to the type.
• PR #16289: axisartist tutorial markup fixes.
• PR #16293: Revert “Fix doc CI by pointing to dev version of scipy docs.”
• PR #16287: Improve markup for rcParams in docs.
• PR #16271: Clean up and clarify Normalize docs
• PR #16290: Fix doc CI by pointing to dev version of scipy docs.
• PR #16276: Cleanup docstring of print_figure, savefig.
• PR #16277: Prefer using MouseButton to numeric values in docs and defaults.
• PR #16270: numpydoc-ify SymLogNorm
• PR #16274: Tiny cleanups to set_xlabel(..., loc=...).
• PR #16273: DOC: Changing the spelling of co-ordinates.
• PR #15974: Enable set_\{x|y\}label(loc=\{‘left’|’right’|’center’\})...
• PR #16248: Update matplotlib.__doc__.
• PR #16262: Dedupe update of rcParams[“backend”] in use() and in switch_backend()
• PR #9629: Make pcolor(mesh) preserve all data
• PR #16254: DOC: pdf.preamble -> pgf.preamble
• PR #16245: Cleanup image docs
• PR #16117: CI: Unify required dependencies installation
• PR #16240: Cleanup custom_scale example.
• PR #16227: Make Animation.repeat_delay an int, not an int-or-None.
• PR #16242: CI: Remove PYTHONUNBUFFERED=1 on Appveyor
• PR #16183: Remove some baseline images for plot() tests.
• PR #16229: And more missing refs.
• PR #16215: Concise dates test
• PR #16233: Reword ScalarFormatter docstrings.
• PR #16218: Cleanup animation docs.
• PR #16172: And more missing references.
• PR #16205: Deprecate the empty matplotlib.compat.
• PR #16214: Fix overindented line in AnchoredOffsetbox doc.
• PR #15943: Deprecate the TTFPATH & AFMPATH environment variables.
• PR #16039: Deprecate unused features of normalize_kwargs.
• PR #16202: Remove outdated statement in tight_layout guide.
• PR #16201: UnCamelCase examples.
• PR #16194: Numpydoc ticklabel_format.
• PR #16195: Numpydoc ContourSet.find_nearest_contour.
• PR #16198: Remove em dash
• PR #16199: Do not use camel case for variables in examples
• PR #15644: Rewrite cursor example to include speedup possibilities
• PR #16196: Cleanup patches docstrings.
• PR #16184: Expire a mpl2.2-deprecated API
• PR #16188: Remove ref. to non-existent method in animation tests.
• PR #16170: Deprecate old and little used formatters.
• PR #16187: Fix overly long lines in examples & tutorials.
• PR #15982: Colorbar cleanup.
• PR #16154: Deprecate setting pickradius via set_picker
• PR #16174: Numpydocify artist.getp().
• PR #16165: Remove rcParams deprecated in mpl3.0/3.1.
• PR #16141: Update _base.py
• PR #16169: Add missing spaces after commas.
• PR #15847: Remove some dead branches from texmanager code.
• PR #16125: Fix more missing references again.
• PR #16150: Simplify transforms addition.
• PR #16152: Inline _init_axes_pad into Grid._init__.
• PR #16129: Deprecate some Transform aliases in scale.py.
• PR #16162: (Mostly) avoid the term “command” in the docs.
• PR #16159: Simple cleanups for contour.py.
• PR #16164: Fix trivial typo in deprecation warning message.
• PR #16160: Cleanup hist() docstring.
• PR #16149: DOC: reword density desc in ax.hist
• PR #16151: Remove outdated comment re: blended transforms.
• PR #16102: Rework example “Scatter Star Poly” to “Marker examples”
• PR #16134: Validate Line2D pickradius when setting it, not when reading it.
• PR #15019: Add step option where=’edges’ to facilitate pre-binned hist plots
• PR #16142: Avoid using np.r_, np.c_.
• PR #16146: Remove LICENSE_CONDA.
• PR #16133: Reword docstring of Line2D.contains.
• PR #16120: Minor fontproperty fixes.
• PR #15670: Reuse Grid._init__ in ImageGrid._init__.
• PR #16025: Deprecate update_datalim_bounds.
• PR #16001: Remove parameters deprecated in 3.1
• PR #16049: Add __repr__ to SubplotSpec.
• PR #16100: Consistently name event callbacks on [event]
• PR #16106: In DraggableLegend, inherit DraggableBase.artist_picker.
• PR #16109: Name Axes variables ax instead of a
• PR #16115: Fix more missing references.
• PR #16096: Deprecate unused parameters
• PR #16085: Improve docstrings in offsetbox.py
• PR #16097: Cleanup unused variables
• PR #16101: Fix incorrect doc regarding projections.
• PR #16095: Deprecate MovieWriter.{exec, args}_key, making them private.
• PR #16078: Refactor a bit animation start/save interaction.
• PR #16081: Delay resolution of animation extra_args.
• PR #16088: Use C++ true/false in ttconv.
• PR #16082: Default to writing animation frames to a temporary directory.
• PR #16070: Make animation blit cache robust against 3d viewpoint changes.
• PR #5056: MNT: more control of colorbar with CountourSet
• PR #16051: Deprecate parameters to colorbar which have no effect.
• PR #16045: Use triple-double-quotes for docstrings
• PR #16076: Cleanup path_editor example.
• PR #16059: Simplify colorbar test.
• PR #16072: Cleanup category.py docstrings.
• PR #15769: scatter() should not rescale if norm is given
• PR #16060: Cleanup pcolor Demo.
• PR #16057: Trivial docstring fix for cbook.deprecated.
• PR #16043: Simplify some comparisons
• PR #16044: Code style cleanup
• PR #15894: rcsetup cleanups.
• PR #16050: Unbreak CI.
• PR #16034: Update comments re: colors._vector_magnitude.
• PR #16035: Make eventplot use the standard alias resolution mechanism.
• PR #15798: Better default behavior for boxplots when rcParams[‘lines.marker’] is set
• PR #16004: Improve documentation of text module
• PR #15507: Use FixedFormatter only with FixedLocator
• PR #16008: Remove unused imports
• PR #16036: Rely on pytest to record warnings, rather than doing it manually.
• PR #15734: Fix home/forward/backward buttons for 3d plots.
• PR #16038: Cleanup contourDemo.
• PR #15998: Join marker reference and marker fillstyle reference
• PR #15976: Cleanup span_where.
• PR #15990: Remove deprecated support for setting single property via multiple aliases
• PR #15940: Some unicode-support related cleanups.
• PR #15836: Compactify a bit the EventCollection tests.
• PR #16013: Relayout some conditions in axes_grid.
• PR #16010: Inherit the Artist.draw docstring in subclasses.
• PR #16017: Document support for no-args plt.subplot() call.
• PR #16014: Simplify calls to AxesGrid/ImageGrid.
• PR #16012: Normalize aspect="equal" to aspect=1 in the setter.
• PR #15997: Shorten wx_onMouseWheel.
• PR #15993: Style fixes for axes_divider.
• PR #15989: Simplify Artist.update.
• PR #16015: Some small extension cleanups
• PR #16011: Replace axes_size.Fraction by multiplication.
• PR #15719: Templatize spectral helpers.
• PR #15995: Remove toolkit functions deprecated in 3.1
• PR #16003: prevent needless float() conversion
• PR #16000: De-deprecate *min/*max parameters to set_x/y/zlim()
• PR #15684: Avoid RuntimeError at wx exit.
• PR #15992: Avoid using np.matrix.
• PR #15961: Be more opinionated for setting up a dev env.
• PR #15991: Avoid setting dtypes as strings...
• PR #15985: Remove unnecessary :func:, :meth: from examples markup.
• PR #15983: Fix some examples docstrings.
• PR #15979: Remove references to scipy cookbook.
• PR #15966: FIX: check subplot kwargs
• PR #15947: Merge the two usetex demos.
• PR #15939: Exceptions should start with a capital letter
• PR #15948: Use rc_context more.
• PR #15962: Add tests for IndexFormatter
• PR #15965: Test registering cmaps
• PR #15950: Remove deprecated TextWithDash
• PR #15942: Update docs of type1font
• PR #15927: Trying to set the labels without setting ticks through pyplot now raises TypeError*
• PR #15944: Minor doc cleanups
• PR #15945: Do not use “object” or “instance” when documenting types
• PR #15897: Cleanup TriAnalyzer docs
• PR #15777: Don’t bother disconnecting idle_draw at gtk shutdown.
• PR #15929: Remove unused cbook._lockstr.
• PR #15935: Raise an ValueError when Axes.pie accepts negative values #15923
• PR #15895: Deprecate unused illegal_s attribute.
• PR #15900: Rewrite test_cycles to avoid image comparison tests.
• PR #15892: Update docs of backend_manager
• PR #15878: Remove API deprecated in 3.1
• PR #15928: DOC: use markers as slanted breaks in broken axis example
• PR #14659: Update some widget docstrings.
• PR #15919: Remove mod_python specific code.
• PR #15883: Improve error when passing 0d array to scatter().
• PR #15907: More docstrings cleanup.
• PR #15906: Cleanup legend docstrings.
• PR #15776: Improve doc for data kwarg.
• PR #15904: Deemphasize ACCEPTS blocks in documenting_mpl docs.
• PR #15891: Mark self.* expressions in docstrings as literal
• PR #15875: Deprecate implicit creation of colormaps in register_cmap()
• PR #15885: Cleanup text.py docstrings.
• PR #15888: Cleanup backend_bases docs.
• PR #15887: Fix AnnotationBbox docstring.
• PR #15858: Avoid some uses of len-1 tuples.
• PR #15873: Standardize parameter types in docs
• PR #15874: Cleanup backend_bases docs
• PR #15876: Deprecate case-insensitive capstyles and joinstyles.
• PR #15877: Suppress exception chaining on rc validator failure.
• PR #15880: Use True/False instead of 0/1 as booleans in backend_ps.
• PR #15827: Fix validation of linestyle in rcparams and cycler.
• PR #15850: Docstrings cleanup in matplotlib.axes
• PR #15853: np.abs -> (builtins).abs
• PR #15854: Simplify Axes3D init.
• PR #15822: More cleanup defaults in docstrings
• PR #15838: Remove some references to Py2.
• PR #15834: Optimize colors.to_rgb.
• PR #15830: Allow failure on nightly builds.
• PR #15788: Fixes pyplot xticks() and yticks() by allowing setting only the labels
• PR #15805: Improve docs on figure size
• PR #15783: Fix stepfilled histogram polygon bottom perimeter
• PR #15812: Cleanup defaults in docstrings
• PR #15804: Cleanup many docstrings.
• PR #15790: Update docs of PolyCollection
• PR #15792: Cleanup dviread docs.
• PR #15801: Cleanup some references to rcParams in docs.
• PR #15787: Cleanup Colormap.__call__.
• PR #15766: Shorten description on search page
• PR #15786: Slightly clarify the implementation of safe_masked_invalid.
• PR #15767: Update badges in README.rst
• PR #15778: Fix typos and comma splices in legend guide
• PR #15775: Some pathlibification.
• PR #15772: Directly dedent the spectral parameter docs.
• PR #15765: Reword some docstrings.
• PR #15686: Simplify and unify character tracking in pdf and ps backends (with linked fonts)
• PR #9321: Add Axes method for drawing infinite lines
• PR #15749: Fix travis links in README
• PR #15673: Rely on findfont autofallback-to-default in pdf/ps backends.
• PR #15740: Small animation cleanup.
• PR #15739: ImageMagick animators now can use extra_args
• PR #15591: Remove FAQ on ‘Search’ – already referenced in search file
• PR #15629: Consistently use realpaths to build XObject names
• PR #15696: Improve mathtext.fontset docs and fix :mathmpl: cache bug.
• PR #15721: Render default values in :rc: directive as literal
• PR #15720: Suppress triage_tests warning on Py3.8.
• PR #15709: Make 3d plot accept scalars as arguments.
• PR #15711: Don’t explicitly list scalez kwarg in Axes3D constructor and docs.
• PR #14948: Simplify Tick and Axis initialization.
• PR #15693: Also test PySide2 on CI.
• PR #15701: Tried to solve Issue #15650: Print URL when webbrowser.open Fails
• PR #15704: Fix more broken refs.
• PR #15687: Add tooltips to HTML animation controls
• PR #15592: Offset text position
• PR #15697: Fix some broken doc refs.
• PR #15700: Parametrize some spectral tests.
• PR #15699: Fix some incorrect ValueErrors.
• PR #15698: Bump numpy dependency to >=1.15.
• PR #15694: Handle upcoming deprecation of np.float.
• PR #15691: Correctly handle high dpi in Pillow animation writer.
• PR #15676: Doc adopt nep29
• PR #15692: Update FUNDING.yml
• PR #15645: Bump minimal numpy version to 1.12.
• PR #15646: Hide sphinx-gallery config comments
• PR #15642: Remove interpolation="nearest" from most examples.
• PR #15671: Don’t mention tcl in tkagg comments anymore.
• PR #15607: Simplify tk loader.
• PR #15651: Simplify axes_pad handling in axes_grid.
• PR #15652: Remove mention of Enthought Canopy from the docs.
• PR #15655: Remove outdated license files.
• PR #15640: Remove some commented-out code from axes_grid.
• PR #15643: Fix examples claiming matplotlib can’t plot np.datetime64.
• PR #15375: Add note to hist docstring about speed
• PR #15461: Fix invalid checks for axes_class parameter in ImageGrid.
• PR #15635: Deprecate “U” mode passed to cbook.to_filehandle().
• PR #15563: In backend_pgf, directly open subprocess in utf8 mode.
• PR #15462: Simplify azure setup.
• PR #13075: Remove logic for optionally building Agg and TkAgg.
• PR #15262: Declare qt figureoptions tool in toolitems.
• PR #15292: Shorten RendererWx.get_wx_font.
• PR #15569: Allow linking against a system qhull as well.
• PR #15589: Make sure that figures are closed when check_figures_equal finishes
• PR #15465: Validate and simplify set_tick_params(which=...)
• PR #15090: Coerce MxNx1 images into MxN images for imshow
• PR #15578: BLD: set the max line length on the flake8 config
• PR #15564: Use True instead of 1 as filternorm default
• PR #15536: Add a backend kwarg to savefig.
• PR #15571: Cleanup following using Pillow as universal image reader
• PR #15476: Default to local_freetype builds.
• PR #15557: Skip failing pgf test when sfmath.sty is not present.
• PR #15555: Add pgf to list of builtin backends in docs.
• PR #15534: BLD: update pillow dependency
• PR #15427: Separate plots using #### in demo_fixed_size_axes.py
• PR #15505: Cleanup axisartist tutorial.
• PR #15506: Rename locator.den to the clearer locator.nbins in mpl_toolkits.
• PR #15502: Get rid of trivial compiler warning.
• PR #15451: Ci py38
• PR #15484: Cleanup docs regarding compilers.
• PR #15467: Validate locator_params(axis=...)
• PR #15330: Add axes method for drawing infinite lines.
• PR #15482: Trivial style fixes to constrained_layout.
• PR #15418: Use correct pip/pytest on azure
• PR #15466: Update tick_params() docs
• PR #15463: Remove staticbuild option from setup.cfg.template.
• PR #15378: Don’t link ft2font to zlib by default.
• PR #15270: When no gui event loop is running, propagate callback exceptions.
• PR #15447: Move testing of Py3.8 to Travis.
• PR #15431: Fix range(len()) usages
• PR #15390: Simplify implementation of vectorized date operations.
• PR #15403: Fix DeprecationWarning in nightly testing
• PR #15394: Deprecate {NonUniformImage,PcolorImage}.is_grayscale.
• PR #15400: Updated INSTALL.rst to correct install commands
• PR #13788: Autoscale for ax.arrow()
• PR #15367: Update the readme on providing API changes
• PR #15193: Switch to using pillow for png as well.
• PR #15346: vectorized calc_arrow loop in quiver
• PR #15011: Adding example for drawstyle
• PR #15371: Deprecate Colorbar.config_axis()
• PR #15361: Update next API changes to new structure
• PR #15274: NavigationToolbar2Tk: make packing optional.
• PR #15158: Change the way API changes are documented
• PR #15356: Fix broken imports.
• PR #15200: Simplify SubplotParams.update().
• PR #15210: Explicitly list allowed “unused” imports, remove the rest.
• PR #15348: Some figure and related docs cleanup
• PR #13355: Simplify and generalize BezierSegment.
• PR #14917: ENH: box aspect for axes
• PR #14949: Use fix_minus in format_data_short.
• PR #15341: Move non-gui warning message to backend_bases.
• PR #15335: Add discourse link to readme
• PR #15293: Fixes for wx savefig dialog.
• PR #15324: Update PR guidelines
• PR #15301: Update colorbar docs
• PR #15340: Always attach a manager attribute (possibly None) on canvas.
• PR #15319: Make validate_movie_writer actually check registered writers.
• PR #10973: PGF: Replace pgfimage by includegraphics to fix import regression
• PR #15302: fix warning used by cbook.warn_deprecated()
• PR #15321: Sort missing_references.json.
• PR #15290: Unify fig.delaxes(ax) and ax.remove().
• PR #15309: Simplify sca().
• PR #15201: Autogenerate gca(), gci() from boilerplate.py.
• PR #15305: Autogenerate footer Copyright year
• PR #15294: Replace custom logging in wx by stdlib logging.
• PR #15288: More properties aliases.
• PR #15286: throw deprecation warning on empty call to fig.add_axes()
• PR #15282: Colorbar cleanup.
• PR #15250: Cleanup font_manager.
• PR #13581: Cleanup _pylab_helpers.
• PR #15273: DOC: don’t use term units in transform tutorial
• PR #15263: Correctly setup comparisons in test_compare_images.
• PR #15226: Turn gtk3 pan/zoom button into togglable buttons.
• PR #14609: Simplify implementation of set_{x,y}bound.
• PR #15261: Change layout of test_triager to avoid cropping images.
• PR #15236: Dedupe SubplotSpec construction in mpl_toolkits.
• PR #14130: Add decorator to inherit keyword-only deprecations
• PR #15249: In findfont(fallback_to_default=False), throw if default font is missing
• PR #15175: Simplify pdf image output.
• PR #7506: [WIP] Add Axes method for drawing infinite lines.

Issues (198):
• #16501: Setting a thetalim > 2pi gives odd results
• #15035: security exposure in the packaged jquery library
• #10375: Coordinate text wrapping in navigation toolbar
• #10720: Option to set the text color in legend to be same as the line
• #17868: plt.bar with nan input fails rendering in notebook using 3.3.0rc1
• #17773: gtk3 rubberband is invisible
• #5726: Cursor displays x, y coordinates with too much or too little precision
• #5164: Sort out qt_compat
• #17905: macosx backend warns when using the zoom method
• #17703: QuadMesh.get_clim changed behavior in 3.3.0rc1
• #17875: animation.writers[‘ffmpeg’]” is hung when run in background.
• #17591: Single-character colors do not match long names
• #16905: if pie normalizes depends on input values
• #17829: trunk fails to build in AIX
• #17820: Regression: _reshape_2D no longer preserves the shape of lists of lists of one scalar each
• #17807: “%matplotlib notebook” Download is Noise After Interacting with Plot
• #17763: matplotlib.use(‘agg’, force=True) does not ignore unavailable configured backend
• #17586: Surprising datetime autoscaling after passing empty data
• #17792: when using plt.tight_layout(), figure title overlaps subplot titles
• #17736: ax.set_xticklabels([]) for categorical plots is broken in 3.3.0rc1
• #17757: Plotting Hist with histtype ‘stepfilled’ does not respect bottom correctly
• #17744: BUG: AttributeError: ‘FigureCanvasBase’ object has no attribute ‘print_png’ in 3.3rc0
• #17730: Using backend Template and plt.tight_layout raises UnboundLocalError
• #17716: Error using “set_window_title” for canvas via backend.Qt5Agg
• #17681: PDF cannot be built due to Zenodo SVGs
• #17627: AttributeError: ‘Figure’ object has no attribute ‘_cachedRenderer’
• #17658: Feature request: Add advanced zoom and inspect feature to GUI for more productivity
• #17629: Use of Python deprecated APIs.
• #17670: BUG: Setting ticksize xx-small broken by #17348
• #17673: RuntimeError: latex was not able to process the following string: b$\mathdefault{-2}$
• #17412: Document the dependency on the type1ec LaTeX package
• #17643: AutoDateLocator docs has a typo
• #9118: make TeXManager more user-configurable
• #11131: Make pyplot.pause not give focus to the figure window
• #17646: more conservative setattr_cm broke mplcairo
• #17634: Cannot copy LinearSegmentedColormap
• #16496: Single path optimisation for Collection w/ offsets broken
• #192: Savefig does not issue a warning on a non-existent keyword n
• #17624: _DummyAxis needs a __name__ attribute for ScalarFormatter
• #16910: Axes.imshow draws invalid color at value is 0 when max of ‘X’ not equal to vmax
• #17637: streamplot and sticky edges interaction
• #17633: Stackplot fails for small numbers
• #17616: waitforbuttonpress in Linux
• #17615: small bug in documentation of backend.FigureCanvasBase.start_event_loop
• #17093: Zero size figure use case
• #17608: How avoid PyQt5 to crash when I move Qslitter to the edge with a matplotlib figure in it?
• #9829: Vertices clipped for certain markers when plotting more than two points and saving as pdf
• #15815: bar3d color length bug
• #15376: ScalarFormatter.set_powerlimits documentation seems inconsistent
• #17595: Master doc builds broken
• #16482: Pyplot hlines and vlines do not use the ‘lines.color’ property in rcParams by default
• #16388: rethink how we display DOI svg badges
• #17172: set_aspect for 3D plots
• #16463: Jupyter “inline” backend seems to misinterpret “figsize” with Axes3D
• #17527: The markers are not hollow when I use ax.scatter() and set markers.MarkerStyle()’s fillstyle to ‘none’. My usage is wrong?
• #7491: sort out if the high-resolution ellipse code still works
• #17398: Plotting an error band along a curve
• #8550: Matplotlib chooses the wrong font for unrecognized weights
• #8788: Font issue: findfonts should differentiate between thin and regular ttf fonts
• #10194: legend is not present in the generated image if I use ‘tight’ for bbox_inches
• #17336: set_url without effect for instances of Line2D
• #9695: set_url() without effect in the plot for instances of Tick
• #17192: How to change the thickness of the marker “x” when using scatter?
• #17507: pyplot.savefig() throwing warning suggesting a bug (possibly in figManger)
• #17502: dict unpacking broken for .plot in 3.2
• #15546: plt.imshow: clip_on=False has no effect
• #17023: DOC: Tutorial/Sample plots should use same fig/axis creation method
• #7537: Conflict between different AGG static libraries in a same binary
• #16836: Dropping support for PyQt4; preparing support for PyQt6.
• #17455: LightSource.shade fails on a masked array
• #16353: BUG: VisibleDeprecationWarning in boxplot
• #11820: Compressed Triangulation Masking in CubicTriInterpolator
• #11823: Animation Examples
• #15410: Change in OSX Catalina makes matplotlib + multiprocessing crash
• #17467: Bug Report: saved Figure ignores figure.facecolor
• #17343: Regression in add_subplot..
• #7093: ordering issues between set_xmargin and set_xscale
• #13971: Unnecessary drawing with NbAgg
• #17432: Scatter accepts marker=MarkerStyle(), but plot does not
• #15675: Boxplot line color with style dark_background should be bright
• #5962: No output from pyplot on cygwin64 python3 virtualenv
• #17393: TexManager.get_rgba fails
• #5830: Incorrect overlap of markers in scatter3D
• #11937: Limiting ticks on colorbar axes falsify tick labels.
• #17354: Converter detection fails for inkscape if on headless system without DISPLAY
• #17352: Zoom In-Out not behaving as expected in QT backend example
• #15409: Datetime plot fails with ‘Agg’ backend in interactive mode
• #14155: Adding GridSpec.subplots?
• #16583: matplotlibrc validates some parameters wrongly
• #16946: Pick_event on AnnotationBbox fires at wrong position
• #15131: set_size_inches doesn’t resize window on macosx backend
• #7619: Figure background colors
• #15899: Describe possible kwargs that may be input into a function
• #17304: constrained-layout gives wrong results when explicitly equal width ratios are set
• #17295: DOC: https://matplotlib.org/api/_as_gen/matplotlib.quiver.Quiver.html
• #17294: DOC: matplotlib.axes.Axes.annotate.html
• #17290: backend_svg fails with dashed line style
• #16677: tmpl_config_or_cache_dir atexit cleanup fails after forks()
• #15091: Turbo color map
• #7372: Moving get_ax and do_event to testing
• #15225: Show offset text on subplots after sharing axis
• #7138: misplaced spines in dates plot
• #17243: Misleading error message in _parse_scatter_color_args
• #16461: Hexbin if singular and mincnt used
• #14596: forward port jquery removal from ipympl
• #17217: Transform operators are not publicly documented....
• #2253: matplotlib makes python lose focus
• #7184: margins does not handle bézier curves
• #16830: _path.get_extents does not correctly handle bezier curves
• #17176: Print figure using PS backend is needlessly slow
• #17141: flake8-docstrings does not check all of our requirements
• #16567: Let legend get the handles from the provided objects if not specified explicitly.
• #16805: Titles cannot be padded to negative numbers anymore.
• #17114: add_axes shows deprecation warning when called with only kwargs
• #16885: Change return type get_{x,y}ticklabels to plain list
• #17044: widgets.TextBox continues to create new text objects and linecollection objects.
• #17066: documentation of animation contains non-working code example
• #16588: Rename next_api_changes to api_changes_3.x (whatever number makes sense)
• #17015: get_major_ticks docs missing return type
• #16976: Thin line color distortion on large scale
• #16934: gtk3 window immediately resizes down to zero-height upon showing up.
• #16941: test_determinism_check is failing (sometimes)
• #16982: pyplot.rgrids don’t do anything
• #16952: How to solve an error of "ValueError: Key backend: Unrecognized backend string ‘”agg”’
• #15272: Axes.violinplot has small issue in using pandas.DataFrame without index 0.
• #16926: tk window immediately resizes down to zero-height upon showing up.
• #16919: wx backends don’t send close_event if window is closed via ”q” keypress
• #16854: small typo in the documentation
• #16895: offset text still visible with ImageGrid axis “L”
• #12712: Autoscale does not work for ax.arrow()
• #14208: shift + w does not close all figures (has no effect)
• #15745: Failed to add annotate to figure
• #11432: Pressing the ”1” key kills the zoom/pan tool
• #13799: BUG: incorrect error bar colors when NaN values are present
• #16185: hist demo appears to incorrectly mention normed and something odd about density as well.
• #15203: Closing figures is done by number
• #16016: Better argument checking of subplot definition in add_subplot()
• #15980: Is the reset of the colorbar’s edgecolor when updating the corresponding image
clim wanted behaviour?
• #16718: Float figure DPI
• #16498: long string of format_coord in osx backend
• #8405: BUG: PDF export seems wrong with dash sequences that include a None offset
• #8619: Feature request: allow mathtext fallback font other than Computer Modern for
custom mathtext setup
• #14996: format error saving eps figure using custom linestyle
• #16493: Example/tutorials warn due to new pcolormesh shading
• #16022: Cleanup Artist.draw() signatures
• #16389: “Size” ignored if placed before fontproperties
• #16687: Creating a figure of size (0, 0) raises an error
• #12729: Docs for contour levels argument is incorrect
• #16593: specifying ecolor in errorbar turns off cycling
• #15621: secondary_xaxis doesn’t seem to use formatters
• #16116: travis36minver.txt needs an update
• #16546: Problem with eventplot - error message claims events & lineoffsets are unequal
sizes
• #16462: Allow wedges of polar plots to include theta = 0.
• #15142: pyplot.annotate() API deprecation
• #16479: font-stretch property missing in svg export
• #14304: ‘NSWindow drag regions should only be invalidated on the Main Thread!’ -
macos/python
• #12085: Tcl_AsyncDelete: async handler deleted by the wrong thread
• #14669: cm.ScalarMappable should fail early when norm input is wrong
• #16468: incorrect cbar minor ticks for extend regions when x/ytick.minor.visible is True
• #16243: windows builds: devenv freetype /update appears not to have an effect
• #11525: Axes3D scatter plot for Numpy arrays in F-order does not give correct z-values
• #8894: mplot3d projection results in non-orthogonal axes
• #1104: Resizing a GUI window with Axes3D
• #16371: Incomplete documentation in axes_grid1
• #6323: Vertical alignment of tick labels with usetex=True
• #7957: clabel not respecting zorder parameter
• #16252: axes.spy plotting function doesn’t respect origin=‘lower’ kwarg when marker
is not None
• #16299: The interactive polar plot animation’s axis label won’t scale.
• #15182: More tests ConciseDateFormatter needed
• #16140: Unclear Documentation for get_xticklabels
• #16147: pp.hist parameter 'density' does not scale data appropriately
• #16069: matplotlib glitch when rotating interactively a 3d animation
• #14603: Scatterplot: should vmin/vmax be ignored when a norm is specified?
• #15730: Setting lines.marker = s in matplotlibrc also sets markers in boxplots
• #11178: home/back/forward buttons do nothing in 3d mode
• #14520: pylab with wx backend not exiting cleanly
• #15964: Guard plt.subplot kwargs a bit better?
• #15404: Add python 3.8 tests
• #15773: Warning:... GLib.source_remove(self._idle_draw_id) when using plt.savefig()
• #15923: pie takes negative values
• #10317: Setting plt.rc('text', usetex=True) after ticker.ScalarFormatter(useMathText=True) causes Error
• #15825: Customised dashed linestyle in matplotlib.cycler throws ValueError when using in Axes.set_prop_cycle
• #9792: Error with linestyles rcParams entries under the form (on, off, ...) and a style context manager
• #15782: Invalid polygon in stepfilled histogram when bottom is set
• #15628: Invalid unicode characters in PDF when font is a symlink
• #8577: mplot3D scalar arguments for plot function
• #15650: URL is not shown when webagg failed to open the browser.
• #5238: the offset of the scientific notation in xaxis stays at bottom when axis is set to top
• #15678: Error at save animation with pillow
• #15079: check_figures_equal decorator reuses figures if called multiple times inside a single test.
• #15089: Coerce MxNx1 images into MxN images for imshow
• #5253: abline() - for drawing arbitrary lines on a plot, given specifications.
• #15165: Switch to requiring Pillow rather than having our own png wrapper?
• #15280: Add pull request checklist to Reviewers Guidelines
• #15289: cbook.warn_deprecated() should warn with a MatplotlibDeprecationWarning not a UserWarning
• #15285: DOC: make copy right year auto-update
• #15059: fig.add_axes() with no arguments silently does nothing
• #14546: Setting lines.markeredgcolor in rcParams affects the ticks’ mark color too
7.1 Previous GitHub Stats

7.1.1 GitHub Stats for Matplotlib 3.0.2

GitHub stats for 2018/09/18 - 2018/11/09 (tag: v3.0.0)
These lists are automatically generated, and may be incomplete or contain duplicates.
We closed 170 issues and merged 224 pull requests.
The following 49 authors contributed 460 commits.

- Abhinuv Nitin Pitale

GitHub issues and pull requests:

Pull Requests (224):

• PR #12785: Use level kwargs in irregular contour example
• PR #12767: Make colorbars constructible with dataless ScalarMappables.
• PR #12775: Add note to errorbar function about sign of errors
• PR #12776: Fix typo in example (on-borad -> on-board).
• PR #12771: Do not rely on external stack frame to exist
• PR #12526: Rename jquery files
• PR #12552: Update docs for writing image comparison tests.
• PR #12746: Use skipif, not xfail, for uncomparable image formats.
• PR #12747: Prefer log.warning(“%s”, ...) to log.warning(“%s” % ...).
• PR #11753: FIX: Apply aspect before drawing starts
• PR #12749: Move toolmanager warning from logging to warning.
• PR #12708: Run flake8 in a separate travis environment
• PR #12737: Improve docstring of Arc
• PR #12598: Support Cn colors with n>=10.
• PR #12670: FIX: add setter for hold to un-break basemap
• PR #12693: Workaround Text3D breaking tight_layout()
• PR #12727: Reorder API docs: separate file per module
• PR #12738: Add unobtrusive deprecation note to the first line of the docstring.
• PR #12740: DOC: constrained layout guide (fix: Spacing with colorbars)
• PR #11663: Refactor color parsing of Axes.scatter
• PR #12736: Move deprecation note to end of docstring
• PR #12704: Rename tkinter import from Tk to tk.
• PR #12730: MNT: merge ignore lines in .flake8
• PR #12707: Fix tk error when closing first pyplot figure
• PR #12715: Cleanup dviread.
• PR #12717: Delete some if __name__ == "__main__" clauses.
• PR #12726: Fix test_non_gui_warning for Azure (and mplcairo).
• PR #12720: Improve docs on Axes scales
• PR #12537: Improve error message on failing test_pyplot_up_to_date
• PR #12721: Make get_scale_docs() internal
• PR #12617: Set up CI with Azure Pipelines
• PR #12673: Fix for _axes.scatter() array index out of bound error
• PR #12676: Doc: document textpath module
• PR #12705: Improve docs on Axes limits and direction
• PR #12706: Extend sphinx Makefile to cleanup completely
• PR #12481: Warn if plot_surface Z values contain NaN
• PR #12709: Correctly remove nans when drawing paths with pycairo.
• PR #12685: Make ticks in demo_axes_rgb.py visible
• PR #12691: DOC: Link to “How to make a PR” tutorials as badge and in contributing
• PR #12684: Change ipython block to code-block
• PR #11974: Make code match comment in sankey.
• PR #12440: Make arguments to @deprecated/warn_deprecated keyword-only.
• PR #12683: TST: mark test_constrainedlayout.py::test_colorbar_location as flaky
• PR #12686: Remove deprecation warnings in tests
• PR #12470: Update AutoDateFormatter with locator
• PR #12656: FIX: fix error in colorbar.get_ticks not having valid data
• PR #12586: Improve linestyles example
• PR #12006: Added stacklevel=2 to all warnings.warn calls (issue 10643)
• PR #12651: FIX: ignore non-finite bbox
• PR #12653: Don’t warn when accessing deprecated properties from the class.
• PR #12608: ENH: allow matplotlib.use after getbackend
• PR #12658: Do not warn-depreacted when iterating over rcParams
• PR #12635: FIX: allow non bbox_extra_artists calls
• PR #12659: Add note that developer discussions are private
• PR #12543: Make rcsetup.py flak8 compliant
• PR #12642: Don’t silence TypeErrors in fmt_{x,y}data.
• PR #11667: DOC: update doc requirement
• PR #12442: Deprecate passing drawstyle with linestyle as single string.
• PR #12625: Shorten some docstrings.
• PR #12627: Be a bit more stringent on invalid inputs.
• PR #12561: Properly css-style exceptions in the documentation
• PR #12629: Fix issue with PyPy on macOS
• PR #10933: Remove “experimental” fontconfig font_manager backend.
• PR #12630: Fix RcParams.__len__
• PR #12285: FIX: Don’t apply tight_layout if axes collapse
• PR #12548: undef_XOPEN_SOURCE breaks the build in AIX
• PR #12615: Fix travis OSX build
• PR #12600: Minor style fixes.
• PR #12607: STY: fix whitespace and escaping
• PR #12603: FIX: don’t import macosx to check if eventloop running
• PR #12599: Fix formatting of docstring
• PR #12569: Don’t confuse uintptr_t and Py_ssize_t.
• PR #12572: Fix singleton hist labels
• PR #12581: Fix hist() error message
• PR #12570: Fix mathtext tutorial for build with Sphinx 1.8.
• PR #12487: Update docs/tests for the deprecation of aname and label1On/label2On/etc.
• PR #12521: Improve docstring of draw_idle()
• PR #12573: BUG: mplot3d: Don’t crash if azim or elev are non-integral
• PR #12574: Remove some unused imports
• PR #12568: Add note regarding builds of old Matplotlibs.
• PR #12555: Clarify horizontalalignment and verticalalignment in suptitle
• PR #12547: Disable sticky edge accumulation if no autoscaling.
• PR #12546: Avoid quadratic behavior when accumulating stickies.
• PR #12159: FIX: colorbar re-check norm before draw for autolabels
• PR #12501: Rectified plot error
• PR #11789: endless looping GIFs with PillowWriter
- PR #12525: Fix some flake8 issues
- PR #12431: FIX: allow single-string color for scatter
- PR #12216: Doc: Fix search for sphinx >=1.8
- PR #12461: FIX: make add_lines work with new colorbar
- PR #12241: FIX: make unused spines invisible
- PR #12516: Don’t handle impossible values for align in hist()
- PR #12504: DOC: clarify min supported version wording
- PR #12507: FIX: make minor ticks formatted with science formatter as well
- PR #12500: Adjust the widths of the messages during the build.
- PR #12492: Simplify radar_chart example.
- PR #12478: MAINT: NumPy deprecates ascalar in 1.16
- PR #12363: FIX: errors in get_position changes
- PR #12495: Fix duplicate condition in pathpatch3d example
- PR #11984: Strip out pkg-config machinery for agg and libqhull.
- PR #12463: Document Artist.cursor_data() parameter
- PR #12489: Fix typo in documentation of ylim
- PR #12482: Test slider orientation
- PR #12317: Always install mpl_toolkits.
- PR #12246: Be less tolerant of broken installs.
- PR #12477: Use N{MICRO SIGN} instead of N{GREEK SMALL LETTER MU} in EngFormatter.
- PR #12483: Kill FontManager.update_fonts.
- PR #12448: Don’t error if some font directories are not readable.
- PR #12474: Throw ValueError when irregularly gridded data is passed to streamplot.
- PR #12469: Clarify documentation of offsetbox.AnchoredText’s prop kw argument
- PR #12468: Fix set_ylim unit handling
- PR #12466: np.fromstring -> np.frombuffer.
- PR #12369: Improved exception handling on animation failure
- PR #12460: Deprecate RendererBase.strip_math.
- PR #12457: Fix tutorial typos.
- PR #12453: Rollback erroneous commit to whats_new.rst from #10746
- PR #12452: Minor updates to the FAQ.
- PR #10746: Adjusted matplotlib.widgets.Slider to have optional vertical orientatation
- PR #12441: Get rid of a signed-compare warning.
- PR #12430: Deprecate Axes3D.plot_surface(shade=None)
- PR #12435: Fix numpydoc parameter formatting
• PR #12434: Clarify documentation for textprops keyword parameter of TextArea
• PR #12427: Document Artist.get_cursor_data
• PR #12277: FIX: datetime64 now recognized if in a list
• PR #10322: Use np.hypot wherever possible.
• PR #12423: Minor simplifications to backend_svg.
• PR #12293: Make pyplot more tolerant wrt. 3rd-party subclasses.
• PR #12360: Replace axes_grid by axes_grid1 in test
• PR #10356: fix detecting which artist(s) the mouse is over
• PR #12416: Move font cache rebuild out of exception handler
• PR #11891: Group some print()s in backend_ps.
• PR #12165: Remove deprecated mlab code
• PR #12394: DOC: fix CL tutorial to give same output from saved file and example
• PR #12387: Update HTML animation as slider is dragged
• PR #12408: Don’t crash on invalid registry font entries on Windows.
• PR #10088: Deprecate Tick.{gridOn,tick1On,label1On,...} in favor of set_visible.
• PR #12149: Mathtext tutorial fixes
• PR #12393: Deprecate to-days converters in matplotlib dates
• PR #12257: Document standard backends in matplotlib.use()
• PR #12383: Revert change of parameter name in annotate()
• PR #12385: CI: Added Appveyor Python 3.7 build
• PR #12247: Machinery for deprecating properties.
• PR #12371: Move check for ImageMagick Windows path to bin_path().
• PR #12384: Cleanup axislines style.
• PR #12353: Doc: clarify default parameters in scatter docs
• PR #12366: TST: Update test images for new Ghostscript.
• PR #11648: FIX: colorbar placement in constrained layout
• PR #12368: Don’t use stdlib private API in animation.py.
• PR #12351: dviread: find_tex_file: Ensure the encoding on windows
• PR #12244: Merge barchart examples.
• PR #12372: Remove two examples.
• PR #12214: Improve docstring of Annotation
• PR #12347: DOC: add_child_axes to axes_api.rst
• PR #12304: TST: Merge Qt tests into one file.
• PR #12321: maint: setupext.py for freetype had a Catch case for missing ft2build.h
• PR #12340: Catch test deprecation warnings for mlab.demean
• PR #12334: Improve selection of inset indicator connectors.
• PR #12316: Fix some warnings from Travis
• PR #12268: FIX: remove unnecessary self in super-calls, fixes #12265
• PR #12212: font_manager: Fixed problems with Path(...).suffix
• PR #12326: fixed minor spelling error in docstring
• PR #12296: Make FooConverter inherit from ConversionInterface in examples
• PR #12322: Fix the docs build.
• PR #12319: Fix Travis 3.6 builds
• PR #12309: Deduplicate implementations of FooNorm.autoscale{,_None}
• PR #12314: Deprecate axis('normal') in favor of axis('auto').
• PR #12313: BUG: Fix typo in view_limits() for MultipleLocator
• PR #12307: Clarify missing-property error message.
• PR #12274: MNT: put back _hold as read-only attribute on AxesBase
• PR #12260: Fix docs: change from issue #12191, remove “if 1:” blocks in examples
• PR #12163: TST: Defer loading Qt framework until test is run.
• PR #12253: Handle utf-8 output by kpathsea on Windows.
• PR #12301: Ghostscript 9.0 requirement revisited
• PR #12294: Fix expand_dims warnings in triinterpolate
• PR #12292: TST: Modify the bar3d test to show three more angles
• PR #12297: Remove some pytest parameterising warnings
• PR #12261: FIX: parasite axis2 demo
• PR #12278: Document inheriting docstrings
• PR #12262: Simplify empty-rasterized pdf test.
• PR #12269: Add some param docs to BlockingInput methods
• PR #12272: Fix contrained to constrained
• PR #12255: Deduplicate inherited docstrings.
• PR #12254: Improve docstrings of Animations
• PR #12258: Fix CSS for module-level data
• PR #12222: Remove extraneous if 1 statements in demo_axisline_style.py
• PR #12137: MAINT: Vectorize bar3d
• PR #12219: Merge OSXInstalledFonts into findSystemFonts.
• PR #12229: Less ACCEPTS, more numpydoc.
• PR #12209: Doc: Sort named colors example by palette
• PR #12237: Use (float, float) as parameter type for 2D positions in docstrings
• PR #12238: Typo in docs
• PR #12236: Make boilerplate-generated pyplot.py flake8 compliant
• PR #12231: CI: Speed up Appveyor repository cloning
• PR #12228: Fix trivial typo in docs.
• PR #12227: Use (float, float) as parameter type for 2D positions
• PR #12199: Allow disabling specific mouse actions in blocking_input
• PR #12213: Change win32InstalledFonts return value
• PR #12207: FIX: don’t check for interactive framework if none required
• PR #11688: Don’t draw axis (spines, ticks, labels) twice when using parasite axes.
• PR #12210: Axes.tick_params() argument checking
• PR #12211: Fix typo
• PR #12200: Slightly clarify some invalid shape exceptions for image data.
• PR #12151: Don’t pretend @deprecated applies to classmethods.
• PR #12190: Remove some unused variables and imports
• PR #12186: DOC: fix API note about get_tightbbox
• PR #12203: Document legend’s slowness when “best” location is used
• PR #12192: Exclude examples from lgtm analysis
• PR #12196: Give Carreau the ability to mention the backport bot.
• PR #12187: DOC: Update INSTALL.rst
• PR #12164: Fix Annotation.contains.
• PR #12177: FIX: remove cwd from mac font path search
• PR #12182: Fix Flash of Unstyled Content by removing remaining Flipcause integration
• PR #12184: DOC: update “Previous What’s New” for 2.2 with reference to cividis paper
• PR #12183: Doc: Don’t use Sphinx 1.8
• PR #12171: Remove internal warning due to zsort deprecation
• PR #12166: Document preference order for backend auto selection
• PR #12154: Avoid triggering deprecation warnings with pytest 3.8.
• PR #12030: Speed up canvas redraw for GTK3Agg backend.
• PR #12157: Properly declare the interactive framework for the qt4foo backends.
• PR #12156: Cleanup the GridSpec demos.
• PR #12144: Add explicit getters and setters for Annotation.anncoords.
• PR #12152: Use_warn_external for deprecations warnings.
• PR #12148: BLD: pragmatic fix for building basic_unit example on py37
• PR #12147: DOC: update the gh_stats code

Issues (170):
• #12699: Annotations get cropped out of figures saved with bbox_inches=‘tight’
• #9217: Weirdness with inline figure DPI settings in Jupyter Notebook
• #4853: %matplotlib notebook creates much bigger figures than %matplotlib inline
• #12780: Vague/misleading exception message in scatter()
• #10239: Weird interaction with Tkinter
• #10045: subplots_adjust() breaks layout of tick labels
• #12765: Matplotlib draws incorrect color
• #11800: Gridspec tutorial
• #12757: up the figure
• #12724: Importing pyplot steals focus on macOS
• #12669: fixing _hold on cartopy broke basemap
• #12687: Plotting text on 3d axes before tight_layout() breaks tight_layout()
• #12734: Wishlist: functionally linked twin axes
• #12576: RcParams is fundamentally broken
• #12641: _axes.py.scatter() array index out of bound / calling from seaborn
• #12703: Error when closing first of several pyplot figures in TkAgg
• #12728: Deprecation Warnings
• #4124: Provide canonical examples of mpl in web frameworks
• #10574: Default color after setting alpha to Patch in legend
• #12702: couldn’t find or load Qt platform plugin “windows” in “”.
• #11139: ”make clean” doesn’t remove all the build doc files
• #12701: semilogy with NaN prevents display of Title (cairo backend)
• #12696: Process finished with exit code -1 due to matplotlib configuration
• #12692: matplotlib.plot.show always blocks the execution of python script
• #12433: Travis error is MacOS image tolerance of 0.005 for test_constrained_layout.
  py::test_colorbar_location
• #10017: unicode_literals considered harmful
• #12682: using AxesImage.set_clim() shrinks the colorbar
• #12620: Overlapping 3D objects
• #12680: matplotlib ui in thread still blocked
• #11908: Improve linestyle documentation
• #12650: Deprecation warnings when calling help(matplotlib)
• #10643: Most warnings calls do not set the stacklevel
• #12671: make_axes_locatable breaks with matplotlib 3.0
• #12664: plt.scatter crashes because overwrites the colors to an empty list
• #12188: matplotlib 3 pyplot on MacOS bounces rocket icon in dock
• #12648: Regression when calling annotate with nan values for the position
• #12362: In 3.0.0 backend cannot be set if 'get_backend()' is run first
• #12649: Over-verbose deprecation warning about examples.directory
• #12661: In version 3.0.0 make_axes_locatable + colorbar does not produce expected result
• #12634: axes_grid1 axes have no keyword argument 'bbox_extra_artists'
• #12654: Broken 'Developer Discussions' link
• #12657: With v3.0.0 mpl_toolkits.axes_grid1.make_axes_locatable().append_axes breaks in Jupyter
• #12645: Markers are offset when 'facecolor' or 'edgecolor' are set to 'none' when plotting data
• #12644: Memory leak with plt.plot in Jupyter Notebooks?
• #12632: Do we need input hooks macosx?
• #12535: AIX Support - Do not undef _XOPEN_SOURCE
• #12626: AttributeError: module 'matplotlib' has no attribute 'artist'
• #11034: Doc Typo: matplotlib.axes.Axes.get_yticklabels / Axis.get_ticklabels
• #12624: make_axes_locatable : Colorbar in the middle instead of bottom while saving a pdf, png.
• #11094: can not use GUI backends inside django request handlers
• #12613: transientsly linked interactivity of unshared pair of axes generated with make_axes_locatable
• #12578: macOS builds are broken
• #12612: gui backends do not work inside of flask request handlers
• #12611: Matplotlib 3.0.0 Likely bug TypeError: stackplot() got multiple values for argument 'x'
• #12610: matplotlibrc causes import to fail 3.0.0 (didn’t crash 2.y.z series)
• #12601: Can’t import matplotlib
• #12597: Please soon add Chinese language support!! It’s to difficult for new people handle character
• #12590: Matplotlib pypi distribution lacks packages for Python 2.7
• #3869: Numeric labels do not work with plt.hist
• #12580: Incorrect hist error message with bad color size
• #12100: document where to get nightly wheels
• #7205: Converting docstrings to numpydoc
• #12564: Saving plot as PNG file prunes tick labels
• #12161: Problems of using sharex options with lines plots and colormesh with colorbar
• #12256: tight_layout for plot with non-clipped screen-unit items causes issues on zoom
• #12545: Program quit unormally without reporting error
• #12532: Incorrect rendering of math symbols
• #12567: Calling pyplot.show() with TkAgg backend on x86 machine raises OverflowError.
• #12571: cannot install because Fatal Python error: initfsencoding: Unable to get the locale encoding
• #12566: Problem installing Version 1.3.1 -> missing pkg-config freetype and libagg
• #12556: Matplotlib 3.0.0 import hangs in clean environment
• #12197: Weird behaviour of suptitle() when horizontalalignment is not ‘center’
• #12550: colorbar resizes in animation
• #12155: Incorrect placement of Colorbar ticks using LogNorm
• #11787: Looping gifs with PillowWriter
• #12533: Plotting with alpha=0 with rasterized=True causes ValueError on saving to pdf
• #12438: Scatter doesn’t accept a list of strings as color spec.
• #12429: scatter() does not accept gray strings anymore
• #12499: run my code failed after i Import pylab failed, python version is 3.6.6
• #12458: add_lines misses lines for matplotlib.colorbar.ColorbarBase
• #12239: 3d axes are collapsed by tight_layout
• #12414: Function to draw angle between two lines
• #12488: inconsistent colorbar tick labels for LogNorm
• #12515: pyplot.step broken in 3.0.0?
• #12355: Error for bbox_inches=’tight’ in savefig with make_axes_locatable
• #12505: ImageGrid in 3.0
• #12502: How can I put the ticks of logarithmic coordinate in the axes?
• #12496: Matplotlib Can’t Plot a Dataset
• #12486: rotate label of legend ?
• #12291: Importing pyplot crashes on macOS due to missing fontlist-v300.json and then permission denied: ‘/opt/local/share/fonts’
• #12480: “close_event” for nbagg/notebook backend
• #12467: Documentation of AnchoredText’s prop keyword argument is misleading
• #12288: New function signatures in pyplot break Cartopy
• #12445: Error on colorbar
• #8760: Traceback from animation.MovieWriter.saving method is confusing because it provides no useful information
• #9205: after the animation encoder (e.g. ffmpeg) fails, the animation framework itself fails internally in various ways while trying to report the error
• #12357: Unclear error when saving Animation using FFMpeg
• #12454: Formatting numerical legend
• #9636: matplotlib crashes upon window resize
• #11473: Continuous plotting cause memory leak 20-50kb/sec
• #12018: No image pop-up or display for plt.imshow() and plt.show()
• #11583: How to draw parallelepiped with real size scaling?
• #12446: Polar Contour - float() argument must be a string or a number, not ‘AxesParasiteParasiteAuxTrans’
• #12444: Issues with gridspec/tight_layout in matplotlib version 2.2.3
• #11154: Unexpected behavior for Axes3D.plot_surface(shade=None)
• #12409: Calling savefig() multiple times causes crash of Spyder IDE / IPython Kernel dying.
• #9799: FigureCanvasTkAgg - “buffer is of wrong type” error during blit
• #12439: FileNotFoundError for font_manager
• #12437: matplotlib-mac
• #12121: Documentation of TextArea’s fontprops keyword argument is misleading
• #12279: Axes.format_cursor_data lacks documentation and seems unused
• #12428: Simple plot spacing bug: ylabel gets wrongfully removed from plot
• #11190: Images in the docs are too large.
• #12271: error with errorbar with datetime64
• #12405: plt.stackplot() does not work with 3.0.0
• #12282: Axes.imshow tooltip does not get updated when another call to Axes.imshow is made
• #12420: How to remove Rectangle Selector from figure?
• #12391: Constrained Layout tutorial needs some cleanup....
• #12406: Bug with font finding, and here is my fix as well.
• #9051: ParasiteAxes over plotting
• #12325: Annotation change from “s” to “text” in 3.0- documentation
• #12397: plt.show( ) not working (can’t get figures to display in external window) when using jupyter QTconsole
• #12396: Defining arrowprops in draggable annotation disables the pick_event
• #12389: Setting row edge color of matplotlib table
• #12376: The output figure file is strange: there is a lot of blank area on the output figure.
• #11641: constrained_layout and colorbar for a subset of axes
• #12373: Unexpected outcome with matplotlib.pyplot.pcolormesh()
• #12370: ImageGrid bug when using inline backend
• #12364: pdf image generated by matplotlib with semi transparent lines missing in Word on Windows.
• #12352: TeX rendering broken on master with windows
• #12354: Too many levels of symbolic links
• #12323: indicate_inset_zoom sometimes draws incorrect connector lines
• #12341: Figures not rendering in docker
• #12335: Matplotlib plt.Rectangle Incoherent Results
• #12265: ParasiteAxesAuxTrans pcolor/pcolormesh and contour/contourf broken
• #12337: AttributeError: module ‘matplotlib.pyplot’ has no attribute ‘hold’
• #11673: Inconsistent font settings when changing style context
• #11693: The rcParams setting for figure.figsize does not change when run from another notebook
• #11725: New mode between non-interactive and interactive?
• #12134: tight_layout flips images when making plots without displaying them
• #12310: plot fails with datetime64[ns] timezone aware objects (for example datetime64[ns, UTC+00:00]
• #12191: “if 1:” blocks in examples
• #11288: FR: Figure.subplots add optional SubplotSpec parameter
• #12298: c and cmap for plot
• #12286: Sample code given in Matplotlib’s site does not work.
• #11955: UnicodeDecodeError on importing pyplot in python2
• #12208: parasite axis2 demo now crashes with log x-axis
• #8871: Error when using quantities when plotting errorbars
• #6658: literature reference for ‘viridis’ colormap
• #6789: Tutorial pyplot_scales.py crashes when used with plt.tight_layout()
• #6922: imshow does not immediately update shared axes
• #11879: Unable to change filename when saving from figure window
• #12225: In histogram, bars whose count is larger than 2**31 sometimes become negative
• #1461: DOC: keyword arguments to plt.axes, plt.subplot, and fig.add_subplot
• #12173: Cannot import pyplot
• #12217: Python will suddenly not plot anymore
• #12120: Default legend behavior (loc=’best’) very slow for large amounts of data.
• #12176: import pyplot on MacOS without font cache will search entire subtree of current dir
• #12146: fix pdf docs
• #12160: MacOS: Cannot import name ‘format_exc’
• #12169: Cannot install 3.0.0 “python setup.py egg_info” failed (freetype & png)
• #12168: pip install v3.0.0 ‘failed with exit status 1181’
• #12107: warnings re: deprecated pytest API with pytest 3.8
• #12162: https://matplotlib.org/users/beginner.html is outdated
• #12010: Popover over plot is very slow
• #6739: Make matplotlib fail more gracefully in headless environments
• #3679: Runtime detection for default backend
• #11340: matplotlib fails to install from source with intel compiler
• #11838: docs do not build on py3.7 due to small change in python handling of -m
• #12115: Plot in JS Animation has larger margin than “normal” PNG plot

7.1.2 GitHub Stats for Matplotlib 3.1.0

GitHub stats for 2018/09/18 - 2019/05/13 (tag: v3.0.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 161 issues and merged 918 pull requests. The full list can be seen on GitHub

The following 150 authors contributed 3426 commits.

• Abhinuv Nitin Pitale
• Adam J. Stewart

GitHub issues and pull requests:

Pull Requests (918):

- PR #14209: Backport PR #14197 on branch v3.1.x (Minor cleanup of acorr/xcoor docs)
- PR #14210: Make intro tutorial less jargony.
- PR #14197: Minor cleanup of acorr/xcoor docs
- PR #14203: Backport PR #14202 on branch v3.1.x (Fix docstring of Line2D.set_data.)
- PR #14202: Fix docstring of Line2D.set_data.
- PR #14196: Backport PR #14188 on branch v3.1.x (Clarify scope of MouseEvent attributes)
- PR #14188: Clarify scope of MouseEvent attributes
- PR #14194: Backport PR #14167 on branch v3.1.x (Fix backend_pgf header.)
- PR #14193: Backport PR #14153 on branch v3.1.x (Update qt_compat.py test for already imported binding.)
- PR #14167: Fix backend_pgf header.
- PR #14153: Update qt_compat.py test for already imported binding.
- PR #14190: Backport PR #14176 on branch v3.1.x (Merge doc/api/api_overview and doc/api/index.)
- PR #14192: Unbreak testsuite for pytest 4.5.
- PR #14189: Backport PR #14186 on branch v3.1.x (Update FancyBboxPatch docs to numpydoc style)
- PR #14176: Merge doc/api/api_overview and doc/api/index.
- PR #14186: Update FancyBboxPatch docs to numpydoc style
- PR #14187: Backport PR #13169 on branch v3.1.x (Add example code for current logo)
- PR #14165: Backport PR #14156 on branch v3.1.x (Fix glyph loading in textpath.)
• PR #14156: Fix glyph loading in textpath.
• PR #14162: Backport PR #14150 on branch v3.1.x (Fix deprecation of withdash for figtext().)
• PR #14150: Fix deprecation of withdash for figtext().
• PR #14136: Backport PR #14109 on branch v3.1.x
• PR #14109: Some simple pyplot doc improvements
• PR #14129: Backport PR #14117 on branch v3.1.x (Simplify ribbon_box example.)
• PR #14128: Backport PR #14057 on branch v3.1.x (Improve Gradient bar example)
• PR #14127: Backport PR #14125 on branch v3.1.x (Remove extra keyword from pytest.skip call.)
• PR #14117: Simplify ribbon_box example.
• PR #14057: Improve Gradient bar example
• PR #14125: Remove extra keyword from pytest.skip call.
• PR #14123: Backport PR #14119 on branch v3.1.x (Add ridge_map to third party packages documentation)
• PR #14119: Add ridge_map to third party packages documentation
• PR #14103: Backport PR #14088 on branch v3.1.x (Cleanup major_minor_demo.)
• PR #14102: Backport PR #14100 on branch v3.1.x (Improve docstring of axes_zoom_effect example.)
• PR #14099: Backport PR #14090 on branch v3.1.x (Pep8ify some variable names in examples.)
• PR #14100: Improve docstring of axes_zoom_effect example.
• PR #14088: Cleanup major_minor_demo.
• PR #14090: Pep8ify some variable names in examples.
• PR #14097: Backport PR #14079 on branch v3.1.x (Consistently use axs.flat instead of axs.flatten())
• PR #14095: Backport PR #14087 on branch v3.1.x (Cleanup date example.)
• PR #14094: Backport PR #14029 on branch v3.1.x (Fix doc building with numpydoc 0.9)
• PR #14093: Backport PR #14052 on branch v3.1.x (Check axes identity in image.contains.)
• PR #14092: Backport PR #14056 on branch v3.1.x (FIX: do not try to manage the visibility of un-drawn ticks)
• PR #14091: Backport PR #14078 on branch v3.1.x (Minor fix in multiple subplots example)
• PR #14079: Consistently use axs.flat instead of axs.flatten()
• PR #14087: Cleanup date example.
• PR #14029: Fix doc building with numpydoc 0.9
• PR #14052: Check axes identity in image.contains.
• PR #14056: FIX: do not try to manage the visibility of un-drawn ticks
• PR #14078: Minor fix in multiple subplots example
• PR #14080: Backport PR #14069 on branch v3.1.x (Don’t try to use the colorbar formatter to format RGBA data.)
• PR #14069: Don’t try to use the colorbar formatter to format RGBA data.
• PR #14074: Backport PR #14019 on branch v3.1.x (Update docstring of locator_params())
• PR #14019: Update docstring of locator_params()
• PR #14066: Backport PR #14053 on branch v3.1.x (Improve fill() example)
• PR #14065: Backport PR #14059 on branch v3.1.x (Improve Scatter hist example)
• PR #14067: Backport PR #14062 on branch v3.1.x (Improve advanced quiver example)
• PR #14062: Improve advanced quiver example
• PR #14053: Improve fill() example
• PR #14059: Improve Scatter hist example
• PR #14064: Backport PR #14043 on branch v3.1.x (Ensure errorbars are always drawn on top of bars in ax.bar)
• PR #14043: Ensure errorbars are always drawn on top of bars in ax.bar
• PR #14061: Backport PR #14051 on branch v3.1.x (Add Yellowbrick to third party packages)
• PR #14051: Add Yellowbrick to third party packages
• PR #14050: Backport PR #14048 on branch v3.1.x (Fix Animation.save)
• PR #14049: Backport PR #14047 on branch v3.1.x (Remove references to “Draws” in matplotlib.patches)
• PR #14048: Fix Animation.save
• PR #14047: Remove references to “Draws” in matplotlib.patches
• PR #14037: Backport PR #14033 on branch v3.1.x (Reword add_subplot docstring.)
• PR #14036: Backport PR #14001 on branch v3.1.x ([BUG] DOC: Remove broken references to vischeck)
• PR #14033: Reword add_subplot docstring.
• PR #14032: Backport PR #14030 on branch v3.1.x (Update colorcet link)
• PR #14030: Update colorcet link
• PR #14027: Backport PR #14026 on branch v3.1.x (Fix bug in plot_directive that caused links to plots in different formats to be missing)
• PR #14026: Fix bug in plot_directive that caused links to plots in different formats to be missing
• PR #14012: Backport PR #14008 on branch v3.1.x (Don’t install tests by default.)
• PR #14017: Backport PR #14015 on branch v3.1.x (Fix docstring of pyplot.clim())
• PR #14015: Fix docstring of pyplot.clim()
• PR #14006: Backport PR #13998 on branch v3.1.x (Fix patch contains logic for patches that don’t have any codes)
• PR #14005: Backport PR #14004 on branch v3.1.x (DOC: pin numpydoc to less than 0.9)
• PR #13998: Fix patch contains logic for patches that don’t have any codes
• PR #13999: Backport PR #13992 on branch v3.1.x (FIX: undeprecate MaxNLocator default_params)
• PR #13997: Backport PR #13995 on branch v3.1.x (DOC: explain zorder for gridlines in grid docstring)
• PR #13992: FIX: undeprecate MaxNLocator default_params
• PR #13995: DOC: explain zorder for gridlines in grid docstring
• PR #13990: Backport PR #13989 on branch v3.1.x (FIX: update not replace hist_kwargs when density is passed)
• PR #13989: FIX: update not replace hist_kwargs when density is passed
• PR #13975: Backport PR #13966 on branch v3.1.x (Fix colorbar setting without artist)
• PR #13976: Backport PR #13973 on branch v3.1.x (BUG: Ensure docstrings are not accessed with -OO)
• PR #13856: What’s new page for 3.1
• PR #13966: Fix colorbar setting without artist
• PR #13973: BUG: Ensure docstrings are not accessed with -OO
• PR #13969: Backport PR #13950 on branch v3.1.x (confidence_ellipse_markup)
• PR #13950: confidence_ellipse_markup
• PR #13965: Backport PR #13962 on branch v3.1.x (Fix typo in code example in docstring.)
• PR #13964: Backport PR #13870 on branch v3.1.x (3.1.0 API changes page)
• PR #13962: Fix typo in code example in docstring.
• PR #13870: 3.1.0 API changes page
• PR #13961: Backport PR #13914 on branch v3.1.x (Improve Rainbow text example)
• PR #13960: Backport PR #13958 on branch v3.1.x (Remove transparent fancy legend example)
• PR #13914: Improve Rainbow text example
• PR #13958: Remove transparent fancy legend example
• PR #13956: Backport PR #13908 on branch v3.1.x (Enh control tick deconflict2)
• PR #13955: Backport PR #13941 on branch v3.1.x (Add project_urls to setup)
• PR #13908: Enh control tick deconflict2
• PR #13954: Backport PR #13949 on branch v3.1.x (DOC: Add documentation to Text.set_fontfamily)
• PR #13941: Add project_urls to setup
• PR #13949: DOC: Add documentation to Text.set_fontfamily
• PR #13951: Backport PR #13939 on branch v3.1.x (Bunch of docstring cleanups.)
• PR #13939: Bunch of docstring cleanups.
• PR #13947: Backport PR #13897 on branch v3.1.x (numpydocification.)
• PR #13897: numpydocification.
• PR #13946: Backport PR #13924 on branch v3.1.x (Followup to deprecation of usetex parameter in get_text_path.)
• PR #13924: Followup to deprecation of usetex parameter in get_text_path.
• PR #13916: Backport PR #13850 on branch v3.1.x (Cleanup STIX Font Demo)
• PR #13915: Backport PR #13835 on branch v3.1.x (Improve Connectionstyle Demo)
• PR #13850: Cleanup STIX Font Demo
• PR #13835: Improve Connectionstyle Demo
• PR #13846: Backport PR #13836 on branch v3.1.x (MNT: account for cpython deprecations)
• PR #13898: Backport PR #13896 on branch v3.1.x (Fix cbook.boxplot_stats docstring)
• PR #13896: Fix cbook.boxplot_stats docstring
• PR #13893: Backport PR #13890 on branch v3.1.x (rst seealso -> numpydoc “See Also”.)
• PR #13890: rst seealso -> numpydoc “See Also”.
• PR #13888: Backport PR #13862 on branch v3.1.x (Move 3.x API changes to prev_api_changes)
• PR #13862: Move 3.x API changes to prev_api_changes
• PR #13882: Backport PR #13867 on branch v3.1.x (Rename “docs” to “contents” in navigation bar)
• PR #13867: Rename “docs” to “contents” in navigation bar
• PR #13881: Backport PR #13874 on branch v3.1.x (Remove redundant call to Formatter.set_locs() before .format_ticks().)
• PR #13874: Remove redundant call to Formatter.set_locs() before .format_ticks().
• PR #13871: Backport PR #13868 on branch v3.1.x (Correctly handle fallout of defining PY_SIZE_T_CLEAN on Windows.)
• PR #13869: Backport PR #13861 on branch v3.1.x (Fix remaining links in docs)
• PR #13868: Correctly handle fallout of defining PY_SIZE_T_CLEAN on Windows.
• PR #13861: Fix remaining links in docs
• PR #13849: Backport PR #13845 on branch v3.1.x (Fix some broken documentation links)
• PR #13845: Fix some broken documentation links
• PR #13836: MNT: account for cpython deprecations
• PR #13841: Backport PR #12928 on branch v3.1.x (textpath encoding)
• PR #13842: Backport PR #13827 on branch v3.1.x (Better MovieWriter init error message)
- PR #13838: Backport PR #13570 on branch v3.1.x (Add new example for plotting a confidence_ellipse)
- PR #13827: Better MovieWriter init error message
- PR #13839: Backport PR #13815 on branch v3.1.x (Numpydocify FontManager.findfont())
- PR #13837: Backport PR #8638 on branch v3.1.x (FIX: if bins input to hist is str, treat like no bins)
- PR #12928: textpath encoding
- PR #13815: Numpydocify FontManager.findfont()
- PR #13570: Add new example for plotting a confidence_ellipse
- PR #8638: FIX: if bins input to hist is str, treat like no bins
- PR #13831: Backport PR #13780 on branch v3.1.x (numpydoc ListedColormap parameters)
- PR #13780: numpydoc ListedColormap parameters
- PR #13830: Backport PR #13829 on branch v3.1.x (numpydoc IndexFormatter)
- PR #13829: numpydoc IndexFormatter
- PR #13828: Backport PR #13821 on branch v3.1.x (Remove mathcircled from mathtext docs following its deprecation.)
- PR #13821: Remove mathcircled from mathtext docs following its deprecation.
- PR #13822: Backport PR #13817 on branch v3.1.x (Remove borders from barcode example)
- PR #13820: Backport PR #13816 on branch v3.1.x (Correct windows env variable format)
- PR #13816: Correct windows env variable format
- PR #13817: Remove borders from barcode example
- PR #13814: Merge pull request #13805 from timhoffm/pin-sphinx-1.x
- PR #13813: Backport PR #13764 on branch v3.1.x (Deprecate mathcircled.)
- PR #13764: Deprecate mathcircled.
- PR #13805: Pin Sphinx to 1.x
- PR #13807: Backport PR #13800 on branch v3.1.x (Doc typos.)
- PR #13800: Doc typos.
- PR #13806: Backport PR #13771 on branch v3.1.x (patches.Arc docstring update #13759)
- PR #13804: Backport PR #13766 on branch v3.1.x (Search for fonts in XDG directory as well.)
- PR #13771: patches.Arc docstring update #13759
- PR #13766: Search for fonts in XDG directory as well.
- PR #13794: Backport PR #13695 on branch v3.1.x (numpydocify transform_angles.)
• PR #13793: Backport PR #13762 on branch v3.1.x (Cleanup marker_reference example.)
• PR #13792: Backport PR #13789 on branch v3.1.x (BUG: Fix function signature mismatch for set_clim)
• PR #13791: Backport PR #13787 on branch v3.1.x (Fix failure to import matplotlib.animation on Windows.)
• PR #13695: numpydocify transform_angles.
• PR #13762: Cleanup marker_reference example.
• PR #13789: BUG: Fix function signature mismatch for set_clim
• PR #13787: Fix failure to import matplotlib.animation on Windows.
• PR #13781: Backport PR #13777 on branch v3.1.x (Use class-based directive for mathmpl_sphinxext.)
• PR #13790: Backport PR #13564 on branch v3.1.x (Add an option to log progress while saving animations)
• PR #13564: Add an option to log progress while saving animations
• PR #13777: Use class-based directive for mathmpl_sphinxext.
• PR #13765: Backport PR #13761 on branch v3.1.x (Deprecate verbose-related rcParams.)
• PR #13761: Deprecate verbose-related rcParams.
• PR #13760: Backport PR #13719 on branch v3.1.x (Doc: Update timeline example)
• PR #13704: Backport PR #13021 on branch v3.1.x (Undesirable behaviour of MixedModeRenderer)
• PR #13758: Backport PR #13674 on branch v3.1.x (Preserve whitespace in svg output.)
• PR #13719: Doc: Update timeline example
• PR #13674: Preserve whitespace in svg output.
• PR #13755: Backport PR #13741 on branch v3.1.x (FIX: make title move above ticklabels)
• PR #13754: Backport PR #13712 on branch v3.1.x (Deprecate NavigationToolbar2QT.adj_window (unused and always None.).)
• PR #13741: FIX: make title move above ticklabels
• PR #13712: Deprecate NavigationToolbar2QT.adj_window (unused and always None).
• PR #13752: Backport PR #13732 on branch v3.1.x (Fix doc markup.)
• PR #13753: Backport PR #13751 on branch v3.1.x (DOC/FIX: try merging comments)
• PR #13751: DOC/FIX: try merging comments
• PR #13732: Fix doc markup.
• PR #13750: Backport PR #13743 on branch v3.1.x (Fix doc warning)
• PR #13743: Fix doc warning
• PR #13747: Backport PR #13745 on branch v3.1.x (Fix stem(use_line_collection))
Matplotlib, Release 3.3.0

• PR #13748: Backport PR #13716 on branch v3.1.x (Kill attributes that are never used/updated.)
• PR #13716: Kill attributes that are never used/updated.
• PR #13745: Fix stem(use_line_collection)
• PR #13710: TST: only test agg_filter extensions with baseline images
• PR #13709: Backport PR #8690 on branch v3.1.x
• PR #13707: Backport PR #12760 on branch v3.1.x (Deduplicate implementation of per-backend Tools.)
• PR #13706: Backport PR #13689 on branch v3.1.x (BUG: fix scaling of quiverkey when quiver scale_units=’xy’)
• PR #13705: Backport PR #12419 on branch v3.1.x (Add DivergingNorm (again, again, again))
• PR #13703: Backport PR #12170 on branch v3.1.x (Deprecate considering *args, **kwargs in Timer.remove_callback.)
• PR #12760: Deduplicate implementation of per-backend Tools.
• PR #13689: BUG: fix scaling of quiverkey when quiver scale_units=’xy’
• PR #12419: Add DivergingNorm (again, again, again)
• PR #8690: Adds support for rgba and rgb images to pcolorfast
• PR #13021: Undesirable behaviour of MixedModeRenderer
• PR #12170: Deprecate considering *args, **kwargs in Timer.remove_callback.
• PR #13700: Backport PR #13588 on branch v3.1.x (FIX: fallback to viewlims if no data)
• PR #13694: Backport PR #13677 on branch v3.1.x (Log all failures to extract font properties.)
• PR #13588: FIX: fallback to viewlims if no data
• PR #13692: Backport PR #13677 on branch v3.0.x (Log all failures to extract font properties.)
• PR #13677: Log all failures to extract font properties.
• PR #13691: Backport PR #13687 on branch v3.1.x (Update stem example)
• PR #13687: Update stem example
• PR #13688: Backport PR #13684 on branch v3.1.x (Use format_data_short to format image cursor data.)
• PR #13684: Use format_data_short to format image cursor data.
• PR #13686: Backport PR #13363 on branch v3.1.x (Inline iter_ticks into _update_ticks, and use that in mplot3d.)
• PR #13363: Inline iter_ticks into _update_ticks, and use that in mplot3d.
• PR #13681: Backport PR #13678 on branch v3.1.x (Fix font deduplication logic in createFontList.)
• PR #13678: Fix font deduplication logic in createFontList.
• PR #13669: Backport PR #13667 on branch v3.1.x (Fix incorrect signature in axis() doc.)
• PR #13667: Fix incorrect signature in axis() doc.
• PR #13664: Backport PR #12637 on branch v3.1.x (Tell IPython the correct GUI event loop to use for all backends.)
• PR #13665: Backport PR #13601 on branch v3.1.x (Add a make-parameter-keyword-only-with-deprecation decorator.)
• PR #13601: Add a make-parameter-keyword-only-with-deprecation decorator.
• PR #12637: Tell IPython the correct GUI event loop to use for all backends.
• PR #13662: Backport PR #13064 on branch v3.1.x (Don’t explicitly add default include paths to Extensions)
• PR #13064: Don’t explicitly add default include paths to Extensions
• PR #13658: Backport PR #13652 on branch v3.1.x (Fix empty FancyArrow crash)
• PR #13652: Fix empty FancyArrow crash
• PR #13655: Backport PR #11692 on branch v3.1.x (Deprecate frameon kwarg and rcParam to savefig.)
• PR #13654: Backport PR #13614 on branch v3.1.x (Fix polar get window extent)
• PR #11692: Deprecate frameon kwarg and rcParam to savefig.
• PR #13614: Fix polar get window extent
• PR #13646: Backport PR #13645 on branch v3.1.x (widgets.py fix examples connect -> mpl_connect)
• PR #13645: widgets.py fix examples connect -> mpl_connect
• PR #13644: Backport PR #13612 on branch v3.1.x (Improve Demo Text Rotation Mode)
• PR #13612: Improve Demo Text Rotation Mode
• PR #13636: Backport PR #13621 on branch v3.1.x (Remove asfileobj=False from a bunch of examples loading sample_data.)
• PR #13635: Backport PR #13632 on branch v3.1.x (Clarify tick collision API change doc.)
• PR #13634: Backport PR #13631 on branch v3.1.x (Switch deprecation of Tick.label to pending.)
• PR #13621: Remove asfileobj=False from a bunch of examples loading sample_data.
• PR #13632: Clarify tick collision API change doc.
• PR #13631: Switch deprecation of Tick.label to pending.
• PR #13628: Backport PR #13603 on branch v3.1.x
• PR #13603: FIX: continue to bail tight layout if rect supplied
• PR #13627: Backport PR #13622 on branch v3.1.x (Change title of named colors example)
• PR #13626: Backport PR #13549 on branch v3.1.x (Simplify some annotation() calls in examples.)
• PR #13624: Backport PR #13610 on branch v3.1.x (Update centered ticklabels example)
• PR #13625: Backport PR #13611 on branch v3.1.x (Fix text position in FancyTextbox demo)
• PR #13622: Change title of named colors example
• PR #13610: Update centered ticklabels example
• PR #13611: Fix text position in Fancytextbox demo
• PR #13607: Backport PR #13605 on branch v3.1.x (Warn on attempts at semi-transparent outputs in ps backend.)
• PR #13608: Backport PR #13602 on branch v3.1.x (Deprecate cbook.is_hashable.)
• PR #13602: Deprecate cbook.is_hashable.
• PR #13605: Warn on attempts at semi-transparent outputs in ps backend.
• PR #13599: Backport PR #13590 on branch v3.1.x (Doc event loop requirements for Figure.show)
• PR #13590: Doc event loop requirements for Figure.show
• PR #13597: Backport PR #12359 on branch v3.1.x (ENH: Add boolean support for axis())
• PR #13594: Backport PR #13592 on branch v3.1.x (DOC: Make canonical URLs point to versioned path.)
• PR #13592: DOC: Make canonical URLs point to versioned path.
• PR #12359: ENH: Add boolean support for axis()
• PR #13573: Fix mplot3d transparency
• PR #13585: Backport PR #13578 on branch v3.1.x (Revert invalid change in Centered Ticklabels example)
• PR #13584: Backport PR #13582 on branch v3.1.x (Cleanup two font-related examples.)
• PR #13578: Revert invalid change in Centered Ticklabels example
• PR #13582: Cleanup two font-related examples.
• PR #13579: Backport PR #13477 on branch v3.1.x (FIX: make EngFormatter respect axes.unicode_minus rcParam)
• PR #13577: Backport PR #12832 on branch v3.1.x (Deprecate redundant log-scale transform classes.)
• PR #13477: FIX: make EngFormatter respect axes.unicode_minus rcParam
• PR #12832: Deprecate redundant log-scale transform classes.
• PR #12856: added property usemathtext to EngFormatter
• PR #12856: added property usemathtext to EngFormatter
• PR #12852: Backport PR #12899 on branch v3.1.x (Small cleanups.)
• PR #13571: Backport PR #11553 on branch v3.1.x (Improved Code for Segments Intersect)
• PR #12899: Small cleanups.
• PR #11553: Improved Code for Segments Intersect
• PR #13568: Backport PR #13563 on branch v3.1.x (FIX: inverted colorbar ticks)
• PR #13563: FIX: inverted colorbar ticks
• PR #13530: BUG: keep the ticks when the colorbar axis is inverted
• PR #13565: Backport PR #13550 on branch v3.1.x (Strip out Py2-compat in setupext.)
• PR #13550: Strip out Py2-compat in setupext.
• PR #13562: Backport PR #13560 on branch v3.1.x (Improve GridSpec doc)
• PR #13560: Improve GridSpec doc
• PR #13558: Backport PR #13546 on branch v3.1.x (Modified docstring of the set_ylabel and set_xlabel)
• PR #13559: Backport PR #12062 on branch v3.1.x (Separate alpha and rgb interpolation then recombine to fix issue11316)
• PR #13557: Backport PR #13548 on branch v3.1.x (Deprecate TextWithDash.)
• PR #12062: Separate alpha and rgb interpolation then recombine to fix issue11316
• PR #13546: Modified docstring of the set_ylabel and set_xlabel
• PR #13548: Deprecate TextWithDash.
• PR #13549: Simplify some annotation() calls in examples.
• PR #13552: Backport PR #11241 on branch v3.1.x (Deprecate the MATPLOTLIBDATA environment variable.)
• PR #11241: Deprecate the MATPLOTLIBDATA environment variable.
• PR #13547: Backport PR #9314 on branch v3.1.x (Simplify units.Registry.get_converter.)
• PR #13545: Backport PR #13541 on branch v3.1.x (DOC: Remove mention of ‘complex’ mode in specgram docstring)
• PR #9314: Simplify units.Registry.get_converter.
• PR #13541: DOC: Remove mention of ‘complex’ mode in specgram docstring
• PR #13539: Backport PR #12950 on branch v3.1.x (Inline or simplify FooFormatter.pprint_val.)
• PR #13538: Backport PR #12748 on branch v3.1.x (Use the builtin GTK3 FileChooser rather than our custom subclass.)

• PR #13511: Add missing plt.show() at end of example.
• PR #13508: Backport PR #13413 on branch v3.1.x (Simplify decade up- and down-rounding, and symmetrize expansion of degenerate log scales.)
• PR #13509: Backport PR #13492 on branch v3.1.x (Doc more release updates)
• PR #13492: Doc more release updates
• PR #13413: Simplify decade up- and down-rounding, and symmetrize expansion of degenerate log scales.
• PR #13507: Backport PR #13488 on branch v3.1.x (Animation: interactive zoom/pan with blitting does not work)
• PR #13488: Animation: interactive zoom/pan with blitting does not work
• PR #13505: Backport PR #13459 on branch v3.1.x (Document histogramming pre-binned data.)
• PR #13503: Backport PR #10776 on branch v3.1.x (fix FancyArrowPatch picker fails depending on arrowstyle)
• PR #13504: Backport PR #13123 on branch v3.1.x (Add shading to Axes3D.voxels, and enable it by default)
• PR #13502: Backport PR #13180 on branch v3.1.x (Various TextPath cleanups.)
• PR #13459: Document histogramming pre-binned data.
• PR #13501: Backport PR #13209 on branch v3.1.x (Deprecate support for (n, 1)-shaped error arrays in errorbar().)
• PR #13500: Backport PR #12763 on branch v3.1.x (Remove deprecated rcParams.)
• PR #13123: Add shading to Axes3D.voxels, and enable it by default
• PR #13499: Backport PR #13303 on branch v3.1.x (Unify checking of executable info.)
• PR #10776: fix FancyArrowPatch picker fails depending on arrowstyle
• **PR #13180**: Various TextPath cleanups.
• **PR #13498**: Backport PR #13314 on branch v3.1.x (Move major/minor tick overstrike logic to Axis.)
• **PR #13209**: Deprecate support for (n, 1)-shaped error arrays in errorbar().
• **PR #12763**: Remove deprecated rcParams.
• **PR #13303**: Unify checking of executable info.
• **PR #13497**: Backport PR #13057 on branch v3.1.x (Simplify callable(self._contains) checks)
• **PR #13314**: Move major/minor tick overstrike logic to Axis.
• **PR #13057**: Simplify callable(self._contains) checks
• **PR #13496**: Backport PR #13465 on branch v3.1.x (FIX: polar set_rlim allow bottom-only call)
• **PR #13465**: FIX: polar set_rlim allow bottom-only call
• **PR #13495**: Backport PR #12232 on branch v3.1.x (Add helper function to check that an argument is in a list of strings.)
• **PR #12232**: Add helper function to check that an argument is in a list of strings.
• **PR #11708**: Revert “Skip wx interactive tests on OSX.”
• **PR #13062**: Update FAQ re: batch/webserver use.
• **PR #12904**: Support forward/backward mouse buttons
• **PR #12150**: Deprecate stackrel.
• **PR #13449**: Let boxplot() defer rcParams application to bxp()
• **PR #13425**: API: un-deprecate keyword only args to set_xlim, set_ylim
• **PR #13447**: Update axes_grid docs
• **PR #13473**: Deprecate backend_wx.IDLE_DELAY.
• **PR #13476**: Add font to pyplot.xkcd()
• **PR #13475**: Cleanup titles of embedding examples.
• **PR #13468**: Suppress chaining of cache lookup failure in color conversion.
• **PR #13467**: Add “c” shorthand for “color” for the Text class.
• **PR #13398**: FIX: let pandas IndexInt64 work for boxplot
• **PR #13375**: Improve Axes selection in Qt figure options.
• **PR #13421**: DOC: update release guide
• **PR #13275**: Simple logging interface.
• **PR #13427**: Simplify check for tight-bbox finiteness.
• **PR #13444**: Allow constructing boxplots over multiple calls.
• **PR #13385**: Remove/rework uses of np.where where possible.
• **PR #13441**: Make AFM parser both more compliant and less strict.
• **PR #13384**: Replace np.compress by boolean indexing.
• PR #13422: Clarify IndexError for out-of-bounds indexing of gridspec.
• PR #13443: Remove some outdated comments from rcsetup.py.
• PR #13357: Inherit some docstrings in backend code.
• PR #12380: Stem speedup2
• PR #13368: FIX: Fix shape of hist output when input is multidimensional empty list
• PR #5590: [mpl_toolkits] Fix picking for things drawn on parasite axes
• PR #13323: Move the call to Formatter.set_locs into Formatter.format_ticks.
• PR #13424: Deprecate Quiver.color in favor of Quiver.get_facecolor().
• PR #13434: More smoketesting of pcolorfast.
• PR #13395: Cleanup demo_curvelinear_grid.
• PR #13411: Deemphasize numeric locations for legend() in docs.
• PR #13419: FIX: secondary_axis resize
• PR #13020: Deprecate proj3d.mod.
• PR #13030: Deprecate internal functions exposed in the public API of mplot3d
• PR #13408: test_figure style fixes.
• PR #11127: Legend for Scatter
• PR #11855: Adding the possible to add full command line in animation
• PR #13409: Add nonsingular to the locator base class, and use it in set_*lim too.
• PR #11859: ENH: add secondary x/y axis
• PR #13235: Vectorize mplot3d.art3d.zalpha.
• PR #10411: New "accepts units" decorator
• PR #13403: FIX: remove idle_event
• PR #13069: 5 minor divisions when major ticks are 2.5 units apart
• PR #13402: Fix empty reshape2d
• PR #11683: Reuse axes_grid1’s AxisDict in axisartist, instead of duplicating it.
• PR #12141: Let digits toggle axes nav only if they correspond to an existing axes.
• PR #9845: Add inaxes method to FigureCanvas to check whether point is in an axes.
• PR #13396: mpl_toolkits style fixes.
• PR #11497: Make CI fail if interactive toolkits can’t be tested
• PR #11595: test doc rendering
• PR #13393: Deprecate Spine.is_frame_like.
• PR #13391: Remove colour specification from some examples
• PR #13386: Replace use of np.<ufunc> by operators (<|&|/)).
• PR #13389: Inherit more docstrings.
• PR #13387: Fix regression in docstring.dedent_interpd.
• PR #13383: Replace np.take by normal indexing.
- PR #13381: Avoid unneeded copies from flatten().
- PR #13354: Properly deprecate non-1D inputs to pie().
- PR #13379: Remove citation entry from FAQ.
- PR #13380: Minor simplifications to scatter3d.
- PR #13173: Decorator for deleting a parameter with a deprecation period.
- PR #8205: [MRG+1] plot_date() after axhline() doesn’t rescale axes
- PR #11027: Specify custom tick space heuristic in MaxNLocator
- PR #13262: Shorten setupext and remove uninformative build log entries.
- PR #13377: Add private helper to internally suppress deprecations.
- PR #13376: Undeprecate case-insensitive “long” colornames.
- PR #13373: Deprecate axis3d.Axis.get_tick_positions.
- PR #13362: Kill the unused, private _get_pixel_distance_along_axis.
- PR #12772: Improve plot() docstring.
- PR #13359: DOC: change language a bit
- PR #13351: Fix: Log Colorbar minorticks_off reverted if ticks set
- PR #13356: More spelling fixes.
- PR #13125: Simplify and tighten the docstring handling API.
- PR #13346: Simplify parsing of tuple in C extension code.
- PR #13282: MAINT install of pinned vers for travis
- PR #13234: FIX: allow colorbar mappable norm to change and do right thing
- PR #13269: Rework a bit axes addition.
- PR #13330: Add Axis.get_inverted and Axis.set_inverted.
- PR #13117: Cleanup matplotlib.use
- PR #13335: Update and factor out Axis.get_tick_positions.
- PR #13324: Cleanup ScalarFormatter; preparatory to moving it to format_ticks.
- PR #13322: Update Axis docs
- PR #13342: Update some (mostly internal) docstrings in image.py.
- PR #11848: Country specific characters in Windows user folder name when locating .tfm-file
- PR #13309: bezier cleanups.
- PR #13334: Inherit some docstrings.
- PR #13332: Rewrite convert_to_string using std::string
- PR #13336: Update imshow docs.
- PR #13331: Try forcing font cache rebuild in flaky ttc test.
- PR #12105: API: make MaxNLocator trim out-of-view ticks before returning
- PR #13329: Pin flake8<3.7 to mitigate issues with flake8-per-file-ignores
• PR #13319: Deprecate dates.{str,bytes}pdate2num.
• PR #13320: Kill some private, unused functions in dates.py.
• PR #12909: Let Formatters format all ticks at once.
• PR #13313: Better explanation of ticks
• PR #13310: Replace *kw by *args.
• PR #13285: Defer checking of tex install to when it is actually used.
• PR #13128: Parameter-renaming decorator
• PR #13307: Spelling fixes.
• PR #13304: TST: deregister pandas
• PR #13300: Trivial bezier cleanups.
• PR #11664: FIX: clean up unit conversion unpacking of data, particularly for dates and pandas series
• PR #9639: Unify querying of executable versions
• PR #13224: numpydocify (some of) mpl_toolkits.
• PR #13301: Replace np.empty + ndarray.fill by np.full.
• PR #13229: Prevent exception when running animation on Agg backend.
• PR #13263: In imsave()’s Pillow-handled case, don’t create a temporary figure.
• PR #13294: Simplify some calculations in polar.py.
• PR #13295: Kill some commented-out code.
• PR #13298: Add note about thread safety to FAQ.
• PR #13299: Don’t emit a non-GUI warning when building the docs on Linux.
• PR #13297: Minor cleanup to OSX FAQ.
• PR #13283: Fix doc style in add_gridspec()
• PR #13129: ENH: add a user-friendly verbose interface
• PR #13279: Remove a useless catch_warnings() from example.
• PR #13268: Select RadioButtons by closest in position.
• PR #13271: Fix animation speed in double_pendulum example
• PR #13265: Allow turning off minor ticks on Colorbar with LogNorm
• PR #13260: Improve docs for format determination in savefig()/imsave().
• PR #12379: MAINT Use np.full when possible
• PR #12905: Add optional parameter use_default_template to rc_file()
• PR #13218: Fix checking of ‘labels’ argument to Sankey.add.
• PR #13256: DOC: reject MEP25 due to being stalled
• PR #13255: TST pandas support bar
• PR #13251: DEBUG-log font-matching results, and print failing logs on CI.
• PR #12818: Enh arbitrary scale
• PR #13187: FIX: bar mixed units, allow ValueError as well
• PR #13232: Fix incorrect kwarg being passed to TextPath.
• PR #13250: Replace safezip() by more informative error message in errorbar().
• PR #13239: Improve sankey logging.
• PR #13247: Simplify and optimize png writing in backend_pdf.
• PR #12455: Warn when “best” loc of legend is used with lots of data
• PR #13233: Remove warning in image_annotated_heatmap, and numpydocify it.
• PR #13248: Remove an unused local variable in backend_gtk3.
• PR #13249: Deprecate an unused “internal” API.
• PR #13243: Rewrite subplots_demo
• PR #13240: FIX: spelling error of local variable in category
• PR #13026: MNT: add a logging call if a categorical string array is all convertible
• PR #13225: Fix a warning in the doc build.
• PR #13237: Make color lowercase in example to avoid warning.
• PR #13217: numpydocify Sankey.add.
• PR #10209: Various backend cleanups.
• PR #13113: Globally cache single TexManager instances.
• PR #13213: Broadcast ‘orientations’ arg to Sankey.add.
• PR #13219: Fix some backend_bases docstrings.
• PR #13214: Reformat Sankey exceptions.
• PR #13211: Deprecate case-insensitive colors.
• PR #13210: Suppress a warning in the test suite.
• PR #13189: Remove cairo-based backends from backend fallback.
• PR #13207: Allow saving PNGs through Pillow instead of the builtin _png module.
• PR #13124: Simplify parsing of errorbar input.
• PR #13162: DOC: better argcheck bar
• PR #8531: Added compression option to save TIFF images
• PR #13094: Allow passing arguments to PIL.Image.save().
• PR #13202: Avoid private API in some examples.
• PR #13197: Cleanup the text of two mpl_toolkits examples.
• PR #13198: Cleanup SkewT example.
• PR #11914: Remove the system_monitor example.
• PR #13196: Deemphasize comment about extremely old Matplotlib versions in example.
• PR #13190: Show returncode when subprocess test fails
• PR #13163: Add explanatory comment to annotation box example
• PR #13104: Remove some more 1-tuples.

• PR #12955: Cleanup cursor_demo.
• PR #12984: Cleanup GTK examples.
• PR #12986: Minor cleanup to double_pendulum example.
• PR #12959: Update the documentation of Cursor
• PR #12945: Correctly get weight & style hints from certain newer Microsoft fonts
• PR #12976: ENH: replace deprecated numpy header
• PR #12975: Fail-fast when trying to run tests with too-oldpytest.
• PR #12970: Minor simplifications.
• PR #12974: Remove some checks for Py<3.6 in the test suite.
• PR #12779: Include scatter plots in Qt figure options editor.
• PR #12459: Improve formatting of imshow() cursor data when a colorbar exists.
• PR #12927: MAINT: Correctly handle empty lists in zip unpacking in mplot3d.art3d
• PR #12919: Suppress deprecation warning when testing drawstyle conflict
• PR #12956: Misc. cleanups.
• PR #12924: Deprecate public use of Formatter.pprint_val.
• PR #12947: Support ~ as nonbreaking space in mathtext.
• PR #12944: Fix the title of testing_api
• PR #12136: MAINT: Unify calculation of normal vectors from polygons
• PR #12880: More table documentation
• PR #12940: Avoid pyplot in showcase examples.
• PR #12935: os.PathLike exists on all supported Pythons now.
• PR #12936: Minor updates following bump to Py3.6+.
• PR #12932: Simplify argument checking in Table.__getitem__.
• PR #12930: Shorten an argument check.
• PR #12538: MNT: drop 3.5 testing for 3.1 branch
• PR #12868: Simplify use of Path._fast_from_codes_and_verts.
• PR #12300: API: Polar: allow flipped y/rlims....
• PR #12861: Don’t use deprecated wx.NewId().
• PR #12908: Allow all valid hist.bins strings to be set in the rcparams
• PR #12902: Kill dead code in textpath.
• PR #12885: Improve margins in formlayout
• PR #12877: fooImage -> foo_image in testing/compare.py
• PR #12845: Deprecate silent dropping of unknown arguments to TextPath().
• PR #12852: Cleanup collections docs.
• PR #12888: Properly enable forward/backward buttons on GTK3
• PR #12865: Avoid 1-tick or 0-tick log-scaled axis.
• PR #12844: Remove unused, private _process_text_args.
• PR #12881: Fix string comparison
• PR #12863: FIX: translate timedeltas in _to_ordinalf
• PR #12640: Introduce MouseButton enum for MouseEvent.
• PR #12897: Reword a bit the contour docs.
• PR #12898: Validate rcParams["image.origin"].
• PR #12882: Write error messages to logger instead of stderr
• PR #12889: Deprecate public access to the vendored formlayout module.
• PR #12891: Add Azure Pipelines build badge
• PR #12883: MAINT Use list comprehension

• PR #12739: make Axes._parse_scatter_color_args static
• PR #12846: Deprecate Path.has_nonfinite.
• PR #12829: Remove unused variables
• PR #12872: Inline references to RendererPS in backend_ps.
• PR #12800: documenting dtype of hist counts
• PR #12842: Fix message in nbagg connection_info()
• PR #12855: Cleanup axes/_base.py.
• PR #12826: Minor code cleanup
• PR #12866: Simplify stride calculations in loglocator.
• PR #12867: Drop compat code for outdated MSVC.
• PR #12218: Improve table docs
• PR #12847: correctly format ticklabels when EngFormatter is used with usetex = True
• PR #12851: Keep Collections and Patches property aliases in sync.
• PR #12849: Update docstrings in path.py, and small cleanups.
• PR #12805: Don’t insert spurious newlines by joining tex.preamble.
• PR #12827: Remove unused imports
• PR #12560: Add matplotlib.testing to the documentation
• PR #12821: MNT: remove debug from update_title_pos
• PR #12764: Cleanup Renderer/GraphicsContext docs.
• PR #12759: Warn on FreeType missing glyphs.
• PR #12799: Reword some colorbar docs.
• PR #12633: Added support for MacOSX backend for PyPy
• PR #12798: Replace assignments to array.shape by calls to reshape().
• PR #11851: Simpler check for whether a Framework Python build is being used.
• PR #12259: BUG: Fix face orientations of bar3d
• PR #12565: Make FontManager.score_weight less lenient.
• PR #12674: Allow “real” LaTeX code for pgf.preamble in matplotlibrc
• PR #12770: Simplify implementation of FontProperties.copy().
• PR #12753: MNT: remove _hold shims to support basemap + cartopy
• PR #12450: Attach a FigureCanvasBase by default to Figures.
• PR #12643: Allow unit input to FancyArrowPatch
• PR #12767: Make colorbars constructible with dataless ScalarMappables.
• PR #12526: Rename jquery files
• PR #12552: Update docs for writing image comparison tests.
• PR #12746: Use skipif, not xfail, for uncomparable image formats.
• PR #12747: Prefer log.warning(“%s”, ...) to log.warning(“%s” % ...).
• PR #11753: FIX: Apply aspect before drawing starts
• PR #12749: Move toolmanager warning from logging to warning.
• PR #12598: Support Cn colors with n>=10.
• PR #12727: Reorder API docs: separate file per module
• PR #12738: Add unobtrusive deprecation note to the first line of the docstring.
• PR #11663: Refactor color parsing of Axes.scatter
• PR #12736: Move deprecation note to end of docstring
• PR #12704: Rename tkinter import from Tk to tk.
• PR #12715: Cleanup dviread.
• PR #12717: Delete some if __name__ == "__main__" clauses.
• PR #10575: FIX patch.update_from to also copy _original_edge/facecolor
• PR #12537: Improve error message on failing test_pyplot_up_to_date
• PR #12721: Make get_scale_docs() internal
• PR #12706: Extend sphinx Makefile to cleanup completely
• PR #12481: Warn if plot_surface Z values contain NaN
• PR #12685: Make ticks in demo_axes_rgb.py visible
• PR #12523: Run flake8 before pytest on travis
• PR #12691: DOC: Link to “How to make a PR” tutorials as badge and in contributing
• PR #11974: Make code match comment in sankey.
• PR #12440: Make arguments to @deprecated/warn_deprecated keyword-only.
• PR #12470: Update AutoDateFormatter with locator
• PR #12586: Improve linestyles example
• PR #12006: Replace warnings.warn with cbook._warn_external or logging.warning
• PR #12659: Add note that developer discussions are private
• PR #12543: Make rcsetup.py flak8 compliant
• PR #12642: Don’t silence TypeErrors in fmt_{x,y}data.
• PR #12442: Deprecate passing drawstyle with linestyle as single string.
• PR #12625: Shorten some docstrings.
• PR #12627: Be a bit more stringent on invalid inputs.
• PR #12629: Fix issue with PyPy on macOS
• PR #10933: Remove “experimental” fontconfig font_manager backend.
• PR #12600: Minor style fixes.
• PR #12570: Fix mathtext tutorial for build with Sphinx 1.8.
• PR #12487: Update docs/tests for the deprecation of aname and label1On/label2On/etc.
• PR #12521: Improve docstring of draw_idle()
• PR #12574: Remove some unused imports
• PR #12568: Add note regarding builds of old Matplotlibs.
• PR #12547: Disable sticky edge accumulation if no autoscaling.
• PR #12546: Avoid quadratic behavior when accumulating stickies.
• PR #11789: endless looping GIFs with PillowWriter
• PR #12525: Fix some flake8 issues
• PR #12516: Don’t handle impossible values for align in hist()
• PR #12500: Adjust the widths of the messages during the build.
• PR #12492: Simplify radar_chart example.
• PR #11984: Strip out pkg-config machinery for agg and libqhull.
• PR #12463: Document Artist.cursor_data() parameter
• PR #12482: Test slider orientation
• PR #12317: Always install mpl_toolkits.
• PR #12246: Be less tolerant of broken installs.
• PR #12477: Use N{MICRO SIGN} instead of N{GREEK SMALL LETTER MU} in Eng-Formatter.
• PR #12483: Kill FontManager.update_fonts.
• PR #12474: Throw ValueError when irregularly gridded data is passed to streamplot.
• PR #12466: np.fromstring -> np.frombuffer.
• PR #12369: Improved exception handling on animation failure
• PR #12460: Deprecate RendererBase.strip_math.
• PR #12453: Rollback erroneous commit to whats_new.rst from #10746
• PR #12452: Minor updates to the FAQ.
• PR #10746: Adjusted matplotlib.widgets.Slider to have optional vertical orientatation
• PR #12441: Get rid of a signed-compare warning.
• PR #12430: Deprecate Axes3D.plot_surface(shade=None)
• PR #12435: Fix numpydoc parameter formatting
• PR #12434: Clarify documentation for textprops keyword parameter of TextArea
• PR #12427: Document Artist.get_cursor_data
• PR #10322: Use np.hypot wherever possible.
• PR #10809: Fix for scatter not showing points with valid x/y but invalid color
• PR #12423: Minor simplifications to backend_svg.
• PR #10356: fix detecting which artist(s) the mouse is over
• PR #10268: Dvi caching
• PR #10238: Call kpsewhich with more arguments at one time
• PR #10236: Cache kpsewhich results persistently
• PR #4675: Deprecate color keyword argument in scatter
• PR #5054: Diverging norm
• PR #12416: Move font cache rebuild out of exception handler
• PR #4762: Traitlets
• PR #5414: WIP: New FreeType wrappers
• PR #3875: ENH: passing colors (and other optional keyword arguments) to violinplot()
• PR #1959: PS backend optionally jpeg-compresses the embedded images
• PR #11891: Group some print()s in backend_ps.
• PR #12165: Remove deprecated mlab code
• PR #12387: Update HTML animation as slider is dragged
• PR #12333: ENH: add colorbar method to axes
• PR #10088: Deprecate Tick.{gridOn,tick1On,label1On,...} in favor of set_visible.
• PR #12393: Deprecate to-days converters in matplotlib dates
• PR #11232: FIX: fix figure.set_dpi when pixel ratio not 1
• PR #12247: Machinery for deprecating properties.
• PR #12371: Move check for ImageMagick Windows path to bin_path().
• PR #12384: Cleanup axislines style.
• PR #9565: Stem performance boost
• PR #12368: Don’t use stdlib private API in animation.py.
• PR #12351: dviread: find_tex_file: Ensure the encoding on windows
• PR #12372: Remove two examples.
• PR #12356: Fix stripping of CRLF on Windows.
• PR #12283: FIX: errorbar xywhere should return ndarray
• PR #12304: TST: Merge Qt tests into one file.
• PR #12340: Catch test deprecation warnings for mlab.demean
• PR #12296: Make FooConverter inherit from ConversionInterface in examples
• PR #12309: Deduplicate implementations of FooNorm.autoscale{,_None}
• PR #7716: [NF] Add `truncate` and `join` methods to colormaps.
• PR #12314: Deprecate axis('normal') in favor of axis('auto').
• PR #12307: Clarify missing-property error message.
• PR #12260: Fix docs : change from issue #12191, remove “if 1:” blocks in examples
• PR #12253: Handle utf-8 output by kpathsea on Windows.
• PR #12292: TST: Modify the bar3d test to show three more angles
• PR #12284: Don’t try to autoscale if no data present to autoscale to
• PR #12255: Deduplicate inherited docstrings.
• PR #12222: Remove extraneous if 1 statements in demo_axisline_style.py
• PR #12137: MAINT: Vectorize bar3d
• PR #12219: Merge OSXInstalledFonts into findSystemFonts.
• PR #12229: Less ACCEPTS, more numpydoc.
• PR #11621: TST: make E402 a universal flake8 ignore
• PR #12231: CI: Speed up Appveyor repository cloning
• PR #11661: Update blocking_input.py
• PR #12199: Allow disabling specific mouse actions in blocking_input
• PR #12210: Axes.tick_params() argument checking
• PR #12211: Fix typo
• PR #12200: Slightly clarify some invalid shape exceptions for image data.
• PR #12151: Don’t pretend @deprecated applies to classmethods.
• PR #12190: Remove some unused variables and imports
• PR #12192: Exclude examples from lgtm analysis
• PR #12196: Give Carreau the ability to mention the backport bot.
• PR #12171: Remove internal warning due to zsort deprecation
• PR #12030: Speed up canvas redraw for GTK3Agg backend.
• PR #12156: Cleanup the GridSpec demos.
• PR #12144: Add explicit getters and setters for Annotation.anncoords.
• PR #12152: Use _warn_external for deprecations warnings.
• PR #12147: DOC: update the gh_stats code
• PR #12139: Unbreak build re: mplot3d style.
• PR #11367: Raise TypeError on unsupported kwargs of spy()
• PR #9990: Fix and document lightsource argument in mplot3d
• PR #12124: Correctly infer units from empty arrays
• PR #11994: Cleanup unused variables and imports
• PR #12122: MNT: re-add chook import art3d
• PR #12086: FIX: make MaxNLocator only follow visible ticks for order of magnitude
• PR #12032: Remove unused imports
• PR #12093: Correct the removal of -Wstrict-prototypes from compiler flags.
• PR #12069: Style fixes for mplot3d.
• PR #11997: Cleanup some axes_grid1 examples
• PR #12098: Improve layout of HTML animation
• PR #12094: Fine-tune logging notes in contributing.rst.
• PR #12079: Clarifications to im_show() doc regarding interpolation=’none’.
• PR #12068: More style fixes.
• PR #11499: FIX: layout for mixed descent multiline text objects
• PR #11921: FIX: allow reshape 2-D to return a bare 1-d list
• PR #12070: Avoid some uses of np.isscalar.
• PR #12067: DOC: make Line2D docstring definition easier to find
• PR #12054: More style fixes.
• PR #12066: fix indentation in docstring interpolation for spy.
• PR #11931: Remove separate autosummary_inher template.
• PR #12049: Make Poly3DCollection.set_zsort less lenient.
• PR #12050: Various cleanups.
• PR #12038: Modernize ArtistInspector a bit...
• PR #12033: DOC: formatting fixes to mplot3d
• PR #12051: Is bool
• PR #12045: Fix 999.9... edge case in ticker.EngFormatter for negative numbers
• PR #12044: Update doc on the progressive and optimize keywords in savefig
• PR #12061: Small refactor/simplification.
• PR #12060: INSTALL.rst fixes
• PR #12055: Fix invalid escape in docstring.
• PR #12026: whitespace(-mostly) style cleanup.
• PR #12043: Deprecate get_py2exe_datafiles.
• PR #12046: Make HTMLWriter constructor a bit more strict.
• PR #12034: Doc markup fixes.
• PR #11972: FIX: close mem leak for repeated draw
• PR #12024: Fix typos
• PR #11996: Minor javascript cleanup
• PR #11989: Remove support for ghostscript 8.60.
• PR #12004: Update acorr and xcorr docs to match numpy docs
• PR #11998: No clf() needed after creating a figure
• PR #12001: Do not use an explicit figum in plt.figure(1, ...) in simple cases
• PR #11999: Do not use an explicit fignum plt.figure(1) in simple cases
• PR #11995: Don’t use bare except statements
• PR #11993: DOC: fixed typos
• PR #11992: Use pytest.warns instead of home-baked warnings capture.
• PR #11975: Derive plt.figlegend._doc__ from Figure.legend._doc__.
• PR #11980: Remove __version__numpy__; simplify dependencies check.
• PR #11982: Remove and old keyword documentation.
• PR #11981: Some extra typos
• PR #11979: Fix a couple of typos.
• PR #11959: cbook.iterable -> np.iterable.
• PR #11965: Move the removal of the -Wstrict-prototypes flag to setup.py.
• PR #11958: Remove unused code
• PR #11960: Make jpl_units a bit less painful to read.
• PR #11951: Improve Artist docstrings
• PR #11954: No need to define _log twice in matplotlib.dates.
• PR #11948: Minor fixes to docs and gitignore.
• PR #11777: Avoid incorrect warning in savefig
• PR #11942: Deprecate Artist.aname and Axes.aname
• PR #11935: Remove ginput demo example
• PR #11939: Improve alias signatures
• PR #11940: Do not use aliases of properties in internal code
• PR #11941: Fix test_large_subscript_title()
• PR #11938: More docstring cleanup of Line2D.
• PR #11920: Add LGTM.com code quality badge
• PR #11922: Improve docstrings of Line2D
• PR #11924: Minor formatting update on alias docstrings
• PR #11926: Minor fix to ginput_demo.
• PR #11912: BLD: update PR template for flake8
• PR #11909: Simplify linestyle and fillstyle reference docs.
• PR #11502: FIX: move title(s) up if subscripts hang too low.
• PR #11906: fix format of bar_of_pie example
• PR #11741: Factor out common code between Patch.draw and FancyArrowPatch.draw.
• PR #11784: Argument checking for grid()
• PR #11888: Factor out a subprocess log-and-check helper.
• PR #11740: Deprecate support for 3rd-party backends without set_hatch_color.
• PR #11884: Deprecate the tk_window_focus function.
• PR #11689: Don’t cache the renderer on the Axes instance.
• PR #11698: For property, use decorator or lambdas.
• PR #11872: Make all builtin cmaps picklable.
• PR #11870: More style fixes.
• PR #11873: Remove mention of deprecated/removed methods from mlab’s docstring.
• PR #11869: Style fixes.
• PR #11874: Remove some remnants of Py2-handling in test_rcparams.
• PR #11865: example file for making a bar of pie chart
• PR #11868: mathtext.py style fixes.
• PR #11854: Accept anything that’s not a directory for $MATPLOTLIBRC.
• PR #11589: WIP ENH secondary axes:
• PR #8449: Including Additional Metadata using the SVG Backend
• PR #11465: ENH: optimize Collection non-affine transform to call transform once

Issues (161):
• #4001: Qt5 Backend: dblclick is always False on ‘mouse_release_event’
• #14152: qt_compat.py performing wrong test for PyQt5
• #10875: Annotation.contains and FancyArrow.contains return incorrect values
• #458: JPG quality keyword in savefig
• #4354: scatter not showing valid x/y points with invalid color
• #14113: scatter could not raise when colors are provided but position data are empty
• #14003: numpydoc 0.9 breaks doc build
• #14054: ticks sometimes disappear when zooming interactively
• #10189: The data decorator does not integrate well with numpydoc
• #14034: pyplot plot raises ValueError when plotting NaN against datetime dates
• #14039: bar plot yerr lines/caps should respect zorder
• #14042: dynamic_image.py + saving animation broken
• #14013: osx backend not usable with ipython/jupyter from conda?
• #13993: Tests files installed by default?
• #13991: MaxNLocator.default_params deprecation may break Cartopy
• #5045: Axes.grid() not honoring specified “zorder” kwarg
• #4371: LaTeX and PGF preambles do not allow commas
• #13982: hist() no longer respects range=... when density=True
• #13963: Dataless colorbars break when updated
• #10381: Issue when setting scatter color in separate method call
• #13618: Minor ticklabels are missing at positions of major ticks.
• #13880: Adding documentation for Text.fontfamily default, set_fontfamily(None)?
• #13865: Appveyor broken
• #8636: plt.hist chooses improper range when using string-based bin options
• #7300: weird mathtext doc markup
• #8862: Replace mathcircled by textcircled
• #13759: DOC: matplotlib.patches.Arc
• #13785: Imshow gives values out of the extent
• #13786: Cannot import matplotlib.animation

7.1. Previous GitHub Stats
• #13561: Progress of animation.save (for long animations)
• #13735: title doesn’t move for ticklables....
• #12175: Example link near markevery in the “What’s new in 3.0” page is malformed/broken
• #13713: Boxplot xlim not correctly calculated
• #11070: Add a “density” kwarg to hist2d
• #11337: Cannot plot fully masked array against datetimes
• #10165: Adapt stem plot
• #10976: ENH: secondary axis for a x or y scale.
• #10763: Cairo in 2.2.0 not working for new backends
• #9737: setupext should not explicitly add /usr/{,local/}include to the include path
• #11217: Crash on zero-length FancyArrow
• #13623: do not cause warning in seaborn
• #13480: Segfault on help(‘modules’) command when matplotlib is installed
• #13604: legend’s framealpha kwarg does not apply when writing to an eps file
• #12311: ’off’ vs. False bug
• #10237: Setting an alpha value to a Poly3DCollection
• #11781: fill_between interpolation & nan issue
• #1077: 3d plots with aspect=’equal’
• #11761: Still naming inconsistency in API on axes limits
• #11623: Regression: “TypeError: Period(‘2000-12-31’, ‘D’) is not a string” when a Series with date index was plotted
• #12655: auto-ticks do not handle values near bounds gracefully
• #13487: labellpad is not the spacing between the axis and the label
• #13540: Docs for matplotlib.pyplot.specgram() reference an unsupported mode setting
• #8997: Proposal: Grid arrangement by number of plots
• #6928: Cannot run setup.py build with numpy master
• #12697: Axes are drawn at wrong positions
• #13478: FuncAnimation: interactive zoom/pan with blitting does not work
• #11575: Setting axis ticks in log scale produces duplicate tick labels.
• #13464: set_rlim(bottom=...) no longer works
• #12628: Write canonical example of how to use Matplotlib inside a webserver
• #10022: boxplot: positions used to take Int64Index
• #11647: Disable buttons in ginput
• #12987: issues parsing AFM fonts
• #12667: Colorbar ticks....
• #13137: Travis for Python 3.7 sometimes fails due to missing font
• #7969: Stem is slow and will crash if I try to close the window
• #13002: Hist color kwarg broken for multiple empty datasets
• #5581: [mpl_toolkits] Things drawn on parasite axes don’t fire pick events
• #13417: Secondary axis doesn’t resize properly
• #8120: Inconsistent inset_axes position between show(), savefig(format=’png’) and savefig(format=’pdf’)
• #8947: Different result, slower runtime of heatmap between 2.0.0 and 2.0.1
• #13264: Use of logging in matplotlib
• #11602: animation error
• #12925: Python pandas datetime plot xticks in unexpected location
• #11025: AxesGrid ticks missing on x-axis
• #10974: Examples not shown in API docs for many methods.
• #13392: boxplot broken for empty inputs
• #12345: Need more tests for units and errorbar
• #10361: FigureCanvas.draw() with tight_layout() needs to be called twice with Matplotlib 2.1.0
• #11376: Temporary styling ignores color cycle

• #11508: bi-directional perceptually flat colormaps in matplotlib?
• #12918: Mac shows an icon in the dock when using matplotlib.pyplot.
• #13339: Log Colorbar minorticks_off reverted if ticks set...
• #13228: MPL 3 + Colorbar + PowerNorm bug
• #13096: Matplotlib.get_backend()/matplotlib.use() cause NSException with Anaconda
• #7712: Number of ticks for dates still gives overlapping labels
• #9978: General poor default formatting of datetimes on plot x-axis
• #13253: imsave outputs JPEG with wrong dimension
• #11391: Use data argument for scatter plotting timestamps from pandas
• #13145: widgets.RadioButtons: select by closest in position
• #13267: “double-pendulum” example’s speed not correct / varying
• #13257: Allow turning off minorticks for Colorbar with LogNorm?
• #13237: Sankey basic gallery example is not rendered properly.
• #12836: matplotlib.rc_file resets to default template before updating rcparams
• #13186: ax.bar throws when x axis is pandas datetime
• #5397: Expose compression and filter PNG options through savefig
• #13142: Cannot plot bar graph with dates: “TypeError: ufunc subtract cannot use operands with types dtype(‘<M8[ns]’) and dtype(‘float64’)”
• #8530: Feature request: TIFF LZW compression support in savefig()
• #13139: font family ['serif'] not found. Falling back to DejaVu Sans
• #1558: Graceful handling of a numpy matrix
• #12954: Fonts installed in the user directory are not detected (Windows 1809)
• #3644: Feature Request: manually set colorbar without mappable
• #12862: broken_barh appears not to work with datetime/timedelta objects
• #11290: ax.bar doesn’t work correctly when width is a timedelta64 object
• #13156: DOC: matplotlib.pyplot.arrow
• #12990: Unclear error message for plt.xticks(names)
• #12769: Failing to save an animated graph with matplotlib.animation
• #13112: LogNorm colorbar prints double tick labels after set_ticks()
• #13132: BUG: matplotlib.sphinxext.plot_directive uses old function-based API
• #8528: Funcanimation memory leak?
• #8914: line3D set_data only takes in x and y data
• #8768: One one tick in a log-scale axis
• #13121: Tests fail with pytest 4.1
• #13098: Likely incorrect code(?) in colorbar.py
• #12562: Clean up unused imports
• #12106: plt.plot does not plot anything with named arguments
• #5145: Python [Error 17]No usable Temporary file name found
• #13012: qt5agg image quality changes when window is out of focus
• #13055: 127.0.0.1 hardcoded in webagg backend server
• #12971: Pandas Series not supported as data kwarg
• #13022: boxplot not showing symbols with seaborn style sheet
• #13028: Bad rotation_mode/center_baseline combination even if rotation=0
• #12745: Sphinx copy button for code block
• #12801: scatter() should not drop data points at nonfinite coordinates
• #12358: Dropping support for Py3.5 and numpy 1.10
• #12994: Axes range with set_xticks with categorical
• #12993: Semantics of set_xticks for categorical
• #12946: ~ in mathrm leads to Unknown symbol: mathrm
• #10704: Add documentation for set_rlim
• #11202: Using of ax.set_ylim() for polar plot leads to “posx and posy should be finite values” error
• #12859: DeprecationWarning: NewId() is deprecated in wxPython.
• #12817: Multiple places where Type Errors on cbook.warn_deprecated will happen
• #12308: #12253 FIX: Handle utf-8 output by kpathsea on Windows – possibly causing issues
• #12804: Usetex produces preamble with one character per line
• #12808: Issue with minor tick spacing in colorbar with custom Normalize class
• #12138: Faces of Axes3d.bar3d are not oriented correctly
• #12591: Adding FancyArrowPatch with datetime coordinates fails
• #11139: ”make clean” doesn’t remove all the build doc files
• #11908: Improve linestyle documentation
• #10643: Most warnings calls do not set the stacklevel
• #12532: Incorrect rendering of math symbols
• #11787: Looping gifs with PillowWriter
• #9205: after the animation encoder (e.g. ffmpeg) fails, the animation framework itself fails internally in various ways while trying to report the error
• #11154: Unexpected behavior for Axes3D.plot_surface(shade=None)
• #12121: Documentation of TextArea’s fontprops keyword argument is misleading
• #12191: ”if 1:” blocks in examples
• #12107: warnings re: deprecated pytest API with pytest 3.8
• #12010: Popover over plot is very slow
• #12118: Scatter: empty np.arrays with non-numeric dtypes cause TypeError
• #12072: MaxNLocator changes the scientific notation exponent with different number of tick labels
• #11795: Un-align animations created with to_jshtml()?
• #10201: Available fonts are ignored by font_manager
• #12065: Keyword interpolation behaving improperly while saving to SVG with savefig()
• #11498: Test layout with big descenders and multiple lines inconsistent.
• #11468: Layout managers have problems with titles containing MathText
• #11899: Histogram of list of datetimes
• #11956: apparent memory leak with live plotting
• #11587: Missing filled contours when using contourf
• #11716: errorbar pickling fails when specifying y error bars
• #11557: Hoping add a drawing function ‘patch’ in matplotlib

7.1.3 GitHub Stats for Matplotlib 3.1.1

GitHub stats for 2019/05/18 - 2019/06/30 (tag: v3.1.0)
These lists are automatically generated, and may be incomplete or contain duplicates.
We closed 30 issues and merged 120 pull requests. The full list can be seen on GitHub
The following 30 authors contributed 323 commits.
• Adam Gomaa
• Antony Lee
• Ben Root
• Christer Jensen
• chuanzhu xu
• David Stansby
• Deng Tian

• Tim Hoffmann

GitHub issues and pull requests:

Pull Requests (120):

• **PR #14636**: Don’t capture stderr in _check_and_log_subprocess.
• **PR #14655**: Backport PR #14649 on branch v3.1.x (Fix appveyor conda py37)
• **PR #14649**: Fix appveyor conda py37
• PR #14646: Backport PR #14640 on branch v3.1.x (FIX: allow secondary axes to be non-linear)
• PR #14640: FIX: allow secondary axes to be non-linear
• PR #14643: Second attempt at fixing axis inversion (for mpl3.1).
• PR #14623: Fix axis inversion with loglocator and logitlocator.
• PR #14619: Backport PR #14598 on branch v3.1.x (Fix inversion of shared axes.)
• PR #14621: Backport PR #14613 on branch v3.1.x (Cleanup DateFormatter docstring.)
• PR #14622: Backport PR #14611 on branch v3.1.x (Update some axis docstrings.)
• PR #14611: Update some axis docstrings.
• PR #14613: Cleanup DateFormatter docstring.
• PR #14598: Fix inversion of shared axes.
• PR #14610: Backport PR #14579 on branch v3.1.x (Fix inversion of 3d axis.)
• PR #14579: Fix inversion of 3d axis.
• PR #14600: Backport PR #14599 on branch v3.1.x (DOC: Add numpngw to third party packages.)
• PR #14574: Backport PR #14568 on branch v3.1.x (Don’t assume tk canvas have a manager attached.)
• PR #14568: Don’t assume tk canvas have a manager attached.
• PR #14571: Backport PR #14566 on branch v3.1.x (Move setting of AA_EnableHighDpiScaling before creating QApplication.)
• PR #14566: Move setting of AA_EnableHighDpiScaling before creating QApplication.
• PR #14541: Backport PR #14535 on branch v3.1.x (Invalidate FT2Font cache when fork(ing).)
• PR #14535: Invalidate FT2Font cache when fork(ing).
• PR #14522: Backport PR #14040 on branch v3.1.x (Gracefully handle non-finite z in tricontour (issue #10167))
• PR #14434: Backport PR #14296 on branch v3.1.x (Fix barbs to accept array of bool for flip_barb)
• PR #14518: Backport PR #14509 on branch v3.1.x (Fix too large icon spacing in Qt5 on non-HiDPI screens)
• PR #14509: Fix too large icon spacing in Qt5 on non-HiDPI screens
• PR #14514: Backport PR #14256 on branch v3.1.x (Improve docstring of Axes.barbs)
• PR #14256: Improve docstring of Axes.barbs
• PR #14505: Backport PR #14395 on branch v3.1.x (MAINT: work around non-zero exit status of "pdftops -v" command.)
• PR #14504: Backport PR #14445 on branch v3.1.x (FIX: fastpath clipped artists)
• PR #14502: Backport PR #14451 on branch v3.1.x (FIX: return points rather than path to fix regression)
• PR #14445: FIX: fastpath clipped artists
• PR #14497: Backport PR #14491 on branch v3.1.x (Fix uses of PyObject_IsTrue.)
• PR #14491: Fix uses of PyObject_IsTrue.
• PR #14492: Backport PR #14490 on branch v3.1.x (Fix links of parameter types)
• PR #14490: Fix links of parameter types
• PR #14489: Backport PR #14459 on branch v3.1.x (Cleanup docstring of DraggableBase.)
• PR #14459: Cleanup docstring of DraggableBase.
• PR #14485: Backport #14429 on v3.1.x
• PR #14486: Backport #14403 on v3.1.
• PR #14429: FIX: if the first elements of an array are masked keep checking
• PR #14481: Backport PR #14475 on branch v3.1.x (change ginoput docstring to match behavior)
• PR #14482: Backport PR #14464 on branch v3.1.x (Mention origin and extent tutorial in API docs for origin kwarg)
• PR #14464: Mention origin and extent tutorial in API docs for origin kwarg
• PR #14468: Backport PR #14449: Improve docs on gridspec
• PR #14475: change ginoput docstring to match behavior
• PR #14477: Backport PR #14461 on branch v3.1.x (Fix out of bounds read in backend_tk.)
• PR #14476: Backport PR #14474 on branch v3.1.x (Fix default value in docstring of errorbar func)
• PR #14461: Fix out of bounds read in backend_tk.
• PR #14474: Fix default value in docstring of errorbar func
• PR #14473: Backport PR #14472 on branch v3.1.x (Fix NameError in example code for setting label via method)
• PR #14472: Fix NameError in example code for setting label via method
• PR #14449: Improve docs on gridspec
• PR #14450: Backport PR #14422 on branch v3.1.x (Fix ReST note in span selector example)
• PR #14446: Backport PR #14438 on branch v3.1.x (Issue #14372 - Add degrees to documentation)
• PR #14438: Issue #14372 - Add degrees to documentation
• PR #14437: Backport PR #14387 on branch v3.1.x (Fix clearing rubberband on nbagg)
• PR #14387: Fix clearing rubberband on nbagg
• PR #14435: Backport PR #14425 on branch v3.1.x (Lic restore license paint)
• PR #14296: Fix barbs to accept array of bool for flip_barb
• PR #14430: Backport PR #14397 on branch v3.1.x (Correctly set clip_path on pcolorfast return artist.)
• PR #14397: Correctly set clip_path on pcolorfast return artist.
• PR #14409: Backport PR #14335 on branch v3.1.x (Add explanation of animation.embed_limit to matplotlibrc.template)
• PR #14335: Add explanation of animation.embed_limit to matplotlibrc.template
• PR #14403: Revert “Preserve whitespace in svg output.”
• PR #14407: Backport PR #14406 on branch v3.1.x (Remove extra iint in math_symbol_table for document)
• PR #14398: Backport PR #14394 on branch v3.1.x (Update link to “MathML torture test”)
• PR #14394: Update link to “MathML torture test”.
• PR #14389: Backport PR #14388 on branch v3.1.x (Fixed one little spelling error)
• PR #14385: Backport PR #14316 on branch v3.1.x (Improve error message for kiwisolver import error (DLL load failed))
• PR #14388: Fixed one little spelling error
• PR #14384: Backport PR #14369 on branch v3.1.x (Don’t use deprecated mathcircled in docs.)
• PR #14316: Improve error message for kiwisolver import error (DLL load failed)
• PR #14369: Don’t use deprecated mathcircled in docs.
• PR #14375: Backport PR #14374 on branch v3.1.x (Check that the figure patch is in bbox_artists before trying to remove.)
• PR #14374: Check that the figure patch is in bbox_artists before trying to remove.
• PR #14040: Gracefully handle non-finite z in tricontour (issue #10167)
• PR #14342: Backport PR #14326 on branch v3.1.x (Correctly apply PNG palette when building ImageBase through Pillow.)
• PR #14326: Correctly apply PNG palette when building ImageBase through Pillow.
• PR #14341: Backport PR #14337 on branch v3.1.x (Docstring cleanup)
• PR #14337: Docstring cleanup
• PR #14325: Backport PR #14126 on branch v3.1.x (Simplify grouped bar chart example)
• PR #14324: Backport PR #14139 on branch v3.1.x (TST: be more explicit about identifying qt4/qt5 imports)
• PR #14126: Simplify grouped bar chart example
• PR #14323: Backport PR #14290 on branch v3.1.x (Convert SymmetricalLogScale to numpydoc)
• PR #14139: TST: be more explicit about identifying qt4/qt5 imports
• PR #14290: Convert SymmetricalLogScale to numpydoc
• PR #14321: Backport PR #14313 on branch v3.1.x
• PR #14313: Support masked array inputs for to_rgba and to_rgba_array.
• PR #14320: Backport PR #14319 on branch v3.1.x (Don’t set missing history buttons.)
• PR #14319: Don’t set missing history buttons.
• PR #14317: Backport PR #14295: Fix bug in SymmetricalLogTransform.
Matplotlib, Release 3.3.0

• PR #14302: Backport PR #14255 on branch v3.1.x (Improve docsstring of Axes.streamplot)
• PR #14255: Improve docsstring of Axes.streamplot
• PR #14295: Fix bug in SymmetricalLogTransform.
• PR #14294: Backport PR #14282 on branch v3.1.x (Fix toolmanager’s destroy subplots in tk)
• PR #14282: Fix toolmanager’s destroy subplots in tk
• PR #14292: Backport PR #14289 on branch v3.1.x (BUG: Fix performance regression when plotting values from Numpy array sub-classes)
• PR #14289: BUG: Fix performance regression when plotting values from Numpy array sub-classes
• PR #14287: Backport PR #14286 on branch v3.1.x (fix minor typo)
• PR #14284: Backport PR #14279 on branch v3.1.x (In case fallback to Agg fails, let the exception propagate out.)
• PR #14254: Merge up 30x
• PR #14279: In case fallback to Agg fails, let the exception propagate out.
• PR #14268: Backport PR #14261 on branch v3.1.x (Updated polar documentation)
• PR #14261: Updated polar documentation
• PR #14264: Backport PR #14260 on branch v3.1.x (Remove old OSX FAQ page)
• PR #14260: Remove old OSX FAQ page
• PR #14249: Backport PR #14243 on branch v3.1.x (Update docstring of makeMappingArray)
• PR #14250: Backport PR #14149 on branch v3.1.x
• PR #14252: Backport PR #14248 on branch v3.1.x (Fix TextBox not respecting events)
• PR #14253: Backport PR #13596 on branch v3.1.x (Normalize properties passed to bxp().)
• PR #14251: Backport PR #14241 on branch v3.1.x (Fix linear segmented colormap with one element)
• PR #13596: Normalize properties passed to bxp().
• PR #14248: Fix TextBox not respecting events
• PR #14241: Fix linear segmented colormap with one element
• PR #14243: Update docstring of makeMappingArray
• PR #14238: Backport PR #14164 on branch v3.1.x (Fix regexp for dvipng version detection)
• PR #14149: Avoid using axis([xlo, xhi, ylo, yhi]) in examples.
• PR #14164: Fix regexp for dvipng version detection
• PR #13739: Fix pressing tab breaks keymap in CanvasTk

Issues (30):
• #14620: Plotting on a log/logit scale overwrites axis inverting
• #14615: Inverting an axis using its limits does not work for log scale
• #14577: Calling `invert_yaxis()` on a 3D plot has either no effect or removes ticks
• #14602: `NavigationToolbar2Tk` save_figure function bug
• #1219: Show fails on figures created with the object-oriented system
• #10167: Segmentation fault with tricontour
• #13723: `RuntimeError` when saving PDFs via parallel processes (not threads!)
• #14315: Improvement: Better error message if `kiwisolver` fails to import
• #14356: `matplotlib.units.ConversionError` on scatter of dates with a NaN in the first position
• #14467: Docs for `plt.ginput()` have the wrong default value for `show_clicks` keyword argument.
• #14225: Matplotlib crashes on windows while maximizing plot window when using Multicursor
• #14458: DOC: small inconsistency in `errobar` docstring
• #14372: Document that `view_init()` arguments should be in degrees
• #12201: issues clearing rubberband on `nbagg` at non-default browser zoom
• #13576: `pcolorfast` misbehaves when changing axis limits
• #14303: Unable to import `matplotlib` on Windows 10 v1903
• #14283: `RendererSVG` CSS ‘white-space’ property conflicts with default HTML CSS
• #14293: `imshow()` producing “inverted” colors since 3.0.3
• #14322: Cannot import `matplotlib` with Python 3.7.x on Win10Pro
• #14137: Qt5 test auto-skip is not working correctly
• #14301: `scatter()` fails on nan-containing input when providing `edgecolor`
• #14318: Don’t try to set missing history buttons.
• #14265: `symlog` looses some points since 3.1.0 (example given)
• #14274: BUG: plotting with Numpy array subclasses is slow with Matplotlib 3.1.0 (regression)
• #14263: import pyplot issue -
• #14227: Update “working with Mpl on OSX” docs
• #13448: boxplot doesn’t normalize properties before applying them
• #14226: Modify `matplotlib` `TextBox` value without triggering callback
• #14232: `LinearSegmentedColormap` with N=1 gives confusing error message
• #10365: Scatter plot with non-sequence ‘c’ color should give a better Error message.

7.1.4 GitHub Stats for Matplotlib 3.1.2

GitHub stats for 2019/05/18 - 2019/06/30 (tag: v3.1.0)
These lists are automatically generated, and may be incomplete or contain duplicates.
We closed 30 issues and merged 120 pull requests. The full list can be seen on GitHub.

Pull Requests (120):

- **PR #14636**: Don’t capture stderr in _check_and_log_subprocess.
- **PR #14655**: Backport PR #14649 on branch v3.1.x (Fix appveyor conda py37)
• PR #14649: Fix appveyor conda py37
• PR #14646: Backport PR #14640 on branch v3.1.x (FIX: allow secondary axes to be non-linear)
• PR #14640: FIX: allow secondary axes to be non-linear
• PR #14643: Second attempt at fixing axis inversion (for mpl3.1).
• PR #14623: Fix axis inversion with loglocator and logitlocator.
• PR #14619: Backport PR #14598 on branch v3.1.x (Fix inversion of shared axes.)
• PR #14621: Backport PR #14613 on branch v3.1.x (Cleanup DateFormatter docstring.)
• PR #14622: Backport PR #14611 on branch v3.1.x (Update some axis docstrings.)
• PR #14611: Update some axis docstrings.
• PR #14613: Cleanup DateFormatter docstring.
• PR #14598: Fix inversion of shared axes.
• PR #14610: Backport PR #14579 on branch v3.1.x (Fix inversion of 3d axis.)
• PR #14579: Fix inversion of 3d axis.
• PR #14600: Backport PR #14599 on branch v3.1.x (DOC: Add numpngw to third party packages.)
• PR #14574: Backport PR #14566 on branch v3.1.x (Move setting of AA_EnableHighDpiScaling before creating QApplication.)
• PR #14566: Move setting of AA_EnableHighDpiScaling before creating QApplication.
• PR #14541: Backport PR #14535 on branch v3.1.x (Invalidate FT2Font cache when fork(jing).)
• PR #14535: Invalidate FT2Font cache when fork(jing).
• PR #14522: Backport PR #14040 on branch v3.1.x (Gracefully handle non-finite z in tricontour (issue #10167))
• PR #14434: Backport PR #14296 on branch v3.1.x (Fix barbs to accept array of bool for flip_barb)
• PR #14518: Backport PR #14509 on branch v3.1.x (Fix too large icon spacing in Qt5 on non-HiDPI screens)
• PR #14509: Fix too large icon spacing in Qt5 on non-HiDPI screens
• PR #14514: Backport PR #14256 on branch v3.1.x (Improve docstring of Axes.barbs)
• PR #14256: Improve docstring of Axes.barbs
• PR #14505: Backport PR #14395 on branch v3.1.x (MAINT: work around non-zero exit status of “pdftops -v” command.)
• PR #14504: Backport PR #14445 on branch v3.1.x (FIX: fastpath clipped artists)
• PR #14502: Backport PR #14451 on branch v3.1.x (FIX: return points rather than path to fix regression)
• PR #14445: FIX: fastpath clipped artists
• PR #14497: Backport PR #14491 on branch v3.1.x (Fix uses of PyObject_IsTrue.)
• PR #14491: Fix uses of PyObject_IsTrue.
• PR #14492: Backport PR #14490 on branch v3.1.x (Fix links of parameter types)
• PR #14490: Fix links of parameter types
• PR #14489: Backport PR #14459 on branch v3.1.x (Cleanup docstring of DraggableBase.)
• PR #14459: Cleanup docstring of DraggableBase.
• PR #14485: Backport #14429 on v3.1.x
• PR #14486: Backport #14403 on v3.1.
• PR #14429: FIX: if the first elements of an array are masked keep checking
• PR #14481: Backport PR #14475 on branch v3.1.x (change ginoput docstring to match behavior)
• PR #14482: Backport PR #14464 on branch v3.1.x (Mention origin and extent tutorial in API docs for origin kwarg)
• PR #14464: Mention origin and extent tutorial in API docs for origin kwarg
• PR #14468: Backport PR #14449: Improve docs on gridspec
• PR #14475: change ginoput docstring to match behavior
• PR #14477: Backport PR #14461 on branch v3.1.x (Fix out of bounds read in backend_tk.)
• PR #14476: Backport PR #14474 on branch v3.1.x (Fix default value in docstring of errorbar func)
• PR #14461: Fix out of bounds read in backend_tk.
• PR #14474: Fix default value in docstring of errorbar func
• PR #14473: Backport PR #14472 on branch v3.1.x (Fix NameError in example code for setting label via method)
• PR #14472: Fix NameError in example code for setting label via method
• PR #14449: Improve docs on gridspec
• PR #14450: Backport PR #14422 on branch v3.1.x (Fix ReST note in span selector example)
• PR #14446: Backport PR #14438 on branch v3.1.x (Issue #14372 - Add degrees to documentation)
• PR #14438: Issue #14372 - Add degrees to documentation
• PR #14437: Backport PR #14387 on branch v3.1.x (Fix clearing rubberband on nbagg)
• PR #14387: Fix clearing rubberband on nbagg
• PR #14435: Backport PR #14425 on branch v3.1.x (Lic restore license paint)
• PR #14296: Fix barbs to accept array of bool for flip_barb
• PR #14430: Backport PR #14397 on branch v3.1.x (Correctly set clip_path on pcolorfast return artist.)
• PR #14397: Correctly set clip_path on pcolorfast return artist.
• PR #14409: Backport PR #14335 on branch v3.1.x (Add explanation of animation.embed_limit to matplotlibrc.template)
• PR #14335: Add explanation of animation.embed_limit to matplotlibrc.template
• PR #14403: Revert “Preserve whitespace in svg output.”
• PR #14407: Backport PR #14406 on branch v3.1.x (Remove extra iint in math_symbol_table for document)
• PR #14398: Backport PR #14394 on branch v3.1.x (Update link to “MathML torture test”.)
• PR #14394: Update link to “MathML torture test”.
• PR #14389: Backport PR #14388 on branch v3.1.x (Fixed one little spelling error)
• PR #14385: Backport PR #14316 on branch v3.1.x (Improve error message for kiwisolver import error (DLL load failed))
• PR #14388: Fixed one little spelling error
• PR #14384: Backport PR #14369 on branch v3.1.x (Don’t use deprecated mathcircled in docs.)
• PR #14316: Improve error message for kiwisolver import error (DLL load failed)
• PR #14369: Don’t use deprecated mathcircled in docs.
• PR #14375: Backport PR #14374 on branch v3.1.x (Check that the figure patch is in bbox_artists before trying to remove.)
• PR #14374: Check that the figure patch is in bbox_artists before trying to remove.
• PR #14040: Gracefully handle non-finite z in tricontour (issue #10167)
• PR #14342: Backport PR #14326 on branch v3.1.x (Correctly apply PNG palette when building ImageBase through Pillow.)
• PR #14326: Correctly apply PNG palette when building ImageBase through Pillow.
• PR #14341: Backport PR #14337 on branch v3.1.x (Docstring cleanup)
• PR #14337: Docstring cleanup
• PR #14325: Backport PR #14126 on branch v3.1.x (Simplify grouped bar chart example)
• PR #14324: Backport PR #14139 on branch v3.1.x (TST: be more explicit about identifying qt4/qt5 imports)
• PR #14126: Simplify grouped bar chart example
• PR #14323: Backport PR #14290 on branch v3.1.x (Convert SymmetricalLogScale to numpydoc)
• PR #14139: TST: be more explicit about identifying qt4/qt5 imports
• PR #14290: Convert SymmetricalLogScale to numpydoc
• PR #14321: Backport PR #14313 on branch v3.1.x
• PR #14313: Support masked array inputs for to_rgba and to_rgba_array.
• PR #14320: Backport PR #14319 on branch v3.1.x (Don’t set missing history buttons.)
• PR #14319: Don’t set missing history buttons.

7.1. Previous GitHub Stats 515
• PR #14317: Backport PR #14295: Fix bug in SymmetricalLogTransform.
• PR #14302: Backport PR #14255 on branch v3.1.x (Improve docsstring of Axes.streamplot)
• PR #14255: Improve docsstring of Axes.streamplot
• PR #14295: Fix bug in SymmetricalLogTransform.
• PR #14294: Backport PR #14282 on branch v3.1.x (Fix toolmanager’s destroy subplots in tk)
• PR #14282: Fix toolmanager’s destroy subplots in tk
• PR #14292: Backport PR #14289 on branch v3.1.x (BUG: Fix performance regression when plotting values from Numpy array sub-classes)
• PR #14289: BUG: Fix performance regression when plotting values from Numpy array sub-classes
• PR #14287: Backport PR #14286 on branch v3.1.x (fix minor typo)
• PR #14284: Backport PR #14279 on branch v3.1.x (In case fallback to Agg fails, let the exception propagate out.)
• PR #14254: Merge up 30x
• PR #14279: In case fallback to Agg fails, let the exception propagate out.
• PR #14268: Backport PR #14261 on branch v3.1.x (Updated polar documentation)
• PR #14261: Updated polar documentation
• PR #14264: Backport PR #14260 on branch v3.1.x (Remove old OSX FAQ page)
• PR #14260: Remove old OSX FAQ page
• PR #14249: Backport PR #14243 on branch v3.1.x (Update docstring of makeMappingArray)
• PR #14250: Backport PR #14149 on branch v3.1.x
• PR #14252: Backport PR #14248 on branch v3.1.x (Fix TextBox not respecting eventson)
• PR #14253: Backport PR #13596 on branch v3.1.x (Normalize properties passed to bxp().)
• PR #14251: Backport PR #14241 on branch v3.1.x (Fix linear segmented colormap with one element)
• PR #13596: Normalize properties passed to bxp().
• PR #14248: Fix TextBox not respecting eventson
• PR #14241: Fix linear segmented colormap with one element
• PR #14243: Update docstring of makeMappingArray
• PR #14238: Backport PR #14164 on branch v3.1.x (Fix regexp for dvipng version detection)
• PR #14149: Avoid using axis([xlo, xhi, ylo, yhi]) in examples.
• PR #14164: Fix regexp for dvipng version detection
• PR #13739: Fix pressing tab breaks keymap in CanvasTk

Issues (30):
• #14620: Plotting on a log/logit scale overwrites axis inverting
• #14615: Inverting an axis using its limits does not work for log scale
• #14577: Calling invert_yaxis() on a 3D plot has either no effect or removes ticks
• #14602: NavigationToolbar2Tk save_figure function bug
• #1219: Show fails on figures created with the object-oriented system
• #10167: Segmentation fault with tricontour
• #13723: RuntimeError when saving PDFs via parallel processes (not threads!)
• #14315: Improvement: Better error message if kiwisolver fails to import
• #14356: matplotlib.units.ConversionError on scatter of dates with a NaN in the first position
• #14467: Docs for plt.ginput() have the wrong default value for show_clicks keyword argument.
• #14225: Matplotlib crashes on windows while maximizing plot window when using Multicursor
• #14458: DOC: small inconsistency in errobar docstring
• #14372: Document that view_init() arguments should be in degrees
• #12201: issues clearing rubberband on nbagg at non-default browser zoom
• #13576: pcolorfast misbehaves when changing axis limits
• #14303: Unable to import matplotlib on Windows 10 v1903
• #14283: RendererSVG CSS ‘white-space’ property conflicts with default HTML CSS
• #14293: imshow() producing “inverted” colors since 3.0.3
• #14322: Cannot import matplotlib with Python 3.7.x on Win10Pro
• #14137: Qt5 test auto-skip is not working correctly
• #14301: scatter() fails on nan-containing input when providing edgecolor
• #14318: Don’t try to set missing history buttons.
• #14265: symlog looses some points since 3.1.0 (example given)
• #14274: BUG: plotting with Numpy array subclasses is slow with Matplotlib 3.1.0 (regression)
• #14263: import pyplot issue -
• #14227: Update “working with Mpl on OSX” docs
• #13448: boxplot doesn’t normalize properties before applying them
• #14226: Modify matplotlib TextBox value without triggering callback
• #14232: LinearSegmentedColormap with N=1 gives confusing error message
• #10365: Scatter plot with non-sequence ‘c’ color should give a better Error message.
7.1.5 GitHub Stats for Matplotlib 3.2.0

GitHub stats for 2019/05/18 - 2020/03/03 (tag: v3.1.0)
These lists are automatically generated, and may be incomplete or contain duplicates.
We closed 125 issues and merged 839 pull requests. The full list can be seen on GitHub.
The following 164 authors contributed 3455 commits.

- Abhinav Sagar

GitHub issues and pull requests:

Pull Requests (839):

- **PR #16626**: Updated Readme + Setup.py for PyPa
- **PR #16627**: ci: Restore nuget install step on Azure for v3.2.x.
- **PR #16625**: v3.2.x: Make Azure use local FreeType.
- **PR #16622**: Backport PR #16613 on branch v3.2.x (Fix edge-case in preprocess_data, if label_namer is optional and unset.)
- **PR #16613**: Fix edge-case in preprocess_data, if label_namer is optional and unset.
- **PR #16612**: Backport PR #16605: CI: tweak the vm images we use on azure
- **PR #16611**: Backport PR #16585 on branch v3.2.x (Fix _preprocess_data for Py3.9.)
- **PR #16605**: CI: tweak the vm images we use on azure
• PR #16585: Fix _preprocess_data for Py3.9.
• PR #16518: Backport PR #16502 on branch v3.2.x (Document theta getters/setters)
• PR #16519: Backport PR #16513 on branch v3.2.x (Add more FreeType tarball hashes.)
• PR #16513: Add more FreeType tarball hashes.
• PR #16502: Document theta getters/setters
• PR #16506: Backport PR #16505 on branch v3.2.x (Add link to blog to front page)
• PR #16505: Add link to blog to front page
• PR #16480: Re-phrase doc for bottom kwarg to hist
• PR #16494: Backport PR #16490 on branch v3.2.x (Fix some typos on the front page)
• PR #16489: Backport PR #16272 on branch v3.2.x (Move mplot3d autoregistration api changes to 3.2.)
• PR #16490: Fix some typos on the front page
• PR #16465: Backport PR #16450 on branch v3.2.x (Fix interaction between sticky_edges and shared axes.)
• PR #16466: Backport PR #16392: FIX colorbars for Norms that do not have a scale.
• PR #16392: FIX colorbars for Norms that do not have a scale.
• PR #16450: Fix interaction between sticky_edges and shared axes.
• PR #16453: Backport PR #16452 on branch v3.2.x (Don’t make InvertedLogTransform inherit from deprecated base class.)
• PR #16452: Don’t make InvertedLogTransform inherit from deprecated base class.
• PR #16436: Backport PR #16435 on branch v3.2.x (Reword intro to colors api docs.)
• PR #16435: Reword intro to colors api docs.
• PR #16399: Backport PR #16396 on branch v3.2.x (font_manager docs cleanup.)
• PR #16396: font_manager docs cleanup.
• PR #16397: Backport PR #16394 on branch v3.2.x (Mark inkscape 1.0 as unsupported (at least for now.).)
• PR #16394: Mark inkscape 1.0 as unsupported (at least for now).
• PR #16286: Fix cbars for different norms
• PR #16385: Backport PR #16226 on branch v3.2.x: Reorganize intro section on main page
• PR #16383: Backport PR #16379 on branch v3.2.x (FIX: catch on message content, not module)
Matplotlib, Release 3.3.0

- PR #16226: Reorganize intro section on main page
- PR #16364: Backport PR #16344 on branch v3.2.x (Cast vmin/vmax to floats before nonsingular-expanding them.)
- PR #16344: Cast vmin/vmax to floats before nonsingular-expanding them.
- PR #16360: Backport PR #16347 on branch v3.2.x (FIX: catch warnings from pandas in cbook_check_1d)
- PR #16357: Backport PR #16330 on branch v3.2.x (Clearer signal handling)
- PR #16349: Backport PR #16255 on branch v3.2.x (Move version info to sidebar)
- PR #16346: Backport PR #16298 on branch v3.2.x (Don’t recursively call draw_idle when updating artists at draw time.)
- PR #16331: Backport PR #16308 on branch v3.2.x (CI: Use Ubuntu Bionic compatible package names)
- PR #16332: Backport PR #16308 on v3.2.x: CI: Use Ubuntu Bionic compatible package names
- PR #16324: Backport PR #16323 on branch v3.2.x (Add sphinx doc for Axis.axis_name.)
- PR #16325: Backport PR #15462 on v3.2.x: Simplify azure setup.
- PR #16323: Add sphinx doc for Axis.axis_name.
- PR #16321: Backport PR #16311 on branch v3.2.x (don’t override non-Python signal handlers)
- PR #16308: CI: Use Ubuntu Bionic compatible package names
- PR #16306: Backport PR #16300 on branch v3.2.x (Don’t default to negative radii in polar plot.)
- PR #16305: Backport PR #16250 on branch v3.2.x (Fix zerolen intersect)
- PR #16300: Don’t default to negative radii in polar plot.
- PR #16278: Backport PR #16273 on branch v3.2.x (DOC: Changing the spelling of coordinates.)
- PR #16260: Backport PR #16259 on branch v3.2.x (TST: something changed in pytest 5.3.3 that breaks our qt fixtures)
- PR #16259: TST: something changed in pytest 5.3.3 that breaks our qt fixtures
- PR #16238: Backport PR #16235 on branch v3.2.x (FIX: AttributeError in TimerBase.start)
- PR #16211: DOC: ValidateInterval was deprecated in 3.2, not 3.1
- PR #16224: Backport PR #16223 on branch v3.2.x (Added DNA Features Viewer description + screenshot in docs/thirdparty/)
- PR #16223: Added DNA Features Viewer description + screenshot in docs/thirdparty/
- PR #16222: Backport PR #16212 on branch v3.2.x (Fix deprecation from #13544)
- PR #16212: Fix deprecation from #13544
- PR #16207: Backport PR #16189 on branch v3.2.x (MNT: set default canvas when un-pickling)
- PR #16189: MNT: set default canvas when un-pickling
• PR #16179: Backport PR #16175: FIX: ignore axes that aren’t visible
• PR #16175: FIX: ignore axes that aren’t visible
• PR #16168: Backport PR #16166 on branch v3.2.x (Add badge for citing 3.1.2)
• PR #16148: Backport PR #16128 on branch v3.2.x (CI: Do not use nbformat 5.0.0/5.0.1 for testing)
• PR #16145: Backport PR #16053 on branch v3.2.x (Fix v_interval setter)
• PR #16128: CI: Do not use nbformat 5.0.0/5.0.1 for testing
• PR #16135: Backport PR #16112 on branch v3.2.x (CI: Fail when failed to install dependencies)
• PR #16132: Backport PR #16126 on branch v3.2.x (TST: test_fork: Missing join)
• PR #16124: Backport PR #16105 on branch v3.2.x (Fix legend dragging.)
• PR #16122: Backport PR #16113 on branch v3.2.x (Renderer Graphviz inheritance diagrams as svg)
• PR #16105: Fix legend dragging.
• PR #16113: Renderer Graphviz inheritance diagrams as svg
• PR #16112: CI: Fail when failed to install dependencies
• PR #16119: Backport PR #16065 on branch v3.2.x (Nicer formatting of community aspects on front page)
• PR #16074: Backport PR #16061 on branch v3.2.x (Fix deprecation message for axes_grid1.colorbar.)
• PR #16093: Backport PR #16079 on branch v3.2.x (Fix restuctured text formatting)
• PR #16094: Backport PR #16080 on branch v3.2.x (Cleanup docstrings in backend_bases.py)
• PR #16086: FIX: use supported attribute to check pillow version
• PR #16084: Backport PR #16077 on branch v3.2.x (Fix some typos)
• PR #16077: Fix some typos
• PR #16079: Fix restuctured text formatting
• PR #16080: Cleanup docstrings in backend_bases.py
• PR #16061: Fix deprecation message for axes_grid1.colorbar.
• PR #16006: Ignore pos in StrCategoryFormatter.__call__ to display correct label in the preview window
• PR #15864: Add ‘sviewgui’ to list of thirdparty packages
• PR #16056: Backport PR #15864 on branch v3.2.x ([Add the info of ‘sviewgui’ in third-party package])
• PR #15864: Add ‘sviewgui’ to list of thirdparty packages
• PR #16055: Backport PR #16037 on branch v3.2.x (Doc: use empty ScalarMappable for colorbars with no associated image.)
• PR #16054: Backport PR #16048 on branch v3.2.x (Document that colorbar() takes a label kwarg.)
• PR #16037: Doc: use empty ScalarMappable for colorbars with no associated image.

7.1. Previous GitHub Stats
• PR #16048: Document that colorbar() takes a label kwarg.
• PR #16042: Backport PR #16031 on branch v3.2.x (Fix docstring of hillshade().)
• PR #16033: Backport PR #16028 on branch v3.2.x (Prevent FigureCanvasQT_draw_idle recursively calling itself.)
• PR #16021: Backport PR #16007 on branch v3.2.x (Fix search on nested pages)
• PR #16019: Backport PR #15735 on branch v3.2.x (Cleanup some mplot3d docstrings.)
• PR #15987: Backport PR #15886 on branch v3.2.x (Fix Annotation using different units and different coords on x/y.)
• PR #15886: Fix Annotation using different units and different coords on x/y.
• PR #15984: Backport PR #15970 on branch v3.2.x (Process clip paths the same way as regular Paths.)
• PR #15970: Process clip paths the same way as regular Paths.
• PR #15963: Backport PR #15937 on branch v3.2.x (Don’t hide exceptions in FontManager.addfont.)
• PR #15956: Backport PR #15901 on branch v3.2.x (Update backend_nbagg for removal of Gcf._activeQue.)
• PR #15937: Don’t hide exceptions in FontManager.addfont.
• PR #15959: Backport PR #15953 on branch v3.2.x (Update donation link)
• PR #15901: Update backend_nbagg for removal of Gcf._activeQue.
• PR #15954: Backport PR #15914 on branch v3.2.x (Example for sigmoid function with horizontal lines)
• PR #15914: Example for sigmoid function with horizontal lines
• PR #15930: Backport PR #15925 on branch v3.2.x (Optimize setting units to None when they’re already None.)
• PR #15925: Optimize setting units to None when they’re already None.
• PR #15915: Backport PR #15903 on branch v3.2.x (Correctly handle non-affine transData in Collection.get_datalim.)
• PR #15903: Correctly handle non-affine transData in Collection.get_datalim.
• PR #15908: Backport PR #15857 on branch v3.2.x (LassoSelection shouldn’t useblit on canvas not supporting blitting.)
• PR #15857: LassoSelection shouldn’t useblit on canvas not supporting blitting.
• PR #15905: Backport PR #15763 on branch v3.2.x (Skip webagg test if tornado is not available.)
• PR #15882: Backport PR #15859 on branch v3.2.x (Doc: Move search field into nav bar)
• PR #15868: Backport PR #15848 on branch v3.2.x: Cleanup environment variables FAQ
• PR #15872: Backport PR #15869 on branch v3.2.x (Update markers docs.)
• PR #15869: Update markers docs.
• PR #15867: Backport PR #15789 on branch v3.2.x (Cleanup xticks/yticks docstrings.)
• PR #15870: Backport PR #15865 on branch v3.2.x (Fix a typo)
• PR #15871: Backport PR #15824 on branch v3.2.x (Document doc style for default values)
• PR #15824: Document doc style for default values
• PR #15865: Fix a typo
• PR #15789: Cleanup xticks/yticks docstrings.
• PR #15862: Backport PR #15851 on branch v3.2.x (ffmpeg is available on default ubuntu packages now)
• PR #15848: Cleanup environment variables FAQ.
• PR #15844: Backport PR #15841 on branch v3.2.x (DOC: specify the expected shape in the Collection.set_offset)
• PR #15841: DOC: specify the expected shape in the Collection.set_offset
• PR #15837: Backport PR #15799 on branch v3.2.x (Improve display of author names on PDF titlepage of matplotlib own docs)
• PR #15799: Improve display of author names on PDF titlepage of matplotlib own docs
• PR #15831: Backport PR #15829 on branch v3.2.x (In C extensions, use FutureWarning, not DeprecationWarning.)
• PR #15829: In C extensions, use FutureWarning, not DeprecationWarning.
• PR #15818: Backport PR #15619 on branch v3.2.x (Improve zorder demo)
• PR #15819: Backport PR #15601 on branch v3.2.x (Fix FontProperties conversion to/from strings)
• PR #15601: Fix FontProperties conversion to/from strings
• PR #15619: Improve zorder demo
• PR #15810: Backport PR #15809 on branch v3.2.x (Exclude artists from legend using label attributte)
• PR #15809: Exclude artists from legend using label attributte
• PR #15808: Backport PR #15513 on branch v3.2.x (Separate plots using #### in make_room_for_ylabel_using_axesgrid.py)
• PR #15513: Separate plots using #### in make_room_for_ylabel_using_axesgrid.py
• PR #15807: Backport PR #15791 on branch v3.2.x (Cleanup backend_bases docstrings.)
• PR #15791: Cleanup backend_bases docstrings.
• PR #15803: Backport PR #15795 on branch v3.2.x (Remove incorrect statement re2: colorbars in image tutorial.)
• PR #15795: Remove incorrect statement re: colorbars in image tutorial.
• PR #15794: Backport PR #15793 on branch v3.2.x (fix a couple typos in tutorials)
• PR #15793: fix a couple typos in tutorials
• PR #15774: Backport PR #15748 on branch v3.2.x (Fix incorrect macro in FT2Font setup.)
• PR #15748: Fix incorrect macro in FT2Font setup.
• PR #15759: Backport PR #15751 on branch v3.2.x (Modernize FAQ entry for plt.show().)
• **PR #15762**: Backport PR #15752 on branch v3.2.x (Update boxplot/violinplot faq.)

• **PR #15755**: Backport PR #15661 on branch v3.2.x (Document scope of 3D scatter depthshading.)

• **PR #15742**: Backport PR #15729 on branch v3.2.x (Catch correct parse error type for dateutil >= 2.8.1)

• **PR #15738**: Backport PR #15737 on branch v3.2.x (Fix env override in WebAgg backend test.)

• **PR #15724**: Backport PR #15718 on branch v3.2.x (Update donation link)

• **PR #15716**: Backport PR #15683 on branch v3.2.x (Cleanup dates.py docstrings.)

• **PR #15683**: Cleanup dates.py docstrings.

• **PR #15688**: Backport PR #15682 on branch v3.2.x (Make histogram_bin_edges private.)

• **PR #15682**: Make histogram_bin_edges private.

• **PR #15666**: Backport PR #15649 on branch v3.2.x (Fix searchindex.js loading when ajax fails (because e.g. CORS in embedded iframes))

• **PR #15669**: Backport PR #15654 on branch v3.2.x (Fix some broken links.)

• **PR #15660**: Backport PR #15647 on branch v3.2.x (Update some links)

• **PR #15653**: Backport PR #15623 on branch v3.2.x (Docstring for Artist.mouseover)

• **PR #15623**: Docstring for Artist.mouseover

• **PR #15634**: Backport PR #15626 on branch v3.2.x (Note minimum supported version for fontconfig.)

• **PR #15633**: Backport PR #15620 on branch v3.2.x (TST: Increase tolerance of some tests for aarch64)

• **PR #15626**: Note minimum supported version for fontconfig.

• **PR #15632**: Backport PR #15627 on branch v3.2.x (Make it easier to test various animation writers in examples.)

• **PR #15620**: TST: Increase tolerance of some tests for aarch64

• **PR #15627**: Make it easier to test various animation writers in examples.

• **PR #15618**: Backport PR #15613 on branch v3.2.x (Revert “Don’t bother with manually resizing the Qt main window.”)

• **PR #15613**: Revert “Don’t bother with manually resizing the Qt main window.”

• **PR #15593**: Backport PR #15590 on branch v3.2.x (Rename numpy to NumPy in docs.)

• **PR #15590**: Rename numpy to NumPy in docs.

• **PR #15588**: Backport PR #15478 on branch v3.2.x (Make ConciseDateFormatter obey timezone)

• **PR #15478**: Make ConciseDateFormatter obey timezone

• **PR #15583**: Backport PR #15512 on branch v3.2.x

• **PR #15584**: Backport PR #15579 on branch v3.2.x (Remove matplotlib.sphinxext.tests from __init__.py)

• **PR #15579**: Remove matplotlib.sphinxext.tests from __init__.py
• **PR #15577**: Backport PR #14705 on branch v3.2.x (Correctly size non-ASCII characters in agg backend.)
• **PR #14705**: Correctly size non-ASCII characters in agg backend.
• **PR #15572**: Backport PR #15452 on branch v3.2.x (Improve example for tick formatters)
• **PR #15570**: Backport PR #15561 on branch v3.2.x (Update thirdparty scalebar)
• **PR #15452**: Improve example for tick formatters
• **PR #15545**: Backport PR #15429 on branch v3.2.x (Fix OSX build on azure)
• **PR #15544**: Backport PR #15537 on branch v3.2.x (Add a third party package in the doc: matplotlib-scalebar)
• **PR #15561**: Update thirdparty scalebar
• **PR #15567**: Backport PR #15562 on branch v3.2.x (Improve docstring of AxesImage)
• **PR #15562**: Improve docstring of AxesImage
• **PR #15565**: Backport PR #15556 on branch v3.2.x (Fix test suite compat with ghostscript 9.50.)
• **PR #15556**: Fix test suite compat with ghostscript 9.50.
• **PR #15560**: Backport PR #15553 on branch v3.2.x (DOC: add cache-buster query string to css path)
• **PR #15552**: Backport PR #15528 on branch v3.2.x (Declutter home page)
• **PR #15554**: Backport PR #15523 on branch v3.2.x (numpydoc AxesImage)
• **PR #15523**: numpydoc AxesImage
• **PR #15549**: Backport PR #15516 on branch v3.2.x (Add logo like font)
• **PR #15543**: Backport PR #15539 on branch v3.2.x (Small cleanups to backend docs.)
• **PR #15542**: Backport PR #15540 on branch v3.2.x (axisartist tutorial fixes.)
• **PR #15537**: Add a third party package in the doc: matplotlib-scalebar
• **PR #15541**: Backport PR #15533 on branch v3.2.x (Use svg instead of png for website logo)
• **PR #15539**: Small cleanups to backend docs.
• **PR #15540**: axisartist tutorial fixes.
• **PR #15538**: Backport PR #15535 on branch v3.2.x (Avoid really long lines in event handling docs.)
• **PR #15535**: Avoid really long lines in event handling docs.
• **PR #15531**: Backport PR #15527 on branch v3.2.x (Clarify imshow() docs concerning scaling and grayscale images)
• **PR #15527**: Clarify imshow() docs concerning scaling and grayscale images
• **PR #15522**: Backport PR #15500 on branch v3.2.x (Improve antialiasing example)
• **PR #15524**: Backport PR #15499 on branch v3.2.x (Do not show path in font table example)
• **PR #15525**: Backport PR #15498 on branch v3.2.x (Simplify matshow example)
• **PR #15498**: Simplify matshow example
• PR #15499: Do not show path in font table example
• PR #15521: Backport PR #15519 on branch v3.2.x (FIX: fix anti-aliasing zoom bug)
• PR #15500: Improve anti-aliasing example
• PR #15519: FIX: fix anti-aliasing zoom bug
• PR #15510: Backport PR #15489 on branch v3.2.x (DOC: adding main nav to site)
• PR #15495: Backport PR #15486 on branch v3.2.x (Fixes an error in the documentation of Ellipse)
• PR #15488: Backport PR #15372 on branch v3.2.x (Add example for drawstyle)
• PR #15490: Backport PR #15487 on branch v3.2.x (Fix window not always raised in Qt example)
• PR #15487: Fix window not always raised in Qt example
• PR #15372: Add example for drawstyle
• PR #15485: Backport PR #15454 on branch v3.2.x (Rewrite Anscombe’s quartet example)
• PR #15483: Backport PR #15480 on branch v3.2.x (Fix wording in [packages] section of setup.cfg)
• PR #15454: Rewrite Anscombe’s quartet example
• PR #15480: Fix wording in [packages] section of setup.cfg
• PR #15477: Backport PR #15464 on branch v3.2.x (Remove unused code (remainder from #15453))
• PR #15471: Backport PR #15460 on branch v3.2.x (Fix incorrect value check in axes_grid.)
• PR #15456: Backport PR #15453 on branch v3.2.x (Improve example for tick locators)
• PR #15457: Backport PR #15450 on branch v3.2.x (API: rename DivergingNorm to TwoSlopeNorm)
• PR #15450: API: rename DivergingNorm to TwoSlopeNorm
• PR #15434: In imsave, let pnginfo have precedence over metadata.
• PR #15445: Backport PR #15439 on branch v3.2.x (DOC: mention discourse main page)
• PR #15425: Backport PR #15422 on branch v3.2.x (FIX: typo in attribute lookup)
• PR #15449: DOC: fix build
• PR #15429: Fix OSX build on azure
• PR #15420: Backport PR #15380 on branch v3.2.x (Update docs of BoxStyle)
• PR #15380: Update docs of BoxStyle
• PR #15300: CI: use python -m to make sure we are using the pip/pytest we want
• PR #15414: Backport PR #15413 on branch v3.2.x (catch OSErr instead of FileNotFoundError in _get_executable_info to resolve #15399)
• PR #15413: catch OSErr instead of FileNotFoundError in _get_executable_info to resolve #15399
• PR #15406: Backport PR #15347 on branch v3.2.x (Fix axes.hist bins units)
• PR #15405: Backport PR #15391 on branch v3.2.x (Increase fontsize in inheritance graphs)
• PR #15347: Fix axes.hist bins units
• PR #15391: Increase fontsize in inheritance graphs
• PR #15389: Backport PR #15379 on branch v3.2.x (Document formatting strings in the docs)
• PR #15379: Document formatting strings in the docs
• PR #15386: Backport PR #15385 on branch v3.2.x (Reword hist() doc.)
• PR #15385: Reword hist() doc.
• PR #15377: Backport PR #15357 on branch v3.2.x (Add ‘step’ and ‘barstacked’ to histogram_histtypes demo)
• PR #15357: Add ‘step’ and ‘barstacked’ to histogram_histtypes demo
• PR #15366: Backport PR #15364 on branch v3.2.x (DOC: fix typo in colormap docs)
• PR #15362: Backport PR #15350 on branch v3.2.x (Don’t generate double-reversed cmaps (“viridis_r_r”, ...))
• PR #15360: Backport PR #15258 on branch v3.2.x (Don’t fallback to view limits when autoscale()ing no data.)
• PR #15350: Don’t generate double-reversed cmaps (“viridis_r_r”, ...).
• PR #15258: Don’t fallback to view limits when autoscale()ing no data.
• PR #15299: Backport PR #15296 on branch v3.2.x (Fix typo/bug from 18cecf7)
• PR #15327: Backport PR #15326 on branch v3.2.x (List of minimal versions of dependencies)
• PR #15326: List of minimal versions of dependencies
• PR #15317: Backport PR #15291 on branch v3.2.x (Remove error_msg_qt from backend_qt4.)
• PR #15316: Backport PR #15283 on branch v3.2.x (Don’t default axes_grid colorbar locator to MaxNLocator.)
• PR #15291: Remove error_msg_qt from backend_qt4.
• PR #15283: Don’t default axes_grid colorbar locator to MaxNLocator.
• PR #15315: Backport PR #15308 on branch v3.2.x (Doc: Add close event to list of events)
• PR #15308: Doc: Add close event to list of events
• PR #15312: Backport PR #15307 on branch v3.2.x (DOC: center footer)
• PR #15307: DOC: center footer
• PR #15276: Backport PR #15271 on branch v3.2.x (Fix font weight validation)
• PR #15279: Backport PR #15252 on branch v3.2.x (Mention labels and milestones in PR review guidelines)
• PR #15252: Mention labels and milestones in PR review guidelines
• PR #15268: Backport PR #15266 on branch v3.2.x (Embedding in Tk example: Fix toolbar being clipped.)
• PR #15269: Backport PR #15267 on branch v3.2.x (added multi-letter example to mathtext tutorial)
• PR #15267: added multi-letter example to mathtext tutorial
• PR #15266: Embedding in Tk example: Fix toolbar being clipped.
• PR #15243: Move some new API changes to the correct place
• PR #15245: Fix incorrect calls to warn_deprecated.
• PR #15239: Composite against white, not the savefig.facecolor rc, in print_jpeg.
• PR #15227: contains_point() docstring fixes
• PR #15242: Cleanup widgets docstrings.
• PR #14889: Support pixel-by-pixel alpha in imshow.
• PR #14928: Logit scale nonsingular
• PR #14998: Fix nonlinear spine positions & inline Spine._calc_offset_transform into get_spine_transform.
• PR #15231: Doc: Do not write default for non-existing rcParams
• PR #15222: Cleanup projections/__init__.py.
• PR #15228: Minor docstring style cleanup
• PR #15237: Cleanup widgets.py.
• PR #15229: Doc: Fix Bbox and BboxBase links
• PR #15235: Kill FigureManagerTk._num.
• PR #15234: Drop mention of msinttypes in Windows build.
• PR #15224: Avoid infinite loop when switching actions in qt backend.
• PR #15230: Doc: Remove hard-documented rcParams defaults
• PR #15149: plt.style.use() to accept pathlib.Path objects as arguments
• PR #15220: Correctly format floats passed to pgf backend.
• PR #15216: Update docstrings of contains_point(s) methods
• PR #15209: Exclude s-g generated files from flake8 check.
• PR #15204: PEP8ify some variable names.
• PR #15196: Force html4 writer for sphinx 2
• PR #13544: Improve handling of subplots spanning multiple gridspec cells.
• PR #15194: Trivial style fixes.
• PR #15202: Deprecate the renderer parameter to Figure.tight_layout.
• PR #15195: Fix integers being passed as length to quiver3d.
• PR #15180: Add some more internal links to 3.2.0 what’s new
• PR #13510: Change Locator MAXTICKS checking to emitting a log at WARNING level.
• PR #15184: Mark missing_references extension as parallel read safe
• PR #15150: Autodetect whether pgf can use includegraphics[interpolate].
• PR #15163: 3.2.0 API changes page
• PR #15176: What’s new for 3.2.0
• PR #11947: Ensure streamplot Euler step is always called when going out of bounds.
• PR #13702: Deduplicate methods shared between Container and Artist.
• PR #15169: TST: verify warnings fail the test suite
• PR #14888: Replace some polar baseline images by check_figures_equal.
• PR #15027: More readability improvements on axis3d.
• PR #15171: Add useful error message when trying to add Slider to 3DAxes
• PR #13775: Doc: Scatter Hist example update
• PR #15164: removed a typo
• PR #15152: Support for shorthand hex colors.
• PR #15159: Follow up on #14424 for docstring
• PR #14424: ENH: Add argument size validation to quiver.
• PR #15137: DOC: add example to power limit API change note
• PR #15144: Improve local page contents CSS
• PR #15143: Restore doc references.
• PR #15124: Replace parameter lists with square brackets
• PR #13077: fix FreeType build on Azure
• PR #15123: Improve categorical example
• PR #15134: Fix missing references in doc build.
• PR #13937: Use PYTHONFAULTHANDLER to switch on the Python fault handler.
• PR #13452: Replace axis_artist.AttributeCopier by normal inheritance.
• PR #15045: Resize canvas when changing figure size
• PR #15122: Fixed app creation in qt5 backend (see #15100)
• PR #15099: Add lightsource parameter to bar3d
• PR #14876: Inline some afm parsing code.
• PR #15119: Deprecate a validator for a deprecated rcParam value.
• PR #15121: Fix Stacked bar graph example
• PR #15113: Cleanup layout_from_subplotspec.
• PR #13543: Remove zip_safe=False flag from setup.py.
• PR #12860: ENH: LogLocator: check for correct dimension of subs added
• PR #14349: Replace ValidateInterval by simpler specialized validators.
• PR #14352: Remove redundant is_landscape kwarg from backend_ps helpers.
• PR #15087: Pass gid to renderer
• PR #14703: Don’t bother with manually resizing the Qt main window.
• PR #14833: Reuse TexManager implementation in convert_psfrags.
• PR #14893: Update layout.html for sphinx themes
• PR #15098: Simplify symlog range determination logic
• PR #15112: Cleanup legend() docstring.
• PR #15108: Fix doc build and resync matplotlibrc.template with actual defaults.
• PR #14940: Fix text kerning calculations and some FT2Font cleanup
• PR #15082: Privatize font_manager.JSONEncoder.
• PR #15106: Update docs of GridSpec
• PR #14832: ENH: made default tick formatter to switch to scientific notation earlier
• PR #15086: Style fixes.
• PR #15073: Add entry for blume to thirdparty package index
• PR #15095: Simplify _png extension by handling file open/close in Python.
• PR #15092: MNT: Add test for aitoff-projection
• PR #15101: Doc: fix typo in contour doc
• PR #14624: Fix axis inversion with loglocator and logitlocator.
• PR #15088: Fix more doc references.
• PR #15063: Add Comic Neue as a fantasy font.
• PR #14867: Propose change to PR merging policy.
• PR #15068: Add FontManager.addfont to register fonts at specific paths.
• PR #13397: Deprecate axes_grid1.colorbar (in favor of matplotlib's own).
• PR #14521: Move required_interactive_framework to canvas class.
• PR #15083: Cleanup spines example.
• PR #14997: Correctly set formatters and locators on removed shared axis
• PR #15064: Fix eps hatching in MacOS Preview
• PR #15074: Write all ACCEPTS markers in docstrings as comments.
• PR #15078: Clarify docstring of FT2Font.get_glyph_name.
• PR #15080: Fix cross-references in API changes < 3.0.0.
• PR #15072: Cleanup patheffects.
• PR #15071: Cleanup offsetbox.py.
• PR #15070: Fix cross-references in API changes < 2.0.0.
• PR #10691: Fix for shared axes diverging after setting tick markers
• PR #15069: Style fixes for font_manager.py.
• PR #15067: Fix cross-references in API changes < 1.0
• PR #15061: Fix cross-references in tutorials and FAQ
• PR #15060: Fix cross-references in examples.
• PR #14957: Documentation for using ConnectionPatch across Axes with constrained...
• PR #15053: Make citation bit of README less wordy
• PR #15044: numpydoc set_size_inches docstring
• PR #15050: Clarify unnecessary special handling for colons in paths.
• PR #14797: DOC: create a Agg figure without pyplot in buffer example
• PR #14844: Add citation info to README
• PR #14884: Do not allow canvas size to become smaller than MinSize in wx backend...
• PR #14941: Improvements to make_icons.py.
• PR #15048: DOC: more nitpick follow up
• PR #15043: Fix Docs: Don’t warn for unused ignores
• PR #15025: Re-write text wrapping logic
• PR #14840: Don’t assume transform is valid on access to matrix.
• PR #14862: Make optional in docstrings optional
• PR #15028: Python version conf.py
• PR #15033: FIX: un-break nightly wheels on py37
• PR #15046: v3.1.x merge up
• PR #15015: Fix bad missing-references.json due to PR merge race condition.
• PR #14581: Make logscale bar/hist autolimits more consistents.
• PR #15034: Doc fix nitpick
• PR #14614: Deprecate \{x,y,z\}axis\_date.
• PR #14991: Handle inherited is\_separable, has\_inverse in transform props detection.
• PR #15032: Clarify effect of axis(‘equal’) on explicit data limits
• PR #15031: Update docs of GridSpec
• PR #14106: Describe FigureManager
• PR #15024: Update docs of GridSpecBase
• PR #14906: Deprecate some FT2Image methods.
• PR #14963: More Axis3D cleanup.
• PR #15009: Provide signatures to some C-level classes and methods.
• PR #14968: DOC: colormap manipulation tutorial update
• PR #15006: Deprecate get/set\_\_ticks minor positional use
• PR #14989: DOC:Update axes documentation
• PR #14871: Parametrize determinism tests.
• PR #14768: DOC: Enable nitpicky
• PR #15013: Matplotlib requires Python 3.6, which in turn requires Mac OS X 10.6+
• PR #15012: Fix typesetting of “GitHub”
• PR #14954: Cleanup polar\_legend example.
• PR #14519: Check parameters of ColorbarBase
• PR #14942: Make \_classic\_test style a tiny patch on top of classic.
• PR #14988: pathlibify/fstringify setup/setupext.
- PR #14511: Deprecate allowing scalars for fill_between where
- PR #14493: Remove deprecated fig parameter from Grid-
  SpecBase.get_subplot_params()
- PR #14995: Further improve backend tutorial.
- PR #15000: Use warnings.warn, not logging.warning, in microseconds locator warning.
- PR #14990: Fix nonsensical transform in mixed-mode axes aspect computation.
- PR #15002: No need to access filesystem in test_dates.py.
- PR #14549: Improve backends documentation
- PR #14774: Fix image bbox clip.
- PR #14978: Typo fixes in pyplot.py
- PR #14702: Don’t enlarge toolbar for Qt high-dpi.
- PR #14922: Autodetect some transform properties.
- PR #14962: Replace inspect.getfullargspec by inspect.signature.
- PR #14958: Improve docs of toplevel module.
- PR #14926: Save a matrix unpacking/repacking in offsetbox.
- PR #14961: Cleanup demo_agg_filter.
- PR #14924: Kill the C-level (private) RendererAgg.buffer_rgba, which returns a copy.
- PR #14946: Delete virtualenv faq.
- PR #14944: Shorten style.py.
- PR #14931: Deprecate some obscure rcParam synonyms.
- PR #14947: Fix inaccuracy re: backends in intro tutorial.
- PR #14904: Fix typo in secondary_axis.py example.
- PR #14925: Support passing spine bounds as single tuple.
- PR #14921: DOC: Make abbreviation of versus consistent.
- PR #14739: Improve indentation of Line2D properties in docstrings.
- PR #14923: In examples, prefer buffer_rgba to print_to_buffer.
- PR #14908: Make matplotlib.style.available sorted alphabetically.
- PR #13567: Deprecate MovieWriterRegistry cache-dirtyness system.
- PR #14879: Error out when unsupported kwargs are passed to Scale.
- PR #14512: Logit scale, changes in LogitLocator and LogitFormatter
- PR #12415: ENH: fig.set_size to allow non-inches units
- PR #13738: Deprecate disable_internet.
- PR #14886: Further simplify the flow of pdf text output.
- PR #14894: Make slowness warning for legend(loc=“best”) more accurate.
- PR #14891: Fix nightly test errors
- PR #14895: Fix typos
• PR #14890: Remove unused private helper method in mplot3d.
• PR #14872: Unify text layout paths.
• PR #8183: Allow array alpha for imshow
• PR #13832: Vectorize handling of stacked/cumulative in hist().
• PR #13630: Simplify PolarAxes.can_pan.
• PR #14565: Rewrite an argument check to _check_getitem
• PR #14875: Cleanup afm module docstring.
• PR #14880: Fix animation blitting for plots with shared axes
• PR #14870: FT2Font.get_char_index never returns None.
• PR #13463: Deprecate Locator.autoscale.
• PR #13724: ENH: anti-alias down-sampled images
• PR #14848: Clearer error message for plt.axis()
• PR #14660: colorbar(label=None) should give an empty label
• PR #14654: Cleanup of docstrings of scales
• PR #14868: Update bar stacked example to directly manipulate axes.
• PR #14749: Fix get_canvas_width_height() for pgf backend.
• PR #14776: Make ExecutableUnavailableError
• PR #14843: Don’t try to cleanup CallbackRegistry during interpreter shutdown.
• PR #14849: Improve tkagg icon resolution
• PR #14866: changed all readme headings to verbs
• PR #13364: Numpyfy tick handling code in Axis3D.
• PR #13642: FIX: get_datalim for collection
• PR #14860: Stopgap fix for pandas converters in tests.
• PR #6498: Check canvas identity in Artist.contains.
• PR #14707: Add titlecolor in rcParams
• PR #14853: Fix typo in set_adjustable check.
• PR #14845: More cleanups.
• PR #14809: Clearer calls to ConnectionPatch.
• PR #14716: Use str instead of string as type in docstrings
• PR #14338: Simplify/pathlibify image_comparison.
• PR #8930: timedelta formatter
• PR #14733: Deprecate FigureFrameWx.statusbar & NavigationToolbar2Wx.statbar.
• PR #14713: Unite masked and NaN plot examples
• PR #14576: Let Axes3D share have_units, _on_units_changed with 2d axes.
• PR #14575: Make ticklabel_format work both for 2D and 3D axes.
• PR #14834: DOC: Webpage not formatted correctly on gallery docs
• PR #14730: Factor out common parts of wx event handlers.
• PR #14727: Fix axes aspect for non-linear, non-log, possibly mixed-scale axes.
• PR #14835: Only allow set_adjustable("datalim") for axes with standard data ratios.
• PR #14746: Simplify Arrow constructor.
• PR #14752: Doc changes to git setup
• PR #14732: Deduplicate wx configure_subplots tool.
• PR #14715: Use array-like in docs
• PR #14728: More floating_axes cleanup.
• PR #14719: Make Qt navtoolbar more robust against removal of either pan or zoom.
• PR #14695: Various small simplifications
• PR #14745: Replace Affine2D().scale(x, x) by Affine2D().scale(x).
• PR #14687: Add missing spaces after commas in docs
• PR #14810: Lighten icons of NavigationToolbar2QT on dark-themes
• PR #14786: Deprecate axis_artist.BezierPath.
• PR #14750: Misc. simplifications.
• PR #14807: API change note on automatic blitting detection for backends
• PR #11004: Deprecate smart_bounds handling in Axis and Spine
• PR #14785: Kill some never-used attributes.
• PR #14723: Cleanup some parameter descriptions in matplotlibrc.template
• PR #14808: Small docstring updates
• PR #14686: Inset orientation
• PR #14805: Simplify text_layout example.
• PR #12052: Make AxesImage.contains account for transforms
• PR #11860: Let MovieFileWriter save temp files in a new dir
• PR #11423: FigureCanvas Designer
• PR #10688: Add legend handler and artist for FancyArrow
• PR #8321: Added ContourSet clip_path kwarg and set_clip_path() method (#2369)
• PR #14641: Simplify_process_plot_var_args.
• PR #14631: Refactor from_levels_and_colors.
• PR #14790: DOC: Add link to style examples in matplotlib.style documentation
• PR #14799: Deprecate dates.mx2num.
• PR #14793: Remove sudo tag in travis
• PR #14795: Autodetect whether a canvas class supports blitting.
• PR #14794: DOC: Update the documentation of homepage of website
• PR #14629: Delete HTML build sources to save on artefact upload time
• PR #14792: Fix spelling typos
• PR #14789: Prefer Affine2D.translate to offset_transform in examples.
• PR #14783: Cleanup mlab.detrend.
• PR #14791: Make ‘extended’ and ‘expanded’ synonymous in font_manager
• PR #14787: Remove axis_artist_update, which is always a noop.
• PR #14758: Compiling C-ext with incorrect FreeType libs makes future compiles break
• PR #14763: Deprecate math_symbol_table function directive
• PR #14762: Decrease uses of get_canvas_width_height.
• PR #14748: Cleanup demo_text_path.
• PR #14740: Remove sudo tag in travis
• PR #14737: Cleanup twin axes docstrings.
• PR #14729: Small simplifications.
• PR #14726: Trivial simplification to Axis3d._get_coord_info.
• PR #14718: Add explanations for single character color names.
• PR #14710: Pin pydocstyle<4.0
• PR #14709: Try to improve the readability and styling of matplotlibrc.template file
• PR #14278: Inset axes bug and docs fix
• PR #14748: MNT: protect from out-of-bounds data access at the c level
• PR #14569: More deduplication of backend_tools.
• PR #14652: Soft-deprecate transform_point.
• PR #14664: Improve error reporting for scatter c as invalid RGBA.
• PR #14657: Don’t double-wrap in silent_list.
• PR #14689: Update embedding_in_wx4 example.
• PR #14769: Further simplify colormap reversal.
• PR #14667: Move most of pytest’s conf to confest.py.
• PR #14632: Remove reference to old Tk/Windows bug.
• PR #14673: More shortening of setup.py prints.
• PR #14678: Fix small typo
• PR #14680: Format parameters in descriptions with emph instead of backticks
• PR #14674: Simplify colormap reversal.
• PR #14672: Artist tutorial fixes
• PR #14653: Remove some unnecessary prints from setup.py.
• PR #14662: Add a _check_getitem helper to go with _check_in_list/_check_isinstance.
• PR #14666: Update IPython’s doc link in Image tutorial
• PR #14671: Improve readability of matplotlibrc.template
• PR #14665: Fix a typo in pyplot tutorial
• PR #14616: Use builtin round instead of np.round for scalars.
• PR #12554: backend_template docs and fixes
• PR #14635: Fix bug when setting negative limits and using log scale
• PR #14604: Update hist() docstring following removal of normed kwarg.
• PR #14630: Remove the private Tick._name attribute.
• PR #14555: Coding guidelines concerning the API
• PR #14516: Document and test _get_packed_offsets()
• PR #14628: matplotlib > Matplotlib in devel docs
• PR #14627: gitignore pip-wheel-meta/ directory
• PR #14612: Update some mplot3d docs.
• PR #14617: Remove a Py2.4(!) backcompat fix.
• PR #14605: Update hist2d() docstring.
• PR #13084: When linking against libpng/zlib on Windows, use upstream lib names.
• PR #13685: Remove What’s new fancy example
• PR #14573: Cleanup jpl_units.
• PR #14583: Fix overly long lines in setupext.
• PR #14588: Remove [status] suppress from setup.cfg.
• PR #14591: Style fixes for secondary_axis.
• PR #14594: DOC: Make temperature scale example use a closure for easier reusability
• PR #14447: FIX: allow secondary axes minor locators to be set
• PR #14567: Fix unicode_minus + usetex.
• PR #14351: Remove some redundant check_in_list calls.
• PR #14550: Restore thumbnail of usage guide
• PR #10222: Use symlinks instead of copies for test result_images.
• PR #14267: cbook docs cleanup
• PR #14556: Improve @deprecated’s docstring.
• PR #14557: Clarify how to work with threads.
• PR #14545: In contributing.rst, encourage kwonly args and minimizing public APIs.
• PR #14533: Misc. style fixes.
• PR #14542: Move plot_directive doc to main API index.
• PR #14499: Improve custom figure example
• PR #14543: Remove the “Developing a new backend” section from contributing guide.
• PR #14540: Simplify backend switching in plot_directive.
• PR #14539: Don’t overindent enumerated list in plot_directive docstring.
• PR #14537: Slightly tighten the Bbox API.
• PR #14223: Rewrite intro to usage guide.
• PR #14495: Numpydocify axes_artist.py
• PR #14529: mpl_toolkits style fixes.
• PR #14528: mathtext style fixes.
• PR #13536: Make unit converters also handle instances of subclasses.
• PR #13730: Include FreeType error codes in FreeType exception messages.
• PR #14500: Fix pydocstyle D403 (First word of the first line should be properly capitalized) in examples
• PR #14506: Simplify Qt tests.
• PR #14513: More fixes to pydocstyle D403 (First word capitalization)
• PR #14496: Fix pydocstyle D208 (Docstring is over-indented)
• PR #14347: Deprecate rcsetup.validate_path_exists.
• PR #14383: Remove the `"package_data.d11s"` setup.cfg entry.
• PR #14346: Simplify various validators in rcsetup.
• PR #14366: Move test_rcparams test files inline into test_rcparams.py.
• PR #14401: Assume that mpl-data is in its standard location.
• PR #14454: Simplify implementation of svg.image_inline.
• PR #14470: Add _check_isinstance helper.
• PR #14479: fstringify backend_ps more.
• PR #14484: Support unicode minus with ps.useafm.
• PR #14494: Style fixes.
• PR #14465: Docstrings cleanups.
• PR #14466: Let SecondaryAxis inherit get_tightbbox from _AxesBase.
• PR #13940: Some more f-strings.
• PR #14379: Remove unnecessary uses of unittest.mock.
• PR #14483: Improve font weight guessing.
• PR #14419: Fix test_imshow_pil on Windows.
• PR #14460: canvas.blit() already defaults to blitting the full figure canvas.
• PR #14462: Register timeout pytest marker.
• PR #14414: FEATURE: Alpha channel in Gouraud triangles in the pdf backend
• PR #13659: Clarify behavior of the 'tight' kwarg to autoscale/autoscale_view.
• PR #13901: Only test png output for mplot3d.
• PR #13338: Replace list.extend by star-expansion or other constructs.
• PR #14448: Misc doc style cleanup
• PR #14310: Update to Bounding Box for Qt5 FigureCanvasATAgg.paintEvent()
• PR #14380: Inline $MPLLOCALFREETYPE/$PYTEST_ADDOPTS/$NPROC in .travis.yml.
• PR #14413: MAINT: small improvements to the pdf backend
• PR #14452: MAINT: Minor cleanup to make functions more self consistent

7.1. Previous GitHub Stats 541
• PR #14441: Misc. docstring cleanups.
• PR #14440: Interpolations example
• PR #14402: Prefer mpl.get_data_path(), and support Paths in FontProperties.
• PR #14420: MAINT: Upgrade pytest again
• PR #14423: Fix docstring of subplots().
• PR #14410: Use aspect=1, not aspect=True.
• PR #14412: MAINT: Don’t install pytest 4.6.0 on Travis
• PR #14377: Rewrite assert np.* tests to use numpy.testing
• PR #14399: Improve warning for case where data kwarg entry is ambiguous.
• PR #14390: Cleanup docs of bezier
• PR #14393: Fix to_rgba_array() for empty input
• PR #14308: Small clean to SymmetricalLogLocator
• PR #14311: travis: add c code coverage measurements
• PR #14391: Remove remaining unicode-strings markers.
• PR #14393: Remove explicit inheritance from object
• PR #14398: acquiring and releasing keypresslock when textbox is being activated
• PR #14393: Register flaky pytest marker.
• PR #14373: Properly hide __has_include to support C++<17 compilers.
• PR #14378: Remove setup_method
• PR #14368: Finish removing jquery from the repo.
• PR #14360: Deprecate boxplot(..., whis="range").
• PR #14376: Simplify removal of figure patch from bbox calculations.
• PR #14363: Make is_natively_supported private.
• PR #14330: Remove remaining unittest.TestCase uses
• PR #13663: Kill the PkgConfig singleton in setupext.
• PR #13067: Simplify generation of error messages for missing libpng/freetype.
• PR #14358: DOC boxplot whis parameter
• PR #14014: Disallow figure argument for pyplot.subplot() and Figure.add_subplot()
• PR #14350: Use cbook._check_in_list more often.
• PR #14348: Cleanup markers.py.
• PR #14345: Use importorskip for tests depending on pytz.
• PR #14170: In setup.py, inline the packages that need to be installed into setup().
• PR #14332: Use raw docstrings instead of escaping backslashes
• PR #14336: Enforce pydocstyle D412
• PR #14144: Deprecate the ‘warn’ parameter to matplotlib.use().
• PR #14328: Remove explicit inheritance from object
• PR #14035: Improve properties formatting in interpolated docstrings.
• PR #14018: pep8ing.
• PR #13542: Move {setup,install}_requires from setupext.py to setup.py.
• PR #13670: Simplify the logic of axis().
• PR #14046: Deprecate checkdep_ps_distiller.
• PR #14236: Simplify StixFonts.get-sized_alternatives_for_symbol.
• PR #14101: Shorten ImageBase._make_image.
• PR #14246: Deprecate public use of makeMappingArray
• PR #13740: Deprecate plotfile.
• PR #14216: Walk the artist tree when preparing for saving with tight bbox.
• PR #14305: Small grammatical error.
• PR #14104: Factor out retrieval of data relative to datapath
• PR #14016: pep8ify backends.
• PR #14299: Fix #13711 by importing cbook.
• PR #14244: Remove APIs deprecated in mpl3.0.
• PR #14068: Alternative fix for passing iterator as frames to FuncAnimation
• PR #13711: Deprecate NavigationToolbar2Tk.set_active.
• PR #14280: Simplify validate_markevery logic.
• PR #14273: pep8ify a couple of variable names.
• PR #14115: Reorganize scatter arguments parsing.
• PR #14271: Replace some uses of np.iterable
• PR #14257: Changing cmap(np.nan) to ‘bad’ value rather than ‘under’ value
• PR #14259: Deprecate string as color sequence
• PR #13506: Change colorbar for contour to have the proper axes limits...
• PR #13494: Add colorbar annotation example plot to gallery
• PR #14266: Make matplotlib.figure.AxesStack private
• PR #14166: Shorten usage of @image_comparison.
• PR #14240: Merge up 31x
• PR #14242: Avoid a buffer copy in PillowWriter.
• PR #9672: Only set the wait cursor if the last draw was >1s ago.
• PR #14224: Update plt.show() doc
• PR #14218: Use stdlib mimetypes instead of hardcoding them.
• PR #14082: In tk backend, don’t try to update mouse position after resize.
• PR #14084: Check number of positional arguments passed to quiver()
• PR #14214: Fix some docstring style issues.
• PR #14201: Fix E124 flake8 violations (closing bracket indentation).
- PR #14096: Consistently use axs to refer to a set of Axes
- PR #14204: Fix various flake8 indent problems.
- PR #14205: Obey flake8 “don’t assign a lambda, use a def”.
- PR #14198: Remove unused imports
- PR #14173: Prepare to change the default pad for AxesDivider.append_axes.
- PR #13738: Fix TypeError when plotting stacked bar chart with decimal
- PR #14151: Clarify error with use_num when cm-super is not installed.
- PR #14107: Feature: draw percentiles in violinplot
- PR #14172: Remove check_requirements from setupext.
- PR #14158: Fix test_lazy_imports in presence of $MPLBACKEND or matplotlibrc.
- PR #14157: Isolate nbagg test from user ipython profile.
- PR #14147: Dedent overindented list in example docstring.
- PR #14134: Deprecate the dryrun parameter to print_foo().
- PR #14145: Remove warnings handling for fixed bugs.
- PR #13977: Always import pyplot when calling matplotlib.use().
- PR #14131: Make test suite fail on warnings.
- PR #13593: Only autoscale_view() when needed, not after every plotting call.
- PR #13902: Add support for metadata= and pil_kwarg= in imsave().
- PR #14140: Avoid backslash-quote by changing surrounding quotes.
- PR #14132: Move some toplevel strings into the only functions that use them.
- PR #13708: Annotation.contains shouldn’t consider the text+arrow’s joint bbox.
- PR #13980: Don’t let margins expand polar plots to negative radii by default.
- PR #14075: Remove uninformative entries from glossary.
- PR #14002: Allow pandas DataFrames through norms
- PR #14114: Allow SVG Text-as-Text to Use Data Coordinates
- PR #14120: Remove mention of $QT_API in matplotlibrc example.
- PR #13878: Style fixes for floating_axes.
- PR #14108: Deprecate FigureCanvasMac.invalidate in favor of draw_idle.
- PR #13879: Clarify handling of “extreme” values in FloatingAxisArtistHelper.
- PR #5602: Automatic downsampling of images.
- PR #14112: Remove old code path in layout.html
- PR #13959: Scatter: make “c” and “s” argument handling more consistent.
- PR #14110: Simplify scatter_piecharts example.
- PR #14111: Trivial cleanups.
- PR #14085: Simplify get_current_fig_manager().
- PR #14083: Deprecate FigureCanvasBase.draw_cursor.
• PR #14089: Cleanup bar_stacked, bar_unit_demo examples.
• PR #14063: Add pydocstyle checks to flake8
• PR #14077: Fix tick label wobbling in animated Qt example
• PR #14070: Cleanup some pyplot docstrings.
• PR #6280: Added ability to offset errorbars when using errorevery.
• PR #13679: Fix passing iterator as frames to FuncAnimation
• PR #14023: Improve Unicode minus example
• PR #14041: Pretty-format subprocess logs.
• PR #14038: Cleanup path.py docstrings.
• PR #13701: Small cleanups.
• PR #14020: Better error message when trying to use Gtk3Agg backend without cairo
• PR #14021: Fix ax.legend Returns markup
• PR #13986: Support RGBA for quadmesh mode of pcolorfast.
• PR #14009: Deprecate compare_versions.
• PR #14010: Deprecate get_home()
• PR #13932: Remove many unused variables.
• PR #13854: Cleanup contour.py.
• PR #13866: Switch PyArg_ParseTupleAndKeywords from “es” to “s”.
• PR #13945: Make unicode_minus example more focused.
• PR #13876: Deprecate factor=None in axisartist.
• PR #13929: Better handle deprecated rcParams.
• PR #13851: Deprecate setting Axis.major.locator to non-Locator; idem for Formatters
• PR #13938: numpydocify quiverkey.
• PR #13936: Pathlibify animation.
• PR #13944: Allow setting tick colour on 3D axes
• PR #13987: Deprecate mlab.{apply_window,stride_repeat}.
• PR #13983: Fix locator/formatter setting when removing shared Axes
• PR #13957: Remove many unused variables in tests.
• PR #13981: Test cleanups.
• PR #13970: Check vmin/vmax are valid when doing inverse in LogNorm
• PR #13978: Make normalize_kwarg more convenient for third-party use.
• PR #13972: Remove_process_plot_var_args.set{line,patch}_props.
• PR #13795: Make_warn_external correctly report warnings arising from tests.
• PR #13885: Deprecate axisartist.grid_finder.GridFinderBase.
• PR #13913: Fix string numbers in to_rgb() and is_color_like()
• PR #13935: Deprecate the useless switch_backend_warn parameter to matplotlib.test.

7.1. Previous GitHub Stats
• PR #13952: Cleanup animation tests.
• PR #13942: Make Cursors an (Int)Enum.
• PR #13953: Unxfail a now fixed test in test_category.
• PR #13925: Fix passing Path to ps backend when text.usetex rc is True.
• PR #13943: Don’t crash on str(figimage(...)).
• PR #13944: Document how to support unicode minus in pgf backend.
• PR #13802: New rcparam to set default axes title location
• PR #13855: a and b or c -> b if a else c
• PR #13923: Correctly handle invalid PNG metadata.
• PR #13926: Suppress warnings in tests.
• PR #13920: Style fixes for category.py.
• PR #13889: Shorten docstrings by removing unneeded :class/:func: + rewordings.
• PR #13911: Fix joinstyles example
• PR #13917: Faster categorical tick formatter.
• PR #13918: Make matplotlib.testing assume pytest by default, not nose.
• PR #13894: Check for positive number of rows and cols
• PR #13895: Remove unused setupext.is_min_version.
• PR #13886: Shorten Figure.set_size_inches.
• PR #13859: Ensure figsize is positive finite
• PR #13877: zeros_like(x) + y -> full_like(x, y)
• PR #13875: Style fixes for grid_helper_curvelinear.
• PR #13873: Style fixes to grid_finder.
• PR #13782: Don’t access internet during tests.
• PR #13833: Some more usage of _check_in_list.
• PR #13834: Cleanup FancyArrowPatch docstring
• PR #13811: Generate Figure method wrappers via boilerplate.py
• PR #13797: Move sphinxext test to matplotlib.tests like everyone else.
• PR #13770: broken_barh docstring
• PR #13757: Remove mention of “enabling fontconfig support”.
• PR #13454: Add “c” as alias for “color” for Collections
• PR #13756: Reorder the logic of _update_title_position.
• PR #13744: Restructure boilerplate.py
• PR #13369: Use default colours for examples
• PR #13697: Delete pyplot_scales example.
• PR #13726: Clarify a bit the implementation of blend_hsv.
• PR #13731: Check for already running QApplication in Qt embedding example.
- PR #13736: Deduplicate docstrings and validation for set_alpha.
- PR #13737: Remove duplicated methods in FixedAxisArtistHelper.
- PR #13721: Kill pyplot docstrings that get overwritten by @docstring.copy.
- PR #13690: Cleanup hexbin.
- PR #13683: Remove axes border for examples that list styles
- PR #13280: Add SubplotSpec.add_subplot.
- PR #11387: Deprecate Axes3D.w_{x,y,z}axis in favor of .{x,y,z}axis.
- PR #13671: Suppress some warnings in tests.
- PR #13657: DOC: fail the doc build on errors, but keep going to end
- PR #13647: Fix FancyArrowPatch joinstyle
- PR #13637: BLD: parameterize python_requires
- PR #13633: plot_directive: Avoid warning if plot_formats doesn’t contain ‘png’
- PR #13629: Small example simplification.
- PR #13620: Improve watermark example
- PR #13589: Kill Axes._connected.
- PR #13428: free cart pendulum animation example
- PR #10487: fixed transparency bug
- PR #13551: Fix IndexError for pyplot.legend() when plotting empty bar chart with label
- PR #13524: Cleanup docs for GraphicsContextBase.{get,set}_dashes.
- PR #13556: Cleanup warnings handling in tests.
- PR #8100: Deprecate MAXTICKS, Locator.raise_if_exceeds.
- PR #13534: More followup to autoregistering 3d axes.
- PR #13327: pcolorfast simplifications.
- PR #13532: More use of cbook._check_in_list.
- PR #13520: Register 3d projection by default.
- PR #13394: Deduplicate some code between floating_axes and grid_helper_curvelinear.
- PR #13527: Make SubplotSpec.num2 never None.
- PR #12249: Replaced noqa-comments by using Axes3D.name instead of ’3d’ for proje...

Issues (125):
- #16487: Add link to blog to front page
- #16478: The bottom parameter of plt.hist() shifts the data as well, not just the baseline

• #9127: ps.useafm and axes.unicode_minus are incompatible
• #7571: matplotlib.widget.TextBox not correctly stopping keyboard shortcuts
• #14370: gcc error when building matplotlib dev from source
• #14011: TypeError on plt.subplot(figure=plt.figure())
• #13676: FuncAnimation with generator causes crash on StopIteration
• #9892: colormaps (cm) do not properly handle NaN values.
• #14122: Unexpected behavior in matplotlib.colors.to_rgba_array when passing unknown color name string
• #9546: The busy cursor is annoying in some instances
• #10788: TypeError when plotting stacked bar chart with decimal
• #14146: Saving polar plots with MiKTeX on Windows fails for some file formats
• #8532: Feature Request: draw percentiles in violinplot
• #13883: In headless mode, matplotlib.use(‘tkagg’) only errors after importing pyplot
• #13967: Creating colorbar without artist fails with LogNorm
• #12542: The plot function of the matplotlib 2 and 3 versions is much slower than 1.5.3
• #13292: Non-sensical negative radial scale minimum autoset in polar plot
• #10909: Calling a Normalize instance with a DataFrame
• #14076: Tick label positions wobble in animated Qt example
• #14007: GTK3Agg backend raises ImportError for missing cairo dependency
• #12911: Tick mark color cannot be set on Axes3D
• #12853: Remove()ing a shared axes prevents the remaining axes from using unit-provided formatters
• #13912: is_color_like returning erroneous value on strings of integers
• #13921: – with save fig in .pgf
• #13872: ValueError message requests impossible condition
• #13857: Zero-width figure crashes libpng
• #13768: broken_barh docstring incorrect information
• #13641: joinstyle is not respected for FancyArrowPatch (either the path or the arrow heads)
• #11923: ColorbarBase fails to show if the first two values map to the same result
• #11527: Inconsistent path intersection
• #13003: IndexError thrown by pyplot.legend() when plotting empty bar chart with label

7.1.6 GitHub Stats for Matplotlib 3.2.1

GitHub stats for 2020/03/03 - 2020/03/17 (tag: v3.2.0)
These lists are automatically generated, and may be incomplete or contain duplicates.
We closed 11 issues and merged 52 pull requests. The full list can be seen on GitHub and on GitHub
The following 12 authors contributed 154 commits.

• Amy Roberts
• Antony Lee
• Elliott Sales de Andrade
• hannah
• Hugo van Kemenade
• Jody Klymak
• Kyle Sunden
• MarcoGorelli
• Maximilian Nöthe
• Sandro Tosi
• Thomas A Caswell
• Tim Hoffmann
GitHub issues and pull requests:

Pull Requests (52):

- PR #15199: MNT/TST: generalize check_figures_equal to work with pytest.marks
- PR #15685: Avoid a RuntimeError at animation shutdown with PySide2.
- PR #15969: Restart pgf’s latex instance after bad latex inputs.
- PR #16640: ci: Fix Azure on v3.2.x
- PR #16648: Document filling of Poly3DCollection
- PR #16649: Fix typo in docs
- PR #16650: Backport PR #16649 on branch v3.2.x (Fix typo in docs)
- PR #16651: Docs: Change Python 2 note to past tense
- PR #16654: Backport PR #16651 on branch v3.2.0-doc (Docs: Change Python 2 note to past tense)
- PR #16656: Make test_imagegrid_cbar_mode_edge less flaky.
- PR #16661: added Framework :: Matplotlib to setup
- PR #16665: Backport PR #16661 on branch v3.2.x (added Framework :: Matplotlib to setup)
- PR #16671: Fix some readme bits
- PR #16672: Update CircleCI and add direct artifact link
- PR #16682: Avoid floating point rounding causing bezier.get_parallels to fail
- PR #16690: Backport PR #16682 on branch v3.2.x (Avoid floating point rounding causing bezier.get_parallels to fail)
- PR #16693: TST: use pytest name in naming files for check_figures_equal
- PR #16695: Restart pgf’s latex instance after bad latex inputs.
- PR #16705: Backport PR #16656 on branch v3.2.x (Make test_imagegrid_cbar_mode_edge less flaky.)
- PR #16708: Backport PR #16671: Fix some readme bits
- PR #16709: Fix saving PNGs to file objects in some places
- PR #16722: Deprecate rcParams[“datapath”] in favor of mpl.get_data_path()
- PR #16725: TST/CI: also try to run test_user_fonts_win32 on azure
- PR #16734: Disable draw.foo methods on renderer used to estimate tight extents.
- PR #16735: Make test.stem less flaky.
- PR #16736: xpdf: Set AutoRotatePages to None, not false.
- PR #16742: nbagg: Don’t send events if manager is disconnected.
- PR #16745: Allow numbers to set uvc for all arrows in quiver.set_UVC, fixes #16743
- PR #16751: Backport PR #16742 on branch v3.2.x (nbagg: Don’t send events if manager is disconnected.)
- PR #16752: ci: Disallow pytest 5.4.0, which is crashing.
- PR #16753: Backport #16752 to v3.2.x
• PR #16760: Backport PR #16735 on branch v3.2.x (Make test_stem less flaky.)
• PR #16761: Backport PR #16745 on branch v3.2.x (Allow numbers to set uvc for all arrows in quiver.set_UVC, fixes #16743)
• PR #16763: Backport PR #16648 on branch v3.2.x (Document filling of Poly3DCollection)
• PR #16764: Backport PR #16672 on branch v3.2.0-doc
• PR #16765: Backport PR #16736 on branch v3.2.x (xpdf: Set AutoRotatePages to None, not false.)
• PR #16766: Backport PR #16734 on branch v3.2.x (Disable draw_foo methods on renderer used to estimate tight extents.)
• PR #16767: Backport PR #15685 on branch v3.2.x (Avoid a Runtime Error at animation shutdown with PySide2.)
• PR #16768: Backport PR #16725 on branch v3.2.x (TST/CI: also try to run test_user_fonts_win32 on azure)
• PR #16770: Fix tuple markers
• PR #16779: Documentation: make instructions for documentation contributions easier to find, add to requirements for building docs
• PR #16784: Update CircleCI URL for downloading humor-sans.ttf.
• PR #16790: Backport PR #16784 on branch v3.2.x (Update CircleCI URL for downloading humor-sans.ttf.)
• PR #16791: Backport PR #16770 on branch v3.2.x (Fix tuple markers)
• PR #16794: DOC: Don’t mention drawstyle in set_linestyle docs.
• PR #16795: Backport PR #15199 on branch v3.2.x (MNT/TST: generalize check_figures_equal to work with pytest.marks)
• PR #16797: Backport #15589 and #16693, fixes for check_figures_equal
• PR #16799: Backport PR #16794 on branch v3.2.0-doc (DOC: Don’t mention drawstyle in set_linestyle docs.)
• PR #16800: Fix check_figures_equal for tests that use its fixtures.
• PR #16803: Fix some doc issues
• PR #16806: Backport PR #16803 on branch v3.2.0-doc (Fix some doc issues)
• PR #16809: Backport PR #16779 on branch v3.2.0-doc (Documentation: make instructions for documentation contributions easier to find, add to requirements for building docs)

Issues (11):
• #12820: [Annotations] ValueError: lines do not intersect when computing tight bounding box containing arrow with filled paths
• #16538: xpdf distiller seems broken
• #16624: Azure pipelines are broken on v3.2.x
• #16633: Wrong drawing Poly3DCollection
• #16645: Minor typo in API document of patches.ConnectionPatch

7.1. Previous GitHub Stats
• #16670: BLD: ascii codec decode on 3.2.0 in non-UTF8 locales
• #16704: 3.2.0: setup.py clean fails with NameError: name 'long_description' is not defined
• #16721: nbAgg backend does not allow saving figures as png
• #16731: PGF backend + savefig.bbox results in I/O error in 3.2
• #16743: Breaking change in 3.2: quiver.set_UVC does not support single numbers any more
• #16801: Doc: figure for colormaps off

Pull Requests (92):
  • PR #17655: Auto backport of pr 17564 on v3.2.x
• PR #17564: FIX: correctly handle large arcs
• PR #17641: Qt backports
• PR #17640: More qt fractional DPI fixes
• PR #17638: V3.2.1 doc
• PR #15656: Support fractional HiDpi scaling with Qt backends
• PR #17600: FIX: work with PyQt 5.15
• PR #17598: DOC: remove banner
• PR #17618: Doc event loop
• PR #17614: DOC: Remove duplicated line.
• PR #17611: Backport #17606 to v3.2.x
• PR #17609: Backport PR #17602: FIX: propagate _is_saving state when changing can...
• PR #17606: Move codecov.yml to .github.
• PR #17602: FIX: propagate _is_saving state when changing canvases
• PR #17605: Backport PR #17560: FIX: do not let no-op monkey patches to renderer leak out
• PR #17601: Backport PR #16948 on branch v3.2.x (solution: All subclasses of Location-Event could be used in cbook.callbacks before being fully initialized - issue 15139)
• PR #17560: FIX: do not let no-op monkey patches to renderer leak out
• PR #16948: solution: All subclasses of LocationEvent could be used in cbook.callbacks before being fully initialized - issue 15139
• PR #17588: Backport PR #17565: FIX: support Qt 5.15
• PR #17593: Backport PR #17587 on branch v3.2.x (Add a docstring to toolkit’s Bezier-Path._init_.)
• PR #17587: Add a docstring to toolkit’s BezierPath._init_.
• PR #17565: FIX: support Qt 5.15
• PR #17562: Backport PR #17470 on branch v3.2.x (FIX: add guardrails for too big tk figures)
• PR #17470: FIX: add guardrails for too big tk figures
• PR #17553: Backport PR #17552 on branch v3.2.x (ci: Add xcb libraries that were removed from PyQt5.)
• PR #17552: ci: Add xcb libraries that were removed from PyQt5.
• PR #17533: Backport PR #17408 on branch v3.2.x
• PR #17408: FIX: cancel pending autoscale on manually setting limits
• PR #17501: Backport PR #17499: Fix scatter singlecolor
• PR #17499: Fix scatter singlecolor
• PR #17468: v3.2.x: Fix leaks in C++ code
• PR #17457: Backport PR #17391 on branch v3.2.x
• PR #17391: tk/wx: Fix saving after the window is closed
• PR #17435: Backport PR #17422: Unstale viewlims before draw(ing) polar axes.

7.1. Previous GitHub Stats
• PR #17422: Unstale viewlims before draw()ing polar axes.
• PR #17407: FIX: don’t try to use non-standard functions on standard status bars
• PR #17346: Backport #17084 and #17210 to v3.2.x
• PR #17084: Fix macOS segfault
• PR #17300: Backport PR #17263 on branch v3.2.x (you can’t call CGDataProviderCreateWithData on a stack pointer)
• PR #17263: you can’t call CGDataProviderCreateWithData on a stack pointer
• PR #17272: Backport PR #17271 on branch v3.2.x (MNT: do not try to import xml.etree.cElementTree)
• PR #17271: MNT: do not try to import xml.etree.cElementTree
• PR #17268: Backport PR #17261 on branch v3.2.x (avoid calling wx.Bitmap() if width or height is zero)
• PR #17261: avoid calling wx.Bitmap() if width or height is zero
• PR #17257: Backport eps work
• PR #17255: Fix eps +usetex combo.
• PR #17254: Backport PR #17252 on branch v3.2.x (Fix bug where matplotlib.style(‘default’) resets the backend)
• PR #17252: Fix bug where matplotlib.style(‘default’) resets the backend
• PR #17250: Merge pull request #17206 from jklymak/fix-bypass-inverse-collection
• PR #17206: FIX: bypass inverse in collection
• PR #17241: Backport PR #17240 on branch v3.2.x (CI: Download wx wheels for the correct Ubuntu version.)
• PR #17240: CI: Download wx wheels for the correct Ubuntu version.
• PR #17210: Fix missing attribute in _SVGConverter.
• PR #17186: Backport PR #17131 on branch v3.2.x
• PR #17188: Backport PR #16958: MAINT: Replace uses of tostring with tobytes
• PR #17187: Backport PR #17076: Fix SyntaxErrors when running setup in old Python
• PR #16913: Fix use of psfrags in ps backend +usetex.
• PR #16476: Fix baseline alignment when using usetex.
• PR #17131: BUG: Fix formatting error in GridSpec.__repr__
• PR #17132: Backport PR #17126 on branch v3.2.x (Remove Python2/3 info box)
• PR #17126: Remove Python2/3 info box
• PR #17076: Fix SyntaxErrors when running setup in old Python
• PR #17071: Backport PR #17065 on branch v3.2.x (Fix macOS CI test failure)
• PR #17065: Fix macOS CI test failure
• PR #17051: Backport PR #17045: Fix missing-references.json.
• PR #17045: Fix missing-references.json.
• PR #17020: Merge pull request #17017 from jklymak/fix-blended-transform
• PR #17017: FIX: force blended transforms with data to be in data space
• PR #16989: Backport PR #16980 on branch v3.2.x (Correctly disable more drawing methods in tight_bboxing renderer.)
• PR #16980: Correctly disable more drawing methods in tight_bboxing renderer.
• PR #16974: Backport PR #16940 on branch v3.2.x (DOC/FIX: clarify the docs for check_figures_equal)
• PR #16979: Backport PR #16970 on branch v3.2.x (tk: Don’t resize toolbar during resize event.)
• PR #16970: tk: Don’t resize toolbar during resize event.
• PR #16940: DOC/FIX: clarify the docs for check_figures_equal
• PR #16969: Backport PR #16966 on branch v3.2.x (Fix animation writer fallback.)
• PR #16966: Fix animation writer fallback.
• PR #16958: MAINT: Replace uses of tostring with tobytes
• PR #16950: Backport PR #16949 on branch v3.2.x (TST: Don’t modify actual pyplot file for boilerplate test.)
• PR #16949: TST: Don’t modify actual pyplot file for boilerplate test.
• PR #16932: Backport PR #16929 on branch v3.2.x (tk: Resize the canvas, not the figure.)
• PR #16929: tk: Resize the canvas, not the figure.
• PR #16880: Backport PR #16870: Unbreak CI by xfailing wxAgg test on macOS
• PR #16870: Unbreak CI by xfailing wxAgg test on macOS
• PR #16869: Backport PR #16867 on branch v3.2.x (BLD: Auto-trigger macOS/Linux wheels on tags.)
• PR #16867: BLD: Auto-trigger macOS/Linux wheels on tags.
• PR #16852: Backport PR #16851 on branch v3.2.x (DOC: Fix docstring of Axes.secondary_yaxis.)
• PR #16851: DOC: Fix docstring of Axes.secondary_yaxis.
• PR #16842: Backport PR #16835 on branch v3.2.x (Don’t forget to export isdeleted on Qt4.)
• PR #16835: Don’t forget to export isdeleted on Qt4.
• PR #15695: Define mathdefault as a noop in the usetex preamble.
• PR #14694: Vectorize Arc.draw.

Issues (34):
• #17547: Arcs with large radii in small
• #17440: Low quality window plots on hidpi display
• #17104: input() caused _tkinter.TclError: invalid command name XXX after plot.close()
• #17613: Matplotlib.pdf duplication
• #15139: All subclasses of LocationEvent could be used in cbook.callbacks before being fully initialized
• #17004: Output regression in 3.2 that affects SymPy’s plotting
• #17599: Saving issue with pdf backend
• #17542: Matplotlib 3.2.1 savefig empty image when fig size matches data size exactly
• #17594: Cannot use Qt4Agg backend in mpl 3.2.1
• #17460: set_size_inches with a width over 14090 crashes Xorg
• #17331: Surprising/changed axis limit (autoscale) behavior
• #17423: Scatter produce multiple colors for a single RGB/RGBA input
• #17385: Matplotlib memory leaks when save figure in a file with qt5 backend
• #15474: Memory leak with log scale in pcolorfast, pcolormesh, imshow ...
• #17388: savefig error: tkinter.TclError: invalid command name “.”
• #16909: plot save and plot show
• #17085: set_function not working properly in backend_wx
• #17418: Issue rendering polar plot (agg backend?) with rorigin set
• #17061: Segmentation fault with macosx backend
• #17253: EPS + usetex is broken
• #16700: Deprecation warnings from stylelib
• #17203: Subplots using bad axis limits in 3.2
• #16898: EPS and usetex give blank output
• #16409: Confusing error on fully commented-out usetex strings
• #17075: Installation error downloading jquery on python3 on Ubuntu
• #17037: Travis Failing in many PRs
• #17033: Using a TextBox in current master produces a seemingly unrelated warning.
• #17016: Issues with autoscaling and transforms with 3.2+
• #16978: savefig(“myplot.svgz”, bbox_inches=“tight”) fails
• #16965: FuncAnimation.save throws TypeError
• #16916: check_figures_equal regression from 3.2.0 to 3.2.1
• #10566: blocking UI functions cause figure size to change
• #10083: Wrong figure height after set_size_inches within event handler
• #16834: Error importing FigureCanvas
8.1 List of changes to Matplotlib prior to 2015

This is a list of the changes made to Matplotlib from 2003 to 2015. For more recent changes, please refer to the what’s new or the API changes.

2015-11-16 Levels passed to contour(f) and tricontour(f) must be in increasing order.

2015-10-21 Added TextBox widget

2015-10-21 Added get_ticks_direction()

2015-02-27 Added the rcParam ‘image.composite_image’ to permit users to decide whether they want the vector graphics backends to combine all images within a set of axes into a single composite image. (If images do not get combined, users can open vector graphics files in Adobe Illustrator or Inkscape and edit each image individually.)

2015-02-19 Rewrite of C++ code that calculates contours to add support for corner masking. This is controlled by the ‘corner_mask’ keyword in plotting commands ‘contour’ and ‘contourf’. - IMT

2015-01-23 Text bounding boxes are now computed with advance width rather than ink area. This may result in slightly different placement of text.

2014-10-27 Allowed selection of the backend using the MPLBACKEND environment variable. Added documentation on backend selection methods.

2014-09-27 Overhauled colors.LightSource. Added LightSource.hillshade to allow the independent generation of illumination maps. Added new types of blending for creating more visually appealing shaded relief plots (e.g. blend_mode="overlay", etc, in addition to the legacy "hsv" mode).

2014-06-10 Added Colorbar.remove()

2014-06-07 Fixed bug so radial plots can be saved as ps in py3k.

2014-06-01 Changed the fmt kwarg of errorbar to support the mpl convention that “none” means “don't draw it”, and to default to the empty string, so that plotting of data points is done with the plot() function defaults. Deprecated use of the None object in place “none”.

2014-05-22 Allow the linscale keyword parameter of symlog scale to be smaller than one.

2014-05-20 Added logic to in FontManager to invalidate font-cache if font-family rcparams have changed.
2014-05-16 Fixed the positioning of multi-line text in the PGF backend.

2014-05-14 Added **Axes.add_image() as the standard way to add AxesImage** instances to Axes. This improves the consistency with add_artist(), add_collection(), add_container(), add_line(), add_patch(), and add_table().

2014-04-27 **Improved input clean up in Axes.{h|v}lines** Coerce input into a 1D ndarrays (after dealing with units).

2014-04-27 removed un-needed cast to float in stem

2014-04-23 Updated references to “ipython -pylab” The preferred method for invoking pylab is now using the “%pylab” magic. -Chris G.

2014-04-22 Added (re-)generate a simple automatic legend to “Figure Options” dialog of the Qt4Agg backend.

2014-04-22 Added an example showing the difference between interpolation = ‘none’ and interpolation = ‘nearest’ in `imshow` when saving vector graphics files.

2014-04-10 Fixed the triangular marker rendering error. The “Up” triangle was rendered instead of “Right” triangle and vice-versa.

2014-04-08 Fixed a bug in parasite_axes.py by making a list out of a generator at line 263.

2014-04-02 Added clipon=False to patch creation of wedges and shadows in `pie`.

2014-02-25 In backend_qt4agg changed from using update -> repaint under windows. See comment in source near self._priv_update for longer explanation.

2014-03-24 Changed the behaviour of axes to not ignore leading or trailing patches of height 0 (or width 0) while calculating the x and y axis limits. Patches having both height == 0 and width == 0 are ignored.

2014-03-24 Added bool kwarg (manage_xticks) to boxplot to enable/disable the managemnet of the xlimits and ticks when making a boxplot. Default in True which maintains current behavior by default.

2014-03-23 Fixed a bug in projections/polar.py by making sure that the theta value being calculated when given the mouse coordinates stays within the range of 0 and 2 * pi.

2014-03-22 Added the keyword arguments wedgeprops and textprops to `pie`. Users can control the wedge and text properties of the pie in more detail, if they choose.

2014-03-17 Bug was fixed in append_axes from the AxesDivider class would not append axes in the right location with respect to the reference locator axes

2014-03-13 Add parameter ‘clockwise’ to function pie, True by default.

2014-02-28 Added ‘origin’ kwarg to `spy`.

2014-02-27 Implemented separate horizontal/vertical axes padding to the ImageGrid in the AxesGrid toolkit
 Allowed markevery property of matplotlib.lines.Line2D to be, an int
numpy fancy index, slice object, or float. The float behaviour turns on markers at
approximately equal display-coordinate-distances along the line.

 In backend_qt4agg changed from using update -> repaint under
windows. See comment in source near self._priv_update for longer explanation.

 triplot now returns the artist it adds and support of line and marker
kargs has been improved. GBY

 Made streamplot grid size consistent for different types of density
argument. A 30x30 grid is now used for both density=1 and density=(1, 1).

 Added a pure boxplot-drawing method that allow a more complete
customization of boxplots. It takes a list of dicts contains stats. Also created a function
(cbook.boxplot_stats) that generates the stats needed.

 Added qhull extension module to perform Delaunay triangulation more
robustly than before. It is used by tri.Triangulation (and hence all pyplot.tri* methods)
and mlab.griddata. Deprecated matplotlib.delaunay module. - IMT

 Add power-law normalization method. This is useful for, e.g., showing
small populations in a "hist2d" histogram.

 Added get_rlabel_position and set_rlabel_position methods to PolarAxes
to control angular position of radial tick labels.

 Add stride-based functions to mlab for easy creation of 2D arrays with
less memory.

 Improve window and detrend functions in mlab, particularart support for
2D arrays.

 Improve performance of all spectrum-related mlab functions and plots.

 Added support for magnitude, phase, and angle spectrums to
axes.specgram, and support for magnitude, phase, angle, and complex spectrums
to mlab-specgram.

 Added magnitude_spectrum, angle_spectrum, and phase_spectrum plots,
as well as magnitude_spectrum, angle_spectrum, phase_spectrum, and com-
plex_spectrum functions to mlab

 Added support for datetime axes to 2d plots. Axis values are passed
through Axes.convert_xunits/Axes.convert_yunits before being used by con-
tour/contourf, pcolor, mesh and pcolor.

 Allowed matplotlib.dates.date2num, matplotlib.dates.num2date, and
matplotlib.dates.datestr2num to accept n-d inputs. Also factored in support for n-d
arrays to matplotlib.dates.DateConverter and matplotlib.units.Registry.

 Refactored the axes module: the axes module is now a folder,
containing the following submodule:

 * _subplots.py, containing all the subplots helper methods
 * _base.py, containing several private methods and a new _AxesBase class. This
_AxesBase class contains all the methods that are not directly linked to plots of
the "old" Axes
 * _axes.py contains the Axes class. This class now inherits from _AxesBase: it
contains all "plotting" methods and labelling methods.

8.1. List of changes to Matplotlib prior to 2015
This refactoring should not affect the API. Only private methods are not importable from the axes module anymore.

2013-05-18 **Added support for arbitrary rasterization resolutions to the SVG backend.** Previously the resolution was hard coded to 72 dpi. Now the backend class takes a `image_dpi` argument for its constructor, adjusts the image bounding box accordingly and forwards a magnification factor to the image renderer. The code and results now resemble those of the PDF backend. - MW

2013-05-08 **Changed behavior of hist when given stacked=True and normed=True.** Histograms are now stacked first, then the sum is normalized. Previously, each histogram was normalized, then they were stacked.

2013-04-25 Changed all instances of:

from matplotlib import MatplotlibDeprecationWarning as mplDeprecation to:

from cbook import mplDeprecation

and removed the import into the matplotlib namespace in `__init__.py` Thomas Caswell

2013-04-15 **Added `axes.xmargin` and `axes.ymargin` to `rcParams` to set default margins on auto-scaling.** - TAC

2013-04-16 Added patheffect support for Line2D objects. -JL

2013-03-31 **Added support for arbitrary unstructured user-specified triangulations** to `Axes3D.tricontour[f]` - Damon McDougall

2013-03-19 **Added support for passing linestyle kwarg to step so all plot kwargs are passed to the underlying plot call.** -TAC

2013-02-25 **Added classes CubicTriInterpolator, UniformTriRefiner, TriAnalyzer** to `matplotlib.tri` module. - GBy

2013-01-23 **Add `savefig.directory` to `rcParams` to remember and fill in the last directory saved to for figure save dialogs** - Martin Spacek

2013-01-13 **Add eventplot method to axes and pyplot and EventCollection class to collections.**

2013-01-08 **Added two extra titles to axes which are flush with the left and right edges of the plot respectively.** Andrew Dawson

2013-01-07 Add framealpha keyword argument to legend - PO

2013-01-16 Till Stensitzki added a baseline feature to stackplot

2012-12-22 **Added classes for interpolation within triangular grids** (LinearTriInterpolator) and to find the triangles in which points lie (TrapezoidMapTriFinder) to `matplotlib.tri` module. - IMT

2012-12-05 **Added MatplotlibDeprecationWarning class for signaling deprecation.** Matplotlib developers can use this class as follows:

from matplotlib import MatplotlibDeprecationWarning as mplDeprecation

In light of the fact that Python builtins DeprecationWarnings are ignored by default as of Python 2.7, this class was put in to allow for the signaling of deprecation, but via UserWarnings which are not ignored by default. - PI
2012-11-27 Added the \texttt{mtext} parameter for supplying \texttt{matplotlib.text.Text} instances to \texttt{RendererBase.draw_text} and \texttt{RendererBase.draw_text}. This allows backends to utilize additional text attributes, like the alignment of text elements. - pwuertz

2012-11-26 deprecate \texttt{matplotlib/mpl.py}, which was used only in \texttt{pylab.py} and is now replaced by the more suitable \texttt{import matplotlib as mpl} - PI

2012-11-25 Make \texttt{rc_context} available via pyplot interface - PI

2012-11-16 \texttt{plt.set_cmap} no longer throws errors if there is not already an active colorable artist, such as an image, and just sets up the colormap to use from that point forward. - PI

2012-11-16 Added the function \texttt{get_rgb_face}, which is identical to \texttt{get_rgb_face} except it return a (r,g,b,a) tuple, to \texttt{line2D}. Modified \texttt{Line2D.draw} to use \texttt{get_rgb_face} to get the markerface color so that any alpha set by markerfacecolor will respected. - Thomas Caswell

2012-11-13 Add a symmetric log normalization class to \texttt{colors.py}. Also added some tests for the normalization class. Till Stensitzki

2012-11-12 Make \texttt{axes.stem} take at least one argument. Uses a default range(n) when the first arg not provided. Damon McDougall

2012-11-09 Make \texttt{plt.subplot()} without arguments act as subplot(111) - PI

2012-11-08 Replaced \texttt{plt.figure} and \texttt{plt.subplot} calls by the newer, more convenient single call to \texttt{plt.subplots()} in the documentation examples - PI

2012-10-05 Add support for saving animations as animated GIFs. - JVDP

2012-08-11 Fix path-closing bug in patches.Polygon, so that regardless of whether the path is the initial one or was subsequently set by \texttt{set_xy()}, \texttt{get_xy()} will return a closed path if and only if \texttt{get_closed()} is True. Thanks to Jacob Vanderplas. - EF

2012-08-05 When a norm is passed to \texttt{contourf}, either or both of the \texttt{vmin}, \texttt{vmax} attributes of that norm are now respected. Formerly they were respected only if both were specified. In addition, \texttt{vmin} and/or \texttt{vmax} can now be passed to \texttt{contourf} directly as kwargs. - EF

2012-07-24 Contourf handles the \texttt{extend} kwarg by mapping the extended ranges outside the normed 0-1 range so that they are handled by colormap colors determined by the \texttt{set_under} and \texttt{set_over} methods. Previously the extended ranges were mapped to 0 or 1 so that the “under” and “over” colormap colors were ignored. This change also increases slightly the color contrast for a given set of contour levels. - EF

2012-06-24 Make use of mathtext in tick labels configurable - DSD

2012-06-05 Images loaded through PIL are now ordered correctly - CG

2012-06-02 Add new Axes method and pyplot function, \texttt{hist2d}. - PO

2012-05-31 Remove support for ‘cairo.<format>’ style of backend specification. Deprecate ‘cairo.format’ and ‘savefig.extension’ rcParams and replace with ‘savefig.format’. - Martin Spacek

2012-05-29 \texttt{pcolormesh} now obeys the passed in “edgecolor” kwarg. To support this, the “shading” argument to \texttt{pcolormesh} now only takes “flat” or “gouraud”. To achieve the old “faceted” behavior, pass “edgecolors='k'”. - MGD

2012-05-22 Added radius kwarg to pie charts. - HH
2012-05-22 Collections now have a setting “offset_position” to select whether the offsets are given in “screen” coordinates (default, following the old behavior) or “data” coordinates. This is currently used internally to improve the performance of hexbin.

As a result, the “draw_path_collection” backend methods have grown a new argument “offset_position”. - MGD

2012-05-04 Add a new argument to pie charts - starting angle - that allows one to specify the angle offset for the first wedge of the chart. - EP

2012-05-03 symlog scale now obeys the logarithmic base. Previously, it was completely ignored and always treated as base e. - MGD

2012-05-03 Allow linscale/x/y keyword to symlog scale that allows the size of the linear portion relative to the logarithmic portion to be adjusted. - MGD

2012-04-14 Added new plot style: stackplot. This new feature supports stacked area plots. - Damon McDougall

2012-04-06 When path clipping changes a LINETO to a MOVETO, it also changes any CLOSEPOLY command to a LINETO to the initial point. This fixes a problem with pdf and svg where the CLOSEPOLY would then draw a line to the latest MOVETO position instead of the intended initial position. - JKS

2012-03-27 Add support to ImageGrid for placing colorbars only at one edge of each column/row. - RMM

2012-03-07 Refactor movie writing into useful classes that make use of pipes to write image data to ffmpeg or mencoder. Also improve settings for these and the ability to pass custom options. - RMM

2012-02-29 errrorevery keyword added to errorbar to enable errorbar subsampling. fixes issue #600.

2012-02-28 Added plot_trisurf to the mplot3d toolkit. This supports plotting three dimensional surfaces on an irregular grid. - Damon McDougall

2012-01-23 The radius labels in polar plots no longer use a fixed padding, but use a different alignment depending on the quadrant they are in. This fixes numerical problems when (rmax - rmin) gets too small. - MGD

2012-01-08 Add axes.streamplot to plot streamlines of a velocity field. Adapted from Tom Flannaghan streamplot implementation. - TSY

2011-12-29 ps and pdf markers are now stroked only if the line width is nonzero for consistency with agg, fixes issue #621. - JKS

2011-12-27 Work around an EINTR bug in some versions of subprocess. - JKS

2011-10-25 added support for operatorname to mathtext, including the ability to insert spaces, such as $operatorname{arg,max}$ - PI

2011-08-18 Change api of Axes.get_tightbbox and add an optional keyword parameter call_axes_locator. - JJL

2011-07-29 A new rcParam “axes.formatter.use_locale” was added, that, when True, will use the current locale to format tick labels. This means that, for example, in the fr_FR locale, ‘,’ will be used as a decimal separator. - MGD

2011-07-15 The set of markers available in the plot() and scatter() commands has been unified. In general, this gives more options to both than were previously available, however, there is one backward-incompatible change to the markers in scatter:
“d” used to mean “diamond”, it now means “narrow diamond”. "D" can be used for a "diamond“.

-MGD

2011-07-13 Fix numerical problems in symlog scale, particularly when linthresh <= 1.0. Symlog plots may look different if one was depending on the old broken behavior - MGD

2011-07-10 Fixed argument handling error in tripcolor/triplot/tricontour, issue #203. - IMT

2011-07-08 Many functions added to mplot3d.axes3d to bring Axes3D objects more feature-parity with regular Axes objects. Significant revisions to the documentation as well. - BVR

2011-07-07 Added compatibility with IPython strategy for picking a version of Qt4 support, and an rcParam for making the choice explicitly: backend.qt4. - EF

2011-07-07 Modified AutoMinorLocator to improve automatic choice of the number of minor intervals per major interval, and to allow one to specify this number via a kwarg. - EF

2011-06-28 3D versions of scatter, plot, plot_wireframe, plot_surface, bar3d, and some other functions now support empty inputs. - BVR

2011-06-22 Add set_theta_offset, set_theta_direction and set_theta_zero_location to polar axes to control the location of 0 and directionality of theta. - MGD

2011-06-22 Add axes.labelweight parameter to set font weight to axis labels - MGD.

2011-06-20 Add pause function to pyplot. - EF

2011-06-16 Added bottom keyword parameter for the stem command. Also, implemented a legend handler for the stem plot. - JJL

2011-06-16 Added legend.frameon rcParams. - Mike Kaufman

2011-05-31 Made backend.Qt4 compatible with PySide. - Gerald Storer

2011-04-17 Disable keyboard auto-repeat in qt4 backend by ignoring key events resulting from auto-repeat. This makes constrained zoom/pan work. - EF

2011-04-14 interpolation="nearest" always interpolate images. A new mode "none" is introduced for no interpolation - JJL

2011-04-03 Fixed broken pick interface to AsteriskCollection objects used by scatter. - EF

2011-04-01 The plot directive Sphinx extension now supports all of the features in the Numpy fork of that extension. These include doctest formatting, an ‘include-source’ option, and a number of new configuration options. - MGD

2011-03-29 Wrapped ViewVCCachedServer definition in a factory function. This class now inherits from urllib2.HTTPSHandler in order to fetch data from github, but HTTPSHandler is not defined if python was built without SSL support. - DSD

2011-03-10 Update pytz version to 2011c, thanks to Simon Cross. - JKS

2011-03-06 Add standalone tests.py test runner script. - JKS

2011-03-06 Set edgecolor to ‘face’ for scatter asterisk-type symbols; this fixes a bug in which these symbols were not responding to the c kwarg. The symbols have no face area, so only the edgecolor is visible. - EF
2011-02-27 Support libpng version 1.5.x; suggestion by Michael Albert. Changed installation specification to a minimum of libpng version 1.2. - EF

2011-02-20 clabel accepts a callable as an fmt kwarg; modified patch by Daniel Hyams. - EF

2011-02-18 scatter([], []) is now valid. Also fixed issues with empty collections - BVR

2011-02-07 Quick workaround for dviread bug #3175113 - JKS

2011-02-05 Add cbook memory monitoring for Windows, using tasklist. - EF

2011-02-05 Speed up Normalize and LogNorm by using in-place operations and by using float32 for float32 inputs and for ints of 2 bytes or shorter; based on patch by Christoph Gohlke. - EF

2011-02-04 Changed imshow to use rgba as uint8 from start to finish, instead of going through an intermediate step as double precision; thanks to Christoph Gohlke. - EF

2011-01-13 Added zdir and offset arguments to contourf3d to bring contourf3d in feature parity with contour3d. - BVR

2011-01-04 Tag 1.0.1 for release at r8896

2011-01-03 Added display of ticker offset to 3d plots. - BVR

2011-01-03 Turn off tick labeling on interior subplots for pyplots.subplots when sharex/sharey is True. - JDH

2010-12-29 Implement axes_divider:HBox and VBox. -JJL

2010-11-22 Fixed error with Hammer projection. - BVR

2010-11-12 Fixed the placement and angle of axis labels in 3D plots. - BVR

2010-11-07 New rc parameters examples.download and examples.directory allow bypassing the download mechanism in get_sample_data. - JKS

2010-10-04 Fix JPEG saving bug: only accept the kwargs documented by PIL for JPEG files. - JKS

2010-09-15 Remove unused _wxagg extension and numerix.h. - EF

2010-08-25 Add new framework for doing animations with examples.- RM

2010-08-21 Change Axis.set_view_interval() so that when updating an existing interval, it respects the orientation of that interval, and can enlarge but not reduce the interval. This fixes a bug in which Axis.set_ticks would change the view limits of an inverted axis. Whether set_ticks should be affecting the viewLim at all remains an open question. - EF

2010-08-16 Handle NaN's correctly in path analysis routines. Fixes a bug where the best location for a legend was not calculated correctly when the line contains NaNs. - MGD

2010-08-14 Fix bug in patch alpha handling, and in bar color kwarg - EF

2010-08-12 Removed all traces of numerix module after 17 months of deprecation warnings. - EF
2010-08-05 Added keyword arguments ‘thetaunits’ and ‘runits’ for polar plots.  
Fixed PolarAxes so that when it set default Formatters, it marked them as such. 
Fixed semilogx and semilogy to no longer blindly reset the ticker information on the 
non-log axis. Axes.arrow can now accept unitized data. - JRE

2010-08-03 Add support for MPLSETUPCFG variable for custom setup.cfg filename.  
Used by sage buildbot to build an mpl w/ no gui support - JDH

2010-08-01 Create directory specified by MPLCONFIGDIR if it does not exist. - ADS

2010-07-20 Return Qt4’s default cursor when leaving the canvas - DSD

2010-07-06 Tagging for mpl 1.0 at r8502

2010-07-05 Added Ben Root’s patch to put 3D plots in arbitrary axes, allowing you to 
mix 3d and 2d in different axes/subplots or to have multiple 3D plots in one figure. See 
examples/mplot3d/subplot3d_demo.py - JDH

2010-07-05 Preferred kwarg names in set_xlim are now ‘left’ and ‘right’; in set_ylim, ‘bottom’ and ‘top’; original kwargs are still accepted without complaint. - EF

2010-07-05 TkAgg and FltkAgg backends are now consistent with other interactive 
backends: when used in scripts from the command line (not from ipython -pylab), show 
blocks, and can be called more than once. - EF

2010-07-02 Modified CXX/WrapPython.h to fix “swab bug” on solaris so mpl 
can compile on Solaris with CXX6 in the trunk. Closes tracker bug 3022815 - JDH

2010-06-30 Added autoscale convenience method and corresponding pyplot function 
for simplified control of autoscaling; and changed axis, set_xlim, and set_ylim so that by 
default, they turn off the autoscaling on the relevant axis or axes. Therefore one can call 
set_xlim before plotting a line, for example, and the limits will be retained. - EF

2010-06-20 Added Axes.tick_params and corresponding pyplot function to control 
tick and tick label appearance after an Axes has been created. - EF

2010-06-09 Allow Axes.grid to control minor gridlines; allow Axes.grid and Axis.grid 
to control major and minor gridlines in the same method call. - EF

2010-06-06 Change the way we do split/dividend adjustments in finance.py to handle 
dividends and fix the zero division bug reported in sf bug 2949906 and 2123566. Note 
that volume is not adjusted because the Yahoo CSV does not distinguish between share 
split and dividend adjustments making it near impossible to get volume adjustment right 
(unless we want to guess based on the size of the adjustment or scrape the html tables, 
which we don’t) - JDH

2010-06-06 Updated dateutil to 1.5 and pytz to 2010h.

2010-06-02 Add error_kw kwarg to Axes.bar(). - EF

2010-06-01 Fix pcolormesh() and QuadMesh to pass on kwargs as appropriate. - RM

2010-05-18 Merge mpl_toolkits.gridspec into the main tree. - JYL

2010-05-04 Improve backend_qt4 so it displays figures with the correct size - DSD

2010-04-20 Added generic support for connecting to a timer for events. This adds 
TimerBase, TimerGTK, TimerQT, TimerWx, and TimerTk to the backends and a 
new_timer() method to each backend’s canvas to allow ease of creating a new timer. - RM

2010-04-20 Added margins() Axes method and pyplot function. - EF

2010-04-18 update the axes_grid documentation. - JYL
2010-04-18 Control MaxNLocator parameters after instantiation, and via 
Axes.locator_params method, with corresponding pyplot function. -EF

2010-04-18 Control ScalarFormatter offsets directly and via the 
Axes.ticklabel_format() method, and add that to pyplot. -EF

2010-04-16 Add a close_event to the backends. -RM

2010-04-06 modify axes_grid examples to use axes_grid1 and axisartist. -JJL

2010-04-06 rebase axes_grid using axes_grid1 and axisartist modules. -JJL

2010-04-06 axes_grid toolkit is split into two separate modules, axes_grid1 and axis-
artist. -JJL

2010-04-05 Speed up import: import pytz only if and when it is needed. It is not 
needed if the rc timezone is UTC. - EF

2010-04-03 Added color kwarg to Axes.hist(), based on work by Jeff Klukas. - EF

2010-03-24 refactor colorbar code so that no cla() is necessary when mappable is 
changed. -JJL

2010-03-22 fix incorrect rubber band during the zoom mode when mouse leaves the 
axes. -JJL

2010-03-21 x/y key during the zoom mode only changes the x/y limits. -JJL

2010-03-20 Added pyplot.sca() function suggested by JJL. - EF

2010-03-20 Added conditional support for new Tooltip API in gtk backend. - EF

2010-03-20 Changed plt.fig_subplot() to plt.subplots() after discussion on list, and 
changed its API to return axes as a numpy object array (with control of dimensions via 
squeeze keyword). FP

2010-03-13 Manually brought in commits from branch:

(continues on next page)
2010-02-25 add annotation_demo3.py that demonstrates new functionality. -JJL

2010-02-25 refactor Annotation to support arbitrary Transform as xycoords or textcoords. Also, if a tuple of two coordinates is provided, they are interpreted as coordinates for each x and y position. -JJL

2010-02-24 Added pyplot.fig_subplot(), to create a figure and a group of subplots in a single call. This offers an easier pattern than manually making figures and calling add_subplot() multiple times. FP

2010-02-17 Added Gokhan’s and Mattias’ customizable keybindings patch for the toolbar. You can now set the keymap.* properties in the matplotlibrc file. Newbindings were added for toggling log scaling on the x-axis. JDH

2010-02-16 Committed TJ’s filled marker patch for left|right|bottom|top|full filled markers. See examples/pylab_examples/filledmarker_demo.py. JDH

2010-02-11 Added ‘bootstrap’ option to boxplot. This allows bootstrap estimates of median confidence intervals. Based on an initial patch by Paul Hobson. - ADS

2010-02-06 Added setup.cfg “basedirlist” option to override setting in setupext.py “basedir” dictionary; added “gnu0” platform requested by Benjamin Drung. - EF

2010-02-03 Made plot_directive use a custom PlotWarning category, so that warnings can be turned into fatal errors easily if desired. - FP

2010-01-29 Added draggable method to Legend to allow mouse drag placement. Thanks Adam Fraser. JDH

2010-01-25 Fixed a bug reported by Olle Engdegard, when using histograms with stepfilled and log=True - MM

2010-01-16 Upgraded CXX to 6.1.1 - JDH

2009-01-16 Don’t create minor ticks on top of existing major ticks. Patch by Neil Crighton. -ADS

2009-01-16 Ensure three minor ticks always drawn (SF# 2924245). Patch by Neil Crighton. -ADS

2010-01-16 Applied patch by Ian Thomas to fix two contouring problems: now contourf handles interior masked regions, and the boundaries of line and filled contours coincide. - EF

2009-01-11 The color of legend patch follows the rc parameters axes.facecolor and axes.edgecolor. -JJL

2009-01-11 adjustable of Axes can be “box-forced” which allow sharing axes. -JJL

2009-01-11 Add add_click and pop_click methods in BlockingContourLabeler. -JJL

2010-01-03 Added rcParams[‘axes.color_cycle’] - EF

2010-01-03 Added Pierre’s qt4 formlayout editor and toolbar button - JDH

2009-12-31 Add support for using math text as marker symbols (Thanks to tcb)

* MGD
2009-12-31 Commit a workaround for a regression in PyQt4-4.6.{0,1} - DSD
2009-12-22 Fix cmap data for gist_earth_r, etc. -JJL
2009-12-20 spines: put spines in data coordinates, add set_bounds() call. -ADS
2009-12-18 Don’t limit notch size in boxplot to q1-q3 range, as this is effectively making the data look better than it is. - ADS
2009-12-18 mlab.prctile handles even-length data, such that the median is the mean of the two middle values. - ADS
2009-12-15 Add raw-image (unsampled) support for the ps backend. - JJL
2009-12-14 Add patch_artist kwarg to boxplot, but keep old default. Convert boxplot_demo2.py to use the new patch_artist. - ADS
2009-12-06 axes_grid: reimplemented AxisArtist with FloatingAxes support. Added new examples. - JJL
2009-12-01 Applied Laurent Dufrechou’s patch to improve blitting with the qt4 backend - DSD
2009-11-13 The pdf backend now allows changing the contents of a pdf file’s information dictionary via PdfPages.infodict. - JKS
2009-11-12 font_manager.py should no longer cause EINTR on Python 2.6 (but will on the 2.5 version of subprocess). Also the fc-list command in that file was fixed so now it should actually find the list of fontconfig fonts. - JKS
2009-11-10 Single images, and all images in renderers with option_image_nocomposite (i.e. agg, macosx and the svg backend when rc-Params['svg.image_noscale'] is True), are now drawn respecting the zorder relative to other artists. (Note that there may now be inconsistencies across backends when more than one image is drawn at varying zorders, but this change introduces correct behavior for the backends in which it’s easy to do so.)
2009-10-21 Make AutoDateLocatormore configurable by adding options to control the maximum and minimum number of ticks. Also add control of the intervals to be used for ticking. This does not change behavior but opens previously hard-coded behavior to runtime modification'. - RMM
2009-10-19 Add “path_effects” support for Text and Patch. See examples/pylab_examples/patheffect_demo.py -JJL
2009-10-19 Add “use_clabeltext” option to clabel. If True, clabels will be created with ClabelText class, which recalculates rotation angle of the label during the drawing time. -JJL
2009-10-16 Make AutoDateFormatter actually use any specified timezone setting. This was only working correctly when no timezone was specified. - RMM
2009-09-27 Beginnings of a capability to test the pdf backend. - JKS
2009-09-27 Add a savefig.extension rcparam to control the default filename extension used by savefig. - JKS
2009-09-21 Tagged for release 0.99.1
2009-09-20 Fix usetex spacing errors in pdf backend. - JKS
2009-09-20 Add Sphinx extension to highlight IPython console sessions, originally authored (I think) by Michael Droetboom. - FP

2009-09-20 Fix off-by-one error in dviread.Tfm, and additionally protect against exceptions in case a dvi font is missing some metrics. - JKS

2009-09-15 Implement draw_text and draw_tex method of backend base using the textpath module. Implement draw_tex method of the svg backend. - JJL

2009-09-15 Don’t fail on AFM files containing floating-point bounding boxes - JKS

2009-09-13 AxesGrid [add modified version of colorbar. Add colorbar] location howto. - JJL

2009-09-07 AxesGrid [implemented axisline style.] Added a demo examples/axes_grid/demo_axisline_style.py- JJL

2009-09-04 Make the textpath class as a separate module (textpath.py). Add support for mathtext and tex.- JJL

2009-09-01 Added support for Gouraud interpolated triangles. pcolormesh now accepts shading=’gouraud’ as an option. - MGD

2009-08-29 Added matplotlib.testing package, which contains a Nose plugin and a decorator that lets tests be marked as KnownFailures - ADS

2009-08-20 Added scaled dict to AutoDateFormatter for customized scales - JDH

2009-08-15 Pyplot interface: the current image is now tracked at the figure and axes level, addressing tracker item 1656374. - EF

2009-08-15 Docstrings are now manipulated with decorators defined in a new module, docstring.py, thanks to Jason Coombs. - EF

2009-08-14 Add support for image filtering for agg back end. See the example demo_agg_filter.py. -JJL

2009-08-09 AnnotationBbox added. Similar to Annotation, but works with OffsetBox instead of Text. See the example demo_annotation_box.py. -JJL

2009-08-07 BboxImage implemented. Two examples, demo_bboximage.py and demo_ribbon_box.py added. - JJL

2009-08-07 In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```python
draw_path_collection(self, master_transform, cliprect, clippath,
    clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors,
    edgecolors, linewidths, linestyles, antialiaseds, urls)
```
becomes:

```python
draw_path_collection(self, gc, master_transform, paths, all_transforms,
    offsets, offsetTrans, facecolors, edgecolor, linewidths, linestyles, antialiaseds, urls)
```

```python
draw_quad_mesh(self, master_transform, cliprect, clippath,
    clippath_trans, meshWidth, meshHeight, coordinates, offsets, offsetTrans, facecolors, antialiased, showedges)
```
becomes:

```python
draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
    coordinates, offsets, offsetTrans, facecolors, antialiased, showedges)
```
draw_image(self, x, y, im, bbox, clippath=None, clippath_trans=None)

becomes:

draw_image(self, gc, x, y, im)

• MGD

2009-08-06 Tagging the 0.99.0 release at svn r7397 - JDH
• fixed an alpha colormapping bug posted on sf 2832575
• fix typo in axes_divider.py. use nanmin, nanmax in angle_helper.py (patch by Christoph Gohlke)
• remove dup gui event in enter/leave events in gtk
• lots of fixes for os x binaries (Thanks Russell Owen)
• attach gtk events to mpl events – fixes sf bug 2816580
• applied sf patch 2815064 (middle button events for wx) and patch 2818092 (resize events for wx)
• fixed boilerplate.py so it doesn’t break the ReST docs.
• removed a couple of cases of mlab.load
• fixed rec2csv win32 file handle bug from sf patch 2831018
• added two examples from Josh Hemann: examples/pylab_examples/barchart_demo2.py and examples/pylab_examples/boxplot_demo2.py
• handled sf bugs 2831556 and 2830525; better bar error messages and backend driver configs
• added miktex win32 patch from sf patch 2820194
• apply sf patches 2830233 and 2823885 for osx setup and 64 bit; thanks Michiel

2009-08-04 Made cbook.get_sample_data make use of the ETag and Last-Modified headers of mod_dav_svn. - JKS

2009-08-03 Add PathCollection; modify contourf to use complex paths instead of simple paths with cuts. - EF

2009-08-03 Fixed boilerplate.py so it doesn’t break the ReST docs. - JKS

2009-08-03 pylab no longer provides a load and save function. These are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary numpy arrays. - JDH

2009-07-31 Added cbook.get_sample_data for urllib enabled fetching and caching of data needed for examples. See examples/misc/sample_data_demo.py - JDH

2009-07-31 Tagging 0.99.0.rc1 at 7314 - MGD

2009-07-30 Add set_cmap and register_cmap, and improve get_cmap, to provide convenient handling of user-generated colormaps. Reorganized _cm and cm modules. - EF

2009-07-28 Quiver speed improved, thanks to tip by Ray Speth. -EF

2009-07-27 Simplify argument handling code for plot method. -EF

2009-07-25 Allow “plot(1, 2, ‘r*’)” to work. - EF
2009-07-22 Added an ‘interp’ keyword to griddata so the faster linear interpolation method can be chosen. Default is ‘nn’, so default behavior (using natural neighbor method) is unchanged (JSW)

2009-07-22 Improved boilerplate.py so that it generates the correct signatures for pyplot functions. - JKS

2009-07-19 Fixed the docstring of Axes.step to reflect the correct meaning of the kwargs "pre" and "post" - See SF bug https://sourceforge.net/tracker/index.php?func=detail&aid=2823304&group_id=80706&atid=560720 - JDL

2009-07-18 Fix support for hatches without color fills to pdf and svg backends. Add an example of that to hatch_demo.py. - JKS

2009-07-17 Removed fossils from swig version of agg backend. - EF

2009-07-14 initial submission of the annotation guide. -JL

2009-07-14 axes_grid [minor improvements in anchored_artists and] inset_locator. -JL

2009-07-14 Fix a few bugs in ConnectionStyle algorithms. Add ConnectionPatch class. -JL

2009-07-11 Added a fillstyle Line2D property for half filled markers - see examples/pylab_examples/fillstyle_demo.py JDH

2009-07-08 Attempt to improve performance of qt4 backend, do not call qApp.processEvents while processing an event. Thanks Ole Streicher for tracking this down - DSD

2009-06-24 Add withheader option to mlab.rec2csv and changed use_mrecords default to False in mlab.csv2rec since this is partially broken - JDH

2009-06-24 backend_agg.draw_marker quantizes the main path (as in the draw_path). - JDL

2009-06-24 axes_grid: floating axis support added. - JDL

2009-06-14 Add new command line options to backend_driver.py to support running only some directories of tests - JKS

2009-06-13 partial cleanup of mlab and its importation in pylab - EF

2009-06-13 Introduce a rotation_mode property for the Text artist. See examples/pylab_examples/demo_text_rotation_mode.py -JL

2009-06-07 add support for bz2 files per sf support request 2794556 - JDH

2009-06-06 added a properties method to the artist and inspector to return a dict mapping property name -> value; see sf feature request 2792183 - JDH

2009-06-06 added Neil’s auto minor tick patch; sf patch #2789713 - JDH

2009-06-06 do not apply alpha to rgba color conversion if input is already rgba - JDH

2009-06-03 axes_grid [Initial check-in of curvilinear grid support. See] examples/axes_grid/demo_curvilinear_grid.py -JL

2009-06-01 Add set_color method to Patch - EF

2009-06-01 Spine is now derived from Patch - ADS

2009-06-01 use cbook.is_string_like() instead of isinstance() for spines - ADS

2009-06-01 cla() support for spines - ADS
2009-06-01 Removed support for gtk < 2.4. - EF

2009-05-29 Improved the animation_blit_qt4 example, which was a mix of the object-oriented and pylab interfaces. It is now strictly object-oriented - DSD

2009-05-28 Fix axes_grid toolkit to work with spine patch by ADS. - JJJL

2009-05-28 Applied fibanco's patch to handle scroll wheel events in the qt4 backend - DSD

2009-05-26 Add support for "axis spines" to have arbitrary location. - ADS

2009-05-20 Add an empty matplotlibrc to the tests/directory so that running tests will use the default set of rcparams rather than the user's config. - RMM

2009-05-19 Axis.grid(): allow use of which='major,minor' to have grid on major and minor ticks. - ADS

2009-05-18 Make psd(), csd(), and cohere() wrap properly for complex/two-sided versions, like specgram() (SF #2791686) - RMM

2009-05-18 Fix the linespacing bug of multiline text (#1239682). See examples/pylab_examples/multiline.py - JJJL

2009-05-18 Add annotation_clip attr. for text.Annotation class. If True, annotation is only drawn when the annotated point is inside the axes area. - JJJL

2009-05-17 Fix bug(#2749174) that some properties of minor ticks are not conserved. - JJJL

2009-05-17 applied Michiel's sf patch 2790638 to turn off gtk event loop in setupext for pygtk>=2.15.10 - JDH

2009-05-17 applied Michiel's sf patch 2792742 to speed up Cairo and macosx collections; speedups can be 20x. Also fixes some bugs in which gc got into inconsistent state

2008-05-17 Release 0.98.5.3 at r7107 from the branch - JDH

2009-05-13 An optional offset and bbox support in restore_bbox. Add animation_blit_gtk2.py - JJJL

2009-05-13 psfrag in backend_ps now uses baseline-alignment when preview.sty is used ((default is bottom-alignment). Also, a small API improvement in OffsetBox-JJJL

2009-05-13 When the x-coordinate of a line is monotonically increasing, it is now automatically clipped at the stage of generating the transformed path in the draw method; this greatly speeds up zooming and panning when one is looking at a short segment of a long time series, for example. - EF

2009-05-11 aspect=1 in log-log plot gives square decades. - JJJL

2009-05-08 clabel takes new kwarg, rightside_up; if False, labels will not be flipped to keep them rightside-up. This allows the use of clabel to make streamfunction arrows, as requested by Evan Mason. - EF

2009-05-07 'labelpad' can now be passed when setting x/y labels. This allows controlling the spacing between the label and its axis. - RMM

2009-05-06 print_ps now uses mixed-mode renderer. Axes.draw rasterize artists whose zorder smaller than rasterization_zorder. - JJJL

2009-05-06 Per-artist Rasterization, originally by Eric Bruning. - JJ
2009-05-05 Add an example that shows how to make a plot that updates using data from another process. Thanks to Robert Cimrman - RMM

2009-05-05 Add Axes.get_legend_handles_labels method. - JJJL

2009-05-04 Fix bug that Text.Annotation is still drawn while set to not visible. - JJJL

2009-05-04 Added TJ’s fill_betweenx patch - JDH

2009-05-02 Added options to plotfile based on question from Joseph Smidt and patch by Matthias Michler. - EF

2009-05-01 Changed add_artist and similar Axes methods to return their argument. - EF

2009-04-30 Incorrect eps bbox for landscape mode fixed - JJJL

2009-04-28 Fixed incorrect bbox of eps output whenusetex=True. - JJJL

2009-04-24 Changed use of os.open* to instead use subprocess.Popen. os.popen* are deprecated in 2.6 and are removed in 3.0. - RMM

2009-04-20 Worked on axes_grid documentation. Added axes_grid.inset_locator. - JJJL

2009-04-17 Initial check-in of the axes_grid toolkit. - JJJL

2009-04-17 Added a support for bbox_to_anchor in offsetbox.AnchoredOffsetbox. Improved a documentation. - JJJL

2009-04-16 Fixed a offsetbox bug that multiline texts are not correctly aligned. - JJJL

2009-04-16 Fixed a bug in mixed mode renderer that images produced by an rasterizing backend are placed with incorrect size. - JJJL

2009-04-14 Added Jonathan Taylor’s Reinier Heeres’ port of John Porters’ mplot3d to svn trunk. Package in mpl_toolkits.mplot3d and demo is examples/mplot3d/demo.py. Thanks Reiner

2009-04-06 The pdf backend now escapes newlines and linefeeds in strings. Fixes sf bug #2708559; thanks to Tiago Pereira for the report.

2009-04-06 texmanager.make_dvi now raises an error if LaTeX failed to create an output file. Thanks to Joao Luis Silva for reporting this. - JKS

2009-04-05 _png.read_png() reads 12 bit PNGs (patch from Tobias Wood) - ADS

2009-04-04 Allow log axis scale to clip non-positive values to small positive value; this is useful for errorbars. - EF

2009-03-28 Make images handle nan in their array argument. A helper, cbook.safe_masked_invalid() was added. - EF

2009-03-25 Make contour and contourf handle nan in their Z argument. - EF

2009-03-20 Add AuxTransformBox in offsetbox.py to support some transformation. anchored_text.py example is enhanced and renamed (anchored_artists.py). - JJJL

2009-03-17 Fix bugs in edge color handling by contour, found by Jae-Joon Lee. - EF

2009-03-14 Added ‘LightSource’ class to colors module for creating shaded relief maps. shading_example.py added to illustrate usage. - JSW

2009-03-11 Ensure wx version >= 2.8; thanks to Sandro Tosi and Chris Barker. - EF
2009-03-10 Fix join style bug in pdf. - JKS
2009-03-07 Add pyplot access to figure number list - EF
2009-02-28 hashing of FontProperties accounts current rcParams - JJL
2009-02-28 Prevent double-rendering of shared axis in twinx, twiny - EF
2009-02-26 Add optional bbox_to_anchor argument for legend class - JJL
2009-02-26 Support image clipping in pdf backend. - JKS
2009-02-25 Improve tick location subset choice in FixedLocator. - EF

2009-02-24 Deprecate numerix, and strip out all but the numpy part of the code. - EF
2009-02-21 Improve scatter argument handling; add an early error message, allow inputs to have more than one dimension. - EF

2009-02-16 Move plot_directive.py to the installed source tree. Add support for inline code content - MGD
2009-02-16 Move mathmpl.py to the installed source tree so it is available to other projects. - MGD
2009-02-14 Added the legend title support - JJL

2009-02-10 Fixed a bug in backend_pdf so it doesn’t break when the setting pdf.use14corefonts=True is used. Added test case in unit/test_pdf_use14corefonts.py. - NGR
2009-02-08 Added a new imsave function to image.py and exposed it in the pyplot interface - GR
2009-02-04 Some reorganization of the legend code. anchored_text.py added as an example. - JJL
2009-02-04 Add extent keyword arg to hexbin - ADS
2009-02-04 Fix bug in mathtext related to dots and ldots - MGD
2009-02-03 Change default joinstyle to round - MGD
2009-02-02 Reduce number of marker XObjects in pdf output - JKS
2009-02-02 Change default resolution on polar plot to 1 - MGD
2009-02-02 Avoid malloc errors in ttconv for fonts that don’t have e.g., PostName (a version of Tahoma triggered this) - JKS

2009-01-30 Remove support for pyExcelerator in exceltools - use xlwt instead - JDH
2009-01-29 Document ‘resolution’ kwarg for polar plots. Support it when using pyplot.polar, not just Figure.add_axes. - MGD
2009-01-29 Rework the nan-handling/clipping/quantizing/simplification framework so each is an independent part of a pipeline. Expose the C++-implementation of all of this so it can be used from all Python backends. Add rcParam “path.simplify_threshold” to control the threshold of similarity below which vertices will be removed.

2009-01-26 Improved tight bbox option of the savefig. - JJL
2009-01-26 Make curves and NaNs play nice together - MGD

2009-01-21 Changed the defaults of acorr and xcorr to use usevlines=True, maxlags=10 and normed=True since these are the best defaults
2009-01-19 Fix bug in quiver argument handling. - EF
2009-01-19 Fix bug in backend_gtk: don’t delete nonexistent toolbar. - EF

2009-01-16 Implement bbox_inches option for savefig. If bbox_inches is “tight”, try to determine the tight bounding box. - JJL

2009-01-16 Fix bug in is_string_like so it doesn’t raise an unnecessary exception. - EF

2009-01-16 Fix an infinite recursion in the unit registry when searching for a converter for a sequence of strings. Add a corresponding test. - RM

2009-01-16 Bugfix of C typedef of MPL_Int64 that was failing on Windows XP 64 bit, as reported by George Goussard on numpy mailing list. - ADS

2009-01-16 Added helper function LinearSegmentedColormap.from_list to facilitate building simple custom colomaps. See examples/pylab_examples/custom_cmap_fromlist.py - JDH

2009-01-16 Applied Michiel’s patch for macosx backend to fix rounding bug. Closed sf bug 2508440 - JSW

2009-01-10 Applied Michiel’s hatch patch for macosx backend and draw_idle patch for qt. Closes sf patched 2497785 and 2468809 - JDH

2009-01-10 Fix bug in pan/zoom with log coordinates. - EF

2009-01-06 Fix bug in setting of dashed negative contours. - EF

2009-01-06 Be fault tolerant when len(linestyles)>NLev in contour. - MM

2009-01-06 Added marginals kwarg to hexbin to plot marginal densities - JDH

2009-01-06 Change user-visible multipage pdf object to PdfPages to avoid accidents with the file-like PdfFile. - JKS

2009-01-05 Fix a bug in pdf usetex: allow using non-embedded fonts. - JKS

2009-01-05 optional use of preview.sty in usetex mode. - JJL

2009-01-02 Allow multipage pdf files. - JKS

2008-12-31 Improve pdf usetex by adding support for font effects (slanting and extending). - JKS

2008-12-29 Fix a bug in pdf usetex support, which occurred if the same Type-1 font was used with different encodings, e.g., with Minion Pro and MnSymbol. - JKS

2008-12-20 fix the dpi-dependent offset of Shadow. - JJL

2008-12-20 fix the hatch bug in the pdf backend. minor update in docs and example - JJL

2008-12-19 Add axes_locator attribute in Axes. Two examples are added.

• JJL

2008-12-19 Update Axes.legend documentation. /api/api_changes.rst is also updated to describe changes in keyword parameters. Issue a warning if old keyword parameters are used. - JJL

2008-12-18 add new arrow style, a line + filled triangles. -JJL

2008-12-18 Re-Released 0.98.5.2 from v0_98_5_maint at r6679 Released 0.98.5.2 from v0_98_5_maint at r6667
2008-12-18 Removed configobj, experimental traits and doc/mpl_data link - JDH

**2008-12-18** Fix bug where a line with NULL data limits prevents subsequent data limits from calculating correctly - MGD

2008-12-17 Major documentation generator changes - MGD

**2008-12-17** Applied macosx backend patch with support for path collections, quadmesh, etc... - JDH

**2008-12-17** Fix dpi-dependent behavior of text bbox and arrow in annotate - JJL

**2008-12-17** Add group id support in artist. Two examples which demonstrate svg filter are added. - JJL

2008-12-16 Another attempt to fix dpi-dependent behavior of Legend. - JJL

2008-12-16 Fixed dpi-dependent behavior of Legend and fancybox in Text.

**2008-12-16** Added markevery property to Line2D to support subsampling of markers - JDH

**2008-12-15** Removed mpl_data symlink in docs. On platforms that do not support symlinks, these become copies, and the font files are large, so the distro becomes unnecessarily bloated. Keeping the mpl_examples dir because relative links are harder for the plot directive and the *.py files are not so large. - JDH

**2008-12-15** Fix $ in non-math text with usetex on/off. Document differences between usetex on/off - MGD

2008-12-15 Fix anti-aliasing when auto-snapping - MGD

2008-12-15 Fix grid lines not moving correctly during pan and zoom - MGD

**2008-12-12** Preparations to eliminate maskedarray rcParams key: its use will now generate a warning. Similarly, importing the obsolete numerix.npyma will generate a warning. - EF

**2008-12-12** Added support for the numpy.histogram() weights parameter to the axes hist() method. Docs taken from numpy - MM

2008-12-12 Fixed warning in hist() with numpy 1.2 - MM

**2008-12-12** Removed external packages: configobj and enthought.traits which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently, see:

http://code.enthought.com/pages/traits.html

and:

http://www.voidspace.org.uk/python/configobj.html

2008-12-12 Added support to assign labels to histograms of multiple data. - MM

2008-12-11 Released 0.98.5 at svn r6573

**2008-12-11** Use subprocess.Popen instead of os.popen in dviread (Windows problem reported by Jorgen Stenarson) - JKS

**2008-12-10** Added Michael’s font_manager fix and Jae-Joon’s figure/subplot fix. Bumped version number to 0.98.5 - JDH
2008-12-09 Released 0.98.4 at svn r6536
2008-12-08 Added mdehoon’s native macosx backend from sf patch 2179017 - JDH

**2008-12-08** Removed the prints in the set_*style commands. Return the list of printed strings instead - JDH

**2008-12-08** Some of the changes Michael made to improve the output of the property tables in the rest docs broke of made difficult to use some of the interactive doc helpers, e.g., setp and getp. Having all the rest markup in the ipython shell also confused the docstrings. I added a new rc param docstring.hardcopy, to format the docstrings differently for hard copy and other use. The ArtistInspector could use a little refactoring now since there is duplication of effort between the rest out put and the non-rest output - JDH

**2008-12-08** Updated spectral methods (psd, csd, etc.) to scale one-sided densities by a factor of 2 and, optionally, scale all densities by the sampling frequency. This gives better MatLab compatibility. -RM

2008-12-08 Fixed alignment of ticks in colorbars. -MGD

**2008-12-07** drop the deprecated “new” keyword of np.histogram() for numpy 1.2 or later. -JJL

**2008-12-06** Fixed a bug in svg backend that new_figure_manager() ignores keywords arguments such as figsize, etc. -JJL

**2008-12-05** Fixed a bug that the handlelength of the new legend class set too short when numpoints=1 -JJL

**2008-12-04** Added support for data with units (e.g., dates) to Axes.fill_between. -RM

**2008-12-04** Added fancybox keyword to legend. Also applied some changes for better look, including baseline adjustment of the multiline texts so that it is center aligned. -JJL

**2008-12-02** The transmuter classes in the patches.py are reorganized as subclasses of the Style classes. A few more box and arrow styles are added. -JJL

**2008-12-02** Fixed a bug in the new legend class that didn’t allowed a tuple of coordinate values as loc. -JJL

**2008-12-02** Improve checks for external dependencies, using subprocess (instead of deprecated popen*) and distutils (for version checking) - DSD

**2008-11-30** Reimplementation of the legend which supports baseline alignment, multi-column, and expand mode. - JJL

**2008-12-01** Fixed histogram autoscaling bug when bins or range are given explicitly (fixes Debian bug 503148) - MM

**2008-11-25** Added rcParam axes.unicode_minus which allows plain hyphen for minus when False - JDH

**2008-11-25** Added scatterpoints support in Legend. patch by Erik Tollerud - JJL

2008-11-24 Fix crash in log ticking. - MGD

**2008-11-20** Added static helper method BrokenHBarCollection.span_where and Axes/pyplot method fill_between. See examples/pylab/fill_between.py - JDH
2008-11-12 Add \texttt{x	extunderscore isdata} and \texttt{y	extunderscore isdata} attributes to \texttt{Artist} instances, and use them to determine whether either or both coordinates are used when updating \texttt{dataLim}. This is used to fix autoscaling problems that had been triggered by \texttt{axhline}, \texttt{axhspan}, \texttt{axvline}, \texttt{axvspan}. - EF

2008-11-11 Update the \texttt{psd()}, \texttt{csd()}, \texttt{cohere()}, and \texttt{specgram()} methods of \texttt{Axes} and the \texttt{csd()} \texttt{cohere()}, and \texttt{specgram()} functions in \texttt{mlab} to be in sync with the changes to \texttt{psd()}. In fact, under the hood, these all call the same core to do computations. - RM

2008-11-11 Add ‘pad	extunderscore to’ and ‘sides’ parameters to \texttt{mlab.psd()} to allow controlling of zero padding and returning of negative frequency components, respectively. These are added in a way that does not change the API. - RM

2008-11-10 Fix handling of \texttt{c kwarg by scatter}; \texttt{generalize is	extunderscore string	extunderscore like} to accept \texttt{numpy} and \texttt{numpy.ma} string array scalars. - RM and EF

2008-11-09 Fix a possible \texttt{EINTR} problem in \texttt{dviread}, which might help when saving pdf files from the \texttt{qt} backend. - JKS

2008-11-05 Fix bug with zoom to rectangle and twin axes - MGD

2008-10-24 Added Jae Joon’s fancy arrow, box and annotation enhancements – see examples/pylab_examples/annotation_demo2.py

2008-10-23 Autoscaling is now supported with shared axes - EF

2008-10-23 Fixed exception in \texttt{dviread} that happened with Minion - JKS

2008-10-21 \texttt{set_xlim}, \texttt{ylim} now return a copy of the viewlim array to avoid modify in-place surprises

2008-10-20 Added image thumbnail generating function \texttt{matplotlib.image.thumbnail}. See examples/misc/image_thumbnail.py - JDH

2008-10-20 Applied scatleg patch based on ideas and work by Erik Tollerud and Jae-Joon Lee. - MM

2008-10-11 Fixed bug in pdf backend: if you pass a file object for output instead of a filename, e.g., in a wep app, we now flush the object at the end. - JKS

2008-10-08 Add path simplification support to paths with gaps. - EF

2008-10-05 Fix problem with AFM files that don’t specify the font’s full name or family name. - JKS

2008-10-04 Added ‘scilimits’ kwarg to \texttt{Axes.ticklabel	extunderscore format()} method, for easy access to the \texttt{set	extunderscore powerlimits} method of the major ScalarFormatter. - EF

2008-10-04 Experimental new kwarg borderpad to replace \texttt{pad} in legend, based on suggestion by Jae-Joon Lee. - EF

2008-09-27 Allow \texttt{spy} to ignore zero values in sparse arrays, based on patch by Tony Yu. Also fixed plot to handle empty data arrays, and fixed handling of markers in figlegend. - EF

2008-09-24 Introduce drawstyles for lines. Transparently split linestyles like ‘steps–’ into drawstyle ‘steps’ and linestyle ‘–’. Legends always use drawstyle ‘default’. - MM

2008-09-18 Fixed quiver and quiverkey bugs (failure to scale properly) when resizing) and added additional methods for determining the arrow angles - EF

2008-09-18 Fix polar interpolation to handle negative values of theta - MGD
2008-09-14 Reorganized cbook and mlab methods related to numerical calculations that have little to do with the goals of those two modules into a separate module numerical_methods.py. Also, added ability to select points and stop point selection with keyboard in ginput and manual contour labeling code. Finally, fixed contour labeling bug. - DMK

2008-09-11 Fix backtick in Postscript output. - MGD

2008-09-10 [2089958] Path simplification for vector output backends Leverage the simplification code exposed through path_to_polygons to simplify certain well-behaved paths in the vector backends (PDF, PS and SVG). “path.simplify” must be set to True in matplotlibrc for this to work. - MGD

2008-09-10 Add “filled” kwarg to Path.intersects_path and Path.intersects_bbox. - MGD

2008-09-07 Changed full arrows slightly to avoid an xpdf rendering problem reported by Friedrich Hagedorn. - JKS

2008-09-07 Fix conversion of quadratic to cubic Bezier curves in PDF and PS backends. Patch by Jae-Joon Lee. - JKS

2008-09-06 Added 5-point star marker to plot command - EF

2008-09-05 Fix hatching in PS backend - MGD

2008-09-03 Fix log with base 2 - MGD

2008-09-01 Added support for bilinear interpolation in NonUniformImage; patch by Gregory Lielens. - EF

2008-08-28 Added support for multiple histograms with data of different length - MM

2008-08-28 Fix step plots with log scale - MGD

2008-08-28 Fix masked arrays with markers in non-Agg backends - MGD

2008-08-28 Fix clip_on kwarg so it actually works correctly - MGD

2008-08-25 Fix locale problems in SVG backend - MGD

2008-08-22 fix quiver so masked values are not plotted - JSW

2008-08-18 improve interactive pan/zoom in qt4 backend on windows - DSD

2008-08-11 Fix more bugs in NaN/inf handling. In particular, path simplification (which does not handle NaNs or infs) will be turned off automatically when infs or NaNs are present. Also masked arrays are now converted to arrays with NaNs for consistent handling of masks and NaNs - MGD and EF

2008-08-03 Released 0.98.3 at svn r5947

2008-08-01 Backported memory leak fixes in _ttconv.cpp - MGD

2008-07-31 Added masked array support to griddata. - JSW

2008-07-26 Added optional C and reduce_C_function arguments to axes.hexbin(). This allows hexbin to accumulate the values of C based on the x,y coordinates and display in hexagonal bins. - ADS

2008-07-24 Deprecated (raise NotImplementedError) all the mlab2 functions from matplotlib.mlab out of concern that some of them were not clean room implementations. - JDH
2008-07-24 Rewrite of a significant portion of the clabel code (class ContourLabeler) to improve inlining. - DMK

2008-07-22 Added Barbs polygon collection (similar to Quiver) for plotting wind barbs. Added corresponding helpers to Axes and pyplot as well. (examples/pylab_examples/barb_demo.py shows it off.) - RMM

2008-07-21 Added scikits.delaunay as matplotlib.delaunay. Added griddata function in matplotlib.mlab, with example (griddata_demo.py) in pylab_examples. griddata function will use mpl_toolkits.natgrid if installed. - JSW

2008-07-21 Re-introduced offset_copy that works in the context of the new transforms. - MGD

2008-07-21 Committed patch by Ryan May to add get_offsets and set_offsets to Collections base class - EF

2008-07-21 Changed the “asarray” strategy in image.py so that colormapping of masked input should work for all image types (thanks Klaus Zimmerman) - EF

2008-07-20 Rewrote cbook.delete_masked_points and corresponding unit test to support rgb color array inputs, datetime inputs, etc. - EF

2008-07-20 Renamed unit/axes_unit.py to cbook_unit.py and modified in accord with Ryan’s move of delete_masked_points from axes to cbook. - EF

2008-07-18 Check for nan and inf in axes.delete_masked_points(). This should help hexbin and scatter deal with nans. - ADS

2008-07-17 Added ability to manually select contour label locations. Also added a waitforbuttonpress function. - DMK

2008-07-17 Fix bug with NaNs at end of path (thanks, Andrew Straw for the report) - MGD

2008-07-16 Improve error handling in texmanager, thanks to Ian Henry for reporting - DSD

2008-07-12 Added support for external backends with the “module://my_backend” syntax - JDH

2008-07-11 Fix memory leak related to shared axes. Grouper should store weak references. - MGD

2008-07-10 Bugfix: crash displaying fontconfig pattern - MGD

2008-07-10 Bugfix: [ 2013963 ] update_datalim_bounds in Axes not works - MGD

2008-07-10 Bugfix: [ 2014183 ] multiple imshow() causes gray edges - MGD

2008-07-09 Fix rectangular axes patch on polar plots bug - MGD

2008-07-09 Improve mathtext radical rendering - MGD

2008-07-08 Improve mathtext superscript placement - MGD

2008-07-07 Fix custom scales in pcolormesh (thanks Matthew Turk) - MGD

2008-07-03 Implemented findobj method for artist and pyplot - see examples/pylab_examples/findobj_demo.py - JDH

2008-06-30 Another attempt to fix TextWithDash - DSD

2008-06-30 Removed Qt4 NavigationToolbar2.destroy - it appears to have been unnecessary and caused a bug reported by P. Raybaut - DSD
2008-06-27 Fixed tick positioning bug - MM

2008-06-27 **Fix dashed text bug where text was at the wrong end of the** dash - MGD

2008-06-26 Fix mathtext bug for expressions like $x_{\leftarrow}$ - MGD

2008-06-26 Fix direction of horizontal/vertical hatches - MGD

2008-06-25 **Figure.figurePatch renamed Figure.patch, Axes.axesPatch renamed** Axes.patch, Axes.axesFrame renamed Axes.frame, Axes.get_frame, which returns Axes.patch, is deprecated. Examples and users guide updated - JDH

2008-06-25 Fix rendering quality of pcolor - MGD

2008-06-24 Released 0.98.2 at svn r5667 - (source only for debian) JDH

2008-06-24 Added “transparent” kwarg to savefig. - MGD

2008-06-24 **Applied Stefan’s patch to draw a single centered marker over** a line with numpoints==1 - JDH

2008-06-23 Use splines to render circles in scatter plots - MGD

2008-06-22 Released 0.98.1 at revision 5637

2008-06-22 **Removed axes3d support and replaced it with a** NotImplementedException for one release cycle

2008-06-21 fix marker placement bug in backend_ps - DSD

2008-06-20 [ 1978629 ] scale documentation missing/incorrect for log - MGD

2008-06-20 **Added closed kwarg to PolyCollection. Fixes bug [ 1994535 ] still missing lines on graph with svn (r 5548).** - MGD

2008-06-20 **Added set/get_closed method to Polygon; fixes error in hist** - MM

2008-06-19 **Use relative font sizes (e.g., ‘medium’ and ‘large’) in** rcsetup.py and matplotlibrc.template so that text will be scaled by default when changing rc-Params[‘font.size’] - EF

2008-06-17 **Add a generic PatchCollection class that can contain any** kind of patch. - MGD

2008-06-13 **Change pie chart label alignment to avoid having labels overwrite the pie** - MGD

2008-06-12 **Added some helper functions to the mathtext parser to** return bitmap arrays or write pngs to make it easier to use mathtext outside the context of an mpl figure. modified the mathpng sphinxext to use the mathtext png save functionality - see examples/api/mathtext_asarray.py - JDH

2008-06-11 **Use matplotlib.mathtext to render math expressions in** online docs - MGD

2008-06-11 **Move PNG loading/saving to its own extension module, and remove** duplicate code in _backend_agg.cpp and _image.cpp that does the same thing - MGD

2008-06-11 **Numerous mathtext bugfixes, primarily related to** dpi-independence - MGD
2008-06-10  Bar now applies the label only to the first patch only, and
    sets _nolegend_ for the other patch labels. This lets
    autolegend work as expected for hist and bar - see
    JDH

2008-06-10  Fix text baseline alignment bug. [ 1985420 ] Repair of baseline alignment in Text._get_layout. Thanks Stan West - MGD

2008-06-09  Committed Gregor's image resample patch to downsampling images with new rcparam image.resample - JDH

2008-06-09  Don’t install Enthought.Traits along with matplotlib. For matplotlib developers convenience, it can still be installed by setting an option in setup.cfg while we figure decide if there is a future for the traited config - DSD

2008-06-09  Added range keyword arg to hist() - MM

2008-06-07  Moved list of backends to rcsetup.py; made use of lower case for backend names consistent; use validate_backend when importing backends subpackage - EF

2008-06-06  hist() revision, applied ideas proposed by Erik Tollerud and Olle Engdegard: make histtype='step' unfilled by default and introduce histtype='stepfilled'; use default color cycle; introduce reverse cumulative histogram; new align keyword - MM

2008-06-06  Fix closed polygon patch and also provide the option to not close the polygon - MGD

2008-06-05  Fix some dpi-changing-related problems with PolyCollection, as called by Axes.scatter() - MGD

2008-06-05  Fix image drawing so there is no extra space to the right or bottom - MGD

2006-06-04  Added a figure title command suptitle as a Figure method and pyplot command - see examples/figure_title.py - JDH

2008-06-02  Added support for log to hist with histtype='step' and fixed a bug for log-scale stacked histograms - MM

2008-05-29  Released 0.98.0 at revision 5314

2008-05-29  matplotlib.image.imread now no longer always returns RGBA – if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.

2008-05-29  Implement path clipping in PS backend - JDH

2008-05-29  Fixed two bugs in texmanager.py: improved comparison of dvipng versions fixed a bug introduced when get_grey method was added - DSD

2008-05-28  Fix crashing of PDFs in xpdf and ghostscript when two-byte characters are used with Type 3 fonts - MGD

2008-05-28 zero width/height Rectangles no longer influence the autoscaler. Useful for log histograms with empty bins - JDH

2008-05-28 Fix rendering of composite glyphs in Type 3 conversion (particularly as evidenced in the Eunjin.ttf Korean font) Thanks Jae-Joon Lee for finding this!

2008-05-27 Rewrote the cm.ScalarMappable callback infrastructure to use cbook.CallbackRegistry rather than custom callback handling. Amy users of add Observer/notify of the cm.ScalarMappable should use the cm.ScalarMappable.callbacksSM CallbackRegistry instead. JDH

2008-05-27 Fix TkAgg build on Ubuntu 8.04 (and hopefully a more general solution for other platforms, too.)

2008-05-24 Added PIL support for loading images to imread (if PIL is available) - JDH

2008-05-23 Provided a function and a method for controlling the plot color cycle. - EF

2008-05-23 Major revision of hist(). Can handle 2D arrays and create stacked histogram plots; keyword ‘width’ deprecated and rwidth (relative width) introduced; align='edge' changed to center of bin - MM

2008-05-22 Added support for ReST-based documentation using Sphinx. Documents are located in doc/, and are broken up into a users guide and an API reference. To build/run the make.py files. Sphinx-0.4 is needed to build generate xml, which will be useful for rendering equations with mathml, use sphinx from svn until 0.4 is released - DSD

2008-05-21 Fix segfault in TkAgg backend - MGD

2008-05-21 Fix a “local variable unreferenced” bug in plotfile - MM

2008-05-19 Fix crash when Windows can not access the registry to determine font path [Bug 1966974, thanks Patrik Simons] - MGD

2008-05-16 removed some unneeded code w/ the python 2.4 requirement. cbook no longer provides compatibility for reversed, enumerate, set or izip. removed lib/subprocess, mpl1, sandbox/units, and the swig code. This stuff should remain on the maintenance branch for archival purposes. JDH

2008-05-16 Reorganized examples dir - JDH

2008-05-16 Added ‘elinewidth’ keyword arg to errorbar, based on patch by Christopher Brown - MM

2008-05-16 Added ‘cumulative’ keyword arg to hist to plot cumulative histograms. For normed hists, this is normalized to one - MM

2008-05-15 Fix Tk backend segfault on some machines - MGD

2008-05-14 Don’t use stat on Windows (fixes font embedding problem) - MGD

2008-05-09 Fix /singlequote (’) in Postscript backend - MGD

2008-05-08 Fix kerning in SVG when embedding character outlines - MGD

2008-05-07 Switched to future numpy histogram semantic in hist - MM

2008-05-06 Fix strange colors when blitting in QtAgg and Qt4Agg - MGD

2008-05-05 pass notify axes change to the figure’s add axobserver in the qt backends, like we do for the other backends. Thanks Glenn Jones for the report - DSD

2008-05-02 Added step histograms, based on patch by Erik Tollerud. - MM
2008-05-02  On PyQt <= 3.14 there is no way to determine the underlying Qt version. [1851364] - MGD

2008-05-02  Don’t call sys.exit() when pyemf is not found [1924199] - MGD

2008-05-02  Update subprocess.c from upstream Python 2.5.2 to get a few memory and reference-counting-related bugfixes. See bug 1949978. - MGD

2008-04-30  Added some record array editing widgets for gtk - see examples/rec_edit*.py - JDH

2008-04-29  Fix bug in mlab.sqrtm - MM

2008-04-28  Fix bug in SVG text with Mozilla-based viewers (the symbol tag is not supported) - MGD

2008-04-27  Applied patch by Michiel de Hoon to add hexbin axes method and pyplot function - EF

2008-04-25  Enforce python >= 2.4; remove subprocess build - EF

2008-04-25  Enforce the numpy requirement at build time - JDH

2008-04-24  Make numpy 1.1 and python 2.3 required when importing matplotlib - EF

2008-04-24  Fix compilation issues on VS2003 (Thanks Martin Spacek for all the help) - MGD

2008-04-24  Fix sub/superscripts when the size of the font has been changed - MGD

2008-04-22  Use “svg.embed_char_paths” consistently everywhere - MGD

2008-04-20  Add support to MaxNLocator for symmetric axis autoscaling. - EF

2008-04-20  Fix double-zoom bug. - MM

2008-04-15  Speed up color mapping. - EF

2008-04-12  Speed up zooming and panning of dense images. - EF

2008-04-11  Fix global font rcParam setting after initialization time. - MGD

2008-04-11  Revert commits 5002 and 5031, which were intended to avoid an unnecessary call to draw(). 5002 broke saving figures before show(). 5031 fixed the problem created in 5002, but broke interactive plotting. Unnecessary call to draw still needs resolution - DSD

2008-04-07  Improve color validation in rc handling, suggested by Lev Givon - EF

2008-04-02  Allow to use both linestyle definition arguments, ‘-‘ and ‘solid’ etc. in plots/collections - MM

2008-03-27  Fix saving to Unicode filenames with Agg backend (other backends appear to already work...) (Thanks, Christopher Barker) - MGD

2008-03-26  Fix SVG backend bug that prevents copying and pasting in Inkscape (thanks Kaushik Ghose) - MGD

2008-03-24  Removed an unnecessary call to draw() in the backend_qt* mouseReleaseEvent. Thanks to Ted Drain - DSD

2008-03-23  Fix a pdf backend bug which sometimes caused the outermost gsave to not be balanced with a grestore. - JKS
2008-03-20 Fixed a minor bug in ContourSet._process_linestyles when
len(linestyles)==Nlev - MM

2008-03-19 Changed ma import statements to "from numpy import ma"; this should
work with past and future versions of numpy, whereas "import numpy.ma as ma" will
work only with numpy >= 1.05, and "import numerix.npyma as ma" is obsolete now that
maskedarray is replacing the earlier implementation, as of numpy 1.05.

2008-03-14 Removed an apparently unnecessary call to FigureCanvasAgg.draw in
backend_qt*agg. Thanks to Ted Drain - DSD

2008-03-10 Workaround a bug in backend_qt4agg’s blitting due to a buffer
width/bbox width mismatch in _backend_agg’s copy_from_bbox - DSD

2008-02-29 Fix class Wx toolbar pan and zoom functions (Thanks Jeff Peery) - MGD

2008-02-16 Added some new rec array functionality to mlab (rec_summarize, rec2txt
and rec_groupby). See examples/rec_groupby_demo.py. Thanks to Tim M for rec2txt.

2008-02-12 Applied Erik Tollerud’s span selector patch - JDH

2008-02-11 Update plotting() doc string to refer to getp/setp. - JKS

2008-02-10 Fixed a problem with square roots in the pdf backend with usetex. - JKS

2008-02-08 Fixed minor __str__ bugs so getp(gca()) works. - JKS

2008-02-05 Added getters for title, xlabel, ylabel, as requested by Brandon Kieth - EF

2008-02-05 Applied Gael’s ginput patch and created examples/ginput_demo.py - JDH

2008-02-03 Expose interpnames, a list of valid interpolation methods, as an AxesIm-
age class attribute. - EF

2008-02-03 Added BoundaryNorm, with examples in colorbar_only.py and image_masked.py. - EF

2008-02-03 Force dpi=72 in pdf backend to fix picture size bug. - JKS

2008-02-01 Fix doubly-included font problem in Postscript backend - MGD

2008-02-01 Fix reference leak in ft2font Glyph objects. - MGD

2008-01-31 Don’t use unicode strings with usetex by default - DSD

2008-01-31 Fix text spacing problems in PDF backend with some fonts, such as STIXGeneral.

2008-01-31 Fix sqrt with radical number (broken by making [ and ] work below) - MGD

2008-01-27 Applied Martin Teichmann’s patch to improve the Qt4 backend. Uses
Qt’s builtin toolbars and statusbars. See bug 1828848 - DSD

2008-01-10 Moved toolkits to mpl_toolkits, made mpl_toolkits a namespace package - JSWHIT

2008-01-10 Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

2008-01-10 Fix bug displaying [ and ] in mathtext - MGD

2008-01-10 Fix bug when displaying a tick value offset with scientfic notation.
(Manifests itself as a warning that the times symbol can not be found). - MGD
2008-01-10 Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

2008-01-06 Released 0.91.2 at revision 4802

2007-12-26 Reduce too-late use of matplotlib.use() to a warning instead of an exception, for backwards compatibility - EF

2007-12-25 Fix bug in errorbar, identified by Noriko Minakawa - EF

2007-12-25 Changed masked array importing to work with the upcoming numpy 1.05 (now the maskedarray branch) as well as with earlier versions. - EF

2007-12-16 rec2csv saves doubles without losing precision. Also, it does not close filehandles passed in open. - JDH, ADS

2007-12-13 Moved rec2gtk to matplotlib.toolkits.gtktools and rec2excel to matplotlib.toolkits.exceltools - JDH

2007-12-12 Support alpha-blended text in the Agg andSvg backends - MGD

2007-12-10 Fix SVG text rendering bug. - MGD

2007-12-10 Increase accuracy of circle and ellipse drawing by using an 8-piece bezier approximation, rather than a 4-piece one. Fix PDF, SVG and Cairo backends so they can draw paths (meaning ellipses as well). - MGD

2007-12-07 Issue a warning when drawing an image on a non-linear axis. - MGD

2007-12-06 let widgets.Cursor initialize to the lower x and y bounds rather than 0,0, which can cause havoc for dates and other transforms - DSD

2007-12-06 updated references to mpl data directories for py2exe - DSD

2007-12-06 fixed a bug in rcsetup, see bug 1845057 - DSD

2007-12-05 Fix how fonts are cached to avoid loading the same one multiple times. (This was a regression since 0.90 caused by the refactoring of font_manager.py) - MGD

2007-12-05 Support arbitrary rotation of usetex text in Agg backend. - MGD

2007-12-04 Support '|' as a character in mathtext - MGD

2007-11-27 Released 0.91.1 at revision 4517

2007-11-27 Released 0.91.0 at revision 4478

2007-11-13 All backends now support writing to a file-like object, not just a regular file. savefig() can be passed a file-like object in place of a file path. - MGD

2007-11-13 Improved the default backend selection at build time: SVG -> Agg -> Tk-Agg -> WXAgg -> GTK -> GTKAgg. The last usable backend in this progression will be chosen in the default config file. If a backend is defined in setup.cfg, that will be the default backend - DSD

2007-11-13 Improved creation of default config files at build time for traited config package - DSD
2007-11-12 Exposed all the build options in setup.cfg. These options are read into a dict called "options" by setupext.py. Also, added "-mpl" tags to the version strings for packages provided by matplotlib. Versions provided by mpl will be identified and updated on subsequent installs - DSD

2007-11-12 Added support for STIX fonts. A new rcParam, mathtext.fontset, can be used to choose between:

'cm': The TeX/LaTeX Computer Modern fonts
'sticx': The STIX fonts (see stixfonts.org)
'sticxsans': The STIX fonts, using sans-serif glyphs by default
'custom': A generic Unicode font, in which case the mathtext font must be specified using mathtext.bf, mathtext.it, mathtext.sf etc.

Added a new example, stix_fonts_demo.py to show how to access different fonts and unusual symbols.

* MGD

2007-11-12 Options to disable building backend extension modules moved from setup.py to setup.cfg - DSD

2007-11-09 Applied Martin Teichmann's patch 1828813: a QPainter is used in paintEvent, which has to be destroyed using the method end(). If matplotlib raises an exception before the call to end - and it does if you feed it with bad data - this method end() is never called and Qt4 will start spitting error messages

2007-11-09 Moved pyparsing back into matplotlib namespace. Don't use system pyparsing, API is too variable from one release to the next - DSD

2007-11-08 Made pylab use straight numpy instead of oldnumeric by default - EF

2007-11-08 Added additional record array utilities to mlab (rec2excel, rec2gtk, rec_join, rec_append_field, rec_drop_field) - JDH

2007-11-08 Updated pytz to version 2007g - DSD

2007-11-08 Updated pyparsing to version 1.4.8 - DSD

2007-11-08 Moved csv2rec to recutils and added other record array utilities - JDH

2007-11-08 If available, use existing pyparsing installation - DSD

2007-11-07 Removed old enthought.traits from lib/matplotlib, added Gael Varoquaux's enthought.traits-2.6b1, which is stripped of setuptools. The package is installed to site-packages if not already available - DSD

2007-11-05 Added easy access to minor tick properties; slight mod of patch by Pierre G-M - EF

2007-11-02 Committed Phil Thompson's patch 1599876, fixes to Qt4Agg backend and qt4 blitting demo - DSD

2007-11-02 Committed Phil Thompson's patch 1599876, fixes to Qt4Agg backend and qt4 blitting demo - DSD

2007-10-31 Made log color scale easier to use with contourf; automatic level generation now works. - EF

2007-10-29 TRANSFORMS REFACTORYING
The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is primarily an internal improvement, and the possible user-visible changes it allows are yet to come.

The transformation framework was completely rewritten in Python (with Numpy). This will make it easier to add new kinds of transformations without writing C/C++ code.

Transforms are composed into a ‘transform tree’, made of transforms whose value depends on other transforms (their children). When the contents of children change, their parents are automatically updated to reflect those changes. To do this an “invalidation” method is used: when children change, all of their ancestors are marked as “invalid”. When the value of a transform is accessed at a later time, its value is recomputed only if it is invalid, otherwise a cached value may be used. This prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

The framework can be used for both affine and non-affine transformations. However, for speed, we want to use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

\[
\text{full transform} = \text{non-affine} + \text{affine}
\]

Much of the drawing has been refactored in terms of compound paths. Therefore, many methods have been removed from the backend interface and replaced with a handful to draw compound paths. This will make updating the backends easier, since there is less to update. It also should make the backends more consistent in terms of functionality.

User visible changes:

- **POLAR PLOTS**: Polar plots are now interactively zoomable, and the r-axis labels can be interactively rotated. Straight line segments are now interpolated to follow the curve of the r-axis.

- **Non-rectangular clipping**: works in more backends and with more types of objects.

- **Sharing an axis across figures**: is now done in exactly the same way as sharing an axis between two axes in the same figure:

```python
fig1 = figure()
fig2 = figure()
ax1 = fig1.add_subplot(111)
ax2 = fig2.add_subplot(111, sharex=ax1, sharey=ax1)
```

- **linestyles**: now include steps-pre, steps-post and steps-mid. The old step still works and is equivalent to step-pre.

- **Multiple line styles**: may be provided to a collection.

See API CHANGES for more low-level information about this refactoring.

2007-10-24 Added ax kwarg to Figure.colorbar and pyplot.colorbar - EF

2007-10-19 Removed a gsave/grestore pair surrounding _draw_ps, which was causing a loss graphics state info (see “EPS output problem - scatter & edgecolors” on mpl-dev, 2007-10-29) - DSD
2007-10-15 Fixed a bug in patches. Ellipse that was broken for aspect='auto'. Scale free ellipses now work properly for equal and auto on Agg and PS, and they fall back on a polygonal approximation for nonlinear transformations until we convince ourselves that the spline approximation holds for nonlinear transformations. Added unit/ellipse_compare.py to compare spline with vertex approx for both aspects. JDH

2007-10-05 remove generator expressions from texmanager and mpltraits. generator expressions are not supported by python-2.3 - DSD

2007-10-01 Made matplotlib.use() raise an exception if called after backends has been imported. - EF

2007-09-30 Modified update* methods of Bbox and Interval so they work with reversed axes. Prior to this, trying to set the ticks on a reversed axis failed with an uninformative error message. - EF

2007-09-30 Applied patches to axes3d to fix index error problem - EF

2007-09-24 Applied Eike Welk’s patch reported on mpl-dev on 2007-09-22 Fixes a bug with multiple plot windows in the qt backend, ported the changes to backend_qt4 as well - DSD

2007-09-21 Changed cbook.reversed to yield the same result as the python reversed builtin - DSD

2007-09-13 Theusetex support in the pdf backend is more usable now, so I am enabling it. - JKS

2007-09-12 Fixed a Axes.bar unit bug - JDH

2007-09-10 Made skiprows=1 the default on csv2rec - JDH

2007-09-09 Split out the plotting part of pylab and put it in pyplot.py; removed numerix from the remaining pylab.py, which imports everything from pylot.py. The intention is that apart from cleanups, the result of importing from pylab is nearly unchanged, but there is the new alternative of importing from pyplot to get the state-engine graphics without all the numeric functions. Numpified examples; deleted two that were obsolete; modified some to use pyplot. - EF

2007-09-08 Eliminated gd and paint backends - EF

2007-09-06 .bmp file format is now longer an alias for .raw

2007-09-07 Added clip path support to pdf backend. - JKS

2007-09-06 Fixed a bug in the embedding of Type 1 fonts in PDF. Now it doesn’t crash Preview.app. - JKS

2007-09-06 Refactored image saving code so that all GUI backends can save most image types. See FILETYPES for a matrix of backends and their supported file types. Backend canvases should no longer write their own print_figure() method – instead they should write a print_xxx method for each filetype they can output and add an entry to their class-scoped filetypes dictionary. - MGD

2007-09-05 Fixed Qt version reporting in setupext.py - DSD

2007-09-04 Embedding Type 1 fonts in PDF, and thus usetex support via dviread, sort of works. To test, enable it by renaming _draw_tex to draw_tex. - JKS

2007-09-03 Added ability of errorbar show limits via caret or arrowhead ends on the bars; patch by Manual Metz. - EF
2007-09-03 Created type1font.py, added features to AFM and FT2Font (see API CHANGES), started work on embedding Type 1 fonts in pdf files. - JKS

2007-09-02 Continued work on dviread.py. - JKS

2007-08-16 Added a set_extent method to AxesImage, allow data extent to be modified after initial call to imshow - DSD

2007-08-14 Fixed a bug in pyqt4 subplots-adjust. Thanks to Xavier Gnata for the report and suggested fix - DSD

2007-08-13 Use pickle to cache entire fontManager; change to using font_manager module-level function findfont wrapper for the fontManager.findfont method - EF

2007-08-11 Numpification and cleanup of mlab.py and some examples - EF

2007-08-06 Removed mathtext2

2007-07-31 Refactoring of distutils scripts.

- Will not fail on the entire build if an optional Python package (e.g., Tkinter) is installed but its development headers are not (e.g., tk-devel). Instead, it will continue to build all other extensions.

- Provide an overview at the top of the output to display what dependencies and their versions were found, and (by extension) what will be built.

- Use pkg-config, when available, to find freetype2, since this was broken on Mac OS-X when using MacPorts in a non-standard location.

2007-07-30 Reorganized configuration code to work with traited config objects. The new config system is located in the matplotlib.config package, but it is disabled by default. To enable it, set NEWCONFIG=True in matplotlib.__init__.py. The new configuration system will still use the old matplotlibrc files by default. To switch to the experimental, traited configuration, set USE_TRAITED_CONFIG=True in config.__init__.py.

2007-07-29 Changed default pcolor shading to flat; added aliases to make collection kwargs agree with setter names, so updating works; related minor cleanups. Removed quiver_classic, scatter_classic, pcolor_classic. - EF

2007-07-26 Major rewrite of mathtext.py, using the TeX box layout model.

There is one (known) backward incompatible change. The font commands (cal, rm, it, tt) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of $\text{cal}\{R\}$ should be changed to $\{\text{cal}\ R\}$. Alternatively, you may use the new LaTeX-style font commands (mathcal, mathrm, mathit, mathtt) which do affect the following group, e.g., $\text{mathcal}\{R\}$.

Other new features include:

- Math may be interspersed with non-math text. Any text with an even number of ´s (non-escaped) will be sent to the mathtext parser for layout.

- Sub/superscripts are less likely to accidentally overlap.

- Support for sub/superscripts in either order, e.g., $x^i_j$ and $x_j^i$ are equivalent.

- Double sub/superscripts (e.g., $x_{i\ j}$) are considered ambiguous and raise an exception. Use braces to disambiguate.

- $\text{frac}\{x\}\{y\}$ can be used for displaying fractions.
• \( \sqrt[3]{x} \) can be used to display the radical symbol with a root number and body.
• \( \left( \frac{x}{y} \right) \) may be used to create parentheses and other delimiters that automatically resize to the height of their contents.
• Spacing around operators etc. is now generally more like TeX.
• Added support (and fonts) for boldface (bf) and sans-serif (sf) symbols.
• Log-like function name shortcuts are supported. For example, \( \sin(x) \) may be used instead of \( \text{rm sin}(x) \)
• Limited use of kerning for the easy case (same font)

Behind the scenes, the pyparsing.py module used for doing the math parsing was updated to the latest stable version (1.4.6). A lot of duplicate code was refactored out of the Font classes.

• MGD

2007-07-19 completed numpification of most trivial cases - NN
2007-07-19 converted non-numpy relicts throughout the code - NN

2007-07-19 replaced the Python code in numerix/ by a minimal wrapper around numpy that explicitly mentions all symbols that need to be addressed for further numpification - NN

2007-07-18 makeusetex respect changes to rcParams. texmanager used to only configure itself when it was created, now it reconfigures when rcParams are changed. Thank you Alexander Schmolck for contributing a patch - DSD

2007-07-17 added validation to setting and changing rcParams - DSD

2007-07-17 bugfix segfault in transforms module. Thanks Ben North for the patch. - ADS

2007-07-16 clean up some code in ticker.ScalarFormatter, use unicode to render multiplication sign in offset ticklabel - DSD

2007-07-16 fixed a formatting bug in ticker.ScalarFormatter's scientific notation (10^0 was being rendered as 10 in some cases) - DSD

2007-07-13 Add MPL_isfinite64() and MPL_isinf64() for testing doubles in (the now misnamed) MPL_isnan.h. - ADS

2007-07-13 The matplotlib._isnan module removed (use numpy.isnan) - ADS

2007-07-13 Some minor cleanups in _transforms.cpp - ADS

2007-07-13 Removed the rest of the numerix extension code detritus, numpified axes.py, and cleaned up the imports in axes.py - JDH

2007-07-13 Added legend.loc as configurable option that could in future default to ‘best’. - NN

2007-07-12 Bugfixes in mlab.py to coerce inputs into numpy arrays. -ADS

2007-07-11 Added linespacing kwarg to text.Text - EF

2007-07-11 Added code to store font paths in SVG files. - MGD

2007-07-10 Store subset of TTF font as a Type 3 font in PDF files. - MGD

2007-07-09 Store subset of TTF font as a Type 3 font in PS files. - MGD
2007-07-09 Applied Paul’s pick restructure pick and add pickers, sourceforge patch 1749829 - JDH

2007-07-09 Applied Allan’s draw_lines agg optimization. JDH

2007-07-08 Applied Carl Worth’s patch to fix cairo draw_arc - SC

2007-07-07 fixed bug 1712099: xpdf distiller on windows - DSD

2007-06-30 Applied patches to tkagg, gtk, and wx backends to reduce memory leakage. Patches supplied by Mike Droettboom; see tracker numbers 1745400, 1745406, 1745408. Also made unit/memleak_gui.py more flexible with command-line options. - EF

2007-06-30 Split defaultParams into separate file rcdefaults (together with validation code). Some heavy refactoring was necessary to do so, but the overall behavior should be the same as before. - NN

2007-06-27 Added MPLCONFIGDIR for the default location for mpl data and configuration. useful for some apache installs where HOME is not writable. Tried to clean up the logic in _get_config_dir to support non-writable HOME where are writable HOME/.matplotlib already exists - JDH

2007-06-27 Patch for get_py2exe_datafiles() to work with new directory layout. (Thanks Tocer and also Werner Bruhin.) -ADS

2007-06-27 Added a scroll event to the mpl event handling system and implemented it for backends GTK* - other backend users/developers/maintainers, please add support for your backend. - JDH

2007-06-25 Changed default to clip=False in colors.Normalize; modified Colorbar-Base for easier colormap display - EF

2007-06-13 Added maskedarray option to rc, numerix - EF

2007-06-11 Python 2.5 compatibility fix for mlab.py - EF

2007-06-10 In matplotlibrc file, use ‘dashed’ | ‘solid’ instead of a pair of floats for contour.negative_linestyle - EF

2007-06-08 Allow plot and fill fmt string to be any mpl string colorspec - EF

2007-06-08 Added gnuplot file plotfile function to pylab - see examples/plotfile_demo.py - JDH

2007-06-07 Disable build of numarray and Numeric extensions for internal MPL use and the numerix layer. - ADS

2007-06-07 Added csv2rec to matplotlib.mlab to support automatically converting csv files to record arrays using type introspection, and turned on native datetime support using the new units support in matplotlib.dates. See examples/loadrec.py ! JDH

2007-06-07 Simplified internal code of _auto_legend_data - NN

2007-06-04 Added labeldistance arg to Axes.pie to control the raidal distance of the wedge labels - JDH
2007-06-03 Turned mathtext in SVG into single <text> with multiple <tspan> objects (easier to edit in inkscape). - NN

2007-06-02 Released 0.90.1 at revision 3352
2007-06-02 Display only meaningful labels when calling legend() without args. - NN
2007-06-02 Have errorbar follow the color cycle even if line is not plotted. Suppress plotting of errorbar caps for capsize=0. - NN
2007-06-02 Set markers to same alpha value as line. - NN
2007-06-02 Fix mathtext position in svg backend. - NN
2007-06-01 Deprecate Numeric and numarray for use as numerix. Props to Travis - job well done. - ADS
2007-05-18 Added LaTeX unicode support. Enable with the ‘text.latex.unicode’ rc-Param. This requires the ucs and inputenc LaTeX packages. - ADS
2007-04-23 Fixed some problems with polar - added general polygon clipping to clip the lines and grids to the polar axes. Added support for set_rmax to easily change the maximum radial grid. Added support for polar legend - JDH
2007-04-16 Added Figure.autofmt_xdate to handle adjusting the bottom and rotating the tick labels for date plots when the ticks often overlap - JDH
2007-04-09 Beginnings of usetex support for pdf backend. -JKS
2007-04-07 Fixed legend/LineCollection bug. Added label support to collections. - EF
2007-04-06 Removed deprecated support for a float value as a gray-scale; now it must be a string, like ‘0.5’. Added alpha kwarg to ColorConverter.to_rgba_list. - EF
2007-04-06 Fixed rotation of ellipses in pdf backend (sf bug #1690559) -JKS
2007-04-04 More matshow tweaks; documentation updates; new method set_bounds() for formatters and locators. - EF
2007-04-02 Fixed problem with imshow and matshow of integer arrays; fixed problems with changes to color autoscaling. - EF
2007-04-01 Made image color autoscaling work correctly with a tracking colorbar; norm.autoscale now scales unconditionally, while norm.autoscale_None changes only None-valued vmin, vmax. - EF
2007-03-31 Added a qt-based subplot-adjustment dialog - DSD
2007-03-30 Fixed a bug in backend_qt4, reported on mpl-dev - DSD
2007-03-26 Removed colorbar_classic from figure.py; fixed bug in Figure.clf() in which _axobservers was not getting cleared. Modernization and cleanups. - EF
2007-03-26 Refactored some of the units support - units now live in the respective x and y Axis instances. See also API_CHANGES for some alterations to the conversion interface. JDH
2007-03-25 Fix masked array handling in quiver.py for numpy. (Numeric and numarray support for masked arrays is broken in other ways when using quiver. I didn't pursue that.) - ADS
2007-03-23 Made font_manager.py close opened files. - JKS
2007-03-22 Made imshow default extent match matshow - EF
2007-03-22 Some more niceties for xcorr – a maxlags option, normed now works for xcorr as well as axorr, usevlines is supported, and a zero correlation hline is added. See examples/xcorr_demo.py. Thanks Sameer for the patch. - JDH

2007-03-21 Axes.vlines and Axes.hlines now create and returns a LineCollection, not a list of lines. This is much faster. The kwarg signature has changed, so consult the docs. Modified Axes.errorbar which uses vlines and hlines. See API_CHANGES; the return signature for these three functions is now different

2007-03-20 Refactored units support and added new examples - JDH
2007-03-19 Added Mike’s units patch - JDH

2007-03-18 Matshow as an Axes method; test version matshow1() in pylab; added ‘integer’ Boolean kwarg to MaxNLocator initializer to force ticks at integer locations. - EF

2007-03-17 Preliminary support for clipping to paths agg - JDH
2007-03-17 Text.set_text() accepts anything convertible with ‘%s’ - EF
2007-03-14 Add masked-array support to hist. - EF

2007-03-03 Change barh to take a kwargs dict and pass it to bar. Fixes sf bug #1669506.

2007-03-02 Add rc parameter pdf.inheritcolor, which disables all color-setting operations in the pdf backend. The idea is that you include the resulting file in another program and set the colors (both stroke and fill color) there, so you can use the same pdf file for e.g., a paper and a presentation and have them in the surrounding color. You will probably not want to draw figure and axis frames in that case, since they would be filled in the same color. - JKS

2007-02-26 Prevent building _wxagg.so with broken Mac OS X wxPython. - ADS
2007-02-23 Require setupools for Python 2.3 - ADS

2007-02-22 WXAgg accelerator updates - KM WXAgg’s C++ accelerator has been fixed to use the correct wxBitmap constructor.

The backend has been updated to use new wxPython functionality to provide fast blit() animation without the C++ accelerator. This requires wxPython 2.8 or later. Previous versions of wxPython can use the C++ accelerator or the old pure Python routines.

setup.py no longer builds the C++ accelerator when wxPython >= 2.8 is present.

The blit() method is now faster regardless of which agg/wxPython conversion routines are used.

2007-02-21 Applied the PDF backend patch by Nicolas Grilly. This impacts several files and directories in matplotlib:

• Created the directory lib/matplotlib/mpl-data/fonts/pdfcorefonts, holding AFM files for the 14 PDF core fonts. These fonts are embedded in every PDF viewing application.

• setup.py: Added the directory pdfcorefonts to package_data.

• lib/matplotlib/_init__.py: Added the default parameter ‘pdf.use14corefonts’. When True, the PDF backend uses only the 14 PDF core fonts.

• lib/matplotlib/afm.py: Added some keywords found in recent AFM files. Added a little workaround to handle Euro symbol.
• lib/matplotlib/fontmanager.py: Added support for the 14 PDF core fonts. These fonts have a dedicated cache (file pdfcorefont.cache), not the same as for other AFM files (file .afmfont.cache). Also cleaned comments to conform to CODING_GUIDE.

• lib/matplotlib/backends/backend_pdf.py: Added support for 14 PDF core fonts. Fixed some issues with incorrect character widths and encodings (works only for the most common encoding, WinAnsiEncoding, defined by the official PDF Reference). Removed parameter ‘dpi’ because it causes alignment issues.

-JKS (patch by Nicolas Grilly)

2007-02-17 Changed ft2font.get_charmap, and updated all the files where get_charmap is mentioned - ES

2007-02-13 Added barcode demo - JDH

2007-02-13 Added binary colormap to cm - JDH

2007-02-13 Added twiny to pylab - JDH

2007-02-12 Moved data files into lib/matplotlib so that setuptools’ develop mode works. Re-organized the mpl-data layout so that this source structure is maintained in the installation. (i.e., the ‘fonts’ and ‘images’ sub-directories are maintained in site-packages.) Suggest removing site-packages/matplotlib/mpl-data and ~/.matplotlib/ttffont.cache before installing - ADS

2007-02-07 Committed Rob Hetland’s patch for qt4: remove references to text()/latin1(), plus some improvements to the toolbar layout - DSD

2007-02-06 Released 0.90.0 at revision 3003

2007-01-22 Extended the new picker API to text, patches and patch collections. Added support for user customizable pick hit testing and attribute tagging of the PickEvent - JDH

2007-01-16 Begun work on a new pick API using the mpl event handling framework. Artists will define their own pick method with a configurable epsilon tolerance and return pick attrs. All artists that meet the tolerance threshold will fire a PickEvent with artist dependent attrs; e.g., a Line2D can set the indices attribute that shows the indices into the line that are within epsilon of the pick point. See examples/pick_event_demo.py. The implementation of pick for the remaining Artists remains to be done, but the core infrastructure at the level of event handling is in place with a proof-of-concept implementation for Line2D - JDH

2007-01-16 src/_image.cpp: update to use Py_ssize_t (for 64-bit systems). Use return value of fread() to prevent warning messages - SC.

2007-01-15 src/_image.cpp: combine buffer_argb32() and buffer_bgra32() into a new method color_conv(format) - SC

2007-01-14 backend_cairo.py: update draw_arc() so that examples/arctest.py looks correct - SC

2007-01-12 backend_cairo.py: enable clipping. Update draw_image() so that examples/contour_demo.py looks correct - SC

2007-01-12 backend_cairo.py: fix draw_image() so that examples/image_demo.py now looks correct - SC

8.1. List of changes to Matplotlib prior to 2015
2007-01-11 Added `Axes.xcorr` and `Axes.acorr` to plot the cross correlation of x vs. y or the autocorrelation of x. `pylab` wrappers also provided. See examples/xcorr_demo.py - JDH

2007-01-10 Added “Subplot.label_outer” method. It will set the visibility of the ticklabels so that yticklabels are only visible in the first column and xticklabels are only visible in the last row - JDH

2007-01-02 Added additional kwarg documentation - JDH

2006-12-28 Improved error message for nonpositive input to log transform; added log kwarg to bar, barh, and hist, and modified bar method to behave sensibly by default when the ordinate has a log scale. (This only works if the log scale is set before or by the call to bar, hence the utility of the log kwarg.) - EF

2006-12-27 `backend_cairo.py`: update `draw_image()` and `_draw_mathtext()` to work with `numpy` - SC

2006-12-20 Fixed xpdf dependency check, which was failing on windows. Removed ps2eps dependency check. - DSD

2006-12-19 Added Tim Leslie’s spectral patch - JDH

2006-12-17 Added rc param ‘axes.formatter.limits’ to control the default threshold for switching to scientific notation. Added convenience method `Axes.ticklabel_format()` for turning scientific notation on or off on either or both axes. - EF

2006-12-16 Added ability to turn control scientific notation in `ScalarFormatter` - EF

2006-12-16 Enhanced boxplot to handle more flexible inputs - EF

2006-12-13 Replaced calls to where() in `colors.py` with much faster clip() and put-mask() calls; removed inappropriate uses of getmaskorNone (which should be needed only very rarely); all in response to profiling by David Cournapeau. Also fixed bugs in my 2-D array support from 12-09. - EF

2006-12-09 Replaced spy and spy2 with the new spy that combines marker and image capabilities - EF

2006-12-09 Added support for plotting 2-D arrays with plot: columns are plotted as in Matlab - EF

2006-12-09 Added linewidth kwarg to bar and barh; fixed arg checking bugs - EF

2006-12-07 Made pcolormesh argument handling match pcolor; fixed kwarg handling problem noted by Pierre GM - EF

2006-12-06 Made pcolor support vector X and/or Y instead of requiring 2-D arrays - EF

2006-12-05 Made the default `Artist._transform` None (rather than invoking identity_transform for each artist only to have it overridden later). Use artist.get_transform() rather than artist._transform, even in derived classes, so that the default transform will be created lazily as needed - JDH

2006-12-03 Added LogNorm to `colors.py` as illustrated by examples/pcolor_log.py, based on suggestion by Jim McDonald. Colorbar modified to handle LogNorm. Norms have additional “inverse” method. - EF

2006-12-02 Changed class names in `colors.py` to match convention: normalize -> Normalize, no_norm -> NoNorm. Old names are still available. Changed __init__.py rc defaults to match those in matplotlibrc - EF
2006-11-22 Fixed bug in set _ * lim that I had introduced on 11-15 - EF

2006-11-22 Added examples/clippedline.py, which shows how to clip line data based on view limits - it also changes the marker style when zoomed in - JDH

2006-11-21 Some spy bug-fixes and added precision arg per Robert C’s suggestion - JDH

2006-11-19 Added semi-automatic docstring generation detailing all the kwargs that functions take using the artist introspection tools; e.g., ’help text now details the scatter kwargs that control the Text properties - JDH

2006-11-17 Removed obsolete scatter _ classic, leaving a stub to raise NotImplement- edError; same for pcolor _ classic - EF

2006-11-15 Removed obsolete pcolor _ classic - EF

2006-11-15 Fixed 1588908 reported by Russel Owen; factored nonsingular method out of ticker.py, put it into transforms.py as a function, and used it in set _ x _ lim and set _ y _ lim. - EF

2006-11-14 Applied patch 1591716 by Ulf Larssen to fix a bug in apply _ aspect. Modified and applied patch 1594894 by mdehoon to fix bugs and improve formatting in lines.py. Applied patch 1573008 by Greg Willden to make psd etc. plot full frequency range for complex inputs. - EF

2006-11-14 Improved the ability of the colorbar to track changes in corresponding image, pcolor, or contourf. - EF

2006-11-11 Fixed bug that broke Numeric compatibility; added support for alpha to colorbar. The alpha information is taken from the mappable object, not specified as a kwarg. - EF

2006-11-05 Added broken _ barh function for makring a sequence of horizontal bars broken by gaps – see examples/broken _ barh.py

2006-11-05 Removed lineprops and markerprops from the Annotation code and replaced them with an arrow configurable with kwarg arrowprops. See examples/annotation _ demo.py - JDH

2006-11-02 Fixed a pylab subplot bug that was causing axes to be deleted with hspace or wspace equals zero in subplots _ adjust - JDH

2006-10-25 Made “tiny” kwarg in Locator.nonsingular much smaller - EF

2006-10-17 Closed sf bug 1562496 update line props dash/solid/cap/join styles - JDH

2006-10-17 Complete overhaul of the annotations API and example code - See matplotlib.text.Annotation and examples/annotation _ demo.py JDH

2006-10-12 Committed Manuel Metz’s StarPolygon code and examples/scatter _ star _ poly.py - JDH

2006-10-11 commented out all default values in matplotlibrc.template Default values should generally be taken from defaultParam in _init_.py - the file matplotlib should only contain those values that the user wants to explicitly change from the default. (see thread “marker color handling” on matplotlib-devel)
2006-10-10 Changed default comment character for load to ‘#’ - JDH

2006-10-10 deactivated rcfile-configurability of markerfacecolor and markeredge-color. Both are now hardcoded to the special value ‘auto’ to follow the line color. Configurability at run-time (using function arguments) remains functional. - NN

2006-10-07 introduced dummy argument magnification=1.0 to FigImage.make_image to satisfy unit test figimage_demo.py. The argument is not yet handled correctly, which should only show up when using non-standard DPI settings in PS backend, introduced by patch #1562394. - NN

2006-10-06 add backend-agnostic example: simple3d.py - NN

2006-09-29 fix line-breaking for SVG-inline images (purely cosmetic) - NN

2006-09-29 reworked set_linestyle and set_marker markeredgecolor and markerface-color now default to a special value “auto” that keeps the color in sync with the line color further, the intelligence of axes.plot is cleaned up, improved and simplified. Complete compatibility cannot be guaranteed, but the new behavior should be much more predictable (see patch #1104615 for details) - NN

2006-09-29 changed implementation of clip-path in SVG to work around a limitation in inkscape - NN

2006-09-29 added two options to matplotlibrc: svg.image_inline svg.image_noscale see patch #1533010 for details - NN

2006-09-29 axes.py: cleaned up kwargs checking - NN

2006-09-29 setup.py: cleaned up setup logic - NN

2006-09-29 setup.py: check for required pygtk versions, fixes bug #1460783 - SC

2006-09-27 Released 0.87.6 at revision 2783

2006-09-24 Added line pointers to the Annotation code, and a pylab interface. See matplotlib.text.Annotation, examples/annotation_demo.py and examples/annotation_demo_pylab.py - JDH

2006-09-18 mathtext2.py: The SVG backend now supports the same things that the AGG backend does. Fixed some bugs with rendering, and out of bounds errors in the AGG backend - ES. Changed the return values of math_parse_s_ft2font_svg to support lines (fractions etc.)

2006-09-17 Added an Annotation class to facilitate annotating objects and an examples file examples/annotation_demo.py. I want to add dash support as in TextWithDash, but haven’t decided yet whether inheriting from TextWithDash is the right base class or if another approach is needed - JDH

2006-09-05 Released 0.87.5 at revision 2761

2006-09-04 Added nxutils for some numeric add-on extension code - specifically a better/more efficient inside polygon tester (see unit/inside_poly_*.py) - JDH

2006-09-04 Made bitstream fonts the rc default - JDH

2006-08-31 Fixed alpha-handling bug in ColorConverter, affecting collections in general and contour/contourf in particular. - EF
2006-08-30 ft2font.cpp: Added draw_rect_filled method (now used by mathtext2 to
draw the fraction bar) to FT2Font - ES

2006-08-29 setupext.py: wrap calls to tk.getvar() with str(). On some systems, get-
var returns a Tcl_Obj instead of a string - DSD

2006-08-28 mathtext2.py: Sub/superscripts can now be complex (i.e. fractions etc.).
The demo is also updated - ES

2006-08-28 font_manager.py: Added /usr/local/share/fonts to list of X11 font directo-
ries - DSD

2006-08-28 mathtext2.py: Initial support for complex fractions. Also, rendering is
now completely separated from parsing. The sub/superscripts now work better.
Updated the mathtext2_demo.py - ES

2006-08-27 qt backends: don’t create a QApplication when backend is imported, do
it when the FigureCanvasQt is created. Simplifies applications where mpl is embedded
in qt. Updated embedding_in_qt* examples - DSD

2006-08-27 mathtext2.py: Now the fonts are searched in the OS font dir and in the
mpl-data dir. Also env is not a dict anymore. - ES

2006-08-26 minor changes to __init__.py, mathtext2_demo.py. Added matplotliblibrc
key “mathtext.mathtext2” (removed the key “mathtext2”) - ES

2006-08-21 mathtext2.py: Initial support for fractions Updated the matht-
text2_demo.py _mathtext_data.py: removed ” ” from the unicode dicts mathtext.py:
Minor modification (because of _mathtext_data.py)- ES

2006-08-20 Added mathtext2.py: Replacement for mathtext.py. Supports __, ^, _
, cal etc., sin, cos etc., unicode, recursive nestings, inline math mode. The only backend
currently supported is Agg __init__.py: added new rc params for mathtext2 added
mathtext2_demo.py example - ES

2006-08-19 Added embedding_in_qt4.py example - DSD

2006-08-11 Added scale free Ellipse patch for Agg - CM

2006-08-10 Added converters to and from julian dates to matplotlib.dates
(num2julian and julian2num) - JDH

2006-08-08 Fixed widget locking so multiple widgets could share the event handling
-JDH

2006-08-07 Added scale free Ellipse patch to SVG and PS - CM

2006-08-05 Re-organized imports in numerix for numpy 1.0b2 - TEO

2006-08-04 Added draw_markers to PDF backend. - JKS

2006-08-01 Fixed a bug in postscript’s rendering of dashed lines - DSD

2006-08-01 figure.py: savefig() update docstring to add support for ‘format’
argument. backend_cairo.py: print_figure() add support ‘format’ argument. - SC

2006-07-31 Don’t let postscript’s xpdf distiller compress images - DSD

2006-07-31 Added shallowcopy() methods to all Transformations; removed
copy_bbox_transform and copy_bbox_transform_shallow from transforms.py; added
offset_copy() function to transforms.py to facilitate positioning artists with offsets. See
examples/transoffset.py. - EF

2006-07-31 Don’t let postscript’s xpdf distiller compress images - DSD
2006-07-29 Fixed numerix polygon bug reported by Nick Fotopoulos. Added inverse_numerix_xy() transform method. Made autoscale_view() preserve axis direction (e.g., increasing down). - EF

2006-07-28 Added shallow bbox copy routine for transforms - mainly useful for copying transforms to apply offset to. - JDH

2006-07-28 Added resize method to FigureManager class for Qt and Gtk backend - CM

2006-07-28 Added subplots_adjust button to Qt backend - CM

2006-07-26 Use numerix more in collections. Quiver now handles masked arrays. - EF

2006-07-22 Fixed bug #1209354 - DSD

2006-07-22 makes scatter() work with the kwarg “color”. Closes bug 1285750 - DSD

2006-07-20 backend_cairo.py: require pycairo 1.2.0. print_figure() update to output SVG using cairo.

2006-07-19 Added blitting for Qt4Agg - CM

2006-07-19 Added lasso widget and example examples/lasso_demo.py - JDH

2006-07-18 Added blitting for QtAgg backend - CM

2006-07-17 Fixed bug #1523585: skip nans in semilog plots - DSD

2006-07-12 Add support to render the scientific notation label over the right-side y-axis - DSD

2006-07-11 Released 0.87.4 at revision 2558

2006-07-07 Fixed a usetex bug with older versions of latex - DSD

2006-07-07 Add compatibility for NumPy 1.0 - TEO

2006-06-29 Added a Qt4Agg backend. Thank you James Amundson - DSD

2006-06-26 Fixed a usetex bug. On Windows, usetex will process postscript output in the current directory rather than in a temp directory. This is due to the use of spaces and tildes in windows paths, which cause problems with latex. The subprocess module is no longer used. - DSD

2006-06-22 Various changes to bar(), barh(), and hist(). Added ‘edgecolor’ keyword arg to bar() and barh(). The x and y args in barh() have been renamed to width and bottom respectively, and their order has been swapped to maintain a (position, value) order ala matlab. left, height, width and bottom args can now all be scalars or sequences. barh() now defaults to edge alignment instead of center alignment. Added a keyword arg ‘align’ to bar(), barh() and hist() that controls between edge or center bar alignment. Fixed ignoring the rcParams['patch.facecolor'] for bar color in bar() and barh(). Fixed ignoring the rcParams['lines.color'] for error bar color in bar() and barh(). Fixed a bug where patches would be cleared when error bars were plotted if rcParams['axes.hold'] was False. - MAS

2006-06-22 Added support for numerix 2-D arrays as alternatives to a sequence of (x,y) tuples for specifying paths in collections, quiver, contour, pcolor, transforms. Fixed contour bug involving setting limits for color mapping. Added numpy-style all() to numerix. - EF

2006-06-20 Added custom FigureClass hook to pylab interface - see examples/custom_figure_class.py

602 Chapter 8. Previous What’s New
2006-06-16 Added colormaps from gist (gist_earth, gist_stern, gist_rainbow, gist_gray, gist_yarg, gist_heat, gist_ncar) - JW

2006-06-16 Added a pointer to parent in figure canvas so you can access the container with fig.canvas.manager. Useful if you want to set the window title, e.g., in gtk fig.canvas.manager.window.set_title, though a GUI neutral method would be preferable. - JDH

2006-06-16 Fixed colorbar.py to handle indexed colors (i.e., norm = no_norm()) by centering each colored region on its index. - EF

2006-06-15 Added scalex and scaley to Axes.autoscale_view to support selective autoscaling just the x or y axis, and supported these command in plot so you can say plot(something, scaley=False) and just the x axis will be autoscaled. Modified axvline and axhline to support this, so for example axvline will no longer autoscale the y axis. - JDH

2006-06-13 Fix so numpy updates are backward compatible - TEO

2006-06-12 Updated numerix to handle numpy restructuring of oldnumeric - TEO

2006-06-12 Updated numerix.fft to handle numpy restructuring Added ImportError to numerix.linear_algebra for numpy. - TEO

2006-06-11 Added quiverkey command to pylab and Axes, using QuiverKey class in quiver.py. Changed pylab and Axes to use quiver2 if possible, but drop back to the newly-renamed quiver_classic if necessary. Modified examples/quiver_demo.py to illustrate the new quiver and quiverkey. Changed LineCollection implementation slightly to improve compatibility with PolyCollection. - EF

2006-06-11 Fixed a use_tex bug for windows, running latex on files with spaces in their names or paths was failing - DSD

2006-06-09 Made additions to numerix, changes to quiver to make it work with all numeric flavors. - EF

2006-06-09 Added quiver2 function to pylab and method to axes, with implementation via a Quiver class in quiver.py, quiver2 will replace quiver before the next release; it is placed alongside it initially to facilitate testing and transition. See also examples/quiver2_demo.py. - EF

2006-06-08 Minor bug fix to make ticker.py draw proper minus signs with use_tex - DSD

2006-06-06 Released 0.87.3 at revision 2432

2006-05-30 More partial support for polygons with outline or fill, but not both. Made LineCollection inherit from ScalarMappable. - EF

2006-05-29 Yet another revision of aspect-ratio handling. - EF

2006-05-27 Committed a patch to prevent stroking zero-width lines in the svg backend - DSD

2006-05-24 Fixed colorbar positioning bug identified by Helge Avlesen, and improved the algorithm; added a ‘pad’ kwarg to control the spacing between colorbar and parent axes. - EF

2006-05-23 Changed color handling so that collection initializers can take any mpl color arg or sequence of args; deprecated float as grayscale, replaced by string representation of float. - EF

8.1. List of changes to Matplotlib prior to 2015
2006-05-19 Fixed bug: plot failed if all points were masked - EF
2006-05-19 Added custom symbol option to scatter - JDH

2006-05-18 New example, multi_image.py; colorbar fixed to show offset text when the ScalarFormatter is used; FixedFormatter augmented to accept and display offset text. - EF

2006-05-14 New colorbar; old one is renamed to colorbar_classic. New colorbar code is in colorbar.py, with wrappers in figure.py and pylab.py. Fixed aspect-handling bug reported by Michael Mossey. Made backend_bases.draw_quad_mesh() run. - EF

2006-05-08 Changed handling of end ranges in contourf: replaced "clip-ends" kwarg with "extend". See docstring for details. -EF
2006-05-08 Added axisbelow to rc - JDH
2006-05-08 If using PyGTK require version 2.2+ - SC

2006-04-19 Added compression support to PDF backend, controlled by new pdf.compression rc setting. - JKS
2006-04-19 Added Jouni’s PDF backend
2006-04-18 Fixed a bug that caused agg to not render long lines

2006-04-16 Masked array support for pcolormesh; made pcolormesh support the same combinations of X,Y,C dimensions as pcolor does; improved (I hope) description of grid used in pcolor, pcolormesh. - EF
2006-04-14 Reorganized axes.py - EF
2006-04-13 Fixed a bug Ryan found usingusetex with sans-serif fonts and exponential tick labels - DSD

2006-04-11 Refactored backend_ps and backend_agg to prevent module-level texmanager imports. Now these imports only occur if text.usetex rc setting is true - DSD

2006-04-10 Committed changes required for building mpl on win32 platforms with visual studio. This allows wxpython blitting for fast animations. - CM
2006-04-10 Fixed an off-by-one bug in Axes.change_geometry.

2006-04-10 Fixed bug in pie charts where wedge wouldn’t have label in legend. Submitted by Simon Hildebrandt. - ADS

2006-05-06 Usetex makes temporary latex and dvi files in a temporary directory, rather than in the user’s current working directory - DSD
2006-04-05 Applied Ken’s wx deprecation warning patch closing sf patch #1465371 - JDH

2006-04-05 Added support for the new API in the postscript backend. Allows values to be masked using nan’s, and faster file creation - DSD

2006-04-05 Use python’s subprocess module for usetex calls to external programs. subprocess catches when they exit abnormally so an error can be raised. - DSD

2006-04-03 Fixed the bug in which widgets would not respond to events. This regressed the twinx functionality, so I also updated subplots_adjust to update axes that share an x or y with a subplot instance. - CM

2006-04-02 Moved PBox class to transforms and deleted pbox.py; made pylab axis command a thin wrapper for Axes.axis; more tweaks to aspect-ratio handling; fixed
Axes.specgram to account for the new imshow default of unit aspect ratio; made contour
set the Axes.dataLim. - EF
2006-03-31 Fixed the Qt “Underlying C/C++ object deleted” bug. - JRE
2006-03-31 Applied Vasily Sulatskov’s Qt Navigation Toolbar enhancement. - JRE
2006-03-31 Ported Norbert’s rewriting of Halldor’s stineman_interp algorithm
to make it numerix compatible and added code to matplotlib.mlab. See exam-
examples/interp_demo.py - JDH
2006-03-30 Fixed a bug in aspect ratio handling; blocked potential crashes when
panning with button 3; added axis(‘image’) support. - EF
2006-03-28 More changes to aspect ratio handling; new PBox class in new file
pbox.py to facilitate resizing and repositioning axes; made PolarAxes maintain unit
aspect ratio. - EF
2006-03-23 Refactored TextWithDash class to inherit from, rather than delegate to,
the Text class. Improves object inspection and closes bug # 1357969 - DSD
2006-03-22 Improved aspect ratio handling, including pylab interface. Interactive
resizing, pan, zoom of images and plots (including panels with a shared axis) should
work. Additions and possible refactoring are still likely. - EF
2006-03-21 Added another colorbrewer colormap (RdYlBu) - JSWHIT
2006-03-21 Fixed tickmarks for logscale plots over very large ranges. Closes bug #
1232920 - DSD
2006-03-21 Added Rob Knight’s arrow code; see examples/arrow_demo.py - JDH
2006-03-20 Added support for masking values with nan’s, using ADS’s isnan module
and the new API. Works for *Agg backends - DSD
2006-03-20 Added contour.negative_linestyle rcParam - ADS
2006-03-20 Added _isnan extension module to test for nan with Numeric
• ADS
2006-03-17 Added Paul and Alex’s support for faceting with quadmesh in sf patch
1411223 - JDH
2006-03-17 Added Charle Twardy’s pie patch to support colors=None. Closes sf
patch 1387861 - JDH
2006-03-17 Applied sophana’s patch to support overlapping axes with toolbar naviga-
tion by toggling activation with the ‘a’ key. Closes sf patch 1432252 - JDH
2006-03-17 Applied Aarre’s linestyle patch for backend EMF; closes sf patch
1449279 - JDH
2006-03-17 Applied Jordan Dawe’s patch to support kwarg properties for grid lines in
the grid command. Closes sf patch 1451661 - JDH
2006-03-17 Center postscript output on page when using usetex - DSD
2006-03-17 subprocess module built if Python <2.4 even if subprocess can be im-
ported from an egg - ADS
2006-03-17 Added _subprocess.c from Python upstream and hopefully enabled build-
ing (without breaking) on Windows, although not tested. - ADS
2006-03-17 Updated subprocess.py to latest Python upstream and reverted name back to subprocess.py - ADS

2006-03-16 Added John Porter’s 3D handling code

2006-03-16 Released 0.87.2 at revision 2150

2006-03-15 Fixed bug in MaxNLocator revealed by daigos@infinito.it. The main change is that Locator.nonsingular now adjusts vmin and vmax if they are nearly the same, not just if they are equal. A new kwarg, “tiny”, sets the threshold. - EF

2006-03-14 Added import of compatibility library for newer numpy linear_algebra - TEO

2006-03-12 Extended “load” function to support individual columns and moved “load” and “save” into matplotlib.mlab so they can be used outside of pylab - see examples/load_converter.py - JDH

2006-03-12 Added AutoDateFormatter and AutoDateLocator submitted by James Evans. Try the load_converter.py example for a demo. - ADS

2006-03-11 Added subprocess module from python-2.4 - DSD

2006-03-11 Fixed landscape orientation support with the use_tex option. The backend_ps print_figure method was getting complicated, I added a _print_figure_tex method to maintain some degree of sanity - DSD

2006-03-11 Added “papertype” savefig kwarg for setting postscript papertypes. paper-type and ps.papersize rc setting can also be set to “auto” to autoscale pagesizes - DSD

2006-03-09 Apply P-J’s patch to make pstoeps work on windows patch report # 1445612 - DSD

2006-03-09 Make backend rc parameter case-insensitive - DSD

2006-03-07 Fixed bug in backend_ps related to C0-C6 papertypes, which were causing problems with postscript viewers. Supported page sizes include letter, legal, ledger, A0-A10, and B0-B10 - DSD

2006-03-07 Released 0.87.1

2006-03-04 backend_cairo.py: fix get_rgb() bug reported by Keith Briggs. Require pycairo 1.0.2. Support saving png to file-like objects. - SC

2006-03-03 Fixed pcolor handling of vmin, vmax - EF

2006-03-02 Improve page sizing with use_tex with the latex geometry package. Closes bug # 1441629 - DSD

2006-03-02 Fixed dpi problem with use_tex png output. Accepted a modified version of patch # 1441809 - DSD

2006-03-01 Fixed axis(‘scaled’) to deal with case xmax < xmin - JSWHIT

2006-03-01 Added reversed colormaps (with ‘_r’ appended to name) - JSWHIT

2006-02-27 Improved eps bounding boxes with use_tex - DSD

2006-02-27 Test svn commit, again!

2006-02-27 Fixed two dependency checking bugs related to use_tex on Windows - DSD
2006-02-27 Made the rc deprecation warnings a little more human readable.
2006-02-26 Update the previous gtk.main_quit() bug fix to use gtk.main_level()
   • SC
2006-02-24 Implemented alpha support in contour and contourf - EF
2006-02-22 Fixed gtk main quit bug when quit was called before mainloop. - JDH
2006-02-22 Small change to colors.py to workaround apparent bug in numpy masked array module - JSWHIT
2006-02-22 Fixed bug in ScalarMappable.to_rgba() reported by Ray Jones, and fixed incorrect fix found by Jeff Whitaker - EF

2006-02-22 Released 0.87
2006-02-21 Fixed portrait/landscape orientation in postscript backend - DSD
2006-02-21 Fix bug introduced in yesterday’s bug fix - SC
2006-02-20 backend_gtk.py FigureCanvasGTK.draw(): fix bug reported by David Tremouilles - SC
2006-02-20 Remove the “pygtk.require(‘2.4’)” error from examples/embedding_in_gtk2.py - SC
2006-02-18 backend_gtk.py FigureCanvasGTK.draw(): simplify to use (rather than duplicate) the expose_event() drawing code - SC
2006-02-12 Added stagger or waterfall plot capability to LineCollection; illustrated in examples/collections.py. - EF
2006-02-11 Massive cleanup of the usetex code in the postscript backend. Possibly fixed the clipping issue users were reporting with older versions of ghostscript - DSD
2006-02-11 Added autolim kwarg to axes.add_collection. Changed collection get_verts() methods accordingly. - EF
2006-02-09 added a temporary rc parameter text.dvipng hack, to allow Mac users to get nice results with the usetex option. - DSD
2006-02-09 Fixed a bug related to setting font sizes with the usetex option. - DSD
2006-02-09 Fixed a bug related to usetex’s latex code. - DSD
2006-02-09 Modified behavior of font.size rc setting. You should define font.size in pts, which will set the “medium” or default fontsize. Special text sizes like axis labels or tick labels can be given relative font sizes like small, large, x-large, etc. and will scale accordingly. - DSD
2006-02-08 Added py2exe specific datapath check again. Also added new py2exe helper function get_py2exe_datafiles for use in py2exe setup.py scripts. - CM
2006-02-02 Added box function to pylab
2006-02-02 Fixed a problem in setupext.py, tk library formatted in unicode caused build problems - DSD
2006-02-01 Dropped TeX engine support in usetex to focus on LaTeX. - DSD

8.1. List of changes to Matplotlib prior to 2015
2006-01-29 Improved use of tex option to respect the serif, sans-serif, monospace, and cursive rc settings. Removed the font.latex.package rc setting, it is no longer required - DSD

2006-01-29 Fixed tex’s caching to include font.family rc information - DSD

2006-01-29 Fixed subpixel rendering bug in *Agg that was causing uneven gridlines - JDH

2006-01-28 Added fontcmd to backend_ps’s RendererPS.draw_tex, to support other font families in eps output - DSD

2006-01-28 Added MaxNLocator to ticker.py, and changed contour.py to use it by default. - EF

2006-01-28 Added fontcmd to backend_ps’s RendererPS.draw_tex, to support other font families in eps output - DSD

2006-01-27 Buffered reading of matplotlibrc parameters in order to allow ‘verbose’ settings to be processed first (allows verbose.report during rc validation process) - DSD

2006-01-27 Removed setuptools support from setup.py and created a separate setuppeg.py file to replace it. - CM

2006-01-26 Replaced the ugly datapath logic with a cleaner approach from http://wiki.python.org/moin/DistutilsInstallDataScattered. Overrides the install_data command. - CM

2006-01-24 Don’t use character typecodes in cntr.c — changed to use defined type-numbers instead. - TEO

2006-01-24 Fixed some bugs in use of tex’s and ps.usedistiller’s dependency

2006-01-24 Added masked array support to scatter - EF

2006-01-24 Fixed some bugs in use of tex’s and ps.usedistiller’s dependency checking - DSD

2006-01-24 Released 0.86.2

2006-01-20 Added a converters dict to pylab load to convert selected columns to float - especially useful for files with date strings, uses a datestr2num converter - JDH

2006-01-20 Added datestr2num to matplotlib dates to convert a string or sequence of strings to a matplotlib datenum

2006-01-18 Added quadrilateral pcolormesh patch 1409190 by Alex Mont and Paul Kienzle - this is *Agg only for now. See examples/quadmesh_demo.py - JDH

2006-01-18 Added Jouni’s boxplot patch - JDH

2006-01-18 Added comma delimiter for pylab save - JDH

2006-01-12 Added Ryan’s legend patch - JDH

2006-1-12 Fixed numpy / numeric to use .dtype.char to keep in SYNC with numpy SVN

2006-1-11 Released 0.86.1

2006-1-11 Fixed setup.py for win32 build and added rc template to the MANIFEST.in
2006-1-10 Added xpdf distiller option. **matplotlibrc ps.usedistiller can now be**
none, false, ghostscript, or xpdf. Validation checks for dependencies. This needs
testing, but the xpdf option should produce the highest-quality output and small file
sizes - DSD

2006-01-10 **For the usetex option, backend_ps now does all the LaTeX work in the**
os’s temp directory - DSD

2006-1-10 Added checks for usetex dependencies. - DSD

2006-1-9 Released 0.86
2006-1-4 Changed to support numpy (new name for scipy_core) - TEO
2006-1-4 Added Mark’s scaled axes patch for shared axis
2005-12-28 Added Chris Barker’s build_wxagg patch - JDH

2005-12-27 **Altered numerix/scipy to support new scipy package** structure - TEO
2005-12-20 Fixed Jame’s Boyles date tick reversal problem - JDH

2005-12-20 **Added Jouni’s rc patch to support lists of keys to set on** - JDH
2005-12-12 **Updated pyparsing and mathtext for some speed enhancements**
(Thanks Paul McGuire) and minor fixes to scipy numerix and setup tools

2005-12-12 **Matplotlib data is now installed as package_data in the matplotlib mod-
ule. This gets rid of checking the many possibilities in matplotlib._get_data_path() - CM
2005-12-11 **Support for setuptools/pkg_resources to build and use** matplotlib as an
egg. Still allows matplotlib to exist using a traditional distutils install. - ADS

2005-12-03 **Modified setup to build matplotlibrc based on compile time** findings. It
will set numerix in the order of scipy, numarray, Numeric depending on which are
found, and backend as in preference order GTKAgg, WXAgg, TkAgg, GTK, Agg, PS

2005-12-03 **Modified scipy patch to support Numeric, scipy and numarray** Some
work remains to be done because some of the scipy imports are broken if only the core
is installed. e.g., apparently we need from scipy.basic.fftpack import * rather than from
scipy.fftpack import *

2005-12-03 **Applied some fixes to Nicholas Young’s nonuniform image** patch
2005-12-01 Applied Alex Gontmakher hatch patch - PS only for now
2005-11-30 Added Rob McMullen’s EMF patch
2005-11-30 Added Daishi’s patch for scipy
2005-11-30 Fixed out of bounds draw markers segfault in agg
2005-11-28 Got TkAgg blitting working 100% (cross fingers) correctly. - CM

2005-11-27 **Multiple changes in cm.py, colors.py, figure.py, image.py,** contour.py,
contour_demo.py; new _cm.py, examples/image_masked.py. 1) Separated the color table
data from cm.py out into a new file, _cm.py, to make it easier to find the actual code
in cm.py and to add new colormaps. Also added some line breaks to the color data
dictionaries. Everything from _cm.py is imported by cm.py, so the split should be trans-
parent. 2) Enabled automatic generation of a colormap from a list of colors in contour;
see modified examples/contour_demo.py. 3) Support for imshow of a masked array,
with the ability to specify colors (or no color at all) for masked regions, and for regions
that are above or below the normally mapped region. See examples/image_masked.py.
4) In support of the above, added two new classes, ListedColormap, and no_norm, to colors.py, and modified the Colormap class to include common functionality. Added a clip kwarg to the normalize class. Reworked color handling in contour.py, especially in the ContourLabeller mixin. - EF

2005-11-25 Changed text.py to ensure color is hashable. EF

2005-11-16 Released 0.85
2005-11-16 Changed the default default linewidth in rc to 1.0

**2005-11-16 Replaced agg_to_gtk_drawable with pure pygtk pixbuf code in**
backend gtkagg. When the equivalent is doe for blit, the agg extension code will
no longer be needed

**2005-11-16 Added a maxdict item to cbook to prevent caches from** growing w/o bounds

**2005-11-15 Fixed a colorup/colordown reversal bug in finance.py** - Thanks Gilles

**2005-11-15 Applied Jouni K Steppanen’s boxplot patch SF patch #1349997**
• JDH

2005-11-09 added axisbelow attr for Axes to determine whether ticks and such are above or below the actors

2005-11-08 Added Nicolas’ irregularly spaced image patch

**2005-11-08 Deprecated HorizontalSpanSelector and replaced with** SpanSelection that takes a third arg, direction. The new SpanSelector supports horizontal and vertical span selection, and the appropriate min/max is returned. - CM

2005-11-08 Added lineprops dialog for gtk

**2005-11-03 Added FIFOBuffer class to mlab to support real time feeds** and examples/fifo_buffer.py

**2005-11-01 Contributed Nickolas Young’s patch for afm mathtext to** support mathtext based upon the standard postscript Symbol font when psusetex = True.

2005-10-26 Added support for scatter legends - thanks John Gill

**2005-10-20 Fixed image clipping bug that made some tex labels** disappear. JDH

2005-10-14 Removed sqrt from dvipng 1.6 alpha channel mask.
2005-10-14 Added width kwarg to hist function
2005-10-10 Replaced all instances of os.rename with shutil.move
2005-10-05 Added Michael Brady’s ydate patch
2005-10-04 Added rkern’s texmanager patch

**2005-09-25 contour.py modified to use a single ContourSet class** that handles filled contours, line contours, and labels; added keyword arg (clip_ends) to contourf. Colorbar modified to work with new ContourSet object; if the ContourSet has lines rather than polygons, the colorbar will follow suit. Fixed a bug introduced in 0.84, in which contourf(..., colors=...) was broken - EF

2005-09-19 Released 0.84
2005-09-14 Added a new ‘resize_event’ which triggers a callback with a
backend_bases.ResizeEvent object - JDH

2005-09-14 font_manager.py: removed chkfontpath from x11FontDirectory() - SC

2005-09-14 Factored out auto date locator/formatter factory code into
matplotlib.date.date_ticker_factory; applies John Bryne’s quiver patch.

2005-09-13 Added Mark’s axes positions history patch #1286915

2005-09-09 Added support for auto canvas resizing with fig.set_figsize_inches(9,5,forward=True)
# inches OR fig.resize(400,300) # pixels

2005-09-07 figure.py: update Figure.draw() to use the updated
renderer.draw_image() so that examples/figimage_demo.py works again. examples/stock_demo.py: remove data_clipping (which no longer exists) - SC

2005-09-06 Added Eric’s tick.direction patch: in or out in rc

2005-09-06 Added Martin’s rectangle selector widget

2005-09-04 Fixed a logic err in text.py that was preventing rgxsuper from matching - JDH

2005-08-29 Committed Ken’s wx blit patch #1275002

2005-08-26 colorbar modifications - now uses contourf instead of imshow so that
colors used by contourf are displayed correctly. Added two new keyword args (cspacing
and clabels) that are only relevant for ContourMappable images - JSWHIT

2005-08-24 Fixed a PS image bug reported by Darren - JDH

2005-08-23 colors.py: change hex2color() to accept unicode strings as well as
normal strings. Use isinstance() instead of types.IntType etc - SC

2005-08-16 removed data_clipping line and rc property - JDH

2005-08-22 backend_svg.py: Remove redundant “x=0.0 y=0.0” from svg element.
Increase svg version from 1.0 to 1.1. Add viewBox attribute to svg element to allow SVG
documents to scale-to-fit into an arbitrary viewport - SC

2005-08-16 Added Eric’s dot marker patch - JDH

2005-08-08 Added blitting/animation for TkAgg - CM

2005-08-05 Fixed duplicate tickline bug - JDH

2005-08-05 Fixed a GTK animation bug that cropped up when doing animations in
gtk/gtkagg canvases that had widgets packed above them

2005-08-05 Added Clovis Goldemberg patch to the tk save dialog

2005-08-04 Removed origin kwarg from backend.draw_image. origin is handled entirely by the frontend now.

2005-07-03 Fixed a bug related to TeX commands in backend_ps

2005-08-03 Fixed SVG images to respect upper and lower origins.

2005-08-03 Added flipud method to image and removed it from to_str.

2005-07-29 Modified figure.figaspect to take an array or number; modified back-
end_svg to write utf-8 - JDH

2005-07-30 backend_svg.py: embed png image files in svg rather than linking to a
separate png file, fixes bug #1245306 (thanks to Norbert Nemec for the patch) - SC
2005-07-29 Released 0.83.2

2005-07-27 Applied SF patch 1242648: minor rounding error in indexdateformatter in dates.py

2005-07-27 Applied SF patch 1244732: Scale axis such that circle looks like circle - Jdh

2005-07-29 Improved message reporting in texmanager and backend_ps - DSD

2005-07-28 backend_gtk.py: update FigureCanvasGTK.draw() (needed due to the recent expose_event() change) so that examples/anim.py works in the usual way - SC

2005-07-26 Added new widgets Cursor and HorizontalSpanSelector to matplotlib.widgets. See examples/widgets/cursor.py and examples/widgets/span_selector.py - JDH

2005-07-26 added draw event to mpl event hierarchy - triggered on figure.draw

2005-07-26 backend_gtk.py: allow ‘f’ key to toggle window fullscreen mode

2005-07-26 backend_svg.py: write “<.../>” elements all on one line and remove surplus spaces - SC

2005-07-25 backend_svg.py: simplify code by deleting GraphicsContextSVG and RendererSVG.new_gc() and moving the gc.get_capstyle() code into RendererSVG._get_gc_props_svg() - SC

2005-07-24 backend_gtk.py: call FigureCanvasBase.motion_notify_event() on all motion-notify-events, not just ones where a modifier key or button has been pressed (fixes bug report from Niklas Volbers) - SC

2005-07-24 backend_gtk.py: modify print_figure() use own pixmap, fixing problems where print_figure() overwrites the display pixmap. return False from all button/key etc events - to allow the event to propagate further - SC

2005-07-23 backend_gtk.py: change expose_event from using set_back_pixmap(); clear() to draw_drawable() - SC

2005-07-23 backend_gtk.py: removed pygtk.require() matplotlib/_init__.py: delete ‘FROZEN’ and ‘McPLError’ which are no longer used - SC

2005-07-22 backend_gdk.py: removed pygtk.require() - SC

2005-07-21 backend_svg.py: Remove unused imports. Remove methods doc strings which just duplicate the docs from backend_bases.py. Rename draw_mathtext to _draw_mathtext. - SC

2005-07-17 examples/embedding_in_gtk3.py: new example demonstrating placing a FigureCanvas in a gtk.ScrolledWindow - SC

2005-07-14 Fixed a Windows related bug (#1238412) in texmanager - DSD

2005-07-11 Fixed color kwarg bug, setting color=1 or 0 caused an exception - DSD

2005-07-07 Added Eric’s MA set_xdata Line2D fix - Jdh

2005-07-06 Made HOME/.matplotlib the new config dir where the matplotlibrc file, the ttf.cache, and the tex.cache live. The new default filenames in .matplotlib have no leading dot and are not hidden. e.g., the new names are matplotlibrc tex.cache ttf/font.cache. This is how ipython does it so it must be right. If old files are found, a warning is issued and they are moved to the new location. Also fixed texmanager to put
all files, including temp files in ~/.matplotlib/tex.cache, which allows you to use \text{} in non-writable dirs.

2005-07-05 Fixed bug \#1231611 in subplots adjust layout. The problem was that the text caching mechanism was not using the transformation affine in the key. - JDH

2005-07-05 Fixed default backend import problem when using API (SF bug \#1209354 - see API CHANGES for more info - JDH

2005-07-04 backend_gtk.py: require PyGTK version 2.0.0 or higher - SC

2005-06-30 setupext.py: added numarray_inc_dirs for building against numarray when not installed in standard location - ADS

2005-06-27 backend_svg.py: write figure width, height as int, not float. Update to fix some of the pychecker warnings - SC

2005-06-23 Updated examples/agg_test.py to demonstrate curved paths and fills - JDH

2005-06-21 Moved some texmanager and backend_agg tex caching to class level rather than instance level - JDH

2005-06-20 setupext.py: fix problem where _nc_backend_gdk is installed to the wrong directory - SC

2005-06-19 Added 10.4 support for CocoaAgg. - CM

2005-06-18 Move Figure.get_width_height() to FigureCanvasBase and return int instead of float. - SC

2005-06-18 Applied Ted Drain’s QtAgg patch: 1) Changed the toolbar to be a horizontal bar of push buttons instead of a QToolbar and updated the layout algorithms in the main window accordingly. This eliminates the ability to drag and drop the toolbar and detach it from the window. 2) Updated the resize algorithm in the main window to show the correct size for the plot widget as requested. This works almost correctly right now. It looks to me like the final size of the widget is off by the border of the main window but I haven’t figured out a way to get that information yet. We could just add a small margin to the new size but that seems a little hacky. 3) Changed the x/y location label to be in the toolbar like the Tk backend instead of as a status line at the bottom of the widget. 4) Changed the toolbar pixmaps to use the ppm files instead of the png files. I noticed that the Tk backend buttons looked much nicer and it uses the ppm files so I switched them.

2005-06-17 Modified the gtk backend to not queue mouse motion events. This allows for live updates when dragging a slider. - CM

2005-06-17 Added starter CocoaAgg backend. Only works on OS 10.3 for now and requires PyObjC. (10.4 is high priority) - CM

2005-06-17 Upgraded pyparsing and applied Paul McGuire’s suggestions for speeding things up. This more than doubles the speed of mathtext in my simple tests. JDH

2005-06-16 Applied David Cooke’s subplot make_key patch

2005-06-15 0.82 released

2005-06-15 Added subplot config tool to GTK* backends - note you must now import the NavigationToolbar2 from your backend of choice rather than from backend_gtk because it needs to know about the backend specific canvas
see examples/embedding_in_gtk2.py. Ditto for wx backend - see examples/embedding_in_wxagg.py

2005-06-15 backend_cairo.py: updated to use pycairo 0.5.0 - SC

2005-06-14 Wrote some GUI neutral widgets (Button, Slider, RadioButtons, Check-Buttons) in matplotlib.widgets. See examples/widgets/*.py - JDH

2005-06-14 Exposed subplot parameters as rc vars and as the fig SubplotParams instance subplotpars. See figure.SubplotParams, figure.Figure.subplots_adjust and the pylab method subplots_adjust and examples/subplots_adjust.py. Also added a GUI neutral widget for adjusting subplots, see examples/subplot_toolbar.py - JDH

2005-06-13 Exposed cap and join style for lines with new rc params and

    line properties
    lines.dash_joinstyle : miter # miter|round|bevel
    lines.dash_capstyle : butt # butt|round|projecting
    lines.solid_joinstyle : miter # miter|round|bevel
    lines.solid_capstyle : projecting # butt|round|projecting

2005-06-13 Added kwargs to Axes init
2005-06-13 Applied Baptiste’s tick patch - JDH

2005-06-13 Fixed rc alias ‘l’ bug reported by Fernando by removing aliases for main-

level rc options. - JDH

2005-06-10 Fixed bug #1217637 in ticker.py - DSD
2005-06-07 Fixed a bug in texmanager.py: .aux files not being removed - DSD
2005-06-08 Added Sean Richard’s hist binning fix - see API_CHANGES - JDH

2005-06-07 Fixed a bug in texmanager.py: .aux files not being removed

    • DSD

2005-06-07 matplotlib-0.81 released
2005-06-06 Added autoscale_on prop to axes
2005-06-06 Added Nick’s picker “among” patch - JDH
2005-06-05 Fixed a TeX/LaTeX font discrepency in backend_ps. - DSD

2005-06-05 Added a ps.distill option in rc settings. If True, postscript output will be
distilled using ghostscript, which should trim the file size and allow it to load more
quickly. Hopefully this will address the issue of large ps files due to font definitions.
Tested with gnu-ghostscript-8.16. - DSD

2005-06-03 Improved support for tex handling of text in backend_ps. - DSD

2005-06-03 Added rc options to render text with tex or latex, and to select the latex
font package. - DSD
2005-06-03 Fixed a bug in ticker.py causing a ZeroDivisionError

2005-06-02 backend_gtk.py remove DBL_BUFFER, add line to expose_event to try to
fix pygtk 2.6 redraw problem - SC

2005-06-01 The default behavior of ScalarFormatter now renders scientific notation
and large numerical offsets in a label at the end of the axis. - DSD
2005-06-01 Added Nicholas’ frombyte image patch - JDH
2005-05-31 Added vertical TeX support for agg - JDH
2005-05-31 Applied Eric’s cntr patch - JDH

2005-05-27 Finally found the pesky agg bug (which Maxim was kind enough to fix within hours) that was causing a segfault in the win32 cached marker drawing. Now windows users can get the enormous performance benefits of caced markers w/o those occasional pesky screenshots. - JDH

2005-05-27 Got win32 build system working again, using a more recent version of gtk and pygtk in the win32 build, gtk 2.6 from https://web.archive.org/web/20050527002647/https://www.gimp.org/~tml/gimp/win32/downloads.html (you will also need libpng12.dl to use these). I haven’t tested whether this binary build of mpl for win32 will work with older gtk runtimes, so you may need to upgrade.

2005-05-27 Fixed bug where 2nd wxapp could be started if using wxagg backend. - ADS

2005-05-26 Added Daishi text with dash patch – see examples/dashtick.py

2005-05-26 Moved backend latex functionality into backend_ps. If text.usetex=True, the PostScript backend will use LaTeX to generate the .ps or .eps file. Ghostscript is required for eps output. - DSD

2005-05-24 Fixed alignment and color issues in latex backend. - DSD

2005-05-21 Fixed raster problem for small rasters with dvipng - looks like it was a premultipled alpha problem - JDH

2005-05-20 Added linewidth and faceted kwarg to scatter to control edgewidth and color. Also added autolegend patch to inspect line segments.

2005-05-17 Added a psfrag latex backend - some alignment issues need to be worked out. Run with -dLaTeX and a .tex file and *.eps file are generated. latex and dvips the generated latex file to get ps output. Note xdvi *does not work, you must generate ps.- JDH

2005-05-13 Added Florent Rougon’s Axis set_label1 patch

2005-05-17 pcolor optimization, fixed bug in previous pcolor patch - JSWHIT

2005-05-16 Added support for masked arrays in pcolor - JSWHIT

2005-05-12 Started work on TeX text for antigrain using pngdvi - see examples/tex demo.py and the new module matplotlib.texmanager. Rotated text not supported and rendering small glyphs is not working right yet. But large fontsizes and/or high dpi saved figs work great.

2005-05-10 New image resize options interpolation options. New values for the interp kwarg are

See help(imshow) for details, particularly the interpolation, filternorm and filterrad kwargs

2005-05-10 Applied Eric’s contour mem leak fixes - JDH
2005-05-10 Extended python agg wrapper and started implementing backend_agg2, an agg renderer based on the python wrapper. This will be more flexible and easier to extend than the current backend_agg. See also examples/agg_test.py - JDH

2005-05-09 Added Marcin’s no legend patch to exclude lines from the autolegend builder

    plot(x, y, label='nolegend')

2005-05-05 Upgraded to agg23

2005-05-05 Added newscalarformatter_demo.py to examples. -DSD

2005-05-04 Added NewScalarFormatter. Improved formatting of ticklabels, scientific notation, and the ability to plot large large numbers with small ranges, by determining a numerical offset. See ticker.NewScalarFormatter for more details. -DSD

2005-05-03 Added the option to specify a delimiter in pylab.load -DSD

2005-04-28 Added Darren’s line collection example

2005-04-28 Fixed aa property in agg - JDH

2005-04-27 Set postscript page size in .matplotlibrc - DSD

2005-04-26 Added embedding in qt example. - JDH

2005-04-14 Applied Michael Brady’s qt backend patch: 1) fix a bug where keyboard input was grabbed by the figure and not released 2) turn on cursor changes 3) clean up a typo and commented-out print statement. - JDH

2005-04-14 Applied Eric Firing’s masked data lines patch and contour patch. Support for masked arrays has been added to the plot command and to the Line2D object. Only the valid points are plotted. A “valid_only” kwarg was added to the get_xdata() and get_ydata() methods of Line2D; by default it is False, so that the original data arrays are returned. Setting it to True returns the plottable points. - see examples/masked_demo.py - JDH

2005-04-13 Applied Tim Leslie’s arrow key event handling patch - JDH

0.80 released

2005-04-11 Applied a variant of rick’s xlim/ylim/axis patch. These functions now take kwargs to let you selectively alter only the min or max if desired. e.g., xlim(xmin=2) or axis(ymax=3). They always return the new lim. - JDH

2005-04-11 Incorporated Werner’s wx patch - wx backend should be compatible with wxpython2.4 and recent versions of 2.5. Some early versions of wxpython 2.5 will not work because there was a temporary change in the dc API that was rolled back to make it 2.4 compliant

2005-04-11 modified tkagg show so that new figure window pops up on call to figure

2005-04-11 fixed wxapp init bug

2005-04-02 updated backend_ps.draw_lines, draw_markers for use with the new API - DSD

2005-04-01 Added editable polygon example

2005-03-31 0.74 released
2005-03-30 Fixed and added checks for floating point inaccuracy in ticker.Base - DSD

2005-03-30 updated ellipse definition in backend_ps.py to address bug #1122041 - DSD

2005-03-29 Added unicode support for Agg and PS - JDH

2005-03-28 Added Jarrod’s svg patch for text - JDH

2005-03-28 Added Ludal’s arrow and quiver patch - JDH

2005-03-28 Added label kwarg to Axes to facilitate forcing the creation of new Axes with otherwise identical attributes

2005-03-28 Applied boxplot and OSX font search patches

2005-03-27 Added ft2font NULL check to fix Japanese font bug - JDH

2005-03-27 Added sprint legend patch plus John Gill’s tests and fix - see examples/legend_auto.py - JDH

2005-03-19 0.73.1 released

2005-03-19 Reverted wxapp handling because it crashed win32 - JDH

2005-03-18 Add .number attribute to figure objects returned by figure() - FP

2005-03-18 0.73 released

2005-03-16 Fixed labelsep bug

2005-03-16 Applied Darren’s ticker fix for small ranges - JDH

2005-03-16 Fixed tick on horiz colorbar - JDH

2005-03-16 Added Japanese winreg patch - JDH

2005-03-15 backend_gtkagg.py: changed to use double buffering, this fixes the problem reported Joachim Berdal Haga - “Parts of plot lagging from previous frame in animation”. Tested with anim.py and it makes no noticeable difference to performance (23.7 before, 23.6 after) - SC

2005-03-14 add src/_backend_gdk.c extension to provide a substitute function for pixbuf.get_pixels_array(). Currently pixbuf.get_pixels_array() only works with Numeric, and then only works if pygtk has been compiled with Numeric support. The change provides a function pixbuf.get_pixels_array() which works with Numeric and numarray and is always available. It means that backend_gtk should be able to display images and mathtext in all circumstances. - SC

2005-03-11 Upgraded CXX to 5.3.1

2005-03-10 remove GraphicsContextPS.set_linestyle() and GraphicsContextSVG.set_linestyle() since they do no more than the base class GraphicsContext.set_linestyle() - SC

2005-03-09 Refactored contour functionality into dedicated module

2005-03-09 Added Eric’s contourf updates and Nadia’s clabel functionality

2005-03-09 Moved colorbar to figure.Figure to expose it for API developers

8.1. List of changes to Matplotlib prior to 2015
• JDH

2005-03-09 backend_cairo.py: implemented draw_markers() - SC

2005-03-09 cbook.py: only use enumerate() (the python version) if the built-in
version is not available. Add new function ‘izip’ which is set to itertools.izip if available and the python equivalent if not available. - SC

2005-03-07 backend_gdk.py: remove PIXELS_PER_INCH from points_to_pixels(), but
still use it to adjust font sizes. This allows the GTK version of line_styles.py to more closely match GTKAgg, previously the markers were being drawn too large. - SC

2005-03-01 Added Eric’s contourf routines

2005-03-01 Added start of proper agg SWIG wrapper. I would like to expose agg functionality directly at the user level and this module will serve that purpose eventually, and will hopefully take over most of the functionality of the current _image and _backend_agg modules. - JDH

2005-02-28 Fixed polyfit / polyval to convert input args to float arrays - JDH

2005-02-25 Add experimental feature to backend_gtk.py to enable/disable double buffering (DBL_BUFFER=True/False) - SC

2005-02-24 colors.py change ColorConverter.to_rgb() so it always returns rgb (and not rgba), allow names keys to be cached, change the exception raised from RuntimeError to ValueError (like hex2color()) hex2color() use a regular expression to check the color string is valid - SC

2005-02-23 Added rc param ps.useafm so backend ps can use native afm fonts or truetype. afme breaks mathtext but causes much smaller font sizes and may result in images that display better in some contexts (e.g., pdfs incorporated into latex docs viewed in acrobat reader). I would like to extend this approach to allow the user to use truetype only for mathtext, which should be easy.

2005-02-23 Used sequence protocol rather than tuple in agg collection drawing routines for greater flexibility - JDH

2005-02-22 0.72.1 released

2005-02-21 fixed linestyles for collections - contour now dashes for levels <0

2005-02-21 fixed ps color bug - JDH

2005-02-15 fixed missing qt file

2005-02-15 banished error_msg and report_error. Internal backend methods like error_msg_gtk are preserved. backend writers, check your backends, and diff against 0.72 to make sure I did the right thing! - JDH

2005-02-14 Added enthought traits to matplotlib tree - JDH

2005-02-14 0.72 released

2005-02-14 fix bug in cbook alltrue() and onetrue() - SC

2005-02-11 updated qtagg backend from Ted - JDH
2005-02-11 matshow fixes for figure numbering, return value and docs - FP

2005-02-09 new zorder example for fine control in zorder_demo.py - FP

2005-02-09 backend renderer draw_lines now has transform in backend, as in draw_markers; use numerix in _backend_agg, added small line optimization to agg

2005-02-09 subplot now deletes axes that it overlaps

2005-02-08 Added transparent support for gzipped files in load/save - Fernando Perez (FP from now on).

2005-02-08 Small optimizations in PS backend. They may have a big impact for large plots, otherwise they don’t hurt - FP

2005-02-08 Added transparent support for gzipped files in load/save - Fernando Perez (FP from now on).

2005-02-07 Added newstyle path drawing for markers - only implemented in agg currently - JDH

2005-02-05 Some superscript text optimizations for ticking log plots

2005-02-05 Added some default key press events to pylab figures: ‘g’ toggles grid - JDH

2005-02-05 Added some support for handling log switching for lines that have non-pos data - JDH

2005-02-04 Added Nadia’s contour patch - contour now has matlab compatible syntax; this also fixed an unequal sized contour array bug - JDH

2005-02-04 Modified GTK backends to allow the FigureCanvas to be resized smaller than its original size - SC

2005-02-02 Fixed a bug in dates mx2num - JDH

2005-02-02 Incorporated Fernando’s matshow - JDH

2005-02-01 Added Fernando’s figure num patch, including experimental support for pylab backend switching, LineCOllection.color warns, savefig now a figure method, fixed a close(fig) bug - JDH

2005-01-31 updated datalim in contour - JDH

2005-01-30 Added backend_qtagg.py provided by Sigve Tjora - SC

2005-01-28 Added tk.inspect rc param to matplotlibrc. IDLE users should set tk.pythoninspect:True and interactive:True and backend:TkAgg

2005-01-28 Replaced examples/interactive.py with an updated script from Fernando Perez - SC

2005-01-27 Added support for shared x or y axes. See examples/shared_axis_demo.py and examples/ganged_plots.py

2005-01-27 Added Lee’s patch for missing symbols leq and LEFTbracket to _math-text_data - JDH

2005-01-26 Added Baptiste’s two scales patch - see help(twinx) in the pylab interface for more info. See also examples/two_scales.py

2005-01-24 Fixed a mathtext parser bug that prevented font changes in sub/superscripts - JDH
2005-01-24 Fixed contour to work w/ interactive changes in colormaps, clim, etc - JDH

2005-01-21 matplotlib-0.71 released
2005-01-21 Refactored numerix to solve vexing namespace issues - JDH
2005-01-21 Applied Nadia’s contour bug fix - JDH

2005-01-20 Made some changes to the contour routine - particularly region=1
seems t fix a lot of the zigzag strangeness. Added colormaps as default for con-
tour - JDH

2005-01-19 Restored builtin names which were overridden (min, max, abs, round, and sum) in pylab. This is a potentially significant change for those who were relying on an array version of those functions that previously overrode builtin function names. - ADS

2005-01-18 Added accents to mathtext: hat, breve, grave, bar, acute, tilde, vec, dot, ddot. All of them have the same syntax, e.g., to make an overbar you do bar{o} or to make an o umlaut you do ddot{o}. The shortcuts are also provided, e.g., "o ‘e ‘e ~n .x ^y" - JDH

2005-01-18 Plugged image resize memory leaks - JDH
2005-01-18 Fixed some mathtext parser problems relating to superscripts

2005-01-17 Fixed a yticklabel problem for colorbars under change of clim - JDH

2005-01-17 Cleaned up Destroy handling in wx reducing memleak/fig from approx 800k to approx 6k- JDH
2005-01-17 Added kappa to latex_to_bakoma - JDH
2005-01-15 Support arbitrary colorbar axes and horizontal colorbars - JDH

2005-01-15 Fixed colormap number of colors bug so that the colorbar has the same discretization as the image - JDH

2005-01-15 Added Nadia’s x,y contour fix - JDH

2005-01-15 backend_cairo: added PDF support which requires pycairo 0.1.4. Its not usable yet, but is ready for when the Cairo PDF backend matures - SC

2005-01-15 Added Nadia’s x,y contour fix
2005-01-12 Fixed set clip_on bug in artist - JDH
2005-01-11 Reverted pythoninspect in tkagg - JDH

2005-01-09 Fixed a backend_bases event bug caused when an event is triggered when location is None - JDH

2005-01-07 Add patch from Stephen Walton to fix bug in pylab.load() when the % character is included in a comment. - ADS

2005-01-07 Added markerscale attribute to Legend class. This allows the marker size in the legend to be adjusted relative to that in the plot. - ADS

2005-01-06 Add patch from Ben Vanhaeren to make the FigureManagerGTK vbox a public attribute - SC
2004-12-30 Release 0.70

2004-12-28 Added coord location to key press and added a examples/picker_demo.py
2004-12-28 Fixed coords notification in wx toolbar - JDH

2004-12-28 Moved connection and disconnection event handling to the FigureCanvasBase. Backends now only need to connect one time for each of the button press, button release and key press/release functions. The base class deals with callbacks and multiple connections. This fixes flakiness on some backends (tk, wx) in the presence of multiple connections and/or disconnect - JDH

2004-12-27 Fixed PS mathtext bug where color was not set - Jochen please verify correct - JDH

2004-12-27 Added Shadow class and added shadow kwarg to legend and pie for shadow effect - JDH

2004-12-27 Added pie charts and new example/pie_demo.py

2004-12-23 Fixed an agg text rotation alignment bug, fixed some text kwarg processing bugs, and added examples/text_rotation.py to explain and demonstrate how text rotations and alignment work in matplotlib. - JDH

2004-12-22 0.65.1 released - JDH

2004-12-22 Fixed colorbar bug which caused colorbar not to respond to changes in colormap in some instances - JDH

2004-12-22 Refactored NavigationToolbar in tkagg to support app embedding, init now takes (canvas, window) rather than (canvas, figman) - JDH

2004-12-21 Refactored axes and subplot management - removed add_subplot and add_axes from the FigureManager. classic toolbar updates are done via an observer pattern on the figure using add axobserver. Figure now maintains the axes stack (for gca) and supports axes deletion. Ported changes to GTK, Tk, Wx, and FLTK. Please test! Added delaxes - JDH

2004-12-21 Lots of image optimizations - 4x performance boost over 0.65 JDH

2004-12-20 Fixed a figimage bug where the axes is shown and modified tkagg to move the destroy binding into the show method.

2004-12-18 Minor refactoring of NavigationToolbar2 to support embedding in an application - JDH

2004-12-14 Added linestyle to collections (currently broken) - JDH

2004-12-14 Applied Nadia’s setupext patch to fix libstdc++ link problem with contour and solaris -JDH

2004-12-14 A number of pychecker inspired fixes, including removal of True and False from chook which I erroneously thought was needed for python2.2 - JDH

2004-12-14 Finished porting doc strings for set introspection. Used silent_list for many get funcs that return lists. JDH

2004-12-13 dates.py: removed all timezone() calls, except for UTC - SC

8.1. List of changes to Matplotlib prior to 2015 621
2004-12-13 0.65 released - JDH

2004-12-13 **colors.py: rgb2hex(), hex2color() made simpler (and faster), also**
   rgb2hex() - added round() instead of integer truncation
   hex2color() - changed 256.0 divisor to 255.0, so now ‘#ffffff’
   becomes (1.0,1.0,1.0) not (0.996,0.996,0.996) - SC

2004-12-11 Added ion and ioff to pylab interface - JDH

2004-12-11 **backend_template.py: delete FigureCanvasTemplate.realize() - most**
   backends don’t use it and its no longer needed

   backend_ps.py, backend_svg.py: delete show() and draw_if_interactive() - they are not
   needed for image backends

   backend_svg.py: write direct to file instead of StringIO - SC

2004-12-10 **Added zorder to artists to control drawing order of lines, patches   and**
   text in axes. See examples/zoder_demo.py - JDH

2004-12-10 Fixed colorbar bug with scatter - JDH

2004-12-10 Added Nadia Dencheva <dencheva@stsci.edu> contour code - JDH

2004-12-10 backend_cairo.py: got mathtext working - SC

2004-12-09 Added Norm Peterson’s svg clipping patch

2004-12-09 Added Matthew Newville’s wx printing patch

2004-12-09 Migrated matlab to pylab - JDH

2004-12-09 **backend_gtk.py: split into two parts**
   • backend_gdk.py - an image backend
   • backend_gtk.py - A GUI backend that uses GDK - SC

2004-12-08 **backend_gtk.py: remove quit_after_print_xvfb(*args), show_xvfb(),**
   Dialog_MeasureTool(gtk.Dialog) one month after sending mail to matplotlib-users
   asking if anyone still uses these functions - SC

2004-12-02 **backend_bases.py, backend_template.py: updated some of the method**
   documentation to make them consistent with each other - SC

2004-12-04 Fixed multiple bindings per event for TkAgg mpl_connect and
   mpl_disconnect. Added a “test_disconnect” command line parameter to coords_demo.py
   JTM

2004-12-04 Fixed some legend bugs JDH

2004-11-30 **Added over command for oneoff over plots. e.g., over(plot, x, y, lw=2).**
   Works with any plot function.

2004-11-30 Added bbox property to text - JDH

2004-11-29 **Zoom to rect now respect reversed axes limits (for both linear and log**
   axes). - GL

2004-11-29 **Added the over command to the matlab interface. over allows you to add**
   an overlay plot regardless of hold state. - JDH

2004-11-25 **Added Printf to mplutils for printf style format string**
   formatting in C++
   (should help write better exceptions)

2004-11-24 **IMAGE_FORMAT: remove from agg and gtkagg backends as its no longer**
   used - SC
2004-11-23 Added matplotlib compatible set and get introspection. See set_and_get.py
2004-11-23 applied Norbert’s patched and exposed legend configuration to kwargs - JDH
2004-11-23 backend_gtk.py: added a default exception handler - SC
2004-11-18 backend_gtk.py: change so that the backend knows about all image formats and does not need to use IMAGE_FORMAT in other backends - SC
2004-11-18 Fixed some report_error bugs in string interpolation as reported on SF bug tracker- JDH
2004-11-17 backend_gtkcairo.py: change so all print_figure() calls render using Cairo and get saved using backend_gtk.print_figure() - SC
2004-11-13 backend_cairo.py: Discovered the magic number (96) required for Cairo PS plots to come out the right size. Restored Cairo PS output and added support for landscape mode - SC
2004-11-13 Added ishold - JDH
2004-11-12 Added many new matlab colormaps - autumn bone cool copper flag gray hot hsv jet pink prism spring summer winter - PG
2004-11-11 greatly simplify the emitted postscript code - JV
2004-11-12 Added new plotting functions spy, spy2 for sparse matrix visualization - JDH
2004-11-11 Added rgrids, thetagrids for customizing the grid locations and labels for polar plots - JDH
2004-11-11 make the Gtk backends build without an X-server connection - JV
2004-11-10 matplotlib/__init__.py: Added FROZEN to signal we are running under py2exe (or similar) - is used by backend_gtk.py - SC
2004-11-09 backend_gtk.py: Made fix suggested by maffew@cat.org.au to prevent problems when py2exe calls pygtk.require(). - SC
2004-11-09 backend_cairo.py: Added support for printing to a fileobject. Disabled cairo PS output which is not working correctly. - SC

2004-11-08 matplotlib-0.64 released
2004-11-04 Changed -dbackend processing to only use known backends, so we don’t clobber other non-matplotlib uses of -d, like -debug.
2004-11-04 backend_agg.py: added IMAGE_FORMAT to list the formats that the backend can save to. backend_gtkagg.py: added support for saving JPG files by using the GTK backend - SC
2004-10-31 backend_cairo.py: now produces png and ps files (although the figure sizing needs some work). pycairo did not wrap all the necessary functions, so I wrapped them myself, they are included in the backend_cairo.py doc string. - SC
2004-10-31 backend_ps.py: clean up the generated PostScript code, use the PostScript stack to hold intermediate values instead of storing them in the dictionary. - JV
2004-10-30 backend_ps.py, ft2font.cpp, ft2font.h: fix the position of text in the PostScript output. The new FT2Font method get_descent gives the distance between the lower edge of the bounding box and the baseline of a string. In backend_ps the text is shifted upwards by this amount. - JV

2004-10-30 backend_ps.py: clean up the code a lot. Change the PostScript output to be more DSC compliant. All definitions for the generated PostScript are now in a PostScript dictionary ‘mpldict’. Moved the long comment about drawing ellipses from the PostScript output into a Python comment. - JV

2004-10-30 backend_gtk.py: removed FigureCanvasGTK.realize() as its no longer needed. Merged ColorManager into GraphicsContext backend_bases.py: For set_capstyle/joinstyle() only set cap or joinstyle if there is no error. - SC

2004-10-30 backend_gtk.py: tidied up print_figure() and removed some of the dependency on widget events - SC

2004-10-28 backend_cairo.py: The renderer is complete except for mathtext, draw_image() and clipping. gtkcairo works reasonably well. cairo does not yet create any files since I can’t figure how to set the ‘target surface’, I don’t think pycairo wraps the required functions - SC

2004-10-28 backend_gtk.py: Improved the save dialog (GTK 2.4 only) so it presents the user with a menu of supported image formats - SC

2004-10-28 backend_svg.py: change print_figure() to restore original face/edge color backend_ps.py: change print_figure() to ensure original face/edge colors are restored even if there’s an IOError - SC

2004-10-27 Applied Norbert’s errorbar patch to support barsabove kwarg
2004-10-27 Applied Norbert’s legend patch to support None handles

2004-10-27 Added two more backends: backend_cairo.py, backend_gtkcairo.py They are not complete yet, currently backend_gtkcairo just renders polygons, rectangles and lines - SC

2004-10-21 Added polar axes and plots - JDH

2004-10-20 Fixed corrcoef bug exposed by corrcoef(X) where X is matrix

• JDH

2004-10-19 Added kwarg support to xticks and yticks to set ticklabel text properties - thanks to T. Edward Whalen for the suggestion

2004-10-19 Added support for PIL images in imshow(), image.py - ADS

2004-10-19 Re-worked exception handling in _image.py and _transforms.py to avoid masking problems with shared libraries. - JTM

2004-10-16 Streamlined the matlab interface wrapper, removed the noplot option to hist - just use mlab.hist instead.

2004-09-30 Added Andrew Dalke’s strftime code to extend the range of dates supported by the DateFormatter - JDH

2004-09-30 Added barh - JDH

2004-09-30 Removed fallback to alternate array package from numerix so that ImportErrors are easier to debug. JTM

2004-09-30 Add GTK+ 2.4 support for the message in the toolbar. SC
2004-09-30 Made some changes to support python22 - lots of doc fixes. - JDH
2004-09-29 Added a Verbose class for reporting - JDH

2004-09-28 Released 0.63.0

2004-09-28 Added save to file object for agg - see examples/print_stdout.py
2004-09-24 Reorganized all py code to lib subdir

2004-09-24 Fixed axes resize image edge effects on interpolation - required upgrade to agg22 which fixed an agg bug related to this problem
2004-09-20 Added toolbar2 message display for backend_tkagg. JTM

2004-09-17 Added coords formatter attributes. These must be callable,
and return a string for the x or y data. These will be used to format the x and y
data for the coords box. Default is the axis major formatter. e.g.:

```python
# format the coords message box
def price(x): return '$%1.2f' % x
ax.format_xdata = DateFormatter('%Y-%m-%d')
ax.format_ydata = price
```

2004-09-17 Total rewrite of dates handling to use python datetime with num2date,
date2num and drange, pytz for timezone handling, dateutils for sophisticated tick-
ing, date ranges from 0001-9999 are supported. rrules allow arbitrary date tick-
ing, examples/date_demo*.py converted to show new usage, new example exam-
ples/date_demo_rrule.py shows how to use rrules in date plots. The date locators
are much more general and almost all of them have different constructors. See
matplotlib.dates for more info.

2004-09-15 Applied Fernando’s backend__init__ patch to support easier backend
maintenance. Added his numutils to mlab. JDH

2004-09-16 Re-designated all files in matlab/images as binary and w/o keyword
substitution using “cvs admin -kb *.svg ...”. See binary files in “info cvs” under Linux.
This was messing up builds from CVS on windows since CVS was doing lf -> cr/lf and
keyword substitution on the bitmaps. - JTM

2004-09-15 Modified setup to build array-package-specific extensions for those ex-
tensions which are array-aware. Setup builds extensions automatically for either Nu-
meric, numarray, or both, depending on what you have installed. Python proxy modules
for the array-aware extensions import the version optimized for numarray or Numeric
determined by numerix. - JTM

2004-09-15 Moved definitions of infinity from mlab to numerix to avoid divide by
zero warnings for numarray - JTM

2004-09-09 Added axhline, axvline, axhspan and axvspan

---

2004-08-30 matplotlib 0.62.4 released

2004-08-30 Fixed a multiple images with different extent bug, Fixed markerfacecolor
as RGB tuple

2004-08-27 Mathtext now more than 5x faster. Thanks to Paul Mcguire for fixes
both to pyparsing and to the matplotlib grammar! mathtext broken on python2.2

2004-08-25 Exposed Darren’s and Greg’s log ticking and formatting options to
semilogx and friends
2004-08-23 Fixed grid w/o args to toggle grid state - JDH
2004-08-11 Added Gregory’s log patches for major and minor ticking
2004-08-18 Some pixel edge effects fixes for images
2004-08-18 Fixed TTF files reads in backend_ps on win32.

**2004-08-18 Added base and subs properties for logscale plots, user** modifiable using
set_[x,y]scale('log',base=b,subs=[mt1,mt2,...]) - GL

**2004-08-18 fixed a bug exposed by trying to find the HOME dir on win32** thanks to
Alan Issac for pointing to the light - JDH

2004-08-18 fixed errorbar bug in setting ecolor - JDH
2004-08-12 Added Darren Dale’s exponential ticking patch
2004-08-11 Added Gregory’s fltkagg backend

2004-08-09 matplotlib-0.61.0 released

**2004-08-08 backend_gtk.py: get rid of the final PyGTK deprecation warning by**
replacing gtkOptionMenu with gtkMenu in the 2.4 version of the classic toolbar.

**2004-08-06 Added Tk zoom to rect rectangle, proper idle drawing, and** keybinding - JDH
2004-08-05 Updated installing.html and INSTALL - JDH
2004-08-01 backend_gtk.py: move all drawing code into the expose_event()
2004-07-28 Added Greg’s toolbar2 and backend_*agg patches - JDH

**2004-07-28 Added image.imread with support for loading png into** numerix arrays
2004-07-28 Added key modifiers to events - implemented dynamic updates and rubber banding for interactive pan/zoom - JDH

**2004-07-27 did a readthrough of SVG, replacing all the string** additions with string interps for efficiency, fixed some layout problems, added font and image support (through external pngs) - JDH

**2004-07-25 backend_gtk.py: modify toolbar2 to make it easier to support GTK+ 2.4.** Add GTK+ 2.4 toolbar support. - SC
2004-07-24 backend_gtk.py: Simplified classic toolbar creation - SC

**2004-07-24 Added images/matplotlib.svg to be used when GTK+ windows are** minimised - SC

2004-07-22 Added right mouse click zoom for NavigationToolbar2 panning mode. - JTM
2004-07-22 Added NavigationToolbar2 support to backend_tkagg. Minor tweak to backend_bases. - JTM

**2004-07-22 Incorporated Gergory’s renderer cache and buffer object** cache - JDH

2004-07-22 Backend_gtk.py: Added support for GtkFileChooser, changed
FileSelection/FileChooser so that only one instance pops up, and made them both modal. - SC
2004-07-21 Applied backend_agg memory leak patch from hayden-
jocallo@online.no. Found and fixed a leak in binary operations on transforms. Moral of
the story: never incref where you meant to decref! Fixed several leaks in ft2font: moral
of story: almost always return Py::asObject over Py::Object - JDH

2004-07-21 Fixed a to string memory allocation bug in agg and image modules - JDH
2004-07-21 Added mpl_connect and mpl_disconnect to matlab interface - JDH
2004-07-21 Added beginnings of users_guide to CVS - JDH
2004-07-20 ported toolbar2 to wx
2004-07-20 upgraded to agg21 - JDH
2004-07-20 Added new icons for toolbar2 - JDH

2004-07-19 Added vertical mathtext for *Agg and GTK - thanks Jim Benson! - JDH
2004-07-16 Added ps/eps/svg savefig options to wx and gtk JDH
2004-07-15 Fixed python framework tk finder in setupext.py - JDH

2004-07-14 Fixed layer images demo which was broken by the 07/12 image extent fixes - JDH
2004-07-13 Modified line collections to handle arbitrary length segments for each
line segment. - JDH

2004-07-13 Fixed problems with image extent and origin - set_image_extent deprecated. Use
imshow blah, blah, extent=(xmin, xmax, ymin, ymax) instead - JDH

2004-07-12 Added prototype for new nav bar with codified event handling. Use
mpl_connect rather than connect for matplotlib event handling. toolbar style determined by rc toolbar param. backend status: gtk: prototype, wx: in progress, tk: not
started - JDH

  • SC

2004-07-10 Added embedding_in_wx3 example - ADS
2004-07-09 Added dynamic_image.wxagg to examples - ADS
2004-07-09 added support for embedding TrueType fonts in PS files - PEB
2004-07-09 fixed a sfnt bug exposed if font cache is not built

2004-07-09 added default arg None to matplotlib.matlab grid command to toggle
current grid state

2004-07-08 0.60.2 released
2004-07-08 fixed a mathtext bug for ‘6’
2004-07-08 added some numarray bug workarounds

2004-07-07 0.60 released
2004-07-07 Fixed a bug in dynamic_demo_wx

2004-07-07 backend_gtk.py: raise SystemExit immediately if ‘import pygtk’ fails - SC
2004-07-05 Added new mathtext commands over{sym1}{sym2} and under{sym1}{sym2}

2004-07-05 Unified image and patch collections colormapping and scaling args. Updated docstrings for all - JDH

2004-07-05 Fixed a figure legend bug and added examples/figlegend_demo.py - JDH

2004-07-01 Fixed a memory leak in image and agg to string methods

2004-06-25 Fixed fonts_demo spacing problems and added a kwargs version of the fonts_demo_fonts_demo_kw.py - JDH

2004-06-25 finance.py: handle case when urlopen() fails - SC

2004-06-24 Support for multiple images on axes and figure, with blending. Support for upper and lower image origins. clim, jet and gray functions in matlab interface operate on current image - JDH

2004-06-23 ported code to Perry’s new colormap and norm scheme. Added new rc attributes image.aspect, image.interpolation, image.cmap, image.lut, image.origin

2004-06-20 backend_gtk.py: replace gtk.TRUE/FALSE with True/False. simplified _make_axis_menu(). - SC

2004-06-19 anim_tk.py: Updated to use TkAgg by default (not GTK)
backend_gtk.py: Added '_.' in front of private widget creation functions - SC

2004-06-17 backend_gtk.py: Create a GC once in realise(), not every time draw() is called. - SC

2004-06-16 Added new py2exe FAQ entry and added frozen support in get_data_path for py2exe - JDH

2004-06-16 Removed GTKGD, which was always just a proof-of-concept backend - JDH

2004-06-16 backend_gtk.py updates to replace deprecated functions
gtk.mainquit(), gtk.mainloop(). Update NavigationToolbar to use the new GtkToolbar API - SC

2004-06-15 removed set_default_font from font_manager to unify font customization using the new function rc. See API_CHANGE for more info. The examples fonts_demo.py and fonts_demo_kw.py are ported to the new API - JDH

2004-06-15 Improved (yet again!) axis scaling to properly handle singleton plots - JDH

2004-06-15 Restored the old FigureCanvasGTK.draw() - SC

2004-06-11 More memory leak fixes in transforms and ft2font - JDH

2004-06-11 Eliminated numerix .numerix file and environment variable NUMERIX. Fixed bug which prevented command line overrides: --numarray or --numeric. - JTM

2004-06-10 Added rc configuration function rc; deferred all rc param setting until object creation time; added new rc attrs: lines.markerfacecolor, lines.markeredgewidth, patch.linewidth, patch.facecolor, patch.edgecolor, patch.antialiased; see examples/customize_rc.py for usage - JDH

2004-06-09 0.54.2 released
2004-06-08 Rewrote ft2font using CXX as part of general memory leak fixes; also fixed transform memory leaks - JDH
2004-06-07 Fixed several problems with log ticks and scaling - JDH
2004-06-07 Fixed width/height issues for images - JDH
2004-06-03 Fixed draw_if_interactive bug for semilogx;
2004-06-02 Fixed text clipping to clip to axes - JDH
2004-06-02 Fixed leading newline text and multiple newline text - JDH
2004-06-02 Fixed plot date to return lines - JDH
2004-06-01 Fixed plot to work with x or y having shape N,1 or 1,N - JDH
2004-05-31 Added renderer markeredgewidth attribute of Line2D. - ADS
2004-05-29 Fixed tick label clipping to work with navigation.

2004-05-28 Added renderer grouping commands to support groups in SVG/PS. - JDH

2004-05-28 Fixed, this time I really mean it, the singleton plot plot([0]) scaling bug;
Fixed Flavio’s shape = N,1 bug - JDH
2004-05-28 added colorbar - JDH

2004-05-28 Made some changes to the matplotlib.colors.Colormap to properly support clim - JDH

2004-05-27 0.54.1 released

2004-05-27 Lots of small bug fixes: rotated text at negative angles, errorbar capsize and autoscaling, right tick label position, gtkagg on win98, alpha of figure background, singleton plots - JDH

2004-05-26 Added Gary’s errorbar stuff and made some fixes for length one plots and constant data plots - JDH

2004-05-25 Tweaked TkAgg backend so that canvas.draw() works more like the other backends. Fixed a bug resulting in 2 draws per figure manager show(). - JTM

2004-05-19 0.54 released

2004-05-18 Added newline separated text with rotations to text.Text layout - JDH
2004-05-16 Added fast pcolor using PolyCollections. - JDH

2004-05-14 Added fast polygon collections - changed scatter to use them. Added multiple symbols to scatter. 10x speedup on large scatters using *Agg and 5X speedup for ps. - JDH

2004-05-14 On second thought... created an “nx” namespace in numerix which maps type names onto typecodes the same way for both numarray and Numeric. This undoes my previous change immediately below. To get a typename for Int16 usable in a Numeric extension: say nx.Int16. - JTM

2004-05-15 Rewrote transformation class in extension code, simplified all the artist constructors - JDH
2004-05-14 Modified the type definitions in the numarray side of numerix so that they are Numeric typecodes and can be used with Numeric complex extensions. The original numarray types were renamed to type<old_name>. - JTM

2004-05-06 Gary Ruben sent me a bevy of new plot symbols and markers. See matplotlib.matlab.plot - JDH

2004-05-06 Total rewrite of mathtext - factored ft2font stuff out of layout engine and defined abstract class for font handling to lay groundwork for ps mathtext. Rewrote parser and made layout engine much more precise. Fixed all the layout hacks. Added spacing commands / and hspace. Added composite chars and defined angstrom. - JDH

2004-05-05 Refactored text instances out of backend; aligned text with arbitrary rotations is now supported - JDH

2004-05-05 Added a Matrix capability for numarray to numerix. JTM

2004-05-04 Updated what's new.html.template to use dictionary and template loop, added anchors for all versions and items; updated goals.txt to use those for links. PG

2004-05-04 Added fonts_demo.py to backend_driver, and AFM and TTF font caches to font_manager.py - PEB

2004-05-03 Redid goals.html.template to use a goals.txt file that has a pseudo restructured text organization. PG

2004-05-03 Removed the close buttons on all GUIs and added the python #! bang line to the examples following Steve Chaplin's advice on matplotlib dev

2004-04-29 Added CXX and rewrote backend_agg using it; tracked down and fixed agg memory leak - JDH

2004-04-29 Added stem plot command - JDH

2004-04-28 Fixed PS scaling and centering bug - JDH

2004-04-26 Fixed errorbar autoscale problem - JDH

2004-04-22 Fixed copy tick attribute bug, fixed singular datalim ticker bug; fixed mathtext fontsize interactive bug. - JDH

2004-04-21 Added calls to draw_if_interactive to axes(), legend(), and pcolor(). Deleted duplicate pcolor(). - JTM

2004-04-21 matplotlib 0.53 release

2004-04-19 Fixed vertical alignment bug in PS backend - JDH

2004-04-17 Added support for two scales on the "same axes" with tick different ticking and labeling left right or top bottom. See examples/two_scales.py - JDH

2004-04-17 Added default dirs as list rather than single dir in setupext.py - JDH

2004-04-16 Fixed wx exception swallowing bug (and there was much rejoicing!) - JDH

2004-04-16 Added new ticker locator a formatter, fixed default font return - JDH

2004-04-16 Added get_name method to FontProperties class. Fixed font lookup in GTK and WX backends. - PEB
2004-04-16 Added get- and set_fontstyle msethods. - PEB
2004-04-10 Mathtext fixes: scaling with dpi, - JDH
2004-04-09 Improved font detection algorithm. - PEB
2004-04-09 Move deprecation warnings from text.py to __init__.py - PEB
2004-04-09 Added default font customization - JDH
2004-04-08 Fixed viewlim set problem on axes and axis. - JDH
2004-04-07 Added validate_comma_sep_str and font properties parameters to __init__. Removed font families and added rcParams to FontProperties __init__ arguments in font_manager. Added default font property parameters to .matplotlibrc file with descriptions. Added deprecation warnings to the get_ - and set_fontXXX methods of the Text object. - PEB
2004-04-06 Added load and save commands for ASCII data - JDH
2004-04-05 Improved font caching by not reading AFM fonts until needed. Added better documentation. Changed the behaviour of the get_family, set_family, and set_name methods of FontProperties. - PEB
2004-04-05 Added WXAgg backend - JDH
2004-04-04 Improved font caching in backend_agg with changes to font_manager - JDH
2004-03-29 Fixed fontdicts and kwargs to work with new font manager - JDH

This is the Old, stale, never used changelog

2002-12-10 - Added a TODO file and CHANGELOG. Lots to do - get crackin’!

• Fixed y zoom tool bug
• Adopted a compromise fix for the y data clipping problem. The problem was that for solid lines, the y data clipping (as opposed to the gc clipping) caused artifac-tual horizontal solid lines near the ylim boundaries. I did a 5% offset hack in Axes set_ylim functions which helped, but didn’t cure the problem for very high gain y zooms. So I disabled y data clipping for connected lines. If you need extensive y clipping, either plot(y,x) because x data clipping is always enabled, or change the _set_clip code to ‘if 1’ as indicated in the lines.py src. See _set_clip in lines.py and set_xlim in figure.py for more information.

2002-12-11 - Added a measurement dialog to the figure window to measure axes position and the delta x delta y with a left mouse drag. These defaults can be overridden by deriving from Figure and overriding button_press_event, button_release_event, and motion_notify_event, and _dia-log_measure_tool.

• fixed the navigation dialog so you can check the axes the navigation buttons apply to.

2003-04-23 Released matplotlib v0.1

2003-04-24 Added a new line style Pixelline2D which is the plots the markers as pix-els (as small as possible) with format symbol ‘,’

Added a new class Patch with derived classes Rectangle, RegularPolygon and Circle

8.1. List of changes to Matplotlib prior to 2015
2003-04-25 Implemented new functions errorbar, scatter and hist

   Added a new line type ‘|’ which is a vline. syntax is plot(x, Y, ‘|’) where y.shape = len(x),2 and each row gives the ymin,ymax for the respective values of x. Previously I had implemented vlines as a list of lines, but I needed the efficiency of the numeric clipping for large numbers of vlines outside the viewport, so I wrote a dedicated class Vline2D which derives from Line2D

2003-05-01

   Fixed ytick bug where grid and tick show outside axis viewport with gc clip

2003-05-14

   Added new ways to specify colors 1) matlab format string 2) html-style hex string, 3) rgb tuple. See examples/color_demo.py

2003-05-28

   Changed figure rendering to draw form a pixmap to reduce flicker. See examples/system_monitor.py for an example where the plot is continuously updated w/o flicker. This example is meant to simulate a system monitor that shows free CPU, RAM, etc...

2003-08-04

   Added Jon Anderson’s GTK shell, which doesn’t require pygtk to have threading built-in and looks nice!

2003-08-25

   Fixed deprecation warnings for python2.3 and pygtk-1.99.18

2003-08-26

   Added figure text with new example examples/figtext.py

2003-08-27

   Fixed bugs i figure text with font override dictionaries and fig text that was placed outside the window bounding box

2003-09-1 through 2003-09-15

   Added a postscript and a GD module backend

2003-09-16

   Fixed font scaling and point scaling so circles, squares, etc on lines will scale with DPI as will fonts. Font scaling is not fully implemented on the gtk backend because I have not figured out how to scale fonts to arbitrary sizes with GTK

2003-09-17

   Fixed figure text bug which crashed X windows on long figure text extending beyond display area. This was, I believe, due to the vestigial erase functionality that was no longer needed since I began rendering to a pixmap

2003-09-30 Added legend

2003-10-01 Fixed bug when colors are specified with rgb tuple or hex string.

2003-10-21 Andrew Straw provided some legend code which I modified and incorporated. Thanks Andrew!
2003-10-27 Fixed a bug in axis.get_view_distance that affected zoom in versus out with interactive scrolling, and a bug in the axis text reset system that prevented the text from being redrawn on a interactive gtk view lim set with the widget

Fixed a bug in that prevented the manual setting of ticklabel strings from working properly

2003-11-02 - Do a nearest neighbor color pick on GD when allocate fails

2003-11-02

• Added pcolor plot
• Added MRI example
• Fixed bug that screwed up label position if xticks or yticks were empty
• added nearest neighbor color picker when GD max colors exceeded
• fixed figure background color bug in GD backend

2003-11-10 - 2003-11-11

• major refactoring.
  - Ticks (with labels, lines and grid) handled by dedicated class
  - Artist now know bounding box and dpi
  - Bounding boxes and transforms handled by dedicated classes
  - legend in dedicated class. Does a better job of alignment and bordering. Can be initialized with specific line instances. See examples/legend_demo2.py

2003-11-14 Fixed legend positioning bug and added new position args

2003-11-16 Finished porting GD to new axes API

2003-11-20 - add TM for matlab on website and in docs

2003-11-20 - make a nice errorbar and scatter screenshot

2003-11-20 - auto line style cycling for multiple line types broken

2003-11-18 (using inkrect) :logical rect too big on gtk backend

2003-11-18 ticks don’t reach edge of axes in gtk mode - rounding error?

2003-11-20 - port Gary’s errorbar code to new API before 0.40

2003-11-20 - problem with stale_set_font. legend axes box doesn’t resize on save in GTK backend - see htdocs legend_demo.py

2003-11-21 - make a dash-dot dict for the GC

2003-12-15 - fix install path bug

8.2 New in matplotlib 0.98.4

Table of Contents

• New in matplotlib 0.98.4
It's been four months since the last matplotlib release, and there are a lot of new features and bug-fixes.

Thanks to Charlie Moad for testing and preparing the source release, including binaries for OS X and Windows for python 2.4 and 2.5 (2.6 and 3.0 will not be available until numpy is available on those releases). Thanks to the many developers who contributed to this release, with contributions from Jae-Joon Lee, Michael Droettboom, Ryan May, Eric Firing, Manuel Metz, Jouni K. Seppänen, Jeff Whitaker, Darren Dale, David Kaplan, Michiel de Hoon and many others who submitted patches

### 8.2.1 Legend enhancements

Jae-Joon has rewritten the legend class, and added support for multiple columns and rows, as well as fancy box drawing. See `legend()` and `matplotlib.legend.Legend`.

![Fig. 1: What's New 98 4 Legend](image)

### 8.2.2 Fancy annotations and arrows

Jae-Joon has added lots of support to annotations for drawing fancy boxes and connectors in annotations. See `annotate()` and `BoxStyle`, `ArrowStyle`, and `ConnectionStyle`.

8.2.3 Native OS X backend

Michiel de Hoon has provided a native Mac OS X backend that is almost completely implemented in C. The backend can therefore use Quartz directly and, depending on the application, can be orders of magnitude faster than the existing backends. In addition, no third-party libraries are needed other than Python and NumPy. The backend is interactive from the usual terminal application on Mac using regular Python. It hasn’t been tested with ipython yet, but in principle it should work there as well. Set `backend : macosx` in your matplotlibrc file, or run your script with:

```
$ python myfile.py -dmacosx
```

8.2.4 psd amplitude scaling

Ryan May did a lot of work to rationalize the amplitude scaling of `psd()` and friends. See /gallery/lines_bars_and_markers/psd_demo. The changes should increase MATLAB compatibility and increase scaling options.

8.2.5 Fill between

Added a `fill_between()` function to make it easier to do shaded region plots in the presence of masked data. You can pass an `x` array and a `ylower` and `yupper` array to fill between, and an optional `where` argument which is a logical mask where you want to do the filling.
8.2.6 Lots more

Here are the 0.98.4 notes from the CHANGELOG:

- Added mdehoon’s native macosx backend from sf patch 2179017 - JDH

- Removed the prints in the set_*style commands. Return the list of pretty-printed strings instead - JDH

- Some of the changes Michael made to improve the output of the property tables in the rest docs broke or made difficult to use some of the interactive doc helpers, e.g., setp and getp. Having all the rest markup in the ipython shell also confused the docstrings. I added a new rc param docstring harcopy, to format the docstrings differently for hardcopy and other use. The ArtistInspector could use a little refactoring now since there is duplication of effort between the rest out put and the non-rest output - JDH

- Updated spectral methods (psd, csd, etc.) to scale one-sided densities by a factor of 2 and, optionally, scale all densities by the sampling frequency. This gives better MATLAB compatibility. -RM

- Fixed alignment of ticks in colorbars. -MGD

- drop the deprecated "new" keyword of np.histogram() for numpy 1.2 or later. -JL

- Fixed a bug in svg backend that new_figure_manager() ignores keywords arguments such as figsize, etc. -JL

- Fixed a bug that the handlelength of the new legend class set too short when numpoints=1 -JL

- Added support for data with units (e.g., dates) to Axes.fill_between. -RM

- Added fancybox keyword to legend. Also applied some changes for

(continues on next page)
better look, including baseline adjustment of the multiline texts
so that it is center aligned. -JJL

The transmuter classes in the patches.py are reorganized as
subclasses of the Style classes. A few more box and arrow styles
are added. -JJL

Fixed a bug in the new legend class that didn't allowed a tuple of
coordinate values as loc. -JJL

Improve checks for external dependencies, using subprocess
(instead of deprecated popen*) and distutils (for version
checking) - DSD

Reimplementation of the legend which supports baseline alignment,
multi-column, and expand mode. - JJL

Fixed histogram autoscaling bug when bins or range are given
explicitly (fixes Debian bug 503148) - MM

Added rcParam axes.unicode_minus which allows plain hyphen for
minus when False - JDH

Added scatterpoints support in Legend. patch by Erik Tollerud -
JJL

Fix crash in log ticking. - MGD

Added static helper method BrokenHBarCollection.span_where and
Axes/pyplot method fill_between. See
examples/pylab/fill_between.py - JDH

Add x_isdata and y_isdata attributes to Artist instances, and use
them to determine whether either or both coordinates are used when
updating dataLim. This is used to fix autoscaling problems that
had been triggered by axhline, axhspan, axvline, axvspan. - EF

Update the psd(), csd(), cohere(), and specgram() methods of Axes
and the csd() cohere(), and specgram() functions in mlab to be in
sync with the changes to psd(). In fact, under the hood, these
all call the same core to do computations. - RM

Add 'pad_to' and 'sides' parameters to mlab.psd() to allow
controlling of zero padding and returning of negative frequency
components, respectively. These are added in a way that does not
change the API. - RM

Fix handling of c kwarg by scatter; generalize is_string_like to
accept numpy and numpy.ma string array scalars. - RM and EF

Fix a possible EINTR problem in dviread, which might help when
saving pdf files from the qt backend. - JKS

Fix bug with zoom to rectangle and twin axes - MGD

Added Jae Joon's fancy arrow, box and annotation enhancements --
see examples/pylab_examples/annotation_demo2.py

Autoscaling is now supported with shared axes - EF

Fixed exception in dviread that happened with Minion - JKS

set_xlim, ylim now return a copy of the viewlim array to avoid modify inplace surprises

Added image thumbnail generating function
matplotlib.image.thumbnail. See examples/misc/image_thumbnail.py - JDH

Applied scatleg patch based on ideas and work by Erik Tollerud and Jae-Joon Lee. - MM

Fixed bug in pdf backend: if you pass a file object for output instead of a filename, e.g., in a wep app, we now flush the object at the end. - JKS

Add path simplification support to paths with gaps. - EF

Fix problem with AFM files that don't specify the font's full name or family name. - JKS

Added 'scilimits' kwarg to Axes.ticklabel_format() method, for easy access to the set_powerlimits method of the major ScalarFormatter. - EF

Experimental new kwarg borderpad to replace pad in legend, based on suggestion by Jae-Joon Lee. - EF

Allow spy to ignore zero values in sparse arrays, based on patch by Tony Yu. Also fixed plot to handle empty data arrays, and fixed handling of markers in figlegend. - EF

Introduce drawstyles for lines. Transparenlty split linestyles like 'steps--' into drawstyle 'steps' and linestyle '--'. Legends always use drawstyle 'default'. - MM

Fixed quiver and quiverkey bugs (failure to scale properly when resizing) and added additional methods for determining the arrow angles - EF

Fix polar interpolation to handle negative values of theta - MGD

Reorganized cbook and mlab methods related to numerical calculations that have little to do with the goals of those two modules into a separate module numerical_methods.py Also, added ability to select points and stop point selection with keyboard in ginput and manual contour labeling code. Finally, fixed contour labeling bug. - DMK

Fix backtick in Postscript output. - MGD

[2089958] Path simplification for vector output backends
Leverage the simplification code exposed through path_to_polygons to simplify certain well-behaved paths in the vector backends (PDF, PS and SVG). "path.simplify" must be set to True in matplotlibrc for this to work. - MGD

Add "filled" kwarg to Path.intersects_path and Path.intersects_bbox. - MGD

Changed full arrows slightly to avoid an xpdf rendering problem reported by Friedrich Hagedorn. - JKS

Fix conversion of quadratic to cubic Bezier curves in PDF and PS backends. Patch by Jae-Joon Lee. - JKS

Added 5-point star marker to plot command q - EF

Fix hatching in PS backend - MGD

Fix log with base 2 - MGD

Added support for bilinear interpolation in NonUniformImage; patch by Gregory Lielens. - EF

Added support for multiple histograms with data of different length - MM

Fix step plots with log scale - MGD

Fix masked arrays with markers in non-Agg backends - MGD

Fix clip_on kwarg so it actually works correctly - MGD

Fix locale problems in SVG backend - MGD

fix quiver so masked values are not plotted - JSW

improve interactive pan/zoom in qt4 backend on windows - DSD

Fix more bugs in NaN/inf handling. In particular, path simplification (which does not handle NaNs or infs) will be turned off automatically when infs or NaNs are present. Also masked arrays are now converted to arrays with NaNs for consistent handling of masks and NaNs - MGD and EF

Added support for arbitrary rasterization resolutions to the SVG backend. - MW

8.3 New in matplotlib 0.99
8.3.1 New documentation

8.3.2 mplot3d

Reinier Heeres has ported John Porter’s mplot3d over to the new matplotlib transformations framework, and it is now available as a toolkit mpl_toolkits.mplot3d (which now comes standard with all mpl installs). See mplot3d-examples-index and Getting started

8.3.3 axes grid toolkit

Jae-Joon Lee has added a new toolkit to ease displaying multiple images in matplotlib, as well as some support for curvilinear grids to support the world coordinate system. The toolkit is included standard with all new mpl installs. See axes_grid1-examples-index, axisartist-examples-index, What is axes_grid1 toolkit? and axisartist

8.3.4 Axis spine placement

Andrew Straw has added the ability to place “axis spines” – the lines that denote the data limits – in various arbitrary locations. No longer are your axis lines con-
strained to be a simple rectangle around the figure – you can turn on or off left, bottom, right and top, as well as “detach” the spine to offset it away from the data. See /gallery/ticks_and_spines/spine-placement-demo and matplotlib.spines.Spine.

Fig. 4: What’s New 99 Axes Grid

Fig. 5: What’s New 99 Spines

8.4 New in matplotlib 1.0

Table of Contents
- New in matplotlib 1.0
  - HTML5/Canvas backend
  - Sophisticated subplot grid layout
  - Easy pythonic subplots
- Contour fixes and and triplot
- multiple calls to show supported
- mplot3d graphs can be embedded in arbitrary axes
- tick_params
- Lots of performance and feature enhancements
- Much improved software carpentry
- Bugfix marathon

8.4.1 HTML5/Canvas backend

Simon Ratcliffe and Ludwig Schwardt have released an HTML5/Canvas backend for matplotlib. The backend is almost feature complete, and they have done a lot of work comparing their html5 rendered images with our core renderer Agg. The backend features client/server interactive navigation of matplotlib figures in an html5 compliant browser.

8.4.2 Sophisticated subplot grid layout

Jae-Joon Lee has written gridspec, a new module for doing complex subplot layouts, featuring row and column spans and more. See Customizing Figure Layouts Using GridSpec and Other Functions for a tutorial overview.

Fig. 6: Demo Gridspec01

8.4.3 Easy pythonic subplots

Fernando Perez got tired of all the boilerplate code needed to create a figure and multiple subplots when using the matplotlib API, and wrote a subplots() helper function. Basic usage allows you to create the figure and an array of subplots with numpy indexing (starts with 0). e.g.:
fig, axarr = plt.subplots(2, 2)
axarr[0,0].plot([1,2,3])  # upper, left

See /gallery/subplots_axes_and_figures/subplot_demo for several code examples.

### 8.4.4 Contour fixes and and triplot

Ian Thomas has fixed a long-standing bug that has vexed our most talented developers for years. \texttt{contourf()} now handles interior masked regions, and the boundaries of line and filled contours coincide.

Additionally, he has contributed a new module \texttt{tri} and helper function \texttt{triplot()} for creating and plotting unstructured triangular grids.

Fig. 7: Triplot Demo

### 8.4.5 multiple calls to show supported

A long standing request is to support multiple calls to \texttt{show()}. This has been difficult because it is hard to get consistent behavior across operating systems, user interface toolkits and versions. Eric Firing has done a lot of work on rationalizing show across backends, with the desired behavior to make show raise all newly created figures and block execution until they are closed. Repeated calls to show should raise newly created figures since the last call. Eric has done a lot of testing on the user interface toolkits and versions and platforms he has access to, but it is not possible to test them all, so please report problems to the mailing list and bug tracker.

### 8.4.6 mplot3d graphs can be embedded in arbitrary axes

You can now place an mplot3d graph into an arbitrary axes location, supporting mixing of 2D and 3D graphs in the same figure, and/or multiple 3D graphs in a single figure, using the "projection" keyword argument to \texttt{add_axes} or \texttt{add_subplot}. Thanks Ben Root.
Fig. 8: What’s New 1 Subplot3d

8.4.7 tick_params

Eric Firing wrote tick_params, a convenience method for changing the appearance of ticks and tick labels. See pyplot function `tick_params()` and associated Axes method `tick_params()`.

8.4.8 Lots of performance and feature enhancements

- Faster magnification of large images, and the ability to zoom in to a single pixel
- Local installs of documentation work better
- Improved “widgets” – mouse grabbing is supported
- More accurate snapping of lines to pixel boundaries
- More consistent handling of color, particularly the alpha channel, throughout the API

8.4.9 Much improved software carpentry

The matplotlib trunk is probably in as good a shape as it has ever been, thanks to improved software carpentry. We now have a buildbot which runs a suite of nose regression tests on every svn commit, auto-generating a set of images and comparing them against a set of known-goods, sending emails to developers on failures with a pixel-by-pixel image comparison. Releases and release bugfixes happen in branches, allowing active new feature development to happen in the trunk while keeping the release branches stable. Thanks to Andrew Straw, Michael Droettboom and other matplotlib developers for the heavy lifting.

8.4.10 Bugfix marathon

Eric Firing went on a bug fixing and closing marathon, closing over 100 bugs on the (now-closed) SourceForge bug tracker with help from Jae-Joon Lee, Michael Droettboom, Christoph Gohlke and Michiel de Hoon.
8.5 New in matplotlib 1.1

Table of Contents

- New in matplotlib 1.1
  - Sankey Diagrams
  - Animation
  - Tight Layout
  - PyQt4, PySide, and IPython
  - Legend
  - mplot3d
  - Numerix support removed
  - Markers
  - Other improvements

Note: matplotlib 1.1 supports Python 2.4 to 2.7

8.5.1 Sankey Diagrams

Kevin Davies has extended Yannick Copin’s original Sankey example into a module (sankey) and provided new examples (/gallery/specialty_plots/sankey Basics, /gallery/specialty_plots/sankey links, /gallery/specialty_plots/sankey rankine).

8.5.2 Animation

Ryan May has written a backend-independent framework for creating animated figures. The animation module is intended to replace the backend-specific examples formerly in the examples-index listings. Examples using the new framework are in animation-examples-index; see the entrancing double pendulum <gallery/animation/double_pendulum_sgskip.py> which uses matplotlib.animation.Animation.save() to create the movie below.

This should be considered as a beta release of the framework; please try it and provide feedback.

8.5.3 Tight Layout

A frequent issue raised by users of matplotlib is the lack of a layout engine to nicely space out elements of the plots. While matplotlib still adheres to the philosophy of giving users complete control over the placement of plot elements, Jae-Joon Lee created the tight_layout module and introduced a new command tight_layout() to address the most common layout issues.

The usage of this functionality can be as simple as
Fig. 9: Sankey Rankine
plt.tight_layout()

and it will adjust the spacing between subplots so that the axis labels do not overlap with neighboring subplots. A *Tight Layout guide* has been created to show how to use this new tool.

### 8.5.4 PyQT4, PySide, and IPython

Gerald Storer made the Qt4 backend compatible with PySide as well as PyQT4. At present, however, PySide does not support the PyOS_InputHook mechanism for handling gui events while waiting for text input, so it cannot be used with the new version 0.11 of IPython. Until this feature appears in PySide, IPython users should use the PyQT4 wrapper for QT4, which remains the matplotlib default.

An rcParam entry, “backend.qt4”, has been added to allow users to select PyQt4, PyQt4v2, or PySide. The latter two use the Version 2 Qt API. In most cases, users can ignore this rcParam variable; it is available to aid in testing, and to provide control for users who are embedding matplotlib in a PyQt4 or PySide app.

### 8.5.5 Legend

Jae-Joon Lee has improved plot legends. First, legends for complex plots such as *stem()* plots will now display correctly. Second, the ‘best’ placement of a legend has been improved in the presence of NANs.

See the *Legend guide* for more detailed explanation and examples.

### 8.5.6 mplot3d

In continuing the efforts to make 3D plotting in matplotlib just as easy as 2D plotting, Ben Root has made several improvements to the *mplot3d* module.
• `Axes3D` has been improved to bring the class towards feature-parity with regular `Axes` objects
• Documentation for *Getting started* was significantly expanded
• Axis labels and orientation improved
• Most 3D plotting functions now support empty inputs
• Ticker offset display added:

![Diagram](image1)

Fig. 11: Offset

• `contourf()` gains `zdir` and `offset` kwargs. You can now do this:

8.5.7 Numerix support removed

After more than two years of deprecation warnings, Numerix support has now been completely removed from matplotlib.
### 8.5.8 Markers

The list of available markers for `plot()` and `scatter()` has now been merged. While they were mostly similar, some markers existed for one function, but not the other. This merge did result in a conflict for the ’d’ diamond marker. Now, ’d’ will be interpreted to always mean “thin” diamond while ’D’ will mean “regular” diamond.

Thanks to Michael Droettboom for this effort.

### 8.5.9 Other improvements

- Unit support for polar axes and `arrow()`
- `PolarAxes` gains getters and setters for “theta direction”, and “theta offset” to allow for theta to go in either the clock-wise or counter-clockwise direction and to specify where zero degrees should be placed. `set_theta_zero_location()` is an added convenience function.
- Fixed error in argument handling for tri-functions such as `tripcolor()`
- `axes.labelweight` parameter added to rcParams.
- For `imshow()`, `interpolation='nearest'` will now always perform an interpolation. A “none” option has been added to indicate no interpolation at all.
- An error in the Hammer projection has been fixed.
- `clabel` for `contour()` now accepts a callable. Thanks to Daniel Hyams for the original patch.
- Jae-Joon Lee added the `HBoxDivider` and `VBoxDivider` classes.
- Christoph Gohlke reduced memory usage in `imshow()`.
- `scatter()` now accepts empty inputs.
- The behavior for ‘symlog’ scale has been fixed, but this may result in some minor changes to existing plots. This work was refined by ssyr.
- Peter Butterworth added named figure support to `figure()`.
• Michiel de Hoon has modified the MacOSX backend to make its interactive behavior consistent with the other backends.

• Pim Schellart added a new colormap called “cubehelix”. Sameer Grover also added a colormap called “coolwarm”. See it and all other colormaps here.

• Many bug fixes and documentation improvements.

8.6 New in matplotlib 1.2

Table of Contents

• New in matplotlib 1.2
  - Python 3.x support
  - PGF/TikZ backend
  - Locator interface
  - Tri-Surface Plots
  - Control the lengths of colorbar extensions
  - Figures are picklable
  - Set default bounding box in matplotlibrc
  - New Boxplot Functionality
  - New RC parameter functionality
  - Streamplot
  - New hist functionality
  - Updated shipped dependencies
  - Face-centred colors in tripcolor plots
  - Hatching patterns in filled contour plots, with legends
  - Known issues in the matplotlib 1.2 release

Note: matplotlib 1.2 supports Python 2.6, 2.7, and 3.1

8.6.1 Python 3.x support

Matplotlib 1.2 is the first version to support Python 3.x, specifically Python 3.1 and 3.2. To make this happen in a reasonable way, we also had to drop support for Python versions earlier than 2.6.

This work was done by Michael Droettboom, the Cape Town Python Users’ Group, many others and supported financially in part by the SAGE project.

The following GUI backends work under Python 3.x: Gtk3Cairo, Qt4Agg, TkAgg and MacOSX. The other GUI backends do not yet have adequate bindings for Python 3.x, but continue
to work on Python 2.6 and 2.7, particularly the Qt and QtAgg backends (which have been deprecated). The non-GUI backends, such as PDF, PS and SVG, work on both Python 2.x and 3.x.

Features that depend on the Python Imaging Library, such as JPEG handling, do not work, since the version of PIL for Python 3.x is not sufficiently mature.

### 8.6.2 PGF/TikZ backend

Peter Würtz wrote a backend that allows matplotlib to export figures as drawing commands for LaTeX. These can be processed by PdfLaTeX, XeLaTeX or LuaLaTeX using the PGF/TikZ package. Usage examples and documentation are found in *Typesetting With XeLaTeX/LuaLaTeX*.

![Graph showing LaTeX and unicode text: \( \lambda = \sum_{i} \mu_i^2 \)](image)

### 8.6.3 Locator interface

Philip Elson exposed the intelligence behind the tick Locator classes with a simple interface. For instance, to get no more than 5 sensible steps which span the values 10 and 19.5:

```python
>>> import matplotlib.ticker as mticker
>>> locator = mticker.MaxNLocator(nbins=5)
>>> print(locator.tick_values(10, 19.5))
```

### 8.6.4 Tri-Surface Plots

Damon McDougall added a new plotting method for the mplot3d toolkit called `plot_trisurf()`.

### 8.6.5 Control the lengths of colorbar extensions

Andrew Dawson added a new keyword argument `extendfrac` to `colorbar()` to control the length of minimum and maximum colorbar extensions.
Fig. 13: Trisurf3d
8.6.6 Figures are picklable

Philip Elson added an experimental feature to make figures picklable for quick and easy short-term storage of plots. Pickle files are not designed for long term storage, are unsupported when restoring a pickle saved in another matplotlib version and are insecure when restoring a pickle from an untrusted source. Having said this, they are useful for short term storage for later modification inside matplotlib.

8.6.7 Set default bounding box in matplotlibrc

Two new defaults are available in the matplotlibrc configuration file: `savefig.bbox`, which can be set to 'standard' or 'tight', and `savefig.pad_inches`, which controls the bounding box padding.

8.6.8 New Boxplot Functionality

Users can now incorporate their own methods for computing the median and its confidence intervals into the `boxplot` method. For every column of data passed to boxplot, the user can specify an accompanying median and confidence interval.

**Fig. 14: Boxplot Demo3**

8.6.9 New RC parameter functionality

Matthew Emmett added a function and a context manager to help manage RC parameters: `rc_file()` and `rc_context`. To load RC parameters from a file:

```python
>>> mpl.rc_file('mpl.rc')
```

To temporarily use RC parameters:
8.6.10 Streamplot

Tom Flannaghan and Tony Yu have added a new `streamplot()` function to plot the streamlines of a vector field. This has been a long-requested feature and complements the existing `quiver()` function for plotting vector fields. In addition to simply plotting the streamlines of the vector field, `streamplot()` allows users to map the colors and/or line widths of the streamlines to a separate parameter, such as the speed or local intensity of the vector field.

![Plot Streamplot](image)

Fig. 15: Plot Streamplot

8.6.11 New hist functionality

Nic Eggert added a new `stacked` kwarg to `hist()` that allows creation of stacked histograms using any of the histogram types. Previously, this functionality was only available by using the `barstacked` histogram type. Now, when `stacked=True` is passed to the function, any of the histogram types can be stacked. The `barstacked` histogram type retains its previous functionality for backwards compatibility.
8.6.12 Updated shipped dependencies

The following dependencies that ship with matplotlib and are optionally installed alongside it have been updated:

- pytz 2012d
- dateutil 1.5 on Python 2.x, and 2.1 on Python 3.x

8.6.13 Face-centred colors in tripcolor plots

Ian Thomas extended tripcolor() to allow one color value to be specified for each triangular face rather than for each point in a triangulation.

![Tripcolor Demo](image)

Fig. 16: Tripcolor Demo

8.6.14 Hatching patterns in filled contour plots, with legends

Phil Elson added support for hatching to contourf(), together with the ability to use a legend to identify contoured ranges.

8.6.15 Known issues in the matplotlib 1.2 release

- When using the Qt4Agg backend with IPython 0.11 or later, the save dialog will not display. This should be fixed in a future version of IPython.

8.7 New in matplotlib 1.2.2

Table of Contents

- New in matplotlib 1.2.2
8.7.1 Improved collections

The individual items of a collection may now have different alpha values and be rendered correctly. This also fixes a bug where collections were always filled in the PDF backend.

8.7.2 Multiple images on same axes are correctly transparent

When putting multiple images onto the same axes, the background color of the axes will now show through correctly.

8.8 New in matplotlib 1.3
Note:  matplotlib 1.3 supports Python 2.6, 2.7, 3.2, and 3.3

8.8.1 New in 1.3.1

1.3.1 is a bugfix release, primarily dealing with improved setup and handling of dependencies, and correcting and enhancing the documentation.
The following changes were made in 1.3.1 since 1.3.0.

Enhancements

- Added a context manager for creating multi-page pdfs (see matplotlib.backends.backend_pdf.PdfPages).
- The WebAgg backend should now have lower latency over heterogeneous Internet connections.

Bug fixes

- Histogram plots now contain the endline.
- Fixes to the Mollweide projection.
- Handling recent fonts from Microsoft and Macintosh-style fonts with non-ascii metadata is improved.
- Hatching of fill between plots now works correctly in the PDF backend.
- Tight bounding box support now works in the PGF backend.
- Transparent figures now display correctly in the Qt4Agg backend.
- Drawing lines from one subplot to another now works.
- Unit handling on masked arrays has been improved.

Setup and dependencies

- Now works with any version of pyparsing 1.5.6 or later, without displaying hundreds of warnings.
- Now works with 64-bit versions of Ghostscript on MS-Windows.
- When installing from source into an environment without Numpy, Numpy will first be downloaded and built and then used to build matplotlib.
- Externally installed backends are now always imported using a fully-qualified path to the module.
- Works with newer version of wxPython.
- Can now build with a PyCXX installed globally on the system from source.
- Better detection of Gtk3 dependencies.

Testing

- Tests should now work in non-English locales.
- PEP8 conformance tests now report on locations of issues.

8.8.2 New plotting features

**xkcd-style sketch plotting**

To give your plots a sense of authority that they may be missing, Michael Droettboom (inspired by the work of many others in PR #1329) has added an xkcd-style sketch plotting mode. To use it, simply call `matplotlib.pyplot.xkcd` before creating your plot. For really fine control, it is also possible to modify each artist’s sketch parameters individually with `matplotlib.artist.Artist.set_sketch_params()`.

![xkcd example](image)

*Fig. 18: xkcd*

8.8.3 Updated Axes3D.contour methods

Damon McDougall updated the `tricontour()` and `tricontourf()` methods to allow 3D contour plots on arbitrary unstructured user-specified triangulations.

**New eventplot plot type**

Todd Jennings added a `eventplot()` function to create multiple rows or columns of identical line segments

As part of this feature, there is a new `EventCollection` class that allows for plotting and manipulating rows or columns of identical line segments.
Fig. 19: Tricontour3d

Fig. 20: Eventplot Demo
Triangular grid interpolation

Geoffroy Billotey and Ian Thomas added classes to perform interpolation within triangular grids: (*LinearTriInterpolator* and *CubicTriInterpolator*) and a utility class to find the triangles in which points lie (*TrapezoidMapTriFinder*). A helper class to perform mesh refinement and smooth contouring was also added (*UniformTriRefiner*). Finally, a class implementing some basic tools for triangular mesh improvement was added (*TriAnalyzer*).

![High-resolution tricontouring](image1)

**Fig. 21: Tricontour Smooth User**

Baselines for stackplot

Till Stensitzki added non-zero baselines to *stackplot()* . They may be symmetric or weighted.

![World population](image2)

**Fig. 22: Stackplot Demo2**

Rectangular colorbar extensions

Andrew Dawson added a new keyword argument *extendrect* to *colorbar()* to optionally make colorbar extensions rectangular instead of triangular.
More robust boxplots

Paul Hobson provided a fix to the `boxplot()` method that prevent whiskers from being drawn inside the box for oddly distributed data sets.

Calling subplot() without arguments

A call to `subplot()` without any arguments now acts the same as `subplot(111)` or `subplot(1, 1, 1)` - it creates one axes for the whole figure. This was already the behavior for both `axes()` and `subplots()`, and now this consistency is shared with `subplot()`.

8.8.4 Drawing

Independent alpha values for face and edge colors

Wes Campainne modified how `Patch` objects are drawn such that (for backends supporting transparency) you can set different alpha values for faces and edges, by specifying their colors in RGBA format. Note that if you set the alpha attribute for the patch object (e.g. using `set_alpha()` or the alpha keyword argument), that value will override the alpha components set in both the face and edge colors.

Path effects on lines

Thanks to Jae-Joon Lee, path effects now also work on plot lines.

![Fig. 23: Patheffect Demo](image)

Easier creation of colormap and normalizer for levels with colors

Phil Elson added the `matplotlib.colors.from_levels_and_colors()` function to easily create a colormap and normalizer for representation of discrete colors for plot types such as `matplotlib.pyplot.pcolormesh()`, with a similar interface to that of `matplotlib.pyplot.contourf`.

Full control of the background color

Wes Campainne and Phil Elson fixed the Agg backend such that PNGs are now saved with the correct background color when `fig.patch.get_alpha()` is not 1.
Improved **bbox_inches="tight"** functionality

Passing **bbox_inches="tight"** through to `pyplot.savefig` now takes into account all artists on a figure - this was previously not the case and led to several corner cases which did not function as expected.

**Initialize a rotated rectangle**

Damon McDougall extended the `Rectangle` constructor to accept an *angle* kwarg, specifying the rotation of a rectangle in degrees.

**8.8.5 Text**

**Anchored text support**

The SVG and pgf backends are now able to save text alignment information to their output formats. This allows to edit text elements in saved figures, using Inkscape for example, while preserving their intended position. For SVG please note that you’ll have to disable the default text-to-path conversion (`mpl.rc('svg', fonttype='none')`).

**Better vertical text alignment and multi-line text**

The vertical alignment of text is now consistent across backends. You may see small differences in text placement, particularly with rotated text.

If you are using a custom backend, note that the `draw_text` renderer method is now passed the location of the baseline, not the location of the bottom of the text bounding box.

Multi-line text will now leave enough room for the height of very tall or very low text, such as superscripts and subscripts.

**Left and right side axes titles**

Andrew Dawson added the ability to add axes titles flush with the left and right sides of the top of the axes using a new keyword argument *loc* to `title()`.

**Improved manual contour plot label positioning**

Brian Mattern modified the manual contour plot label positioning code to interpolate along line segments and find the actual closest point on a contour to the requested position. Previously, the closest path vertex was used, which, in the case of straight contours was sometimes quite distant from the requested location. Much more precise label positioning is now possible.
8.8.6 Configuration (rcParams)

Quickly find rcParams

Phil Elson made it easier to search for rcParameters by passing a valid regular expression to `matplotlib.RcParams.find_all()`. `matplotlib.RcParams` now also has a pretty repr and str representation so that search results are printed prettily:

```python
>>> import matplotlib
>>> print(matplotlib.rcParams.find_all(r'\size'))  # Using a regular expression
RcParams({'font.size': 12,  # font size
          'xtick.major.size': 4,  # xtick major size
          'xtick.minor.size': 2,  # xtick minor size
          'ytick.major.size': 4,  # ytick major size
          'ytick.minor.size': 2})  # ytick minor size
```

**axes.xmargin and axes.ymargin added to rcParams**

rcParams["axes.xmargin"] (default: 0.05) and rcParams["axes.ymargin"] (default: 0.05) were added to configure the default margins used. Previously they were hard-coded to default to 0, default value of both rcParam values is 0.

**Changes to font rcParams**

The font.* rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.

**Added rcParams["savefig.jpeg_quality"] (default: 95)**

rcParam value rcParams["savefig.jpeg_quality"] (default: 95) was added so that the user can configure the default quality used when a figure is written as a JPEG. The default quality is 95; previously, the default quality was 75. This change minimizes the artifacting inherent in JPEG images, particularly with images that have sharp changes in color as plots often do.

**8.8.7 Backends**

**WebAgg backend**

Michael Droettboom, Phil Elson and others have developed a new backend, WebAgg, to display figures in a web browser. It works with animations as well as being fully interactive.
Future versions of matplotlib will integrate this backend with the IPython notebook for a fully web browser based plotting frontend.

Remember save directory

Martin Spacek made the save figure dialog remember the last directory saved to. The default is configurable with the new `rcParams["savefig.directory"]` (default: `'~'`) rcParam in `matplotlibrc`.

8.8.8 Documentation and examples

Numpydoc docstrings

Nelle Varoquaux has started an ongoing project to convert matplotlib’s docstrings to numpydoc format. See `MEP10` for more information.
Example reorganization

Tony Yu has begun work reorganizing the examples into more meaningful categories. The new gallery page is the fruit of this ongoing work. See MEP12 for more information.

Examples now use subplots()

For the sake of brevity and clarity, most of the examples now use the newer `subplots()`, which creates a figure and one (or multiple) axes object(s) in one call. The old way involved a call to `figure()`, followed by one (or multiple) `subplot()` calls.

8.8.9 Infrastructure

Housecleaning

A number of features that were deprecated in 1.2 or earlier, or have not been in a working state for a long time have been removed. Highlights include removing the Qt version 3 backends, and the FltkAgg and Emf backends. See Changes in 1.3.x for a complete list.

New setup script

matplotlib 1.3 includes an entirely rewritten setup script. We now ship fewer dependencies with the tarballs and installers themselves. Notably, `pytz`, `dateutil`, `pyparsing` and `six` are no longer included with matplotlib. You can either install them manually first, or let `pip` install them as dependencies along with matplotlib. It is now possible to not include certain subcomponents, such as the unit test data, in the install. See `setup.cfg.template` for more information.

XDG base directory support

On Linux, matplotlib now uses the XDG base directory specification to find the `matplotlibrc` configuration file. `matplotlibrc` should now be kept in `~/.config/matplotlib`, rather than `~/.matplotlib`. If your configuration is found in the old location, it will still be used, but a warning will be displayed.

Catch opening too many figures using pyplot

Figures created through `pyplot.figure` are retained until they are explicitly closed. It is therefore common for new users of matplotlib to run out of memory when creating a large series of figures in a loop without closing them.

matplotlib will now display a `RuntimeWarning` when too many figures have been opened at once. By default, this is displayed for 20 or more figures, but the exact number may be controlled using the `figure.max_open_warning` rcParam.
8.9 New in matplotlib 1.4

Thomas A. Caswell served as the release manager for the 1.4 release.

Table of Contents

- New in matplotlib 1.4
  - New colormap
  - The nbagg backend
  - New plotting features
  - Date handling
  - Configuration (rcParams)
  - style package added
  - Backends
  - Text
  - Sphinx extensions
  - Legend and PathEffects documentation
  - Widgets
  - GAE integration

Note: matplotlib 1.4 supports Python 2.6, 2.7, 3.3, and 3.4

8.9.1 New colormap

In heatmaps, a green-to-red spectrum is often used to indicate intensity of activity, but this can be problematic for the red/green colorblind. A new, colorblind-friendly colormap is now available at matplotlib.cm.Wistia. This colormap maintains the red/green symbolism while achieving deuteranopic legibility through brightness variations. See here for more information.

8.9.2 The nbagg backend

Phil Elson added a new backend, named “nbagg”, which enables interactive figures in a live IPython notebook session. The backend makes use of the infrastructure developed for the webagg backend, which itself gives standalone server backed interactive figures in the browser; however nbagg does not require a dedicated matplotlib server as all communications are handled through the IPython Comm machinery.

As with other backends nbagg can be enabled inside the IPython notebook with:

```python
import matplotlib
matplotlib.use('nbagg')
```
Once figures are created and then subsequently shown, they will placed in an interactive widget inside the notebook allowing panning and zooming in the same way as any other matplotlib backend. Because figures require a connection to the IPython notebook server for their interactivity, once the notebook is saved, each figure will be rendered as a static image - thus allowing non-interactive viewing of figures on services such as nbviewer.

8.9.3 New plotting features

Power-law normalization

Ben Gamari added a power-law normalization method, PowerNorm. This class maps a range of values to the interval [0,1] with power-law scaling with the exponent provided by the constructor’s gamma argument. Power law normalization can be useful for, e.g., emphasizing small populations in a histogram.

Fully customizable boxplots

Paul Hobson overhauled the boxplot() method such that it is now completely customizable in terms of the styles and positions of the individual artists. Under the hood, boxplot() relies on a new function (boxplot_stats()), which accepts any data structure currently compatible with boxplot(), and returns a list of dictionaries containing the positions for each element of the boxplots. Then a second method, bxp is called to draw the boxplots based on the stats.

The boxplot() function can be used as before to generate boxplots from data in one step. But now the user has the flexibility to generate the statistics independently, or to modify the output of boxplot_stats() prior to plotting with bxp.

Lastly, each artist (e.g., the box, outliers, cap, notches) can now be toggled on or off and their styles can be passed in through individual kwargs. See the examples: /gallery/statistics/boxplot and /gallery/statistics/bxp

Added a bool kwarg, manage_xticks, which if False disables the management of the ticks and limits on the x-axis by bxp().

Support for datetime axes in 2d plots

Andrew Dawson added support for datetime axes to contour(), contourf(), pcolormesh() and pcolor().

Support for additional spectrum types

Todd Jennings added support for new types of frequency spectrum plots: magnitude_spectrum(), phase_spectrum(), and angle_spectrum(), as well as corresponding functions in mlab.

He also added these spectrum types to specgram(), as well as adding support for linear scaling there (in addition to the existing dB scaling). Support for additional spectrum types was also added to specgram().

He also increased the performance for all of these functions and plot types.
Support for detrending and windowing 2D arrays in mlab

Todd Jennings added support for 2D arrays in the `detrend_mean()`, `detrend_none()`, and `detrend()`, as well as adding `apply_window()` which support windowing 2D arrays.

Support for strides in mlab

Todd Jennings added some functions to mlab to make it easier to use numpy strides to create memory-efficient 2D arrays. This includes `stride_repeat()`, which repeats an array to create a 2D array, and `stride_windows()`, which uses a moving window to create a 2D array from a 1D array.

Formatter for new-style formatting strings

Added `StrMethodFormatter` which does the same job as `FormatStrFormatter`, but accepts new-style formatting strings instead of printf-style formatting strings.

Consistent grid sizes in streamplots

`streamplot()` uses a base grid size of 30x30 for both `density=1` and `density=(1, 1)`. Previously a grid size of 30x30 was used for `density=1`, but a grid size of 25x25 was used for `density=(1, 1)`.

Get a list of all tick labels (major and minor)

Added the kwarg ‘which’ to `Axes.get_xticklabels`, `Axes.get_yticklabels` and `Axis.get_ticklabels`. ‘which’ can be ‘major’, ‘minor’, or ‘both’ select which ticks to return, like `set_ticks_position()`. If ‘which’ is `None` then the old behaviour (controlled by the bool `minor`).

Separate horizontal/vertical axes padding support in ImageGrid

The kwarg ‘axes_pad’ to `mpl_toolkits.axes_grid1.axes_grid.AxesGrid.ImageGrid` can now be a tuple if separate horizontal/vertical padding is needed. This is supposed to be very helpful when you have a labelled legend next to every subplot and you need to make some space for legend’s labels.

Support for skewed transformations

The `Affine2D` gained additional methods `skew` and `skew_deg` to create skewed transformations. Additionally, matplotlib internals were cleaned up to support using such transforms in `Axes`. This transform is important for some plot types, specifically the Skew-T used in meteorology.
Support for specifying properties of wedge and text in pie charts.

Added the kwargs ‘wedgeprops’ and ‘textprops’ to `pie` to accept properties for wedge and text objects in a pie. For example, one can specify `wedgeprops = {'linewidth':3}` to specify the width of the borders of the wedges in the pie. For more properties that the user can specify, look at the docs for the wedge and text objects.

Fixed the direction of errorbar upper/lower limits

Larry Bradley fixed the `errorbar()` method such that the upper and lower limits (`lolims`, `uplims`, `xlolims`, `xuplims`) now point in the correct direction.

More consistent add-object API for Axes

Added the Axes method `add_image` to put image handling on a par with artists, collections, containers, lines, patches, and tables.

Violin Plots

Per Parker, Gregory Kelsie, Adam Ortiz, Kevin Chan, Geoffrey Lee, Deokjae Donald Seo, and Taesu Terry Lim added a basic implementation for violin plots. Violin plots can be used to represent the distribution of sample data. They are similar to box plots, but use a kernel density estimation function to present a smooth approximation of the data sample used. The added features are:

- `violin` - Renders a violin plot from a collection of statistics. `violin_stats()` - Produces a collection of statistics suitable for rendering a violin plot. `violinplot()` - Creates a violin plot from a set of sample data. This method makes use of `violin_stats()` to process the input data, and
_violin_stats_() to do the actual rendering. Users are also free to modify or replace the output of _violin_stats_() in order to customize the violin plots to their liking.

This feature was implemented for a software engineering course at the University of Toronto, Scarborough, run in Winter 2014 by Anya Tafliovich.

**More `markevery` options to show only a subset of markers**

Rohan Walker extended the `markevery` property in _Line2D_. You can now specify a subset of markers to show with an int, slice object, numpy fancy indexing, or float. Using a float shows markers at approximately equal display-coordinate-distances along the line.

**Added size related functions to specialized Collections**

Added the `get_size` and `set_size` functions to control the size of elements of specialized collections (_AsteriskPolygonCollection_, _BrokenBarHCollection_, _CircleCollection_, _PathCollection_, _PolyCollection_, _RegularPolyCollection_, _StarPolygonCollection_).

**Fixed the mouse coordinates giving the wrong theta value in Polar graph**

Added code to _transform_non_affine_() to ensure that the calculated theta value was between the range of 0 and 2 * pi since the problem was that the value can become negative after applying the direction and rotation to the theta calculation.

**Simple quiver plot for mplot3d toolkit**

A team of students in an _Engineering Large Software Systems_ course, taught by Prof. Anya Tafliovich at the University of Toronto, implemented a simple version of a quiver plot in 3D space for the mplot3d toolkit as one of their term project. This feature is documented in _quiver_(). The team members are: Ryan Steve D’Souza, Victor B, xbtsw, Yang Wang, David, Caradec Bisesar and Vlad Vassilovski.
polar-plot r-tick locations

Added the ability to control the angular position of the r-tick labels on a polar plot via `set_rlabel_position`.

8.9.4 Date handling

n-d array support for date conversion

Andrew Dawson added support for n-d array handling to `matplotlib.dates.num2date()`, `matplotlib.dates.date2num()` and `matplotlib.dates.datestr2num()`. Support is also added to the unit conversion interfaces `matplotlib.dates.DateConverter` and `matplotlib.units.Registry`.

8.9.5 Configuration (rcParams)

`savefig.transparent` added

Controls whether figures are saved with a transparent background by default. Previously `savefig` always defaulted to a non-transparent background.

`axes.titleweight`

Added rcParam to control the weight of the title

`axes.formatter.useoffset` added

Controls the default value of `useOffset` in `ScalarFormatter`. If `True` and the data range is much smaller than the data average, then an offset will be determined such that the tick labels are meaningful. If `False` then the full number will be formatted in all conditions.

`nbagg.transparent` added

Controls whether nbagg figures have a transparent background. `nbagg.transparent` is `True` by default.

XDG compliance

Matplotlib now looks for configuration files (both rcparams and style) in XDG compliant locations.
8.9.6 style package added

You can now easily switch between different styles using the new style package:

```python
>>> from matplotlib import style
>>> style.use('dark_background')
```

Subsequent plots will use updated colors, sizes, etc. To list all available styles, use:

```python
>>> print style.available
```

You can add your own custom <style name>.mplstyle files to ~/.matplotlib/stylelib or call use with a URL pointing to a file with matplotlibrc settings.

*Note that this is an experimental feature*, and the interface may change as users test out this new feature.

8.9.7 Backends

Qt5 backend

Martin Fitzpatrick and Tom Badran implemented a Qt5 backend. The differences in namespace locations between Qt4 and Qt5 was dealt with by shimming Qt4 to look like Qt5, thus the Qt5 implementation is the primary implementation. Backwards compatibility for Qt4 is maintained by wrapping the Qt5 implementation.

The Qt5Agg backend currently does not work with IPython’s %matplotlib magic.

The 1.4.0 release has a known bug where the toolbar is broken. This can be fixed by:

```bash
cd path/to/installed/matplotlib
wget https://github.com/matplotlib/matplotlib/pull/3322.diff
# unix2dos 3322.diff (if on windows to fix line endings)
patch -p2 < 3322.diff
```

Qt4 backend

Rudolf Höfler changed the appearance of the subplottool. All sliders are vertically arranged now, buttons for tight layout and reset were added. Furthermore, the subplottool is now implemented as a modal dialog. It was previously a QMainWindow, leaving the SPT open if one closed the plot window.

In the figure options dialog one can now choose to (re-)generate a simple automatic legend. Any explicitly set legend entries will be lost, but changes to the curves’ label, linestyle, et cetera will now be updated in the legend.

Interactive performance of the Qt4 backend has been dramatically improved under windows.

The mapping of key-signals from Qt to values matplotlib understands was greatly improved (For both Qt4 and Qt5).
Cairo backends

The Cairo backends are now able to use the cairocffi bindings which are more actively maintained than the pycairo bindings.

Gtk3Agg backend

The Gtk3Agg backend now works on Python 3.x, if the cairocffi bindings are installed.

PDF backend

Added context manager for saving to multi-page PDFs.

8.9.8 Text

Text URLs supported by SVG backend

The SVG backend will now render Text objects’ url as a link in output SVGs. This allows one to make clickable text in saved figures using the url kwarg of the Text class.

Anchored sizebar font

Added the fontproperties kwarg to AnchoredSizeBar to control the font properties.

8.9.9 Sphinx extensions

The :context: directive in the plot_directive Sphinx extension can now accept an optional reset setting, which will cause the context to be reset. This allows more than one distinct context to be present in documentation. To enable this option, use :context: reset instead of :context: any time you want to reset the context.

8.9.10 Legend and PathEffects documentation

The Legend guide and Path effects guide have both been updated to better reflect the full potential of each of these powerful features.

8.9.11 Widgets

Span Selector

Added an option span_stays to the SpanSelector which makes the selector rectangle stay on the axes after you release the mouse.
8.9.12 GAE integration

Matplotlib will now run on google app engine.

8.10 New in matplotlib 1.5

Table of Contents

• New in matplotlib 1.5
  - Interactive OO usage
  - Working with labeled data like pandas DataFrames
  - Added `axes.prop_cycle` key to `rcParams`
  - New Colormaps
  - Styles
  - Backends
  - Configuration (rcParams)
  - Widgets
  - New plotting features
  - ToolManager
  - `cbook.is_sequence_of_strings` recognizes string objects
  - New `close-figs` argument for plot directive
  - Support for URL string arguments to `imread`
  - Display hook for animations in the IPython notebook
  - Prefixed `pkg-config` for building

Note: matplotlib 1.5 supports Python 2.7, 3.4, and 3.5

8.10.1 Interactive OO usage

All `Artist`s now keep track of if their internal state has been changed but not reflected in the display (`'stale'`) by a call to `draw`. It is thus possible to pragmatically determine if a given `Figure` needs to be re-drawn in an interactive session.

To facilitate interactive usage a `draw_all` method has been added to `pyplot` which will redraw all of the figures which are 'stale'.

To make this convenient for interactive use matplotlib now registers a function either with IPython’s ‘post_execute’ event or with the displayhook in the standard python REPL to automatically call `plt.draw_all` just before control is returned to the REPL. This ensures that the `draw` command is deferred and only called once.
The upshot of this is that for interactive backends (including %matplotlib notebook) in interactive mode (with plt.ion())

```python
import matplotlib.pyplot as plt
fig, ax = plt.subplots()
lw, = ax.plot([0, 1, 4, 9, 16])
plt.show()
lw.set_color('g')
```

will automatically update the plot to be green. Any subsequent modifications to the Artist objects will do likewise.

This is the first step of a larger consolidation and simplification of the pyplot internals.

### 8.10.2 Working with labeled data like pandas DataFrames

Plot methods which take arrays as inputs can now also work with labeled data and unpack such data.

This means that the following two examples produce the same plot:

**Example**

```python
df = pandas.DataFrame({'var1':[1,2,3,4,5,6], 'var2':[1,2,3,4,5,6]})
plt.plot(df['var1'], df['var2'])
```

**Example**

```python
plt.plot('var1', 'var2', data=df)
```

This works for most plotting methods, which expect arrays/sequences as inputs. data can be anything which supports `__getitem__` (dict, pandas.DataFrame, h5py, ...) to access array like values with string keys.

In addition to this, some other changes were made, which makes working with labeled data (ex pandas.Series) easier:

- For plotting methods with label keyword argument, one of the data inputs is designated as the label source. If the user does not supply a label that value object will be introspected for a label, currently by looking for a `name` attribute. If the value object does not have a `name` attribute but was specified by as a key into the data kwarg, then the key is used. In the above examples, this results in an implicit label="var2" for both cases.
- `plot()` now uses the index of a Series instead of `np.arange(len(y))`, if no x argument is supplied.

### 8.10.3 Added `axes.prop_cycle` key to rcParams

This is a more generic form of the now-deprecated `axes.color_cycle` param. Now, we can cycle more than just colors, but also linestyles, hatches, and just about any other artist property. Cycler notation is used for defining property cycles. Adding cyclers together will be like you are `zip-ing` together two or more property cycles together:

```python
axes.prop_cycle: cycler('color', ['rgb']) + cycler('lw', [1, 2, 3])
```
You can even multiply cyclers, which is like using `itertools.product` on two or more property cycles.

![Set default color cycle to rgb](image)

![Set axes color cycle to cmyk](image)

**Fig. 26: Color Cycle**

### 8.10.4 New Colormaps

All four of the colormaps proposed as the new default are available as 'viridis' (the new default in 2.0), 'magma', 'plasma', and 'inferno'.

### 8.10.5 Styles

Several new styles have been added, including many styles from the Seaborn project. Additionally, in order to prep for the upcoming 2.0 style-change release, a 'classic' and 'default' style has been added. For this release, the 'default' and 'classic' styles are identical. By using them now in your scripts, you can help ensure a smooth transition during future upgrades of matplotlib, so that you can upgrade to the snazzy new defaults when you are ready!

```python
import matplotlib.style
matplotlib.style.use('classic')
```

The 'default' style will give you matplotlib’s latest plotting styles:

```python
matplotlib.style.use('default')
```

### 8.10.6 Backends

#### New backend selection

The environment variable `MPLBACKEND` can now be used to set the matplotlib backend.
wx backend has been updated

The wx backend can now be used with both wxPython classic and Phoenix.
wxPython classic has to be at least version 2.8.12 and works on Python 2.x. As of May 2015 no official release of wxPython Phoenix is available but a current snapshot will work on Python 2.7+ and 3.4+.

If you have multiple versions of wxPython installed, then the user code is responsible setting the wxPython version. How to do this is explained in the comment at the beginning of the example /gallery/user_interfaces/embedding_in_wx2_sgskip.

8.10.7 Configuration (rcParams)

Some parameters have been added, others have been improved.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rcParams[&quot;xaxis.labelpad&quot;],</td>
<td>mplot3d now respects these parameters</td>
</tr>
<tr>
<td>rcParams[&quot;yaxis.labelpad&quot;] (default: 4.0)</td>
<td>Default space between the axis and the label</td>
</tr>
<tr>
<td>rcParams[&quot;errorbar.capsize&quot;]</td>
<td>Default length of end caps on error bars</td>
</tr>
<tr>
<td>rcParams[&quot;xtick.minor.visible&quot;] (default: False),</td>
<td>Default visibility of minor x/y ticks</td>
</tr>
<tr>
<td>rcParams[&quot;ytick.minor.visible&quot;] (default: False)</td>
<td>Default transparency of the legend frame box</td>
</tr>
<tr>
<td>rcParams[&quot;legend.framealpha&quot;]</td>
<td>Default facecolor of legend frame box (or 'inherit' from rcParams[&quot;axes.facecolor&quot;] (default: 'white'))</td>
</tr>
<tr>
<td>rcParams[&quot;legend.facecolor&quot;]</td>
<td>Default edgecolor of legend frame box (or 'inherit' from rcParams[&quot;axes.edgecolor&quot;] (default: 'black'))</td>
</tr>
<tr>
<td>rcParams[&quot;figure.titlesize&quot;]</td>
<td>Default font size for figure subtitles</td>
</tr>
<tr>
<td>rcParams[&quot;figure.titleweight&quot;]</td>
<td>Default font weight for figure subtitles</td>
</tr>
<tr>
<td>rcParams[&quot;image.composite_image&quot;] (default: True)</td>
<td>Whether a vector graphics backend should composite several images into a single image or not when saving. Useful when needing to edit the files further in Inkscape or other programs.</td>
</tr>
<tr>
<td>rcParams[&quot;markers.fillstyle&quot;]</td>
<td>Default fillstyle of markers. Possible values are 'full' (the default), 'left', 'right', 'bottom', 'top' and 'none'</td>
</tr>
<tr>
<td>rcParams[&quot;toolbar&quot;] (default: 'toolbar2')</td>
<td>Added 'toolmanager' as a valid value, enabling the experimental ToolManager feature.</td>
</tr>
</tbody>
</table>

### 8.10.8 Widgets

**Active state of Selectors**

All selectors now implement set_active and get_active methods (also called when accessing the active property) to properly update and query whether they are active.

**Moved ignore, set_active, and get_active methods to base class Widget**

Pushes up duplicate methods in child class to parent class to avoid duplication of code.

**Adds enable/disable feature to MultiCursor**

A MultiCursor object can be disabled (and enabled) after it has been created without destroying the object. Example:

```python
multi_cursor.active = False
```
Improved RectangleSelector and new EllipseSelector Widget

Adds an interactive keyword which enables visible handles for manipulating the shape after it has been drawn.

Adds keyboard modifiers for:

- Moving the existing shape (default key = ‘space’)
- Making the shape square (default ‘shift’)
- Make the initial point the center of the shape (default ‘control’)
- Square and center can be combined

Allow Artists to Display Pixel Data in Cursor

Adds `get_cursor_data` and `format_cursor_data` methods to artists which can be used to add zdata to the cursor display in the status bar. Also adds an implementation for Images.

8.10.9 New plotting features

Auto-wrapping Text

Added the keyword argument “wrap” to Text, which automatically breaks long lines of text when being drawn. Works for any rotated text, different modes of alignment, and for text that are either labels or titles. This breaks at the Figure, not Axes edge.

Contour plot corner masking

Ian Thomas rewrote the C++ code that calculates contours to add support for corner masking. This is controlled by a new keyword argument `corner_mask` in the functions `contour()` and `contourf()`. The previous behaviour, which is now obtained using `corner_mask=False`, was for a single masked point to completely mask out all four quads touching that point. The new behaviour, obtained using `corner_mask=True`, only masks the corners of those quads touching the point; any triangular corners comprising three unmasked points are contoured as usual. If the `corner_mask` keyword argument is not specified, the default value is taken from rcParams.

Mostly unified linestyles for Line2D, Patch and Collection

The handling of linestyles for Lines, Patches and Collections has been unified. Now they all support defining linestyles with short symbols, like “–”, as well as with full names, like “dashed”. Also the definition using a dash pattern ((0., [3., 3.])) is supported for all methods using `Line2D`, `Patch` or `Collection`.

Legend marker order

Added ability to place the label before the marker in a legend box with `markerfirst` keyword
This is a really long string that should be wrapped so that it does not go outside the figure.

Fig. 27: Contour Corner Mask
Support for legend for PolyCollection and stackplot

Added a legend_handler for PolyCollection as well as a labels argument to stackplot().

Support for alternate pivots in mplot3d quiver plot

Added a pivot kwarg to quiver() that controls the pivot point around which the quiver line rotates. This also determines the placement of the arrow head along the quiver line.

Logit Scale

Added support for the ‘logit’ axis scale, a nonlinear transformation

\[ x \rightarrow \log_{10}(x/(1-x)) \]

for data between 0 and 1 excluded.

Add step kwargs to fill_between

Added step kwarg to Axes.fill_between to allow to fill between lines drawn using the ‘step’ draw style. The values of step match those of the where kwarg of Axes.step. The asymmetry of the kwargs names is not ideal, but Axes.fill_between already has a where kwarg.

This is particularly useful for plotting pre-binned histograms.

![Filled Step Square Plot](image)

Fig. 28: Filled Step

Square Plot

Implemented square plots feature as a new parameter in the axis function. When argument ‘square’ is specified, equal scaling is set, and the limits are set such that xmax-xmin == ymax-ymin.
Updated figimage to take optional resize parameter

Added the ability to plot simple 2D-Array using `plt.figimage(X, resize=True)`. This is useful for plotting simple 2D-Array without the Axes or whitespacing around the image.

Updated `Figure.savefig()` can now use figure’s dpi

Added support to save the figure with the same dpi as the figure on the screen using `dpi='figure'`.

Example:

```python
f = plt.figure(dpi=25)  # dpi set to 25
S = plt.scatter([1,2,3],[4,5,6])
f.savefig('output.png', dpi='figure')  # output savefig dpi set to 25 (same as figure)
```

Updated Table to control edge visibility

Added the ability to toggle the visibility of lines in Tables. Functionality added to the `pyplot.table` factory function under the keyword argument “edges”. Values can be the strings “open”, “closed”, “horizontal”, “vertical” or combinations of the letters “L”, “R”, “T”, “B” which represent left, right, top, and bottom respectively.

Example:
Zero r/cstride support in plot_wireframe

Adam Hughes added support to mplot3d’s plot_wireframe to draw only row or column line plots.

Plot bar and barh with labels

Added kwarg tick_label to bar and barh to support plotting bar graphs with a text label for each bar.

Added center and frame kwargs to pie

These control where the center of the pie graph are and if the Axes frame is shown.
Fixed 3D filled contour plot polygon rendering

Certain cases of 3D filled contour plots that produce polygons with multiple holes produced improper rendering due to a loss of path information between `PolyCollection` and `Poly3DCollection`. A function `set_verts_and_codes()` was added to allow path information to be retained for proper rendering.

Dense colorbars are rasterized

Vector file formats (pdf, ps, svg) are efficient for many types of plot element, but for some they can yield excessive file size and even rendering artifacts, depending on the renderer used for screen display. This is a problem for colorbars that show a large number of shades, as is most commonly the case. Now, if a colorbar is showing 50 or more colors, it will be rasterized in vector backends.

DateFormatter strftime

`DateFormatter`'s `__call__()` method will format a `datetime.datetime` object with the format string passed to the formatter's constructor. This method accepts datetimes with years before 1900, unlike `datetime.datetime.strftime()`.
Artist-level \{get,set\}_usetex for text

Add \{get,set\}_usetex methods to \texttt{Text} objects which allow artist-level control of LaTeX rendering vs. the internal mathtex rendering.

\texttt{Axes.remove()} works as expected

As with artists added to an \texttt{Axes}, \texttt{Axes} objects can be removed from their figure via \texttt{remove()}.

API Consistency fix within Locators \texttt{set\_params()} function

\texttt{set\_params()} function, which sets parameters within a \texttt{Locator} type instance, is now available to all \texttt{Locator} types. The implementation also prevents unsafe usage by strictly defining the parameters that a user can set.

To use, call \texttt{set\_params()} on a \texttt{Locator} instance with desired arguments:

```python
loc = matplotlib.ticker.LogLocator()
# Set given attributes for loc.
loc.set_params(numticks=8, numdecs=8, subs=[2.0], base=8)
# The below will error, as there is no such parameter for LogLocator
# named foo
# loc.set_params(foo='bar')
```

Date Locators

Date Locators (derived from \texttt{DateLocator}) now implement the \texttt{tick\_values} method. This is expected of all Locators derived from \texttt{Locator}.

The Date Locators can now be used easily without creating axes

```python
from datetime import datetime
from matplotlib.dates import YearLocator
t0 = datetime(2002, 10, 9, 12, 10)
tf = datetime(2005, 10, 9, 12, 15)
loc = YearLocator()
values = loc.tick_values(t0, tf)
```

OffsetBoxes now support clipping

\texttt{Artists} draw onto objects of type \texttt{OffsetBox} through \texttt{DrawingArea} and \texttt{TextArea}. The \texttt{TextArea} calculates the required space for the text and so the text is always within the bounds, for this nothing has changed.

However, \texttt{DrawingArea} acts as a parent for zero or more \texttt{Artists} that draw on it and may do so beyond the bounds. Now child \texttt{Artists} can be clipped to the bounds of the \texttt{DrawingArea}.
OffsetBoxes now considered by tight_layout

When `tight_layout()` or `Figure.tight_layout` or `GridSpec.tight_layout()` is called, OffsetBoxes that are anchored outside the axes will not get chopped out. The OffsetBoxes will also not get overlapped by other axes in case of multiple subplots.

Per-page pdf notes in multi-page pdfs (PdfPages)

Add a new method `attach_note()` to the PdfPages class, allowing the attachment of simple text notes to pages in a multi-page pdf of figures. The new note is visible in the list of pdf annotations in a viewer that has this facility (Adobe Reader, OSX Preview, Skim, etc.). Per default the note itself is kept off-page to prevent it to appear in print-outs. `PdfPages.attach_note` needs to be called before `savefig` in order to be added to the correct figure.

Updated fignum_exists to take figure name

Added the ability to check the existence of a figure using its name instead of just the figure number. Example:

```python
def figure_exists(figname):
    return fignum_exists(figname)"'
```

8.10.10 ToolManager

Federico Ariza wrote the new `ToolManager` that comes as replacement for `NavigationToolbar2`. `ToolManager` offers a new way of looking at the user interactions with the figures. Before we had the `NavigationToolbar2` with its own tools like zoom/pan/home/save/... and also we had the shortcuts like yscale/grid/quit/..... `ToolManager` relocate all those actions as Tools (located in backend_tools), and defines a way to access/trigger/reconfigure them.

The Toolbars are replaced for ToolContainers that are just GUI interfaces to trigger the tools. But don’t worry the default backends include a ToolContainer called toolbar

Note: At the moment, we release this primarily for feedback purposes and should be treated as experimental until further notice as API changes will occur. For the moment the ToolManager works only with the GTK3 and Tk backends. Make sure you use one of those. Port for the rest of the backends is coming soon.

To activate the ToolManager include the following at the top of your file

```python
>>> matplotlib.rcParams["toolbar"] = 'toolmanager'
```

Interact with the ToolContainer

The most important feature is the ability to easily reconfigure the ToolContainer (aka toolbar). For example, if we want to remove the “forward” button we would just do.
>>> fig.canvas.manager.toolmanager.remove_tool('forward')

Now if you want to programmatically trigger the “home” button

>>> fig.canvas.manager.toolmanager.trigger_tool('home')

**New Tools for ToolManager**

It is possible to add new tools to the ToolManager

A very simple tool that prints “You’re awesome” would be:

```python
from matplotlib.backend_tools import ToolBase

class AwesomeTool(ToolBase):
    def trigger(self, *args, **kwargs):
        print("You're awesome")
```

To add this tool to `ToolManager`

```python
>>> fig.canvas.manager.toolmanager.add_tool('Awesome', AwesomeTool)
```

If we want to add a shortcut ("d") for the tool

```python
>>> fig.canvas.manager.toolmanager.update_keymap('Awesome', 'd')
```

To add it to the toolbar inside the group ‘foo’

```python
>>> fig.canvas.manager.toolbar.add_tool('Awesome', 'foo')
```

There is a second class of tools, “Toggleable Tools”, this are almost the same as our basic tools, just that belong to a group, and are mutually exclusive inside that group. For tools derived from `ToolToggleBase` there are two basic methods `enable` and `disable` that are called automatically whenever it is toggled.

A full example is located in `/gallery/user_interfaces/toolmanager_sgskip`

### 8.10.11 cbook.is_sequence_of_strings recognizes string objects

This is primarily how pandas stores a sequence of strings

```python
import pandas as pd
import matplotlib.cbook as cbook

a = np.array(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(a))  # True

a = np.array(['a', 'b', 'c'], dtype=object)
print(cbook.is_sequence_of_strings(a))  # True

s = pd.Series(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(s))  # True
```

Previously, the last two prints returned false.
8.10.12 New close-figs argument for plot directive

Matplotlib has a sphinx extension `plot_directive` that creates plots for inclusion in sphinx documents. Matplotlib 1.5 adds a new option to the plot directive - `close-figs` - that closes any previous figure windows before creating the plots. This can help avoid some surprising duplicates of plots when using `plot_directive`.

8.10.13 Support for URL string arguments to `imread`

The `imread()` function now accepts URL strings that point to remote PNG files. This circumvents the generation of a HTTPResponse object directly.

8.10.14 Display hook for animations in the IPython notebook

`Animation` instances gained a `_repr_html_` method to support inline display of animations in the notebook. The method used to display is controlled by the `animation.html` rc parameter, which currently supports values of `none` and `html5`. `none` is the default, performing no display. `html5` converts the animation to an h264 encoded video, which is embedded directly in the notebook.

Users not wishing to use the `_repr_html_` display hook can also manually call the `to_html5_video` method to get the HTML and display using IPython’s `HTML` display class:

```python
from IPython.display import HTML
HTML(anim.to_html5_video())
```

8.10.15 Prefixed pkg-config for building

Handling of pkg-config has been fixed in so far as it is now possible to set it using the environment variable `PKG_CONFIG`. This is important if your toolchain is prefixed. This is done in a similar way as setting `CC` or `CXX` before building. An example follows.

```bash
export PKG_CONFIG=x86_64-pc-linux-gnu-pkg-config
```

8.11 New in matplotlib 2.0

**Note:** matplotlib 2.0 supports Python 2.7, and 3.4+

8.11.1 Default style changes

The major changes in v2.0 are related to overhauling the default styles.
Changes to the default style

The most important changes in matplotlib 2.0 are the changes to the default style. While it is impossible to select the best default for all cases, these are designed to work well in the most common cases.

A ‘classic’ style sheet is provided so reverting to the 1.x default values is a single line of python

```python
import matplotlib
import matplotlib as mpl
mpl.style.use('classic')
```

See The matplotlibrc file for details about how to persistently and selectively revert many of these changes.

Table of Contents

- Colors, color cycles, and color maps
  - Colors in default property cycle
  - Colormap
  - Interactive figures
  - Grid lines
- Figure size, font size, and screen dpi
- Plotting functions
  - scatter
  - plot
  - errorbar
  - boxplot
  - fill_between and fill_betweenx
  - Patch edges and color
  - hexbin
  - bar and barh
- Hatching
- Fonts
  - Normal text
  - Math text
- Legends
- Image
  - Interpolation
  - Colormapping pipeline
  - Shading
Colors, color cycles, and color maps

Colors in default property cycle

The colors in the default property cycle have been changed from ['b', 'g', 'r', 'c', 'm', 'y', 'k'] to the category10 color palette used by Vega and d3 originally developed at Tableau.

In addition to changing the colors, an additional method to specify colors was added. Previously, the default colors were the single character short-hand notations for red, green, blue, cyan, magenta, yellow, and black. This made them easy to type and usable in the abbreviated style string in `plot`, however the new default colors are only specified via hex values. To access these colors outside of the property cycling the notation for colors 'CN', where N takes values 0-9, was added to denote the first 10 colors in `rcParams['axes.prop_cycle']` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`). See Specifying Colors for more details.

To restore the old color cycle use

```python
from cycler import cycler
mpl.rcParams['axes.prop_cycle'] = cycler(color='bgrcmyk')
```

or set
axes.prop_cycle : cycler('color', 'bgrcmyk')

in your matplotlibrc file.

Colormap

The new default color map used by `matplotlib.cm.ScalarMappable` instances is 'viridis' (aka option D).

For an introduction to color theory and how 'viridis' was generated watch Nathaniel Smith and Stéfan van der Walt's talk from SciPy2015. See here for many more details about the other alternatives and the tools used to create the color map. For details on all of the color maps available in matplotlib see Choosing Colormaps in Matplotlib.

The previous default can be restored using

```
mpl.rcParams['image.cmap'] = 'jet'
```

or setting

```
image.cmap : 'jet'
```

in your matplotlibrc file; however this is strongly discouraged.

Interactive figures

The default interactive figure background color has changed from grey to white, which matches the default background color used when saving.

The previous defaults can be restored by

```
mpl.rcParams['figure.facecolor'] = '0.75'
```

or by setting
Grid lines

The default style of grid lines was changed from black dashed lines to thicker solid light grey lines.

The previous default can be restored by using:

```python
mpl.rcParams['grid.color'] = 'k'
mpl.rcParams['grid.linestyle'] = ':'
mpl.rcParams['grid.linewidth'] = 0.5
```

or by setting:

```python
grid.color : k  # grid color
grid.linestyle : :  # dotted
grid.linewidth : 0.5  # in points
```

in your matplotlibrc file.

Figure size, font size, and screen dpi

The default dpi used for on-screen display was changed from 80 dpi to 100 dpi, the same as the default dpi for saving files. Due to this change, the on-screen display is now more what-you-see-is-what-you-get for saved files. To keep the figure the same size in terms of pixels, in order to maintain approximately the same size on the screen, the default figure size was reduced from 8x6 inches to 6.4x4.8 inches. As a consequence of this the default font sizes used for the title, tick labels, and axes labels were reduced to maintain their size relative to the overall size of the figure. By default the dpi of the saved image is now the dpi of the `Figure` instance being saved.
Matplotlib, Release 3.3.0

This will have consequences if you are trying to match text in a ﬁgure directly with external
text.
The previous defaults can be restored by
mpl.rcParams['figure.figsize'] = [8.0, 6.0]
mpl.rcParams['figure.dpi'] = 80
mpl.rcParams['savefig.dpi'] = 100
mpl.rcParams['font.size'] = 12
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['figure.titlesize'] = 'medium'

or by setting:
figure.figsize
figure.dpi
savefig.dpi

: [8.0, 6.0]
: 80
: 100

font.size
: 12.0
legend.fontsize : 'large'
figure.titlesize : 'medium'

In your matplotlibrc ﬁle.
In addition, the forward kwarg to set_size_inches now defaults to True to improve the interactive experience. Backend canvases that adjust the size of their bound matplotlib.figure.
Figure must pass forward=False to avoid circular behavior. This default is not conﬁgurable.
Plotting functions
scatter
The following changes were made to the default behavior of scatter
• The default size of the elements in a scatter plot is now based on rcParams["lines.
markersize"] (default: 6.0) so it is consistent with plot(X, Y, 'o'). The old value was
20, and the new value is 36 (6^2).
• Scatter markers no longer have a black edge.
• If the color of the markers is not speciﬁed it will follow the property cycle, pulling from
the ’patches’ cycle on the Axes.
The classic default behavior of scatter can only be recovered through mpl.style.
use('classic'). The marker size can be recovered via
mpl.rcParam['lines.markersize'] = np.sqrt(20)

however, this will also aﬀect the default marker size of plot. To recover the classic behavior
on a per-call basis pass the following kwargs:
classic_kwargs = {'s': 20, 'edgecolors': 'k', 'c': 'b'}

694

Chapter 8. Previous What’s New


The following changes were made to the default behavior of `plot`:

- The default linewidth increased from 1 to 1.5
- The dash patterns associated with `'--'`, `': '`, and `'-.'` have changed
- The dash patterns now scale with line width

The previous defaults can be restored by setting:

```python
mpl.rcParams['lines.linewidth'] = 1.0
mpl.rcParams['lines.dashed_pattern'] = [6, 6]
mpl.rcParams['lines.dashdot_pattern'] = [3, 5, 1, 5]
mpl.rcParams['lines.dotted_pattern'] = [1, 3]
mpl.rcParams['lines.scale_dashes'] = False
```
or by setting:

```python
lines.linewidth : 1.0
lines.dashed_pattern : 6, 6
lines.dashdot_pattern : 3, 5, 1, 5
lines.dotted_pattern : 1, 3
lines.scale_dashes: False
```

in your `matplotlibrc` file.

**errorbar**

By default, caps on the ends of errorbars are not present.

![Errorbar comparison](image)

This also changes the return value of `errorbar()` as the list of 'caplines' will be empty by default.

The previous defaults can be restored by setting:

```python
mpl.rcParams['errorbar.capsize'] = 3
```

or by setting

```python
errorbar.capsize : 3
```

in your `matplotlibrc` file.

**boxplot**

Previously, boxplots were composed of a mish-mash of styles that were, for better for worse, inherited from Matlab. Most of the elements were blue, but the medians were red. The fliers (outliers) were black plus-symbols (‘+’) and the whiskers were dashed lines, which created ambiguity if the (solid and black) caps were not drawn.
For the new defaults, everything is black except for the median and mean lines (if drawn), which are set to the first two elements of the current color cycle. Also, the default flier markers are now hollow circles, which maintain the ability of the plus-symbols to overlap without obscuring data too much.

The previous defaults can be restored by setting:

```python
mpl.rcParams['boxplot.flierprops.color'] = 'k'
mpl.rcParams['boxplot.flierprops.marker'] = '+'
mpl.rcParams['boxplot.flierprops.markerfacecolor'] = 'none'
mpl.rcParams['boxplot.boxprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.linestyle'] = '--'
mpl.rcParams['boxplot.medianprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.marker'] = '^'
mpl.rcParams['boxplot.meanprops.markerfacecolor'] = 'r'
mpl.rcParams['boxplot.meanprops.markeredgecolor'] = 'k'
mpl.rcParams['boxplot.meanprops.markersize'] = 6
mpl.rcParams['boxplot.meanprops.linewidth'] = 1.0
```

or by setting:

```python
boxplot.flierprops.color: 'k'
boxplot.flierprops.marker: '+'
```

(continues on next page)
in your `matplotlibrc` file.

`fill_between` and `fill_betweenx`

`fill_between` and `fill_betweenx` both follow the patch color cycle.

If the facecolor is set via the `facecolors` or `color` keyword argument, then the color is not cycled.
To restore the previous behavior, explicitly pass the keyword argument `facecolors='C0'` to the method call.

**Patch edges and color**

Most artists drawn with a patch (~matplotlib.axes.Axes.bar, ~matplotlib.axes.Axes.pie, etc) no longer have a black edge by default. The default face color is now 'C0' instead of 'b'.
The previous defaults can be restored by setting:
8.11. New in matplotlib 2.0

- Frogs
- Hogs
- Dogs
- Logs

- Classic
  - Frogs
  - Hogs
  - Dogs
  - Logs

- V2.0
  - Frogs
  - Hogs
  - Dogs
  - Logs

- Bar charts showing the same data with different styles.
Matplotlib, Release 3.3.0

```python
mpl.rcParams['patch.force_edgecolor'] = True
mpl.rcParams['patch.facecolor'] = 'b'
```

or by setting:

```python
patch.facecolor : b
patch.force_edgecolor : True
```

in your `matplotlibrc` file.

**hexbin**

The default value of the `linecolor` kwarg for `hexbin` has changed from 'none' to 'face'. If 'none' is now supplied, no line edges are drawn around the hexagons.

**bar and barh**

The default value of the `align` kwarg for both `bar` and `barh` is changed from 'edge' to 'center'.

To restore the previous behavior explicitly pass the keyword argument `align='edge'` to the method call.
Hatching

The color of the lines in the hatch is now determined by

- If an edge color is explicitly set, use $\texttt{rcParams["hatch.color"]}$ (default: ‘black’) which is looked up at artist creation time.

The width of the lines in a hatch pattern is now configurable by the $\texttt{rcParams["hatch.linewidth"]}$ (default: 1.0), which defaults to 1 point. The old behavior for the line width was different depending on backend:

- PDF: 0.1 pt
- SVG: 1.0 pt
- PS: 1 px
- Agg: 1 px

The old line width behavior can not be restored across all backends simultaneously, but can be restored for a single backend by setting:

```python
mpl.rcParams['hatch.linewidth'] = 0.1  # previous pdf hatch linewidth
mpl.rcParams['hatch.linewidth'] = 1.0  # previous svg hatch linewidth
```

The behavior of the PS and Agg backends was DPI dependent, thus:

```python
mpl.rcParams['figure.dpi'] = dpi
mpl.rcParams['savefig.dpi'] = dpi  # or leave as default 'figure'
mpl.rcParams['hatch.linewidth'] = 1.0 / dpi  # previous ps and Agg hatch linewidth
```

There is no direct API level control of the hatch color or linewidth.

Hatching patterns are now rendered at a consistent density, regardless of DPI. Formerly, high DPI figures would be more dense than the default, and low DPI figures would be less dense. This old behavior cannot be directly restored, but the density may be increased by repeating the hatch specifier.

Fonts

Normal text

The default font has changed from “Bitstream Vera Sans” to “DejaVu Sans”. DejaVu Sans has additional international and math characters, but otherwise has the same appearance as Bitstream Vera Sans. Latin, Greek, Cyrillic, Armenian, Georgian, Hebrew, and Arabic are all supported (but right-to-left rendering is still not handled by matplotlib). In addition, DejaVu contains a sub-set of emoji symbols.

See the DejaVu Sans PDF sample for full coverage.

Math text

The default math font when using the built-in math rendering engine (mathtext) has changed from “Computer Modern” (i.e. LaTeX-like) to “DejaVu Sans”. This change has no effect if the TeX backend is used (i.e. $\texttt{text.usetex}$ is True).
### Chapter 8. Previous What’s New
To revert to the old behavior set the:

```python
mpl.rcParams['mathtext.fontset'] = 'cm'
mpl.rcParams['mathtext.rm'] = 'serif'
```

or set:

```python
mathtext.fontset: cm
mathtext.rm: serif
```

in your `matplotlibrc` file.

This `rcParam` is consulted when the text is drawn, not when the artist is created. Thus all mathtext on a given canvas will use the same fontset.

### Legends

- By default, the number of points displayed in a legend is now 1.
- The default legend location is `'best'`, so the legend will be automatically placed in a location to minimize overlap with data.
- The legend defaults now include rounded corners, a lighter boundary, and partially transparent boundary and background.

The previous defaults can be restored by setting:

```python
mpl.rcParams['legend.fancybox'] = False
mpl.rcParams['legend.loc'] = 'upper right'
mpl.rcParams['legend.numpoints'] = 2
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['legend.framealpha'] = None
mpl.rcParams['legend.scatterpoints'] = 3
mpl.rcParams['legend.edgecolor'] = 'inherit'
```

or by setting:
Image

Interpolation

The default interpolation method for `imshow` is now 'nearest' and by default it resamples the data (both up and down sampling) before color mapping.

To restore the previous behavior set:

```python
mpl.rcParams['image.interpolation'] = 'bilinear'
mpl.rcParams['image.resample'] = False
```

or set:

```python
image.interpolation = 'bilinear' # see help(imshow) for options
image.resample = False
```

in your `matplotlibrc` file.
Colormapping pipeline

Previously, the input data was normalized, then color mapped, and then resampled to the resolution required for the screen. This meant that the final resampling was being done in color space. Because the color maps are not generally linear in RGB space, colors not in the color map may appear in the final image. This bug was addressed by an almost complete overhaul of the image handling code.

The input data is now normalized, then resampled to the correct resolution (in normalized dataspace), and then color mapped to RGB space. This ensures that only colors from the color map appear in the final image. (If your viewer subsequently resamples the image, the artifact may reappear.)

The previous behavior cannot be restored.

Shading

- The default shading mode for light source shading, in matplotlib.colors.LightSource.shade, is now overlay. Formerly, it was hsv.

Plot layout

Auto limits

The previous auto-scaling behavior was to find ‘nice’ round numbers as view limits that enclosed the data limits, but this could produce bad plots if the data happened to fall on a vertical or horizontal line near the chosen ‘round number’ limit. The new default sets the view limits to 5% wider than the data range.

The size of the padding in the x and y directions is controlled by the 'axes.xmargin' and 'axes.ymargin' rcParams respectively. Whether the view limits should be ‘round numbers’ is controlled by rcParams['axes.autolimit_mode'] (default: 'data'). In the original 'round_number' mode, the view limits coincide with ticks.
The previous default can be restored by using:

```python
mpl.rcParams['axes.autolimit_mode'] = 'round_numbers'
mpl.rcParams['axes.xmargin'] = 0
mpl.rcParams['axes.ymargin'] = 0
```

or setting:

```python
axes.autolimit_mode: round_numbers
axes.xmargin: 0
axes.ymargin: 0
```

in your matplotlibrc file.

**Z-order**

- Ticks and grids are now plotted above solid elements such as filled contours, but below lines. To return to the previous behavior of plotting ticks and grids above lines, set

  ```python
  rcParams['axes.axisbelow'] = False
  ```

**Ticks**

**Direction**

To reduce the collision of tick marks with data, the default ticks now point outward by default. In addition, ticks are now drawn only on the bottom and left spines to prevent a porcupine appearance, and for a cleaner separation between subplots.

To restore the previous behavior set:

```python
mpl.rcParams['xtick.direction'] = 'in'
mpl.rcParams['ytick.direction'] = 'in'
```
8.11. New in matplotlib 2.0
or set:

```python
xtick.top: True
xtick.direction: in

ytick.right: True
ytick.direction: in
```

in your `matplotlibrc` file.

### Number of ticks

The default `Locator` used for the x and y axis is `AutoLocator` which tries to find, up to some maximum number, 'nicely' spaced ticks. The locator now includes an algorithm to estimate the maximum number of ticks that will leave room for the tick labels. By default it also ensures that there are at least two ticks visible.

There is no way, other than using `mpl.style.use('classic')`, to restore the previous behavior as the default. On an axis-by-axis basis you may either control the existing locator via:

```python
ax.xaxis.get_major_locator().set_params(nbins=9, steps=[1, 2, 5, 10])
```

or create a new `MaxNLocator`:

```python
import matplotlib.ticker as mticker
ax.set_major_locator(mticker.MaxNLocator(nbins=9, steps=[1, 2, 5, 10]))
```

The algorithm used by `MaxNLocator` has been improved, and this may change the choice of tick locations in some cases. This also affects `AutoLocator`, which uses `MaxNLocator` internally.

For a log-scaled axis the default locator is the `LogLocator`. Previously the maximum number of ticks was set to 15, and could not be changed. Now there is a `numticks` kwarg for setting
the maximum to any integer value, to the string ‘auto’, or to its default value of None which is equivalent to ‘auto’. With the ‘auto’ setting the maximum number will be no larger than 9, and will be reduced depending on the length of the axis in units of the tick font size. As in the case of the AutoLocator, the heuristic algorithm reduces the incidence of overlapping tick labels but does not prevent it.

**Tick label formatting**

**LogFormatter labeling of minor ticks**

Minor ticks on a log axis are now labeled when the axis view limits span a range less than or equal to the interval between two major ticks. See *LogFormatter* for details. The minor tick labeling is turned off when using `mpl.style.use('classic')`, but cannot be controlled independently via `rcParams`.

![classic vs v2.0 comparison](image)

**ScalarFormatter tick label formatting with offsets**

With the default `rcParams["axes.formatter.useoffset"]` (default: True), an offset will be used when it will save 4 or more digits. This can be controlled with the new `rcParams["axes.formatter.offset_threshold"]` (default: 4). To restore the previous behavior of using an offset to save 2 or more digits, use `rcParams["axes.formatter.offset_threshold"] = 2`.

**AutoDateFormatter format strings**

The default date formats are now all based on ISO format, i.e., with the slowest-moving value first. The date formatters are configurable through the `date.autoformatter.*` `rcParams`. 
Threshold (tick interval >= than) | rcParam                  | classic | v2.0  
---|--------------------------|---------|-------
365 days | 'date.autoformatter.year' : %Y | %Y     | %Y   
30 days  | 'date.autoformatter.month' : %b %Y | %b %Y | %b-%m  
1 day    | 'date.autoformatter.day' : %b %d %Y | %b-%m-%d | %b-%Y 
1 hour   | 'date.autoformatter.hour' : %H:%M:%S | %H:%M:%S | %H:%M:%S 
1 minute | 'date.autoformatter.minute' : %H:%M:%S.%f | %H:%M:%S.%f | %H:%M:%S.%f 
1 second | 'date.autoformatter.second' : %H:%M:%S.%f | %H:%M:%S.%f | %H:%M:%S.%f 
1 microsecond | 'date.autoformatter.microsecond' : %H:%M:%S.%f | %H:%M:%S.%f | %H:%M:%S.%f 

Python’s `%x` and `%X` date formats may be of particular interest to format dates based on the current locale.

The previous default can be restored by:

```python
mpl.rcParams['date.autoformatter.year'] = 'Y
mpl.rcParams['date.autoformatter.month'] = '%b %Y
mpl.rcParams['date.autoformatter.day'] = '%b %d %Y
mpl.rcParams['date.autoformatter.hour'] = '%H:%M:%S
mpl.rcParams['date.autoformatter.minute'] = '%H:%M:%S.%f
mpl.rcParams['date.autoformatter.second'] = '%H:%M:%S.%f
mpl.rcParams['date.autoformatter.microsecond'] = '%H:%M:%S.%f'
```

or setting

- `date.autoformatter.year : %Y`
- `date.autoformatter.month : %b %Y`
- `date.autoformatter.day : %b %d %Y`
- `date.autoformatter.hour : %H:%M:%S`
- `date.autoformatter.minute : %H:%M:%S.%f`
- `date.autoformatter.second : %H:%M:%S.%f`
- `date.autoformatter.microsecond : %H:%M:%S.%f`
in your `matplotlibrc` file.

**mplot3d**

- mplot3d now obeys some style-related `rcParams`, rather than using hard-coded defaults. These include:
  - `xtick.major.width`
  - `ytick.major.width`
  - `xtick.color`
  - `ytick.color`
  - `axes.linewidth`
  - `axes.edgecolor`
  - `grid.color`
  - `grid.linewidth`
  - `grid.linestyle`

### 8.11.2 Improved color conversion API and RGBA support

The `colors` gained a new color conversion API with full support for the alpha channel. The main public functions are `is_color_like()`, `matplotlib.colors.to_rgba()`, `matplotlib.colors.to_rgba_array()` and `to_hex()`. RGBA quadruplets are encoded in hex format as “#rrggbbaa”. A side benefit is that the Qt options editor now allows setting the alpha channel of the artists as well.

### 8.11.3 New Configuration (`rcParams`)

New `rcparams` added
### Parameter Description

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>rcParams[&quot;date.autoformatter.year&quot;]</code> (default: '%Y')</td>
<td>format string for 'year' scale dates</td>
</tr>
<tr>
<td><code>rcParams[&quot;date.autoformatter.month&quot;]</code> (default: '%Y-%m')</td>
<td>format string for 'month' scale dates</td>
</tr>
<tr>
<td><code>rcParams[&quot;date.autoformatter.day&quot;]</code> (default: '%Y-%m-%d')</td>
<td>format string for 'day' scale dates</td>
</tr>
<tr>
<td><code>rcParams[&quot;date.autoformatter.hour&quot;]</code> (default: '%m-%d %H')</td>
<td>format string for 'hour' scale times</td>
</tr>
<tr>
<td><code>rcParams[&quot;date.autoformatter.minute&quot;]</code> (default: '%d %H:%M')</td>
<td>format string for 'minute' scale times</td>
</tr>
<tr>
<td><code>rcParams[&quot;date.autoformatter.second&quot;]</code> (default: '%H:%M:%S')</td>
<td>format string for 'second' scale times</td>
</tr>
<tr>
<td><code>rcParams[&quot;date.autoformatter.microsecond&quot;]</code> (default: '%M:%S.%f')</td>
<td>format string for 'microsecond' scale times</td>
</tr>
<tr>
<td><code>rcParams[&quot;scatter.marker&quot;]</code> (default: 'o')</td>
<td>default marker for scatter plot</td>
</tr>
<tr>
<td><code>rcParams[&quot;svg.hashsalt&quot;]</code> (default: None)</td>
<td>see note</td>
</tr>
<tr>
<td><code>rcParams[&quot;xtick.top&quot;]</code> (default: False), <code>rcParams[&quot;xtick.major.top&quot;]</code> (default: True), <code>rcParams[&quot;xtick.bottom&quot;]</code> (default: True), <code>rcParams[&quot;xtick.major.bottom&quot;]</code> (default: True), <code>rcParams[&quot;ytick.left&quot;]</code> (default: True), <code>rcParams[&quot;ytick.minor.left&quot;]</code> (default: True), <code>rcParams[&quot;ytick.right&quot;]</code> (default: True), <code>rcParams[&quot;xtick.major.right&quot;]</code> (default: True)</td>
<td>Control where major and minor ticks are drawn. The global values are added with the corresponding major/minor values. Corresponding major/minor values.</td>
</tr>
<tr>
<td><code>rcParams[&quot;hist.bins&quot;]</code> (default: 10)</td>
<td>The default number of bins to use in <code>hist</code>. This can be an int, a list of floats, or 'auto' if numpy &gt;= 1.11 is installed.</td>
</tr>
<tr>
<td><code>rcParams[&quot;lines.scale_dashes&quot;]</code> (default: True)</td>
<td>Whether the line dash patterns should scale with linewidth.</td>
</tr>
<tr>
<td><code>rcParams[&quot;axes.formatter.offset_threshold&quot;]</code> (default: 4)</td>
<td>Minimum number of digits saved in tick labels that triggers using an offset.</td>
</tr>
</tbody>
</table>

**Added `svg.hashsalt` key to rcParams**

If `svg.hashsalt` is `None` (which it is by default), the svg backend uses `uuid4` to generate the hash salt. If it is not `None`, it must be a string that is used as the hash salt instead of `uuid4`. This allows for deterministic SVG output.
Removed the `svg.image_noscale` rcParam

As a result of the extensive changes to image handling, the `svg.image_noscale` rcParam has been removed. The same functionality may be achieved by setting `interpolation='none'` on individual images or globally using the `image.interpolation` rcParam.

### 8.11.4 Qualitative colormaps

ColorBrewer's "qualitative" colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") were intended for discrete categorical data, with no implication of value, and therefore have been converted to `ListedColormap` instead of `LinearSegmentedColormap`, so the colors will no longer be interpolated and they can be used for choropleths, labeled image features, etc.

### 8.11.5 Axis offset label now responds to labelcolor

Axis offset labels are now colored the same as axis tick markers when `labelcolor` is altered.

### 8.11.6 Improved offset text choice

The default offset-text choice was changed to only use significant digits that are common to all ticks (e.g. 1231.1239 -> 1230, instead of 1231), except when they straddle a relatively large multiple of a power of ten, in which case that multiple is chosen (e.g. 1999.2001->2000).

### 8.11.7 Style parameter blacklist

In order to prevent unexpected consequences from using a style, style files are no longer able to set parameters that affect things unrelated to style. These parameters include:

```python
'interactive', 'backend', 'backend.qt4', 'webagg.port',
'webagg.port_retries', 'webagg.open_in_browser', 'backend_fallback',
'toolbar', 'timezone', 'datapath', 'figure.max_open_warning',
'savefig.directory', 'tk.window_focus', 'docstring.hardcopy'
```

### 8.11.8 Change in default font

The default font used by matplotlib in text has been changed to DejaVu Sans and DejaVu Serif for the sans-serif and serif families, respectively. The DejaVu font family is based on the previous matplotlib default –Bitstream Vera– but includes a much wider range of characters.

The default mathtext font has been changed from Computer Modern to the DejaVu family to maintain consistency with regular text. Two new options for the `mathtext.fontset` configuration parameter have been added: `dejavusans` (default) and `dejavuserif`. Both of these options use DejaVu glyphs whenever possible and fall back to STIX symbols when a glyph is not found in DejaVu. To return to the previous behavior, set the rcParam `mathtext.fontset` to `cm`.

8.11. New in matplotlib 2.0

713
8.11.9 Faster text rendering

Rendering text in the Agg backend is now less fuzzy and about 20% faster to draw.

8.11.10 Improvements for the Qt figure options editor

Various usability improvements were implemented for the Qt figure options editor, among which:

- Line style entries are now sorted without duplicates.
- The colormap and normalization limits can now be set for images.
- Line edits for floating values now display only as many digits as necessary to avoid precision loss. An important bug was also fixed regarding input validation using Qt5 and a locale where the decimal separator is ",".
- The axes selector now uses shorter, more user-friendly names for axes, and does not crash if there are no axes.
- Line and image entries using the default labels ("_lineX", "_imageX") are now sorted numerically even when there are more than 10 entries.

8.11.11 Improved image support

Prior to version 2.0, matplotlib resampled images by first applying the color map and then resizing the result. Since the resampling was performed on the colored image, this introduced colors in the output image that didn’t actually exist in the color map. Now, images are resampled first (and entirely in floating-point, if the input image is floating-point), and then the color map is applied.

In order to make this important change, the image handling code was almost entirely rewritten. As a side effect, image resampling uses less memory and fewer datatype conversions than before.

The experimental private feature where one could "skew" an image by setting the private member _image_skew_coordinate has been removed. Instead, images will obey the transform of the axes on which they are drawn.

Non-linear scales on image plots

`imshow` now draws data at the requested points in data space after the application of non-linear scales.

The image on the left demonstrates the new, correct behavior. The old behavior can be recreated using `pcolormesh` as demonstrated on the right.

This can be understood by analogy to plotting a histogram with linearly spaced bins with a logarithmic x-axis. Equal sized bins will be displayed as wider for small x and narrower for large x.
8.11.12 Support for HiDPI (Retina) displays in the NbAgg and WebAgg backends

The NbAgg and WebAgg backends will now use the full resolution of your high-pixel-density display.

8.11.13 Change in the default animation codec

The default animation codec has been changed from mpeg4 to h264, which is more efficient. It can be set via the animation.codec rcParam.

8.11.14 Deprecated support for mencoder in animation

The use of mencoder for writing video files with mpl is problematic; switching to ffmpeg is strongly advised. All support for mencoder will be removed in version 2.2.

8.11.15 Boxplot Zorder Keyword Argument

The zorder parameter now exists for boxplot. This allows the zorder of a boxplot to be set in the plotting function call.

```python
gt.boxplot(np.arange(10), zorder=10)
```

8.11.16 Filled + and x markers

New fillable plus and x markers have been added. See the markers module and marker reference examples.
8.11.17 rcount and ccount for plot_surface

As of v2.0, mplot3d’s plot_surface now accepts rcount and ccount arguments for controlling the sampling of the input data for plotting. These arguments specify the maximum number of evenly spaced samples to take from the input data. These arguments are also the new default sampling method for the function, and is considered a style change.

The old rstride and cstride arguments, which specified the size of the evenly spaced samples, become the default when ‘classic’ mode is invoked, and are still available for use. There are no plans for deprecating these arguments.

8.11.18 Streamplot Zorder Keyword Argument Changes

The zorder parameter for streamplot now has default value of None instead of 2. If None is given as zorder, streamplot has a default zorder of matplotlib.lines.Line2D.zorder.

8.11.19 Extension to matplotlib.backend_bases.GraphicsContextBase

To support standardizing hatch behavior across the backends we ship the matplotlib.backend_bases.GraphicsContextBase.get_hatch_color method as added to matplotlib.backend_bases.GraphicsContextBase. This is only used during the render process in the backends we ship so will not break any third-party backends.

If you maintain a third-party backend which extends GraphicsContextBase this method is now available to you and should be used to color hatch patterns.

8.12 New in Matplotlib 2.1.0

8.12.1 Documentation

The examples have been migrated to use sphinx gallery. This allows better mixing of prose and code in the examples, provides links to download the examples as both a Python script and a Jupyter notebook, and improves the thumbnail galleries. The examples have been re-organized into Tutorials and a gallery.

Many docstrings and examples have been clarified and improved.

8.12.2 New features

String categorical values

All plotting functions now support string categorical values as input. For example:

```python
data = {'apples': 10, 'oranges': 15, 'lemons': 5, 'limes': 20}
fig, ax = plt.subplots()
ax.bar(data.keys(), data.values(), color='lightgray')
```
Interactive JS widgets for animation

Jake Vanderplas’ JSAnimation package has been merged into Matplotlib. This adds to Matplotlib the HTMLWriter class for generating a JavaScript HTML animation, suitable for the IPython notebook. This can be activated by default by setting the animation.html rc parameter to jshtml. One can also call the to_jshtml method to manually convert an animation. This can be displayed using IPython’s HTML display class:

```python
from IPython.display import HTML
HTML(animation.to_jshtml())
```

The HTMLWriter class can also be used to generate an HTML file by asking for the html writer.

Enhancements to polar plot

The polar axes transforms have been greatly re-factored to allow for more customization of view limits and tick labelling. Additional options for view limits allow for creating an annulus, a sector, or some combination of the two.

The set_rorigin() method may be used to provide an offset to the minimum plotting radius, producing an annulus.

The set_theta_zero_location() method now has an optional offset argument. This argument may be used to further specify the zero location based on the given anchor point.
The `set_thetamin()` and `set_thetamax()` methods may be used to limit the range of angles plotted, producing sectors of a circle.

Previous releases allowed plots containing negative radii for which the negative values are simply used as labels, and the real radius is shifted by the configured minimum. This release also allows negative radii to be used for grids and ticks, which were previously silently ignored.

Radial ticks have been modified to be parallel to the circular grid line, and angular ticks have been modified to be parallel to the grid line. It may also be useful to rotate tick labels to match the boundary. Calling `ax.tick_params(rotation='auto')` will enable the new behavior: radial tick labels will be parallel to the circular grid line, and angular tick labels will be perpendicular to the grid line (i.e., parallel to the outer boundary). Additionally, tick labels now obey the padding settings that previously only worked on Cartesian plots. Consequently, the `frac` argument to `PolarAxes.set_thetagrids` is no longer applied. Tick padding can be modified with the `pad` argument to `Axes.tick_params` or `Axis.set_tick_params`.

**Figure class now has subplots method**

The `Figure` class now has a `subplots()` method which behaves the same as `pyplot.subplots()` but on an existing figure.

**Metadata savefig keyword argument**

`savefig()` now accepts metadata as a keyword argument. It can be used to store key/value pairs in the image metadata.

- ‘png’ with Agg backend
- ‘pdf’ with PDF backend (see `writeInfoDict()` for a list of supported keywords)
• ‘eps’ and ‘ps’ with PS backend (only ‘Creator’ key is accepted)

```python
plt.savefig('test.png', metadata={'Software': 'My awesome software'})
```

**Busy Cursor**

The interactive GUI backends will now change the cursor to busy when Matplotlib is rendering the canvas.

**PolygonSelector**

A `PolygonSelector` class has been added to `matplotlib.widgets`. See /gallery/widgets/polygon_selector_demo for details.

**Added `matplotlib.ticker.PercentFormatter`**

The new `PercentFormatter` formatter has some nice features like being able to convert from arbitrary data scales to percents, a customizable percent symbol and either automatic or manual control over the decimal points.

**Reproducible PS, PDF and SVG output**

The `SOURCE_DATE_EPOCH` environment variable can now be used to set the timestamp value in the PS and PDF outputs. See `source date epoch`. 
Alternatively, calling `savefig` with `metadata={'CreationDate': None}` will omit the timestamp altogether for the PDF backend.

The reproducibility of the output from the PS and PDF backends has so far been tested using various plot elements but only default values of options such as `{ps,pdf}.fonttype` that can affect the output at a low level, and not with the `mathtext` or `usetex` features. When Matplotlib calls external tools (such as PS distillers or LaTeX) their versions need to be kept constant for reproducibility, and they may add sources of nondeterminism outside the control of Matplotlib.

For SVG output, the `svg.hashsalt` rc parameter has been added in an earlier release. This parameter changes some random identifiers in the SVG file to be deterministic. The downside of this setting is that if more than one file is generated using deterministic identifiers and they end up as parts of one larger document, the identifiers can collide and cause the different parts to affect each other.

These features are now enabled in the tests for the PDF and SVG backends, so most test output files (but not all of them) are now deterministic.

**Orthographic projection for mplot3d**

`Axes3D` now accepts `proj_type` keyword argument and has a method `set_proj_type()`. The default option is `'persp'` as before, and supplying `'ortho'` enables orthographic view.

Compare the z-axis which is vertical in orthographic view, but slightly skewed in the perspective view.

```python
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

fig = plt.figure(figsize=(4, 6))
ax1 = fig.add_subplot(2, 1, 1, projection='3d')
ax1.set_proj_type('persp')
ax1.set_title('Perspective (default)')

ax2 = fig.add_subplot(2, 1, 2, projection='3d')
ax2.set_proj_type('ortho')
ax2.set_title('Orthographic')

plt.show()
```

**voxels function for mplot3d**

`Axes3D` now has a `voxels` method, for visualizing boolean 3D data. Uses could include plotting a sparse 3D heat map, or visualizing a volumetric model.

### 8.12.3 Improvements

**CheckButtons widget get_status function**

A `get_status()` method has been added to the `matplotlib.widgets.CheckButtons` class. This `get_status` method allows user to query the status (True/False) of all of the buttons in the
Perspective (default)

Orthographic

8.12. New in Matplotlib 2.1.0
CheckButtons object.

Add fill_bar argument to AnchoredSizeBar

The mpl_toolkits class AnchoredSizeBar now has an additional fill_bar argument, which makes the size bar a solid rectangle instead of just drawing the border of the rectangle. The default is None, and whether or not the bar will be filled by default depends on the value of size_vertical. If size_vertical is nonzero, fill_bar will be set to True. If size_vertical is zero then fill_bar will be set to False. If you wish to override this default behavior, set fill_bar to True or False to unconditionally always or never use a filled patch rectangle for the size bar.

```python
import matplotlib.pyplot as plt
from mpl_toolkits.axes_grid1.anchored_artists import AnchoredSizeBar

fig, ax = plt.subplots(figsize=(3, 3))

bar0 = AnchoredSizeBar(ax.transData, 0.3, 'unfilled', loc='lower left',
                       frameon=False, size_vertical=0.05, fill_bar=False)
ax.add_artist(bar0)

bar1 = AnchoredSizeBar(ax.transData, 0.3, 'filled', loc='lower right',
                       frameon=False, size_vertical=0.05, fill_bar=True)
ax.add_artist(bar1)

plt.show()
```

Annotation can use a default arrow style

Annotations now use the default arrow style when setting arrowprops={}, rather than no arrow (the new behavior actually matches the documentation).
Barbs and Quiver Support Dates

When using the `quiver()` and `barbs()` plotting methods, it is now possible to pass dates, just like for other methods like `plot()`. This also allows these functions to handle values that need unit-conversion applied.

Hexbin default line color

The default `linecolor` keyword argument for `hexbin()` is now `'face'`, and supplying `'none'` now prevents lines from being drawn around the hexagons.

Figure.legend() can be called without arguments

Calling `Figure.legend()` can now be done with no arguments. In this case a legend will be created that contains all the artists on all the axes contained within the figure.

Multiple legend keys for legend entries

A legend entry can now contain more than one legend key. The extended `HandlerTuple` class now accepts two parameters: `ndivide` divides the legend area in the specified number of sections; `pad` changes the padding between the legend keys.

New parameter `clear` for `figure()`

When the pyplot’s function `figure()` is called with a `num` parameter, a new window is only created if no existing window with the same value exists. A new bool parameter `clear` was added for explicitly clearing its existing contents. This is particularly useful when utilized in interactive sessions. Since `subplots()` also accepts keyword arguments from `figure()`, it can also be used there:
Fig. 32: Multiple Legend Keys

```python
import matplotlib.pyplot as plt

fig0 = plt.figure(num=1)
fig0.suptitle("A fancy plot")
print("fig0.texts: ", [t.get_text() for t in fig0.texts])

fig1 = plt.figure(num=1, clear=False)  # do not clear contents of window
fig1.text(0.5, 0.5, "Really fancy!")
print("fig0 is fig1: ", fig0 is fig1)
print("fig1.texts: ", [t.get_text() for t in fig1.texts])

fig2, ax2 = plt.subplots(2, 1, num=1, clear=True)  # clear contents
print("fig0 is fig2: ", fig0 is fig2)
print("fig2.texts: ", [t.get_text() for t in fig2.texts])

# The output:
# fig0.texts: ['A fancy plot']
# fig0 is fig1: True
# fig1.texts: ['A fancy plot', 'Really fancy!']
# fig0 is fig2: True
# fig2.texts: []
```

Specify minimum value to format as scalar for LogFormatterMathText

`LogFormatterMathText` now includes the option to specify a minimum value exponent to format as a scalar (i.e., 0.001 instead of $10^{-3}$).
New quiverkey angle keyword argument

Plotting a `quiverkey()` now admits the `angle` keyword argument, which sets the angle at which to draw the key arrow.

Colormap reversed method

The methods `matplotlib.colors.LinearSegmentedColormap.reversed()` and `matplotlib.colors.ListedColormap.reversed()` return a reversed instance of the Colormap. This implements a way for any Colormap to be reversed.

`artist.setp (and pyplot.setp) accept a file argument`

The argument is keyword-only. It allows an output file other than `sys.stdout` to be specified. It works exactly like the `file` argument to `print`.

Streamplot streamline generation more configurable

The starting point, direction, and length of the stream lines can now be configured. This allows to follow the vector field for a longer time and can enhance the visibility of the flow pattern in some use cases.

`Axis.set_tick_params now responds to rotation`

Bulk setting of tick label rotation is now possible via `tick_params()` using the `rotation` keyword.

```python
ax.tick_params(which='both', rotation=90)
```

Ticklabels are turned off instead of being invisible

Internally, the `Tick`'s `label1On()` attribute is now used to hide tick labels instead of setting the visibility on the tick label objects. This improves overall performance and fixes some issues. As a consequence, in case those labels ought to be shown, `tick_params()` needs to be used, e.g.

```python
ax.tick_params(labelbottom=True)
```

Shading in 3D bar plots

A new `shade` parameter has been added the 3D `bar` plotting method. The default behavior remains to shade the bars, but now users have the option of setting `shade` to `False`.

```python
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

x = np.arange(2)
```
y = np.arange(3)
x2d, y2d = np.meshgrid(x, y)
x, y = x2d.ravel(), y2d.ravel()
z = np.zeros_like(x)
dz = x + y

fig = plt.figure(figsize=(4, 6))
ax1 = fig.add_subplot(2, 1, 1, projection='3d')
ax1.bar3d(x, y, z, 1, 1, dz, shade=True)
ax1.set_title('Shading On')

ax2 = fig.add_subplot(2, 1, 2, projection='3d')
ax2.bar3d(x, y, z, 1, 1, dz, shade=False)
ax2.set_title('Shading Off')

plt.show()}
New which Parameter for `autofmt_xdate`

A `which` parameter now exists for the method `autofmt_xdate()`. This allows a user to format major, minor or both tick labels selectively. The default behavior will rotate and align the major tick labels.

```python
fig.autofmt_xdate(bottom=0.2, rotation=30, ha='right', which='minor')
```

New Figure Parameter for `subplot2grid`

A `fig` parameter now exists for the function `subplot2grid()`. This allows a user to specify the figure where the subplots will be created. If `fig` is `None` (default) then the method will use the current figure retrieved by `gcf()`.

```python
subplot2grid(shape, loc, rowspan=1, colspan=1, fig=myfig)
```

Interpolation in `fill_betweenx`

The `interpolate` parameter now exists for the method `fill_betweenx()`. This allows a user to interpolate the data and fill the areas in the crossover points, similarly to `fill_between()`.

New keyword argument `sep` for `EngFormatter`

A new `sep` keyword argument has been added to `EngFormatter` and provides a means to define the string that will be used between the value and its unit. The default string is " ", which preserves the former behavior. Additionally, the separator is now present between the value and its unit even in the absence of SI prefix. There was formerly a bug that was causing strings like "3.14V" to be returned instead of the expected "3.14 V" (with the default behavior).

Extend MATPLOTLIBRC behavior

The environmental variable can now specify the full file path or the path to a directory containing a `matplotlibrc` file.

density kwarg to `hist`

The `hist()` method now prefers `density` to `normed` to control if the histogram should be normalized, following a change upstream to NumPy. This will reduce confusion as the behavior has always been that the integral of the histogram is 1 (rather than sum or maximum value).

8.12.4 Internals

New `TransformedPatchPath` caching object

A newly added `TransformedPatchPath` provides a means to transform a `Patch` into a `Path` via a `Transform` while caching the resulting path. If neither the patch nor the transform have changed, a cached copy of the path is returned.
This class differs from the older `TransformedPath` in that it is able to refresh itself based on the underlying patch while the older class uses an immutable path.

**Abstract base class for movie writers**

The new `AbstractMovieWriter` class defines the API required by a class that is to be used as the writer in the `matplotlib.animation.Animation.save()` method. The existing `MovieWriter` class now derives from the new abstract base class.

**Stricter validation of line style rcParams**

The validation of rcParams that are related to line styles (`lines.linestyle`, `boxplot.*.linestyle`, `grid.linestyle` and `contour.negative_linestyle`) now effectively checks that the values are valid line styles. Strings like 'dashed' or '--' are accepted, as well as even-length sequences of on-off ink like [1, 1.65]. In this latter case, the offset value is handled internally and should not be provided by the user.

The new validation scheme replaces the former one used for the `contour.negative_linestyle` rcParams, that was limited to 'solid' and 'dashed' line styles.

The validation is case-insensitive. The following are now valid:

```plaintext
| grid.linestyle     | (1, 3)   # loosely dotted grid lines |
| contour.negative_linestyle | dashdot  # previously only solid or dashed |
```

**pytest**

The automated tests have been switched from `nose` to `pytest`.

**8.12.5 Performance**

**Path simplification updates**

Line simplification controlled by the `path.simplify` and `path.simplify_threshold` parameters has been improved. You should notice better rendering performance when plotting large amounts of data (as long as the above parameters are set accordingly). Only the line segment portion of paths will be simplified – if you are also drawing markers and experiencing problems with rendering speed, you should consider using the `markevery` option to `plot`. See the `Performance` section in the usage tutorial for more information.

The simplification works by iteratively merging line segments into a single vector until the next line segment’s perpendicular distance to the vector (measured in display-coordinate space) is greater than the `path.simplify_threshold` parameter. Thus, higher values of `path.simplify_threshold` result in quicker rendering times. If you are plotting just to explore data and not for publication quality, pixel perfect plots, then a value of 1.0 can be safely used. If you want to make sure your plot reflects your data exactly, then you should set `path.simplify` to false and/or `path.simplify_threshold` to 0. Matplotlib currently defaults to a conservative value of 1/9, smaller values are unlikely to cause any visible differences in your plots.
Implement `intersects_bbox` in c++

`intersects_bbox()` has been implemented in c++ which improves the performance of automatically placing the legend.

## 8.13 New in Matplotlib 2.2

### 8.13.1 Constrained Layout Manager

**Warning:** Constrained Layout is experimental. The behaviour and API are subject to change, or the whole functionality may be removed without a deprecation period.

A new method to automatically decide spacing between subplots and their organizing `GridSpec` instances has been added. It is meant to replace the venerable `tight_layout` method. It is invoked via a new `constrained_layout=True` kwarg to `Figure` or `subplots`.

There are new `rcParams` for this package, and spacing can be more finely tuned with the new `set_constrained_layout_pads`.

Features include:

- Automatic spacing for subplots with a fixed-size padding in inches around subplots and all their decorators, and space between as a fraction of subplot size between subplots.
- Spacing for `suptitle`, and colorbars that are attached to more than one axes.
- Nested `GridSpec` layouts using `GridSpecFromSubplotSpec`.

For more details and capabilities please see the new tutorial: [Constrained Layout Guide](#).

Note the new API to access this:

**New** `plt.figure` and `plt.subplots` kwarg: `constrained_layout`

`figure()` and `subplots()` can now be called with `constrained_layout=True` kwarg to enable `constrained_layout`.

**New** `ax.set_position` behaviour

`Axes.set_position` now makes the specified axis no longer responsive to `constrained_layout`, consistent with the idea that the user wants to place an axis manually.

Internally, this means that old `ax.set_position` calls `inside` the library are changed to private `ax._set_position` calls so that `constrained_layout` will still work with these axes.
New figure kwarg for GridSpec

In order to facilitate constrained_layout, GridSpec now accepts a figure keyword. This is backwards compatible, in that not supplying this will simply cause constrained_layout to not operate on the subplots organized by this GridSpec instance. Routines that use GridSpec (e.g. fig.subplots) have been modified to pass the figure to GridSpec.

8.13.2 xlabels and ylabels can now be automatically aligned

Subplot axes ylabels can be misaligned horizontally if the tick labels are very different widths. The same can happen to xlabels if the ticklabels are rotated on one subplot (for instance). The new methods on the Figure class: Figure.align_xlabels and Figure.align_ylabels will now align these labels horizontally or vertically. If the user only wants to align some axes, a list of axes can be passed. If no list is passed, the algorithm looks at all the labels on the figure.

Only labels that have the same subplot locations are aligned. i.e. the ylabels are aligned only if the subplots are in the same column of the subplot layout.

Alignment is persistent and automatic after these are called.

A convenience wrapper Figure.align_labels calls both functions at once.

8.13.3 Axes legends now included in tight_bbox

Legends created via ax.legend can sometimes overspill the limits of the axis. Tools like fig.tight_layout() and fig.savefig(bbox_inches='tight') would clip these legends. A change was made to include them in the tight calculations.

8.13.4 Cividis colormap

A new dark blue/yellow colormap named 'cividis' was added. Like viridis, cividis is perceptually uniform and colorblind friendly. However, cividis also goes a step further: not only
is it usable by colorblind users, it should actually look effectively identical to colorblind and non-colorblind users. For more details see Nuñez J, Anderton C, and Renslow R: “Optimizing colormaps with consideration for color vision deficiency to enable accurate interpretation of scientific data”.

8.13.5 New style colorblind-friendly color cycle

A new style defining a color cycle has been added, tableau-colorblind10, to provide another option for colorblind-friendly plots. A demonstration of this new style can be found in the reference of style sheets. To load this color cycle in place of the default one:

```python
import matplotlib.pyplot as plt
plt.style.use('tableau-colorblind10')
```

8.13.6 Support for numpy.datetime64

Matplotlib has supported `datetime.datetime` dates for a long time in `matplotlib.dates`. We now support `numpy.datetime64` dates as well. Anywhere that `datetime.datetime` could be used, `numpy.datetime64` can be used. eg:

```python
time = np.arange('2005-02-01', '2005-02-02', dtype='datetime64[h]')
plt.plot(time)
```
8.13.7 Writing animations with Pillow

It is now possible to use Pillow as an animation writer. Supported output formats are currently gif (Pillow>=3.4) and webp (Pillow>=5.0). Use e.g. as

```python
from __future__ import division
from matplotlib import pyplot as plt
from matplotlib.animation import FuncAnimation, PillowWriter

fig, ax = plt.subplots()
line, = plt.plot([0, 1])

def animate(i):
    line.set_ydata([0, i / 20])
    return [line]

anim = FuncAnimation(fig, animate, 20, blit=True)
anim.save("movie.gif", writer=PillowWriter(fps=24))
plt.show()
```

8.13.8 Slider UI widget can snap to discrete values

The slider UI widget can take the optional argument valstep. Doing so forces the slider to take on only discrete values, starting from valmin and counting up to valmax with steps of size valstep.

If closedmax==True, then the slider will snap to valmax as well.

8.13.9 capstyle and joinstyle attributes added to Collection

The Collection class now has customizable capstyle and joinstyle attributes. This allows the user for example to set the capstyle of errorbars.

8.13.10 pad kwarg added to ax.set_title

The method Axes.set_title now has a pad kwarg, that specifies the distance from the top of an axes to where the title is drawn. The units of pad is points, and the default is the value of the (already-existing) rcParams["axes.titlepad"] (default: 6.0).

8.13.11 Comparison of 2 colors in Matplotlib

As the colors in Matplotlib can be specified with a wide variety of ways, the matplotlib.colors.same_color method has been added which checks if two colors are the same.

8.13.12 Autoscaling a polar plot snaps to the origin

Setting the limits automatically in a polar plot now snaps the radial limit to zero if the automatic limit is nearby. This means plotting from zero doesn’t automatically scale to include small negative values on the radial axis.
The limits can still be set manually in the usual way using `set_ylim`.

### 8.13.13 PathLike support

On Python 3.6+, `savefig`, `imsave`, `imread`, and animation writers now accept `os.PathLike`s as input.

### 8.13.14 Axes.tick_params can set gridline properties

`Tick` objects hold gridlines as well as the tick mark and its label. `Axis.set_tick_params`, `Axes.tick_params` and `pyplot.tick_params` now have keyword arguments `‘grid_color’`, `‘grid_alpha’`, `‘grid_linewidth’`, and `‘grid_linestyle’` for overriding the defaults in `rcParams`: `‘grid.color’`, etc.

### 8.13.15 Axes.imshow clips RGB values to the valid range

When `Axes.imshow` is passed an RGB or RGBA value with out-of-range values, it now logs a warning and clips them to the valid range. The old behaviour, wrapping back in to the range, often hid outliers and made interpreting RGB images unreliable.

### 8.13.16 Properties in matplotlibrc to place xaxis and yaxis tick labels

Introducing four new boolean properties in `matplotlibrc` for default positions of xaxis and yaxis tick labels, namely, `rcParams["xtick.labeltop"]` (default: `False`), `rcParams["xtick.labelbottom"]` (default: `True`), `rcParams["ytick.labelright"]` (default: `False`) and `rcParams["ytick.labelleft"]` (default: `True`). These can also be changed in `rcParams`.

### 8.13.17 PGI bindings for gtk3

The GTK3 backends can now use PGI instead of PyGObject. PGI is a fairly incomplete binding for GObject, thus its use is not recommended; its main benefit is its availability on Travis (thus allowing CI testing for the gtk3agg and gtk3cairo backends).

The binding selection rules are as follows: - if `gi` has already been imported, use it; else - if `pgi` has already been imported, use it; else - if `gi` can be imported, use it; else - if `pgi` can be imported, use it; else - error out.

Thus, to force usage of PGI when both bindings are installed, import it first.

### 8.13.18 Cairo rendering for Qt, WX, and Tk canvases

The new Qt4Cairo, Qt5Cairo, WXcairo, and Tkcairo backends allow Qt, Wx, and Tk canvases to use Cairo rendering instead of Agg.
8.13.19 Added support for QT in new ToolManager

Now it is possible to use the ToolManager with Qt5 For example

```python
import matplotlib
matplotlib.use('QT5AGG')
matplotlib.rcParams['toolbar'] = 'toolmanager'
import matplotlib.pyplot as plt
plt.plot([1, 2, 3])
plt.show()
```

Treat the new Tool classes experimental for now, the API will likely change and perhaps the rcParam as well

The main example /gallery/user_interfaces/toolmanager_sgskip shows more details, just adjust the header to use QT instead of GTK3

8.13.20 TkAgg backend reworked to support PyPy

**PyPy** can now plot using the TkAgg backend, supported on PyPy 5.9 and greater (both PyPy for python 2.7 and PyPy for python 3.5).

8.13.21 Python logging library used for debug output

Matplotlib has in the past (sporadically) used an internal verbose-output reporter. This version converts those calls to using the standard python logging library.

Support for the old rcParams verbose.level and verbose.fileo is dropped.

The command-line options --verbose-helpful and --verbose-debug are still accepted, but deprecated. They are now equivalent to setting logging.INFO and logging.DEBUG.

The logger’s root name is matplotlib and can be accessed from programs as:

```python
import logging
mlog = logging.getLogger('matplotlib')
```

Instructions for basic usage are in Troubleshooting and for developers in Contributing.

8.13.22 Improved repr for Transforms

**Transforms** now indent their reprs in a more legible manner:

```python
In [1]: 1, = plt.plot([]); 1.get_transform()
Out[1]:
CompositeGenericTransform(
  TransformWrapper(
    BlendedAffine2D(
      IdentityTransform(),
      IdentityTransform())),
  CompositeGenericTransform(
    BboxTransformFrom(
      TransformedBbox(
        Bbox(x0=-0.05500000000000001, y0=-0.05500000000000001, x1=0.05500000000000001, y1=0.
        ...05500000000000001),
```

(continues on next page)
8.14 New in Matplotlib 3.0

8.14.1 Improved default backend selection

The default backend no longer must be set as part of the build process. Instead, at run time, the built-in backends are tried in sequence until one of them imports.

Headless Linux servers (identified by the DISPLAY environment variable not being defined) will not select a GUI backend.

8.14.2 Cyclic colormaps

Two new colormaps named ‘twilight’ and ‘twilight_shifted’ have been added. These colormaps start and end on the same color, and have two symmetric halves with equal lightness, but diverging color. Since they wrap around, they are a good choice for cyclic data such as phase angles, compass directions, or time of day. Like viridis and cividis, twilight is perceptually uniform and colorblind friendly.

8.14.3 Ability to scale axis by a fixed order of magnitude

To scale an axis by a fixed order of magnitude, set the `scilimits` argument of `Axes.ticklabel_format` to the same (non-zero) lower and upper limits. Say to scale the y axis by a million (1e6), use

```python
ax.ticklabel_format(style='sci', scilimits=(6, 6), axis='y')
```

The behavior of `scilimits=(0, 0)` is unchanged. With this setting, Matplotlib will adjust the order of magnitude depending on the axis values, rather than keeping it fixed. Previously, setting `scilimits=(m, m)` was equivalent to setting `scilimits=(0, 0).`
8.14.4 Add AnchoredDirectionArrows feature to mpl_toolkits

A new mpl_toolkits class AnchoredDirectionArrows draws a pair of orthogonal arrows to indicate directions on a 2D plot. A minimal working example takes in the transformation object for the coordinate system (typically ax.transAxes), and arrow labels. There are several optional parameters that can be used to alter layout. For example, the arrow pairs can be rotated and the color can be changed. By default the labels and arrows have the same color, but the class may also pass arguments for customizing arrow and text layout, these are passed to matplotlib.textpath.TextPath and matplotlib.patches.FancyArrowPatch. Location, length and width for both arrow tail and head can be adjusted, the direction arrows and labels can have a frame. Padding and separation parameters can be adjusted.

8.14.5 Add minorticks_on()/off() methods for colorbar

A new method colorbar.Colobar.minorticks_on() has been added to correctly display minor ticks on a colorbar. This method doesn't allow the minor ticks to extend into the regions beyond vmin and vmax when the extend keyword argument (used while creating the colorbar) is set to 'both', 'max' or 'min'. A complementary method colorbar.Colobar.minorticks_off() has also been added to remove the minor ticks on the colorbar.

8.14.6 Colorbar ticks can now be automatic

The number of ticks placed on colorbars was previously appropriate for a large colorbar, but looked bad if the colorbar was made smaller (i.e. via the shrink keyword argument). This has been changed so that the number of ticks is now responsive to how large the colorbar is.

8.14.7 Don't automatically rename duplicate file names

Previously, when saving a figure to a file using the GUI's save dialog box, if the default filename (based on the figure window title) already existed on disk, Matplotlib would append a suffix (e.g. Figure_1-1.png), preventing the dialog from prompting to overwrite the file. This behaviour has been removed. Now if the file name exists on disk, the user is prompted whether or not to overwrite it. This eliminates guesswork, and allows intentional overwriting, especially when the figure name has been manually set using figure.Figure.canvas.set_window_title().

8.14.8 Legend now has a title_fontsize keyword argument (and rcParam)

The title for a Figure.legend and Axes.legend can now have its font size set via the title_fontsize keyword argument. There is also a new rcParams["legend.title_fontsize"] (default: None). Both default to None, which means the legend title will have the same font size as the axes default font size (not the legend font size, set by the fontsize keyword argument or rcParams["legend.fontsize"] (default: 'medium')).

8.14.9 Support for axes.prop_cycle property markevery in rcParams

The Matplotlib rcParams settings object now supports configuration of the attribute axes.prop_cycle with cyclers using the markevery Line2D object property. An example of this feature
is provided at /gallery/lines_bars_and_markers/markevery_prop_cycle.

8.14.10 Multi-page PDF support for pgf backend

The pgf backend now also supports multi-page PDF files.

```python
from matplotlib.backends.backend_pgf import PdfPages
import matplotlib.pyplot as plt

with PdfPages('multipage.pdf') as pdf:
    # page 1
    plt.plot([2, 1, 3])
    pdf.savefig()

    # page 2
    plt.cla()
    plt.plot([3, 1, 2])
    pdf.savefig()
```

8.14.11 Pie charts are now circular by default

We acknowledge that the majority of people do not like egg-shaped pies. Therefore, an axes
to which a pie chart is plotted will be set to have equal aspect ratio by default. This en-
sures that the pie appears circular independent on the axes size or units. To revert to the
previous behaviour set the axes’ aspect ratio to automatic by using `ax.set_aspect("auto")` or
`plt.axis("auto")`.

8.14.12 Add `ax.get_gridspec` to `SubplotBase`

New method `SubplotBase.get_gridspec` is added so that users can easily get the gridspec that
went into making an axes:

```python
import matplotlib.pyplot as plt

fig, axs = plt.subplots(3, 2)
gs = axs[0, -1].get_gridspec()

# remove the last column
for ax in axs[:,-1].flatten():
    ax.remove()

# make a subplot in last column that spans rows.
ax = fig.add_subplot(gs[:, -1])
plt.show()
```

8.14.13 Axes titles will no longer overlap xaxis

Previously an axes title had to be moved manually if an xaxis overlapped (usually when the
xaxis was put on the top of the axes). Now, the title will be automatically moved above the
xaxis and its decorators (including the xlabel) if they are at the top.
If desired, the title can still be placed manually. There is a slight kludge; the algorithm checks if the y-position of the title is 1.0 (the default), and moves if it is. If the user places the title in the default location (i.e. ax.title.set_position(0.5, 1.0)), the title will still be moved above the xaxis. If the user wants to avoid this, they can specify a number that is close (i.e. ax.title.set_position(0.5, 1.01)) and the title will not be moved via this algorithm.

### 8.14.14 New convenience methods for GridSpec

There are new convenience methods for `gridspec.GridSpec` and `gridspec.GridSpecFromSubplotSpec`. Instead of the former we can now call `Figure.add_gridspec` and for the latter `SubplotSpec.subgridspec`.

```python
import matplotlib.pyplot as plt

fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

### 8.14.15 Figure has an add_artist method

A method `add_artist` has been added to the `Figure` class, which allows artists to be added directly to a figure. E.g.

```python
circ = plt.Circle((.7, .5), .05)
fig.add_artist(circ)
```

In case the added artist has no transform set previously, it will be set to the figure transform (fig.transFigure). This new method may be useful for adding artists to figures without axes or to easily position static elements in figure coordinates.

### 8.14.16 :math: directive renamed to :mathmpl:

The :math: rst role provided by `matplotlib.sphinxext.mathmpl` has been renamed to :mathmpl: to avoid conflicting with the :math: role that Sphinx 1.8 provides by default. (:mathmpl: uses Matplotlib to render math expressions to images embedded in html, whereas Sphinx uses MathJax.)

When using Sphinx<1.8, both names (:math: and :mathmpl:) remain available for backwards-compatibility.

### 8.15 What’s new in Matplotlib 3.1

For a list of all of the issues and pull requests since the last revision, see the *GitHub Stats*. 

---

Matplotlib, Release 3.3.0

8.14.15 Figure has an add_artist method

8.14.16 :math: directive renamed to :mathmpl:

8.15 What’s new in Matplotlib 3.1
What’s new in Matplotlib 3.1

- New Features
  - Concise DateFormatter
  - Secondary x/y Axis support
  - FuncScale for arbitrary axes scales
  - Legend for scatter
  - Matplotlib no longer requires framework app build on MacOSX backend
- Figure, FigureCanvas, and Backends
  - Figure.frameon is now a direct proxy for the Figure patch visibility state
  - pil_kwargs argument added to savefig
  - Add inaxes method to FigureCanvasBase
  - cairo backend defaults to pycairo instead of cairoffi
- Axes and Artists
  - axes_grid1 and axisartist Axes no longer draw spines twice
  - Return type of ArtistInspector.get_aliases changed
  - ConnectionPatch accepts arbitrary transforms
  - mplot3d Line3D now allows {set,get}_data_3d
  - Axes3D.voxels now shades the resulting voxels
- Axis and Ticks
  - Added Axix.get_inverted and Axix.set_inverted
  - Adjust default minor tick spacing
  - EngFormatter now accepts usetex, useMathText as keyword only arguments
- Animation and Interactivity
  - Support for forward/backward mouse buttons
  - progress_callback argument to save()
  - Add cache_frame_data keyword-only argument into animation.FuncAnimation
  - Endless Looping GIFs with PillowWriter
  - Adjusted matplotlib.widgets.Slider to have vertical orientation
  - Improved formatting of image values under cursor when a colorbar is present
  - MouseEvent button attribute is now an IntEnum
- Configuration, Install, and Development
  - The MATPLOTLIBRC environment variable can now point to any “file” path
  - Allow LaTeX code pgf.preamble and text.latex.preamble in MATPLOTLIBRC file
  - New logging API
8.15.1 New Features

ConciseDateFormatter

The automatic date formatter used by default can be quite verbose. A new formatter can be accessed that tries to make the tick labels appropriately concise.

Secondary x/y Axis support

A new method provides the ability to add a second axis to an existing axes via `Axes.secondary_xaxis` and `Axes.secondary_yaxis`. See /gallery/subplots_axes_and_figures/secondary_axis for examples.

**FuncScale for arbitrary axes scales**

A new `FuncScale` class was added (and `FuncTransform`) to allow the user to have arbitrary scale transformations without having to write a new subclass of `ScaleBase`. This can be accessed by:

```python
tax.set_yscale('function', functions=(forward, inverse))```
where `forward` and `inverse` are callables that return the scale transform and its inverse. See the last example in /gallery/scales/scales.

Legend for scatter

A new method for creating legends for scatter plots has been introduced. Previously, in order to obtain a legend for a `scatter()` plot, one could either plot several scatters, each with an individual label, or create proxy artists to show in the legend manually. Now, `PathCollection` provides a method `legend_elements()` to obtain the handles and labels for a scatter plot in an automated way. This makes creating a legend for a scatter plot as easy as

An example can be found in automatedlegendcreation.

Matplotlib no longer requires framework app build on MacOSX backend

Previous versions of matplotlib required a Framework build of python to work. The app type was updated to no longer require this, so the MacOSX backend should work with non-framework python.

This also adds support for the MacOSX backend for PyPy3.

8.15.2 Figure, FigureCanvas, and Backends

`Figure.frameon` is now a direct proxy for the `Figure` patch visibility state

Accessing `Figure.frameon` (including via `get_frameon` and `set_frameon` now directly forwards to the visibility of the underlying Rectangle artist (`Figure.patch.get_frameon`, `Figure.patch.set_frameon`).
Matplotlib uses Pillow to handle saving to the JPEG and TIFF formats. The `savefig()` function gained a `pil_kwargs` keyword argument, which can be used to forward arguments to Pillow’s `pillow.Image.save()`.

The `pil_kwargs` argument can also be used when saving to PNG. In that case, Matplotlib also uses Pillow’s `pillow.Image.save()` instead of going through its own builtin PNG support.

**Add `inaxes` method to `FigureCanvasBase`**

The `FigureCanvasBase` class has now an `inaxes` method to check whether a point is in an axes and returns the topmost axes, else None.

**cairo backend defaults to `pycairo` instead of `cairocffi`**

This leads to faster import/runtime performance in some cases. The backend will fall back to `cairocffi` in case `pycairo` isn’t available.

**8.15.3 Axes and Artists**
axes_grid1 and axisartist Axes no longer draw spines twice

Previously, spines of axes_grid1 and axisartist Axes would be drawn twice, leading to a "bold" appearance. This is no longer the case.

Return type of ArtistInspector.get_aliases changed

ArtistInspector.get_aliases previously returned the set of aliases as {fullname: {alias1: None, alias2: None, ...}}. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. {fullname: {alias1, alias2, ...}}. This value is also stored in ArtistInspector.aliasd, which has likewise changed.

ConnectionPatch accepts arbitrary transforms

Alternatively to strings like "data" or "axes fraction", ConnectionPatch now accepts any Transform as input for the coordsA and coordsB arguments. This allows to draw lines between points defined in different user defined coordinate systems. Also see the Connect Simple01 example.

mplot3d Line3D now allows {set.get}_data_3d

Lines created with the 3d projection in mplot3d can now access the data using get_data_3d() which returns a tuple of array_likes containing the (x, y, z) data. The equivalent set_data_3d can be used to modify the data of an existing Line3D.

Axes3D.voxels now shades the resulting voxels

The Axes3D.voxels method now takes a shade parameter that defaults to True. This shades faces based on their orientation, behaving just like the matching parameters to plot_trisurf() and bar3d(). The plot below shows how this affects the output.

8.15.4 Axis and Ticks

Added Axis.get_inverted and Axis.set_inverted

The Axis.get_inverted and Axis.set_inverted methods query and set whether the axis uses "inverted" orientation (i.e. increasing to the left for the x-axis and to the bottom for the y-axis).

They perform tasks similar to Axes.xaxis_inverted, Axes.yaxis_inverted, Axes.invert_xaxis, and Axes.invert_yaxis, with the specific difference that Axis.set_inverted makes it easier to set the inversion of an axis regardless of whether it had previously been inverted before.

Adjust default minor tick spacing

Default minor tick spacing was changed from 0.625 to 0.5 for major ticks spaced 2.5 units apart.
EngFormatter now accepts `usetex`, `useMathText` as keyword only arguments

A public API has been added to `EngFormatter` to control how the numbers in the ticklabels will be rendered. By default, `useMathText` evaluates to `rcParams["axes.formatter.use_mathtext"]` and `usetex` evaluates to `rcParams["text.usetex"]`.

If either is `True` then the numbers will be encapsulated by $\$ signs. When using TeX this implies that the numbers will be shown in TeX’s math font. When using mathtext, the $ signs around numbers will ensure Unicode rendering (as implied by mathtext). This will make sure that the minus signs in the ticks are rendered as the Unicode minus (U+2212) when using mathtext (without relying on the `fix_minus` method).

### 8.15.5 Animation and Interactivity

Support for forward/backward mouse buttons

Figure managers now support a `button_press` event for mouse buttons, similar to the `key_press` events. This allows binding actions to mouse buttons (see `MouseButton`). The first application of this mechanism is support of forward/backward mouse buttons in figures created with the Qt5 backend.

`progress_callback` argument to `save()`

The method `Animation.save` gained an optional `progress_callback` argument to notify the saving progress.

Add `cache_frame_data` keyword-only argument into `animation.FuncAnimation`

`matplotlib.animation.FuncAnimation` has been caching frame data by default; however, this caching is not ideal in certain cases e.g. When `FuncAnimation` needs to be only drawn(without
saved) interactively and memory required by frame data is quite large. By adding `cache_frame_data` keyword-only argument, users can now disable this caching; thereby, this new argument provides a fix for issue #8528.

**Endless Looping GIFs with PillowWriter**

We acknowledge that most people want to watch a GIF more than once. Saving an animation as a GIF with PillowWriter now produces an endless looping GIF.

**Adjusted `matplotlib.widgets.Slider` to have vertical orientation**

The `matplotlib.widgets.Slider` widget now takes an optional argument `orientation` which indicates the direction ('horizontal' or 'vertical') that the slider should take.

**Improved formatting of image values under cursor when a colorbar is present**

When a colorbar is present, its formatter is now used to format the image values under the mouse cursor in the status bar. For example, for an image displaying the values 10,000 and 10,001, the statusbar will now (using default settings) display the values as 10000 and 10001), whereas both values were previously displayed as 1e+04.

**MouseEvent button attribute is now an IntEnum**

The `button` attribute of `MouseEvent` instances can take the values None, 1 (left button), 2 (middle button), 3 (right button), "up" (scroll), and "down" (scroll). For better legibility, the 1, 2, and 3 values are now represented using the `enum.IntEnum` class `matplotlib.backend_bases.MouseButton`, with the values `MouseButton.LEFT` (== 1), `MouseButton.MIDDLE` (== 2), and `MouseButton.RIGHT` (== 3).

### 8.15.6 Configuration, Install, and Development

**The `MATPLOTLIBRC` environment variable can now point to any "file" path**

This includes device files; in particular, on Unix systems, one can set `MATPLOTLIBRC` to `/dev/null to ignore the user’s matplotlibrc file and fall back to Matplotlib’s defaults.

As a reminder, if `MATPLOTLIBRC` points to a directory, Matplotlib will try to load the matplotlibrc file from `$MATPLOTLIBRC/matplotlibrc`.

**Allow LaTeX code `pgf.preamble` and `text.latex.preamble` in `MATPLOTLIBRC` file**

Previously, the rc file keys `rcParams["pgf.preamble"]` (default: '') and `rcParams["text.latex.preamble"]` (default: '') were parsed using commas as separators. This would break valid LaTeX code, such as:

```
\usepackage[protrusion=true, expansion=false]{microtype}
```
The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to.

**New logging API**

`matplotlib.set_loglevel` / `pyplot.set_loglevel` can be called to display more (or less) detailed logging output.

### 8.16 What’s new in Matplotlib 3.2

For a list of all of the issues and pull requests since the last revision, see the [GitHub Stats](#).

**Table of Contents**

- **What’s new in Matplotlib 3.2**
  - Unit converters recognize subclasses
  - `imsave` accepts metadata and PIL options
  - `cbook.normalize_kwargs`
  - `FontProperties` accepts `os.PathLike`
  - Gouraud-shading alpha channel in PDF backend
  - Kerning adjustments now use correct values
  - `bar3d` lightsource shading
  - `Shifting errorbars`
  - Improvements in Logit scale ticker and formatter
  - `rcParams` for axes title location and color
  - 3-digit and 4-digit hex colors
  - Added support for RGBA images in pcolorfast

#### 8.16.1 Unit converters recognize subclasses

Unit converters now also handle instances of subclasses of the class they have been registered for.

#### 8.16.2 `imsave` accepts metadata and PIL options

`imsave` has gained support for the `metadata` and `pil_kwargs` parameters. These parameters behave similarly as for the `Figure.savefig()` method.
8.16.3 cbook.normalize_kwargs

cbook.normalize_kwargs now presents a convenient interface to normalize artist properties (e.g., from “lw” to “linewidth”):

```python
>>> cbook.normalize_kwargs({"lw": 1}, Line2D)
{"linewidth": 1}
```

The first argument is the mapping to be normalized, and the second argument can be an artist class or an artist instance (it can also be a mapping in a specific format; see the function’s docstring for details).

8.16.4 FontProperties accepts os.PathLike

The `fname` argument to `FontProperties` can now be an `os.PathLike`, e.g.

```python
>>> FontProperties(fname=pathlib.Path("/path/to/font.ttf"))
```

8.16.5 Gouraud-shading alpha channel in PDF backend

The pdf backend now supports an alpha channel in Gouraud-shaded triangle meshes.

8.16.6 Kerning adjustments now use correct values

Due to an error in how kerning adjustments were applied, previous versions of Matplotlib would under-correct kerning. This version will now correctly apply kerning (for fonts supported by FreeType). To restore the old behavior (e.g., for test images), you may set `rcParams["text.kerning_factor"]` (default: 0) to 6 (instead of 0). Other values have undefined behavior.

Note how the spacing between characters is uniform between their bounding boxes (above). With corrected kerning (below), slanted characters (e.g., AV or VA) will be spaced closer together, as well as various other character pairs, depending on font support (e.g., T and e, or the period after the W).

8.16.7 bar3d lightsource shading

`bar3d()` now supports lighting from different angles when the `shade` parameter is `True`, which can be configured using the `lightsource` parameter.

8.16.8 Shifting errorbars

Previously, `errorbar()` accepted a keyword argument `errorevery` such that the command `plt.errorbar(x, y, yerr, errorevery=6)` would add error bars to datapoints `x[:,6], y[:,6]`.

`errorbar()` now also accepts a tuple for `errorevery` such that `plt.errorbar(x, y, yerr, errorevery=(start, N))` adds error bars to points `x[start::N], y[start::N]`. 
8.16.9 Improvements in Logit scale ticker and formatter

Introduced in version 1.5, the logit scale didn’t have an appropriate ticker and formatter. Previously, the location of ticks was not zoom dependent, too many labels were displayed causing overlapping which broke readability, and label formatting did not adapt to precision.

Starting from this version, the logit locator has nearly the same behavior as the locator for the log scale or the linear scale, depending on used zoom. The number of ticks is controlled. Some minor labels are displayed adaptively as sublabels in log scale. Formatting is adapted for probabilities and the precision adapts to the scale.

8.16.10 rcParams for axes title location and color

Two new rcParams have been added: `rcParams["axes.titlelocation"]` (default: 'center') denotes the default axes title alignment, and `rcParams["axes.titlecolor"]` (default: 'auto') the default axes title color.

Valid values for `axes.titlelocation` are: left, center, and right. Valid values for `axes.titlecolor` are: auto or a color. Setting it to auto will fall back to previous behaviour, which is using the color in `text.color`. 
8.16.11 3-digit and 4-digit hex colors

Colors can now be specified using 3-digit or 4-digit hex colors, shorthand for the colors obtained by duplicating each character, e.g. #123 is equivalent to #112233 and #123a is equivalent to #112233aa.

8.16.12 Added support for RGB(A) images in `pcolorfast`

`Axes.pcolorfast` now accepts 3D images (RGB or RGBA) arrays.

8.17 What’s new in Matplotlib 3.3.0

For a list of all of the issues and pull requests since the last revision, see the `GitHub Stats`.

Table of Contents

- What’s new in Matplotlib 3.3.0
  - Figure and Axes creation / management
    * Provisional API for composing semantic axes layouts from text or nested lists
* `GridSpec.subplots()`
* New `Axes.sharex`, `Axes.sharey` methods
* `tight_layout` now supports `suptitle`
* Setting `axes.box_aspect`

- Colors and colormaps
  * Turbo colormap
  * `colors.BoundaryNorm` supports `extend` keyword argument
  * Text color for legend labels
  * `Pcolor` and `Pcolormesh` now accept `shading='nearest'` and `'auto'`

- Titles, ticks, and labels
  * Align labels to `Axes edges`
  * Allow tick formatters to be set with `str` or `function inputs`
  * `Axes.set_title` gains a `y` keyword argument to control auto positioning
  * Offset text is now set to the top when using `axis.tick_top()`
  * Set `zorder` of contour labels

- Other changes
  * New `Axes.axline` method
  * `imshow` now coerces 3D arrays with depth 1 to 2D
  * Better control of `Axes.pie` normalization
  * Dates use a modern epoch
  * Lines now accept `MarkerStyle` instances as input

- Fonts
  * Simple syntax to select fonts by absolute path
  * Improved font weight detection

- rcParams improvements
  * `matplotlib.rc_context` can be used as a decorator
  * `rcParams` for controlling default “raise window” behavior
  * Add generalized `mathtext.fallback` to `rcParams`
  * Add `contour.linewidth` to `rcParams`

- 3D Axes improvements
  * `Axes3D` no longer distorts the 3D plot to match the 2D aspect ratio
  * 3D axes now support minor ticks
  * Home/Forward/Backward buttons now work with 3D axes

- Interactive tool improvements
  * More consistent toolbar behavior across backends
8.17. What’s new in Matplotlib 3.3.0

8.17.1 Figure and Axes creation / management

Provisional API for composing semantic axes layouts from text or nested lists

The `Figure` class has a provisional method to generate complex grids of named axes based on nested list input or ASCII art:

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic(
    [['.', 'histx'],
     ['histy', 'scat']]
)
for k, ax in axd.items():
    ax.text(0.5, 0.5, k,
            ha='center', va='center', fontsize=36,
            color='darkgrey')
```

or as a string (with single-character Axes labels):

```python
axd = plt.figure(constrained_layout=True).subplot_mosaic("TTE
L.E
")
for k, ax in axd.items():
    ax.text(0.5, 0.5, k,
            ha='center', va='center', fontsize=36,
            color='darkgrey')
```

See Complex and semantic figure composition for more details and examples.
GridSpec.subplots()

The GridSpec class gained a subplots method, so that one can write

```python
fig.add_gridspec(2, 2, height_ratios=[3, 1]).subplots()
```

as an alternative to

```python
fig.subplots(2, 2, gridspec_kw={"height_ratios": [3, 1]})
```

New Axes.sharex, Axes.sharey methods

These new methods allow sharing axes *immediately* after creating them. Note that behavior is indeterminate if axes are not shared immediately after creation.

For example, they can be used to selectively link some axes created all together using subplot_mosaic:

```python
fig = plt.figure(constrained_layout=True)
axd = fig.subplot_mosaic([[':', 'histx'], ['histy', 'scat']],
                         gridspec_kw={'width_ratios': [1, 7],
                                      'height_ratios': [2, 7]})

axd['histx'].sharex(axd['scat'])
axd['histy'].sharey(axd['scat'])
```
**tight_layout now supports suptitle**

Previous versions did not consider `Figure.suptitle`, so it may overlap with other artists after calling `tight_layout`:

From now on, the `suptitle` will be considered:

**Setting axes box aspect**

It is now possible to set the aspect of an axes box directly via `set_box_aspect`. The box aspect is the ratio between axes height and axes width in physical units, independent of the data limits. This is useful to, e.g., produce a square plot, independent of the data it contains, or to have a non-image plot with the same axes dimensions next to an image plot with fixed (data-)aspect.

For use cases check out the Axes box aspect example.

**8.17.2 Colors and colormaps**

**Turbo colormap**

Turbo is an improved rainbow colormap for visualization, created by the Google AI team for computer visualization and machine learning. Its purpose is to display depth and disparity data. Please see the *Google AI Blog* for further details.
colors.BoundaryNorm supports extend keyword argument

BoundaryNorm now has an extend keyword argument, analogous to extend in contourf. When set to ‘both’, ‘min’, or ‘max’, it maps the corresponding out-of-range values to Colormap lookup-table indices near the appropriate ends of their range so that the colors for out-of-range values are adjacent to, but distinct from, their in-range neighbors. The colorbar inherits the extend argument from the norm, so with extend=’both’, for example, the colorbar will have triangular extensions for out-of-range values with colors that differ from adjacent in-range colors.

Text color for legend labels

The text color of legend labels can now be set by passing a parameter labelcolor to legend. The labelcolor keyword can be:

- A single color (either a string or RGBA tuple), which adjusts the text color of all the labels.
- A list or tuple, allowing the text color of each label to be set individually.
- linecolor, which sets the text color of each label to match the corresponding line color.
- markerfacecolor, which sets the text color of each label to match the corresponding marker face color.
* markeredgecolor, which sets the text color of each label to match the corresponding marker edge color.

**Pcolor and Pcolormesh now accept shading='nearest' and 'auto'**

Previously `axes.Axes.pcolor` and `axes.Axes.pcolormesh` handled the situation where `x` and `y` have the same (respective) size as `C` by dropping the last row and column of `C`, and `x` and `y` are regarded as the edges of the remaining rows and columns in `C`. However, many users want `x` and `y` centered on the rows and columns of `C`.

To accommodate this, `shading='nearest'` and `shading='auto'` are new allowed strings for the `shading` keyword argument. `shading='nearest'` will center the color on `x` and `y` if `x` and `y` have the same dimensions as `C` (otherwise an error will be thrown). `shading='auto'` will choose 'flat' or 'nearest' based on the size of `X`, `Y`, `C`.

If `shading='flat'` then `X` and `Y` should have dimensions one larger than `C`. If `X` and `Y` have the same dimensions as `C`, then the previous behavior is used and the last row and column of `C` are dropped, and a DeprecationWarning is emitted.

Users can also specify this by the new `rcParams['pcolor.shading']` (default: 'flat') in their `.matplotlibrc` or via `rcParams`.

See `pcolormesh` for examples.
8.17.3 Titles, ticks, and labels

Align labels to Axes edges

`set_xlabel`, `set_ylabel` and `ColorbarBase.set_label` support a parameter `loc` for simplified positioning. For the xlabel, the supported values are ‘left’, ‘center’, or ‘right’. For the ylabel, the supported values are ‘bottom’, ‘center’, or ‘top’.

The default is controlled via `rcParams["xaxis.labelposition"]` and `rcParams["yaxis.labelposition"]`; the Colorbar label takes the rcParam based on its orientation.

Allow tick formatters to be set with str or function inputs

`set_major_formatter` and `set_minor_formatter` now accept `str` or function inputs in addition to `Formatter` instances. For a `str` a `StrMethodFormatter` is automatically generated and used. For a function a `FuncFormatter` is automatically generated and used. In other words,

```python
ax.xaxis.set_major_formatter('{x} km')
ax.xaxis.set_minor_formatter(lambda x, pos: str(x-5))
```

are shortcuts for:

```python
import matplotlib.ticker as mticker
```
Axes.set_title gains a y keyword argument to control auto positioning

set_title tries to auto-position the title to avoid any decorators on the top x-axis. This is not always desirable so now y is an explicit keyword argument of set_title. It defaults to None which means to use auto-positioning. If a value is supplied (i.e. the pre-3.0 default was y=1.0) then auto-positioning is turned off. This can also be set with the new rcParameter rcParams["axes.titley"] (default: None).

Offset text is now set to the top when using axis.tick_top()

Solves the issue that the power indicator (e.g., 1e4) stayed on the bottom, even if the ticks were on the top.

Set zorder of contour labels

clabel now accepts a zorder keyword argument making it easier to set the zorder of contour labels. If not specified, the default zorder of clabels used to always be 3 (i.e. the default
Colorbar with extend='both'

BoundaryNorm with extend='both'

The new default \textit{zorder} for clabels has been changed to \((2 + \text{zorder passed to contour/contourf})\).

\subsection*{8.17.4 Other changes}

\textbf{New \texttt{Axes.axline} method}

A new \texttt{axline} method has been added to draw infinitely long lines that pass through two points.

```python
fig, ax = plt.subplots()

ax.axline((.1, .1), slope=5, color='C0', label='by slope')
ax.axline((.1, .2), (.8, .7), color='C3', label='by points')

ax.legend()
```

\textit{imshow} now coerces 3D arrays with depth 1 to 2D

Starting from this version arrays of size \(M \times N \times 1\) will be coerced into \(M \times N\) for displaying. This means commands like \texttt{plt.imshow(np.random.rand(3, 3, 1))} will no longer return an error message that the image shape is invalid.
Better control of `Axes.pie` normalization

Previously, `Axes.pie` would normalize its input x if \( \text{sum}(x) > 1 \), but would do nothing if the sum were less than 1. This can be confusing, so an explicit keyword argument `normalize` has been added. By default, the old behavior is preserved.

By passing `normalize`, one can explicitly control whether any rescaling takes place or whether partial pies should be created. If normalization is disabled, and \( \text{sum}(x) > 1 \), then an error is raised.

Dates use a modern epoch

Matplotlib converts dates to days since an epoch using `dates.date2num` (via `matplotlib.units`). Previously, an epoch of 0000-12-31T00:00:00 was used so that 0001-01-01 was converted to 1.0. An epoch so distant in the past meant that a modern date was not able to preserve microseconds because 2000 years times the \( 2^{-52} \) resolution of a 64-bit float gives 14 microseconds.

Here we change the default epoch to the more reasonable UNIX default of 1970-01-01T00:00:00 which for a modern date has 0.35 microsecond resolution. (Finer resolution is not possible because we rely on `datetime.datetime` for the date locators). Access to the epoch is provided by `get_epoch`, and there is a new `rcParams["date.epoch"]` (default: '1970-01-01T00:00:00') `rcParam`. The user may also call `set_epoch`, but it must be set before any date conversion or plotting is used.

If you have data stored as ordinal floats in the old epoch, you can convert them to the new...
ordinal using the following formula:

```python
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31'))
```

**Lines now accept MarkerStyle instances as input**

Similar to `scatter`, `plot` and `Line2D` now accept `MarkerStyle` instances as input for the `marker` parameter:

```python
plt.plot(..., marker=matplotlib.markers.MarkerStyle("D"))
```

# 8.17.5 Fonts

**Simple syntax to select fonts by absolute path**

Fonts can now be selected by passing an absolute `pathlib.Path` to the `font` keyword argument of `Text`. 
ax.xaxis.set_major_formatter('{{x} km}')

ax.xaxis.set_major_formatter(lambda x, pos: str(x-5))
Improved font weight detection

Matplotlib is now better able to determine the weight of fonts from their metadata, allowing to differentiate between fonts within the same family more accurately.

8.17.6 rcParams improvements

**matplotlib.rc_context** can be used as a decorator

*matplotlib.rc_context* can now be used as a decorator (technically, it is now implemented as a *contextlib.contextmanager*), e.g.,

```python
@rc_context({'lines.linewidth': 2})
def some_function(...):
    ...
```

rcParams for controlling default "raise window" behavior

The new config option rcParams["figure.raise_window"] (default: True) allows disabling of the raising of the plot window when calling *show* or *pause*. The MacOSX backend is currently not supported.
Add generalized `mathtext.fallback` to `rcParams`

New `rcParams["mathtext.fallback"]` (default: `'cm'`) `rcParam`. Takes "cm", "stix", "stixsans" or "none" to turn fallback off. The `rcParam` `mathtext.fallback_to_cm` is deprecated, but if used, will override new fallback.

Add `contour.linewidth` to `rcParams`

The new config option `rcParams["contour.linewidth"]` (default: `None`) allows to control the default line width of contours as a float. When set to `None`, the line widths fall back to `rcParams["lines.linewidth"]` (default: `1.5`). The config value is overridden as usual by the `linewidths` argument passed to `contour` when it is not set to `None`.

8.17.7 3D Axes improvements

`Axes3D` no longer distorts the 3D plot to match the 2D aspect ratio

Plots made with `Axes3D` were previously stretched to fit a square bounding box. As this stretching was done after the projection from 3D to 2D, it resulted in distorted images if non-square bounding boxes were used. As of 3.3, this no longer occurs.

Currently, modes of setting the aspect (via `set_aspect`) in data space are not supported for `Axes3D` but may be in the future. If you want to simulate having equal aspect in data space,
set the ratio of your data limits to match the value of `get_box_aspect`. To control these ratios use the `set_box_aspect` method which accepts the ratios as a 3-tuple of X:Y:Z. The default aspect ratio is 4:4:3.

3D axes now support minor ticks

```python
ax = plt.figure().add_subplot(projection='3d')
ax.scatter([0, 1, 2], [1, 3, 5], [30, 50, 70])
ax.set_xticks([0.25, 0.75, 1.25, 1.75], minor=True)
ax.set_xticklabels(['a', 'b', 'c', 'd'], minor=True)
ax.set_yticks([1.5, 2.5, 3.5, 4.5], minor=True)
ax.set_yticklabels(['A', 'B', 'C', 'D'], minor=True)
ax.set_zticks([35, 45, 55, 65], minor=True)
ax.set_zticklabels(['$\alpha$', '$\beta$', '$\delta$', '$\gamma$'], minor=True)
ax.tick_params(which='major', color='C0', labelcolor='C0', width=5)
ax.tick_params(which='minor', color='C1', labelcolor='C1', width=3)
```
Home/Forward/Backward buttons now work with 3D axes

8.17.8 Interactive tool improvements

More consistent toolbar behavior across backends

Toolbar features are now more consistent across backends. The history buttons will auto-disable when there is no further action in a direction. The pan and zoom buttons will be marked active when they are in use.

In NbAgg and WebAgg, the toolbar buttons are now grouped similarly to other backends. The WebAgg toolbar now uses the same icons as other backends.

Toolbar icons are now styled for dark themes

On dark themes, toolbar icons will now be inverted. When using the GTK3Agg backend, toolbar icons are now symbolic, and both foreground and background colors will follow the theme. Tooltips should also behave correctly.

Cursor text now uses a number of significant digits matching pointing precision

Previously, the x/y position displayed by the cursor text would usually include far more significant digits than the mouse pointing precision (typically one pixel). This is now fixed for linear scales.

GTK / Qt zoom rectangle now black and white

This makes it visible even over a dark background.

Event handler simplifications

The backend_bases.key_press_handler and backend_bases.button_press_handler event handlers can now be directly connected to a canvas with canvas.mpl_connect("key_press_event", key_press_handler) and canvas.mpl_connect("button_press_event", button_press_handler), rather than having to write wrapper functions that fill in the (now optional) canvas and toolbar parameters.

8.17.9 Functions to compute a Path’s size

Various functions were added to BezierSegment and Path to allow computation of the shape/size of a Path and its composite Bezier curves.

In addition to the fixes below, BezierSegment has gained more documentation and usability improvements, including properties that contain its dimension, degree, control_points, and more.
**Better interface for Path segment iteration**

`iter_bezier` iterates through the `BezierSegment`’s that make up the Path. This is much more useful typically than the existing `iter_segments` function, which returns the absolute minimum amount of information possible to reconstruct the Path.

**Fixed bug that computed a Path's Bbox incorrectly**

Historically, `get_extents` has always simply returned the Bbox of a curve’s control points, instead of the Bbox of the curve itself. While this is a correct upper bound for the path’s extents, it can differ dramatically from the Path’s actual extents for non-linear Bezier curves.

**8.17.10 Backend-specific improvements**

**savefig() gained a backend keyword argument**

The `backend` keyword argument to `savefig` can now be used to pick the rendering backend without having to globally set the backend; e.g., one can save PDFs using the pgf backend with `savefig("file.pdf", backend="pgf").`

**The SVG backend can now render hatches with transparency**

The SVG backend now respects the hatch stroke alpha. Useful applications are, among others, semi-transparent hatches as a subtle way to differentiate columns in bar plots.

**SVG supports URLs on more artists**

URLs on more artists (i.e., from `Artist.set_url`) will now be saved in SVG files, namely, Ticks and Line2Ds are now supported.

**Images in SVG will no longer be blurred in some viewers**

A style is now supplied to images without interpolation (`imshow(..., interpolation='none')`) so that SVG image viewers will no longer perform interpolation when rendering themselves.

**Saving SVG now supports adding metadata**

When saving SVG files, metadata can now be passed which will be saved in the file using Dublin Core and RDF. A list of valid metadata can be found in the documentation for `FigureCanvasSVG.print_svg`.
Saving PDF metadata via PGF now consistent with PDF backend

When saving PDF files using the PGF backend, passed metadata will be interpreted in the same way as with the PDF backend. Previously, this metadata was only accepted by the PGF backend when saving a multi-page PDF with `backend_pdf.PdfPages`, but is now allowed when saving a single figure, as well.

NbAgg and WebAgg no longer use jQuery & jQuery UI

Instead, they are implemented using vanilla JavaScript. Please report any issues with browsers.
Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (e.g., LGPL) are acceptable in matplotlib toolkits. For a discussion of the motivations behind the licencing choice, see Licenses.

9.1 Copyright Policy

John Hunter began matplotlib around 2003. Since shortly before his passing in 2012, Michael Droettboom has been the lead maintainer of matplotlib, but, as has always been the case, matplotlib is the work of many.

Prior to July of 2013, and the 1.3.0 release, the copyright of the source code was held by John Hunter. As of July 2013, and the 1.3.0 release, matplotlib has moved to a shared copyright model.

matplotlib uses a shared copyright model. Each contributor maintains copyright over their contributions to matplotlib. But, it is important to note that these contributions are typically only changes to the repositories. Thus, the matplotlib source code, in its entirety, is not the copyright of any single person or institution. Instead, it is the collective copyright of the entire matplotlib Development Team. If individual contributors want to maintain a record of what changes/contributions they have specific copyright on, they should indicate their copyright in the commit message of the change, when they commit the change to one of the matplotlib repositories.

The Matplotlib Development Team is the set of all contributors to the matplotlib project. A full list can be obtained from the git version control logs.

9.2 License agreement for matplotlib 3.3.0

1. This LICENSE AGREEMENT is between the Matplotlib Development Team (“MDT”), and the Individual or Organization (“Licensee”) accessing and otherwise using matplotlib software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, MDT hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use matplotlib 3.3.0 alone or in any derivative version, provided, however, that MDT’s License Agreement and MDT’s notice of copyright, i.e., “Copyright (c) 2012-2013 Matplotlib Development Team;
All Rights Reserved“ are retained in matplotlib 3.3.0 alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates matplotlib 3.3.0 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to matplotlib 3.3.0.

4. MDT is making matplotlib 3.3.0 available to Licensee on an “AS IS” basis. MDT MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, MDT MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB 3.3.0 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. MDT SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB 3.3.0 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING MATPLOTLIB 3.3.0, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between MDT and Licensee. This License Agreement does not grant permission to use MDT trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib 3.3.0, Licensee agrees to be bound by the terms and conditions of this License Agreement.

### 9.3 License agreement for matplotlib versions prior to 1.3.0

1. This LICENSE AGREEMENT is between John D. Hunter (“JDH”), and the Individual or Organization (“Licensee”) accessing and otherwise using matplotlib software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, JDH hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use matplotlib 3.3.0 alone or in any derivative version, provided, however, that JDH’s License Agreement and JDH’s notice of copyright, i.e., “Copyright (c) 2002-2009 John D. Hunter; All Rights Reserved” are retained in matplotlib 3.3.0 alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates matplotlib 3.3.0 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to matplotlib 3.3.0.

4. JDH is making matplotlib 3.3.0 available to Licensee on an “AS IS” basis. JDH MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, JDH MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB 3.3.0 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. JDH SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB 3.3.0 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A
RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING MATPLOTLIB 3.3.0, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between JDH and Licensee. This License Agreement does not grant permission to use JDH trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib 3.3.0, Licensee agrees to be bound by the terms and conditions of this License Agreement.
CITING MATPLOTLIB

If Matplotlib contributes to a project that leads to a scientific publication, please acknowledge this fact by citing J. D. Hunter, "Matplotlib: A 2D Graphics Environment", Computing in Science & Engineering, vol. 9, no. 3, pp. 90-95, 2007.

```plaintext
@Article{Hunter:2007,
    Author = {Hunter, J. D.},
    Title = {Matplotlib: A 2D graphics environment},
    Journal = {Computing in Science \& Engineering},
    Volume = {9},
    Number = {3},
    Pages = {90--95},
    abstract = {Matplotlib is a 2D graphics package used for Python for application development, interactive scripting, and publication-quality image generation across user interfaces and operating systems.},
    publisher = {IEEE COMPUTER SOC},

Thanks to Tony Yu for the original logo design.

We also thank all who have reported bugs, commented on proposed changes, or otherwise contributed to Matplotlib’s development and usefulness.
Part II

The Matplotlib FAQ
12.1 Report a compilation problem

See *Getting help*.

12.2 Matplotlib compiled fine, but nothing shows up when I use it

The first thing to try is a *clean install* and see if that helps. If not, the best way to test your install is by running a script, rather than working interactively from a python shell or an integrated development environment such as *IDLE* which add additional complexities. Open up a UNIX shell or a DOS command prompt and run, for example:

```python
python -c "from pylab import *; set_loglevel('debug'); plot(); show()"
```

This will give you additional information about which backends Matplotlib is loading, version information, and more. At this point you might want to make sure you understand Matplotlib’s *configuration* process, governed by the *matplotlibrc* configuration file which contains instructions within and the concept of the Matplotlib backend.
If you are still having trouble, see *Getting help.*

### 12.3 How to completely remove Matplotlib

Occasionally, problems with Matplotlib can be solved with a clean installation of the package. In order to fully remove an installed Matplotlib:

1. Delete the caches from your *Matplotlib configuration directory*.
2. Delete any Matplotlib directories or eggs from your *installation directory*.

### 12.4 Linux Notes

To install Matplotlib at the system-level, we recommend that you use your distribution’s package manager. This will guarantee that Matplotlib’s dependencies will be installed as well.

If, for some reason, you cannot use the package manager, you may use the wheels available on PyPI:

```
python -mpip install matplotlib
```

or build Matplotlib from source.

### 12.5 OSX Notes

#### 12.5.1 Which python for OSX?

Apple ships OSX with its own Python, in `/usr/bin/python`, and its own copy of Matplotlib. Unfortunately, the way Apple currently installs its own copies of NumPy, Scipy and Matplotlib means that these packages are difficult to upgrade (see system python packages). For that reason we strongly suggest that you install a fresh version of Python and use that as the basis for installing libraries such as NumPy and Matplotlib. One convenient way to install Matplotlib with other useful Python software is to use the Anaconda Python scientific software collection, which includes Python itself and a wide range of libraries; if you need a library that is not available from the collection, you can install it yourself using standard methods such as *pip*. See the Anaconda web page for installation support.

Other options for a fresh Python install are the standard installer from python.org, or installing Python using a general OSX package management system such as homebrew or macports. Power users on OSX will likely want one of homebrew or macports on their system to install open source software packages, but it is perfectly possible to use these systems with another source for your Python binary, such as Anaconda or Python.org Python.

#### 12.5.2 Installing OSX binary wheels

If you are using Python from https://www.python.org, Homebrew, or Macports, then you can use the standard pip installer to install Matplotlib binaries in the form of wheels.
pip is installed by default with python.org and Homebrew Python, but needs to be manually installed on Macports with

```
sudo port install py36-pip
```

Once pip is installed, you can install Matplotlib and all its dependencies with from the Terminal.app command line:

```
python3 -mpip install matplotlib
```

(sudo python3.6 ... on Macports).

You might also want to install IPython or the Jupyter notebook (python3 -mpip install ipython notebook).

### 12.5.3 Checking your installation

The new version of Matplotlib should now be on your Python “path”. Check this at the Terminal.app command line:

```
python3 -c 'import matplotlib; print(matplotlib.__version__, matplotlib.__file__)
```

You should see something like

```
3.0.0 /Library/Frameworks/Python.framework/Versions/3.6/lib/python3.6/site-packages/matplotlib/__init__.py
```

where 3.0.0 is the Matplotlib version you just installed, and the path following depends on whether you are using Python.org Python, Homebrew or Macports. If you see another version, or you get an error like

```
Traceback (most recent call last):
  File "<string>", line 1, in <module>
ImportError: No module named matplotlib
```

then check that the Python binary is the one you expected by running

```
which python3
```

If you get a result like `/usr/bin/python...`, then you are getting the Python installed with OSX, which is probably not what you want. Try closing and restarting Terminal.app before running the check again. If that doesn’t fix the problem, depending on which Python you wanted to use, consider reinstalling Python.org Python, or check your homebrew or macports setup. Remember that the disk image installer only works for Python.org Python, and will not get picked up by other Pythons. If all these fail, please let us know.

### 12.6 Install from source

A C compiler is required. Typically, on Linux, you will need gcc, which should be installed using your distribution’s package manager; on macOS, you will need xcode; on Windows, you will need Visual Studio 2015 or later.

Clone the main source using one of:
git clone git@github.com:matplotlib/matplotlib.git

or:

git clone git://github.com/matplotlib/matplotlib.git

and build and install with:

cd matplotlib
python -mpip install .

If you want to be able to follow the development branch as it changes just replace the last step with:

python -mpip install -e .

This creates links and installs the command line script in the appropriate places. Then, if you want to update your Matplotlib at any time, just do:

git pull

When you run git pull, if the output shows that only Python files have been updated, you are all set. If C files have changed, you need to run pip install -e . again to compile them. There is more information on using git in the developer docs.

    * Make the aspect ratio for plots equal
    * Multiple y-axis scales
    * Generate images without having a window appear
    * Use `show()`
    * Interpreting box plots and violin plots
    * Working with threads
  - How-to: Contributing
    * Request a new feature
    * Reporting a bug or submitting a patch
    * Contribute to Matplotlib documentation
  - How to use Matplotlib in a web application server
13.1 How-to: Plotting

13.1.1 Plot numpy.datetime64 values

As of Matplotlib 2.2, numpy.datetime64 objects are handled the same way as datetime.datetime objects.

If you prefer the pandas converters and locators, you can register them. This is done automatically when calling a pandas plot function and may be unnecessary when using pandas instead of Matplotlib directly.

```python
from pandas.plotting import register_matplotlib_converters
register_matplotlib_converters()
```

13.1.2 Check whether a figure is empty

Empty can actually mean different things. Does the figure contain any artists? Does a figure with an empty Axes still count as empty? Is the figure empty if it was rendered pure white (there may be artists present, but they could be outside the drawing area or transparent)?

For the purpose here, we define empty as: “The figure does not contain any artists except it’s background patch.” The exception for the background is necessary, because by default every figure contains a Rectangle as it’s background patch. This definition could be checked via:

```python
def is_empty(figure):
    """
    Return whether the figure contains no Artists (other than the default background patch).
    """
    contained_artists = figure.get_children()
    return len(contained_artists) <= 1
```

We’ve decided not to include this as a figure method because this is only one way of defining empty, and checking the above is only rarely necessary. Usually the user or program handling the figure know if they have added something to the figure.

Checking whether a figure would render empty cannot be reliably checked except by actually rendering the figure and investigating the rendered result.

13.1.3 Find all objects in a figure of a certain type

Every Matplotlib artist (see Artist tutorial) has a method called findobj() that can be used to recursively search the artist for any artists it may contain that meet some criteria (e.g., match all Line2D instances or match some arbitrary filter function). For example, the following snippet finds every object in the figure which has a set_color property and makes the object blue:
def myfunc(x):
    return hasattr(x, 'set_color')
for o in fig.findobj(myfunc):
    o.set_color('blue')

You can also filter on class instances:

import matplotlib.text as text
for o in fig.findobj(text.Text):
    o.set_fontstyle('italic')

### 13.1.4 How to prevent ticklabels from having an offset

The default formatter will use an offset to reduce the length of the ticklabels. To turn this feature off on a per-axis basis:

```python
ax.get_xaxis().get_major_formatter().set_useOffset(False)
```

Set `rcParams["axes.formatter.useoffset"]` (default: `True`), or use a different formatter. See `ticker` for details.

### 13.1.5 Save transparent figures

The `savefig()` command has a keyword argument `transparent` which, if `True`, will make the figure and axes backgrounds transparent when saving, but will not affect the displayed image on the screen.

If you need finer grained control, e.g., you do not want full transparency or you want to affect the screen displayed version as well, you can set the alpha properties directly. The figure has a `Rectangle` instance called `patch` and the axes has a `Rectangle` instance called `patch`. You can set any property on them directly (`facecolor`, `edgecolor`, `linewidth`, `linestyle`, `alpha`). e.g.:

```python
fig = plt.figure()
fig.patch.set_alpha(0.5)
ax = fig.add_subplot(111)
ax.patch.set_alpha(0.5)
```

If you need all the figure elements to be transparent, there is currently no global alpha setting, but you can set the alpha channel on individual elements, e.g.:

```python
ax.plot(x, y, alpha=0.5)
ax.set_xlabel('volts', alpha=0.5)
```

### 13.1.6 Save multiple plots to one pdf file

Many image file formats can only have one image per file, but some formats support multi-page files. Currently only the pdf backend has support for this. To make a multi-page pdf file, first initialize the file:
from matplotlib.backends.backend_pdf import PdfPages
pp = PdfPages('multipage.pdf')

You can give the PdfPages object to savefig(), but you have to specify the format:

plt.savefig(pp, format='pdf')

An easier way is to call PdfPages.savefig:

pp.savefig()

Finally, the multipage pdf object has to be closed:

pp.close()

The same can be done using the pgf backend:

from matplotlib.backends.backend_pgf import PdfPages

13.1.7 Move the edge of an axes to make room for tick labels

For subplots, you can control the default spacing on the left, right, bottom, and top as well as
the horizontal and vertical spacing between multiple rows and columns using the matplotlib.figure.Figure.subplots_adjust() method (in pyplot it is subplots_adjust()). For example, to
move the bottom of the subplots up to make room for some rotated x tick labels:

fig = plt.figure()
fig.subplots_adjust(bottom=0.2)
ax = fig.add_subplot(111)

You can control the defaults for these parameters in your matplotlibrc file; see Customizing
Matplotlib with style sheets and rcParams. For example, to make the above setting permanent,
you would set:

figure.subplot.bottom : 0.2 # the bottom of the subplots of the figure

The other parameters you can configure are, with their defaults

left = 0.125 the left side of the subplots of the figure
right = 0.9 the right side of the subplots of the figure
bottom = 0.1 the bottom of the subplots of the figure
top = 0.9 the top of the subplots of the figure
wspace = 0.2 the amount of width reserved for space between subplots, expressed as a frac-
tion of the average axis width
hspace = 0.2 the amount of height reserved for space between subplots, expressed as a
fraction of the average axis height

If you want additional control, you can create an Axes using the axex() command (or equiva-
lently the figure add_axes() method), which allows you to specify the location explicitly:

ax = fig.add_axes([left, bottom, width, height])
where all values are in fractional (0 to 1) coordinates. See /gallery/subplots_axes_and_figures/axes_demo for an example of placing axes manually.

13.1.8 Automatically make room for tick labels

**Note:** This is now easier to handle than ever before. Calling `tight_layout()` or alternatively using `constrained_layout=True` argument in `subplots()` can fix many common layout issues. See the [Tight Layout guide](https://matplotlib.org/stable/tutorials/user_guide/tight_layout_guide.html) and [Constrained Layout Guide](https://matplotlib.org/stable/tutorials/user_guide/constrained_layout_guide.html) for more details.

The information below is kept here in case it is useful for other purposes.

In most use cases, it is enough to simply change the subplots adjust parameters as described in *Move the edge of an axes to make room for tick labels*. But in some cases, you don’t know ahead of time what your tick labels will be, or how large they will be (data and labels outside your control may be being fed into your graphing application), and you may need to automatically adjust your subplot parameters based on the size of the tick labels. Any `Text` instance can report its extent in window coordinates (a negative x coordinate is outside the window), but there is a rub.

The `RendererBase` instance, which is used to calculate the text size, is not known until the figure is drawn (`draw()`). After the window is drawn and the text instance knows its renderer, you can call `get_window_extent()`. One way to solve this chicken and egg problem is to wait until the figure is drawn by connecting (`mpl_connect()`) to the “on_draw” signal (`DrawEvent`) and get the window extent there, and then do something with it, e.g., move the left of the canvas over; see [Event handling and picking](https://matplotlib.org/stable/tutorials/user_guide/event_handling.html).

Here is an example that gets a bounding box in relative figure coordinates (0..1) of each of the labels and uses it to move the left of the subplots over so that the tick labels fit in the figure:

![Fig. 1: Auto Subplots Adjust](image)

13.1.9 Configure the tick widths

Wherever possible, it is recommended to use the `tick_params()` or `set_tick_params()` methods to modify tick properties:
For more control of tick properties that are not provided by the above methods, it is important to know that in Matplotlib, the ticks are *markers*. All *Line2D* objects support a line (solid, dashed, etc) and a marker (circle, square, tick). The tick width is controlled by the "markeredgewidth" property, so the above effect can also be achieved by:

```python
import matplotlib.pyplot as plt
fig, ax = plt.subplots()
ax.plot(range(10))
ax.tick_params(width=10)
plt.show()
```

The other properties that control the tick marker, and all markers, are `markerfacecolor`, `markeredgecolor`, `markeredgewidth`, `markersize`. For more information on configuring ticks, see *Axis containers* and *Tick containers*.

### 13.1.10 Align my ylabels across multiple subplots

If you have multiple subplots over one another, and the y data have different scales, you can often get ylabels that do not align vertically across the multiple subplots, which can be unattractive. By default, Matplotlib positions the x location of the ylabel so that it does not overlap any of the y ticks. You can override this default behavior by specifying the coordinates of the label. The example below shows the default behavior in the left subplots, and the manual setting in the right subplots.

```python
import matplotlib.pyplot as plt
fig, ax = plt.subplots()
ax.plot(range(10))
for line in ax.get_xticklines() + ax.get_yticklines():
    line.set_markeredgewidth(10)
plt.show()
```

![Fig. 2: Align Ylabels](image)

Fig. 2: Align Ylabels
13.1.11 Skip dates where there is no data

When plotting time series, e.g., financial time series, one often wants to leave out days on which there is no data, e.g., weekends. By passing in dates on the x-axis, you get large horizontal gaps on periods when there is not data. The solution is to pass in some proxy x-data, e.g., evenly sampled indices, and then use a custom formatter to format these as dates. /gallery/text_labels_and_annotations/date_index_formatter demonstrates how to use an ‘index formatter’ to achieve the desired plot.

13.1.12 Control the depth of plot elements

Within an axes, the order that the various lines, markers, text, collections, etc appear is determined by the `set_zorder()` property. The default order is patches, lines, text, with collections of lines and collections of patches appearing at the same level as regular lines and patches, respectively:

```python
line, = ax.plot(x, y, zorder=10)
```

You can also use the Axes property `set_axisbelow()` to control whether the grid lines are placed above or below your other plot elements.

13.1.13 Make the aspect ratio for plots equal

The Axes property `set_aspect()` controls the aspect ratio of the axes. You can set it to be ‘auto’, ‘equal’, or some ratio which controls the ratio:

```python
ax = fig.add_subplot(111, aspect='equal')
```

13.1.14 Multiple y-axis scales

A frequent request is to have two scales for the left and right y-axis, which is possible using `twinx()` (more than two scales are not currently supported, though it is on the wish list). This works pretty well, though there are some quirks when you are trying to interactively pan and zoom, because both scales do not get the signals.

The approach uses `twinx()` (and its sister `twiny()`) to use 2 different axes, turning the axes rectangular frame off on the 2nd axes to keep it from obscuring the first, and manually setting the tick locs and labels as desired. You can use separate `matplotlib.ticker` formatters and locators as desired because the two axes are independent.

13.1.15 Generate images without having a window appear

Simply do not call `show`, and directly save the figure to the desired format:

```python
import matplotlib.pyplot as plt
plt.plot([1, 2, 3])
plt.savefig('myfig.png')
```
See also:

How to use Matplotlib in a web application server for information about running matplotlib inside of a web application.

13.1.16 Use show()

When you want to view your plots on your display, the user interface backend will need to start the GUI mainloop. This is what show() does. It tells Matplotlib to raise all of the figure windows created so far and start the mainloop. Because this mainloop is blocking by default (i.e., script execution is paused), you should only call this once per script, at the end. Script execution is resumed after the last window is closed. Therefore, if you are using Matplotlib to generate only images and do not want a user interface window, you do not need to call show (see Generate images without having a window appear and What is a backend?).

Note: Because closing a figure window unregisters it from pyplot, you must call savefig before calling show if you wish to save the figure as well as view it.

Whether show blocks further execution of the script or the python interpreter depends on whether Matplotlib is set to use interactive mode. In non-interactive mode (the default setting), execution is paused until the last figure window is closed. In interactive mode, the execution is not paused, which allows you to create additional figures (but the script won’t finish until the last figure window is closed).
Because it is expensive to draw, you typically will not want Matplotlib to redraw a figure many times in a script such as the following:

```python
plot([1, 2, 3])  # draw here?
xlabel('time')   # and here?
ylabel('volts')  # and here?
title('a simple plot')  # and here?
show()
```

However, it is **possible** to force Matplotlib to draw after every command, which might be what you want when working interactively at the python console (see Interactive Figures), but in a script you want to defer all drawing until the call to `show`. This is especially important for complex figures that take some time to draw. `show()` is designed to tell Matplotlib that you’re all done issuing commands and you want to draw the figure now.

**Note:** `show()` should typically only be called at most once per script and it should be the last line of your script. At that point, the GUI takes control of the interpreter. If you want to force a figure draw, use `draw()` instead.

New in version v1.0.0: Matplotlib 1.0.0 and 1.0.1 added support for calling `show` multiple times per script, and harmonized the behavior of interactive mode, across most backends.

### 13.1.17 Interpreting box plots and violin plots

Tukey’s box plots (Robert McGill, John W. Tukey and Wayne A. Larsen: “The American Statistician” Vol. 32, No. 1, Feb., 1978, pp. 12-16) are statistical plots that provide useful information about the data distribution such as skewness. However, bar plots with error bars are still the common standard in most scientific literature, and thus, the interpretation of box plots can be challenging for the unfamiliar reader. The figure below illustrates the different visual features of a box plot.

![Box plot diagram](image)

- **Q1**: Quantile 1, or median of the left data subset after dividing the original data set into 2 subsets via the median (25% of the data points fall below this threshold)
- **Q3**: Quantile 3, median of the right data subset (75% of the data points fall below this threshold)
- **IQR**: Interquantile range, Q3 - Q1
- **Outliers**: Data points are considered to be outliers if value < Q1 - 1.5 x IQR or value > Q3 + 1.5 x IQR

Violin plots are closely related to box plots but add useful information such as the distribution of the sample data (density trace). Violin plots were added in Matplotlib 1.4.
13.1.18 Working with threads

Matplotlib is not thread-safe: in fact, there are known race conditions that affect certain artists. Hence, if you work with threads, it is your responsibility to set up the proper locks to serialize access to Matplotlib artists.

You may be able to work on separate figures from separate threads. However, you must in that case use a *non-interactive backend* (typically Agg), because most GUI backends *require* being run from the main thread as well.

13.2 How-to: Contributing

13.2.1 Request a new feature

Is there a feature you wish Matplotlib had? Then ask! The best way to get started is to email the developer mailing list for discussion. This is an open source project developed primarily in the contributors free time, so there is no guarantee that your feature will be added. The *best* way to get the feature you need added is to contribute it yourself.

13.2.2 Reporting a bug or submitting a patch

The development of Matplotlib is organized through github. If you would like to report a bug or submit a patch please use that interface.

To report a bug create an issue on github (this requires having a github account). Please include a Short, Self Contained, Correct (Compilable), Example demonstrating what the bug is. Including a clear, easy to test example makes it easy for the developers to evaluate the bug. Expect that the bug reports will be a conversation. If you do not want to register with github, please email bug reports to the mailing list.

The easiest way to submit patches to Matplotlib is through pull requests on github. Please see the *The Matplotlib Developers' Guide* for the details.

13.2.3 Contribute to Matplotlib documentation

Matplotlib is a big library, which is used in many ways, and the documentation has only scratched the surface of everything it can do. So far, the place most people have learned all these features are through studying the examples-index, which is a recommended and great way to learn, but it would be nice to have more official narrative documentation guiding people through all the dark corners. This is where you come in.

There is a good chance you know more about Matplotlib usage in some areas, the stuff you do every day, than many of the core developers who wrote most of the documentation. Just pulled your hair out compiling Matplotlib for Windows? Write a FAQ or a section for the *Installation* page. Are you a digital signal processing wizard? Write a tutorial on the signal analysis plotting functions like *xcorr()*,*psd()* and *specgram()* . Do you use Matplotlib with *django* or other popular web application servers? Write a FAQ or tutorial and we'll find a place for it in the *User's Guide*. And so on... I think you get the idea.

Matplotlib is documented using the *sphinx* extensions to restructured text (ReST). *sphinx* is an extensible python framework for documentation projects which generates HTML and PDF,
and is pretty easy to write; you can see the source for this document or any page on this site by clicking on the *Show Source* link at the end of the page in the sidebar.

The sphinx website is a good resource for learning sphinx, but we have put together a cheat-sheet at *Writing documentation* which shows you how to get started, and outlines the Matplotlib conventions and extensions, e.g., for including plots directly from external code in your documents.

Once your documentation contributions are working (and hopefully tested by actually *building* the docs) you can submit them as a patch against git. See *Install git* and *Reporting a bug or submitting a patch*. Looking for something to do? Search for *TODO* or look at the open issues on github.

## 13.3 How to use Matplotlib in a web application server

In general, the simplest solution when using Matplotlib in a web server is to completely avoid using pyplot (pyplot maintains references to the opened figures to make *show* work, but this will cause memory leaks unless the figures are properly closed). Since Matplotlib 3.1, one can directly create figures using the *Figure* constructor and save them to in-memory buffers. The following example uses *Flask*, but other frameworks work similarly:

```python
import base64
from io import BytesIO

from flask import Flask
from matplotlib.figure import Figure

app = Flask(__name__)

@app.route("/")
def hello():
    # Generate the figure **without using pyplot**.
    fig = Figure()
    ax = fig.subplots()
    ax.plot([1, 2])
    # Save it to a temporary buffer.
    buf = BytesIO()
    fig.savefig(buf, format="png")
    # Embed the result in the html output.
    data = base64.b64encode(buf.getbuffer()).decode("ascii")
    return f"<img src='data:image/png;base64,{data}'>"
```

When using Matplotlib versions older than 3.1, it is necessary to explicitly instantiate an Agg canvas; see e.g. /gallery/user_interfaces/canvasagg.

### 13.3.1 Clickable images for HTML

Andrew Dalke of Dalke Scientific has written a nice article on how to make html click maps with Matplotlib agg PNGs. We would also like to add this functionality to SVG. If you are interested in contributing to these efforts that would be great.
CHAPTER
FOURTEEN

TROUBLESHOOTING

Contents

- Troubleshooting
  - Obtaining Matplotlib version
  - matplotlib install location
  - matplotlib configuration and cache directory locations
  - Getting help
  - Problems with recent git versions

14.1 Obtaining Matplotlib version

To find out your Matplotlib version number, import it and print the \_\_version\_\_ attribute:

```python
>>> import matplotlib
>>> matplotlib.__version__
'0.98.0'
```

14.2 matplotlib install location

You can find what directory Matplotlib is installed in by importing it and printing the \_\_file\_\_ attribute:

```python
>>> import matplotlib
>>> matplotlib.__file__
'/home/jdhunter/dev/lib64/python2.5/site-packages/matplotlib/__init__.pyc'
```

14.3 matplotlib configuration and cache directory locations

Each user has a Matplotlib configuration directory which may contain a matplotlibrc file. To locate your matplotlib/ configuration directory, use matplotlib.get_configdir():

```python
```
On unix-like systems, this directory is generally located in your `HOME` directory under the `.config/` directory.

In addition, users have a cache directory. On unix-like systems, this is separate from the configuration directory by default. To locate your `.cache/` directory, use `mpl.get_cachedir()`:

```python
>>> import matplotlib as mpl
>>> mpl.get_configdir()
'/home/darren/.config/matplotlib'
On windows, both the config directory and the cache directory are the same and are in your `Documents and Settings` or `Users` directory by default:

```python
>>> import matplotlib as mpl
>>> mpl.get_configdir()
'C:\Documents and Settings\jdhunter\.matplotlib'
>>> mpl.get_cachedir()
'C:\Documents and Settings\jdhunter\.matplotlib'
```

If you would like to use a different configuration directory, you can do so by specifying the location in your `MPLCONFIGDIR` environment variable – see `Setting environment variables in Linux and macOS`. Note that `MPLCONFIGDIR` sets the location of both the configuration directory and the cache directory.

### 14.4 Getting help

There are a number of good resources for getting help with Matplotlib. There is a good chance your question has already been asked:

- The mailing list archive.
- GitHub issues.
- Stackoverflow questions tagged `matplotlib`.

If you are unable to find an answer to your question through search, please provide the following information in your e-mail to the mailing list:

- Your operating system (Linux/UNIX users: post the output of `uname -a`).
- Matplotlib version:

  ```python
  python -c "import matplotlib; print(matplotlib.__version__)"
  ```

- Where you obtained Matplotlib (e.g., your Linux distribution’s packages, GitHub, PyPI, or Anaconda).
- Any customizations to your `matplotlibrc` file (see `Customizing Matplotlib with style sheets and rcParams`).
- If the problem is reproducible, please try to provide a `minimal`, standalone Python script that demonstrates the problem. This is `the` critical step. If you can't post a piece of code
that we can run and reproduce your error, the chances of getting help are significantly diminished. Very often, the mere act of trying to minimize your code to the smallest bit that produces the error will help you find a bug in your code that is causing the problem.

- Matplotlib provides debugging information through the `logging` library, and a helper function to set the logging level: one can call

```python
plt.set_loglevel("info")  # or "debug" for more info
```

to obtain this debugging information.

Standard functions from the `logging` module are also applicable; e.g. one could call `logging.basicConfig(level="DEBUG")` even before importing Matplotlib (this is in particular necessary to get the logging info emitted during Matplotlib’s import), or attach a custom handler to the “matplotlib” logger. This may be useful if you use a custom logging configuration.

If you compiled Matplotlib yourself, please also provide:

- any changes you have made to `setup.py` or `setupext.py`.
- the output of:

```bash
rm -rf build
python setup.py build
```

The beginning of the build output contains lots of details about your platform that are useful for the Matplotlib developers to diagnose your problem.

- your compiler version - e.g., `gcc --version`.

Including this information in your first e-mail to the mailing list will save a lot of time. You will likely get a faster response writing to the mailing list than filing a bug in the bug tracker. Most developers check the bug tracker only periodically. If your problem has been determined to be a bug and can not be quickly solved, you may be asked to file a bug in the tracker so the issue doesn’t get lost.

### 14.5 Problems with recent git versions

First make sure you have a clean build and install (see *How to completely remove Matplotlib*), get the latest git update, install it and run a simple test script in debug mode:

```bash
rm -rf /path/to/site-packages/matplotlib*
git clean -xdf
git pull
python -m pip install -v . > build.out
python -c "from pypub import *; set_loglevel('debug'); plot(); show()" > run.out
```

and post `build.out` and `run.out` to the `matplotlib-devel` mailing list (please do not post git problems to the `users list`).

Of course, you will want to clearly describe your problem, what you are expecting and what you are getting, but often a clean build and install will help. See also *Getting help*.

---

**DISPLAY**

The server and screen on which to place windows. This is interpreted by GUI toolkits in a backend-specific manner, but generally refers to an X.org display name.

**HOME**

The user’s home directory. On Linux, ~ is shorthand for HOME.

**MPLBACKEND**

This optional variable can be set to choose the Matplotlib backend. See What is a backend?.

**MPLCONFIGDIR**

This is the directory used to store user customizations to Matplotlib, as well as some caches to improve performance. If MPLCONFIGDIR is not defined, HOME/.config/matplotlib and HOME/.cache/matplotlib are used on Linux, and HOME/.matplotlib on other platforms, if they are writable. Otherwise, the Python standard library’s tempfile.gettempdir is used to find a base directory in which the matplotlib subdirectory is created.

**PATH**

The list of directories searched to find executable programs.

**PYTHONPATH**

The list of directories that are added to Python’s standard search list when importing packages and modules.

**QT_API**

The Python Qt wrapper to prefer when using Qt-based backends. See the entry in the usage guide for more information.

---

15.1 Setting environment variables in Linux and macOS

To list the current value of PYTHONPATH, which may be empty, try:
The procedure for setting environment variables in depends on what your default shell is. Common shells include bash and csh. You should be able to determine which by running at the command prompt:

```
$ echo $SHELL
```

To create a new environment variable:

```
$ export PYTHONPATH=~/.Python
```

```
setenv PYTHONPATH ~/Python
```

To prepend to an existing environment variable:

```
$ export PATH=~/bin:${PATH} # bash/ksh
```

```
setenv PATH ~/bin:${PATH} # csh/tcsh
```

The search order may be important to you, do you want ~/bin to be searched first or last? To append to an existing environment variable:

```
$ export PATH=$PATH:~/bin # bash/ksh
```

```
setenv PATH ${PATH}:~/bin # csh/tcsh
```

To make your changes available in the future, add the commands to your ~/.bashrc/.cshrc file.

### 15.2 Setting environment variables in Windows

Open the Control Panel (Start → Control Panel), start the System program. Click the Advanced tab and select the Environment Variables button. You can edit or add to the User Variables.
Part III

API Overview
CHAPTER
SIXTEEN

API CHANGES

If updating Matplotlib breaks your scripts, this list may help you figure out what caused the breakage and how to fix it by updating your code.

For API changes in older versions see

16.1 Old API Changes

16.1.1 Changes for 0.40

- Artist
  * `__init__` takes a DPI instance and a Bound2D instance which is the bounding box of the artist in display coords
  * `get_window_extent` returns a Bound2D instance
  * `set_size` is removed; replaced by `bbox` and `dpi`
  * the `clip_gc` method is removed. Artists now clip themselves with their box
  * added `_clipOn` boolean attribute. If True, gc clip to `bbox`.

- AxisTextBase
  * Initialized with a `transx`, `transy` which are Transform instances
  * `set_drawing_area` removed
  * `get_left_right` and `get_top_bottom` are replaced by `get_window_extent`

- Line2D Patches now take `transx`, `transy`
  * Initialized with a `transx`, `transy` which are Transform instances

- Patches
  * Initialized with a `transx`, `transy` which are Transform instances

- FigureBase attributes `dpi` is a DPI instance rather than scalar and new attribute `bbox` is a Bound2D in display coords, and I got rid of the left, width, height, etc... attributes. These are now accessible as, for example, `bbox.x.min` is left, `bbox.x.interval()` is width, `bbox.y.max` is top, etc...

- GcfBase attribute `pagesize` renamed to `figsize`

- Axes
  * removed `figbg` attribute
  * added `fig` instance to `__init__`

(continues on next page)
* resizing is handled by figure call to resize.

- Subplot
  * added fig instance to __init__

- Renderer methods for patches now take gcEdge and gcFace instances. gcFace=None takes the place of filled=False

- True and False symbols provided by cbook in a python2.3 compatible way

- new module transforms supplies Bound1D, Bound2D and Transform instances and more

- Changes to the MATLAB helpers API

  * _matlab_helpers.GcfBase is renamed by Gcf. Backends no longer need to derive from this class. Instead, they provide a factory function new_figure_manager(num, figsize, dpi). The destroy method of the GcfDerived from the backends is moved to the derived FigureManager.

  * FigureManagerBase moved to backend_bases

  * Gcf.get_all_figwins renamed to Gcf.get_all_fig_managers

Jeremy:

Make sure to self._reset = False in AxisTextWX._set_font. This was something missing in my backend code.

### 16.1.2 Changes for 0.42

* Refactoring AxisText to be backend independent. Text drawing and get_window_extent functionality will be moved to the Renderer.

* backend_bases.AxisTextBase is now text.Text module

* All the erase and reset functionality removed from AxisText - not needed with double buffered drawing. Ditto with state change. Text instances have a get_prop_tup method that returns a hashable tuple of text properties which you can use to see if text props have changed, e.g., by caching a font or layout instance in a dict with the prop tup as a key -- see RendererGTK.get_pango_layout in backend_gtk for an example.

* Text._get_xy_display renamed Text.get_xy_display

* Artist set_renderer and wash_brushes methods removed

* Moved Legend class from matplotlib.axes into matplotlib.legend

* Moved Tick, XTick, YTick, Axis, XAxis, YAxis from matplotlib.axes to matplotlib.axis

(continues on next page)
16.1.3 Changes for 0.50

* refactored Figure class so it is no longer backend dependent. FigureCanvasBackend takes over the backend specific duties of the Figure. matplotlib.backend_bases.FigureBase moved to matplotlib.figure.Figure.

* backends must implement FigureCanvasBackend (the thing that controls the figure and handles the events if any) and FigureManagerBackend (wraps the canvas and the window for MATLAB interface). FigureCanvasBase implements a backend switching mechanism

* Figure is now an Artist (like everything else in the figure) and is totally backend independent

* GDFONTPATH renamed to TTFPATH

* backend faceColor argument changed to rgbFace

* colormap stuff moved to colors.py

* arg_to_rgb in backend_bases moved to class ColorConverter in colors.py

* GD users must upgrade to gd-2.0.22 and gdmodule-0.52 since new gd features (clipping, antialiased lines) are now used.

* Renderer must implement points_to_pixels

Migrating code:

MATLAB interface:

The only API change for those using the MATLAB interface is in how you call figure redraws for dynamically updating figures. In the old API, you did

```
fig.draw()
```

In the new API, you do

```
```
manager = get_current_fig_manager()
manager.canvas.draw()

See the examples system_monitor.py, dynamic_demo.py, and anim.py

API

There is one important API change for application developers. Figure instances used subclass GUI widgets that enabled them to be placed directly into figures. e.g., FigureGTK subclassed gtk.DrawingArea. Now the Figure class is independent of the backend, and FigureCanvas takes over the functionality formerly handled by Figure. In order to include figures into your apps, you now need to do, for example

```
# gtk example
fig = Figure(figsize=(5, 4), dpi=100)
canvas = FigureCanvasGTK(fig)  # a gtk.DrawingArea
canvas.show()
vbox.pack_start(canvas)
```

If you use the NavigationToolbar, this is now initialized with a FigureCanvas, not a Figure. The examples embedding_in_gtk.py, embedding_in_gtk2.py, and mpl_with_glade.py all reflect the new API so use these as a guide.

All prior calls to

```
figure.draw() and
figure.print_figure(args)
```

should now be

```
canvas.draw() and
canvas.print_figure(args)
```

Apologies for the inconvenience. This refactorization brings significant more freedom in developing matplotlib and should bring better plotting capabilities, so I hope the inconvenience is worth it.

16.1.4 Changes for 0.54

MATLAB interface
dpi

Several of the backends used a PIXELS_PER_INCH hack that I added to try and make images render consistently across backends. This just complicated matters. So you may find that some font sizes and line widths appear different than before. Apologies for the inconvenience. You should set the dpi to an accurate value for your screen to get true sizes.
pcolor and scatter

There are two changes to the MATLAB interface API, both involving the patch drawing commands. For efficiency, pcolor and scatter have been rewritten to use polygon collections, which are a new set of objects from matplotlib.collections designed to enable efficient handling of large collections of objects. These new collections make it possible to build large scatter plots or pcolor plots with no loops at the python level, and are significantly faster than their predecessors. The original pcolor and scatter functions are retained as pcolor_classic and scatter_classic.

The return value from pcolor is a PolyCollection. Most of the properties that are available on rectangles or other patches are also available on PolyCollections, e.g., you can say:

```python
c = scatter(blah, blah)
c.set_linewidth(1.0)
c.set_facecolor('r')
c.set_alpha(0.5)
```

or:

```python
c = scatter(blah, blah)
set(c, 'linewidth', 1.0, 'facecolor', 'r', 'alpha', 0.5)
```

Because the collection is a single object, you no longer need to loop over the return value of scatter or pcolor to set properties for the entire list.

If you want the different elements of a collection to vary on a property, e.g., to have different line widths, see matplotlib.collections for a discussion on how to set the properties as a sequence.

For scatter, the size argument is now in points^2 (the area of the symbol in points) as in MATLAB and is not in data coords as before. Using sizes in data coords caused several problems. So you will need to adjust your size arguments accordingly or use scatter_classic.

mathtext spacing

For reasons not clear to me (and which I’ll eventually fix) spacing no longer works in font groups. However, I added three new spacing commands which compensate for this ‘ ’ (regular space), ‘ ’ (small space) and ‘hspace{frac}’ where frac is a fraction of fontsize in points. You will need to quote spaces in font strings, is:

```latex
title(r'\$\mathrm{Histogram\ of\ IQ:}$\backslash\ \backslash \mathrm{\mu=100,} \ \backslash \ \backslash \mathrm{\sigma=15}$')
```

Object interface - Application programmers

Autoscaling

The x and y axis instances no longer have autoscale view. These are handled by `axes.autoscale_view`

16.1. Old API Changes
Axes creation

You should not instantiate your own Axes any more using the OO API. Rather, create a Figure as before and in place of:

```python
f = Figure(figsize=(5,4), dpi=100)
a = Subplot(f, 111)
f.add_axis(a)
```

use:

```python
f = Figure(figsize=(5,4), dpi=100)
a = f.add_subplot(111)
```

That is, add_axis no longer exists and is replaced by:

```python
add_axes(rect, axisbg=defaultcolor, frameon=True)
add_subplot(num, axisbg=defaultcolor, frameon=True)
```

Artist methods

If you define your own Artists, you need to rename the _draw method to draw

Bounding boxes

`matplotlib.transforms.Bound2D` is replaced by `matplotlib.transforms.Bbox`. If you want to construct a bbox from left, bottom, width, height (the signature for Bound2D), use `matplotlib.transforms.lbwh_to_bbox`, as in

```python
bbox = clickBBox = lbwh_to_bbox(left, bottom, width, height)
```

The Bbox has a different API than the Bound2D. e.g., if you want to get the width and height of the bbox

OLD::  
width = fig.bbox.x.interval()  
height = fig.bbox.y.interval()

New::  
width = fig.bbox.width()  
height = fig.bbox.height()  

Object constructors

You no longer pass the bbox, dpi, or transforms to the various Artist constructors. The old way of creating lines and rectangles was cumbersome because you had to pass so many attributes to the Line2D and Rectangle classes not related directly to the geometry and properties of the object. Now default values are added to the object when you call `axes.add_line` or `axes.add_patch`, so they are hidden from the user.

If you want to define a custom transformation on these objects, call `o.set_transform(trans)` where `trans` is a Transformation instance.

In prior versions of you wanted to add a custom line in data coords, you would have to do
\[ l = \textbf{Line2D}(\texttt{dpi, bbox, x, y}, \texttt{color = color, transx = transx, transy = transy}) \]

now all you need is
\[ l = \text{Line2D}(x, y, \texttt{color=color}) \]

and the axes will set the transformation for you (unless you have set your own already, in which case it will leave it unchanged)

**Transformations**

The entire transformation architecture has been rewritten. Previously the x and y transformations were stored in the xaxis and yaxis instances. The problem with this approach is it only allows for separable transforms (where the x and y transformations don't depend on one another). But for cases like polar, they do. Now transformations operate on x,y together. There is a new base class `matplotlib.transforms.Transformation` and two concrete implementations, `matplotlib.transforms.SeparableTransformation` and `matplotlib.transforms.Affine`. The SeparableTransformation is constructed with the bounding box of the input (this determines the rectangular coordinate system of the input, i.e., the x and y view limits), the bounding box of the display, and possibly nonlinear transformations of x and y. The 2 most frequently used transformations, data coordinates -> display and axes coordinates -> display are available as `ax.transData` and `ax.transAxes`. See `alignment_demo.py` which uses axes coords.

Also, the transformations should be much faster now, for two reasons

- they are written entirely in extension code
- because they operate on x and y together, they can do the entire transformation in one loop. Earlier I did something along the lines of:

\[
x_t = s_x \cdot \text{func}(x) + t_x \\
y_t = s_y \cdot \text{func}(y) + t_y
\]

Although this was done in numerix, it still involves 6 `length(x)` for-loops (the multiply, add, and function evaluation each for x and y). Now all of that is done in a single pass.

If you are using transformations and bounding boxes to get the cursor position in data coordinates, the method calls are a little different now. See the updated examples/coords_demo.py which shows you how to do this.

Likewise, if you are using the artist bounding boxes to pick items on the canvas with the GUI, the bbox methods are somewhat different. You will need to see the updated examples/object_picker.py.

See unit/transforms_unit.py for many examples using the new transformations.

**16.1.5 Changes for 0.54.3**

- removed the `set_default_font / get_default_font` scheme from the font_manager to unify customization of font defaults with the rest of the rc scheme. See examples/font_properties_demo.py and help(rc) in `matplotlib.matlab`.

16.1. Old API Changes
16.1.6 Changes for 0.60

ColormapJet and Grayscale are deprecated. For backwards compatibility, they can be obtained either by doing

```
from matplotlib.cm import ColormapJet
```

or

```
from matplotlib.matlab import *
```

They are replaced by cm.jet and cm.grey

16.1.7 Changes for 0.61

canvas.connect is now deprecated for event handling. use mpl_connect and mpl_disconnect instead. The callback signature is func(event) rather than func(widget, event)

16.1.8 Changes for 0.63

Dates are now represented internally as float days since 0001-01-01, UTC.

All date tickers and formatters are now in matplotlib.dates, rather than matplotlib.tickers

converters have been abolished from all functions and classes. num2date and date2num are now the converter functions for all date plots

Most of the date tick locators have a different meaning in their constructors. In the prior implementation, the first argument was a base and multiples of the base were ticked. e.g.,

```
HourLocator(5)  # old: tick every 5 minutes
```

In the new implementation, the explicit points you want to tick are provided as a number or sequence

```
HourLocator(range(0,5,61))  # new: tick every 5 minutes
```

This gives much greater flexibility. I have tried to make the default constructors (no args) behave similarly, where possible.

Note that YearLocator still works under the base/multiple scheme. The difference between the YearLocator and the other locators is that years are not recurrent.

Financial functions:

(continues on next page)
matplotlib.finance.quotes_historical_yahoo(ticker, date1, date2)

date1, date2 are now datetime instances. Return value is a list of quotes where the quote time is a float - days since gregorian start, as returned by date2num.

See examples/finance_demo.py for example usage of new API

16.1.9 Changes for 0.65

mpl_connect and mpl_disconnect in the MATLAB interface renamed to connect and disconnect

Did away with the text methods for angle since they were ambiguous. fontangle could mean fontstyle (oblique, etc) or the rotation of the text. Use style and rotation instead.

16.1.10 Changes for 0.65.1

removed add_axes and add_subplot from backend_bases. Use figure.add_axes and add_subplot instead. The figure now manages the current axes with gca and sca for get and set current axes. If you have code you are porting which called, e.g., figmanager.add_axes, you can now simply do figmanager.canvas.figure.add_axes.

16.1.11 Changes for 0.70

MplEvent factored into a base class Event and derived classes MouseEvent and KeyEvent

Removed definct set_measurement in wx toolbar

16.1.12 Changes for 0.71

Significant numerix namespace changes, introduced to resolve namespace clashes between python built-ins and mlab names. Refactored numerix to maintain separate modules, rather than folding all these names into a single namespace. See the following mailing list threads for more information and background

OLD usage

from matplotlib.numerix import array, mean, fft
NEW usage

from matplotlib.numerix import array
from matplotlib.numerix.mlab import mean
from matplotlib.numerix.fft import fft

umerix dir structure mirrors numarray (though it is an incomplete implementation)

umerix
numerix/mlab
numerix/linear_algebra
numerix/fft
numerix/random_array

but of course you can use 'numerix : Numeric' and still get the symbols.

pylab still imports most of the symbols from Numerix, MLab, fft, etc, but is more cautious. For names that clash with python names (min, max, sum), pylab keeps the builtins and provides the numeric versions with an a* prefix, e.g., (amin, amax, asum)

16.1.13 Changes for 0.72

- Line2D, Text, and Patch copy_properties renamed update_from and moved into artist base class

- LineCollections.color renamed to LineCollections.set_color for consistency with set/get introspection mechanism,

- pylab figure now defaults to num=None, which creates a new figure with a guaranteed unique number

- contour method syntax changed - now it is MATLAB compatible

  unchanged: contour(Z)
  old: contour(Z, x=Y, y=Y)
  new: contour(X, Y, Z)

  see http://matplotlib.sf.net/matplotlib.pylab.html#-contour

- Increased the default resolution for save command.

- Renamed the base attribute of the ticker classes to _base to avoid conflict with the base method. Sitt for subs

- subs=None now does autosubbing in the tick locator.

- New subplots that overlap old will delete the old axes. If you do not want this behavior, use fig.add_subplot or the axes command
16.1.14 Changes for 0.73

- Removed deprecated ColormapJet and friends
- Removed all error handling from the verbose object
- figure num of zero is now allowed

16.1.15 Changes for 0.80

- xlim/ylim/axis always return the new limits regardless of arguments. They now take kwargs which allow you to selectively change the upper or lower limits while leaving unnamed limits unchanged. See help(xlim) for example

16.1.16 Changes for 0.81

- pylab and artist "set" functions renamed to setp to avoid clash with python2.4 built-in set. Current version will issue a deprecation warning which will be removed in future versions
- imshow interpolation arguments changes for advanced interpolation schemes. See help imshow, particularly the interpolation, filternorm and filterrad kwargs
- Support for masked arrays has been added to the plot command and to the Line2D object. Only the valid points are plotted. A "valid_only" kwarg was added to the get_xdata() and get_ydata() methods of Line2D; by default it is False, so that the original data arrays are returned. Setting it to True returns the plottable points.
- contour changes:
  Masked arrays: contour and contourf now accept masked arrays as the variable to be contoured. Masking works correctly for contour, but a bug remains to be fixed before it will work for contourf. The "badmask" kwarg has been removed from both functions.
  Level argument changes:
  Old version: a list of levels as one of the positional arguments specified the lower bound of each filled region; the upper bound of the last region was taken as a very large number. Hence, it was not possible to specify that z values between 0 and 1, for example, be filled, and that values outside that range remain unfilled.
  New version: a list of N levels is taken as specifying the boundaries of N-1 z ranges. Now the user has more control over what is colored and what is not. Repeated calls to contourf

(continues on next page)
(continued from previous page)

(with different colormaps or color specifications, for example) can be used to color different ranges of z. Values of z outside an expected range are left uncolored.

Example:
Old: `contourf(z, [0, 1, 2])` would yield 3 regions: 0-1, 1-2, and >2.
New: it would yield 2 regions: 0-1, 1-2. If the same 3 regions were desired, the equivalent list of levels would be `[0, 1, 2, 1e38]`.

16.1.17 Changes for 0.82

- toolbar import change in GTKAgg, GTKCairo and WXAgg

- Added subplot config tool to GTK* backends -- note you must now import the NavigationToolbar2 from your backend of choice rather than from backend_gtk because it needs to know about the backend specific canvas -- see examples/embedding_in_gtk2.py. Ditto for wx backend -- see examples/embedding_in_wxagg.py

- hist bin change

Sean Richards notes there was a problem in the way we created the binning for histogram, which made the last bin underrepresented. From his post:

I see that `hist` uses the `linspace` function to create the bins and then uses `searchsorted` to put the values in their correct bin. That's all good but I am confused over the use of `linspace` for the bin creation. I wouldn't have thought that it does what is needed, to quote the docstring it creates a "Linear spaced array from min to max". For it to work correctly shouldn't the values in the bins array be the same bound for each bin? (i.e. each value should be the lower bound of a bin). To provide the correct bins for `hist` would it not be something like

```python
def bins(xmin, xmax, N):
    if N==1: return xmax
    dx = (xmax-xmin)/N # instead of N-1
    return xmin + dx*arange(N)
```

This suggestion is implemented in 0.81. My test script with these changes does not reveal any bias in the binning

```python
from matplotlib.numerix.mlab import randn, rand, zeros, Float
from matplotlib.mlab import hist, mean

Nbins = 50
Ntests = 200
results = zeros((Ntests,Nbins), typecode=Float)
for i in range(Ntests):
```

(continues on next page)
print 'computing', i
x = rand(10000)
n, bins = hist(x, Nbins)
results[i] = n
print mean(results)

16.1.18 Changes for 0.83

- Made HOME/.matplotlib the new config dir where the matplotlibrc file, the ttf.cache, and the tex.cache live. The new default filenames in .matplotlib have no leading dot and are not hidden. e.g., the new names are matplotlibrc, tex.cache, and ttffont.cache. This is how ipython does it so it must be right.

  If old files are found, a warning is issued and they are moved to the new location.

- backends/__init__.py no longer imports new_figure_manager, draw_if_interactive and show from the default backend, but puts these imports into a call to pylab_setup. Also, the Toolbar is no longer imported from WX/WXAgg. New usage:

  from backends import pylab_setup
  new_figure_manager, draw_if_interactive, show = pylab_setup()

- Moved Figure.get_width_height() to FigureCanvasBase. It now returns int instead of float.

16.1.19 Changes for 0.84

Unified argument handling between hlines and vlines. Both now take optionally a fmt argument (as in plot) and a keyword args that can be passed onto Line2D.

Removed all references to "data clipping" in rc and lines.py since these were not used and not optimized. I'm sure they'll be resurrected later with a better implementation when needed.

'\texttt{\textquote-left set\textquote-right} removed - no more deprecation warnings. Use 'setp' instead.

Backend developers: Added flipud method to image and removed it from to_str. Removed origin kwarg from backend.draw_image. origin is handled entirely by the frontend now.

16.1.20 Changes for 0.85

Made xtick and ytick separate props in rc

made pos=None the default for tick formatters rather than 0 to
indicate "not supplied"

Removed "feature" of minor ticks which prevents them from overlapping major ticks. Often you want major and minor ticks at the same place, and can offset the major ticks with the pad. This could be made configurable

Changed the internal structure of contour.py to a more OO style. Calls to contour or contourf in axes.py or pylab.py now return a ContourSet object which contains references to the LineCollections or PolyCollections created by the call, as well as the configuration variables that were used. The ContourSet object is a "mappable" if a colormap was used.

Added a clip_ends kwarg to contourf. From the docstring:

* clip_ends = True
  * If False, the limits for color scaling are set to the minimum and maximum contour levels.
  * True (default) clips the scaling limits. Example:
  * if the contour boundaries are $V = \{-100, 2, 1, 0, 1, 2, 100\}$, then the scaling limits will be $[-100, 100]$ if clip_ends is False, and $[-3, 3]$ if clip_ends is True.

Added kwargs linewidths, antialiased, and nchunk to contourf. These are experimental; see the docstring.

Changed Figure.colorbar():

  kw argument order changed;
  if mappable arg is a non-filled ContourSet, colorbar() shows lines instead hof polygons.
  if mappable arg is a filled ContourSet with clip_ends=True, the endpoints are not labelled, so as to give the correct impression of open-endedness.

Changed LineCollection.get_linewidths to get_linewidth, for consistency.

16.1.21 Changes for 0.86

Matplotlib data is installed into the matplotlib module. This is similar to package_data. This should get rid of having to check for many possibilities in _get_data_path(). The MATPLOTLIBDATA env key is still checked first to allow for flexibility.

1) Separated the color table data from cm.py out into a new file, _cm.py, to make it easier to find the actual code in cm.py and to add new colormaps. Everything from _cm.py is imported by cm.py, so the split should be transparent.

2) Enabled automatic generation of a colormap from a list of colors in contour; see modified examples/contour_demo.py.

3) Support for imshow of a masked array, with the ability to specify colors (or no color at all) for
masked regions, and for regions that are above or
down the normally mapped region. See
examples/image_masked.py.
4) In support of the above, added two new classes,
ListedColormap, and no_norm, to colors.py, and modified
the Colormap class to include common functionality. Added
a clip kwarg to the normalize class.

16.1.22 Changes for 0.87.7

Completely reworked the annotations API because I found the old
API cumbersome. The new design is much more legible and easy to
read. See matplotlib.text.Annotation and
examples/annotation_demo.py

markeredgecolor and markerfacecolor cannot be configured in
matplotlibrc any more. Instead, markers are generally colored
automatically based on the color of the line, unless marker colors
are explicitly set as kwargs - NN

Changed default comment character for load to '#' - JDH

math_parse_s_ft2font_svg from mathtext.py & mathtext2.py now returns
width, height, svg_elements. svg_elements is an instance of Bunch (cmbook.py) and has the attributes svg_glyphs and svg_lines, which are both lists.

Renderer.draw_arc now takes an additional parameter, rotation.
It specifies to draw the artist rotated in degrees anti-
clockwise. It was added for rotated ellipses.

Renamed Figure.set_figsize_inches to Figure.set_size_inches to
better match the get method, Figure.get_size_inches.

Removed the copy_bbox_transform from transforms.py; added
shallowcopy methods to all transforms. All transforms already
had deepcopy methods.

FigureManager.resize(width, height): resize the window
specified in pixels

barh: x and y args have been renamed to width and bottom
respectively, and their order has been swapped to maintain
a (position, value) order.

bar and barh: now accept kwarg 'edgecolor'.

bar and barh: The left, height, width and bottom args can
now all be scalars or sequences; see docstring.

barh: now defaults to edge aligned instead of center
aligned bars

bar, barh and hist: Added a keyword arg 'align' that

(continues on next page)
controls between edge or center bar alignment.

Collections: PolyCollection and LineCollection now accept
vertices or segments either in the original form [(x,y),
(x,y), ...] or as a 2D numerix array, with X as the first column
and Y as the second. Contour and quiver output the numerix
form. The transforms methods Bbox.update() and
Transformation.seq_xy_tups() now accept either form.

Collections: LineCollection is now a ScalarMappable like
PolyCollection, etc.

Specifying a grayscale color as a float is deprecated; use
a string instead, e.g., 0.75 -> '0.75'.

Collections: initializers now accept any mpl color arg, or
sequence of such args; previously only a sequence of rgba
tuples was accepted.

Colorbar: completely new version and api; see docstring. The
original version is still accessible as colorbar_classic, but
is deprecated.

Contourf: "extend" kwarg replaces "clip_ends"; see docstring.
Masked array support added to pcolormesh.

Modified aspect-ratio handling:
  Removed aspect kwarg from imshow
  Axes methods:
    set_aspect(self, aspect, adjustable=None, anchor=None)
    set_adjustable(self, adjustable)
    set_anchor(self, anchor)
  Pylab interface:
    axis('image')

Backend developers: ft2font's load_char now takes a flags
argument, which you can OR together from the LOAD_XX
constants.

16.1.23 Changes for 0.90.0

All artists now implement a "pick" method which users should not
call. Rather, set the "picker" property of any artist you want to
pick on (the epsilon distance in points for a hit test) and
register with the "pick_event" callback. See
examples/pick_event_demo.py for details

Bar, barh, and hist have "log" binary kwarg: log=True
sets the ordinate to a log scale.

Boxplot can handle a list of vectors instead of just
an array, so vectors can have different lengths.

Plot can handle 2-D x and/or y; it plots the columns.
Added linewidth kwarg to bar and barh.

Made the default Artist._transform None (rather than invoking identity_transform for each artist only to have it overridden later). Use artist.get_transform() rather than artist._transform, even in derived classes, so that the default transform will be created lazily as needed.

New LogNorm subclass of Normalize added to colors.py. All Normalize subclasses have new inverse() method, and the __call__() method has a new clip kwarg.

Changed class names in colors.py to match convention: normalize -> Normalize, no_norm -> NoNorm. Old names are still available for now.

Removed obsolete pcolor_classic command and method.

Removed lineprops and markerprops from the Annotation code and replaced them with an arrow configurable with kwarg arrowprops. See examples/annotation_demo.py - JDH

16.1.24 Changes for 0.90.1

The file dviread.py has a (very limited and fragile) dvi reader for usetex support. The API might change in the future so don't depend on it yet.

Removed deprecated support for a float value as a gray-scale; now it must be a string, like '0.5'. Added alpha kwarg to ColorConverter.to_rgba_list.

New method set_bounds(vmin, vmax) for formatters, locators sets the viewInterval and dataInterval from floats.

Removed deprecated colorbar_classic.

Line2D.get_xdata and get_ydata valid_only=False kwarg is replaced by orig=True. When True, it returns the original data, otherwise the processed data (masked, converted)

Some modifications to the units interface. units.ConversionInterface.tickers renamed to units.ConversionInterface.axisinfo and it now returns a units.AxisInfo object rather than a tuple. This will make it easier to add axis info functionality (e.g., I added a default label on this iteration) w/o having to change the tuple length and hence the API of the client code every time new functionality is added. Also, units.ConversionInterface.convert_to_value is now simply named units.ConversionInterface.convert.

Axes.errorbar uses Axes.vlines and Axes.hlines to draw its error limits int he vertical and horizontal direction. As you'll see
in the changes below, these functions now return a LineCollection rather than a list of lines. The new return signature for errorbar is `ylins`, `caplines`, `errorcollections` where `errorcollections` is a `xerrcollection`, `yerrcollection`

Axes.vlines and Axes.hlines now create and returns a LineCollection, not a list of lines. This is much faster. The kwarg signature has changed, so consult the docs

MaxNLocator accepts a new Boolean kwarg ('integer') to force ticks to integer locations.

Commands that pass an argument to the Text constructor or to `Text.set_text()` now accept any object that can be converted with '%s'. This affects `xlabel()`, `title()`, etc.

Barh now takes a **kwargs dict instead of most of the old arguments. This helps ensure that bar and barh are kept in sync, but as a side effect you can no longer pass e.g., color as a positional argument.

`ft2font.get_charmap()` now returns a dict that maps character codes to glyph indices (until now it was reversed)

Moved data files into lib/matplotlib so that setuptools' develop mode works. Re-organized the mpl-data layout so that this source structure is maintained in the installation. (i.e., the 'fonts' and 'images' sub-directories are maintained in site-packages.). Suggest removing site-packages/matplotlib/mpl-data and ~/.matplotlib/ttffont.cache before installing

### 16.1.25 Changes for 0.91.0

- Changed `cbook.is_file_like` to `cbook.is_writable_file_like` and corrected behavior.
- Added `ax` keyword argument to `pyplot.colorbar()` and `Figure.colorbar()` so that one can specify the axes object from which space for the colorbar is to be taken, if one does not want to make the colorbar axes manually.
- Changed `cbook.reversed` so it yields a tuple rather than a (index, tuple). This agrees with the Python reversed builtin, and `cbook` only defines reversed if Python doesn’t provide the builtin.
- Made `skiprows=1` the default on `csv2rec`
- The gd and paint backends have been deleted.
- The errorbar method and function now accept additional kwargs so that upper and lower limits can be indicated by capping the bar with a caret instead of a straight line segment.
- The `matplotlib.dviread` file now has a parser for files like `psfonts.map` and `pdftex.map`, to map TeX font names to external files.
- The file `matplotlib.type1font` contains a new class for Type 1 fonts. Currently it simply reads pfa and pfb format files and stores the data in a way that is suitable for embedding in pdf files. In the future the class might actually parse the font to allow e.g., subsetting.
• `matplotlib.ft2font` now supports `FT_Attach_File`. In practice this can be used to read an afm file in addition to a pfa/pfb file, to get metrics and kerning information for a Type 1 font.

• The `AFM` class now supports querying CapHeight and stem widths. The `get_name_char` method now has an isord kwarg like `get_width_char`.

• Changed `pcolor()` default to `shading='flat'`; but as noted now in the docstring, it is preferable to simply use the `edgecolor` keyword argument.

• The mathtext font commands (`\cal`, `\rm`, `\it`, `\tt`) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of `$\cal{R}$` should be changed to `$\cal{R}$`. Alternatively, you may use the new LaTeX-style font commands (`\mathcal`, `\mathrm`, `\mathit`, `\mathtt`) which do affect the following group, e.g., `$\mathcal{R}$`.

• Text creation commands have a new default linespacing and a new `linespacing` kwarg, which is a multiple of the maximum vertical extent of a line of ordinary text. The default is 1.2; `linespacing=2` would be like ordinary double spacing, for example.

• Changed default kwarg in `matplotlib.colors.Normalize` to `clip=False`; clipping silently defeats the purpose of the special over, under, and bad values in the colormap, thereby leading to unexpected behavior. The new default should reduce such surprises.

• Made the emit property of `set_xlim()` and `set_ylim()` True by default; removed the Axes custom callback handling into a ‘callbacks’ attribute which is a `CallbackRegistry` instance. This now supports the ‘xlim_changed’ and ‘ylim_changed’ Axes events.

16.1.26 Changes for 0.91.2

• For `csv2rec`, `checkrows=0` is the new default indicating all rows will be checked for type inference

• A warning is issued when an image is drawn on log-scaled axes, since it will not log-scale the image data.

• Moved `rec2gtk` to `matplotlib.toolkits.gtktools`

• Moved `rec2excel` to `matplotlib.toolkits.exceltools`

• Removed, dead/experimental ExampleInfo, Namespace and Importer code from `matplotlib`

16.1.27 Changes for 0.98.0

• `matplotlib.image.imread()` now no longer always returns RGBA data—if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also `uint8` is no longer always forced to float.

• Rewrote the `matplotlib.cm.ScalarMappable` callback infrastructure to use `matplotlib.cbook.CallbackRegistry` rather than custom callback handling. Any users of `matplotlib.cm.ScalarMappable.add_observer` of the `ScalarMappable` should use the `matplotlib.cm.ScalarMappable.callbacksSM` `CallbackRegistry` instead.

• New axes function and Axes method provide control over the plot color cycle: `matplotlib.axes.set_default_color_cycle` and `matplotlib.axes.Axes.set_color_cycle`.
Matplotlib now requires Python 2.4, so `matplotlib.cbook` will no longer provide `set`, `enumerate()`, `reversed()` or `izip` compatibility functions.

In Numpy 1.0, bins are specified by the left edges only. The axes method `matplotlib.axes.Axes.hist()` now uses future Numpy 1.3 semantics for histograms. Providing `binedges`, the last value gives the upper-right edge now, which was implicitly set to +infinity in Numpy 1.0. This also means that the last bin doesn’t contain upper outliers any more by default.

New axes method and pyplot function, `hexbin()`, is an alternative to `scatter()` for large datasets. It makes something like a `pcolor()` of a 2-D histogram, but uses hexagonal bins.

New kwarg, `symmetric`, in `matplotlib.ticker.MaxNLocator` allows one require an axis to be centered around zero.

Toolkits must now be imported from `mpl_toolkits` (not `matplotlib.toolkits`)

Notes about the transforms refactoring

A major new feature of the 0.98 series is a more flexible and extensible transformation infrastructure, written in Python/Numpy rather than a custom C extension.

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is mostly an internal improvement, and the possible user-visible changes it allows are yet to come.

See `matplotlib.transforms` for a description of the design of the new transformation framework.

For efficiency, many of these functions return views into Numpy arrays. This means that if you hold on to a reference to them, their contents may change. If you want to store a snapshot of their current values, use the Numpy array method `copy()`.

The view intervals are now stored only in one place – in the `matplotlib.axes.Axes` instance, not in the locator instances as well. This means locators must get their limits from their `matplotlib.axis.Axis`, which in turn looks up its limits from the `Axes`. If a locator is used temporarily and not assigned to an Axis or Axes, (e.g., in `matplotlib.contour`), a dummy axis must be created to store its bounds. Call `matplotlib.ticker.TickHelper.create_dummy_axis()` to do so.

The functionality of `Pbox` has been merged with `Bbox`. Its methods now all return copies rather than modifying in place.

The following lists many of the simple changes necessary to update code from the old transformation framework to the new one. In particular, methods that return a copy are named with a verb in the past tense, whereas methods that alter an object in place are named with a verb in the present tense.

</tr>
</tbody>
</table>

The Polar class has moved to matplotlib.projections.polar.

---

1 The Bbox is bound by the points (x0, y0) to (x1, y1) and there is no defined order to these points, that is, x0 is not necessarily the left edge of the box. To get the left edge of the Bbox, use the read-only property xmin.

2 matplotlib.axes.Axes.get_position() used to return a list of points, now it returns a matplotlib.transforms.Bbox instance.

3 matplotlib.axes.Axes.set_position() now accepts either four scalars or a matplotlib.transforms.Bbox instance.

4 Since the refactoring allows for more than two scale types ('log' or 'linear'), it no longer makes sense to have a toggle. Axes.toggle_log_lineary() has been removed.
**Matplotlib, Release 3.3.0**

</tr>
</tbody>
</table>

---

5. `matplotlib.artist.Artist.set_clip_path()` now accepts a `matplotlib.path.Path` instance and a `matplotlib.transforms.Transform` that will be applied to the path immediately before clipping.

6. Linestyles are now treated like all other collection attributes, i.e. a single value or multiple values may be provided.
matplotlib.backend_bases

<tr>
<td>GraphicsContext.set_clip_path()</td>
<td>GraphicsContext.set_clip_path()</td>
</tr>
</tbody>
</table>

**RendererBase**

New methods:
- `draw_path(self, gc, path, transform, rgbFace)`
- `draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace)`
- `draw_path_collection(self, master_transform, cliprect, clippath, clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds)` [optional]

Changed methods:
- `draw_image(self, x, y, im, bbox)` is now `draw_image(self, x, y, im, bbox, clippath, clippath_trans)`

Removed methods:
- `draw_arc`
- `draw_line_collection`
- `draw_line`
- `draw_lines`
- `draw_point`
- `draw_quad_mesh`
- `draw_poly_collection`
- `draw_polygon`
- `draw_rectangle`
- `draw_regpoly_collection`

**16.1.28 Changes for 0.98.1**

- Removed broken `matplotlib.axes3d` support and replaced it with a non-implemented error pointing to 0.91.x

7 `matplotlib.backend_bases.GraphicsContextBase.get_clip_path()` returns a tuple of the form `(path, affine_transform)`, where `path` is a `matplotlib.path.Path` instance and `affine_transform` is a `matplotlib.transforms.Affine2D` instance.

8 `matplotlib.backend_bases.GraphicsContextBase.set_clip_path()` now only accepts a `matplotlib.transforms.TransformedPath` instance.
16.1.29 Changes for 0.98.x

- `psd()`, `csd()`, and `cohere()` will now automatically wrap negative frequency components to the beginning of the returned arrays. This is much more sensible behavior and makes them consistent with `specgram()`. The previous behavior was more of an oversight than a design decision.

- Added new keyword parameters `nonposx`, `nonposy` to `matplotlib.axes.Axes` methods that set log scale parameters. The default is still to mask out non-positive values, but the kwargs accept 'clip', which causes non-positive values to be replaced with a very small positive value.

- Added new `matplotlib.pyplot.fignum_exists()` and `matplotlib.pyplot.get_fignums()`; they merely expose information that had been hidden in `matplotlib._pylab_helpers`.

- Deprecated numerix package.

- Added new `matplotlib.image.imsave()` and exposed it to the `matplotlib.pyplot` interface.

- Remove support for pyExcelerator in exceltools – use xlwt instead.

- Changed the defaults of `acorr` and `xcorr` to use `usevlines=True`, `maxlags=10` and `normed=True` since these are the best defaults.

- Following keyword parameters for `matplotlib.legend.Legend` are now deprecated and new set of parameters are introduced. The new parameters are given as a fraction of the font-size. Also, `scatteryoffsets`, `fancybox` and `columnspacing` are added as keyword parameters.

<table>

<td>borderaxespad</td>
</tr>
</tbody>
</table>

- Removed the configobj and experimental traits rc support.

- Modified `matplotlib.mlab.psd()`, `matplotlib.mlab.csd()`, `matplotlib.mlab.cohere()`, and `matplotlib.mlab.specgram()` to scale one-sided densities by a factor of 2. Also, optionally scale the densities by the sampling frequency, which gives true values of densities that can be integrated by the returned frequency values. This also gives better MATLAB compatibility. The corresponding `matplotlib.axes.Axes` methods and `matplotlib.pyplot` functions were updated as well.

- Font lookup now uses a nearest-neighbor approach rather than an exact match. Some fonts may be different in plots, but should be closer to what was requested.

- `matplotlib.afm.AFM.get_fullname()` and `matplotlib.afm.AFM.get_familyname()` no longer raise an exception if the AFM file does not specify these optional attributes, but returns a guess based on the required FontName attribute.

- Changed precision kwarg in `matplotlib.pyplot.spy()`; default is 0, and the string value ‘present’ is used for sparse arrays only to show filled locations.

- `matplotlib.collections.EllipseCollection` added.
• Added angles kwarg to `matplotlib.pyplot.quiver()` for more flexible specification of the arrow angles.

• Deprecated (raise NotImplementedError) all the mlab2 functions from `matplotlib.mlab` out of concern that some of them were not clean room implementations.

• Methods `matplotlib.collections.Collection.get_offsets()` and `matplotlib.collections.Collection.set_offsets()` added to `Collection` base class.

• `matplotlib.figure.Figure.figurePatch` renamed `matplotlib.figure.Figure.patch`; `matplotlib.axes.Axes.axesPatch` renamed `matplotlib.axes.Axes.patch`; `matplotlib.axes.Axes.axesFrame` renamed `matplotlib.axes.Axes.frame`. `matplotlib.axes.Axes.get_frame`, which returns `matplotlib.axes.Axes.patch`, is deprecated.

• Changes in the `matplotlib.contour.ContourLabeler` attributes (`matplotlib.pyplot.clabel()` function) so that they all have a form like `.labelAttribute`. The three attributes that are most likely to be used by end users, `.cl`, `.cl_xy` and `.cl_cvalues` have been maintained for the moment (in addition to their renamed versions), but they are deprecated and will eventually be removed.

• Moved several functions in `matplotlib.mlab` and `matplotlib.cbook` into a separate module `matplotlib.numerical_methods` because they were unrelated to the initial purpose of mlab or cbook and appeared more coherent elsewhere.

16.1.30 Changes in 0.99

• `pylab` no longer provides a load and save function. These are available in `matplotlib.mlab`, or you can use `numpy.loadtxt` and `numpy.savetxt` for text files, or `np.save` and `np.load` for binary NumPy arrays.

• User-generated colormaps can now be added to the set recognized by `matplotlib.cm.get_cmap()`. Colormaps can be made the default and applied to the current image using `matplotlib.pyplot.pyplot.set_cmap()`.

• changed use_mrecords default to False in mlab.csv2rec since this is partially broken

• Axes instances no longer have a “frame” attribute. Instead, use the new “spines” attribute. Spines is a dictionary where the keys are the names of the spines (e.g., ‘left’, ‘right’ and so on) and the values are the artists that draw the spines. For normal (rectilinear) axes, these artists are Line2D instances. For other axes (such as polar axes), these artists may be Patch instances.

• Polar plots no longer accept a resolution kwarg. Instead, each Path must specify its own number of interpolation steps. This is unlikely to be a user-visible change – if interpolation of data is required, that should be done before passing it to Matplotlib.

16.1.31 Changes beyond 0.99.x

• The default behavior of `matplotlib.axes.Axes.set_xlim()`, `matplotlib.axes.Axes.set_ylim()`, and `matplotlib.axes.Axes.azis()`, and their corresponding pyplot functions, has been changed: when view limits are set explicitly with one of these methods, autoscaling is turned off for the matching axis. A new `auto` kwarg is available to control this behavior. The limit kwargs have been renamed to `left` and `right` instead of `xmin` and `xmax`, and `bottom` and `top` instead of `ymin` and `ymax`. The old names may still be used, however.
• There are five new Axes methods with corresponding pyplot functions to facilitate auto-
scaling, tick location, and tick label formatting, and the general appearance of ticks
and tick labels:

- `matplotlib.axes.Axes.autoscale()` turns autoscaling on or off, and applies it.
- `matplotlib.axes.Axes.margins()` sets margins used to autoscale the `matplotlib.axes.Axes.viewLim` based on the `matplotlib.axes.Axes.dataLim`.
- `matplotlib.axes.Axes.locator_params()` allows one to adjust axes locator parameters such as `nbins`.
- `matplotlib.axes.Axes.ticklabel_format()` is a convenience method for controlling the `matplotlib.ticker.ScalarFormatter` that is used by default with linear axes.
- `matplotlib.axes.Axes.tick_params()` controls direction, size, visibility, and color of ticks and their labels.

• The `matplotlib.axes.Axes.bar()` method accepts a `error_kw` kwarg; it is a dictionary of kwargs to be passed to the errorbar function.

• The `matplotlib.axes.Axes.hist()` `color` kwarg now accepts a sequence of color specs to match a sequence of datasets.

• The `EllipseCollection` has been changed in two ways:

  - There is a new `units` option, ‘xy’, that scales the ellipse with the data units. This matches the :class:`~matplotlib.patches.Ellipse` scaling.
  - The `height` and `width` kwargs have been changed to specify the height and width, again for consistency with `Ellipse`, and to better match their names; previously they specified the half-height and half-width.

• There is a new rc parameter `axes.color_cycle`, and the color cycle is now independent of the rc parameter `lines.color`. `matplotlib.Axes.set_default_color_cycle` is deprecated.

• You can now print several figures to one pdf file and modify the document information dictionary of a pdf file. See the docstrings of the class `matplotlib.backends.backend_pdf.PdfPages` for more information.

• Removed `configobj` and `enthought.traits` packages, which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently.

• The new rc parameter `savefig.extension` sets the filename extension that is used by `matplotlib.figure.Figure.savefig()` if its `fname` argument lacks an extension.

• In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```python
draw_path_collection(self, master_transform, cliprect, clippath,
    clippath_trans, paths, all_transforms, offsets,
    offsetTrans, facecolors, edgecolors, linewidths,
    linestyles, antialiaseds, urls)
```

# is now

```python
draw_path_collection(self, gc, master_transform, paths, all_transforms,
    offsets, offsetTrans, facecolors, edgecolors,
    linewidths, linestyles, antialiaseds, urls)
```
draw_quad_mesh(self, master_transform, cliprect, clippath,
    clippath_trans, meshWidth, meshHeight, coordinates,
    offsets, offsetTrans, facecolors, antialiased,
    showedges)

# is now

draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
    coordinates, offsets, offsetTrans, facecolors,
    antialiased, showedges)

draw_image(self, x, y, im, bbox, clippath=None, clippath_trans=None)

# is now

draw_image(self, gc, x, y, im)

- There are four new Axes methods with corresponding pyplot functions that deal with
  unstructured triangular grids:
  - matplotlib.axes.Axes.tricontour() draws contour lines on a triangular grid.
  - matplotlib.axes.Axes.tricontourf() draws filled contours on a triangular grid.
  - matplotlib.axes.Axes.tripcolor() draws a pseudocolor plot on a triangular grid.
  - matplotlib.axes.Axes.triplot() draws a triangular grid as lines and/or markers.

16.1.32 Changes in 1.1.x

- Added new matplotlib.sankey.Sankey for generating Sankey diagrams.
- In imshow(), setting interpolation to ‘nearest’ will now always mean that the nearest-
  neighbor interpolation is performed. If you want the no-op interpolation to be performed,
  choose ‘none’.
- There were errors in how the tri-functions were handling input parameters that had to be
  fixed. If your tri-plots are not working correctly anymore, or you were working around
  apparent mistakes, please see issue #203 in the github tracker. When in doubt, use
  kwargs.
- The ‘symlog’ scale had some bad behavior in previous versions. This has now been fixed
  and users should now be able to use it without frustrations. The fixes did result in some
  minor changes in appearance for some users who may have been depending on the bad
  behavior.
- There is now a common set of markers for all plotting functions. Previously, some mark-
  ers existed only for scatter() or just for plot(). This is now no longer the case. This
  merge did result in a conflict. The string ‘d’ now means “thin diamond” while ‘D’ will
  mean “regular diamond”.

16.1.33 Changes in 1.2.x

- The classic option of the rc parameter toolbar is deprecated and will be removed in the
  next release.
• The matplotlib.cbook.isvector method has been removed since it is no longer functional.

• The rasterization_zorder property on Axes sets a zorder below which artists are rasterized. This has defaulted to -30000.0, but it now defaults to None, meaning no artists will be rasterized. In order to rasterize artists below a given zorder value, set_rasterization_zorder must be explicitly called.

• In scatter(), and scatter, when specifying a marker using a tuple, the angle is now specified in degrees, not radians.

• Using twinx() or twiny() no longer overrides the current locaters and formatters on the axes.

• In contourf(), the handling of the extend kwarg has changed. Formerly, the extended ranges were mapped after to 0, 1 after being normed, so that they always corresponded to the extreme values of the colormap. Now they are mapped outside this range so that they correspond to the special colormap values determined by the set_under() and set_over() methods, which default to the colormap end points.

• The new rc parameter savefig.format replaces cairo.format and savefig.extension, and sets the default file format used by matplotlib.figure.Figure.savefig().

• In pyplot.pie() and axes.Axes.pie(), one can now set the radius of the pie; setting the radius to ’None’ (the default value), will result in a pie with a radius of 1 as before.

• Use of matplotlib.projections.projection_factory is now deprecated in favour of axes class identification using matplotlib.projections.process_projection_requirements followed by direct axes class invocation (at the time of writing, functions which do this are: add_axes(), add_subplot() and gca()). Therefore:

```python
key = figure._make_key(*args, **kwargs)
ispolar = kwargs.pop('polar', False)
projection = kwargs.pop('projection', None)
if ispolar:
    if projection is not None and projection != 'polar':
        raise ValueError('polar and projection args are inconsistent')
    projection = 'polar'
ax = projection_factory(projection, self, rect, **kwargs)
key = self._make_key(*args, **kwargs)

# is now

projection_class, kwargs, key = \
process_projection_requirements(self, *args, **kwargs)
ax = projection_class(self, rect, **kwargs)
```

This change means that third party objects can expose themselves as Matplotlib axes by providing a _as_mpl_axes method. See Developer’s guide for creating scales and transformations for more detail.

• A new keyword extendfrac in colorbar() and ColorbarBase allows one to control the size of the triangular minimum and maximum extensions on colorbars.

• A new keyword capthick in errorbar() has been added as an intuitive alias to the markeredgewidth and mew keyword arguments, which indirectly controlled the thickness of the caps on the errorbars. For backwards compatibility, specifying either of the original keyword arguments will override any value provided by capthick.

• Transform subclassing behaviour is now subtly changed. If your transform implements a non-affine transformation, then it should override the transform_non_affine method,
rather than the generic transform method. Previously transforms would define transform
and then copy the method into transform_non_affine:

```python
class MyTransform(mtrans.Transform):
    def transform(self, xy):
        ...
    transform_non_affine = transform
```

This approach will no longer function correctly and should be changed to:

```python
class MyTransform(mtrans.Transform):
    def transform_non_affine(self, xy):
        ...
```

- Artists no longer have x_isdata or y_isdata attributes; instead any artist’s transform can
be interrogated with artist_instance.get_transform().contains_branch(ax.transData)
- Lines added to an axes now take into account their transform when updating the data and
view limits. This means transforms can now be used as a pre-transform. For instance:

```python
>>> import matplotlib.pyplot as plt
>>> import matplotlib.transforms as mtrans
>>> ax = plt.axes()
>>> ax.plot(range(10), transform=mtrans.Affine2D().scale(10) + ax.transData)
>>> print(ax.viewLim)
Bbox('array([[ 0., 0.],
         [ 90., 90.]])')
```

- One can now easily get a transform which goes from one transform’s coordinate system
to another, in an optimized way, using the new subtract method on a transform. For
instance, to go from data coordinates to axes coordinates:

```python
>>> import matplotlib.pyplot as plt
>>> ax = plt.axes()
>>> data2ax = ax.transData - ax.transAxes
>>> print(ax.transData.depth, ax.transAxes.depth)
3, 1
>>> print(data2ax.depth)
2
```

for versions before 1.2 this could only be achieved in a sub-optimal way, using ax.
transData + ax.transAxes.inverted() (depth is a new concept, but had it existed it would
return 4 for this example).
- twinx and twiny now returns an instance of SubplotBase if parent axes is an instance of
SubplotBase.
- All Qt3-based backends are now deprecated due to the lack of py3k bindings. Qt and
QtAgg backends will continue to work in v1.2.x for py2.6 and py2.7. It is anticipated
that the Qt3 support will be completely removed for the next release.
- matplotlib.colors.ColorConverter, Colormap and Normalize now subclasses object
- ContourSet instances no longer have a transform attribute. Instead, access the transform
with the get_transform method.

16.1.34 Changes in 1.3.x
Changes in 1.3.1

It is rare that we make an API change in a bugfix release, however, for 1.3.1 since 1.3.0 the following change was made:

- text.Text.cached (used to cache font objects) has been made into a private variable. Among the obvious encapsulation benefit, this removes this confusing-looking member from the documentation.

- The method hist() now always returns bin occupancies as an array of type float. Previously, it was sometimes an array of type int, depending on the call.

Code removal

- The following items that were deprecated in version 1.2 or earlier have now been removed completely.
  - The Qt 3.x backends (qt and qt4agg) have been removed in favor of the Qt 4.x backends (qt4 and qt4agg).
  - The FltkAgg and Emf backends have been removed.
  - The matplotlib.nxutils module has been removed. Use the functionality on matplotlib.path.Path.contains_point and friends instead.
  - The following keyword arguments to the legend function have been renamed:
    * pad -> borderpad
    * labelsep -> labelspacing
    * handlelen -> handlelength
    * handletextsep -> handletextpad
    * axespad -> borderaxespad
  
  Related to this, the following rcParams have been removed:
    * legend.pad,
    * legend.labelsep,
    * legend.handlelen,
    * legend.handletextsep and
    * legend.axespad

  - For the hist function, instead of width, use rwidth (relative width).
  - On patches.Circle, the resolution keyword argument has been removed. For a circle made up of line segments, use patches.CirclePolygon.
  
  - The printing functions in the Wx backend have been removed due to the burden of keeping them up-to-date.
  
  - mlab.iaupunov has been removed.
  - mlab.save, mlab.load, pylab.save and pylab.load have been removed. We recommend using numpy.savetxt and numpy.loadtxt instead.
- widgets.HorizontalSpanSelector has been removed. Use widgets.SpanSelector instead.

Code deprecation

- The CocoaAgg backend has been deprecated, with the possibility for deletion or resurrection in a future release.

- The top-level functions in matplotlib.path that are implemented in C++ were never meant to be public. Instead, users should use the Pythonic wrappers for them in the path.Path and collections.Collection classes. Use the following mapping to update your code:
  - point_in_path -> path.Path.contains_point
  - get_path_extents -> path.Path.get_extents
  - point_in_path_collection -> collections.Collection.contains
  - path_in_path -> path.Path.contains_path
  - path_intersects_path -> path.Path.intersects_path
  - convert_path_to_polygons -> path.Path.to_polygons
  - cleanup_path -> path.Path.cleaned
  - points_in_path -> path.Path.contains_points
  - clip_path_to_rect -> path.Path.clip_to_bbox

- matplotlib.colors.normalize and matplotlib.colors.no_norm have been deprecated in favour of matplotlib.colors.Normalize and matplotlib.colors.NoNorm respectively.

- The ScalarMappable class’ set_colorbar method is now deprecated. Instead, the matplotlib.cm.ScalarMappable.colorbar attribute should be used. In previous Matplotlib versions this attribute was an undocumented tuple of (colorbar_instance, colorbar_axes) but is now just colorbar_instance. To get the colorbar axes it is possible to just use the ax attribute on a colorbar instance.

- The matplotlib.mpl module is now deprecated. Those who relied on this module should transition to simply using import matplotlib as mpl.

Code changes

- Patch now fully supports using RGBA values for its facecolor and edgecolor attributes, which enables faces and edges to have different alpha values. If the Patch object’s alpha attribute is set to anything other than None, that value will override any alpha-channel value in both the face and edge colors. Previously, if Patch had alpha=None, the alpha component of edgecolor would be applied to both the edge and face.

- The optional isRGB argument to set_foreground() (and the other GraphicsContext classes that descend from it) has been renamed to isRGBA, and should now only be set to True if the fg color argument is known to be an RGBA tuple.

- For Patch, the capstyle used is now butt, to be consistent with the default for most other objects, and to avoid problems with non-solid linestyle appearing solid when using a large linewidth. Previously, Patch used capstyle='projecting'.
• *Path* objects can now be marked as *readonly* by passing *readonly=True* to its constructor. The built-in path singletons, obtained through *Path.unit* class methods return readonly paths. If you have code that modified these, you will need to make a deepcopy first, using either:

```python
import copy
def path = copy.deepcopy(Path.unit_circle())
```

Deep copying a *Path* always creates an editable (i.e. non-readonly) *Path*.

• The list at *Path.NUM_VERTICES* was replaced by a dictionary mapping *Path* codes to the number of expected vertices at *NUM_VERTICES_FOR_CODE*.

• To support XKCD style plots, the *matplotlib.path.cleanup_path* method’s signature was updated to require a sketch argument. Users of *matplotlib.path.cleanup_path* are encouraged to use the new *cleaned()* *Path* method.

• Data limits on a plot now start from a state of having “null” limits, rather than limits in the range (0, 1). This has an effect on artists that only control limits in one direction, such as *axes.Axes.axvline* and *axes.Axes.axhline*, since their limits will no longer also include the range (0, 1). This fixes some problems where the computed limits would be dependent on the order in which artists were added to the axes.

• Fixed a bug in setting the position for the right/top spine with data position type. Previously, it would draw the right or top spine at +1 data offset.

• In *FancyArrow*, the default arrow head width, head_width, has been made larger to produce a visible arrow head. The new value of this kwarg is head_width = 20 * width.

• It is now possible to provide number of levels + 1 colors in the case of extend='both' for contourf (or just number of levels colors for an extend value min or max) such that the resulting colormap’s set_under and set_over are defined appropriately. Any other number of colors will continue to behave as before (if more colors are provided than levels, the colors will be unused). A similar change has been applied to contour, where extend='both' would expect number of levels + 2 colors.

• A new keyword *extendrect* in *colorbar()* and *ColorbarBase* allows one to control the shape of colorbar extensions.

• The extension of *MultiCursor* to both vertical (default) and/or horizontal cursor implied that *self.line* is replaced by *self.vline* for vertical cursors lines and *self.hline* is added for the horizontal cursors lines.

• On POSIX platforms, the *report_memory()* function raises *NotImplementedError* instead of *OSError* if the *ps* command cannot be run.

• The *matplotlib.cbook.check_output* function has been moved to *matplotlib.compat.subprocess*.

**Configuration and rcParams**

• On Linux, the user-specific *matplotlibrc* configuration file is now located in *~/.config/matplotlib/matplotlibrc* to conform to the *XDG Base Directory Specification*. 
• The `font.*` rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.

• Removed call of `grid()` in `matplotlib.pyplot.plotfile`. To draw the axes grid, set the `axes.grid` rcParam to `True`, or explicitly call `grid()`.

16.1.35 Changes in 1.4.x

Code changes

• A major refactoring of the axes module was made. The axes module has been split into smaller modules:
  - the `_base` module, which contains a new private `_AxesBase` class. This class contains all methods except plotting and labelling methods.
  - the `axes` module, which contains the `axes.Axes` class. This class inherits from `_AxesBase`, and contains all plotting and labelling methods.
  - the `_subplot` module, with all the classes concerning sub plotting.

There are a couple of things that do not exists in the `axes` module’s namespace anymore. If you use them, you need to import them from their original location:

• `math` -> import math
• `ma` -> from numpy import ma
• `cbook` -> from matplotlib import cbook
• `docstring` -> from matplotlib import docstring
• `is_sequence_of_strings` -> from matplotlib.cbook import is_sequence_of_strings
• `is_string_like` -> from matplotlib.cbook import is_string_like
• `iterable` -> from matplotlib.cbook import iterable
• `itertools` -> import itertools
• `martist` -> from matplotlib import artist as martist
• `matplotlib` -> import matplotlib
• `mcoll` -> from matplotlib import collections as mcoll
• `mcolors` -> from matplotlib import colors as mcolors
• `mcontour` -> from matplotlib import contour as mcontour
• `mpatches` -> from matplotlib import patches as mpatches
• `mpath` -> from matplotlib import path as mpath
• `mquiver` -> from matplotlib import quiver as mquiver
• `mstack` -> from matplotlib import stack as mstack
• `mstream` -> from matplotlib import stream as mstream
• `mtable` -> from matplotlib import table as mtable
• As part of the refactoring to enable Qt5 support, the module matplotlib.backends.
qt4_compat was renamed to matplotlib.backends.qt_compat. qt4_compat is deprecated in
1.4 and will be removed in 1.5.

• The errorbar() method has been changed such that the upper and lower limits (lolims,
uplims, xlolims, xuplims) now point in the correct direction.

• The fmt kwarg for errorbar() now supports the string ‘none’ to suppress drawing of a
line and markers; use of the None object for this is deprecated. The default fmt value
is changed to the empty string ("), so the line and markers are governed by the plot()
defaults.

• A bug has been fixed in the path effects rendering of fonts, which now means that the
font size is consistent with non-path effect fonts. See https://github.com/matplotlib/
matplotlib/issues/2889 for more detail.

• The Sphinx extensions ipython_directive and ipython_console_highlighting have been
moved to the IPython project itself. While they remain in Matplotlib for this release, they
have been deprecated. Update your extensions in conf.py to point to IPython.sphinxext.
ipython_directive instead of matplotlib.sphinxext.ipython_directive.

• In matplotlib.finance, almost all functions have been deprecated and replaced with a
pair of functions name *_ochl and *_ohlc. The former is the ‘open-close-high-low’ order
of quotes used previously in this module, and the latter is the ‘open-high-low-close’ order
that is standard in finance.

• For consistency the face_alpha keyword to matplotlib.pathEffects.SimplePathEffect has
been deprecated in favour of the alpha keyword. Similarly, the keyword offset_xy is
now named offset across all AbstractPathEffectS. matplotlib.pathEffects.Base has
been renamed to matplotlib.pathEffects(AbstractPathEffect, matplotlib.pathEffect.
ProxyRenderer has been renamed to matplotlib.pathEffects.PathEffectRenderer and is
now a full RendererBase subclass.

• The artist used to draw the outline of a Figure.colorbar has been changed from a
matplotlib.lines.Line2D to matplotlib.patches.Polygon, thus colorbar.ColorbarBase.
outline is now a matplotlib.patches.Polygon object.

• The legend handler interface has changed from a callable, to any object which imple-
ments the legend_artists method (a deprecation phase will see this interface be main-
tained for v1.4). See Legend guide for further details. Further legend changes include:

  - matplotlib.axes.Axes._get_legend_handles now returns a generator of handles,
    rather than a list.
  - The legend() function’s loc positional argument has been deprecated. Use the loc
    keyword argument instead.

• The rcParams["savefig.transparent"] (default: False) has been added to control default
transparency when saving figures.

• Slightly refactored the Annotation family. The text location in Annotation is now entirely
handled by the underlying Text object so .set_position works as expected. The attributes
xytext and textcoords have been deprecated in favor of xyann and anncoords so that
Annotation and AnnotationBox can share a common sensibly named api for getting/setting
the location of the text or box.

  - xyann -> set the location of the annotation
  - xy -> set where the arrow points to
  - anncoords -> set the units of the annotation location
- `xycoords` -> set the units of the point location
- `set_position()` -> `Annotation` only set location of annotation

- `matplotlib.mlab.specgram`, `matplotlib.mlab.psd`, `matplotlib.mlab.csd`, `matplotlib.mlab.cohere`, `matplotlib.mlab.coherence_pairs`, `matplotlib.pyplot.specgram`, `matplotlib.pyplot.psd`, `matplotlib.pyplot.csd`, and `matplotlib.pyplot.coherence` now raise `ValueError` where they previously raised `AssertionError`.

- For `matplotlib.mlab.psd`, `matplotlib.mlab.csd`, `matplotlib.mlab.cohere`, `matplotlib.mlab.coherence_pairs`, `matplotlib.pyplot.specgram`, `matplotlib.pyplot.psd`, `matplotlib.pyplot.csd`, and `matplotlib.pyplot.coherence`, in cases where a shape `(n, 1)` array is returned, this is now converted to a `(n,)` array. Previously, `(n, m)` arrays were averaged to an `(n,)` array, but `(n, 1)` arrays were returned unchanged. This change makes the dimensions consistent in both cases.

- Added the `rcParams["axes.formatter.useoffset"]` (default: `True`) to control the default value of `useOffset` in `ticker.ScalarFormatter`

- Added `Formatter` sub-class `StrMethodFormatter` which does the exact same thing as `FormatStrFormatter`, but for new-style formatting strings.

- Deprecated `matplotlib.testing.image_util` and the only function within, `matplotlib.testing.image_util.autocontrast`. These will be removed completely in v1.5.0.

- The `fmt` argument of `plot_date()` has been changed from `bo` to just `o`, so color cycling can happen by default.

- Removed the class `FigureManagerQTAgg` and deprecated `NavigationToolbar2QTAgg` which will be removed in 1.5.

- Removed formerly public (non-prefixed) attributes `rect` and `drawRect` from `FigureCanvasQTAgg`; they were always an implementation detail of the (preserved) `drawRectangle()` function.

- The function signatures of `tight_bbox.adjust_bbox` and `tight_bbox.process_figure_for_rasterizing` have been changed. A new `fixed_dpi` parameter allows for overriding the `figure.dpi` setting instead of trying to deduce the intended behaviour from the file format.

- Added support for horizontal/vertical axes padding to `mpl_toolkits.axes_grid1.axes_grid.ImageGrid` — argument `axes_pad` can now be tuple-like if separate axis padding is required. The original behavior is preserved.

- Added support for skewed transforms to `matplotlib.transforms.Affine2D`, which can be created using the `skew` and `skew_deg` methods.

- Added clockwise parameter to control sectors direction in `axes.Axes.pie`

- In `matplotlib.lines.Line2D` the `markevery` functionality has been extended. Previously an integer start-index and stride-length could be specified using either a two-element-list or a two-element-tuple. Now this can only be done using a two-element-tuple. If a two-element-list is used then it will be treated as NumPy fancy indexing and only the two markers corresponding to the given indexes will be shown.

- Removed `prop` keyword argument from `mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar` call. It was passed through to the base-class `__init__` and is only used for setting padding. Now `fontproperties` (which is what is really used to set the font properties of `AnchoredSizeBar`) is passed through in place of `prop`. If `fontproperties` is not passed in, but `prop` is, then `prop` is used in place of `fontproperties`. If both are passed in, `prop` is silently ignored.
• The use of the index 0 in `pyplot.subplot` and related commands is deprecated. Due to a lack of validation, calling `plt.subplots(2, 2, 0)` does not raise an exception, but puts an axes in the last position. This is due to the indexing in subplot being 1-based (to mirror MATLAB) so before indexing into the `GridSpec` object used to determine where the axes should go, 1 is subtracted off. Passing in 0 results in passing -1 to `GridSpec` which results in getting the last position back. Even though this behavior is clearly wrong and not intended, we are going through a deprecation cycle in an abundance of caution that any users are exploiting this ‘feature’. The use of 0 as an index will raise a warning in 1.4 and an exception in 1.5.

• Clipping is now off by default on offset boxes.

• Matplotlib now uses a less-aggressive call to `gc.collect(1)` when closing figures to avoid major delays with large numbers of user objects in memory.

• The default clip value of all pie artists now defaults to `False`.

**Code removal**

• Removed `mlab.levypdf`. The code raised a NumPy error (and has for a long time) and was not the standard form of the Levy distribution. `scipy.stats.levy` should be used instead.

**16.1.36 Changes in 1.5.0**

**Code Changes**

**Reversed `matplotlib.cbook.ls_mapper`, added `ls_mapper_r`**

Formerly, `matplotlib.cbook.ls_mapper` was a dictionary with the long-form line-style names ("solid") as keys and the short forms ("-") as values. This long-to-short mapping is now done by `ls_mapper_r`, and the short-to-long mapping is done by the `ls_mapper`.

**Prevent moving artists between Axes, Property-ify Artist.axes, deprecate Artist.{get,set}_axes**

This was done to prevent an Artist that is already associated with an Axes from being moved/add to a different Axes. This was never supported as it causes havoc with the transform stack. The apparent support for this (as it did not raise an exception) was the source of multiple bug reports and questions on SO.

For almost all use-cases, the assignment of the axes to an artist should be taken care of by the axes as part of the `Axes.add_*` method, hence the deprecation of `{get,set}_axes`.

Removing the `set_axes` method will also remove the ‘axes’ line from the ACCEPTS kwarg tables (assuming that the removal date gets here before that gets overhauled).

**Tightened input validation on ‘pivot’ kwarg to quiver**

Tightened validation so that only {'tip', 'tail', 'mid', and 'middle'} (but any capitalization) are valid values for the `pivot` keyword argument in the `Quiver` class (and hence `axes.Axes.quiver` and `pyplot.quiver` which both fully delegate to `Quiver`). Previously any input matching ‘mid.***
would be interpreted as 'middle', 'tip.*' as 'tip' and any string not matching one of those patterns as 'tail'.

The value of `Quiver.pivot` is normalized to be in the set {'tip', 'tail', 'middle'} in `Quiver`.

**Reordered Axes.get_children**

The artist order returned by `axes.Axes.get_children` did not match the one used by `axes.Axes.draw`. They now use the same order, as `axes.Axes.draw` now calls `axes.Axes.get_children`.

**Changed behaviour of contour plots**

The default behaviour of `contour()` and `contourf()` when using a masked array is now determined by the new keyword argument `corner_mask`, or if this is not specified then the new `rcParams["contour.corner_mask"]` (default: True) instead. The new default behaviour is equivalent to using `corner_mask=True`; the previous behaviour can be obtained using `corner_mask=False` or by changing the rcParam. The example [http://matplotlib.org/examples/pylab_examples/contour_corner_mask.html](http://matplotlib.org/examples/pylab_examples/contour_corner_mask.html) demonstrates the difference. Use of the old contouring algorithm, which is obtained with `corner_mask='legacy'`, is now deprecated.

Contour labels may now appear in different places than in earlier versions of Matplotlib.

In addition, the keyword argument `nchunk` now applies to `contour()` as well as `contourf()`, and it subdivides the domain into subdomains of exactly `nchunk` by `nchunk` quads, whereas previously it was only roughly `nchunk` by `nchunk` quads.

The C/C++ object that performs contour calculations used to be stored in the public attribute `QuadContourSet.Cntr`, but is now stored in a private attribute and should not be accessed by end users.

**Added set_params function to all Locator types**

This was a bug fix targeted at making the api for Locators more consistent.

In the old behavior, only locators of type MaxNLocator have `set_params()` defined, causing its use on any other Locator to raise an `AttributeError` (aside: `set_params(args)` is a function that sets the parameters of a Locator instance to be as specified within args). The fix involves moving `set_params()` to the Locator class such that all subtypes will have this function defined.

Since each of the Locator subtypes have their own modifiable parameters, a universal `set_params()` in Locator isn’t ideal. Instead, a default no-operation function that raises a warning is implemented in Locator. Subtypes extending Locator will then override with their own implementations. Subtypes that do not have a need for `set_params()` will fall back onto their parent’s implementation, which raises a warning as intended.

In the new behavior, Locator instances will not raise an `AttributeError` when `set_params()` is called. For Locators that do not implement `set_params()`, the default implementation in Locator is used.

**Disallow None as x or y value in ax.plot**

Do not allow `None` as a valid input for the `x` or `y` args in `axes.Axes.plot`. This may break some user code, but this was never officially supported (ex documented) and allowing `None` objects
through can lead to confusing exceptions downstream.

To create an empty line use

```python
ln1, = ax.plot([], [], ...
ln2, = ax.plot([], ...
```

In either case to update the data in the `Line2D` object you must update both the x and y data.

**Removed args and kwargs from MicrosecondLocator.__call__**

The call signature of `__call__()` has changed from `__call__(self, *args, **kwargs)` to `__call__(self)`. This is consistent with the superclass `Locator` and also all the other Locators derived from this superclass.

**No ValueError for the MicrosecondLocator and YearLocator**

The `MicrosecondLocator` and `YearLocator` objects when called will return an empty list if the axes have no data or the view has no interval. Previously, they raised a `ValueError`. This is consistent with all the Date Locators.

**'OffsetBox.DrawingArea' respects the 'clip' keyword argument**

The call signature was `OffsetBox.DrawingArea(..., clip=True)` but nothing was done with the `clip` argument. The object did not do any clipping regardless of that parameter. Now the object can and does clip the child `Artist` if they are set to be clipped.

You can turn off the clipping on a per-child basis using `child.set_clip_on(False)`.

**Add salt to clipPath id**

Add salt to the hash used to determine the id of the `clipPath` nodes. This is to avoid conflicts when two svg documents with the same clip path are included in the same document (see [https://github.com/ipython/ipython/issues/8133](https://github.com/ipython/ipython/issues/8133) and [https://github.com/matplotlib/matplotlib/issues/4349](https://github.com/matplotlib/matplotlib/issues/4349)), however this means that the svg output is no longer deterministic if the same figure is saved twice. It is not expected that this will affect any users as the current ids are generated from an md5 hash of properties of the clip path and any user would have a very difficult time anticipating the value of the id.

**Changed snap threshold for circle markers to inf**

When drawing circle markers above some marker size (previously 6.0) the path used to generate the marker was snapped to pixel centers. However, this ends up distorting the marker away from a circle. By setting the snap threshold to inf snapping is never done on circles.

This change broke several tests, but is an improvement.
Preserve units with Text position

Previously the ‘get_position’ method on Text would strip away unit information even though the units were still present. There was no inherent need to do this, so it has been changed so that unit data (if present) will be preserved. Essentially a call to ‘get_position’ will return the exact value from a call to ‘set_position’.

If you wish to get the old behaviour, then you can use the new method called ‘get_unitless_position’.

New API for custom Axes view changes

Interactive pan and zoom were previously implemented using a Cartesian-specific algorithm that was not necessarily applicable to custom Axes. Three new private methods, matplotlib.axes._base._AxesBase._get_view, matplotlib.axes._base._AxesBase._set_view, and matplotlib.axes._base._AxesBase._set_view_from_bbox, allow for custom Axes classes to override the pan and zoom algorithms. Implementors of custom Axes who override these methods may provide suitable behaviour for both pan and zoom as well as the view navigation buttons on the interactive toolbars.

MathTex visual changes

The spacing commands in mathtext have been changed to more closely match vanilla TeX.

Improved spacing in mathtext

The extra space that appeared after subscripts and superscripts has been removed.

No annotation coordinates wrap

In #2351 for 1.4.0 the behavior of ['axes points', 'axes pixel', 'figure points', 'figure pixel'] as coordinates was changed to no longer wrap for negative values. In 1.4.3 this change was reverted for ‘axes points’ and ‘axes pixel’ and in addition caused ‘axes fraction’ to wrap. For 1.5 the behavior has been reverted to as it was in 1.4.0-1.4.2, no wrapping for any type of coordinate.

Deprecation

Deprecated GraphicsContextBase.set_graylevel

The GraphicsContextBase.set_graylevel function has been deprecated in 1.5 and will be removed in 1.6. It has been unused. The GraphicsContextBase.set_foreground could be used instead.
deprecated idle_event

The `idle_event` was broken or missing in most backends and causes spurious warnings in some cases, and its use in creating animations is now obsolete due to the `animations` module. Therefore code involving it has been removed from all but the wx backend (where it partially works), and its use is deprecated. The `animation` module may be used instead to create animations.

color_cycle deprecated

In light of the new property cycling feature, the Axes method `set_color_cycle` is now deprecated. Calling this method will replace the current property cycle with one that cycles just the given colors.

Similarly, the rc parameter `axes.color_cycle` is also deprecated in lieu of the new `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`) parameter. Having both parameters in the same rc file is not recommended as the result cannot be predicted. For compatibility, setting `axes.color_cycle` will replace the cycler in `rcParams["axes.prop_cycle"]` (default: `cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])`) with a color cycle. Accessing `axes.color_cycle` will return just the color portion of the property cycle, if it exists.

Timeline for removal has not been set.

Bundled jquery

The version ofjquery bundled with the webagg backend has been upgraded from 1.7.1 to 1.11.3. If you are using the version of jquery bundled with webagg you will need to update your html files as such

```
- <script src="_static/jquery/js/jquery-1.7.1.min.js"></script>
+ <script src="_static/jquery/js/jquery-1.11.3.min.js"></script>
```

Code Removed

Removed Image from main namespace

Image was imported from PIL/pillow to test if PIL is available, but there is no reason to keep Image in the namespace once the availability has been determined.

Removed lod from Artist

Removed the method `set_lod` and all references to the attribute `_lod` as they are not used anywhere else in the code base. It appears to be a feature stub that was never built out.
Removed threading related classes from cbook

The classes Scheduler, Timeout, and Idle were in cbook, but are not used internally. They appear to be a prototype for the idle event system which was not working and has recently been pulled out.

Removed Lena images from sample_data

The lena.png and lena.jpg images have been removed from Matplotlib’s sample_data directory. The images are also no longer available from matplotlib.cbook.get_sample_data. We suggest using matplotlib.cbook.get_sample_data('grace_hopper.png') or matplotlib.cbook.get_sample_data('grace_hopper.jpg') instead.

Legend

Removed handling of loc as a positional argument to Legend

Legend handlers

Remove code to allow legend handlers to be callable. They must now implement a method legend_artist.

Axis

Removed method set_scale. This is now handled via a private method which should not be used directly by users. It is called via Axes.set_{x,y}scale which takes care of ensuring the related changes are also made to the Axes object.

finance.py

Removed functions with ambiguous argument order from finance.py

Annotation

Removed textcoords and xytext proprieties from Annotation objects.

sphinxext.ipython_*.*

Both ipython_console_highlighting and ipython_directive have been moved to IPython.

Change your import from matplotlib.sphinxext.ipython_directive to IPython.sphinxext.ipython_directive and from matplotlib.sphinxext.ipython_directive to IPython.sphinxext.ipython_directive
LineCollection.color

Deprecated in 2005, use set_color

remove 'faceted' as a valid value for shading in tri.tripcolor

Use edgecolor instead. Added validation on shading to only be valid values.

Remove faceted kwarg from scatter

Remove support for the faceted kwarg. This was deprecated in d48b34288e9651ff95c3b8a071ef5ac5cf50bae7 (2008-04-18!) and replaced by edgecolor.

Remove set_colorbar method from ScalarMappable

Remove set_colorbar method, use colorbar attribute directly.

patheffects.svg

• remove get_proxy_renderer method from AbstractPathEffect class
• remove patch_alpha and offset_xy from SimplePatchShadow

Remove testing.image_util.py

Contained only a no-longer used port of functionality from PIL

Remove mlab.FIFOBuffer

Not used internally and not part of core mission of mpl.

Remove mlab.prepca

Deprecated in 2009.

Remove NavigationToolbar2QTAgg

Added no functionality over the base NavigationToolbar2Qt

mpl.py

Remove the module matplotlib.mpl. Deprecated in 1.3 by PR #1670 and commit 78ce67d161625833cacff23cfe5d74920248c5b2
16.1.37 Changes in 1.5.2

Default Behavior Changes

Changed default autorange behavior in boxplots

Prior to v1.5.2, the whiskers of boxplots would extend to the minimum and maximum values if the quartiles were all equal (i.e., Q1 = median = Q3). This behavior has been disabled by default to restore consistency with other plotting packages.

To restore the old behavior, simply set autorange=True when calling plt.boxplot.

16.1.38 Changes in 1.5.3

ax.plot(..., marker=None) gives default marker

Prior to 1.5.3 keyword arguments passed to plot were handled in two parts – default keyword arguments generated internal to plot (such as the cycled styles) and user supplied keyword arguments. The internally generated keyword arguments were passed to the matplotlib.lines.Line2D and the user keyword arguments were passed to ln.set(**kwargs) to update the artist after it was created. Now both sets of keyword arguments are merged and passed to Line2D. This change was made to allow None to be passed in via the user keyword arguments to mean ‘do the default thing’ as is the convention throughout Matplotlib rather than raising an exception.

Unlike most Line2D setter methods set_marker did accept None as a valid input which was mapped to ‘no marker’. Thus, by routing this marker=None through __init__ rather than set(...) the meaning of ax.plot(..., marker=None) changed from ‘no markers’ to ‘default markers from rcparams’.

This is change is only evident if mpl.rcParams['lines.marker'] has a value other than 'None' (which is string 'None' which means 'no marker').

16.1.39 API Changes in 2.0.0

Deprecation and removal

Color of Axes

The axisbg and axisbgcolor properties on Axes have been deprecated in favor of facecolor.

GTK and GDK backends deprecated

The GDK and GTK backends have been deprecated. These obsolete backends allow figures to be rendered via the GDK API to files and GTK2 figures. They are untested and known to be broken, and their use has been discouraged for some time. Instead, use the GTKAgg and GTKCairo backends for rendering to GTK2 windows.
WX backend deprecated

The WX backend has been deprecated. It is untested, and its use has been discouraged for some time. Instead, use the WXAgg backend for rendering figures to WX windows.

CocoaAgg backend removed

The deprecated and not fully functional CocoaAgg backend has been removed.

round removed from TkAgg Backend

The TkAgg backend had its own implementation of the round function. This was unused internally and has been removed. Instead, use either the round builtin function or numpy.around.

'hold' functionality deprecated

The 'hold' keyword argument and all functions and methods related to it are deprecated, along with the axes.hold rcParams entry. The behavior will remain consistent with the default hold=True state that has long been in place. Instead of using a function or keyword argument (hold=False) to change that behavior, explicitly clear the axes or figure as needed prior to subsequent plotting commands.

Artist.update has return value

The methods matplotlib.artist.Artist.set, matplotlib.artist.Artist.update, and the function matplotlib.artist.setp now use a common codepath to look up how to update the given artist properties (either using the setter methods or an attribute/property).

The behavior of matplotlib.artist.Artist.update is slightly changed to return a list of the values returned from the setter methods to avoid changing the API of matplotlib.artist.Artist.set and matplotlib.artist.setp.

The keys passed into matplotlib.artist.Artist.update are now converted to lower case before being processed, to match the behavior of matplotlib.artist.Artist.set and matplotlib.artist.setp. This should not break any user code because there are no set methods with capitals in their names, but this puts a constraint on naming properties in the future.

Legend initializers gain edgcolor and facecolor keyword arguments

The Legend background patch (or 'frame') can have its edgcolor and facecolor determined by the corresponding keyword arguments to the matplotlib.legend.Legend initializer, or to any of the methods or functions that call that initializer. If left to their default values of None, their values will be taken from matplotlib.rcParams. The previously-existing framealpha kwarg still controls the alpha transparency of the patch.
Qualitative colormaps

Colorbrewer's qualitative/discrete colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") are now implemented as `ListedColormap` instead of `LinearSegmentedColormap`.

To use these for images where categories are specified as integers, for instance, use:

```python
plt.imshow(x, cmap='Dark2', norm=colors.NoNorm())
```

Change in the draw_image backend API

The `draw_image` method implemented by backends has changed its interface.

This change is only relevant if the backend declares that it is able to transform images by returning True from `option_scale_image`. See the `draw_image` docstring for more information.

`matplotlib.ticker.LinearLocator` algorithm update

The `matplotlib.ticker.LinearLocator` is used to define the range and location of axis ticks when the user wants an exact number of ticks. `LinearLocator` thus differs from the default locator `MaxNLocator`, for which the user specifies a maximum number of intervals rather than a precise number of ticks.

The view range algorithm in `matplotlib.ticker.LinearLocator` has been changed so that more convenient tick locations are chosen. The new algorithm returns a plot view range that is a multiple of the user-requested number of ticks. This ensures tick marks will be located at whole integers more consistently. For example, when both y-axes of a "twinx" plot use `matplotlib.ticker.LinearLocator` with the same number of ticks, their y-tick locations and grid lines will coincide.

`matplotlib.ticker.LogLocator` gains `numticks` kwarg

The maximum number of ticks generated by the `LogLocator` can now be controlled explicitly via setting the new `numticks` kwarg to an integer. By default the kwarg is None which internally sets it to the 'auto' string, triggering a new algorithm for adjusting the maximum according to the axis length relative to the ticklabel font size.

`matplotlib.ticker.LogFormatter`: two new kwargs

Previously, minor ticks on log-scaled axes were not labeled by default. An algorithm has been added to the `LogFormatter` to control the labeling of ticks between integer powers of the base. The algorithm uses two parameters supplied in a kwarg tuple named 'minor_thresholds'. See the docstring for further explanation.

To improve support for axes using `SymmetricalLogLocator`, a `linthresh` keyword argument was added.
New defaults for 3D quiver function in mpl_toolkits.mplot3d.axes3d.py

Matplotlib has both a 2D and a 3D quiver function. These changes affect only the 3D function and make the default behavior of the 3D function match the 2D version. There are two changes:

1) The 3D quiver function previously normalized the arrows to be the same length, which makes it unusable for situations where the arrows should be different lengths and does not match the behavior of the 2D function. This normalization behavior is now controlled with the `normalize` keyword, which defaults to False.

2) The `pivot` keyword now defaults to `tail` instead of `tip`. This was done in order to match the default behavior of the 2D quiver function.

To obtain the previous behavior with the 3D quiver function, one can call the function with

```python
ax.quiver(x, y, z, u, v, w, normalize=True, pivot='tip')
```

where “ax” is an `Axes3d` object created with something like

```python
import mpl_toolkits.mplot3d.axes3d
ax = plt.subplot(111, projection='3d')
```

Stale figure behavior

Attempting to draw the figure will now mark it as not stale (independent if the draw succeeds). This change is to prevent repeatedly trying to re-draw a figure which is raising an error on draw. The previous behavior would only mark a figure as not stale after a full re-draw succeeded.

The spectral colormap is now nipy_spectral

The colormaps formerly known as `spectral` and `spectral_r` have been replaced by `nipy_spectral` and `nipy_spectral_r` since Matplotlib 1.3.0. Even though the colormap was deprecated in Matplotlib 1.3.0, it never raised a warning. As of Matplotlib 2.0.0, using the old names raises a deprecation warning. In the future, using the old names will raise an error.

Default install no longer includes test images

To reduce the size of wheels and source installs, the tests and baseline images are no longer included by default.

To restore installing the tests and images, use a `setup.cfg` with

```plaintext
[packages]
tests = True
toolkits_tests = True
```

in the source directory at build/install time.
16.1.40 API Changes in 2.0.1

Extensions to `matplotlib.backend_bases.GraphicsContextBase`

To better support controlling the color of hatches, the method `matplotlib.backend_bases.GraphicsContextBase.set_hatch_color` was added to the expected API of `GraphicsContext` classes. Calls to this method are currently wrapped with a `try:...except AttributeError:` block to preserve back-compatibility with any third-party backends which do not extend `GraphicsContextBase`.

This value can be accessed in the backends via `matplotlib.backend_bases.GraphicsContextBase.get_hatch_color` (which was added in 2.0 see Extension to `matplotlib.backend_bases.GraphicsContextBase`) and should be used to color the hatches.

In the future there may also be `hatch_linewidth` and `hatch_density` related methods added. It is encouraged, but not required that third-party backends extend `GraphicsContextBase` to make adapting to these changes easier.

`afm.get_fontconfig_fonts` returns a list of paths and does not check for existence

`afm.get_fontconfig_fonts` used to return a set of paths encoded as a `{key: 1, ...}` dict, and checked for the existence of the paths. It now returns a list and dropped the existence check, as the same check is performed by the caller (`afm.findSystemFonts`) as well.

`bar` now returns rectangles of negative height or width if the corresponding input is negative

`pyplot.bar` used to normalize the coordinates of the rectangles that it created, to keep their height and width positives, even if the corresponding input was negative. This normalization has been removed to permit a simpler computation of the correct `Artist.sticky_edges` to use.

Do not clip line width when scaling dashes

The algorithm to scale dashes was changed to no longer clip the scaling factor: the dash patterns now continue to shrink at thin line widths. If the line width is smaller than the effective pixel size, this may result in dashed lines turning into solid gray-ish lines. This also required slightly tweaking the default patterns for ‘-‘, ‘:’, and ‘.-’ so that with the default line width the final patterns would not change.

There is no way to restore the old behavior.

Deprecate ‘Vega’ color maps

The “Vega” colormaps are deprecated in Matplotlib 2.0.1 and will be removed in Matplotlib 2.2. Use the “tab” colormaps instead: “tab10”, “tab20”, “tab20b”, “tab20c”.

16.1.41 API Changes in 2.1.0
Default behavior of log scales changed to mask \( \leq 0 \) values

Calling `matplotlib.axes.Axes.set_xscale` or `matplotlib.axes.Axes.set_yscale` now uses ‘mask’ as the default method to handle invalid values (as opposed to ‘clip’). This means that any values \( \leq 0 \) on a log scale will not be shown.

Previously they were clipped to a very small number and shown.

`matplotlib.cbook.CallbackRegistry.process()` suppresses exceptions by default

Matplotlib uses instances of `CallbackRegistry` as a bridge between user input event from the GUI and user callbacks. Previously, any exceptions raised in a user call back would bubble out of the `process` method, which is typically in the GUI event loop. Most GUI frameworks simple print the traceback to the screen and continue as there is not always a clear method of getting the exception back to the user. However PyQt5 now exits the process when it receives an un-handled python exception in the event loop. Thus, `process()` now suppresses and prints tracebacks to stderr by default.

What `process()` does with exceptions is now user configurable via the `exception_handler` attribute and kwarg. To restore the previous behavior pass `None`

```python
cb = CallbackRegistry(exception_handler=None)
```

A function which take and `Exception` as its only argument may also be passed

```python
def maybe_reraise(exc):
    if isinstance(exc, RuntimeError):
        pass
    else:
        raise exc

cb = CallbackRegistry(exception_handler=maybe_reraise)
```

Improved toggling of the axes grids

The `g` key binding now switches the states of the `x` and `y` grids independently (by cycling through all four on/off combinations).

The new `G` key binding switches the states of the minor grids.

Both bindings are disabled if only a subset of the grid lines (in either direction) is visible, to avoid making irreversible changes to the figure.

Ticklabels are turned off instead of being invisible

Internally, the `Tick`'s `~matplotlib.axis.Tick.label1On` attribute is now used to hide tick labels instead of setting the visibility on the tick label objects. This improves overall performance and fixes some issues. As a consequence, in case those labels ought to be shown, `tick_params()` needs to be used, e.g.

```python
ax.tick_params(labelbottom=True)
```
Removal of warning on empty legends

`pyplot.legend` used to issue a warning when no labeled artist could be found. This warning has been removed.

More accurate legend autoplacement

Automatic positioning of legends now prefers using the area surrounded by a `Line2D` rather than placing the legend over the line itself.

Cleanup of stock sample data

The sample data of stocks has been cleaned up to remove redundancies and increase portability. The `AAPL.dat.gz`, `INTC.dat.gz` and `aapl.csv` files have been removed entirely and will also no longer be available from `matplotlib.cbook.get_sample_data`. If a CSV file is required, we suggest using the `msft.csv` that continues to be shipped in the sample data. If a NumPy binary file is acceptable, we suggest using one of the following two new files. The `aapl.npy.gz` and `goog.npy` files have been replaced by `aapl.npz` and `goog.npz`, wherein the first column’s type has changed from `datetime.date` to `numpy.datetime64` for better portability across Python versions. Note that Matplotlib does not fully support `numpy.datetime64` as yet.

Updated qhull to 2015.2

The version of qhull shipped with Matplotlib, which is used for Delaunay triangulation, has been updated from version 2012.1 to 2015.2.

Improved Delaunay triangulations with large offsets

Delaunay triangulations now deal with large x,y offsets in a better way. This can cause minor changes to any triangulations calculated using Matplotlib, i.e. any use of `matplotlib.tri.Triangulation` that requests that a Delaunay triangulation is calculated, which includes `matplotlib.pyplot.tricontour`, `matplotlib.pyplot.tricontourf`, `matplotlib.pyplot.tripcolor`, `matplotlib.pyplot.triplot`, `matplotlib.mlab.griddata` and `mpl_toolkits.mplot3d.Axes3D.plot_trisurf`.

Use `backports.functools_lru_cache` instead of `functools32`

It’s better maintained and more widely used (by pylint, jaraco, etc).

cbook.is_numlike only performs an instance check

`matplotlib.cbook.is_numlike` now only checks that its argument is an instance of `(numbers.Number, np.Number)`. In particular, this means that arrays are now not num-like.
Elliptical arcs now drawn between correct angles

The matplotlib.patches.Arc patch is now correctly drawn between the given angles. Previously a circular arc was drawn and then stretched into an ellipse, so the resulting arc did not lie between $\theta_1$ and $\theta_2$.

-d$backend no longer sets the backend

It is no longer possible to set the backend by passing -d$backend at the command line. Use the MPLBACKEND environment variable instead.

Path.intersects_bbox always treats the bounding box as filled

Previously, when Path.intersects_bbox was called with filled set to False, it would treat both the path and the bounding box as unfilled. This behavior was not well documented and it is usually not the desired behavior, since bounding boxes are used to represent more complex shapes located inside the bounding box. This behavior has now been changed: when filled is False, the path will be treated as unfilled, but the bounding box is still treated as filled. The old behavior was arguably an implementation bug.

When Path.intersects_bbox is called with filled set to True (the default value), there is no change in behavior. For those rare cases where Path.intersects_bbox was called with filled set to False and where the old behavior is actually desired, the suggested workaround is to call Path.intersects_path with a rectangle as the path:

```python
from matplotlib.path import Path
from matplotlib.transforms import Bbox, BboxTransformTo
rect = Path.unit_rectangle().transformed(BboxTransformTo(bbox))
result = path.intersects_path(rect, filled=False)
```

WX no longer calls generates IdleEvent events or calls idle_event

Removed unused private method _onIdle from FigureCanvasWx.

The IdleEvent class and FigureCanvasBase.idle_event method will be removed in 2.2

Correct scaling of magnitude_spectrum()

The functions matplotlib.mlab.magnitude_spectrum() and matplotlib.pyplot.magnitude_spectrum() implicitly assumed the sum of windowing function values to be one. In Matplotlib and Numpy the standard windowing functions are scaled to have maximum value of one, which usually results in a sum of the order of n/2 for a n-point signal. Thus the amplitude scaling magnitude_spectrum() was off by that amount when using standard windowing functions (Bug 8417). Now the behavior is consistent with matplotlib.pyplot.psd() and scipy.signal.welch(). The following example demonstrates the new and old scaling:

```python
import matplotlib.pyplot as plt
import numpy as np

tau, n = 10, 1024  # 10 second signal with 1024 points
```
T = tau/n  # sampling interval
t = np.arange(n)*T

a = 4  # amplitude
x = a*np.sin(40*np.pi*t)  # 20 Hz sine with amplitude a

# New correct behavior: Amplitude at 20 Hz is a/2
plt.magnitude_spectrum(x, Fs=1/T, sides='onesided', scale='linear')

# Original behavior: Amplitude at 20 Hz is (a/2)*(n/2) for a Hanning window
w = np.hanning(n)  # default window is a Hanning window
plt.magnitude_spectrum(x*np.sum(w), Fs=1/T, sides='onesided', scale='linear')

Change to signatures of bar() & barh()

For 2.0 the default value of *align* changed to 'center'. However this caused the signature of bar() and barh() to be misleading as the first parameters were still left and bottom respectively:

```python
bar(left, height, *, align='center', **kwargs)
barh(bottom, width, *, align='center', **kwargs)
```

despite behaving as the center in both cases. The methods now take *args, **kwargs as input and are documented to have the primary signatures of:

```python
bar(x, height, *, align='center', **kwargs)
barh(y, width, *, align='center', **kwargs)
```

Passing left and bottom as keyword arguments to bar() and barh() respectively will warn. Support will be removed in Matplotlib 3.0.

Font cache as json

The font cache is now saved as json, rather than a pickle.

Invalid (Non-finite) Axis Limit Error

When using set_xlim() and set_ylim(), passing non-finite values now results in a ValueError. The previous behavior resulted in the limits being erroneously reset to (-0.001, 0.001).

scatter and Collection offsets are no longer implicitly flattened

Collection (and thus both 2D scatter and 3D scatter) no longer implicitly flattens its offsets. As a consequence, scatter’s x and y arguments can no longer be 2+-dimensional arrays.

Deprecations
GraphicsContextBase's linestyle property.

The GraphicsContextBase.get_linestyle and GraphicsContextBase.set_linestyle methods, which had no effect, have been deprecated. All of the backends Matplotlib ships use GraphicsContextBase.get_dashes and GraphicsContextBase.set_dashes which are more general. Third-party backends should also migrate to the *_dashes methods.

NavigationToolbar2.dynamic_update

Use draw_idle() method on the Canvas instance instead.

Testing

matplotlib.testing.noseclasses is deprecated and will be removed in 2.3

EngFormatter num arg as string

Passing a string as num argument when calling an instance of matplotlib.ticker.EngFormatter is deprecated and will be removed in 2.3.

mpl_toolkits.axes_grid module

All functionally from mpl_toolkits.axes_grid can be found in either mpl_toolkits.axes_grid1 or mpl_toolkits.axisartist. Axes classes from mpl_toolkits.axes_grid based on Axis from mpl_toolkits.axisartist can be found in mpl_toolkits.axisartist.

Axes collision in Figure.add_axes

Adding an axes instance to a figure by using the same arguments as for a previous axes instance currently reuses the earlier instance. This behavior has been deprecated in Matplotlib 2.1. In a future version, a new instance will always be created and returned. Meanwhile, in such a situation, a deprecation warning is raised by AxesStack.

This warning can be suppressed, and the future behavior ensured, by passing a unique label to each axes instance. See the docstring of add_axes() for more information.

Additional details on the rationale behind this deprecation can be found in #7377 and #9024.

Former validators for contour.negative_linestyle

The former public validation functions validate_negative_linestyle and validate_negative_linestyle_legacy will be deprecated in 2.1 and may be removed in 2.3. There are no public functions to replace them.
Many unused or near-unused matplotlib.cbook functions and classes have been deprecated: converter, tostr, todatetime, todate, tofloat, toint, unique, is_string_like, is_sequence_of_strings, is_scalar, Sorter, Xlator, soundex, Null, dict_delall, RingBuffer, get_split_ind, wrap, get_recursive_filelist, pieces, exception_to_str, allequal, alltrue, onetrue, allpairs, finddir, reverse_dict, restrict_dict, issubclass_safe, recursive_remove, unmasked_index_ranges.

Code Removal

qt4_compat.py

Moved to qt_compat.py. Renamed because it now handles Qt5 as well.

Previously Deprecated methods

The GraphicsContextBase.set_graylevel, FigureCanvasBase.onHilite and mpl_toolkits.axes_grid1.mpl_axes.Axes.toggle_axisline methods have been removed.

The ArtistInspector.findobj method, which was never working due to the lack of a get_children method, has been removed.

The deprecated point_in_path, get_path_extents, point_in_path_collection, path_intersects_path, convert_path_to_polygons, cleanup_path and clip_path_to_rect functions in the matplotlib.path module have been removed. Their functionality remains exposed as methods on the Path class.

The deprecated Artist.get_axes and Artist.set_axes methods have been removed.

The matplotlib.backends.backend_ps.seq_allequal function has been removed. Use np.array_equal instead.

The deprecated matplotlib.rcsetup.validate_maskedarray, matplotlib.rcsetup.deprecate_savefig_extension and matplotlib.rcsetup.validate_tkpythoninspect functions, and associated savefig.extension and tk.pythoninspect rcparams entries have been removed.

The keyword argument resolution of matplotlib.projections.polar.PolarAxes has been removed. It has deprecation with no effect from version 0.98.x.

Axes.set_aspect("normal")

Support for setting an Axes’s aspect to "normal" has been removed, in favor of the synonym "auto".

shading kwarg to pcolor

The shading kwarg to pcolor has been removed. Set edgecolors appropriately instead.
Functions removed from the lines module

The `matplotlib.lines` module no longer imports the `pts_to_prestep`, `pts_to_midstep` and `pts_to_poststep` functions from `matplotlib.cbook`.

PDF backend functions

The methods `embedTeXFont` and `tex_font_mapping` of `matplotlib.backends.backend_pdf.PdfFile` have been removed. It is unlikely that external users would have called these methods, which are related to the font system internal to the PDF backend.

`matplotlib.delaunay`

Remove the delaunay triangulation code which is now handled by Qhull via `matplotlib.tri`.

16.1.42 API Changes in 2.1.1

Default behavior of log scales reverted to clip \( \leq 0 \) values

The change in 2.1.0 to mask in logscale by default had more disruptive changes than anticipated and has been reverted, however the clipping is now done in a way that fixes the issues that motivated changing the default behavior to 'mask'.

As a side effect of this change, error bars which go negative now work as expected on log scales.

16.1.43 API Changes in 2.1.2

`Figure.legend` no longer checks for repeated lines to ignore

`matplotlib.figure.Figure.legend` used to check if a line had the same label as an existing legend entry. If it also had the same line color or marker color legend didn’t add a new entry for that line. However, the list of conditions was incomplete, didn’t handle RGB tuples, didn’t handle linewidths or linestyles etc.

This logic did not exist in `axes.Axes.legend`. It was included (erroneously) in Matplotlib 2.1.1 when the legend argument parsing was unified [#9324](https://github.com/matplotlib/matplotlib/pull/9324). This change removes that check in `axes.Axes.legend` again to restore the old behavior.

This logic has also been dropped from `Figure.legend`, where it was previously undocumented. Repeated lines with the same label will now each have an entry in the legend. If you do not want the duplicate entries, don’t add a label to the line, or prepend the label with an underscore.
16.1.44 API Changes in 2.2.0

New dependency

kiwisolver is now a required dependency to support the new constrained_layout, see Constrained Layout Guide for more details.

Deprecations

Classes, functions, and methods

The unused and untested Artist.onRemove and Artist.hitlist methods have been deprecated.
The now unused mlab.less_simple_linear_interpolation function is deprecated.
The unused ContourLabeler.get_real_label_width method is deprecated.
The unused FigureManagerBase.show_popup method is deprecated. This introduced in e945059b327d42a99938b939a1be867fa023e7ba in 2005 but never built out into any of the backends.
backend_tkagg.AxesMenu is deprecated, as it has become unused since the removal of "classic" toolbars.

Changed function signatures

kwarg fig to GridSpec.get_subplot_params is deprecated, use figure instead.
Using pyplot.axes with an Axes as argument is deprecated. This sets the current axes, i.e. it has the same effect as pyplot.sca. For clarity plt.sca(ax) should be preferred over plt.axes(ax).
Using strings instead of booleans to control grid and tick visibility is deprecated. Using "on", "off", "true", or "false" to control grid and tick visibility has been deprecated. Instead, use normal booleans (True/False) or boolean-likes. In the future, all non-empty strings may be interpreted as True.
When given 2D inputs with non-matching numbers of columns, plot currently cycles through the columns of the narrower input, until all the columns of the wider input have been plotted. This behavior is deprecated; in the future, only broadcasting (1 column to n columns) will be performed.

rcparams

The rcParams["backend.qt4"] and rcParams["backend.qt5"] rcParams were deprecated in version 2.2. In order to force the use of a specific Qt binding, either import that binding first, or set the QT_API environment variable.
Deprecation of the nbagg.transparent rcParam. To control transparency of figure patches in the nbagg (or any other) backend, directly set figure.patch.facecolor, or the figure.facecolor rcParam.
**Deprecated** `Axis.unit_data`

Use `Axis.units` (which has long existed) instead.

**Removals**

**Function Signatures**

Contouring no longer supports `legacy` corner masking. The deprecated `ContourSet.vmin` and `ContourSet.vmax` properties have been removed.

Passing `None` instead of "none" as format to `errorbar` is no longer supported.

The `bgcolor` keyword argument to `Axes` has been removed.

**Modules, methods, and functions**

The `matplotlib.finance`, `mpl_toolkits.exceltools` and `mpl_toolkits.gtktools` modules have been removed. `matplotlib.finance` remains available at https://github.com/matplotlib/mpl_finance.

The `mpl_toolkits.mplot3d.art3d.iscolor` function has been removed.

The `Axes.get_axis_bgcolor`, `Axes.set_axis_bgcolor`, `Bbox.update_from_data`, `Bbox.update_datalim_numerix`, `MaxNLocator.bin_boundaries` methods have been removed.

`mencoder` can no longer be used to encode animations.

The unused `FONT_SCALE` and `fontd` attributes of the `RendererSVG` class have been removed.

**color maps**

The `spectral` colormap has been removed. The `Vega*` colormaps, which were aliases for the `tab*` colormaps, have been removed.

**rcparams**

The following deprecated rcParams have been removed:

- `axes.color_cycle` (see `axes.prop_cycle`),
- `legend.isaxes`,
- `svg.embed_char_paths` (see `svg.fonttype`),
- `text.fontstyle`, `text.fontangle`, `text.fontvariant`, `text.fontweight`, `text.fontsize` (renamed to `text.style`, etc.),
- `tick.size` (renamed to `tick.major.size`).

**Only accept string-like for Categorical input**

Do not accept mixed string / float / int input, only strings are valid categoricals.
Removal of unused imports

Many unused imports were removed from the codebase. As a result, trying to import certain classes or functions from the “wrong” module (e.g. `Figure` from `matplotlib.backends.backend_agg` instead of `matplotlib.figure`) will now raise an `ImportError`.

Axes3D.get_xlim, get_ylim and get_zlim now return a tuple

They previously returned an array. Returning a tuple is consistent with the behavior for 2D axes.

Exception type changes

If `MovieWriterRegistry` can’t find the requested `MovieWriter`, a more helpful `RuntimeError` message is now raised instead of the previously raised `KeyError`.

`auto_adjust_subplotpars` now raises `ValueError` instead of `RuntimeError` when sizes of input lists don’t match.

Figure.set_figwidth and Figure.set_figheight default `forward` to True

`matplotlib.figure.Figure.set_figwidth` and `matplotlib.figure.Figure.set_figheight` had the keyword argument `forward=False` by default, but `figure.Figure.set_size_inches` now defaults to `forward=True`. This makes these functions consistent.

Do not truncate svg sizes to nearest point

There is no reason to size the SVG output in integer points, change to outputting floats for the `height`, `width`, and `viewBox` attributes of the `svg` element.

Fontsizes less than 1 pt are clipped to be 1 pt.

FreeType doesn’t allow fonts to get smaller than 1 pt, so all Agg backends were silently rounding up to 1 pt. PDF (other vector backends?) were letting us write fonts that were less than 1 pt, but they could not be placed properly because position information comes from FreeType. This change makes it so no backends can use fonts smaller than 1 pt, consistent with FreeType and ensuring more consistent results across backends.

Changes to Qt backend class MRO

To support both Agg and cairo rendering for Qt backends all of the non-Agg specific code previously in `backend_qt5agg.FigureCanvasQTAggBase` has been moved to `backend_qt5.FigureCanvasQT` so it can be shared with the cairo implementation. The `FigureCanvasQTAggBase.paintEvent`, `FigureCanvasQTAggBase.blit`, and `FigureCanvasQTAggBase.print_figure` methods have moved to `FigureCanvasQTAgg.paintEvent()`, `FigureCanvasQTAgg.blit()`, and `FigureCanvasQTAgg.print_figure()`. The first two methods assume that the instance is also a `QWidget` so to use `FigureCanvasQTAggBase` it was required to multiple inherit from a `QWidget` sub-class.
Matplotlib, Release 3.3.0

Having moved all of its methods either up or down the class hierarchy, `FigureCanvasQTAggBase` has been deprecated. To do this without warning and to preserve as much API as possible, `.backend_qt5agg.FigureCanvasQTAggBase` now inherits from `.backend_qt5.FigureCanvasQTAgg`.

The MRO for `FigureCanvasQTAgg` and `FigureCanvasQTAggBase` used to be

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backends.backend_qt5.FigureCanvasQT,
 PyQt5.QtWidgets.QWidget,
 PyQt5.QtCore.QObject,
 sip.wrapper,
 PyQt5.QtGui.QPaintDevice,
 sip.simplewrapper,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

and

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

respectively. They are now

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backends.backend_qt5.FigureCanvasQT,
 PyQt5.QtWidgets.QWidget,
 PyQt5.QtCore.QObject,
 sip.wrapper,
 PyQt5.QtGui.QPaintDevice,
 sip.simplewrapper,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

and

```
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backends.backend_qt5.FigureCanvasQT,
 PyQt5.QtWidgets.QWidget,
 PyQt5.QtCore.QObject,
 sip.wrapper,
 PyQt5.QtGui.QPaintDevice,
 sip.simplewrapper,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

`axes.Axes.imshow` clips RGB values to the valid range

When `axes.Axes.imshow` is passed an RGB or RGBA value with out-of-range values, it now logs a warning and clips them to the valid range. The old behaviour, wrapping back in to the range, often hid outliers and made interpreting RGB images unreliable.
GTKAgg and GTKCairo backends deprecated

The GTKAgg and GTKCairo backends have been deprecated. These obsolete backends allow figures to be rendered via the GTK+ 2 toolkit. They are untested, known to be broken, will not work with Python 3, and their use has been discouraged for some time. Instead, use the GTK3Agg and GTK3Cairo backends for rendering to GTK+ 3 windows.

16.1.45 API Changes for 3.0.0

Drop support for python 2

Matplotlib 3 only supports python 3.5 and higher.

Changes to backend loading

Failure to load backend modules (macosx on non-framework builds and gtk3 when running headless) now raises `ImportError` (instead of `RuntimeError` and `TypeError`, respectively).

Third-party backends that integrate with an interactive framework are now encouraged to define the `required_interactive_framework` global value to one of the following values: "qt5", "qt4", "gtk3", "wx", "tk", or "macosx". This information will be used to determine whether it is possible to switch from a backend to another (specifically, whether they use the same interactive framework).

`Axes.hist2d` now uses `pcolormesh` instead of `pcolorfast`

`Axes.hist2d` now uses `pcolormesh` instead of `pcolorfast`, which will improve the handling of log-axes. Note that the returned `image` now is of type `QuadMesh` instead of `AxesImage`.

`matplotlib.axes.Axes.get_tightbbox` now includes all artists

For Matplotlib 3.0, all artists are now included in the bounding box returned by `matplotlib.axes.Axes.get_tightbbox`.

`matplotlib.axes.Axes.get_tightbbox` adds a new kwarg `bbox_extra_artists` to manually specify the list of artists on the axes to include in the tight bounding box calculation.

Layout tools like `Figure.tight_layout`, `constrained_layout`, and `fig.savefig('fname.png', bbox_inches="tight")` use `matplotlib.axes.Axes.get_tightbbox` to determine the bounds of each axes on a figure and adjust spacing between axes.

In Matplotlib 2.2 `get_tightbbox` started to include legends made on the axes, but still excluded some other artists, like text that may overspill an axes. This has been expanded to include all artists.

This new default may be overridden in either of three ways:

1. Make the artist to be excluded a child of the figure, not the axes. E.g., call `fig.legend()` instead of `ax.legend()` (perhaps using `get_legend_handles_labels` to gather handles and labels from the parent axes).
2. If the artist is a child of the axes, set the artist property `artist.set_in_layout(False)`.

16.1. Old API Changes
3. Manually specify a list of artists in the new kwarg `bbox_extra_artists`.

**Text.set_text with string argument None sets string to empty**

When passed a string value of `None` would set the string to "None", so subsequent calls to `Text.get_text` would return the ambiguous "None" string.

This change sets text objects passed `None` to have empty strings, so that `Text.get_text` returns an empty string.

**Axes3D.get_xlim, get_ylim and get_zlim now return a tuple**

They previously returned an array. Returning a tuple is consistent with the behavior for 2D axes.

**font_manager.list_fonts now follows the platform’s casefolding semantics**

i.e., it behaves case-insensitively on Windows only.

**bar / barh no longer accepts left / bottom as first named argument**

These arguments were renamed in 2.0 to `x / y` following the change of the default alignment from `edge` to `center`.

**Different exception types for undocumented options**

- Passing `style='comma'` to `ticklabel_format()` was never supported. It now raises `ValueError` like all other unsupported styles, rather than `NotImplementedError`.
- Passing the undocumented `xmin` or `xmax` arguments to `set_xlim()` would silently override the left and right arguments. `set_ylim()` and the 3D equivalents (e.g. `set_zlim3d`) had a corresponding problem. A `TypeError` will be raised if they would override the earlier limit arguments. In 3.0 these were kwargs were deprecated, but in 3.1 the deprecation was undone.

**Improved call signature for Axes.margins**

`Axes.margins` and `Axes3D.margins` no longer accept arbitrary keywords. `TypeError` will therefore be raised if unknown kwargs are passed; previously they would be silently ignored.

If too many positional arguments are passed, `TypeError` will be raised instead of `ValueError`, for consistency with other call-signature violations.

`Axes3D.margins` now raises `TypeError` instead of emitting a deprecation warning if only two positional arguments are passed. To supply only `x` and `y` margins, use keyword arguments.
Explicit arguments instead of *args, **kwargs

**PEP 3102** describes keyword-only arguments, which allow Matplotlib to provide explicit call signatures - where we previously used *args, **kwargs and kwargs.pop, we can now expose named arguments. In some places, unknown kwargs were previously ignored but now raise TypeError because **kwargs has been removed.

- `matplotlib.axes.Axes.stem()` no longer accepts unknown keywords, and raises TypeError instead of emitting a deprecation.
- `matplotlib.axes.Axes.stem()` now raises TypeError when passed unhandled positional arguments. If two or more arguments are passed (ie X, Y, [linefmt], ...) and Y cannot be cast to an array, an error will be raised instead of treating X as Y and Y as linefmt.
- `mpl_toolkits.axes_grid1.axes_divider.SubplotDivider` raises TypeError instead of Exception when passed unknown kwargs.

Cleanup decorators and test classes no longer destroy warnings filter on exit

The decorators and classes in matplotlib.testing.decorators no longer destroy the warnings filter on exit. Instead, they restore the warnings filter that existed before the test started using `warnings.catch_warnings`.

Non-interactive FigureManager classes are now aliases of FigureManagerBase

The FigureManagerPdf, FigureManagerPS, and FigureManagerSVG classes, which were previously empty subclasses of FigureManagerBase (i.e., not adding or overriding any attribute or method), are now direct aliases for FigureManagerBase.

Change to the output of `image.thumbnail`

When called with `preview=False`, `image.thumbnail` previously returned an figure whose canvas class was set according to the output file extension. It now returns a figure whose canvas class is the base FigureCanvasBase (and relies on FigureCanvasBase.print_figure to handle the canvas switching properly).

As a side effect of this change, `image.thumbnail` now also supports .ps, .eps, and .svgz output.

**FuncAnimation now draws artists according to their zorder when blitting**

**FuncAnimation** now draws artists returned by the user- function according to their zorder when using blitting, instead of using the order in which they are being passed. However, note that only zorder of passed artists will be respected, as they are drawn on top of any existing artists (see #11369).

Contour color autoscaling improvements

Selection of contour levels is now the same for contour and contourf; previously, for contour, levels outside the data range were deleted. (Exception: if no contour levels are found within the data range, the levels attribute is replaced with a list holding only the minimum of the data range.)
When contour is called with levels specified as a target number rather than a list, and the ‘extend’ kwarg is used, the levels are now chosen such that some data typically will fall in the extended range.

When contour is called with a :class:`LogNorm` or a :class:`LogLocator`, it will now select colors using the geometric mean rather than the arithmetic mean of the contour levels.

**Streamplot last row and column fixed**

A bug was fixed where the last row and column of data in :func:`streamplot` were being dropped.

**Changed default :class:`AutoDateLocator` kwarg :attr:`interval_multiples` to True**

The default value of the tick locator for dates, :class:`dates.AutoDateLocator` kwarg :attr:`interval_multiples` was set to `False` which leads to not-nice looking automatic ticks in many instances. The much nicer `interval_multiples=True` is the new default. See below to get the old behavior back:

```
0.00 0.25 0.50 0.75 1.00
01:10
01:15
01:20
01:25
01:30
01:35
01:40
01:45
20 Aug 2009
```

**Axes.get_position now returns actual position if aspect changed**

:func:`Axes.get_position` used to return the original position unless a draw had been triggered or :func:`Axes.apply_aspect` had been called, even if the kwarg :attr:`original` was set to `False`. Now :func:`Axes.
**apply_aspect** is called so `ax.get_position()` will return the new modified position. To get the old behavior use `ax.get_position(original=True)`.

The ticks for colorbar now adjust for the size of the colorbar

Colorbar ticks now adjust for the size of the colorbar if the colorbar is made from a mappable that is not a contour or doesn’t have a BoundaryNorm, or boundaries are not specified. If boundaries, etc are specified, the colorbar maintains the original behavior.

**Colorbar for log-scaled hexbin**

When using `hexbin` and plotting with a logarithmic color scale, the colorbar ticks are now correctly log scaled. Previously the tick values were linear scaled log(number of counts).

**PGF backend now explicitly makes black text black**

Previous behavior with the pgf backend was for text specified as black to actually be the default color of whatever was rendering the pgf file (which was of course usually black). The new behavior is that black text is black, regardless of the default color. However, this means that there is no way to fall back on the default color of the renderer.

**Blacklisted rcparams no longer updated by rcdefaults, rc_file_defaults, rc_file**

The rc modifier functions `rcdefaults`, `rc_file_defaults` and `rc_file` now ignore rcParams in the `matplotlib.style.core.STYLE_BLACKLIST` set. In particular, this prevents the backend and interactive rcParams from being incorrectly modified by these functions.

**CallbackRegistry now stores callbacks using stdlib’s weakref.WeakMethods**

In particular, this implies that `CallbackRegistry.callbacks[signal]` is now a mapping of callback ids to `weakref.WeakMethods` (i.e., they need to be first called with no arguments to retrieve the method itself).

**Changes regarding the text.latex.unicode rcParam**

The rcParam now defaults to True and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported).

Moreover, the underlying implementation now uses \usepackage[utf8]{inputenc} instead of \usepackage[ucs]\usepackage[utf8x]{inputenc}.

**Return type of ArtistInspector.get_aliases changed**

`ArtistInspector.get_aliases` previously returned the set of aliases as `{fullname: {alias1: None, alias2: None, ...}}`. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. `{fullname: {alias1, alias2, ...}}`. This value is also stored in `ArtistInspector.aliasd`, which has likewise changed.
Removed pytz as a dependency

Since dateutil and pytz both provide time zones, and matplotlib already depends on dateutil, matplotlib will now use dateutil time zones internally and drop the redundant dependency on pytz. While dateutil time zones are preferred (and currently recommended in the Python documentation), the explicit use of pytz zones is still supported.

Deprecations

Modules

The following modules are deprecated:

- matplotlib.compat.subprocess. This was a python 2 workaround, but all the functionality can now be found in the python 3 standard library subprocess.
- matplotlib.backends.wx_compat. Python 3 is only compatible with wxPython 4, so support for wxPython 3 or earlier can be dropped.

Classes, methods, functions, and attributes

The following classes, methods, functions, and attributes are deprecated:

- RcParams.msg_depr, RcParams.msg_depr_ignore, RcParams.msg_depr_set, RcParams.msg_obsolete, RcParams.msg_backend_obsolete
- afm.parse_afm
- backend_pdf.PdfFile.texFontMap
- backend_pgf.get_texcommand
- backend_ps.get_bbox
- backend_qt5.FigureCanvasQT.keyAutoRepeat (directly check event.guiEvent.isAutoRepeat() in the event handler to decide whether to handle autorepeated key presses).
- backend_qt5.error_msg_qt, backend_qt5.exception_handler
- backend_wx.FigureCanvasWx.macros
- backends.pylab_setup
- cbook.GetRealpathAndStat, cbook.Locked
- cbook.is_numlike (use isinstance(..., numbers.Number) instead), cbook.listFiles, cbook.unicode_safe
- container.Container.set_remove_method,
- contour.ContourLabeler.cl, .cl_xy, and .cl_cvalues
- dates.DateFormatter.strftime_pre_1900, dates.DateFormatter.strftime
- font_manager.TempCache
- image._ImageBase.iterpnames, use the interpolation_names property instead. (this affects classes that inherit from _ImageBase including FigureImage, BboxImage, and AxesImage)
- mathtext.unichr_safe (use chr instead)
• patches.Polygon.xy
• table.Table.get_child_artists (use get_children instead)
• testing.compare.ImageComparisonTest, testing.compare.compare_float
• testing.decorators.CleanupTest, testing.decorators.skip_if_command_unavailable
• FigureCanvasQT.keyAutoRepeat (directly check event.guiEvent.isAutoRepeat() in the event handler to decide whether to handle autorepeated key presses)
• FigureCanvasWx.macros
• _ImageBase.iterpnames, use the interpolation_names property instead. (this affects classes that inherit from _ImageBase including FigureImage, BboxImage, and AxesImage)
• patches.Polygon.xy
• texmanager.dvipng_hack_alpha
• text.Annotation.arrow
• Legend.draggable(), in favor of Legend.set_draggable() (Legend.draggable may be reintroduced as a property in future releases)
• textpath.TextToPath.tex_font_map
• matplotlib.cbook.deprecation.mplDeprecation will be removed in future versions. It is just an alias for matplotlib.cbook.deprecation.MatplotlibDeprecationWarning. Please use matplotlib.cbook.MatplotlibDeprecationWarning directly if necessary.
• The matplotlib.cbook.Bunch class has been deprecated. Instead, use types.SimpleNamespace from the standard library which provides the same functionality.
• Axes.mouseover_set is now a frozenset, and deprecated. Directly manipulate the artist’s .mouseover attribute to change their mouseover status.

The following keyword arguments are deprecated:
• passing verts to Axes.scatter (use marker instead)
• passing obj_type to cbook.deprecated

The following call signatures are deprecated:
• passing a wx.EVTHandler as first argument to backend_wx.TimerWx

rcParams

The following rcParams are deprecated:
• examples.directory (use datapath instead)
• pgf.debug (the pgf backend relies on logging)
• text.latex.unicode (always True now)

marker styles

• Using (n, 3) as marker style to specify a circle marker is deprecated. Use "o" instead.
• Using ((x0, y0), (x1, y1), ...) as marker style to specify a custom marker path is deprecated. Use [(x0, y0), (x1, y1), ...] instead.
Deprecation of \texttt{LocatableAxes} in toolkits

The \texttt{LocatableAxes} classes in toolkits have been deprecated. The base \texttt{Axes} classes provide the same functionality to all subclasses, thus these mixins are no longer necessary. Related functions have also been deprecated. Specifically:

- \texttt{mpl_toolkits.axes_grid1.axes_divider.LocatableAxesBase}: no specific replacement; use any other \texttt{Axes}-derived class directly instead.
- \texttt{mpl_toolkits.axes_grid1.axes_divider.locatable_axes_factory}: no specific replacement; use any other \texttt{Axes}-derived class directly instead.
- \texttt{mpl_toolkits.axisartist.axes_divider.Axes}: use \texttt{mpl_toolkits.axisartist.axislines.Axes} directly.
- \texttt{mpl_toolkits.axisartist.axes_divider.LocatableAxes}: use \texttt{mpl_toolkits.axisartist.axislines.Axes} directly.

Removals

\textbf{Hold machinery}

Setting or unsetting \texttt{hold} (\textit{deprecated in version 2.0}) has now been completely removed. Matplotlib now always behaves as if \texttt{hold=True}. To clear an axes you can manually use \texttt{cla()}, or to clear an entire figure use \texttt{clf()}.

Removal of deprecated backends

Deprecated backends have been removed:

- GTKAgg
- GTKCairo
- GTK
- GDK

\textbf{Deprecated APIs}

The following deprecated API elements have been removed:

- The deprecated methods \texttt{knownfailureif} and \texttt{remove_text} have been removed from \texttt{matplotlib.testing.decorators}.
- The entire contents of \texttt{testing.noseclasses} have also been removed.
- \texttt{matplotlib.checkdep_tex}, \texttt{matplotlib.checkdep_xmlhint}
- \texttt{backend_bases.IdleEvent}
• cbook.converter, cbook.tostr, cbook.todatetime, cbook.todate, cbook.tofloat, cbook.toint, cbook.unique, cbook.is_string_like, cbook.is_sequence_of_strings, cbook.is_scalar, cbook.soundex, cbook.dict_delall, cbook.get_split_ind, cbook.wrap, cbook.get_recursive_filelist, cbook.pieces, cbook.exception_to_str, cbook.allequal, cbook.alltrue, cbook.onetruem, cbook.allpairs, cbook.finddir, cbook.reverse_dict, cbook.restrict_dict, cbook.issubclass_safe, cbook.recursive_remove, cbook.unmasked_index_ranges, cbook.Null, cbook.RingBuffer, cbook.Sorter, cbook.Xlator,
• font_manager.weight_as_number, font_manager.ttfdict_to_fnames
• pyplot.colors, pyplot.spectral
• rcsetup.validate_negative_linestyle, rcsetup.validate_negative_linestyle_legacy,
• testing.compare.verifiers, testing.compare.verify
• testing.decorators.knownfailureif, testing.decorators.ImageComparisonTest.remove_text
• tests.assert_str_equal, tests.test_tinypages.file_same
• texmanager.dvipng_hack_alpha,
• _AxesBase.axesPatch, _AxesBase.set_color_cycle, _AxesBase.get_cursor_props, _AxesBase.set_cursor_props
• _ImageBase.iterpnames
• FigureCanvasBase.start_event_loop_default;
• FigureCanvasBase.stop_event_loop_default;
• Figure.figurePatch,
• FigureCanvasBase.dynamic_update, FigureCanvasBase.idle_event, FigureCanvasBase.get_linestyle, FigureCanvasBase.set_linestyle
• FigureCanvasQTAggBase
• FigureCanvasQTAgg.blitbox
• FigureCanvasTk.show (alternative: FigureCanvasTk.draw)
• FigureManagerTkAgg (alternative: FigureManagerTk)
• NavigationToolbar2TkAgg (alternative: NavigationToolbar2Tk)
• backend_wxagg.Toolbar (alternative: backend_wxagg.NavigationToolbar2WxAgg)
• RendererAgg.debug()
• passing non-numbers to EngFormatter.format_eng
• passing frac to PolarAxes.set_theta_grids
• any mention of idle events

The following API elements have been removed:
• backend_cairo.HAS_CAIRO_CFFI
• sphinxext.sphinx_version
Proprietary sphinx directives

The matplotlib documentation used the proprietary sphinx directives `.. htmlonly::`, and `.. latexonly::`. These have been replaced with the standard sphinx directives `.. only:: html` and `.. only:: latex`. This change will not affect any users. Only downstream package maintainers, who have used the proprietary directives in their docs, will have to switch to the sphinx directives.

lib/mpl_examples symlink

The symlink from lib/mpl_examples to ../examples has been removed. This is not installed as an importable package and should not affect end users, however this may require downstream packagers to adjust. The content is still available top-level examples directory.

16.1.46 API Changes for 3.0.1

tight_layout.auto_adjust_subplotpars can return `None` now if the new subplotpars will collapse axes to zero width or height. This prevents `tight_layout` from being executed. Similarly `tight_layout.get_tight_layout_figure` will return `None`.

To improve import (startup) time, private modules are now imported lazily. These modules are no longer available at these locations:

- `matplotlib.backends.backend_agg._png`
- `matplotlib.contour._contour`
- `matplotlib.image._png`
- `matplotlib.mathtext._png`
- `matplotlib.testing.compare._png`
- `matplotlib.texmanager._png`
- `matplotlib.tri.triangulation._tri`
- `matplotlib.tri.triangulation._qhull`
- `matplotlib.tri.tricontour._tri`
- `matplotlib.tri.trifinder._tri`

16.1.47 API Changes for 3.1.0

- Behavior changes
- pgi support dropped
- rcParam changes
- Exception changes
- Removals
- `matplotlib.mlab removals`
• pylab removals
• mplot3d changes
• Testing
• Dependency changes
• Mathtext changes
• Signature deprecations
• Changes in parameter names
• Class/method/attribute deprecations
• Undeprecations
• New features
• Invalid inputs

Behavior changes

Matplotlib.use

Switching backends via `matplotlib.use` is now allowed by default, regardless of whether `matplotlib.pyplot` has been imported. If the user tries to switch from an already-started interactive backend to a different interactive backend, an `ImportError` will be raised.

Invalid points in PathCollections

PathCollections created with `scatter` now keep track of invalid points. Previously, points with nonfinite (infinite or nan) coordinates would not be included in the offsets (as returned by `PathCollection.get_offsets`) of a `PathCollection` created by `scatter`, and points with nonfinite values (as specified by the `c` kwarg) would not be included in the array (as returned by `PathCollection.get_array`).

Such points are now included, but masked out by returning a masked array.

If the `plotnonfinite` kwarg to `scatter` is set, then points with nonfinite values are plotted using the bad color of the `collections.PathCollection`'s colormap (as set by `colors.Colormap.set_bad()`).

Alpha blending in imshow of RBGA input

The alpha-channel of RBGA images is now re-sampled independently of RGB channels. While this is a bug fix, it does change the output and may result in some down-stream image comparison tests to fail.

Autoscaling

On log-axes where a single value is plotted at a “full” decade (1, 10, 100, etc.), the autoscaling now expands the axis symmetrically around that point, instead of adding a decade only to the
right.

**Log-scaled axes**

When the default `LogLocator` would generate no ticks for an axis (e.g., an axis with limits from 0.31 to 0.39) or only a single tick, it now instead falls back on the linear `AutoLocator` to pick reasonable tick positions.

**Figure.add_subplot with no arguments**

Calling `Figure.add_subplot()` with no positional arguments used to do nothing; this now is equivalent to calling `add_subplot(111)` instead.

**bxp and rcparams**

`bxp` now respects `rcParams["boxplot.boxprops.linewidth"]` (default: 1.0) even when `patch_artist` is set. Previously, when the `patch_artist` parameter was set, `bxp` would ignore `rcParams["boxplot.boxprops.linewidth"]` (default: 1.0). This was an oversight – in particular, `boxplot` did not ignore it.

**Major/minor tick collisions**

Minor ticks that collide with major ticks are now hidden by default. Previously, certain locator classes (`LogLocator`, `AutoMinorLocator`) contained custom logic to avoid emitting tick locations that collided with major ticks when they were used as minor locators. This logic has now moved to the `Axis` class, and is used regardless of the locator class. You can control this behavior via the `remove_overlapping_locs` attribute on `Axis`.

If you were relying on both the major and minor tick labels to appear on the same tick, you may need to update your code. For example, the following snippet

```python
import numpy as np
import matplotlib.dates as mdates
import matplotlib.pyplot as plt

t = np.arange("2018-11-03", "2018-11-06", dtype="datetime64")
x = np.random.rand(len(t))

fig, ax = plt.subplots()
ax.plot(t, x)
ax.xaxis.set(
    major_locator=mdates.DayLocator(),
    major_formatter=mdates.DateFormatter("%a"),
    minor_locator=mdates.HourLocator((0, 6, 12, 18)),
    minor_formatter=mdates.DateFormatter("%H:%M"),
)

# disable removing overlapping locations
ax.xaxis.remove_overlapping_locs = False
plt.show()
```
labeled days using major ticks, and hours and minutes using minor ticks and added a newline to the major ticks labels to avoid them crashing into the minor tick labels. Setting the `remove_overlapping_locs` property (also accessible via `set_remove_overlapping_locs` / `get_remove_overlapping_locs` and `setp`) disables removing overlapping tick locations.

The major tick labels could also be adjusted include hours and minutes, as the minor ticks are gone, so the `major_formatter` would be:

```python
mdates.DateFormatter("%H:%M\n%a")
```

**usetex support**

Previously, if `rcParams["text.usetex"]` (default: False) was True, then constructing a `TextPath` on a non-mathtext string with `usetex=False` would rely on the mathtext parser (but not on usetex support!) to parse the string. The mathtext parser is not invoked anymore, which may cause slight changes in glyph positioning.

**get_window_extents**

`matplotlib.axes.Axes.get_window_extent` used to return a bounding box that was slightly larger than the axes, presumably to take into account the ticks that may be on a spine. However, it was not scaling the tick sizes according to the dpi of the canvas, and it did not check if the ticks were visible, or on the spine.

Now `matplotlib.axes.Axes.get_window_extent` just returns the axes extent with no padding for ticks.

This affects `matplotlib.axes.Axes.get_tightbbox` in cases where there are outward ticks with no tick labels, and it also removes the (small) pad around axes in that case.

`spines.Spine.get_window_extent` now takes into account ticks that are on the spine.

**Sankey**

Previously, `Sankey.add` would only accept a single string as the `labels` argument if its length is equal to the number of flows, in which case it would use one character of the string for each flow.

The behavior has been changed to match the documented one: when a single string is passed, it is used to label all the flows.

**FontManager scores**

`font_manager.FontManager.score_weight` is now more strict with its inputs. Previously, when a weight string was passed to `font_manager.FontManager.score_weight`,

- if the weight was the string representation of an integer, it would be converted to that integer,
- otherwise, if the weight was not a standard weight name, it would be silently replaced by a value of 500 ("normal" weight).

`font_manager.FontManager.score_weight` now raises an exception on such inputs.
Text alignment

Text alignment was previously incorrect, in particular for multiline text objects with large descenders (i.e. subscripts) and rotated text. These have been fixed and made more consistent, but could make old code that has compensated for this no longer have the correct alignment.

Upper case color strings

Support for passing single-letter colors (one of “rgbcmykw”) as UPPERCASE characters is deprecated; these colors will become case-sensitive (lowercase) after the deprecation period has passed.

The goal is to decrease the number of ambiguous cases when using the `data` keyword to plotting methods; e.g. `plot("X", "Y", data=\{"X": ...", "Y": ...\})` will not warn about “Y” possibly being a color anymore after the deprecation period has passed.

Degenerate limits

When bounds passed to `set_xlim` are degenerate (i.e. the lower and upper value are equal), the method used to “expand” the bounds now matches the expansion behavior of autoscaling when the plot contains a single x-value, and should in particular produce nicer limits for non-linear scales.

Plot format string parsing

In certain cases, `plot` would previously accept format strings specifying more than one linestyle (e.g. "---." which specifies both "--" and ".-"), only use one of them would be used. This now raises a `ValueError` instead.

HTMLWriter

The HTMLWriter constructor is more strict: it no longer normalizes unknown values of `default_mode` to 'loop', but errors out instead.

AFM parsing

In accordance with the AFM spec, the AFM parser no longer truncates the `UnderlinePosition` and `UnderlineThickness` fields to integers.

The `Notice` field (which can only be publicly accessed by the deprecated `afm.parse_afm` API) is no longer decoded to a `str`, but instead kept as `bytes`, to support non-conformant AFM files that use non-ASCII characters in that field.

Artist.set keyword normalisation

`Artist.set` now normalizes keywords before sorting them. Previously it sorted its keyword arguments in reverse alphabetical order (with a special-case to put `color` at the end) before applying them.
It now normalizes aliases (and, as above, emits a warning on duplicate properties) before
doing the sorting (so c goes to the end too).

**Axes.tick_params argument checking**

Previously *Axes.tick_params* silently did nothing when an invalid *axis* parameter was supplied.
This behavior has been changed to raise a *ValueError* instead.

**Axes.hist output**

Input that consists of multiple empty lists will now return a list of histogram values for each
one of the lists. For example, an input of `[[], []]` will return 2 lists of histogram values.
Previously, a single list was returned.

**backend_bases.Timer.remove_callback future signature change**

Currently, *backend_bases.Timer.remove_callback(func, *args, **kwargs)* removes a callback
previously added by *backend_bases.Timer.add_callback(func, *args, **kwargs)*, but if *args,
**kwargs is not passed in (ex, *Timer.remove_callback(func)*), then the first callback with a
matching *func* is removed, regardless of whether it was added with or without *args, **kwargs*.

In a future version, *Timer.remove_callback* will always use the latter behavior (not consider
*args, **kwargs); to specifically consider them, add the callback as a *functools.partial* object

```python
cb = timer.add_callback(functools.partial(func, *args, **kwargs))
# ...
# later
timer.remove_callback(cb)
```

*backend_bases.Timer.add_callback* was modified to return *func* to simplify the above usage
(previously it returned None); this also allows using it as a decorator.

The new API is modelled after *atexit.register* / *atexit.unregister*.

**StemContainer performance increase**

*StemContainer* objects can now store a *LineCollection* object instead of a list of *Line2D* objects
for stem lines plotted using *stem*. This gives a very large performance boost to displaying and
moving *stem* plots.

This will become the default behaviour in Matplotlib 3.3. To use it now, the *use_line_collection*
keyword argument to *stem* can be set to *True*

```python
ax.stem(..., use_line_collection=True)
```

Individual line segments can be extracted from the *LineCollection* using *get_segments()*.
See the *LineCollection* documentation for other methods to retrieve the collection properties.
ColorbarBase inheritance

`matplotlib.colorbar.ColorbarBase` is no longer a subclass of `cm.ScalarMappable`. This inheritance lead to a confusing situation where the `cm.ScalarMappable` passed to `matplotlib.colorbar.Colorbar(colorbar)` had a `set_norm` method, as did the colorbar. The colorbar is now purely a follower to the `ScalarMappable` norm and colormap, and the old inherited methods `set_norm`, `set_cmap`, `set_clim` are deprecated, as are the getter versions of those calls. To set the norm associated with a colorbar do `colorbar.mappable.set_norm()` etc.

FreeType and libpng search paths

The `MPLBASEDIRLIST` environment variables and `basedirlist` entry in `setup.cfg` have no effect anymore. Instead, if building in situations where FreeType or libpng are not in the compiler or linker’s default path, set the standard environment variables `CFLAGS/LDFLAGS` on Linux or OSX, or `CL/LINK` on Windows, to indicate the relevant paths.

See details in `Installation Guide`.

Setting artist properties twice or more in the same call

Setting the same artist property multiple time via aliases is deprecated. Previously, code such as

```python
plt.plot([0, 1], c="red", color="blue")
```

would emit a warning indicating that `c` and `color` are aliases of one another, and only keep the `color` kwarg. This behavior has been deprecated; in a future version, this will raise a `TypeError`, similar to Python’s behavior when a keyword argument is passed twice

```python
plt.plot([0, 1], c="red", c="blue")
```

This warning is raised by `normalize_kwargs`.

Path code types

Path code types like `Path.MOVETO` are now `np.uint8` instead of `int`. `Path.STOP`, `Path.MOVETO`, `Path.LINETO`, `Path.CURVE3`, `Path.CURVE4` and `Path.CLOSEPOLY` are now of the type `Path.code_type` (`np.uint8` by default) instead of plain `int`. This makes their type match the array value type of the `Path.codes` array.

LaTeX code in matplotlibrc file

Previously, the rc file keys `pgf.preamble` and `text.latex.preamble` were parsed using commas as separators. This would break valid LaTeX code, such as:

```latex
\usepackage[protrusion=true, expansion=false]{microtype}
```

The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to. Passing a list containing non-strings now fails, instead of coercing the results to strings.
Axes.spy

The method `Axes.spy` now raises a `TypeError` for the keyword arguments `interpolation` and `linestyle` instead of silently ignoring them.

Furthermore, `Axes.spy` spy does now allow for an `extent` argument (was silently ignored so far).

A bug with `Axes.spy(..., origin='lower')` is fixed. Previously this flipped the data but not the y-axis resulting in a mismatch between axes labels and actual data indices. Now, `origin='lower'` flips both the data and the y-axis labels.

Boxplot tick methods

The `manage_xticks` parameter of `boxplot` and `bxp` has been renamed (with a deprecation period) to `manage_ticks`, to take into account the fact that it manages either x or y ticks depending on the `vert` parameter.

When `manage_ticks=True` (the default), these methods now attempt to take previously drawn boxplots into account when setting the axis limits, ticks, and tick labels.

MouseEvents

MouseEvents now include the event name in their `str()`. Previously they contained the prefix “MPL MouseEvent”.

RGBA buffer return type

`FigureCanvasAgg.buffer_rgba` and `RendererAgg.buffer_rgba` now return a memoryview. The `buffer_rgba` method now allows direct access to the renderer’s underlying buffer (as a `(m, n, 4)`-shape memoryview) rather than copying the data to a new bytestring. This is consistent with the behavior on Py2, where a buffer object was returned.

`matplotlib.font_manager.win32InstalledFonts` return type

`matplotlib.font_manager.win32InstalledFonts` returns an empty list instead of `None` if no fonts are found.

`Axes.fmt_xdata` and `Axes.fmt_ydata` error handling

Previously, if the user provided a `Axes.fmt_xdata` or `Axes.fmt_ydata` function that raised a `TypeError` (or set them to a non-callable), the exception would be silently ignored and the default formatter be used instead. This is no longer the case; the exception is now propagated out.
Deprecation of redundant Tick attributes

The gridOn, tick1On, tick2On, label1On, and label2On Tick attributes have been deprecated. Directly get and set the visibility on the underlying artists, available as the gridline, tick1line, tick2line, label1, and label2 attributes.

The label attribute, which was an alias for label1, has been deprecated.

Subclasses that relied on setting the above visibility attributes needs to be updated; see e.g. examples/api/skewt.py.

Passing a Line2D’s drawstyle together with the linestyle is deprecated

Instead of plt.plot(..., linestyle="steps--"), use plt.plot(..., linestyle="--", drawstyle="steps"). ds is now an alias for drawstyle.

pgi support dropped

Support for pgi in the GTK3 backends has been dropped. pgi is an alternative implementation to PyGObject. PyGObject should be used instead.

rcParam changes

Removed

The following deprecated rcParams have been removed:

• text.dvipnghack
• nbagg.transparent (use rcParams["figure.facecolor"] (default: 'white') instead)
• plugins.directory
• axes.hold
• backend.qt4 and backend.qt5 (set the QT_API environment variable instead)

 Deprecated

The associated validator functions rcsetup.validate_qt4 and validate_qt5 are deprecated.

The verbose.fileo and verbose.level rcParams have been deprecated. These have had no effect since the switch from Matplotlib’s old custom Verbose logging to the stdlib’s logging module. In addition the rcsetup.validate_verbose function is deprecated.

The text.latex.unicode rcParam now defaults to True and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported). Moreover, the underlying implementation now uses \usepackage[utf8]{inputenc} instead of \usepackage{ucs}\usepackage[utf8x]{inputenc}.
Exception changes

- Previously, subprocess failures in the animation framework would raise either in a `RuntimeError` or a `ValueError` depending on when the error occurred. They now raise a `subprocess.CalledProcessError` with attributes set as documented by the exception class.

- In certain cases, Axes methods (and pyplot functions) used to raise a `RuntimeError` if they were called with a data kwarg and otherwise mismatched arguments. They now raise a `TypeError` instead.

- `Axes.streamplot` does not support irregularly gridded x and y values. So far, it used to silently plot an incorrect result. This has been changed to raise a `ValueError` instead.

- The `streamplot.Grid` class, which is internally used by streamplot code, also throws a `ValueError` when irregularly gridded values are passed in.

Removals

The following deprecated APIs have been removed:

Classes and methods

- `Verbose` (replaced by python logging library)
- `artist.Artist.hitlist` (no replacement)
- `artist.Artist.is_figure_set` (use `artist.figure is not None` instead)
- `axis.Axis.unit_data` (use `axis.Axis.units` instead)
- `backend_bases.FigureCanvasBase.onRemove` (no replacement) `backend_bases.FigureManagerBase.show_popup` (this never did anything)
- `backend_wx.SubplotToolWx` (no replacement)
- `backend_wx.Toolbar` (use `backend_wx.NavigationToolbar2Wx` instead)
- `cbook.align_iterators` (no replacement)
- `contour.ContourLabeler.get_real_label_width` (no replacement)
- `legend.Legend.draggable` (use `legend.Legend.set draggable()` instead)
- `texmanager.TexManager.postscriptd, texmanager.TexManager.pscnt, texmanager.TexManager.make_ps, texmanager.TexManager.get_ps_bbox` (no replacements)

Arguments

- The `fig` kwarg to `GridSpec.get_subplot_params` and `GridSpecFromSubplotSpec.get_subplot_params` (use the argument `figure` instead)
- Passing `‘box-forced’` to `Axes.set_adjustable` (use `‘box’` instead)
- Support for the strings `‘on’/’true’/’off’/’false’` to mean `True` / `False` (directly use `True` / `False` instead). The following functions are affected:
- `axes.Axes.grid`
- `Axes3D.grid`
- `Axis.set_tick_params`
- `pyplot.box`
  
  • Using `pyplot.axes` with an `axes.Axes` type argument (use `pyplot.sca` instead)

**Other**

The following miscellaneous API elements have been removed

• svgfont support (in `rcParams["svg.fonttype"]` (default: 'path'))

• Logging is now done with the standard python logging library. `matplotlib.verbose` and the command line switches `--verbose-LEVEL` have been removed.

  To control the logging output use:

  ```python
  import logging
  logger = logging.getLogger('matplotlib')
  logger.set_level(logging.INFO)
  ```

• `__version__.numpy__`
• `collections.CIRCLE_AREA_FACTOR`
• `font_manager.USE_FONTCONFIG`
• `font_manager.cachedir`

**matplotlib.mlab removals**

Lots of code inside the `matplotlib.mlab` module which was deprecated in Matplotlib 2.2 has been removed. See below for a list:

• `mlab.exp_safe` (use `numpy.exp` instead)
• `mlab.amap`
• `mlab.logspace` (use `numpy.logspace` instead)
• `mlab.rms_flat`
• `mlab.linalg.norm(a, ord=1)` instead)
• `mlab.linalg.norm(a, ord=2)` instead)
• `mlab.linalg.norm(a.flat, ord=2)` instead)
• `mlab.frange` (use `numpy.arange` instead)
• `mlab.identity` (use `numpy.identity` instead)
• `mlab.base_repr`
• `mlab.binary_repr`
• `mlab.ispower2`
• `mlab.log2` (use `numpy.log2` instead)
- mlab.isvector
- mlab.movavg
- mlab.safe_isinf (use numpy.isinf instead)
- mlab.safe_isnan (use numpy.isnan instead)
- mlab.cohere_pairs (use scipy.signal.coherence instead)
- mlab.entropy (use scipy.stats.entropy instead)
- mlab.normpdf (use scipy.stats.norm.pdf instead)
- mlab.find (use np.nonzero(np.ravel(condition)) instead)
- mlab.longest_contiguous_ones
- mlab.longest_ones
- mlab.PCA
- mlab.prctile (use numpy.percentile instead)
- mlab.prctile_rank
- mlab.center_matrix
- mlab.rk4 (use scipy.integrate.ode instead)
- mlab.bivariate_normal
- mlab.get_xyz_where
- mlab.get_sparse_matrix
- mlab.dist (use numpy.hypot instead)
- mlab.dist_point_to_segment
- mlab.griddata (use scipy.interpolate.griddata)
- mlab.less_simple_linear_interpolation (use numpy.interp instead)
- mlab.slopes
- mlab.stineman_interp
- mlab.segments_intersect
- mlab.fftsurr
- mlab.offset_line
- mlab.quad2cubic
- mlab.vector_lengths
- mlab.distances_along_curve
- mlab.path_length
- mlab.cross_from_above
- mlab.cross_from_below
- mlab.contiguous_regions (use cbook.contiguous_regions instead)
- mlab.is_closed_polygon
- mlab.poly_between
Matplotlib, Release 3.3.0

- mlab.poly_below
- mlab.inside_poly
- mlab.csv2rec
- mlab.rec2csv (use numpy.recarray.tofile instead)
- mlab.rec2text (use numpy.recarray.tofile instead)
- mlab.rec_summarize
- mlab.rec_join
- mlab.recs_join
- mlab.rec_groupby
- mlab.rec_keep_fields
- mlab.rec_drop_fields
- mlab.rec_append_fields
- mlab.csvformat_factory
- mlab.get_formatd
- mlab.FormatDatetime (use datetime.datetime.strftime instead)
- mlab.FormatDate (use datetime.date.strftime instead)
- mlab.donothing_callback

pylab removals

Lots of code inside the matplotlib.mlab module which was deprecated in Matplotlib 2.2 has been removed. This means the following functions are no longer available in the pylab module:

- amap
- base_repr
- binary_repr
- bivariate_normal
- center_matrix
- csv2rec (use numpy.recarray.tofile instead)
- dist (use numpy.hypot instead)
- dist_point_to_segment
- distances_along_curve
- entropy (use scipy.stats.entropy instead)
- exp_safe (use numpy.exp instead)
- fftsurr
- find (use np.nonzero(np.ravel(condition)) instead)
• `frange` (use `numpy.arange` instead)
• `get_sparse_matrix`
• `get_xyz_where`
• `griddata` (use `scipy.interpolate.griddata` instead)
• `identity` (use `numpy.identity` instead)
• `inside_poly`
• `is_closed_polygon`
• `ispower2`
• `isvector`
• `l1norm` (use `numpy.linalg.norm(a, ord=1)` instead)
• `l2norm` (use `numpy.linalg.norm(a, ord=2)` instead)
• `log2` (use `numpy.log2` instead)
• `longest_contiguous_ones`
• `longest_ones`
• `movavg`
• `norm_flat` (use `numpy.linalg.norm(a.flat, ord=2)` instead)
• `normpdf` (use `scipy.stats.norm.pdf` instead)
• `path_length`
• `poly_below`
• `poly_between`
• `prctile` (use `numpy.percentile` instead)
• `prctile_rank`
• `rec2csv` (use `numpy.recarray.tofile` instead)
• `rec_append_fields`
• `rec_drop_fields`
• `rec_join`
• `rk4` (use `scipy.integrate.ode` instead)
• `rms_flat`
• `segments_intersect`
• `slopes`
• `stineman_interp`
• `vector_lengths`
mplot3d changes

**Voxel shading**

*Axes3D.voxels* now shades the resulting voxels; for more details see What’s new. The previous behavior can be achieved by passing

\[
\text{ax.voxels(..., shade=False)}
\]

**Equal aspect axes disabled**

Setting the aspect on 3D axes previously returned non-sensical results (e.g. see #1077). Calling *ax.set_aspect('equal')* or *ax.set_aspect(num)* on a 3D axes now raises a *NotImplementedError*.

**Poly3DCollection.set_zsort**

*Poly3DCollection.set_zsort* no longer silently ignores invalid inputs, or *False* (which was always broken). Passing *True* to mean "average" is deprecated.

**Testing**

The --no-network flag to tests.py has been removed (no test requires internet access anymore). If it is desired to disable internet access both for old and new versions of Matplotlib, use tests.py -m 'not network' (which is now a no-op).

The image comparison test decorators now skip (rather than xfail) the test for uncomparable formats. The affected decorators are *image_comparison* and *check_figures_equal*. The deprecated ImageComparisonTest class is likewise changed.

**Dependency changes**

**NumPy**

Matplotlib 3.1 now requires NumPy>=1.11.

**ghostscript**

Support for ghostscript 8.60 (released in 2007) has been removed. The oldest supported version of ghostscript is now 9.0 (released in 2010).

**Mathtext changes**

- In constructs such as "$1-2$", mathtext now interprets the tilde as a space, consistently with TeX (this was previously a parse error).
Deprecations

- The \textbackslash stackrel mathtext command has been deprecated (it behaved differently from LaTeX's \textbackslash stackrel. To stack two mathtext expressions, use \texttt{\textbackslash genfrac\{left-delim\}\{right-delim\}\{fraction-bar-thickness\}\{top\}\{bottom\}).

- The \textbackslash mathtextcommand (which is not a real TeX command) is deprecated. Directly use unicode characters (e.g. "\textbackslash N\{CIRCLED LATIN CAPITAL LETTER A\}" or "\textbackslash u24b6") instead.

- Support for setting \texttt{rcParams[\textbackslash mathtext.default]} (default: 'it') to circled is deprecated.

Signature deprecations

The following signature related behaviours are deprecated:

- The \texttt{withdash} keyword argument to \texttt{Axes.text()} is deprecated.
- Passing (n, 1)-shaped error arrays to \texttt{Axes.errorbar()}, which was not documented and did not work for \texttt{n = 2}. Pass a 1D array instead.
- The \texttt{frameon} kwarg to \texttt{savefig} and the \texttt{rcParams[\textbackslash savefig.frameon]} rcParam. To emulate \texttt{frameon = False}, set \texttt{facecolor} to fully transparent ("none", or \texttt{(0, 0, 0, 0)}).
- Passing a non-1D (typically, (n, 1)-shaped) input to \texttt{Axes.pie}. Pass a 1D array instead.
- The \texttt{TextPath} constructor used to silently drop ignored arguments; this behavior is deprecated.
- The \texttt{usetex} parameter of \texttt{TextToPath.get_text_path} is deprecated and folded into the \texttt{is-math} parameter; which can now take the values \texttt{False}, \texttt{True}, and "TeX", consistently with other low-level text processing functions.
- Passing 'normal' to \texttt{axes.Axes.axis()} is deprecated, use \texttt{ax.axis('auto')} instead.
- Passing the \texttt{block} argument of \texttt{pyplot.show} positionally is deprecated; it should be passed by keyword.
- When using the nbagg backend, \texttt{pyplot.show} used to silently accept and ignore all combinations of positional and keyword arguments. This behavior is deprecated.
- The unused \texttt{shape} and \texttt{imlim} parameters to \texttt{Axes.imshow} are deprecated. To avoid triggering the deprecation warning, the \texttt{filternorm}, \texttt{filterrad}, \texttt{resample}, and \texttt{url} arguments should be passed by keyword.
- The \texttt{interp\_at\_native} parameter to \texttt{BboxImage}, which has had no effect since Matplotlib 2.0, is deprecated.
- All arguments to the \texttt{cbook.deprecated} decorator and \texttt{cbook.warn\_deprecated} function, except the first one (the version where the deprecation occurred), are now keyword-only. The goal is to avoid accidentally setting the "message" argument when the "name" (or "alternative") argument was intended, as this has repeatedly occurred in the past.
- The arguments of \texttt{matplotlib.testing.compare.calculate_rms} have been renamed from \texttt{expectedImage, actualImage}, to \texttt{expected\_image, actual\_image}.
- Passing positional arguments to \texttt{Axes.set\_ticklabels} beyond \texttt{ticklabels} itself has no effect, and support for them is deprecated.
- Passing \texttt{shade=None} to \texttt{plot\_surface} is deprecated. This was an unintended implementation detail with the same semantics as \texttt{shade=False}. Please use the latter code instead.
• `matplotlib.ticker.MaxNLocator` and its `set_params` method will issue a warning on unknown keyword arguments instead of silently ignoring them. Future versions will raise an error.

Changes in parameter names

• The `arg` parameter to `matplotlib.use` has been renamed to `backend`.
  This will only affect cases where that parameter has been set as a keyword argument. The common usage pattern as a positional argument `matplotlib.use('Qt5Agg')` is not affected.

• The `normed` parameter to `Axes.hist2d` has been renamed to `density`.

• The `s` parameter to `Annotation` (and indirectly `Axes.annotate`) has been renamed to `text`.

• The `tolerence` parameter to `bezier.find_bezier_t_intersecting_with_closedpath`, `bezier.split_bezier_intersecting_with_closedpath`, `bezier.find_r_to_boundary_of_closedpath`, `bezier.split_path_inout` and `bezier.check_if_parallel` has been renamed to `tolerance`.

In each case, the old parameter name remains supported (it cannot be used simultaneously with the new name), but support for it will be dropped in Matplotlib 3.3.

Class/method/attribute deprecations

Support for custom backends that do not provide a `GraphicsContextBase.set_hatch_color` method is deprecated. We suggest that custom backends let their `GraphicsContext` class inherit from `GraphicsContextBase`, to at least provide stubs for all required methods.

• `spine.Spine.is_frame_like`
  This has not been used in the codebase since its addition in 2009.

• `axis3d.Axis.get_tick_positions`
  This has never been used internally, there is no equivalent method exists on the 2D Axis classes, and despite the similar name, it has a completely different behavior from the 2D Axis` axis.Axis.get_ticks_position method.

• `.backend_pgf.LatexManagerFactory`
• `mpl_toolkits.axisartist.axislines.SimpleChainedObjects`
• `mpl_toolkits.Axes.AxisDict`

Internal Helper Functions

• `checkdep_dvipng`
• `checkdep_ghostscript`
• `checkdep_pdftops`
• `checkdep_inkscape`
• `ticker.decade_up`
• `ticker.decade_down`
• `cbook.dedent`
• docstring.Appender
• docstring.dedent
• docstring.copy_dedent

Use the standard library’s docstring manipulation tools instead, such as inspect.cleandoc and inspect.getdoc.

• matplotlib.scale.get_scale_docs()
• matplotlib.pyplot.get_scale_docs()

These are considered internal and will be removed from the public API in a future version.

• projections.process_projection_requirements
• backend_ps.PsBackendHelper
• backend_ps.ps_backend_helper,
• cbook.iterable
• cbook.get_label
• cbook.safezip Manually check the lengths of the inputs instead, or rely on NumPy to do it.
• cbook.is_hashable Use isinstance(..., collections.abc.Hashable) instead.
• The .backend_bases.RendererBase.strip_math. Use cbook.strip_math instead.

Multiple internal functions that were exposed as part of the public API of mpl_toolkits.mplot3d are deprecated,

**mpl_toolkits.mplot3d.art3d**

• mpl_toolkits.mplot3d.art3d.norm_angle
• mpl_toolkits.mplot3d.art3d.norm_text_angle
• mpl_toolkits.mplot3d.art3d.path_to_3d_segment
• mpl_toolkits.mplot3d.art3d.paths_to_3d_segments
• mpl_toolkits.mplot3d.art3d.path_to_3d_segment_with_codes
• mpl_toolkits.mplot3d.art3d.paths_to_3d_segments_with_codes
• mpl_toolkits.mplot3d.art3d.get_patch_verts
• mpl_toolkits.mplot3d.art3d.get_colors
• mpl_toolkits.mplot3d.art3d.zalpha

**mpl_toolkits.mplot3d.proj3d**

• mpl_toolkits.mplot3d.proj3d.line2d
• mpl_toolkits.mplot3d.proj3d.line2d_dist
• mpl_toolkits.mplot3d.proj3d.line2d_seg_dist
• mpl_toolkits.mplot3d.proj3d.mod
• mpl_toolkits.mplot3d.proj3d.proj_transform_vec
• mpl_toolkits.mplot3d.proj3d.proj_transform_vec_clip
• mpl_toolkits.mplot3d.proj3d.vec_pad_ones
• mpl_toolkits.mplot3d.proj3d.proj_trans_clip_points

If your project relies on these functions, consider vendoring them.

Font Handling

• backend_pdf.RendererPdf.afm_font_cache
• backend_ps.RendererPS.afmfontd
• font_manager.OSXInstalledFonts
• Axes3D.w_xaxis
• Axes3D.w_yaxis
• Axes3D.w_zaxis

Use Axes3D.xaxis, Axes3D.yaxis and Axes3D.zaxis instead.

Date related functions

• dates.seconds()
• dates.minutes()
• dates.hours()
• dates.weeks()
• dates.strpdate2num
• dates.bytespdate2num

These are brittle in the presence of locale changes. Use standard datetime parsers such as time.strptime or dateutil.parser.parse, and additionally call matplotlib.dates.date2num if you need to convert to Matplotlib's internal datetime representation; or use dates.datestr2num.

Testing

• matplotlib.testing.decorators.switch_backend decorator

Test functions should use pytest.mark.backend, and the mark will be picked up by the matplotlib.testing.conftest.mpl_test_settings fixture.

Quiver

• .color attribute of Quiver objects

Instead, use (as for any Collection) the get_facecolor method. Note that setting to the .color attribute did not update the quiver artist, whereas calling set_facecolor does.
GUI / backend details

- `.get_py2exe_datafiles`
- `.tk_window_focus`
- `backend_gtk3FileChooserDialog`
- `backend_gtk3.NavigationToolbar2GTK3.get_filechooser`
- `backend_gtk3.SaveFigureGTK3.get_filechooser`
- `NavigationToolbar2QT.adj_window` attribute. This is unused and always `None`.
- `backend.wx.IDLE_DELAY` global variable. This is unused and only relevant to the now removed wx “idling” code (note that as it is a module-level global, no deprecation warning is emitted when accessing it).
- `mlab.demean`
- `backend_gtk3cairo.FigureCanvasGTK3Cairo`
- `backend.wx.debug_on_error, backend.wx.fake_stderr, backend.wx.raise_msg_to_str, backend.wx.MenuButtonWx, backend.wx.PrintoutWx`
- `matplotlib.backends.qt_editor.formlayout` module

This module is a vendored, modified version of the official `formlayout` module available on PyPI. Install that module separately if you need it.

- `GraphicsContextPS.shouldstroke`

Transforms / scales

- `LogTransformBase`
- `Log10Transform`
- `Log2Transform`
- `NaturalLogTransformLog`
- `InvertedLogTransformBase`
- `InvertedLog10Transform`
- `InvertedLog2Transform`
- `InvertedNaturalLogTransform`

These classes defined in `matplotlib.scale` are deprecated. As a replacement, use the general `LogTransform` and `InvertedLogTransform` classes, whose constructors take a `base` argument.

Locators / Formatters

- `OldScalarFormatter.pprint_val`
- `ScalarFormatter.pprint_val`
- `LogFormatter.pprint_val`

These are helper methods that do not have a consistent signature across formatter classes.
Path tools

- path.get_paths_extents
Use get_path_collection_extents instead.
- \_Path.has_nonfinite attribute
Use not np.isfinite(path.vertices).all() instead.
- bezier.find_r_to_boundary_of_closedpath function is deprecated
This has always returned None instead of the requested radius.

Text

- text.TextWithDash
- Text.is_math_text
- TextPath.is_math_text
- TextPath.text_get_vertices_codes (As an alternative, construct a new TextPath object.)

Unused attributes

- NavigationToolbar2QT.buttons
- Line2D.verticalOffset
- Quiver.keytext
- Quiver.keyvec
- SpanSelector.buttonDown
These are unused and never updated.

Sphinx extensions

- matplotlib.sphinxext.mathmpl.math_directive
- matplotlib.sphinxext.plot_directive.plot_directive
This is because the matplotlib.sphinxext.mathmpl and matplotlib.sphinxext.plot_directive interfaces have changed from the (Sphinx-)deprecated function-based interface to a class-based interface; this should not affect end users.
- mpl_toolkits.axisartist.axis_artist.UnimplementedException

Environmental Variables

- The MATPLOTLIBDATA environment variable
Axis

- Axis.iter_ticks
  This only served as a helper to the private Axis._update_ticks

Undeprecations

The following API elements have been un-deprecated:
- The obj_type kwarg to the cbook.deprecated decorator.
- xmin, xmax kwargs to Axes.set_xlim and ymin, ymax kwargs to Axes.set_ylim

New features

Text now has a c alias for the color property

For consistency with Line2D, the Text class has gained the c alias for the color property. For example, one can now write

```python
ax.text(.5, .5, "foo", c="red")
```

Cn colors now support n>=10

It is now possible to go beyond the tenth color in the property cycle using Cn syntax, e.g.

```python
plt.plot([1, 2], color="C11")
```

now uses the 12th color in the cycle.

Note that previously, a construct such as:

```python
plt.plot([1, 2], "C11")
```

would be interpreted as a request to use color C1 and marker 1 (an “inverted Y”). To obtain such a plot, one should now use

```python
plt.plot([1, 2], "1C1")
```

(so that the first “1” gets correctly interpreted as a marker specification), or, more explicitly:

```python
plt.plot([1, 2], marker="1", color="C1")
```

New Formatter.format_ticks method

The Formatter class gained a new format_ticks method, which takes the list of all tick locations as a single argument and returns the list of all formatted values. It is called by the axis tick handling code and, by default, first calls set_locs with all locations, then repeatedly calls __call__ for each location.
Tick-handling code in the codebase that previously performed this sequence (``set_locs`` followed by repeated ``__call__``) have been updated to use ``format_ticks``.

``format_ticks`` is intended to be overridden by ``Formatter`` subclasses for which the formatting of a tick value depends on other tick values, such as `ConciseDateFormatter`.

**Added support for RGB(A) images in pcolorfast**

``pcolorfast`` now accepts 3D images (RGB or RGBA) arrays if the X and Y specifications allow image or pcolorimage rendering; they remain unsupported by the more general quadmesh rendering.

**Invalid inputs**

Passing invalid locations to ``legend`` and ``table`` used to fallback on a default location. This behavior is deprecated and will throw an exception in a future version.

``offsetbox.AnchoredText`` is unable to handle the `horizontalalignment` or `verticalalignment` kwargs, and used to ignore them with a warning. This behavior is deprecated and will throw an exception in a future version.

Passing steps less than 1 or greater than 10 to `MaxNLocator` used to result in undefined behavior. It now throws a `ValueError`.

The signature of the (private) `axis._update_ticks` has been changed to not take the renderer as argument anymore (that argument is unused).

### 16.1.48 API Changes for 3.1.1

- **Behavior changes**

  **Locator.nonsingular return order**

  ``Locator.nonsingular`` (introduced in mpl 3.1) now returns a range $v_0$, $v_1$ with $v_0 \leq v_1$. This behavior is consistent with the implementation of `nonsingular` by the `LogLocator` and `LogitLocator` subclasses.

### 16.1.49 API Changes for 3.2.0

- **Behavior changes**
- **Deprecations**
- **Removals**
Behavior changes

**Reduced default value of rcParams** *axes.formatter.limits* (default: [-5, 6])

Changed the default value of rcParams *axes.formatter.limits* (default: [-5, 6]) from -7, 7 to -5, 6 for better readability.

matplotlib.colorbar.Colorbar uses un-normalized axes for all mappables

Before 3.0, *matplotlib.colorbar.Colorbar* (colorbar) normalized all axes limits between 0 and 1 and had custom tickers to handle the labelling of the colorbar ticks. After 3.0, colorbars constructed from mappables that were not contours were constructed with axes that had limits between vmin and vmax of the mappable’s norm, and the tickers were made children of the normal axes tickers.

This version of Matplotlib extends that to mappables made by contours, and allows the axes to run between the lowest boundary in the contour and the highest.

Code that worked around the normalization between 0 and 1 will need to be modified.
MovieWriterRegistry

MovieWriterRegistry now always checks the availability of the writer classes before returning them. If one wishes, for example, to get the first available writer, without performing the availability check on subsequent writers, it is now possible to iterate over the registry, which will yield the names of the available classes.

Autoscaling

Matplotlib used to recompute autoscaled limits after every plotting (plot(), bar(), etc.) call. It now only does so when actually rendering the canvas, or when the user queries the Axes limits. This is a major performance improvement for plots with a large number of artists.

In particular, this means that artists added manually with Axes.add_line, Axes.add_patch, etc. will be taken into account by the autoscale, even without an explicit call to Axes.autoscale_view.

In some cases, this can result in different limits being reported. If this is an issue, consider triggering a draw with fig.canvas.draw().

Autoscaling has also changed for artists that are based on the Collection class. Previously, the method that calculates the automatic limits Collection.get_datalim tried to take into account the size of objects in the collection and make the limits large enough to not clip any of the object, i.e., for Axes.scatter it would make the limits large enough to not clip any markers in the scatter. This is problematic when the object size is specified in physical space, or figure-relative space, because the transform from physical units to data limits requires knowing the data limits, and becomes invalid when the new limits are applied. This is an inverse problem that is theoretically solvable (if the object is physically smaller than the axes), but the extra complexity was not deemed worth it, particularly as the most common use case is for markers in scatter that are usually small enough to be accommodated by the default data limit margins.

While the new behavior is algorithmically simpler, it is conditional on properties of the Collection object:

1. offsets = None, transform is a child of Axes.transData: use the paths for the automatic limits (i.e. for LineCollection in Axes.streamplot).
2. offsets != None, and offset_transform is child of Axes.transData:
   a) transform is child of Axes.transData: use the path + offset for limits (i.e., for Axes.bar).
   b) transform is not a child of Axes.transData: just use the offsets for the limits (i.e. for scatter)
3. otherwise return a null Bbox.

While this seems complicated, the logic is simply to use the information from the object that are in data space for the limits, but not information that is in physical units.

log-scale bar() / hist() autolimits

The autolimits computation in bar and hist when the axes already uses log-scale has changed to match the computation when the axes is switched to log-scale after the call to bar and hist, and when calling bar(..., log=True) / hist(..., log=True): if there are at least two different bar heights, add the normal axes margins to them (in log-scale); if there is only a single
bar height, expand the axes limits by one order of magnitude around it and then apply axes margins.

Axes labels spanning multiple rows/columns

Axes.label_outer now correctly keep the x labels and tick labels visible for Axes spanning multiple rows, as long as they cover the last row of the Axes grid. (This is consistent with keeping the y labels and tick labels visible for Axes spanning multiple columns as long as they cover the first column of the Axes grid.)

The Axes.is_last_row and Axes.is_last_col methods now correctly return True for Axes spanning multiple rows, as long as they cover the last row or column respectively. Again this is consistent with the behavior for axes covering the first row or column.

The Axes.rowNum and Axes.colNum attributes are deprecated, as they only refer to the first grid cell covered by the Axes. Instead, use the new ax.get_subplotspec().rowspan and ax.get_subplotspec().colspan properties, which are range objects indicating the whole span of rows and columns covered by the subplot.

(Note that all methods and attributes mentioned here actually only exist on the Subplot subclass of Axes, which is used for grid-positioned Axes but not for Axes positioned directly in absolute coordinates.)

The GridSpec class gained the nrows and ncols properties as more explicit synonyms for the parameters returned by GridSpec.get_geometry.

Locators

When more than Locator.MAXTICKS ticks are generated, the behavior of Locator.raise_if_exceeds changed from raising a RuntimeError to emitting a log at WARNING level.

nonsingular Locators

Locator.nonsingular (introduced in mpl 3.1), DateLocator.nonsingular, and AutoDateLocator.nonsingular now returns a range v0, v1 with v0 <= v1. This behavior is consistent with the implementation of nonsingular by the LogLocator and LogitLocator subclasses.

get_data_ratio

Axes.get_data_ratio now takes the axes scale into account (linear, log, logit, etc.) before computing the y-to-x ratio. This change allows fixed aspects to be applied to any combination of x and y scales.

Artist sticky edges

Previously, the sticky_edges attribute of artists was a list of values such that if an axis limit coincides with a sticky edge, it would not be expanded by the axes margins (this is the mechanism that e.g. prevents margins from being added around images).
sticky_edges now have an additional effect on margins application: even if an axis limit did not coincide with a sticky edge, it cannot cross a sticky edge through margin application – instead, the margins will only expand the axis limit until it bumps against the sticky edge.

This change improves the margins of axes displaying a streamplot:

- if the streamplot goes all the way to the edges of the vector field, then the axis limits are set to match exactly the vector field limits (whereas they would sometimes be off by a small floating point error previously).
- if the streamplot does not reach the edges of the vector field (e.g., due to the use of start_points and maxlength), then margins expansion will not cross the vector field limits anymore.

This change is also used internally to ensure that polar plots don’t display negative r values unless the user really passes in a negative value.

**gid in svg output**

Previously, if a figure, axis, legend or some other artists had a custom gid set (e.g. via .set_gid()), this would not be reflected in the svg output. Instead a default gid, like figure_1 would be shown. This is now fixed, such that e.g. fig.set_gid("myfigure") correctly shows up as <g id="myfigure"> in the svg file. If you relied on the gid having the default format, you now need to make sure not to set the gid parameter of the artists.

**Fonts**

Font weight guessing now first checks for the presence of the FT_STYLE_BOLD_FLAG before trying to match substrings in the font name. In particular, this means that Times New Roman Bold is now correctly detected as bold, not normal weight.

**Color-like checking**

`matplotlib.colors.is_color_like` used to return True for all string representations of floats. However, only those with values in 0-1 are valid colors (representing grayscale values). `is_color_like` now returns False for string representations of floats outside 0-1.

**Default image interpolation**

Images displayed in Matplotlib previously used nearest-neighbor interpolation, leading to aliasing effects for downscaling and non-integer upscaling.

New default for `rcParams["image.interpolation"]` (default: 'antialiased') is the new option "antialiased". `imshow(A, interpolation='antialiased')` will apply a Hanning filter when resampling the data in A for display (or saving to file) if the upsample rate is less than a factor of three, and not an integer; downsampled data is always smoothed at resampling.

To get the old behavior, set `rcParams["image.interpolation"]` (default: 'antialiased') to the old default "nearest" (or specify the interpolation kwarg of `Axes.imshow`)

To always get the anti-aliasing behavior, no matter what the up/down sample rate, set `rcParams["image.interpolation"]` (default: 'antialiased') to “hanning” (or one of the other filters available).
Note that the “hanning” filter was chosen because it has only a modest performance penalty. Anti-aliasing can be improved with other filters.

rcParams

When using RendererSVG with rcParams["svg.image_inline"] == True, externally written images now use a single counter even if the renderer.basename attribute is overwritten, rather than a counter per basename.

This change will only affect you if you used rcParams["svg.image_inline"] = True (the default is False) and manually modified renderer.basename.

Changed the default value of rcParams["axes.formatter.limits"] (default: [-5, 6]) from -7, 7 to -5, 6 for better readability.

add_subplot()

Figure.add_subplot() and pyplot.subplot() do not accept a figure keyword argument anymore. It only used to work anyway if the passed figure was self or the current figure, respectively.

indicate_inset()

In <= 3.1.0, indicate_inset and indicate_inset.zoom were documented as returning a 4-tuple of ConnectionPatch, where in fact they returned a 4-length list.

They now correctly return a 4-tuple. indicate_inset would previously raise an error if the optional inset_ax was not supplied; it now completes successfully, and returns None instead of the tuple of ConnectionPatch.

PGF backend

The pgf backend’s get_canvas_width_height now returns the canvas size in display units rather than in inches, which it previously did. The new behavior is the correct one given the uses of get_canvas_width_height in the rest of the codebase.

The pgf backend now includes images using \includegraphics instead of \pgfimage if the version of graphicx is recent enough to support the interpolate option (this is detected automatically).

cbook

The default value of the “obj_type” parameter to cbook.warn_deprecated has been changed from “attribute” (a default that was never used internally) to the empty string.

Testing

The test suite no longer turns on the Python fault handler by default. Set the standard PYTHONFAULTHANDLER environment variable to do so.
Backend supports_blit

Backends do not need to explicitly define the flag `supports_blit` anymore. This is only relevant for backend developers. Backends had to define the flag `supports_blit`. This is not needed anymore because the blitting capability is now automatically detected.

Exception changes

If extra kwargs are passed to `LogScale`, `TypeError` will now be raised instead of `ValueError`.

mpl3d auto-registration

`mpl_toolkits.mplot3d` is always registered by default now. It is no longer necessary to import `mpl3d` to create 3d axes with

```
ax = fig.add_subplot(111, projection="3d")
```

SymLogNorm now has a `base` parameter

Previously, `SymLogNorm` had no `base` keyword argument and the base was hard-coded to `base=np.e`. This was inconsistent with the default behavior of `SymmetricalLogScale` (which defaults to `base=10`) and the use of the word "decade" in the documentation.

In preparation for changing the default base to 10, calling `SymLogNorm` without the new `base` keyword argument emits a deprecation warning.

Deprecations

`matplotlib.use`

The `warn` parameter to `matplotlib.use()` is deprecated (catch the `ImportError` emitted on backend switch failure and reemit a warning yourself if so desired).

`plotfile`

`.pyplot.plotfile` is deprecated in favor of separately loading and plotting the data. Use pandas or NumPy to load data, and pandas or matplotlib to plot the resulting data.
axes and axis

Setting Axis.major.locator, Axis.minor.locator, Axis.major.formatter or Axis.minor.formatter to an object that is not a subclass of Locator or Formatter (respectively) is deprecated. Note that these attributes should usually be set using Axis.set_major_locator, Axis.set_minor_locator, etc. which already raise an exception when an object of the wrong class is passed.

Passing more than one positional argument or unsupported keyword arguments to axis() is deprecated (such arguments used to be silently ignored).

minor argument will become keyword-only

Using the parameter minor to get_.*ticks() / set_.*ticks() as a positional parameter is deprecated. It will become keyword-only in future versions.

axes_grid1

The mpl_toolkits.axes_grid1.colorbar module and its colorbar implementation are deprecated in favor of matplotlib.colorbar, as the former is essentially abandoned and the latter is a more featureful replacement with a nearly compatible API (for example, the following additional keywords are supported: panchor, extendfrac, extendrect).

The main differences are:

• Setting the ticks on the colorbar is done by calling colorbar.set_ticks rather than colorbar.cbar_axis.set_xticks or colorbar.cbar_axis.set_yticks; the locator parameter to colorbar() is deprecated in favor of its synonym ticks (which already existed previously, and is consistent with matplotlib.colorbar).

• The colorbar’s long axis is accessed with colorbar.xaxis or colorbar.yaxis depending on the orientation, rather than colorbar.cbar_axis.

• The default ticker is no longer MaxNLocator(5), but a _ColorbarAutoLocator.

• Overdrawing multiple colorbars on top of one another in a single Axes (e.g. when using the cax attribute of ImageGrid elements) is not supported; if you previously relied on the second colorbar being drawn over the first, you can call cax.cla() to clear the axes before drawing the second colorbar.

During the deprecation period, the mpl_toolkits.legacy_colorbar rcParam can be set to True to use mpl_toolkits.axes_grid1.colorbar in mpl_toolkits.axes_grid1 code with a deprecation warning (the default), or to False to use matplotlib.colorbar.

Passing a pad size of None (the default) as a synonym for zero to the append_axes, new_horizontal and new_vertical methods of axes_grid1.axes_divider.AxesDivider is deprecated. In a future release, the default value of None will mean “use rcParams["figure.subplot.wspace"] (default: 0.2) or rcParams["figure.subplot.hspace"] (default: 0.2)” (depending on the orientation). Explicitly pass pad=0 to keep the old behavior.

Axes3D

mplplot3d.axis3d.get_flip_min_max is deprecated.
axes3d.unit_bbox is deprecated (use Bbox.unit instead).
axes3d.Axes3D.w_xaxis, .w_yaxis, and .w_zaxis are deprecated (use .xaxis, .yaxis, and .zaxis instead).

matplotlib.cm

cm.revcmap is deprecated. Use Colormap.reversed to reverse a colormap.
cm.datad no longer contains entries for reversed colormaps in their “unconverted” form.

axisartist

mpl_toolkits.axisartist.grid_finder.GridFinderBase is deprecated (its only use is to be inherited by the GridFinder class which just provides more defaults in the constructor and directly sets the transforms, so GridFinderBase’s methods were just moved to GridFinder).
axisartist.axis_artist.BezierPath is deprecated (use patches.PathPatch to draw arbitrary Paths).
AxisArtist.line is now a patches.PathPatch instance instead of a BezierPath instance.

Returning a factor equal to None from axisartist Locators (which are not the same as “standard” tick Locators), or passing a factor equal to None to axisartist Formatters (which are not the same as “standard” tick Formatters) is deprecated. Pass a factor equal to 1 instead.

For the mpl_toolkits.axisartist.axis_artist.AttributeCopier class, the constructor and the set_ref_artist method, and the default_value parameter of get_attribute_from_ref_artist, are deprecated.

Deprecation of the constructor means that classes inheriting from AttributeCopier should no longer call its constructor.

Locators

The unused Locator.autoscale method is deprecated (pass the axis limits to Locator.view_limits instead).

Animation

The following methods and attributes of the MovieWriterRegistry class are deprecated: set_dirty, ensure_not_dirty, reset_available_writers, avail.

smart_bounds()

The “smart_bounds” functionality is deprecated. This includes Axis.set_smart_bounds(), Axis.get_smart_bounds(), Spine.set_smart_bounds(), and Spine.get_smart_bounds().
boxplot()

Setting the `whis` parameter of `Axes.boxplot` and `cbook.boxplot_stats` to "range" to mean "the whole data range" is deprecated; set it to (0, 100) (which gets interpreted as percentiles) to achieve the same effect.

fill_between()

Passing scalars to parameter `where` in `fill_between()` and `fill_betweenx()` is deprecated. While the documentation already states that `where` must be of the same size as `x` (or `y`), scalars were accepted and broadcasted to the size of `x`. Non-matching sizes will raise a `ValueError` in the future.

tight_layout()

The `renderer` parameter to `Figure.tight_layout` is deprecated; this method now always uses the renderer instance cached on the `Figure`.

rcParams

The `rcsetup.validate_animation_writer_path` function is deprecated.

Setting `rcParams["savefig.format"]` (default: 'png') to "auto" is deprecated; use its synonym "png" instead.

Setting `rcParams["text.hinting"]` (default: 'force_autohint') to True or False is deprecated; use their synonyms "auto" or "none" instead.

`rcsetup.update_savefig_format` is deprecated.

`rcsetup.validate_path_exists` is deprecated (use `os.path.exists` to check whether a path exists).

`rcsetup.ValidateInterval` is deprecated.

Dates

dates.mx2num is deprecated.

TK

`NavigationToolbar2Tk.set_active` is deprecated, as it has no (observable) effect.

WX

`FigureFrameWx.statusbar` and `NavigationToolbar2Wx.statbar` are deprecated. The status bar can be retrieved by calling standard `wx` methods (`frame.GetStatusBar()` and `toolbar.GetTopLevelParent().GetStatusBar()`).
backend_wx.ConfigureSubplotsWx.configure_subplots and backend_wx.ConfigureSubplotsWx.get_canvas are deprecated.

PGF

backend_pgf.repl_escapetext and backend_pgf.repl_mathdefault are deprecated.
RendererPgf.latexManager is deprecated.

FigureCanvas

FigureCanvasBase.draw_cursor (which has never done anything and has never been overridden in any backend) is deprecated.
FigureCanvasMac.invalidate is deprecated in favor of its synonym, FigureCanvasMac.draw_idle.
The dryrun parameter to the various FigureCanvasFoo.print_foo methods is deprecated.

QuiverKey doc

quiver.QuiverKey.quiverkey_doc is deprecated; use quiver.QuiverKey.__init__.__doc__ instead.

matplotlib.mlab

mlab.apply_window and mlab.stride_repeat are deprecated.

Fonts

font_manager.JSONEncoder is deprecated. Use font_manager.json_dump to dump a FontManager instance.
font_manager.createFontList is deprecated. font_manager.FontManager.addfont is now available to register a font at a given path.
The as_str, as_rgba_str, as_array, get_width and get_height methods of matplotlib.ft2font.FT2Image are deprecated. Convert the FT2Image to a NumPy array with np.asarray before processing it.

Colors

The function matplotlib.colors.makeMappingArray is not considered part of the public API any longer. Thus, it’s deprecated.
Using a string of single-character colors as a color sequence (e.g. ”rgb”) is deprecated. Use an explicit list instead.
Scales

Passing unsupported keyword arguments to ScaleBase, and its subclasses LinearScale and SymmetricalLogScale, is deprecated and will raise a TypeError in 3.3.

If extra keyword arguments are passed to LogScale, TypeError will now be raised instead of ValueError.

Testing

The matplotlib.testing.disable_internet module is deprecated. Use (for example) pytest-remotedata instead.

Support in matplotlib.testing for nose-based tests is deprecated (a deprecation is emitted if using e.g. the decorators from that module while both 1) matplotlib’s conftests have not been called and 2) nose is in sys.modules).

testing.is.called_from_pytest is deprecated.

During the deprecation period, to force the generation of nose base tests, import nose first.

The switch_backend_warn parameter to matplotlib.test has no effect and is deprecated.

testing.jpl_units.UnitDb.UnitDb.checkUnits is deprecated.

DivergingNorm renamed to TwoSlopeNorm

DivergingNorm was a misleading name; although the norm was developed with the idea that it would likely be used with diverging colormaps, the word ‘diverging’ does not describe or evoke the norm’s mapping function. Since that function is monotonic, continuous, and piecewise linear with two segments, the norm has been renamed to TwoSlopeNorm

Misc

matplotlib.get_home is deprecated (use e.g. os.path.expanduser("-")) instead.

matplotlib.compare_versions is deprecated (use comparison of distutils.version.LooseVersion instead).

matplotlib.checkdep_ps_distiller is deprecated.

matplotlib.figure.AxesStack is considered private API and will be removed from the public API in future versions.

BboxBase.is_unit is deprecated (check the Bbox extents if needed).

Affine2DBase.matrix_from_values(...) is deprecated. Use (for example) Affine2D.from_values(...).get_matrix() instead.

style.core.is_style_file and style.core.iter_style_files are deprecated.
The **datapath rcParam**

Use `get_data_path` instead. (The rcParam is deprecated because it cannot be meaningfully set by an end user.) The rcParam had no effect from 3.2.0, but was deprecated only in 3.2.1. In 3.2.1+ if ‘datapath’ is set in a matplotlibrc file it will be respected, but this behavior will be removed in 3.3.

**Removals**

The `matplotlib.testing.determinism` module, which exposes no public API, has been deleted. The following API elements have been removed:

- `backend_gtk3.PIXELS_PER_INCH`
- `backend_pdf.re_escapetext, backend_pdf.re_mathdefault.`
- `the matplotlib.backends.tkagg, matplotlib.backends.windowing, matplotlib.backends.wx_compat, and matplotlib.compat.subprocess modules`
- `RcParams.msg_depr, RcParams.msg_depr_ignore, RcParams.msg_depr_set, RcParams.msg_obsolete, RcParams.msg_backend_obsolete`
- `afm.parse_afm (use afm.AFM instead)`
- `axes.Axes.mouseover_set`
- `backend_cairo.ArrayWrapper, backend_cairo.RendererCairo.convert_path`
- `backend_gtk3.FileChooserDialog.sorted_filetypes (use sorted(self.filetypes.items()) instead)`
- `backend_pdf.get_texcommand`
- `backend_pdf.PdfFile.texFontMap`
- `backend_ps.get_bbox`
- `backend_qt.FigureCanvasQt.keyAutoRepeat (use event.guiEvent.isAutoRepeat instead), backend_qt.error_msg_qt, backend_qt.exception_handler`
- `backend_wx.FigureCanvasWx.macros`
- `backends.pylab_setup`
- `cbook.Bunch (use types.SimpleNamespace instead), cbook.Locked, cbook.unicode_safe, cbook.is_numlike (use isinstance(..., numbers.Number) instead), cbook.mkdirs (use os.makedirs(..., exist_ok=True) instead), cbook.GetRealpathAndStat (use cbook.get_realpath_and_stat instead), cbook.listFiles`
- `container.Container.set_remove_method`
- `contour.ContourLabeler.cl, contour.ContourLabeler.cl_xy, contour.ContourLabeler.cl_cvalues (use labelTexts, labelXYs, labelCVales instead)`
- `dates DateFormatter.strftime, dates DateFormatter.strftime_pre_1900`
- `font_manager.TempCache, font_manager.FontManager.ttffiles, font_manager.FontManager.afmfiles`
- `mathtext.unichr_safe (use chr instead)`
- `patches.YAArrow (use patches.FancyArrowPatch instead)`
• sphinxext.plot_directive.remove_coding
• table.Table.get_child_artists
• testing.compare.compare_float, testing.decorators.CleanupTest, testing.decorators.ImageComparisonTest, testing.decorators.skip_if_command_unavailable, support for nose-based tests
• text.Annotation.arrow (use text.Annotation.arrow_patch instead)
• textpath.TextToPath.tex_font_map
• ticker.Base, ticker.closeto, ticker.nearest_long
• axisartist.axes_divider.Axes, axisartist.axes_divider.LocatableAxes (use axisartist.axislines.Axes instead)
• the normed kwarg to hist (use density instead)
• the verts parameter to scatter (use marker instead)
• passing (verts, 0) or (... , 3) when specifying a marker to specify a path or a circle, respectively (instead, use verts or "o", respectively)
• rcParams["examples.directory"]

The following members of matplotlib.backends.backend_pdf.PdfFile were removed:
• nextObject
• nextFont
• nextAlphaState
• nextHatch
• nextImage
• alphaStateObject

The required_interactive_framework attribute of backend modules introduced in Matplotlib 3.0 has been moved to the FigureCanvas class, in order to let it be inherited by third-party canvas subclasses and to make it easier to know what interactive framework is required by a canvas class.

backend_qt4.FigureCanvasQT5, which is an alias for backend_qt5.FigureCanvasQT (but only exists under that name in backend_qt4), has been removed.

Development changes

Windows build

Previously, when building the matplotlib._png extension, the build script would add “png” and “z” to the extensions .libraries attribute (if pkg-config information is not available, which is in particular the case on Windows).

In particular, this implies that the Windows build would look up files named png.lib and z.lib; but neither libpng upstream nor zlib upstream provides these files by default. (On Linux, this would look up libpng.so and libz.so, which are indeed standard names.)
Instead, on Windows, we now look up *libpng16.lib* and *zlib.lib*, which are the upstream names for the shared libraries (as of libpng 1.6.x).

For a statically-linked build, the upstream names are *libpng16_static.lib* and *zlibstatic.lib*; one still needs to manually rename them if such a build is desired.

### Packaging DLLs

Previously, it was possible to package Windows DLLs into the Matplotlib wheel (or sdist) by copying them into the source tree and setting the *package_data.dlls* entry in *setup.cfg*.

DLLs copied in the source tree are now always packaged; the *package_data.dlls* entry has no effect anymore. If you do not want to include the DLLs, don’t copy them into the source tree.

#### 16.1.50 API Changes for 3.3.0

- **Behaviour changes**
- **Deprecations**
- **Removals**
- **Development changes**

#### Behaviour changes

**Formatter.fix_minus**

*Formatter.fix_minus* now performs hyphen-to-unicode-minus replacement whenever `rcParams["axes.unicode_minus"]` (default: *True*) is *True*; i.e. its behavior matches the one of *ScalarFormatter.fix_minus* (*ScalarFormatter* now just inherits that implementation).

This replacement is now used by the *format_data_short* method of the various builtin formatter classes, which affects the cursor value in the GUI toolbars.

**FigureCanvasBase now always has a manager attribute, which may be None**

Previously, it did not necessarily have such an attribute. A check for `hasattr(figure.canvas, "manager")` should now be replaced by `figure.canvas.manager is not None` (or `getattr(figure.canvas, "manager", None) is not None` for back-compatibility).

**cbook.CallbackRegistry now propagates exceptions when no GUI event loop is running**

*cbook.CallbackRegistry* now defaults to propagating exceptions thrown by callbacks when no interactive GUI event loop is running. If a GUI event loop is running, *cbook.CallbackRegistry* still defaults to just printing a traceback, as unhandled exceptions can make the program completely abort() in that case.
Axes.locator_params() validates axis parameter

`axes.Axes.locator_params` used to accept any value for axis and silently did nothing, when passed an unsupported value. It now raises a ValueError.

Axis.set_tick_params() validates which parameter

`Axis.set_tick_params` (and the higher level `axes.Axes.tick_params` and `pyplot.tick_params`) used to accept any value for which and silently did nothing, when passed an unsupported value. It now raises a ValueError.

Axis.set_ticklabels() must match FixedLocator.locs

If an axis is using a `ticker.FixedLocator`, typically set by a call to `Axis.set_ticks`, then the number of ticklabels supplied must match the number of locations available (`FixedFormatter.locs`). If not, a ValueError is raised.

backend_pgf.LatexManager.latex

`backend_pgf.LatexManager.latex` is now created with encoding="utf-8", so its stdin, stdout, and stderr attributes are utf8-encoded.

pyplot.xticks() and pyplot.yticks()

Previously, passing labels without passing the ticks to either `pyplot.xticks` and `pyplot.yticks` would result in

    TypeError: object of type 'NoneType' has no len()

It now raises a TypeError with a proper description of the error.

Setting the same property under multiple aliases now raises a TypeError

Previously, calling e.g. `plot(..., color=somecolor, c=othercolor)` would emit a warning because color and c actually map to the same Artist property. This now raises a TypeError.

FileMovieWriter temporary frames directory

`FileMovieWriter` now defaults to writing temporary frames in a temporary directory, which is always cleared at exit. In order to keep the individual frames saved on the filesystem, pass an explicit `frame_prefix`. 
Axes.plot no longer accepts $x$ and $y$ being both 2D and with different numbers of columns

Previously, calling `Axes.plot` e.g. with $x$ of shape $(n, 3)$ and $y$ of shape $(n, 2)$ would plot the first column of $x$ against the first column of $y$, the second column of $x$ against the second column of $y$, and the first column of $x$ against the third column of $y$. This now raises an error instead.

`Text.update_from` now copies usetex state from the source `Text`

`stem` now defaults to `use_line_collection=True`

This creates the stem plot as a `LineCollection` rather than individual `Line2D` objects, greatly improving performance.

`rcParams color validator is now stricter`

Previously, `rcParams` entries whose values were color-like accepted “spurious” extra letters or characters in the “middle” of the string, e.g. "(0, 1a, '0.5')" would be interpreted as (0, 1, 0.5). These extra characters (including the internal quotes) now cause a ValueError to be raised.

`SymLogNorm` now has a `base` parameter

Previously, `SymLogNorm` had no `base` keyword argument, and defaulted to `base=np.e` whereas the documentation said it was `base=10`. In preparation to make the default 10, calling `SymLogNorm` without the new `base` keyword argument emits a deprecation warning.

`errorbar` now color cycles when only `errorbar` color is set

Previously setting the `ecolor` would turn off automatic color cycling for the plot, leading to the the lines and markers defaulting to whatever the first color in the color cycle was in the case of multiple plot calls.

`rcsetup.validate_color_for_prop_cycle` now always raises `TypeError` for bytes input

It previously raised `TypeError`, except when the input was of the form `b"C[number]"` in which case it raised a ValueError.

`FigureCanvasPS.print_ps` and `FigureCanvasPS.print_eps` no longer apply edgecolor and facecolor

These methods now assume that the figure edge and facecolor have been correctly applied by `FigureCanvasBase.print_figure`, as they are normally called through it.

This behavior is consistent with other figure saving methods (`FigureCanvasAgg.print_png`, `FigureCanvasPdf.print_pdf`, `FigureCanvasSVG.print_svg`).
pyplot.subplot() now raises TypeError when given an incorrect number of arguments

This is consistent with other signature mismatch errors. Previously a ValueError was raised.

Shortcut for closing all figures

Shortcuts for closing all figures now also work for the classic toolbar. There is no default shortcut any more because unintentionally closing all figures by a key press might happen too easily. You can configure the shortcut yourself using rcParams["keymap.quit_all"] (default: []).

Autoscale for arrow

Calling ax.arrow() will now autoscale the axes.

set_tick_params(label1On=False) now also makes the offset text (if any) invisible

... because the offset text can rarely be interpreted without tick labels anyways.

Axes.annotate and pyplot.annotate parameter name changed

The parameter s to Axes.annotate and pyplot.annotate is renamed to text, matching Annotation.

The old parameter name remains supported, but support for it will be dropped in a future Matplotlib release.

current_manager.json_dump now locks the font manager dump file

... to prevent multiple processes from writing to it at the same time.

pyplot.rgrids and pyplot.thetagrids now act as setters also when called with only kwargs

Previously, keyword arguments were silently ignored when no positional arguments were given.

Axis.get_minorticklabels and Axis.get_majorticklabels now returns plain list

Previously, Axis.get_minorticklabels and Axis.get_majorticklabels returns silent_list. Their return type is now changed to normal list. get_zminorticklabels, get_yminorticklabels, get_zminorticklabels, Azis.get_ticklabels, get_zmajorticklabels, get_ymajorticklabels and get_zmajorticklabels methods will be affected by this change.
Default slider formatter

The default method used to format Slider values has been changed to use a ScalarFormatter adapted the slider values limits. This should ensure that values are displayed with an appropriate number of significant digits even if they are much smaller or much bigger than 1. To restore the old behavior, explicitly pass a “%1.2f” as the valfmt parameter to Slider.

Add normalize keyword argument to Axes.pie

pie() used to draw a partial pie if the sum of the values was < 1. This behavior is deprecated and will change to always normalizing the values to a full pie by default. If you want to draw a partial pie, please pass normalize=False explicitly.

table.CustomCell is now an alias for table.Cell

All the functionality of CustomCell has been moved to its base class Cell.

wx Timer interval

Setting the timer interval on a not-yet-started TimerWx won’t start it anymore.

"step"-type histograms default to the zorder of Line2D

This ensures that they go above gridlines by default. The old zorder can be kept by passing it as a keyword argument to Axes.hist.

Legend and OffsetBox visibility

Legend and OffsetBox subclasses (PaddedBox, AnchoredOffsetbox, and AnnotationBbox) no longer directly keep track of the visibility of their underlying Patch artist, but instead pass that flag down to the Patch.

Legend and Table no longer allow invalid locations

This affects legends produced on an Axes (Axes.legend and pyplot.legend) and on a Figure (Figure.legend and pyplot.figlegend). Figure legends also no longer accept the unsupported 'best' location. Previously, invalid Axes locations would use 'best' and invalid Figure locations would used 'upper right'.

Passing Line2D’s drawstyle together with linestyle is removed

Instead of plt.plot(..., linestyle="steps--"), use plt.plot(..., linestyle="--", drawstyle="steps"). ds is also an alias for drawstyle.
Upper case color strings

Support for passing single-letter colors (one of “rgbcmykw”) as UPPERCASE characters is removed; these colors are now case-sensitive (lowercase).

tight/constrained_layout no longer worry about titles that are too wide

tight_layout and constrained_layout shrink axes to accommodate “decorations” on the axes. However, if an xlabel or title is too long in the x direction, making the axes smaller in the x-direction doesn’t help. The behavior of both has been changed to ignore the width of the title and xlabel and the height of the ylabel in the layout logic.

This also means there is a new keyword argument for axes.Axes.get_tightbbox and axis.Axis.get_tightbbox: for_layout_only, which defaults to False, but if True returns a bounding box using the rules above.

rcParams["savefig.facecolor"] (default: 'auto') and rcParams["savefig.edgecolor"] (default: 'auto') now default to "auto"

This newly allowed value for rcParams["savefig.facecolor"] (default: 'auto') and rcParams["savefig.edgecolor"] (default: 'auto'), as well as the facecolor and edgecolor parameters to Figure.savefig, means "use whatever facecolor and edgecolor the figure current has".

When using a single dataset, Axes.hist no longer wraps the added artist in a silent_list

When Axes.hist is called with a single dataset, it adds to the axes either a BarContainer object (when histtype="bar" or "barstacked"), or a Polygon object (when histtype="step" or "stepfilled") - the latter being wrapped in a list-of-one-element. Previously, either artist would be wrapped in a silent_list. This is no longer the case: the BarContainer is now returned as is (this is an API breaking change if you were directly relying on the concrete list API; however, BarContainer inherits from tuple so most common operations remain available), and the list-of-one Polygon is returned as is. This makes the repr of the returned artist more accurate: it is now

```
<BarContainer object of of 10 artists>  # "bar", "barstacked"
[[<matplotlib.patches.Polygon object at 0xdeadbeef>]  # "step", "stepfilled"
```

instead of

```
[a list of 10 Patch objects]  # "bar", "barstacked"
[a list of 1 Patch objects]  # "step", "stepfilled"
```

When Axes.hist is called with multiple artists, it still wraps its return value in a silent_list, but uses more accurate type information

```
[a list of 3 BarContainer objects]  # "bar", "barstacked"
[a list of 3 List[Polygon] objects]  # "step", "stepfilled"
```

instead of

```
[a list of 3 Patch objects]  # "bar", "barstacked"
[a list of 3 List[Patch] objects]  # "step", "stepfilled"
```
Qt and wx backends no longer create a status bar by default

The coordinates information is now displayed in the toolbar, consistently with the other back-ends. This is intended to simplify embedding of Matplotlib in larger GUIs, where Matplotlib may control the toolbar but not the status bar.

rcParams["text.hinting"] (default: 'force_autohint') now supports names mapping to FreeType flags

rcParams["text.hinting"] (default: 'force_autohint') now supports the values "default", "no_autohint", "force_autohint", and "no_hinting", which directly map to the FreeType flags FT_LOAD_DEFAULT, etc. The old synonyms (respectively "either", "native", "auto", and "none") are still supported, but their use is discouraged. To get normalized values, use backend_agg.get_hinting_flag, which returns integer flag values.

cbook.get_sample_data auto-loads numpy arrays

When cbook.get_sample_data is used to load a npy or npz file and the keyword-only parameter np_load is True, the file is automatically loaded using numpy.load. np_load defaults to False for backwards compatibility, but will become True in a later release.

get_text_width_height_descent now checks ismath rather than rcParams["text.usetex"] (default: False)

... to determine whether a string should be passed to the usetex machinery or not. This allows single strings to be marked as not-usetex even when the rcParam is True.

Axes.vlines, Axes.hlines, pyplot.vlines and pyplot.hlines colors parameter default change

The colors parameter will now default to rcParams["lines.color"] (default: 'C0'), while previously it defaulted to 'k'.

Aggressively autoscale clim in ScalerMappable classes

Previously some plotting methods would defer autoscaling until the first draw if only one of the vmin or vmax keyword arguments were passed (Axes.scatter, Axes.hexbin, Axes.imshow, Axes.pcolorfast) but would scale based on the passed data if neither was passed (independent of the norm keyword arguments). Other methods (Axes.pcolor, Axes.pcolormesh) always autoscaled base on the initial data.

All of the plotting methods now resolve the unset vmin or vmax at the initial call time using the data passed in.
If you were relying on exactly one of the \texttt{vmin} or \texttt{vmax} remaining unset between the time when the method is called and the first time the figure is rendered you get back the old behavior by manually setting the relevant limit back to \texttt{None}

\begin{verbatim}
  cm_obj.norm.vmin = None
  # or
  cm_obj.norm.vmax = None
\end{verbatim}

which will be resolved during the draw process.

**Deprecations**

\texttt{figure.add_axes()} \textbf{without arguments}

Calling \texttt{fig.add_axes()} with no arguments currently does nothing. This call will raise an error in the future. Adding a free-floating axes needs a position rectangle. If you want a figure-filling single axes, use \texttt{add_subplot()} instead.

\texttt{backend_wx.DEBUG_MSG}

\texttt{backend_wx.DEBUG_MSG} is deprecated. The wx backends now use regular logging.

\texttt{Colorbar.config_axis()}

\texttt{Colorbar.config_axis()} is considered internal. Its use is deprecated.

\texttt{NonUniformImage.is_grayscale} and \texttt{PcolorImage.is_grayscale}

These attributes are deprecated, for consistency with \texttt{AxesImage.is_grayscale}, which was removed back in Matplotlib 2.0.0. (Note that previously, these attributes were only available \textit{after rendering the image}).

\texttt{den} \textbf{parameter and attribute to mpl_toolkits.axisartist.angle_helper}

For all locator classes defined in \texttt{mpl_toolkits.axisartist.angle_helper}, the \texttt{den} parameter has been renamed to \texttt{nbins}, and the \texttt{den} attribute deprecated in favor of its (preexisting) synonym \texttt{nbins}, for consistency with locator classes defined in \texttt{matplotlib.ticker}.

\texttt{backend_pgf.LatexManager.latex_stdin_utf8}

\texttt{backend_pgf.LatexManager.latex_stdin_utf8} is now created with encoding="utf-8", so its stdin attribute is already utf8-encoded; the \texttt{latex_stdin_utf8} attribute is thus deprecated.
Flags containing "U" passed to `cbook.to_filehandle` and `cbook.open_file_cm`

Please remove "U" from flags passed to `cbook.to_filehandle` and `cbook.open_file_cm`. This is consistent with their removal from `open` in Python 3.9.

PDF and PS character tracking internals

The `used_characters` attribute and `track_characters` and `merge_used_characters` methods of `RendererPdf`, `PdfFile`, and `RendererPS` are deprecated.

Case-insensitive capstyles and joinstyles

Please pass capstyles ("miter", "round", "bevel") and joinstyles ("butt", "round", "projecting") as lowercase.

Passing raw data to `register_cmap()`

Passing raw data via parameters `data` and `lut` to `register_cmap()` is deprecated. Instead, explicitly create a `LinearSegmentedColormap` and pass it via the `cmap` parameter: `register_cmap(cmap=LinearSegmentedColormap(name, data, lut))`.

`DateFormatter.illegal_s`

This attribute is unused and deprecated.

`widgets.TextBox.params_to_disable`

This attribute is deprecated.

Revert deprecation *min, *max keyword arguments to `set_x/y/zlim_3d()`

These keyword arguments were deprecated in 3.0, alongside with the respective parameters in `set_xlim()` / `set_ylim()`. The deprecations of the 2D versions were already reverted in in 3.1.

`cbook.local_over_kwdict`

This function is deprecated. Use `cbook.normalize_keywords` instead.

Passing both singular and plural `colors`, `linewidths`, `linestyles` to `Axes.eventplot`

Passing e.g. both `linewidth` and `linewidths` will raise a `TypeError` in the future.
Setting `rcParams["text.latex.preamble"]` (default: '') or `rcParams["pdf.preamble"]` to non-strings

These `rcParams` should be set to string values. Support for None (meaning the empty string) and lists of strings (implicitly joined with newlines) is deprecated.

**Parameters `norm` and `vmin/vmax` should not be used simultaneously**

Passing parameters `norm` and `vmin/vmax` simultaneously to functions using colormapping such as `scatter()` and `imshow()` is deprecated. Instead of `norm=LogNorm(), vmin=min_val, vmax=max_val` pass `norm=LogNorm(min_val, max_val)`. `vmin` and `vmax` should only be used without setting `norm`.

**Effectless parameters of `Figure.colorbar` and `matplotlib.colorbar.Colorbar`**

The `cmap` and `norm` parameters of `Figure.colorbar` and `matplotlib.colorbar.Colorbar` have no effect because they are always overridden by the mappable’s colormap and norm; they are thus deprecated. Likewise, passing the `alpha, boundaries, values, extend, or filled` parameters with a `ContourSet` mappable, or the `alpha` parameter with an `Artist` mappable, is deprecated, as the mappable would likewise override them.

**args_key and exec_key attributes of builtin MovieWriters**

These attributes are deprecated.

**Unused parameters**

The following parameters do not have any effect and are deprecated:

- arbitrary keyword arguments to `StreamplotSet`
- parameter `quantize` of `Path.cleaned()`
- parameter `s` of `AnnotationBbox.get_fontsize()`
- parameter `label` of `Tick`

**Passing `props` to `Shadow`**

The parameter `props` of `Shadow` is deprecated. Use keyword arguments instead.

**Axes.update_datalim_bounds**

This method is deprecated. Use `ax.dataLim.set(Bbox.union([ax.dataLim, bounds]))` instead.
LogScale, LogTransform, InvertedLogTransform, SymmetricalScale, SymmetricalTransform and SymmetricalScale.InvertedSymmetricalTransform are deprecated. Directly access the transform classes from the scale module.

**TexManager.cachedir, TexManager.rgba_arrayd**

Use `matplotlib.get_cachedir()` instead for the former; there is no replacement for the latter.

**Setting Line2D’s pickradius via Line2D.set_picker**

Setting a Line2D’s pickradius (i.e. the tolerance for pick events and containment checks) via `Line2D.set_picker` is deprecated. Use `Line2D.set_pickradius` instead.

`Line2D.set_picker` no longer sets the artist’s custom-contain() check.

**Artist.set_contains, Artist.get_contains**

Setting a custom method overriding `Artist.contains` is deprecated. There is no replacement, but you may still customize pick events using `Artist.set_picker`.

**Colorbar methods**

The `on_mappable_changed` and `update_bruteforce` methods of `Colorbar` are deprecated; both can be replaced by calls to `update_normal`.

**OldScalarFormatter, IndexFormatter and DateIndexFormatter**

These formatters are deprecated. Their functionality can be implemented using e.g. `FuncFormatter`.

**OldAutoLocator**

This ticker is deprecated.

**required, forbidden and allowed parameters of cbook.normalize_kwargs**

These parameters are deprecated.

**The TTFPATH and AFMPATH environment variables**

Support for the (undocumented) TTFPATH and AFMPATH environment variables is deprecated. Additional fonts may be registered using `matplotlib.font_manager.fontManager.addfont()`.
Matplotlib, Release 3.3.0

matplotlib.compat

This module is deprecated.

matplotlib.backends.qt_editor.formsfigtool

This module is deprecated. Use matplotlib.backends.backend_qt5.SubplotToolQt instead.

AVConv animation writer deprecated

The AVConvBase, AVConvWriter and AVConvFileWriter classes, and the associated animation.avconv_path and animation.avconv_args rcParams are deprecated.

Debian 8 (2015, EOL 06/2020) and Ubuntu 14.04 (EOL 04/2019) were the last versions of Debian and Ubuntu to ship avconv. It remains possible to force the use of avconv by using the ffmpeg-based writers with rcParams["animation.ffmpeg_path"] (default: 'ffmpeg') set to "avconv".

log/symlog scale base, ticks, and nonpos specification

semilogx, semilogy, loglog, LogScale, and SymmetricalLogScale used to take keyword arguments that depends on the axis orientation ("basex" vs "basey", "subsx" vs "subsy", "nonposx" vs "nonposy"); these parameter names are now deprecated in favor of "base", "subs", "nonpositive". This deprecation also affects e.g. ax.set_yscale("log", basey=...) which must now be spelled ax.set_yscale("log", base=...).

The change from "nonpos" to "nonpositive" also affects LogTransform, InvertedLogTransform, SymmetricalLogTransform, etc.

To use different bases for the x-axis and y-axis of a loglog plot, use e.g. ax.set_xscale("log", base=10); ax.set_yscale("log", base=2).

DraggableBase.artist_picker

This method is deprecated. If you previously reimplemented it in a subclass, set the artist's picker instead with Artist.set_picker.

clear_temp parameter and attribute of FileMovieWriter

The clear_temp parameter and attribute of FileMovieWriter is deprecated. In the future, files placed in a temporary directory (using frame_prefix=None, the default) will be cleared; files placed elsewhere will not.

Deprecated rcParams validators

The following validators, defined in rcsetup, are deprecated: validate_fontset, validate_mathtext_default, validate_alignment, validate_svg_fontset, validate_pgf_texsystem, validate_movie_frame_fmt, validate_axis_locator, validate_movie_html_fmt,
validate_grid_axis, validate_axes_titlelocation, validate_toolbar, validate_ps_papersize, validate_legend_loc, validate_bool_maybe_none, validate_hinting, validate_movie_writers, validate_webagg_address, validate_nseq_float, validate_nseq_int. To test whether an rcParam value would be acceptable, one can test e.g. \( rc = \text{RcParams()} \); \( rc[k] = v \) raises an exception.

**Stricter rcParam validation**

\( \text{rcParams["axes.axisbelow"]} \) (default: 'line') currently normalizes all strings starting with "line" (case-insensitive) to the option "line". This is deprecated; in a future version only the exact string "line" (case-sensitive) will be supported.

**add_subplot() validates its inputs**

In particular, for \( \text{add_subplot(rows, cols, index)} \), all parameters must be integral. Previously strings and floats were accepted and converted to int. This will now emit a deprecation warning.

**Toggling axes navigation from the keyboard using "a" and digit keys**

Axes navigation can still be toggled programmatically using \( \text{Axes.set_navigate} \).

The following related APIs are also deprecated: backend_tools.ToolEnableAllNavigation, backend_tools.ToolEnableNavigation, and \( \text{rcParams["keymap.all_axes"]} \).

**matplotlib.test(recursionlimit=...)**

The \( \text{recursionlimit} \) parameter of \( \text{matplotlib.test} \) is deprecated.

**mathtext glues**

The \( \text{copy} \) parameter of \( \text{mathtext.Glue} \) is deprecated (the underlying glue spec is now immutable). \( \text{mathtext.GlueSpec} \) is deprecated.

**Signatures of Artist.draw and Axes.draw**

The \( \text{inframe} \) parameter to \( \text{Axes.draw} \) is deprecated. Use \( \text{Axes.redraw_in_frame} \) instead.

Not passing the \( \text{renderer} \) parameter to \( \text{Axes.draw} \) is deprecated. Use \( \text{axes.draw_artist(axes)} \) instead.

These changes make the signature of the \text{draw} (\text{artist.draw(renderer)}) method consistent across all artists; thus, additional parameters to \( \text{Artist.draw} \) are deprecated.

**DraggableBase.on_motion_blit**

This method is deprecated. \( \text{DraggableBase.on_motion} \) now handles both the blitting and the non-blitting cases.
Passing the dash offset as None

Fine control of dash patterns can be achieved by passing an \((\text{offset}, \ (\text{on-length}, \ \text{off-length}, \ \text{on-length}, \ \text{off-length}, \ \ldots))\) pair as the linestyle property of \texttt{Line2D} and \texttt{LineCollection}. Previously, certain APIs would accept \texttt{offset = None} as a synonym for \texttt{offset = 0}, but this was never universally implemented, e.g. for vector output. Support for \texttt{offset = None} is deprecated, set the offset to 0 instead.

\texttt{RendererCairo.fontweights, RendererCairo.fontangles}

... are deprecated.

\texttt{autofmt_xdate(\texttt{which=None})}

This is deprecated, use its more explicit synonym, \texttt{which="major"}, instead.

**JPEG options**

The \texttt{quality}, \texttt{optimize}, and \texttt{progressive} keyword arguments to \texttt{savefig}, which were only used when saving to JPEG, are deprecated. \texttt{rcParams["savefig.jpeg_quality"]} (default: 95) is likewise deprecated. Such options should now be directly passed to Pillow using \texttt{savefig(..., pil_kwargs={"quality": ... , "optimize": ... , "progressive": ...}).}

\texttt{dviread.Encoding}

This class was (mostly) broken and is deprecated.

**Axis and Locator pan and zoom**

The unused \texttt{pan} and \texttt{zoom} methods of \texttt{Axes} and \texttt{Locator} are deprecated. Panning and zooming are now implemented using the \texttt{start_pan}, \texttt{drag_pan}, and \texttt{end_pan} methods of \texttt{Axes}.

**Passing None to various Axes subclass factories**

Support for passing \texttt{None} as base class to \texttt{axes subplot class factory}, \texttt{axes_grid1 parasite axes host axes class factory}, \texttt{axes_grid1 parasite axes host subplot class factory}, \texttt{axes_grid1 parasite axes parasite axes class factory}, \texttt{axes_grid1 parasite axes parasite axes auxtrans class factory} is deprecated. Explicitly pass the correct base \texttt{Axes} class instead.
In `mpl_toolkits.axes_grid1.axes_rgb`, `imshow_rgb` is deprecated (use `ax.imshow(np.dstack([r, g, b]))` instead); `RGBAxesBase` is deprecated (use `RGBAxes` instead); `RGBAxes.add_RGB_to_figure` is deprecated (it was an internal helper).

### Substitution.from_params

This method is deprecated. If needed, directly assign to the `params` attribute of the Substitution object.

### PGF backend cleanups

The `dummy` parameter of `RendererPgf` is deprecated.

`GraphicsContextPgf` is deprecated (use `GraphicsContextBase` instead).

### set_factor method of mpl_toolkits.axisartist locators

The `set_factor` method of `mpl_toolkits.axisartist.locators` is deprecated.

### widgets.SubplotTool callbacks and axes

The `funcleft`, `funcright`, `funcbottom`, `funcTop`, `funcwspace`, and `funcvspace` methods of `widgets.SubplotTool` are deprecated.

The `axleft`, `axright`, `axbottom`, `axtop`, `axwspace`, and `axvspace` attributes of `widgets.SubplotTool` are deprecated. Access the `ax` attribute of the corresponding slider, if needed.

### mathtext Glue helper classes

The `Fil`, `Fill`, `Filll`, `NegFil`, `NegFill`, `NegFilII`, and `SsGlue` classes in the `matplotlib.mathtext` module are deprecated. As an alternative, directly construct glue instances with `Glue("fil"), etc.

### NavigationToolbar2.__init_toolbar

Overriding this method to initialize third-party toolbars is deprecated. Instead, the toolbar should be initialized in the `__init__` method of the subclass (which should call the base-class’ `__init__` as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which `required` `__init_toolbar` to be overridden), a fully empty implementation (def `__init_toolbar(self): pass`) may be kept and will not trigger the deprecation warning.
**NavigationToolbar2QT.parent and .basedir**

These attributes are deprecated. In order to access the parent window, use `toolbar.canvas.parent()`. Once the deprecation period is elapsed, it will also be accessible as `toolbar.parent()`. The base directory to the icons is `os.path.join(mpl.get_data_path(), "images")`.

**NavigationToolbar2QT.ctx**

This attribute is deprecated.

**NavigationToolbar2Wx attributes**

The `prevZoomRect`, `retinaFix`, `savedRetinaImage`, `wxoverlay`, `zoomAxes`, `zoomStartX`, and `zoomStartY` attributes are deprecated.

**NavigationToolbar2.press and .release**

These methods were called when pressing or releasing a mouse button, but only when an interactive pan or zoom was occurring (contrary to what the docs stated). They are deprecated; if you write a backend which needs to customize such events, please directly override `press_pan/press_zoom/release_pan/release_zoom` instead.

**FigureCanvasGTK3._renderer_init**

Overriding this method to initialize renderers for GTK3 canvases is deprecated. Instead, the renderer should be initialized in the `__init__` method of the subclass (which should call the base-class’ `__init__` as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which required `_renderer_init` to be overridden), a fully empty implementation (def `_renderer_init(self): pass`) may be kept and will not trigger the deprecation warning.

**Path helpers in bezier**

`bezier.make_path_regular` is deprecated. Use `Path.cleaned()` (or `Path.cleaned(curves=True)`, etc.) instead (but note that these methods add a STOP code at the end of the path).

`bezier.concatenate_paths` is deprecated. Use `Path.make_compound_path()` instead.

**animation.html_args rcParam**

The unused `animation.html_args rcParam` and `animation.HTMLWriter.args_key` attribute are deprecated.
This rcParam, which controlled the use of the preview.sty LaTeX package to align TeX string baselines, is deprecated, as Matplotlib’s own dvi parser now computes baselines just as well as preview.sty.

This method is deprecated. Use the GridSpec.nrows, GridSpec.ncols, SubplotSpec.rowspan, and SubplotSpec.colspan properties instead.

The qt4agg and qt4cairo backends are deprecated. Qt4 has reached its end-of-life in 2015 and there are no releases for recent versions of Python. Please consider switching to Qt5.

All parameters of Figure.subplots except nrows and ncols will become keyword-only

This avoids typing e.g. subplots(1, 1, 1) when meaning subplot(1, 1, 1), but actually getting subplots(1, 1, sharex=1).

This method is deprecated. Access the gc attribute directly instead.

The add_all parameter of axes_grid1.axes_grid.Grid, axes_grid1.axes_grid.ImageGrid, axes_grid1.axes_rgb.make_rgb_axes and axes_grid1.axes_rgb.RGBAxes is deprecated. Axes are now always added to the parent figure, though they can be later removed with ax.remove().

.BboxBase.inverse_transformed is deprecated (call BboxBase.transformed on the inverted() transform instead).

Setting the orientation of an eventplot() or EventCollection to “none” or None is deprecated; set it to “horizontal” instead. Moreover, the two orientations (“horizontal” and “vertical”) will become case-sensitive in the future.
**minor** kwarg to `Axis.get_ticklocs` will become keyword-only

Passing this argument positionally is deprecated.

**Case-insensitive properties**

Normalization of upper or mixed-case property names to lowercase in `Artist.set` and `Artist.update` is deprecated. In the future, property names will be passed as is, allowing one to pass names such as `patchA` or `UVC`.

`ContourSet.ax`, `Quiver.ax`

These attributes are deprecated in favor of `ContourSet.axes` and `Quiver.axes`, for consistency with other artists.

**Locator.refresh() and associated methods**

`Locator.refresh()` is deprecated. This method was called at certain places to let locators update their internal state, typically based on the axis limits. Locators should now always consult the axis limits when called, if needed.

The associated helper methods `NavigationToolbar2.draw()` and `ToolViewsPositions.refresh_locators()` are deprecated, and should be replaced by calls to `draw_idle()` on the corresponding canvas.

**ScalarMappable checkers**

The `add_checker` and `check_update` methods and `update_dict` attribute of `ScalarMappable` are deprecated.

**pyplot.tight_layout and ColorbarBase parameters will become keyword-only**

All parameters of `pyplot.tight_layout` and all parameters of `ColorbarBase` except for the first (`ax`) will become keyword-only, consistently with `Figure.tight_layout` and `Colorbar`, respectively.

**Axes.pie radius and startangle**

Passing `None` as either the radius or startangle of an `Axes.pie` is deprecated; use the explicit defaults of 1 and 0, respectively, instead.

**AxisArtist.dpi_transform**

... is deprecated. Scale `Figure.dpi_scale_trans` by 1/72 to achieve the same effect.
offset_position property of Collection

The offset_position property of Collection is deprecated. In the future, Collections will always behave as if offset_position is set to "screen" (the default).

Support for passing offset_position=“data” to the draw_path_collection of all renderer classes is deprecated. transforms.AffineDeltaTransform can be used as a replacement. This API is experimental and may change in the future.

testing.compare.make_external_conversion_command

... is deprecated.

ePOCH2NUM and NUM2EPOCH are deprecated

These are unused and can be easily reproduced by other date tools. get_epoch will return Matplotlib’s epoch.

axes_grid1.CbarAxes attributes

The cbid and locator attribute are deprecated. Use mappable.colorbar_cid and colorbar.locator, as for standard colorbars.

qt_compat.is_pyqt5

This function is deprecated in prevision of the future release of PyQt6. The Qt version can be checked using QtCore.qVersion().

Reordering of parameters by Artist.set

In a future version, Artist.set will apply artist properties in the order in which they are given. This only affects the interaction between the color, edgecolor, facecolor, and, for Collections, alpha properties: the color property now needs to be passed first in order not to override the other properties. This is consistent with e.g. Artist.update, which did not reorder the properties passed to it.

Passing multiple keys as a single comma-separated string or multiple arguments to ToolManager.update_keymap

This is deprecated; pass keys as a list of strings instead.
StatusBar classes and attributes

The `statusbar` attribute of `FigureManagerBase`, `StatusbarBase` and all its subclasses, and `StatusBarWx`, are deprecated, as messages are now displayed in the toolbar instead.

**ismath parameter of `draw_tex`**

The `ismath` parameter of the `draw_tex` method of all renderer classes is deprecated (as a call to `draw_tex` – not to be confused with `draw_text`! – means that the entire string should be passed to the `usetex` machinery anyways). Likewise, the text machinery will no longer pass the `ismath` parameter when calling `draw_tex` (this should only matter for backend implementers).

Passing `ismath="TeX!"` to `RendererAgg.get_text_width_height_descent` is deprecated. Pass `ismath="TeX"` instead, consistently with other low-level APIs which support the values `True`, `False`, and "TeX" for `ismath`.

**matplotlib.ttconv**

This module is deprecated.

**Stricter PDF metadata keys in PGF**

Saving metadata in PDF with the PGF backend currently normalizes all keys to lowercase, unlike the PDF backend, which only accepts the canonical case. This is deprecated; in a future version, only the canonically cased keys listed in the PDF specification (and the `PdfPages` documentation) will be accepted.

**Qt modifier keys**

The `MODIFIER_KEYS`, `SUPER`, `ALT`, `CTRL`, and `SHIFT` global variables of the `matplotlib.backends.backend_qt4agg`, `matplotlib.backends.backend_qt4cairo`, `matplotlib.backends.backend_qt5agg` and `matplotlib.backends.backend_qt5cairo` modules are deprecated.

**TexManager**

The `TexManager.serif`, `TexManager.sans_serif`, `TexManager.cursive` and `TexManager.monospace` attributes are deprecated.

**Removals**

The following deprecated APIs have been removed:

**Modules**

- `backends.qt_editor.formlayout` (use the formlayout module available on PyPI instead).
Classes, methods and attributes

- artist.Artist.aname property (no replacement)
- axis.Axis.iter_ticks (no replacement)
- Support for custom backends that do not provide a backend_bases.GraphicsContextBase.
  set_hatch_color method
- backend_bases.RendererBase.strip_math() (use cbook.strip_math() instead)
- backend_wx.debug_on_error() (no replacement)
- backend_wx.raise_msg_to_str() (no replacement)
- backend_wx.fake_stderr (no replacement)
- backend_wx.MenuButtonWx (no replacement)
- backend_wx.PrintoutWx (no replacement)
- _backend_tk.NavigationToolbar2Tk.set_active() (no replacement)
- backend_ps.PsBackendHelper.gs_exe property (no replacement)
- backend_ps.PsBackendHelper.gs_version property (no replacement)
- backend_ps.PsBackendHelper.supports_ps2write property (no replacement)
- backend_ps.RendererPS.afmfontd property (no replacement)
- backend_ps.GraphicsContextPS.shouldstroke property (no replacement)
- backend_gtk3.FileChooserDialog (no replacement)
- backend_gtk3.SaveFigureGTK3.get_filechooser() (no replacement)
- backend_gtk3.NavigationToolbar2GTK3.get_filechooser() (no replacement)
- backend_gtk3cairo.FigureManagerGTK3Cairo (use backend_gtk3.FigureManagerGTK3 instead)
- backend_pdf.RendererPdf.afm_font_cache property (no replacement)
- backend_pgf.LatexManagerFactory (no replacement)
- backend_qt5.NavigationToolbar2QT.buttons property (no replacement)
- backend_qt5.NavigationToolbar2QT.adj_window property (no replacement)
- bezier.find_r_to_boundary_of_closedpath() (no replacement)
- cbook.dedent() (use inspect.cleandoc instead)
- cbook.get_label() (no replacement)
- cbook.is_hashable() (use isinstance(..., collections.abc.Hashable) instead)
- cbook.iterable() (use numpy.iterable() instead)
- cbook.safezip() (no replacement)
- colorbar.ColorbarBase.get_cmap (use ScalarMappable.get_cmap instead)
- colorbar.ColorbarBase.set_cmap (use ScalarMappable.set_cmap instead)
- colorbar.ColorbarBase.get_clim (use ScalarMappable.get_clim instead)
- colorbar.ColorbarBase.set_clim (use ScalarMappable.set_clim instead)
- colorbar.ColorbarBase.set_norm (use ScalarMappable.set_norm instead)
• dates.seconds() (no replacement)
• dates.minutes() (no replacement)
• dates.hours() (no replacement)
• dates.weeks() (no replacement)
• dates.strpdate2num and dates.bytespdate2num (use time.strptime or dateutil.parser.parse or dates.datestr2num instead)
• docstring.Appender (no replacement)
• docstring.dedent() (use inspect.getdoc instead)
• docstring.copy_dedent() (use docstring.copy() and inspect.getdoc instead)
• font_manager.OSXInstalledFonts() (no replacement)
• image.BboxImage.interp_at_native property (no replacement)
• lines.Line2D.verticalOffset property (no replacement)
• matplotlib.checkdep_dvipng (no replacement)
• matplotlib.checkdep_ghostscript (no replacement)
• matplotlib.checkdep_pdfops (no replacement)
• matplotlib.checkdep_inkscape (no replacement)
• matplotlib.get_py2exe_datafiles (no replacement)
• matplotlib.tk_window_focus (use rcParams['tk.window_focus'] instead)
• mlab.demean() (use mlab.detrend_mean() instead)
• path.get_paths_extents() (use path.get_path_collection_extents() instead)
• path.Path.has_nonfinite() (use not np.isfinite(self.vertices).all() instead)
• projections.process_projection_requirements() (no replacement)
• pyplot.plotfile() (Instead, load the data using pandas.read_csv or numpy.loadtxt or similar and use regular pyplot functions to plot the loaded data.)
• quiver.Quiver.color() (use Quiver.get_facecolor() instead)
• quiver.Quiver.keyvec property (no replacement)
• quiver.Quiver.keytext property (no replacement)
• rcsetup.validate_qt4() (no replacement)
• rcsetup.validate_qt5() (no replacement)
• rcsetup.validate_verbose() (no replacement)
• rcsetup.ValidateInterval (no replacement)
• scale.LogTransformBase (use scale.LogTransform instead)
• scale.InvertedLogTransformBase (use scale.InvertedLogTransform instead)
• scale.Log10Transform (use scale.LogTransform instead)
• scale.InvertedLog10Transform (use scale.InvertedLogTransform instead)
• scale.Log2Transform (use scale.LogTransform instead)
• scale.InvertedLog2Transform (use scale.InvertedLogTransform instead)
Matplotlib, Release 3.3.0

- scale.NaturalLogTransform (use scale.LogTransform instead)
- scale.InvertedNaturalLogTransform (use scale.InvertedLogTransform instead)
- scale.get_scale_docs() (no replacement)
- sphinxext.plot_directive.plot_directive() (use the class PlotDirective instead)
- sphinxext.mathmpl.math_directive() (use the class MathDirective instead)
- spines.Spine.is_frame_like() (no replacement)
- testing.decorators.switch_backend() (use @pytest.mark.backend decorator instead)
- text.Text.is_math_text() (use cbook.is_math_text() instead)
- text.TextWithDash() (use text.Annotation instead)
- textpath.TextPath.is_math_text() (use cbook.is_math_text() instead)
- textpath.TextPath.text_get_vertices_codes() (use textpath.text_to_path.get_text_path() instead)
- textpath.TextToPath.glyph_to_path() (use font.get_path() and manual translation of the vertices instead)
- ticker.OldScalarFormatter.pprint_val() (no replacement)
- ticker.ScalarFormatter.pprint_val() (no replacement)
- ticker.LogFormatter.pprint_val() (no replacement)
- ticker.decade_down() (no replacement)
- ticker.decade_up() (no replacement)
- Tick properties gridOn, tick1On, tick2On, label1On, label2On (use set_visible() / get_visible() on Tick.gridline, Tick.tick1line, Tick.tick2line, Tick.label1, Tick.label2 instead)
- widgets.SpanSelector.buttonDown property (no replacement)
- mplot3d.proj3d.line2d() (no replacement)
- mplot3d.proj3d.line2d_dist() (no replacement)
- mplot3d.proj3d.line2d_seg_dist() (no replacement)
- mplot3d.proj3d.mod() (use numpy.linalg.norm instead)
- mplot3d.proj3d.proj_transform_vec() (no replacement)
- mplot3d.proj3d.proj_transform_vec_clip() (no replacement)
- mplot3d.proj3d.vec_pad_ones() (no replacement)
- mplot3d.proj3d.proj_trans_clip_points() (no replacement)
- mplot3d.art3d.norm_angle() (no replacement)
- mplot3d.art3d.norm_text_angle() (no replacement)
- mplot3d.art3d.path_to_3d_segment() (no replacement)
- mplot3d.art3d.paths_to_3d_segments() (no replacement)
- mplot3d.art3d.path_to_3d_segment_with_codes() (no replacement)
- mplot3d.art3d.paths_to_3d_segments_with_codes() (no replacement)
• mplot3d.art3d.get_patch_verts() (no replacement)
• mplot3d.art3d.get_colors() (no replacement)
• mplot3d.art3d.zalpha() (no replacement)
• mplot3d.axis3d.get_flip_min_max() (no replacement)
• mplot3d.axis3d.Axis.get_tick_positions() (no replacement)
• axisartist.axis_artist.UnimplementedException (no replacement)
• axisartist.axislines.SimpleChainedObjects (use axis_grid1.mpl_axes.SimpleChainedObjects instead)

Arguments

• Axes.text() / pyplot.text() do not support the parameter withdash anymore. Use Axes.annotate() and pyplot.annotate() instead.
• The first parameter of matplotlib.use has been renamed from arg to backend (only relevant if you pass by keyword).
• The parameter warn of matplotlib.use has been removed. A failure to switch the backend will now always raise an ImportError if force is set; catch that error if necessary.
• All parameters of matplotlib.use except the first one are now keyword-only.
• The unused parameters shape and imlim of imshow() are now removed. All parameters beyond extent are now keyword-only.
• The unused parameter interp_at_native of BboxImage has been removed.
• The parameter usetex of TextToPath.get_text_path has been removed. Use ismath='TeX' instead.
• The parameter block of show() is now keyword-only, and arbitrary arguments or keyword arguments are no longer accepted.
• The parameter frameon of Figure.savefig has been removed. Use facecolor="none" to get a transparent background.
• Passing a wx.EVTHandler as the first argument to backend_wx.TimerWx is not supported anymore; the signature of TimerWx is now consistent with TimerBase.
• The manage_xticks parameter of boxplot and bxp has been renamed to manage_ticks.
• The normed parameter of hist2d has been renamed to density.
• The s parameter of Annotation has been renamed to text.
• For all functions in bezier that supported a tolerance parameter, this parameter has been renamed to tolerance.
• axis("normal") is not supported anymore. Use the equivalent axis("auto") instead.
• axis() does not accept arbitrary keyword arguments anymore.
• Axis.set_ticklabels() does not accept arbitrary positional arguments other than ticklabels.
• mpl_toolkits.mplot3d.art3d.Poly3DCollection.set_zsort does not accept the value True anymore. Pass the equivalent value 'average' instead.
• *AnchoredText* no longer accepts *horizontalalignment* or *verticalalignment* keyword arguments.

• *ConnectionPatch* no longer accepts the *arrow_transmuter* and *connector* keyword arguments, which did nothing since 3.0.

• *FancyArrowPatch* no longer accepts the *arrow_transmuter* and *connector* keyword arguments, which did nothing since 3.0.

• *TextPath* no longer accepts arbitrary positional or keyword arguments.

• *MaxNLocator.set_params()* no longer accepts arbitrary keyword arguments.

• *pie* no longer accepts and squeezes non-1D inputs; pass 1D input to the *x* argument.

• Passing (n, 1)-shaped error arrays to *Axes.errorbar()* is no longer supported; pass a 1D array instead.

**rcParams**

• The *text.latex.unicode* rcParam has been removed, with no replacement. Matplotlib now always supports unicode in usetex.

• The *savefig.frameon* rcParam has been removed. Set *rcParams["savefig.facecolor"]* (default: ‘auto’) to “none” to get a transparent background.

• The *pgf.debug*, *verbose.fileo* and *verbose.verbose.level* rcParams, which had no effect, have been removed.

• Support for setting *rcParams["mathtext.default"]* (default: ‘it’) to “circled” has been removed.

**Environment variables**

• *MATPLOTLIBDATA* (no replacement).

**mathtext**

• The *\stackrel* command (which behaved differently from its LaTeX version) has been removed. Use *\genfrac* instead.

• The *\mathcircled* command has been removed. Directly use Unicode characters, such as ‘\N{CIRCLED LATIN CAPITAL LETTER A}’, instead.

**Development changes**

Matplotlib now requires *numpy* $\geq 1.15$

Matplotlib now uses Pillow to save and read pngs

The builtin png encoder and decoder has been removed, and Pillow is now a dependency. Note that when reading 16-bit RGB(A) images, Pillow truncates them to 8-bit precision, whereas the old builtin decoder kept the full precision.
The deprecated wx backend (not wxagg!) now always uses wx's builtin jpeg and tiff support
rather than relying on Pillow for writing these formats; this behavior is consistent with wx's
png output.

Changes for the latest version are listed below. For new features that were added to Mat-
plotlib, see What's new?

16.2 API Changes for 3.3.0

- Behaviour changes
- Deprecations
- Removals
- Development changes

16.2.1 Behaviour changes

Formatter.fix_minus

Formatter.fix_minus now performs hyphen-to-unicode-minus replacement whenever
rcParams["axes.unicode_minus"] (default: True) is True; i.e. its behavior matches the
one of ScalarFormatter.fix_minus (ScalarFormatter now just inherits that implementation).

This replacement is now used by the format_data_short method of the various built-in formatter
classes, which affects the cursor value in the GUI toolbars.

FigureCanvasBase now always has a manager attribute, which may be None

Previously, it did not necessarily have such an attribute. A check for hasattr(figure.canvas,
"manager") should now be replaced by figure.canvas.manager is not None (or getattr(figure.
canvas, "manager", None) is not None for back-compatibility).

cbook.CallbackRegistry now propagates exceptions when no GUI event loop is running

cbook.CallbackRegistry now defaults to propagating exceptions thrown by callbacks when no
interactive GUI event loop is running. If a GUI event loop is running, cbook.CallbackRegistry
still defaults to just printing a traceback, as unhandled exceptions can make the program
completely abort() in that case.

Axes.locator_params() validates axis parameter

axes.Axes.locator_params used to accept any value for axis and silently did nothing, when
passed an unsupported value. It now raises a ValueError.
Axis.set_tick_params() validates which parameter

Axis.set_tick_params (and the higher level ax.plot.Axes.tick_params and pyplot.tick_params) used to accept any value for which and silently did nothing, when passed an unsupported value. It now raises a ValueError.

Axis.set_ticklabels() must match FixedLocator.locs

If an axis is using a ticker.FixedLocator, typically set by a call to Axes.set_ticks, then the number of ticklabels supplied must match the number of locations available (FixedFormatter.locs). If not, a ValueError is raised.

backend_pgf.LatexManager.latex

backend_pgf.LatexManager.latex is now created with encoding="utf-8", so its stdin, stdout, and stderr attributes are utf8-encoded.

pyplot.xticks() and pyplot.yticks()

Previously, passing labels without passing the ticks to either pyplot.xticks and pyplot.yticks would result in

    TypeError: object of type ‘NoneType’ has no len()

It now raises a TypeError with a proper description of the error.

Setting the same property under multiple aliases now raises a TypeError

Previously, calling e.g. plot(..., color=somecolor, c=othercolor) would emit a warning because color and c actually map to the same Artist property. This now raises a TypeError.

FileMovieWriter temporary frames directory

FileMovieWriter now defaults to writing temporary frames in a temporary directory, which is always cleared at exit. In order to keep the individual frames saved on the filesystem, pass an explicit frame_prefix.

Axes.plot no longer accepts x and y being both 2D and with different numbers of columns

Previously, calling Axes.plot e.g. with x of shape (n, 3) and y of shape (n, 2) would plot the first column of x against the first column of y, the second column of x against the second column of y, and the first column of x against the third column of y. This now raises an error instead.
Text.update_from now copies usetex state from the source Text

stem now defaults to use_line_collection=True

This creates the stem plot as a LineCollection rather than individual Line2D objects, greatly improving performance.

rcParams color validator is now stricter

Previously, rcParams entries whose values were color-like accepted “spurious” extra letters or characters in the “middle” of the string, e.g. "(0, 1a, '0.5')" would be interpreted as (0, 1, 0.5). These extra characters (including the internal quotes) now cause a ValueError to be raised.

SymLogNorm now has a base parameter

Previously, SymLogNorm had no base keyword argument, and defaulted to base=np.e whereas the documentation said it was base=10. In preparation to make the default 10, calling SymLogNorm without the new base keyword argument emits a deprecation warning.

errorbar now color cycles when only errorbar color is set

Previously setting the ecolor would turn off automatic color cycling for the plot, leading to the the lines and markers defaulting to whatever the first color in the color cycle was in the case of multiple plot calls.

rcsetup.validate_color_for_prop_cycle now always raises TypeError for bytes input

It previously raised TypeError, except when the input was of the form b"C[number]" in which case it raised a ValueError.

FigureCanvasPS.print_ps and FigureCanvasPS.print_eps no longer apply edgecolor and facecolor

These methods now assume that the figure edge and facecolor have been correctly applied by FigureCanvasBase.print_figure, as they are normally called through it.
This behavior is consistent with other figure saving methods (FigureCanvasAgg.print_png, FigureCanvasPdf.print_pdf, FigureCanvasSVG.print_svg).

pyplot.subplot() now raises TypeError when given an incorrect number of arguments

This is consistent with other signature mismatch errors. Previously a ValueError was raised.
Shortcut for closing all figures

Shortcuts for closing all figures now also work for the classic toolbar. There is no default shortcut any more because unintentionally closing all figures by a key press might happen too easily. You can configure the shortcut yourself using `rcParams["keymap.quit_all"]` (default: `[]`).

Autoscale for arrow

Calling `ax.arrow()` will now autoscale the axes.

`set_tick_params(label1On=False)` now also makes the offset text (if any) invisible

... because the offset text can rarely be interpreted without tick labels anyways.

Axes.annotate and pyplot.annotate parameter name changed

The parameter `s` to `Axes.annotate` and `pyplot.annotate` is renamed to `text`, matching `Annotation`.

The old parameter name remains supported, but support for it will be dropped in a future Matplotlib release.

`font_manager.json_dump` now locks the font manager dump file

... to prevent multiple processes from writing to it at the same time.

`pyplot.rgrids` and `pyplot.thetagrids` now act as setters also when called with only kwargs

Previously, keyword arguments were silently ignored when no positional arguments were given.

Axes.get_minorticklabels and Axis.get_majorticklabels now returns plain list

Previously, `Axes.get_minorticklabels` and `Axis.get_majorticklabels` returns `silent_list`. Their return type is now changed to normal list. `get_zminorticklabels`, `get_yminorticklabels`, `get_zminorticklabels`, `Axes.get_ticklabels`, `get_xmajorticklabels`, `get_ymajorticklabels` and `get_zmajorticklabels` methods will be affected by this change.

Default slider formatter

The default method used to format `Slider` values has been changed to use a `ScalarFormatter` adapted the slider values limits. This should ensure that values are displayed with an appropriate number of significant digits even if they are much smaller or much bigger than 1. To restore the old behavior, explicitly pass a "%1.2f" as the `valfmt` parameter to `Slider`. 

936 Chapter 16. API Changes
Add *normalize* keyword argument to *Axes.pie*

`pie()` used to draw a partial pie if the sum of the values was < 1. This behavior is deprecated and will change to always normalizing the values to a full pie by default. If you want to draw a partial pie, please pass `normalize=False` explicitly.

*table.CustomCell* is now an alias for *table.Cell*

All the functionality of CustomCell has been moved to its base class *Cell*.

**wx Timer interval**

Setting the timer interval on a not-yet-started *TimerWx* won’t start it anymore.

"step"-type histograms default to the zorder of *Line2D*

This ensures that they go above gridlines by default. The old `zorder` can be kept by passing it as a keyword argument to *Axes.hist*.

**Legend and OffsetBox visibility**

*Legend* and *OffsetBox* subclasses (*PaddedBox*, *AnchoredOffsetbox*, and *AnnotationBbox*) no longer directly keep track of the visibility of their underlying *Patch* artist, but instead pass that flag down to the *Patch*.

**Legend and Table no longer allow invalid locations**

This affects legends produced on an Axes (*Axes.legend* and *pyplot.legend*) and on a Figure (*Figure.legend* and *pyplot.figlegend*). Figure legends also no longer accept the unsupported 'best' location. Previously, invalid Axes locations would use 'best' and invalid Figure locations would used 'upper right'.

**Passing Line2D’s drawstyle together with linestyle is removed**

Instead of `plt.plot(..., linestyle="steps--"), use `plt.plot(..., linestyle="--", drawstyle="steps")`. *ds* is also an alias for *drawstyle*.

**Upper case color strings**

Support for passing single-letter colors (one of “rgbcmykw”) as UPPERCASE characters is removed; these colors are now case-sensitive (lowercase).
tight/constrained_layout no longer worry about titles that are too wide

tight_layout and constrained_layout shrink axes to accommodate “decorations” on the axes. However, if an xlabel or title is too long in the x direction, making the axes smaller in the x-direction doesn’t help. The behavior of both has been changed to ignore the width of the title and xlabel and the height of the ylabel in the layout logic.

This also means there is a new keyword argument for axes.Axes.get_tightbbox and axis.Axis.get_tightbbox: for_layout_only, which defaults to False, but if True returns a bounding box using the rules above.

rcParams["savefig.facecolor"] (default: 'auto') and rcParams["savefig.edgecolor"] (default: 'auto') now default to "auto"

This newly allowed value for rcParams["savefig.facecolor"] (default: 'auto') and rcParams["savefig.edgecolor"] (default: 'auto'), as well as the facecolor and edgecolor parameters to Figure.savefig, means “use whatever facecolor and edgecolor the figure current has”.

When using a single dataset, Axes.hist no longer wraps the added artist in a silent_list

When Axes.hist is called with a single dataset, it adds to the axes either a BarContainer object (when histtype="bar" or "barstacked"), or a Polygon object (when histtype="step" or "stepfilled") – the latter being wrapped in a list-of-one-element. Previously, either artist would be wrapped in a silent_list. This is no longer the case: the BarContainer is now returned as is (this is an API breaking change if you were directly relying on the concrete list API; however, BarContainer inherits from tuple so most common operations remain available), and the list-of-one Polygon is returned as is. This makes the repr of the returned artist more accurate: it is now

```
<BarContainer object of of 10 artists> # "bar", "barstacked"
[<matplotlib.patches.Polygon object at 0xdeadbeef>] # "step", "stepfilled"
```

instead of

```
<a list of 10 Patch objects> # "bar", "barstacked"
<a list of 1 Patch objects> # "step", "stepfilled"
```

When Axes.hist is called with multiple artists, it still wraps its return value in a silent_list, but uses more accurate type information

```
<a list of 3 BarContainer objects> # "bar", "barstacked"
<a list of 3 List[Polygon] objects> # "step", "stepfilled"
```

instead of

```
<a list of 3 Lists of Patches objects> # "bar", "barstacked"
<a list of 3 Lists of Patches objects> # "step", "stepfilled"
```
Qt and wx backends no longer create a status bar by default

The coordinates information is now displayed in the toolbar, consistently with the other backends. This is intended to simplify embedding of Matplotlib in larger GUIs, where Matplotlib may control the toolbar but not the status bar.

```
rcParams["text.hinting"] (default: 'force_autohint') now supports names mapping to FreeType flags
```

```
rcParams["text.hinting"] (default: 'force_autohint') now supports the values “default”, “no_autohint”, “force_autohint”, and “no_hinting”, which directly map to the FreeType flags FT_LOAD_DEFAULT, etc. The old synonyms (respectively “either”, “native”, “auto”, and “none”) are still supported, but their use is discouraged. To get normalized values, use backend_agg.get_hinting_flag, which returns integer flag values.
```

cbook.get_sample_data auto-loads numpy arrays

When cbook.get_sample_data is used to load a npy or npz file and the keyword-only parameter np_load is True, the file is automatically loaded using numpy.load. np_load defaults to False for backwards compatibility, but will become True in a later release.

```
get_text_width_height_descent now checks ismath rather than rcParams["text.usetex"] (default: False)
```

... to determine whether a string should be passed to the usetex machinery or not. This allows single strings to be marked as not-usetex even when the rcParam is True.

```
Axes.vlines, Axes.hlines, pyplot.vlines and pyplot.hlines colors parameter default change
```

The colors parameter will now default to rcParams["lines.color"] (default: 'C0'), while previously it defaulted to 'k'.

```
Aggressively autoscale clim in ScalerMappable classes
```

Previously some plotting methods would defer autoscaling until the first draw if only one of the vmin or vmax keyword arguments were passed (Axes.scatter, Axes.hexbin, Axes.imshow, Axes.pcolorfast) but would scale based on the passed data if neither was passed (independent of the norm keyword arguments). Other methods (Axes.pcolor, Axes.pcolormesh) always autoscaled base on the initial data.

All of the plotting methods now resolve the unset vmin or vmax at the initial call time using the data passed in.

If you were relying on exactly one of the vmin or vmax remaining unset between the time when the method is called and the first time the figure is rendered you get back the old behavior by manually setting the relevant limit back to None

```
cm_obj.norm.vmin = None
# or
cm_obj.norm.vmax = None
```
which will be resolved during the draw process.

### 16.2.2 Deprecations

#### figure.add_axes() without arguments

Calling `fig.add_axes()` with no arguments currently does nothing. This call will raise an error in the future. Adding a free-floating axes needs a position rectangle. If you want a figure-filling single axes, use `add_subplot()` instead.

#### backend_wx.DEBUG_MSG

`backend_wx.DEBUG_MSG` is deprecated. The wx backends now use regular logging.

#### Colorbar.config_axis()

`Colorbar.config_axis()` is considered internal. Its use is deprecated.

#### NonUniformImage.is_grayscale and PcolorImage.is_grayscale

These attributes are deprecated, for consistency with `AxesImage.is_grayscale`, which was removed back in Matplotlib 2.0.0. (Note that previously, these attributes were only available after rendering the image).

#### den parameter and attribute to mpl_toolkits.axisartist.angle_helper

For all locator classes defined in `mpl_toolkits.axisartist.angle_helper`, the `den` parameter has been renamed to `nbins`, and the `den` attribute deprecated in favor of its (preexisting) synonym `nbins`, for consistency with locator classes defined in `matplotlib.ticker`.

#### backend_pgf.LatexManager.latex_stdin_utf8

`backend_pgf.LatexManager.latex` is now created with `encoding="utf-8"`, so its `stdin` attribute is already utf8-encoded; the `latex_stdin_utf8` attribute is thus deprecated.

#### Flags containing "U" passed to cbook.to_filehandle and cbook.open_file_cm

Please remove "U" from flags passed to `cbook.to_filehandle` and `cbook.open_file_cm`. This is consistent with their removal from `open` in Python 3.9.

#### PDF and PS character tracking internals

The `used_characters` attribute and `track_characters` and `merge_used_characters` methods of `RendererPdf`, `PdfFile`, and `RendererPS` are deprecated.
Case-insensitive capstyles and joinstyles

Please pass capstyles ("miter", "round", "bevel") and joinstyles ("butt", "round", "projecting") as lowercase.

**Passing raw data to `register_cmap()`**

Passing raw data via parameters *data* and *lut* to `register_cmap()` is deprecated. Instead, explicitly create a `LinearSegmentedColormap` and pass it via the *cmap* parameter: `register_cmap(cmap=LinearSegmentedColormap(name, data, lut))`.

**DateFormatter.illegal_s**

This attribute is unused and deprecated.

**widgets.TextBox.params_to_disable**

This attribute is deprecated.

**Revert deprecation *min, *max keyword arguments to set_x/y/zlim_3d()**

These keyword arguments were deprecated in 3.0, alongside with the respective parameters in *set_xlim() / set_ylim()*. The deprecations of the 2D versions were already reverted in in 3.1.

**cbook.local_over_kwdict**

This function is deprecated. Use `cbook.normalize_kwargs` instead.

**Passing both singular and plural colors, linewidths, linestyles to Axes.eventplot**

Passing e.g. both *linewidth* and *linewidths* will raise a TypeError in the future.

**Setting rcParams["text.latex.preamble"] (default: '') or rcParams["pdf.preamble"] to non-strings**

These rcParams should be set to string values. Support for None (meaning the empty string) and lists of strings (implicitly joined with newlines) is deprecated.

**Parameters norm and vmin/vmax should not be used simultaneously**

Passing parameters *norm* and *vmin/vmax* simultaneously to functions using colormapping such as `scatter()` and `imshow()` is deprecated. Instead of `norm=LogNorm(), vmin=min_val, vmax=max_val` pass `norm=LogNorm(min_val, max_val)`. *vmin* and *vmax* should only be used without setting *norm*. 

16.2. API Changes for 3.3.0 941
Effectless parameters of `Figure.colorbar` and `matplotlib.colorbar.Colorbar`

The `cmap` and `norm` parameters of `Figure.colorbar` and `matplotlib.colorbar.Colorbar` have no effect because they are always overridden by the mappable’s colormap and norm; they are thus deprecated. Likewise, passing the `alpha`, `boundaries`, `values`, `extend`, or `filled` parameters with a `ContourSet` mappable, or the `alpha` parameter with an `Artist` mappable, is deprecated, as the mappable would likewise override them.

`args_key` and `exec_key` attributes of built-in MovieWriters

These attributes are deprecated.

Unused parameters

The following parameters do not have any effect and are deprecated:

- arbitrary keyword arguments to `StreamplotSet`
- parameter `quantize` of `Path.cleaned()`
- parameter `s` of `AnnotationBbox.get_fontsize()`
- parameter `label` of `Tick`

Passing `props` to `Shadow`

The parameter `props` of `Shadow` is deprecated. Use keyword arguments instead.

`Axes.update_datalim_bounds`

This method is deprecated. Use `ax.dataLim.set(Bbox.union([ax.dataLim, bounds]))` instead.

`,Symmetrical}LogScale{,Inverted}LogTransform

`TexManager.cachedir`, `TexManager.png_arrayd`

Use `matplotlib.get_cachedir()` instead for the former; there is no replacement for the latter.

Setting `Line2D`’s `pickradius` via `Line2D.set_picker`

Setting a `Line2D`’s `pickradius` (i.e. the tolerance for pick events and containment checks) via `Line2D.set_picker` is deprecated. Use `Line2D.set_pickradius` instead.

`Line2D.set_picker` no longer sets the artist’s custom-contain() check.
Setting a custom method overriding `Artist.contains` is deprecated. There is no replacement, but you may still customize pick events using `Artist.set_picker`.

Colorbar methods

The `on_mappable_changed` and `update_bruteforce` methods of `Colorbar` are deprecated; both can be replaced by calls to `update_normal`.

`OldScalarFormatter`, `IndexFormatter` and `DateIndexFormatter`

These formatters are deprecated. Their functionality can be implemented using e.g. `FuncFormatter`.

`OldAutoLocator`

This ticker is deprecated.

`required`, `forbidden` and `allowed` parameters of `cbook.normalize_kwargs`

These parameters are deprecated.

**The TTFFPATH and AFMPATH environment variables**

Support for the (undocumented) `TTFFPATH` and `AFMPATH` environment variables is deprecated. Additional fonts may be registered using `matplotlib.font_manager.fontManager.addfont()`.

`matplotlib.compat`

This module is deprecated.

`matplotlib.backends.qt_editor.formssubplottool`

This module is deprecated. Use `matplotlib.backends.backend_qt5.SubplotToolQt` instead.

**AVConv animation writer deprecated**

The `AVConvBase`, `AVConvWriter` and `AVConvFileWriter` classes, and the associated animation. `avconv_path` and `animation.avconv_args` `rcParams` are deprecated.

Debian 8 (2015, EOL 06/2020) and Ubuntu 14.04 (EOL 04/2019) were the last versions of Debian and Ubuntu to ship `avconv`. It remains possible to force the use of `avconv` by using the `ffmpeg`-based writers with `rcParams["animation.ffmpeg_path"]` (default: `'ffmpeg'`) set to `'avconv'`.

16.2. API Changes for 3.3.0

943
log/symlog scale base, ticks, and nonpos specification

semilogy, semilogx, loglog, LogScale, and SymmetricalLogScale used to take keyword arguments that depends on the axis orientation ("basex" vs "basey", "subsx" vs "subsy", "nonposx" vs "nonposy"); these parameter names are now deprecated in favor of "base", "subs", "nonpositive". This deprecation also affects e.g. ax.set_yscale("log", basey=...) which must now be spelled ax.set_yscale("log", base=...).

The change from "nonpos" to "nonpositive" also affects LogTransform, InvertedLogTransform, SymmetricalLogTransform, etc.

To use different bases for the x-axis and y-axis of a loglog plot, use e.g. ax.set_xscale("log", base=10); ax.set_yscale("log", base=2).

DraggableBase.artist_picker

This method is deprecated. If you previously reimplemented it in a subclass, set the artist's picker instead with Artist.set_picker.

clear_temp parameter and attribute of FileMovieWriter

The clear temp parameter and attribute of FileMovieWriter is deprecated. In the future, files placed in a temporary directory (using frame_prefix=None, the default) will be cleared; files placed elsewhere will not.

Deprecated rcParams validators

The following validators, defined in rcsetup, are deprecated: validate_fontset, validate_mathtext_default, validate_alignment, validate_svg_fontset, validate_pgf_texpystem, validate_movie_frame_fmt, validate_axis_locator, validate_movie_html_fmt, validate_grid_axis, validate_axes_titlelocation, validate_toolbar, validate_ps_papersize, validate_legend_loc, validate_bool_maybe_none, validate_hinting, validate_movie_writers, validate_webagg_address, validate_nseq_float, validate_nseq_int. To test whether an rcParam value would be acceptable, one can test e.g. rc = RcParams(); rc[k] = v raises an exception.

Stricter rcParam validation

rcParams["axes.axisbelow"] (default: 'line') currently normalizes all strings starting with "line" (case-insensitive) to the option "line". This is deprecated; in a future version only the exact string "line" (case-sensitive) will be supported.

add_subplot() validates its inputs

In particular, for add_subplot(rows, cols, index), all parameters must be integral. Previously strings and floats were accepted and converted to int. This will now emit a deprecation warning.
Toggling axes navigation from the keyboard using "a" and digit keys

Axes navigation can still be toggled programmatically using `Axes.set_navigate`.

The following related APIs are also deprecated: `backend_tools.ToolEnableAllNavigation`, `backend_tools.ToolEnableNavigation`, and `rcParams["keymap.all_axes"]`.

```python
matplotlib.test(recursionlimit=...)
```

The `recursionlimit` parameter of `matplotlib.test` is deprecated.

**mathtext glues**

The `copy` parameter of `mathtext.Glue` is deprecated (the underlying glue spec is now immutable). `mathtext.GlueSpec` is deprecated.

**Signatures of Artist.draw and Axes.draw**

The `inframe` parameter to `Axes.draw` is deprecated. Use `Axes.redraw_in_frame` instead.

Not passing the `renderer` parameter to `Axes.draw` is deprecated. Use `axes.draw_artist(axes)` instead.

These changes make the signature of the `draw` (`artist.draw(renderer)`) method consistent across all artists; thus, additional parameters to `Artist.draw` are deprecated.

**DraggableBase.on_motion_blit**

This method is deprecated. `DraggableBase.on_motion` now handles both the blitting and the non-blitting cases.

**Passing the dash offset as None**

Fine control of dash patterns can be achieved by passing an `(offset, (on-length, off-length, on-length, off-length, ...))` pair as the linestyle property of `Line2D` and `LineCollection`. Previously, certain APIs would accept `offset = None` as a synonym for `offset = 0`, but this was never universally implemented, e.g. for vector output. Support for `offset = None` is deprecated, set the offset to 0 instead.

```python
RendererCairo.fontweights, RendererCairo.fontangles
```

... are deprecated.

```python
autofmt_xdate(which=None)
```

This is deprecated, use its more explicit synonym, `which="major"`, instead.
**JPEG options**

The *quality*, *optimize*, and *progressive* keyword arguments to `savefig`, which were only used when saving to JPEG, are deprecated. `rcParams["savefig.jpeg_quality"]` (default: 95) is likewise deprecated.

Such options should now be directly passed to Pillow using `savefig(..., pil_kwargs={"quality": ..., "optimize": ..., "progressive": ...})`.

**dviread.Encoding**

This class was (mostly) broken and is deprecated.

**Axis and Locator pan and zoom**

The unused *pan* and *zoom* methods of `Axes` and `Locator` are deprecated. Panning and zooming are now implemented using the `start_pan`, `drag_pan`, and `end_pan` methods of `Axes`.

**Passing None to various Axes subclass factories**

Support for passing `None` as base class to `axes.subplot_class_factory`, `axes_grid1.parasite_axes.host_axes_class_factory`, `axes_grid1.parasite_axes.host_subplot_class_factory`, `axes_grid1.parasite_axes.parasite_axes_class_factory`, and `axes_grid1.parasite_axes.parasite_axes_auxtrans_class_factory` is deprecated. Explicitly pass the correct base `Axes` class instead.

**axes_rgb**

In `mpl_toolkits.axes_grid1.axes_rgb`, `imshow_rgb` is deprecated (use `ax.imshow(np.dstack([r, g, b]))` instead); `RGBAxesBase` is deprecated (use `RGBAxes` instead); `RGBAxes.add_RGB_to_figure` is deprecated (it was an internal helper).

**Substitution.from_params**

This method is deprecated. If needed, directly assign to the `params` attribute of the Substitution object.

**PGF backend cleanups**

The *dummy* parameter of `RendererPgf` is deprecated.

`GraphicsContextPgf` is deprecated (use `GraphicsContextBase` instead).

**set_factor method of mpl_toolkits.axisartist locators**

The *set_factor* method of `mpl_toolkits.axisartist locators` (which are different from “standard” Matplotlib tick locators) is deprecated.
widgets.SubplotTool callbacks and axes

The funcleft, funcright, funcbottom, functop, funcwspace, and funchsace methods of widgets.SubplotTool are deprecated.

The axleft, axright, axbottom, axtop, axwspace, and axhspace attributes of widgets.SubplotTool are deprecated. Access the ax attribute of the corresponding slider, if needed.

mathtext Glue helper classes

The Fil, Fill, Filll, NegFil, NegFill, NegFilll, and SsGlue classes in the matplotlib.mathtext module are deprecated. As an alternative, directly construct glue instances with Glue("fil"), etc.

NavigationToolbar2._init_toolbar

Overriding this method to initialize third-party toolbars is deprecated. Instead, the toolbar should be initialized in the __init__ method of the subclass (which should call the base-class' __init__ as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which required _init_toolbar to be overridden), a fully empty implementation (def _init_toolbar(self): pass) may be kept and will not trigger the deprecation warning.

NavigationToolbar2QT.parent and .basedir

These attributes are deprecated. In order to access the parent window, use toolbar.canvas.parent(). Once the deprecation period is elapsed, it will also be accessible as toolbar.parent(). The base directory to the icons is os.path.join(mpl.get_data_path(), "images").

NavigationToolbar2QT.ctx

This attribute is deprecated.

NavigationToolbar2Wx attributes

The prevZoomRect, retinaFix, savedRetinaImage, wxoverlay, zoomAxes, zoomStartX, and zoomStartY attributes are deprecated.

NavigationToolbar2.press and .release

These methods were called when pressing or releasing a mouse button, but only when an interactive pan or zoom was occurring (contrary to what the docs stated). They are deprecated; if you write a backend which needs to customize such events, please directly override press_pan/press_zoom/release_pan/release_zoom instead.
FigureCanvasGTK3._renderer_init

Overriding this method to initialize renderers for GTK3 canvases is deprecated. Instead, the renderer should be initialized in the __init__ method of the subclass (which should call the base-class’ __init__ as appropriate). To keep back-compatibility with earlier versions of Matplotlib (which required _renderer_init to be overridden), a fully empty implementation (def _renderer_init(self): pass) may be kept and will not trigger the deprecation warning.

Path helpers in bezier

bezier.make_path_regular is deprecated. Use Path.cleaned() (or Path.cleaned(curves=True), etc.) instead (but note that these methods add a STOP code at the end of the path).

bezier.concatenate_paths is deprecated. Use Path.make_compound_path() instead.

animation.html_args rcParam

The unused animation.html_args rcParam and animation.HTMLWriter.args_key attribute are deprecated.

text.latex.preview rcParam

This rcParam, which controlled the use of the preview.sty LaTeX package to align TeX string baselines, is deprecated, as Matplotlib’s own dvi parser now computes baselines just as well as preview.sty.

SubplotSpec.get_rows_columns

This method is deprecated. Use the GridSpec.nrows, GridSpec.ncols, SubplotSpec.rowspan, and SubplotSpec.colspan properties instead.

Qt4-based backends

The qt4agg and qt4cairo backends are deprecated. Qt4 has reached its end-of-life in 2015 and there are no releases for recent versions of Python. Please consider switching to Qt5.

fontdict and minor parameters of Axes.set_xticklabels and Axes.set_yticklabels will become keyword-only

All parameters of Figure.subplots except nrows and ncols will become keyword-only

This avoids typing e.g. subplots(1, 1, 1) when meaning subplot(1, 1, 1), but actually getting subplots(1, 1, sharex=True).

RendererWx.get_gc

This method is deprecated. Access the gc attribute directly instead.
add_all parameter in axes_grid

The add_all parameter of axes_grid1.axes_grid.Grid, axes_grid1.axes_grid.ImageGrid, axes_grid1.axes_rgb.make_rgb_axes and axes_grid1.axes_rgb.RGBAxes is deprecated. Axes are now always added to the parent figure, though they can be later removed with ax.remove().

BboxBase.inverse_transformed

.BboxBase.inverse_transformed is deprecated (call BboxBase.transformed on the inverted() transform instead).

orientation of eventplot() and EventCollection

Setting the orientation of an eventplot() or EventCollection to “none” or None is deprecated; set it to “horizontal” instead. Moreover, the two orientations (“horizontal” and “vertical”) will become case-sensitive in the future.

minor kwarg to Axis.get_ticklocs will become keyword-only

Passing this argument positionally is deprecated.

Case-insensitive properties

Normalization of upper or mixed-case property names to lowercase in Artist.set and Artist.update is deprecated. In the future, property names will be passed as is, allowing one to pass names such as patchA or UVC.

ContourSet.ax, Quiver.ax

These attributes are deprecated in favor of ContourSet.axes and Quiver.axes, for consistency with other artists.

Locator.refresh() and associated methods

Locator.refresh() is deprecated. This method was called at certain places to let locators update their internal state, typically based on the axis limits. Locators should now always consult the axis limits when called, if needed.

The associated helper methods NavigationToolbar2.draw() and ToolViewsPositions.refresh_locators() are deprecated, and should be replaced by calls to draw_idle() on the corresponding canvas.

ScalarMappable checkers

The add_checker and check_update methods and update_dict attribute of ScalarMappable are deprecated.
pyplot.tight_layout and ColorbarBase parameters will become keyword-only

All parameters of `pyplot.tight_layout` and all parameters of ColorbarBase except for the first (ax) will become keyword-only, consistently with `Figure.tight_layout` and Colorbar, respectively.

Axes.pie radius and startangle

Passing `None` as either the radius or startangle of an `Axes.pie` is deprecated; use the explicit defaults of 1 and 0, respectively, instead.

AxisArtist.dpi_transform

... is deprecated. Scale `Figure.dpi_scale_trans` by 1/72 to achieve the same effect.

offset_position property of Collection

The `offset_position` property of `Collection` is deprecated. In the future, `Collections` will always behave as if `offset_position` is set to "screen" (the default).

Support for passing `offset_position="data"` to the `draw_path_collection` of all renderer classes is deprecated.

`transforms.AffineDeltaTransform` can be used as a replacement. This API is experimental and may change in the future.

testing.compare.make_external_conversion_command

... is deprecated.

ePOCH2NUM and NUM2epoch are deprecated

These are unused and can be easily reproduced by other date tools. `get_epoch` will return Matplotlib’s epoch.

axes_grid1.CbarAxes attributes

The `cbid` and `locator` attribute are deprecated. Use `mappable.colorbar_cid` and `colorbar.locator`, as for standard colorbars.

qt_compat.is_pyqt5

This function is deprecated in prevision of the future release of PyQt6. The Qt version can be checked using `QtCore.qVersion()`.
Reordering of parameters by Artist.set

In a future version, Artist.set will apply artist properties in the order in which they are given. This only affects the interaction between the color, edgecolor, facecolor, and, for Collections, alpha properties: the color property now needs to be passed first in order not to override the other properties. This is consistent with e.g. Artist.update, which did not reorder the properties passed to it.

Passing multiple keys as a single comma-separated string or multiple arguments to ToolManager.update_keymap

This is deprecated; pass keys as a list of strings instead.

StatusBar classes and attributes

The statusbar attribute of FigureManagerBase, StatusbarBase and all its subclasses, and StatusBarWx, are deprecated, as messages are now displayed in the toolbar instead.

ismath parameter of draw_tex

The ismath parameter of the draw_tex method of all renderer classes is deprecated (as a call to draw_tex - not to be confused with draw_text! - means that the entire string should be passed to the usetex machinery anyways). Likewise, the text machinery will no longer pass the ismath parameter when calling draw_tex (this should only matter for backend implementers).

Passing ismath="TeX!" to RendererAgg.get_text_width_height_descent is deprecated. Pass ismath="TeX" instead, consistently with other low-level APIs which support the values True, False, and "TeX" for ismath.

matplotlib.ttconv

This module is deprecated.

Stricter PDF metadata keys in PGF

Saving metadata in PDF with the PGF backend currently normalizes all keys to lowercase, unlike the PDF backend, which only accepts the canonical case. This is deprecated; in a future version, only the canonically cased keys listed in the PDF specification (and the PdfPages documentation) will be accepted.

Qt modifier keys

The MODIFIER_KEYS, SUPER, ALT, CTRL, and SHIFT global variables of the matplotlib.backends.backend_qt4agg, matplotlib.backends.backend_qt4cairo, matplotlib.backends.backend_qt5agg and matplotlib.backends.backend_qt5cairo modules are deprecated.
TexManager

The TexManager.serif, TexManager.sans_serif, TexManager.cursive and TexManager.monospace attributes are deprecated.

16.2.3 Removals

The following deprecated APIs have been removed:

Modules

- backends.qt_editor.formlayout (use the formlayout module available on PyPI instead).

Classes, methods and attributes

- artist.Artist.aname property (no replacement)
- axis.Axis.iter_ticks (no replacement)
- Support for custom backends that do not provide a backend_bases.GraphicsContextBase.set_hatch_color method
- backend_bases.RendererBase.strip_math() (use cbook.strip_math() instead)
- backend_wx.debug_on_error() (no replacement)
- backend_wx.raise_msg_to_str() (no replacement)
- backend_wx.fake_stderr (no replacement)
- backend_wx.MenuButtonWx (no replacement)
- backend_wx.PrintoutWx (no replacement)
- _backend_tk.NavigationToolbar2Tk.set_active() (no replacement)
- backend_ps.PsBackendHelper.gs_exe property (no replacement)
- backend_ps.PsBackendHelper.gs_version property (no replacement)
- backend_ps.PsBackendHelper.supports_ps2write property (no replacement)
- backend_ps.RendererPS.afmfontd property (no replacement)
- backend_ps.GraphicsContextPS.shouldstroke property (no replacement)
- backend_gtk3.FileChooserDialog (no replacement)
- backend_gtk3.SaveFigureGTK3.get_filechooser() (no replacement)
- backend_gtk3.NavigationToolbar2GTK3.get_filechooser() (no replacement)
- backend_gtk3cairo.FigureManagerGTK3Cairo (use backend_gtk3.FigureManagerGTK3 instead)
- backend_pdf.RendererPdf.afm_font_cache property (no replacement)
- backend_pgf.LatexManagerFactory (no replacement)
- backend_qt5.NavigationToolbar2QT.buttons property (no replacement)
- backend_qt5.NavigationToolbar2QT.adj_window property (no replacement)
- `bezier.find_r_to_boundary_of_closedpath()` (no replacement)
- `cbook.dedent()` (use `inspect.cleandoc` instead)
- `cbook.get_label()` (no replacement)
- `cbook.is_hashable()` (use `isinstance(..., collections.abc.Hashable)` instead)
- `cbook.iterable()` (use `numpy.iterable()` instead)
- `cbook.safezip()` (no replacement)
- `colorbar.ColorbarBase.get_cmap` (use `ScalarMappable.get_cmap` instead)
- `colorbar.ColorbarBase.set_cmap` (use `ScalarMappable.set_cmap` instead)
- `colorbar.ColorbarBase.get_clim` (use `ScalarMappable.get_clim` instead)
- `colorbar.ColorbarBase.set_clim` (use `ScalarMappable.set_clim` instead)
- `colorbar.ColorbarBase.set_norm` (use `ScalarMappable.set_norm` instead)
- `dates.seconds()` (no replacement)
- `dates.minutes()` (no replacement)
- `dates.hours()` (no replacement)
- `dates.weeks()` (no replacement)
- `dates.strpdate2num` and `dates.bytespdate2num` (use `time.strptime` or `dateutil.parser.parse` or `dates.datestr2num` instead)
- `docstring.Appender` (no replacement)
- `docstring.dedent()` (use `inspect.getdoc` instead)
- `docstring.copy_dedent()` (use `docstring.copy()` and `inspect.getdoc` instead)
- `font_manager.OSXInstalledFonts()` (no replacement)
- `image.BboxImage.interp_at_native` property (no replacement)
- `lines.Line2D.verticalOffset` property (no replacement)
- `matplotlib.checkdep_dvipng` (no replacement)
- `matplotlib.checkdep_ghostscript` (no replacement)
- `matplotlib.checkdep_pdftops` (no replacement)
- `matplotlib.checkdep_inkscape` (no replacement)
- `matplotlib.get_py2exe_datafiles` (no replacement)
- `matplotlib.tk_window_focus` (use `rcParams['tk.window_focus']` instead)
- `mlab.demean()` (use `mlab.detrend_mean()` instead)
- `path.get_paths_extents()` (use `path.get_path_collection_extents()` instead)
- `path.Path.has_nonfinite()` (use `not np.isfinite(self.vertices).all()` instead)
- `projections.process_projection_requirements()` (no replacement)
- `pyplot.plotfile()` (Instead, load the data using `pandas.read_csv` or `numpy.loadtxt` or similar and use regular `pyplot` functions to plot the loaded data.)
- `quiver.Quiver.color()` (use `Quiver.get_facecolor()` instead)
- `quiver.Quiver.keyvec` property (no replacement)
- quiver.Quiver.keytext property (no replacement)
- rcsetup.validate_qt4() (no replacement)
- rcsetup.validate_qt5() (no replacement)
- rcsetup.validate_verbose() (no replacement)
- rcsetup.ValidateInterval (no replacement)
- scale.LogTransformBase (use scale.LogTransform instead)
- scale.InvertedLogTransformBase (use scale.InvertedLogTransform instead)
- scale.Log10Transform (use scale.LogTransform instead)
- scale.InvertedLog10Transform (use scale.InvertedLogTransform instead)
- scale.Log2Transform (use scale.LogTransform instead)
- scale.InvertedLog2Transform (use scale.InvertedLogTransform instead)
- scale.NaturalLogTransform (use scale.LogTransform instead)
- scale.InvertedNaturalLogTransform (use scale.InvertedLogTransform instead)
- scale.get_scale_docs() (no replacement)
- sphinxext.plot_directive.plot_directive() (use the class PlotDirective instead)
- sphinxext.mathmpl.math_directive() (use the class MathDirective instead)
- spines.Spine.is_frame_like() (no replacement)
- testing.decorators.switch_backend() (use @pytest.mark.backend decorator instead)
- text.Text.is_math_text() (use cbook.is_math_text() instead)
- text.TextWithDash() (use text.Annotation instead)
- textpath.TextPath.is_math_text() (use cbook.is_math_text() instead)
- textpath.TextPath.text_get_vertices_codes() (use textpath.text_to_path.get_text_path() instead)
- textpath.TextToPath.glyph_to_path() (use font.get_path() and manual translation of the vertices instead)
- ticker.OldScalarFormatter.pprint_val() (no replacement)
- ticker.ScalarFormatter.pprint_val() (no replacement)
- ticker.LogFormatter.pprint_val() (no replacement)
- ticker.decade_down() (no replacement)
- ticker.decade_up() (no replacement)
- Tick properties gridOn, tick1On, tick2On, label1On, label2On (use set_visible() / get_visible() on Tick.gridline, Tick.tick1line, Tick.tick2line, Tick.label1, Tick.label2 instead)
- widgets.SpanSelector.buttonDown property (no replacement)
- mplot3d.proj3d.line2d() (no replacement)
- mplot3d.proj3d.line2d_dist() (no replacement)
- mplot3d.proj3d.line2d_seg_dist() (no replacement)
• `mplot3d.pro3d.mod()` (use `numpy.linalg.norm` instead)
• `mplot3d.pro3d.proj_transform_vec()` (no replacement)
• `mplot3d.pro3d.proj_transform_vec_clip()` (no replacement)
• `mplot3d.pro3d.vec_pad_ones()` (no replacement)
• `mplot3d.pro3d.proj_trans_clip_points()` (no replacement)
• `mplot3d.art3d.norm_angle()` (no replacement)
• `mplot3d.art3d.norm_text_angle()` (no replacement)
• `mplot3d.art3d.path_to_3d_segment()` (no replacement)
• `mplot3d.art3d.paths_to_3d_segments()` (no replacement)
• `mplot3d.art3d.path_to_3d_segment_with_codes()` (no replacement)
• `mplot3d.art3d.paths_to_3d_segments_with_codes()` (no replacement)
• `mplot3d.art3d.get_patch_verts()` (no replacement)
• `mplot3d.art3d.get_colors()` (no replacement)
• `mplot3d.art3d.zalpha()` (no replacement)
• `mplot3d.axis3d.get_flip_min_max()` (no replacement)
• `mplot3d.axis3d.Axis.get_tick_positions()` (no replacement)
• `axisartist.axis_artist.UnimplementedException` (no replacement)
• `axisartist.axislines.SimpleChainedObjects` (use `axis_grid1.mpl_axes.SimpleChainedObjects` instead)

Arguments

• `Axes.text() / pyplot.text()` do not support the parameter `withdash` anymore. Use `Axes.annotate()` and `pyplot.annotate()` instead.
• The first parameter of `matplotlib.use` has been renamed from `arg` to `backend` (only relevant if you pass by keyword).
• The parameter `warn` of `matplotlib.use` has been removed. A failure to switch the backend will now always raise an `ImportError` if `force` is set; catch that error if necessary.
• All parameters of `matplotlib.use` except the first one are now keyword-only.
• The unused parameters `shape` and `imlim` of `imshow()` are now removed. All parameters beyond `extent` are now keyword-only.
• The unused parameter `interp_at_native` of `BboxImage` has been removed.
• The parameter `usetex` of `TextToPath.get_text_path` has been removed. Use `ismath='TeX'` instead.
• The parameter `block` of `show()` is now keyword-only, and arbitrary arguments or keyword arguments are no longer accepted.
• The parameter `frameon` of `Figure.savefig` has been removed. Use `facecolor="none"` to get a transparent background.
• Passing a `wx.EvtHandler` as the first argument to `backend_wx.TimerWx` is not supported anymore; the signature of `TimerWx` is now consistent with `TimerBase`.

• The `manage_xticks` parameter of `boxplot` and `bxp` has been renamed to `manage_ticks`.

• The `normed` parameter of `hist2d` has been renamed to `density`.

• The `s` parameter of `Annotation` has been renamed to `text`.

• For all functions in `bezier` that supported a `tolerance` parameter, this parameter has been renamed to `tolerance`.

• `axis("normal")` is not supported anymore. Use the equivalent `axis("auto")` instead.

• `axis()` does not accept arbitrary keyword arguments anymore.

• `Axis.set_ticklabels()` does not accept arbitrary positional arguments other than `ticklabels`.

• `mpl_toolkits.mplot3d.art3d.Poly3DCollection.set_zsort` does not accept the value `True` anymore. Pass the equivalent value ‘average’ instead.

• `AnchoredText` no longer accepts `horizontalalignment` or `verticalalignment` keyword arguments.

• `ConnectionPatch` no longer accepts the `arrow_transmuter` and `connector` keyword arguments, which did nothing since 3.0.

• `FancyArrowPatch` no longer accepts the `arrow_transmuter` and `connector` keyword arguments, which did nothing since 3.0.

• `TextPath` no longer accepts arbitrary positional or keyword arguments.

• `MaxNLocator.set_params()` no longer accepts arbitrary keyword arguments.

• `pie` no longer accepts and squeezes non-1D inputs; pass 1D input to the `x` argument.

• Passing `(n, 1)`-shaped error arrays to `Axes.errorbar()` is no longer supported; pass a 1D array instead.

rcParams

• The `text.latex.unicode` rcParam has been removed, with no replacement. Matplotlib now always supports unicode in usetex.

• The `savefig.frameon` rcParam has been removed. Set `rcParams["savefig.facecolor"]` (default: 'auto') to "none" to get a transparent background.

• The `pgf.debug`, `verbose.fileo` and `verbose.verbose.level` rcParams, which had no effect, have been removed.

• Support for setting `rcParams["mathtext.default"]` (default: 'it') to "circled" has been removed.

Environment variables

• MATPLOTLIBDATA (no replacement).
mathtext

- The \stackrel command (which behaved differently from its LaTeX version) has been removed. Use \genfrac instead.
- The \mathcircled command has been removed. Directly use Unicode characters, such as '{\N{CIRCLED LATIN CAPITAL LETTER A}}', instead.

16.2.4 Development changes

Matplotlib now requires numpy $\geq 1.15$

Matplotlib now uses Pillow to save and read pngs

The builtin png encoder and decoder has been removed, and Pillow is now a dependency. Note that when reading 16-bit RGB(A) images, Pillow truncates them to 8-bit precision, whereas the old builtin decoder kept the full precision.

The deprecated wx backend (not wxagg!) now always uses wx’s builtin jpeg and tiff support rather than relying on Pillow for writing these formats; this behavior is consistent with wx’s png output.

- Usage patterns
  - The pyplot API
  - The object-oriented API
  - The pylab API (disapproved)
- Modules
- Toolkits

See also the API Changes.
Below we describe several common approaches to plotting with Matplotlib.

17.1 The pyplot API

`matplotlib.pyplot` is a collection of command style functions that make Matplotlib work like MATLAB. Each pyplot function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc.

`pyplot` is mainly intended for interactive plots and simple cases of programmatic plot generation.

Further reading:
- The `matplotlib.pyplot` function reference
- Pyplot tutorial
- Pyplot examples

17.2 The object-oriented API

At its core, Matplotlib is object-oriented. We recommend directly working with the objects, if you need more control and customization of your plots.

In many cases you will create a `Figure` and one or more `Axes` using `pyplot.subplots` and from then on only work on these objects. However, it’s also possible to create `Figures` explicitly (e.g. when including them in GUI applications).

Further reading:
- `matplotlib.axes.Axes` and `matplotlib.figure.Figure` for an overview of plotting functions.
- Most of the examples use the object-oriented approach (except for the pyplot section)
17.3 The *pylab* API (disapproved)

**Warning:** Since heavily importing into the global namespace may result in unexpected behavior, the use of *pylab* is strongly discouraged. Use *matplotlib.pyplot* instead.

*p pylab* is a module that includes *matplotlib.pyplot*, *numpy*, *numpy.fft*, *numpy.linalg*, *numpy.random*, and some additional functions, all within a single namespace. Its original purpose was to mimic a MATLAB-like way of working by importing all functions into the global namespace. This is considered bad style nowadays.
Matplotlib consists of the following submodules:

### 18.1 matplotlib

#### 18.1.1 Backend management

`matplotlib.use(backend, *, force=True)`

Select the backend used for rendering and GUI integration.

**Parameters**

- **backend** [str] The backend to switch to. This can either be one of the standard backend names, which are case-insensitive:
  - interactive backends: GTK3Agg, GTK3Cairo, MacOSX, nbAgg, Qt4Agg, Qt4Cairo, Qt5Agg, Qt5Cairo, TkAgg, TkCairo, WebAgg, WX, WXAgg, WXcairo
  - non-interactive backends: agg, cairo, pdf, pgf, ps, svg, template
  - or a string of the form: module://my.module.name.

- **force** [bool, default: True] If True (the default), raise an `ImportError` if the backend cannot be set up (either because it fails to import, or because an incompatible GUI interactive framework is already running); if False, ignore the failure.

**See also:**

- **Backends**
  - `matplotlib.get_backend`

`matplotlib.get_backend()`

Return the name of the current backend.

**See also:**

- `matplotlib.use`

`matplotlib.interactive(b)`

Set whether to redraw after every plotting command (e.g. `pyplot.xlabel`).

---

CHAPTER

EIGHTEEN

MODULES

---

961
matplotlib.is_interactive()

Return whether to redraw after every plotting command.

18.1.2 Default values and styling

matplotlib.rcParams

An instance of RcParams for handling default Matplotlib values.

class matplotlib.RcParams(*args, **kwargs)

A dictionary object including validation.

Validating functions are defined and associated with rc parameters in matplotlib.rcsetup.

See also:

The matplotlibrc file

find_all(self, pattern)

Return the subset of this RcParams dictionary whose keys match, using re.search(), the given pattern.

Note: Changes to the returned dictionary are not propagated to the parent RcParams dictionary.

matplotlib.rc_context(rc=None, fname=None)

Return a context manager for temporarily changing rcParams.

Parameters

rc [dict] The rcParams to temporarily set.

fname [str or path-like] A file with Matplotlib rc settings. If both fname and rc are given, settings from rc take precedence.

See also:

The matplotlibrc file

Examples

Passing explicit values via a dict:

```python
with mpl.rc_context({'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('example.png')
    plt.close(fig)
```

Loading settings from a file:

```python
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, y)  # uses 'print.rc'
```
matplotlib.rc(group, **kwargs)

Set the current rcParams. group is the grouping for the rc, e.g., for lines.linewidth the group is lines, for axes.facecolor, the group is axes, and so on. Group may also be a list or tuple of group names, e.g., (xtick, ytick). kwargs is a dictionary attribute name/value pairs, e.g.,:

```python
rc('lines', linewidth=2, color='r')
```

sets the current rcParams and is equivalent to:

```python
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

<table>
<thead>
<tr>
<th>Alias</th>
<th>Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>'lw'</td>
<td>'linewidth'</td>
</tr>
<tr>
<td>'ls'</td>
<td>'linestyle'</td>
</tr>
<tr>
<td>'c'</td>
<td>'color'</td>
</tr>
<tr>
<td>'fc'</td>
<td>'facecolor'</td>
</tr>
<tr>
<td>'ec'</td>
<td>'edgecolor'</td>
</tr>
<tr>
<td>'mew'</td>
<td>'markeredgewidth'</td>
</tr>
<tr>
<td>'aa'</td>
<td>'antialiased'</td>
</tr>
</tbody>
</table>

Thus you could abbreviate the above call as:

```python
rc('lines', lw=2, c='r')
```

Note you can use python’s kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```python
font = {'family' : 'monospace',
        'weight' : 'bold',
        'size' : 'larger'}
rc('font', **font)  # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use matplotlib.style.use('default') or rcdefaults() to restore the default rcParams after changes.

**Notes**

Similar functionality is available by using the normal dict interface, i.e. rcParams.update({"lines.linewidth": 2, ...}) (but rcParams.update does not support abbreviations or grouping).

matplotlib.rcdefaults()

Restore the rcParams from Matplotlib’s internal default style.

Style-blacklisted rcParams (defined in matplotlib.style.core.STYLE_BLACKLIST) are not updated.

**See also:**

- matplotlib.rc_file_defaults Restore the rcParams from the rc file originally loaded by Matplotlib.
**matplotlib.style.use** Use a specific style file. Call `style.use('default')` to restore the default style.

`matplotlib.rc_file_defaults()`

Restore the `rcParams` from the original rc file loaded by Matplotlib.

Style-blacklisted `rcParams` (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

`matplotlib.rc_file(fname, *, use_default_template=True)`

Update `rcParams` from file.

Style-blacklisted `rcParams` (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

**Parameters**

- `fname` [str or path-like] A file with Matplotlib rc settings.
- `use_default_template` [bool] If True, initialize with default parameters before updating with those in the given file. If False, the current configuration persists and only the parameters specified in the file are updated.

`matplotlib.rc_params(fail_on_error=False)`

Construct a `RcParams` instance from the default Matplotlib rc file.

`matplotlib.rc_params_from_file(fname, fail_on_error=False, use_default_template=True)`

Construct a `RcParams` from file `fname`.

**Parameters**

- `fname` [str or path-like] A file with Matplotlib rc settings.
- `fail_on_error` [bool] If True, raise an error when the parser fails to convert a parameter.
- `use_default_template` [bool] If True, initialize with default parameters before updating with those in the given file. If False, the configuration class only contains the parameters specified in the file. (Useful for updating dicts.)

`matplotlib.get_configdir()`

Return the string path of the the configuration directory.

The directory is chosen as follows:

1. If the MPLCONFIGDIR environment variable is supplied, choose that.
2. On Linux, follow the XDG specification and look first in `$XDG_CONFIG_HOME`, if defined, or `$HOME/.config`. On other platforms, choose `$HOME/.matplotlib`.
3. If the chosen directory exists and is writable, use that as the configuration directory.
4. Else, create a temporary directory, and use it as the configuration directory.

`matplotlib.matplotlib_fname()`

Get the location of the config file.

The file location is determined in the following order:

- `$PWD/matplotlibrc`
- `$MATPLOTLIBRC` if it is not a directory
- `$MATPLOTLIBRC/matplotlibrc`
• $MPLCONFIGDIR/matplotlibrc

• On Linux,
  - $XDG_CONFIG_HOME/matplotlib/matplotlibrc (if $XDG_CONFIG_HOME is defined)
  - or $HOME/.config/matplotlib/matplotlibrc (if $XDG_CONFIG_HOME is not defined)

• On other platforms, - $HOME/.matplotlib/matplotlibrc if $HOME is defined

• Lastly, it looks in $MATPLOTLIBDATA/matplotlibrc, which should always exist.

matplotlib.get_data_path(*, _from_rc=None)
Return the path to Matplotlib data.

18.1.3 Logging

matplotlib.set_loglevel(level)
Set Matplotlib's root logger and root logger handler level, creating the handler if it does not exist yet.

Typically, one should call set_loglevel("info") or set_loglevel("debug") to get additional debugging information.

Parameters

level [{"notset", "debug", "info", "warning", "error", "critical"}] The log level of the handler.

Notes

The first time this function is called, an additional handler is attached to Matplotlib’s root handler; this handler is reused every time and this function simply manipulates the logger and handler's level.

18.1.4 Miscellaneous

matplotlib.get_cachedir()
Return the string path of the cache directory.

The procedure used to find the directory is the same as for get_config_dir, except using $XDG_CACHE_HOME/$HOME/.cache instead.

18.2 matplotlib.afm

A python interface to Adobe Font Metrics Files.

Although a number of other python implementations exist, and may be more complete than this, it was decided not to go with them because they were either:

1) copyrighted or used a non-BSD compatible license

2) had too many dependencies and a free standing lib was needed
3) did more than needed and it was easier to write afresh rather than figure out how to get just what was needed.

It is pretty easy to use, and has no external dependencies:

```python
>>> import matplotlib as mpl
>>> from pathlib import Path
>>> afm_path = Path(mpl.get_data_path(), 'fonts', 'afm', 'ptmr8a.afm')
>>> from matplotlib.afm import AFM
>>> with afm_path.open('rb') as fh:
...     afm = AFM(fh)
>>> afm.string_width_height('What the heck?')
(6220.0, 694)
>>> afm.get_fontname()
'Times-Roman'
>>> afm.get_kern_dist('A', 'f')
0
>>> afm.get_kern_dist('A', 'y')
-92.0
>>> afm.get_bbox_char('!')
[130, -9, 238, 676]
```

As in the Adobe Font Metrics File Format Specification, all dimensions are given in units of 1/1000 of the scale factor (point size) of the font being used.

class matplotlib.afm.AFM(fh)

Bases: object

Parse the AFM file in file object `fh`.

property family_name

The font family name, e.g., 'Times'.

get_angle(self)

Return the fontangle as float.

get_bbox_char(self, c, isord=False)

get_capheight(self)

Return the cap height as float.

get-familyname(self)

Return the font family name, e.g., 'Times'.

get-fontname(self)

Return the font name, e.g., 'Times-Roman'.

get-fullname(self)

Return the font full name, e.g., 'Times-Roman'.

g-get_height_char(self, c, isord=False)

Get the bounding box (ink) height of character `c` (space is 0).

g-get-horizontal-stem-width(self)

Return the standard horizontal stem width as float, or `None` if not specified in AFM file.

g-get_kern_dist(self, c1, c2)

Return the kerning pair distance (possibly 0) for chars `c1` and `c2`.

g-get_kern_dist_from_name(self, name1, name2)

Return the kerning pair distance (possibly 0) for chars `name1` and `name2`. 
get_name_char(self, c, isord=False)
    Get the name of the character, i.e., ';' is 'semicolon'.

get_str_bbox(self, s)
    Return the string bounding box.

get_str_bbox_and_descent(self, s)
    Return the string bounding box and the maximal descent.

get_underline_thickness(self)
    Return the underline thickness as float.

get_vertical_stem_width(self)
    Return the standard vertical stem width as float, or None if not specified in AFM file.

get_weight(self)
    Return the font weight, e.g., 'Bold' or 'Roman'.

get_width_char(self, c, isord=False)
    Get the width of the character from the character metric WX field.

get_width_from_char_name(self, name)
    Get the width of the character from a type1 character name.

get_xheight(self)
    Return the xheight as float.

string_width_height(self, s)
    Return the string width (including kerning) and string height as a (w, h) tuple.

class matplotlib.afm.CharMetrics
    Bases: tuple

    Represents the character metrics of a single character.

    Notes

    The fields do currently only describe a subset of character metrics information defined
    in the AFM standard.

    Create new instance of CharMetrics(width, name, bbox)

    bbox
        The bbox of the character (B) as a tuple (llx, lly, urx, ury).

    name
        The character name (N).

    width
        The character width (WX).

class matplotlib.afm.CompositePart
    Bases: tuple

    Represents the information on a composite element of a composite char.

    Create new instance of CompositePart(name, dx, dy)

    dx
        x-displacement of the part from the origin.
dy
    y-displacement of the part from the origin.

name
    Name of the part, e.g. ‘acute’.

18.3 matplotlib.animation

Table of Contents

- Animation
- Writer Classes
- Helper Classes
- Inheritance Diagrams

18.3.1 Animation

The easiest way to make a live animation in matplotlib is to use one of the Animation classes.

<table>
<thead>
<tr>
<th>Animation</th>
<th>A base class for Animations.</th>
</tr>
</thead>
<tbody>
<tr>
<td>FuncAnimation</td>
<td>Makes an animation by repeatedly calling a function func.</td>
</tr>
<tr>
<td>ArtistAnimation</td>
<td>Animation using a fixed set of Artist objects.</td>
</tr>
</tbody>
</table>

matplotlib.animation.Animation

class matplotlib.animation.Animation(fig, event_source=None, blit=False)
    A base class forAnimations.

    This class is not usable as is, and should be subclassed to provide needed behavior.

    Parameters

    fig [Figure] The figure object used to get needed events, such as draw or resize.

    event_source [object, optional] A class that can run a callback when desired events are generated, as well as be stopped and started.

    Examples include timers (see TimedAnimation) and file system notifications.

    blit [bool, default: False] Whether blitting is used to optimize drawing.

    See also:

    FuncAnimation, ArtistAnimation
__init__(self, fig, event_source=None, blit=False)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, fig[, event_source, blit]) Initialize self.

new_frame_seq(self) Return a new sequence of frame information.

new_saved_frame_seq(self) Return a new sequence of saved/cached frame information.

save(self, filename[, writer, fps, dpi, ...]) Save the animation as a movie file by drawing every frame.

to_html5_video(self[, embed_limit]) Convert the animation to an HTML5 <video> tag.

to_jshtml(self[, fps, embed_frames, ...]) Generate HTML representation of the animation

new_frame_seq(self)
Return a new sequence of frame information.

new_saved_frame_seq(self)
Return a new sequence of saved/cached frame information.

save(self, filename[, writer, fps, dpi, ...])
Save the animation as a movie file by drawing every frame.

Parameters

filename [str] The output filename, e.g., mymovie.mp4.

writer [MovieWriter or str, default: rcParams["animation.writer"] (default: 'ffmpeg')] A MovieWriter instance to use or a key that identifies a class to use, such as 'ffmpeg'.

fps [int, optional] Movie frame rate (per second). If not set, the frame rate from the animation’s frame interval.

dpi [float, default: rcParams["savefig.dpi"] (default: 'figure')] Controls the dots per inch for the movie frames. Together with the figure’s size in inches, this controls the size of the movie.

codec [str, default: rcParams["animation.codec"] (default: 'h264').] The video codec to use. Not all codecs are supported by a given MovieWriter.

bitrate [int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the builtin writers.
metadata [Dict[str, str], default {}] Dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

extraAnim [list, default: []] Additional Animation objects that should be included in the saved movie file. These need to be from the same matplotlib.figure.Figure instance. Also, animation frames will just be simply combined, so there should be a 1:1 correspondence between the frames from the different animations.

savefig_kwargs [dict, default: {}] Keyword arguments passed to each savefig call used to save the individual frames.

progress_callback [function, optional] A callback function that will be called for every frame to notify the saving progress. It must have the signature

```python
def func(current_frame: int, total_frames: int) -> Any
```

where current_frame is the current frame number and total_frames is the total number of frames to be saved. total_frames is set to None, if the total number of frames can not be determined. Return values may exist but are ignored.

Example code to write the progress to stdout:

```python
progress_callback = lambda i, n: print(f'Saving frame \{i\} of \{n\}')
```

Notes

fps, codec, bitrate, extra_args and metadata are used to construct a MovieWriter instance and can only be passed if writer is a string. If they are passed as non-None and writer is a MovieWriter, a RuntimeError will be raised.

to_html5_video(self, embed_limit=None)
Convert the animation to an HTML5 <video> tag.

This saves the animation as an h264 video, encoded in base64 directly into the HTML5 video tag. This respects rcParams["animation.writer"] (default: 'ffmpeg') and rcParams["animation.bitrate"] (default: -1). This also makes use of the interval to control the speed, and uses the repeat parameter to decide whether to loop.

Parameters

embed_limit [float, optional] Limit, in MB, of the returned animation. No animation is created if the limit is exceeded. Defaults to rcParams["animation.embed_limit"] (default: 20.0) = 20.0.

Returns

str An HTML5 video tag with the animation embedded as base64 encoded h264 video. If the embed limit is exceeded, this returns the string “Video too large to embed.”

to_jshtml(self, fps=None, embed_frames=True, default_mode=None)
Generate HTML representation of the animation
matplotlib.animation.FuncAnimation

class matplotlib.animation.FuncAnimation(fig, func, frames=None, init_func=None, fargs=None, save_count=None, *, cache_frame_data=True, **kwargs)

Makes an animation by repeatedly calling a function `func`.

**Parameters**

- **fig** [Figure] The figure object used to get needed events, such as draw or resize.

- **func** [callable] The function to call at each frame. The first argument will be the next value in `frames`. Any additional positional arguments can be supplied via the `fargs` parameter.

  The required signature is:

  ```python
def func(frame, *fargs) -> iterable_of_artists
  ```

  If `blit == True`, `func` must return an iterable of all artists that were modified or created. This information is used by the blitting algorithm to determine which parts of the figure have to be updated. The return value is unused if `blit == False` and may be omitted in that case.

- **frames** [iterable, int, generator function, or None, optional] Source of data to pass `func` and each frame of the animation

  - If an iterable, then simply use the values provided. If the iterable has a length, it will override the `save_count` kwarg.
  
  - If an integer, then equivalent to passing `range(frames)`

  - If a generator function, then must have the signature:

    ```python
def gen_function() -> obj
    ```

    - If `None`, then equivalent to passing `itertools.count`.

  In all of these cases, the values in `frames` is simply passed through to the user-supplied `func` and thus can be of any type.

- **init_func** [callable, optional] A function used to draw a clear frame. If not given, the results of drawing from the first item in the frames sequence will be used. This function will be called once before the first frame.

  The required signature is:

  ```python
def init_func() -> iterable_of_artists
  ```

  If `blit == True`, `init_func` must return an iterable of artists to be re-drawn. This information is used by the blitting algorithm to determine which parts of the figure have to be updated. The return value is unused if `blit == False` and may be omitted in that case.

- **fargs** [tuple or None, optional] Additional arguments to pass to each call to `func`.

- **save_count** [int, default: 100] Fallback for the number of values from `frames` to cache. This is only used if the number of frames cannot be
inferred from frames, i.e. when it’s an iterator without length or a generator.

**interval** [int, default: 200] Delay between frames in milliseconds.

**repeat_delay** [int, default: 0] The delay in milliseconds between consecutive animation runs, if repeat is True.

**repeat** [bool, default: True] Whether the animation repeats when the sequence of frames is completed.

**blit** [bool, default: False] Whether blitting is used to optimize drawing. Note: when using blitting, any animated artists will be drawn according to their zorder; however, they will be drawn on top of any previous artists, regardless of their zorder.

**cache_frame_data** [bool, default: True] Whether frame data is cached. Disabling cache might be helpful when frames contain large objects.

```python
def __init__(self, fig, func, frames=None, init_func=None, fargs=None, save_count=None, *, cache_frame_data=True, **kwargs):
    Initialize self. See help(type(self)) for accurate signature.
```

### Methods

- **__init__**(self, fig, func[, frames, ...]) Initialize self.
- **new_frame_seq**(self) Return a new sequence of frame information.
- **new_saved_frame_seq**(self) Return a new sequence of saved/cached frame information.
- **save**(self, filename[, writer, fps, dpi, ...]) Save the animation as a movie file by drawing every frame.
- **to_html5_video**(self[, embed_limit]) Convert the animation to an HTML5 `<video>` tag.
- **to_jshtml**(self[, fps, embed_frames, ...]) Generate HTML representation of the animation

```python
def new_frame_seq(self)
    Return a new sequence of frame information.

def new_saved_frame_seq(self)
    Return a new sequence of saved/cached frame information.
```

```python
matplotlib.animation.ArtistAnimation

class matplotlib.animation.ArtistAnimation(fig, artists, *args, **kwargs)
    Animation using a fixed set of Artist objects.

    Before creating an instance, all plotting should have taken place and the relevant artists saved.

    **Parameters**

    - **fig** [Figure] The figure object used to get needed events, such as draw or resize.
```
artists [list] Each list entry is a collection of artists that are made visible on the corresponding frame. Other artists are made invisible.

interval [int, default: 200] Delay between frames in milliseconds.

repeat_delay [int, default: 0] The delay in milliseconds between consecutive animation runs, if repeat is True.

repeat [bool, default: True] Whether the animation repeats when the sequence of frames is completed.

blit [bool, default: False] Whether blitting is used to optimize drawing.

__init__ (self, fig, artists, *args, **kwargs)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__ (self, fig, artists, *args, **kwargs)
Initialize self.

new_frame_seq(self)
Return a new sequence of frame information.

new_saved_frame_seq(self)
Return a new sequence of saved/cached frame information.

save(self, filename[, writer, fps, dpi, ...])
Save the animation as a movie file by drawing every frame.

to_html5_video(self[, embed_limit])
Convert the animation to an HTML5 <video> tag.

to_jshtml(self[, fps, embed_frames, ...])
Generate HTML representation of the animation

In both cases it is critical to keep a reference to the instance object. The animation is advanced by a timer (typically from the host GUI framework) which the Animation object holds the only reference to. If you do not hold a reference to the Animation object, it (and hence the timers), will be garbage collected which will stop the animation.

To save an animation to disk use Animation.save or Animation.to_html5_video.

See Helper Classes below for details about what movie formats are supported.

FuncAnimation

The inner workings of FuncAnimation is more-or-less:

```python
for d in frames:
    artists = func(d, *fargs)
    fig.canvas.draw_idle()
    fig.canvas.start_event_loop(interval)
```

with details to handle ‘blitting’ (to dramatically improve the live performance), to be non-blocking, not repeatedly start/stop the GUI event loop, handle repeats, multiple animated axes, and easily save the animation to a movie file.

‘Blitting’ is a standard technique in computer graphics. The general gist is to take an existing bit map (in our case a mostly rasterized figure) and then ‘blit’ one more artist on top. Thus, by managing a saved ‘clean’ bitmap, we can only re-draw the few artists that are changing at
each frame and possibly save significant amounts of time. When we use blitting (by passing `blit=True`), the core loop of `FuncAnimation` gets a bit more complicated:

```python
ax = fig.gca()

def update_blit(artists):
    fig.canvas.restore_region(bg_cache)
    for a in artists:
        a.axes.draw_artist(a)
        ax.figure.canvas.blit(ax.bbox)
    artists = init_func()

    for a in artists:
        a.set_animated(True)

    fig.canvas.draw()
    bg_cache = fig.canvas.copy_from_bbox(ax.bbox)

    for f in frames:
        artists = func(f, *fargs)
        update_blit(artists)
        fig.canvas.start_event_loop(interval)
```

This is of course leaving out many details (such as updating the background when the figure is resized or fully re-drawn). However, this hopefully minimalist example gives a sense of how `init_func` and `func` are used inside of `FuncAnimation` and the theory of how 'blitting' works.

The expected signature on `func` and `init_func` is very simple to keep `FuncAnimation` out of your book keeping and plotting logic, but this means that the callable objects you pass in must know what artists they should be working on. There are several approaches to handling this, of varying complexity and encapsulation. The simplest approach, which works quite well in the case of a script, is to define the artist at a global scope and let Python sort things out. For example

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

fig, ax = plt.subplots()
xdata, ydata = [], []
ln, = plt.plot([], [], 'ro')

def init():
    ax.set_xlim(0, 2*np.pi)
    ax.set_ylim(-1, 1)
    return ln,

def update(frame):
    xdata.append(frame)
    ydata.append(np.sin(frame))
    ln.set_data(xdata, ydata)
    return ln,

ani = FuncAnimation(fig, update, frames=np.linspace(0, 2*np.pi, 128),
                     init_func=init, blit=True)
plt.show()  
```
The second method is to use `functools.partial` to 'bind' artists to function. A third method is to use closures to build up the required artists and functions. A fourth method is to create a class.

**Examples**

**Decay**

This example showcases: - using a generator to drive an animation, - changing axes limits during an animation.

```python
import itertools
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.animation as animation

def data_gen():
    for cnt in itertools.count():
        t = cnt / 10
        yield t, np.sin(2*np.pi*t) * np.exp(-t/10.)

def init():
    ax.set_ylim(-1.1, 1.1)
    ax.set_xlim(0, 10)
    del xdata[:]
    del ydata[:]
    line.set_data(xdata, ydata)
    return line,

fig, ax = plt.subplots()
line, = ax.plot([], [], lw=2)
ax.grid()
xdata, ydata = [], []

def run(data):
    # update the data
    t, y = data
    xdata.append(t)
    ydata.append(y)
    xmin, xmax = ax.get_xlim()

    if t >= xmax:
        ax.set_xlim(xmin, 2*xmax)
        ax.figure.canvas.draw()
    line.set_data(xdata, ydata)
    return line,

ani = animation.FuncAnimation(fig, run, data_gen, interval=10, init_func=init)
plt.show()
```

**Total running time of the script:** ( 0 minutes 15.610 seconds)
The Bayes update

This animation displays the posterior estimate updates as it is refitted when new data arrives. The vertical line represents the theoretical value to which the plotted distribution should converge.

```python
import math
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

def beta_pdf(x, a, b):
    return (x**a - 1) * (1-x)**(b-1) * math.gamma(a + b) / (math.gamma(a) * math.gamma(b))

class UpdateDist:
    def __init__(self, ax, prob=0.5):
        self.success = 0
        self.prob = prob
        self.line, = ax.plot([], [], 'k-')
        self.x = np.linspace(0, 1, 200)
        self.ax = ax

        # Set up plot parameters
        self.ax.set_xlim(0, 1)
        self.ax.set_ylim(0, 10)
        self.ax.grid(True)

        # This vertical line represents the theoretical value, to which the plotted distribution should converge.
        self.ax.axvline(prob, linestyle='--', color='black')

    def __call__(self, i):
        # This way the plot can continuously run and we just keep watching new realizations of the process
        if i == 0:
            self.success = 0
            self.line.set_data([], [])
            return self.line,

        # Choose success based on exceed a threshold with a uniform pick
        if np.random.rand(1) < self.prob:
            self.success += 1
            y = beta_pdf(self.x, self.success + 1, (i - self.success) + 1)
            self.line.set_data(self.x, y)
            return self.line,

        # Fixing random state for reproducibility
        np.random.seed(19680801)

fig, ax = plt.subplots()
ud = UpdateDist(ax, prob=0.7)
anim = FuncAnimation(fig, ud, frames=100, interval=100, blit=True)
plt.show()
```
**The double pendulum problem**

This animation illustrates the double pendulum problem.

```python
from numpy import sin, cos
import numpy as np
import matplotlib.pyplot as plt
import scipy.integrate as integrate
import matplotlib.animation as animation

G = 9.8  # acceleration due to gravity, in m/s^2
L1 = 1.0  # length of pendulum 1 in m
L2 = 1.0  # length of pendulum 2 in m
M1 = 1.0  # mass of pendulum 1 in kg
M2 = 1.0  # mass of pendulum 2 in kg
t_stop = 5  # how many seconds to simulate

def derivs(state, t):
    dydx = np.zeros_like(state)
    dydx[0] = state[1]

    delta = state[2] - state[0]
    den1 = (M1+M2) * L1 - M2 * L1 * cos(delta) * cos(delta)

    den2 = (L2/L1) * den1

    return dydx

# create a time array from 0..100 sampled at 0.05 second steps
dt = 0.05
t = np.arange(0, t_stop, dt)

# th1 and th2 are the initial angles (degrees)
# w10 and w20 are the initial angular velocities (degrees per second)
th1 = 120.0
w1 = 0.0
th2 = -10.0
w2 = 0.0
```
# initial state
state = np.radians([th1, w1, th2, w2])

# integrate your ODE using scipy.integrate.
y = integrate.odeint(derivs, state, t)

x1 = L1*sin(y[:, 0])
y1 = -L1*cos(y[:, 0])

x2 = L2*sin(y[:, 2]) + x1
y2 = -L2*cos(y[:, 2]) + y1

fig = plt.figure(figsize=(5, 4))
ax = fig.add_subplot(111, autoscale_on=False, xlim=(-2, 2), ylim=(-2, 1))
ax.set_aspect('equal')
ax.grid()

line, = ax.plot([], [], 'o-', lw=2)
time_template = 'time = %.1f s'
time_text = ax.text(0.05, 0.9, '', transform=ax.transAxes)

def animate(i):
    thisx = [0, x1[i], x2[i]]
    thisy = [0, y1[i], y2[i]]

    line.set_data(thisx, thisy)
    time_text.set_text(time_template % (i*dt))
    return line, time_text

ani = animation.FuncAnimation(
    fig, animate, len(y), interval=dt*1000, blit=True)
plt.show()

Total running time of the script: ( 0 minutes 15.632 seconds)

Animated histogram

Use a path patch to draw a bunch of rectangles for an animated histogram.

import numpy as np

import matplotlib.pyplot as plt
import matplotlib.patches as patches
import matplotlib.path as path
import matplotlib.animation as animation

# Fixing random state for reproducibility
np.random.seed(19680801)

# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)
Here comes the tricky part – we have to set up the vertex and path codes arrays using `Path.\nMOVETO, Path.LINETO` and `Path.CLOSEPOLY` for each rect.

- We need 1 `MOVETO` per rectangle, which sets the initial point.
- We need 3 `LINETO`'s, which tell Matplotlib to draw lines from vertex 1 to vertex 2, v2 to v3, and v3 to v4.
- We then need one `CLOSEPOLY` which tells Matplotlib to draw a line from the v4 to our initial vertex (the `MOVETO` vertex), in order to close the polygon.

**Note:** The vertex for `CLOSEPOLY` is ignored, but we still need a placeholder in the `verts` array to keep the codes aligned with the vertices.

```
nverts = nrects * (1 + 3 + 1)
verts = np.zeros((nverts, 2))
codes = np.full(nverts, path.Path.LINETO)
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5, 0] = left
verts[0::5, 1] = bottom
verts[1::5, 0] = left
verts[1::5, 1] = top
verts[2::5, 0] = right
verts[2::5, 1] = top
verts[3::5, 0] = right
verts[3::5, 1] = bottom
```

To animate the histogram, we need an `animate` function, which generates a random set of numbers and updates the locations of the vertices for the histogram (in this case, only the heights of each rectangle). `patch` will eventually be a `Patch` object.

```
patch = None

def animate(i):
    # simulate new data coming in
    data = np.random.randn(1000)
    n, bins = np.histogram(data, 100)
    top = bottom + n
    verts[1::5, 1] = top
    verts[2::5, 1] = top
    return [patch, ]
```

And now we build the `Path` and `Patch` instances for the histogram using our vertices and codes. We add the patch to the `Axes` instance, and setup the `FuncAnimation` with our `animate` function.
Matplotlib, Release 3.3.0

```python
fig, ax = plt.subplots()
barpath = path.Path(verts, codes)
patch = patches.PathPatch(
    barpath, facecolor='green', edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)

ax.set_xlim(left[0], right[-1])
ax.set_ylim(bottom.min(), top.max())

ani = animation.FuncAnimation(fig, animate, 50, repeat=False, blit=True)
plt.show()
```

**Total running time of the script:** (0 minutes 7.754 seconds)

**Rain simulation**

Simulates rain drops on a surface by animating the scale and opacity of 50 scatter points.

Author: Nicolas P. Rougier

Out:

```
/root/matplotlib/examples/animation/rain.py:28: FutureWarning: Passing (type, 1) or '1type' as a synonym of type is deprecated; in a future version of numpy, it will be understood as (type, (1,...)) / '(1,)type'.

18.3.2 Writer Classes

The provided writers fall into a few broad categories.
The Pillow writer relies on the Pillow library to write the animation, keeping all data in memory.

---

**PillowWriter**

```python
class matplotlib.animation.PillowWriter(fps=5, metadata=None, codec=None, bitrate=None):
    __init__ (self, fps=5, metadata=None, codec=None, bitrate=None)
    Initialize self. See help(type(self)) for accurate signature.

Methods

    __init__ (self[, fps, metadata, codec, bitrate])  Initialize self.
    finish(self)  Finish any processing for writing the movie.
    grab_frame(self, **savefig_kwargs)  Grab the image information from the figure and save as a movie frame.
    isAvailable()  Continued on next page
```

The HTML writer generates JavaScript-based animations.

**HTMLWriter** Writer for JavaScript-based HTML movies.

```python
class matplotlib.animation.HTMLWriter(fps=30, codec=None, bitrate=None, extra_args=None, metadata=None, embed_frames=False, default_mode='loop', embed_limit=None)
```

Writer for JavaScript-based HTML movies.

**Parameters**

</tr>
<tr>
<td>bitrate</td>
<td>int, default: <code>rcParams[&quot;animation.bitrate&quot;]</code> (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.</td>
</tr>
</tbody>
</table>
**extra_args** [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

**metadata** [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

```python
__init__(self, fps=30, codec=None, bitrate=None, extra_args=None, metadata=None, embed_frames=False, default_mode='loop', embed_limit=None)
```

**Parameters**

- **fps** [int, default: 5] Movie frame rate (per second).
- **codec** [str or None, default: `rcParams["animation.codec"]` (default: 'h264')] The codec to use.
- **bitrate** [int, default: `rcParams["animation.bitrate"]` (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.
- **extra_args** [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.
- **metadata** [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

**Methods**

```python
__init__(self, fps, codec, bitrate, ...)
```

**Parameters**

- **bin_path()** Return the binary path to the command-line tool used by a specific subclass.
- **cleanup(self)** Clean-up and collect the process used to write the movie file.
- **finish(self)** Finish any processing for writing the movie.
- **grab_frame(self, \*

*\savefig_kwargs)** Grab the image information from the figure and save as a movie frame.
- **isAvailable()** Return whether a MovieWriter subclass is actually available.
- **saving(self, fig, outfile, dpi, \*args, ...)** Context manager to facilitate writing the movie file.
- **setup(self, fig, outfile, dpi[, frame_dir])** Setup for writing the movie file.

**Attributes**

18.3. matplotlib.animation

</tbody>
</table>

**Function Descriptions**

- **finish**(self)
  - Finish any processing for writing the movie.

- **grab_frame**(self, **savefig_kwargs**)
  - Grab the image information from the figure and save as a movie frame.
  - All keyword arguments in savefig_kwargs are passed on to the savefig call that saves the figure.

- **classmethod isAvailable()**
  - Return whether a MovieWriter subclass is actually available.

- **setup**(self, fig, outfile, dpi, frame_dir=None)
  - Setup for writing the movie file.
  - **Parameters**
    - **fig** [Figure] The figure to grab the rendered frames from.
    - **outfile** [str] The filename of the resulting movie file.
    - **dpi** [float, optional] The dpi of the output file. This, with the figure size, controls the size in pixels of the resulting movie file. Default is fig.dpi.
    - **frame_prefix** [str, optional] The filename prefix to use for temporary files. If None (the default), files are written to a temporary directory which is deleted by cleanup (regardless of the value of clear_temp).
    - **clear_temp** [bool, optional] If the temporary files should be deleted after stitching the final result. Setting this to False can be useful for debugging. Defaults to True.

- **supported_formats** = ['png', 'jpeg', 'tiff', 'svg']
  - The pipe-based writers stream the captured frames over a pipe to an external process. The pipe-based variants tend to be more performant, but may not work on all systems.

- **FFMpegWriter**
  - Pipe-based ffmpeg writer.

- **ImageMagickWriter**
  - Pipe-based animated gif.

- **AVConwWriter**
  - Pipe-based avconv writer.
matplotlib.animation.FFMpegWriter

class matplotlib.animation.FFMpegWriter(fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)

Pipe-based ffmpeg writer.
Frames are streamed directly to ffmpeg via a pipe and written in a single pass.

Parameters

- **fps** [int, default: 5] Movie frame rate (per second).
- **codec** [str or None, default: rcParams["animation.codec"] (default: 'h264')] The codec to use.
- **bitrate** [int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.
- **extra_args** [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the builtin writers.
- **metadata** [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(self, fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)

Parameters

- **fps** [int, default: 5] Movie frame rate (per second).
- **codec** [str or None, default: rcParams["animation.codec"] (default: 'h264')] The codec to use.
- **bitrate** [int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.
- **extra_args** [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the builtin writers.
- **metadata** [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Attributes

- `args_key`
- `exec_key`
- `frame_size` A tuple `(width, height)` in pixels of a movie frame.
- `output_args`

**matplotlib.animation.ImageMagickWriter**

```python
class matplotlib.animation.ImageMagickWriter(fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)
```

Pipe-based animated gif.

Frames are streamed directly to ImageMagick via a pipe and written in a single pass.

**Parameters**

- `fps` [int, default: 5] Movie frame rate (per second).
- `codec` [str or None, default: `rcParams["animation.codec"]` (default: 'h264')] The codec to use.
- `bitrate` [int, default: `rcParams["animation.bitrate"]` (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.
- `extra_args` [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams["animation.[name-of-encoder].args"]` for the builtin writers.
- `metadata` [Dict[str, str], default: `{}`] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

```python
__init__(self, fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)
```

**Parameters**

- `fps` [int, default: 5] Movie frame rate (per second).
codec [str or None, default: \texttt{rcParams["animation.codec"]} (default: \textquoteleft\textquoteleft h264\textquoteright\textquoteright)] The codec to use.

bitrate [int, default: \texttt{rcParams["animation.bitrate"]} (default: -1)] The bitrate of the movie, in kilobits per second. Higher values mean higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use \texttt{rcParams["animation.[name-of-encoder]_args"]} for the built-in writers.

metadata [Dict[str, str], default: \{\}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

\begin{itemize}
  \item \texttt{\_\_init\_\_}(self[, fps, codec, bitrate, ...])
  \item \texttt{bin\_path}()
  \item \texttt{cleanup}(self)
  \item \texttt{finish}(self)
  \item \texttt{grab\_frame}(self, **savefig\_kwargs)
  \item \texttt{isAvailable}()
  \item \texttt{saving}(self, fig, outfile, dpi, \*\*\*args, ...) Context manager to facilitate writing the movie file.
  \item \texttt{setup}(self, fig, outfile[, dpi])
\end{itemize}

Attributes

\begin{itemize}
  \item \texttt{args\_key}
  \item \texttt{delay}
  \item \texttt{exec\_key}
  \item \texttt{frame\_size} A tuple (width, height) in pixels of a movie frame.
  \item \texttt{output\_args}
\end{itemize}

\texttt{matplotlib.animation.AVConvWriter}

class \texttt{matplotlib.animation.AVConvWriter(*args, **kwargs)}

Pipe-based avconv writer.

Frames are streamed directly to avconv via a pipe and written in a single pass.
Methods

___init___(self, /, *args, **kwargs)
Initialize self. See help(type(self)) for accurate signature.

__init__ (self, /, \*\*args, \*\*kwargs)
Initialize self.

bin_path()
Return the binary path to the command-line tool used by a specific subclass.

cleanup(self)
Clean-up and collect the process used to write the movie file.

finish(self)
Finish any processing for writing the movie.

grab_frame(self, \*\*savefig_kwargs)
Grab the image information from the figure and save as a movie frame.

isAvailable()
Return whether a MovieWriter subclass is actually available.

saving(self, fig, outfile, dpi, \*args, ...)
Context manager to facilitate writing the movie file.

setup(self, fig, outfile[, dpi])
Setup for writing the movie file.

Attributes

args_key
exec_key
frame_size
output_args

A tuple (width, height) in pixels of a movie frame.

The file-based writers save temporary files for each frame which are stitched into a single file at the end. Although slower, these writers can be easier to debug.

FFMpegFileWriter
File-based ffmpeg writer.

ImageMagickFileWriter
File-based animated gif writer.

AVConvFileWriter
File-based avconv writer.

matplotlib.animation.FFMpegFileWriter

class matplotlib.animation.FFMpegFileWriter(*args, **kwargs)
File-based ffmpeg writer.

Frames are written to temporary files on disk and then stitched together at the end.

Parameters

defps [int, default: 5] Movie frame rate (per second).

codec [str or None, default: rcParams["animation.codec"] (default: 'h264')]
The codec to use.

bitrate [int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher
quality movies, but increase the file size. A value of -1 lets the underlying
movie encoder select the bitrate.

**extra_args** [list of str or None, optional] Extra command-line arguments
passed to the underlying movie encoder. The default, None, means to
use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writers.

**metadata** [Dict[str, str], default: {}] A dictionary of keys and values for
metadata to include in the output file. Some keys that may be of use
include: title, artist, genre, subject, copyright, srcform, comment.

```
__init__(self, *args, **kwargs)
```

**Parameters**

**fps** [int, default: 5] Movie frame rate (per second).

**codec** [str or None, default: `rcParams["animation.codec"]` (default: 'h264')] The codec to use.

**bitrate** [int, default: `rcParams["animation.bitrate"]` (default: -1)] The bi-
trate of the movie, in kilobits per second. Higher values means higher
quality movies, but increase the file size. A value of -1 lets the underly-
ing movie encoder select the bitrate.

**extra_args** [list of str or None, optional] Extra command-line arguments
passed to the underlying movie encoder. The default, None, means to
use `rcParams["animation.[name-of-encoder]_args"]` for the builtin writ-
ers.

**metadata** [Dict[str, str], default: {}] A dictionary of keys and values for
metadata to include in the output file. Some keys that may be of use
include: title, artist, genre, subject, copyright, srcform, comment.

**Methods**

```
__init__(self, *args, **kwargs)
```

**Parameters**

- **bin_path()** Return the binary path to the command-
  line tool used by a specific subclass.

- **cleanup(self)** Clean-up and collect the process used to
  write the movie file.

- **finish(self)** Finish any processing for writing the
  movie.

- **grab_frame(self, **savefig_kwargs)** Grab the image information from the fig-
  ure and save as a movie frame.

- **isAvailable()** Return whether a MovieWriter subclass is
  actually available.

- **saving(self, fig, outfile, dpi, **args, ...)** Context manager to facilitate writing the
  movie file.

- **setup(self, fig, outfile[, dpi, ...])** Setup for writing the movie file.

**Attributes**
### Supported Formats

### Matplotlib.animation.ImageMagickFileWriter

#### Class Matplotlib.animation.ImageMagickFileWriter(*args, **kwargs)

File-based animated gif writer.

Frames are written to temporary files on disk and then stitched together at the end.

**Parameters**

- **fps** [int, default: 5] Movie frame rate (per second).
- **codec** [str or None, default: `rcParams['animation.codec']` (default: `'h264'`)]
  The codec to use.
- **bitrate** [int, default: `rcParams['animation.bitrate']` (default: -1)] The bitrate of the movie, in kilobits per second. Higher values mean higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.
- **extra_args** [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams['animation.[name-of-encoder]_args']` for the builtin writers.
- **metadata** [Dict[str, str], default: `{}`] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

#### __init__(self, *args, **kwargs)

**Parameters**

- **fps** [int, default: 5] Movie frame rate (per second).
- **codec** [str or None, default: `rcParams['animation.codec']` (default: `'h264'`)]
  The codec to use.
- **bitrate** [int, default: `rcParams['animation.bitrate']` (default: -1)] The bitrate of the movie, in kilobits per second. Higher values mean higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.
- **extra_args** [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use `rcParams['animation.[name-of-encoder]_args']` for the builtin writers.
metadata [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, \*args, \**kwargs)

Parameters

bin_path()
Return the binary path to the command-line tool used by a specific subclass.

cleanup(self)
Clean-up and collect the process used to write the movie file.

finish(self)
Finish any processing for writing the movie.

grab_frame(self, \*\*savefig_kwargs)
Grab the image information from the figure and save as a movie frame.

isAvailable()
Return whether a MovieWriter subclass is actually available.

saving(self, fig, outfile, dpi, \*args, ...)
Context manager to facilitate writing the movie file.

setup(self, fig, outfile[, dpi, ...])
Setup for writing the movie file.

Attributes

args_key

clear_temp

delay

ext_key

frame_format
Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.

frame_size
A tuple (width, height) in pixels of a movie frame.

output_args

supported_formats

supported_formats = ['png', 'jpeg', 'ppm', 'tiff', 'sgi', 'bmp', 'pnm', 'raw', 'rgba']

matplotlib.animation.AVConvFileWriter

class matplotlib.animation.AVConvFileWriter(*args, **kwargs)
File-based avconv writer.

Frames are written to temporary files on disk and then stitched together at the end.

__init__(self, /, *args, **kwargs)
Initialize self. See help(type(self)) for accurate signature.
Methods

```python
Methods

__init__(self, /, *args, **kwargs) Initialize self.

bin_path() Return the binary path to the command-line tool used by a specific subclass.

cleanup(self) Clean-up and collect the process used to write the movie file.

finish(self) Finish any processing for writing the movie.

grab_frame(self, **savefig_kwargs) Grab the image information from the figure and save as a movie frame.

isAvailable() Return whether a MovieWriter subclass is actually available.

saving(self, fig, outfile, dpi, *args, ...) Context manager to facilitate writing the movie file.

setup(self, fig, outfile[, dpi, ...]) Setup for writing the movie file.
```

Attributes

```python
Attributes

args_key

clear_temp

exec_key

frame_format Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.

frame_size A tuple (width, height) in pixels of a movie frame.

output_args

supported_formats
```

Fundamentally, a `MovieWriter` provides a way to grab sequential frames from the same underlying `Figure` object. The base class `MovieWriter` implements 3 methods and a context manager. The only difference between the pipe-based and file-based writers is in the arguments to their respective `setup` methods.

The `setup()` method is used to prepare the writer (possibly opening a pipe), successive calls to `grab_frame()` capture a single frame at a time and `finish()` finalizes the movie and writes the output file to disk. For example

```python
moviewriter = MovieWriter(...)
moviewriter.setup(fig, 'my_movie_ext', dpi=100)
for j in range(n):
    update_figure(j)
    moviewriter.grab_frame()
moviewriter.finish()
```

If using the writer classes directly (not through `Animation.save`), it is strongly encouraged to use the saving context manager

```python
with moviewriter.saving(fig, 'myfile.mp4', dpi=100):
    for j in range(n):
        update_figure(j)
```

(continues on next page)
to ensure that setup and cleanup are performed as necessary.

**Examples**

**Frame grabbing**

Use a MovieWriter directly to grab individual frames and write them to a file. This avoids any event loop integration, and thus works even with the Agg backend. This is not recommended for use in an interactive setting.

```python
import numpy as np
import matplotlib
matplotlib.use("Agg")
import matplotlib.pyplot as plt
from matplotlib.animation import FFMpegWriter

# Fixing random state for reproducibility
np.random.seed(19680801)

metadata = dict(title='Movie Test', artist='Matplotlib',
                comment='Movie support!')
writer = FFMpegWriter(fps=15, metadata=metadata)

fig = plt.figure()
l, = plt.plot([], [], 'k-o')
plt.xlim(-5, 5)
plt.ylim(-5, 5)

x0, y0 = 0, 0

with writer.saving(fig, "writer_test.mp4", 100):
    for i in range(100):
        x0 += 0.1 * np.random.randn()
        y0 += 0.1 * np.random.randn()
        l.set_data(x0, y0)
        writer.grab_frame()
```

### 18.3.3 Helper Classes

**Animation Base Classes**

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Animation</code></td>
<td>A base class for Animations.</td>
</tr>
<tr>
<td><code>TimedAnimation</code></td>
<td><code>Animation</code> subclass for time-based animation.</td>
</tr>
</tbody>
</table>
Animation subclass for time-based animation.

A new frame is drawn every interval milliseconds.

Parameters

fig [Figure] The figure object used to get needed events, such as draw or resize.

interval [int, default: 200] Delay between frames in milliseconds.

repeat_delay [int, default: 0] The delay in milliseconds between consecutive animation runs, if repeat is True.

repeat [bool, default: True] Whether the animation repeats when the sequence of frames is completed.

blit [bool, default: False] Whether blitting is used to optimize drawing.

__init__(self, fig[, interval, ...]) Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, fig[, interval, ...]) Initialize self.
new_frame_seq(self) Return a new sequence of frame information.
new_saved_frame_seq(self) Return a new sequence of saved/cached frame information.
save(self, filename[, writer, fps, dpi, ...]) Save the animation as a movie file by drawing every frame.
to_html5_video(self[, embed_limit]) Convert the animation to an HTML5 <video> tag.
to_jshtml(self[, fps, embed_frames, ...]) Generate HTML representation of the animation

Writer Registry

A module-level registry is provided to map between the name of the writer and the class to allow a string to be passed to Animation.save instead of a writer instance.

MovieWriterRegistry Registry of available writer classes by human readable name.
matplotlib.animation.MovieWriterRegistry

class matplotlib.animation.MovieWriterRegistry
    Registry of available writer classes by human readable name.
    
    __init__(self)
        Initialize self. See help(type(self)) for accurate signature.

    Methods

    __init__(self) Initialize self.
    ensure_not_dirty(self) [Deprecated] If dirty, reasks the writers if they are available
    is_available(self, name) Check if given writer is available by name.
    list(self) Get a list of available MovieWriters.
    register(self, name) Decorator for registering a class under a name.
    reset_available_writers(self) [Deprecated] Reset the available state of all registered writers
    set_dirty(self) [Deprecated] Sets a flag to re-setup the writers.

    Attributes

    avail

    property avail
    ensure_not_dirty(self) [Deprecated] If dirty, reasks the writers if they are available

    Notes

    Deprecated since version 3.2.

    is_available(self, name)
        Check if given writer is available by name.

        Parameters
        name [str]

        Returns
        bool
    list(self)
        Get a list of available MovieWriters.

    register(self, name)
        Decorator for registering a class under a name.

        Example use:
reset_available_writers(self)  
[Deprecated] Reset the available state of all registered writers

Notes

Deprecated since version 3.2.

set_dirty(self)  
[Deprecated] Sets a flag to re-setup the writers.

Notes

Deprecated since version 3.2.

**Writer Base Classes**

To reduce code duplication base classes

---

<table>
<thead>
<tr>
<th>AbstractMovieWriter</th>
<th>Abstract base class for writing movies.</th>
</tr>
</thead>
<tbody>
<tr>
<td>MovieWriter</td>
<td>Base class for writing movies.</td>
</tr>
<tr>
<td>FileMovieWriter</td>
<td>MovieWriter for writing to individual files and stitching at the end.</td>
</tr>
</tbody>
</table>

---

```
import matplotlib.animation as animation

class AbstractMovieWriter:
    pass

class MovieWriter:
    pass

class FileMovieWriter:
    pass
```

**matplotlib.animation.AbstractMovieWriter**

```
class matplotlib.animation.AbstractMovieWriter(fps=5, metadata=None, codec=None, bitrate=None):
    pass
```

Abstract base class for writing movies. Fundamentally, what a MovieWriter does is provide is a way to grab frames by calling grab_frame().

setup() is called to start the process and finish() is called afterwards.

This class is set up to provide for writing movie frame data to a pipe. saving() is provided as a context manager to facilitate this process as:

```
with moviewriter.saving(fig, outfile='myfile.mp4', dpi=100):
    # Iterate over frames
    moviewriter.grab_frame(**savefig_kwargs)
```

The use of the context manager ensures that setup() and finish() are performed as necessary.

An instance of a concrete subclass of this class can be given as the writer argument of Animation.save().

```
__init__(self, fps=5, metadata=None, codec=None, bitrate=None)
    Initialize self. See help(type(self)) for accurate signature.
```
Methods

__init__(self[, fps, metadata, codec, bitrate])
Initialize self.

finish(self)
Finish any processing for writing the movie.

grab_frame(self, \*\*savefig_kwargs)
Grab the image information from the figure and save as a movie frame.

saving(self, fig, outfile, dpi, \*args, ...)
Context manager to facilitate writing the movie file.

setup(self, fig, outfile[, dpi])
Setup for writing the movie file.

Attributes

frame_size
A tuple (width, height) in pixels of a movie frame.

abstract finish(self)
Finish any processing for writing the movie.

property frame_size
A tuple (width, height) in pixels of a movie frame.

abstract grab_frame(self, \*\*savefig_kwags)
Grab the image information from the figure and save as a movie frame.

All keyword arguments in savefig KWargs are passed on to the savefig call that saves the figure.

saving(self, fig, outfile, dpi, \*args, **kwargs)
Context manager to facilitate writing the movie file.

*args, **kw are any parameters that should be passed to setup.

abstract setup(self, fig, outfile, dpi=None)
Setup for writing the movie file.

Parameters

fig [Figure] The figure object that contains the information for frames.

outfile [str] The filename of the resulting movie file.

dpi [float, default: fig.dpi] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.

matplotlib.animation.MovieWriter

class matplotlib.animation.MovieWriter(fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)
Base class for writing movies.

This is a base class for MovieWriter subclasses that write a movie frame data to a pipe. You cannot instantiate this class directly. See examples for how to use its subclasses.

Attributes
frame_format [str] The format used in writing frame data, defaults to 'rgba'.

fig [Figure] The figure to capture data from. This must be provided by the sub-classes.

Parameters

fps [int, default: 5] Movie frame rate (per second).

codec [str or None, default: rcParams["animation.codec"] (default: 'h264')] The codec to use.

bitrate [int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the built-in writers.

metadata [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(self, fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)

Parameters

fps [int, default: 5] Movie frame rate (per second).

codec [str or None, default: rcParams["animation.codec"] (default: 'h264')] The codec to use.

bitrate [int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.

extra_args [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the built-in writers.

metadata [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, fps, codec, bitrate, ...)

Parameters

bin_path() Return the binary path to the command-line tool used by a specific subclass.

Continued on next page
Table 33 - continued from previous page

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>cleanup(self)</td>
<td>Clean-up and collect the process used to write the movie file.</td>

<tr>
<td>grab_frame(self, **savefig_kwargs)</td>
<td>Grab the image information from the figure and save as a movie frame.</td>
</tr>
<tr>
<td>isAvailable()</td>
<td>Return whether a MovieWriter subclass is actually available.</td>
</tr>
<tr>
<td>saving(self, fig, outfile, dpi, **args, ...)</td>
<td>Context manager to facilitate writing the movie file.</td>
</tr>
<tr>
<td>setup(self, fig, outfile[, dpi])</td>
<td>Setup for writing the movie file.</td>
</tr>
</tbody>
</table>

Attributes

- args_key
- exec_key
- frame_size A tuple (width, height) in pixels of a movie frame.

property args_key

classmethod bin_path()  
Return the binary path to the commandline tool used by a specific subclass. This is a class method so that the tool can be looked for before making a particular MovieWriter subclass available.

cleanup(self)  
Clean-up and collect the process used to write the movie file.

property exec_key

finish(self)  
Finish any processing for writing the movie.

grab_frame(self, **savefig_kwargs)  
Grab the image information from the figure and save as a movie frame.
  
All keyword arguments in savefig_kwargs are passed on to the savefig call that saves the figure.

classmethod isAvailable()  
Return whether a MovieWriter subclass is actually available.

setup(self, fig, outfile, dpi=None)  
Setup for writing the movie file.

Parameters

- **fig** [Figure] The figure object that contains the information for frames.
- **outfile** [str] The filename of the resulting movie file.
- **dpi** [float, default: fig.dpi] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file.
class matplotlib.animation.FileMovieWriter(*args, **kwargs)

MovieWriter for writing to individual files and stitching at the end.

This must be sub-classed to be useful.

Parameters

- **fps** [int, default: 5] Movie frame rate (per second).
- **codec** [str or None, default: rcParams["animation.codec"] (default: 'h264')] The codec to use.
- **bitrate** [int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.
- **extra_args** [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the builtin writers.
- **metadata** [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

__init__(self, *args, **kwargs)

Parameters

- **fps** [int, default: 5] Movie frame rate (per second).
- **codec** [str or None, default: rcParams["animation.codec"] (default: 'h264')] The codec to use.
- **bitrate** [int, default: rcParams["animation.bitrate"] (default: -1)] The bitrate of the movie, in kilobits per second. Higher values means higher quality movies, but increase the file size. A value of -1 lets the underlying movie encoder select the bitrate.
- **extra_args** [list of str or None, optional] Extra command-line arguments passed to the underlying movie encoder. The default, None, means to use rcParams["animation.[name-of-encoder]_args"] for the builtin writers.
- **metadata** [Dict[str, str], default: {}] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, *args, **kwargs)

Parameters

- **bin_path**() Return the binary path to the command-line tool used by a specific subclass.

<td>Return whether a MovieWriter subclass is actually available.</td>
</tr>
<tr>
<td><code>saving(self, fig, outfile, dpi, **args, ...)</code></td>
<td>Context manager to facilitate writing the movie file.</td>
</tr>
<tr>
<td><code>setup(self, fig, outfile[, dpi, ...])</code></td>
<td>Setup for writing the movie file.</td>
</tr>
</tbody>
</table>

#### Attributes

- `args_key`
- `clear_temp`
- `exec_key`
- `frame_format` Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.
- `frame_size` A tuple `(width, height)` in pixels of a movie frame.

```python
cleanup(self)
    Clean-up and collect the process used to write the movie file.

property clear_temp
finish(self)
    Finish any processing for writing the movie.

property frame_format
    Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.

grab_frame(self, **savefig_kwargs)
    Grab the image information from the figure and save as a movie frame.
    All keyword arguments in `savefig_kwargs` are passed on to the `savefig` call that saves the figure.

setup(self, fig, outfile[, dpi, ...])
    Setup for writing the movie file.
```

#### Parameters

- **fig** [Figure] The figure to grab the rendered frames from.
- **outfile** [str] The filename of the resulting movie file.
- **dpi** [float, optional] The dpi of the output file. This, with the figure size, controls the size in pixels of the resulting movie file. Default is `fig.dpi`.
- **frame_prefix** [str, optional] The filename prefix to use for temporary files. If None (the default), files are written to a temporary directory which is deleted by `cleanup` (regardless of the value of `clear_temp`).
**clear_temp** [bool, optional] If the temporary files should be deleted after stitching the final result. Setting this to False can be useful for debugging. Defaults to True.

and mixins

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AVConvBase</td>
<td>[Deprecated] Mixin class for avconv output.</td>
</tr>
<tr>
<td>FFMpegBase</td>
<td>Mixin class for FFMpeg output.</td>
</tr>
<tr>
<td>ImageMagickBase</td>
<td>Mixin class for ImageMagick output.</td>
</tr>
</tbody>
</table>

**matplotlib.animation.AVConvBase**

class matplotlib.animation.AVConvBase(*args, **kwargs)

[Deprecated] Mixin class for avconv output.

To be useful this must be multiply-inherited from a MovieWriterBase sub-class.

**Notes**

Deprecated since version 3.3.

__init__(self, /, *args, **kwargs)

Initialize self. See help(type(self)) for accurate signature.

**Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>init</strong>(self, /, *args, **kwargs)</td>
<td>Initialize self.</td>
</tr>
<tr>
<td>isAvailable()</td>
<td>Return whether a MovieWriter subclass is actually available.</td>
</tr>
</tbody>
</table>

**Attributes**

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Method</th>
</tr>
</thead>
<tbody>
<tr>
<td>output_args</td>
<td>isAvailable()</td>
</tr>
</tbody>
</table>

Return whether a MovieWriter subclass is actually available.

**matplotlib.animation.FFMpegBase**

class matplotlib.animation.FFMpegBase

Mixin class for FFMpeg output.

To be useful this must be multiply-inherited from a MovieWriterBase sub-class.

__init__(self, /, *args, **kwargs)

Initialize self. See help(type(self)) for accurate signature.
Methods

```python
__init__(self, /, *args, **kwargs) Initialize self.
isAvailable()
```

Attributes

```python
output_args

classmethod isAvailable()
property output_args
```

`matplotlib.animation.ImageMagickBase`

class matplotlib.animation.ImageMagickBase
    Mixin class for ImageMagick output.
    To be useful this must be multiply-inherited from with a `MovieWriterBase` sub-class.
```python
__init__(self, /, *args, **kwargs)
    Initialize self. See help(type(self)) for accurate signature.
```

Methods

```python
__init__(self, /, *args, **kwargs) Initialize self.
bin_path()
isAvailable()
```

Attributes

```python
delay
output_args

classmethod bin_path()
property delay
classmethod isAvailable()
property output_args
```

See the source code for how to easily implement new `MovieWriter` classes.
18.3.4 Inheritance Diagrams
18.4 matplotlib.artist

18.4.1 Artist class

class matplotlib.artist.Artist
  Abstract base class for objects that render into a FigureCanvas.

  Typically, all visible elements in a figure are subclasses of Artist.
Interactive

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Define the picking behavior of the artist.</td>
</tr>
<tr>
<td><code>artist.get_picker</code></td>
<td>Return the picking behavior of the artist.</td>
</tr>
</tbody>
</table>

`matplotlib.artist.Artist.add_callback`

Add a callback function that will be called whenever one of the artist's properties changes.

**Parameters**

- `func` [callable] The callback function. It must have the signature:

  ```python
def func(artist: Artist) -> Any
  ```

  where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

- `int` The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

- `remove_callback`

`matplotlib.artist.Artist.remove_callback`

Remove a callback based on its observer id.

**See also:**
Matplotlib, Release 3.3.0

```
add_callback

matplotlib.artist.Artist.pchanged

Artist.pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:
        add_callback
        remove_callback

matplotlib.artist.Artist.get_cursor_data

Artist.get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.
    Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.
    The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

    Parameters
        event [matplotlib.backend_bases.MouseEvent]
    See also:

    format_cursor_data

matplotlib.artist.Artist.format_cursor_data

Artist.format_cursor_data(self, data)
    Return a string representation of data.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.
    See also:
```
get_cursor_data

matplotlib.artist.Artist.mouseover

property Artist.mouseover
    If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.

See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

matplotlib.artist.Artist.contains

Artist.contains(self, mouseevent)
    Test whether the artist contains the mouse event.

Parameters
    mouseevent [matplotlib.backend_bases.MouseEvent]

Returns
    contains [bool] Whether any values are within the radius.
    details [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

matplotlib.artist.Artist.set_contains

Artist.set_contains(self, picker)
    [Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters
    picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

    def contains(artist: Artist, event: MouseEvent) -> bool, dict

    that returns:
    • a bool indicating if the event is within the artist
    • a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.
matplotlib.artist.Artist.get_contains

Artist.get_contains(self)

[Deprecated] Return the custom contains function of the artist if set, or None.

See also:

set_contains

Notes

Deprecated since version 3.3.

matplotlib.artist.Artist.pick

Artist.pick(self, mouseevent)

Process a pick event.

Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

See also:

set_picker, get_picker, pickable

matplotlib.artist.Artist.pickable

Artist.pickable(self)

Return whether the artist is pickable.

See also:

set_picker, get_picker, pick

matplotlib.artist.Artist.set_picker

Artist.set_picker(self, picker)

Define the picking behavior of the artist.

Parameters

picker [None or bool or callable] This can be one of the following:

- None: Picking is disabled for this artist (default).
- A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  hit, props = picker(artist, mouseevent)
to determine the hit test. If the mouse event is over the artist, return
hit=True and props is a dictionary of properties you want added to the
PickEvent attributes.

- **deprecated**: For *Line2D* only, *picker* can also be a float that sets the
tolerance for checking whether an event occurred “on” the line; this is
deprecated. Use *Line2D.set_pickradius* instead.

```python
matplotlib.artist.Artist.get_picker

Artist.get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in *set_picker*.

See also:
    *set_picker*, *pickable*, *pick*
```

**Clipping**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Artist.set_clip_on</code></td>
<td>Set whether the artist uses clipping.</td>
</tr>
<tr>
<td><code>Artist.get_clip_on</code></td>
<td>Return whether the artist uses clipping.</td>
</tr>
<tr>
<td><code>Artist.set_clip_box</code></td>
<td>Set the artist’s clip Bbox.</td>
</tr>
<tr>
<td><code>Artist.get_clip_box</code></td>
<td>Return the clipbox.</td>
</tr>
<tr>
<td><code>Artist.set_clip_path</code></td>
<td>Set the artist’s clip path.</td>
</tr>
<tr>
<td><code>Artist.get_clip_path</code></td>
<td>Return the clip path.</td>
</tr>
</tbody>
</table>

```python
matplotlib.artist.Artist.set_clip_on

Artist.set_clip_on(self, b)
    Set whether the artist uses clipping.
    When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters
    b [bool]
```

```python
matplotlib.artist.Artist.get_clip_on

Artist.get_clip_on(self)
    Return whether the artist uses clipping.
```

```python
matplotlib.artist.Artist.set_clip_box

Artist.set_clip_box(self, clipbox)
    Set the artist’s clip Bbox.

Parameters
```
clipbox \[Bbox\]

matplotlib.artist.Artist.get_clip_box

Artist.get_clip_box(self)
Return the clipbox.

matplotlib.artist.Artist.set_clip_path

Artist.set_clip_path(self, path, transform=None)
Set the artist’s clip path.

Parameters

- **path** [Patch or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.
- **transform** [Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

Notes

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

matplotlib.artist.Artist.get_clip_path

Artist.get_clip_path(self)
Return the clip path.

Bulk Properties

<table>

matplotlib.artist.Artist.update

Artist.update(self, props)
Update this artist’s properties from the dict props.

Parameters
**props** [dict]

matplotlib.artist.Artist.update_from

`Artist.update_from(self, other)`

Copy properties from `other` to `self`.

matplotlib.artist.Artist.properties

`Artist.properties(self)`

Return a dictionary of all the properties of the artist.

matplotlib.artist.Artist.set

`Artist.set(self, **kwargs)`

A property batch setter. Pass `kwargs` to set properties.

Table 47 – continued from previous page

| **Artist.get_transformed_clip_path_and_affine** | Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation. |

```python
matplotlib.artist.Artist.draw
```

**Artist.draw(self, renderer, *args, **kwargs)**

Draw the Artist (and its children) using the given renderer.

- This has no effect if the artist is not visible (`Artist.get_visible` returns False).

  **Parameters**

  - `renderer` [RendererBase subclass.]

  **Notes**

  This method is overridden in the Artist subclasses.

```python
matplotlib.artist.Artist.set_animated
```

**Artist.set_animated(self, b)**

Set the artist’s animation state.

  **Parameters**

  - `b` [bool]

```python
matplotlib.artist.Artist.get_animated
```

**Artist.get_animated(self)**

Return whether the artist is animated.

```python
matplotlib.artist.Artist.set_alpha
```

**Artist.set_alpha(self, alpha)**

Set the alpha value used for blending - not supported on all backends.

  **Parameters**

  - `alpha` [float or None]

```python
matplotlib.artist.Artist.get_alpha
```

**Artist.get_alpha(self)**

Return the alpha value used for blending - not supported on all backends.
matplotlib.artist.Artist.set_snap

Artist.set_snap(self, snap)
   
   Set the snapping behavior.

   Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

   Snapping is currently only supported by the Agg and MacOSX backends.

   Parameters

   snap [bool or None] Possible values:
   • True: Snap vertices to the nearest pixel center.
   • False: Do not modify vertex positions.
   • None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

matplotlib.artist.Artist.get_snap

Artist.get_snap(self)
   
   Return the snap setting.

   See set_snap for details.

matplotlib.artist.Artist.set_visible

Artist.set_visible(self, b)
   
   Set the artist’s visibility.

   Parameters

   b [bool]

matplotlib.artist.Artist.get_visible

Artist.get_visible(self)
   
   Return the visibility.

matplotlib.artist.Artist.zorder

Artist.zorder = 0
**matplotlib.artist.Artist.set_zorder**

*Artist.set_zorder(self, level)*

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

- **level** [float]

**matplotlib.artist.Artist.get_zorder**

*Artist.get_zorder(self)*

Return the artist’s zorder.

**matplotlib.artist.Artist.set_agg_filter**

*Artist.set_agg_filter(self, filter_func)*

Set the agg filter.

**Parameters**

- **filter_func** [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**matplotlib.artist.Artist.set_sketch_params**

*Artist.set_sketch_params(self, scale=None, length=None, randomness=None)*

Sets the sketch parameters.

**Parameters**

- **scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None or not provided, no sketch filter will be provided.
- **length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
- **randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**matplotlib.artist.Artist.get_sketch_params**

*Artist.get_sketch_params(self)*

Return the sketch parameters for the artist.

**Returns**

- **tuple or None** A 3-tuple with the following elements:
  - **scale**: The amplitude of the wiggle perpendicular to the source line.
  - **length**: The length of the wiggle along the line.
• **randomness**: The scale factor by which the length is shrunken or expanded.
  Returns *None* if no sketch parameters were set.

**matplotlib.artist.Artist.set_rasterized**

`Artist.set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.
Defaults to None, which implies the backend’s default behavior.

**Parameters**

  **rasterized** [bool or None]

**matplotlib.artist.Artist.get_rasterized**

`Artist.get_rasterized(self)`

Return whether the artist is to be rasterized.

**matplotlib.artist.Artist.set_path_effects**

`Artist.set_path_effects(self, path_effects)`

Set the path effects.

**Parameters**

  **path_effects** [AbstractPathEffect]

**matplotlib.artist.Artist.get_path_effects**

`Artist.get_path_effects(self)`

**matplotlib.artist.Artist.get_agg_filter**

`Artist.get_agg_filter(self)`

Return filter function to be used for agg filter.

**matplotlib.artist.Artist.get_window_extent**

`Artist.get_window_extent(self, renderer)`

Get the axes bounding box in display space.

  The bounding box’ width and height are nonnegative.

  Subclasses should override for inclusion in the bounding box “tight” calculation. Default
  is to return an empty bounding box at 0, 0.

  Be careful when using this function, the results will not update if the artist window extent
  of the artist changes. The extent can change due to any changes in the transform stack,
such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.artist.Artist.get_transformed_clip_path_and_affine

Artist.get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

Figure and Axes

<table>
<thead>
<tr>
<th>Artist.remove</th>
<th>Remove the artist from the figure if possible.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Artist.axes</td>
<td>The Axes instance the artist resides in, or None.</td>
</tr>
<tr>
<td>Artist.set_figure</td>
<td>Set the Figure instance the artist belongs to.</td>
</tr>
<tr>
<td>Artist.get_figure</td>
<td>Return the Figure instance the artist belongs to.</td>
</tr>
</tbody>
</table>

matplotlib.artist.Artist.remove

Artist.remove(self)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the axes with autolim = True.

Note: there is no support for removing the artist's legend entry.

matplotlib.artist.Artist.axes

property Artist.axes
The Axes instance the artist resides in, or None.

matplotlib.artist.Artist.set_figure

Artist.set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig [Figure]
**matplotlib.artist.Artist.get_figure**

`Artist.get_figure(self)`

Return the *Figure* instance the artist belongs to.

**Children**

<table>
<thead>
<tr>
<th><code>Artist.get_children</code></th>
<th>Return a list of the child <em>Artists</em> of this <em>Artist</em>.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Artist.findobj</code></td>
<td>Find artist objects.</td>
</tr>
</tbody>
</table>

**matplotlib.artist.Artist.get_children**

`Artist.get_children(self)`

Return a list of the child *Artists* of this *Artist*.

**matplotlib.artist.Artist.findobj**

`Artist.findobj(self, match=None, include_self=True)`

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

**Parameters**

- **match** A filter criterion for the matches. This can be
  - *None*: Return all objects contained in artist.
  - A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
  - A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (*isinstance* check).

- **include_self** [bool] Include `self` in the list to be checked for a match.

**Returns**

- list of *Artist*

**Transform**

<table>
<thead>
<tr>
<th><code>Artist.set_transform</code></th>
<th>Set the artist transform.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Artist.get_transform</code></td>
<td>Return the <em>Transform</em> instance used by this artist.</td>
</tr>
<tr>
<td><code>Artist.is_transform_set</code></td>
<td>Return whether the Artist has an explicitly set transform.</td>
</tr>
</tbody>
</table>
**matplotlib.artist.Artist.set_transform**

*Artist.set_transform*(self, t)*

Set the artist transform.

**Parameters**

- t [Transform]

**matplotlib.artist.Artist.get_transform**

*Artist.get_transform*(self)*

Return the *Transform* instance used by this artist.

**matplotlib.artist.Artist.is_transform_set**

*Artist.is_transform_set*(self)*

Return whether the Artist has an explicitly set transform.

This is True after *set_transform* has been called.

**Units**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Artist.convert_xunits</em></td>
<td>Convert x using the unit type of the xaxis.</td>
</tr>
<tr>
<td><em>Artist.convert_yunits</em></td>
<td>Convert y using the unit type of the yaxis.</td>
</tr>
<tr>
<td><em>Artist.have_units</em></td>
<td>Return True if units are set on any axis.</td>
</tr>
</tbody>
</table>

**matplotlib.artist.Artist.convert_xunits**

*Artist.convert_xunits*(self, x)*

Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

**matplotlib.artist.Artist.convert_yunits**

*Artist.convert_yunits*(self, y)*

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

**matplotlib.artist.Artist.have_units**

*Artist.have_units*(self)*

Return True if units are set on any axis.
### Metadata

<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Artist.set_gid</code></td>
<td>Set the (group) id for the artist.</td>
</tr>
<tr>
<td><code>Artist.get_gid</code></td>
<td>Return the group id.</td>
</tr>
<tr>
<td><code>Artist.set_label</code></td>
<td>Set a label that will be displayed in the legend.</td>
</tr>
<tr>
<td><code>Artist.get_label</code></td>
<td>Return the label used for this artist in the legend.</td>
</tr>
<tr>
<td><code>Artist.set_url</code></td>
<td>Set the url for the artist.</td>
</tr>
<tr>
<td><code>Artist.get_url</code></td>
<td>Return the url.</td>
</tr>
</tbody>
</table>

#### matplotlib.artist.Artist.set_gid

```python
def set_gid(self, gid)
    # Set the (group) id for the artist.
```

**Parameters**

- `gid` [str]

#### matplotlib.artist.Artist.get_gid

```python
def get_gid(self)
    # Return the group id.
```

#### matplotlib.artist.Artist.set_label

```python
def set_label(self, s)
    # Set a label that will be displayed in the legend.
```

**Parameters**

- `s` [object] `s` will be converted to a string by calling `str`.

#### matplotlib.artist.Artist.get_label

```python
def get_label(self)
    # Return the label used for this artist in the legend.
```

#### matplotlib.artist.Artist.set_url

```python
def set_url(self, url)
    # Set the url for the artist.
```

**Parameters**

- `url` [str]
**matplotlib.artist.Artist.get_url**

```
Artist.get_url(self)
    Return the url.
```

**Miscellaneous**

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Artist.sticky_edges</code></td>
<td>x and y sticky edge lists for autoscaling.</td>
</tr>
<tr>
<td><code>Artist.set_in_layout</code></td>
<td>Set if artist is to be included in layout calculations, E.g.</td>
</tr>
<tr>
<td><code>Artist.get_in_layout</code></td>
<td>Return boolean flag, True if artist is included in layout calculations.</td>
</tr>
<tr>
<td><code>Artist.stale</code></td>
<td>Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.</td>
</tr>
</tbody>
</table>

**matplotlib.artist.Artist.sticky_edges**

```
property Artist.sticky_edges
    x and y sticky edge lists for autoscaling.
```

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**matplotlib.artist.Artist.set_in_layout**

```
Artist.set_in_layout(self, in_layout)
    Set if artist is to be included in layout calculations, E.g.  
    Constrained Layout Guide, 
    Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').
```

**Parameters**

- `in_layout` [bool]

**matplotlib.artist.Artist.get_in_layout**

```
Artist.get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
```
**Matplotlib, Release 3.3.0**

E.g. *Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').*

matplotlib.artist.Artist.stale

**property Artist.stale**

Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

### 18.4.2 Functions

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>allow_rasterization</code></td>
<td>Decorator for Artist.draw method.</td>
</tr>
<tr>
<td><code>get</code></td>
<td>Return the value of an object’s <code>property</code>, or print all of them.</td>
</tr>
<tr>
<td><code>getp</code></td>
<td>Return the value of an object’s <code>property</code>, or print all of them.</td>
</tr>
<tr>
<td><code>setp</code></td>
<td>Set a property on an artist object.</td>
</tr>
<tr>
<td><code>kwdoc</code></td>
<td>Inspect an <code>Artist</code> class (using <code>ArtistInspector</code>) and return information about its settable properties and their current values.</td>
</tr>
<tr>
<td><code>ArtistInspector</code></td>
<td>A helper class to inspect an <code>Artist</code> and return information about its settable properties and their current values.</td>
</tr>
</tbody>
</table>

**matplotlib.artist.allow_rasterization**

**matplotlib.artist.allow_rasterization(draw)**

Decorator for Artist.draw method. Provides routines that run before and after the draw call. The before and after functions are useful for changing artist-dependent renderer attributes or making other setup function calls, such as starting and flushing a mixed-mode renderer.

**matplotlib.artist.get**

**matplotlib.artist.get(obj, property=None)**

Return the value of an object’s `property`, or print all of them.

**Parameters**

**obj** [Artist] The queried artist; e.g., a `Line2D`, a `Text`, or an `Axes`.

**property** [str or None, default: None] If `property` is ‘somename’, this function returns `obj.get_somename()`.

If is is None (or unset), it prints all gettable properties from `obj`. Many properties have aliases for shorter typing, e.g. ‘lw’ is an alias for ‘linewidth’. In the output, aliases and full property names will be listed as:

property or alias = value
e.g.:
linewdth or lw = 2

matplotlib.artist.getp

matplotlib.artist.getp(obj, property=None)
Return the value of an object’s property, or print all of them.

Parameters

obj [Artist] The queried artist; e.g., a Line2D, a Text, or an Axes.

property [str or None, default: None] If property is ‘somename’, this function
returns obj.get_somename().
If is is None (or unset), it prints all gettable properties from obj. Many
properties have aliases for shorter typing, e.g. ‘lw’ is an alias for
‘linewdth’. In the output, aliases and full property names will be listed
as:
property or alias = value
e.g.:
linewdth or lw = 2

matplotlib.artist.setp

matplotlib.artist.setp(obj, *args, file=None, **kwargs)
Set a property on an artist object.

matplotlib supports the use of setp() (“set property”) and getp() to set and get object
properties, as well as to do introspection on the object. For example, to set the linestyle
of a line to be dashed, you can do:

```python
>>> line, = plot([1, 2, 3])
>>> setp(line, linestyle='--')
```

If you want to know the valid types of arguments, you can provide the name of the
property you want to set without a value:

```python
>>> setp(line, 'linestyle')
linestyle: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

If you want to see all the properties that can be set, and their possible values, you can do:

```python
>>> setp(line)
... long output listing omitted
```

By default setp prints to sys.stdout, but this can be modified using the file keyword-only
argument:

```python
>>> with fopen('output.log') as f:
...     setp(line, file=f)
```
`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. E.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```python
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r') # MATLAB style
>>> setp(lines, linewidth=2, color='r') # python style
```

`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. E.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```python
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r') # MATLAB style
>>> setp(lines, linewidth=2, color='r') # python style
```

`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. E.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```python
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r') # MATLAB style
>>> setp(lines, linewidth=2, color='r') # python style
```

`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. E.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```python
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r') # MATLAB style
>>> setp(lines, linewidth=2, color='r') # python style
```

`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. E.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```python
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r') # MATLAB style
>>> setp(lines, linewidth=2, color='r') # python style
```

```python
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r') # MATLAB style
>>> setp(lines, linewidth=2, color='r') # python style
```
aliased_name(self, s)
Return 'PROPNAME or alias' if s has an alias, else return 'PROPNAME'.

e.g., for the line markerfacecolor property, which has an alias, return 'markerface-color or mfc' and for the transform property, which does not, return 'transform'.

aliased_name_rest(self, s, target)
Return 'PROPNAME or alias' if s has an alias, else return 'PROPNAME', formatted for reST.

e.g., for the line markerfacecolor property, which has an alias, return 'markerface-color or mfc' and for the transform property, which does not, return 'transform'.

get_aliases(self)
Get a dict mapping property fullnames to sets of aliases for each alias in the ArtistInspector.

e.g., for lines:

```python
{ 'markerfacecolor': { 'mfc' },
  'linewidth' : { 'lw' },
}
```

get_setters(self)
Get the attribute strings with setters for object.

For example, for a line, return ['markerfacecolor', 'linewidth', ...].

get_valid_values(self, attr)
Get the legal arguments for the setter associated with attr.
This is done by querying the docstring of the setter for a line that begins with “ACCEPTS:” or “.. ACCEPTS:”, and then by looking for a numpydoc-style documentation for the setter’s first argument.

```python
is_alias(self, o)
    Return whether method object o is an alias for another method.
```

```python
pprint_getters(self)
    Return the getters and actual values as list of strings.
```

```python
pprint_setters(self, prop=None, leadingspace=2)
    If prop is None, return a list of strings of all settable properties and their valid values.
    If prop is not None, it is a valid property name and that property will be returned as a string of property : valid values.
```

```python
pprint_setters_rest(self, prop=None, leadingspace=4)
    If prop is None, return a list of reST-formatted strings of all settable properties and their valid values.
    If prop is not None, it is a valid property name and that property will be returned as a string of “property : valid” values.
```

```python
properties(self)
    Return a dictionary mapping property name -> value.
```

18.5.1 Inheritance

```python
```

18.5.2 The Axes class

class matplotlib.axes.Axes(fig, rect, facecolor=None, frameon=True, sharex=None, sharey=None, label="", xscale=None, yscale=None, box_aspect=None, **kwargs)

Bases: matplotlib.axes._base._AxesBase

The Axes contains most of the figure elements: Ax, Tick, Line2D, Text, Polygon, etc., and sets the coordinate system.

The Axes instance supports callbacks through a callbacks attribute which is a CallbackRegistry instance. The events you can connect to are ‘xlim_changed’ and ‘ylim_changed’ and the callback will be called with func(ax) where ax is the Axes instance.
Attributes

**dataLim** [Bbox] The bounding box enclosing all data displayed in the Axes.

**viewLim** [Bbox] The view limits in data coordinates.

Build an axes in a figure.

**Parameters**

**fig** [Figure] The axes is build in the Figure fig.

**rect** [[left, bottom, width, height]] The axes is build in the rectangle rect.
rect is in Figure coordinates.

**sharex, sharey** [Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.

**frameon** [bool, default: True] Whether the axes frame is visible.

**box_aspect** [None, or a number, optional] Sets the aspect of the axes box.
See `set_box_aspect` for details.

****kwargs Other optional keyword arguments:

**Returns**

*Axes* The new *Axes* object.

### 18.5.3 Subplots

**SubplotBase**

Base class for subplots, which are *Axes* instances with additional methods to facilitate generating and manipulating a set of *Axes* within a figure.

**subplot_class_factory**

Make a new class that inherits from `SubplotBase` and the given axes_class (which is assumed to be a subclass of `axes.Axes`).

```python
class matplotlib.axes.SubplotBase(fig, *args, **kwargs)
    Bases: object
    Base class for subplots, which are *Axes* instances with additional methods to facilitate generating and manipulating a set of *Axes* within a figure.

    Parameters

    * fig [matplotlib.figure.Figure]
    * args [tuple (nrows, ncols, index) or int] The array of subplots in the figure has dimensions (nrows, ncols), and index is the index of the subplot being created. index starts at 1 in the upper left corner and increases to the right.
```
If `nrows`, `ncols`, and `index` are all single digit numbers, then `args` can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

**`**kwargs** Keyword arguments are passed to the Axes (sub)class constructor.

```python
    __dict__ = mappingproxy({'__module__': 'matplotlib.axes._subplots', '__doc__': '
 Base class for subplots, which are ... <attribute '__dict__' of 'SubplotBase' objects>, '__weakref__': <attribute '__weakref__' of 'SubplotBase' objects>})
    __init__ (self, fig, *args, **kwargs)

Parameters

fig [matplotlib.figure.Figure]

*args [tuple (nrows, ncols, index) or int] The array of subplots in the figure has dimensions (nrows, ncols), and index is the index of the subplot being created. index starts at 1 in the upper left corner and increases to the right.

If `nrows, ncols, and index` are all single digit numbers, then `args` can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

**`**kwargs** Keyword arguments are passed to the Axes (sub)class constructor.

```
set_subplotspec(self, subplotspec)
    Set the SubplotSpec. instance associated with the subplot.

update_params(self)
    Update the subplot position from self.figure.subplotpars.

Examples using matplotlib.axes.SubplotBase

- sphx_glr_gallery_text_labels_and_annotations_usetex_baseline_test.py

- sphx_glr_gallery_axisartist_simple_axisline3.py

matplotlib.axes.subplot_class_factory

axes.subplot_class_factory(axes_class=None)
    Make a new class that inherits from SubplotBase and the given axes_class (which is assumed to be a subclass of axes.Axes). This is perhaps a little bit roundabout to make a new class on the fly like this, but it means that a new Subplot class does not have to be created for every type of Axes.
18.5.4 Plotting

Basic

- `Axes.plot` - Plot y versus x as lines and/or markers.
- `Axes.errorbar` - Plot y versus x as lines and/or markers with attached errorbars.
- `Axes.scatter` - A scatter plot of y vs.
- `Axes.plot_date` - Plot data that contains dates.
- `Axes.step` - Make a step plot.
- `Axes.loglog` - Make a plot with log scaling on both the x and y axis.
- `Axes.semilogx` - Make a plot with log scaling on the x axis.
- `Axes.semilogy` - Make a plot with log scaling on the y axis.
- `Axes.fill_between` - Fill the area between two horizontal curves.
- `Axes.fill_betweenx` - Fill the area between two vertical curves.
- `Axes.bar` - Make a bar plot.
- `Axes.barh` - Make a horizontal bar plot.
- `Axes.stem` - Create a stem plot.
- `Axes.eventplot` - Plot identical parallel lines at the given positions.
- `Axes.pie` - Plot a pie chart.
- `Axes.stackplot` - Draw a stacked area plot.
- `Axes.broken_barh` - Plot a horizontal sequence of rectangles.
- `Axes.vlines` - Plot vertical lines.
- `Axes.hlines` - Plot horizontal lines at each y from xmin to xmax.
- `Axes.fill` - Plot filled polygons.

```python
matplotlib.axes.Axes.plot

Axes.plot(self, *args, scalex=True, scaley=True, data=None, **kwargs)
Plot y versus x as lines and/or markers.

Call signatures:

plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by x, y.

The optional parameter `fmt` is a convenient way for defining basic formatting like color, marker and linestyle. It’s a shortcut string notation described in the Notes section below.

```python
>>> plot(x, y)  # plot x and y using default line style and color
>>> plot(x, y, 'bo')  # plot x and y using blue circle markers
>>> plot(y)  # plot y using x as index array 0..N-1
>>> plot(y, 'r+')  # ditto, but with red plusses
```

You can use `Line2D` properties as keyword arguments for more control on the appearance. Line properties and `fmt` can be mixed. The following two calls yield identical results:
When conflicting with `fmt`, keyword arguments take precedence.

**Plotting labelled data**

There’s a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index `obj['y']`). Instead of giving the data in `x` and `y`, you can provide the object in the `data` parameter and just give the labels for `x` and `y`:

```python
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a `dict`, a `pandas.DataFrame` or a structured numpy array.

**Plotting multiple sets of data**

There are various ways to plot multiple sets of data.

- The most straightforward way is just to call `plot` multiple times. Example:

```python
>>> plot(x1, y1, 'bo')
>>> plot(x2, y2, 'go')
```

- Alternatively, if your data is already a 2d array, you can pass it directly to `x`, `y`. A separate data set will be drawn for every column.
  
  Example: an array `a` where the first column represents the `x` values and the other columns are the `y` columns:

```python
>>> plot(a[0], a[:,])
```

- The third way is to specify multiple sets of `[x], [y], [fmt]` groups:

```python
>>> plot(x1, y1, 'g-', x2, y2, 'g-')
```

In this case, any additional keyword argument applies to all datasets. Also this syntax cannot be combined with the `data` parameter.

By default, each line is assigned a different style specified by a ‘style cycle’. The `fmt` and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using `rcParams['axes.prop_cycle']` (default: cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])).

**Parameters**

- **x, y** [array-like or scalar] The horizontal / vertical coordinates of the data points. `x` values are optional and default to `range(len(y))`. Commonly, these parameters are 1D arrays. They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

  These arguments cannot be passed as keywords.

- **fmt** [str, optional] A format string, e.g. ‘ro’ for red circles. See the Notes section for a full description of the format strings.
Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

**data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.

*Note:* Technically there’s a slight ambiguity in calls where the second label is a valid fmt. `plot('n', 'o', data=obj)` could be `plt(x, y)` or `plt(y, fmt)`. In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string `plot('n', 'o', '', data=obj)`.

**Returns**

- list of *Line2D* A list of lines representing the plotted data.

**Other Parameters**

- **scalex, scaley** [bool, default: True] These parameters determine if the view limits are adapted to the data limits. The values are passed on to `autoscale_view`.

- ****kwargs [Line2D properties, optional] kwargs are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

  ```python
  >>> plot([[1, 2, 3], [1, 2, 3], 'go-', label='line 1', linewidth=2)
  >>> plot([[1, 2, 3], [1, 4, 9], 'rs', label='line 2'])
  ```

If you make multiple lines with one plot call, the kwargs apply to all those lines.

Here is a list of available *Line2D* properties:

<table>

See also:

scatter XY scatter plot with markers of varying size and/or color (sometimes also called bubble chart).

Notes

**Format Strings**

A format string consists of a part for color, marker and line:

```
fmt = '[marker][line][color]'
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If `line` is given, but no `marker`, the data will be a line without markers.

Other combinations such as `[color][marker][line]` are also supported, but note that their parsing may be ambiguous.

Markers
## Marker styles

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>.</code></td>
<td>point marker</td>
</tr>
<tr>
<td><code>,</code></td>

<td>`</td>
</tr>
<tr>
<td><code>_</code></td>
<td>hline marker</td>
</tr>
</tbody>
</table>

## Line styles

<table>
<thead>
<tr>
<th>Character</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>`-'</td>
<td>solid line style</td>
</tr>
<tr>
<td><code>--</code></td>
<td>dashed line style</td>
</tr>
<tr>
<td><code>-.</code></td>
<td>dash-dot line style</td>
</tr>
<tr>
<td><code>:</code></td>
<td>dotted line style</td>
</tr>
</tbody>
</table>

### Example format strings:

- `'b'` # blue markers with default shape
- `'or'` # red circles
- `'g'` # green solid line
- `'--'` # dashed line with default color
- `'^k:'` # black triangle_up markers connected by a dotted line

## Colors

The supported color abbreviations are the single letter codes

<table>
<thead>
<tr>
<th>Character</th>
<th>Color</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>'b'</code></td>
<td>blue</td>
</tr>
<tr>
<td><code>'g'</code></td>
<td>green</td>
</tr>
<tr>
<td><code>'r'</code></td>
<td>red</td>
</tr>
<tr>
<td><code>'c'</code></td>
<td>cyan</td>
</tr>
<tr>
<td><code>'m'</code></td>
<td>magenta</td>
</tr>
<tr>
<td><code>'y'</code></td>
<td>yellow</td>
</tr>
<tr>
<td><code>'k'</code></td>
<td>black</td>
</tr>
<tr>
<td><code>'w'</code></td>
<td>white</td>
</tr>
</tbody>
</table>
and the 'CN' colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any matplotlib.colors spec, e.g. full names ('green') or hex strings ('#008000').

Plot y versus x as lines and/or markers with attached errorbars.
x, y define the data locations, xerr, yerr define the errorbar sizes. By default, this draws the data markers/lines as well as the errorbars. Use fmt='none' to draw errorbars without any data markers.

**Parameters**

**x, y** [float or array-like] The data positions.

**xerr, yerr** [float or array-like, shape(N,) or shape(2, N), optional] The errorbar sizes:
- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- **None**: No errorbar.

Note that all error arrays should have *positive* values.

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

**fmt** [str, default: ‘ ’] The format for the data points / data lines. See *plot* for details.

Use ‘none’ (case insensitive) to plot errorbars without any data markers.

**ecolor** [color, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

**elinewidth** [float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

**capsize** [float, default: *rcParams*["errorbar.capsize"] (default: 0.0)] The length of the error bar caps in points.

**capthick** [float, default: None] An alias to the keyword argument *markeredgewidth* (a.k.a. *mew*). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if *mew* or *markeredgewidth* are given, then they will over-ride *capthick*. This may change in future releases.

**barsabove** [bool, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

**lolims, uplims, xlolims, xuplims** [bool, default: False] These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. *lims*-arguments may be scalars, or array-likes of the same length as xerr and yerr. To use limits with inverted axes, *set_zlim* or *set_ylim* must be called before *errorbar()*. Note the tricky parameter names: setting e.g. *lolims* to True means that the y-value is a lower limit of the True value, so, only an upward-pointing arrow will be drawn!

**errorevery** [int or (int, int), default: 1] draws error bars on a subset of the data. errorevery = N draws error bars on the points (x[:N], y[:N]). errorevery = (start, N) draws error bars on the points (x[start::N], y[start::N]). e.g. errorevery=(6, 3) adds error bars to the data at (x[6], x[9], x[12], x[15], ...). Used to avoid overlapping error bars when two series share x-axis values.
Returns

**ErrorbarContainer** The container contains:

- plotline: `Line2D` instance of x, y plot markers and/or line.
- caplines: A tuple of `Line2D` instances of the error bar caps.
- barlinecols: A tuple of `LineCollection` with the horizontal and vertical error ranges.

Other Parameters

**kwargs** All other keyword arguments are passed on to the `plot` call drawing the markers. For example, this code makes big red squares with thick green edges:

```python
x, y, yerr = rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red',
         mec='green', ms=20, mew=4)
```

where `mfc`, `mec`, `ms` and `mew` are aliases for the longer property names, `markerfacecolor`, `markeredgecolor`, `markersize` and `markeredgewidth`.

Valid kwargs for the marker properties are `Line2D` properties:

Notes

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, y, xerr, yerr.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.axes.Axes.errorbar

- sphx_glr_gallery_axes_grid1_parasite_simple2.py
- sphx_glr_gallery_scales_log_demo.py

matplotlib.axes.Axes.scatter

Axess.scatter(self, x, y, s=None, c=None, marker=None, cmap=None, norm=None, vmin=None, vmax=None, alpha=None, linewidths=None, verts=<deprecated parameter>, edgecolors=None, *, plotnonfinite=False, data=None, **kwargs)
A scatter plot of y vs. x with varying marker size and/or color.
Parameters

\(x, y\) [float or array-like, shape (n, )] The data positions.

\(s\) [float or array-like, shape (n, ), optional] The marker size in points**2. Default is \(\text{rcParams['lines.markersize']}\) ** 2.

\(c\) [array-like or list of colors or color, optional] The marker colors. Possible values:

- A scalar or sequence of \(n\) numbers to be mapped to colors using \(cmap\) and \(norm\).
- A 2-D array in which the rows are RGB or RGBA.
- A sequence of colors of length \(n\).
- A single color format string.

Note that \(c\) should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be color-mapped. If you want to specify the same RGB or RGBA value for all points, use a 2-D array with a single row. Otherwise, value-matching will have precedence in case of a size matching with \(x\) and \(y\).

If you wish to specify a single color for all points prefer the \(color\) keyword argument.

Defaults to \(\text{None}\). In that case the marker color is determined by the value of \(color\), \(facecolor\) or \(facecolors\). In case those are not specified or \(\text{None}\), the marker color is determined by the next color of the Axes’ current “shape and fill” color cycle. This cycle defaults to \(\text{rcParams['axes.prop_cycle']}\) (default: \(\text{cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])}\)).

\(marker\) [\(\text{MarkerStyle}\), default: \(\text{rcParams['scatter.marker']}\) (default: 'o')] The marker style. \(marker\) can be either an instance of the class or the text shorthand for a particular marker. See \(\text{matplotlib.markers}\) for more information about marker styles.

\(cmap\) [str or \(\text{Colormap}\), default: \(\text{rcParams['image.cmap']}\) (default: 'viridis')] A \(\text{Colormap}\) instance or registered colormap name. \(cmap\) is only used if \(c\) is an array of floats.

\(\text{norm}\) [\(\text{Normalize}\), default: \(\text{None}\)] If \(c\) is an array of floats, \(\text{norm}\) is used to scale the color data, \(c\), in the range 0 to 1, in order to map into the colormap \(cmap\). If \(\text{None}\), use the default \(\text{colors.Normalize}\).

\(\text{vmin}, \text{vmax}\) [float, default: \(\text{None}\)] \(\text{vmin}\) and \(\text{vmax}\) are used in conjunction with the default norm to map the color array \(c\) to the colormap \(cmap\). If \(\text{None}\), the respective min and max of the color array is used. It is deprecated to use \(\text{vmin/vmax}\) when \(\text{norm}\) is given.

\(\text{alpha}\) [float, default: \(\text{None}\)] The alpha blending value, between 0 (transparent) and 1 (opaque).

\(\text{linewidths}\) [float or array-like, default: \(\text{rcParams['lines.linewidth']}\) (default: 1.5)] The linewidth of the marker edges. Note: The default \(\text{edgecolors}\) is ‘face’. You may want to change this as well.
**edgcolor**s [{‘face’, ‘none’, None} or color or sequence of color, default: rcParams["scatter.edgcolor"] (default: ‘face’)] The edge color of the marker. Possible values:

• ‘face’: The edge color will always be the same as the face color.
• ’none’: No patch boundary will be drawn.
• A color or sequence of colors.

For non-filled markers, the edgcolor kwarg is ignored and forced to ‘face’ internally.

**plotnonfinite** [bool, default: False] Set to plot points with nonfinite c, in conjunction with set_bad.

**Returns**

PathCollection

**.Other Parameters**

**kwargs [Collection properties]

**See also:**

plot To plot scatter plots when markers are identical in size and color.

**Notes**

• The plot function will be faster for scatterplots where markers don’t vary in size or color.

• Any or all of x, y, s, and c may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.

• Fundamentally, scatter works with 1-D arrays; x, y, s, and c may be input as N-D arrays, but within scatter they will be flattened. The exception is c, which will be flattened only if its size matches the size of x and y.

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, y, s, linewidths, edgcolor, c, facecolor, facecolors, color.

Objects passed as data must support item access (data[s]) and membership test (s in data).

matplotlib.axes.Axes.plot_date

Axes.plot_date(self, x, y, fmt='o', tz=None, xdate=True, ydate=False, *, data=None, **kwargs)

Plot data that contains dates.

Similar to plot, this plots y vs. x as lines or markers. However, the axis labels are formatted as dates depending on xdate and ydate.

Parameters

x, y [array-like] The coordinates of the data points. If xdate or ydate is True, the respective values x or y are interpreted as Matplotlib dates.

fmt [str, optional] The plot format string. For details, see the corresponding parameter in plot.

tz [timezone string or datetime.tzinfo, default: rcParams["timezone"] (default: 'UTC')] The time zone to use in labeling dates.

xdate [bool, default: True] If True, the x-axis will be interpreted as Matplotlib dates.
**ydate** [bool, default: False] If True, the y-axis will be interpreted as Matplotlib dates.

**Returns**

lines A list of Line2D objects representing the plotted data.

**Other Parameters**

****kwargs Keyword arguments control the Line2D properties:

**See also:**

*matplotlib.dates* Helper functions on dates.

*matplotlib.dates.date2num* Convert dates to num.

*matplotlib.dates.num2date* Convert num to dates.

*matplotlib.dates.drange* Create an equally spaced sequence of dates.

**Notes**

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to `plot_date`. `plot_date` will set the default tick locator to `AutoDateLocator` (if the tick locator is not already set to a `DateLocator` instance) and the default tick formatter to `AutoDateFormatter` (if the tick formatter is not already set to a `DateFormatter` instance).

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using matplotlib.axes.Axes.plot_date**

- sphx_glr_gallery_ticks_and_spines_date_demo_convert.py

**matplotlib.axes.Axes.step**

```
Axes.step(self, x, y, *args, where='pre', data=None, **kwargs)
```

Make a step plot.

Call signatures:

```
step(x, y, [fmt], *, data=None, where='pre', **kwargs)
step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)
```

This is just a thin wrapper around `plot` which changes some formatting options. Most of the concepts and parameters of `plot` can be used here as well.

**Parameters**

- `x` [array-like] 1-D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.
- `y` [array-like] 1-D sequence of y levels.
`step` is a special case of the `plot` function, which creates step curves from a given set of data. It is used to represent data that is discontinuous, such as time series with occasional jumps. The function takes several parameters:

- **fmt** [str, optional] A format string, e.g. `g` for a green line. See `plot` for a more detailed description.
  
  Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument `linestyle` instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.

- **data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.

- **where** [{‘pre’, ‘post’, ‘mid’}, default: ‘pre’] Define where the steps should be placed:
  
  - ’pre’: The y value is continued constantly to the left from every x position, i.e. the interval $(x[i-1], x[i])$ has the value $y[i]$.
  
  - ’post’: The y value is continued constantly to the right from every x position, i.e. the interval $[x[i], x[i+1))$ has the value $y[i]$.
  
  - ’mid’: Steps occur half-way between the x positions.

**Returns**

- **lines** A list of `Line2D` objects representing the plotted data.

**Other Parameters**

- ****kwargs Additional parameters are the same as those for `plot`.

**Notes**

**Examples using matplotlib.axes.Axes.step**

- sphx_glr_gallery_lines_bars_and_markers_step_demo.py

**matplotlib.axes.Axes.loglog**

`Axes.loglog(self, *args, **kwargs)`

Make a plot with log scaling on both the x and y axis.

Call signatures:

```python
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes both the x-axis and the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters `base`, `subs` and `nonpositive` control the x/y-axis properties. They are just forwarded to `Axes.set_xscale` and `Axes.set_yscale`. To use different properties on the x-axis and the y-axis, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2).

**Parameters**

- **base** [float, default: 10] Base of the logarithm.
**subs** [sequence, optional] The location of the minor ticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale/Axes.set_yscale` for details.

**nonpositive** [{'mask', 'clip'}, default: 'mask'] Non-positive values can be masked as invalid, or clipped to a very small positive number.

**Returns**

**lines** A list of `Line2D` objects representing the plotted data.

**Other Parameters**

****kwargs** All parameters supported by `plot`.

**Examples using matplotlib.axes.Axes.loglog**

- sphx_glr_gallery_subplot_axes_and_figures_secondary_axis.py
- sphx_glr_gallery_scales_log_demo.py

**matplotlib.axes.Axes.semilogy**

`Axes.semilogy(self, *args, **kwargs)`

Make a plot with log scaling on the x axis.

Call signatures:

```
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the x-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters `base`, `subs`, and `nonpositive` control the x-axis properties. They are just forwarded to `Axes.set_xscale`.

**Parameters**

**base** [float, default: 10] Base of the x logarithm.

**subs** [array-like, optional] The location of the minor xticks. If *None*, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale` for details.

**nonpositive** [{'mask', 'clip'}, default: 'mask'] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

**Returns**

**lines** A list of `Line2D` objects representing the plotted data.

**Other Parameters**

****kwargs** All parameters supported by `plot`.
Examples using `matplotlib.axes.Axes.semilogx`

- `sphx_glr_gallery_scales_log_demo.py`
- `sphx_glr_gallery_scales_log_test.py`
- `Transformations Tutorial`

`matplotlib.axes.Axes.semilogy`

Axes.semilogy(self, *args, **kwargs)

Make a plot with log scaling on the y axis.

Call signatures:

```python
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the y-axis to log scaling. All of the concepts and parameters of `plot` can be used here as well.

The additional parameters `base`, `subs`, and `nonpositive` control the y-axis properties. They are just forwarded to `Axes.set_yscale`.

**Parameters**

- **base** [float, default: 10] Base of the y logarithm.
- **subs** [array-like, optional] The location of the minor yticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_yscale` for details.
- **nonpositive** [{‘mask’, ‘clip’}, default: ‘mask’] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

**Returns**

- **lines** A list of `Line2D` objects representing the plotted data.

**Other Parameters**

- **kwargs** All parameters supported by `plot`.

Examples using `matplotlib.axes.Axes.semilogy`

- `sphx_glr_gallery_scales_log_demo.py`
- `sphx_glr_gallery_specialty_plots_skewt.py`

`matplotlib.axes.Axes.fill_between`

Axes.fill_between(self, x, y1, y2=0, where=None, interpolate=False, step=None, *, data=None, **kwargs)

Fill the area between two horizontal curves.

The curves are defined by the points (x, y1) and (x, y2). This creates one or multiple polygons describing the filled area.
You may exclude some horizontal sections from filling using `where`.

By default, the edges connect the given points directly. Use `step` if the filling should be a step function, i.e. constant in between x.

**Parameters**

`x` [array (length N)] The x coordinates of the nodes defining the curves.

`y1` [array (length N) or scalar] The y coordinates of the nodes defining the first curve.

`y2` [array (length N) or scalar, default: 0] The y coordinates of the nodes defining the second curve.

`where` [array of bool (length N), optional] Define `where` to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates \(x[\text{where}]\). More precisely, fill between \(x[i]\) and \(x[i+1]\) if \(\text{where}[i]\) and \(\text{where}[i+1]\). Note that this definition implies that an isolated `True` value between two `False` values in `where` will not result in filling. Both sides of the `True` position remain unfilled due to the adjacent `False` values.

`interpolate` [bool, default: False] This option is only relevant if `where` is used and the two curves are crossing each other.

Semantically, `where` is often used for \(y1 > y2\) or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the x array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting `interpolate` to `True` will calculate the actual intersection point and extend the filled region up to this point.

`step` [{‘pre’, ‘post’, ‘mid’}, optional] Define `step` if the filling should be a step function, i.e. constant in between x. The value determines where the step will occur:

- ‘pre’: The y value is continued constantly to the left from every x position, i.e. the interval \((x[i-1], x[i])\] has the value \(y[i]\).
- ‘post’: The y value is continued constantly to the right from every x position, i.e. the interval \([x[i], x[i+1])\] has the value \(y[i]\).
- ‘mid’: Steps occur half-way between the x positions.

**Returns**

A `PolyCollection` containing the plotted polygons.

**Other Parameters**

**kwargs All other keyword arguments are passed on to `PolyCollection`. They control the `Polygon` properties:

*fill_between* Fill between two sets of y-values.

*fill_betweenx* Fill between two sets of x-values.

Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data*[s] (unless this raises an exception): *x*, *y1*, *y2*, *where*.

Objects passed as *data* must support item access (*data*[s]) and membership test (*s* in *data*).
Examples using `matplotlib.axes.Axes.fill_between`

- `sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py`
- `sphx_glr_gallery_lines_bars_and_markers_filled_step.py`
- `sphx_glr_gallery_pyplots_whats_new_98_4_fill_between.py`
- `sphx_glr_gallery_recipes_fill_between_alpha.py`

`matplotlib.axes.Axes.fill_betweenx`:

```python
Axes.fill_betweenx(self, y, x1, x2=0, where=None, step=None, interpolate=False, *
, data=None, **kwargs)
```

Fill the area between two vertical curves. The curves are defined by the points \((y, x1)\) and \((y, x2)\). This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using `where`.

By default, the edges connect the given points directly. Use `step` if the filling should be a step function, i.e. constant in between \(y\).

**Parameters**

- `y` [array (length N)] The \(y\) coordinates of the nodes defining the curves.
- `x1` [array (length N) or scalar] The \(x\) coordinates of the nodes defining the first curve.
- `x2` [array (length N) or scalar, default: 0] The \(x\) coordinates of the nodes defining the second curve.
- `where` [array of bool (length N), optional] Define `where` to exclude some vertical regions from being filled. The filled regions are defined by the coordinates \(y[where]\). More precisely, fill between \(y[i]\) and \(y[i+1]\) if \(where[i]\) and \(where[i+1]\). Note that this definition implies that an isolated `True` value between two `False` values in `where` will not result in filling. Both sides of the `True` position remain unfilled due to the adjacent `False` values.
- `interpolate` [bool, default: False] This option is only relevant if `where` is used and the two curves are crossing each other.

Semantically, `where` is often used for \(x1 > x2\) or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the \(y\) array. Such a polygon cannot describe the above semantics close to the intersection. The \(y\)-sections containing the intersection are simply clipped.

Setting `interpolate` to `True` will calculate the actual intersection point and extend the filled region up to this point.

- `step` [{‘pre’, ‘post’, ‘mid’}, optional] Define `step` if the filling should be a step function, i.e. constant in between \(y\). The value determines where the step will occur:
  - `pre`: The \(y\) value is continued constantly to the left from every \(x\) position, i.e. the interval \((x[i-1], x[i])\] has the value \(y[i]\).
'post': The y value is continued constantly to the right from every x position, i.e. the interval \([x[i], x[i+1])\) has the value \(y[i]\).

'\text{mid}': Steps occur half-way between the x positions.

**Returns**

*PolyCollection* A *PolyCollection* containing the plotted polygons.

**Other Parameters**

**\textbf{kwargs}** All other keyword arguments are passed on to *PolyCollection*.

They control the *Polygon* properties:

1062 Chapter 18. Modules
**fill_between** Fill between two sets of y-values.

**fill_betweenx** Fill between two sets of x-values.

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `y, x1, x2, where`

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using** matplotlib.axes.Axes.fill_betweenx

- sphx_glr_gallery_lines_bars_and_markers_fill_betweenx_demo.py
- sphx_glr_gallery_lines_bars_and_markers_filled_step.py

**matplotlib.axes.Axes.bar**

`Axes.bar(self, x, height, width=0.8, bottom=None, *, align='center', data=None, **kwargs)`

Make a bar plot.

The bars are positioned at `x` with the given `alignment`. Their dimensions are given by `height` and `width`. The vertical baseline is `bottom` (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

**Parameters**

- **x** [float or array-like] The x coordinates of the bars. See also `align` for the alignment of the bars to the coordinates.
- **height** [float or array-like] The height(s) of the bars.
- **width** [float or array-like, default: 0.8] The width(s) of the bars.
- **bottom** [float or array-like, default: 0] The y coordinate(s) of the bars bases.
- **align** [{‘center’, ‘edge’}, default: ‘center’] Alignment of the bars to the x coordinates:
  - ‘center’: Center the base on the x positions.
  - ‘edge’: Align the left edges of the bars with the x positions.

To align the bars on the right edge pass a negative `width` and `align='edge'`.

**Returns**

- **BarContainer** Container with all the bars and optionally errorbars.
### Other Parameters

- **color** [color or list of color, optional] The colors of the bar faces.
- **edgecolor** [color or list of color, optional] The colors of the bar edges.
- **linewidth** [float or array-like, optional] Width of the bar edge(s). If 0, don’t draw edges.
- **tick_label** [str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)
- **xerr, yerr** [float or array-like of shape(N,) or shape(2, N), optional] If not None, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:
  - scalar: symmetric +/- values for all bars
  - shape(N,): symmetric +/- values for each bar
  - shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
  - None: No errorbar. (Default)

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

- **ecolor** [color or list of color, default: ‘black’] The line color of the errorbars.
- **capsize** [float, default: \texttt{rcParams["errorbar.capsize"]} (default: 0.0)] The length of the error bar caps in points.
- **error_kw** [dict, optional] Dictionary of kwargs to be passed to the errorbar method. Values of ecolor or capsize defined here take precedence over the independent kwargs.
- **log** [bool, default: False] If True, set the y-axis to be log scale.

**kwargs [\texttt{Rectangle} properties]

barh Plot a horizontal bar plot.

**Notes**

Stacked bars can be achieved by passing individual bottom values per bar. See /gallery/lines_bars_and_markers/bar_stacked.

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, every other argument can also be string s, which is interpreted as data[s] (unless this raises an exception).

Objects passed as data must support item access (data[s]) and membership test (s in data).

18.5. matplotlib.axes
Axes.barh

Make a horizontal bar plot.

The bars are positioned at y with the given alignment. Their dimensions are given by width and height. The horizontal baseline is left (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

- y [float or array-like] The y coordinates of the bars. See also align for the alignment of the bars to the coordinates.
- width [float or array-like] The width(s) of the bars.
- height [float or array-like, default: 0.8] The heights of the bars.
- left [float or array-like, default: 0] The x coordinates of the left sides of the bars.
- align [{‘center’, ‘edge’}, default: ‘center’] Alignment of the base to the y coordinates*:
  - ‘center’: Center the bars on the y positions.
  - ‘edge’: Align the bottom edges of the bars with the y positions.

To align the bars on the top edge pass a negative height and align=’edge’.

Returns

BarContainer Container with all the bars and optionally errorbars.

Other Parameters

- color [color or list of color, optional] The colors of the bar faces.
- edgecolor [color or list of color, optional] The colors of the bar edges.
- linewidth [float or array-like, optional] Width of the bar edge(s). If 0, don’t draw edges.
- tick_label [str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)
- xerr, yerr [float or array-like of shape(N,) or shape(2, N), optional] If not None, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:
  - scalar: symmetric +/- values for all bars
• shape(N,): symmetric +/- values for each bar
• shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
• None: No errorbar. (default)

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

ecolor [color or list of color, default: 'black'] The line color of the errorbars.
capsize [float, default: rcParams['errorbar.capsize'] (default: 0.0)] The length of the error bar caps in points.
error_kw [dict, optional] Dictionary of kwargs to be passed to the errorbar method. Values of ecolor or capsize defined here take precedence over the independent kwargs.
log [bool, default: False] If True, set the x-axis to be log scale.

**kwargs [Rectangle properties]

See also:
**bar** Plot a vertical bar plot.

**Notes**

Stacked bars can be achieved by passing individual *left* values per bar. See `/gallery/lines_bars_and_markers/horizontal_barchart_distribution`.

**Examples using matplotlib.axes.Axes.barh**

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_horizontal_barchart_distribution.py
- sphx_glr_gallery_statistics_multiple_histograms_side_by_side.py
- *The Lifecycle of a Plot*

**matplotlib.axes.Axes.stem**

`Axes.stem(self, *args, linefmt=None, markerfmt=None, basefmt=None, bottom=0, label=None, use_line_collection=True, data=None)`

Create a stem plot.

A stem plot plots vertical lines at each x location from the baseline to y, and places a marker there.

Call signature:

```python
stem([x,] y, linefmt=None, markerfmt=None, basefmt=None)
```

The x-positions are optional. The formats may be provided either as positional or as keyword-arguments.

**Parameters**

- **x** [array-like, optional] The x-positions of the stems. Default: `(0, 1, ..., len(y) - 1)`.
- **y** [array-like] The y-values of the stem heads.
- **linefmt** [str, optional] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

<table>
<thead>
<tr>
<th>Character</th>
<th>Line Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>' '</td>
<td>solid line</td>
</tr>
<tr>
<td>'-'</td>
<td>dashed line</td>
</tr>
<tr>
<td>':-'</td>
<td>dash-dot line</td>
</tr>
<tr>
<td>':'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

  Default: 'C0-', i.e. solid line with the first color of the color cycle.

  Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.
**markerfmt** [str, optional] A string defining the properties of the markers at the stem heads. Default: ‘C0o’, i.e. filled circles with the first color of the color cycle.

**basefmt** [str, default: ‘C3-‘ (‘C2-‘ in classic mode)] A format string defining the properties of the baseline.

**bottom** [float, default: 0] The y-position of the baseline.

**label** [str, default: None] The label to use for the stems in legends.

**use_line_collection** [bool, default: True] If True, store and plot the stem lines as a LineCollection instead of individual lines, which significantly increases performance. If False, defaults to the old behavior of using a list of Line2D objects. This parameter may be deprecated in the future.

**Returns**

*StemContainer* The container may be treated like a tuple (markerline, stemlines, baseline)

**Notes**

**See also:**

The MATLAB function *stem* which inspired this method.

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as *data*[s] (unless this raises an exception). Objects passed as *data* must support item access (*data*[s]) and membership test (*s* in *data*).

**Examples using matplotlib.axes.Axes.stem**

- sphx_glr_gallery_lines_bars_and_markers_stem_plot.py
- sphx_glr_gallery_text_labels_and_annotations_legend_demo.py

**matplotlib.axes.Axes.eventplot**

*Axes.eventplot*(self, positions, orientation=’horizontal’, lineoffsets=1, linelengths=1, linewidths=None, colors=None, linestyles=’solid’, *, data=None, **kwargs)

Plot identical parallel lines at the given positions.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

**Parameters**
**positions** [array-like or list of array-like] A 1D array-like defines the positions of one sequence of events.

Multiple groups of events may be passed as a list of array-likes. Each group can be styled independently by passing lists of values to `lineoffsets`, `linelengths`, `linewidths`, `colors` and `linestyles`.

Note that `positions` can be a 2D array, but in practice different event groups usually have different counts so that one will use a list of different-length arrays rather than a 2D array.

**orientation** [{‘horizontal’, ‘vertical’}, default: ‘horizontal’] The direction of the event sequence:

- ‘horizontal’: the events are arranged horizontally. The indicator lines are vertical.
- ‘vertical’: the events are arranged vertically. The indicator lines are horizontal.

**lineoffsets** [float or array-like, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to `orientation`.

If `positions` is 2D, this can be a sequence with length matching the length of `positions`.

**linelengths** [float or array-like, default: 1] The total height of the lines (i.e. the lines stretches from `lineoffset - linelength/2` to `lineoffset + linelength/2`).

If `positions` is 2D, this can be a sequence with length matching the length of `positions`.

**linewidths** [float or array-like, default: `rcParams["lines.linewidth"]` (default: 1.5)] The line width(s) of the event lines, in points.

If `positions` is 2D, this can be a sequence with length matching the length of `positions`.

**colors** [color or list of colors, default: `rcParams["lines.color"]` (default: ‘C0’)] The color(s) of the event lines.

If `positions` is 2D, this can be a sequence with length matching the length of `positions`.

**linestyles** [str or tuple or list of such values, default: ‘solid’] Default is ‘solid’. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-'. '–', '-', '-·', '.']

Dash tuples should be of the form:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

If `positions` is 2D, this can be a sequence with length matching the length of `positions`.

**kwargs** Other keyword arguments are line collection properties. See `LineCollection` for a list of the valid properties.

**Returns**

list of `EventCollection` The `EventCollection` that were added.
Notes

For `linelengths`, `linewidths`, `colors`, and `linestyles`, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as `positions`, and each value will be applied to the corresponding row of the array.

Examples

Note: In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `positions`, `lineoffsets`, `linelengths`, `linewidths`, `colors`, `linestyles`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.eventplot`
Axes.pie(self, x, explode=None, labels=None, colors=None, autopct=None, pctdistance=0.6, shadow=False, labeldistance=1.1, startangle=0, radius=1, counterclock=True, wedgeprops=None, textprops=None, center=(0, 0), frame=False, rotatelabels=False, *, normalize=None, data=None)

Plot a pie chart.

Make a pie chart of array x. The fractional area of each wedge is given by $x/\sum(x)$. If $\sum(x) < 1$, then the values of x give the fractional area directly and the array will not be normalized. The resulting pie will have an empty wedge of size $1 - \sum(x)$.

The wedges are plotted counterclockwise, by default starting from the x-axis.

**Parameters**

- **x** [1D array-like] The wedge sizes.
- **explode** [array-like, default: None] If not None, is a $\text{len}(x)$ array which specifies the fraction of the radius with which to offset each wedge.
- **labels** [list, default: None] A sequence of strings providing the labels for each wedge.
- **colors** [array-like, default: None] A sequence of colors through which the pie chart will cycle. If None, will use the colors in the currently active cycle.
- **autopct** [None or str or callable, default: None] If not None, is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If it is a format string, the label will be $\text{fmt} \ % \ \text{pct}$. If it is a function, it will be called.
- **pctdistance** [float, default: 0.6] The ratio between the center of each pie slice and the start of the text generated by autopct. Ignored if autopct is None.
- **shadow** [bool, default: False] Draw a shadow beneath the pie.
- **normalize**: None or bool, default: None When True, always make a full pie by normalizing x so that $\sum(x) == 1$. False makes a partial pie if $\sum(x) <= 1$ and raises a ValueError for $\sum(x) > 1$.

When None, defaults to True if $\sum(x) >= 1$ and False if $\sum(x) < 1$.

Please note that the previous default value of None is now deprecated, and the default will change to True in the next release. Please pass normalize=False explicitly if you want to draw a partial pie.

- **labeldistance** [float or None, default: 1.1] The radial distance at which the pie labels are drawn. If set to None, label are not drawn, but are stored for use in legend().
- **startangle** [float, default: 0 degrees] The angle by which the start of the pie is rotated, counterclockwise from the x-axis.
- **radius** [float, default: 1] The radius of the pie.
- **counterclock** [bool, default: True] Specify fractions direction, clockwise or counterclockwise.
- **wedgeprops** [dict, default: None] Dict of arguments passed to the wedge objects making the pie. For example, you can pass in wedgeprops =
{'linewidth': 3} to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default clip_on=False.

textprops [dict, default: None] Dict of arguments to pass to the text objects.

center [(float, float), default: (0, 0)] The coordinates of the center of the chart.

frame [bool, default: False] Plot axes frame with the chart if true.

rotatelabels [bool, default: False] Rotate each label to the angle of the corresponding slice if true.

Returns

patches [list] A sequence of matplotlib.patches.Wedge instances

texts [list] A list of the label Text instances.

autotexts [list] A list of Text instances for the numeric labels. This will only be returned if the parameter autopct is not None.

Notes

The pie chart will probably look best if the figure and axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to "equal". The axes aspect ratio can be controlled with Axes.set_aspect.

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, explode, labels, colors.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.axes.Axes.pie

• sphx_glr_gallery_pie_and_polar_charts_pie_features.py
• sphx_glr_gallery_pie_and_polar_charts_pie_demo2.py
• sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py
• sphx_glr_gallery_pie_and_polar_charts_nested_pie.py
• sphx_glr_gallery_pie_and_polar_charts_pie_and_donut_labels.py
• sphx_glr_gallery_misc_svg_filter_pie.py
Axes.stackplot

Axes.stackplot(axes, x, *args, labels=(), colors=None, baseline='zero', data=None, **kwargs)

Draw a stacked area plot.

Parameters

- **x** [1d array of dimension N]
- **y** [2d array (dimension MxN), or sequence of 1d arrays (each dimension 1xN)] The data is assumed to be unstacked. Each of the following calls is legal:

  - `stackplot(x, y)`  
  - `stackplot(x, y1, y2, y3, y4)`  

- **baseline** [{‘zero’, ‘sym’, ‘wiggle’, ‘weighted_wiggle’}] Method used to calculate the baseline:
  - ‘zero’: Constant zero baseline, i.e. a simple stacked plot.
  - ‘sym’: Symmetric around zero and is sometimes called ‘ThemeRiver’.
  - ‘wiggle’: Minimizes the sum of the squared slopes.
  - ‘weighted_wiggle’: Does the same but weights to account for size of each layer. It is also called ‘Streamgraph’-layout. More details can be found at [http://leebyron.com/streamgraph/](http://leebyron.com/streamgraph/).

- **labels** [Length N sequence of strings] Labels to assign to each data series.
- **colors** [Length N sequence of colors] A list or tuple of colors. These will be cycled through and used to colour the stacked areas.

**kwargs All other keyword arguments are passed to `Axes.fill_between`.

Returns

- list of PolyCollection A list of PolyCollection instances, one for each element in the stacked area plot.

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.stackplot`

- sphx_glr_gallery_lines_bars_and_markers_stackplot_demo.py
Axes.broken_barh

Axes.broken_barh(self, xranges, yrange, *, data=None, **kwargs)

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of xranges. All rectangles have the same vertical position and size defined by yrange.

This is a convenience function for instantiating a BrokenBarHCollection, adding it to the axes and autoscaling the view.

Parameters

xranges [sequence of tuples (xmin, xwidth)] The x-positions and extends of the rectangles. For each tuple (xmin, xwidth) a rectangle is drawn from xmin to xmin + xwidth.

yrange [(ymin, yheight)] The y-position and extend for all the rectangles.

Returns

BrokenBarHCollection

Other Parameters

**kwargs [BrokenBarHCollection properties] Each kwarg can be either a single argument applying to all rectangles, e.g.:

```plaintext
facecolors='black'
```

or a sequence of arguments over which is cycled, e.g.:

```plaintext
facecolors=('black', 'blue')
```

would create interleaving black and blue rectangles.

Supported keywords:

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.broken_barh`

- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py

`matplotlib.axes.Axes.vlines`

`Axes.vlines(self, x, ymin, ymax, colors=None, linestyles='solid', label='', *, data=None, **kwargs)`

Plot vertical lines.

Plot vertical lines at each `x` from `ymin` to `ymax`.

**Parameters**

- `x` [float or array-like] x-indexes where to plot the lines.
- `ymin, ymax` [float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.
- `colors` [list of colors, default: `rcParams["lines.color"]` (default: 'C0')]
linestyles [{‘solid’, ‘dashed’, ‘dashdot’, ‘dotted’}, optional]
label [str, default: “"

Returns
LineCollection

Other Parameters
**kwargs [LineCollection properties.]

See also:
hlines horizontal lines
axvline vertical line across the axes

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, y, ymin, ymax, colors.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.axes.Axes.vlines

- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py
- sphx_glr_gallery_statistics_customized_violin.py

matplotlib.axes.Axes.hlines

Axes.hlines(self, y, xmin, xmax, colors=None, linestyles=‘solid’, label=”, *, data=None, **kwargs)

Plot horizontal lines at each y from xmin to xmax.

Parameters
y [float or array-like] y-indexes where to plot the lines.

xmin, xmax [float or array-like] Respective beginning and end of each line.

If scalars are provided, all lines will have same length.

colors [list of colors, default: rcParams["lines.color"] (default: 'C0')]
linestyles [{‘solid’, ‘dashed’, ‘dashdot’, ‘dotted’}, optional]
label [str, default: “”

Returns
LineCollection
**Other Parameters**

**kwargs [LineCollection properties.]

See also:

vlines vertical lines

axhline horizontal line across the axes

Notes

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): y, xmin, xmax, colors.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.axes.Axes.hlines

- sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py

matplotlib.axes.Axes.fill

Axes.fill(self, *args, data=None, **kwargs)
Plot filled polygons.

Parameters

*args [sequence of x, y, [color]] Each polygon is defined by the lists of x and y positions of its nodes, optionally followed by a color specifier. See matplotlib.colors for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple x, y, [color] groups.

For example, each of the following is legal:

```
ax.fill(x, y)  # a polygon with default color
ax.fill(x, y, "b")  # a blue polygon
ax.fill(x, y, x2, y2)  # two polygons
ax.fill(x, y, "b", x2, y2, "r")  # a blue and a red polygon
```

data [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y, e.g.:

```
ax.fill("time", "signal",
       data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

Returns

list of Polygon
Other Parameters

**kwargs [Polygon properties]

Notes

Use `fill_between()` if you would like to fill the region between two curves.

Examples using `matplotlib.axes.Axes.fill`

- sphx_glr_gallery_lines_bars_and_markers_fill.py
- sphx_glr_gallery_shapes_and_collections_hatch_demo.py
- sphx_glr_gallery_specialty_plots_radar_chart.py
- sphx_glr_gallery_units_ellipse_with_units.py

Spans

<table>
<thead>

</tr>
</tbody>
</table>

`matplotlib.axes.Axes.axhline`

`Axes.axhline(self, y=0, xmin=0, xmax=1, **kwargs)`
Add a horizontal line across the axis.

Parameters

- **y** [float, default: 0] y position in data coordinates of the horizontal line.
- **xmin** [float, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.
- **xmax** [float, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

Returns

- `Line2D`

Other Parameters

**kwargs Valid keyword arguments are `Line2D` properties, with the exception of `transform`:

**See also:**

- **hlines** Add horizontal lines in data coordinates.
- **axhspan** Add a horizontal span (rectangle) across the axis.
- **axline** Add a line with an arbitrary slope.
Examples

• draw a thick red hline at ‘y’ = 0 that spans the xrange:

```python
>>> axhline(linewidth=4, color='r')
```

• draw a default hline at ‘y’ = 1 that spans the xrange:

```python
>>> axhline(y=1)
```

• draw a default hline at ‘y’ = .5 that spans the middle half of the xrange:

```python
>>> axhline(y=.5, xmin=0.25, xmax=0.75)
```

`matplotlib.axes.Axes.axhspan`

```python
Axes.axhspan(self, ymin, ymax, xmin=0, xmax=1, **kwargs)
```

Add a horizontal span (rectangle) across the axis.

The rectangle spans from `ymin` to `ymax` vertically, and, by default, the whole x-axis horizontally. The x-span can be set using `xmin` (default: 0) and `xmax` (default: 1) which are in axis units; e.g. `xmin = 0.5` always refers to the middle of the x-axis regardless of the limits set by `set_xlim`.

Parameters

- **ymin** [float] Lower y-coordinate of the span, in data units.
- **ymax** [float] Upper y-coordinate of the span, in data units.
- **xmin** [float, default: 0] Lower x-coordinate of the span, in x-axis (0-1) units.
- **xmax** [float, default: 1] Upper x-coordinate of the span, in x-axis (0-1) units.

Returns

- **Polygon** Horizontal span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters
**kwargs [Polygon properties]

matplotlib.axes.Axes.axvline

Axes.axvline(self, x=0, ymin=0, ymax=1, **kwargs)

Add a vertical line across the axes.

Parameters
x [float, default: 0] x position in data coordinates of the vertical line.

ymin [float, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

ymax [float, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

Returns

Line2D

Other Parameters

**kwargs Valid keyword arguments are Line2D properties, with the exception of 'transform':

- **vlines** Add vertical lines in data coordinates.
- **axvspan** Add a vertical span (rectangle) across the axis.
- **axline** Add a line with an arbitrary slope.

Examples

- draw a thick red vline at $x = 0$ that spans the yrange:
  
  ```python
  >>> axvline(linewidth=4, color='r')
  ```

- draw a default vline at $x = 1$ that spans the yrange:
  
  ```python
  >>> axvline(x=1)
  ```

- draw a default vline at $x = .5$ that spans the middle half of the yrange:
  
  ```python
  >>> axvline(x=.5, ymin=0.25, ymax=0.75)
  ```

`matplotlib.axes.Axes.axvspan`

```python
Axes.axvspan(self, xmin, xmax, ymin=0, ymax=1, **kwargs)
```

Add a vertical span (rectangle) across the axes.
The rectangle spans from $xmin$ to $xmax$ horizontally, and, by default, the whole y-axis vertically. The y-span can be set using $ymin$ (default: 0) and $ymax$ (default: 1) which are in axis units; e.g. $ymin = 0.5$ always refers to the middle of the y-axis regardless of the limits set by `set_ylim`.

**Parameters**

- **xmin** [float] Lower x-coordinate of the span, in data units.
- **xmax** [float] Upper x-coordinate of the span, in data units.
- **ymin** [float, default: 0] Lower y-coordinate of the span, in y-axis units (0-1).
- **ymax** [float, default: 1] Upper y-coordinate of the span, in y-axis units (0-1).

**Returns**

- **Polygon** Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

**Other Parameters**

- **kwargs** [Polygon properties]
- **%(Polygon)s**

**See also:**

- `axhspan` Add a horizontal span across the axes.

**Examples**

Draw a vertical, green, translucent rectangle from x = 1.25 to x = 1.55 that spans the yrange of the axes.

```python
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

**Examples using matplotlib.axes.Axes.axvspan**

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py
- *Transformations Tutorial*

**matplotlib.axes.Axes.axline**

- **Axes.axline**(self, xy1, xy2=None, *, slope=None, **kwargs)
  
  Add an infinitely long straight line.
  
  The line can be defined either by two points $xy1$ and $xy2$, or by one point $xy1$ and a $slope$. This draws a straight line “on the screen”, regardless of the x and y scales, and is thus also suitable for drawing exponential decays in semilog plots, power laws in loglog plots, etc. However, $slope$ should only be used with linear scales; It has no clear meaning for all other scales, and thus the behavior is undefined. Please specify the line using the points $xy1$, $xy2$ for non-linear scales.

  **Parameters**

  - **slope** [float] Slope of the line.
  - **%(Polygon)s**
xy1, xy2 [(float, float)] Points for the line to pass through. Either xy2 or slope has to be given.

slope [float, optional] The slope of the line. Either xy2 or slope has to be given.

Returns

Line2D

Other Parameters

**kwargs Valid kwargs are Line2D properties, with the exception of ‘transform’:

- agg_filter: a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array.
- alpha: float or None
- animated: bool
- antialiased or aa: bool
- clip_box: Bbox
- clip_on: bool
- clip_path: Patch or (Path, Transform) or None
- color or c: color

</tbody>
</table>

`matplotlib.axes.Axes.acorr`

`Axes.acorr(self, x, *, data=None, **kwargs)`
Plot the autocorrelation of x.

Parameters

- **x** [array-like]
  - **detrend** [callable, default: `mlab.detrend_none` (no detrending)] A detrending function applied to x. It must have the signature

```python
detrend(x: np.ndarray) -> np.ndarray
```
**normed** [bool, default: True] If True, input vectors are normalised to unit length.

**usevlines** [bool, default: True] Determines the plot style.

If True, vertical lines are plotted from 0 to the acorr value using *Axes.vlines*. Additionally, a horizontal line is plotted at y=0 using *Axes.axhline*.

If False, markers are plotted at the acorr values using *Axes.plot*.

**maxlags** [int, default: 10] Number of lags to show. If None, will return all \(2 \times \text{len}(x) - 1\) lags.

Returns

**lags** [array (length 2*maxlags+1)] The lag vector.

**c** [array (length 2*maxlags+1)] The auto correlation vector.

**line** [*LineCollection* or *Line2D*] *Artist* added to the axes of the correlation:

• *LineCollection* if *usevlines* is True.

• *Line2D* if *usevlines* is False.

**b** [*Line2D* or None] Horizontal line at 0 if *usevlines* is True None *usevlines* is False.

**Other Parameters**

**linestyle** [*Line2D property, optional*] The linestyle for plotting the data points. Only used if *usevlines* is False.

**marker** [str, default: ‘o’] The marker for plotting the data points. Only used if *usevlines* is False.

****kwargs Additional parameters are passed to *Axes.vlines* and *Axes.axhline* if *usevlines* is True; otherwise they are passed to *Axes.plot*.

**Notes**

The cross correlation is performed with *numpy.correlate* with mode = "full".

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data[s]* (unless this raises an exception): *x*.

Objects passed as *data* must support item access (*data[s]*) and membership test (*s in data*).
Axes.angle_spectrum

Axes.angle_spectrum(self, x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of x. Data is padded to a length of pad_to and the windowing function window is applied to the signal.

Parameters

x [1-D array or sequence] Array or sequence containing the data.

Fs [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

window [callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to the length of the input signal (i.e. no padding).

Fc [int, default: 0] The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsamped to baseband.

Returns

spectrum [1-D array] The values for the angle spectrum in radians (real valued).

freqs [1-D array] The frequencies corresponding to the elements in spectrum.

line [Line2D] The line created by this function.

Other Parameters

**kwargs Keyword arguments control the Line2D properties:

**See also:**

- `magnitude_spectrum` Plots the magnitudes of the corresponding frequencies.
- `phase_spectrum` Plots the unwrapped version of this function.
- `specgram` Can plot the angle spectrum of segments within the signal in a colormap.

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also
be string s, which is interpreted as data[s] (unless this raises an exception): x.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.axes.Axes.angle_spectrum

matplotlib.axes.Axes.cohere

Axes.cohere(self, x, y, NFFT=256, Fs=2, Fc=0, detrend=<function detrend_none at 0x7f39f4d34a60>, window=<function window_hanning at 0x7f39f4d343a0>, noverlap=0, pad_to=None, sides='default', scale_by_freq=None, *, data=None, **kwargs)
Plot the coherence between x and y.

Plot the coherence between x and y. Coherence is the normalized cross spectral density:

\[
C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}
\]

Parameters

Fs [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

window [callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT

NFFT [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.

detrend [{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib is it a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as
well. You can also use a string to choose one of the functions: ‘none’ calls `detrend_none`, ‘mean’ calls `detrend_mean`, ‘linear’ calls `detrend_linear`.

scale_by_freq [bool, default: True] Whether the resulting density values should be scaled by the frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap [int, default: 0 (no overlap)] The number of points of overlap between blocks.

Fc [int, default: 0] The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

Cxy [1-D array] The coherence vector.

freqs [1-D array] The frequencies for the elements in Cxy.

Other Parameters

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

References

Examples using `matplotlib.axes.Axes.cohere`

```
import matplotlib.pyplot as plt

fig, axs = plt.subplots(2, 2)

NFFT = 1024

axs[0, 0].title.set_text('Example 1')
axs[0, 0].cohere(np.random.randn(1024), np.random.randn(1024), NFFT=NFFT)

axs[0, 1].title.set_text('Example 2')
axs[0, 1].cohere(np.random.randn(1024), np.random.randn(1024), NFFT=NFFT, Fs=22050)

axs[1, 0].title.set_text('Example 3')
axs[1, 0].cohere(np.random.randn(1024), np.random.randn(1024), NFFT=NFFT, Fs=22050, detrend='constant')

axs[1, 1].title.set_text('Example 4')
axs[1, 1].cohere(np.random.randn(1024), np.random.randn(1024), NFFT=NFFT, Fs=22050, detrend='constant', noverlap=64)

fig.tight_layout()
plt.show()
```

Parameters

- `x`, `y` [1-D arrays or sequences] Arrays or sequences containing the data.
Fs [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

window [callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT

NFFT [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.

detrend [{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib is it a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls detrend_none. 'mean' calls detrend_mean. 'linear' calls detrend_linear.

scale_by_freq [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap [int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc [int, default: 0] The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsamped to baseband.

return_line [bool, default: False] Whether to include the line object plotted in the returned values.

Returns

Pxy [1-D array] The values for the cross spectrum $P_{xy}$ before scaling (complex valued).

defreqs [1-D array] The frequencies corresponding to the elements in Pxy.

dline [Line2D] The line created by this function. Only returned if return_line is True.
### Other Parameters

**See also:**

* psd is equivalent to setting $y = x$. 
Notes

For plotting, the power is plotted as \(10 \log_{10}(P_{xy})\) for decibels, though \(P_{xy}\) itself is returned.

References

Note: In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x, y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.csd`

- sphx_glr_gallery_lines_bars_and_markers_csd_demo.py

`matplotlib.axes.Axes.magnitude_spectrum`

```python
Axes.magnitude_spectrum(self, x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, scale=None, *, data=None, **kwargs)
```

Plot the magnitude spectrum.

Compute the magnitude spectrum of `x`. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

Parameters

- **x** [1-D array or sequence] Array or sequence containing the data.
- **Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.
- **window** [callable or ndarray, default: `window_hanning`] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides** [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **pad_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks),
this can give more points in the plot, allowing for more detail. This corre-
sponds to the $n$ parameter in the call to fft(). The default is None, which
sets pad_to equal to the length of the input signal (i.e. no padding).

**scale** [{‘default’, ‘linear’, ‘dB’}] The scaling of the values in the spec.
‘linear’ is no scaling. ‘dB’ returns the values in dB scale, i.e., the dB ampli-
tude ($20 \log_{10}$). ‘default’ is ‘linear’.

**Fc** [int, default: 0] The center frequency of x, which offsets the x extents
of the plot to reflect the frequency range used when a signal is acquired
and then filtered and downsampled to baseband.

**Returns**

- **spectrum** [1-D array] The values for the magnitude spectrum before scal-
ing (real valued).
- **freqs** [1-D array] The frequencies corresponding to the elements in spec-
trum.
- **line** [Line2D] The line created by this function.

**Other Parameters**

**kwargs** Keyword arguments control the Line2D properties:

See also:

- **psd** Plots the power spectral density.
- **angle_spectrum** Plots the angles of the corresponding frequencies.
- **phase_spectrum** Plots the phase (unwrapped angle) of the corresponding frequencies.
- **specgram** Can plot the magnitude spectrum of segments within the signal in a colormap.

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.magnitude_spectrum`

```python
matplotlib.axes.Axes.magnitude_spectrum
```

`Axes.magnitude_spectrum(self, x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)`

Plot the magnitude spectrum.

Compute the magnitude spectrum (unwrapped angle spectrum) of `x`. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

Parameters

- **x** [1-D array or sequence] Array or sequence containing the data
- **Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.
window [callable or ndarray, default: `window_hanning`] A function or a
vector of length `NFFT`. To create window vectors see `window_hanning`,
`window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`,
`scipy.signal.get_window`, etc. If a function is passed as the argument,
it must take a data segment as an argument and return the windowed
version of the segment.

sides [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spec-
trum to return. ‘default’ is one-sided for real data and two-sided for com-
plex data. ‘onesided’ forces the return of a one-sided spectrum, while
‘twosided’ forces two-sided.

pad_to [int, optional] The number of points to which the data segment is
padded when performing the FFT. While not increasing the actual reso-
lution of the spectrum (the minimum distance between resolvable peaks),
this can give more points in the plot, allowing for more detail. This corre-
sponds to the n parameter in the call to fft(). The default is None, which
sets pad_to equal to the length of the input signal (i.e. no padding).

Fc [int, default: 0] The center frequency of x, which offsets the x extents
of the plot to reflect the frequency range used when a signal is acquired
and then filtered and downsamples to baseband.

Returns

spectrum [1-D array] The values for the phase spectrum in radians (real
valued).

freqs [1-D array] The frequencies corresponding to the elements in spectrum.

line [Line2D] The line created by this function.

Other Parameters

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.axes.Axes.phase_spectrum
Axes.psd(self, x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)

Plot the power spectral density.

The power spectral density $P_{xx}$ by Welch’s average periodogram method. The vector $x$ is divided into $NFFT$ length segments. Each segment is detrended by function $detrend$ and windowed by function $window$. $noverlap$ gives the length of the overlap between segments. The $|\text{fft}(i)|^2$ of each segment $i$ are averaged to compute $P_{xx}$, with a scaling to correct for power loss due to windowing.

If len($x$) < $NFFT$, it will be zero padded to $NFFT$.

**Parameters**

- **x** [1-D array or sequence] Array or sequence containing the data
- **Fs** [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, $freqs$, in cycles per time unit.
- **window** [callable or ndarrray, default: window_hanning] A function or a vector of length $NFFT$. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides** [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **pad_to** [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from $NFFT$, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the $n$ parameter in the call to fft(). The default is None, which sets pad_to equal to $NFFT$
- **NFFT** [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.
- **detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls detrend_none. ‘mean’ calls detrend_mean. ‘linear’ calls detrend_linear.
- **scale_by_freq** [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.
noverlap [int, default: 0 (no overlap)] The number of points of overlap between segments.

Fc [int, default: 0] The center frequency of \( x \), which offsets the \( x \) extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line [bool, default: False] Whether to include the line object plotted in the returned values.

Returns

- **Pxx** [1-D array] The values for the power spectrum \( P_{xx} \) before scaling (real valued).
- **freqs** [1-D array] The frequencies corresponding to the elements in \( P_{xx} \).
- **line** [Line2D] The line created by this function. Only returned if return_line is True.

Other Parameters

See also:

- **specgram** Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

- **magnitude_spectrum** Plots the magnitude spectrum.

- **csd** Plots the spectral density between two signals.

Notes

For plotting, the power is plotted as \(10 \log_{10}(P_{xx})\) for decibels, though \(P_{xx}\) itself is returned.

References

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.psd`

- `sphx_glr_gallery_lines_bars_and_markers_psd_demo.py`
Axes.specgram(self, x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, cmap=None, xextent=None, pad_to=None, sides=None, scale_by_freq=None, mode=None, scale=None, vmin=None, vmax=None, *, data=None, **kwargs)

Plot a spectrogram.

Compute and plot a spectrogram of data in x. Data are split into NFFT length segments and the spectrum of each section is computed. The windowing function window is applied to each segment, and the amount of overlap of each segment is specified with noverlap. The spectrogram is plotted as a colormap (using imshow).

Parameters

- x [1-D array or sequence] Array or sequence containing the data.
- Fs [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.
- window [callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- sides [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- pad_to [int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT
- NFFT [int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.
- detrend [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is it a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls detrend_none, ‘mean’ calls detrend_mean, ‘linear’ calls detrend_linear.
- scale_by_freq [bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.
**mode** [{‘default’, ‘psd’, ‘magnitude’, ‘angle’, ‘phase’}] What sort of spectrum to use. Default is ‘psd’, which takes the power spectral density. ‘magnitude’ returns the magnitude spectrum. ‘angle’ returns the phase spectrum without unwrapping. ‘phase’ returns the phase spectrum with unwrapping.

**noverlap** [int] The number of points of overlap between blocks. The default value is 128.

**scale** [{‘default’, ‘linear’, ‘dB’}] The scaling of the values in the spec. ‘linear’ is no scaling. ‘dB’ returns the values in dB scale. When **mode** is ‘psd’, this is dB power (10 * log10). Otherwise this is dB amplitude (20 * log10). ‘default’ is ‘dB’ if **mode** is ‘psd’ or ‘magnitude’ and ‘linear’ otherwise. This must be ‘linear’ if **mode** is ‘angle’ or ‘phase’.

**Fc** [int, default: 0] The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**cmap** [Colormap, default: rcParams["image.cmap"] (default: ‘viridis’)]

**xextent** [None or (xmin, xmax)] The image extent along the x-axis. The default sets xmin to the left border of the first bin (spectrum column) and xmax to the right border of the last bin. Note that for noverlap>0 the width of the bins is smaller than those of the segments.

****kwargs** Additional keyword arguments are passed on to imshow which makes the specgram image.

**Returns**

**spectrum** [2-D array] Columns are the periodograms of successive segments.

**freqs** [1-D array] The frequencies corresponding to the rows in spectrum.

**t** [1-D array] The times corresponding to midpoints of segments (i.e., the columns in spectrum).

**im** [AxesImage] The image created by imshow containing the spectrogram.

**See also:**

**psd** Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

**magnitude_spectrum** A single spectrum, similar to having a single segment when **mode** is ‘magnitude’. Plots a line instead of a colormap.

**angle_spectrum** A single spectrum, similar to having a single segment when **mode** is ‘angle’. Plots a line instead of a colormap.

**phase_spectrum** A single spectrum, similar to having a single segment when **mode** is ‘phase’. Plots a line instead of a colormap.

**Notes**

The parameters detrend and scale_by_freq do only apply when **mode** is set to ‘psd’. 

18.5. matplotlib.axes 1105
Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.axes.Axes.specgram

• sphx_glr_gallery_images_contours_and_fields_specgram_demo.py

matplotlib.axes.Axes.xcorr

Axes.xcorr(self, x, y, normed=True, detrend=<function detrend_none at 0x7f39f4d34a60>, usevlines=True, maxlags=10, *, data=None, **kwargs)

Plot the cross correlation between x and y.

The correlation with lag k is defined as \( \sum_n x[n+k] \cdot y^*[n] \), where \( y^* \) is the complex conjugate of y.

Parameters

x, y [array-like of length n]

detrend [callable, default: mlab.detrend_none (no detrending)] A detrending function applied to x and y. It must have the signature

```python
detrend(x: np.ndarray) -> np.ndarray
```

normed [bool, default: True] If True, input vectors are normalised to unit length.

usevlines [bool, default: True] Determines the plot style.

If True, vertical lines are plotted from 0 to the xcorr value using Axes.vlines. Additionally, a horizontal line is plotted at y=0 using Axes.axhline.

If False, markers are plotted at the xcorr values using Axes.plot.

maxlags [int, default: 10] Number of lags to show. If None, will return all 2 * len(x) - 1 lags.

Returns

lags [array (length 2*maxlags+1)] The lag vector.

c [array (length 2*maxlags+1)] The auto correlation vector.

line [LineCollection or Line2D] Artist added to the axes of the correlation:

• LineCollection if usevlines is True.

• Line2D if usevlines is False.

b [Line2D or None] Horizontal line at 0 if usevlines is True None usevlines is False.
Other Parameters

- **linestyle** [Line2D property, optional] The linestyle for plotting the data points. Only used if usevlines is False.
- **marker** [str, default: ‘o’] The marker for plotting the data points. Only used if usevlines is False.
- **kwargs** Additional parameters are passed to Axes.vlines and Axes.azhline if usevlines is True; otherwise they are passed to Axes.plot.

Notes

The cross correlation is performed with numpy.correlate with mode = "full".

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, y.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.axes.Axes.xcorr

- sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py

Statistics

- Axes.boxplot Make a box and whisker plot.
- Axes.violinplot Make a violin plot.
- Axes.violin Drawing function for violin plots.
- Axes.bxp Drawing function for box and whisker plots.

matplotlib.axes.Axes.boxplot

Axes.boxplot(self, x, notch=None, sym=None, vert=None, whis=None, positions=None, widths=None, patch_artist=None, bootstrap=None, usermedians=None, conf_intervals=None, meanline=None, showmeans=None, showcaps=None, showbox=None, showfliers=None, boxprops=None, capprops=None, whiskerprops=None, manage_ticks=True, autorange=False, zorder=None, *, data=None)

Make a box and whisker plot.

Make a box and whisker plot for each column of x or each vector in sequence x. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters
x [Array or a sequence of vectors.] The input data.

**notch** [bool, default: False] Whether to draw a notched box plot (True), or a rectangular box plot (False). The notches represent the confidence interval (CI) around the median. The documentation for bootstrap describes how the locations of the notches are computed.

**Note:** In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive “flipped” appearance. This is expected behavior and consistent with other statistical visualization packages.

**sym** [str, optional] The default symbol for flier points. An empty string (") hides the fliers. If None, then the fliers default to ‘b+’. More control is provided by the flierprops parameter.

**vert** [bool, default: True] If True, draws vertical boxes. If False, draw horizontal boxes.

**whis** [float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above Q1 - whis*(Q3-Q1), and the upper whisker at the highest datum below Q3 + whis*(Q3-Q1), where Q1 and Q3 are the first and third quartiles. The default value of whis = 1.5 corresponds to Tukey’s original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data. “range” is a deprecated synonym for (0, 100).

In the edge case where Q1 == Q3, whis is automatically set to (0, 100) (cover the whole range of the data) if autorange is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

**bootstrap** [int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If bootstrap is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

**usermedians** [array-like, optional] A 1D array-like of length len(x). Each entry that is not None forces the value of the median for the corresponding dataset. For entries that are None, the medians are computed by Matplotlib as normal.

**conf_intervals** [array-like, optional] A 2D array-like of shape (len(x), 2). Each entry that is not None forces the location of the corresponding notch (which is only drawn if notch is True). For entries that are None, the notches are computed by the method specified by the other parameters (e.g., bootstrap).
**positions** [array-like, optional] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to range(1, N+1) where N is the number of boxes to be drawn.

**widths** [float or array-like] Sets the width of each box either with a scalar or a sequence. The default is 0.5, or 0.15*(distance between extreme positions) if that is smaller.

**patch_artist** [bool, default: False] If False produces boxes with the Line2D artist. Otherwise, boxes and drawn with Patch artists.

**labels** [sequence, optional] Labels for each dataset (one per dataset).

**manage_ticks** [bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

**autorange** [bool, default: False] When True and the data are distributed such that the 25th and 75th percentiles are equal, *whis* is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

**meanline** [bool, default: False] If True (and *showmeans* is True), will try to render the mean as a line spanning the full width of the box according to *meanprops* (see below). Not recommended if *shownotches* is also True. Otherwise, means will be shown as points.

**zorder** [float, default: Line2D.zorder = 2] Sets the zorder of the boxplot.

**Returns**

**dict** A dictionary mapping each component of the boxplot to a list of the *Line2D* instances created. That dictionary has the following keys (assuming vertical boxplots):

- **boxes:** the main body of the boxplot showing the quartiles and the median’s confidence intervals if enabled.
- **medians:** horizontal lines at the median of each box.
- **whiskers:** the vertical lines extending to the most extreme, non-outlier data points.
- **caps:** the horizontal lines at the ends of the whiskers.
- **fliers:** points representing data that extend beyond the whiskers (fliers).
- **means:** points or lines representing the means.

**Other Parameters**

**showcaps** [bool, default: True] Show the caps on the ends of whiskers.

**showbox** [bool, default: True] Show the central box.

**showfliers** [bool, default: True] Show the outliers beyond the caps.

**showmeans** [bool, default: False] Show the arithmetic means.

**capprops** [dict, default: None] The style of the caps.

**boxprops** [dict, default: None] The style of the box.

**whiskerprops** [dict, default: None] The style of the whiskers.

**flierprops** [dict, default: None] The style of the fliers.
**medianprops** [dict, default: None] The style of the median.

**meanprops** [dict, default: None] The style of the mean.

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be a string, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using matplotlib.axes.Axes.boxplot**

- sphx_glr_gallery_statistics_boxplot_color.py
- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_pyplots_boxplot_demo_pyplot.py

**matplotlib.axes.Axes.violinplot**

```python
Axes.violinplot(self, dataset, positions=None, vert=True, widths=0.5,
                 showmeans=False, showextrema=True, showmedians=False, quantiles=None, points=100, bw_method=None, *, data=None)
```

Make a violin plot.

Make a violin plot for each column of `dataset` or each vector in sequence `dataset`. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and user-specified quantiles.

**Parameters**

- **dataset** [Array or a sequence of vectors.] The input data.

- **positions** [array-like, default: [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

- **vert** [bool, default: True.] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.

- **widths** [array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

- **showmeans** [bool, default: False] If `True`, will toggle rendering of the means.

- **showextrema** [bool, default: True] If `True`, will toggle rendering of the extrema.

- **showmedians** [bool, default: False] If `True`, will toggle rendering of the medians.
quantiles [array-like, default: None] If not None, set a list of floats in interval [0, 1] for each violin, which stands for the quantiles that will be rendered for that violin.

points [int, default: 100] Defines the number of points to evaluate each of the gaussian kernel density estimations at.

bw_method [str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be ‘scott’, ‘silverman’, a scalar constant or a callable. If a scalar, this will be used directly as kde.factor. If a callable, it should take a GaussianKDE instance as its only parameter and return a scalar. If None (default), ‘scott’ is used.

Returns
dict A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- **bodies**: A list of the PolyCollection instances containing the filled area of each violin.
- **cmeans**: A LineCollection instance that marks the mean values of each of the violin’s distribution.
- **cmins**: A LineCollection instance that marks the bottom of each violin’s distribution.
- **cmaxes**: A LineCollection instance that marks the top of each violin’s distribution.
- **cbars**: A LineCollection instance that marks the centers of each violin’s distribution.
- **cmedians**: A LineCollection instance that marks the median values of each of the violin’s distribution.
- **cquantiles**: A LineCollection instance created to identify the quantile values of each of the violin’s distribution.

Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data*[s] (unless this raises an exception): *dataset*.

Objects passed as *data* must support item access (*data*[s]) and membership test (*s in data)*.

Examples using matplotlib.axes.Axes.violinplot

- sphx_glr_gallery_statistics_customized_violin.py
The `violin` function in Matplotlib is used to draw violin plots. A violin plot is a method for visualizing the probability density of a numeric variable. Each violin represents the data range, with optional lines at the mean, median, minimum, maximum, and quantiles.

### Parameters

- **vpstats** [list of dicts] A list of dictionaries containing stats for each violin plot. Required keys are:
  - `coords`: A list of scalars containing the coordinates that the violin’s kernel density estimate was evaluated at.
  - `vals`: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in `coords`.
  - `mean`: The mean value for this violin’s dataset.
  - `median`: The median value for this violin’s dataset.
  - `min`: The minimum value for this violin’s dataset.
  - `max`: The maximum value for this violin’s dataset.

Optional keys are:
  - `quantiles`: A list of scalars containing the quantile values for this violin’s dataset.

- **positions** [array-like, default: [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

- **vert** [bool, default: True] If true, plots the violins vertically. Otherwise, plots the violins horizontally.

- **widths** [array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

- **showmeans** [bool, default: False] If true, will toggle rendering of the means.

- **showextrema** [bool, default: True] If true, will toggle rendering of the extrema.

- **showmedians** [bool, default: False] If true, will toggle rendering of the medians.

### Returns

- **dict** A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:
  - `bodies`: A list of the `PolyCollection` instances containing the filled area of each violin.
  - `cmeans`: A `LineCollection` instance that marks the mean values of each of the violin’s distribution.
• cmins: A LineCollection instance that marks the bottom of each violin’s distribution.
• cmaxes: A LineCollection instance that marks the top of each violin’s distribution.
• cbars: A LineCollection instance that marks the centers of each violin’s distribution.
• cmedians: A LineCollection instance that marks the median values of each of the violin’s distribution.
• cquantiles: A LineCollection instance created to identify the quantiles values of each of the violin’s distribution.

Examples using matplotlib.axes.Axes.violin

matplotlib.axes.Axes.bxp

Axes.bxp(self, bxpstats, positions=None, widths=None, vert=True, patch_artist=False, shownotches=False, showmeans=False, showcaps=True, showfliers=True, showboxes=True, boxprops=None, whiskerprops=None, flierprops=None, medianprops=None, cilo=None, cihi=None, label=None, positions=[1, 2, ..., n])

Drawing function for box and whisker plots.

Make a box and whisker plot for each column of x or each vector in sequence x. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

Parameters

bxpstats [list of dicts] A list of dictionaries containing stats for each boxplot. Required keys are:
• med: The median (scalar float).
• q1: The first quartile (25th percentile) (scalar float).
• q3: The third quartile (75th percentile) (scalar float).
• whislo: Lower bound of the lower whisker (scalar float).
• whishi: Upper bound of the upper whisker (scalar float).

Optional keys are:
• mean: The mean (scalar float). Needed if showmeans=True.
• fliers: Data beyond the whiskers (sequence of floats). Needed if showfliers=True.
• cilo & cihi: Lower and upper confidence intervals about the median. Needed if shownotches=True.
• label: Name of the dataset (string). If available, this will be used a tick label for the boxplot

positions [array-like, default: [1, 2, ..., n]] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions.
widths [array-like, default: None] Either a scalar or a vector and sets the width of each box. The default is $0.15 \times (\text{distance between extreme positions})$, clipped to no less than 0.15 and no more than 0.5.

vert [bool, default: True] If True (default), makes the boxes vertical. If False, makes horizontal boxes.

patch_artist [bool, default: False] If False produces boxes with the Line2D artist. If True produces boxes with the Patch artist.

shownotches [bool, default: False] If False (default), produces a rectangular box plot. If True, will produce a notched box plot.

showmeans [bool, default: False] If True, will toggle on the rendering of the means.

showcaps [bool, default: True] If True, will toggle on the rendering of the caps.

showbox [bool, default: True] If True, will toggle on the rendering of the box.

showfliers [bool, default: True] If True, will toggle on the rendering of the fliers.

boxprops [dict or None (default)] If provided, will set the plotting style of the boxes.

whiskerprops [dict or None (default)] If provided, will set the plotting style of the whiskers.

capprops [dict or None (default)] If provided, will set the plotting style of the caps.

flierprops [dict or None (default)] If provided will set the plotting style of the fliers.

medianprops [dict or None (default)] If provided, will set the plotting style of the medians.

meanprops [dict or None (default)] If provided, will set the plotting style of the means.

meanline [bool, default: False] If True (and showmeans is True), will try to render the mean as a line spanning the full width of the box according to meanprops. Not recommended if shownotches is also True. Otherwise, means will be shown as points.

manage_ticks [bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

Returns

dict A dictionary mapping each component of the boxplot to a list of the Line2D instances created. That dictionary has the following keys (assuming vertical boxplots):

- boxes: the main body of the boxplot showing the quartiles and the median’s confidence intervals if enabled.
- medians: horizontal lines at the median of each box.
• **whiskers**: the vertical lines extending to the most extreme, non-outlier data points.
• **caps**: the horizontal lines at the ends of the whiskers.
• **fliers**: points representing data that extend beyond the whiskers (fliers).
• **means**: points or lines representing the means.

Examples using `matplotlib.axes.Axes.bxp`
I never said they'd be pretty

Custom boxprops

Custom medianprops and flierprops

Custom mean as point

Custom mean as line
Binned

**Axes.hexbin**
Make a 2D hexagonal binning plot of points $x$, $y$.

**Axes.hist**
Plot a histogram.

**Axes.hist2d**
Make a 2D histogram plot.

```python
matplotlib.axes.Axes.hexbin(self, x, y, C=None, gridsize=100, bins=None, xscale='linear', yscale='linear', extent=None, cmap=None, norm=None, vmin=None, vmax=None, alpha=None, linewidths=None, edgecolors='face', reduce_C_function=<function mean at 0x7f39f99a09d0>, mincnt=None, marginals=False, *, data=None, **kwargs)
```

Make a 2D hexagonal binning plot of points $x$, $y$.

If $C$ is `None`, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, $C$ specifies values at the coordinate $(x[i], y[i])$. For each hexagon, these values are reduced using `reduce_C_function`.

**Parameters**

- **x, y** [array-like] The data positions. $x$ and $y$ must be of the same length.

- **C** [array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as $x$ and $y$.

- **gridsize** [int or (int, int), default: 100] If a single int, the number of hexagons in the $x$-direction. The number of hexagons in the $y$-direction is chosen such that the hexagons are approximately regular.
  Alternatively, if a tuple $(nx, ny)$, the number of hexagons in the $x$-direction and the $y$-direction.

- **bins** ['log' or int or sequence, default: None] Discretization of the hexagon values.
  - If `None`, no binning is applied; the color of each hexagon directly corresponds to its count value.
  - If 'log', use a logarithmic scale for the color map. Internally, $\log_{10}(i + 1)$ is used to determine the hexagon color. This is equivalent to `norm=LogNorm()`.
  - If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
  - If a sequence of values, the values of the lower bound of the bins to be used.

- **xscale** [{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

- **yscale** [{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.

- **mincnt** [int > 0, default: None] If not `None`, only display cells with more than `mincnt` number of points in the cell.
marginals [bool, default: False] If marginals is True, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

extent [float, default: None] The limits of the bins. The default assigns the limits based on gridsize, x, y, xscale and yscale.

If xscale or yscale is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

Returns

PolyCollection A PolyCollection defining the hexagonal bins.

- PolyCollection.get_offset contains a Mx2 array containing the x, y positions of the M hexagon centers.
- PolyCollection.get_array contains the values of the M hexagons.

If marginals is True, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes hbar and vbar.

Other Parameters

cmap [str or Colormap, default: rcParams["image.cmap"] (default: 'viridis')] The Colormap instance or registered colormap name used to map the bin values to colors.

norm [Normalize, optional] The Normalize instance scales the bin values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax [float, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of the bins in case of the default linear scaling). It is deprecated to use vmin/vmax when norm is given.

alpha [float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths [float, default: None] If None, defaults to 1.0.

edgecolors [{'face', 'none', None} or color, default: 'face'] The color of the hexagon edges. Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- None: Draw outlines in the default color.
- An explicit color.

reduce_C_function [callable, default: numpy.mean] The function to aggregate C within the bins. It is ignored if C is not given. This must have the signature:

```python
def reduce_C_function(C: array) -> float
```
Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpy.max`: value taken from the largest point

**kwargs [PolyCollection properties] All other keyword arguments are passed on to PolyCollection:

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using** matplotlib.axes.Axes.hexbin

- sphx_glr_gallery_statistics_hexbin_demo.py

**matplotlib.axes.Axes.hist**

```python
Axes.hist(self, x, bins=None, range=None, density=False, weights=None, cumulative=False, bottom=None, histtype='bar', align='mid', orientation='vertical', rwidth=None, log=False, color=None, label=None, stacked=False, *, data=None, **kwargs)
```

Plot a histogram.

Compute and draw the histogram of `x`. The return value is a tuple `n, bins, patches` or `([n0, n1, ...], bins, [patches0, patches1, ...])` if the input contains multiple data. See the documentation of the `weights` parameter to draw a histogram of already-binned data.

Multiple data can be provided via `x` as a list of datasets of potentially different length (`[x0, x1, ...]`), or as a 2-D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported.

The `bins`, `range`, `weights`, and `density` parameters behave as in `numpy.histogram`.

**Parameters**

- **x** `[n,] array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

- **bins** `[int or sequence or str, default: rcParams["hist.bins"] (default: 10)] If `bins` is an integer, it defines the number of equal-width bins in the range. If `bins` is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, bins may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if `bins` is:

  ```
  [1, 2, 3, 4]
  ```

  then the first bin is [1, 2) (including 1, but excluding 2) and the second [2, 3). The last bin, however, is [3, 4], which includes 4.

If `bins` is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: ‘auto’, ‘fd’, ‘doane’, ‘scott’, ‘stone’, ‘rice’, ‘sturges’, or ‘sqrt'.

---

**1120 Chapter 18. Modules**
**range** [tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, `range` is `(x.min(), x.max())`. Range has no effect if `bins` is a sequence.

If `bins` is a sequence or `range` is specified, autoscaling is based on the specified bin range instead of the range of `x`.

**density** [bool, default: False] If True, draw and return a probability density: each bin will display the bin’s raw count divided by the total number of counts and the bin width (density = counts / (sum(counts) * np.diff(bins))), so that the area under the histogram integrates to 1 (np.sum(density * np.diff(bins)) == 1).

If stacked is also True, the sum of the histograms is normalized to 1.

**weights** [(n,) array-like or None, default: None] An array of weights, of the same shape as `x`. Each value in `x` only contributes its associated weight towards the bin count (instead of 1). If `density` is True, the weights are normalized, so that the integral of the density over the range remains 1.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using `numpy.histogram` (by treating each bin as a single point with a weight equal to its count)

```python
counts, bins = np.histogram(data)
plt.hist(bins[1:], bins, weights=counts)
```

(or you may alternatively use `bar()`).

**cumulative** [bool or -1, default: False] If True, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If `density` is also True then the histogram is normalized such that the last bin equals 1.

If `cumulative` is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if `density` is also True, then the histogram is normalized such that the first bin equals 1.

**bottom** [array-like, scalar, or None, default: None] Location of the bottom of each bin, ie. bins are drawn from bottom to bottom + hist(x, bins) If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

**histtype** [{'bar', 'barstacked', 'step', 'stepfilled'}, default: 'bar'] The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- 'barstacked' is a bar-type histogram where multiple data are stacked on top of each other.
- 'step' generates a lineplot that is by default unfilled.
- 'stepfilled' generates a lineplot that is by default filled.

**align** [{'left', 'mid', 'right'}, default: 'mid'] The horizontal alignment of the histogram bars.
- 'left': bars are centered on the left bin edges.
- 'mid': bars are centered between the bin edges.
- 'right': bars are centered on the right bin edges.

**orientation** [{‘vertical’, ‘horizontal’}, default: ‘vertical’] If ‘horizontal’, barh will be used for bar-type histograms and the bottom kwarg will be the left edges.

**rwidth** [float or None, default: None] The relative width of the bars as a fraction of the bin width. If None, automatically compute the width.

Ignored if histtype is ‘step’ or ‘stepfilled’.

**log** [bool, default: False] If True, the histogram axis will be set to a log scale. If log is True and x is a 1D array, empty bins will be filtered out and only the non-empty (n, bins, patches) will be returned.

**color** [color or array-like of colors or None, default: None] Color or sequence of colors, one per dataset. Default (None) uses the standard line color sequence.

**label** [str or None, default: None] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that legend will work as expected.

**stacked** [bool, default: False] If True, multiple data are stacked on top of each other If False multiple data are arranged side by side if histtype is ‘bar’ or on top of each other if histtype is ‘step’

**Returns**

- **n** [array or list of arrays] The values of the histogram bins. See density and weights for a description of the possible semantics. If input x is an array, then this is an array of length nbins. If input is a sequence of arrays [data1, data2, ...], then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array n (or of its element arrays) will always be float even if no weighting or normalization is used.

- **bins** [array] The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

- **patches** [BarContainer or list of a single Polygon or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.

**Other Parameters**

**kwargs** Patch properties

**See also:**

- hist2d 2D histograms

**Notes**

For large numbers of bins (>1000), ‘step’ and ‘stepfilled’ can be significantly faster than ‘bar’ and ‘barstacked’.
**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `weights`. Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

`matplotlib.axes.Axes.hist2d`

`Axes.hist2d(self, x, y, bins=10, range=None, density=False, weights=None, cmin=None, cmax=None, *, data=None, **kwargs)`

Make a 2D histogram plot.

**Parameters**

- `x, y` [array-like, shape (n, )] Input values
- `bins` [None or int or [int, int] or array-like or [array, array]] The bin specification:
  - If int, the number of bins for the two dimensions (nx=ny=bins).
  - If [int, int], the number of bins in each dimension (nx, ny = bins).
  - If array-like, the bin edges for the two dimensions (x_edges=y_edges=bins).
  - If [array, array], the bin edges in each dimension (x_edges, y_edges = bins).
The default value is 10.

**range** [array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): [[xmin, xmax], [ymin, ymax]]. All values outside of this range will be considered outliers and not tallied in the histogram.

**density** [bool, default: False] Normalize histogram. See the documentation for the density parameter of `hist` for more details.

**weights** [array-like, shape (n, ), optional] An array of values w_i weighing each sample (x_i, y_i).

**cmin, cmax** [float, default: None] All bins that has count less than cmin or more than cmax will not be displayed (set to NaN before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return.

**Returns**

**h** [2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

**xedges** [1D array] The bin edges along the x axis.

**yedges** [1D array] The bin edges along the y axis.

**image** [QuadMesh]

**Other Parameters**

**cmap** [Colormap or str, optional] A `colors.Colormap` instance. If not set, use rc settings.

**norm** [Normalize, optional] A `colors.Normalize` instance is used to scale luminance data to [0, 1]. If not set, defaults to `colors.Normalize()`.

**vmin/vmax** [None or scalar, optional] Arguments passed to the Normalize instance.

**alpha** [0 <= scalar <= 1 or None, optional] The alpha blending value.

****kwargs** Additional parameters are passed along to the `pcolormesh` method and QuadMesh constructor.

**See also:**

**hist** 1D histogram plotting

**Notes**

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.

- Rendering the histogram with a logarithmic color scale is accomplished by passing a `colors.LogNorm` instance to the `norm` keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with `colors.PowerNorm`. 

Matplotlib, Release 3.3.0
**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `weights`. Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

- `sphx_glr_gallery_scales_power_norm.py`

**Contours**

| Axes.clabel | Label a contour plot. |
| Axess.contour | Plot contours. |
| Axes.contourf | Plot contours. |

`matplotlib.axes.Axes.clabel`

```python
Axes.clabel(self, CS, levels=None, **kwargs)
```
Label a contour plot.

Adds labels to line contours in given `ContourSet`.

**Parameters**

- **CS** [``ContourSet`` instance] Line contours to label.
- **levels** [array-like, optional] A list of level values, that should be labeled.
  The list must be a subset of `CS.levels`. If not given, all levels are labeled.
- ****kwargs** All other parameters are documented in `clabel`.

Examples using `matplotlib.axes.Axes.clabel`

Matplotlib, Release 3.3.0

`matplotlib.axes.Axes.contour`

```python
Axes.contour(self, *args, data=None, **kwargs)
```
Plot contours.

Call signature:

```python
contour([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

**Parameters**

- `X, Y` [array-like, optional] The coordinates of the values in `Z`.
  - `X` and `Y` must both be 2-D with the same shape as `Z` (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in `Z` and `len(Y) == N` is the number of rows in `Z`.
  - If not given, they are assumed to be integer indices, i.e. `X = range(M)`, `Y = range(N)`.

- `Z` [array-like(N, M)] The height values over which the contour is drawn.

- `levels` [int or array-like, optional] Determines the number and positions of the contour lines / regions.
  - If an int `n`, use `MaxNLocator`, which tries to automatically choose no more than `n+1` “nice” contour levels between `vmin` and `vmax`.
  - If array-like, draw contour lines at the specified levels. The values must be in increasing order.

**Returns**

- `QuadContourSet`

**Other Parameters**

- `corner_mask` [bool, default: `rcParams["contour.corner_mask"]`](default: `True`) Enable/disable corner masking, which only has an effect if `Z` is a masked array. If `False`, any quad touching a masked point is masked out. If `True`, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

- `colors` [color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.
  - The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it’s repeated.
  - As a shortcut, single color strings may be used in place of one-element lists, i.e. `"red"` instead of `"[red]"` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.
  - By default (value `None`), the colormap specified by `cmap` will be used.

- `alpha` [float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).
**cmap** [str or `Colormap`, default: `rcParams["image.cmap"]` (default: ‘viridis’)]

A `Colormap` instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

**norm** [`Normalize`, optional] If a colormap is used, the `Normalize` instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax** [float, optional] If not `None`, either or both of these values will be supplied to the `Normalize` instance, overriding the default color scaling based on `levels`.

**origin** [{`None`, ‘upper’, ‘lower’, ‘image’}, default: `None`] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.

- `None`: Z[0, 0] is at X=0, Y=0 in the lower left corner.
- ‘lower’: Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- ‘upper’: Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- ‘image’: Use the value from `rcParams["image.origin"]` (default: ‘upper’).

**extent** [(x0, x1, y0, y1), optional] If `origin` is not `None`, then `extent` is interpreted as in `imshow`: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If `origin` is `None`, then (x0, y0) is the position of Z[0, 0], and (x1, y1) is the position of Z[-1, -1].

This argument is ignored if X and Y are specified in the call to contour.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via `levels`. Defaults to `MaxNLocator`.

**extend** [{'neither', 'both', 'min', 'max'}, default: ‘neither’] Determines the contourf-coloring of values that are outside the `levels` range.

If ‘neither’, values outside the `levels` range are not colored. If ‘min’, ‘max’ or ‘both’, color the values below, above or below and above the `levels` range.

Values below min(`levels`) and above max(`levels`) are mapped to the under/over values of the `Colormap`. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

**Note:** An existing `QuadContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `QuadContourSet` because it internally calls `QuadContourSet.changed()`.

Example:
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                  colors=['#908080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
2. *contourf* fills intervals that are closed at the top; that is, for boundaries $z_1$ and $z_2$, the filled region is:

$$z_1 < Z \leq z_2$$

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

- sphx_glr_gallery_mplot3d_contour3d_3.py

`matplotlib.axes.Axes.contourf`

`Axes.contourf(self, *args, data=None, **kwargs)`

Plot contours.

**Call signature:**

```
contour([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

**Parameters**

- **X, Y** [array-like, optional] The coordinates of the values in Z.
  
  X and Y must both be 2-D with the same shape as Z (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in Z and `len(Y) == N` is the number of rows in Z.

  If not given, they are assumed to be integer indices, i.e. `X = range(M), Y = range(N)`.

- **Z** [array-like(N, M)] The height values over which the contour is drawn.
levels [int or array-like, optional] Determines the number and positions of
the contour lines / regions.

If an int n, use MaxNLocator, which tries to automatically choose no more
than n+1 “nice” contour levels between vmin and vmax.

If array-like, draw contour lines at the specified levels. The values must
be in increasing order.

Returns
 QuadContourSet

Other Parameters

corner_mask [bool, default: rcParams["contour.corner_mask"] (default: True)]
Enable/disable corner masking, which only has an effect if Z is
a masked array. If False, any quad touching a masked point is masked
out. If True, only the triangular corners of quads nearest those points are
always masked out, other triangular corners comprising three unmasked
points are contoured as usual.

colors [color string or sequence of colors, optional] The colors of the levels,
i.e. the lines for contour and the areas for contourf.

The sequence is cycled for the levels in ascending order. If the sequence
is shorter than the number of levels, it’s repeated.

As a shortcut, single color strings may be used in place of one-element
lists, i.e. 'red' instead of ['red'] to color all levels with the same color.
This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value None), the colormap specified by cmap will be used.

alpha [float, default: 1] The alpha blending value, between 0 (transparent)
and 1 (opaque).

cmap [str or Colormap, default: rcParams["image.cmap"] (default: 'viridis')] A
Colormap instance or registered colormap name. The colormap maps
the level values to colors.

If both colors and cmap are given, an error is raised.

norm [Normalize, optional] If a colormap is used, the Normalize instance
scales the level values to the canonical colormap range [0, 1] for mapping
to colors. If not given, the default linear scaling is used.

vmin, vmax [float, optional] If not None, either or both of these values will
be supplied to the Normalize instance, overriding the default color scaling
based on levels.

origin [{"None", 'upper', 'lower', 'image'}, default: None] Determines the
orientation and exact position of Z by specifying the position of Z[0, 0].
This is only relevant, if X, Y are not given.

• None: Z[0, 0] is at X=0, Y=0 in the lower left corner.
• 'lower': Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
• 'upper': Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
• 'image': Use the value from rcParams["image.origin"] (default:
  'upper').
**extent**  [(x0, x1, y0, y1), optional] If *origin* is not *None*, then **extent** is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (x0, y0) is the position of Z[0, 0], and (x1, y1) is the position of Z[-1, -1].

This argument is ignored if X and Y are specified in the call to contour.

**locator**  [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

**extend**  [{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the contourf-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below min(*levels*) and above max(*levels*) are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

**Note:** An existing *QuadContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call *QuadContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *QuadContourSet* because it internally calls *QuadContourSet.changed()*.

---

**Example:**

```python
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                  colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

**xunits, yunits**  [registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

**antialiased**  [bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is *True*. For line contours, it is taken from *rcParams*["lines.antialiased"] (default: *True*).

**nchunk**  [int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of *nchunk* by *nchunk* quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the *antialiased* flag and value of *alpha*. 
**linewidths** [float or array-like, default: `rcParams["contour.linewidth"]` (default: None)] *(Only applies to `contour`)*

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

**linestyles** [{`None`, `solid`, `dashed`, `dashdot`, `dotted`}, optional] *(Only applies to `contour`)*

If `linestyles` is `None`, the default is `solid` unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: `dashed`) setting.

`linestyles` can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**hatches** [List[str], optional] *(Only applies to `contourf`)*

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

**Notes**

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.

2. `contourf` fills intervals that are closed at the top; that is, for boundaries $z_1$ and $z_2$, the filled region is:

   \[ z_1 < Z \leq z_2 \]

   except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

```
matplotlib.axes.Axes.imshow
```

The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image set up the color mapping using the parameters cmap='gray', vmin=0, vmax=255.

The number of pixels used to render an image is set by the axes size and the dpi of the figure. This can lead to aliasing artifacts when the image is resampled because the displayed image size will usually not match the size of X (see gallery/images_contours_and_fields/image_antialiasing). The resampling can be controlled via the interpolation parameter and/or rcParams["image.interpolation"] (default: 'antialiased').

**Parameters**

**X** [array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters norm, cmap, vmin, vmax.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

**cmap** [str or Colormap, default: rcParams["image.cmap"] (default: 'viridis')] The Colormap instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data.
**norm** [Normalize, optional] The Normalize instance used to scale scalar data to the [0, 1] range before mapping to colors using cmap. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

**aspect** [{‘equal’, ‘auto’} or float, default: rcParams[“image.aspect”] (default: ‘equal’)] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling Axes.set_aspect. See there for further details.

- ‘equal’: Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using extent).
- ‘auto’: The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.

**interpolation** [str, default: rcParams[“image.interpolation”] (default: ‘antialiased’)] The interpolation method used.

If interpolation is ‘none’, then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to ‘nearest’. Note that most SVG renderers perform interpolation at rendering and that the default interpolation method they implement may differ.

If interpolation is the default ‘antialiased’, then ‘nearest’ interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller than 3, or the image is downsampled, then ‘hanning’ interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See /gallery/images_contours_and_fields/interpolation_methods for an overview of the supported interpolation methods, and /gallery/images_contours_and_fields/image_antialiasing for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by filterrad. Additionally, the antigrain image resize filter is controlled by the parameter filternorm.

**alpha** [float or array-like, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If alpha is an array, the alpha blending values are applied pixel by pixel, and alpha must have the same shape as X.

**vmin, vmax** [float, optional] When using scalar data and no explicit norm, vmin and vmax define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. It is deprecated to use vmin/vmax when norm is given.

**origin** [{‘upper’, ‘lower’}, default: rcParams[“image.origin”] (default: ‘upper’)] Place the [0, 0] index of the array in the upper left or lower
left corner of the axes. The convention (the default) 'upper' is typically used for matrices and images.

Note that the vertical axes points upward for 'lower' but downward for 'upper'.

See the `origin and extent in imshow` tutorial for examples and a more detailed description.

**extent** [floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on `origin`:

• For `origin == 'upper'` the default is \((-0.5, \text{numcols}-0.5, \text{numrows}-0.5, -0.5)\).
• For `origin == 'lower'` the default is \((-0.5, \text{numcols}-0.5, -0.5, \text{numrows}-0.5)\).

See the `origin and extent in imshow` tutorial for examples and a more detailed description.

**filternorm** [bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If `filternorm` is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

**filterrad** [float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

**resample** [bool, default: `rcParams["image.resample"]` (default: True)] When `True`, use a full resampling method. When `False`, only resample when the output image is larger than the input image.

**url** [str, optional] Set the url of the created `AxesImage`. See `Artist.set_url`.

**Returns**

`AxesImage`

**Other Parameters**

**kwargs** [`Artist` properties] These parameters are passed on to the constructor of the `AxesImage` artist.

**See also:**

`matshow` Plot a matrix or an array as an image.
Notes

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

`imshow` expects RGB images adopting the straight (unassociated) alpha representation.

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as *data* must support item access (`data[s]`) and membership test (`s in data`).

Axes.matshow

Axes.matshow(self, Z, **kwargs)

Plot the values of a 2D matrix or array as color-coded image.

The matrix will be shown the way it would be printed, with the first row at the top. Row and column numbering is zero-based.

Parameters
Z [array-like(M, N)] The matrix to be displayed.

Returns

AxesImage

Other Parameters

**kwargs [imshow arguments]

See also:

imshow More general function to plot data on a 2D regular raster.

Notes

This is just a convenience function wrapping imshow to set useful defaults for displaying a matrix. In particular:

• Set origin='upper'.
• Set interpolation='nearest'.
• Set aspect='equal'.
• Ticks are placed to the left and above.
• Ticks are formatted to show integer indices.

Examples using matplotlib.axes.Axes.matshow

• sphx_glr_gallery_images_contours_and_fields_matshow.py

matplotlib.axes.Axes.pcolor

Axes.pcolor(self, *args, shading=None, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

pcolor([X, Y,] C, **kwargs)

X and Y can be used to specify the corners of the quadrilaterals.

Hint: pcolor() can be very slow for large arrays. In most cases you should use the similar but much faster pcolormesh instead. See Differences between pcolor() and pcolormesh() for a discussion of the differences.

Parameters

C [array-like] A scalar 2-D array. The values will be color-mapped.

X, Y [array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:
Matplotlib, Release 3.3.0

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the Notes section below.

If shading='flat' the dimensions of X and Y should be one greater than those of C, and the quadrilateral is colored due to the value at C[i, j]. If X, Y and C have equal dimensions, a warning will be raised and the last row and column of C will be ignored.

If shading='nearest', the dimensions of X and Y should be the same as those of C (if not, a ValueError will be raised). The color C[i, j] will be centered on (X[i, j], Y[i, j]).

If X and/or Y are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

shading [{‘flat’, ‘nearest’, ‘auto’}, optional] The fill style for the quadrilateral; defaults to ‘flat’ or rcParams["pcolor.shading"] (default: ‘flat’). Possible values:

- ‘flat’: A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by C[i, j]. The dimensions of X and Y should be one greater than those of C; if they are the same as C, then a deprecation warning is raised, and the last row and column of C are dropped.

- ‘nearest’: Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of X and Y must be the same as C.

- ‘auto’: Choose ‘flat’ if dimensions of X and Y are one larger than C. Choose ‘nearest’ if dimensions are the same.

See /gallery/images_contours_and_fields/pcolormesh_grids for more description.

cmap [str or Colormap, default: rcParams["image.cmap"] (default: ‘viridis’)]
A Colormap instance or registered colormap name. The colormap maps the C values to colors.

norm [Normalize, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax [float, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of C in case of the default linear scaling). It is deprecated to use vmin/vmax when norm is given.

decorators [{‘none’, None, ‘face’, color, color sequence}, optional] The color of the edges. Defaults to ‘none’. Possible values:

- ‘none’ or ’": No edge.
None: rcParams["patch.edgecolor"] (default: 'black') will be used.
Note that currently rcParams["patch.force_edgecolor"] (default: False)
has to be True for this to work.

'face': Use the adjacent face color.
• A color or sequence of colors will set the edge color.

The singular form edgecolor works as an alias.

alpha [float, default: None] The alpha blending value of the face color, be-
tween 0 (transparent) and 1 (opaque). Note: The edgecolor is currently
not affected by this.

snap [bool, default: False] Whether to snap the mesh to pixel boundaries.

Returns

matplotlib.collections.Collection

Other Parameters

antialiaseds [bool, default: False] The default antialiaseds is False if
the default edgecolors="none" is used. This eliminates artificial lines
at patch boundaries, and works regardless of the value of alpha. If
defaults is not "none", then the default antialiaseds is taken from
rcParams["patch.antialiased"] (default: True). Stroking the edges may
be preferred if alpha is 1, but will cause artifacts otherwise.

**kwargs Additionally, the following arguments are allowed. They are
passed along to the PolyCollection constructor:

<table>

- `imshow` If X and Y are each equidistant, `imshow` can be a faster alternative.

Notes

**Masked arrays**

X, Y and C may be masked arrays. If either C[i, j], or one of the vertices surrounding C[i, j] (X or Y at [i, j], [i+1, j], [i, j+1], [i+1, j+1]) is masked, nothing is plotted.

**Grid orientation**

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string s, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.axes.Axes.pcolor`

- `sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py`
- `sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py`

`Axes.pcolorfast`

`Axes.pcolorfast(self, *args, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)`

Create a pseudocolor plot with a non-regular rectangular grid.
Call signature:

```python
ax.pcolorfast([X, Y], C, /, **kwargs)
```

This method is similar to `pcolor` and `pcolormesh`. It’s designed to provide the fastest pcolor-type plotting with the Agg backend. To achieve this, it uses different algorithms internally depending on the complexity of the input grid (regular rectangular, non-regular rectangular or arbitrary quadrilateral).

**Warning:** This method is experimental. Compared to `pcolor` or `pcolormesh` it has some limitations:

- It supports only flat shading (no outlines)
- It lacks support for log scaling of the axes.
- It does not have a have a pyplot wrapper.

**Parameters**

- **C** [array-like(M, N)] The image data. Supported array shapes are:
  - (M, N): an image with scalar data. The data is visualized using a colormap.
  - (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
  - (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

  The first two dimensions (M, N) define the rows and columns of the image.

  This parameter can only be passed positionally.

- **X, Y** [tuple or array-like, default: (0, N), (0, M)] X and Y are used to specify the coordinates of the quadrilaterals. There are different ways to do this:
  - Use tuples `X=(xmin, xmax)` and `Y=(ymin, ymax)` to define a uniform rectangular grid.
    The tuples define the outer edges of the grid. All individual quadrilaterals will be of the same size. This is the fastest version.
  - Use 1D arrays `X, Y` to specify a non-uniform rectangular grid.
    In this case `X` and `Y` have to be monotonic 1D arrays of length `N+1` and `M+1`, specifying the x and y boundaries of the cells.
    The speed is intermediate. Note: The grid is checked, and if found to be uniform the fast version is used.
  - Use 2D arrays `X, Y` if you need an arbitrary quadrilateral grid (i.e. if the quadrilaterals are not rectangular).
    In this case `X` and `Y` are 2D arrays with shape `(M + 1, N + 1)`, specifying the x and y coordinates of the corners of the colored quadrilaterals.
    This is the most general, but the slowest to render. It may produce faster and more compact output using ps, pdf, and svg backends, however.
These arguments can only be passed positionally.

**cmap**  
[str or `Colormap`, default: `rcParams["image.cmap"]` (default: 'viridis')]  
A Colormap instance or registered colormap name. The colormap maps the $C$ values to colors.

**norm**  
`[Normalize, optional]` The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax**  
[float, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of $C$ in case of the default linear scaling). It is deprecated to use vmin/vmax when norm is given.

**alpha**  
[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

**snap**  
[bool, default: False] Whether to snap the mesh to pixel boundaries.

**Returns**

`AxesImage` or `PcolorImage` or `QuadMesh`  
The return type depends on the type of grid:

- `AxesImage` for a regular rectangular grid.
- `PcolorImage` for a non-regular rectangular grid.
- `QuadMesh` for a non-rectangular grid.

**Other Parameters**

**kwargs**  
Supported additional parameters depend on the type of grid. See return types of `image` for further description.

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string s, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using matplotlib.axes.Axes.pcolorfast**

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py

**matplotlib.axes.Axes.pcolormesh**

`Axes.pcolormesh(self, *args, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, shading=None, antialiased=False, data=None, **kwargs)`  
Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:
pcolormesh([X, Y,] C, **kwargs)

X and Y can be used to specify the corners of the quadrilaterals.

**Hint:** *pcolormesh* is similar to *pcolor*. It is much faster and preferred in most cases. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

**Parameters**

- **C** [array-like] A scalar 2-D array. The values will be color-mapped.
- **X, Y** [array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

\[
\begin{align*}
(X[i+1, j], Y[i+1, j]) & \quad (X[i+1, j+1], Y[i+1, j+1]) \\
| & \\
(X[i, j], Y[i, j]) & \quad (X[i, j+1], Y[i, j+1])
\end{align*}
\]

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the **Notes** section below.

- If shading='flat' the dimensions of X and Y should be one greater than those of C, and the quadrilateral is colored due to the value at C[i, j]. If X, Y and C have equal dimensions, a warning will be raised and the last row and column of C will be ignored.

- If shading='nearest' or 'gouraud', the dimensions of X and Y should be the same as those of C (if not, a ValueError will be raised). For 'nearest' the color C[i, j] is centered on (X[i, j], Y[i, j]). For 'gouraud', a smooth interpolation is carried out between the quadrilateral corners.

- If X and/or Y are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

- **cmap** [str or *Colormap*, default: rcParams['image.cmap'] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps the C values to colors.

- **norm** [Normalize, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

- **vmin, vmax** [float, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of C in case of the default linear scaling). It is deprecated to use vmin/vmax when norm is given.

- **edgecolors** [{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:
  - 'none' or "": No edge.
  - **None**: rcParams['patch.edgecolor'] (default: 'black') will be used. Note that currently rcParams['patch.force_edgecolor'] (default: False) has to be True for this to work.
- `face`: Use the adjacent face color.
- A color or sequence of colors will set the edge color.

  The singular form `edgecolor` works as an alias.

**alpha** [float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

**shading** [{‘flat’, ‘nearest’, ‘gouraud’, ‘auto’}, optional] The fill style for the quadrilateral; defaults to ‘flat’ or `rcParams["pcolor.shading"]` (default: ‘flat’). Possible values:

  - ‘flat’: A solid color is used for each quad. The color of the quad `(i, j), (i+1, j), (i, j+1), (i+1, j+1)` is given by `C[i, j]`. The dimensions of `X` and `Y` should be one greater than those of `C`; if they are the same as `C`, then a deprecation warning is raised, and the last row and column of `C` are dropped.

  - ‘nearest’: Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of `X` and `Y` must be the same as `C`.

  - ‘gouraud’: Each quad will be Gouraud shaded: The color of the corners `(i', j')` are given by `C[i', j']`. The color values of the area in between is interpolated from the corner values. The dimensions of `X` and `Y` must be the same as `C`. When Gouraud shading is used, `edgecolors` is ignored.

  - ‘auto’: Choose ‘flat’ if dimensions of `X` and `Y` are one larger than `C`. Choose ‘nearest’ if dimensions are the same.

  See `/gallery/images_contours_and_fields/pcolormesh_grids` for more description.

**snap** [bool, default: False] Whether to snap the mesh to pixel boundaries.

**Returns**

`matplotlib.collections.QuadMesh`

**Other Parameters**

**kwargs** Additionally, the following arguments are allowed. They are passed along to the `QuadMesh` constructor:

<table>
<thead>
<tr>
<th>Property</th>

See also:

`pcolor` An alternative implementation with slightly different features. For a detailed discussion on the differences see [Differences between `pcolor()` and `pcolormesh()`](#).

`imshow` If X and Y are each equidistant, `imshow` can be a faster alternative.

Notes

Masked arrays

C may be a masked array. If C[i, j] is masked, the corresponding quadrilateral will be transparent. Masking of X and Y is not supported. Use `pcolor` if you need this functionality.

Grid orientation

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

Differences between `pcolor()` and `pcolormesh()`

Both methods are used to create a pseudocolor plot of a 2-D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While `pcolor` returns a `PolyCollection`, `pcolormesh` returns a `QuadMesh`. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.
There is also a slight difference in the handling of masked arrays. Both `pcolor` and `pcolormesh` support masked arrays for C. However, only `pcolor` supports masked arrays for X and Y. The reason lies in the internal handling of the masked values. `pcolor` leaves out the respective polygons from the PolyCollection. `pcolormesh` sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in `pcolor` is not drawn as the corresponding polygons do not exist in the PolyCollection.

Another difference is the support of Gouraud shading in `pcolormesh`, which is not available with `pcolor`.

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string s, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

- Constrained Layout Guide
- Creating Colormaps in Matplotlib
- Colormap Normalization

```python
Axes.spy(self, Z, precision=0, marker=None, markersize=None, aspect='equal', origin='upper', **kwargs)
```

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

**Image style**

If `marker` and `markersize` are `None`, `imshow` is used. Any extra remaining keyword arguments are passed to this method.

**Marker style**
If \( Z \) is a `scipy.sparse.spmatrix` or `marker` or `markersize` are `None`, a `Line2D` object will be returned with the value of `marker` determining the marker type, and any remaining keyword arguments passed to `plot`.

**Parameters**

- **Z** [array-like (M, N)] The array to be plotted.
- **precision** [float or ‘present’, default: 0] If `precision` is 0, any non-zero value will be plotted. Otherwise, values of \( |Z| > precision \) will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass ‘present’. In this case any value present in the array will be plotted, even if it is identically zero.

- **aspect** [{‘equal’, ‘auto’, None} or float, default: ‘equal’] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling `Axes.set_aspect`. See there for further details.

- ‘equal’: Ensures an aspect ratio of 1. Pixels will be square.
- ‘auto’: The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.
- `None`: Use `rcParams["image.aspect"]` (default: ‘equal’).

- **origin** [{‘upper’, ‘lower’}, default: `rcParams["image.origin"]` (default: ‘upper’)] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention ‘upper’ is typically used for matrices and images.

**Returns**

- `AxesImage` or `Line2D` The return type depends on the plotting style (see above).

**Other Parameters**

- ****kwargs The supported additional parameters depend on the plotting style.

  For the image style, you can pass the following additional parameters of `imshow`:
  - `cmap`
  - `alpha`
  - `url`
  - any `Artist` properties (passed on to the `AxesImage`)

  For the marker style, you can pass any `Line2D` property except for `linestyle`.

**Examples using matplotlib.axes.Axes.spy**

- sphx_glr_gallery_images_contours_and_fields_spy_demos.py

**Unstructured Triangles**
Axes.tripcolor

Create a pseudocolor plot of an unstructured triangular grid. The triangulation can be specified in one of two ways; either:

- `Axes.tripcolor(triangulation, ...)`
- `Axes.tripcolor(x, y, ...)`
- `Axes.tripcolor(x, y, triangles, ...)`
- `Axes.tripcolor(x, y, mask=mask, ...)`

The triangulation must be a `Triangulation` object, or

The next argument must be `C`, the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the kwarg `facecolors=C` instead of just `C`.

`shading` may be ‘flat’ (the default) or ‘gouraud’. If `shading` is ‘flat’ and `C` values are defined at points, the color values used for each triangle are from the mean `C` of the triangle’s three points. If `shading` is ‘gouraud’ then color values must be defined at points.

The remaining kwargs are the same as for `pcolor`.

Examples using `matplotlib.axes.Axes.tripcolor`

- sphx_glr_gallery_images_contours_and_fields_tripcolor_demo.py

Axes.triplot

Draw a unstructured triangular grid as lines and/or markers. The triangulation to plot can be specified in one of two ways; either:

- `Axes.triplot(ax, *args, **kwargs)`
```python
triplot(triangulation, ...)
```

where triangulation is a _Triangulation_ object, or

```python
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a _Triangulation_ object will be created. See _Triangulation_ for an explanation of these possibilities.

The remaining args and kwargs are the same as for _plot_.

**Returns**

- **lines** [Line2D] The drawn triangles edges.
- **markers** [Line2D] The drawn marker nodes.

### Examples using `matplotlib.axes.Axes.triplot`

- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py
- sphx_glr_gallery_images_contours_and_fields_triplot_demo.py

### `matplotlib.axes.Axes.tricontour`

```python
Axes.tricontour(ax, *args, **kwargs)
```

Draw contour lines on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```python
tricontour(triangulation, ...)
```

where _triangulation_ is a _Triangulation_ object, or

```python
tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)
```

in which case a _Triangulation_ object will be created. See that class’ docstring for an explanation of these cases.

The remaining arguments may be:

```python
tricontour(..., Z)
```
where \( Z \) is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```python
tricontour(..., Z, levels)
```

contour up to \( \text{levels}+1 \) automatically chosen contour levels (\( \text{levels} \) intervals).

```python
tricontour(..., Z, levels)
```

draw contour lines at the values specified in sequence \( \text{levels} \), which must be in increasing order.

```python
tricontour(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

**Parameters**

- **triangulation** [Triangulation, optional] The unstructured triangular grid.
  
  If specified, then \( x \), \( y \), \( \text{triangles} \), and \( \text{mask} \) are not accepted.

- **x**, **y** [array-like, optional] The coordinates of the values in \( Z \).

- **triangles** [int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anti-clockwise manner. If not specified, the Delaunay triangulation is calculated.

- **mask** [bool array-like of shape (ntri), optional] Which triangles are masked out.

- **Z** [array-like(N, M)] The height values over which the contour is drawn.

- **levels** [int or array-like, optional] Determines the number and positions of the contour lines / regions.
  
  If an int \( n \), use MaxNLocator, which tries to automatically choose no more than \( n+1 \) “nice” contour levels between \( \text{vmin} \) and \( \text{vmax} \).

  If array-like, draw contour lines at the specified levels. The values must be in increasing order.

**Returns**

- **TriContourSet**

**Other Parameters**

- **colors** [color string or sequence of colors, optional] The colors of the levels, i.e., the contour lines.
  
  The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it’s repeated.

  As a shortcut, single color strings may be used in place of one-element lists, i.e. ‘red’ instead of [‘red’] to color all levels with the same color.

  This shortcut does only work for color strings, not for other ways of specifying colors.

  By default (value \( \text{None} \)), the colormap specified by \( \text{cmap} \) will be used.
**alpha** [float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap** [str or Colormap, default: rcParams["image.cmap"] (default: ‘viridis’)]
A Colormap instance or registered colormap name. The colormap maps the level values to colors.

If both `colors` and `cmap` are given, an error is raised.

**norm** [Normalize, optional] If a colormap is used, the Normalize instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**origin** [{None, ‘upper’, ‘lower’, ‘image’}, default: None] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.

- **None**: Z[0, 0] is at X=0, Y=0 in the lower left corner.
- **‘lower’**: Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- **‘upper’**: Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- **‘image’**: Use the value from rcParams["image.origin"] (default: ‘upper’).

**extent** [(x0, x1, y0, y1), optional] If `origin` is not `None`, then `extent` is interpreted as in `imshow`: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If `origin` is `None`, then (x0, y0) is the position of Z[0, 0], and (x1, y1) is the position of Z[-1, -1].

This argument is ignored if X and Y are specified in the call to contour.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via `levels`. Defaults to `MaxNLocator`.

**extend** [{‘neither’, ‘both’, ‘min’, ‘max’}, default: ‘neither’] Determines the tricontour-coloring of values that are outside the `levels` range.

If ‘neither’, values outside the `levels` range are not colored. If ‘min’, ‘max’ or ‘both’, color the values below, above or below and above the `levels` range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the Colormap. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

**Note:** An existing `TriContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call to `ContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `TriContourSet` because it internally calls `ContourSet.changed()`.

**xunits, yunits** [registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.
**linewidths** [float or array-like, default: `rcParams["contour.linewidth"]` (default: None)] The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

**linestyles** [{None, ‘solid’, ‘dashed’, ‘dashdot’, ‘dotted’}, optional] If `linestyles` is None, the default is ‘solid’ unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: ‘dashed’) setting.

`linestyles` can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**Examples using matplotlib.axes.Axes.tricontour**

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_demo.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_mplot3d_tricontour3d.py

**matplotlib.axes.Axes.tricontourf**

`Axes.tricontourf(ax, *args, **kwargs)`

Draw contour regions on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontourf(triangulation, ...)
```

where `triangulation` is a `Triangulation` object, or

```
tricontourf(x, y, ...)
tricontourf(x, y, triangles, ...)
tricontourf(x, y, triangles=triangles, ...)
tricontourf(x, y, mask=mask, ...)
tricontourf(x, y, triangles, mask=mask, ...)
```

in which case a `Triangulation` object will be created. See that class’ docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontourf(..., Z)
```

where `Z` is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.
tricontourf(..., Z, levels)

countour up to levels+1 automatically chosen contour levels (levels intervals).

tricontourf(..., Z, levels)

draw contour regions at the values specified in sequence levels, which must be in increasing order.

tricontourf(Z, **kwargs)

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

Parameters

- **triangulation** ([Triangulation, optional]) The unstructured triangular grid.
  
  If specified, then x, y, triangles, and mask are not accepted.

- **x, y** ([array-like, optional]) The coordinates of the values in Z.

- **triangles** ([int array-like of shape (ntri, 3), optional]) For each triangle, the indices of the three points that make up the triangle, ordered in an anti-clockwise manner. If not specified, the Delaunay triangulation is calculated.

- **mask** ([bool array-like of shape (ntri), optional]) Which triangles are masked out.

- **Z** ([array-like(N, M)]) The height values over which the contour is drawn.

- **levels** ([int or array-like, optional]) Determines the number and positions of the contour lines / regions.

  If an int n, use MaxNLocator, which tries to automatically choose no more than n+1 “nice” contour levels between vmin and vmax.

  If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

- **TriContourSet**

Other Parameters

- **colors** ([color string or sequence of colors, optional]) The colors of the levels, i.e., the contour regions.

  The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

  As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

  By default (value None), the colormap specified by cmap will be used.

- **alpha** ([float, default: 1]) The alpha blending value, between 0 (transparent) and 1 (opaque).
**cmap** [str or *Colormap*, default: *rcParams["image.cmap"]* (default: ‘viridis’)]

A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

**norm** [*Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**origin** [{*None*, ‘upper’, ‘lower’, ‘image’}, default: *None*] Determines the orientation and exact position of Z by specifying the position of *Z*[0, 0]. This is only relevant, if *X*, *Y* are not given.

- *None*: *Z*[0, 0] is at *X*=0, *Y*=0 in the lower left corner.
- ‘lower’: *Z*[0, 0] is at *X*=0.5, *Y*=0.5 in the lower left corner.
- ‘upper’: *Z*[0, 0] is at *X*=*N*+0.5, *Y*=0.5 in the upper left corner.
- ‘image’: Use the value from *rcParams["image.origin"]* (default: ‘upper’).

**extent** [{*x0*, *x1*, *y0*, *y1*}, optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of *Z*[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (*x0*, *y0*) is the position of *Z*[0, 0], and (*x1*, *y1*) is the position of *Z*[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to contour.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

**extend** [{'neither', 'both', 'min', 'max'}, default: ‘neither’] Determines the tricontourf-coloring of values that are outside the *levels* range.

If ‘neither’, values outside the *levels* range are not colored. If ‘min’, ‘max’ or ‘both’, color the values below, above or below and above the *levels* range.

Values below *min(levels)* and above *max(levels)* are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

**Note:** An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

**xunits**, **yunits** [registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

**antialiased** [bool, default: True] Whether to use antialiasing.
Notes

`tricontourf` fills intervals that are closed at the top; that is, for boundaries $z1$ and $z2$, the filled region is:

$$z1 < Z \leq z2$$

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Text and Annotations

| `Axes.annotate` | Annotate the point $xy$ with text `text`. |
| `Axes.text`     | Add text to the axes.                      |
| `Axes.table`    | Add a table to an `Axes`.                  |
| `Axes.arrow`    | Add an arrow to the axes.                  |
| `Axes.inset_axes` | Add a child inset axes to this existing axes. |
| `Axes.indicate_inset` | Add an inset indicator to the axes.        |
| `Axes.indicate_inset_zoom` | Add an inset indicator rectangle to the axes based on the axis limits for an `inset_ax` and draw connectors between `inset_ax` and the rectangle. |
| `Axes.secondary_xaxis` | Add a second x-axis to this axes.          |
| `Axes.secondary_yaxis` | Add a second y-axis to this axes.          |

`matplotlib.axes.Axes.annotate`

```
Axes.annotate(self, text, xy, *args, **kwargs)
```

Annotate the point $xy$ with text `text`.

In the simplest form, the text is placed at $xy$.

Optionally, the text can be displayed in another position $xytext$. An arrow pointing from the text to the annotated point $xy$ can then be added by defining `arrowprops`.

**Parameters**

- `text` [str] The text of the annotation. $s$ is a deprecated synonym for this parameter.
xy [(float, float)] The point \((x, y)\) to annotate. The coordinate system is determined by \textit{xycoords}.

\textbf{xytext} [(float, float), default: \textit{xy}] The position \((x, y)\) to place the text at. The coordinate system is determined by \textit{textcoords}.

\textbf{xycoords} [str or \textit{Artist} or \textit{Transform} or callable or (float, float), default: \textquoteleft data\textquoteright] The coordinate system that \textit{xy} is given in. The following types of values are supported:

- One of the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>Points from the lower left of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>Pixels from the lower left of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>Fraction of figure from lower left</td>
</tr>
<tr>
<td>'axes points'</td>
<td>Points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>Pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>Fraction of axes from lower left</td>
</tr>
<tr>
<td>'data'</td>
<td>Use the coordinate system of the object being annotated (default)</td>
</tr>
<tr>
<td>'polar'</td>
<td>((\theta, r)) if not native \textquoteleft data\textquoteright coordinates</td>
</tr>
</tbody>
</table>

- An \textit{Artist}: \textit{xy} is interpreted as a fraction of the artist’s \textit{Bbox}. E.g. \((0, 0)\) would be the lower left corner of the bounding box and \((0.5, 1)\) would be the center top of the bounding box.

- A \textit{Transform} to transform \textit{xy} to screen coordinates.

- A function with one of the following signatures:

```python
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where \textit{renderer} is a \textit{RendererBase} subclass.

The result of the function is interpreted like the \textit{Artist} and \textit{Transform} cases above.

- A tuple \((xcoords, ycoords)\) specifying separate coordinate systems for \textit{x} and \textit{y}. \textit{xcoords} and \textit{ycoords} must each be of one of the above described types.

See \textit{Advanced Annotation}s for more details.

\textbf{textcoords} [str or \textit{Artist} or \textit{Transform} or callable or (float, float), default: value of \textit{xycoords}] The coordinate system that \textit{xytext} is given in.

All \textit{xycoords} values are valid as well as the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'offset points'</td>
<td>Offset (in points) from the \textit{xy} value</td>
</tr>
<tr>
<td>'offset pixels'</td>
<td>Offset (in pixels) from the \textit{xy} value</td>
</tr>
</tbody>
</table>
**arrowprops** [dict, optional] The properties used to draw a `FancyArrowPatch` arrow between the positions `xy` and `xytext`.

If `arrowprops` does not contain the key 'arrowstyle' the allowed keys are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>The width of the arrow in points</td>
</tr>
<tr>
<td>headwidth</td>
<td>The width of the base of the arrow head in points</td>
</tr>
<tr>
<td>headlength</td>
<td>The length of the arrow head in points</td>
</tr>
<tr>
<td>shrink</td>
<td>Fraction of total length to shrink from both ends</td>
</tr>
<tr>
<td>?</td>
<td>Any key to <code>matplotlib.patches.FancyArrowPatch</code></td>
</tr>
</tbody>
</table>

If `arrowprops` contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>None</td>
</tr>
<tr>
<td>'-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'-['</td>
<td>widthB=1.0,lengthB=0.2,angleB=None</td>
</tr>
<tr>
<td>'-</td>
<td>'</td>
</tr>
<tr>
<td>'-</td>
<td>&gt;'</td>
</tr>
<tr>
<td>'&lt;-'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;</td>
<td>--'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>&gt;'</td>
</tr>
<tr>
<td>'fancy'</td>
<td>head_length=0.4,head_width=0.4,tail_width=0.4</td>
</tr>
<tr>
<td>'simple'</td>
<td>head_length=0.5,head_width=0.5,tail_width=0.2</td>
</tr>
<tr>
<td>'wedge'</td>
<td>tail_width=0.3,shrink_factor=0.5</td>
</tr>
</tbody>
</table>

Valid keys for `FancyArrowPatch` are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>mutation_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>mutation_aspect</td>
<td>default is 1.</td>
</tr>
<tr>
<td>?</td>
<td>any key for <code>matplotlib.patches.PathPatch</code></td>
</tr>
</tbody>
</table>

Defaults to None, i.e. no arrow is drawn.

**annotation_clip** [bool or None, default: None] Whether to draw the annotation when the annotation point `xy` is outside the axes area.

- If `True`, the annotation will only be drawn when `xy` is within the axes.
- If `False`, the annotation will always be drawn.
- If `None`, the annotation will only be drawn when `xy` is within the axes and `xycoords` is 'data'.
**kwargs  Additional kwargs are passed to Text.

Returns

Annotation

matplotlib.axes.Axes.text

```
Axes.text(self, x, y, s, fontdict=None, **kwargs)
```

Add text to the axes.

Add the text `s` to the axes at location `x, y` in data coordinates.

**Parameters**

- `x, y` [float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the `transform` parameter.
- `s` [str] The text.
- `fontdict` [dict, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by `rcParams`.

**Returns**

- `Text` The created `Text` instance.

**Other Parameters**

- `**kwargs` [Text properties] Other miscellaneous text parameters.

</tbody>
</table>

**Examples**

Individual keyword arguments can be used to override any given parameter:

```python
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```python
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
        ...       verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword `bbox`. `bbox` is a dictionary of `Rectangle` properties. For example:

```python
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

- `sphx_glr_gallery_userdemo_annotate_text_arrow.py`
Add a table to an `Axes`.

At least one of `cellText` or `cellColours` must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using `rowLabels`, `rowColours`, `rowLoc` and `colLabels`, `colColours`, `colLoc` respectively.

For finer grained control over tables, use the `Table` class and add it to the axes with `Axes.add_table`.

**Parameters**

- `cellText` [2D list of str, optional] The texts to place into the table cells. 
  
  *Note*: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

- `cellColours` [2D list of colors, optional] The background colors of the cells.

- `cellLoc` [{‘left’, ‘center’, ‘right’}, default: ‘right’] The alignment of the text within the cells.

- `colWidths` [list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of $1 / \text{n_cols}$.

- `rowLabels` [list of str, optional] The text of the row header cells.

- `rowColours` [list of colors, optional] The colors of the row header cells.

- `colLabels` [list of str, optional] The text of the column header cells.

- `colColours` [list of colors, optional] The colors of the column header cells.
**colLoc** [{‘left’, ‘center’, ‘right’}, default: ‘left’] The text alignment of the column header cells.

**loc** [str, optional] The position of the cell with respect to **ax**. This must be one of the codes.

**bbox** [bbox, optional] A bounding box to draw the table into. If this is not None, this overrides loc.

**edges** [substring of ‘BRTL’ or {‘open’, ‘closed’, ‘horizontal’, ‘vertical’}] The cell edges to be drawn with a line. See also visible_edges.

**Returns**

**Table** The created table.

**Other Parameters**

**kwargs** Table properties.

**Examples using** matplotlib.axes.Axes.table

matplotlib.axes.Axes.arrow

**Axes.arrow**(self, x, y, dx, dy, **kwargs)

Add an arrow to the axes.

This draws an arrow from (x, y) to (x+dx, y+dy).

**Parameters**

x, y [float] The x and y coordinates of the arrow base.
dx, dy [float] The length of the arrow along x and y direction.

width: float, default: 0.001 Width of full arrow tail.

length_includes_head: bool, default: False True if head is to be counted in calculating the length.

head_width: float or None, default: 3*width Total width of the full arrow head.

head_length: float or None, default: 1.5*head_width Length of arrow head.

shape: ['full', 'left', 'right'], default: 'full' Draw the left-half, right-half, or full arrow.

overhang: float, default: 0 Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

head_starts_at_zero: bool, default: False If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**kwargs Patch properties:

Returns

FancyArrow  The created FancyArrow object.

Notes

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use annotate() for example:

```python
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...     arrowprops=dict(arrowstyle="->"))
```

Examples using matplotlib.axes.Axes.arrow

- sphx_glr_gallery_text_labels_and_annotations_arrow_simple_demo.py

matplotlib.axes.Axes.inset_axes

Axes.inset_axes(self, bounds, *, transform=None, zorder=5, **kwargs)

Add a child inset axes to this existing axes.

Parameters

- **bounds**  [[x0, y0, width, height]] Lower-left corner of inset axes, and its width and height.
- **transform**  [Transform] Defaults to ax.transAxes, i.e. the units of rect are in axes-relative coordinates.
- **zorder**  [number] Defaults to 5 (same as Axes.legend). Adjust higher or lower to change whether it is above or below data plotted on the parent axes.
- ****kwargs  Other keyword arguments are passed on to the child Axes.

Returns

- **ax**  The created Axes instance.

**Warning:**  This method is experimental as of 3.0, and the API may change.

Examples

This example makes two inset axes, the first is in axes-relative coordinates, and the second in data-coordinates:

```python
fig, ax = plt.subplots()
ax.plot(range(10))
axin1 = ax.inset_axes([0.8, 0.1, 0.15, 0.15])
axin2 = ax.inset_axes([5, 7, 2.3, 2.3], transform=ax.transData)
```
Examples using `matplotlib.axes.Axes.inset_axes`

- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py

`matplotlib.axes.Axes.indicate_inset`

```python
Axes.indicate_inset(self, bounds, inset_ax=None, *, transform=None, facecolor='none', edgecolor='0.5', alpha=0.5, zorder=4.99, **kwargs)
```

Add an inset indicator to the axes. This is a rectangle on the plot at the position indicated by `bounds` that optionally has lines that connect the rectangle to an inset axes (`Axes.inset_axes`).

**Parameters**

- `bounds` `[[x0, y0, width, height]]` Lower-left corner of rectangle to be marked, and its width and height.
- `inset_ax` `Axes` An optional inset axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset axes on corners chosen so as to not overlap with the indicator box.
- `transform` `Transform` Transform for the rectangle coordinates. Defaults to `ax.transAxes`, i.e. the units of `rect` are in axes-relative coordinates.
- `facecolor` `color`, default: ‘none’] Facecolor of the rectangle.
- `edgecolor` `color`, default: ‘0.5’] Color of the rectangle and color of the connecting lines.
- `alpha` `float`, default: 0.5] Transparency of the rectangle and connector lines.
- `zorder` `float`, default: 4.99] Drawing order of the rectangle and connector lines. The default, 4.99, is just below the default level of inset axes.
- `**kwargs` Other keyword arguments are passed on to the `Rectangle` patch:

**Returns**

- `rectangle_patch` `patches.Rectangle` The indicator frame.
- `connector_lines` `4-tuple of patches.ConnectionPatch` The four connector lines connecting to (lower_left, upper_left, lower_right upper_right) corners of `inset_ax`. Two lines are set with visibility to False, but the user can set the visibility to True if the automatic choice is not deemed correct.

**Warning:** This method is experimental as of 3.0, and the API may change.

Examples using `matplotlib.axes.Axes.indicate_inset`

`matplotlib.axes.Axes.indicate_inset_zoom`

```python
Axes.indicate_inset_zoom(self, inset_ax, **kwargs)
```

Add an inset indicator rectangle to the axes based on the axis limits for an `inset_ax` and
draw connectors between `inset_ax` and the rectangle.

**Parameters**

- **inset_ax** [Axes] Inset axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset axes on corners chosen so as not to overlap with the indicator box.

- **kwargs** Other keyword arguments are passed on to `Axes.indicate_inset`

**Returns**

- `connector_lines` [4-tuple of patches.ConnectionPatch] Each of four connector lines coming from the rectangle drawn on this axis, in the order lower left, upper left, lower right, upper right. Two are set with visibility to `False`, but the user can set the visibility to `True` if the automatic choice is not deemed correct.

**Warning:** This method is experimental as of 3.0, and the API may change.

**Examples using matplotlib.axes.Axes.indicate_inset_zoom**

- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py

**matplotlib.axes.Axes.secondary_xaxis**

`Axes.secondary_xaxis(self, location, *, functions=None, **kwargs)`

Add a second x-axis to this axes.

For example if we want to have a second scale for the data plotted on the xaxis.

**Parameters**

- **location** [{‘top’, ‘bottom’, ‘left’, ‘right’} or float] The position to put the secondary axis. Strings can be ‘top’ or ‘bottom’ for orientation=‘x’ and ‘right’ or ‘left’ for orientation=‘y’. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

- **functions** [2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. functions=(lambda x: 2 / x, lambda x: 2 / x) would be an reciprocal transform with a factor of 2.

The user can also directly supply a subclass of `transforms.Transform` so long as it has an inverse.

See /gallery/subplots_axes_and_figures/secondary_axis for examples of making these conversions.

**Returns**

- `ax` [axes._secondary_axes.SecondaryAxis]
**kwargs

Axes properties. Other miscellaneous axes parameters.

**Warning:** This method is experimental as of 3.1, and the API may change.

**Examples**

The main axis shows frequency, and the secondary axis shows period.

![Graph showing frequency and period](image)

**Examples using** matplotlib.axes.Axes.secondary_xaxis

- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py

matplotlib.axes.Axes.secondary_yaxis

Axes.secondary_yaxis(self, location, *, functions=None, **kwargs)

Add a second y-axis to this axes.

For example if we want to have a second scale for the data plotted on the yaxis.

**Parameters**
location [{’top’, ’bottom’, ’left’, ’right’} or float] The position to put the secondary axis. Strings can be ’top’ or ’bottom’ for orientation=’x’ and ’right’ or ’left’ for orientation=’y’. A float indicates the relative position on the parent axes to put the new axes, 0.0 being the bottom (or left) and 1.0 being the top (or right).

functions [2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. functions=(lambda x: 2 / x, lambda x: 2 / x) would be a reciprocal transform with a factor of 2.

The user can also directly supply a subclass of transforms.Transform so long as it has an inverse.

See /gallery/subplots_axes_and_figures/secondary_axis for examples of making these conversions.

Returns

ax [axes._secondary_axes.SecondaryAxis]

Other Parameters

**kwargs [Axes properties.] Other miscellaneous axes parameters.

Warning: This method is experimental as of 3.1, and the API may change.

Examples

Add a secondary axes that converts from radians to degrees

Examples using matplotlib.axes.Axes.secondary_yaxis

- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py

matplotlib.axes.Axes.barbs

Axes.barbs(self, *args, data=None, **kw)

Plot a 2D field of barbs.

Call signature:

barbs([X, Y], U, V, [C], **kw)

Where X, Y define the barb locations, U, V define the barb directions, and C optionally
sets the color.

All arguments may be 1D or 2D. $U$, $V$, $C$ may be masked arrays, but masked $X$, $Y$ are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
/`
/ `\
/ ` `\
/ ` ` `\
/ ` ` ` `\
```

The largest increment is given by a triangle (or “flag”). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

**Parameters**
X, Y [1D or 2D array-like, optional] The x and y coordinates of the barb locations. See pivot for how the barbs are drawn to the x, y positions. If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

U, V [1D or 2D array-like] The x and y components of the barb shaft.

C [1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via norm and cmap. This does not support explicit colors. If you want to set colors directly, use barbcolor instead.

length [float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot [{‘tip’, ‘middle’} or float, default: ‘tip’] The part of the arrow that is anchored to the X, Y grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor [color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the edgcolor parameter for polygons, which can be used instead. However this parameter will override facecolor.

flagcolor [color or color sequence] The color of any flags on the barb. This parameter is analogous to the facecolor parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and C has not either) then flagcolor will be set to match barbcolor so that the barb has a uniform color. If C has been set, flagcolor has no effect.

sizes [dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- ‘spacing’ - space between features (flags, full/half barbs)
- ‘height’ - height (distance from shaft to top) of a flag or full barb
- ‘width’ - width of a flag, twice the width of a full barb
- ‘emptybarb’ - radius of the circle used for low magnitudes

fill_empty [bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding [bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments [dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.
Matplotlib, Release 3.3.0

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

**flip_barb** [bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as $U$ and $V$.

**Returns**

barbs [Barbs]

**Other Parameters**

**kwargs The barbs can further be customized using PolyCollection keyword arguments:

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be a string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using matplotlib.axes.Axes.barbs**

- sphx_glr_gallery_images_contours_and_fields_barb_demo.py

**matplotlib.axes.Axes.quiver**

```python
Axes.quiver(self, *args, data=None, **kw)
```

Plot a 2D field of arrows.

Call signature:

```python
quiver([X, Y], U, V, [C], **kw)
```

`X, Y` define the arrow locations, `U, V` define the arrow directions, and `C` optionally sets the color.

**Arrow size**

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the `scale` and `scale_units` parameters.

**Arrow shape**

The defaults give a slightly swept-back arrow; to make the head a triangle, make `headaxislength` the same as `headlength`. To make the arrow more pointed, reduce `headwidth` or increase `headlength` and `headaxislength`. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave `minshaft` alone.

**Arrow outline**

`linewidhts` and `edgecolors` can be used to customize the arrow outlines.

**Parameters**
X, Y [1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using x, y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

U, V [1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. U and V may be masked. Only locations unmasked in U, V, and C will be drawn.

C [1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via norm and cmap.

This does not support explicit colors. If you want to set colors directly, use color instead. The size of C must match the number of arrow locations.

units [{‘width’, ‘height’, ‘dots’, ‘inches’, ‘x’, ‘y’ ‘xy’}, default: ‘width’] The arrow dimensions (except for length) are measured in multiples of this unit.

The following values are supported:

- ‘width’, ‘height’: The width or height of the axis.
- ‘dots’, ‘inches’: Pixels or inches based on the figure dpi.
- ‘x’, ‘y’, ‘xy’: X, Y or \sqrt{X^2 + Y^2} in data units.

The arrows scale differently depending on the units. For ‘x’ or ‘y’, the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For ‘width’ or ‘height’, the arrow size increases with the width and height of the axes, respectively, when the window is resized; for ‘dots’ or ‘inches’, resizing does not change the arrows.

angles [{‘uv’, ‘xy’} or array-like, default: ‘uv’] Method for determining the angle of the arrows.

- ‘uv’: The arrow axis aspect ratio is 1 so that if U == V the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).
  
  Use this if the arrows symbolize a quantity that is not based on X, Y data coordinates.

- ‘xy’: Arrows point from (x, y) to (x+u, y+v). Use this for plotting a gradient field, for example.

- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.
  
  In this case U, V is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with angles='xy'.
scale [float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is None.

If None, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the scale_units parameter.

scale_units [{‘width’, ‘height’, ‘dots’, ‘inches’, ‘x’, ‘y’, ‘xy’}, optional] If the scale kwarg is None, the arrow length unit. Default is None.

e.g. scale_units is ‘inches’, scale is 2.0, and (u, v) = (1, 0), then the vector will be 0.5 inches long.

If scale_units is ‘width’ or ‘height’, then the vector will be half the width/height of the axes.

If scale_units is ‘x’ then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use angles='xy', scale_units='xy', scale=1.

width [float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth [float, default: 3] Head width as multiple of shaft width.

headlength [float, default: 5] Head length as multiple of shaft width.

headaxislength [float, default: 4.5] Head length at shaft intersection.

minshaft [float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength [float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

pivot [{‘tail’, ‘mid’, ‘middle’, ‘tip’}, default: ‘tail’] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

‘mid’ is a synonym for ‘middle’.

color [color or color sequence, optional] Explicit color(s) for the arrows. If C has been set, color has no effect.

This is a synonym for the PolyCollection facecolor parameter.

Other Parameters

**kwargs [PolyCollection properties, optional] All other keyword arguments are passed on to PolyCollection:

**See also:**

*Axes.quiverkey* Add a key to a quiver plot.

**Examples using matplotlib.axes.Axes.quiver**

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_mplot3d_quiver3d.py

*matplotlib.axes.Axes.quiverkey*

*Axes.quiverkey*(self, Q, X, Y, U, label, **kw)

Add a key to a quiver plot.
The positioning of the key depends on $X$, $Y$, coordinates, and labelpos. If labelpos is ‘N’ or ‘S’, $X$, $Y$ give the position of the middle of the key arrow. If labelpos is ‘E’, $X$, $Y$ positions the head, and if labelpos is ‘W’, $X$, $Y$ positions the tail; in either of these two cases, $X$, $Y$ is somewhere in the middle of the arrow+key object.

Parameters

- Q [matplotlib.quiver.Quiver] A Quiver object as returned by a call to quiver().
- X, Y [float] The location of the key.
- U [float] The length of the key.
- label [str] The key label (e.g., length and units of the key).
- angle [float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.
- coordinates [{‘axes’, ‘figure’, ‘data’, ‘inches’}, default: ‘axes’] Coordinate system and units for $X$, $Y$; ‘axes’ and ‘figure’ are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; ‘data’ are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); ‘inches’ is position in the figure in inches, with (0, 0) at the lower left corner.
- color [color] Overrides face and edge colors from Q.
- labelpos [{‘N’, ‘S’, ‘E’, ‘W’}] Position the label above, below, to the right, to the left of the arrow, respectively.
- labelsep [float, default: 0.1] Distance in inches between the arrow and the label.
- labelcolor [color, default: rcParams["text.color" (default: ‘black’))] Label color.
- fontproperties [dict, optional] A dictionary with keyword arguments accepted by the FontProperties initializer: family, style, variant, size, weight.
- **kwargs Any additional keyword arguments are used to override vector properties taken from Q.

Examples using matplotlib.axes.Axes.quiverkey

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py

**mathtext**

matplotlib.axes.Axes.streamplot

Axes.streamplot(axes, x, y, u, v, density=1, linewidth=None, color=None, cmap=None, norm=None, arrowsize=1, arrowstyle='->', minlength=0.1, transform=None, zorder=None, start_points=None, maxlength=4.0, integration_direction='both', *, data=None)

Draw streamlines of a vector flow.

Parameters
x, y [1D arrays] An evenly spaced grid.

u, v [2D arrays] x and y-velocities. The number of rows and columns must match the length of y and x, respectively.

density [float or (float, float)] Controls the closeness of streamlines. When density = 1, the domain is divided into a 30x30 grid. density linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (density_x, density_y).

linewidth [float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as u and v.

color [color or 2D array] The streamline color. If given an array, its values are converted to colors using cmap and norm. The array must have the same shape as u and v.

cmap [Colormap] Colormap used to plot streamlines and arrows. This is only used if color is an array.

norm [Normalize] Normalize object used to scale luminance data to 0, 1. If None, stretch (min, max) to (0, 1). This is only used if color is an array.

arrowsize [float] Scaling factor for the arrow size.

start_points [Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the x and y arrays).

zorder [int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

maxlength [float] Maximum length of streamline in axes coordinates.

integration_direction [{‘forward’, ‘backward’, ‘both’}, default: ‘both’] Integrate the streamline in forward, backward or both directions.

Returns

StreamplotSet Container object with attributes

• lines: LineCollection of streamlines

• arrows: PatchCollection containing FancyArrowPatch objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, y, u, v, start_points.
Objects passed as **data** must support item access (`data[s]`) and membership test (`s in data`).

#### matplotlib.axes.Axes.axis

**Axes.axis**

Convenience method to get or set some axis properties.

**Call signatures:**

```python
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

**Parameters**

- **xmin, xmax, ymin, ymax** [float, optional] The axis limits to be set. This can also be achieved using
  ```python
  ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
  ```

- **option** [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'on'</td>
<td>Turn on axis lines and labels. Same as True.</td>
</tr>
<tr>
<td>'off'</td>
<td>Turn off axis lines and labels. Same as False.</td>
</tr>
<tr>
<td>'equal'</td>
<td>Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code>. Explicit data limits may not be respected in this case.</td>
</tr>
<tr>
<td>'scaled'</td>
<td>Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code>. Additionally, further autoscaling will be disabled.</td>
</tr>
<tr>
<td>'tight'</td>
<td>Set limits just large enough to show all data, then disable further autoscaling.</td>
</tr>
<tr>
<td>'auto'</td>
<td>Automatic scaling (fill plot box with data).</td>
</tr>
<tr>
<td>'image'</td>
<td>'scaled' with axis limits equal to data limits.</td>
</tr>
<tr>
<td>'square'</td>
<td>Square plot; similar to 'scaled', but initially forcing xmax-xmin == ymax-ymin.</td>
</tr>
</tbody>
</table>

- **emit** [bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

- **xmin, xmax, ymin, ymax** [float] The axis limits.

- Specifying Colors
Text in Matplotlib Plots

**matplotlib.axes.Axes.set_axis_off**

```python
Axes.set_axis_off(self)
```

Turn the x- and y-axis off.
This affects the axis lines, ticks, ticklabels, grid and axis labels.

**Examples using matplotlib.axes.Axes.set_axis_off**

- sphx_glr_gallery_lines_bars_and_markers_joinstyle.py
- sphx_glr_gallery_lines_bars_and_markers_marker_reference.py

Choosing Colormaps in Matplotlib

Text properties and layout

**matplotlib.axes.Axes.set_axis_on**

```python
Axes.set_axis_on(self)
```

Turn the x- and y-axis on.
This affects the axis lines, ticks, ticklabels, grid and axis labels.

**Examples using matplotlib.axes.Axes.set_axis_on**

**matplotlib.axes.Axes.set_frame_on**

```python
Axes.set_frame_on(self, b)
```

Set whether the axes rectangle patch is drawn.

**Parameters**

- `b` [bool]

**Examples using matplotlib.axes.Axes.set_frame_on**

**matplotlib.axes.Axes.get_frame_on**

```python
Axes.get_frame_on(self)
```

Get whether the axes rectangle patch is drawn.
Examples using `matplotlib.axes.Axes.get_frame_on`

`matplotlib.axes.Axes.set_axisbelow`

```python
Axes.set_axisbelow(self, b)
```

Set whether axis ticks and gridlines are above or below most artists.
This controls the zorder of the ticks and gridlines. For more information on the zorder see /gallery/misc/zorder_demo.

**Parameters**

- `b` [bool or 'line'] Possible values:
  - `True` (zorder = 0.5): Ticks and gridlines are below all Artists.
  - `'line'` (zorder = 1.5): Ticks and gridlines are above patches (e.g. rectangles, with default zorder = 1) but still below lines and markers (with their default zorder = 2).
  - `False` (zorder = 2.5): Ticks and gridlines are above patches and lines / markers.

**See also:**

`get_axisbelow`

Examples using `matplotlib.axes.Axes.set_axisbelow`

`matplotlib.axes.Axes.get_axisbelow`

```python
Axes.get_axisbelow(self)
```

Get whether axis ticks and gridlines are above or below most artists.

**Returns**

- `bool or 'line'

**See also:**

`set_axisbelow`

Examples using `matplotlib.axes.Axes.get_axisbelow`

`matplotlib.axes.Axes.grid`

```python
Axes.grid(self, b=None, which='major', axis='both', **kwargs)
```

Configure the grid lines.

**Parameters**

- `b` [bool or None, optional] Whether to show the grid lines. If any `kwargs` are supplied, it is assumed you want the grid on and `b` will be set to `True`.
  - If `b` is `None` and there are no `kwargs`, this toggles the visibility of the lines.
which ([‘major’, ‘minor’, ‘both’], optional) The grid lines to apply the changes on.

axis ([‘both’, ‘x’, ‘y’], optional) The axis to apply the changes on.

**kwargs [Line2D properties] Define the line properties of the grid, e.g.:

```python
g grid(color=’r’, linestyle=’-’, linewidth=2)
```

Valid keyword arguments are:

Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the Line2D objects comprising the grid. Therefore, to set grid zorder, use `set_axisbelow` or, for more control, call the `set_zorder` method of each axis.

**Axes.get_facecolor**

*Axes.get_facecolor(self)*

Get the facecolor of the Axes.

**Examples using** matplotlib.axes.Axes.get_facecolor

**Axes.set_facecolor**

*Axes.set_facecolor(self, color)*

Set the facecolor of the Axes.

**Parameters**

- **color** [color]

**Examples using** matplotlib.axes.Axes.set_facecolor

- sphx_glr_gallery_color_color_demo.py
- sphx_glr_gallery_color_color_cycle_default.py

18.5.7 Property cycle

**Axes.set_prop_cycle**

Set the property cycle of the Axes.

**matplotlib.axes.Axes.set_prop_cycle**

*Axes.set_prop_cycle(self, *args, **kwargs)*

Set the property cycle of the Axes.

The property cycle controls the style properties such as color, marker and linestyle of future plot commands. The style properties of data already added to the Axes are not modified.

Call signatures:

```python
set_prop_cycle(cycler)
set_prop_cycle(label=values[, label2=values2[, ...]])
set_prop_cycle(label, values)
```

Form 1 sets given *Cycler* object.

Form 2 creates a *Cycler* which cycles over one or more properties simultaneously and set it as the property cycle of the axes. If multiple properties are given, their value lists must
have the same length. This is just a shortcut for explicitly creating a cycler and passing it to the function, i.e. it’s short for set_prop_cycle(cycler(label=values label2=values2, ...)).

Form 3 creates a Cycler for a single property and set it as the property cycle of the axes. This form exists for compatibility with the original cycler.cycler interface. Its use is discouraged in favor of the kwarg form, i.e. set_prop_cycle(label=values).

**Parameters**

- **cycler** [Cycler] Set the given Cycler. None resets to the cycle defined by the current style.
- **label** [str] The property key. Must be a valid Artist property. For example, ‘color’ or ‘linestyle’. Aliases are allowed, such as ‘c’ for ‘color’ and ‘lw’ for ‘linewidth’.
- **values** [iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

**See also:**

- matplotlib.rcsetup.cycler Convenience function for creating validated cyclers for properties.
- cycler.cycler The original function for creating unvalidated cyclers.

**Examples**

Setting the property cycle for a single property:

```python
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'])
```

Setting the property cycle for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```python
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'],
                     marker=['o', '+', 'x'])
```

**Examples using** matplotlib.axes.Axes.set_prop_cycle

- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py
- *Styling with cycler*

</tbody>
</table>
Axes.invert_xaxis(self)
    Invert the x-axis.

    See also:
    
    xaxis_inverted
get_xlim, set_xlim
get_xbound, set_xbound

Examples using matplotlib.axes.Axes.invert_xaxis

Axes.xaxis_inverted

Axes.xaxis_inverted(self)
    Return whether the xaxis is oriented in the “inverse” direction.
    
    The “normal” direction is increasing to the right for the x-axis and to the top for the
    y-axis; the “inverse” direction is increasing to the left for the x-axis and to the bottom
    for the y-axis.

Examples using matplotlib.axes.Axes.xaxis_inverted

Axes.invert_yaxis

Axes.invert_yaxis(self)
    Invert the y-axis.

    See also:

    yaxis_inverted
get_ylim, set_ylim
get_ybound, set_ybound

Examples using matplotlib.axes.Axes.invert_yaxis

• sphx_glr_gallery_lines_bars_and_markers_barh.py
• sphx_glr_gallery_lines_bars_and_markers_marker_reference.py

Axes.yaxis_inverted

Axes.yaxis_inverted(self)
    Return whether the yaxis is oriented in the “inverse” direction.
    
    The “normal” direction is increasing to the right for the x-axis and to the top for the
    y-axis; the “inverse” direction is increasing to the left for the x-axis and to the bottom
    for the y-axis.
**Examples using** matplotlib.axes.Axes.yaxis_inverted

**matplotlib.axes.Axes.set_xlim**

```python
Axes.set_xlim(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)
```

Set the x-axis view limits.

**Parameters**

- **left** [float, optional] The left xlim in data coordinates. Passing `None` leaves the limit unchanged.
  
The left and right xlims may also be passed as the tuple `(left, right)` as the first positional argument (or as the `left` keyword argument).

- **right** [float, optional] The right xlim in data coordinates. Passing `None` leaves the limit unchanged.

- **emit** [bool, default: True] Whether to notify observers of limit change.

- **auto** [bool or None, default: False] Whether to turn on autoscaling of the x-axis. True turns on, False turns off, None leaves unchanged.

- **xmin, xmax** [float, optional] They are equivalent to left and right respectively, and it is an error to pass both `xmin` and `left` or `xmax` and `right`.

**Returns**

- **left, right** [(float, float)] The new x-axis limits in data coordinates.

**See also:**

- `get_xlim`
- `set_xbound, get_xbound`
- `invert_xaxis, xaxis_inverted`

**Notes**

The `left` value may be greater than the `right` value, in which case the x-axis values will decrease from left to right.

**Examples**

```python
>>> set_xlim(left, right)
>>> set_xlim((left, right))
>>> left, right = set_xlim(left, right)
```

One limit may be left unchanged.

```python
>>> set_xlim(right=right_lim)
```

Limits may be passed in reverse order to flip the direction of the x-axis. For example, suppose `x` represents the number of years before present. The x-axis limits might be set like the following so 5000 years ago is on the left of the plot and the present is on the right.

matplotlib.axes.Axes.get_xlim

Axes.get_xlim(self)
    Return the x-axis view limits.

    Returns
    left, right [(float, float)] The current x-axis limits in data coordinates.

    See also:
    set_xlim
    set_xbound, get_xbound
    invert_xaxis, xaxis_inverted

    Notes
    The x-axis may be inverted, in which case the left value will be greater than the right value.

    Examples using matplotlib.axes.Axes.get_xlim

    • Decay

matplotlib.axes.Axes.set_ylim

Axes.set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
    Set the y-axis view limits.

    Parameters
    bottom [float, optional] The bottom ylim in data coordinates. Passing None leaves the limit unchanged.

    The bottom and top ylims may also be passed as the tuple (bottom, top) as the first positional argument (or as the bottom keyword argument).

    top [float, optional] The top ylim in data coordinates. Passing None leaves the limit unchanged.

    emit [bool, default: True] Whether to notify observers of limit change.
**auto** [bool or None, default: False] Whether to turn on autoscaling of the y-axis. True turns on, False turns off, None leaves unchanged.

**ymin, ymax** [float, optional] They are equivalent to bottom and top respectively, and it is an error to pass both ymin and bottom or ymax and top.

**Returns**

**bottom, top** [(float, float)] The new y-axis limits in data coordinates.

**See also:**

get_ylim

set_ybound, get_ybound

invert_yaxis, yaxis_inverted

**Notes**

The bottom value may be greater than the top value, in which case the y-axis values will decrease from bottom to top.

**Examples**

```python
>>> set_ylim(bottom, top)
>>> set_ylim((bottom, top))
>>> bottom, top = set_ylim(bottom, top)
```

One limit may be left unchanged.

```python
>>> set_ylim(top=top_lim)
```

Limits may be passed in reverse order to flip the direction of the y-axis. For example, suppose y represents depth of the ocean in m. The y-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

```python
>>> set_ylim(5000, 0)
```

matplotlib.axes.Axes.get_ylim

Axes.get_ylim(self)

Return the y-axis view limits.

Returns

bottom, top [(float, float)] The current y-axis limits in data coordinates.

See also:
Matplotlib, Release 3.3.0

Notes

The y-axis may be inverted, in which case the bottom value will be greater than the top value.

Examples using `matplotlib.axes.Axes.get_ylim`

- sphx_glr_gallery_shapes_and_collections_collections.py

`matplotlib.axes.Axes.update_datalim`

`Axes.update_datalim(self, xys, updatex=True, updatey=True)`

Extend the datalim Bbox to include the given points.

If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of the x-data (xys). Otherwise, it will compute the bounds of the union of its current data and the data in xys.

Parameters

- `xys` [2D array-like] The points to include in the data limits Bbox. This can be either a list of (x, y) tuples or a Nx2 array.
- `updatex`, `updatey` [bool, default: True] Whether to update the x/y limits.

Examples using `matplotlib.axes.Axes.update_datalim`

`matplotlib.axes.Axes.update_datalim_bounds`

`Axes.update_datalim_bounds(self, bounds)`

[Deprecated] Extend the datalim Bbox to include the given Bbox.

Parameters

- `bounds` [Bbox]

Notes

Deprecated since version 3.3.
Examples using `matplotlib.axes.Axes.update_datalim_bounds`

`matplotlib.axes.Axes.set_xbound`

```python
Axes.set_xbound(self, lower=None, upper=None)
```
Set the lower and upper numerical bounds of the x-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (`get_autoscalex_on()`).

**Parameters**

- `lower, upper` [float or None] The lower and upper bounds. If `None`, the respective axis bound is not modified.

**See also:**

- `get_xbound`
- `get_xlim, set_xlim`
- `invert_xaxis, xaxis_inverted`

Examples using `matplotlib.axes.Axes.set_xbound`

`matplotlib.axes.Axes.get_xbound`

```python
Axes.get_xbound(self)
```
Return the lower and upper x-axis bounds, in increasing order.

**See also:**

- `set_xbound`
- `get_xlim, set_xlim`
- `invert_xaxis, xaxis_inverted`

Examples using `matplotlib.axes.Axes.get_xbound`

`matplotlib.axes.Axes.set_ybound`

```python
Axes.set_ybound(self, lower=None, upper=None)
```
Set the lower and upper numerical bounds of the y-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (`get_autoscaley_on()`).

**Parameters**

- `lower, upper` [float or None] The lower and upper bounds. If `None`, the respective axis bound is not modified.

**See also:**

- `get_ybound`
get_ylim, set_ylim
invert_yaxis, yaxis_inverted

Examples using matplotlib.axes.Axes.set_ybound

matplotlib.axes.Axes.get_ybound

Axes.get_ybound(self)
Return the lower and upper y-axis bounds, in increasing order.

matplotlib.axes.Axes.set_xlabel

Axes.set_xlabel(self, xlabel, fontdict=None, labelpad=None, *, loc=None, **kwargs)
Set the label for the x-axis.

Parameters

- xlabel [str] The label text.
- labelpad [float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.
- loc [{‘left’, ‘center’, ‘right’}, default: rcParams["xaxis.labellocation"] (default: ‘center’)] The label position. This is a high-level alternative for passing parameters x and horizontalalignment.

Other Parameters

- **kwargs [Text properties] Text properties control the appearance of the label.
See also:

text Documents the properties supported by Text.

matplotlib.axes.Axes.get_xlabel

Axes.get_xlabel(self)
Get the xlabel text string.

Examples using matplotlib.axes.Axes.get_xlabel

matplotlib.axes.Axes.set_ylabel

Axes.set_ylabel(self, ylabel, fontdict=None, labelpad=None, *loc=None, **kwargs)
Set the label for the y-axis.

Parameters
   ylabel [str] The label text.
   labelpad [float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.
   loc [{'bottom', 'center', 'top'}, default: rcParams['yaxis.labellocation'] (default: 'center')] The label position. This is a high-level alternative for passing parameters y and horizontalalignment.

Other Parameters
   **kwargs [Text properties] Text properties control the appearance of the label.

Axes.get_ylabel

Get the ylabel text string.
Examples using `matplotlib.axes.Axes.get_ylabel`

`matplotlib.axes.Axes.set_title`

```python
Axes.set_title(self, label, fontdict=None, loc=None, pad=None, *, y=None, **kwargs)
```

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

**Parameters**

- `label` [str] Text to use for the title
- `fontdict` [dict] A dictionary controlling the appearance of the title text, the default `fontdict` is:

```python
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

- `y` [float, default: rcParams["axes.titley"] (default: None)] Vertical axes location for the title (1.0 is the top). If None (the default), y is determined automatically to avoid decorators on the axes.
- `pad` [float, default: rcParams["axes.titlepad"] (default: 6.0)] The offset of the title from the top of the axes, in points.

**Returns**

- `Text` The matplotlib text instance representing the title

**Other Parameters**

- `**kwargs` [{Text properties}] Other keyword arguments are text properties, see `Text` for a list of valid text properties.

Axes.get_title

Axes.get_title(self, loc='center')
Get an axes title.

Get one of the three available axes titles. The available titles are positioned above the
axes in the center, flush with the left edge, and flush with the right edge.

Parameters

Returns

str The title text string.

Examples using matplotlib.axes.Axes.get_title

matplotlib.axes.Axes.legend

Axes.legend(self, *args, **kwargs)
Place a legend on the axes.

Call signatures:

legend()
legend(labels)
legend(handles, labels)

The call signatures correspond to three different ways how to use this method.

1. **Automatic detection of elements to be shown in the legend**

The elements to be added to the legend are automatically determined, when you do not
pass in any extra arguments.
In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```python
line, = ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```python
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Axes.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

2. Labeling existing plot elements

To make a legend for lines which already exist on the axes (via `plot` for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```python
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This way of using is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```python
legend((line1, line2, line3), ('label1', 'label2', 'label3'))
```

Parameters

- **handles** [sequence of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

  The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

- **labels** [list of str, optional] A list of labels to show next to the artists. Use this together with `handles`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

- **Legend**

Other Parameters

- **loc** [str or pair of floats, default: `rcParams["legend.loc"]` (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

  The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.
The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case bbox_to_anchor will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each “string” locations can also be given as a numeric value:

<table>
<thead>
<tr>
<th>Location String</th>
<th>Location Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>'best'</td>
<td>0</td>
</tr>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

bbox_to_anchor [BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc. Defaults to axes.bbox (if called as a method to Axes.legend) or figure.bbox (if Figure.legend). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by bbox_transform, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or BboxBase is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0.5, 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by loc at x, y. For example, to put the legend’s upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncol [int, default: 1] The number of columns that the legend has.

prop [None or matplotlib.font_manager.FontProperties or dict] The font
properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

**fontsize** [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

**labelcolor** [str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints** [int, default: `rcParams['legend.numpoints']` (default: 1)] The number of marker points in the legend when creating a legend entry for a `Line2D` (line).

**scatterpoints** [int, default: `rcParams['legend.scatterpoints']` (default: 1)] The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot).

**scatteryoffsets** [iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale** [float, default: `rcParams['legend.markerscale']` (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.

**markerfirst** [bool, default: True] If True, legend marker is placed to the left of the legend label. If False, legend marker is placed to the right of the legend label.

**frameon** [bool, default: `rcParams['legend.frameon']` (default: True)] Whether the legend should be drawn on a patch (frame).

**fancybox** [bool, default: `rcParams['legend.fancybox']` (default: True)] Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend’s background.

**shadow** [bool, default: `rcParams['legend.shadow']` (default: False)] Whether to draw a shadow behind the legend.

**framealpha** [float, default: `rcParams['legend.framealpha']` (default: 0.8)] The alpha transparency of the legend’s background. If shadow is activated and framealpha is None, the default value is ignored.

**facecolor** ["inherit" or color, default: `rcParams['legend.facecolor']` (default: 'inherit')] The legend’s background color. If "inherit", use `rcParams['axes.facecolor']` (default: 'white').

**edgecolor** ["inherit" or color, default: `rcParams['legend.edgecolor']` (default: '0.8')] The legend’s background patch edge color. If "inherit", use take `rcParams['axes.edgecolor']` (default: 'black').

**mode** [{"expand", None}] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or `bbox_to_anchor` if defines the legend’s size).
bbox_transform [None or matplotlib.transforms.Transform] The transform for the bounding box (bbox to anchor). For a value of None (default) the Axes’ transAxes transform will be used.

title [str or None] The legend’s title. Default is no title (None).

title_fontsize [int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: rcParams["legend.title_fontsize"] (default: None)] The font size of the legend’s title.

borderpad [float, default: rcParams["legend.borderpad"] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing [float, default: rcParams["legend.labelspacing"] (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength [float, default: rcParams["legend.handlelength"] (default: 2.0)] The length of the legend handles, in font-size units.

handletextpad [float, default: rcParams["legend.handletextpad"] (default: 0.8)] The pad between the legend handle and text, in font-size units.

borderaxespad [float, default: rcParams["legend.borderaxespad"] (default: 0.5)] The pad between the axes and legend border, in font-size units.

columnspacing [float, default: rcParams["legend.columnspacing"] (default: 2.0)] The spacing between columns, in font-size units.

handler_map [dict or None] The custom dictionary mapping instances or types to a legend handler. This handler_map updates the default handler map found at matplotlib.legend.Legend.get_legend_handler_map.

Notes

Some artists are not supported by this function. See Legend guide for details.

Usage Guide
Constrained Layout Guide
Tight Layout guide
Specifying Colors

matplotlib.axes.Axes.get_legend

Axes.get_legend(self)
   Return the Legend instance, or None if no legend is defined.

Examples using matplotlib.axes.Axes.get_legend

matplotlib.axes.Axes.get_legend_handles_labels

Axes.get_legend_handles_labels(self, legend_handler_map=None)
   Return handles and labels for legend
   ax.legend() is equivalent to
   
   h, l = ax.get_legend_handles_labels()
   ax.legend(h, l)

Examples using matplotlib.axes.Axes.get_legend_handles_labels

<tr>
<td>Axes.set_yscale</td>
<td>Set the y-axis scale.</td>
</tr>
<tr>
<td>Axes.get_yscale</td>
<td>Return the yaxis’ scale (as a str).</td>
</tr>
</tbody>
</table>

matplotlib.axes.Axes.set_xscale

Axes.set_xscale(self, value, **kwargs)
   Set the x-axis scale.
Parameters

**value** [{“linear”, “log”, “symlog”, “logit”, ...}] The axis scale type to apply.

**kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

Examples using `matplotlib.axes.Axes.set_xscale`

- `sphx_glr_gallery_scales_scales.py`
- *Transformations Tutorial*

`matplotlib.axes.Axes.get_xscale`

`Axes.get_xscale(self)`

Return the xaxis’ scale (as a str).

Examples using `matplotlib.axes.Axes.get_xscale`

`matplotlib.axes.Axes.set_yscale`

`Axes.set_yscale(self, value, **kwargs)`

Set the y-axis scale.

Parameters

**value** [{“linear”, “log”, “symlog”, “logit”, ...}] The axis scale type to apply.

**kwargs** Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
• `matplotlib.scale.LogScale`
• `matplotlib.scale.SymmetricalLogScale`
• `matplotlib.scale.LogitScale`

**Notes**

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

</tr>
</tbody>
</table>

Matplotlib.axes.Axes.use_sticky_edges

**property Axes.use_sticky_edges**

When autoscaling, whether to obey all `Artist.sticky_edges`.

- Default is `True`.

Setting this to `False` ensures that the specified margins will be applied, even if the plot includes an image, for example, which would otherwise force a view limit to coincide with its data limit.

The changing this property does not change the plot until `autoscale` or `autoscale_view` is called.

Matplotlib.axes.Axes.margins

**Axes.margins(self, *margins, x=None, y=None, tight=True)**

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the `margin` times the data interval. All input parameters must be floats within the range $[0, 1]$. Passing both positional and keyword arguments is invalid and will raise a `TypeError`. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if `xmargin` is not `None`, then `xmargin` times the X data interval will be added to each end of that interval before it is used in autoscaling.

**Parameters**

- **margins** [float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as `xmargin`, `ymargin`. If setting the margin on a single axis is desired, use the keyword arguments described below.

- **x, y** [float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter on e.g., only the y-axis.

- **tight** [bool or None, default: `True`] The `tight` parameter is passed to `autoscale_view()`, which is executed after a margin is changed; the default here is `True`, on the assumption that when margins are specified,
no additional padding to match tick marks is usually desired. Set *tight* to *None* will preserve the previous setting.

**Returns**

`xmargin, ymargin` [float]

**Notes**

If a previously used Axes method such as *pcolor()* has set *use_sticky_edges* to *True*, only the limits not set by the “sticky artists” will be modified. To force all of the margins to be set, set *use_sticky_edges* to *False* before calling *margins()*.

**Examples using matplotlib.axes.Axes.margins**

- sphx_glr_gallery_lines_bars_and_markers_marker_reference.py
- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py
- sphx_glr_gallery_style_sheets_ggplot.py
- sphx_glr_gallery_widgets_slider_demo.py

**matplotlib.axes.Axes.set_xmargin**

*Axes.set_xmargin*(self, m)

Set padding of X data limits prior to autoscaling.

`m` times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of `m = 0.1` will result in a range [-0.2, 2.2].

Negative values `-0.5 < m < 0` will result in clipping of the data range. I.e. for a data range [0, 2], a factor of `m = -0.1` will result in a range [0.2, 1.8].

**Parameters**

- `m` [float greater than -0.5]

**Examples using matplotlib.axes.Axes.set_xmargin**

**matplotlib.axes.Axes.set_ymargin**

*Axes.set_ymargin*(self, m)

Set padding of Y data limits prior to autoscaling.

`m` times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of `m = 0.1` will result in a range [-0.2, 2.2].

Negative values `-0.5 < m < 0` will result in clipping of the data range. I.e. for a data range [0, 2], a factor of `m = -0.1` will result in a range [0.2, 1.8].
Parameters

\( m \) [float greater than -0.5]

Examples using `matplotlib.axes.Axes.set_ymargin`

`matplotlib.axes.Axes.relim`

\[ \text{Axes.relim}(\text{self, visible_only=False}) \]
Recompute the data limits based on current artists.
At present, `Collection` instances are not supported.

Parameters

\( \text{visible_only} \) [bool, default: False] Whether to exclude invisible artists.

Examples using `matplotlib.axes.Axes.relim`

- sphx_glr_gallery_widgets_textbox.py

`matplotlib.axes.Axes.autoscale`

\[ \text{Axes.autoscale}(\text{self, enable=True, axis='both', tight=None}) \]
Autoscale the axis view to the data (toggle).
Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and
then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis
or axes.

Parameters

\( \text{enable} \) [bool or None, default: True] True turns autoscaling on, False turns
it off. None leaves the autoscaling state unchanged.
\( \text{axis} \) [{‘both’, ‘x’, ‘y’}, default: ‘both’] Which axis to operate on.
\( \text{tight} \) [bool or None, default: None] If True, first set the margins to zero.
Then, this argument is forwarded to `autoscale_view` (regardless of its
value); see the description of its behavior there.

Examples using `matplotlib.axes.Axes.autoscale`

- sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py

`matplotlib.axes.Axes.autoscale_view`

\[ \text{Axes.autoscale_view}(\text{self, tight=None, scalex=True, scaley=True}) \]
Autoscale the view limits using the data limits.

Parameters
**tight** [bool or None] If *True*, only expand the axis limits using the margins. Note that unlike for *autoscale*, *tight=True* does *not* set the margins to zero.

If *False* and `rcParams["axes.autolimit_mode"]` (default: ‘data’) is ‘round_numbers’, then after expansion by the margins, further expand the axis limits using the axis major locator.

If None (the default), reuse the value set in the previous call to `autoscale_view` (the initial value is False, but the default style sets `rcParams["axes.autolimit_mode"]` (default: ‘data’) to ‘data’, in which case this behaves like *True*).

**scalex** [bool, default: *True*] Whether to autoscale the x axis.

**scaley** [bool, default: *True*] Whether to autoscale the y axis.

**Notes**

The autoscaling preserves any preexisting axis direction reversal.

The data limits are not updated automatically when artist data are changed after the artist has been added to an Axes instance. In that case, use `matplotlib.axes.Axes.relim()` prior to calling autoscale_view.

If the views of the axes are fixed, e.g. via `set_xlim`, they will not be changed by autoscale_view(). See `matplotlib.axes.Axes.autoscale()` for an alternative.

**Examples using matplotlib.axes.Axes.autoscale_view**

- sphx_glr_gallery_shapes_and_collections_collections.py
- sphx_glr_gallery_shapes_and_collections_compound_path.py
- sphx_glr_gallery_shapes_and_collections_ellipse_collection.py
- sphx_glr_gallery_units_bar_unit_demo.py
- sphx_glr_gallery_widgets_textbox.py

**matplotlib.axes.Axes.set_autoscale_on**

`Axes.set_autoscale_on(self, b)`

Set whether autoscaling is applied on plot commands

**Parameters**

*b* [bool]

**Examples using matplotlib.axes.Axes.set_autoscale_on**

- sphx_glr_gallery_event_handling_resample.py
Axes.get_autoscale_on(self)
        Get whether autoscaling is applied for both axes on plot commands

Examples using matplotlib.axes.Axes.get_autoscale_on

Axes.set_autoscalex_on(self, b)
        Set whether autoscaling for the x-axis is applied on plot commands

Parameters
        b [bool]

Examples using matplotlib.axes.Axes.set_autoscalex_on

Axes.get_autoscalex_on(self)
        Get whether autoscaling for the x-axis is applied on plot commands

Examples using matplotlib.axes.Axes.get_autoscalex_on

Axes.set_autoscaley_on(self, b)
        Set whether autoscaling for the y-axis is applied on plot commands

Parameters
        b [bool]

Examples using matplotlib.axes.Axes.set_autoscaley_on

Axes.get_autoscaley_on(self)
        Get whether autoscaling for the y-axis is applied on plot commands

Examples using matplotlib.axes.Axes.get_autoscaley_on

Aspect ratio
### `Axes.apply_aspect`

Adjust the Axes for a specified data aspect ratio.

- **`Axes.set_aspect`**
  - Set the aspect of the axis scaling, i.e.
- **`Axes.get_aspect`**
  - Get the aspect of the axis scaling.
- **`Axes.set_box_aspect`**
  - Set the box aspect.
- **`Axes.get_box_aspect`**
  - Get the box aspect.
- **`Axes.set_adjustable`**
  - Set how the Axes adjusts to achieve the required aspect ratio.
- **`Axes.get_adjustable`**
  - Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

#### `matplotlib.axes.Axes.apply_aspect`

```python
Axes.apply_aspect(self, position=None)
```

Adjust the Axes for a specified data aspect ratio.

- Depending on `get_adjustable` this will modify either the Axes box (position) or the view limits. In the former case, `get_anchor` will affect the position.

**See also:**

- `matplotlib.axes.Axes.set_aspect` For a description of aspect ratio handling.
- `matplotlib.axes.Axes.set_adjustable` Set how the Axes adjusts to achieve the required aspect ratio.
- `matplotlib.axes.Axes.set_anchor` Set the position in case of extra space.

**Notes**

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

#### Examples using `matplotlib.axes.Axes.apply_aspect`

#### `matplotlib.axes.Axes.set_aspect`

```python
Axes.set_aspect(self, aspect, adjustable=None, anchor=None, share=False)
```

Set the aspect of the axis scaling, i.e. the ratio of y-unit to x-unit.

**Parameters**

- **aspect** [{‘auto’} or num] Possible values:
  - **value** | **description**
    - ‘auto’ | automatic; fill the position rectangle with data.
    - num | a circle will be stretched such that the height is num times the width. ‘equal’ is a synonym for aspect=1, i.e. same scaling for x and y.
adjustable [None or {'box', 'datalim'}, optional] If not None, this defines which parameter will be adjusted to meet the required aspect. See set_adjustable for further details.

anchor [None or str or 2-tuple of float, optional] If not None, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to specify the anchor are abbreviations of cardinal directions:

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'C'</td>
<td>centered</td>
</tr>
<tr>
<td>'SW'</td>
<td>lower left corner</td>
</tr>
<tr>
<td>'S'</td>
<td>middle of bottom edge</td>
</tr>
<tr>
<td>'SE'</td>
<td>lower right corner</td>
</tr>
<tr>
<td>etc.</td>
<td></td>
</tr>
</tbody>
</table>

See set_anchor for further details.

share [bool, default: False] If True, apply the settings to all shared Axes.

See also:

matplotlib.axes.Axes.set_adjustable Set how the Axes adjusts to achieve the required aspect ratio.

matplotlib.axes.Axes.set_anchor Set the position in case of extra space.

`matplotlib.axes.Axes.get_aspect`

`Axes.get_aspect(self)`

**Examples using matplotlib.axes.Axes.get_aspect**

`matplotlib.axes.Axes.set_box_aspect`

`Axes.set_box_aspect(self, aspect=None)`

Set the axes box aspect. The box aspect is the ratio of the axes height to the axes width in physical units. This is not to be confused with the data aspect, set via `set_aspect`.

**Parameters**

*aspect* [None, or a number] Changes the physical dimensions of the Axes, such that the ratio of the axes height to the axes width in physical units is equal to `aspect`. If `None`, the axes geometry will not be adjusted.

**Note that calling this function with a number changes the *adjustable* to *datalim***.

**See also:**

**Examples using matplotlib.axes.Axes.set_box_aspect**

• sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py

`matplotlib.axes.Axes.get_box_aspect`

`Axes.get_box_aspect(self)`

Get the axes box aspect. Will be `None` if not explicitly specified.

**See also:**

`matplotlib.axes.Axes.set_box_aspect` for a description of box aspect.

Examples using `matplotlib.axes.Axes.get_box_aspect`

`matplotlib.axes.Axes.set_adjustable`

```
Axes.set_adjustable(self, adjustable, share=False)
```

Set how the Axes adjusts to achieve the required aspect ratio.

**Parameters**

- `adjustable` [{‘box’, ‘datalim’}] If ‘box’, change the physical dimensions of the Axes. If ‘datalim’, change the x or y data limits.
- `share` [bool, default: False] If True, apply the settings to all shared Axes.

**See also:**

**Notes**

Shared Axes (of which twinned Axes are a special case) impose restrictions on how aspect ratios can be imposed. For twinned Axes, use ‘datalim’. For Axes that share both x and y, use ‘box’. Otherwise, either ‘datalim’ or ‘box’ may be used. These limitations are partly a requirement to avoid over-specification, and partly a result of the particular implementation we are currently using, in which the adjustments for aspect ratios are done sequentially and independently on each Axes as it is drawn.

Examples using `matplotlib.axes.Axes.set_adjustable`

- sphx_glr_gallery_scales_aspect_loglog.py

`matplotlib.axes.Axes.get_adjustable`

```
Axes.get_adjustable(self)
```

Return whether the Axes will adjust its physical dimension (‘box’) or its data limits (‘datalim’) to achieve the desired aspect ratio.

**See also:**

- `matplotlib.axes.Axes.set_adjustable` Set how the Axes adjusts to achieve the required aspect ratio.

Examples using `matplotlib.axes.Axes.get_adjustable`

**Ticks and tick labels**

```
Axes.set_xticks
```

Set the xaxis’ tick locations.

**matplotlib.axes.Axes.set_xticks**

Axes.set_xticks(self, ticks, *, minor=False)

Set the xaxis’ tick locations.

**Parameters**

- **ticks** [list of floats] List of tick locations.
- **minor** [bool, default: False] If False, set the major ticks; if True, the minor ticks.

**Examples using** matplotlib.axes.Axes.set_xticks

- sphx_glr_gallery_lines_bars_and_markers_barchart.py
matplotlib.axes.Axes.get_xticks

Axes.get_xticks(self, *, minor=False)

Return the xaxis’ tick locations in data coordinates.
Examples using matplotlib.axes.Axes.get_xticks

matplotlib.axes.Axes.set_xticklabels

Axes.set_xticklabels(*self, labels, *, fontdict=None, minor=False, **kwargs)

Set the xaxis' labels with list of string labels.

Warning: This method should only be used after fixing the tick positions using Axes.set_xticks. Otherwise, the labels may end up in unexpected positions.

Parameters

- labels [list of str] The label texts.
- fontdict [dict, optional] A dictionary controlling the appearance of the ticklabels. The default fontdict is:

  ```
  {'fontsize': rcParams['axes.titlesize'],
   'fontweight': rcParams['axes.titleweight'],
   'verticalalignment': 'baseline',
   'horizontalalignment': 'center'}
  ```

- minor [bool, default: False] Whether to set the minor ticklabels rather than the major ones.

Returns

- list of Text The labels.

Other Parameters

- **kwargs [Text properties.]

\texttt{matplotlib.axes.Axes.get_xticklabels}

\texttt{Axes.get_xticklabels}(\texttt{self}, \texttt{minor}=\texttt{False}, \texttt{which}=\texttt{None})

Get the xaxis’ tick labels.

\textbf{Parameters}

\begin{itemize}
\item \texttt{minor} [\texttt{bool}] Whether to return the minor or the major ticklabels.
\item \texttt{which} [\texttt{None}, (‘\texttt{minor}’, ‘\texttt{major}’, ‘\texttt{both}’)\texttt{]} Overrides \texttt{minor}.
\end{itemize}

Selects which ticklabels to return

\textbf{Returns}

list of \texttt{Text}

\textbf{Notes}

The tick label strings are not populated until a \texttt{draw} method has been called.

See also: \texttt{draw} and \texttt{draw}.

\texttt{matplotlib.axes.Axes.get_xmajorticklabels}

\texttt{Axes.get_xmajorticklabels}(\texttt{self})

Return the xaxis’ major tick labels, as a list of \texttt{Text}. 
Examples using `matplotlib.axes.Axes.get_xmajorticklabels`

`matplotlib.axes.Axes.get_xmajorticklabels`

`Axes.get_xmajorticklabels(self)`

Return the xaxis' major tick labels, as a list of `Text`.

Examples using `matplotlib.axes.Axes.get_xmajorticklabels`

`matplotlib.axes.Axes.get_xminorticklabels`

`Axes.get_xminorticklabels(self)`

Return the xaxis' minor tick labels, as a list of `Text`.

Examples using `matplotlib.axes.Axes.get_xminorticklabels`

`matplotlib.axes.Axes.get_xgridlines`

`Axes.get_xgridlines(self)`

Return the xaxis' grid lines as a list of `Line2D`.

Examples using `matplotlib.axes.Axes.get_xgridlines`

`matplotlib.axes.Axes.get_xticklines`

`Axes.get_xticklines(self, minor=False)`

Return the xaxis' tick lines as a list of `Line2D`.

Examples using `matplotlib.axes.Axes.get_xticklines`

`matplotlib.axes.Axes.xaxis_date`

`Axes.xaxis_date(self, tz=None)`

Sets up axis ticks and labels to treat data along the xaxis as dates.

Parameters

- `tz` [str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: 'UTC')] The timezone used to create date labels.

Examples using `matplotlib.axes.Axes.xaxis_date`

`matplotlib.axes.Axes.set_yticks`

`Axes.set_yticks(self, ticks, *, minor=False)`

Set the yaxis' tick locations.

Parameters

- `ticks` [list of floats] List of tick locations.
- `minor` [bool, default: False] If False, set the major ticks; if True, the minor ticks.
Examples using `matplotlib.axes.Axes.set_yticks`

- `sphx_glr_gallery_lines_bars_and_markers_barh.py`

`matplotlib.axes.Axes.get_yticks`

```python
Axes.get_yticks(self, *, minor=False)
```

Return the yaxis’ tick locations in data coordinates.

Examples using `matplotlib.axes.Axes.get_yticks`

`matplotlib.axes.Axes.set_yticklabels`

```python
Axes.set_yticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)
```

Set the yaxis’ labels with list of string labels.
Warning: This method should only be used after fixing the tick positions using `Axes.set_yticks`. Otherwise, the labels may end up in unexpected positions.

Parameters

- **labels** [list of str] The label texts.
- **fontdict** [dict, optional] A dictionary controlling the appearance of the tick-labels. The default `fontdict` is:

```python
{
    'fontsize': rcParams['axes.titlesize'],
    'fontweight': rcParams['axes.titleweight'],
    'verticalalignment': 'baseline',
    'horizontalalignment': 'loc'
}
```

- **minor** [bool, default: False] Whether to set the minor ticklabels rather than the major ones.

Returns

- list of `Text` The labels.

Other Parameters

- **kwargs** `[Text properties.]`

Examples using `matplotlib.axes.Axes.set_yticklabels`

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py
- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py

- sphx_glr_gallery_specialty_plots_mri_with_eeg.py
- sphx_glr_gallery_ticks_and_spines_colorbar_tick_labelling_demo.py
- Constrained Layout Guide

`matplotlib.axes.Axes.get_yticklabels`

```python
Axes.get_yticklabels(self, minor=False, which=None)
```

Get the yaxis’ tick labels.
Parameters

- **minor** [bool] Whether to return the minor or the major ticklabels.
- **which** [None, ('minor', 'major', 'both')] Overrides `minor`.
  Selects which ticklabels to return

Returns

- list of `Text`

Notes

The tick label strings are not populated until a `draw` method has been called.

See also: `draw` and `draw`.

Examples using `matplotlib.axes.Axes.get_yticklabels`

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py
- sphx_glr_gallery_recipes_fill_between_alpha.py

`matplotlib.axes.Axes.get_ymajorticklabels`

`Axes.get_ymajorticklabels(self)`

Return the yaxis’ major tick labels, as a list of `Text`.

Examples using `matplotlib.axes.Axes.get_ymajorticklabels`

`matplotlib.axes.Axes.get_yminorticklabels`

`Axes.get_yminorticklabels(self)`

Return the yaxis’ minor tick labels, as a list of `Text`.

Examples using `matplotlib.axes.Axes.get_yminorticklabels`

`matplotlib.axes.Axes.get_ygridlines`

`Axes.get_ygridlines(self)`

Return the yaxis’ grid lines as a list of `Line2Ds`.

Examples using `matplotlib.axes.Axes.get_ygridlines`

`matplotlib.axes.Axes.get_yticklines`

`Axes.get_yticklines(self, minor=False)`

Return the yaxis’ tick lines as a list of `Line2Ds`.
Examples using `matplotlib.axes.Axes.yaxis_date`

`matplotlib.axes.Axes.yaxis_date` (self, tz=None)
Sets up axis ticks and labels to treat data along the yaxis as dates.

**Parameters**

- `tz` [str or `datetime.tzinfo`, default: `rcParams["timezone"]` (default: 'UTC')]
  The timezone used to create date labels.

Examples using `matplotlib.axes.Axes.yaxis_date`

`matplotlib.axes.Axes.minorticks_off`

`Axes.minorticks_off(self)`
Remove minor ticks from the axes.

Examples using `matplotlib.axes.Axes.minorticks_off`

`matplotlib.axes.Axes.minorticks_on`

`Axes.minorticks_on(self)`
Display minor ticks on the axes.

Displaying minor ticks may reduce performance; you may turn them off using `minorticks_off()` if drawing speed is a problem.

Examples using `matplotlib.axes.Axes.minorticks_on`

- `sphx_glr_gallery_specialty_plots_mri_with_eeg.py`

`matplotlib.axes.Axes.ticklabel_format`

`Axes.ticklabel_format(self, *, axis='both', style='', scilimits=None, useOffset=None, useLocale=None, useMathText=None)`
Configure the `ScalarFormatter` used by default for linear axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

**Parameters**

- `axis` [{'x', 'y', 'both'}, default: 'both'] The axes to configure. Only major ticks are affected.

- `style` [{'sci', 'scientific', 'plain'}] Whether to use scientific notation. The formatter default is to use scientific notation.
**scilimits** [pair of ints (m, n)] Scientific notation is used only for numbers outside the range \(10^m\) to \(10^n\) (and only if the formatter is configured to use scientific notation at all). Use (0, 0) to include all numbers. Use (m, m) where \(m \neq 0\) to fix the order of magnitude to \(10^m\). The formatter default is \texttt{rcParams["axes.formatter.limits"]} (default: \([-5, 6]\)).
