## Contents

- Installing
  - Installing an official release
    - Test data
  - Third-party distributions of Matplotlib
    - Scientific Python Distributions
    - Linux: using your package manager
  - Installing from source
    - Dependencies
    - Building on Linux
    - Building on macOS
    - Building on Windows
      - Wheel builds using conda packages
      - Conda packages

### 1.1 Installing an official release

Matplotlib and its dependencies are available as wheel packages for macOS, Windows and Linux distributions:

```bash
python -m pip install -U pip
python -m pip install -U matplotlib
```

Note: The following backends work out of the box: Agg, ps, pdf, svg and TkAgg.
For support of other GUI frameworks, LaTeX rendering, saving animations and a larger selection of file formats, you may need to install additional dependencies.

Although not required, we suggest also installing IPython for interactive use. To easily install a complete Scientific Python stack, see Scientific Python Distributions below.

1.1.1 Test data

The wheels (*.whl) on the PyPI download page do not contain test data or example code. If you want to try the many demos that come in the Matplotlib source distribution, download the *.tar.gz file and look in the examples subdirectory.

To run the test suite:
- extract the lib/matplotlib/tests or lib/mpl_toolkits/tests directories from the source distribution;
- install test dependencies: pytest, Pillow, MiKTeX, GhostScript, ffmpeg, avconv, ImageMagick, and Inkscape;
- run python -mpytest.

1.2 Third-party distributions of Matplotlib

1.2.1 Scientific Python Distributions

Anaconda and Canopy and ActiveState are excellent choices that “just work” out of the box for Windows, macOS and common Linux platforms. WinPython is an option for Windows users. All of these distributions include Matplotlib and lots of other useful (data) science tools.

1.2.2 Linux: using your package manager

If you are on Linux, you might prefer to use your package manager. Matplotlib is packaged for almost every major Linux distribution.
- Debian / Ubuntu: sudo apt-get install python3-matplotlib
- Fedora: sudo dnf install python3-matplotlib
- Red Hat: sudo yum install python3-matplotlib
- Arch: sudo pacman -S python-matplotlib

1.3 Installing from source

If you are interested in contributing to Matplotlib development, running the latest source code, or just like to build everything yourself, it is not difficult to build Matplotlib from source. Grab the latest tar.gz release file from the PyPI files page, or if you want to develop Matplotlib or just need the latest bugfixed version, grab the latest git version, and see Install from source.
The standard environment variables \texttt{CC}, \texttt{CXX}, \texttt{PKG_CONFIG} are respected. This means you can set them if your toolchain is prefixed. This may be used for cross compiling.

```bash
export CC=x86_64-pc-linux-gnu-gcc
export CXX=x86_64-pc-linux-gnu-g++
export PKG_CONFIG=x86_64-pc-linux-gnu-pkg-config
```

Once you have satisfied the requirements detailed below (mainly Python, NumPy, libpng and FreeType), you can build Matplotlib.

```bash
cd matplotlib
python -m pip install .
```

We provide a \texttt{setup.cfg} file which you can use to customize the build process. For example, which default backend to use, whether some of the optional libraries that Matplotlib ships with are installed, and so on. This file will be particularly useful to those packaging Matplotlib.

### 1.3.1 Dependencies

Matplotlib requires the following dependencies:

- \texttt{Python} (>= 3.6)
- \texttt{FreeType} (>= 2.3)
- \texttt{libpng} (>= 1.2)
- \texttt{NumPy} (>= 1.11)
- \texttt{setuptools}
- \texttt{cycler} (>= 0.10.0)
- \texttt{dateutil} (>= 2.1)
- \texttt{kiwisolver} (>= 1.0.0)
- \texttt{pyparsing}

Optionally, you can also install a number of packages to enable better user interface toolkits. See \texttt{What is a backend?} for more details on the optional Matplotlib backends and the capabilities they provide.

- \texttt{tk} (>= 8.3, != 8.6.0 or 8.6.1): for the Tk-based backends;
- \texttt{PyQt4} (>= 4.6) or \texttt{PySide} (>= 1.0.3): for the Qt4-based backends;
- \texttt{PyQt5}: for the Qt5-based backends;
- \texttt{PyGObject}: for the GTK3-based backends;
- \texttt{wxpython} (>= 4): for the WX-based backends;
- \texttt{cairocffi} (>= 0.8) or \texttt{pycairo}: for the cairo-based backends;
- \texttt{Tornado}: for the WebAgg backend;

For better support of animation output format and image file formats, LaTeX, etc., you can install the following:

- \texttt{ffmpeg/avconv}: for saving movies;
- \texttt{ImageMagick}: for saving animated gifs;
Matplotlib, Release 3.1.3

- **Pillow** (*>= 3.4)*: for a larger selection of image file formats: JPEG, BMP, and TIFF image files;
- **LaTeX** and **GhostScript** (*>=9.0*): for rendering text with LaTeX.

**Note:** Matplotlib depends on non-Python libraries.

On Linux and OSX, **pkg-config** can be used to find required non-Python libraries and thus make the install go more smoothly if the libraries and headers are not in the expected locations.

If not using pkg-config (in particular on Windows), you may need to set the include path (to the FreeType, libpng, and zlib headers) and link path (to the FreeType, libpng, and zlib libraries) explicitly, if they are not in standard locations. This can be done using standard environment variables – on Linux and OSX:

```
export CFLAGS='"-I/directory/containing/ft2build.h ..."'
export LDFLAGS='"-L/directory/containing/libfreetype.so ..."'
```

and on Windows:

```
set CL="C:\directory\containing\ft2build.h ..."
set LINK="C:\directory\containing\freetype.lib ..."
```

where ... means “also give, in the same format, the directories containing png.h and zlib.h for the include path, and for libpng.so/png.lib and libz.so/z.lib for the link path.”

**Note:** The following libraries are shipped with Matplotlib:
- **Agg**: the Anti-Grain Geometry C++ rendering engine;
- **qhull**: to compute Delaunay triangulation;
- **ttconv**: a TrueType font utility.

### 1.3.2 Building on Linux

It is easiest to use your system package manager to install the dependencies.

If you are on Debian/Ubuntu, you can get all the dependencies required to build Matplotlib with:

```
sudo apt-get build-dep python-matplotlib
```

If you are on Fedora, you can get all the dependencies required to build Matplotlib with:

```
sudo dnf builddep python-matplotlib
```

If you are on RedHat, you can get all the dependencies required to build Matplotlib by first installing `yum-builddep` and then running:

```
su -c "yum-builddep python-matplotlib"
```

These commands do not build Matplotlib, but instead get and install the build dependencies, which will make building from source easier.
1.3.3 Building on macOS

The build situation on macOS is complicated by the various places one can get the libpng and FreeType requirements (MacPorts, Fink, /usr/X11R6), the different architectures (e.g., x86, ppc, universal), and the different macOS versions (e.g., 10.4 and 10.5). We recommend that you build the way we do for the macOS release: get the source from the tarball or the git repository and install the required dependencies through a third-party package manager. Two widely used package managers are Homebrew, and MacPorts. The following example illustrates how to install libpng and FreeType using brew:

```
brew install libpng freetype pkg-config
```

If you are using MacPorts, execute the following instead:

```
port install libpng freetype pkgconfig
```

After installing the above requirements, install Matplotlib from source by executing:

```
python -mpip install .
```

Note that your environment is somewhat important. Some conda users have found that, to run the tests, their PYTHONPATH must include /path/to/anaconda/.../site-packages and their DYLD_FALLBACK_LIBRARY_PATH must include /path/to/anaconda/lib.

1.3.4 Building on Windows

The Python shipped from https://www.python.org is compiled with Visual Studio 2015 for 3.5+. Python extensions should be compiled with the same compiler, see e.g. https://packaging.python.org/guides/packaging-binary-extensions/#setting-up-a-build-environment-on-windows for how to set up a build environment.

Since there is no canonical Windows package manager, the methods for building FreeType, zlib, and libpng from source code are documented as a build script at matplotlib-winbuild.

There are a few possibilities to build Matplotlib on Windows:
- Wheels via matplotlib-winbuild
- Wheels by using conda packages (see below)
- Conda packages (see below)

Wheel builds using conda packages

This is a wheel build, but we use conda packages to get all the requirements. The binary requirements (png, FreeType,...) are statically linked and therefore not needed during the wheel install.

Set up the conda environment. Note, if you want a qt backend, add pyqt to the list of conda packages.

```
conda create -n "matplotlib_build" python=3.7 numpy python-dateutil pyparsing tornado
cycler tk libpng zlib freetype msinttypes
conda activate matplotlib_build
```

1.3. Installing from source
For building, call the script `build_alllocal.cmd` in the root folder of the repository:

```
build_alllocal.cmd
```

**Conda packages**

The conda packaging scripts for Matplotlib are available at [https://github.com/conda-forge/mpl-feedstock](https://github.com/conda-forge/mpl-feedstock).
CHAPTER TWO

TUTORIALS

This page contains more in-depth guides for using Matplotlib. It is broken up into beginner, intermediate, and advanced sections, as well as sections covering specific topics.

For shorter examples, see our examples page. You can also find external resources and a FAQ in our user guide.

2.1 Introductory

These tutorials cover the basics of creating visualizations with Matplotlib, as well as some best-practices in using the package effectively.

Note: Click here to download the full example code

2.1.1 Usage Guide

This tutorial covers some basic usage patterns and best-practices to help you get started with Matplotlib.

General Concepts

Matplotlib has an extensive codebase that can be daunting to many new users. However, most of matplotlib can be understood with a fairly simple conceptual framework and knowledge of a few important points.

Plotting requires action on a range of levels, from the most general (e.g., ‘contour this 2-D array’) to the most specific (e.g., ‘color this screen pixel red’). The purpose of a plotting package is to assist you in visualizing your data as easily as possible, with all the necessary control – that is, by using relatively high-level commands most of the time, and still have the ability to use the low-level commands when needed.

Therefore, everything in matplotlib is organized in a hierarchy. At the top of the hierarchy is the matplotlib “state-machine environment” which is provided by the matplotlib.pyplot module. At this level, simple functions are used to add plot elements (lines, images, text, etc.) to the current axes in the current figure.
Note: Pyplot’s state-machine environment behaves similarly to MATLAB and should be most familiar to users with MATLAB experience.

The next level down in the hierarchy is the first level of the object-oriented interface, in which pyplot is used only for a few functions such as figure creation, and the user explicitly creates and keeps track of the figure and axes objects. At this level, the user uses pyplot to create figures, and through those figures, one or more axes objects can be created. These axes objects are then used for most plotting actions.

For even more control – which is essential for things like embedding matplotlib plots in GUI applications – the pyplot level may be dropped completely, leaving a purely object-oriented approach.

```python
# sphinx_gallery_thumbnail_number = 3
import matplotlib.pyplot as plt
import numpy as np
```
Parts of a Figure

The whole figure. The figure keeps track of all the child Axes, a smattering of ‘special’ artists (titles, figure legends, etc), and the canvas. (Don’t worry too much about the canvas, it is crucial as it is the object that actually does the drawing to get you your plot, but as the user it is more-or-less invisible to you). A figure can have any number of Axes, but to be useful should have at least one.

The easiest way to create a new figure is with pyplot:
```python
fig = plt.figure()  # an empty figure with no axes
fig.suptitle('No axes on this figure')  # Add a title so we know which it is
fig, ax_lst = plt.subplots(2, 2)  # a figure with a 2x2 grid of Axes
```

No axes on this figure
Axes

This is what you think of as ‘a plot’, it is the region of the image with the data space. A given figure can contain many Axes, but a given Axes object can only be in one Figure. The Axes contains two (or three in the case of 3D) Axis objects (be aware of the difference between Axes and Axis) which take care of the data limits (the data limits can also be controlled via set via the set_xlim() and set_ylim() Axes methods). Each Axes has a title (set via set_title()), an x-label (set via set_xlabel()), and a y-label set via set_ylabel()).

The Axes class and its member functions are the primary entry point to working with the OO interface.

Axis

These are the number-line-like objects. They take care of setting the graph limits and generating the ticks (the marks on the axis) and ticklabels (strings labeling the ticks). The location of the ticks is determined by a Locator object and the ticklabel strings are formatted by a Formatter. The combination of the correct Locator and Formatter gives very fine control over the tick locations and labels.
Artist

Basically everything you can see on the figure is an artist (even the Figure, Axes, and Axis objects). This includes Text objects, Line2D objects, collection objects, Patch objects … (you get the idea). When the figure is rendered, all of the artists are drawn to the canvas. Most Artists are tied to an Axes; such an Artist cannot be shared by multiple Axes, or moved from one to another.

Types of inputs to plotting functions

All of plotting functions expect np.array or np.ma.masked_array as input. Classes that are ‘array-like’ such as pandas data objects and np.matrix may or may not work as intended. It is best to convert these to np.array objects prior to plotting.

For example, to convert a pandas.DataFrame

```python
a = pandas.DataFrame(np.random.rand(4,5), columns = list('abcde'))
a_asarray = a.values
```

and to convert a np.matrix

```python
b = np.matrix([[[1,2],[3,4]]])
b_asarray = np.asarray(b)
```

Matplotlib, pyplot and pylab: how are they related?

Matplotlib is the whole package and `matplotlib.pyplot` is a module in Matplotlib.

For functions in the pyplot module, there is always a “current” figure and axes (which is created automatically on request). For example, in the following example, the first call to `plt.plot` creates the axes, then subsequent calls to `plt.plot` add additional lines on the same axes, and `plt.xlabel`, `plt.ylabel`, `plt.title` and `plt.legend` set the axes labels and title and add a legend.

```python
x = np.linspace(0, 2, 100)
plt.plot(x, x, label='linear')
plt.plot(x, x**2, label='quadratic')
plt.plot(x, x**3, label='cubic')
plt.xlabel('x label')
plt.ylabel('y label')
plt.title("Simple Plot")
plt.legend()
plt.show()
```
**pylab** is a convenience module that bulk imports *matplotlib.pyplot* (for plotting) and *numpy* (for mathematics and working with arrays) in a single namespace. *pylab* is deprecated and its use is strongly discouraged because of namespace pollution. Use *pyplot* instead.

For non-interactive plotting it is suggested to use *pyplot* to create the figures and then the OO interface for plotting.

### Coding Styles

When viewing this documentation and examples, you will find different coding styles and usage patterns. These styles are perfectly valid and have their pros and cons. Just about all of the examples can be converted into another style and achieve the same results. The only caveat is to avoid mixing the coding styles for your own code.

**Note:** Developers for *matplotlib* have to follow a specific style and guidelines. See *The Matplotlib Developers’ Guide*.

Of the different styles, there are two that are officially supported. Therefore, these are the preferred ways to use *matplotlib*.

For the *pyplot* style, the imports at the top of your scripts will typically be:
import matplotlib.pyplot as plt
import numpy as np

Then one calls, for example, np.arange, np.zeros, np.pi, plt.figure, plt.plot, plt.show, etc. Use the pyplot interface for creating figures, and then use the object methods for the rest:

```python
x = np.arange(0, 10, 0.2)
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)
plt.show()
```

So, why all the extra typing instead of the MATLAB-style (which relies on global state and a flat namespace)? For very simple things like this example, the only advantage is academic: the wordier styles are more explicit, more clear as to where things come from and what is going on. For more complicated applications, this explicitness and clarity becomes increasingly valuable, and the richer and more complete object-oriented interface will likely make the program easier to write and maintain.

Typically one finds oneself making the same plots over and over again, but with different data sets, which leads to needing to write specialized functions to do the plotting. The recommended function signature is something like:
```python
def my_plotter(ax, data1, data2, param_dict):
    
    A helper function to make a graph

    Parameters
    ----------
    ax : Axes
        The axes to draw to

    data1 : array
        The x data

    data2 : array
        The y data

    param_dict : dict
        Dictionary of kwargs to pass to ax.plot

    Returns
    -------
    out : list
        list of artists added
    
    out = ax.plot(data1, data2, **param_dict)
    return out

# which you would then use as:

data1, data2, data3, data4 = np.random.randn(4, 100)
fig, ax = plt.subplots(1, 1)
my_plotter(ax, data1, data2, {'marker': 'x'})
```
Out:

```python
[<matplotlib.lines.Line2D object at 0x7f1889198850>]
```

or if you wanted to have 2 sub-plots:

```python
fig, (ax1, ax2) = plt.subplots(1, 2)
my_plotter(ax1, data1, data2, {'marker': 'x'})
my_plotter(ax2, data3, data4, {'marker': 'o'})
```
Again, for these simple examples this style seems like overkill, however once the graphs get slightly more complex it pays off.

Backends

What is a backend?

A lot of documentation on the website and in the mailing lists refers to the “backend” and many new users are confused by this term. matplotlib targets many different use cases and output formats. Some people use matplotlib interactively from the python shell and have plotting windows pop up when they type commands. Some people run Jupyter notebooks and draw inline plots for quick data analysis. Others embed matplotlib into graphical user interfaces like wxpython or pygtk to build rich applications. Some people use matplotlib in batch scripts to generate postscript images from numerical simulations, and still others run web application servers to dynamically serve up graphs.

To support all of these use cases, matplotlib can target different outputs, and each of these capabilities is called a backend; the “frontend” is the user facing code, i.e., the plotting code, whereas the “backend” does all the hard work behind-the-scenes to make the figure. There are two types of backends: user interface backends (for use in pygtk, wxpython, tkinter, qt4,
There are four ways to configure your backend. If they conflict each other, the method mentioned last in the following list will be used, e.g. calling `use()` will override the setting in your `matplotlibrc`.

1. The `backend` parameter in your `matplotlibrc` file (see [Customizing Matplotlib with style sheets and rcParams](#customizing-matplotlib-with-style-sheets-and-rcparams)):

```plaintext
backend : WXAgg  # use wxpython with antigrain (agg) rendering
```

2. Setting the `MPLBACKEND` environment variable, either for your current shell or for a single script. On Unix:

```plaintext
> export MPLBACKEND=module://my_backend
> python simple_plot.py

> MPLBACKEND="module://my_backend" python simple_plot.py
```

On Windows, only the former is possible:

```plaintext
> set MPLBACKEND=module://my_backend
> python simple_plot.py
```

Setting this environment variable will override the `backend` parameter in any `matplotlibrc`, even if there is a `matplotlibrc` in your current working directory. Therefore setting `MPLBACKEND` globally, e.g. in your `.bashrc` or `.profile`, is discouraged as it might lead to counter-intuitive behavior.

3. If your script depends on a specific backend you can use the `use()` function:

```python
import matplotlib
matplotlib.use('PS')  # generate postscript output by default
```

If you use the `use()` function, this must be done before importing `matplotlib.pyplot`. Calling `use()` after `pyplot` has been imported will have no effect. Using `use()` will require changes in your code if users want to use a different backend. Therefore, you should avoid explicitly calling `use()` unless absolutely necessary.

**Note:** Backend name specifications are not case-sensitive; e.g., ‘GTK3Agg’ and ‘gtk3agg’ are equivalent.

With a typical installation of `matplotlib`, such as from a binary installer or a `linux` distribution package, a good default backend will already be set, allowing both interactive work and plotting from scripts, with output to the screen and/or to a file, so at least initially you will not need to use any of the methods given above.

If, however, you want to write graphical user interfaces, or a web application server ([How to use Matplotlib in a web application server](#how-to-use-matplotlib-in-a-web-application-server)), or need a better understanding of what is going on, read on. To make things a little more customizable for graphical user interfaces, `matplotlib` separates the concept of the renderer (the thing that actually does the drawing) from the canvas (the place where the drawing goes). The canonical renderer for user interfaces is `Agg` which uses the [Anti-Grain Geometry C++](#anti-grain-geometry-cplusplus) library to make a raster (pixel) image of the figure. All of the user interfaces except `macosx` can be used with `agg` rendering, e.g., `WXAgg`,...
GTK3Agg, QT4Agg, QT5Agg, TkAgg. In addition, some of the user interfaces support other rendering engines. For example, with GTK+ 3, you can also select Cairo rendering (backend GTK3Cairo).

For the rendering engines, one can also distinguish between vector or raster renderers. Vector graphics languages issue drawing commands like “draw a line from this point to this point” and hence are scale free, and raster backends generate a pixel representation of the line whose accuracy depends on a DPI setting.

Here is a summary of the matplotlib renderers (there is an eponymous backend for each; these are non-interactive backends, capable of writing to a file):

<table>
<thead>
<tr>
<th>Renderer</th>
<th>Filetypes</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>AGG</td>
<td>png</td>
<td>raster graphics – high quality images using the Anti-Grain Geometry engine</td>
</tr>
<tr>
<td>PS</td>
<td>ps eps</td>
<td>vector graphics – Postscript output</td>
</tr>
<tr>
<td>PDF</td>
<td>pdf</td>
<td>vector graphics – Portable Document Format</td>
</tr>
<tr>
<td>SVG</td>
<td>svg</td>
<td>vector graphics – Scalable Vector Graphics</td>
</tr>
<tr>
<td>Cairo</td>
<td>png ps pdf</td>
<td>raster graphics and vector graphics – using the Cairo graphics library</td>
</tr>
</tbody>
</table>

To save plots using the non-interactive backends, use the matplotlib.pyplot.savefig('filename') method.

And here are the user interfaces and renderer combinations supported; these are interactive backends, capable of displaying to the screen and of using appropriate renderers from the table above to write to a file:

<table>
<thead>
<tr>
<th>Backend</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Qt5Agg</td>
<td>Agg rendering in a Qt5 canvas (requires PyQt5). This backend can be activated in IPython with %matplotlib qt5.</td>
</tr>
<tr>
<td>ipympl</td>
<td>Agg rendering embedded in a Jupyter widget. (requires ipympl). This backend can be enabled in a Jupyter notebook with %matplotlib ipympl.</td>
</tr>
<tr>
<td>GTK3Agg</td>
<td>Agg rendering to a GTK 3.x canvas (requires PyGObject, and pycairo or cairocffi). This backend can be activated in IPython with %matplotlib gtk3.</td>
</tr>
<tr>
<td>macOSx</td>
<td>Agg rendering into a Cocoa canvas in OSX. This backend can be activated in IPython with %matplotlib osx.</td>
</tr>
<tr>
<td>Tk-Agg</td>
<td>Agg rendering to a Tk canvas (requires TkInter). This backend can be activated in IPython with %matplotlib tk.</td>
</tr>
<tr>
<td>nbAgg</td>
<td>Embed an interactive figure in a Jupyter classic notebook. This backend can be enabled in Jupyter notebooks via %matplotlib notebook.</td>
</tr>
<tr>
<td>Web-Agg</td>
<td>On show() will start a tornado server with an interactive figure.</td>
</tr>
<tr>
<td>GTK3Cairo</td>
<td>Cairo rendering to a GTK 3.x canvas (requires PyGObject, and pycairo or cairocffi).</td>
</tr>
<tr>
<td>QT4Agg</td>
<td>Agg rendering to a Qt4 canvas (requires PyQt4 or pyside). This backend can be activated in IPython with %matplotlib qt4.</td>
</tr>
<tr>
<td>WX-Agg</td>
<td>Agg rendering to a wxWidgets canvas (requires wxPython 4). This backend can be activated in IPython with %matplotlib wx.</td>
</tr>
</tbody>
</table>
ipyml

The Jupyter widget ecosystem is moving too fast to support directly in Matplotlib. To install ipyml

```
pip install ipyml
jupyter nbextension enable --py --sys-prefix ipyml
```

or

```
conda install ipyml -c conda-forge
```

See jupyter-matplotlib for more details.

GTK and Cairo

GTK3 backends (both GTK3Agg and GTK3Cairo) depend on Cairo (pycairo>=1.11.0 or cairocffi).

How do I select PyQt4 or PySide?

The QT_API environment variable can be set to either pyqt or pyside to use PyQt4 or PySide, respectively.

Since the default value for the bindings to be used is PyQt4, matplotlib first tries to import it, if the import fails, it tries to import PySide.

What is interactive mode?

Use of an interactive backend (see What is a backend?) permits—but does not by itself require or ensure—plotting to the screen. Whether and when plotting to the screen occurs, and whether a script or shell session continues after a plot is drawn on the screen, depends on the functions and methods that are called, and on a state variable that determines whether matplotlib is in “interactive mode”. The default Boolean value is set by the matplotlibrc file, and may be customized like any other configuration parameter (see Customizing Matplotlib with style sheets and rcParams). It may also be set via matplotlib.interactive(), and its value may be queried via matplotlib.is_interactive(). Turning interactive mode on and off in the middle of a stream of plotting commands, whether in a script or in a shell, is rarely needed and potentially confusing, so in the following we will assume all plotting is done with interactive mode either on or off.

**Note:** Major changes related to interactivity, and in particular the role and behavior of show(), were made in the transition to matplotlib version 1.0, and bugs were fixed in 1.0.1. Here we describe the version 1.0.1 behavior for the primary interactive backends, with the partial exception of macOSx.

Interactive mode may also be turned on via matplotlib.pyplot.ion(), and turned off via matplotlib.pyplot.ioff().
Interactive mode works with suitable backends in ipython and in the ordinary python shell, but it does not work in the IDLE IDE. If the default backend does not support interactivity, an interactive backend can be explicitly activated using any of the methods discussed in \textit{What is a backend?}.

Interactive example

From an ordinary python prompt, or after invoking ipython with no options, try this:

```python
import matplotlib.pyplot as plt
plt.ion()
plt.plot([1.6, 2.7])
```

Assuming you are running version 1.0.1 or higher, and you have an interactive backend installed and selected by default, you should see a plot, and your terminal prompt should also be active; you can type additional commands such as:

```python
plt.title("interactive test")
plt.xlabel("index")
```

and you will see the plot being updated after each line. Since version 1.5, modifying the plot by other means \textit{should} also automatically update the display on most backends. Get a reference to the \textit{Axes} instance, and call a method of that instance:

```python
ax = plt.gca()
ax.plot([3.1, 2.2])
```

If you are using certain backends (like macOSx), or an older version of matplotlib, you may not see the new line added to the plot immediately. In this case, you need to explicitly call \texttt{draw()} in order to update the plot:

```python
plt.draw()
```

Non-interactive example

Start a fresh session as in the previous example, but now turn interactive mode off:

```python
import matplotlib.pyplot as plt
plt.ioff()
plt.plot([1.6, 2.7])
```

Nothing happened—or at least nothing has shown up on the screen (unless you are using macOSx backend, which is anomalous). To make the plot appear, you need to do this:

```python
plt.show()
```

Now you see the plot, but your terminal command line is unresponsive; the \texttt{show()} command \texttt{blocks} the input of additional commands until you manually kill the plot window.

What good is this—being forced to use a blocking function? Suppose you need a script that plots the contents of a file to the screen. You want to look at that plot, and then end the script.
Without some blocking command such as show(), the script would flash up the plot and then end immediately, leaving nothing on the screen.

In addition, non-interactive mode delays all drawing until show() is called; this is more efficient than redrawing the plot each time a line in the script adds a new feature.

Prior to version 1.0, show() generally could not be called more than once in a single script (although sometimes one could get away with it); for version 1.0.1 and above, this restriction is lifted, so one can write a script like this:

```python
import numpy as np
import matplotlib.pyplot as plt

plt.ioff()
for i in range(3):
    plt.plot(np.random.rand(10))
    plt.show()
```

which makes three plots, one at a time. I.e. the second plot will show up, once the first plot is closed.

**Summary**

In interactive mode, pyplot functions automatically draw to the screen.

When plotting interactively, if using object method calls in addition to pyplot functions, then call `draw()` whenever you want to refresh the plot.

Use non-interactive mode in scripts in which you want to generate one or more figures and display them before ending or generating a new set of figures. In that case, use `show()` to display the figure(s) and to block execution until you have manually destroyed them.

**Performance**

Whether exploring data in interactive mode or programmatically saving lots of plots, rendering performance can be a painful bottleneck in your pipeline. Matplotlib provides a couple ways to greatly reduce rendering time at the cost of a slight change (to a settable tolerance) in your plot’s appearance. The methods available to reduce rendering time depend on the type of plot that is being created.

**Line segment simplification**

For plots that have line segments (e.g. typical line plots, outlines of polygons, etc.), rendering performance can be controlled by the `path.simplify` and `path.simplify_threshold` parameters in your `matplotlibrc` file (see *Customizing Matplotlib with style sheets and rcParams* for more information about the `matplotlibrc` file). The `path.simplify` parameter is a boolean indicating whether or not line segments are simplified at all. The `path.simplify_threshold` parameter controls how much line segments are simplified; higher thresholds result in quicker rendering.

The following script will first display the data without any simplification, and then display the same data with simplification. Try interacting with both of them:
```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl

# Setup, and create the data to plot
y = np.random.rand(100000)
y[50000:] *= 2
y[np.logspace(1, np.log10(50000), 400).astype(int)] = -1
mpl.rcParams['path.simplify'] = True

mpl.rcParams['path.simplify_threshold'] = 0.0
plt.plot(y)
plt.show()

mpl.rcParams['path.simplify_threshold'] = 1.0
plt.plot(y)
plt.show()
```

Matplotlib currently defaults to a conservative simplification threshold of $1/9$. If you want to change your default settings to use a different value, you can change your `matplotlibrc` file. Alternatively, you could create a new style for interactive plotting (with maximal simplification) and another style for publication quality plotting (with minimal simplification) and activate them as necessary. See *Customizing Matplotlib with style sheets and rcParams* for instructions on how to perform these actions.

The simplification works by iteratively merging line segments into a single vector until the next line segment’s perpendicular distance to the vector (measured in display-coordinate space) is greater than the `path.simplify_threshold` parameter.

**Note:** Changes related to how line segments are simplified were made in version 2.1. Rendering time will still be improved by these parameters prior to 2.1, but rendering time for some kinds of data will be vastly improved in versions 2.1 and greater.

### Marker simplification

Markers can also be simplified, albeit less robustly than line segments. Marker simplification is only available to `Line2D` objects (through the `markevery` property). Wherever `Line2D` construction parameters are passed through, such as `matplotlib.pyplot.plot()` and `matplotlib.axes.Axes.plot()`, the `markevery` parameter can be used:

```python
plt.plot(x, y, markevery=10)
```

The `markevery` argument allows for naive subsampling, or an attempt at evenly spaced (along the x axis) sampling. See the `/gallery/lines_bars_and_markers/markevery_demo` for more information.

### Splitting lines into smaller chunks

If you are using the Agg backend (see *What is a backend?*), then you can make use of the `agg.path.chunksize` rc parameter. This allows you to specify a chunk size, and any lines with...
greater than that many vertices will be split into multiple lines, each of which has no more than
`agg.path.chunksize` many vertices. (Unless `agg.path.chunksize` is zero, in which case there is
no chunking.) For some kind of data, chunking the line up into reasonable sizes can greatly
decrease rendering time.

The following script will first display the data without any chunk size restriction, and then
display the same data with a chunk size of 10,000. The difference can best be seen when the
figures are large, try maximizing the GUI and then interacting with them:

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl
mpl.rcParams['path.simplify_threshold'] = 1.0

# Setup, and create the data to plot
y = np.random.rand(100000)
y[50000:] *= 2
y[np.logspace(1, np.log10(50000), 400).astype(int)] = -1
mpl.rcParams['path.simplify'] = True
mpl.rcParams['agg.path.chunksize'] = 0
plt.plot(y)
plt.show()

mpl.rcParams['agg.path.chunksize'] = 10000
plt.plot(y)
plt.show()
```

**Legends**

The default legend behavior for axes attempts to find the location that covers the fewest data
points (`loc='best'`). This can be a very expensive computation if there are lots of data points.
In this case, you may want to provide a specific location.

**Using the fast style**

The *fast* style can be used to automatically set simplification and chunking parameters to
reasonable settings to speed up plotting large amounts of data. It can be used simply by running:

```python
import matplotlib.style as mplstyle
mplstyle.use('fast')
```

It is very light weight, so it plays nicely with other styles, just make sure the fast style is
applied last so that other styles do not overwrite the settings:

```python
mplstyle.use(['dark_background', 'ggplot', 'fast'])
```

**Note:** Click *here* to download the full example code
2.1.2 Pyplot tutorial

An introduction to the pyplot interface.

Intro to pyplot

`matplotlib.pyplot` is a collection of command style functions that make matplotlib work like MATLAB. Each `pyplot` function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc.

In `matplotlib.pyplot` various states are preserved across function calls, so that it keeps track of things like the current figure and plotting area, and the plotting functions are directed to the current axes (please note that “axes” here and in most places in the documentation refers to the axes part of a figure and not the strict mathematical term for more than one axis).

Note: the pyplot API is generally less-flexible than the object-oriented API. Most of the function calls you see here can also be called as methods from an `Axes` object. We recommend browsing the tutorials and examples to see how this works.

Generating visualizations with pyplot is very quick:

```python
import matplotlib.pyplot as plt
plt.plot([1, 2, 3, 4])
plt.ylabel('some numbers')
plt.show()
```
You may be wondering why the x-axis ranges from 0-3 and the y-axis from 1-4. If you provide a single list or array to the `plot()` command, matplotlib assumes it is a sequence of y values, and automatically generates the x values for you. Since python ranges start with 0, the default x vector has the same length as y but starts with 0. Hence the x data are [0,1,2,3].

`plot()` is a versatile command, and will take an arbitrary number of arguments. For example, to plot x versus y, you can issue the command:

```python
plt.plot([1, 2, 3, 4], [1, 4, 9, 16])
```
Formatting the style of your plot

For every x, y pair of arguments, there is an optional third argument which is the format string that indicates the color and line type of the plot. The letters and symbols of the format string are from MATLAB, and you concatenate a color string with a line style string. The default format string is 'b-', which is a solid blue line. For example, to plot the above with red circles, you would issue

```python
plt.plot([1, 2, 3, 4], [1, 4, 9, 16], 'ro')
plt.axis([0, 6, 0, 20])
plt.show()
```
See the `plot()` documentation for a complete list of line styles and format strings. The `axis()` command in the example above takes a list of `[xmin, xmax, ymin, ymax]` and specifies the viewport of the axes.

If matplotlib were limited to working with lists, it would be fairly useless for numeric processing. Generally, you will use `numpy` arrays. In fact, all sequences are converted to numpy arrays internally. The example below illustrates a plotting several lines with different format styles in one command using arrays.

```python
import numpy as np

# evenly sampled time at 200ms intervals
t = np.arange(0., 5., 0.2)

# red dashes, blue squares and green triangles
plt.plot(t, t, 'r--', t, t**2, 'bs', t, t**3, 'g^')
plt.show()
```
Plotting with keyword strings

There are some instances where you have data in a format that lets you access particular variables with strings. For example, with `numpy.recarray` or `pandas.DataFrame`.

Matplotlib allows you provide such an object with the `data` keyword argument. If provided, then you may generate plots with the strings corresponding to these variables.

```python
data = {'a': np.arange(50),
        'c': np.random.randint(0, 50, 50),
        'd': np.random.randn(50)}
data['b'] = data['a'] + 10 * np.random.randn(50)
data['d'] = np.abs(data['d']) * 100

plt.scatter('a', 'b', c='c', s='d', data=data)
plt.xlabel('entry a')
plt.ylabel('entry b')
plt.show()
```
Plotting with categorical variables

It is also possible to create a plot using categorical variables. Matplotlib allows you to pass categorical variables directly to many plotting functions. For example:

```python
names = ['group_a', 'group_b', 'group_c']
values = [1, 10, 100]

plt.figure(figsize=(9, 3))

plt.subplot(131)
plt.bar(names, values)
plt.subplot(132)
plt.scatter(names, values)
plt.subplot(133)
plt.plot(names, values)
plt.suptitle('Categorical Plotting')
plt.show()
```
Controlling line properties

Lines have many attributes that you can set: linewidth, dash style, antialiased, etc; see `matplotlib.lines.Line2D`. There are several ways to set line properties

- Use keyword args:

  ```python
  plt.plot(x, y, linewidth=2.0)
  ```

- Use the setter methods of a Line2D instance. `plot` returns a list of Line2D objects; e.g., `line1, line2 = plot(x1, y1, x2, y2)`. In the code below we will suppose that we have only one line so that the list returned is of length 1. We use tuple unpacking with `line`, to get the first element of that list:

  ```python
  line, = plt.plot(x, y, '-')
  line.set_antialiased(False) # turn off antialiasing
  ```

- Use the `setp()` command. The example below uses a MATLAB-style command to set multiple properties on a list of lines. `setp` works transparently with a list of objects or a single object. You can either use python keyword arguments or MATLAB-style string/value pairs:

  ```python
  lines = plt.plot(x1, y1, x2, y2)
  # use keyword args
  plt.setp(lines, color='r', linewidth=2.0)
  # or MATLAB style string value pairs
  plt.setp(lines, 'color', 'r', 'linewidth', 2.0)
  ```

Here are the available `Line2D` properties.

To get a list of settable line properties, call the setp() function with a line or lines as argument

In [69]: lines = plt.plot([1, 2, 3])

In [70]: plt.setp(lines)
   alpha: float
   animated: [True | False]
   antialiased or aa: [True | False]
   ...snip

Working with multiple figures and axes

MATLAB, and pyplot, have the concept of the current figure and the current axes. All plotting commands apply to the current axes. The function gca() returns the current axes (a matplotlib.axes.Axes instance), and gcf() returns the current figure (matplotlib.figure.Figure instance). Normally, you don’t have to worry about this, because it is all taken care of behind the scenes. Below is a script to create two subplots.

```python
def f(t):
    return np.exp(-t) * np.cos(2*np.pi*t)

t1 = np.arange(0.0, 5.0, 0.1)
t2 = np.arange(0.0, 5.0, 0.02)
```

(continues on next page)
The `plt.figure()` command here is optional because `plt.figure(1)` will be created by default, just as a subplot(111) will be created by default if you don’t manually specify any axes. The `plt.subplot()` command specifies `numrows`, `numcols`, `plot_number` where `plot_number` ranges from 1 to `numrows*numcols`. The commas in the subplot command are optional if `numrows*numcols<10`. So `plt.subplot(211)` is identical to `subplot(2, 1, 1)`.

You can create an arbitrary number of subplots and axes. If you want to place an axes manually, i.e., not on a rectangular grid, use the `axes()` command, which allows you to specify the location as `axes([left, bottom, width, height])` where all values are in fractional (0 to 1) coordinates. See /gallery/subplots_axes_and_figures/axes_demo for an example of placing axes manually and /gallery/subplots_axes_and_figures/subplot_demo for an example with lots of subplots.

You can create multiple figures by using multiple `plt.figure()` calls with an increasing figure number. Of course, each figure can contain as many axes and subplots as your heart desires:
Matplotlib, Release 3.1.3

import matplotlib.pyplot as plt
plt.figure(1)
# the first figure
plt.subplot(211)
# the first subplot in the first figure
plt.plot([1, 2, 3])
plt.subplot(212)
# the second subplot in the first figure
plt.plot([4, 5, 6])

plt.figure(2)
plt.plot([4, 5, 6])

# a second figure
# creates a subplot(111) by default

plt.figure(1)
# figure 1 current; subplot(212) still current
plt.subplot(211)
# make subplot(211) in figure1 current
plt.title('Easy as 1, 2, 3') # subplot 211 title
You can clear the current figure with clf() and the current axes with cla(). If you find it
annoying that states (specifically the current image, figure and axes) are being maintained
for you behind the scenes, don’t despair: this is just a thin stateful wrapper around an object
oriented API, which you can use instead (see Artist tutorial)
If you are making lots of figures, you need to be aware of one more thing: the memory required
for a figure is not completely released until the figure is explicitly closed with close(). Deleting
all references to the figure, and/or using the window manager to kill the window in which the
figure appears on the screen, is not enough, because pyplot maintains internal references
until close() is called.
Working with text
The text() command can be used to add text in an arbitrary location, and the xlabel(),
ylabel() and title() are used to add text in the indicated locations (see Text in Matplotlib
Plots for a more detailed example)
mu, sigma = 100, 15
x = mu + sigma * np.random.randn(10000)
# the histogram of the data
n, bins, patches = plt.hist(x, 50, density=1, facecolor='g', alpha=0.75)

plt.xlabel('Smarts')
plt.ylabel('Probability')
plt.title('Histogram of IQ')
plt.text(60, .025, r'$\mu=100,\ \sigma=15$')
plt.axis([40, 160, 0, 0.03])
plt.grid(True)
plt.show()

36

Chapter 2. Tutorials


All of the `text()` commands return an `matplotlib.text.Text` instance. Just as with lines above, you can customize the properties by passing keyword arguments into the text functions or using `setp()`:

```python
t = plt.xlabel('my data', fontsize=14, color='red')
```

These properties are covered in more detail in *Text properties and layout*.

### Using mathematical expressions in text

`matplotlib` accepts TeX equation expressions in any text expression. For example to write the expression $\sigma_i = 15$ in the title, you can write a TeX expression surrounded by dollar signs:

```python
plt.title(r'\sigma_i=15')
```

The `r` preceding the title string is important – it signifies that the string is a *raw* string and not to treat backslashes as python escapes. `matplotlib` has a built-in TeX expression parser and layout engine, and ships its own math fonts – for details see *Writing mathematical expressions*. Thus you can use mathematical text across platforms without requiring a TeX installation. For those who have LaTeX and dvipng installed, you can also use LaTeX to format your text and incorporate the output directly into your display figures or saved postscript – see *Text rendering With LaTeX*. 

2.1. Introductory 37
Annotating text

The uses of the basic `text()` command above place text at an arbitrary position on the Axes. A common use for text is to annotate some feature of the plot, and the `annotate()` method provides helper functionality to make annotations easy. In an annotation, there are two points to consider: the location being annotated represented by the argument `xy` and the location of the text `xytext`. Both of these arguments are `(x, y)` tuples.

```python
ax = plt.subplot(111)

t = np.arange(0.0, 5.0, 0.01)
s = np.cos(2*np.pi*t)
line, = plt.plot(t, s, lw=2)

plt.annotate('local max', xy=(2, 1), xytext=(3, 1.5),
             arrowprops=dict(facecolor='black', shrink=0.05),)

plt.ylim(-2, 2)
plt.show()
```

In this basic example, both the `xy` (arrow tip) and `xytext` locations (text location) are in data coordinates. There are a variety of other coordinate systems one can choose – see `Basic annotation` and `Advanced Annotation` for details. More examples can be found in...
Logarithmic and other nonlinear axes

`matplotlib.pyplot` supports not only linear axis scales, but also logarithmic and logit scales. This is commonly used if data spans many orders of magnitude. Changing the scale of an axis is easy:

```python
plt.xscale('log')
```

An example of four plots with the same data and different scales for the y axis is shown below.

```python
from matplotlib.ticker import NullFormatter  # useful for 'logit' scale

# Fixing random state for reproducibility
np.random.seed(19680801)

# make up some data in the interval ]0, 1[
y = np.random.normal(loc=0.5, scale=0.4, size=1000)
y = y[(y > 0) & (y < 1)]
y.sort()
x = np.arange(len(y))

# plot with various axes scales
plt.figure()

# linear
plt.subplot(221)
plt.plot(x, y)
plt.yscale('linear')
plt.title('linear')
plt.grid(True)

# log
plt.subplot(222)
plt.plot(x, y)
plt.yscale('log')
plt.title('log')
plt.grid(True)

# symmetric log
plt.subplot(223)
plt.plot(x, y - y.mean())
plt.yscale('symlog', linthreshy=0.01)
plt.title('symlog')
plt.grid(True)

# logit
plt.subplot(224)
plt.plot(x, y)
plt.yscale('logit')
```

(continues on next page)
Matplotlib, Release 3.1.3

(continued from previous page)

plt.title('logit')
plt.grid(True)

# Format the minor tick labels of the y-axis into empty strings with
# `NullFormatter`, to avoid cumbering the axis with too many labels.
plt.gca().yaxis.set_minor_formatter(NullFormatter())

# Adjust the subplot layout, because the logit one may take more space
# than usual, due to y-tick labels like "$1 - 10^{-3}\$"
plt.subplots_adjust(top=0.92, bottom=0.08, left=0.10, right=0.95, hspace=0.25,
                    wspace=0.35)

plt.show()
Line Plot

Here’s how to create a line plot with text labels using `plot()`.

![Fig. 1: Simple Plot](image1)

Multiple subplots in one figure

Multiple axes (i.e. subplots) are created with the `subplot()` function:

![Fig. 2: Subplot](image2)

Images

Matplotlib can display images (assuming equally spaced horizontal dimensions) using the `imshow()` function.
Contouring and pseudocolor

The `pcolormesh()` function can make a colored representation of a two-dimensional array, even if the horizontal dimensions are unevenly spaced. The `contour()` function is another way to represent the same data:

![Fig. 4: Example comparing `pcolormesh()` and `contour()` for plotting two-dimensional data](image)

Histograms

The `hist()` function automatically generates histograms and returns the bin counts or probabilities:

Paths

You can add arbitrary paths in Matplotlib using the `matplotlib.path` module:
Fig. 5: Histogram Features

Fig. 6: Path Patch
Three-dimensional plotting

The mplot3d toolkit (see Getting started and mplot3d-examples-index) has support for simple 3d graphs including surface, wireframe, scatter, and bar charts.

![Surface3d](image)

**Fig. 7: Surface3d**

Thanks to John Porter, Jonathon Taylor, Reinier Heeres, and Ben Root for the mplot3d toolkit. This toolkit is included with all standard Matplotlib installs.

Streamplot

The `streamplot()` function plots the streamlines of a vector field. In addition to simply plotting the streamlines, it allows you to map the colors and/or line widths of streamlines to a separate parameter, such as the speed or local intensity of the vector field.

This feature complements the `quiver()` function for plotting vector fields. Thanks to Tom Flannaghan and Tony Yu for adding the streamplot function.

Ellipses

In support of the Phoenix mission to Mars (which used Matplotlib to display ground tracking of spacecraft), Michael Droettboom built on work by Charlie Moad to provide an extremely accurate 8-spline approximation to elliptical arcs (see `Arc`), which are insensitive to zoom level.

Bar charts

Use the `bar()` function to make bar charts, which includes customizations such as error bars:

You can also create stacked bars (`bar_stacked.py`), or horizontal bar charts (`barh.py`).

Pie charts

The `pie()` function allows you to create pie charts. Optional features include auto-labeling the percentage of area, exploding one or more wedges from the center of the pie, and a shadow
Fig. 8: Streamplot with various plotting options.

Fig. 9: Ellipse Demo
Fig. 10: Barchart Demo

effect. Take a close look at the attached code, which generates this figure in just a few lines of code.

Fig. 11: Pie Features

Tables

The `table()` function adds a text table to an axes.
Scatter plots

The `scatter()` function makes a scatter plot with (optional) size and color arguments. This example plots changes in Google’s stock price, with marker sizes reflecting the trading volume and colors varying with time. Here, the alpha attribute is used to make semitransparent circle markers.

Fig. 13: Scatter Demo2

GUI widgets

Matplotlib has basic GUI widgets that are independent of the graphical user interface you are using, allowing you to write cross GUI figures and widgets. See `matplotlib.widgets` and the widget examples.

Filled curves

The `fill()` function lets you plot filled curves and polygons:
Fig. 14: Slider and radio-button GUI.

Fig. 15: Fill
Thanks to Andrew Straw for adding this function.

Date handling

You can plot timeseries data with major and minor ticks and custom tick formatters for both.

![Date Plot](image)

**Fig. 16: Date**

See `matplotlib.ticker` and `matplotlib.dates` for details and usage.

Log plots

The `semilogx()`, `semilogy()` and `loglog()` functions simplify the creation of logarithmic plots.

![Log Plots](image)

**Fig. 17: Log Demo**

Thanks to Andrew Straw, Darren Dale and Gregory Lielens for contributions log-scaling infrastructure.
Polar plots

The `polar()` function generates polar plots.

![A line plot on a polar axis](image)

**Fig. 18: Polar Demo**

Legends

The `legend()` function automatically generates figure legends, with MATLAB-compatible legend-placement functions.

![Legend](image)

**Fig. 19: Legend**

Thanks to Charles Twardy for input on the legend function.

TeX-notation for text objects

Below is a sampling of the many TeX expressions now supported by Matplotlib’s internal mathtext engine. The mathtext module provides TeX style mathematical expressions using FreeType and the DejaVu, BaKoMa computer modern, or STIX fonts. See the `matplotlib.mathtext` module for additional details.
Matplotlib’s math rendering engine

\[ W^{3\beta}_{\theta_1 \theta_2} = U^{3\beta}_{\theta_1 \theta_2} + \frac{1}{8n^2} \int_{\alpha} \frac{\alpha_{2}^2}{U^{3\beta}_{\phi, \theta}} \left( \frac{U^{3\beta}_{\theta, \phi} - \alpha_{2}^2 U^{3\beta}_{\phi, \theta}}{U^{3\beta}_{\phi, \theta}} \right) \]

- Subscripts and superscripts: \( a_1 > \beta_i, a_{i+1}^{\beta} = \sin(2\pi f t) e^{-\pi/t}, \ldots \)
- Fractions, binomials, and stacked numbers: \( \frac{1}{2}, \frac{1}{3}, \left( \frac{1}{4} \right), \ldots \)
- Radicals: \( \sqrt{2}, \sqrt[3]{x}, \ldots \)
- Fonts: Roman, Italic, Typewriter or Calligraphic
- Accents: \( à, â, ã, ä, ü, ö, ñ, ñ, xyZ, XyZ, \ldots \)
- Greek, Hebrew: \( \alpha, \beta, \chi, \delta, \lambda, \mu, \Delta, \Gamma, \Phi, \Pi, \Upsilon, \Xi, \Psi, \Omega \)
- Delimiters, functions, and symbols: \( \cup, \int, \infty, \sum, \log, \sin, \approx, \oplus, \ast, \infty, \partial, \Re, \ldots \)

Fig. 20: Mathtext Examples

Matplotlib’s mathtext infrastructure is an independent implementation and does not require TeX or any external packages installed on your computer. See the tutorial at Writing mathematical expressions.

Native TeX rendering

Although Matplotlib’s internal math rendering engine is quite powerful, sometimes you need TeX. Matplotlib supports external TeX rendering of strings with the usetex option.

Fig. 21: TeX Demo
EEG GUI

You can embed Matplotlib into pygtk, wx, Tk, or Qt applications. Here is a screenshot of an EEG viewer called pbrain.

The lower axes uses `specgram()` to plot the spectrogram of one of the EEG channels.

For examples of how to embed Matplotlib in different toolkits, see:

- `/gallery/user Interfaces/embedding_in_gtk3_sgskip`
- `/gallery/user Interfaces/embedding_in_wx2_sgskip`
- `/gallery/user Interfaces/mpl_with_glade3_sgskip`
- `/gallery/user Interfaces/embedding_in_qt_sgskip`
- `/gallery/user Interfaces/embedding_in_tk_sgskip`
XKCD-style sketch plots

Just for fun, Matplotlib supports plotting in the style of xkcd.

![Subplot example](image)

Fig. 22: xkcd

**Subplot example**

Many plot types can be combined in one figure to create powerful and flexible representations of data.
```python
import matplotlib.pyplot as plt
import numpy as np

np.random.seed(19680801)
data = np.random.randn(2, 100)

fig, axs = plt.subplots(2, 2, figsize=(5, 5))
axs[0, 0].hist(data[0])
axs[1, 0].scatter(data[0], data[1])
axs[0, 1].plot(data[0], data[1])
axs[1, 1].hist2d(data[0], data[1])

plt.show()
```

**Note:** Click *here* to download the full example code

### 2.1.4 Image tutorial

A short tutorial on plotting images with Matplotlib.
**Startup commands**

First, let’s start IPython. It is a most excellent enhancement to the standard Python prompt, and it ties in especially well with Matplotlib. Start IPython either at a shell, or the IPython Notebook now.

With IPython started, we now need to connect to a GUI event loop. This tells IPython where (and how) to display plots. To connect to a GUI loop, execute the `%matplotlib` magic at your IPython prompt. There’s more detail on exactly what this does at IPython’s documentation on GUI event loops.

If you’re using IPython Notebook, the same commands are available, but people commonly use a specific argument to the `%matplotlib` magic:

```
In [1]: %matplotlib inline
```

This turns on inline plotting, where plot graphics will appear in your notebook. This has important implications for interactivity. For inline plotting, commands in cells below the cell that outputs a plot will not affect the plot. For example, changing the color map is not possible from cells below the cell that creates a plot. However, for other backends, such as Qt5, that open a separate window, cells below those that create the plot will change the plot - it is a live object in memory.

This tutorial will use matplotlib’s imperative-style plotting interface, pyplot. This interface maintains global state, and is very useful for quickly and easily experimenting with various plot settings. The alternative is the object-oriented interface, which is also very powerful, and generally more suitable for large application development. If you’d like to learn about the object-oriented interface, a great place to start is our Usage guide. For now, let’s get on with the imperative-style approach:

```python
import matplotlib.pyplot as plt
import matplotlib.image as mpimg
```

**Importing image data into Numpy arrays**

Loading image data is supported by the Pillow library. Natively, Matplotlib only supports PNG images. The commands shown below fall back on Pillow if the native read fails.

The image used in this example is a PNG file, but keep that Pillow requirement in mind for your own data.

Here’s the image we’re going to play with:
It’s a 24-bit RGB PNG image (8 bits for each of R, G, B). Depending on where you get your data, the other kinds of image that you’ll most likely encounter are RGBA images, which allow for transparency, or single-channel grayscale (luminosity) images. You can right click on it and choose “Save image as” to download it to your computer for the rest of this tutorial.

And here we go...

```python
img = mpimg.imread('../../doc/_static/stinkbug.png')
print(img)
```

Out:

```
[[0.40784314 0.40784314 0.40784314]
 [0.40784314 0.40784314 0.40784314]
 [0.40784314 0.40784314 0.40784314]
 ...]
```

(continues on next page)
Matplotlib has rescaled the 8 bit data from each channel to floating point data between 0.0 and 1.0. As a side note, the only datatype that Pillow can work with is uint8. Matplotlib plotting can handle float32 and uint8, but image reading/writing for any format other than PNG is limited to uint8 data. Why 8 bits? Most displays can only render 8 bits per channel worth of color gradation. Why can they only render 8 bits/channel? Because that’s about all the human eye can see. More here (from a photography standpoint): Luminous Landscape bit depth tutorial.

Each inner list represents a pixel. Here, with an RGB image, there are 3 values. Since it’s a black and white image, R, G, and B are all similar. An RGBA (where A is alpha, or transparency), has 4 values per inner list, and a simple luminance image just has one value (and is thus only a 2-D array, not a 3-D array). For RGB and RGBA images, matplotlib supports float32 and uint8 data types. For grayscale, matplotlib supports only float32. If your array data does not meet one of these descriptions, you need to rescale it.
Plotting numpy arrays as images

So, you have your data in a numpy array (either by importing it, or by generating it). Let’s render it. In Matplotlib, this is performed using the `imshow()` function. Here we’ll grab the plot object. This object gives you an easy way to manipulate the plot from the prompt.

```python
imgplot = plt.imshow(img)
```

You can also plot any numpy array.

Applying pseudocolor schemes to image plots

Pseudocolor can be a useful tool for enhancing contrast and visualizing your data more easily. This is especially useful when making presentations of your data using projectors - their contrast is typically quite poor.

Pseudocolor is only relevant to single-channel, grayscale, luminosity images. We currently have an RGB image. Since R, G, and B are all similar (see for yourself above or in your data), we can just pick one channel of our data:

```python
lum_img = img[:,:,0]
```

# This is array slicing. You can read more in the `Numpy tutorial`
Now, with a luminosity (2D, no color) image, the default colormap (aka lookup table, LUT), is applied. The default is called viridis. There are plenty of others to choose from.

```python
plt.imshow(lum_img, cmap="hot")
```
Note that you can also change colormaps on existing plot objects using the `set_cmap()` method:

```python
imgplot = plt.imshow(lum_img)
imgplot.set_cmap('nipy_spectral')
```
Note: However, remember that in the IPython notebook with the inline backend, you can't make changes to plots that have already been rendered. If you create imgplot here in one cell, you cannot call set_cmap() on it in a later cell and expect the earlier plot to change. Make sure that you enter these commands together in one cell. plt commands will not change plots from earlier cells.

There are many other colormap schemes available. See the list and images of the colormaps.

Color scale reference

It’s helpful to have an idea of what value a color represents. We can do that by adding color bars.

```python
imgplot = plt.imshow(lum_img)
plt.colorbar()
```
This adds a colorbar to your existing figure. This won’t automatically change if you change you switch to a different colormap - you have to re-create your plot, and add in the colorbar again.

Examining a specific data range

Sometimes you want to enhance the contrast in your image, or expand the contrast in a particular region while sacrificing the detail in colors that don’t vary much, or don’t matter. A good tool to find interesting regions is the histogram. To create a histogram of our image data, we use the `hist()` function.

```python
plt.hist(lum_img.ravel(), bins=256, range=(0.0, 1.0), fc='k', ec='k')
```
Out:

```python
(array([2.000e+00, 2.000e+00, 3.000e+00, 3.000e+00, 2.000e+00, 2.000e+00,
       7.000e+00, 1.000e+01, 1.100e+01, 1.500e+01, 1.400e+01, 2.700e+01,
       2.100e+01, 2.400e+01, 1.400e+01, 3.100e+01, 2.900e+01, 2.800e+01,

9.148e+03, 8.564e+03, 8.574e+03, 8.674e+03, 8.278e+03, 7.291e+03,
Most often, the “interesting” part of the image is around the peak, and you can get extra contrast by clipping the regions above and/or below the peak. In our histogram, it looks like there’s not much useful information in the high end (not many white things in the image). Let’s adjust the upper limit, so that we effectively “zoom in” part of the histogram. We do this by passing the clim argument to imshow. You could also do this by calling the set_clim() method of the image plot object, but make sure that you do so in the same cell as your plot command when working with the IPython Notebook - it will not change plots from earlier cells.

You can specify the clim in the call to plot.

```python
imgplot = plt.imshow(lum_img, clim=(0.0, 0.7))
```
You can also specify the clim using the returned object

```python
fig = plt.figure()
a = fig.add_subplot(1, 2, 1)
imgplot = plt.imshow(lum_img)
a.set_title('Before')
plt.colorbar(ticks=[0.1, 0.3, 0.5, 0.7], orientation='horizontal')
a = fig.add_subplot(1, 2, 2)
imgplot = plt.imshow(lum_img)
imgplot.set_clim(0.0, 0.7)
a.set_title('After')
plt.colorbar(ticks=[0.1, 0.3, 0.5, 0.7], orientation='horizontal')
```
Array Interpolation schemes

Interpolation calculates what the color or value of a pixel “should” be, according to different mathematical schemes. One common place that this happens is when you resize an image. The number of pixels change, but you want the same information. Since pixels are discrete, there’s missing space. Interpolation is how you fill that space. This is why your images sometimes come out looking pixelated when you blow them up. The effect is more pronounced when the difference between the original image and the expanded image is greater. Let’s take our image and shrink it. We’re effectively discarding pixels, only keeping a select few. Now when we plot it, that data gets blown up to the size on your screen. The old pixels aren’t there anymore, and the computer has to draw in pixels to fill that space.

We’ll use the Pillow library that we used to load the image also to resize the image.

```python
from PIL import Image

img = Image.open('..//..//doc/_static/stinkbug.png')
img.thumbnail((64, 64), Image.ANTIALIAS)  # resizes image in-place
imgplot = plt.imshow(img)
```
Here we have the default interpolation, bilinear, since we did not give `imshow()` any interpolation argument.

Let's try some others. Here's "nearest", which does no interpolation.

```python
imgplot = plt.imshow(img, interpolation="nearest")
```
and bicubic:

```python
imgplot = plt.imshow(img, interpolation="bicubic")
```
Bicubic interpolation is often used when blowing up photos - people tend to prefer blurry over pixelated.

**Total running time of the script:** ( 0 minutes 1.073 seconds)

### 2.1.5 The Lifecycle of a Plot

This tutorial aims to show the beginning, middle, and end of a single visualization using Matplotlib. We’ll begin with some raw data and end by saving a figure of a customized visualization. Along the way we’ll try to highlight some neat features and best-practices using Matplotlib.

**Note:** This tutorial is based off of [this excellent blog post](#) by Chris Moffitt. It was transformed into this tutorial by Chris Holdgraf.
A note on the Object-Oriented API vs Pyplot

Matplotlib has two interfaces. The first is an object-oriented (OO) interface. In this case, we utilize an instance of `axes.Axes` in order to render visualizations on an instance of `figure.Figure`.

The second is based on MATLAB and uses a state-based interface. This is encapsulated in the `pyplot` module. See the `pyplot tutorials` for a more in-depth look at the pyplot interface.

Most of the terms are straightforward but the main thing to remember is that:

- The Figure is the final image that may contain 1 or more Axes.
- The Axes represent an individual plot (don’t confuse this with the word “axis”, which refers to the x/y axis of a plot).

We call methods that do the plotting directly from the Axes, which gives us much more flexibility and power in customizing our plot.

**Note:** In general, try to use the object-oriented interface over the pyplot interface.

Our data

We’ll use the data from the post from which this tutorial was derived. It contains sales information for a number of companies.

```python
# sphinx_gallery_thumbnail_number = 10
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.ticker import FuncFormatter

data = {'Barton LLC': 109438.50,
        'Frami, Hills and Schmidt': 103569.59,
        'Fritsch, Russel and Anderson': 112214.71,
        'Jerde-Hilpert': 112591.43,
        'Keeling LLC': 100934.30,
        'Koepf Ltd': 103660.54,
        'Kulas Inc': 137351.96,
        'Trantow-Barrows': 123381.38,
        'White-Trantow': 135841.99,
        'Will LLC': 104437.60}
group_data = list(data.values())
group_names = list(data.keys())
group_mean = np.mean(group_data)
```

Getting started

This data is naturally visualized as a barplot, with one bar per group. To do this with the object-oriented approach, we’ll first generate an instance of `figure.Figure` and `axes.Axes`. The Figure is like a canvas, and the Axes is a part of that canvas on which we will make a particular visualization.
**Note:** Figures can have multiple axes on them. For information on how to do this, see the *Tight Layout tutorial*.

```python
fig, ax = plt.subplots()
```

Now that we have an Axes instance, we can plot on top of it.

```python
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
```
Controlling the style

There are many styles available in Matplotlib in order to let you tailor your visualization to your needs. To see a list of styles, we can use `pyplot.style`.

```
print(plt.style.available)
```

Out:

```
```

You can activate a style with the following:

```
plt.style.use('fivethirtyeight')
```
Now let’s remake the above plot to see how it looks:

```python
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
```

Out:
```
<BarContainer object of 10 artists>
```

The style controls many things, such as color, linewdths, backgrounds, etc.

**Customizing the plot**

Now we’ve got a plot with the general look that we want, so let’s fine-tune it so that it’s ready for print. First let’s rotate the labels on the x-axis so that they show up more clearly. We can gain access to these labels with the `axes.Axes.get_xticklabels()` method:

```python
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
```
If we'd like to set the property of many items at once, it's useful to use the `pyplot.setp()` function. This will take a list (or many lists) of Matplotlib objects, and attempt to set some style element of each one.

```python
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
```
It looks like this cut off some of the labels on the bottom. We can tell Matplotlib to automatically make room for elements in the figures that we create. To do this we’ll set the `autolayout` value of our rcParams. For more information on controlling the style, layout, and other features of plots with rcParams, see *Customizing Matplotlib with style sheets and rcParams*.

```python
plt.rcParams.update({'figure.autolayout': True})
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
```
Next, we’ll add labels to the plot. To do this with the OO interface, we can use the `axes.Axes.set()` method to set properties of this Axes object.

```python
code
fig, ax = plt.subplots()
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company', title='Company Revenue')
```
We can also adjust the size of this plot using the `pyplot.subplots()` function. We can do this with the `figsize` kwarg.

**Note:** While indexing in NumPy follows the form (row, column), the `figsize` kwarg follows the form (width, height). This follows conventions in visualization, which unfortunately are different from those of linear algebra.

```python
fig, ax = plt.subplots(figsize=(8, 4))
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')
ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
```
For labels, we can specify custom formatting guidelines in the form of functions by using the `ticker.FuncFormatter` class. Below we’ll define a function that takes an integer as input, and returns a string as an output.

```python
def currency(x, pos):
    """The two args are the value and tick position""
    if x >= 1e6:
        s = '${:1.1f}M'.format(x*1e-6)
    else:
        s = '${:1.0f}K'.format(x*1e-3)
    return s

formatter = FuncFormatter(currency)
```

We can then apply this formatter to the labels on our plot. To do this, we’ll use the `xaxis` attribute of our axis. This lets you perform actions on a specific axis on our plot.

```python
fig, ax = plt.subplots(figsize=(6, 8))
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')

ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
       title='Company Revenue')
ax.xaxis.set_major_formatter(formatter)
```
Combining multiple visualizations

It is possible to draw multiple plot elements on the same instance of `axes.Axes`. To do this we simply need to call another one of the plot methods on that axes object.
```python
fig, ax = plt.subplots(figsize=(8, 8))
ax.barh(group_names, group_data)
labels = ax.get_xticklabels()
plt.setp(labels, rotation=45, horizontalalignment='right')

# Add a vertical line, here we set the style in the function call
ax.axvline(group_mean, ls='--', color='r')

# Annotate new companies
for group in [3, 5, 8]:
    ax.text(145000, group, "New Company", fontsize=10,
            verticalalignment="center")

# Now we'll move our title up since it's getting a little cramped
ax.title.set(y=1.05)
ax.set(xlim=[-10000, 140000], xlabel='Total Revenue', ylabel='Company',
      title='Company Revenue')
ax.xaxis.set_major_formatter(formatter)
ax.set_xticks([0, 25e3, 50e3, 75e3, 100e3, 125e3])
fig.subplots_adjust(right=.1)
plt.show()
```
Saving our plot

Now that we’re happy with the outcome of our plot, we want to save it to disk. There are many file formats we can save to in Matplotlib. To see a list of available options, use:

```python
print(fig.canvas.get_supported_filetypes())
```

Out:

```python
```
We can then use the `figure.Figure.savefig()` in order to save the figure to disk. Note that there are several useful flags we’ll show below:

- `transparent=True` makes the background of the saved figure transparent if the format supports it.
- `dpi=80` controls the resolution (dots per square inch) of the output.
- `bbox_inches="tight"` fits the bounds of the figure to our plot.

```
# Uncomment this line to save the figure.
# fig.savefig('sales.png', transparent=False, dpi=80, bbox_inches="tight")
```

**Note:** Click [here](#) to download the full example code

### 2.1.6 Customizing Matplotlib with style sheets and rcParams

Tips for customizing the properties and default styles of Matplotlib.

#### Using style sheets

The `style` package adds support for easy-to-switch plotting “styles” with the same parameters as a `matplotlibrc` file (which is read at startup to configure matplotlib).

There are a number of pre-defined styles provided by Matplotlib. For example, there’s a pre-defined style called “ggplot”, which emulates the aesthetics of ggplot (a popular plotting package for R). To use this style, just add:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl
plt.style.use('ggplot')
data = np.random.randn(50)
```

To list all available styles, use:

```
print(plt.style.available)
```

Out:

```
['seaborn-deep', 'seaborn-white', 'grayscale', 'fivethirtyeight', 'seaborn-whitegrid',
 'seaborn-darkgrid', 'tableau-colorblind10', 'seaborn-dark-palette', 'seaborn-talk',
 'seaborn-bright', 'seaborn-colorblind', 'seaborn-paper', '_classic_test', 'seaborn-muted',
 'seaborn-pastel', 'seaborn-dark', 'Solarize_Light2', 'classic', 'seaborn',
 'fast', 'seaborn-notebook', 'seaborn-poster', 'bmh', 'dark_background', 'ggplot',
 'seaborn-ticks']
```
Defining your own style

You can create custom styles and use them by calling `style.use` with the path or URL to the style sheet. Additionally, if you add your `<style-name>.mplstyle` file to `mpl_configdir/stylelib`, you can reuse your custom style sheet with a call to `style.use(<style-name>)`. By default `mpl_configdir` should be `~/.config/matplotlib`, but you can check where yours is with `matplotlib.get_configdir()`; you may need to create this directory. You also can change the directory where `matplotlib` looks for the stylelib/ folder by setting the `MPLCONFIGDIR` environment variable, see `matplotlib configuration and cache directory locations`.

Note that a custom style sheet in `mpl_configdir/stylelib` will override a style sheet defined by `matplotlib` if the styles have the same name.

For example, you might want to create `mpl_configdir/stylelib/presentation.mplstyle` with the following:

```python
axes.titlesize : 24
axes.labelsize : 20
lines.linewidth : 3
lines.markersize : 10
xtick.labelsize : 16
ytick.labelsize : 16
```

Then, when you want to adapt a plot designed for a paper to one that looks good in a presentation, you can just add:

```python
>>> import matplotlib.pyplot as plt
>>> plt.style.use('presentation')
```

Composing styles

Style sheets are designed to be composed together. So you can have a style sheet that customizes colors and a separate style sheet that alters element sizes for presentations. These styles can easily be combined by passing a list of styles:

```python
>>> import matplotlib.pyplot as plt
>>> plt.style.use(['dark_background', 'presentation'])
```

Note that styles further to the right will overwrite values that are already defined by styles on the left.

Temporary styling

If you only want to use a style for a specific block of code but don’t want to change the global styling, the style package provides a context manager for limiting your changes to a specific scope. To isolate your styling changes, you can write something like the following:

```python
with plt.style.context('dark_background'):
    plt.plot(np.sin(np.linspace(0, 2 * np.pi)), 'r-o')
plt.show()
```
2.1.7 matplotlib rcParams

Dynamic rc settings

You can also dynamically change the default rc settings in a python script or interactively from the python shell. All of the rc settings are stored in a dictionary-like variable called `matplotlib.rcParams`, which is global to the matplotlib package. `rcParams` can be modified directly, for example:

```python
mpl.rcParams['lines.linewidth'] = 2
mpl.rcParams['lines.color'] = 'r'
plt.plot(data)
```
Matplotlib also provides a couple of convenience functions for modifying rc settings. The `matplotlib.rc()` command can be used to modify multiple settings in a single group at once, using keyword arguments:

```python
mpl.rc('lines', linewidth=4, color='g')
plt.plot(data)
```
The `matplotlib.rcdefaults()` command will restore the standard matplotlib default settings. There is some degree of validation when setting the values of rcParams, see `matplotlib.rcsetup` for details.

The `matplotlibrc` file

`matplotlib` uses `matplotlibrc` configuration files to customize all kinds of properties, which we call rc settings or rc parameters. You can control the defaults of almost every property in `matplotlib`: figure size and dpi, line width, color and style, axes, axis and grid properties, text and font properties and so on. `matplotlib` looks for `matplotlibrc` in four locations, in the following order:

1. `matplotlibrc` in the current working directory, usually used for specific customizations that you do not want to apply elsewhere.
2. `$MATPLOTLIBRC` if it is a file, else `$MATPLOTLIBRC/matplotlibrc`.
3. It next looks in a user-specific place, depending on your platform:
   - On Linux and FreeBSD, it looks in `.config/matplotlib/matplotlibrc` (or `$XDG_CONFIG_HOME/matplotlib/matplotlibrc`) if you’ve customized your environment.
• On other platforms, it looks in .matplotlib/matplotlibrc.

See matplotlib configuration and cache directory locations.

4. INSTALL/matplotlib/mpl-data/matplotlibrc, where INSTALL is something like /usr/lib/python3.7/site-packages on Linux, and maybe C:\Python37\Lib\site-packages on Windows. Every time you install matplotlib, this file will be overwritten, so if you want your customizations to be saved, please move this file to your user-specific matplotlib directory.

Once a matplotlibrc file has been found, it will not search any of the other paths.

To display where the currently active matplotlibrc file was loaded from, one can do the following:

```python
>>> import matplotlib
>>> matplotlib.matplotlib_fname()
'/home/foo/.config/matplotlib/matplotlibrc'
```

See below for a sample matplotlibrc file.

A sample matplotlibrc file

```python

### MATPLOTLIBRC FORMAT

## This is a sample matplotlib configuration file - you can find a copy
## of it on your system in
## site-packages/matplotlib/mpl-data/matplotlibrc. If you edit it
## there, please note that it will be overwritten in your next install.
## If you want to keep a permanent local copy that will not be
## overwritten, place it in the following location:
## unix/linux:
##   $HOME/.config/matplotlib/matplotlibrc or
##   $XDG_CONFIG_HOME/matplotlib/matplotlibrc (if $XDG_CONFIG_HOME is set)
## other platforms:
##   $HOME/.matplotlib/matplotlibrc
##
## See http://matplotlib.org/users/customizing.html#the-matplotlibrc-file for
## more details on the paths which are checked for the configuration file.
##
## This file is best viewed in a editor which supports python mode
## syntax highlighting. Blank lines, or lines starting with a comment
## symbol, are ignored, as are trailing comments. Other lines must
## have the format
##   key : val ## optional comment
##
## Colors: for the color values below, you can either use - a
## matplotlib color string, such as r, k, or b - an rgb tuple, such as
##   (1.0, 0.5, 0.0) - a hex string, such as ff00ff - a scalar
## grayscale intensity such as 0.75 - a legal html color name, e.g., red,
## blue, darkslategrey

#### CONFIGURATION BEGINS HERE

(continues on next page)
```
## The default backend. If you omit this parameter, the first working backend from the following list is used:
## MacOSX Qt5Agg Qt4Agg Gtk3Agg TkAgg WxAgg Agg
##
## Other choices include:
## Qt5Cairo Qt4Cairo GTK3Cairo TkCairo WxCairo Cairo Wx PS PDF SVG Template.
##
## You can also deploy your own backend outside of matplotlib by referring to the module name (which must be in the PYTHONPATH) as 'module://my_backend'.

## Note that this can be overridden by the environment variable QT_API used by Enthought Tool Suite (ETS); valid values are "pyqt" and "pyside". The "pyqt" setting has the side effect of forcing the use of Version 2 API for QString and QVariant.

## The port to use for the web server in the WebAgg backend.
##webagg.port : 8988

## The address on which the WebAgg web server should be reachable
##webagg.address : 127.0.0.1

## If webagg.port is unavailable, a number of other random ports will be tried until one that is available is found.
##webagg.port_retries : 50

## When True, open the webbrowser to the plot that is shown
##webagg.open_in_browser : True

## if you are running pyplot inside a GUI and your backend choice conflicts, we will automatically try to find a compatible one for you if backend_fallback is True
##backend_fallback: True

#interactive : False

#toolbar : toolbar2 ## None | toolbar2 ("classic" is deprecated)

#timezone : UTC ## a pytz timezone string, e.g., US/Central or Europe/Paris

## Where your matplotlib data lives if you installed to a non-default location. This is where the matplotlib fonts, bitmaps, etc reside
#datapath : /home/jdhunter/mpldata

#### LINES
## See http://matplotlib.org/api/artist_api.html#module-matplotlib.lines for more information on line properties.
#lines.linewidth : 1.5 ## line width in points
#lines.linestyle : - ## solid line
#lines.color : C0 ## has no affect on plot(); see axes.prop_cycle
#lines.marker : None ## the default marker
#lines.markercolor : auto ## the default markercolor
#lines.markeredgecolor : auto ## the default markeredgecolor
#lines.markeredgewidth : 1.0 ## the line width around the marker symbol
#lines.markersize : 6 ## markersize, in points
#lines.dash_joinstyle : round ## miter/round/bevel
#lines.dash_capstyle : butt ## butt/round/projecting
#lines.solid_joinstyle : round ## miter/round/bevel
#lines.solid_capstyle : projecting ## butt/round/projecting
#lines.antialiased : True ## render lines in antialiased (no jaggies)

## The three standard dash patterns. These are scaled by the linewidth.
#lines.dashed_pattern : 3.7, 1.6
#lines.dashdot_pattern : 6.4, 1.6, 1, 1.6
#lines.dotted_pattern : 1, 1.65
#lines.scale_dashes : True

#markers.fillstyle: full ## full/left/right/bottom/top/none

#### PATCHES
## Patches are graphical objects that fill 2D space, like polygons or circles. See
## http://matplotlib.org/api/artist_api.html#module-matplotlib.patches
## information on patch properties
#patch.linewidth : 1 ## edge width in points.
#patch.facecolor : C0
#patch.edgecolor : black ## if forced, or patch is not filled
#patch.force_edgecolor : False ## True to always use edgecolor
#patch.antialiased : True ## render patches in antialiased (no jaggies)

#### HATCHES
#hatch.color : black
#hatch.linewidth : 1.0

#### Boxplot
#boxplot.notch : False
#boxplot.vertical : True
#boxplot.whiskers : 1.5
#boxplot.bootstrap : None
#boxplot.patchartist : False
#boxplot.showmeans : False
#boxplot.showcaps : True
#boxplot.showbox : True
#boxplot.showfliers : True
#boxplot.meanline : False

#boxplot.flierprops.color : black
#boxplot.flierprops.marker : o
#boxplot.flierprops.markerfacecolor : none
#boxplot.flierprops.markeredgecolor : black
#boxplot.flierprops.markeredgewidth : 1.0
#boxplot.flierprops.markersize : 6
#boxplot.flierprops.linestyle : none
#boxplot.flierprops.linewidth : 1.0
#boxplot.boxprops.color : black
#boxplot.boxprops.linewidth : 1.0
#boxplot.boxprops.linestyle : -

#boxplot.whiskerprops.color : black
#boxplot.whiskerprops.linewidth : 1.0
#boxplot.whiskerprops.linestyle : -

#boxplot.capprops.color : black
#boxplot.capprops.linewidth : 1.0
#boxplot.capprops.linestyle : -

#boxplot.medianprops.color : C1
#boxplot.medianprops.linewidth : 1.0
#boxplot.medianprops.linestyle : -

#boxplot.meanprops.color : C2
#boxplot.meanprops.marker : ^
#boxplot.meanprops.markerfacecolor : C2
#boxplot.meanprops.markeredgecolor : C2
#boxplot.meanprops.markersize : 6
#boxplot.meanprops.linestyle : --
#boxplot.meanprops.linewidth : 1.0

### FONT

## font properties used by text.Text. See
## http://matplotlib.org/api/font_manager_api.html for more
## information on font properties. The 6 font properties used for font
## matching are given below with their default values.
##
## The font.family property has five values: 'serif' (e.g., Times),
## 'sans-serif' (e.g., Helvetica), 'cursive' (e.g., Zapf-Chancery),
## 'fantasy' (e.g., Western), and 'monospace' (e.g., Courier). Each of
## these font families has a default list of font names in decreasing
## order of priority associated with them. When text.usetex is False,
## font.family may also be one or more concrete font names.
##
## The font.style property has three values: normal (or roman), italic
## or oblique. The oblique style will be used for italic, if it is not
## present.
##
## The font.variant property has two values: normal or small-caps. For
## TrueType fonts, which are scalable fonts, small-caps is equivalent
## to using a font size of 'smaller', or about 83% of the current font
## size.
##
## The font.weight property has effectively 13 values: normal, bold,
## bolder, lighter, 100, 200, 300, ..., 900. Normal is the same as
## 400, and bold is 700. bolder and lighter are relative values with

(continues on next page)
## respect to the current weight.

## The font.stretch property has 11 values: ultra-condensed,
## extra-condensed, condensed, semi-condensed, normal, semi-expanded,
## expanded, extra-expanded, ultra-expanded, wider, and narrower. This
## property is not currently implemented.

## The font.size property is the default font size for text, given in pts.
## 10 pt is the standard value.

#font.family : sans-serif
#font.style : normal
#font.variant : normal
#font.weight : normal
#font.stretch : normal
## note that font.size controls default text sizes. To configure
## special text sizes tick labels, azes, labels, title, etc, see the rc
## settings for axes and ticks. Special text sizes can be defined
## relative to font.size, using the following values: xx-small, x-small,
## small, medium, large, x-large, xx-large, larger, or smaller
#font.size : 10.0
#font.serif : DejaVu Serif, Bitstream Vera Serif, Computer Modern Roman, New
→ Century Schoolbook, Century Schoolbook L, Utopia, ITC Bookman, Bookman, Nimbus Roman,
→ No9 L, Times New Roman, Times, Palatino, Charter, serif
#font.sans-serif : DejaVu Sans, Bitstream Vera Sans, Computer Modern Sans Serif,
→ Lucida Grande, Verdana, Geneva, Lucid, Arial, Helvetica, Avant Garde, sans-serif
#font.cursive : Apple Chancery, Textile, Zapf Chancery, Sand, Script MT, Felipa,
→ cursive
#font.fantasy : Comic Sans MS, Chicago, Charcoal, ImpactWestern, Humor Sans, zkcd,
→ fantasy
#font.monospace : DejaVu Sans Mono, Bitstream Vera Sans Mono, Computer Modern
→ Typewriter, Andale Mono, Nimbus Mono L, Courier New, Courier, Fixed, Terminal,
→ monospace

#### TEXT

## text properties used by text.Text. See
## http://matplotlib.org/api/artist_api.html#module-matplotlib.text for more
## information on text properties
#text.color : black

#### LaTeX customizations. See http://wiki.scipy.org/Cookbook/Matplotlib/UsingTex
#text.usetex : False
## use latex for all text handling. The following fonts
## are supported through the usual rc parameter settings:
## new century schoolbook, bookman, times, palatino,
## zapf chancery, charter, serif, sans-serif, helvetica,
## avant garde, courier, monospace, computer modern roman,
## computer modern sans serif, computer modern typewriter
## If another font is desired which can loaded using the
## LaTeX \usepackage command, please inquiere at the
## matplotlib mailing list
#text.latex.preamble : ## IMPROPER USE OF THIS FEATURE WILL LEAD TO LATEX FAILURES
## AND IS THEREFORE UNSUPPORTED. PLEASE DO NOT ASK FOR HELP

(continues on next page)
## IF THIS FEATURE DOES NOT DO WHAT YOU EXPECT IT TO.

text.latex.preamble is a single line of LaTeX code that
will be passed on to the LaTeX system. It may contain
any code that is valid for the LaTeX "preamble", i.e.
between the "\documentclass" and "\begin{document}"
statements.
Note that it has to be put on a single line, which may
become quite long.
The following packages are always loaded with usetex, so
beware of package collisions: color, geometry, graphicx,
type1cm, textcomp.
Adobe Postscript (PSSNFS) font packages may also be
loaded, depending on your font settings.

#text.latex.preview : False

#text.hinting : auto  ## May be one of the following:
## none: Perform no hinting
## auto: Use FreeType's autohinter
## native: Use the hinting information in the
##     font file, if available, and if your
##     FreeType library supports it
## either: Use the native hinting information,
## or the autohinter if none is available.
## For backward compatibility, this value may also be
## True === 'auto' or False === 'none'.
#text.hinting_factor : 8 ## Specifies the amount of softness for hinting in the
## horizontal direction. A value of 1 will hint to full
## pixels. A value of 2 will hint to half pixels etc.
#text.antialiased : True  ## If True (default), the text will be antialiased.
## This only affects the Agg backend.

## The following settings allow you to select the fonts in math mode.
## They map from a TeX font name to a fontconfig font pattern.
## These settings are only used if mathtext.fontset is 'custom'.
## Note that this "custom" mode is unsupported and may go away in the
## future.
#mathtext.cal : cursive
#mathtext.rm : sans
#mathtext.tt : monospace
#mathtext.it : sans:italic
#mathtext.bf : sans:bold
#mathtext.sf : sans
#mathtext.fontset : dejavusans ## Should be 'dejavusans' (default),
## 'dejavuserif', 'cm' (Computer Modern), 'stix',
## 'stixsans' or 'custom'
#mathtext.fallback_to_cm : True  ## When True, use symbols from the Computer Modern
## fonts when a symbol can not be found in one of
## the custom math fonts.
#mathtext.default : it  ## The default font to use for math.
## Can be any of the LaTeX font names, including
## the special name "regular" for the same font
## used in regular text.
### AXES

**default face and edge color, default tick sizes,**
**default fontsize for ticklabels, and so on. See**
**http://matplotlib.org/api/axes_api.html#module-matplotlib.axes**

- `axes.facecolor`: white  ## axes background color
- `axes.edgecolor`: black  ## axes edge color
- `axes.linewidth`: 0.8  ## edge linewidth
- `axes.grid`: False  ## display grid or not
- `axes.grid.azis`: both  ## which axis the grid should apply to
- `axes.grid.which`: major  ## gridlines at major, minor or both ticks
- `axes.titlesize`: large  ## fontsize of the axes title
- `axes.titleweight`: normal  ## font weight of title
- `axes.titlepad`: 6.0  ## pad between axes and title in points
- `axes.labelsize`: medium  ## fontsize of the x any y labels
- `axes.labelpad`: 4.0  ## space between label and axis
- `axes.labelweight`: normal  ## weight of the x and y labels
- `axes.labelcolor`: black
- `axes.unicode_minus`: True  ## use unicode for the minus symbol

| `axes.formatter.limits`: -7, 7  ## use scientific notation if log10
| `axes.formatter.use_locale`: False  ## When True, format tick labels
  | according to the user’s locale.
  | For example, use ‘,’ as a decimal
  | separator in the fr_FR locale.
| `axes.formatter.use_mathtext`: False  ## When True, use mathtext for scientific
  | notation.
| `axes.formatter.min_exponent`: 0  ## minimum exponent to format in scientific notation
| `axes.formatter.useoffset`: True  ## If True, the tick label formatter
  | will default to labeling ticks relative
  | to an offset when the data range is
  | small compared to the minimum absolute
  | value of the data.
| `axes.formatter.offset_threshold`: 4  ## When useoffset is True, the offset
  | will be used when it can remove
  | at least this number of significant
  | digits from tick labels.

- `axes.spines.left`: True  ## display axis spines
- `axes.spines.bottom`: True
- `axes.spines.top`: True
- `axes.spines.right`: True
- `axes.unicode_minus`: True  ## use unicode for the minus symbol

| `axes.prop_cycle`: cycler('color', ['1f77b4', 'ff7f0e', '2ca02c', 'd62728', '9467bd',
| '8c564b', 'e377c2', '7f7f7f', 'bcbd22', '17becf'])
| `axes.prop_cycle`: cycler('color', ['1f77b4', 'ff7f0e', '2ca02c', 'd62728', '9467bd',
| '8c564b', 'e377c2', '7f7f7f', 'bcbd22', '17becf'])
  | color cycle for plot lines as list of string
  | colorspecs: single letter, long name, or web-style hex

---

(continues on next page)
## Note the use of string escapes here ('1f77b4
->', instead of 1f77b4)

## as opposed to the rest of this file.

#axes.autolimit_mode : data ## How to scale axes limits to the data.
## Use "data" to use data limits, plus some margin
## Use "round_number" move to the nearest "round" number
#axes.xmargin : .05 ## x margin. See `axes.Axes.margins`
#axes.ymargin : .05 ## y margin See `axes.Axes.margins`'
#polaraxes.grid : True ## display grid on polar axes
#axes3d.grid : True ## display grid on 3d axes

#### DATES
## These control the default format strings used in AutoDateFormatter.
## Any valid format datetime format string can be used (see the python
## `datetime` for details). For example using '%Y' will use the locale date
## representation
## '%XX' will use the locale time representation and '%c' will use the full locale
## representation.
## These values map to the scales:
## {'year': 365, 'month': 30, 'day': 1, 'hour': 1/24, 'minute': 1 / (24 * 60)}
#date.autoformatter.year : %Y
#date.autoformatter.month : %Y-%m
#date.autoformatter.day : %Y-%m-%d
#date.autoformatter.hour : %m-%d %H
#date.autoformatter.minute : %d %H:%M
#date.autoformatter.second : %H:%M:%S
#date.autoformatter.microsecond : %M:%S.%f

#### TICKS
## see http://matplotlib.org/api/axis_api.html#matplotlib.axis.Tick
#tick.top : False ## draw ticks on the top side
#tick.bottom : True ## draw ticks on the bottom side
#tick.labeltop : False ## draw label on the top
#tick.labelbottom : True ## draw label on the bottom
#tick.major.size : 3.5 ## major tick size in points
#tick.minor.size : 2 ## minor tick size in points
#tick.major.width : 0.8 ## major tick width in points
#tick.minor.width : 0.6 ## minor tick width in points
#tick.major.pad : 3.5 ## distance to major tick label in points
#tick.minor.pad : 3.4 ## distance to the minor tick label in points
#tick.color : black ## color of the tick labels
#tick.labelsize : medium ## fontsize of the tick labels
#tick.direction : out ## direction: in, out, or inout
#tick.minor.visible : False ## visibility of minor ticks on x-axis
#tick.major.top : True ## draw x axis top major ticks
#tick.major.bottom : True ## draw x axis bottom major ticks
#tick.minor.top : True ## draw x axis top minor ticks
#tick.minor.bottom : True ## draw x axis bottom minor ticks
#tick.alignment : center ## alignment of xticks

(continues on next page)
#ytick.left : True  ## draw ticks on the left side
#ytick.right : False  ## draw ticks on the right side
#ytick.labelleft : True  ## draw tick labels on the left side
#ytick.labelright : False  ## draw tick labels on the right side
#ytick.major.size : 3.5  ## major tick size in points
#ytick.minor.size : 2  ## minor tick size in points
#ytick.major.width : 0.8  ## major tick width in points
#ytick.minor.width : 0.6  ## minor tick width in points
#ytick.major.pad : 3.5  ## distance to major tick label in points
#ytick.minor.pad : 3.4  ## distance to the minor tick label in points
#ytick.color : black  ## color of the tick labels
#ytick.labelsizes : medium  ## fontsize of the tick labels
#ytick.direction : out  ## direction: in, out, or inout
#ytick.minor.visible : False  ## visibility of minor ticks on y-axis
#ytick.major.left : True  ## draw y axis left major ticks
#ytick.major.right : True  ## draw y axis right major ticks
#ytick.minor.left : True  ## draw y axis left minor ticks
#ytick.minor.right : True  ## draw y axis right minor ticks
#ytick.alignment : center_baseline  ## alignment of yticks

#### GRIDS
#grid.color : b0b0b0  ## grid color
#grid.linestyle : -  ## solid
#grid.linewidth : 0.8  ## in points
#grid.alpha : 1.0  ## transparency, between 0.0 and 1.0

#### Legend
#legend.loc : best
#legend.frameon : True  ## if True, draw the legend on a background patch
#legend.framealpha : 0.8  ## legend patch transparency
#legend.facecolor : inherit  ## inherit from axes.facecolor; or color spec
#legend.edgecolor : 0.8  ## background patch boundary color
#legend.fancybox : True  ## if True, use a rounded box for the
## legend background, else a rectangle
#legend.shadow : False  ## if True, give background a shadow effect
#legend.numpoints : 1  ## the number of marker points in the legend line
#legend.scatterpoints : 1  ## number of scatter points
#legend.markerscale : 1.0  ## the relative size of legend markers vs. original
#legend.fontsize : medium
#legend.title_fontsize : None  ## None sets to the same as the default axes.
## Dimensions as fraction of fontsize:
#legend.borderpad : 0.4  ## border whitespace
#legend.labelspacing : 0.5  ## the vertical space between the legend entries
#legend.handlelength : 2.0  ## the length of the legend lines
#legend.handleheight : 0.7  ## the hieght of the legend handle
#legend.handlelengthpad : 0.8  ## the space between the legend line and legend text
#legend.borderaxespad : 0.5  ## the border between the axes and legend edge
#legend.columnspace : 2.0  ## column separation

#### FIGURE
## See http://matplotlib.org/api/figure_api.html#matplotlib.figure.Figure
#figure.titlesize : large  ## size of the figure title (Figure.suptitle())

(continues on next page)
#figure.titleweight : normal  ## weight of the figure title
#figure.figsize : 6.4, 4.8  ## figure size in inches
#figure.dpi : 100  ## figure dots per inch
#figure.facecolor : white  ## figure facecolor
#figure.edgecolor : white  ## figure edgecolor
#figure.frameon : True  ## enable figure frame
#figure.max_open_warning : 20  ## The maximum number of figures to open through
## the pyplot interface before emitting a warning.
## If less than one this feature is disabled.

## The figure subplot parameters. All dimensions are a fraction of the
#figure.subplot.left : 0.125  ## the left side of the subplots of the figure
#figure.subplot.right : 0.9  ## the right side of the subplots of the figure
#figure.subplot.bottom : 0.11  ## the bottom of the subplots of the figure
#figure.subplot.top : 0.88  ## the top of the subplots of the figure
#figure.subplot.wspace : 0.2  ## the amount of width reserved for space between,
## subplots,
## expressed as a fraction of the average axis width
#figure.subplot.hspace : 0.2  ## the amount of height reserved for space between,
## subplots,
## expressed as a fraction of the average axis height

## Figure layout
#figure.autolayout : False  ## When True, automatically adjust subplot
## parameters to make the plot fit the figure
## using `tight_layout`
#figure.constrained_layout.use: False  ## When True, automatically make plot
## elements fit on the figure. (Not compatible
## with `autolayout`, above).
#figure.constrained_layout.h_pad : 0.04167  ## Padding around axes objects. Float
## representing
#figure.constrained_layout.w_pad : 0.04167  ## inches. Default is 3./72. inches (3 pts)
## representing
#figure.constrained_layout.hspace : 0.02  ## Space between subplot groups. Float
## representing
#figure.constrained_layout.wspace : 0.02  ## a fraction of the subplot widths being
## separated.

### IMAGES
#image.aspect : equal  ## equal / auto / a number
#image.interpolation : nearest  ## see help(imshow) for options
#image.cmap : viridis  ## A colormap name, gray etc...
#image.lut : 256  ## the size of the colormap lookup table
#image.origin : upper  ## lower / upper
#image.resample : True
#image.composite_image : True  ## When True, all the images on a set of axes are
## combined into a single composite image before
## saving a figure as a vector graphics file,
## such as a PDF.

### CONTOUR PLOTS
#contour.negative_linestyle : dashed  ## string or on-off ink sequence
#contour.corner_mask : True  ## True / False / legacy

(continues on next page)
### ERRORBAR PLOTS
#errorbar.capsize : 0  # length of end cap on error bars in pixels

### HISTOGRAM PLOTS
#hist.bins : 10  # The default number of histogram bins.
  # If Numpy 1.11 or later is
  # installed, may also be `auto`

### SCATTER PLOTS
#scatter.marker : o  # The default marker type for scatter plots.
#scatter.edgecolors : face  # The default edgecolors for scatter plots.

### Agg rendering
### Warning: experimental, 2008/10/10
#agg.path.chunksize : 0  # 0 to disable; values in the range
  # 10000 to 100000 can improve speed slightly
  # and prevent an Agg rendering failure
  # when plotting very large data sets,
  # especially if they are very gappy.
  # It may cause minor artifacts, though.
  # A value of 20000 is probably a good
  # starting point.

### PATHS
#path.simplify : True  # When True, simplify paths by removing "invisible"
  # points to reduce file size and increase rendering
  # speed
#path.simplify_threshold : 0.111111111111  # The threshold of similarity below which
  # vertices will be removed in the
  # simplification process
#path.snap : True  # When True, rectilinear axis-aligned paths will be snapped to
  # the nearest pixel when certain criteria are met. When False,
  # paths will never be snapped.
#path.sketch : None  # May be none, or a 3-tuple of the form (scale, length,
  # randomness).
  # *scale* is the amplitude of the wiggle
  # perpendicular to the line (in pixels). *length*
  # is the length of the wiggle along the line (in
  # pixels). *randomness* is the factor by which
  # the length is randomly scaled.
#path.effects : []  #

### SAVING FIGURES
#savefig.dpi : figure  # figure dots per inch or 'figure'
#savefig.facecolor : white  # figure facecolor when saving
#savefig.edgecolor : white  # figure edgecolor when saving
#savefig.format : png  # png, ps, pdf, svg
#savefig.bbox : standard  # 'tight' or 'standard'.
  # 'tight' is incompatible with pipe-based animation
  # backends but will workd with temporary file based,
## e.g. setting animation.writer to ffmpeg will not work, use ffmpeg_file instead

#savefig.pad_inches : 0.1
## Padding to be used when bbox is set to 'tight'

#savefig.jpeg_quality: 95
## when a jpeg is saved, the default quality parameter.

#savefig.directory : ~
## default directory in savefig dialog box,
## leave empty to always use current working directory

#savefig.transparent : False
## setting that controls whether figures are saved with a
## transparent background by default

#savefig.orientation : portrait
## Orientation of saved figure

### tk backend params

#tk.window_focus : False
## Maintain shell focus for TkAgg

### ps backend params

#ps.papersize : letter
## auto, letter, legal, ledger, A0-A10, B0-B10

#ps.useafm : False
## use of afm fonts, results in small files

#ps.usedistiller : False
## can be: None, ghostscript or zpdf
## Experimental: may produce smaller files.
## zpdf intended for production of publication,
## but requires ghostscript, xpdf and ps2eps

#ps.distiller.res : 6000
## dpi

#ps.fonttype : 3
## Output Type 3 (Type3) or Type 42 (TrueType)

### pdf backend params

#pdf.compression : 6
## integer from 0 to 9
## 0 disables compression (good for debugging)

#pdf.fonttype : 3
## Output Type 3 (Type3) or Type 42 (TrueType)

#pdf.use14corefonts : False

#pdf.inheritcolor : False

### svg backend params

#svg.image_inline : True
## write raster image data directly into the svg file

#svg.fonttype : path
## How to handle SVG fonts:
## none: Assume fonts are installed on the machine where the SVG will be viewed.
## path: Embed characters as paths -- supported by most SVG renderers

#svg.hashsalt : None
## if not None, use this string as hash salt
## instead of uuid4

### pgf parameter

#pgf.rcfonts : True

#pgf.preamble :
## see text.latex.preamble for documentation

#pgf.texsystem : xelatex

### docstring params

##docstring.hardcopy = False
## set this when you want to generate hardcopy docstring

## Event keys to interact with figures/plots via keyboard.
## Customize these settings according to your needs.
## Leave the field(s) empty if you don’t need a key-map. (i.e., fullscreen : '')
#keymap.fullscreen : f, ctrl+f
## toggling

#keymap.home : h, v, home
## home or reset mnemonic

#keymap.back : left, c, backspace, MouseButton.BACK
## forward / backward keys
# ANIMATION settings

- **animation.html**: none ## How to display the animation as HTML in
  - the IPython notebook. 'html5' uses
  - HTML5 video tag; 'jshtml' creates a
    - Javascript animation

- **animation.writer**: ffmpeg ## MovieWriter 'backend' to use
- **animation.codec**: h264 ## Codec to use for writing movie
- **animation.bitrate**: -1 ## Controls size/quality tradeoff for movie. 
  - -1 implies let utility auto-determine
- **animation.frame_format**: png ## Controls frame format used by temp files
- **animation.html_args**: ## Additional arguments to pass to html writer
- **animation.ffmpeg_path**: ffmpeg ## Path to ffmpeg binary. Without full path
  - $PATH is searched
- **animation.ffmpeg_args**: ## Additional arguments to pass to ffmpeg
- **animation.avconv_path**: avconv ## Path to avconv binary. Without full path
  - $PATH is searched
- **animation.avconv_args**: ## Additional arguments to pass to avconv
- **animation.convert_path**: convert ## Path to ImageMagick's convert binary.
  - On Windows use the full path since convert
  - is also the name of a system tool.
- **animation.convert_args**: ## Additional arguments to pass to convert
- **animation.embed_limit**: 20.0 ## Limit, in MB, of size of base64 encoded
  - animation in HTML (i.e. IPython notebook)

### 2.2 Intermediate

These tutorials cover some of the more complicated classes and functions in Matplotlib. They can be useful for particular custom and complex visualizations.

**Note**: Click [here](#) to download the full example code
2.2.1 Artist tutorial

Using Artist objects to render on the canvas.

There are three layers to the matplotlib API.

- the `matplotlib.backend_bases.FigureCanvas` is the area onto which the figure is drawn
- the `matplotlib.backend_bases.Renderer` is the object which knows how to draw on the FigureCanvas
- and the `matplotlib.artist.Artist` is the object that knows how to use a renderer to paint onto the canvas.

The FigureCanvas and Renderer handle all the details of talking to user interface toolkits like wxPython or drawing languages like PostScript®, and the Artist handles all the high level constructs like representing and laying out the figure, text, and lines. The typical user will spend 95% of their time working with the Artists.

There are two types of Artists: primitives and containers. The primitives represent the standard graphical objects we want to paint onto our canvas: Line2D, Rectangle, Text, AxesImage, etc., and the containers are places to put them (Axis, Axes and Figure). The standard use is to create a Figure instance, use the Figure to create one or more Axes or Subplot instances, and use the Axes instance helper methods to create the primitives. In the example below, we create a Figure instance using `matplotlib.pyplot.figure()`, which is a convenience method for instantiating Figure instances and connecting them with your user interface or drawing toolkit FigureCanvas. As we will discuss below, this is not necessary – you can work directly with PostScript, PDF Gtk+, or wxPython FigureCanvas instances, instantiate your Figures directly and connect them yourselves - but since we are focusing here on the Artist API we’ll let `pyplot` handle some of those details for us:

```python
import matplotlib.pyplot as plt
fig = plt.figure()
ax = fig.add_subplot(2, 1, 1) # two rows, one column, first plot

ax.plot(t, s, color='blue', lw=2)
```

The Axes is probably the most important class in the matplotlib API, and the one you will be working with most of the time. This is because the Axes is the plotting area into which most of the objects go, and the Axes has many special helper methods (`plot()`, `text()`, `hist()`, `imshow()`) to create the most common graphics primitives (`Line2D`, `Text`, `Rectangle`, `Image`, respectively). These helper methods will take your data (e.g., numpy arrays and strings) and create primitive Artist instances as needed (e.g., Line2D), add them to the relevant containers, and draw them when requested. Most of you are probably familiar with the Subplot, which is just a special case of an Axes that lives on a regular rows by columns grid of Subplot instances. If you want to create an Axes at an arbitrary location, simply use the `add_axes()` method which takes a list of [left, bottom, width, height] values in 0-1 relative figure coordinates:

```python
fig2 = plt.figure()
ax2 = fig2.add_axes([0.15, 0.1, 0.7, 0.3])
```

Continuing with our example:

```python
import numpy as np
t = np.arange(0.0, 1.0, 0.01)
s = np.sin(2*np.pi*t)
line, = ax.plot(t, s, color='blue', lw=2)
```

In this example, ax is the Axes instance created by the `fig.add_subplot` call above (remember Subplot is just a subclass of Axes) and when you call ax.plot, it creates a Line2D instance and
adds it to the Axes.lines list. In the interactive ipython session below, you can see that the Axes.lines list is length one and contains the same line that was returned by the line, = ax.plot... call:

```python
In [101]: ax.lines[0]
Out[101]: <matplotlib.lines.Line2D instance at 0x19a95710>

In [102]: line
Out[102]: <matplotlib.lines.Line2D instance at 0x19a95710>
```

If you make subsequent calls to ax.plot (and the hold state is "on" which is the default) then additional lines will be added to the list. You can remove lines later simply by calling the list methods; either of these will work:

```python
del ax.lines[0]
ax.lines.remove(line)  # one or the other, not both!
```

The Axes also has helper methods to configure and decorate the x-axis and y-axis tick, tick labels and axis labels:

```python
xtext = ax.set_xlabel('my xdata')  # returns a Text instance
ytext = ax.set_ylabel('my ydata')
```

When you call `ax.set_xlabel`, it passes the information on the `Text` instance of the `XAxis`. Each Axes instance contains an `XAxis` and a `YAxis` instance, which handle the layout and drawing of the ticks, tick labels and axis labels.

Try creating the figure below.

```python
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
fig.subplots_adjust(top=0.8)
ax1 = fig.add_subplot(211)
ax1.set_ylabel('volts')
ax1.set_title('a sine wave')

t = np.arange(0.0, 1.0, 0.01)
s = np.sin(2*np.pi*t)
line, = ax1.plot(t, s, color='blue', lw=2)

# Fixing random state for reproducibility
np.random.seed(19680801)

ax2 = fig.add_axes([0.15, 0.1, 0.7, 0.3])
n, bins, patches = ax2.hist(np.random.randn(1000), 50,
                           facecolor='yellow', edgecolor='yellow')
ax2.set_xlabel('time (s)')

plt.show()
```
Customizing your objects

Every element in the figure is represented by a matplotlib Artist, and each has an extensive list of properties to configure its appearance. The figure itself contains a Rectangle exactly the size of the figure, which you can use to set the background color and transparency of the figures. Likewise, each Axes bounding box (the standard white box with black edges in the typical matplotlib plot, has a Rectangle instance that determines the color, transparency, and other properties of the Axes. These instances are stored as member variables Figure.patch and Axes.patch (“Patch” is a name inherited from MATLAB, and is a 2D “patch” of color on the figure, e.g., rectangles, circles and polygons). Every matplotlib Artist has the following properties
### Property Description

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alpha</td>
<td>The transparency - a scalar from 0-1</td>
</tr>
<tr>
<td>animated</td>
<td>A boolean that is used to facilitate animated drawing</td>
</tr>
<tr>
<td>axes</td>
<td>The axes that the Artist lives in, possibly None</td>
</tr>
<tr>
<td>clip_box</td>
<td>The bounding box that clips the Artist</td>
</tr>
<tr>
<td>clip_on</td>
<td>Whether clipping is enabled</td>
</tr>
<tr>
<td>clip_path</td>
<td>The path the artist is clipped to</td>
</tr>
<tr>
<td>contains</td>
<td>A picking function to test whether the artist contains the pick point</td>
</tr>
<tr>
<td>figure</td>
<td>The figure instance the artist lives in, possibly None</td>
</tr>
<tr>
<td>label</td>
<td>A text label (e.g., for auto-labeling)</td>
</tr>
<tr>
<td>picker</td>
<td>A python object that controls object picking</td>
</tr>
<tr>
<td>transform</td>
<td>The transformation</td>
</tr>
<tr>
<td>visible</td>
<td>A boolean whether the artist should be drawn</td>
</tr>
<tr>
<td>zorder</td>
<td>A number which determines the drawing order</td>
</tr>
<tr>
<td>rasterized</td>
<td>Boolean; Turns vectors into raster graphics (for compression &amp; eps transparency)</td>
</tr>
</tbody>
</table>

Each of the properties is accessed with an old-fashioned setter or getter (yes we know this irritates Pythonistas and we plan to support direct access via properties or traits but it hasn’t been done yet). For example, to multiply the current alpha by a half:

```python
a = o.get_alpha()
o.set_alpha(0.5*a)
```

If you want to set a number of properties at once, you can also use the `set` method with keyword arguments. For example:

```python
o.set(alpha=0.5, zorder=2)
```

If you are working interactively at the python shell, a handy way to inspect the `Artist` properties is to use the `matplotlib.artist.getp()` function (simply `getp()` in pyplot), which lists the properties and their values. This works for classes derived from `Artist` as well, e.g., `Figure` and `Rectangle`. Here are the `Figure` rectangle properties mentioned above:

```python
In [149]: matplotlib.artist.getp(fig.patch)
    alpha = 1.0
    animated = False
    antialiased or aa = True
    axes = None
    clip_box = None
    clip_on = False
    clip_path = None
    contains = None
    edgecolor or ec = w
    facecolor or fc = 0.75
    figure = Figure(8.125x6.125)
    fill = 1
    hatch = None
    height = 1
    label =
    linewidth or lw = 1.0
```

(continues on next page)
The docstrings for all of the classes also contain the Artist properties, so you can consult the interactive “help” or the matplotlib.artist for a listing of properties for a given object.

Object containers

Now that we know how to inspect and set the properties of a given object we want to configure, we need to know how to get at that object. As mentioned in the introduction, there are two kinds of objects: primitives and containers. The primitives are usually the things you want to configure (the font of a Text instance, the width of a Line2D) although the containers also have some properties as well - for example the Axes Artist is a container that contains many of the primitives in your plot, but it also has properties like the xscale to control whether the xaxis is ‘linear’ or ‘log’. In this section we’ll review where the various container objects store the Artists that you want to get at.

Figure container

The top level container Artist is the matplotlib.figure.Figure, and it contains everything in the figure. The background of the figure is a Rectangle which is stored in Figure.patch. As you add subplots (add_subplot()) and axes (add_axes()) to the figure these will be appended to the Figure.axes. These are also returned by the methods that create them:

```python
In [156]: fig = plt.figure()
In [157]: ax1 = fig.add_subplot(211)
In [158]: ax2 = fig.add_axes([0.1, 0.1, 0.7, 0.3])
In [159]: ax1
Out[159]: <matplotlib.axes._subplots.AxesSubplot at 0xd54b26c>
```

Because the figure maintains the concept of the "current axes" (see Figure.gca and Figure.sca) to support the pylab/pyplot state machine, you should not insert or remove axes directly from the axes list, but rather use the add_subplot() and add_axes() methods to insert, and the delaxes() method to delete. You are free however, to iterate over the list of axes or index into it to get access to Axes instances you want to customize. Here is an example which turns all the axes grids on:

```python
In [160]: print(fig.axes)
[<matplotlib.axes._subplots.AxesSubplot at 0xd54b26c>, <matplotlib.axes._subplots.AxesSubplot at 0xd54b26c>, <matplotlib.axes._subplots.AxesSubplot at 0xd54b26c>]
```

2.2. Intermediate
for ax in fig.axes:
    ax.grid(True)

The figure also has its own text, lines, patches and images, which you can use to add primitives directly. The default coordinate system for the Figure will simply be in pixels (which is not usually what you want) but you can control this by setting the transform property of the Artist you are adding to the figure.

More useful is “figure coordinates” where (0, 0) is the bottom-left of the figure and (1, 1) is the top-right of the figure which you can obtain by setting the Artist transform to fig.transFigure:

```python
import matplotlib.pyplot as plt

fig = plt.figure()

l1 = plt.Line2D([0, 1], [0, 1], transform=fig.transFigure, figure=fig)
l2 = plt.Line2D([0, 1], [1, 0], transform=fig.transFigure, figure=fig)
fig.lines.extend([l1, l2])

plt.show()
```

Here is a summary of the Artists the figure contains
<table>
<thead>
<tr>
<th>Figure attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>axes</td>
<td>A list of Axes instances (includes Subplot)</td>
</tr>
<tr>
<td>patch</td>
<td>The Rectangle background</td>
</tr>
<tr>
<td>images</td>
<td>A list of FigureImages patches - useful for raw pixel display</td>
</tr>
<tr>
<td>legends</td>
<td>A list of Figure Legend instances (different from Axes.legends)</td>
</tr>
<tr>
<td>lines</td>
<td>A list of Figure Line2D instances (rarely used, see Axes.lines)</td>
</tr>
<tr>
<td>patches</td>
<td>A list of Figure patches (rarely used, see Axes.patches)</td>
</tr>
<tr>
<td>texts</td>
<td>A list Figure Text instances</td>
</tr>
</tbody>
</table>

**Axes container**

The `matplotlib.axes.Axes` is the center of the matplotlib universe – it contains the vast majority of all the Artists used in a figure with many helper methods to create and add these Artists to itself, as well as helper methods to access and customize the Artists it contains. Like the `Figure`, it contains a `Patch` patch which is a `Rectangle` for Cartesian coordinates and a `Circle` for polar coordinates; this patch determines the shape, background and border of the plotting region:

```python
ax = fig.add_subplot(111)
rect = ax.patch  # a Rectangle instance
rect.set_facecolor('green')
```

When you call a plotting method, e.g., the canonical `plot()` and pass in arrays or lists of values, the method will create a `matplotlib.lines.Line2D()` instance, update the line with all the Line2D properties passed as keyword arguments, add the line to the `Axes.lines` container, and returns it to you:

```python
In [213]: x, y = np.random.rand(2, 100)
In [214]: line, = ax.plot(x, y, '-', color='blue', linewidth=2)
```

`plot` returns a list of lines because you can pass in multiple x, y pairs to plot, and we are unpacking the first element of the length one list into the line variable. The line has been added to the `Axes.lines` list:

```python
In [229]: print(ax.lines)
[[<matplotlib.lines.Line2D instance at 0xd378b0c>]]
```

Similarly, methods that create patches, like `bar()` creates a list of rectangles, will add the patches to the `Axes.patches` list:

```python
In [233]: n, bins, rectangles = ax.hist(np.random.randn(1000), 50, facecolor='yellow')
In [234]: rectangles
Out[234]: <a list of 50 Patch objects>
In [235]: print(len(ax.patches))
```

You should not add objects directly to the `Axes.lines` or `Axes.patches` lists unless you know exactly what you are doing, because the `Axes` needs to do a few things when it creates and adds an object. It sets the figure and axes property of the `Artist`, as well as the default `Axes` transformation (unless a transformation is set). It also inspects the data contained in the
Artist to update the data structures controlling auto-scaling, so that the view limits can be adjusted to contain the plotted data. You can, nonetheless, create objects yourself and add them directly to the Axes using helper methods like `add_line()` and `add_patch()`. Here is an annotated interactive session illustrating what is going on:

```python
In [262]: fig, ax = plt.subplots()

# create a rectangle instance
In [263]: rect = matplotlib.patches.Rectangle((1,1), width=5, height=12)

# by default the axes instance is None
In [264]: print(rect.get_axes())
None

# and the transformation instance is set to the "identity transform"
In [265]: print(rect.get_transform())
<Affine object at 0x13695544>

# now we add the Rectangle to the Axes
In [266]: ax.add_patch(rect)

# and notice that the ax.add_patch method has set the axes
# instance
In [267]: print(rect.get_axes())
Axes(0.125,0.1;0.775x0.8)

# and the transformation has been set too
In [268]: print(rect.get_transform())
<Affine object at 0x15009ca4>

# the default axes transformation is ax.transData
In [269]: print(ax.transData)
<Affine object at 0x15009ca4>

# notice that the xlims of the Axes have not been changed
In [270]: print(ax.get_xlim())
(0.0, 1.0)

# but the data limits have been updated to encompass the rectangle
In [271]: print(ax.dataLim.bounds)
(1.0, 1.0, 5.0, 12.0)

# we can manually invoke the auto-scaling machinery
In [272]: ax.autoscale_view()

# and now the xlim are updated to encompass the rectangle
In [273]: print(ax.get_xlim())
(1.0, 6.0)

# we have to manually force a figure draw
In [274]: ax.figure.canvas.draw()
```

There are many, many Axes helper methods for creating primitive Artists and adding them to their respective containers. The table below summarizes a small sampling of them, the kinds
of Artist they create, and where they store them

<table>
<thead>
<tr>

In addition to all of these Artists, the Axes contains two important Artist containers: the XAxis and YAxis, which handle the drawing of the ticks and labels. These are stored as instance variables xaxis and yaxis. The XAxis and YAxis containers will be detailed below, but note that the Axes contains many helper methods which forward calls on to the Axis instances so you often do not need to work with them directly unless you want to. For example, you can set the font color of the XAxis ticklabels using the Axes helper method:

```python
for label in ax.get_xticklabels():
    label.set_color('orange')
```

Below is a summary of the Artists that the Axes contains

Axis containers

The matplotlib.axis.Axis instances handle the drawing of the tick lines, the grid lines, the tick labels and the axis label. You can configure the left and right ticks separately for the y-axis, and the upper and lower ticks separately for the x-axis. The Axis also stores the data and view intervals used in auto-scaling, panning and zooming, as well as the Locator and Formatter instances which control where the ticks are placed and how they are represented as strings.

Each Axis object contains a label attribute (this is what pyplot modifies in calls to xlabel() and ylabel()) as well as a list of major and minor ticks. The ticks are XTick and YTick instances, which contain the actual line and text primitives that render the ticks and ticklabels. Because the ticks are dynamically created as needed (e.g., when panning and zooming), you should access the lists of major and minor ticks through their accessor methods get_major_ticks()
and \texttt{get\_minor\_ticks()}. Although the ticks contain all the primitives and will be covered below, \texttt{Axis} instances have accessor methods that return the tick lines, tick labels, tick locations etc.:

```python
fig, ax = plt.subplots()
axis = ax.xaxis
axis.get_ticklocs()
```

Out:

```python
array([0. , 0.2, 0.4, 0.6, 0.8, 1. ])
```

```python
axis.get_ticklabels()
```

Out:

```python
<a list of 6 Text major ticklabel objects>
```

\textbf{note there are twice as many ticklines as labels because by default there are tick lines at the top and bottom but only tick labels below the xaxis; this can be customized}

```python
axis.get_ticklines()
```

Out:
by default you get the major ticks back

```
axis.get_ticklines()
```

Out:

```
<a list of 12 Line2D ticklines objects>
```

but you can also ask for the minor ticks

```
axis.get_ticklines(minor=True)
```

# Here is a summary of some of the useful accessor methods of the ``Axis``
# (these have corresponding setters where useful, such as
# set_major_formatter)
#
# Accessor method Description
# ----------------------------------------------------------------------
# get_scale The scale of the axis, e.g., 'log' or 'linear'
# get_view_interval The interval instance of the axis view limits
# get_data_interval The interval instance of the axis data limits
# get_gridlines A list of grid lines for the Axis
# get_label The axis label - a Text instance
# get_ticklabels A list of Text instances - keyword minor=True|False
# get_ticklines A list of Line2D instances - keyword minor=True|False
# get_ticklocs A list of Tick locations - keyword minor=True|False
# get_major_locator The matplotlib.ticker.Locator instance for major ticks
# get_major_formatter The matplotlib.ticker.Formatter instance for major ticks
# get_minor_locator The matplotlib.ticker.Locator instance for minor ticks
# get_minor_formatter The matplotlib.ticker.Formatter instance for minor ticks
# get_major_ticks A list of Tick instances for major ticks
# get_minor_ticks A list of Tick instances for minor ticks
# grid Turn the grid on or off for the major or minor ticks
#
# Here is an example, not recommended for its beauty, which customizes
# the axes and tick properties
#
# `plt.figure` creates a `matplotlib.figure.Figure` instance

```
fig = plt.figure()
rect = fig.patch  # a rectangle instance
rect.set_facecolor('lightgoldenrodyellow')

ax1 = fig.add_axes([0.1, 0.3, 0.4, 0.4])
rect = ax1.patch
rect.set_facecolor('lightslategray')
```

```
for label in ax1.xaxis.get_ticklabels():
    # label is a Text instance
```

(continues on next page)
label.set_color('red')
label.set_rotation(45)
label.set_fontsize(16)

for line in ax1.yaxis.get_ticklines():
    line.set_color('green')
    line.set_markersize(25)
    line.set_markeredgewidth(3)

plt.show()

Tick containers

The *matplotlib.axes.Tick* is the final container object in our descent from the *Figure* to the *Axes* to the *Axis* to the *Tick*. The *Tick* contains the tick and grid line instances, as well as the label instances for the upper and lower ticks. Each of these is accessible directly as an attribute of the *Tick*. 
Here is an example which sets the formatter for the right side ticks with dollar signs and colors them green on the right side of the yaxis:

```python
import matplotlib.ticker as ticker

# Fixing random state for reproducibility
np.random.seed(19680801)

fig, ax = plt.subplots()
ax.plot(100*np.random.rand(20))

formatter = ticker.FormatStrFormatter('$%1.2f')
ax.yaxis.set_major_formatter(formatter)

for tick in ax.yaxis.get_major_ticks():
    tick.label1.set_visible(False)
    tick.label2.set_visible(True)
    tick.label2.set_color('green')

plt.show()
```
2.2.2 Legend guide

Generating legends flexibly in Matplotlib.

This legend guide is an extension of the documentation available at `legend()` - please ensure you are familiar with contents of that documentation before proceeding with this guide.

This guide makes use of some common terms, which are documented here for clarity:

- **legend entry**: A legend is made up of one or more legend entries. An entry is made up of exactly one key and one label.

- **legend key**: The colored/patterned marker to the left of each legend label.

- **legend label**: The text which describes the handle represented by the key.

- **legend handle**: The original object which is used to generate an appropriate entry in the legend.
Controlling the legend entries

Calling `legend()` with no arguments automatically fetches the legend handles and their associated labels. This functionality is equivalent to:

```python
handles, labels = ax.get_legend_handles_labels()
ax.legend(handles, labels)
```

The `get_legend_handles_labels()` function returns a list of handles/artists which exist on the Axes which can be used to generate entries for the resulting legend - it is worth noting however that not all artists can be added to a legend, at which point a “proxy” will have to be created (see Creating artists specifically for adding to the legend (aka. Proxy artists) for further details).

For full control of what is being added to the legend, it is common to pass the appropriate handles directly to `legend()`:

```python
line_up, = plt.plot([1,2,3], label='Line 2')
line_down, = plt.plot([3,2,1], label='Line 1')
plt.legend(handles=[line_up, line_down])
```

In some cases, it is not possible to set the label of the handle, so it is possible to pass through the list of labels to `legend()`:

```python
line_up, = plt.plot([1,2,3], label='Line 2')
line_down, = plt.plot([3,2,1], label='Line 1')
plt.legend([line_up, line_down], ['Line Up', 'Line Down'])
```

Creating artists specifically for adding to the legend (aka. Proxy artists)

Not all handles can be turned into legend entries automatically, so it is often necessary to create an artist which can. Legend handles don’t have to exists on the Figure or Axes in order to be used.

Suppose we wanted to create a legend which has an entry for some data which is represented by a red color:

```python
import matplotlib.patches as mpatches
import matplotlib.pyplot as plt

red_patch = mpatches.Patch(color='red', label='The red data')
plt.legend(handles=[red_patch])
plt.show()
```
There are many supported legend handles, instead of creating a patch of color we could have created a line with a marker:

```python
import matplotlib.lines as mlines

blue_line = mlines.Line2D([], [], color='blue', marker='*',
                          markersize=15, label='Blue stars')

plt.legend(handles=[blue_line])

plt.show()
```
Legend location

The location of the legend can be specified by the keyword argument `loc`. Please see the documentation at `legend()` for more details.

The `bbox_to_anchor` keyword gives a great degree of control for manual legend placement. For example, if you want your axes legend located at the figure's top right-hand corner instead of the axes' corner, simply specify the corner's location, and the coordinate system of that location:

```python
plt.legend(bbox_to_anchor=(1, 1),
           bbox_transform=plt.gcf().transFigure)
```

More examples of custom legend placement:

```python
plt.subplot(211)
plt.plot([1, 2, 3], label="test1")
plt.plot([3, 2, 1], label="test2")

# Place a legend above this subplot, expanding itself to
# fully use the given bounding box.
plt.legend(bbox_to_anchor=(0., 1.02, 1., .102), loc='lower left',
           ncol=2, mode="expand", borderaxespad=0.)
```

(continues on next page)
plt.subplot(223)
plt.plot([1, 2, 3], label="test1")
plt.plot([3, 2, 1], label="test2")
# Place a legend to the right of this smaller subplot.
plt.legend(bbox_to_anchor=(1.05, 1), loc='upper left', borderaxespad=0.)
plt.show()
first_legend = plt.legend(handles=[line1], loc='upper right')

# Add the legend manually to the current Axes.
ax = plt.gca().add_artist(first_legend)

# Create another legend for the second line.
plt.legend(handles=[line2], loc='lower right')

plt.show()

Legend Handlers

In order to create legend entries, handles are given as an argument to an appropriate
HandlerBase subclass. The choice of handler subclass is determined by the following rules:

1. Update get_legend_handler_map() with the value in the handler_map keyword.
2. Check if the handle is in the newly created handler_map.
3. Check if the type of handle is in the newly created handler_map.
4. Check if any of the types in the handle’s mro is in the newly created handler_map.

For completeness, this logic is mostly implemented in get_legend_handler().
All of this flexibility means that we have the necessary hooks to implement custom handlers for our own type of legend key.

The simplest example of using custom handlers is to instantiate one of the existing `HandlerBase` subclasses. For the sake of simplicity, let's choose `matplotlib.legend_handler.HandlerLine2D` which accepts a `numpoints` argument (note `numpoints` is a keyword on the `legend()` function for convenience). We can then pass the mapping of instance to Handler as a keyword to legend.

```python
from matplotlib.legend_handler import HandlerLine2D

line1, = plt.plot([3, 2, 1], marker='o', label='Line 1')
line2, = plt.plot([1, 2, 3], marker='o', label='Line 2')
plt.legend(handler_map={line1: HandlerLine2D(numpoints=4)})
```

![Plot with custom legend handler](image)

As you can see, "Line 1" now has 4 marker points, where "Line 2" has 2 (the default). Try the above code, only change the map's key from `line1` to `type(line1)`. Notice how now both `Line2D` instances get 4 markers.

Along with handlers for complex plot types such as errorbars, stem plots and histograms, the default `handler_map` has a special `tuple` handler (`HandlerTuple`) which simply plots the handles on top of one another for each item in the given tuple. The following example demonstrates...
combining two legend keys on top of one another:

```python
from numpy.random import randn

z = randn(10)

red_dot, = plt.plot(z, "ro", markersize=15)
# Put a white cross over some of the data.
white_cross, = plt.plot(z[:5], "w+", markeredgewidth=3, markersize=15)

plt.legend([red_dot, (red_dot, white_cross)], ["Attr A", "Attr A+B"])
```

Out:

```python
<matplotlib.legend.Legend object at 0x7f1888f91850>
```

The `HandlerTuple` class can also be used to assign several legend keys to the same entry:

```python
from matplotlib.legend_handler import HandlerLine2D, HandlerTuple

p1, = plt.plot([1, 2.5, 3], 'r-d')
p2, = plt.plot([3, 2, 1], 'k-o')

l = plt.legend([(p1, p2)], ['Two keys'], numpoints=1,
              handler_map={tuple: HandlerTuple(ndivide=None)})
```
Implementing a custom legend handler

A custom handler can be implemented to turn any handle into a legend key (handles don’t necessarily need to be matplotlib artists). The handler must implement a “legend_artist” method which returns a single artist for the legend to use. Signature details about the ”legend_artist” are documented at `legend_artist()`.

```python
import matplotlib.patches as mpatches

class AnyObject(object):
    pass

class AnyObjectHandler(object):
    def legend_artist(self, legend, orig_handle, fontsize, handlebox):
        x0, y0 = handlebox.xdescent, handlebox.ydescent
        width, height = handlebox.width, handlebox.height
        patch = mpatches.Rectangle([x0, y0], width, height, facecolor='red',
                                   edgecolor='black', hatch='xx', lw=3,
                                   transform=handlebox.get_transform())
        handlebox.add_artist(patch)
```

(continues on next page)
return patch

plt.legend([AnyObject()], ['My first handler'],
handler_map={AnyObject: AnyObjectHandler()})

Out:

<matplotlib.legend.Legend object at 0x7f1889301dc0>

Alternatively, had we wanted to globally accept AnyObject instances without needing to manually set the handler_map keyword all the time, we could have registered the new handler with:

from matplotlib.legend import Legend
Legend.update_default_handler_map({AnyObject: AnyObjectHandler()})

Whilst the power here is clear, remember that there are already many handlers implemented and what you want to achieve may already be easily possible with existing classes. For example, to produce elliptical legend keys, rather than rectangular ones:

from matplotlib.legend_handler import HandlerPatch
```python
class HandlerEllipse(HandlerPatch):
    def create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans):
        center = 0.5 * width - 0.5 * xdescent, 0.5 * height - 0.5 * ydescent
        p = mpatches.Ellipse(xy=center, width=width + xdescent, height=height + ydescent)
        self.update_prop(p, orig_handle, legend)
        p.set_transform(trans)
        return [p]

c = mpatches.Circle((0.5, 0.5), 0.25, facecolor="green",
                       edgecolor="red", linewidth=3)
plt.gca().add_patch(c)
plt.legend([c], ["An ellipse, not a rectangle"],
           handler_map={mpatches.Circle: HandlerEllipse()})
```

Out:

```
<matplotlib.legend.Legend object at 0x7f18890a0610>
```
2.2.3 Styling with cycler

Demo of custom property-cycle settings to control colors and other style properties for multi-line plots.

Note: More complete documentation of the cycler API can be found here.

This example demonstrates two different APIs:

1. Setting the default rc parameter specifying the property cycle. This affects all subsequent axes (but not axes already created).
2. Setting the property cycle for a single pair of axes.

```python
from cycler import cycler
import numpy as np
import matplotlib.pyplot as plt

First we'll generate some sample data, in this case, four offset sine curves.

```python
x = np.linspace(0, 2 * np.pi, 50)
offsets = np.linspace(0, 2 * np.pi, 4, endpoint=False)
yy = np.transpose([np.sin(x + phi) for phi in offsets])
```

Now `yy` has shape

```python
print(yy.shape)
```

Out:

```
(50, 4)
```

So `yy[:, i]` will give you the `i`-th offset sine curve. Let’s set the default `prop_cycle` using `matplotlib.pyplot.rc()`. We’ll combine a color cycler and a linestyle cycler by adding (+) two cycler’s together. See the bottom of this tutorial for more information about combining different cyclers.

```python
default_cycler = (cycler(color=['r', 'g', 'b', 'y']) +
                  cycler(linestyle=['-', '--', ':', '-.']))

plt.rc('lines', linewidth=4)
plt.rc('axes', prop_cycle=default_cycler)
```

Now we’ll generate a figure with two axes, one on top of the other. On the first axis, we’ll plot with the default cycler. On the second axis, we’ll set the `prop_cycle` using `matplotlib.axes.Axes.set_prop_cycle()`, which will only set the `prop_cycle` for this `matplotlib.axes.Axes` instance. We’ll use a second `cycler` that combines a color cycler and a linewidth cycler.
custom_cycler = (cycler(color=['c', 'm', 'y', 'k']) +
cycler(lw=[1, 2, 3, 4]))

fig, (ax0, ax1) = plt.subplots(nrows=2)
ax0.plot(yy)
ax0.set_title('Set default color cycle to rgb')
ax1.set_prop_cycle(custom_cycler)
ax1.plot(yy)
ax1.set_title('Set axes color cycle to cmyk')

# Add a bit more space between the two plots.
fig.subplots_adjust(hspace=0.3)
plt.show()

Setting prop_cycle in the matplotlibrc file or style files

Remember, if you want to set a custom cycler in your .matplotlibrc file or a style file (style.mplstyle), you can set the axes.prop_cycle property:

axes.prop_cycle : cycler(color='bgrcmyk')
Cycling through multiple properties

You can add cyclers:

```python
from cycler import cycler
cc = (cycler(color=list('rgb')) +
      cycler(linestyle=['-','--','-.']))
for d in cc:
    print(d)
```

Results in:

```plaintext
{'color': 'r', 'linestyle': '-'}
{'color': 'g', 'linestyle': '--'}
{'color': 'b', 'linestyle': '-.'}
```

You can multiply cyclers:

```python
from cycler import cycler
cc = (cycler(color=list('rgb')) *
      cycler(linestyle=['-','--','-.']))
for d in cc:
    print(d)
```

Results in:

```plaintext
{'color': 'r', 'linestyle': '-'}
{'color': 'r', 'linestyle': '--'}
{'color': 'r', 'linestyle': '-.'}
{'color': 'g', 'linestyle': '-'}
{'color': 'g', 'linestyle': '--'}
{'color': 'g', 'linestyle': '-.'}
{'color': 'b', 'linestyle': '-'}
{'color': 'b', 'linestyle': '--'}
{'color': 'b', 'linestyle': '-.'}
```

**Note:** Click [here](#) to download the full example code

### 2.2.4 Customizing Figure Layouts Using GridSpec and Other Functions

How to create grid-shaped combinations of axes.

- **subplots()** Perhaps the primary function used to create figures and axes. It’s also similar to `matplotlib.pyplot.subplots()`, but creates and places all axes on the figure at once. See also `matplotlib.Figure.subplots`.

- **GridSpec** Specifies the geometry of the grid that a subplot will be placed. The number of rows and number of columns of the grid need to be set. Optionally, the subplot layout parameters (e.g., left, right, etc.) can be tuned.

- **SubplotSpec** Specifies the location of the subplot in the given `GridSpec`. 
**subplot2grid()** A helper function that is similar to `subplot()`, but uses 0-based indexing and let subplot to occupy multiple cells. This function is not covered in this tutorial.

```python
import matplotlib
import matplotlib.pyplot as plt
import matplotlib.gridspec as gridspec
```

### Basic Quickstart Guide

These first two examples show how to create a basic 2-by-2 grid using both `subplots()` and `gridspec`.

Using `subplots()` is quite simple. It returns a `Figure` instance and an array of `Axes` objects.

```python
fig1, f1_axes = plt.subplots(ncols=2, nrows=2, constrained_layout=True)
```

For a simple use case such as this, `gridspec` is perhaps overly verbose. You have to create the figure and `GridSpec` instance separately, then pass elements of gridspec instance to the `add_subplot()` method to create the axes objects. The elements of the gridspec are accessed in generally the same manner as numpy arrays.
```python
fig2 = plt.figure(constrained_layout=True)
spec2 = gridspec.GridSpec(ncols=2, nrows=2, figure=fig2)
f2_ax1 = fig2.add_subplot(spec2[0, 0])
f2_ax2 = fig2.add_subplot(spec2[0, 1])
f2_ax3 = fig2.add_subplot(spec2[1, 0])
f2_ax4 = fig2.add_subplot(spec2[1, 1])
```

The power of gridspec comes in being able to create subplots that span rows and columns. Note the Numpy slice syntax for selecting the part of the gridspec each subplot will occupy.

Note that we have also used the convenience method `Figure.add_gridspec` instead of `gridspec.GridSpec`, potentially saving the user an import, and keeping the namespace cleaner.

```python
fig3 = plt.figure(constrained_layout=True)
gs = fig3.add_gridspec(3, 3)
f3_ax1 = fig3.add_subplot(gs[0, :])
f3_ax1.set_title('gs[0, :]')
f3_ax2 = fig3.add_subplot(gs[1, :-1])
f3_ax2.set_title('gs[1, :-1]')
f3_ax3 = fig3.add_subplot(gs[1:, -1])
f3_ax3.set_title('gs[1:, -1]')
f3_ax4 = fig3.add_subplot(gs[-1, 0])
f3_ax4.set_title('gs[-1, 0]')
f3_ax5 = fig3.add_subplot(gs[-1, -2])
```

(continues on next page)

2.2. Intermediate
The gridspec is also indispensable for creating subplots of different widths via a couple of methods.

The method shown here is similar to the one above and initializes a uniform grid specification, and then uses numpy indexing and slices to allocate multiple “cells” for a given subplot.

```python
fig4 = plt.figure(constrained_layout=True)
spec4 = fig4.add_gridspec(ncols=2, nrows=2)
anno_opts = dict(xy=(0.5, 0.5), xycoords='axes fraction', va='center', ha='center')

f4_ax1 = fig4.add_subplot(spec4[0, 0])
f4_ax1.annotate('GridSpec[0, 0]', **anno_opts)
fig4.add_subplot(spec4[0, 1]).annotate('GridSpec[0, 1]', **anno_opts)
fig4.add_subplot(spec4[1, 0]).annotate('GridSpec[1, 0]', **anno_opts)
fig4.add_subplot(spec4[1, 1]).annotate('GridSpec[1, 1]', **anno_opts)
```
Another option is to use the `width_ratios` and `height_ratios` parameters. These keyword arguments are lists of numbers. Note that absolute values are meaningless, only their relative ratios matter. That means that `width_ratios=[2, 4, 8]` is equivalent to `width_ratios=[1, 2, 4]` within equally wide figures. For the sake of demonstration, we’ll blindly create the axes within for loops since we won’t need them later.

```python
fig5 = plt.figure(constrained_layout=True)
widths = [2, 3, 1.5]
heights = [1, 3, 2]
spec5 = fig5.add_gridspec(ncols=3, nrows=3, width_ratios=widths,
                          height_ratios=heights)
for row in range(3):
    for col in range(3):
        ax = fig5.add_subplot(spec5[row, col])
        label = 'Width: {}
Height: {}'.format(widths[col], heights[row])
        ax.annotate(label, (0.1, 0.5), xycoords='axes fraction', va='center')
```
Learning to use `width_ratios` and `height_ratios` is particularly useful since the top-level function `subplots()` accepts them within the `gridspec_kw` parameter. For that matter, any parameter accepted by `GridSpec` can be passed to `subplots()` via the `gridspec_kw` parameter. This example recreates the previous figure without directly using a gridspec instance.

```python
gs_kw = dict(width_ratios=widths, height_ratios=heights)
fig6, f6_axes = plt.subplots(ncols=3, nrows=3, constrained_layout=True, gridspec_kw=gs_kw)
for r, row in enumerate(f6_axes):
    for c, ax in enumerate(row):
        label = 'Width: {}
Height: {}
'.format(widths[c], heights[r])
        ax.annotate(label, (0.1, 0.5), xycoords='axes fraction', va='center')
```
The `subplots` and `get_gridspec` methods can be combined since it is sometimes more convenient to make most of the subplots using `subplots` and then remove some and combine them. Here we create a layout with the bottom two axes in the last column combined.

```python
fig7, f7_axs = plt.subplots(ncols=3, nrows=3)
gs = f7_axs[1, 2].get_gridspec()
# remove the underlying axes
for ax in f7_axs[1:, -1]:
    ax.remove()
axbig = fig7.add_subplot(gs[1:, -1])
axbig.annotate('Big Axes
\nGridSpec[1:, -1]', (0.1, 0.5),
    xycoords='axes fraction', va='center')
fig7.tight_layout()
```
Fine Adjustments to a Gridspec Layout

When a GridSpec is explicitly used, you can adjust the layout parameters of subplots that are created from the GridSpec. Note this option is not compatible with `constrained_layout` or `Figure.tight_layout` which both adjust subplot sizes to fill the figure.

```python
fig8 = plt.figure(constrained_layout=False)
gs1 = fig8.add_gridspec(nrows=3, ncols=3, left=0.05, right=0.48, wspace=0.05)
f8_ax1 = fig8.add_subplot(gs1[:, :])
f8_ax2 = fig8.add_subplot(gs1[-1, :-1])
f8_ax3 = fig8.add_subplot(gs1[-1, -1])
```
This is similar to `subplots_adjust()`, but it only affects the subplots that are created from the given GridSpec.

For example, compare the left and right sides of this figure:

```python
fig9 = plt.figure(constrained_layout=False)
gs1 = fig9.add_gridspec(nrows=3, ncols=3, left=0.05, right=0.48, wspace=0.05)
f9_ax1 = fig9.add_subplot(gs1[:-1, :])
f9_ax2 = fig9.add_subplot(gs1[-1, :-1])
f9_ax3 = fig9.add_subplot(gs1[-1, -1])

gs2 = fig9.add_gridspec(nrows=3, ncols=3, left=0.55, right=0.98, hspace=0.05)
f9_ax4 = fig9.add_subplot(gs2[:, :-1])
f9_ax5 = fig9.add_subplot(gs2[-1, -1])
f9_ax6 = fig9.add_subplot(gs2[-1, -1])
```
GridSpec using SubplotSpec

You can create GridSpec from the `SubplotSpec`, in which case its layout parameters are set to that of the location of the given SubplotSpec.

Note this is also available from the more verbose `gridspec.GridSpecFromSubplotSpec`.

```python
fig10 = plt.figure(constrained_layout=True)
gs0 = fig10.add_gridspec(1, 2)
gs00 = gs0[0].subgridspec(2, 3)
gs01 = gs0[1].subgridspec(3, 2)

for a in range(2):
    for b in range(3):
        fig10.add_subplot(gs00[a, b])
        fig10.add_subplot(gs01[b, a])
```
A Complex Nested GridSpec using SubplotSpec

Here’s a more sophisticated example of nested GridSpec where we put a box around each cell of the outer 4x4 grid, by hiding appropriate spines in each of the inner 3x3 grids.

```python
import numpy as np
from itertools import product

def squiggle_xy(a, b, c, d, i=np.arange(0.0, 2*np.pi, 0.05)):  
    return np.sin(i*a)*np.cos(i*b), np.sin(i*c)*np.cos(i*d)

fig11 = plt.figure(figsize=(8, 8), constrained_layout=False)

# gridspec inside gridspec
outer_grid = fig11.add_gridspec(4, 4, wspace=0.0, hspace=0.0)

for i in range(16):
    inner_grid = outer_grid[i].subgridspec(3, 3, wspace=0.0, hspace=0.0)
    a, b = int(i/4)+1, i % 4+1
    for j, (c, d) in enumerate(product(range(1, 4), repeat=2)):
```

(continues on next page)
```
ax = fig11.add_subplot(inner_grid[j])
ax.plot(squiggle_xy(a, b, c, d))
ax.set_xticks([])
ax.set_yticks([])
fig11.add_subplot(ax)

all_axes = fig11.get_axes()

# show only the outside spines
for ax in all_axes:
    for sp in ax.spines.values():
        sp.set_visible(False)
    if ax.is_first_row():
        ax.spines['top'].set_visible(True)
    if ax.is_last_row():
        ax.spines['bottom'].set_visible(True)
    if ax.is_first_col():
        ax.spines['left'].set_visible(True)
    if ax.is_last_col():
        ax.spines['right'].set_visible(True)

plt.show()
```
References

The usage of the following functions and methods is shown in this example:

```python
matplotlib.pyplot.subplots
matplotlib.figure.Figure.add_gridspec
matplotlib.figure.Figure.add_subplot
matplotlib.gridspec.GridSpec
matplotlib.gridspec.SubplotSpec.subgridspec
matplotlib.gridspec.GridSpecFromSubplotSpec
```
2.2.5 Constrained Layout Guide

How to use constrained-layout to fit plots within your figure cleanly.

`constrained_layout` automatically adjusts subplots and decorations like legends and colorbars so that they fit in the figure window while still preserving, as best they can, the logical layout requested by the user.

`constrained_layout` is similar to `tight_layout`, but uses a constraint solver to determine the size of axes that allows them to fit.

`constrained_layout` needs to be activated before any axes are added to a figure. Two ways of doing so are

- using the respective argument to `subplots()` or `figure()`, e.g.:

  ```python
  plt.subplots(constrained_layout=True)
  ```

- activate it via `rcParams`, like:

  ```python
  plt.rcParams['figure.constrained_layout.use'] = True
  ```

Those are described in detail throughout the following sections.

**Warning:** Currently Constrained Layout is experimental. The behaviour and API are subject to change, or the whole functionality may be removed without a deprecation period. If you require your plots to be absolutely reproducible, get the Axes positions after running Constrained Layout and use `ax.set_position()` in your code with `constrained_layout=False`.

Simple Example

In Matplotlib, the location of axes (including subplots) are specified in normalized figure coordinates. It can happen that your axis labels or titles (or sometimes even ticklabels) go outside the figure area, and are thus clipped.

```python
# sphinx_gallery_thumbnail_number = 18

import matplotlib.pyplot as plt
import matplotlib.colors as mcolors
import matplotlib.gridspec as gridspec
import numpy as np

plt.rcParams['savefig.facecolor'] = "0.8"
plt.rcParams['figure.figsize'] = 4.5, 4.
```
def example_plot(ax, fontsize=12, nodec=False):
    ax.plot([1, 2])
    ax.locator_params(nbins=3)
    if not nodec:
        ax.set_xlabel('x-label', fontsize=fontsize)
        ax.set_ylabel('y-label', fontsize=fontsize)
        ax.set_title('Title', fontsize=fontsize)
    else:
        ax.set_xticklabels('')
        ax.set_yticklabels('')

fig, ax = plt.subplots(constrained_layout=False)
exmaple_plot(ax, fontsize=24)

To prevent this, the location of axes needs to be adjusted. For subplots, this can be done by adjusting the subplot params (Move the edge of an axes to make room for tick labels). However, specifying your figure with the constrained_layout=True kwarg will do the adjusting automatically.

fig, ax = plt.subplots(constrained_layout=True)
exmaple_plot(ax, fontsize=24)
When you have multiple subplots, often you see labels of different axes overlapping each other.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=False)
for ax in axs.flat:
    example_plot(ax)
```
Specifying `constrained_layout=True` in the call to `plt.subplots` causes the layout to be properly constrained.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax)
```
If you create a colorbar with the `colorbar()` command you need to make room for it. `constrained_layout` does this automatically. Note that if you specify `use_gridspec=True` it will be ignored because this option is made for improving the layout via `tight_layout`.

**Note:** For the `pcolormesh` `kwargs` (`pc_kwargs`) we use a dictionary. Below we will assign one colorbar to a number of axes each containing a `ScalarMappable`; specifying the norm and colormap ensures the colorbar is accurate for all the axes.

```python
arr = np.arange(100).reshape((10, 10))
norm = mcolors.Normalize(vmin=0., vmax=100.)
# see note above: this makes all pcolormesh calls consistent:
pc_kwargs = {'rasterized': True, 'cmap': 'viridis', 'norm': norm}
fig, ax = plt.subplots(figsize=(4, 4), constrained_layout=True)
im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=ax, shrink=0.6)
```
Out:

<matplotlib.colorbar.Colorbar object at 0x7f1889089100>

If you specify a list of axes (or other iterable container) to the ax argument of `colorbar`, constrained_layout will take space from the specified axes.

```python
fig, axs = plt.subplots(2, 2, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
```
If you specify a list of axes from inside a grid of axes, the colorbar will steal space appropriately, and leave a gap, but all subplots will still be the same size.

```
fig, axs = plt.subplots(3, 3, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[:, 1], shrink=0.8)
fig.colorbar(im, ax=axs[1:, -1], shrink=0.6)
```
Note that there is a bit of a subtlety when specifying a single axes as the parent. In the following, it might be desirable and expected for the colorbars to line up, but they don’t because the colorbar paired with the bottom axes is tied to the subplotspec of the axes, and hence shrinks when the gridspec-level colorbar is added.

```
fig, axs = plt.subplots(3, 1, figsize=(4, 4), constrained_layout=True)
for ax in axs[:-2]:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[:-2], shrink=0.6)
im = axs[-2].pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[-2], shrink=0.6)
```
The API to make a single-axes behave like a list of axes is to specify it as a list (or other iterable container), as below:

```python
fig, axs = plt.subplots(3, 1, figsize=(4, 4), constrained_layout=True)
for ax in axs[:-1]:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[1], shrink=0.6)
im = axs[2].pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs[2], shrink=0.6)
```
Out:

<matplotlib.colorbar.Colorbar object at 0x7f188c19da00>

Suptitle

constrained_layout can also make room for `suptitle`.

```python
fig, axs = plt.subplots(2, 2, figsize=(4, 4), constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
fig.suptitle('Big Suptitle')
```
Legends

Legends can be placed outside of their parent axis. Constrained-layout is designed to handle this for `Axes.legend()`. However, constrained-layout does not handle legends being created via `Figure.legend()` (yet).

```python
fig, ax = plt.subplots(constrained_layout=True)
ax.plot(np.arange(10), label='This is a plot')
ax.legend(loc='center left', bbox_to_anchor=(0.8, 0.5))
```
However, this will steal space from a subplot layout:

```python
fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)
axs[0].plot(np.arange(10))
axs[1].plot(np.arange(10), label='This is a plot')
axs[1].legend(loc='center left', bbox_to_anchor=(0.8, 0.5))
```

Out:

```
<matplotlib.legend.Legend object at 0x7f1894ac190>
```

In order for a legend or other artist to not steal space from the subplot layout, we can `legend.set_in_layout(False)`. Of course this can mean the legend ends up cropped, but can be useful
if the plot is subsequently called with `fig.savefig('outname.png', bbox_inches='tight')`. Note, however, that the legend's `get_in_layout` status will have to be toggled again to make the saved file work, and we must manually trigger a draw if we want `constrained_layout` to adjust the size of the axes before printing.

```python
fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)

axs[0].plot(np.arange(10))
axs[1].plot(np.arange(10), label='This is a plot')
leg = axs[1].legend(loc='center left', bbox_to_anchor=(0.8, 0.5))
leg.set_in_layout(False)
# trigger a draw so that constrained_layout is executed once
# before we turn it off when printing....
fig.canvas.draw()
# we want the legend included in the bbox_inches='tight' calcs.
leg.set_in_layout(True)
# we don’t want the layout to change at this point.
fig.set_constrained_layout(False)
fig.savefig('CL01.png', bbox_inches='tight', dpi=100)
```

The saved file looks like:

A better way to get around this awkwardness is to simply use the legend method provided by `Figure.legend`:

```python
fig, axs = plt.subplots(1, 2, figsize=(4, 2), constrained_layout=True)
axs[0].plot(np.arange(10))
lines = axs[1].plot(np.arange(10), label='This is a plot')
(continues on next page)```
labels = [l.get_label() for l in lines]
leg = fig.legend(lines, labels, loc='center left',
                 bbox_to_anchor=(0.8, 0.5), bbox_transform= axs[1].transAxes)
fig.savefig('CL02.png', bbox_inches='tight', dpi=100)

The saved file looks like:

**Padding and Spacing**

For constrained layout, we have implemented a padding around the edge of each axes. This padding sets the distance from the edge of the plot, and the minimum distance between adjacent plots. It is specified in inches by the keyword arguments w_pad and h_pad to the function `set_constrained_layout_pads`:

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax, nodec=True)
    ax.set_xticklabels('')
    ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=4./72., h_pad=4./72.,
                                hspace=0., wspace=0.)
```

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax, nodec=True)
```

(continues on next page)
ax.set_xticklabels('')
ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=2./72., h_pad=2./72.,
                               hspace=0., wspace=0.)
Spacing between subplots is set by `wspace` and `hspace`. There are specified as a fraction of the size of the subplot group as a whole. If the size of the figure is changed, then these spaces change in proportion. Note in the below how the space at the edges doesn’t change from the above, but the space between subplots does.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    example_plot(ax, nodec=True)
    ax.set_xticklabels('')
    ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=2./72., h_pad=2./72.,
                               hspace=0.2, wspace=0.2)
```
Spacing with colorbars

Colorbars will be placed \texttt{wspace} and \texttt{hspace} apart from other subplots. The padding between the colorbar and the axis it is attached to will never be less than \texttt{w_pad} (for a vertical colorbar) or \texttt{h_pad} (for a horizontal colorbar). Note the use of the \texttt{pad} kwarg here in the \texttt{colorbar} call. It defaults to 0.02 of the size of the axis it is attached to.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    pc = ax.pcolormesh(arr, **pc_kwargs)
    fig.colorbar(pc, ax=ax, shrink=0.6, pad=0)
    ax.set_xticklabels('')
    ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=2./72., h_pad=2./72.,
                                 hspace=0.2, wspace=0.2)
```
In the above example, the colorbar will not ever be closer than 2 pts to the plot, but if we want it a bit further away, we can specify its value for pad to be non-zero.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    pc = ax.pcolormesh(arr, **pc_kwargs)
    fig.colorbar(im, ax=ax, shrink=0.6, pad=0.05)
    ax.set_xticklabels('')
    ax.set_yticklabels('')
fig.set_constrained_layout_pads(w_pad=2./72., h_pad=2./72.,
                               hspace=0.2, wspace=0.2)
```
There are five `rcParams` that can be set, either in a script or in the `matplotlibrc` file. They all have the prefix `figure.constrained_layout`:

- **use**: Whether to use constrained_layout. Default is False
- **w_pad, h_pad**: Padding around axes objects. Float representing inches. Default is 3./72. inches (3 pts)
- **wspace, hspace**: Space between subplot groups. Float representing a fraction of the subplot widths being separated. Default is 0.02.

```python
cpyt, axs = plt.subplots(2, 2, figsize=(3, 3))
for ax in axs.flat:
    example_plot(ax)
```
Use with GridSpec

constrained_layout is meant to be used with subplots() or GridSpec() and add_subplot().
Note that in what follows constrained_layout=True

```python
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1, figure=fig)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

date_plot(ax1)
example_plot(ax2)
```
More complicated gridspec layouts are possible. Note here we use the convenience functions
add_gridspec and subgridspec.

```python
fig = plt.figure()
gs0 = fig.add_gridspec(1, 2)
gs1 = gs0[0].subgridspec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

test_plot(ax1)
test_plot(ax2)

gs2 = gs0[1].subgridspec(3, 1)
for ss in gs2:
    ax = fig.add_subplot(ss)
    test_plot(ax)
    ax.set_title('')
    ax.set_xlabel('')

ax.set_xlabel("x-label", fontsize=12)
```
Note that in the above the left and columns don't have the same vertical extent. If we want the top and bottom of the two grids to line up then they need to be in the same gridspec:

```python
fig = plt.figure()
gs0 = fig.add_gridspec(6, 2)
ax1 = fig.add_subplot(gs0[:3, 0])
ax2 = fig.add_subplot(gs0[3:, 0])
example_plot(ax1)
example_plot(ax2)
ax = fig.add_subplot(gs0[0:2, 1])
example_plot(ax)
ax = fig.add_subplot(gs0[2:4, 1])
example_plot(ax)
ax = fig.add_subplot(gs0[4:, 1])
example_plot(ax)
```
This example uses two gridspecs to have the colorbar only pertain to one set of pcolors. Note how the left column is wider than the two right-hand columns because of this. Of course, if you wanted the subplots to be the same size you only needed one gridspec.

def docomplicated(suptitle=None):
    fig = plt.figure()
    gs0 = fig.add_gridspec(1, 2, figure=fig, width_ratios=[1., 2.])
    gsl = gs0[0].subgridspec(2, 1)
    gsr = gs0[1].subgridspec(2, 2)

    for gs in gsl:
        ax = fig.add_subplot(gs)
        example_plot(ax)
    axs = []
    for gs in gsr:
        ax = fig.add_subplot(gs)
        pcm = ax.pcolormesh(arr, **pc_kwargs)
        ax.set_xlabel('x-label')
        ax.set_ylabel('y-label')
        ax.set_title('title')
        axs += [ax]
    fig.colorbar(pcm, ax=axs)
if suptitle is not None:
    fig.suptitle(suptitle)

docomplicated()
Manually setting axes positions

There can be good reasons to manually set an axes position. A manual call to `set_position` will set the axes so constrained_layout has no effect on it anymore. (Note that constrained_layout still leaves the space for the axes that is moved).

```python
fig, axs = plt.subplots(1, 2)
example_plot(axs[0], fontsize=12)
axs[1].set_position([0.2, 0.2, 0.4, 0.4])
```
If you want an inset axes in data-space, you need to manually execute the layout using `fig.execute_constrained_layout()` call. The inset figure will then be properly positioned. However, it will not be properly positioned if the size of the figure is subsequently changed. Similarly, if the figure is printed to another backend, there may be slight changes of location due to small differences in how the backends render fonts.

```python
from matplotlib.transforms import Bbox

fig, axs = plt.subplots(1, 2)
example_plot(axs[0], fontsize=12)
fig.execute_constrained_layout()

# put into data-space:
bb_data_ax2 = Bbox.from_bounds(0.5, 1., 0.2, 0.4)
disp_coords = axs[0].transData.transform(bb_data_ax2)
fig_coords_ax2 = fig.transFigure.inverted().transform(disp_coords)
bb_ax2 = Bbox(fig_coords_ax2)
ax2 = fig.add_axes(bb_ax2)
```
Manually turning off `constrained_layout`

`constrained_layout` usually adjusts the axes positions on each draw of the figure. If you want to get the spacing provided by `constrained_layout` but not have it update, then do the initial draw and then call `fig.set_constrained_layout(False)`. This is potentially useful for animations where the tick labels may change length.

Note that `constrained_layout` is turned off for ZOOM and PAN GUI events for the backends that use the toolbar. This prevents the axes from changing position during zooming and panning.

Limitations

Incompatible functions

`constrained_layout` will not work on subplots created via the `subplot` command. The reason is that each of these commands creates a separate `GridSpec` instance and `constrained_layout` uses (nested) gridspecs to carry out the layout. So the following fails to yield a nice layout:

```python
fig = plt.figure()
ax1 = plt.subplot(221)
ax2 = plt.subplot(223)
ax3 = plt.subplot(122)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
```
Of course that layout is possible using a gridspec:

```python
fig = plt.figure()
gs = fig.add_gridspec(2, 2)

ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
ax3 = fig.add_subplot(gs[:, 1])

text for example_plot(ax1)
text for example_plot(ax2)
text for example_plot(ax3)
```
Similarly, `subplot2grid()` doesn’t work for the same reason: each call creates a different parent gridspec.

```python
fig = plt.figure()

ax1 = plt.subplot2grid((3, 3), (0, 0))
ax2 = plt.subplot2grid((3, 3), (0, 1), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 0), colspan=2, rowspan=2)
ax4 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
```
The way to make this plot compatible with `constrained_layout` is again to use `gridspec` directly

```python
fig = plt.figure()
gs = fig.add_gridspec(3, 3)

ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[0, 1:])
ax3 = fig.add_subplot(gs[1:, 0:2])
ax4 = fig.add_subplot(gs[1:, -1])

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
```
Other Caveats

- constrained_layout only considers ticklabels, axis labels, titles, and legends. Thus, other artists may be clipped and also may overlap.

- It assumes that the extra space needed for ticklabels, axis labels, and titles is independent of original location of axes. This is often true, but there are rare cases where it is not.

- There are small differences in how the backends handle rendering fonts, so the results will not be pixel-identical.

Debugging

Constrained-layout can fail in somewhat unexpected ways. Because it uses a constraint solver the solver can find solutions that are mathematically correct, but that aren’t at all what the user wants. The usual failure mode is for all sizes to collapse to their smallest allowable value. If this happens, it is for one of two reasons:

1. There was not enough room for the elements you were requesting to draw.

2. There is a bug - in which case open an issue at https://github.com/matplotlib/matplotlib/issues.

If there is a bug, please report with a self-contained example that does not require outside data or dependencies (other than numpy).
Notes on the algorithm

The algorithm for the constraint is relatively straightforward, but has some complexity due to the complex ways we can layout a figure.

Figure layout

Figures are laid out in a hierarchy:

1. Figure: `fig = plt.figure()
   a. Gridspec `gs0 = gridspec.GridSpec(1, 2, figure=fig)
      i. Subplotspec: `ss = gs[0, 0]
         1. Axes: `ax0 = fig.add_subplot(ss)
      ii. Subplotspec: `ss = gs[0, 1]
         1. Gridspec: `gsR = gridspec.GridSpecFromSubplotSpec(2, 1, ss)
            • Subplotspec: `ss = gsR[0, 0]
               - Axes: `axR0 = fig.add_subplot(ss)
            • Subplotspec: `ss = gsR[1, 0]
               - Axes: `axR1 = fig.add_subplot(ss)

Each item has a layoutbox associated with it. The nesting of gridspecs created with `GridSpecFromSubplotSpec can be arbitrarily deep.

Each `Axes has two layoutboxes. The first one, `ax._layoutbox represents the outside of the Axes and all its decorations (i.e. ticklabels, axis labels, etc.). The second layoutbox corresponds to the Axes’ `ax.position, which sets where in the figure the spines are placed.

Why so many stacked containers? Ideally, all that would be needed are the Axes layout boxes. For the Gridspec case, a container is needed if the Gridspec is nested via `GridSpecFromSubplotSpec. At the top level, it is desirable for symmetry, but it also makes room for `suptitle.

For the Subplotspec/Axes case, Axes often have colorbars or other annotations that need to be packaged inside the Subplotspec, hence the need for the outer layer.

Simple case: one Axes

For a single Axes the layout is straightforward. The Figure and outer Gridspec layoutboxes coincide. The Subplotspec and Axes boxes also coincide because the Axes has no colorbar. Note the difference between the red `pos box and the green `ax box is set by the size of the decorations around the Axes.

In the code, this is accomplished by the entries in `do_constrained_layout() like:

```python
ax._poslayoutbox.edit_left_margin_min(-bbox.x0 + pos.x0 + w_padt)
```
for matplotlib._layoutbox import plot_children

fig, ax = plt.subplots(constrained_layout=True)
example_plot(ax, fontsize=24)
plot_children(fig, fig._layoutbox, printit=False)

Simple case: two Axes

For this case, the Axes layoutboxes and the Subplotspec boxes still co-incide. However, because the decorations in the right-hand plot are so much smaller than the left-hand, so the right-hand layoutboxes are smaller.

The Subplotspec boxes are laid out in the code in the subroutine arange_subplotspecs(), which simply checks the subplotspecs in the code against one another and stacks them appropriately.

The two pos axes are lined up. Because they have the same minimum row, they are lined up at the top. Because they have the same maximum row they are lined up at the bottom. In the code this is accomplished via the calls to layoutbox.align. If there was more than one row, then the same horizontal alignment would occur between the rows.

The two pos axes are given the same width because the subplotspecs occupy the same number of columns. This is accomplished in the code where dcols0 is compared to dcolsC. If they are equal, then their widths are constrained to be equal.

While it is a bit subtle in this case, note that the division between the Subplotspecs is not centered, but has been moved to the right to make space for the larger labels on the left-hand plot.
Two Axes and colorbar

Adding a colorbar makes it clear why the Subplotspec layoutboxes must be different from the axes layoutboxes. Here we see the left-hand subplotspec has more room to accommodate the colorbar, and that there are two green ax boxes inside the ss box.

Note that the width of the pos boxes is still the same because of the constraint on their widths because their subplotspecs occupy the same number of columns (one in this example).

The colorbar layout logic is contained in make_axes which calls _constrained_layout. layoutcolorbarsingle() for cbars attached to a single axes, and _constrained_layout. layoutcolorbargspec() if the colorbar is associated with a gridspec.
This example shows the Subplotspec layoutboxes being made smaller by a colorbar layoutbox. The size of the colorbar layoutbox is set to be shrink smaller than the vertical extent of the pos layoutboxes in the gridspec, and it is made to be centered between those two points.

```python
fig, axs = plt.subplots(2, 2, constrained_layout=True)
for ax in axs.flat:
    im = ax.pcolormesh(arr, **pc_kwargs)
fig.colorbar(im, ax=axs, shrink=0.6)
plot_children(fig, fig._layoutbox, printit=False)
```
Uneven sized Axes

There are two ways to make axes have an uneven size in a Gridspec layout, either by specifying them to cross Gridspecs rows or columns, or by specifying width and height ratios.

The first method is used here. The constraint that makes the heights be correct is in the code where $drowsC < drows0$ which in this case would be 1 is less than 2. So we constrain the height of the 1-row Axes to be less than half the height of the 2-row Axes.

**Note:** This algorithm can be wrong if the decorations attached to the smaller axes are very large, so there is an unaccounted-for edge case.

```python
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(2, 2, figure=fig)
ax = fig.add_subplot(gs[:, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[0, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[1, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
```
Height and width ratios are accommodated with the same part of the code with the smaller axes always constrained to be less in size than the larger.

```python
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(3, 2, figure=fig,
    height_ratios=[1., 0.5, 1.5],
    width_ratios=[1.2, 0.8])
ax = fig.add_subplot(gs[:2, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[2, 0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[0, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[1:, 1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
```
Empty gridspec slots

The final piece of the code that has not been explained is what happens if there is an empty gridspec opening. In that case a fake invisible axes is added and we proceed as before. The empty gridspec has no decorations, but the axes position in made the same size as the occupied Axes positions.

This is done at the start of `_constrained_layout.do_constrained_layout()` (hassubplotspec).

```python
fig = plt.figure(constrained_layout=True)
gs = gridspec.GridSpec(1, 3, figure=fig)
ax = fig.add_subplot(gs[0])
im = ax.pcolormesh(arr, **pc_kwargs)
ax = fig.add_subplot(gs[-1])
im = ax.pcolormesh(arr, **pc_kwargs)
plot_children(fig, fig._layoutbox, printit=False)
plt.show()
```
Other notes

The layout is called only once. This is OK if the original layout was pretty close (which it should be in most cases). However, if the layout changes a lot from the default layout then the decorators can change size. In particular the x and ytick labels can change. If this happens, then we should probably call the whole routine twice.

**Total running time of the script:** (0 minutes 6.995 seconds)

### 2.2.6 Tight Layout guide

How to use tight-layout to fit plots within your figure cleanly.

*tight layout* automatically adjusts subplot params so that the subplot(s) fits in to the figure area. This is an experimental feature and may not work for some cases. It only checks the extents of ticklabels, axis labels, and titles.

An alternative to *tight_layout* is *constrained_layout*.

**Simple Example**

In matplotlib, the location of axes (including subplots) are specified in normalized figure coordinates. It can happen that your axis labels or titles (or sometimes even ticklabels) go outside
the figure area, and are thus clipped.

```python
# sphinx_gallery_thumbnail_number = 7
import matplotlib.pyplot as plt
import numpy as np

plt.rcParams['savefig.facecolor'] = "0.8"

def example_plot(ax, fontsize=12):
    ax.plot([1, 2])
    ax.locator_params(nbins=3)
    ax.set_xlabel('x-label', fontsize=fontsize)
    ax.set_ylabel('y-label', fontsize=fontsize)
    ax.set_title('Title', fontsize=fontsize)

plt.close('all')
fig, ax = plt.subplots()
example_plot(ax, fontsize=24)
```

To prevent this, the location of axes needs to be adjusted. For subplots, this can be done by adjusting the subplot params (Move the edge of an axes to make room for tick labels). Matplotlib v1.1 introduces a new command `tight_layout()` that does this automatically for
Note that `matplotlib.pyplot.tight_layout()` will only adjust the subplot params when it is called. In order to perform this adjustment each time the figure is redrawn, you can call `fig.set_tight_layout(True)`, or, equivalently, set the `figure.autolayout` rcParam to `True`.

When you have multiple subplots, often you see labels of different axes overlapping each other.

```python
plt.close('all')

fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
```
**tight_layout()** will also adjust spacing between subplots to minimize the overlaps.

```python
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)
plt.tight_layout()
```
`tight_layout()` can take keyword arguments of `pad`, `w_pad` and `h_pad`. These control the extra padding around the figure border and between subplots. The pads are specified in fraction of fontsize.

```python
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplots(nrows=2, ncols=2)
eexample_plot(ax1)
eexample_plot(ax2)
eexample_plot(ax3)
eexample_plot(ax4)
plt.tight_layout(pad=0.4, w_pad=0.5, h_pad=1.0)
```
**tight_layout()** will work even if the sizes of subplots are different as far as their grid specification is compatible. In the example below, `ax1` and `ax2` are subplots of a 2x2 grid, while `ax3` is of a 1x2 grid.

```python
plt.close('all')
fig = plt.figure()

ax1 = plt.subplot(221)
ax2 = plt.subplot(223)
ax3 = plt.subplot(122)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)

plt.tight_layout()
```
It works with subplots created with `subplot2grid()`. In general, subplots created from the gridspec (Customizing Figure Layouts Using GridSpec and Other Functions) will work.

```python
plt.close('all')
fig = plt.figure()

ax1 = plt.subplot2grid((3, 3), (0, 0))
ax2 = plt.subplot2grid((3, 3), (0, 1), colspan=2)
ax3 = plt.subplot2grid((3, 3), (1, 0), colspan=2, rowspan=2)
ax4 = plt.subplot2grid((3, 3), (1, 2), rowspan=2)

example_plot(ax1)
example_plot(ax2)
example_plot(ax3)
example_plot(ax4)

plt.tight_layout()
```
Although not thoroughly tested, it seems to work for subplots with aspect != “auto” (e.g., axes with images).

```python
arr = np.arange(100).reshape((10, 10))
plt.close('all')
fig = plt.figure(figsize=(5, 4))
ax = plt.subplot(111)
im = ax.imshow(arr, interpolation="none")
plt.tight_layout()
```
Caveats

- `tight_layout()` only considers ticklabels, axis labels, and titles. Thus, other artists may be clipped and also may overlap.

- It assumes that the extra space needed for ticklabels, axis labels, and titles is independent of original location of axes. This is often true, but there are rare cases where it is not.

- `pad=0` clips some of the texts by a few pixels. This may be a bug or a limitation of the current algorithm and it is not clear why it happens. Meanwhile, use of pad at least larger than 0.3 is recommended.

Use with GridSpec

GridSpec has its own `tight_layout()` method (the pyplot api `tight_layout()` also works).

```python
import matplotlib.gridspec as gridspec

plt.close('all')
fig = plt.figure()

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
```

(continues on next page)
You may provide an optional `rect` parameter, which specifies the bounding box that the subplots will be fit inside. The coordinates must be in normalized figure coordinates and the default is `(0, 0, 1, 1).

```python
fig = plt.figure()
gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
example_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])
```
For example, this can be used for a figure with multiple gridspecs.

```python
def example_plot(ax):
    pass

fig = plt.figure()
gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

eample_plot(ax1)
eample_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])

gs2 = gridspec.GridSpec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
eample_plot(ax)
    ax.set_title(""")
    ax.set_xlabel("x-label")

ax.set_xlabel("x-label", fontsize=12)

gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)
```

(continues on next page)
We may try to match the top and bottom of two grids ::

```python
# We may try to match the top and bottom of two grids ::
top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.update(top=top, bottom=bottom)
gs2.update(top=top, bottom=bottom)
plt.show()
```

While this should be mostly good enough, adjusting top and bottom may require adjustment of hspace also. To update hspace & vspace, we call `tight_layout()` again with updated rect argument. Note that the rect argument specifies the area including the ticklabels, etc. Thus, we will increase the bottom (which is 0 for the normal case) by the difference between the bottom from above and the bottom of each gridspec. Same thing for the top.

```python
fig = plt.gcf()

gs1 = gridspec.GridSpec(2, 1)
ax1 = fig.add_subplot(gs1[0])
ax2 = fig.add_subplot(gs1[1])

example_plot(ax1)
```
example_plot(ax2)

gs1.tight_layout(fig, rect=[0, 0, 0.5, 1])

gs2 = gridspec.GridSpec(3, 1)

for ss in gs2:
    ax = fig.add_subplot(ss)
    example_plot(ax)
    ax.set_title('')
    ax.set_xlabel('')

    ax.set_xlabel("x-label", fontsize=12)

gs2.tight_layout(fig, rect=[0.5, 0, 1, 1], h_pad=0.5)

top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.update(top=top, bottom=bottom)
gs2.update(top=top, bottom=bottom)

top = min(gs1.top, gs2.top)
bottom = max(gs1.bottom, gs2.bottom)

gs1.tight_layout(fig, rect=[None, 0 + (bottom-gs1.bottom),
                           0.5, 1 - (gs1.top-top)])
gs2.tight_layout(fig, rect=[0.5, 0 + (bottom-gs2.bottom),
                           None, 1 - (gs2.top-top)],
                           h_pad=0.5)
Legends and Annotations

Pre Matplotlib 2.2, legends and annotations were excluded from the bounding box calculations that decide the layout. Subsequently these artists were added to the calculation, but sometimes it is undesirable to include them. For instance in this case it might be good to have the axes shrunk a bit to make room for the legend:

```python
fig, ax = plt.subplots(figsize=(4, 3))
lines = ax.plot(range(10), label='A simple plot')
ax.legend(bbox_to_anchor=(0.7, 0.5), loc='center left',)
fig.tight_layout()
plt.show()
```
However, sometimes this is not desired (quite often when using `fig.savefig('outname.png', bbox_inches='tight')`). In order to remove the legend from the bounding box calculation, we simply set its bounding box with `leg.set_in_layout(False)` and the legend will be ignored.

```python
fig, ax = plt.subplots(figsize=(4, 3))
lines = ax.plot(range(10), label='B simple plot')
leg = ax.legend(bbox_to_anchor=(0.7, 0.5), loc='center left',)
leg.set_in_layout(False)
fig.tight_layout()
plt.show()
```

**Use with AxesGrid1**

While limited, the `axes_grid1` toolkit is also supported.

2.2. Intermediate
from mpl_toolkits.axes_grid1 import Grid

plt.close('all')
fig = plt.figure()
grid = Grid(fig, rect=111, nrows_ncols=(2, 2),
           axes_pad=0.25, label_mode='L',
           )

for ax in grid:
    example_plot(ax)
    ax.title.set_visible(False)

plt.tight_layout()

Colorbar

If you create a colorbar with the `colorbar()` command, the created colorbar is an instance of Axes, *not* Subplot, so tight layout does not work. With Matplotlib v1.1, you may create a colorbar as a subplot using the gridspec.

```python
plt.close('all')
arr = np.arange(100).reshape((10, 10))
(continues on next page)```
Another option is to use AxesGrid1 toolkit to explicitly create an axes for colorbar.

```python
from mpl_toolkits.axes_grid1 import make_axes_locatable

plt.close('all')
arr = np.arange(100).reshape((10, 10))
fig = plt.figure(figsize=(4, 4))
im = plt.imshow(arr, interpolation="none")

divider = make_axes_locatable(fig.gca())
cax = divider.append_axes("right", "5%", pad="3%")
plt.colorbar(im, cax=cax)
plt.tight_layout()
```
2.2.7 *origin* and *extent* in imshow

`imshow()` allows you to render an image (either a 2D array which will be color-mapped (based on norm and cmap) or and 3D RGB(A) array which will be used as-is) to a rectangular region in dataspace. The orientation of the image in the final rendering is controlled by the *origin* and *extent* kwargs (and attributes on the resulting AxesImage instance) and the data limits of the axes.

The *extent* kwarg controls the bounding box in data coordinates that the image will fill specified as (left, right, bottom, top) in data coordinates, the *origin* kwarg controls how the image fills that bounding box, and the orientation in the final rendered image is also affected by the axes limits.

**Hint:** Most of the code below is used for adding labels and informative text to the plots. The described effects of *origin* and *extent* can be seen in the plots without the need to follow all code details.

For a quick understanding, you may want to skip the code details below and directly continue with the discussion of the results.
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.gridspec import GridSpec

def index_to_coordinate(index, extent, origin):
    """Return the pixel center of an index."""
    hshift = 0.5 * np.sign(right - left)
    left, right = left + hshift, right - hshift
    vshift = 0.5 * np.sign(top - bottom)
    bottom, top = bottom + vshift, top - vshift

    if origin == 'upper':
        bottom, top = top, bottom

    return {
        "[0, 0]": (left, bottom),
        "[M', 0]": (left, top),

            ax.axis('off')

    return columns

Default extent

First, let's have a look at the default extent=None

```python
generate_imshow_demo_grid(extents=[None])
```
Generally, for an array of shape \((M, N)\), the first index runs along the vertical, the second index runs along the horizontal. The pixel centers are at integer positions ranging from 0 to \(N' = N - 1\) horizontally and from 0 to \(M' = M - 1\) vertically. \(origin\) determines how to the data is filled in the bounding box.

For \(origin='lower'\):

- \([0, 0]\) is at (left, bottom)
- \([M', 0]\) is at (left, top)
- \([0, N']\) is at (right, bottom)
- \([M', N']\) is at (right, top)

\(origin='upper'\) reverses the vertical axes direction and filling:

- \([0, 0]\) is at (left, top)
- \([M', 0]\) is at (left, bottom)
- \([0, N']\) is at (right, top)
- \([M', N']\) is at (right, bottom)

In summary, the position of the \([0, 0]\) index as well as the extent are influenced by \(origin\):

<table>
<thead>
<tr>
<th>(origin)</th>
<th>([0, 0]) position</th>
<th>extent</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper</td>
<td>top left</td>
<td>((-0.5, \text{numcols}-0.5, \text{numrows}-0.5, -0.5))</td>
</tr>
<tr>
<td>lower</td>
<td>bottom left</td>
<td>((-0.5, \text{numcols}-0.5, -0.5, \text{numrows}-0.5))</td>
</tr>
</tbody>
</table>

The default value of \(origin\) is set by \(rcParams["image.origin"]\) (default: ‘upper’) which defaults to ‘upper’ to match the matrix indexing conventions in math and computer graphics image indexing conventions.
Explicit extent

By setting `extent` we define the coordinates of the image area. The underlying image data is interpolated/resampled to fill that area.

If the axes is set to autoscale, then the view limits of the axes are set to match the `extent` which ensures that the coordinate set by `(left, bottom)` is at the bottom left of the axes! However, this may invert the axis so they do not increase in the ‘natural’ direction.

```python
extents = [(-0.5, 6.5, -0.5, 5.5),
           (-0.5, 6.5, 5.5, -0.5),
           (6.5, -0.5, -0.5, 5.5),
           (6.5, -0.5, 5.5, -0.5)]

columns = generate_imshow_demo_grid(extents)
set_extent_None_text(columns['upper'][i])
set_extent_None_text(columns['lower'][0])
```
Explicit extent and axes limits

If we fix the axes limits by explicitly setting `set_xlim` / `set_ylim`, we force a certain size and orientation of the axes. This can decouple the 'left-right' and 'top-bottom' sense of the image from the orientation on the screen.

In the example below we have chosen the limits slightly larger than the extent (note the white areas within the Axes).

While we keep the extents as in the examples before, the coordinate (0, 0) is now explicitly put at the bottom left and values increase to up and to the right (from the viewer point of view). We can see that:

- The coordinate `(left, bottom)` anchors the image which then fills the box going towards the `(right, top)` point in data space.
- The first column is always closest to the 'left'.
- `origin` controls if the first row is closest to 'top' or 'bottom'.
- The image may be inverted along either direction.
- The 'left-right' and 'top-bottom' sense of the image may be uncoupled from the orientation on the screen.

```python
generate_imshow_demo_grid(extents=[None] + extents,
                          xlim=(-2, 8), ylim=(-1, 6))
```
extent=

2.3.1 Path Tutorial

Defining paths in your Matplotlib visualization.

The object underlying all of the `matplotlib.patches` objects is the Path, which supports the standard set of moveto, lineto, curveto commands to draw simple and compound outlines consisting of line segments and splines. The Path is instantiated with a (N,2) array of (x,y) vertices, and a N-length array of path codes. For example to draw the unit rectangle from (0,0) to (1,1), we could use this code

```python
import matplotlib.pyplot as plt
from matplotlib.path import Path
import matplotlib.patches as patches

verts = [
    (0., 0.),  # left, bottom
    (0., 1.),  # left, top
    (1., 1.),  # right, top
    (1., 0.),  # right, bottom
    (0., 0.),  # ignored
]

codes = [
    Path.MOVETO,
    Path.LINETO,
]
```

(continues on next page)
The following path codes are recognized

```python
Path.LINETO,
Path.LINETO,
Path.CLOSEPOLY,
]
path = Path(verts, codes)
fig, ax = plt.subplots()
patch = patches.PathPatch(path, facecolor='orange', lw=2)
ax.add_patch(patch)
ax.set_xlim(-2, 2)
ax.set_ylim(-2, 2)
plt.show()
```
### Vertices Description

<table>
<thead>
<tr>
<th>Code</th>
<th>Vertices</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>STOP</td>
<td>1 (ignored)</td>
<td>A marker for the end of the entire path (currently not required and ignored)</td>
</tr>
<tr>
<td>MOVETO</td>
<td>1</td>
<td>Pick up the pen and move to the given vertex.</td>
</tr>
<tr>
<td>LINETO</td>
<td>1</td>
<td>Draw a line from the current position to the given vertex.</td>
</tr>
<tr>
<td>CURVE3</td>
<td>2 (1 control point, 1 endpoint)</td>
<td>Draw a quadratic Bézier curve from the current position, with the given control point, to the given end point.</td>
</tr>
<tr>
<td>CURVE4</td>
<td>3 (2 control points, 1 endpoint)</td>
<td>Draw a cubic Bézier curve from the current position, with the given control points, to the given end point.</td>
</tr>
<tr>
<td>CLOSEPOLY</td>
<td>0 (point itself is ignored)</td>
<td>Draw a line segment to the start point of the current polyline.</td>
</tr>
</tbody>
</table>

#### Bézier example

Some of the path components require multiple vertices to specify them: for example CURVE 3 is a Bézier curve with one control point and one end point, and CURVE4 has three vertices for the two control points and the end point. The example below shows a CURVE4 Bézier spline – the Bézier curve will be contained in the convex hull of the start point, the two control points, and the end point.

```python
verts = [
    (0., 0.),  # P0
    (0.2, 1.),  # P1
    (1., 0.8),  # P2
    (0.8, 0.),  # P3
]
codes = [
    Path.MOVETO,
    Path.CURVE4,
    Path.CURVE4,
    Path.CURVE4,
]
path = Path(verts, codes)

fig, ax = plt.subplots()
patch = patches.PathPatch(path, facecolor='none', lw=2)
ax.add_patch(patch)
xs, ys = zip(*verts)
ax.plot(xs, ys, 'x--', lw=2, color='black', ms=10)

ax.text(-0.05, -0.05, 'P0')
ax.text(0.15, 1.05, 'P1')
ax.text(1.05, 0.85, 'P2')
ax.text(0.85, -0.05, 'P3')

ax.set_xlim(-0.1, 1.1)
ax.set_ylim(-0.1, 1.1)
```

(continues on next page)
plt.show()

Compound paths

All of the simple patch primitives in matplotlib, Rectangle, Circle, Polygon, etc, are implemented with simple path. Plotting functions like `hist()` and `bar()`, which create a number of primitives, e.g., a bunch of Rectangles, can usually be implemented more efficiently using a compound path. The reason `bar` creates a list of rectangles and not a compound path is largely historical: the `Path` code is comparatively new and `bar` predates it. While we could change it now, it would break old code, so here we will cover how to create compound paths, replacing the functionality in `bar`, in case you need to do so in your own code for efficiency reasons, e.g., you are creating an animated bar plot.

We will make the histogram chart by creating a series of rectangles for each histogram bar: the rectangle width is the bin width and the rectangle height is the number of datapoints in that bin. First we'll create some random normally distributed data and compute the histogram. Because numpy returns the bin edges and not centers, the length of `bins` is 1 greater than the length of `n` in the example below:

```python
# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)
```
We’ll now extract the corners of the rectangles. Each of the left, bottom, etc, arrays below is \( \text{len}(n) \), where \( n \) is the array of counts for each histogram bar:

```python
# get the corners of the rectangles for the histogram
left = np.array(bins[:-1])
right = np.array(bins[1:1])
bottom = np.zeros(len(left))
top = bottom + n
```

Now we have to construct our compound path, which will consist of a series of MOVETO, LINETO and CLOSEPOLY for each rectangle. For each rectangle, we need 5 vertices: 1 for the MOVETO, 3 for the LINETO, and 1 for the CLOSEPOLY. As indicated in the table above, the vertex for the closepoly is ignored but we still need it to keep the codes aligned with the vertices:

```python
nverts = nrects*(1+3+1)
verts = np.zeros((nverts, 2))
codes = np.ones(nverts, int) * path.Path.LINETO
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5,0] = left
verts[0::5,1] = bottom
verts[1::5,0] = left
verts[1::5,1] = top
verts[2::5,0] = right
verts[2::5,1] = top
verts[3::5,0] = right
verts[3::5,1] = bottom
```

All that remains is to create the path, attach it to a PathPatch, and add it to our axes:

```python
barpath = path.Path(verts, codes)
patch = patches.PathPatch(barpath, facecolor='green',
                          edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)
```

```python
import numpy as np
import matplotlib.patches as patches
import matplotlib.path as path

fig, ax = plt.subplots()
# Fixing random state for reproducibility
np.random.seed(19680801)

# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)

# get the corners of the rectangles for the histogram
left = np.array(bins[:-1])
right = np.array(bins[1:1])
bottom = np.zeros(len(left))
top = bottom + n
nrects = len(left)

(continues on next page)
```
nverts = nrects*(1+3+1)
verts = np.zeros((nverts, 2))
codes = np.ones(nverts, int) * path.Path.LINETO
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5, 0] = left
verts[0::5, 1] = bottom
verts[1::5, 0] = left
verts[1::5, 1] = top
verts[2::5, 0] = right
verts[2::5, 1] = top
verts[3::5, 0] = right
verts[3::5, 1] = bottom
barpath = path.Path(verts, codes)
patch = patches.PathPatch(barpath, facecolor='green',
                           edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)
ax.set_xlim(left[0], right[-1])
ax.set_ylim(bottom.min(), top.max())
plt.show()
2.3.2 Path effects guide

Defining paths that objects follow on a canvas.

Matplotlib’s patheffects module provides functionality to apply a multiple draw stage to any Artist which can be rendered via a Path.

Artists which can have a path effect applied to them include Patch, Line2D, Collection and even Text. Each artist’s path effects can be controlled via the set_path_effects method (set_path_effects), which takes an iterable of AbstractPathEffect instances.

The simplest path effect is the Normal effect, which simply draws the artist without any effect:

```python
import matplotlib.pyplot as plt
import matplotlib.patheffects as path_effects

fig = plt.figure(figsize=(5, 1.5))
text = fig.text(0.5, 0.5, 'Hello path effects world!
This is the normal
Pretty dull, huh?',
                ha='center', va='center', size=20)
text.set_path_effects([path_effects.Normal()])
plt.show()
```

Hello path effects world!
This is the normal path effect.
Pretty dull, huh?

Whilst the plot doesn’t look any different to what you would expect without any path effects, the drawing of the text now been changed to use the path effects framework, opening up the possibilities for more interesting examples.

Adding a shadow

A far more interesting path effect than Normal is the drop-shadow, which we can apply to any of our path based artists. The classes SimplePatchShadow and SimpleLineShadow do precisely this by drawing either a filled patch or a line patch below the original artist:

```python
import matplotlib.patheffects as path_effects

text = plt.text(0.5, 0.5, 'Hello path effects world!',
                path_effects=[path_effects.withSimplePatchShadow()])
plt.plot([0, 3, 2, 5], linewidth=5, color='blue',
         (continues on next page)
path_effects=[path_effects.SimpleLineShadow(),
            path_effects.Normal()]
plt.show()

Notice the two approaches to setting the path effects in this example. The first uses the `with` classes to include the desired functionality automatically followed with the “normal” effect, whereas the latter explicitly defines the two path effects to draw.

**Making an artist stand out**

One nice way of making artists visually stand out is to draw an outline in a bold color below the actual artist. The *Stroke* path effect makes this a relatively simple task:

```python
fig = plt.figure(figsize=(7, 1))
text = fig.text(0.5, 0.5, 'This text stands out because of its black border.',
              color='white', ha='center', va='center', size=30)
text.set_path_effects([path_effects.Stroke(linewidth=3, foreground='black'), path_effects.Normal()])
plt.show()
```
This text stands out because of its black border.

It is important to note that this effect only works because we have drawn the text path twice; once with a thick black line, and then once with the original text path on top.

You may have noticed that the keywords to Stroke and SimplePatchShadow and SimpleLineShadow are not the usual Artist keywords (such as facecolor and edgecolor etc.). This is because with these path effects we are operating at lower level of matplotlib. In fact, the keywords which are accepted are those for a matplotlib.backend_bases.GraphicsContextBase instance, which have been designed for making it easy to create new backends - and not for its user interface.

Greater control of the path effect artist

As already mentioned, some of the path effects operate at a lower level than most users will be used to, meaning that setting keywords such as facecolor and edgecolor raise an AttributeError. Luckily there is a generic PathPatchEffect path effect which creates a PathPatch class with the original path. The keywords to this effect are identical to those of PathPatch:

```python
fig = plt.figure(figsize=(8, 1))
t = fig.text(0.02, 0.5, 'Hatch shadow', fontsize=75, weight=1000, va='center')
t.set_path_effects([path_effects.PathPatchEffect(offset=(4, -4), hatch='xxxx', facecolor='gray'), path_effects.PathPatchEffect(edgecolor='white', linewidth=1.1, facecolor='black')])
plt.show()
```

Note: Click here to download the full example code

2.3.3 Transformations Tutorial

Like any graphics packages, Matplotlib is built on top of a transformation framework to easily move between coordinate systems, the userland data coordinate system, the axes coordinate system, the figure coordinate system, and the display coordinate system. In 95% of your plotting, you won’t need to think about this, as it happens under the hood, but as you push the limits of custom figure generation, it helps to have an understanding of these objects so you can reuse the existing transformations Matplotlib makes available to you, or create your own (see matplotlib.transforms). The table below summarizes the some useful coordinate systems, the transformation object you should use to work in that coordinate system, and the description of that system. In the Transformation Object Column, ax is a Axes instance, and fig is a Figure instance.
Coordiates | Transformation object | Description
--- | --- | ---
"data" | ax.transData | The coordinate system for the data, controlled by xlim and ylim.
"axes" | ax.transAxes | The coordinate system of the Axes; (0, 0) is bottom left of the axes, and (1, 1) is top right of the axes.
"figure" | fig.transFigure | The coordinate system of the Figure; (0, 0) is bottom left of the figure, and (1, 1) is top right of the figure.
"figure-inches" | fig.dpi_scale_trans | The coordinate system of the Figure in inches; (0, 0) is bottom left of the figure, and (width, height) is the top right of the figure in inches.
"display" | None, or IdentityTransform() | The pixel coordinate system of the display window; (0, 0) is bottom left of the window, and (width, height) is top right of the display window in pixels.
"xaxis", "yaxis" | ax.get_xaxis_transform(), ax.get_yaxis_transform() | Blended coordinate systems; use data coordinates on one of the axis and axes coordinates on the other.

All of the transformation objects in the table above take inputs in their coordinate system, and transform the input to the display coordinate system. That is why the display coordinate system has None for the Transformation Object column – it already is in display coordinates. The transformations also know how to invert themselves, to go from display back to the native coordinate system. This is particularly useful when processing events from the user interface, which typically occur in display space, and you want to know where the mouse click or key-press occurred in your data coordinate system.

Note that specifying objects in display coordinates will change their location if the dpi of the figure changes. This can cause confusion when printing or changing screen resolution, because the object can change location and size. Therefore it is most common for artists placed in an axes or figure to have their transform set to something other than the IdentityTransform(); the default when an artist is placed on an axes using add_artist is for the transform to be ax.transData.

Data coordinates

Let’s start with the most commonly used coordinate, the data coordinate system. Whenever you add data to the axes, Matplotlib updates the datalimits, most commonly updated with the set_xlim() and set_ylim() methods. For example, in the figure below, the data limits stretch from 0 to 10 on the x-axis, and -1 to 1 on the y-axis.

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.patches as mpatches

x = np.arange(0, 10, 0.005)
y = np.exp(-x/2.) * np.sin(2*np.pi*x)

fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_xlim(0, 10)
ax.set_ylim(-1, 1)
```

(continues on next page)
You can use the `ax.transData` instance to transform from your data to your display coordinate system, either a single point or a sequence of points as shown below:

```python
In [14]: type(ax.transData)
Out[14]: <class 'matplotlib.transforms.CompositeGenericTransform'>

In [15]: ax.transData.transform((5, 0))
Out[15]: array([ 335.175,  247. ])

In [16]: ax.transData.transform(((5, 0), (1, 2)))
Out[16]:
array([[[ 335.175, 247.  ]],
       [[ 132.435,  642.2 ]]])
```

You can use the `inverted()` method to create a transform which will take you from display to data coordinates:

```python
In [41]: inv = ax.transData.inverted()

In [42]: type(inv)
```

(continues on next page)
Out[42]: <class 'matplotlib.transforms.CompositeGenericTransform'>

In [43]: inv.transform((335.175, 247.))
Out[43]: array([ 5.,  0.])

If you are typing along with this tutorial, the exact values of the display coordinates may differ if you have a different window size or dpi setting. Likewise, in the figure below, the display labeled points are probably not the same as in the ipython session because the documentation figure size defaults are different.

```python
x = np.arange(0, 10, 0.005)
y = np.exp(-x/2.) * np.sin(2*np.pi*x)

fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_xlim(0, 10)
ax.set_ylim(-1, 1)

xdata, ydata = 5, 0
xdisplay, ydisplay = ax.transData.transform_point((xdata, ydata))

bbox = dict(boxstyle="round", fc="0.8")
arrowprops = dict(
    arrowstyle="->",
    connectionstyle="angle,angleA=0,angleB=90,rad=10")

offset = 72
ax.annotate('data = (%.1f, %.1f)' % (xdata, ydata),
            (xdata, ydata), xytext=(-2*offset, offset),
            textcoords='offset points', bbox=bbox, arrowprops=arrowprops)

disp = ax.annotate('display = (%.1f, %.1f)' % (xdisplay, ydisplay),
                   (xdisplay, ydisplay), xytext=(0.5*offset, -offset),
                   xycoords='figure pixels',
                   textcoords='offset points',
                   bbox=bbox, arrowprops=arrowprops)

plt.show()
```
Note: If you run the source code in the example above in a GUI backend, you may also find that the two arrows for the data and display annotations do not point to exactly the same point. This is because the display point was computed before the figure was displayed, and the GUI backend may slightly resize the figure when it is created. The effect is more pronounced if you resize the figure yourself. This is one good reason why you rarely want to work in display space, but you can connect to the 'on_draw' Event to update figure coordinates on figure draws; see Event handling and picking.

When you change the x or y limits of your axes, the data limits are updated so the transformation yields a new display point. Note that when we just change the ylim, only the y-display coordinate is altered, and when we change the xlim too, both are altered. More on this later when we talk about the Bbox.

```
In [54]: ax.transData.transform((5, 0))
Out[54]: array([ 335.175, 247. ])

In [55]: ax.set_ylim(-1, 2)
Out[55]: (-1, 2)

In [56]: ax.transData.transform((5, 0))
Out[56]: array([ 335.175, 181.13333333])
```
Axes coordinates

After the data coordinate system, axes is probably the second most useful coordinate system. Here the point (0, 0) is the bottom left of your axes or subplot, (0.5, 0.5) is the center, and (1.0, 1.0) is the top right. You can also refer to points outside the range, so (-0.1, 1.1) is to the left and above your axes. This coordinate system is extremely useful when placing text in your axes, because you often want a text bubble in a fixed, location, e.g., the upper left of the axes pane, and have that location remain fixed when you pan or zoom. Here is a simple example that creates four panels and labels them ‘A’, ‘B’, ‘C’, ‘D’ as you often see in journals.

```python
fig = plt.figure()
for i, label in enumerate(['A', 'B', 'C', 'D']):
    ax = fig.add_subplot(2, 2, i+1)
    ax.text(0.05, 0.95, label, transform=ax.transAxes,
            fontsize=16, fontweight='bold', va='top')
plt.show()
```
You can also make lines or patches in the axes coordinate system, but this is less useful in my experience than using `ax.transAxes` for placing text. Nonetheless, here is a silly example which plots some random dots in data space, and overlays a semi-transparent `Circle` centered in the middle of the axes with a radius one quarter of the axes – if your axes does not preserve aspect ratio (see `set_aspect()`), this will look like an ellipse. Use the pan/zoom tool to move around, or manually change the data xlim and ylim, and you will see the data move, but the circle will remain fixed because it is not in data coordinates and will always remain at the center of the axes.

```python
fig, ax = plt.subplots()
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y, 'go', alpha=0.2)  # plot some data in data coordinates
circ = mpatches.Circle((0.5, 0.5), 0.25, transform=ax.transAxes,
                        facecolor='blue', alpha=0.75)
ax.add_patch(circ)
plt.show()
```
Blended transformations

Drawing in blended coordinate spaces which mix axes with data coordinates is extremely useful, for example to create a horizontal span which highlights some region of the y-data but spans across the x-axis regardless of the data limits, pan or zoom level, etc. In fact these blended lines and spans are so useful, we have built in functions to make them easy to plot (see `axhline()`, `axvline()`, `axhspan()`, `axvspan()`) but for didactic purposes we will implement the horizontal span here using a blended transformation. This trick only works for separable transformations, like you see in normal Cartesian coordinate systems, but not on inseparable transformations like the `PolarTransform`.

```python
import matplotlib.transforms as transforms

fig, ax = plt.subplots()
x = np.random.randn(1000)

ax.hist(x, 30)
ax.set_title(r'$\sigma=1$ / dots / $\sigma=2$\n', fontsize=16)

# the x coords of this transformation are data, and the
# y coord are axes
trans = transforms.blended_transform_factory(
```

(continues on next page)
ax.transData, ax.transAxes)

# highlight the 1..2 stddev region with a span.
# We want x to be in data coordinates and y to
# span from 0..1 in axes coords
rect = mpatches.Rectangle((1, 0), width=1, height=1,
    transform=trans, color='yellow',
    alpha=0.5)

ax.add_patch(rect)

plt.show()

\[ \sigma = 1 \ldots \sigma = 2 \]

**Note:** The blended transformations where x is in data coords and y in axes coordinates is so useful that we have helper methods to return the versions mpl uses internally for drawing ticks, ticklabels, etc. The methods are `matplotlib.axes.Axes.get_xaxis_transform()` and `matplotlib.axes.Axes.get_yaxis_transform()`. So in the example above, the call to `blended_transform_factory()` can be replaced by `get_xaxis_transform`:

```
trans = ax.get_xaxis_transform()
```
Plotting in physical units

Sometimes we want an object to be a certain physical size on the plot. Here we draw the same circle as above, but in physical units. If done interactively, you can see that changing the size of the figure does not change the offset of the circle from the lower-left corner, does not change its size, and the circle remains a circle regardless of the aspect ratio of the axes.

```python
fig, ax = plt.subplots(figsize=(5, 4))
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y*10., 'go', alpha=0.2)  # plot some data in data coordinates
# add a circle in fixed-units
circ = mpatches.Circle((2.5, 2), 1.0, transform=fig.dpi_scale_trans,
                        facecolor='blue', alpha=0.75)
ax.add_patch(circ)
plt.show()
```

If we change the figure size, the circle does not change its absolute position and is cropped.

```python
fig, ax = plt.subplots(figsize=(7, 2))
x, y = 10*np.random.rand(2, 1000)
ax.plot(x, y*10., 'go', alpha=0.2)  # plot some data in data coordinates
# add a circle in fixed-units
circ = mpatches.Circle((2.5, 2), 1.0, transform=fig.dpi_scale_trans,
                        facecolor='blue', alpha=0.75)
ax.add_patch(circ)
plt.show()
```
Another use is putting a patch with a set physical dimension around a data point on the axes. Here we add together two transforms. The first sets the scaling of how large the ellipse should be and the second sets its position. The ellipse is then placed at the origin, and then we use the helper transform `ScaledTranslation` to move it to the right place in the `ax.transData` coordinate system. This helper is instantiated with:

\[ \text{trans} = \text{ScaledTranslation}(xt, yt, \text{scale}_\text{trans}) \]

where \( xt \) and \( yt \) are the translation offsets, and \( \text{scale}_\text{trans} \) is a transformation which scales \( xt \) and \( yt \) at transformation time before applying the offsets.

Note the use of the plus operator on the transforms below. This code says: first apply the scale transformation `fig.dpi_scale_trans` to make the ellipse the proper size, but still centered at \((0, 0)\), and then translate the data to \( xdata[0] \) and \( ydata[0] \) in data space.

In interactive use, the ellipse stays the same size even if the axes limits are changed via zoom.
Note: The order of transformation matters. Here the ellipse is given the right dimensions in display space first and then moved in data space to the correct spot. If we had done the ScaledTranslation first, then xdata[0] and ydata[0] would first be transformed to display coordinates ([ 358.4 475.2] on a 200-dpi monitor) and then those coordinates would be scaled by fig.dpi_scale_trans pushing the center of the ellipse well off the screen (i.e. [ 71680. 95040.]).

Using offset transforms to create a shadow effect

Another use of ScaledTranslation is to create a new transformation that is offset from another transformation, e.g., to place one object shifted a bit relative to another object. Typically you want the shift to be in some physical dimension, like points or inches rather than in data coordinates, so that the shift effect is constant at different zoom levels and dpi settings.

One use for an offset is to create a shadow effect, where you draw one object identical to the first just to the right of it, and just below it, adjusting the zorder to make sure the shadow is drawn first and then the object it is shadowing above it.

Here we apply the transforms in the opposite order to the use of ScaledTranslation above. The plot is first made in data units (ax.transData) and then shifted by dx and dy points using fig.dpi_scale_trans. (In typography, a point <https://en.wikipedia.org/wiki/Point_%28typography%29> is 1/72 inches, and by specifying your offsets in points, your figure...
Note: The dpi and inches offset is a common-enough use case that we have a special helper
function to create it in `matplotlib.transforms.offset_copy()`, which returns a new transform with an added offset. So above we could have done:

```python
shadow_transform = transforms.offset_copy(ax.transData,  
  fig=fig, dx, dy, units='inches')
```

### The transformation pipeline

The `ax.transData` transform we have been working with in this tutorial is a composite of three different transformations that comprise the transformation pipeline from `data` -> `display` coordinates. Michael Droettboom implemented the transformations framework, taking care to provide a clean API that segregated the nonlinear projections and scales that happen in polar and logarithmic plots, from the linear affine transformations that happen when you pan and zoom. There is an efficiency here, because you can pan and zoom in your axes which affects the affine transformation, but you may not need to compute the potentially expensive nonlinear scales or projections on simple navigation events. It is also possible to multiply affine transformation matrices together, and then apply them to coordinates in one step. This is not true of all possible transformations.

Here is how the `ax.transData` instance is defined in the basic separable axis `Axes` class:

```python
self.transData = self.transScale + (self.transLimits + self.transAxes)
```

We’ve been introduced to the `transAxes` instance above in `Axes coordinates`, which maps the (0, 0), (1, 1) corners of the axes or subplot bounding box to `display` space, so let’s look at these other two pieces.

`self.transLimits` is the transformation that takes you from `data` to `axes` coordinates; i.e., it maps your view `xlim` and `ylim` to the unit space of the axes (and `transAxes` then takes that unit space to display space). We can see this in action here

```python
In [80]: ax = subplot(111)  
In [81]: ax.set_xlim(0, 10)  
Out[81]: (0, 10)  
In [82]: ax.set_ylim(-1, 1)  
Out[82]: (-1, 1)  
In [84]: ax.transLimits.transform((0, -1))  
Out[84]: array([ 0., 0.])  
In [85]: ax.transLimits.transform((10, -1))  
Out[85]: array([ 1., 0.])  
In [86]: ax.transLimits.transform((10, 1))  
Out[86]: array([ 1., 1.])  
In [87]: ax.transLimits.transform((5, 0))  
Out[87]: array([ 0.5, 0.5])
```

and we can use this same inverted transformation to go from the unit `axes` coordinates back to data coordinates.
The final piece is the self.transScale attribute, which is responsible for the optional non-linear scaling of the data, e.g., for logarithmic axes. When an Axes is initially setup, this is just set to the identity transform, since the basic Matplotlib axes has linear scale, but when you call a logarithmic scaling function like semilogz() or explicitly set the scale to logarithmic with set_xscale(), then the ax.transScale attribute is set to handle the nonlinear projection. The scales transforms are properties of the respective xaxis and yaxis Axis instances. For example, when you call ax.set_xscale('log'), the xaxis updates its scale to a matplotlib.scale.LogScale instance.

For non-separable axes the PolarAxes, there is one more piece to consider, the projection transformation. The transData matplotlib.projections.polar.PolarAxes is similar to that for the typical separable matplotlib Axes, with one additional piece transProjection:

\[
\text{self.transData} = \text{self.transScale} + \text{self.transProjection} + (\text{self.transProjectionAffine} + \text{self.transAxes})
\]

transProjection handles the projection from the space, e.g., latitude and longitude for map data, or radius and theta for polar data, to a separable Cartesian coordinate system. There are several projection examples in the matplotlib.projections package, and the best way to learn more is to open the source for those packages and see how to make your own, since Matplotlib supports extensible axes and projections. Michael Droettboom has provided a nice tutorial example of creating a Hammer projection axes; see /gallery/misc/custom_projection.

2.4 Colors

Matplotlib has support for visualizing information with a wide array of colors and colormaps. These tutorials cover the basics of how these colormaps look, how you can create your own, and how you can customize colormaps for your use case.

For even more information see the examples page.

Note: Click here to download the full example code

2.4.1 Specifying Colors

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA (red, green, blue, alpha) tuple of float values in [0, 1] (e.g., (0.1, 0.2, 0.5) or (0.1, 0.2, 0.5, 0.3));
- a hex RGB or RGBA string (e.g., '#0f0f0f' or '#0f0f0f80'; case-insensitive);
- a string representation of a float value in [0, 1] inclusive for gray level (e.g., '0.5');
- one of {'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'};
- a X11/CSS4 color name (case-insensitive);
- a name from the xkcd color survey, prefixed with 'xkcd:' (e.g., 'xkcd:sky blue'; case insensitive);

• a “CN” color spec, i.e. 'C' followed by a number, which is an index into the default property cycle (matplotlib.rcParams[‘axes.prop_cycle’]); the indexing is intended to occur at rendering time, and defaults to black if the cycle does not include color.

"Red", "Green", and "Blue" are the intensities of those colors, the combination of which span the colorspace.

How "Alpha" behaves depends on the zorder of the Artist. Higher zorder Artists are drawn on top of lower Artists, and "Alpha" determines whether the lower artist is covered by the higher. If the old RGB of a pixel is RGBold and the RGB of the pixel of the Artist being added is RGBnew with Alpha alpha, then the RGB of the pixel is updated to: RGB = RGBold * (1 - Alpha) + RGBnew * Alpha. Alpha of 1 means the old color is completely covered by the new Artist, Alpha of 0 means that pixel of the Artist is transparent.

For more information on colors in matplotlib see
• the /gallery/color/color_demo example;
• the matplotlib.colors API;
• the /gallery/color/named_colors example.

"CN" color selection

"CN" colors are converted to RGBA as soon as the artist is created. For example,

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib as mpl

th = np.linspace(0, 2*np.pi, 128)

def demo(sty):
    mpl.style.use(sty)
    fig, ax = plt.subplots(figsize=(3, 3))
    ax.set_title(r'\textit{style: {\color{C0}}'}
    ax.plot(th, np.cos(th), 'C1', label='C1')
    ax.plot(th, np.sin(th), 'C2', label='C2')
    ax.legend()

demo('default')
demo('seaborn')
```
will use the first color for the title and then plot using the second and third colors of each style's `mpl.rcParams['axes.prop_cycle']`.

**xkcd v X11/CSS4**

The xkcd colors are derived from a user survey conducted by the webcomic xkcd. Details of the survey are available on the xkcd blog.

Out of 148 colors in the CSS color list, there are 95 name collisions between the X11/CSS4 names and the xkcd names, all but 3 of which have different hex values. For example, 'blue' maps to '#0000FF' whereas 'xkcd:blue' maps to '#0343DF'. Due to these name collisions all of the xkcd colors have 'xkcd:' prefixed. As noted in the blog post, while it might be interesting to re-define the X11/CSS4 names based on such a survey, we do not do so unilaterally.

The name collisions are shown in the table below; the color names where the hex values agree are shown in bold.
import matplotlib._color_data as mcd
import matplotlib.patches as mpatch

overlap = {name for name in mcd.CSS4_COLORS
    if "xkcd:" + name in mcd.XKCD_COLORS}

fig = plt.figure(figsize=[4.8, 16])
ax = fig.add_axes([0, 0, 1, 1])

for j, n in enumerate(sorted(overlap, reverse=True)):
    weight = None
    cn = mcd.CSS4_COLORS[n]
xkcd = mcd.XKCD_COLORS["xkcd:" + n].upper()
    if cn == xkcd:
        weight = 'bold'

    r1 = mpatch.Rectangle((0, j), 1, 1, color=cn)
r2 = mpatch.Rectangle((1, j), 1, 1, color=xkcd)
txt = ax.text(2, j+.5, ' ' + n, va='center', fontsize=10,
        weight=weight)
ax.add_patch(r1)
ax.add_patch(r2)
ax.axhline(j, color='k')

ax.text(.5, j + 1.5, 'X11', ha='center', va='center')
ax.text(1.5, j + 1.5, 'xkcd', ha='center', va='center')
ax.set_xlim(0, 3)
ax.set_ylim(0, j + 2)
ax.axis('off')

2.4.2 Customized Colorbars Tutorial

This tutorial shows how to build colorbars without an attached plot.

Customized Colorbars

`ColorbarBase` puts a colorbar in a specified axes, and can make a colorbar for a given colormap; it does not need a mappable object like an image. In this tutorial we will explore what can be done with standalone colorbar.

Basic continuous colorbar

Set the colormap and norm to correspond to the data for which the colorbar will be used. Then create the colorbar by calling `ColorbarBase` and specify axis, colormap, norm and orientation as parameters. Here we create a basic continuous colorbar with ticks and labels. For more information see the `colorbar` API.

```python
import matplotlib.pyplot as plt
import matplotlib as mpl

fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.cm.cool
norm = mpl.colors.Normalize(vmin=5, vmax=10)

cb1 = mpl.colorbar.ColorbarBase(ax, cmap=cmap,
                               norm=norm,
                               orientation='horizontal')

fig.show()
```
Discrete intervals colorbar

The second example illustrates the use of a `ListedColormap` which generates a colormap from a set of listed colors, and `colors.BoundaryNorm()` which generates a colormap index based on discrete intervals and extended ends to show the “over” and “under” value colors. Over and under are used to display data outside of the normalized [0,1] range. Here we pass colors as gray shades as a string encoding a float in the 0-1 range.

If a `ListedColormap` is used, the length of the bounds array must be one greater than the length of the color list. The bounds must be monotonically increasing.

This time we pass some more arguments in addition to previous arguments to `ColorbarBase`. For the out-of-range values to display on the colorbar, we have to use the `extend` keyword argument. To use `extend`, you must specify two extra boundaries. Finally, spacing argument ensures that intervals are shown on colorbar proportionally.

```python
fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.colors.ListedColormap(['red', 'green', 'blue', 'cyan'])
cmap.set_over('0.25')
cmap.set_under('0.75')

bounds = [1, 2, 4, 7, 8]
norm = mpl.colors.BoundaryNorm(bounds, cmap.N)

cb2 = mpl.colorbar.ColorbarBase(ax, cmap=cmap,
                                norm=norm,
                                boundaries=[0] + bounds + [13],
                                extend='both',
                                ticks=bounds,
                                spacing='proportional',
                                orientation='horizontal')

cb2.set_label('Discrete intervals, some other units')
fig.show()
```

Colorbar with custom extension lengths

Here we illustrate the use of custom length colorbar extensions, used on a colorbar with discrete intervals. To make the length of each extension the same as the length of the interior colors, use `extendfrac='auto'`.

```python
fig, ax = plt.subplots(figsize=(6, 1))
fig.subplots_adjust(bottom=0.5)

cmap = mpl.colors.ListedColormap(['royalblue', 'cyan',
                                   'yellow', 'orange'])
(continues on next page)
```
cmap.set_over('red')
cmap.set_under('blue')

bounds = [-1.0, -0.5, 0.0, 0.5, 1.0]
norm = mpl.colors.BoundaryNorm(bounds, cmap.N)
cb3 = mpl.colorbar.ColorbarBase(ax, cmap=cmap,
    norm=norm,
    boundaries=[-10] + bounds + [10],
    extend='both',
    extendfrac='auto',
    ticks=bounds,
    spacing='uniform',
    orientation='horizontal')
cb3.set_label('Custom extension lengths, some other units')
fig.show()

**Note:** Click [here](#) to download the full example code

### 2.4.3 Creating Colormaps in Matplotlib

Matplotlib has a number of built-in colormaps accessible via `matplotlib.cm.get_cmap`. There are also external libraries like `palettable` that have many extra colormaps.

However, we often want to create or manipulate colormaps in Matplotlib. This can be done using the class `ListedColormap` and a Nx4 numpy array of values between 0 and 1 to represent the RGBA values of the colormap. There is also a `LinearSegmentedColormap` class that allows colormaps to be specified with a few anchor points defining segments, and linearly interpolating between the anchor points.

#### Getting colormaps and accessing their values

First, getting a named colormap, most of which are listed in [Choosing Colormaps in Matplotlib](#) requires the use of `matplotlib.cm.get_cmap`, which returns a `matplotlib.colors.ListedColormap` object. The second argument gives the size of the list of colors used to define the colormap, and below we use a modest value of 12 so there are not a lot of values to look at.

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cm
from matplotlib.colors import ListedColormap, LinearSegmentedColormap
```
The object `viridis` is a callable, that when passed a float between 0 and 1 returns an RGBA value from the colormap:

```python
print(viridis(0.56))
```

Out:

```
(0.119512, 0.607464, 0.540218, 1.0)
```

The list of colors that comprise the colormap can be directly accessed using the `colors` property, or it can be accessed indirectly by calling `viridis` with an array of values matching the length of the colormap. Note that the returned list is in the form of an RGBA Nx4 array, where N is the length of the colormap.

```python
print('viridis.colors', viridis.colors)

print('viridis(range(12))', viridis(range(12)))
print('viridis(np.linspace(0, 1, 12))', viridis(np.linspace(0, 1, 12)))
```

Out:

```plaintext
viridis.colors [[0.267004 0.004874 0.329415 1.]
                [0.283072 0.130895 0.449241 1.]
                [0.262138 0.242286 0.520837 1.]
                [0.220057 0.343307 0.549413 1.]
                [0.177423 0.437527 0.557565 1.]
                [0.143343 0.522773 0.556295 1.]
                [0.119512 0.607464 0.540218 1.]
                [0.166383 0.690856 0.496502 1.]
                [0.319809 0.770914 0.411152 1.]
                [0.525776 0.834911 0.288127 1.]
                [0.762373 0.864244 0.137064 1.]
                [0.993248 0.906157 0.143936 1.]]

viridis(range(12)) [[0.267004 0.004874 0.329415 1.]
                    [0.283072 0.130895 0.449241 1.]
                    [0.262138 0.242286 0.520837 1.]
                    [0.220057 0.343307 0.549413 1.]
                    [0.177423 0.437527 0.557565 1.]
                    [0.143343 0.522773 0.556295 1.]
                    [0.119512 0.607464 0.540218 1.]
                    [0.166383 0.690856 0.496502 1.]
                    [0.319809 0.770914 0.411152 1.]
                    [0.525776 0.834911 0.288127 1.]
                    [0.762373 0.864244 0.137064 1.]
                    [0.993248 0.906157 0.143936 1.]]

viridis(np.linspace(0, 1, 12)) [[0.267004 0.004874 0.329415 1.]
                                [0.283072 0.130895 0.449241 1.]
```
The colormap is a lookup table, so “oversampling” the colormap returns nearest-neighbor interpolation (note the repeated colors in the list below)

```
print('viridis(np.linspace(0, 1, 15))', viridis(np.linspace(0, 1, 15)))
```

Out:

```
viridis(np.linspace(0, 1, 15)) [[0.267004 0.004874 0.329415 1. ]
[0.267004 0.004874 0.329415 1. ]
[0.283072 0.130895 0.449241 1. ]
[0.262138 0.242286 0.520837 1. ]
[0.220057 0.343307 0.549413 1. ]
[0.177423 0.437527 0.557565 1. ]
[0.143343 0.522773 0.556295 1. ]
[0.119512 0.607464 0.540218 1. ]
[0.119512 0.607464 0.540218 1. ]
[0.166383 0.690856 0.496502 1. ]
[0.319809 0.770914 0.411152 1. ]
[0.525776 0.833491 0.288127 1. ]
[0.762373 0.876424 0.137064 1. ]
[0.993248 0.906157 0.143936 1. ]
]
```

Creating listed colormaps

This is essential the inverse operation of the above where we supply a Nx4 numpy array with all values between 0 and 1, to `ListedColormap` to make a new colormap. This means that any numpy operations that we can do on a Nx4 array make carpentry of new colormaps from existing colormaps quite straight forward.

Suppose we want to make the first 25 entries of a 256-length “viridis” colormap pink for some reason:

```
viridis = cm.get_cmap('viridis', 256)
newcolors = viridis(np.linspace(0, 1, 256))
pink = np.array([[248/256, 24/256, 148/256, 1]])
newcolors[:,2:] = pink
newcmp = ListedColormap(newcolors)
```

(continues on next page)
def plot_examples(cms):
    """
    helper function to plot two colormaps
    """
    np.random.seed(19680801)
    data = np.random.randn(30, 30)

    fig, axs = plt.subplots(1, 2, figsize=(6, 3), constrained_layout=True)
    for [ax, cmap] in zip(axs, cms):
        psm = ax.pcolormesh(data, cmap=cmap, rasterized=True, vmin=-4, vmax=4)
        fig.colorbar(psm, ax=ax)

    plt.show()
    plot_examples([viridis, newcmp])

We can easily reduce the dynamic range of a colormap; here we choose the middle 0.5 of
the colormap. However, we need to interpolate from a larger colormap, otherwise the new
colormap will have repeated values.

viridisBig = cm.get_cmap('viridis', 512)
newcmp = ListedColormap(viridisBig(np.linspace(0.25, 0.75, 256)))
plot_examples([viridis, newcmp])
and we can easily concatenate two colormaps:

```python
import matplotlib.pyplot as plt

top = cm.get_cmap('Oranges_r', 128)
bottom = cm.get_cmap('Blues', 128)

newcolors = np.vstack((top(np.linspace(0, 1, 128)),
                        bottom(np.linspace(0, 1, 128))))
newcmp = ListedColormap(newcolors, name='OrangeBlue')
plot_examples([viridis, newcmp])
```

Of course we need not start from a named colormap, we just need to create the Nx4 array to pass to `ListedColormap`. Here we create a brown colormap that goes to white....

```python
N = 256
vals = np.ones((N, 4))
vals[:, 0] = np.linspace(90/256, 1, N)
```
vals[:, 1] = np.linspace(39/256, 1, N)
vals[:, 2] = np.linspace(41/256, 1, N)
newcmp = ListedColormap(vals)
plot_examples([viridis, newcmp])

2.4. Colors

Creating linear segmented colormaps

*LinearSegmentedColormap* class specifies colormaps using anchor points between which RGB(A) values are interpolated.

The format to specify these colormaps allows discontinuities at the anchor points. Each anchor point is specified as a row in a matrix of the form 
\[
\begin{bmatrix}
x[i] & yleft[i] & yright[i]
\end{bmatrix}
\]
where \(x[i]\) is the anchor, and \(yleft[i]\) and \(yright[i]\) are the values of the color on either side of the anchor point.

If there are no discontinuities, then \(yleft[i]=yright[i]\):

cdict = {'red': [[0.0, 0.0, 0.0],
                 [0.5, 1.0, 1.0],
                 [1.0, 1.0, 1.0]],
         'green': [[0.0, 0.0, 0.0],
                   [0.25, 0.0, 0.0],
                   [0.75, 1.0, 1.0],
                   [1.0, 1.0, 1.0]],
         'blue': [[0.0, 0.0, 0.0],
                  [0.5, 0.0, 0.0],
                  [1.0, 1.0, 1.0]]}

def plot_linearmap(cdict):
    newcmp = LinearSegmentedColormap('testCmap', segmentdata=cdict, N=256)
    rgba = newcmp(np.linspace(0, 1, 256))
    fig, ax = plt.subplots(figsize=(4, 3), constrained_layout=True)
In order to make a discontinuity at an anchor point, the third column is different than the second. The matrix for each of "red", "green", "blue", and optionally "alpha" is set up as:

```python
cdict['red'] = [...
    [x[i]  yleft[i]  yright[i]],
    [x[i+1] yleft[i+1] yright[i+1]],
    ...
]
```

and for values passed to the colormap between x[i] and x[i+1], the interpolation is between yright[i] and yleft[i+1].

In the example below there is a discontinuity in red at 0.5. The interpolation between 0 and 0.5 goes from 0.3 to 1, and between 0.5 and 1 it goes from 0.9 to 1. Note that red[0, 1], and red[2, 2] are both superfluous to the interpolation because red[0, 1] is the value to the left of 0, and red[2, 2] is the value to the right of 1.0.

```python
cdict['red'] = [[0.0, 0.0, 0.3],
                [0.5, 1.0, 0.9],
                [1.0, 1.0, 1.0]]
plot_linearmap(cdict)
```
References

The use of the following functions, methods, classes and modules is shown in this example:

```python
import matplotlib
import matplotlib.axes.Axes.pcolormesh
import matplotlib.figure.Figure.colorbar
import matplotlib.colors
import matplotlib.colors.LinearSegmentedColormap
import matplotlib.colors.ListedColormap
import matplotlib.cm
import matplotlib.cm.get_cmap
```

Out:

```python
<function get_cmap at 0x7f18a85f0dc0>
```

**Total running time of the script:** (0 minutes 1.164 seconds)

### 2.4.4 Colormap Normalization

Objects that use colormaps by default linearly map the colors in the colormap from data values vmin to vmax. For example:

```python
pcm = ax.pcolormesh(x, y, Z, vmin=-1., vmax=1., cmap='RdBu_r')
```

will map the data in Z linearly from -1 to +1, so Z=0 will give a color at the center of the colormap RdBu_r (white in this case).
Matplotlib does this mapping in two steps, with a normalization from the input data to [0, 1] occurring first, and then mapping onto the indices in the colormap. Normalizations are classes defined in the `matplotlib.colors()` module. The default, linear normalization is `matplotlib.colors.Normalize()`.

Artists that map data to color pass the arguments `vmin` and `vmax` to construct a `matplotlib.colors.Normalize()` instance, then call it:

```
In [1]: import matplotlib as mpl
In [2]: norm = mpl.colors.Normalize(vmin=-1., vmax=1.)
In [3]: norm(0.)
Out[3]: 0.5
```

However, there are sometimes cases where it is useful to map data to colormaps in a non-linear fashion.

**Logarithmic**

One of the most common transformations is to plot data by taking its logarithm (to the base-10). This transformation is useful to display changes across disparate scales. Using `colors.LogNorm` normalizes the data via $\log_{10}$. In the example below, there are two bumps, one much smaller than the other. Using `colors.LogNorm`, the shape and location of each bump can clearly be seen:

```
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.colors as colors
import matplotlib.cbook as cbook

N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]

# A low hump with a spike coming out of the top right. Needs to have
# z/colour axis on a log scale so we see both hump and spike. linear
# scale only shows the spike.
Z1 = np.exp(-(X)**2 - (Y)**2)
Z2 = np.exp(-(X * 10)**2 - (Y * 10)**2)
Z = Z1 + 50 * Z2

fig, ax = plt.subplots(2, 1)
pcm = ax[0].pcolor(X, Y, Z,
                  norm=colors.LogNorm(vmin=Z.min(), vmax=Z.max()),
                  cmap='PuBu_r')
fig.colorbar(pcm, ax=ax[0], extend='max')

pcm = ax[1].pcolor(X, Y, Z, cmap='PuBu_r')
fig.colorbar(pcm, ax=ax[1], extend='max')
plt.show()
```
Symmetric logarithmic

Similarly, it sometimes happens that there is data that is positive and negative, but we would still like a logarithmic scaling applied to both. In this case, the negative numbers are also scaled logarithmically, and mapped to smaller numbers; e.g., if $v_{\text{min}}=-v_{\text{max}}$, then they the negative numbers are mapped from 0 to 0.5 and the positive from 0.5 to 1.

Since the logarithm of values close to zero tends toward infinity, a small range around zero needs to be mapped linearly. The parameter $\text{linthresh}$ allows the user to specify the size of this range (-$\text{linthresh}$, $\text{linthresh}$). The size of this range in the colormap is set by $\text{linscale}$. When $\text{linscale} == 1.0$ (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

```python
N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-(X - 1)**2 - (Y - 1)**2)
Z = (Z1 - Z2) * 2

fig, ax = plt.subplots(2, 1)
pcm = ax[0].pcolormesh(X, Y, Z,
    norm=colors.SymLogNorm(linthresh=0.03, linscale=0.03),
)```

(continues on next page)
vmin=-1.0, vmax=1.0),
cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[0], extend='both')

pcm = ax[1].pcolormesh(X, Y, Z, cmap='RdBu_r', vmin=-np.max(Z))
fig.colorbar(pcm, ax=ax[1], extend='both')
plt.show()
```python
N = 100
X, Y = np.mgrid[0:3:complex(0, N), 0:2:complex(0, N)]
Z1 = (1 + np.sin(Y * 10.)) * X**2

fig, ax = plt.subplots(2, 1)
pcm = ax[0].pcolormesh(X, Y, Z1, norm=colors.PowerNorm(gamma=0.5),
                       cmap='PuBu_r')
fig.colorbar(pcm, ax=ax[0], extend='max')

pcm = ax[1].pcolormesh(X, Y, Z1, cmap='PuBu_r')
fig.colorbar(pcm, ax=ax[1], extend='max')
plt.show()
```

Discrete bounds

Another normalization that comes with Matplotlib is `colors.BoundaryNorm()`. In addition to `vmin` and `vmax`, this takes as arguments boundaries between which data is to be mapped. The colors are then linearly distributed between these “bounds”. For instance:

```
In [4]: import matplotlib.colors as colors
```

(continues on next page)
In [5]: bounds = np.array([-0.25, -0.125, 0, 0.5, 1])

In [6]: norm = colors.BoundaryNorm(boundaries=bounds, ncolors=4)

In [7]: print(norm([-0.2, -0.15, -0.02, 0.3, 0.8, 0.99]))
[0 0 1 2 3 3]

Note unlike the other norms, this norm returns values from 0 to $ncolors$-1.

N = 100
X, Y = np.mgrid[-3:3:complex(0, N), -2:2:complex(0, N)]
Z1 = np.exp(-X**2 - Y**2)
Z2 = np.exp(-(X - 1)**2 - (Y - 1)**2)
Z = (Z1 - Z2) * 2

fig, ax = plt.subplots(3, 1, figsize=(8, 8))
ax = ax.flatten()
# even bounds gives a contour-like effect
bounds = np.linspace(-1, 1, 10)
norm = colors.BoundaryNorm(boundaries=bounds, ncolors=256)
pcm = ax[0].pcolormesh(X, Y, Z,
    norm=norm,
    cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[0], extend='both', orientation='vertical')

# uneven bounds changes the colormapping:
bounds = np.array([-0.25, -0.125, 0, 0.5, 1])
norm = colors.BoundaryNorm(boundaries=bounds, ncolors=256)
pcm = ax[1].pcolormesh(X, Y, Z, norm=norm, cmap='RdBu_r')
fig.colorbar(pcm, ax=ax[1], extend='both', orientation='vertical')

pcm = ax[2].pcolormesh(X, Y, Z, cmap='RdBu_r', vmin=-np.max(Z))
fig.colorbar(pcm, ax=ax[2], extend='both', orientation='vertical')
plt.show()
DivergingNorm: Different mapping on either side of a center

Sometimes we want to have a different colormap on either side of a conceptual center point, and we want those two colormaps to have different linear scales. An example is a topographic map where the land and ocean have a center at zero, but land typically has a greater elevation range than the water has depth range, and they are often represented by a different colormap.

```python
filename = cbook.get_sample_data('topobathy.npz', asfileobj=False)
with np.load(filename) as dem:
    topo = dem['topo']
    longitude = dem['longitude']
    latitude = dem['latitude']
```

(continues on next page)
fig, ax = plt.subplots()
# make a colormap that has land and ocean clearly delineated and of the
# same length (256 + 256)
colors_undersea = plt.cm.terrain(np.linspace(0, 0.17, 256))
colors_land = plt.cm.terrain(np.linspace(0.25, 1, 256))
all_colors = np.vstack((colors_undersea, colors_land))
terrain_map = colors.LinearSegmentedColormap.from_list('terrain_map',
    all_colors)

# make the norm: Note the center is offset so that the land has more
# dynamic range:
divnorm = colors.DivergingNorm(vmin=-500., vcenter=0, vmax=4000)

pcm = ax.pcolormesh(longitude, latitude, topo, rasterized=True, norm=divnorm,
    cmap=terrain_map,)
# Simple geographic plot, set aspect ratio because distance between lines of
# longitude depends on latitude.
ax.set_aspect(1 / np.cos(np.deg2rad(49)))
fig.colorbar(pcm, shrink=0.6)
plt.show()
Custom normalization: Manually implement two linear ranges

The `DivergingNorm` described above makes a useful example for defining your own norm.

```python
class MidpointNormalize(colors.Normalize):
    def __init__(self, vmin=None, vmax=None, vcenter=None, clip=False):
        self.vcenter = vcenter
        colors.Normalize.__init__(self, vmin, vmax, clip)

    def __call__(self, value, clip=None):
        # I'm ignoring masked values and all kinds of edge cases to make a
        # simple example...
        x, y = [self.vmin, self.vcenter, self.vmax], [0, 0.5, 1]
        return np.ma.masked_array(np.interp(value, x, y))

fig, ax = plt.subplots()
midnorm = MidpointNormalize(vmin=-500., vcenter=0, vmax=4000)
pcm = ax.pcolormesh(longitude, latitude, topo, rasterized=True, norm=midnorm,
        cmap=terrain_map)
ax.set_aspect(1 / np.cos(np.deg2rad(49)))
fig.colorbar(pcm, shrink=0.6, extend='both')
plt.show()
```

2.4. Colors
2.4.5 Choosing Colormaps in Matplotlib

Matplotlib has a number of built-in colormaps accessible via `matplotlib.cm.get_cmap`. There are also external libraries like [palettable] and [colorcet] that have many extra colormaps. Here we briefly discuss how to choose between the many options. For help on creating your own colormaps, see Creating Colormaps in Matplotlib.

Overview

The idea behind choosing a good colormap is to find a good representation in 3D colorspace for your data set. The best colormap for any given data set depends on many things including:

- Whether representing form or metric data ([Ware])
- Your knowledge of the data set (e.g., is there a critical value from which the other values deviate?)
- If there is an intuitive color scheme for the parameter you are plotting
- If there is a standard in the field the audience may be expecting

For many applications, a perceptually uniform colormap is the best choice — one in which equal steps in data are perceived as equal steps in the color space. Researchers have found that the human brain perceives changes in the lightness parameter as changes in the data much better than, for example, changes in hue. Therefore, colormaps which have monotonically increasing lightness through the colormap will be better interpreted by the viewer. A wonderful example of perceptually uniform colormaps is [colorcet].

Color can be represented in 3D space in various ways. One way to represent color is using CIELAB. In CIELAB, color space is represented by lightness, \( L^* \); red-green, \( a^* \); and yellow-blue, \( b^* \). The lightness parameter \( L^* \) can then be used to learn more about how the matplotlib colormaps will be perceived by viewers.

An excellent starting resource for learning about human perception of colormaps is from [IBM].

Classes of colormaps

Colormaps are often split into several categories based on their function (see, e.g., [Moreland]):

1. Sequential: change in lightness and often saturation of color incrementally, often using a single hue; should be used for representing information that has ordering.
2. Diverging: change in lightness and possibly saturation of two different colors that meet in the middle at an unsaturated color; should be used when the information being plotted has a critical middle value, such as topography or when the data deviates around zero.
3. Cyclic: change in lightness of two different colors that meet in the middle and begin/end at an unsaturated color; should be used for values that wrap around at the endpoints, such as phase angle, wind direction, or time of day.
4. Qualitative: often are miscellaneous colors; should be used to represent information which does not have ordering or relationships.

```python
# sphinx_gallery_thumbnail_number = 2
import numpy as np
import matplotlib as mpl
import matplotlib.pyplot as plt
from matplotlib import cm
from colorspacious import cspace_converter
from collections import OrderedDict

cmaps = OrderedDict()
```

**Sequential**

For the Sequential plots, the lightness value increases monotonically through the colormaps. This is good. Some of the $L^*$ values in the colormaps span from 0 to 100 (binary and the other grayscale), and others start around $L^* = 20$. Those that have a smaller range of $L^*$ will accordingly have a smaller perceptual range. Note also that the $L^*$ function varies amongst the colormaps: some are approximately linear in $L^*$ and others are more curved.

```python
cmaps['Perceptually Uniform Sequential'] = [
    'viridis', 'plasma', 'inferno', 'magma', 'cividis']
cmaps['Sequential'] = [
    'Greys', 'Purples', 'Blues', 'Greens', 'Oranges', 'Reds',
    'YlOrBr', 'YlOrRd', 'OrRd', 'PuRd', 'RdPu', 'BuPu',
    'GnBu', 'PuBu', 'YlGnBu', 'PuBuGn', 'BuGn', 'YlGn']
```

**Sequential2**

Many of the $L^*$ values from the Sequential2 plots are monotonically increasing, but some (autumn, cool, spring, and winter) plateau or even go both up and down in $L^*$ space. Others (afmhot, copper, gist_heat, and hot) have kinks in the $L^*$ functions. Data that is being represented in a region of the colormap that is at a plateau or kink will lead to a perception of banding of the data in those values in the colormap (see [mycarta-banding](https://matplotlib.org/stable/tutorials/colors/colormaps.html#sphx-glr-tutorials-colors-colormaps-py) for an excellent example of this).

```python
cmaps['Sequential (2)'] = [
    'binary', 'gist_yarg', 'gist_gray', 'gray', 'bone', 'pink',
    'spring', 'summer', 'autumn', 'winter', 'cool', 'Wistia',
    'hot', 'afmhot', 'gist_heat', 'copper']
```

**Diverging**

For the Diverging maps, we want to have monotonically increasing $L^*$ values up to a maximum, which should be close to $L^* = 100$, followed by monotonically decreasing $L^*$ values. We are looking for approximately equal minimum $L^*$ values at opposite ends of the colormap. By
these measures, BrBG and RdBu are good options. coolwarm is a good option, but it doesn’t span a wide range of $L^*$ values (see grayscale section below).

```python
cmaps['Diverging'] = ['PiYG', 'PRGn', 'BrBG', 'PuOr', 'RdGy', 'RdBu', 'RdYlBu', 'RdYlGn', 'Spectral', 'coolwarm', 'bwr', 'seismic']
```

Cyclic

For Cyclic maps, we want to start and end on the same color, and meet a symmetric center point in the middle. $L^*$ should change monotonically from start to middle, and inversely from middle to end. It should be symmetric on the increasing and decreasing side, and only differ in hue. At the ends and middle, $L^*$ will reverse direction, which should be smoothed in $L^*$ space to reduce artifacts. See [kovesi-colormaps] for more information on the design of cyclic maps.

The often-used HSV colormap is included in this set of colormaps, although it is not symmetric to a center point. Additionally, the $L^*$ values vary widely throughout the colormap, making it a poor choice for representing data for viewers to see perceptually. See an extension on this idea at [mycarta-jet].

```python
cmaps['Cyclic'] = ['twilight', 'twilight_shifted', 'hsv']
```

Qualitative

Qualitative colormaps are not aimed at being perceptual maps, but looking at the lightness parameter can verify that for us. The $L^*$ values move all over the place throughout the colormap, and are clearly not monotonically increasing. These would not be good options for use as perceptual colormaps.

```python
cmaps['Qualitative'] = ['Pastel1', 'Pastel2', 'Paired', 'Accent', 'Dark2', 'Set1', 'Set2', 'Set3', 'tab10', 'tab20', 'tab20b', 'tab20c']
```

Miscellaneous

Some of the miscellaneous colormaps have particular uses for which they have been created. For example, gist_earth, ocean, and terrain all seem to be created for plotting topography (green/brown) and water depths (blue) together. We would expect to see a divergence in these colormaps, then, but multiple kinks may not be ideal, such as in gist_earth and terrain. CMRmap was created to convert well to grayscale, though it does appear to have some small kinks in $L^*$. cubehelix was created to vary smoothly in both lightness and hue, but appears to have a small hump in the green hue area.

The often-used jet colormap is included in this set of colormaps. We can see that the $L^*$ values vary widely throughout the colormap, making it a poor choice for representing data for viewers to see perceptually. See an extension on this idea at [mycarta-jet].

```python
cmaps['Miscellaneous'] = ['flag', 'prism', 'ocean', 'gist_earth', 'terrain', 'gist_stern',
(continues on next page)```
First, we’ll show the range of each colormap. Note that some seem to change more “quickly” than others.

```python
nrows = max(len(cmap_list) for cmap_category, cmap_list in cmaps.items())
gradient = np.linspace(0, 1, 256)
gradient = np.vstack((gradient, gradient))

def plot_color_gradients(cmap_category, cmap_list, nrows):
    fig, axes = plt.subplots(nrows=nrows)
    fig.subplots_adjust(top=0.95, bottom=0.01, left=0.2, right=0.99)
    axes[0].set_title(cmap_category + ' colormaps', fontsize=14)

    for ax, name in zip(axes, cmap_list):
        ax.imshow(gradient, aspect='auto', cmap=plt.get_cmap(name))
        pos = list(ax.get_position().bounds)
        x_text = pos[0] - 0.01
        fig.text(x_text, y_text, name, va='center', ha='right', fontsize=10)

    # Turn off *all* ticks & spines, not just the ones with colormaps.
    for ax in axes:
        ax.set_axis_off()

for cmap_category, cmap_list in cmaps.items():
    plot_color_gradients(cmap_category, cmap_list, nrows)
plt.show()
```

    # (continues on next page)
```

Lightness of matplotlib colormaps

Here we examine the lightness values of the matplotlib colormaps. Note that some documentation on the colormaps is available ([list-colormaps]).
# Do subplots so that colormaps have enough space.
# Default is 6 colormaps per subplot.
dsub = _DSUBS.get(cmap_category, 6)
nsubplots = int(np.ceil(len(cmap_list) / dsub))

# squeeze=False to handle similarly the case of a single subplot
fig, axes = plt.subplots(nrows=nsubplots, squeeze=False, figsize=(7, 2.6*nsubplots))

for i, ax in enumerate(axes.flat):
    locs = []  # locations for text labels

    for j, cmap in enumerate(cmap_list[i*dsub:(i+1)*dsub]):

        # Get RGB values for colormap and convert the colormap in
        # CAM02-UCS colorspace. lab[0, :, 0] is the lightness.
        rgb = cm.get_cmap(cmap)(x)[np.newaxis, :, :3]
        lab = cspace_converter("sRGB1", "CAM02-UCS")(rgb)

        # Plot colormap L values. Do separately for each category
        # so each plot can be pretty. To make scatter markers change
        # color along plot:
        # http://stackoverflow.com/questions/8202605/
        if cmap_category == 'Sequential':
            # These colormaps all start at high lightness but we want them
            # reversed to look nice in the plot, so reverse the order.
            y_ = lab[0, ::-1, 0]
            c_ = x[::-1]
        else:

Sequential colormaps
2.4. Colors
Grayscale conversion

It is important to pay attention to conversion to grayscale for color plots, since they may be printed on black and white printers. If not carefully considered, your readers may end up with indecipherable plots because the grayscale changes unpredictably through the colormap.

Conversion to grayscale is done in many different ways [bw]. Some of the better ones use a linear combination of the rgb values of a pixel, but weighted according to how we perceive color intensity. A nonlinear method of conversion to grayscale is to use the $L^*$ values of the pixels. In general, similar principles apply for this question as they do for presenting one’s information perceptually; that is, if a colormap is chosen that is monotonically increasing in
With this in mind, we see that the Sequential colormaps have reasonable representations in grayscale. Some of the Sequential2 colormaps have decent enough grayscale representations, though some (autumn, spring, summer, winter) have very little grayscale change. If a colormap like this was used in a plot and then the plot was printed to grayscale, a lot of the information may map to the same gray values. The Diverging colormaps mostly vary from darker gray on the outer edges to white in the middle. Some (PuOr and seismic) have noticeably darker gray on one side than the other and therefore are not very symmetric. coolwarm has little range of grayscale and would print to a more uniform plot, losing a lot of detail. Note that overlaid, labeled contours could help differentiate between one side of the colormap vs. the other since color cannot be used once a plot is printed to grayscale. Many of the Qualitative and Miscellaneous colormaps, such as Accent, hsv, and jet, change from darker to lighter and back to darker gray throughout the colormap. This would make it impossible for a viewer to interpret the information in a plot once it is printed in grayscale.

```python
mpl.rcParams.update({'font.size': 14})

# Indices to step through colormap.
x = np.linspace(0.0, 1.0, 100)

gradient = np.linspace(0, 1, 256)
gradient = np.vstack((gradient, gradient))

def plot_color_gradients(cmap_category, cmap_list):
    fig, axes = plt.subplots(nrows=len(cmap_list), ncols=2)
    fig.subplots_adjust(top=0.95, bottom=0.01, left=0.2, right=0.99, wspace=0.05)
    fig.suptitle(cmap_category + ' colormaps', fontsize=14, y=1.0, x=0.6)

    for ax, name in zip(axes, cmap_list):

        # Get RGB values for colormap.
        rgb = cm.get_cmap(plt.get_cmap(name))(x)[np.newaxis, :, :3]

        # Get colormap in CAM02-UCS colorspace. We want the lightness.
        lab = cspace_converter("sRGB1", "CAM02-UCS")(rgb)
        L = lab[0, :, 0]
        L = np.float32(np.vstack((L, L, L)))

        ax[0].imshow(gradient, aspect='auto', cmap=plt.get_cmap(name))
        ax[1].imshow(L, aspect='auto', cmap='binary_r', vmin=0, vmax=100)
        pos = list(ax[0].get_position().bounds)
        x_text = pos[0] - 0.01
        fig.text(x_text, y_text, name, va='center', ha='right', fontsize=10)

        # Turn off *all* ticks & spines, not just the ones with colormaps.
    for ax in axes.flat:
        ax.set_axis_off()

    plt.show()
```

Color vision deficiencies

There is a lot of information available about color blindness (e.g., [colorblindness]). Additionally, there are tools available to convert images to how they look for different types of color vision deficiencies.

The most common form of color vision deficiency involves differentiating between red and green. Thus, avoiding colormaps with both red and green will avoid many problems in general.

2.5 Text

matplotlib has extensive text support, including support for mathematical expressions, true-type support for raster and vector outputs, newline separated text with arbitrary rotations, and unicode support. These tutorials cover the basics of working with text in Matplotlib.
2.5.1 Text in Matplotlib Plots

Introduction to plotting and working with text in Matplotlib.
Matplotlib has extensive text support, including support for mathematical expressions, true-type support for raster and vector outputs, newline separated text with arbitrary rotations, and unicode support.

Because it embeds fonts directly in output documents, e.g., for postscript or PDF, what you see on the screen is what you get in the hardcopy. FreeType support produces very nice, antialiased fonts, that look good even at small raster sizes. Matplotlib includes its own `matplotlib.font_manager` (thanks to Paul Barrett), which implements a cross platform, W3C compliant font finding algorithm.

The user has a great deal of control over text properties (font size, font weight, text location and color, etc.) with sensible defaults set in the rc file. And significantly, for those interested in mathematical or scientific figures, Matplotlib implements a large number of TeX math symbols and commands, supporting mathematical expressions anywhere in your figure.

Basic text commands

The following commands are used to create text in the pyplot interface and the object-oriented API:

<table>
<thead>
<tr>
<th><code>pyplot API</code></th>
<th><code>OO API</code></th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>text</td>
<td>text</td>
<td>Add text at an arbitrary location of the Axes.</td>
</tr>
<tr>
<td>annotate</td>
<td>annotate</td>
<td>Add an annotation, with an optional arrow, at an arbitrary location of the Axes.</td>
</tr>
<tr>
<td>xlabel</td>
<td>set_xlabel</td>
<td>Add a label to the Axes’s x-axis.</td>
</tr>
<tr>
<td>ylabel</td>
<td>set_ylabel</td>
<td>Add a label to the Axes’s y-axis.</td>
</tr>
<tr>
<td>title</td>
<td>set_title</td>
<td>Add a title to the Axes.</td>
</tr>
<tr>
<td>figtext</td>
<td>text</td>
<td>Add text at an arbitrary location of the Figure.</td>
</tr>
<tr>
<td>suptitle</td>
<td>suptitle</td>
<td>Add a title to the Figure.</td>
</tr>
</tbody>
</table>

All of these functions create and return a `Text` instance, which can be configured with a variety of font and other properties. The example below shows all of these commands in action, and more detail is provided in the sections that follow.

```python
import matplotlib
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111)
fig.subplots_adjust(top=0.85)

# Set titles for the figure and the subplot respectively
fig.suptitle('bold figure suptitle', fontsize=14, fontweight='bold')
```
ax.set_title('axes title')
ax.set_xlabel('xlabel')
ax.set_ylabel('ylabel')

# Set both x- and y-axis limits to [0, 10] instead of default [0, 1]
ax.axis([0, 10, 0, 10])

ax.text(3, 8, 'boxed italics text in data coords', style='italic',
        bbox={'facecolor': 'red', 'alpha': 0.5, 'pad': 10})

ax.text(2, 6, r'an equation: $E=mc^2$', fontsize=15)

ax.text(3, 2, 'unicode: Institut für Festkörperphysik')

ax.text(0.95, 0.01, 'colored text in axes coords',
        verticalalignment='bottom', horizontalalignment='right',
        transform=ax.transAxes,
        color='green', fontsize=15)

ax.plot([2], [1], 'o')
ax.annotate('annotate', xy=(2, 1), xytext=(3, 4),
            arrowprops=dict(facecolor='black', shrink=0.05))

plt.show()
Labels for x- and y-axis

Specifying the labels for the x- and y-axis is straightforward, via the `set_xlabel` and `set_ylabel` methods.

```python
import matplotlib.pyplot as plt
import numpy as np

x1 = np.linspace(0.0, 5.0, 100)
y1 = np.cos(2 * np.pi * x1) * np.exp(-x1)

fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1)
ax.set_xlabel('time [s]')
ax.set_ylabel('Damped oscillation [V]')

plt.show()
```
The x- and y-labels are automatically placed so that they clear the x- and y-ticklabels. Compare the plot below with that above, and note the y-label is to the left of the one above.

If you want to move the labels, you can specify the `labelpad` keyword argument, where the value is points (1/72", the same unit used to specify fontsizes).

```python
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1*10000)
ax.set_xlabel('time [s]')
ax.set_ylabel('Damped oscillation [V]')
plt.show()
```
Or, the labels accept all the *Text* keyword arguments, including *position*, via which we can manually specify the label positions. Here we put the xlabel to the far left of the axis. Note, that the y-coordinate of this position has no effect - to adjust the y-position we need to use the *labelpad* kwarg.

```python
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ax.plot(x1, y1)
ax.set_xlabel('time [s]', position=(0., 1e6), horizontalalignment='left')
ax.set_ylabel('Damped oscillation [V]')
plt.show()
```
All the labelling in this tutorial can be changed by manipulating the `matplotlib.font_manager.FontProperties` method, or by named kwargs to `set_xlabel`

```python
from matplotlib.font_manager import FontProperties

font = FontProperties()
font.set_family('serif')
font.set_name('Times New Roman')
font.set_style('italic')

fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.15, left=0.2)
ad.plot(x1, y1)
ad.set_xlabel('time [s]', fontsize='large', fontweight='bold')
ad.set_ylabel('Damped oscillation [V]', fontproperties=font)

plt.show()
```
Finally, we can use native TeX rendering in all text objects and have multiple lines:

```python
fig, ax = plt.subplots(figsize=(5, 3))
fig.subplots_adjust(bottom=0.2, left=0.2)
ax.plot(x1, np.cumsum(y1**2))
ax.set_xlabel('time [s] 
This was a long experiment')
ax.set_ylabel(r'$\int Y^2 \ dt \ [V^2 s]$')
plt.show()
```

Titles

Subplot titles are set in much the same way as labels, but there is the `loc` keyword arguments that can change the position and justification from the default value of `loc=center`. 
Vertical spacing for titles is controlled via `rcParams["axes.titlepad"]` (default: 6.0), which defaults to 5 points. Setting to a different value moves the title.
Placing ticks and ticklabels is a very tricky aspect of making a figure. Matplotlib does its best to accomplish the task automatically, but it also offers a very flexible framework for determining the choices for tick locations, and how they are labelled.

**Terminology**

Axes have a `matplotlib.axis` object for the `ax.xaxis` and `ax.yaxis` that contain the information about how the labels in the axis are laid out.

The axis API is explained in detail in the documentation to `axis`.

An Axis object has major and minor ticks. The Axis has `matplotlib.xaxis.set_major_locator` and `matplotlib.xaxis.set_minor_locator` methods that use the data being plotted to determine the location of major and minor ticks. There are also `matplotlib.xaxis.set_major_formatter` and `matplotlib.xaxis.set_minor_formatter` methods that format the tick labels.

**Simple ticks**

It often is convenient to simply define the tick values, and sometimes the tick labels, over-riding the default locators and formatters. This is discouraged because it breaks interactive navigation of the plot. It also can reset the axis limits: note that the second plot has the ticks we asked for, including ones that are well outside the automatic view limits.

```python
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
axs[1].xaxis.set_ticks(np.arange(0., 8.1, 2.))
plt.show()
```
We can of course fix this after the fact, but it does highlight a weakness of hard-coding the ticks. This example also changes the format of the ticks:

```python
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
ticks = np.arange(0., 8.1, 2.)
# list comprehension to get all tick labels...
tickla = ['%.1f' % tick for tick in ticks]
axs[1].xaxis.set_ticks(ticks)
axs[1].xaxis.set_ticklabels(tickla)
axs[1].set_xlim(axs[0].get_xlim())
plt.show()
```
Tick Locators and Formatters

Instead of making a list of all the tick labels, we could have used `matplotlib.ticker.StrMethodFormatter` (new-style `str.format()` format string) or `matplotlib.ticker.FormatStrFormatter` (old-style '%f' format string) and passed it to the `ax.xaxis`.

```python
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
ticks = np.arange(0., 8.1, 2.)
# list comprehension to get all tick labels...
formatter = matplotlib.ticker.StrMethodFormatter('{x:1.1f}')
axs[1].xaxis.set_ticks(ticks)
axs[1].xaxis.set_major_formatter(formatter)
axs[1].set_xlim(axs[0].get_xlim())
plt.show()
```

And of course we could have used a non-default locator to set the tick locations. Note we still pass in the tick values, but the x-limit fix used above is not needed.

```python
fig, axs = plt.subplots(2, 1, figsize=(5, 3), tight_layout=True)
axs[0].plot(x1, y1)
axs[1].plot(x1, y1)
locator = matplotlib.ticker.FixedLocator(ticks)
axs[1].xaxis.set_major_locator(locator)
axs[1].xaxis.set_major_formatter(formatter)
plt.show()
```
The default formatter is the `matplotlib.ticker.MaxNLocator` called as `ticker.MaxNLocator(self, nbins='auto', steps=[1, 2, 2.5, 5, 10])` The `steps` keyword contains a list of multiples that can be used for tick values. i.e. in this case, 2, 4, 6 would be acceptable ticks, as would 20, 40, 60 or 0.2, 0.4, 0.6. However, 3, 6, 9 would not be acceptable because 3 doesn’t appear in the list of steps.

`nbins=auto` uses an algorithm to determine how many ticks will be acceptable based on how long the axis is. The fontsize of the ticklabel is taken into account, but the length of the tick string is not (because its not yet known.) In the bottom row, the ticklabels are quite large, so we set `nbins=4` to make the labels fit in the right-hand plot.

```python
fig, axs = plt.subplots(2, 2, figsize=(8, 5), tight_layout=True)
for n, ax in enumerate(axs.flat):
    ax.plot(x1*10., y1)

formatter = matplotlib.ticker.FormatStrFormatter('%.1f')
locator = matplotlib.ticker.MaxNLocator(nbins='auto', steps=[1, 4, 10])
axs[0, 1].xaxis.set_major_locator(locator)
axs[0, 1].xaxis.set_major_formatter(formatter)

formatter = matplotlib.ticker.FormatStrFormatter('%.5f')
locator = matplotlib.ticker.AutoLocator()
axs[1, 0].xaxis.set_major_formatter(formatter)
axs[1, 0].xaxis.set_major_locator(locator)

formatter = matplotlib.ticker.FormatStrFormatter('%.5f')
locator = matplotlib.ticker.MaxNLocator(nbins=4)
axs[1, 1].xaxis.set_major_formatter(formatter)
axs[1, 1].xaxis.set_major_locator(locator)

plt.show()
```
Finally, we can specify functions for the formatter using `matplotlib.ticker.FuncFormatter`.

```python
def formatoddticks(x, pos):
    """Format odd tick positions
    ""
    if x % 2:
        return '%1.2f' % x
    else:
        return ''

fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
ax.plot(x1, y1)
formatter = matplotlib.ticker.FuncFormatter(formatoddticks)
locator = matplotlib.ticker.MaxNLocator(nbins=6)
ax.xaxis.set_major_formatter(formatter)
ax.xaxis.set_major_locator(locator)
plt.show()
```
Matplotlib can accept `datetime.datetime` and `numpy.datetime64` objects as plotting arguments. Dates and times require special formatting, which can often benefit from manual intervention. In order to help, dates have special Locators and Formatters, defined in the `matplotlib.dates` module.

A simple example is as follows. Note how we have to rotate the tick labels so that they don’t over-run each other.

```python
import datetime

fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
base = datetime.datetime(2017, 1, 1, 0, 0, 0)
time = [base + datetime.timedelta(days=x) for x in range(len(x1))]

ax.plot(time, y1)
ax.tick_params(axis='x', rotation=70)
plt.show()
```
We can pass a format to `matplotlib.dates.DateFormatter`. Also note that the 29th and the next month are very close together. We can fix this by using the `dates.DayLocator` class, which allows us to specify a list of days of the month to use. Similar formatters are listed in the `matplotlib.dates` module.

```python
import matplotlib.dates as mdates

locator = mdates.DayLocator(bymonthday=[1, 15])
formatter = mdates.DateFormatter('%b %d')

fig, ax = plt.subplots(figsize=(5, 3), tight_layout=True)
ax.xaxis.set_major_locator(locator)
ax.xaxis.set_major_formatter(formatter)
ax.plot(time, y1)
ax.tick_params(axis='x', rotation=70)
plt.show()
```
2.5.2 Text properties and layout

Controlling properties of text and its layout with Matplotlib.

The `matplotlib.text.Text` instances have a variety of properties which can be configured via keyword arguments to the text commands (e.g., `title()`, `xlabel()` and `text()`).

</table>

You can lay out text with the alignment arguments `horizontalalignment`, `verticalalignment`, and `multialignment`. `horizontalalignment` controls whether the x positional argument for the text indicates the left, center or right side of the text bounding box. `verticalalignment` controls
whether the y positional argument for the text indicates the bottom, center or top side of the text bounding box. multialignment, for newline separated strings only, controls whether the different lines are left, center or right justified. Here is an example which uses the text() command to show the various alignment possibilities. The use of transform=ax.transAxes throughout the code indicates that the coordinates are given relative to the axes bounding box, with 0,0 being the lower left of the axes and 1,1 the upper right.

```python
import matplotlib.pyplot as plt
import matplotlib.patches as patches

# build a rectangle in axes coords
left, width = .25, .5
bottom, height = .25, .5
right = left + width
top = bottom + height

fig = plt.figure()
ax = fig.add_axes([0, 0, 1, 1])

# axes coordinates are 0,0 is bottom left and 1,1 is upper right
p = patches.Rectangle((left, bottom), width, height,
    fill=False, transform=ax.transAxes, clip_on=False)

ax.add_patch(p)

ax.text(left, bottom, 'left top',
    horizontalalignment='left',
    verticalalignment='top',
    transform=ax.transAxes)

ax.text(left, bottom, 'left bottom',
    horizontalalignment='left',
    verticalalignment='bottom',
    transform=ax.transAxes)

ax.text(right, top, 'right bottom',
    horizontalalignment='right',
    verticalalignment='bottom',
    transform=ax.transAxes)

ax.text(right, top, 'right top',
    horizontalalignment='right',
    verticalalignment='top',
    transform=ax.transAxes)

ax.text(right, bottom, 'center top',
    horizontalalignment='center',
    verticalalignment='top',
    transform=ax.transAxes)

ax.text(left, 0.5*(bottom+top), 'right center',
    horizontalalignment='center',
    verticalalignment='center',
    transform=ax.transAxes)

(continues on next page)
horizontalalignment='right',
verticalalignment='center',
rotation='vertical',
transform=ax.transAxes)

ax.text(left, 0.5*(bottom+top), 'left center',
horizontalalignment='left',
verticalalignment='center',
rotation='vertical',
transform=ax.transAxes)

ax.text(0.5*(left+right), 0.5*(bottom+top), 'middle',
horizontalalignment='center',
verticalalignment='center',
fontsize=20, color='red',
transform=ax.transAxes)

ax.text(right, 0.5*(bottom+top), 'centered',
horizontalalignment='center',
verticalalignment='center',
rotation='vertical',
transform=ax.transAxes)

ax.text(left, top, 'rotated
with newlines',
horizontalalignment='center',
verticalalignment='center',
rotation=45,
transform=ax.transAxes)

ax.set_axis_off()
plt.show()
2.5.3 Default Font

The base default font is controlled by a set of rcParams. To set the font for mathematical expressions, use the rcParams beginning with `mathtext` (see `mathtext`).

<table>
<thead>
<tr>
<th>rcParam</th>
<th>usage</th>
</tr>
</thead>
<tbody>
<tr>
<td>'font.family'</td>
<td>List of either names of font or {'cursive', 'fantasy', 'monospace', 'sans', 'sans serif', 'sans-serif', 'serif'}.</td>
</tr>
<tr>
<td>'font.style'</td>
<td>The default style, ex 'normal', 'italic'.</td>
</tr>
<tr>
<td>'font.variant'</td>
<td>Default variant, ex 'normal', 'small-caps' (untested)</td>
</tr>
<tr>
<td>'font.stretch'</td>
<td>Default stretch, ex 'normal', 'condensed' (incomplete)</td>
</tr>
<tr>
<td>'font.weight'</td>
<td>Default weight. Either string or integer</td>
</tr>
<tr>
<td>'font.size'</td>
<td>Default font size in points. Relative font sizes ('large', 'x-small') are computed against this size.</td>
</tr>
</tbody>
</table>

The mapping between the family aliases ({'cursive', 'fantasy', 'monospace', 'sans', 'sans serif', 'sans-serif', 'serif'}) and actual font names is controlled by the following rcParams:
family alias | rcParam with mappings
---|---
'serif' | 'font.serif'
'monospace' | 'font.monospace'
'fantasy' | 'font.fantasy'
'cursive' | 'font.cursive'
{'sans', 'sans serif', 'sans-serif'} | 'font.sans-serif'

which are lists of font names.

**Text with non-latin glyphs**

As of v2.0 the default font contains glyphs for many western alphabets, but still does not cover all of the glyphs that may be required by mpl users. For example, DejaVu has no coverage of Chinese, Korean, or Japanese.

To set the default font to be one that supports the code points you need, prepend the font name to `font.family` or the desired alias lists

```
matplotlib.rcParams['font.sans-serif'] = ['Source Han Sans TW', 'sans-serif']
```

or set it in your `.matplotlibrc` file:

```
font.sans-serif: Source Han Sans TW, Arial, sans-serif
```

To control the font used on per-artist basis use the `name`, `fontname` or `fontproperties` kwargs documented above.

On linux, `fc-list` can be a useful tool to discover the font name; for example

```
$ fc-list :lang=zh family
Noto to Sans Mono CJK TC, Noto Sans Mono CJK TC Bold
Noto Sans CJK TC, Noto Sans CJK TC Medium
Noto Sans CJK TC, Noto Sans CJK TC DemiLight
Noto Sans CJK TC, Noto Sans CJK TC Black
Noto Sans Mono CJK TC, Noto Sans Mono CJK TC Regular
Noto Sans CJK SC, Noto Sans CJK SC Light
```

lists all of the fonts that support Chinese.

**Note:** Click [here](#) to download the full example code

### 2.5.4 Annotations

Annotating text with Matplotlib.

**Table of Contents**

- Annotations
2.5.5 Basic annotation

The uses of the basic `text()` will place text at an arbitrary position on the Axes. A common use case of `text()` is to annotate some feature of the plot, and the `annotate()` method provides helper functionality to make annotations easy. In an annotation, there are two points to consider: the location being annotated represented by the argument `xy` and the location of the text `xytext`. Both of these arguments are `(x, y)` tuples.

![Fig. 23: Annotation Basic](image)

In this example, both the `xy` (arrow tip) and `xytext` locations (text location) are in data coordinates. There are a variety of other coordinate systems one can choose – you can specify the coordinate system of `xy` and `xytext` with one of the following strings for `xycoords` and `textcoords` (default is ‘data’)
For example to place the text coordinates in fractional axes coordinates, one could do:

```python
ax.annotate('local max', xy=(3, 1), xycoords='data',
            xytex=(0.8, 0.95), textcoords='axes fraction',
            arrowprops=dict(facecolor='black', shrink=0.05),
            horizontalalignment='right', verticalalignment='top',
            )
```

For physical coordinate systems (points or pixels) the origin is the bottom-left of the figure or axes.

Optionally, you can enable drawing of an arrow from the text to the annotated point by giving a dictionary of arrow properties in the optional keyword argument `arrowprops`.

<table>
<thead>
<tr>
<th>key</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>the width of the arrow in points</td>
</tr>
<tr>
<td>frac</td>
<td>the fraction of the arrow length occupied by the head</td>
</tr>
<tr>
<td>headwidth</td>
<td>the width of the base of the arrow head in points</td>
</tr>
<tr>
<td>shrink</td>
<td>move the tip and base some percent away from the annotated point and text</td>
</tr>
<tr>
<td>**kwargs</td>
<td>any key for <code>matplotlib.patches.Polygon</code>, e.g., facecolor</td>
</tr>
</tbody>
</table>

In the example below, the `xy` point is in native coordinates (`xycoords` defaults to 'data'). For a polar axes, this is in (theta, radius) space. The text in this example is placed in the fractional figure coordinate system. `matplotlib.text.Text` keyword args like horizontalalignment, verticalalignment and fontsize are passed from `annotate` to the Text instance.

For more on all the wild and wonderful things you can do with annotations, including fancy arrows, see `Advanced Annotation` and /gallery/text_labels_and_annotations/annotation_demo.

Do not proceed unless you have already read `Basic annotation`, `text()` and `annotate()`!

### 2.5.6 Advanced Annotation

**Annotating with Text with Box**

Let’s start with a simple example.

The `text()` function in the pyplot module (or text method of the Axes class) takes bbox keyword argument, and when given, a box around the text is drawn.
Fig. 24: Annotation Polar

Fig. 25: Annotate Text Arrow
bbox_props = dict(boxstyle="rarrow,pad=0.3", fc="cyan", ec="b", lw=2)
t = ax.text(0, 0, "Direction", ha="center", va="center", rotation=45,
           size=15,
           bbox=bbox_props)

The patch object associated with the text can be accessed by:

```
bb = t.get_bbox_patch()
```

The return value is an instance of FancyBboxPatch and the patch properties like facecolor, edgewidth, etc. can be accessed and modified as usual. To change the shape of the box, use the `set_boxstyle` method.

```
bb.set_boxstyle("rarrow", pad=0.6)
```

The arguments are the name of the box style with its attributes as keyword arguments. Currently, following box styles are implemented.

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circle</td>
<td>circle</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>DArrow</td>
<td>darrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>LArrow</td>
<td>larrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>RArrow</td>
<td>rarrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>Round</td>
<td>round</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Round4</td>
<td>round4</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Roundtooth</td>
<td>roundtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Sawtooth</td>
<td>sawtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Square</td>
<td>square</td>
<td>pad=0.3</td>
</tr>
</tbody>
</table>

Note that the attribute arguments can be specified within the style name with separating comma (this form can be used as “boxstyle” value of bbox argument when initializing the text instance)

```
bb.set_boxstyle("rarrow,pad=0.6")
```

**Annotating with Arrow**

The `annotate()` function in the pyplot module (or annotate method of the Axes class) is used to draw an arrow connecting two points on the plot.

```
ax.annotate("Annotation",
            xy=(x1, y1), xycoords='data',
            xytext=(x2, y2), textcoords='offset points',
           )
```

This annotates a point at xy in the given coordinate (xycoords) with the text at xytext given in textcoords. Often, the annotated point is specified in the `data` coordinate and the annotating text in `offset points`. See `annotate()` for available coordinate systems.

An arrow connecting two points (xy & xytext) can be optionally drawn by specifying the `arrowprops` argument. To draw only an arrow, use empty string as the first argument.
ax.annotate("",
        xy=(0.2, 0.2), xycoords='data',
        xytext=(0.8, 0.8), textcoords='data',
        arrowprops=dict(arrowstyle="->",
                        connectionstyle="arc3"),
    )

The arrow drawing takes a few steps.

1. a connecting path between two points are created. This is controlled by connectionstyle key value.
2. If patch object is given (patchA & patchB), the path is clipped to avoid the patch.
3. The path is further shrunk by given amount of pixels (shrinkA & shrinkB)
4. The path is transmuted to arrow patch, which is controlled by the arrowstyle key value.
The creation of the connecting path between two points is controlled by `connectionstyle` key and the following styles are available.

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>angle</td>
<td>angleA=90,angleB=0,rad=0.0</td>
</tr>
<tr>
<td>angle3</td>
<td>angleA=90,angleB=0</td>
</tr>
<tr>
<td>arc</td>
<td>angleA=0,angleB=0,armA=None,armB=None,rad=0.0</td>
</tr>
<tr>
<td>arc3</td>
<td>rad=0.0</td>
</tr>
<tr>
<td>bar</td>
<td>armA=0.0,armB=0.0,fraction=0.3,angle=None</td>
</tr>
</tbody>
</table>

Note that “3” in `angle3` and `arc3` is meant to indicate that the resulting path is a quadratic spline segment (three control points). As will be discussed below, some arrow style options can only be used when the connecting path is a quadratic spline.

The behavior of each connection style is (limitedly) demonstrated in the example below. (Warning : The behavior of the `bar` style is currently not well defined, it may be changed in the future).

The connecting path (after clipping and shrinking) is then mutated to an arrow patch, accord-
ing to the given arrowstyle.

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>-</td>
<td>None</td>
</tr>
<tr>
<td>-&gt;</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>[-</td>
<td>widthB=1.0,lengthB=0.2,angleB=None</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>-</td>
<td>&gt;</td>
</tr>
<tr>
<td>&lt;=</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>&lt;-&gt;</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>&lt;</td>
<td>-</td>
</tr>
<tr>
<td>&lt;</td>
<td>-</td>
</tr>
<tr>
<td>fancy</td>
<td>head_length=0.4,head_width=0.4, tail_width=0.4</td>
</tr>
<tr>
<td>simple</td>
<td>head_length=0.5,head_width=0.5, tail_width=0.2</td>
</tr>
<tr>
<td>wedge</td>
<td>tail_width=0.3,shrink_factor=0.5</td>
</tr>
</tbody>
</table>

Fig. 30: Fancyarrow Demo

Some arrowstyles only work with connection styles that generate a quadratic-spline segment. They are fancy, simple, and wedge. For these arrow styles, you must use the “angle3” or “arc3” connection style.

If the annotation string is given, the patchA is set to the bbox patch of the text by default.

Fig. 31: Annotate Simple02

As in the text command, a box around the text can be drawn using the bbox argument.
By default, the starting point is set to the center of the text extent. This can be adjusted with `relpos` key value. The values are normalized to the extent of the text. For example, (0,0) means lower-left corner and (1,1) means top-right.

Placing Artist at the anchored location of the Axes

There are classes of artists that can be placed at an anchored location in the Axes. A common example is the legend. This type of artist can be created by using the `OffsetBox` class. A few predefined classes are available in `mpl_toolkits.axes_grid1.anchored_artists` others in `matplotlib.offsetbox`.

```python
from matplotlib.offsetbox import AnchoredText
at = AnchoredText("Figure 1a",
                   prop= dict(size=15), frameon=True,
                   loc='upper left',
                  )
at.patch.set_boxstyle("round,pad=0.,rounding_size=0.2")
ax.add_artist(at)
```

The `loc` keyword has same meaning as in the legend command.

A simple application is when the size of the artist (or collection of artists) is known in pixel size during the time of creation. For example, If you want to draw a circle with fixed size of 20 pixel x 20 pixel (radius = 10 pixel), you can utilize `AnchoredDrawingArea`. The instance is created with a size of the drawing area (in pixels), and arbitrary artists can added to the drawing area. Note that the extents of the artists that are added to the drawing area are not related to the placement of the drawing area itself. Only the initial size matters.
from mpl_toolkits.axes_grid1.anchored_artists import AnchoredDrawingArea

ada = AnchoredDrawingArea(20, 20, 0, 0, loc='upper right', pad=0., frameon=False)
p1 = Circle((10, 10), 10)
ada.drawing_area.add_artist(p1)
p2 = Circle((30, 10), 5, fc="r")
ada.drawing_area.add_artist(p2)

The artists that are added to the drawing area should not have a transform set (it will be overridden) and the dimensions of those artists are interpreted as a pixel coordinate, i.e., the radius of the circles in above example are 10 pixels and 5 pixels, respectively.

from mpl_toolkits.axes_grid1.anchored_artists import AnchoredAuxTransformBox

box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
el = Ellipse((0,0), width=0.1, height=0.4, angle=30)  # in data coordinates!
box.drawing_area.add_artist(el)

The ellipse in the above example will have width and height corresponding to 0.1 and 0.4 in data coordinates and will be automatically scaled when the view limits of the axes change.

As in the legend, the bbox_to_anchor argument can be set. Using the HPacker and VPacker, you can have an arrangement(?) of artist as in the legend (as a matter of fact, this is how the legend is created).
Note that unlike the legend, the `bbox_transform` is set to `IdentityTransform` by default.

**Using Complex Coordinates with Annotations**

The Annotation in matplotlib supports several types of coordinates as described in *Basic annotation*. For an advanced user who wants more control, it supports a few other options.

1. **Transform** instance. For example,

   ```python
   ax.annotate("Test", xy=(0.5, 0.5), xycoords=ax.transAxes)
   ```

   is identical to

   ```python
   ax.annotate("Test", xy=(0.5, 0.5), xycoords="axes fraction")
   ```

   With this, you can annotate a point in other axes.

   ```python
   ax1, ax2 = subplot(121), subplot(122)
   ax2.annotate("Test", xy=(0.5, 0.5), xycoords=ax1.transData,
                   xytext=(0.5, 0.5), textcoords=ax2.transData,
                   arrowprops=dict(arrowstyle="->"))
   ```

2. **Artist** instance. The `xy` value (or `xytext`) is interpreted as a fractional coordinate of the `bbox` (return value of `get_window_extent`) of the artist.

   ```python
   an1 = ax.annotate("Test 1", xy=(0.5, 0.5), xycoords="data",
                    va="center", ha="center",
                    bbox=dict(boxstyle="round", fc="w"))
   an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1,
                    # (1,0.5) of the an1's bbox
                    # (continues on next page)
   ```
xytext=(30,0), textcoords="offset points",
va="center", ha="left",
bbox=dict(boxstyle="round", fc="w"),
arrowprops=dict(arrowstyle="->")

![Figure 38: Annotation with Simple Coordinates](image)

Note that it is your responsibility that the extent of the coordinate artist (an1 in above example) is determined before an2 gets drawn. In most cases, it means that an2 needs to be drawn later than an1.

3. A callable object that returns an instance of either BboxBase or Transform. If a transform is returned, it is the same as 1 and if a bbox is returned, it is the same as 2. The callable object should take a single argument of the renderer instance. For example, the following two commands give identical results

```python
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1,
                   xytext=(30,0), textcoords="offset points")
an2 = ax.annotate("Test 2", xy=(1, 0.5), xycoords=an1.get_window_extent,
                   xytext=(30,0), textcoords="offset points")
```

4. A tuple of two coordinate specifications. The first item is for the x-coordinate and the second is for the y-coordinate. For example,

```python
annotate("Test", xy=(0.5, 1), xycoords=("data", "axes fraction"))
```

0.5 is in data coordinates, and 1 is in normalized axes coordinates. You may use an artist or transform as with a tuple. For example,

![Figure 39: Annotation with Simple Coordinates 2](image)

5. Sometimes, you want your annotation with some "offset points", not from the annotated point but from some other point. OffsetFrom is a helper class for such cases.

You may take a look at this example /gallery/text_labels_and_annotations/annotation_demo.
Using ConnectionPatch

The ConnectionPatch is like an annotation without text. While the annotate function is recommended in most situations, the ConnectionPatch is useful when you want to connect points in different axes.

```python
from matplotlib.patches import ConnectionPatch
xy = (0.2, 0.2)
con = ConnectionPatch(xyA=xy, xyB=xy, coordsA="data", coordsB="data",
                      axesA=ax1, axesB=ax2)
ax2.add_artist(con)
```

The above code connects point xy in the data coordinates of ax1 to point xy in the data coordinates of ax2. Here is a simple example.

```
```

While the ConnectionPatch instance can be added to any axes, you may want to add it to the axes that is latest in drawing order to prevent overlap by other axes.

Advanced Topics

Zoom effect between Axes

mpl_toolkits.axes_grid1.inset_locator defines some patch classes useful for interconnecting two axes. Understanding the code requires some knowledge of how mpl’s transform works. But, utilizing it will be straightforward.

Define Custom BoxStyle

You can use a custom box style. The value for the boxstyle can be a callable object in the following forms.:
def __call__(self, x0, y0, width, height, mutation_size, aspect_ratio=1.):
    
    Given the location and size of the box, return the path of the box around it.

    - *x0*, *y0*, *width*, *height*: location and size of the box
    - *mutation_size*: a reference scale for the mutation.
    - *aspect_ratio*: aspect-ratio for the mutation.

    path = ...
    return path

Here is a complete example.

However, it is recommended that you derive from the matplotlib.patches.BoxStyle._Base as demonstrated below.

Similarly, you can define a custom ConnectionStyle and a custom ArrowStyle. See the source code of lib/matplotlib/patches.py and check how each style class is defined.

Note: Click here to download the full example code
2.5.7 Writing mathematical expressions

An introduction to writing mathematical expressions in Matplotlib.

You can use a subset TeX markup in any matplotlib text string by placing it inside a pair of dollar signs ($).

Note that you do not need to have TeX installed, since Matplotlib ships its own TeX expression parser, layout engine, and fonts. The layout engine is a fairly direct adaptation of the layout algorithms in Donald Knuth’s TeX, so the quality is quite good (matplotlib also provides a \texttt{usetex} option for those who do want to call out to TeX to generate their text (see \texttt{Text rendering With \LaTeX}).

Any text element can use math text. You should use raw strings (precede the quotes with an ‘\texttt{r}’), and surround the math text with dollar signs ($), as in TeX. Regular text and mathtext can be interleaved within the same string. Mathtext can use DejaVu Sans (default), DejaVu Serif, the Computer Modern fonts (from (La)TeX), \texttt{STIX} fonts (with are designed to blend well with Times), or a Unicode font that you provide. The mathtext font can be selected with the customization variable \texttt{mathtext.fontset} (see \texttt{Customizing Matplotlib with style sheets and \texttt{rcParams}}).

Here is a simple example:

```python
# plain text
plt.title('alpha > beta')
```

produces “alpha > beta”.

Whereas this:

```python
# math text
plt.title(r'$\alpha > \beta$')
```

produces “$\alpha > \beta$”.

\textbf{Note: } Mathtext should be placed between a pair of dollar signs ($). To make it easy to display monetary values, e.g., “$100.00”, if a single dollar sign is present in the entire string, it will be displayed verbatim as a dollar sign. This is a small change from regular TeX, where the dollar sign in non-math text would have to be escaped (’\$’).

\textbf{Note: } While the syntax inside the pair of dollar signs ($) aims to be TeX-like, the text outside does not. In particular, characters such as:
have special meaning outside of math mode in TeX. Therefore, these characters will behave differently depending on the `rcParam text.usetex` flag. See the `usetex tutorial` for more information.

**Subscripts and superscripts**

To make subscripts and superscripts, use the ‘\_’ and ‘\^’ symbols:

```latex
\alpha_i > \beta_i
```

Some symbols automatically put their sub/superscripts under and over the operator. For example, to write the sum of $x_i$ from 0 to $\infty$, you could do:

```latex
\sum_{i=0}^{\infty} x_i
```

**Fractions, binomials, and stacked numbers**

Fractions, binomials, and stacked numbers can be created with the `\frac{\{\}}{\{\}}`, `\binom{\{\}}{\{\}}` and `\genfrac{\{\}}{\{\}}{\{\}}{\{\}}` commands, respectively:

```latex
\frac{3}{4} \binom{3}{4} \genfrac{\{\}}{\{\}}{0}{3}{4}{4}
```

produces

\[
\frac{\binom{3}{4}}{4} 034
\]

Fractions can be arbitrarily nested:

```latex
\frac{5 - \frac{1}{x}}{4}
```

produces

\[
\frac{5 - \frac{1}{x}}{4}
\]

Note that special care needs to be taken to place parentheses and brackets around fractions. Doing things the obvious way produces brackets that are too small:

```latex\frac{\{\frac{5}{4}\}}{4}
```

The solution is to precede the bracket with `\left` and `\right` to inform the parser that those brackets encompass the entire object.
Radicals

Radicals can be produced with the \sqrt{} command. For example:

$$\sqrt{2}$$

Any base can (optionally) be provided inside square brackets. Note that the base must be a simple expression, and can not contain layout commands such as fractions or sub/superscripts:

$$\sqrt[3]{x}$$

Fonts

The default font is *italics* for mathematical symbols.

**Note:** This default can be changed using the mathtext.default rcParam. This is useful, for example, to use the same font as regular non-math text for math text, by setting it to *regular*.

To change fonts, e.g., to write “sin” in a Roman font, enclose the text in a font command:

$$s(t) = \mathcal{A}\text{sin}(2 \omega t)$$

More conveniently, many commonly used function names that are typeset in a Roman font have shortcuts. So the expression above could be written as follows:

$$s(t) = \mathcal{A}\sin(2\omega t)$$

Here “s” and “t” are variable in italics font (default), “sin” is in Roman font, and the amplitude “A” is in calligraphy font. Note in the example above the calligraphy A is squished into the sin. You can use a spacing command to add a little whitespace between them:

$$s(t) = \mathcal{A}/\sin(2\omega t)$$

The choices available with all fonts are:
Matplotlib, Release 3.1.3

<table>
<thead>
<tr>
<th>Command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textsc{Roman}</td>
<td>Roman</td>
</tr>
<tr>
<td>\textit{Italic}</td>
<td>Italic</td>
</tr>
<tr>
<td>\texttt{Typewriter}</td>
<td>Typewriter</td>
</tr>
<tr>
<td>\textcal{CALLIGRAPHY}</td>
<td>CALLIGRAPHY</td>
</tr>
</tbody>
</table>

When using the **STIX** fonts, you also have the choice of:

<table>
<thead>
<tr>

</tr>
<tr>
<td>\textsf{sansserif}</td>
<td>sansserif</td>
</tr>
<tr>
<td>\textrm{\textsf{sansserif}}</td>
<td>sansserif</td>
</tr>
</tbody>
</table>

There are also three global “font sets” to choose from, which are selected using the `mathtext.fontset` parameter in `matplotlibrc`.

**cm:** **Computer Modern** (TeX)

\[
\mathcal{R} \prod_{i=\alpha_{i+1}}^{\infty} a_i \sin(2\pi f x_i)
\]

**stix:** **STIX** (designed to blend well with Times)

\[
\mathcal{R} \prod_{i=\alpha_{i+1}}^{\infty} a_i \sin(2\pi f x_i)
\]

**stixsans:** **STIX sans-serif**

\[
\mathcal{R} \prod_{i=\alpha_{i+1}}^{\infty} a_i \sin(2\pi f x_i)
\]

Additionally, you can use \texttt{\textdefault{...}} or its alias \texttt{\textregular{...}} to use the font used for regular text outside of mathtext. There are a number of limitations to this approach, most notably that far fewer symbols will be available, but it can be useful to make math expressions blend well with other text in the plot.

**Custom fonts**

mathtext also provides a way to use custom fonts for math. This method is fairly tricky to use, and should be considered an experimental feature for patient users only. By setting the `rcParam` `mathtext.fontset` to `custom`, you can then set the following parameters, which control which font file to use for a particular set of math characters.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Corresponds to</th>
</tr>
</thead>
<tbody>
<tr>
<td>mathtext.it</td>
<td>\textit{} or default italic</td>
</tr>
<tr>
<td>mathtext.rm</td>
<td>\texttt{} Roman (upright)</td>
</tr>
<tr>
<td>mathtext.tt</td>
<td>\texttt{} Typewriter (monospace)</td>
</tr>
<tr>
<td>mathtext.bf</td>
<td>\textbf{} bold italic</td>
</tr>
<tr>
<td>mathtext.cal</td>
<td>\textcal{} calligraphic</td>
</tr>
<tr>
<td>mathtext.sf</td>
<td>\textsf{} sans-serif</td>
</tr>
</tbody>
</table>

Each parameter should be set to a fontconfig font descriptor (as defined in the yet-to-be-written font chapter).

The fonts used should have a Unicode mapping in order to find any non-Latin characters, such as Greek. If you want to use a math symbol that is not contained in your custom fonts, you can set the rcParam `mathtext.fallback_to_cm` to `True` which will cause the mathtext system to use characters from the default Computer Modern fonts whenever a particular character cannot be found in the custom font.

Note that the math glyphs specified in Unicode have evolved over time, and many fonts may not have glyphs in the correct place for mathtext.

**Accents**

An accent command may precede any symbol to add an accent above it. There are long and short forms for some of them.

<table>
<thead>
<tr>
<th>Command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textacute{a} or \acute{a}</td>
<td>\textacute{a} or \acute{a}</td>
</tr>
<tr>
<td>\textbar{a}</td>
<td>\textbar{a}</td>
</tr>
<tr>
<td>\textbreve{a}</td>
<td>\textbreve{a}</td>
</tr>
<tr>
<td>\textddot{a} or \dddot{a}</td>
<td>\textddot{a} or \dddot{a}</td>
</tr>
<tr>
<td>\textdot{a} or \dot{a}</td>
<td>\textdot{a} or \dot{a}</td>
</tr>
<tr>
<td>\textgrave{a} or \grave{a}</td>
<td>\textgrave{a} or \grave{a}</td>
</tr>
<tr>
<td>\texthat{a} or \hat{a}</td>
<td>\texthat{a} or \hat{a}</td>
</tr>
<tr>
<td>\texttilde{a} or \tilde{a}</td>
<td>\texttilde{a} or \tilde{a}</td>
</tr>
<tr>
<td>\textvec{a}</td>
<td>\textvec{a}</td>
</tr>
<tr>
<td>\textoverline{abc}</td>
<td>\textoverline{abc}</td>
</tr>
</tbody>
</table>

In addition, there are two special accents that automatically adjust to the width of the symbols below:

<table>
<thead>
<tr>
<th>Command</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>\textwidehat{xyz}</td>
<td>\textwidehat{xyz}</td>
</tr>
<tr>
<td>\textwidetilde{xyz}</td>
<td>\textwidetilde{xyz}</td>
</tr>
</tbody>
</table>

Care should be taken when putting accents on lower-case i’s and j’s. Note that in the following \textit{imath} is used to avoid the extra dot over the i:

```latex
r"\hat i \ \ \hat \textit{i}\\ \hat \textit{i}"
```
Symbols

You can also use a large number of the TeX symbols, as in \infty, \leftarrow, \sum, \int.

Lower-case Greek

</tr>
</tbody>
</table>

If a particular symbol does not have a name (as is true of many of the more obscure symbols in the STIX fonts), Unicode characters can also be used:

`\ur'$\u23ce$'`

Example

Here is an example illustrating many of these features in context.

![Graph](image)

\[ \alpha_i > \beta_i \]

\[ A \sin(2\omega t) \]

\[ \sum_{i=0}^{\infty} x_i \]

Fig. 45: Pyplot Mathtext

### 2.5.8 Typesetting With XeLaTeX/LuaLaTeX

How to typeset text with the `pgf` backend in Matplotlib.
Using the pgf backend, matplotlib can export figures as pgf drawing commands that can be processed with pdflatex, xelatex or lualatex. XeLaTeX and LuaLaTeX have full unicode support and can use any font that is installed in the operating system, making use of advanced typographic features of OpenType, AAT and Graphite. Pgf pictures created by plt.savefig('figure.pgf') can be embedded as raw commands in LaTeX documents. Figures can also be directly compiled and saved to PDF with plt.savefig('figure.pdf') by either switching to the backend

```python
matplotlib.use('pgf')
```
or registering it for handling pdf output

```python
from matplotlib.backends.backend_pgf import FigureCanvasPgf
matplotlib.backend_bases.register_backend('pdf', FigureCanvasPgf)
```

The second method allows you to keep using regular interactive backends and to save xelatex, lualatex or pdflatex compiled PDF files from the graphical user interface.

Matplotlib’s pgf support requires a recent LaTeX installation that includes the TikZ/PGF packages (such as TeXLive), preferably with XeLaTeX or LuaLaTeX installed. If either pdftocairo or ghostscript is present on your system, figures can optionally be saved to PNG images as well. The executables for all applications must be located on your PATH.

Rc parameters that control the behavior of the pgf backend:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Documentation</th>
</tr>
</thead>
<tbody>
<tr>
<td>pgf.preamble</td>
<td>Lines to be included in the LaTeX preamble</td>
</tr>
<tr>
<td>pgf.rcfonts</td>
<td>Setup fonts from rc params using the fontspec package</td>
</tr>
<tr>
<td>pgf.texsystem</td>
<td>Either &quot;xelatex&quot; (default), &quot;lualatex&quot; or &quot;pdflatex&quot;</td>
</tr>
</tbody>
</table>

**Note:** TeX defines a set of special characters, such as:

```latex
\# \$ \% \& \~ \_ ^ \{ \}
```

Generally, these characters must be escaped correctly. For convenience, some characters (_^-^) are automatically escaped outside of math environments.

**Multi-Page PDF Files**

The pgf backend also supports multipage pdf files using PdfPages

```python
from matplotlib.backends.backend_pgf import PdfPages
import matplotlib.pyplot as plt

with PdfPages('multipage.pdf', metadata={'author': 'Me'}) as pdf:

    fig1, ax1 = plt.subplots()
    ax1.plot([1, 5, 3])
    pdf.savefig(fig1)

    fig2, ax2 = plt.subplots()
```

(continues on next page)
Font specification

The fonts used for obtaining the size of text elements or when compiling figures to PDF are usually defined in the matplotlib rc parameters. You can also use the LaTeX default Computer Modern fonts by clearing the lists for font.serif, font.sans-serif or font.monospace. Please note that the glyph coverage of these fonts is very limited. If you want to keep the Computer Modern font face but require extended unicode support, consider installing the Computer Modern Unicode fonts CMU Serif, CMU Sans Serif, etc.

When saving to .pgf, the font configuration matplotlib used for the layout of the figure is included in the header of the text file.

Custom preamble

Full customization is possible by adding your own commands to the preamble. Use the pgf.preamble parameter if you want to configure the math fonts, using unicode-math for example, or for loading additional packages. Also, if you want to do the font configuration yourself instead of using the fonts specified in the rc parameters, make sure to disable pgf.rcfonts.
Choosing the TeX system

The TeX system to be used by matplotlib is chosen by the `pgf.texsystem` parameter. Possible values are 'xelatex' (default), 'lualatex' and 'pdflatex'. Please note that when selecting pdflatex the fonts and unicode handling must be configured in the preamble.

```python
import matplotlib.pyplot as plt
plt.rcParams.update({
    "pgf.texsystem": "pdflatex",
    "pgf.preamble": [r"\usepackage[utf8x]{inputenc}",
                     r"\usepackage[T1]{fontenc}",
                     r"\usepackage{cmbright}"],
})
plt.figure(figsize=(4.5, 2.5))
plt.plot(range(5))
plt.text(0.5, 3., "serif", family="serif")
plt.text(0.5, 2., "monospace", family="monospace")
plt.text(2.5, 2., "sans-serif", family="sans-serif")
plt.xlabel(r"µ is not $\mu$")
plt.tight_layout(.5)
```

Troubleshooting

- Please note that the TeX packages found in some Linux distributions and MiKTeX installations are dramatically outdated. Make sure to update your package catalog and upgrade or install a recent TeX distribution.

- On Windows, the `PATH` environment variable may need to be modified to include the directories containing the latex, dvipng and ghostscript executables. See Environment Variables and Setting environment variables in windows for details.

- A limitation on Windows causes the backend to keep file handles that have been opened by your application open. As a result, it may not be possible to delete the corresponding files until the application closes (see #1324).
• Sometimes the font rendering in figures that are saved to png images is very bad. This happens when the pdftocairo tool is not available and ghostscript is used for the pdf to png conversion.

• Make sure what you are trying to do is possible in a LaTeX document, that your LaTeX syntax is valid and that you are using raw strings if necessary to avoid unintended escape sequences.

• The `pgf.preamble` rc setting provides lots of flexibility, and lots of ways to cause problems. When experiencing problems, try to minimalize or disable the custom preamble.

• Configuring an `unicode-math` environment can be a bit tricky. The TeXLive distribution for example provides a set of math fonts which are usually not installed system-wide. XeTeX, unlike LuaLatex, cannot find these fonts by their name, which is why you might have to specify \setmathfont{XITS Math} or alternatively make the fonts available to your OS. See this tex.stackexchange.com question for more details.

• If the font configuration used by matplotlib differs from the font setting in your LaTeX document, the alignment of text elements in imported figures may be off. Check the header of your .pgf file if you are unsure about the fonts matplotlib used for the layout.

• Vector images and hence .pgf files can become bloated if there are a lot of objects in the graph. This can be the case for image processing or very big scatter graphs. In an extreme case this can cause TeX to run out of memory: “TeX capacity exceeded, sorry” You can configure latex to increase the amount of memory available to generate the .pdf image as discussed on tex.stackexchange.com. Another way would be to “rasterize” parts of the graph causing problems using either the `rasterized=True` keyword, or `.set_rasterized(True)` as per this example.

• If you still need help, please see Getting help

---

**Note:** Click [here](#) to download the full example code

### 2.5.9 Text rendering With LaTeX

Rendering text with LaTeX in Matplotlib.

Matplotlib has the option to use LaTeX to manage all text layout. This option is available with the following backends:

- Agg
- PS
- PDF

The LaTeX option is activated by setting `text.usetex : True` in your rc settings. Text handling with matplotlib’s LaTeX support is slower than matplotlib’s very capable `mathtext`, but is more flexible, since different LaTeX packages (font packages, math packages, etc.) can be used. The results can be striking, especially when you take care to use the same fonts in your figures as in the main document.

Matplotlib’s LaTeX support requires a working LaTeX installation, `dvipng` (which may be included with your LaTeX installation), and Ghostscript (GPL Ghostscript 9.0 or later is required). The executables for these external dependencies must all be located on your `PATH`. 
There are a couple of options to mention, which can be changed using *rc settings*. Here is an example *matplotlibrc* file:

```python
font.family : serif
font.serif : Times, Palatino, New Century Schoolbook, Bookman, Computer Modern
...Roman
font.sans-serif : Helvetica, Avant Garde, Computer Modern Sans serif
font.cursive : Zapf Chancery
font.monospace : Courier, Computer Modern Typewriter
text.usetex : true
```

The first valid font in each family is the one that will be loaded. If the fonts are not specified, the Computer Modern fonts are used by default. All of the other fonts are Adobe fonts. Times and Palatino each have their own accompanying math fonts, while the other Adobe serif fonts make use of the Computer Modern math fonts. See the *PSNFSS* documentation for more details.

To use LaTeX and select Helvetica as the default font, without editing matplotlibrc use:

```python
from matplotlib import rc
cr('font',**{'family':'sans-serif','sans-serif':['Helvetica']})
```

Here is the standard example, *tex_demo.py*:

```python
from matplotlib import rc
rc('font',**{'family':'sans-serif','sans-serif':['Helvetica']})
## for Palatino and other serif fonts use:
#rc('font',**{'family':'serif','serif':['Palatino']})
rc('text', usetex=True)
```

Note that display math mode (\( e=mc^2 \)) is not supported, but adding the command \displaystyle, as in *tex_demo.py*, will produce the same results.

**Note:** Certain characters require special escaping in TeX, such as:

```latex
# $ % & ~ _ \{ \} \( \) \[ \] \$
```

Therefore, these characters will behave differently depending on the rcParam *text.usetex* flag.
usetex with unicode

It is also possible to use unicode strings with the LaTeX text manager, here is an example taken from `tex_demo.py`. The axis labels include Unicode text:

![Graph](image)

Fig. 47: TeX Unicode Demo

Postscript options

In order to produce encapsulated postscript files that can be embedded in a new LaTeX document, the default behavior of matplotlib is to distill the output, which removes some postscript operators used by LaTeX that are illegal in an eps file. This step produces results which may be unacceptable to some users, because the text is coarsely rasterized and converted to bitmaps, which are not scalable like standard postscript, and the text is not searchable. One workaround is to set `ps.distiller.res` to a higher value (perhaps 6000) in your rc settings, which will produce larger files but may look better and scale reasonably. A better workaround, which requires Poppler or Xpdf, can be activated by changing the `ps.usedistiller` rc setting to `xpdf`. This alternative produces postscript without rasterizing text, so it scales properly, can be edited in Adobe Illustrator, and searched text in pdf documents.

Possible hangups

- On Windows, the `PATH` environment variable may need to be modified to include the directories containing the latex, dvipng and ghostscript executables. See Environment Variables and Setting environment variables in windows for details.
- Using MiKTeX with Computer Modern fonts, if you get odd *Agg and PNG results, go to MiKTeX/Options and update your format files
- On Ubuntu and Gentoo, the base texlive install does not ship with the type1cm package. You may need to install some of the extra packages to get all the goodies that come bundled with other latex distributions.
- Some progress has been made so matplotlib uses the dvi files directly for text layout. This allows latex to be used for text layout with the pdf and svg backends, as well as the *Agg and PS backends. In the future, a latex installation may be the only external dependency.
Troubleshooting

- Try deleting your `.matplotlib/tex.cache` directory. If you don’t know where to find `matplotlib`, see `matplotlib configuration and cache directory locations`.
- Make sure LaTeX, dvi2png and ghostscript are each working and on your `PATH`.
- Make sure what you are trying to do is possible in a LaTeX document, that your LaTeX syntax is valid and that you are using raw strings if necessary to avoid unintended escape sequences.
- Most problems reported on the mailing list have been cleared up by upgrading Ghostscript. If possible, please try upgrading to the latest release before reporting problems to the list.
- The `text.latex.preamble` rc setting is not officially supported. This option provides lots of flexibility, and lots of ways to cause problems. Please disable this option before reporting problems to the mailing list.
- If you still need help, please see `Getting help`.

2.6 Toolkits

These tutorials cover toolkits designed to extend the functionality of Matplotlib in order to accomplish specific goals.

**Note:** Click [here](#) to download the full example code.

2.6.1 Overview of axes_grid1 toolkit

Controlling the layout of plots with the axes_grid toolkit.

**What is axes_grid1 toolkit?**

`axes_grid1` is a collection of helper classes to ease displaying (multiple) images with matplotlib. In matplotlib, the axes location (and size) is specified in the normalized figure coordinates, which may not be ideal for displaying images that needs to have a given aspect ratio. For example, it helps if you have a colorbar whose height always matches that of the image. `ImageGrid`, `RGB Axes` and `AxesDivider` are helper classes that deals with adjusting the location of (multiple) Axes. They provides a framework to adjust the position of multiple axes at the drawing time. `ParasiteAxes` provides twinx(or twiny)-like features so that you can plot different data (e.g., different y-scale) in a same Axes. `AnchoredArtists` includes custom artists which are placed at some anchored position, like the legend.

`axes_grid1`
ImageGrid

A class that creates a grid of Axes. In matplotlib, the axes location (and size) is specified in the normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio. For example, displaying images of a same size with some fixed padding between them cannot be easily done in matplotlib. ImageGrid is used in such case.

- The position of each axes is determined at the drawing time (see AxesDivider), so that the size of the entire grid fits in the given rectangle (like the aspect of axes). Note that in this example, the paddings between axes are fixed even if you changes the figure size.
- axes in the same column has a same axes width (in figure coordinate), and similarly, axes in the same row has a same height. The widths (height) of the axes in the same row (column) are scaled according to their view limits (xlim or ylim).

Fig. 48: Demo Axes Grid

Fig. 49: Simple Axesgrid

Fig. 50: Simple Axes Grid
• xaxis are shared among axes in a same column. Similarly, yaxis are shared among axes in a same row. Therefore, changing axis properties (view limits, tick location, etc. either by plot commands or using your mouse in interactive backends) of one axes will affect all other shared axes.

When initialized, ImageGrid creates given number (ngrids or ncols * nrows if ngrids is None) of Axes instances. A sequence-like interface is provided to access the individual Axes instances (e.g., grid[0] is the first Axes in the grid. See below for the order of axes).

ImageGrid takes following arguments,

<table>
<thead>
<tr>
<th>Name</th>
<th>Default</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>fig</td>
<td></td>
<td></td>
</tr>
<tr>
<td>rect</td>
<td></td>
<td></td>
</tr>
<tr>
<td>nrows_ncols</td>
<td></td>
<td>number of rows and cols. e.g., (2,2)</td>
</tr>
<tr>
<td>ngrids</td>
<td>None</td>
<td>number of grids. nrows x ncols if None</td>
</tr>
<tr>
<td>direction</td>
<td>“row”</td>
<td>increasing direction of axes number. [row</td>
</tr>
<tr>
<td>axes_pad</td>
<td>0.02</td>
<td>pad between axes in inches</td>
</tr>
<tr>
<td>add_all</td>
<td>True</td>
<td>Add axes to figures if True</td>
</tr>
<tr>
<td>share_all</td>
<td>False</td>
<td>xaxis &amp; yaxis of all axes are shared if True</td>
</tr>
<tr>
<td>aspect</td>
<td>True</td>
<td>aspect of axes</td>
</tr>
<tr>
<td>label_mode</td>
<td>“L”</td>
<td>location of tick labels thaw will be displayed. “L” (only the lower left axes), “L” (left most and bottom most axes), or ”all”.</td>
</tr>
<tr>
<td>cbar_mode</td>
<td>None</td>
<td>[None</td>
</tr>
<tr>
<td>cbar_location</td>
<td>right</td>
<td>[right</td>
</tr>
<tr>
<td>cbar_pad</td>
<td>None</td>
<td>pad between image axes and colorbar axes</td>
</tr>
<tr>
<td>cbar_size</td>
<td>“5%”</td>
<td>size of the colorbar</td>
</tr>
<tr>
<td>axes_class</td>
<td>None</td>
<td></td>
</tr>
</tbody>
</table>

rect specifies the location of the grid. You can either specify coordinates of the rectangle to be used (e.g., (0.1, 0.1, 0.8, 0.8) as in the Axes), or the subplot-like position (e.g., “121”).

direction means the increasing direction of the axes number.

aspect By default (False), widths and heights of axes in the grid are scaled independently. If True, they are scaled according to their data limits (similar to aspect parameter in mpl).

share_all if True, xaxis and yaxis of all axes are shared.

direction direction of increasing axes number. For “row”,

```
grid[0] grid[1]
```

For “column”,

```
grid[0] grid[2]
```

You can also create a colorbar (or colorbars). You can have colorbar for each axes (cbar_mode=“each”), or you can have a single colorbar for the grid (cbar_mode=“single”).
The colorbar can be placed on your right, or top. The axes for each colorbar is stored as a cbar_axes attribute.

The examples below show what you can do with ImageGrid.

![Demo Axes Grid](image1)

**Fig. 51: Demo Axes Grid**

**AxesDivider Class**

Behind the scene, the ImageGrid class and the RGBAxes class utilize the AxesDivider class, whose role is to calculate the location of the axes at drawing time. While a more about the AxesDivider is (will be) explained in (yet to be written) AxesDividerGuide, direct use of the AxesDivider class will not be necessary for most users. The axes_divider module provides a helper function make_axes_locatable, which can be useful. It takes a existing axes instance and create a divider for it.

```python
ax = subplot(1,1,1)
divider = make_axes_locatable(ax)
```

*make_axes_locatable* returns an instance of the AxesLocator class, derived from the Locator. It provides *append_axes* method that creates a new axes on the given side of (“top”, “right”, “bottom” and “left”) of the original axes.

**colorbar whose height (or width) in sync with the master axes**

![Simple Colorbar](image2)

**Fig. 52: Simple Colorbar**
scatter_hist.py with AxesDivider

The "scatter_hist.py" example in mpl can be rewritten using make_axes_locatable.

```python
import matplotlib.pyplot as plt
import numpy as np

# the scatter plot:
av, axScatter = subplot(111)
axScatter.scatter(x, y)
axScatter.set_aspect(1.)

# create new axes on the right and on the top of the current axes.
divider = make_axes_locatable(axScatter)
axHistx = divider.append_axes("top", size=1.2, pad=0.1, sharex=axScatter)
axHisty = divider.append_axes("right", size=1.2, pad=0.1, sharey=axScatter)

# histograms
bins = np.arange(-lim, lim + binwidth, binwidth)
axHistx.hist(x, bins=bins)
axHisty.hist(y, bins=bins, orientation='horizontal')
```

See the full source code below.

![Scatter Hist](image)

Fig. 53: Scatter Hist

The scatter_hist using the AxesDivider has some advantage over the original scatter_hist.py in mpl. For example, you can set the aspect ratio of the scatter plot, even with the x-axis or y-axis is shared accordingly.

**ParasiteAxes**

The ParasiteAxes is an axes whose location is identical to its host axes. The location is adjusted in the drawing time, thus it works even if the host change its location (e.g., images).

In most cases, you first create a host axes, which provides a few method that can be used to create parasite axes. They are `twinx`, `twiny` (which are similar to twinx and twiny in the matplotlib) and `twin`. `twin` takes an arbitrary transformation that maps between the data coordinates of the host axes and the parasite axes. `draw` method of the parasite axes are
never called. Instead, host axes collects artists in parasite axes and draw them as if they
belong to the host axes, i.e., artists in parasite axes are merged to those of the host axes and
then drawn according to their zorder. The host and parasite axes modifies some of the axes
behavior. For example, color cycle for plot lines are shared between host and parasites. Also,
the legend command in host, creates a legend that includes lines in the parasite axes. To
create a host axes, you may use `host_subplot` or `host_axes` command.

Example 1. `twinx`

```
Fig. 54: Parasite Simple
```

Example 2. `twin`

twin without a transform argument assumes that the parasite axes has the same data trans-
form as the host. This can be useful when you want the top(or right)-axis to have different
tick-locations, tick-labels, or tick-formatter for bottom(or left)-axis.

```
ax2 = ax.twin() # now, ax2 is responsible for "top" axis and "right" axis
ax2.set_xticks([0., .5*np.pi, np.pi, 1.5*np.pi, 2*np.pi])
ax2.set_xticklabels(['0', r'$\frac{1}{2}\pi$', r'$\pi$', r'$\frac{3}{2}\pi$', r'$2\pi$'])
```

A more sophisticated example using twin. Note that if you change the x-limit in the host axes,
the x-limit of the parasite axes will change accordingly.

AnchoredArtists

It’s a collection of artists whose location is anchored to the (axes) bbox, like the legend. It
is derived from `OffsetBox` in mpl, and artist need to be drawn in the canvas coordinate. But,
there is a limited support for an arbitrary transform. For example, the ellipse in the example
below will have width and height in the data coordinate.
Fig. 55: Simple Axisline4

Fig. 56: Parasite Simple2

Fig. 57: Simple Anchored Artists
InsetLocate

`mpl_toolkits.axes_grid1.inset_locator` provides helper classes and functions to place your (inset) axes at the anchored position of the parent axes, similarly to AnchoredArtist.

Using `mpl_toolkits.axes_grid1.inset_locator.inset_axes()`, you can have inset axes whose size is either fixed, or a fixed proportion of the parent axes. For example:

```python
inset_axes = inset_axes(parent_axes,
    width="30\%", # width = 30% of parent_bbox
    height=1., # height : 1 inch
    loc='lower left')
```

creates an inset axes whose width is 30% of the parent axes and whose height is fixed at 1 inch.

You may create your inset whose size is determined so that the data scale of the inset axes to be that of the parent axes multiplied by some factor. For example,

```python
inset_axes = zoomed_inset_axes(ax,
    0.5, # zoom = 0.5
    loc='upper right')
```

creates an inset axes whose data scale is half of the parent axes. Here is complete examples.

![Fig. 58: Inset Locator Demo](image)

For example, `zoomed_inset_axes()` can be used when you want the inset represents the zoom-up of the small portion in the parent axes. And `mpl_toolkits/axes_grid/inset_locator` provides a helper function `mark_inset()` to mark the location of the area represented by the inset axes.

![Fig. 59: Inset Locator Demo2](image)
RGB Axes

RGBAxes is a helper class to conveniently show RGB composite images. Like ImageGrid, the location of axes are adjusted so that the area occupied by them fits in a given rectangle. Also, the xaxis and yaxis of each axes are shared.

```python
from mpl_toolkits.axes_grid1.axes_rgb import RGBAxes

fig = plt.figure()
ax = RGBAxes(fig, [0.1, 0.1, 0.8, 0.8])

r, g, b = get_rgb()  # r, g, b are 2-d images
ax.imshow_rgb(r, g, b,
              origin="lower", interpolation="nearest")
```

![Simple Rgb](image)

Fig. 60: Simple Rgb

AxesDivider

The axes_divider module provides helper classes to adjust the axes positions of a set of images at drawing time.

- `axes_size` provides a class of units that are used to determine the size of each axes. For example, you can specify a fixed size.

- `Divider` is the class that calculates the axes position. It divides the given rectangular area into several areas. The divider is initialized by setting the lists of horizontal and vertical sizes on which the division will be based. Then use `new_locator()`, which returns a callable object that can be used to set the axes_locator of the axes.

First, initialize the divider by specifying its grids, i.e., horizontal and vertical.

```python
rect = [0.2, 0.2, 0.6, 0.6]
horiz=[h0, h1, h2, h3]
vert=[v0, v1, v2]

divider = Divider(fig, rect, horiz, vert)
```
where, rect is a bounds of the box that will be divided and h0...h3, v0...v2 need to be an instance of classes in the `axes_size`. They have `get_size` method that returns a tuple of two floats. The first float is the relative size, and the second float is the absolute size. Consider a following grid.

```
 v0
 v1
 h0, v2 h1 h2 h3
```

- v0 => 0, 2
- v1 => 2, 0
- v2 => 3, 0

The height of the bottom row is always 2 (axes divider internally assumes that the unit is inches). The first and the second rows have a height ratio of 2:3. For example, if the total height of the grid is 6, then the first and second row will each occupy \(\frac{2}{2+3}\) and \(\frac{3}{2+3}\) of (6-1) inches. The widths of the horizontal columns will be similarly determined. When the aspect ratio is set, the total height (or width) will be adjusted accordingly.

The `mpl_toolkits.axes_grid1.axes_size` contains several classes that can be used to set the horizontal and vertical configurations. For example, for vertical configuration one could use:

```python
from mpl_toolkits.axes_grid1.axes_size import Fixed, Scaled
vert = [Fixed(2), Scaled(2), Scaled(3)]
```

After you set up the divider object, then you create a locator instance that will be given to the axes object:

```python
locator = divider.new_locator(nx=0, ny=1)
ax.set_axes_locator(locator)
```

The return value of the new locator method is an instance of the AxesLocator class. It is a callable object that returns the location and size of the cell at the first column and the second row. You may create a locator that spans over multiple cells:

```python
locator = divider.new_locator(nx=0, nx=2, ny=1)
```

The above locator, when called, will return the position and size of the cells spanning the first and second column and the first row. In this example, it will return [0:2, 1].

See the example,

You can adjust the size of each axes according to its x or y data limits (AxesX and AxesY).

**Note:** Click here to download the full example code

### 2.6.2 Overview of axisartist toolkit

The axisartist toolkit tutorial.
Fig. 61: Simple Axes Divider2

Fig. 62: Simple Axes Divider3
**Warning:** `axisartist` uses a custom Axes class (derived from the mpl’s original Axes class). As a side effect, some commands (mostly tick-related) do not work.

The `axisartist` contains a custom Axes class that is meant to support curvilinear grids (e.g., the world coordinate system in astronomy). Unlike mpl’s original Axes class which uses `Axes.xaxis` and `Axes.yaxis` to draw ticks, ticklines, etc., `axisartist` uses a special artist (`AxisArtist`) that can handle ticks, ticklines, etc. for curved coordinate systems.

![Fig. 63: Demo Floating Axis](image)

Since it uses special artists, some Matplotlib commands that work on `Axes.xaxis` and `Axes.yaxis` may not work.

**axisartist**

The `axisartist` module provides a custom (and very experimental) Axes class, where each axis (left, right, top, and bottom) have a separate associated artist which is responsible for drawing the axis-line, ticks, ticklabels, and labels. You can also create your own axis, which can pass through a fixed position in the axes coordinate, or a fixed position in the data coordinate (i.e., the axis floats around when viewlimit changes).

The axes class, by default, has its `xaxis` and `yaxis` invisible, and has 4 additional artists which are responsible for drawing the 4 axis spines in “left”, “right”, “bottom”, and “top”. They are accessed as `ax.axis["left"]`, `ax.axis["right"]`, and so on, i.e., `ax.axis` is a dictionary that contains artists (note that `ax.axis` is still a callable method and it behaves as an original `Axes.axis` method in Matplotlib).

To create an axes,

```python
import mpl_toolkits.axisartist as AA
fig = plt.figure()
ax = AA.Axes(fig, [0.1, 0.1, 0.8, 0.8])
fig.add_axes(ax)
```

or to create a subplot
For example, you can hide the right and top spines using:

```python
ax.axis["right"].set_visible(False)
ax.axis["top"].set_visible(False)
```

![Fig. 64: Simple Axisline3](image)

It is also possible to add a horizontal axis. For example, you may have an horizontal axis at y=0 (in data coordinate).

```python
ax.axis["y=0"] = ax.new_floating_axis(nth_coord=0, value=0)
```

![Fig. 65: Simple Axisartist1](image)

Or a fixed axis with some offset

```python
# make new (right-side) yaxis, but with some offset
ax.axis["right2"] = ax.new_fixed_axis(loc="right",
    offset=(20, 0))
```

**axisartist with ParasiteAxes**

Most commands in the axes_grid1 toolkit can take an axes_class keyword argument, and the commands create an axes of the given class. For example, to create a host subplot with
axisartist.Axes,

```python
import mpl_toolkits.axisartist as AA
from mpl_toolkits.axes_grid1 import host_subplot
host = host_subplot(111, axes_class=AA.Axes)
```

Here is an example that uses ParasiteAxes.

![Fig. 66: Demo Parasite Axes2](image)

**Curvilinear Grid**

The motivation behind the AxisArtist module is to support a curvilinear grid and ticks.

![Fig. 67: Demo Curvelinear Grid](image)

**Floating Axes**

AxisArtist also supports a Floating Axes whose outer axes are defined as floating axis.
Fig. 68: Demo Floating Axes

axisartist namespace

The axisartist namespace includes a derived Axes implementation. The biggest difference is that the artists responsible to draw axis line, ticks, ticklabel and axis labels are separated out from the mpl’s Axis class, which are much more than artists in the original mpl. This change was strongly motivated to support curvilinear grid. Here are a few things that mpl_toolkits.axisartist.Axes is different from original Axes from mpl.

- Axis elements (axis line(spine), ticks, ticklabel and axis labels) are drawn by a AxisArtist instance. Unlike Axis, left, right, top and bottom axis are drawn by separate artists. And each of them may have different tick location and different tick labels.

- gridlines are drawn by a Gridlines instance. The change was motivated that in curvilinear coordinate, a gridline may not cross axis-lines (i.e., no associated ticks). In the original Axes class, gridlines are tied to ticks.

- ticklines can be rotated if necessary (i.e, along the gridlines)

In summary, all these changes was to support

- a curvilinear grid.
- a floating axis

Fig. 69: Demo Floating Axis
mpl_toolkits.axisartist.Axes class defines a `axis` attribute, which is a dictionary of AxisArtist instances. By default, the dictionary has 4 AxisArtist instances, responsible for drawing of left, right, bottom and top axis.

xaxis and yaxis attributes are still available, however they are set to not visible. As separate artists are used for rendering axis, some axis-related method in mpl may have no effect. In addition to AxisArtist instances, the mpl_toolkits.axisartist.Axes will have `gridlines` attribute (Gridlines), which obviously draws grid lines.

In both AxisArtist and Gridlines, the calculation of tick and grid location is delegated to an instance of GridHelper class. mpl_toolkits.axisartist.Axes class uses GridHelperRectlinear as a grid helper. The GridHelperRectlinear class is a wrapper around the `xaxis` and `yaxis` of mpl’s original Axes, and it was meant to work as the way how mpl’s original axes works. For example, tick location changes using `set_ticks` method and etc. should work as expected. But change in artist properties (e.g., color) will not work in general, although some effort has been made so that some often-change attributes (color, etc.) are respected.

**AxisArtist**

AxisArtist can be considered as a container artist with following attributes which will draw ticks, labels, etc.

- **line**
- **major_ticks, major_ticklabels**
- **minor_ticks, minor_ticklabels**
- **offsetText**
- **label**

**line**

Derived from Line2d class. Responsible for drawing a spinal(?) line.

**major_ticks, minor_ticks**

Derived from Line2d class. Note that ticks are markers.

**major_ticklabels, minor_ticklabels**

Derived from Text. Note that it is not a list of Text artist, but a single artist (similar to a collection).

**axislabel**

Derived from Text.
Default AxisArtists

By default, following for axis artists are defined:

```
ax.axis["left"], ax.axis["bottom"], ax.axis["right"], ax.axis["top"]
```

The ticklabels and axislabel of the top and the right axis are set to not visible.
For example, if you want to change the color attributes of major_ticklabels of the bottom x-axis

```
ax.axis["bottom"].major_ticklabels.set_color("b")
```

Similarly, to make ticklabels invisible

```
ax.axis["bottom"].major_ticklabels.set_visible(False)
```

AxisArtist provides a helper method to control the visibility of ticks, ticklabels, and label. To make ticklabel invisible,

```
ax.axis["bottom"].toggle(ticklabels=False)
```

To make all of ticks, ticklabels, and (axis) label invisible

```
ax.axis["bottom"].toggle(all=False)
```

To turn all off but ticks on

```
ax.axis["bottom"].toggle(all=False, ticks=True)
```

To turn all on but (axis) label off

```
ax.axis["bottom"].toggle(all=True, label=False)
```

ax.axis's __getitem__ method can take multiple axis names. For example, to turn ticklabels of "top" and "right" axis on,

```
ax.axis["top","right"].toggle(ticklabels=True)
```

Note that `ax.axis["top","right"]` returns a simple proxy object that translate above code to something like below.

```
for n in ["top","right"]:
    ax.axis[n].toggle(ticklabels=True)
```

So, any return values in the for loop are ignored. And you should not use it anything more than a simple method.

Like the list indexing ":" means all items, i.e.,

```
ax.axis[:].major_ticks.set_color("r")
```

changes tick color in all axis.

**HowTo**

1. Changing tick locations and label.
Same as the original mpl's axes:

```python
ax.set_xticks([1, 2, 3])
```

2. Changing axis properties like color, etc.

Change the properties of appropriate artists. For example, to change the color of the ticklabels:

```python
ax.axis['left'].major_ticklabels.set_color('r')
```

3. To change the attributes of multiple axis:

```python
ax.axis['left', 'bottom'].major_ticklabels.set_color('r')
```

or to change the attributes of all axis:

```python
ax.axis[:].major_ticklabels.set_color('r')
```

4. **To change the tick size (length), you need to use** `axis.major_ticks.set_ticksize` method. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use `axis.major_ticks.set_tick_out` method.

   To change the pad between ticks and ticklabels, use `axis.major_ticklabels.set_pad` method.

   To change the pad between ticklabels and axis label, `axis.label.set_pad` method.

Rotation and Alignment of TickLabels

This is also quite different from the original mpl and can be confusing. When you want to rotate the ticklabels, first consider using **"set_axis_direction" method**.

```python
ax1.axis['left'].major_ticklabels.set_axis_direction('top')
ax1.axis['right'].label.set_axis_direction('left')
```

![Fig. 70: Simple Axis Direction01](image)

The parameter for `set_axis_direction` is one of ["left", "right", "bottom", "top"].

You must understand some underlying concept of directions.

1. There is a reference direction which is defined as the direction of the axis line with increasing coordinate. For example, the reference direction of the left x-axis is from bottom to top.

   The direction, text angle, and alignments of the ticks, ticklabels and axis-label are determined with respect to the reference direction.
2. \textit{ticklabel\_direction} is either the right-hand side (+) of the reference direction or the left-hand side (-).

3. same for the \textit{label\_direction}

4. ticks are by default drawn toward the opposite direction of the ticklabels.

5. text rotation of ticklabels and label is determined in reference to the \textit{ticklabel\_direction} or \textit{label\_direction}, respectively. The rotation of ticklabels and label is anchored.

On the other hand, there is a concept of “axis\_direction”. This is a default setting of above properties for each, “bottom”, “left”, “top”, and “right” axis.

<table>
<thead>
<tr>
<th>?</th>
<th>?</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>axis_label_direction</td>
<td>']'</td>
<td>'+'</td>
<td>'+'</td>
<td>'+'</td>
<td>'+'</td>
</tr>
<tr>
<td>axis_label_rotation</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
<td></td>
</tr>
<tr>
<td>axis_label_va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
<td></td>
</tr>

<td>180</td>
<td></td>
</tr>
<tr>
<td>tick_label_va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
<td></td>
</tr>
</tbody>
</table>
And, `set_axis_direction("top")` means to adjust the text rotation etc, for settings suitable for "top" axis. The concept of axis direction can be more clear with curved axis.

![Fig. 74: Axis Direction Demo - Step 04](image)

The axis direction can be adjusted in the AxisArtist level, or in the level of its child artists, i.e., ticks, ticklabels, and axis-label.

```
ax1.axis["left").set_axis_direction("top")
```

changes axis_direction of all the associated artist with the "left" axis, while

```
ax1.axis["left").major_ticklabels.set_axis_direction("top")
```

changes the axis direction of only the major_ticklabels. Note that set_axis_direction in the AxisArtist level changes the ticklabel direction and label_direction, while changing the axis_direction of ticks, ticklabels, and axis-label does not affect them.

If you want to make ticks outward and ticklabels inside the axes, use invert_ticklabel_direction method.

```
ax.axis[:].invert_ticklabel_direction()
```

A related method is "set_tick_out". It makes ticks outward (as a matter of fact, it makes ticks toward the opposite direction of the default direction).

```
ax.axis[:].major_ticks.set_tick_out(True)
```

So, in summary,

- **AxisArtist’s methods**
- set_axis_direction: “left”, “right”, “bottom”, or “top”
- set_ticklabel_direction: “+” or “-”
- set_axislabel_direction: “+” or “-”
- invert_ticklabel_direction

• **Ticks’ methods (major_ticks and minor_ticks)**
  - set_tick_out: True or False
  - set_ticksize: size in points

• **TickLabels’ methods (major_ticklabels and minor_ticklabels)**
  - set_axis_direction: “left”, “right”, “bottom”, or “top”
  - set_rotation: angle with respect to the reference direction
  - set_ha and set_va: see below

• **AxisLabels’ methods (label)**
  - set_axis_direction: “left”, “right”, “bottom”, or “top”
  - set_rotation: angle with respect to the reference direction
  - set_ha and set_va

**Adjusting ticklabels alignment**

Alignment of TickLabels are treated specially. See below

**Adjusting pad**

To change the pad between ticks and ticklabels

```python
ax.axis["left"]).major_ticklabels.set_pad(10)
```

Or ticklabels and axis-label

```python
ax.axis["left"]).label.set_pad(10)
```
Fig. 77: Demo Ticklabel Alignment

Fig. 78: Simple Axis Pad
GridHelper

To actually define a curvilinear coordinate, you have to use your own grid helper. A generalised version of grid helper class is supplied and this class should suffice in most of cases. A user may provide two functions which defines a transformation (and its inverse pair) from the curved coordinate to (rectilinear) image coordinate. Note that while ticks and grids are drawn for curved coordinate, the data transform of the axes itself (ax.transData) is still rectilinear (image) coordinate.

```python
from mpl_toolkits.axisartist.grid_helper_curvelinear \
    import GridHelperCurveLinear
from mpl_toolkits.axisartist import Subplot

# from curved coordinate to rectlinear coordinate.
def tr(x, y):
    x, y = np.asarray(x), np.asarray(y)
    return x, y-x

# from rectlinear coordinate to curved coordinate.
def inv_tr(x,y):
    x, y = np.asarray(x), np.asarray(y)
    return x, y+x

grid_helper = GridHelperCurveLinear((tr, inv_tr))
ax1 = Subplot(fig, 1, 1, 1, grid_helper=grid_helper)
fig.add_subplot(ax1)
```

You may use matplotlib's Transform instance instead (but a inverse transformation must be defined). Often, coordinate range in a curved coordinate system may have a limited range, or may have cycles. In those cases, a more customized version of grid helper is required.

```python
import mpl_toolkits.axisartist.angle_helper as angle_helper

# PolarAxes.PolarTransform takes radian. However, we want our coordinate
# system in degree
tr = Affine2D().scale(np.pi/180., 1.) + PolarAxes.PolarTransform()

# extreme finder : find a range of coordinate.
# 20, 20 : number of sampling points along x, y direction
# The first coordinate (longitude, but theta in polar)
# has a cycle of 360 degree.
# The second coordinate (latitude, but radius in polar) has a minimum of 0
extreme_finder = angle_helper.ExtremeFinderCycle(20, 20,
    lon_cycle = 360,
    lat_cycle = None,
    lon_minmax = None,
    lat_minmax = (0, np.inf),
)

# Find a grid values appropriate for the coordinate (degree,
# minute, second). The argument is a approximate number of grids.
```

(continues on next page)
grid_locator1 = angle_helper.LocatorDMS(12)

# And also uses an appropriate formatter. Note that, the
# acceptable Locator and Formatter class is a bit different than
# that of mpl's, and you cannot directly use mpl's Locator and
# Formatter here (but may be possible in the future).
tick_formatter1 = angle_helper.FormatterDMS()

grid_helper = GridHelperCurveLinear(tr,
    extreme_finder=extreme_finder,
    grid_locator1=grid_locator1,
    tick_formatter1=tick_formatter1
)

Again, the transData of the axes is still a rectilinear coordinate (image coordinate). You may manually do conversion between two coordinates, or you may use Parasite Axes for convenience.:

ax1 = SubplotHost(fig, 1, 2, 2, grid_helper=grid_helper)

# A parasite axes with given transform
ax2 = ParasiteAxesAuxTrans(ax1, tr, "equal")
# note that ax2.transData == tr + ax1.transData
# Anything you draw in ax2 will match the ticks and grids of ax1.
ax1.parasites.append(ax2)

Fig. 79: Demo Curvelinear Grid

**FloatingAxis**

A floating axis is an axis one of whose data coordinate is fixed, i.e, its location is not fixed in Axes coordinate but changes as axes data limits changes. A floating axis can be created using new_floating_axis method. However, it is your responsibility that the resulting AxisArtist is properly added to the axes. A recommended way is to add it as an item of Axes’s axis attribute.:
# floating axis whose first (index starts from 0) coordinate
# (theta) is fixed at 60

ax1.axis["lat"] = axis = ax1.new_floating_axis(0, 60)
axis.label.set_text(r"$\theta = 60^{\circ}$")
axis.label.set_visible(True)

See the first example of this page.

**Current Limitations and TODO’s**

The code need more refinement. Here is a incomplete list of issues and TODO’s

- No easy way to support a user customized tick location (for curvilinear grid). A new Locator class needs to be created.
- FloatingAxis may have coordinate limits, e.g., a floating axis of x = 0, but y only spans from 0 to 1.
- The location of axislabel of FloatingAxis needs to be optionally given as a coordinate value. ex, a floating axis of x=0 with label at y=1

**Note:** Click [here](#) to download the full example code

## 2.6.3 The mplot3d Toolkit

Generating 3D plots using the mplot3d toolkit.

### Contents

- **The mplot3d Toolkit**
  - Getting started
    - Line plots
    - Scatter plots
    - Wireframe plots
    - Surface plots
    - Tri-Surface plots
    - Contour plots
    - Filled contour plots
    - Polygon plots
    - Bar plots
    - Quiver
    - 2D plots in 3D
Getting started

An Axes3D object is created just like any other axes using the projection='3d' keyword. Create a new `matplotlib.figure.Figure` and add a new axes to it of type `Axes3D`:

```python
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D
fig = plt.figure()
ax = fig.add_subplot(111, projection='3d')
```

New in version 1.0.0: This approach is the preferred method of creating a 3D axes.

**Note:** Prior to version 1.0.0, the method of creating a 3D axes was different. For those using older versions of matplotlib, change `ax = fig.add_subplot(111, projection='3d')` to `ax = Axes3D(fig)`.

See the `mplot3d FAQ` for more information about the mplot3d toolkit.

Line plots

`Axes3D.plot(self, xs, ys, *args, zdir='z', **kwargs)`

Plot 2D or 3D data.

**Parameters**

- `xs` [1D array-like] x coordinates of vertices.
- `ys` [1D array-like] y coordinates of vertices.
- `zs` [scalar or 1D array-like] z coordinates of vertices; either one for all points or one for each point.
- `zdir` [{‘x’, ‘y’, ‘z’}] When plotting 2D data, the direction to use as z (‘x’, ‘y’ or ‘z’); defaults to ‘z’.
- `**kwargs` Other arguments are forwarded to `matplotlib.axes.Axes.plot`.

Scatter plots

`Axes3D.scatter(self, xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args, **kwargs)`

Create a scatter plot.

**Parameters**

- `xs, ys` [array-like] The data positions.
- `zs` [float or array-like, optional, default: 0] The z-positions. Either an array of the same length as `xs` and `ys` or a single value to place all points in the same plane.
**zdir** [{‘x’, ‘y’, ‘z’, ‘-x’, ‘-y’, ‘-z’}, optional, default: ‘z’] The axis direction for the zs. This is useful when plotting 2D data on a 3D Axes. The data must be passed as xs, ys. Setting zdir to ‘y’ then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.

**s** [scalar or array-like, optional, default: 20] The marker size in points**2. Either an array of the same length as xs and ys or a single value to make all markers the same size.

**c** [color, sequence, or sequence of color, optional] The marker color. Possible values:
- A single color format string.
- A sequence of color specifications of length n.
- A sequence of n numbers to be mapped to colors using cmap and norm.
- A 2-D array in which the rows are RGB or RGBA.

For more details see the c argument of scatter.

**depthshade** [bool, optional, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to scatter() will perform its depthshading independently.

**kwargs** All other arguments are passed on to scatter.

**Returns**

paths [PathCollection]

**Wireframe plots**

Axes3D.plot_wireframe(self, X, Y, Z, *args, **kwargs)

Plot a 3D wireframe.

**Note:** The rcount and ccount kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be
downsampled (by slicing) to these numbers of points.

**Parameters**

- **X, Y, Z** [2d arrays] Data values.

- **rcount, ccount** [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.

  New in version 2.0.

- **rstride, cstride** [int] Downsampling stride in each direction. These arguments are mutually exclusive with rcount and ccount. If only one of rstride or cstride is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

  'classic' mode uses a default of rstride = cstride = 1 instead of the new default of rcount = ccount = 50.

- **kwargs** Other arguments are forwarded to Line3DCollection.

**Surface plots**

```python
Axes3D.plot_surface(self, X, Y, Z, *args, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)
```

Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports color mapping by supplying the cmap argument.

**Note:** The rcount and ccount kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be
downsampled (by slicing) to these numbers of points.

**Parameters**

- **X, Y, Z** [2d arrays] Data values.
- **rcount, ccount** [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.
  
  New in version 2.0.
- **rstride, cstride** [int] Downsampling stride in each direction. These arguments are mutually exclusive with rcount and ccount. If only one of rstride or cstride is set, the other defaults to 10.
  
  ‘classic’ mode uses a default of rstride = cstride = 10 instead of the new default of rcount = ccount = 50.
- **color** [color-like] Color of the surface patches.
- **cmap** [Colormap] Colormap of the surface patches.
- **facecolors** [array-like of colors.] Colors of each individual patch.
- **norm** [Normalize] Normalization for the colormap.
- **vmin, vmax** [float] Bounds for the normalization.
- **shade** [bool] Whether to shade the facecolors. Defaults to True. Shading is always disabled when cmap is specified.
- **lightsource** [LightSource] The lightsource to use when shade is True.
- ****kwargs Other arguments are forwarded to Poly3DCollection.
Axes3D.plot_trisurf(self, *args, color=None, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```python
plot_trisurf(triangulation, ...)
```

where triangulation is a `Triangulation` object, or:

```python
plot_trisurf(X, Y, ...)
plot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a Triangulation object will be created. See `Triangulation` for an explanation of these possibilities.

The remaining arguments are:

```python
plot_trisurf(..., Z)
```

where Z is the array of values to contour, one per point in the triangulation.

**Parameters**

- **X, Y, Z** [array-like] Data values as 1D arrays.
- **color** Color of the surface patches.
- **cmap** A colormap for the surface patches.
- **norm** [Normalize] An instance of Normalize to map values to colors.
- **vmin, vmax** [scalar, optional, default: None] Minimum and maximum value to map.
shade [bool] Whether to shade the facecolors. Defaults to True. Shading is always disabled when cmap is specified.

lightsource [LightSource] The lightsource to use when shade is True.

**kwargs All other arguments are passed on to Poly3DCollection

Examples

New in version 1.2.0.

Contour plots

Axes3D.contour(self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)

Create a 3D contour plot.

Parameters

X, Y, Z [array-likes] Input data.

extend3d [bool] Whether to extend contour in 3D; defaults to False.

stride [int] Step size for extending contour.

zdir [{'x', 'y', 'z'}] The direction to use; defaults to 'z'.
Fig. 84: Trisurf3d
offset [scalar] If specified, plot a projection of the contour lines at this position in a plane normal to zdir

*args, **kwargs Other arguments are forwarded to \texttt{matplotlib.axes.Axes.contour}.

Returns

\texttt{matplotlib.contour.QuadContourSet}

Fig. 85: Contour3d

Contour3d 2
Contour3d 3

Filled contour plots

\texttt{Axes3D.contourf(self, X, Y, Z, *args, zdir='z', offset=None, **kwargs)}

Create a 3D filled contour plot.

Parameters

\texttt{X, Y, Z [array-likes]} Input data.

\texttt{zdir \{\{'x', 'y', 'z'\}\} The direction to use; defaults to 'z'.}

\texttt{offset [scalar] If specified, plot a projection of the contour lines at this position in a plane normal to zdir}

*args, **kwargs Other arguments are forwarded to \texttt{matplotlib.axes.Axes.contourf}.

Returns

\texttt{matplotlib.contour.QuadContourSet}

Notes

New in version 1.1.0: The zdir and offset parameters.

New in version 1.1.0: The feature demoed in the second contourf3d example was enabled as a result of a bugfix for version 1.1.0.
Polygon plots

Axes3D.add_collection3d(self, col, zs=0, zdir='z')

Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

**Supported are:**

- PolyCollection
- LineCollection
- PatchCollection
Bar plots

```python
Axes3D.bar(self, left, height, zs=0, zdir='z', *args, **kwargs)
```
Add 2D bar(s).

**Parameters**
- `left` [1D array-like] The x coordinates of the left sides of the bars.
- `zs` [scalar or 1D array-like] Z coordinate of bars; if a single value is specified, it will be used for all bars.
- `zdir` [{'x', 'y', 'z'}] When plotting 2D data, the direction to use as z ('x', 'y' or 'z'); defaults to 'z'.
- `**kwargs` Other arguments are forwarded to `matplotlib.axes.Axes.bar`.

**Returns**
- `mpl_toolkits.mplot3d.art3d.Patch3DCollection`

![Fig. 88: Bars3d](image)

Quiver

```python
Axes3D.quiver(X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=.3, pivot='tail', normalize=False, **kwargs)
```
Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they they can be broadcast together. The arguments can also be masked arrays. If an element in any argument is masked, then that corresponding quiver element will not be plotted.

**Parameters**
- `X, Y, Z` [array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see `pivot` keyword)
- `U, V, W` [array-like] The x, y and z components of the arrow vectors
**length** [float] The length of each quiver, default to 1.0, the unit is the same with the axes

**arrow_length_ratio** [float] The ratio of the arrow head with respect to the quiver, default to 0.3

**pivot** [{’tail’, ’middle’, ’tip’}] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name pivot. Default is ‘tail’

**normalize** [bool] When True, all of the arrows will be the same length. This defaults to False, where the arrows will be different lengths depending on the values of u,v,w.

**kwargs** Any additional keyword arguments are delegated to `LineCollection`

---

**Fig. 89: Quiver3d**

**Fig. 90: 2dcollections3d**

2D plots in 3D
Text

Axes3D.text(self, x, y, z, s, zdir=None, **kwargs)

Add text to the plot. kwargs will be passed on to Axes.text, except for the zdir keyword, which sets the direction to be used as the z direction.

Fig. 91: Text3d

Subplotting

Having multiple 3D plots in a single figure is the same as it is for 2D plots. Also, you can have both 2D and 3D plots in the same figure.

New in version 1.0.0: Subplotting 3D plots was added in v1.0.0. Earlier version can not do this.

Fig. 92: Subplot3d
Mixed Subplots
3.1 Interactive navigation

All figure windows come with a navigation toolbar, which can be used to navigate through the data set. Here is a description of each of the buttons at the bottom of the toolbar.

**The Home, Forward and Back buttons** These are akin to a web browser’s home, forward and back controls. Forward and Back are used to navigate back and forth between previously defined views. They have no meaning unless you have already navigated somewhere else using the pan and zoom buttons. This is analogous to trying to click Back on your web browser before visiting a new page or Forward before you have gone back to a page – nothing happens. Home always takes you to the first, default view of your data. Again, all of these buttons should feel very familiar to any user of a web browser.
The **Pan/Zoom button** This button has two modes: pan and zoom. Click the toolbar button to activate panning and zooming, then put your mouse somewhere over an axes. Press the left mouse button and hold it to pan the figure, dragging it to a new position. When you release it, the data under the point where you pressed will be moved to the point where you released. If you press 'x' or 'y' while panning the motion will be constrained to the x or y axis, respectively. Press the right mouse button to zoom, dragging it to a new position. The x axis will be zoomed in proportionately to the rightward movement and zoomed out proportionately to the leftward movement. The same is true for the y axis and up/down motions. The point under your mouse when you begin the zoom remains stationary, allowing you to zoom in or out around that point as much as you wish. You can use the modifier keys 'x', 'y' or 'CONTROL' to constrain the zoom to the x axis, the y axis, or aspect ratio preserve, respectively.

With polar plots, the pan and zoom functionality behaves differently. The radius axis labels can be dragged using the left mouse button. The radius scale can be zoomed in and out using the right mouse button.

The **Zoom-to-rectangle button** Click this toolbar button to activate this mode. Put your mouse somewhere over an axes and press a mouse button. Define a rectangular region by dragging the mouse while holding the button to a new location. When using the left mouse button, the axes view limits will be zoomed to the defined region. When using the right mouse button, the axes view limits will be zoomed out, placing the original axes in the defined region.

The **Subplot-configuration button** Use this tool to configure the appearance of the subplot: you can stretch or compress the left, right, top, or bottom side of the subplot, or the space between the rows or space between the columns.

The **Save button** Click this button to launch a file save dialog. You can save files with the
following extensions: png, ps, eps, svg and pdf.

### 3.1.1 Navigation Keyboard Shortcuts

The following table holds all the default keys, which can be overwritten by use of your matplotlibrc (#keymap.*).

<table>
<thead>
<tr>
<th>Command</th>
<th>Keyboard Shortcut(s)</th>
</tr>
</thead>
<tbody>
<tr>
<td>Home/Reset</td>
<td><strong>h</strong> or <strong>r</strong> or <strong>home</strong></td>
</tr>
<tr>
<td>Back</td>
<td><strong>c</strong> or <strong>left arrow</strong> or <strong>backspace</strong></td>
</tr>
<tr>
<td>Forward</td>
<td><strong>v</strong> or <strong>right arrow</strong></td>
</tr>
<tr>
<td>Pan/Zoom</td>
<td><strong>p</strong></td>
</tr>
<tr>
<td>Zoom-to-rect</td>
<td><strong>o</strong></td>
</tr>
<tr>
<td>Save</td>
<td><strong>ctrl + s</strong></td>
</tr>
<tr>
<td>Toggle fullscreen</td>
<td><strong>f</strong> or <strong>ctrl + f</strong></td>
</tr>
<tr>
<td>Close plot</td>
<td><strong>ctrl + w</strong></td>
</tr>
<tr>
<td>Close all plots</td>
<td><strong>shift + w</strong></td>
</tr>
<tr>
<td>Constrain pan/zoom to x axis</td>
<td>hold <strong>x</strong> when panning/zooming with mouse</td>
</tr>
<tr>
<td>Constrain pan/zoom to y axis</td>
<td>hold <strong>y</strong> when panning/zooming with mouse</td>
</tr>
<tr>
<td>Preserve aspect ratio</td>
<td>hold <strong>CONTROL</strong> when panning/zooming with mouse</td>
</tr>
<tr>
<td>Toggle major grids</td>
<td><strong>g</strong> when mouse is over an axes</td>
</tr>
<tr>
<td>Toggle minor grids</td>
<td><strong>G</strong> when mouse is over an axes</td>
</tr>
<tr>
<td>Toggle x axis scale (log/linear)</td>
<td><strong>L</strong> or <strong>k</strong> when mouse is over an axes</td>
</tr>
<tr>
<td>Toggle y axis scale (log/linear)</td>
<td><strong>I</strong> when mouse is over an axes</td>
</tr>
</tbody>
</table>

If you are using `matplotlib.pyplot` the toolbar will be created automatically for every figure. If you are writing your own user interface code, you can add the toolbar as a widget. The exact syntax depends on your UI, but we have examples for every supported UI in the `matplotlib/examples/user_interfaces` directory. Here is some example code for GTK+ 3:

```python
import gi
gi.require_version('Gtk', '3.0')
from gi.repository import Gtk

from matplotlib.figure import Figure
from matplotlib.backends.backend_gtk3agg import FigureCanvas
from matplotlib.backends.backend_gtk3 import (  
    NavigationToolbar2GTK3 as NavigationToolbar)

win = Gtk.Window()
win.connect("destroy", lambda x: Gtk.main_quit())
win.set_default_size(400, 300)
win.set_title("Embedding in GTK")

vbox = Gtk.VBox()
win.add(vbox)

fig = Figure(figsize=(5, 4), dpi=100)
ax = fig.add_subplot(111)
ax.plot([1, 2, 3])
```

(continues on next page)
3.2 Using matplotlib in a python shell

**Warning:** This page is significantly out of date

By default, matplotlib defers drawing until the end of the script because drawing can be an expensive operation, and you may not want to update the plot every time a single property is changed, only once after all the properties have changed.

But when working from the python shell, you usually do want to update the plot with every command, e.g., after changing the `xlabel()`, or the marker style of a line. While this is simple in concept, in practice it can be tricky, because matplotlib is a graphical user interface application under the hood, and there are some tricks to make the applications work right in a python shell.

### 3.2.1 IPython to the rescue

**Note:** The mode described here still exists for historical reasons, but it is highly advised not to use. It pollutes namespaces with functions that will shadow python built-in and can lead to hard to track bugs. To get IPython integration without imports the use of the `%matplotlib` magic is preferred. See [ipython documentation](#).

Fortunately, `ipython`, an enhanced interactive python shell, has figured out all of these tricks, and is matplotlib aware, so when you start ipython in the `pylab` mode.

```python
johnh@flag:~> ipython
Python 2.4.5 (#4, Apr 12 2008, 09:09:16)
IPython 0.9.0 -- An enhanced Interactive Python.

In [1]: %pylab

Welcome to pylab, a matplotlib-based Python environment.
For more information, type 'help(pylab)'.

In [2]: x = randn(10000)

In [3]: hist(x, 100)
```
it sets everything up for you so interactive plotting works as you would expect it to. Call
figure() and a figure window pops up, call plot() and your data appears in the figure window.

Note in the example above that we did not import any matplotlib names because in pylab
mode, ipython will import them automatically. ipython also turns on interactive mode for you,
which causes every pyplot command to trigger a figure update, and also provides a matplotlib
aware run command to run matplotlib scripts efficiently. ipython will turn off interactive mode
during a run command, and then restore the interactive state at the end of the run so you can
continue tweaking the figure manually.

There has been a lot of recent work to embed ipython, with pylab support, into various GUI
applications, so check on the ipython mailing list for the latest status.

3.2.2 Other python interpreters

If you can’t use ipython, and still want to use matplotlib/pylab from an interactive python
shell, e.g., the plain-ole standard python interactive interpreter, you are going to need to
understand what a matplotlib backend is What is a backend?.

With the TkAgg backend, which uses the Tkinter user interface toolkit, you can use matplotlib
from an arbitrary non-gui python shell. Just set your backend : TkAgg and interactive : True
in your matplotlibrc file (see Customizing Matplotlib with style sheets and rcParams) and fire
up python. Then:

```python
>>> from pylab import *
>>> plot([1,2,3])
>>> xlabel('hi mom')
```

should work out of the box. This is also likely to work with recent versions of the qt4agg and
gtk3agg backends, and with the macosx backend on the Macintosh. Note, in batch mode,
i.e. when making figures from scripts, interactive mode can be slow since it redraws the
figure with each command. So you may want to think carefully before making this the default
behavior via the matplotlibrc file instead of using the functions listed in the next section.

Gui shells are at best problematic, because they have to run a mainloop, but interactive plot-
ting also involves a mainloop. Ipython has sorted all this out for the primary matplotlib back-
ends. There may be other shells and IDEs that also work with matplotlib in interactive mode,
but one obvious candidate does not: the python IDLE IDE is a Tkinter gui app that does not
support pylab interactive mode, regardless of backend.

3.2.3 Controlling interactive updating

The interactive property of the pyplot interface controls whether a figure canvas is drawn on
every pyplot command. If interactive is False, then the figure state is updated on every plot
command, but will only be drawn on explicit calls to draw(). When interactive is True, then
every pyplot command triggers a draw.

The pyplot interface provides 4 commands that are useful for interactive control.

- isinteractive() returns the interactive setting True|False
- ion() turns interactive mode on
- ioff() turns interactive mode off
- draw() forces a figure redraw
When working with a big figure in which drawing is expensive, you may want to turn matplotlib’s interactive setting off temporarily to avoid the performance hit:

```python
>>> #create big-expensive-figure
>>> ioff()  # turn updates off
>>> title('now how much would you pay?')
>>> xticklabels(fontsize=20, color='green')
>>> draw()  # force a draw
>>> savefig('alldone', dpi=300)
>>> close()
>>> ion()  # turn updating back on
>>> plot(rand(20), mfc='g', mec='r', ms=40, mew=4, ls='--', lw=3)
```

### 3.3 Event handling and picking

Matplotlib works with a number of user interface toolkits (wxpython, tkinter, qt4, gtk, and macosx) and in order to support features like interactive panning and zooming of figures, it is helpful to the developers to have an API for interacting with the figure via key presses and mouse movements that is “GUI neutral” so we don’t have to repeat a lot of code across the different user interfaces. Although the event handling API is GUI neutral, it is based on the GTK model, which was the first user interface matplotlib supported. The events that are triggered are also a bit richer vis-a-vis matplotlib than standard GUI events, including information like which `matplotlib.axes.Axes` the event occurred in. The events also understand the matplotlib coordinate system, and report event locations in both pixel and data coordinates.

#### 3.3.1 Event connections

To receive events, you need to write a callback function and then connect your function to the event manager, which is part of the `FigureCanvasBase`. Here is a simple example that prints the location of the mouse click and which button was pressed:

```python
fig, ax = plt.subplots()
ax.plot(np.random.rand(10))

def onclick(event):
    print(’%s click: button=%d, x=%d, y=%d, xdata=%f, ydata=%f’ %
          (’double’ if event.dblclick else ’single’, event.button,
           event.x, event.y, event.xdata, event.ydata))

cid = fig.canvas.mpl_connect(’button_press_event’, onclick)
```

The `FigureCanvas` method `mpl_connect()` returns a connection id which is simply an integer. When you want to disconnect the callback, just call:

```python
fig.canvas.mpl_disconnect(cid)
```

**Note:** The canvas retains only weak references to instance methods used as callbacks. Therefore, you need to retain a reference to instances owning such methods. Otherwise the instance will be garbage-collected and the callback will vanish.
This does not affect free functions used as callbacks.

Here are the events that you can connect to, the class instances that are sent back to you when the event occurs, and the event descriptions:

<table>
<thead>
<tr>
<th>Event name</th>
<th>Class and description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'button_press_event'</td>
<td>MouseEvent - mouse button is pressed</td>
</tr>
<tr>
<td>'button_release_event'</td>
<td>MouseEvent - mouse button is released</td>
</tr>
<tr>
<td>'draw_event'</td>
<td>DrawEvent - canvas draw (but before screen update)</td>
</tr>
<tr>
<td>'key_press_event'</td>
<td>KeyEvent - key is pressed</td>
</tr>
<tr>
<td>'key_release_event'</td>
<td>KeyEvent - key is released</td>
</tr>
<tr>
<td>'motion_notify_event'</td>
<td>MouseEvent - mouse motion</td>
</tr>
<tr>
<td>'pick_event'</td>
<td>PickEvent - an object in the canvas is selected</td>
</tr>
<tr>
<td>'resize_event'</td>
<td>ResizeEvent - figure canvas is resized</td>
</tr>
<tr>
<td>'scroll_event'</td>
<td>MouseEvent - mouse scroll wheel is rolled</td>
</tr>
<tr>
<td>'figure_enter_event'</td>
<td>LocationEvent - mouse enters a new figure</td>
</tr>
<tr>
<td>'figure_leave_event'</td>
<td>LocationEvent - mouse leaves a figure</td>
</tr>
<tr>
<td>'axes_enter_event'</td>
<td>LocationEvent - mouse enters a new axes</td>
</tr>
<tr>
<td>'axes_leave_event'</td>
<td>LocationEvent - mouse leaves an axes</td>
</tr>
</tbody>
</table>

3.3.2 Event attributes

All matplotlib events inherit from the base class `matplotlib.backend_bases.Event`, which store the attributes:

- **name** the event name
- **canvas** the FigureCanvas instance generating the event
- **guiEvent** the GUI event that triggered the matplotlib event

The most common events that are the bread and butter of event handling are key press/release events and mouse press/release and movement events. The `KeyEvent` and `MouseEvent` classes that handle these events are both derived from the `LocationEvent`, which has the following attributes:

- **x** x position - pixels from left of canvas
- **y** y position - pixels from bottom of canvas
- **inaxes** the Axes instance if mouse is over axes
- **xdata** x coord of mouse in data coords
- **ydata** y coord of mouse in data coords

Let’s look a simple example of a canvas, where a simple line segment is created every time a mouse is pressed:

```python
from matplotlib import pyplot as plt

class LineBuilder:
    def __init__(self, line):
        self.line = line
        self.xs = list(line.get_xdata())
        self.ys = list(line.get_ydata())
```

(continues on next page)
```python
self.cid = line.figure.canvas.mpl_connect('button_press_event', self)

def __call__(self, event):
    print('click', event)
    if event.inaxes != self.line.axes: return
    self.xs.append(event.xdata)
    self.ys.append(event.ydata)
    self.line.set_data(self.xs, self.ys)
    self.line.figure.canvas.draw()
```

```python
fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click to build line segments')
line, = ax.plot([0], [0])  # empty line
linebuilder = LineBuilder(line)
plt.show()
```

The `MouseEvnet` that we just used is a `LocationEvent`, so we have access to the data and pixel coordinates in `event.x` and `event.xdata`. In addition to the `LocationEvent` attributes, it has:

- `button` button pressed None, 1, 2, 3, ‘up’, ‘down’ (up and down are used for scroll events)
- `key` the key pressed: None, any character, ‘shift’, ‘win’, or ‘control’

**Draggable rectangle exercise**

Write draggable rectangle class that is initialized with a `Rectangle` instance but will move its x,y location when dragged. Hint: you will need to store the original xy location of the rectangle which is stored as `rect.xy` and connect to the press, motion and release mouse events. When the mouse is pressed, check to see if the click occurs over your rectangle (see `matplotlib.patches.Rectangle.contains()`) and if it does, store the rectangle xy and the location of the mouse click in data coords. In the motion event callback, compute the deltax and deltay of the mouse movement, and add those deltas to the origin of the rectangle you stored. The redraw the figure. On the button release event, just reset all the button press data you stored as None.

Here is the solution:

```python
import numpy as np
import matplotlib.pyplot as plt

class DraggableRectangle:
    def __init__(self, rect):
        self.rect = rect
        self.press = None

    def connect(self):
        'connect to all the events we need'
        self.cidpress = self.rect.figure.canvas.mpl_connect(  
            'button_press_event', self.on_press)
```

(continues on next page)
```python
self.cidrelease = self.rect.figure.canvas.mpl_connect('button_release_event', self.on_release)
self.cidmotion = self.rect.figure.canvas.mpl_connect('motion_notify_event', self.on_motion)

def on_press(self, event):
    'on button press we will see if the mouse is over us and store some data'
if event.inaxes != self.rect.axes: return
contains, attrd = self.rect.contains(event)
if not contains: return
print('event contains', self.rect.xy)
x0, y0 = self.rect.xy
self.press = x0, y0, event.xdata, event.ydata

def on_motion(self, event):
    'on motion we will move the rect if the mouse is over us'
if self.press is None: return
if event.inaxes != self.rect.axes: return
x0, y0, xpress, ypress = self.press
dx = event.xdata - xpress
dy = event.ydata - ypress
# print('%f, %f, %f, %f, %f, %f' %
#     (x0, xpress, event.xdata, dx, x0+dx))
self.rect.set_x(x0+dx)
self.rect.set_y(y0+dy)
self.rect.figure.canvas.draw()

def on_release(self, event):
    'on release we reset the press data'
self.press = None
self.rect.figure.canvas.draw()

def disconnect(self):
    'disconnect all the stored connection ids'
self.rect.figure.canvas.mpl_disconnect(self.cidpress)
self.rect.figure.canvas.mpl_disconnect(self.cidrelease)
self.rect.figure.canvas.mpl_disconnect(self.cidmotion)
```

Extra credit: use the animation blit techniques discussed in the animations recipe to make 3.3. Event handling and picking
the animated drawing faster and smoother.

Extra credit solution:

```python
# draggable rectangle with the animation blit techniques; see
# http://www.scipy.org/Cookbook/Matplotlib/Animations
import numpy as np
import matplotlib.pyplot as plt

class DraggableRectangle:
    lock = None  # only one can be animated at a time

    def __init__(self, rect):
        self.rect = rect
        self.press = None
        self.background = None

    def connect(self):
        'connect to all the events we need'
        self.cidpress = self.rect.figure.canvas.mpl_connect('button_press_event', self.on_press)
        self.cidrelease = self.rect.figure.canvas.mpl_connect('button_release_event', self.on_release)
        self.cidmotion = self.rect.figure.canvas.mpl_connect('motion_notify_event', self.on_motion)

    def on_press(self, event):
        'on button press we will see if the mouse is over us and store some data'
        if event.inaxes != self.rect.axes: return
        if DraggableRectangle.lock is not None: return
        contains, attrd = self.rect.contains(event)
        if not contains: return
        x0, y0 = self.rect.xy
        self.press = x0, y0, event.xdata, event.ydata
        DraggableRectangle.lock = self

        # draw everything but the selected rectangle and store the pixel buffer
        canvas = self.rect.figure.canvas
        axes = self.rect.axes
        self.rect.set_animated(True)
        canvas.draw()
        self.background = canvas.copy_from_bbox(self.rect.axes.bbox)

        # now redraw just the rectangle
        axes.draw_artist(self.rect)

        # and blit just the redrawn area
        canvas.blit(axes.bbox)

    def on_motion(self, event):
        'on motion we will move the rect if the mouse is over us'
        if DraggableRectangle.lock is not self: return
        if event.inaxes != self.rect.axes: return

        # use the event to calculate the new location
        x0, y0, xdata, ydata = self.press
        dx, dy = xdata - x0, ydata - y0
        self.rect.set_x(self.rect.x + dx)
        self.rect.set_y(self.rect.y + dy)

        # redraw background and cast
        canvas.restore_region(self.background)
        axes.draw_artist(self.rect)
        canvas.blit(axes.bbox)
```

(continues on next page)
x0, y0, xpress, ypress = self.press
dx = event.xdata - xpress
dy = event.ydata - ypress
self.rect.set_x(x0+dx)
self.rect.set_y(y0+dy)
canvas = self.rect.figure.canvas
axes = self.rect.axes
# restore the background region
canvas.restore_region(self.background)

# redraw just the current rectangle
axes.draw_artist(self.rect)

# blit just the redrawn area
canvas.blit(axes.bbox)

def on_release(self, event):
    'on release we reset the press data'
    if DraggableRectangle.lock is not self:
        return
    self.press = None
    DraggableRectangle.lock = None

    # turn off the rect animation property and reset the background
    self.rect.set_animated(False)
    self.background = None

    # redraw the full figure
    self.rect.figure.canvas.draw()

def disconnect(self):
    'disconnect all the stored connection ids'
    self.rect.figure.canvas.mpl_disconnect(self.cidpress)
    self.rect.figure.canvas.mpl_disconnect(self.cidrelease)
    self.rect.figure.canvas.mpl_disconnect(self.cidmotion)

fig = plt.figure()
ax = fig.add_subplot(111)
rects = ax.bar(range(10), 20*np.random.rand(10))
drs = []
for rect in rects:
    dr = DraggableRectangle(rect)
    dr.connect()
    drs.append(dr)

plt.show()
3.3.3 Mouse enter and leave

If you want to be notified when the mouse enters or leaves a figure or axes, you can connect to the figure/axes enter/leave events. Here is a simple example that changes the colors of the axes and figure background that the mouse is over:

```python
# Illustrate the figure and axes enter and leave events by changing the frame colors on enter and leave

import matplotlib.pyplot as plt

def enter_axes(event):
    print('enter_axes', event.inaxes)
    event.inaxes.patch.set_facecolor('yellow')
    event.canvas.draw()

def leave_axes(event):
    print('leave_axes', event.inaxes)
    event.inaxes.patch.set_facecolor('white')
    event.canvas.draw()

def enter_figure(event):
    print('enter_figure', event.canvas.figure)
    event.canvas.figure.patch.set_facecolor('red')
    event.canvas.draw()

def leave_figure(event):
    print('leave_figure', event.canvas.figure)
    event.canvas.figure.patch.set_facecolor('grey')
    event.canvas.draw()

fig1 = plt.figure()
fig1.suptitle('mouse hover over figure or axes to trigger events')
ax1 = fig1.add_subplot(211)
ax2 = fig1.add_subplot(212)

fig1.canvas.mpl_connect('figure_enter_event', enter_figure)
fig1.canvas.mpl_connect('figure_leave_event', leave_figure)
fig1.canvas.mpl_connect('axes_enter_event', enter_axes)
fig1.canvas.mpl_connect('axes_leave_event', leave_axes)

fig2 = plt.figure()
fig2.suptitle('mouse hover over figure or axes to trigger events')
ax1 = fig2.add_subplot(211)
ax2 = fig2.add_subplot(212)

fig2.canvas.mpl_connect('figure_enter_event', enter_figure)
fig2.canvas.mpl_connect('figure_leave_event', leave_figure)
fig2.canvas.mpl_connect('axes_enter_event', enter_axes)
fig2.canvas.mpl_connect('axes_leave_event', leave_axes)

plt.show()
```
3.3.4 Object picking

You can enable picking by setting the `picker` property of an `Artist` (e.g., a matplotlib `Line2D`, `Text`, `Patch`, `Polygon`, `AxesImage`, etc...)

There are a variety of meanings of the `picker` property:

- **None** picking is disabled for this artist (default)
- **boolean** if True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist
- **float** if picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if its data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.
- **function** if picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event. The signature is `hit, props = picker(artist, mouseevent)` to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the `PickEvent` attributes

After you have enabled an artist for picking by setting the `picker` property, you need to connect to the figure canvas pick_event to get pick callbacks on mouse press events. e.g.:

```python
def pick_handler(event):
    mouseevent = event.mouseevent
    artist = event.artist
    # now do something with this...
```

The `PickEvent` which is passed to your callback is always fired with two attributes:

- **mouseevent** the mouse event that generate the pick event. The mouse event in turn has attributes like `x` and `y` (the coords in display space, e.g., pixels from left, bottom) and `xdata`, `ydata` (the coords in data space). Additionally, you can get information about which buttons were pressed, which keys were pressed, which `Axes` the mouse is over, etc. See `matplotlib.backend_bases.MouseEvent` for details.
- **artist** the `Artist` that generated the pick event.

Additionally, certain artists like `Line2D` and `PatchCollection` may attach additional meta data like the indices into the data that meet the picker criteria (e.g., all the points in the line that are within the specified epsilon tolerance)

**Simple picking example**

In the example below, we set the line picker property to a scalar, so it represents a tolerance in points (72 points per inch). The onpick callback function will be called when the pick event it within the tolerance distance from the line, and has the indices of the data vertices that are within the pick distance tolerance. Our onpick callback function simply prints the data that are under the pick location. Different matplotlib Artists can attach different data to the PickEvent. For example, `Line2D` attaches the ind property, which are the indices into the line data under the pick point. See `pick()` for details on the `PickEvent` properties of the line. Here is the code:
import numpy as np
import matplotlib.pyplot as plt

fig = plt.figure()
ax = fig.add_subplot(111)
ax.set_title('click on points')

line, = ax.plot(np.random.rand(100), 'o', picker=5)  # 5 points tolerance

def onpick(event):
    thisline = event.artist
    xdata = thisline.get_xdata()
    ydata = thisline.get_ydata()
    ind = event.ind
    points = tuple(zip(xdata[ind], ydata[ind]))
    print('onpick points:', points)

fig.canvas.mpl_connect('pick_event', onpick)

plt.show()
if event.artist!=line: return True

N = len(event.ind)
if not N: return True

figi = plt.figure()
for subplotnum, dataind in enumerate(event.ind):
    ax = figi.add_subplot(N,1,subplotnum+1)
    ax.plot(X[dataind])
    ax.text(0.05, 0.9, 'mu=%1.3f
    sigma=%1.3f' %(xs[dataind], ys[dataind]),
            transform=ax.transAxes, va='top')
    ax.set_ylim(-0.5, 1.5)
figi.show()
return True

fig.canvas.mpl_connect('pick_event', onpick)

plt.show()
CHAPTER
FOUR

WHATS NEW

4.1 What’s new in Matplotlib 3.1

For a list of all of the issues and pull requests since the last revision, see the GitHub Stats.

Table of Contents

- What’s new in Matplotlib 3.1
  * New Features
    - ConciseDateFormatter
    - Secondary x/y Axis support
    - FuncScale for arbitrary axes scales
    - Legend for scatter
    - Matplotlib no longer requires framework app build on MacOSX backend
  * Figure, FigureCanvas, and Backends
    - Figure.frameon is now a direct proxy for the Figure patch visibility state
    - pil_kwargs argument added to savefig
    - Add inaxes method to FigureCanvasBase
    - cairo backend defaults to pycairo instead of cairocffi
  * Axes and Artists
    - axes_grid1 and axisartist Axes no longer draw spines twice
    - Return type of ArtistInspector.get_aliases changed
    - ConnectionPatch accepts arbitrary transforms
    - mplot3d Line3D now allows {set,get}_data_3d
    - Axes3D.voxels now shades the resulting voxels
  * Axis and Ticks
    - Added Axis.get_inverted and Axis.set_inverted
    - Adjust default minor tick spacing
4.1.1 New Features

ConciseDateFormatter

The automatic date formatter used by default can be quite verbose. A new formatter can be accessed that tries to make the tick labels appropriately concise.

Secondary x/y Axis support

A new method provides the ability to add a second axis to an existing axes via `Axes.secondary_xaxis` and `Axes.secondary_yaxis`. See /gallery/subplots_axes_and_figures/secondary_axis for examples.

**FuncScale for arbitrary axes scales**

A new `FuncScale` class was added (and `FuncTransform`) to allow the user to have arbitrary scale transformations without having to write a new subclass of `ScaleBase`. This can be accessed by:

```python
ax.set_yscale('function', functions=(forward, inverse))
```

where `forward` and `inverse` are callables that return the scale transform and its inverse. See the last example in /gallery/scales/scales.
4.1. What's new in Matplotlib 3.1
Legend for scatter

A new method for creating legends for scatter plots has been introduced. Previously, in order to obtain a legend for a `scatter()` plot, one could either plot several scatters, each with an individual label, or create proxy artists to show in the legend manually. Now, `PathCollection` provides a method `legend_elements()` to obtain the handles and labels for a scatter plot in an automated way. This makes creating a legend for a scatter plot as easy as

![Example scatter plot]

An example can be found in `automatedlegendcreation`.

**Matplotlib no longer requires framework app build on MacOSX backend**

Previous versions of matplotlib required a Framework build of python to work. The app type was updated to no longer require this, so the MacOSX backend should work with non-framework python.

This also adds support for the MacOSX backend for PyPy3.

### 4.1.2 Figure, FigureCanvas, and Backends

**Figure.frameon is now a direct proxy for the Figure patch visibility state**

Accessing `Figure.frameon` (including via `get_frameon` and `set_frameon` now directly forwards to the visibility of the underlying Rectangle artist (`Figure.patch.get_frameon`, `Figure.patch`).
set_frameon).

**pil_kwargs argument added to savefig**

Matplotlib uses Pillow to handle saving to the JPEG and TIFF formats. The `savefig()` function gained a `pil_kwargs` keyword argument, which can be used to forward arguments to Pillow’s `pillow.Image.save()`.

The `pil_kwargs` argument can also be used when saving to PNG. In that case, Matplotlib also uses Pillow’s `pillow.Image.save()` instead of going through its own built-in PNG support.

**Add inaxes method to FigureCanvasBase**

The `FigureCanvasBase` class has now an `inaxes` method to check whether a point is in an axes and returns the topmost axes, else None.

**cairo backend defaults to pycairo instead of cairocffi**

This leads to faster import/runtime performance in some cases. The backend will fall back to cairocffi in case pycairo isn’t available.

### 4.1.3 Axes and Artists

**axes_grid1 and axisartist Axes no longer draw spines twice**

Previously, spines of `axes_grid1` and `axisartist` Axes would be drawn twice, leading to a "bold" appearance. This is no longer the case.

**Return type of ArtistInspector.get_aliases changed**

`ArtistInspector.get_aliases` previously returned the set of aliases as `{fullname: {alias1: None, alias2: None, ...}}`. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. `{fullname: {alias1, alias2, ...}}`. This value is also stored in `ArtistInspector.aliasd`, which has likewise changed.

**ConnectionPatch accepts arbitrary transforms**

Alternatively to strings like "data" or "axes fraction" `ConnectionPatch` now accepts any `Transform` as input for the `coordsA` and `coordsB` argument. This allows to draw lines between points defined in different user defined coordinate systems. Also see the Connect Simple01 example.

**mplot3d Line3D now allows {set, get}_data_3d**

Lines created with the 3d projection in mplot3d can now access the data using `get_data_3d()` which returns a tuple of array_likes containing the (x, y, z) data. The equivalent `set_data_3d` can be used to modify the data of an existing Line3D.
Axes3D.voxels now shades the resulting voxels

The voxels() method now takes a shade parameter that defaults to True. This shades faces based on their orientation, behaving just like the matching parameters to trisurf() and bar3d(). The plot below shows how this affects the output.

![Unshaded and Shaded Voxels](image)

4.1.4 Axis and Ticks

Added Axis.get_inverted and Axis.set_inverted

The Axis.get_inverted and Axis.set_inverted methods query and set whether the axis uses "inverted" orientation (i.e. increasing to the left for the x-axis and to the bottom for the y-axis).

They perform tasks similar to Axes.xaxis_inverted, Axes.yaxis_inverted, Axes.invert_xaxis, and Axes.invert_yaxis, with the specific difference that Axes..set_inverted makes it easier to set the invertedness of an axis regardless of whether it had previously been inverted before.

Adjust default minor tick spacing

Default minor tick spacing was changed from 0.625 to 0.5 for major ticks spaced 2.5 units apart.

EngFormatter now acceptsusetex, useMathText as keyword only arguments

A public API has been added to EngFormatter to control how the numbers in the ticklabels will be rendered. By default, useMathText evaluates to rcParams["axes.formatter.use_mathtext"] and usetex evaluates to rcParams["text.usetex"].
If either `is` True then the numbers will be encapsulated by $\$ signs. When using TeX this implies that the numbers will be shown in TeX’s math font. When using mathtext, the $\$ signs around numbers will ensure unicode rendering (as implied by mathtext). This will make sure that the minus signs in the ticks are rendered as the unicode=minus (U+2212) when using mathtext (without relying on the fix_minus method).

### 4.1.5 Animation and Interactivity

**Support for forward/backward mouse buttons**

Figure managers now support a `button_press` event for mouse buttons, similar to the `key_press` events. This allows binding actions to mouse buttons (see `MouseButton`) The first application of this mechanism is support of forward/backward mouse buttons in figures created with the Qt5 backend.

**`progress_callback` argument to `save()`**

The method `Animation.save` gained an optional `progress_callback` argument to notify the saving progress.

**Add `cache_frame_data` keyword-only argument into `animation.FuncAnimation`**

`matplotlib.animation.FuncAnimation` has been caching frame data by default; however, this caching is not ideal in certain cases e.g. When `FuncAnimation` needs to be only drawn(not saved) interactively and memory required by frame data is quite large. By adding `cache_frame_data` keyword-only argument, users can now disable this caching; thereby, this new argument provides a fix for issue #8528.

**Endless Looping GIFs with PillowWriter**

We acknowledge that most people want to watch a gif more than once. Saving an animation as a gif with PillowWriter now produces an endless looping gif.

**Adjusted `matplotlib.widgets.Slider` to have vertical orientation**

The `matplotlib.widgets.Slider` widget now takes an optional argument `orientation` which indicates the direction ('horizontal' or 'vertical') that the slider should take.

**Improved formatting of image values under cursor when a colorbar is present**

When a colorbar is present, its formatter is now used to format the image values under the mouse cursor in the status bar. For example, for an image displaying the values 10,000 and 10,001, the statusbar will now (using default settings) display the values as 10000 and 10001), whereas both values were previously displayed as 1e+04.
**MouseEvent button attribute is now an IntEnum**

The button attribute of `MouseEvent` instances can take the values None, 1 (left button), 2 (middle button), 3 (right button), "up" (scroll), and "down" (scroll). For better legibility, the 1, 2, and 3 values are now represented using the `IntEnum` class `matplotlib.backend_bases.MouseButton`, with the values MouseButton.LEFT (== 1), MouseButton.MIDDLE (== 2), and MouseButton.RIGHT (== 3).

### 4.1.6 Configuration, Install, and Development

**The MATPLOTLIBRC environment variable can now point to any "file" path**

This includes device files; in particular, on Unix systems, one can set `MATPLOTLIBRC` to `/dev/null` to ignore the user’s matplotlibrc file and fall back to Matplotlib’s defaults.

As a reminder, if `MATPLOTLIBRC` points to a directory, Matplotlib will try to load the matplotlibrc file from `$MATPLOTLIBRC/matplotlibrc`.

**Allow LaTeX code `pgf.preamble` and `text.latex.preamble` in MATPLOTLIBRC file**

Previously, the rc file keys `rcParams["pgf.preamble"]` (default: "") and `rcParams["text.latex.preamble"]` (default: ") were parsed using commas as separators. This would break valid LaTeX code, such as:

\usepackage[protrusion=true, expansion=false]{microtype}

The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to.

**New logging API**

`matplotlib.set_loglevel`/`pyplot.set_loglevel` can be called to display more (or less) detailed logging output.
Note: The following introductory text was written in 2008 by John D. Hunter (1968-2012), the original author of Matplotlib.

Matplotlib is a library for making 2D plots of arrays in Python. Although it has its origins in emulating the MATLAB graphics commands, it is independent of MATLAB, and can be used in a Pythonic, object oriented way. Although Matplotlib is written primarily in pure Python, it makes heavy use of NumPy and other extension code to provide good performance even for large arrays.

Matplotlib is designed with the philosophy that you should be able to create simple plots with just a few commands, or just one! If you want to see a histogram of your data, you shouldn’t need to instantiate objects, call methods, set properties, and so on; it should just work.

For years, I used to use MATLAB exclusively for data analysis and visualization. MATLAB excels at making nice looking plots easy. When I began working with EEG data, I found that I needed to write applications to interact with my data, and developed an EEG analysis application in MATLAB. As the application grew in complexity, interacting with databases, http servers, manipulating complex data structures, I began to strain against the limitations of MATLAB as a programming language, and decided to start over in Python. Python more than makes up for all of MATLAB’s deficiencies as a programming language, but I was having difficulty finding a 2D plotting package (for 3D VTK more than exceeds all of my needs).

When I went searching for a Python plotting package, I had several requirements:

- Plots should look great - publication quality. One important requirement for me is that the text looks good (antialiased, etc.)
- Postscript output for inclusion with TeX documents
- Embeddable in a graphical user interface for application development
- Code should be easy enough that I can understand it and extend it
- Making plots should be easy

Finding no package that suited me just right, I did what any self-respecting Python programmer would do: rolled up my sleeves and dived in. Not having any real experience with computer graphics, I decided to emulate MATLAB’s plotting capabilities because that is something MATLAB does very well. This had the added advantage that many people have a lot of MATLAB experience, and thus they can quickly get up to steam plotting in python. From a developer’s perspective, having a fixed user interface (the pylab interface) has been very useful, because the guts of the code base can be redesigned without affecting user code.
The Matplotlib code is conceptually divided into three parts: the *pylab interface* is the set of functions provided by `matplotlib.pylab` which allow the user to create plots with code quite similar to MATLAB figure generating code (*Pyplot tutorial*). The *Matplotlib frontend* or *Matplotlib API* is the set of classes that do the heavy lifting, creating and managing figures, text, lines, plots and so on (*Artist tutorial*). This is an abstract interface that knows nothing about output. The *backends* are device-dependent drawing devices, aka renderers, that transform the frontend representation to hardcopy or a display device (*What is a backend?*). Example backends:  PS creates PostScript® hardcopy, SVG creates Scalable Vector Graphics hardcopy, Agg creates PNG output using the high quality Anti-Grain Geometry library that ships with Matplotlib, GTK embeds Matplotlib in a Gtk+ application, GTKAgg uses the Anti-Grain renderer to create a figure and embed it in a Gtk+ application, and so on for PDF, WxWidgets, Tkinter, etc.

Matplotlib is used by many people in many different contexts. Some people want to automatically generate PostScript files to send to a printer or publishers. Others deploy Matplotlib on a web application server to generate PNG output for inclusion in dynamically-generated web pages. Some use Matplotlib interactively from the Python shell in Tkinter on Windows. My primary use is to embed Matplotlib in a Gtk+ EEG application that runs on Windows, Linux and Macintosh OS X.

Matplotlib’s original logo (2003 – 2008).

GitHub stats for 2019/05/18 - 2020/02/01 (tag: v3.1.0)

Pull Requests (47):

- **PR #16362**: Backport PR #16347: FIX: catch warnings from pandas in cbook._check_1d
- **PR #16356**: Backport PR #16330 on branch v3.1.x (Clearer signal handling)
- **PR #16330**: Clearer signal handling
- **PR #16348**: Backport PR #16330 on branch v3.1.x (Move version info to sidebar)
- **PR #16346**: Backport PR #16298 on branch v3.2.x (Don’t recursively call draw_idle when updating artists at draw time.)
- **PR #16345**: Backport PR #16298 on branch v3.1.x (Don’t recursively call draw_idle when updating artists at draw time.)
- **PR #16298**: Don’t recursively call draw_idle when updating artists at draw time.
- **PR #16322**: Backport PR #16250: Fix zerolen intersect
- **PR #16320**: Backport PR #16311 on branch v3.1.x (don’t override non-Python signal handlers)
- **PR #16311**: don’t override non-Python signal handlers
- **PR #16250**: Fix zerolen intersect
- **PR #16259**: TST: something changed in pytest 5.3.3 that breaks our qt fixtures
- **PR #16238**: Merge pull request #16238 from meeseeksmachine/auto-backport-of-pr-16235-on-v3.2.x
- **PR #16237**: Merge pull request #16237 from meeseeksmachine/auto-backport-of-pr-16235-on-v3.1.x
- **PR #16235**: FIX: AttributeError in TimerBase.start
- **PR #16208**: Backport PR #15556 on branch v3.1.x (Fix test suite compat with ghostscript 9.50.)
- **PR #16213**: Backport PR #15763 on branch v3.1.x (Skip webagg test if tornado is not available.)
- **PR #16167**: Backport PR #16166 on branch v3.1.x (Add badge for citing 3.1.2)
- **PR #16166**: Add badge for citing 3.1.2
- **PR #16144**: Backport PR #16053 on branch v3.1.x (Fix v_interval setter)
- **PR #16053**: Fix v_interval setter
- **PR #16136**: Backport PR #16112 on branch v3.1.x (CI: Fail when failed to install dependencies)
- **PR #16131**: Backport PR #16126 on branch v3.1.x (TST: test_fork: Missing join)
- **PR #16126**: TST: test_fork: Missing join
- **PR #16091**: Backport PR #16086 on branch v3.1.x (FIX: use supported attribute to check pillow version)
- **PR #16040**: Backport PR #16031 on branch v3.1.x (Fix docstring of hillshade()
• PR #16032: Backport PR #16028 on branch v3.1.x (Prevent FigureCanvasQT_draw_idle recursively calling itself.)
• PR #16028: Prevent FigureCanvasQT_draw_idle recursively calling itself.
• PR #16020: Backport PR #16007 on branch v3.1.x (Fix search on nested pages)
• PR #16018: Backport PR #15735 on branch v3.1.x (Cleanup some mplot3d docstrings.)
• PR #16007: Fix search on nested pages
• PR #15957: Backport PR #15953 on branch v3.1.x (Update donation link)
• PR #15763: Skip webagg test if tornado is not available.
• PR #15881: Backport PR #15859 on branch v3.1.x (Doc: Move search field into nav bar)
• PR #15863: Backport PR #15244 on branch v3.1.x: Change documentation format of rcParams defaults
• PR #15859: Doc: Move search field into nav bar
• PR #15860: Backport PR #15851 on branch v3.1.x (ffmpeg is available on default ubuntu packages now)
• PR #15851: ffmpeg is available on default ubuntu packages now.
• PR #15843: Backport PR #15737 on branch v3.1.x (Fix env override in WebAgg backend test.)
• PR #15760: Backport PR #15752 on branch v3.1.x (Update boxplot/violinplot faq.)
• PR #15757: Backport PR #15751 on branch v3.1.x (Modernize FAQ entry for plt.show().)
• PR #15735: Cleanup some mplot3d docstrings.
• PR #15753: Backport PR #15661 on branch v3.1.x (Document scope of 3D scatter depthshading.)
• PR #15741: Backport PR #15729 on branch v3.1.x (Catch correct parse error type for dateutil >= 2.8.1)
• PR #15729: Catch correct parse error type for dateutil >= 2.8.1
• PR #15737: Fix env override in WebAgg backend test.
• PR #15244: Change documentation format of rcParams defaults

Issues (5):
• #16294: BUG: Interactive mode slow
• #15842: Path.intersects_path returns True when it shouldn’t
• #16163: libpng error: Read Error when using matplotlib after setting usetex=True
• #15481: Recursion error
• #15717: Move search field into nav bar

GitHub issues and pull requests:

Pull Requests (224):

- PR #12785: Use level kwargs in irregular contour example
- PR #12767: Make colorbars constructible with dataless ScalarMappables.
- PR #12775: Add note to errorbar function about sign of errors
- PR #12776: Fix typo in example (on-borad -> on-board).
- PR #12771: Do not rely on external stack frame to exist
- PR #12526: Rename jquery files
- PR #12552: Update docs for writing image comparison tests.
- PR #12746: Use skipif, not xfail, for uncomparable image formats.
- PR #12747: Prefer log.warning("%s", ...) to log.warning("%s" % ...).
- PR #11753: FIX: Apply aspect before drawing starts
- PR #12749: Move toolmanager warning from logging to warning.
- PR #12708: Run flake8 in a separate travis environment
- PR #12737: Improve docstring of Arc
- PR #12598: Support Cn colors with n>=10.
- PR #12670: FIX: add setter for hold to un-break basemap
- PR #12693: Workaround Text3D breaking tight_layout()
- PR #12727: Reorder API docs: separate file per module
- PR #12738: Add unobtrusive deprecation note to the first line of the docstring.
- PR #12740: DOC: constrained layout guide (fix: Spacing with colorbars)
- PR #11663: Refactor color parsing of Axes.scatter
- PR #12736: Move deprecation note to end of docstring
- PR #12704: Rename tkinter import from Tk to tk.
- PR #12730: MNT: merge ignore lines in .flake8
- PR #12707: Fix tk error when closing first pyplot figure
- PR #12715: Cleanup dviread.
- PR #12717: Delete some if __name__ == "__main__" clauses.
- PR #12726: Fix test_non_gui_warning for Azure (and mplcairo).
- PR #12720: Improve docs on Axes scales
- PR #12537: Improve error message on failing test_pyplot_up_to_date
- PR #12721: Make get_scale_docs() internal
- PR #12617: Set up CI with Azure Pipelines
- PR #12673: Fix for _axes.scatter() array index out of bound error
- PR #12676: Doc: document textpath module
- PR #12705: Improve docs on Axes limits and direction
- PR #12706: Extend sphinx Makefile to cleanup completely
- PR #12481: Warn if plot_surface Z values contain NaN
- PR #12709: Correctly remove nans when drawing paths with pycairo.
- PR #12685: Make ticks in demo_axes_rgb.py visible
- PR #12691: DOC: Link to "How to make a PR" tutorials as badge and in contributing
- PR #12684: Change ipython block to code-block
- PR #11974: Make code match comment in sankey.
- PR #12440: Make arguments to @deprecated/warn_deprecated keyword-only.
- PR #12683: TST: mark test_constrainedlayout.py::test_colorbar_location as flaky
- PR #12686: Remove deprecation warnings in tests
- PR #12470: Update AutoDateFormatter with locator
- PR #12656: FIX: fix error in colorbar.get_ticks not having valid data
- PR #12586: Improve linestyles example
- PR #12006: Added stacklevel=2 to all warnings.warn calls (issue 10643)
- PR #12651: FIX: ignore non-finite bbox
- PR #12653: Don’t warn when accessing deprecated properties from the class.
- PR #12608: ENH: allow matplotlib.use after getbackend
- PR #12658: Do not warn-deprecated when iterating over rcParams
- PR #12635: FIX: allow non bbox_extra_artists calls
- PR #12659: Add note that developer discussions are private
- PR #12543: Make rcsetup.py flak8 compliant
- PR #12642: Don’t silence TypeErrors in fmt_{x,y}data.
- PR #11667: DOC: update doc requirement
- PR #12442: Deprecate passing drawstyle with linestyle as single string.
- PR #12625: Shorten some docstrings.
- PR #12627: Be a bit more stringent on invalid inputs.
- PR #12561: Properly css-style exceptions in the documentation
- PR #12629: Fix issue with PyPy on macOS
- PR #10933: Remove “experimental” fontconfig font_manager backend.
- PR #12630: Fix RcParams._len_
- PR #12285: FIX: Don’t apply tight_layout if axes collapse
- PR #12548: undef_XOPEN_SOURCE breaks the build in AIX
- PR #12615: Fix travis OSX build
- PR #12600: Minor style fixes.
- PR #12607: STY: fix whitespace and escaping
- PR #12603: FIX: don’t import macOSx to check if eventloop running
- PR #12599: Fix formatting of docstring
- PR #12569: Don’t confuse uintptr_t and Py_ssize_t.
- PR #12572: Fix singleton hist labels
- PR #12581: Fix hist() error message
- PR #12570: Fix mathtext tutorial for build with Sphinx 1.8.
- PR #12487: Update docs/tests for the deprecation of aname and label1On/label2On/etc.
- PR #12521: Improve docstring of draw_idle()
- PR #12573: BUG: mplot3d: Don’t crash if azim or elev are non-integral
- PR #12574: Remove some unused imports
- PR #12568: Add note regarding builds of old Matplotlibs.
- PR #12555: Clarify horizontalalignment and verticalalignment in suptitle
- PR #12547: Disable sticky edge accumulation if no autoscaling.
- PR #12546: Avoid quadratic behavior when accumulating stickies.
- PR #12159: FIX: colorbar re-check norm before draw for autolabels
- PR #12501: Rectified plot error
- PR #11789: endless looping GIFs with PillowWriter
• PR #12525: Fix some flake8 issues
• PR #12431: FIX: allow single-string color for scatter
• PR #12216: Doc: Fix search for sphinx >=1.8
• PR #12461: FIX: make add_lines work with new colorbar
• PR #12241: FIX: make unused spines invisible
• PR #12516: Don’t handle impossible values for align in hist()
• PR #12504: DOC: clarify min supported version wording
• PR #12507: FIX: make minor ticks formatted with science formatter as well
• PR #12500: Adjust the widths of the messages during the build.
• PR #12492: Simplify radar_chart example.
• PR #12478: MAINT: numpy deprecates ascalar in 1.16
• PR #12363: FIX: errors in get_position changes
• PR #12495: Fix duplicate condition in pathpatch3d example
• PR #11984: Strip out pkg-config machinery for agg and libqhull.
• PR #12463: Document Artist.cursor_data() parameter
• PR #12489: Fix typo in documentation of ylim
• PR #12482: Test slider orientation
• PR #12317: Always install mpl_toolkits.
• PR #12246: Be less tolerant of broken installs.
• PR #12477: Use \{MICRO SIGN\} instead of \{GREEK SMALL LETTER MU\} in EnumFormatter.
• PR #12483: Kill FontManager.update_fonts.
• PR #12448: Don’t error if some font directories are not readable.
• PR #12474: Throw ValueError when irregularly gridded data is passed to streamplot.
• PR #12469: Clarify documentation of offsetbox.AnchoredText’s prop kw argument
• PR #12468: Fix set_ylim unit handling
• PR #12466: np.fromstring -> np.frombuffer.
• PR #12369: Improved exception handling on animation failure
• PR #12460: Deprecate RendererBase.strip_math.
• PR #12457: Fix tutorial typos.
• PR #12453: Rollback erroneous commit to whats_new.rst from #10746
• PR #12452: Minor updates to the FAQ.
• PR #10746: Adjusted matplotlib.widgets.Slider to have optional vertical orientation
• PR #12441: Get rid of a signed-compare warning.
• PR #12430: Deprecate Axes3D.plot_surface(shade=None)
• PR #12435: Fix numpydoc parameter formatting
• PR #12434: Clarify documentation for textprops keyword parameter of TextArea
• PR #12427: Document Artist.get_cursor_data
• PR #12277: FIX: datetime64 now recognized if in a list
• PR #10322: Use np.hypot whereever possible.
• PR #12423: Minor simplifications to backend_svg.
• PR #12293: Make pyplot more tolerant wrt. 3rd-party subclasses.
• PR #12360: Replace axes_grid by axes_grid1 in test
• PR #10356: fix detecting which artist(s) the mouse is over
• PR #12416: Move font cache rebuild out of exception handler
• PR #11891: Group some print()s in backend_ps.
• PR #12165: Remove deprecated mlab code
• PR #12394: DOC: fix CL tutorial to give same output from saved file and example
• PR #12387: Update HTML animation as slider is dragged
• PR #12408: Don’t crash on invalid registry font entries on Windows.
• PR #10088: Deprecate Tick.{gridOn,tick1On,label1On,...} in favor of set_visible.
• PR #12149: Mathtext tutorial fixes
• PR #12393: Deprecate to-days converters in matplotlib dates
• PR #12257: Document standard backends in matplotlib.use()
• PR #12383: Revert change of parameter name in annotate()
• PR #12385: CI: Added Appveyor Python 3.7 build
• PR #12247: Machinery for deprecating properties.
• PR #12371: Move check for ImageMagick Windows path to bin_path().
• PR #12384: Cleanup axislines style.
• PR #12353: Doc: clarify default parameters in scatter docs
• PR #12366: TST: Update test images for new Ghostscript.
• PR #11648: FIX: colorbar placement in constrained layout
• PR #12368: Don’t use stdlib private API in animation.py.
• PR #12351: dviread: find_tex_file: Ensure the encoding on windows
• PR #12244: Merge barchart examples.
• PR #12372: Remove two examples.
• PR #12214: Improve docstring of Annoation
• PR #12347: DOC: add_child_axes to axes_api.rst
• PR #12304: TST: Merge Qt tests into one file.
• PR #12321: maint: setupext.py for freetype had a Catch case for missing ft2build.h
• PR #12340: Catch test deprecation warnings for mlab.demean
• PR #12334: Improve selection of inset indicator connectors.
• PR #12316: Fix some warnings from Travis
• PR #12268: FIX: remove unnecessary self in super-calls, fixes #12265
• PR #12212: font_manager: Fixed problems with Path(...).suffix
• PR #12326: fixed minor spelling error in docstring
• PR #12296: Make FooConverter inherit from ConversionInterface in examples
• PR #12322: Fix the docs build.
• PR #12319: Fix Travis 3.6 builds
• PR #12309: Deduplicate implementations of FooNorm.autoscale{,_None}
• PR #12314: Deprecate axis('normal') in favor of axis('auto').
• PR #12313: BUG: Fix typo in view_limits() for MultipleLocator
• PR #12307: Clarify missing-property error message.
• PR #12274: MNT: put back _hold as read-only attribute on AxesBase
• PR #12260: Fix docs : change from issue #12191, remove “if 1:” blocks in examples
• PR #12163: TST: Defer loading Qt framework until test is run.
• PR #12253: Handle utf-8 output by kpathsea on Windows.
• PR #12301: Ghostscript 9.0 requirement revisited
• PR #12294: Fix expand_dims warnings in triinterpolate
• PR #12292: TST: Modify the bar3d test to show three more angles
• PR #12297: Remove some pytest parameterising warnings
• PR #12261: FIX: parasite axis2 demo
• PR #12278: Document inheriting docstrings
• PR #12262: Simplify empty-rasterized pdf test.
• PR #12269: Add some param docs to BlockingInput methods
• PR #12272: Fix contrained to constrained
• PR #12255: Deduplicate inherited docstrings.
• PR #12254: Improve docstrings of Animations
• PR #12258: Fix CSS for module-level data
• PR #12222: Remove extraneous if 1 statements in demo_axisline_style.py
• PR #12137: MAINT: Vectorize bar3d
• PR #12219: Merge OSXInstalledFonts into findSystemFonts.
• PR #12229: Less ACCEPTS, more numpydoc.
• PR #12209: Doc: Sort named colors example by palette
• PR #12237: Use (float, float) as parameter type for 2D positions in docstrings
• PR #12238: Typo in docs
• PR #12236: Make boilerplate-generated pyplot.py flake8 compliant
• PR #12231: CI: Speed up Appveyor repository cloning
- PR #12228: Fix trivial typo in docs.
- PR #12227: Use (float, float) as parameter type for 2D positions
- PR #12199: Allow disabling specific mouse actions in blocking_input
- PR #12213: Change win32InstalledFonts return value
- PR #12207: FIX: don’t check for interactive framework if none required
- PR #11688: Don’t draw axis (spines, ticks, labels) twice when using parasite axes.
- PR #12210: Axes.tick_params() argument checking
- PR #12211: Fix typo
- PR #12200: Slightly clarify some invalid shape exceptions for image data.
- PR #12151: Don’t pretend @deprecated applies to classmethods.
- PR #12190: Remove some unused variables and imports
- PR #12186: DOC: fix API note about get_tightbbox
- PR #12203: Document legend’s slowness when “best” location is used
- PR #12192: Exclude examples from lgtm analysis
- PR #12196: Give Carreau the ability to mention the backport bot.
- PR #12187: DOC: Update INSTALL.rst
- PR #12164: Fix Annotation.contains.
- PR #12177: FIX: remove cwd from mac font path search
- PR #12182: Fix Flash of Unstyled Content by removing remaining Flipcause integration
- PR #12184: DOC: update “Previous Whats New” for 2.2 with reference to cividis paper
- PR #12183: Doc: Don’t use Sphinx 1.8
- PR #12171: Remove internal warning due to zsort deprecation
- PR #12166: Document preference order for backend auto selection
- PR #12154: Avoid triggering deprecation warnings with pytest 3.8.
- PR #12030: Speed up canvas redraw for GTK3Agg backend.
- PR #12157: Properly declare the interactive framework for the qt4foo backends.
- PR #12156: Cleanup the GridSpec demos.
- PR #12144: Add explicit getters and setters for Annotation.anncoords.
- PR #12152: Use _warn_external for deprecations warnings.
- PR #12148: BLD: pragmatic fix for building basic_unit example on py37
- PR #12147: DOC: update the gh_stats code

Issues (170):
- #12699: Annotations get cropped out of figures saved with bbox_inches=’tight’
- #9217: Weirdness with inline figure DPI settings in Jupyter Notebook
- #4853: %matplotlib notebook creates much bigger figures than %matplotlib inline
- #12780: Vague/misleading exception message in scatter()
- #10239: Weird interaction with Tkinter
- #10045: subplots_adjust() breaks layout of tick labels
- #12765: Matplotlib draws incorrect color
- #11800: Gridspec tutorial
- #12757: up the figure
- #12724: Importing pyplot steals focus on macOS
- #12669: fixing _hold on cartopy broke basemap
- #12687: Plotting text on 3d axes before tight_layout() breaks tight_layout()
- #12734: Wishlist: functionally linked twin axes
- #12576: RcParams is fundamentally broken
- #12641: __axes.py.scatter() array index out of bound / calling from seaborn
- #12703: Error when closing first of several pyplot figures in TkAgg
- #12728: Deprecation Warnings
- #4124: Provide canonical examples of mpl in web frameworks
- #10574: Default color after setting alpha to Patch in legend
- #12702: couldn’t find or load Qt platform plugin “windows” in ”.”.
- #11139: ”make clean” doesn’t remove all the build doc files
- #12701: semilogy with NaN prevents display of Title (cairo backend)
- #12696: Process finished with exit code -1 due to matplotlib configuration
- #12692: matplotlib.plot.show always blocks the execution of python script
- #12433: Travis error is MacOS image tolerance of 0.005 for test_constrained_layout.
  py::test_colorbar_location
- #10017: unicode_literals considered harmful
- #12682: using AxesImage.set_clim() shrinks the colorbar
- #12620: Overlapping 3D objects
- #12680: matplotlib ui in thread still blocked
- #11908: Improve linestyle documentation
- #12650: Deprecation warnings when calling help(matplotlib)
- #10643: Most warnings calls do not set the stacklevel
- #12671: make_axes_locatable breaks with matplotlib 3.0
- #12664: plt.scatter crashes because overwrites the colors to an empty list
- #12188: matplotlib 3 pyplot on MacOS bounces rocket icon in dock
- #12648: Regression when calling annotate with nan values for the position
- #12362: In 3.0.0 backend cannot be set if ’get_backend()’ is run first
- #12649: Over-verbose deprecation warning about examples.directory
- #12661: In version 3.0.0 make_axes_locatable + colorbar does not produce expected result
• #12634: axes_grid1 axes have no keyword argument 'bbox_extra_artists'
• #12654: Broken 'Developer Discussions' link
• #12657: With v3.0.0 mpl_toolkits.axes_grid1.make_axes_locatable().append_axes
  breaks in Jupyter
• #12645: Markers are offset when ‘facecolor’ or ‘edgecolor’ are set to ‘none’ when plot-
  ting data
• #12644: Memory leak with plt.plot in Jupyter Notebooks?
• #12632: Do we need input hooks macosx?
• #12535: AIX Support - Do not undef _XOPEN_SOURCE
• #12626: AttributeError: module ‘matplotlib’ has no attribute ‘artist’
• #11034: Doc Typo: matplotlib.axes.Axes.get_yticklabels / Axis.get_ticklabels
• #12624: make_axes_locatable : Colorbar in the middle instead of bottom while saving a
  pdf, png.
• #11094: can not use GUI backends inside django request handlers
• #12613: transientsly linked interactivity of unshared pair of axes generated with
  make_axes_locatable
• #12578: macOS builds are broken
• #12612: gui backends do not work inside of flask request handlers
• #12611: Matplotlib 3.0.0 Likely bug TypeError: stackplot() got multiple values for ar-
  gument ‘x’
• #12610: matplotlibrc causes import to fail 3.0.0 (didn’t crash 2.y.z series)
• #12601: Can’t import matplotlib
• #12597: Please soon add Chinese language support!! It’s to difficult for new people
  handle character
• #12590: Matplotlib pypi distribution lacks packages for Python 2.7
• #3869: Numeric labels do not work with plt.hist
• #12580: Incorrect hist error message with bad color size
• #12100: document where to get nightly wheels
• #7205: Converting docstrings to numpydoc
• #12564: Saving plot as PNG file prunes tick labels
• #12161: Problems of using sharex options with lines plots and colormesh with colorbar
• #12256: tight_layout for plot with non-clipped screen-unit items causes issues on zoom
• #12545: Program quit unormally without reporting error
• #12532: Incorrect rendering of math symbols
• #12567: Calling pyplot.show() with TkAgg backend on x86 machine raises OverflowEr-
  ror.
• #12571: cannot install because Fatal Python error: initfsencoding: Unable to get the
  locale encoding
• #12566: Problem installing Version 1.3.1 -> missing pkg-config freetype and libagg
• #12556: Matplotlib 3.0.0 import hangs in clean environment
• #12197: Weird behaviour of suptitle() when horizontalalignment is not ‘center’
• #12550: colorbar resizes in animation
• #12155: Incorrect placement of Colorbar ticks using LogNorm
• #11787: Looping gifs with PillowWriter
• #12533: Plotting with alpha=0 with rasterized=True causes ValueError on saving to pdf
• #12438: Scatter doesn’t accept a list of strings as color spec.
• #12429: scatter() does not accept gray strings anymore
• #12499: run my code failed after i Import pylab failed, python version is 3.6.6
• #12458: add_lines misses lines for matplotlib.colorbar.ColorbarBase
• #12239: 3d axes are collapsed by tight_layout
• #12414: Function to draw angle between two lines
• #12488: inconsistent colorbar tick labels for LogNorm
• #12515: pyplot.step broken in 3.0.0?
• #12355: Error for bbox_inches='tight' in savefig with make_axes_locatable
• #12505: ImageGrid in 3.0
• #12502: How can I put the ticks of logarithmic coordinate in the axes?
• #12496: Matplotlib Can’t Plot a Dataset
• #12486: rotate label of legend?
• #12291: Importing pyplot crashes on macOS due to missing fontlist-v300.json and then Permission denied: ‘/opt/local/share/fonts’
• #12480: “close_event” for nbagg/notebook backend
• #12467: Documentation of AnchoredText’s prop keyword argument is misleading
• #12288: New function signatures in pyplot break Cartopy
• #12445: Error on colorbar
• #8760: Traceback from animation.MovieWriter.saving method is confusing because it provides no useful information
• #9205: after the animation encoder (e.g. ffmpeg) fails, the animation framework itself fails internally in various ways while trying to report the error
• #12357: Unclear error when saving Animation using FFmpeg
• #12454: Formatting numerical legend
• #9636: matplotlib crashes upon window resize
• #11473: Continuous plotting cause memory leak 20-50kb/sec
• #12018: No image pop-up or display for plt.imshow() and plt.show()
• #11583: How to draw parallelepiped with real size scaling?
• #12446: Polar Contour - float() argument must be a string or a number, not ‘AxesParasiteParasiteAuxTrans’
• #12444: Issues with gridspec/tight_layout in matplotlib version 2.2.3
• #11154: Unexpected behavior for Axes3D.plot_surface(shade=None)
• #12409: Calling savefig() multiple times causes crash of Spyder IDE / IPython Kernel dying.
• #9799: FigureCanvasTkAgg - “buffer is of wrong type” error during blit
• #12439: FileNotFoundError for font_manager
• #12437: matplotlib-mac
• #12121: Documentation of TextArea’s fontprops keyword argument is misleading
• #12279: Axes.format_cursor_data lacks documentation and seems unused
• #12428: Simple plot spacing bug: ylabel gets wrongfully removed from plot
• #11190: Images in the docs are too large.
• #12271: error with errorbar with datetime64
• #12405: plt.stackplot() does not work with 3.0.0
• #12282: Axes.imshow tooltip does not get updated when another call to Axes.imshow is made
• #12420: How to remove Rectangle Selector from figure?
• #12391: Constrained Layout tutorial needs some cleanup....
• #12406: Bug with font finding, and here is my fix as well.
• #9051: ParasiteAxes over plotting
• #12325: Annotation change from “s” to “text” in 3.0- documentation
• #12397: plt.show() not working (can’t get figures to display in external window) when using jupyter QTconsole
• #12396: Defining arrowprops in draggable annotation disables the pick_event
• #12389: Setting row edge color of matplotlib table
• #12376: The output figure file is strange: there is a lot of blank area on the output figure.
• #11641: constrained_layout and colorbar for a subset of axes
• #12373: Unexpected outcome with matplotlib.pyplot.pyplot.pcolor()
• #12370: ImageGrid bug when using inline backend
• #12364: pdf image generated by matplotlib with semi transparent lines missing in Word on Windows.
• #12352: TeX rendering broken on master with windows
• #12354: Too many levels of symbolic links
• #12323: indicate_inset_zoom sometimes draws incorrect connector lines
• #12341: Figures not rendering in docker
• #12335: Matplotlib plt.Rectangle Incoherent Results
• #12265: ParasiteAxesAuxTrans pcolor/pcolormesh and contour/contourf broken
• #12337: AttributeError: module ‘matplotlib.pyplot’ has no attribute ‘hold’
• #11673: Inconsistent font settings when changing style context
• #11693: The rcParams setting for figure.figsize does not change when run from another notebook
• #11725: New mode between non-interactive and interactive?
• #12134: tight_layout flips images when making plots without displaying them
• #12310: plot fails with datetime64[ns] timezone aware objects (for example datetime64[ns, UTC+00:00])
• #12191: “if 1:” blocks in examples
• #11288: FR: Figure.subplots add optional SubplotSpec parameter
• #12298: c and cmap for plot
• #12286: Sample code given in Matplotlib’s site does not work.
• #11955: UnicodeDecodeError on importing pyplot in python2
• #12208: parasite axis2 demo now crashes with log x-axis
• #8871: Error when using quantities when plotting errorbars
• #6658: literature reference for ‘viridis’ colormap
• #6789: Tutorial pyplot_scales.py crashes when used with plt.tight_layout()
• #6922: imshow does not immediately update shared axes
• #11879: Unable to change filename when saving from figure window
• #12225: In histogram, bars whose count is larger than 2**31 sometimes become negative
• #1461: DOC: keyword arguments to plt.axes, plt.subplot, and fig.add_subplot
• #12173: Cannot import pyplot
• #12217: Python will suddenly not plot anymore
• #12120: Default legend behavior (loc=’best’) very slow for large amounts of data.
• #12176: import pyplot on MacOS without font cache will search entire subtree of current dir
• #12146: fix pdf docs
• #12160: MacOS: Cannot import name ‘format_exc’
• #12169: Cannot install 3.0.0 “python setup.py egg_info” failed (freetype & png)
• #12168: pip install v3.0.0 ‘failed with exit status 1181’
• #12107: warnings re: deprecated pytest API with pytest 3.8
• #12162: https://matplotlib.org/users/beginner.html is outdated
• #12010: Popover over plot is very slow
• #6739: Make matplotlib fail more gracefully in headless environments
• #3679: Runtime detection for default backend
• #11340: matplotlib fails to install from source with intel compiler
• #11838: docs do not build on py3.7 due to small change in python handling of -m
• **#12115**: Plot in JS Animation has larger margin than “normal” PNG plot

### 6.1.2 GitHub Stats for Matplotlib 3.1.0

GitHub stats for 2018/09/18 - 2019/05/13 (tag: v3.0.0)

These lists are automatically generated, and may be incomplete or contain duplicates.

We closed 161 issues and merged 918 pull requests. The full list can be seen [on GitHub](https://github.com/mpl-dev/mpl). The following 150 authors contributed 3426 commits.

- Abhinuv Nitin Pitale
- Adam J. Stewart
- Alistair Muldal
- Alon Hershenhorn
- Andras Deak
- Ankur Dedania
- Antony Lee
- Anubhav Shrimal

GitHub issues and pull requests:

Pull Requests (918):

• PR #14209: Backport PR #14197 on branch v3.1.x (Minor cleanup of acorr/xcoor docs)
• PR #14210: Make intro tutorial less jargony.
• PR #14197: Minor cleanup of acorr/xcoor docs
• PR #14203: Backport PR #14202 on branch v3.1.x (Fix docstring of Line2D.set_data.)
• PR #14202: Fix docstring of Line2D.set_data.
• PR #14196: Backport PR #14188 on branch v3.1.x (Clarify scope of MouseEvent attributes)
• PR #14188: Clarify scope of MouseEvent attributes
• PR #14194: Backport PR #14167 on branch v3.1.x (Fix backend_pgf header.)
• PR #14193: Backport PR #14153 on branch v3.1.x (Update qt_compat.py test for already imported binding.)
• PR #14167: Fix backend_pgf header.
• PR #14153: Update qt_compat.py test for already imported binding.
• PR #14190: Backport PR #14176 on branch v3.1.x (Merge doc/api/api_overview and doc/api/index.)
• PR #14192: Unbreak testsuite for pytest 4.5.
• PR #14189: Backport PR #14186 on branch v3.1.x (Update FancyBboxPatch docs to numpydoc style)
• PR #14176: Merge doc/api/api_overview and doc/api/index.
• PR #14186: Update FancyBboxPatch docs to numpydoc style
• PR #14187: Backport PR #13169 on branch v3.1.x (Add example code for current logo)
• PR #14165: Backport PR #14156 on branch v3.1.x (Fix glyph loading in textpath.)
• PR #14156: Fix glyph loading in textpath.
• PR #14162: Backport PR #14150 on branch v3.1.x (Fix deprecation of withdash for figtext().)
• PR #14150: Fix deprecation of withdash for figtext().
• PR #14136: Backport PR #14109 on branch v3.1.x
• PR #14109: Some simple pyplot doc improvements
• PR #14129: Backport PR #14117 on branch v3.1.x (Simplify ribbon_box example.)
• PR #14128: Backport PR #14057 on branch v3.1.x (Improve Gradient bar example)
• PR #14127: Backport PR #14125 on branch v3.1.x (Remove extra keyword from pytest.skip call.)
• PR #14117: Simplify ribbon_box example.
• PR #14057: Improve Gradient bar example
• PR #14125: Remove extra keyword from pytest.skip call.
• PR #14123: Backport PR #14119 on branch v3.1.x (Add ridge_map to third party packages documentation)
• PR #14119: Add ridge_map to third party packages documentation
• PR #14103: Backport PR #14088 on branch v3.1.x (Cleanup major_minor_demo.)
• PR #14102: Backport PR #14100 on branch v3.1.x ( Improve docstring of axes_zoom_effect example.)
• PR #14099: Backport PR #14090 on branch v3.1.x (Pep8ify some variable names in examples.)
• PR #14100: Improve docstring of axes_zoom_effect example.
• PR #14088: Cleanup major_minor_demo.
• PR #14090: Pep8ify some variable names in examples.
• PR #14097: Backport PR #14079 on branch v3.1.x (Consistently use axs.flat instead of axs.flatten())
• PR #14095: Backport PR #14087 on branch v3.1.x (Cleanup date example.)
• PR #14094: Backport PR #14029 on branch v3.1.x (Fix doc building with numpydoc 0.9)
• PR #14093: Backport PR #14052 on branch v3.1.x (Check axes identity in image.contains.)
• PR #14092: Backport PR #14056 on branch v3.1.x (FIX: do not try to manage the visibility of un-drawn ticks)
• PR #14091: Backport PR #14078 on branch v3.1.x (Minor fix in multiple subplots example)
• PR #14079: Consistently use axs.flat instead of axs.flatten()
• PR #14078: Minor fix in multiple subplots example
• PR #14080: Backport PR #14069 on branch v3.1.x (Don’t try to use the colorbar formatter to format RGBA data.)
• PR #14069: Don’t try to use the colorbar formatter to format RGBA data.
• PR #14074: Backport PR #14019 on branch v3.1.x (Update docstring of locator_params())
• PR #14019: Update docstring of locator_params()
• PR #14066: Backport PR #14053 on branch v3.1.x (Improve fill() example)
• PR #14065: Backport PR #14059 on branch v3.1.x (Improve Scatter hist example)
• PR #14067: Backport PR #14062 on branch v3.1.x (Improve advanced quiver example)
• PR #14062: Improve advanced quiver example
• PR #14053: Improve fill() example
• PR #14059: Improve Scatter hist example
• PR #14064: Backport PR #14043 on branch v3.1.x (Ensure errorbars are always drawn on top of bars in ax.bar)
• PR #14043: Ensure errorbars are always drawn on top of bars in ax.bar
• PR #14061: Backport PR #14051 on branch v3.1.x (Add Yellowbrick to third party packages)
• PR #14051: Add Yellowbrick to third party packages
• PR #14050: Backport PR #14048 on branch v3.1.x (Fix Animation.save)
• PR #14049: Backport PR #14047 on branch v3.1.x (Remove references to "Draws" in matplotlib.patches)
• PR #14048: Fix Animation.save
• PR #14047: Remove references to "Draws" in matplotlib.patches
• PR #14037: Backport PR #14033 on branch v3.1.x (Reword add_subplot docstring.)
• PR #14036: Backport PR #14001 on branch v3.1.x ([BUG] DOC: Remove broken references to vischeck)
• PR #14033: Reword add_subplot docstring.
• PR #14032: Backport PR #14030 on branch v3.1.x (Update colorcet link)
• PR #14030: Update colorcet link
• PR #14027: Backport PR #14026 on branch v3.1.x (Fix bug in plot_directive that caused links to plots in different formats to be missing)
• PR #14026: Fix bug in plot_directive that caused links to plots in different formats to be missing
• PR #14012: Backport PR #14008 on branch v3.1.x (Don’t install tests by default.)
• PR #14017: Backport PR #14015 on branch v3.1.x (Fix docstring of pyplot.clim())
• PR #14015: Fix docstring of pyplot.clim()
• PR #14008: Don’t install tests by default.
• PR #14006: Backport PR #13998 on branch v3.1.x (Fix patch contains logic for patches that don’t have any codes)
• PR #14005: Backport PR #14004 on branch v3.1.x (DOC: pin numpydoc to less than 0.9)
• PR #13998: Fix patch contains logic for patches that don’t have any codes
• PR #13999: Backport PR #13992 on branch v3.1.x (FIX: undeprecate MaxNLocator default_params)
• PR #13997: Backport PR #13995 on branch v3.1.x (DOC: explain zorder for gridlines in grid docstring)
• PR #13992: FIX: undeprecate MaxNLocator default_params
• PR #13995: DOC: explain zorder for gridlines in grid docstring
• PR #13990: Backport PR #13989 on branch v3.1.x (FIX: update not replace hist_kwargs when density is passed)
• PR #13989: FIX: update not replace hist_kwargs when density is passed
• PR #13975: Backport PR #13966 on branch v3.1.x (Fix colorbar setting without artist)
• PR #13976: Backport PR #13973 on branch v3.1.x (BUG: Ensure docstrings are not accessed with -OO)
• PR #13856: What’s new page for 3.1
• PR #13966: Fix colorbar setting without artist
• PR #13973: BUG: Ensure docstrings are not accessed with -OO
• PR #13969: Backport PR #13950 on branch v3.1.x (confidence_ellipse_markup)
• PR #13950: confidence_ellipse_markup
• PR #13965: Backport PR #13962 on branch v3.1.x (Fix typo in code example in docstring.)
• PR #13964: Backport PR #13870 on branch v3.1.x (3.1.0 API changes page)
• PR #13962: Fix typo in code example in docstring.
• PR #13870: 3.1.0 API changes page
• PR #13961: Backport PR #13914 on branch v3.1.x (Improve Rainbow text example)
• PR #13960: Backport PR #13958 on branch v3.1.x (Remove transparent fancy legend example)
• PR #13914: Improve Rainbow text example
• PR #13958: Remove transparent fancy legend example
• PR #13956: Backport PR #13908 on branch v3.1.x (Enh control tick deconflict2)
• PR #13955: Backport PR #13941 on branch v3.1.x (Add project_urls to setup)
• PR #13908: Enh control tick deconflict2
• PR #13954: Backport PR #13949 on branch v3.1.x (DOC: Add documentation to Text.set_fontfamily)
• PR #13941: Add project_urls to setup
• PR #13949: DOC: Add documentation to Text.set_fontfamily
• PR #13951: Backport PR #13939 on branch v3.1.x (Bunch of docstring cleanups.)
• PR #13939: Bunch of docstring cleanups.
• PR #13947: Backport PR #13897 on branch v3.1.x (numydocification.)
• PR #13897: numydocification.
• PR #13946: Backport PR #13924 on branch v3.1.x (Followup to deprecation of usetex parameter in get_text_path.)
• PR #13924: Followup to deprecation of usetex parameter in get_text_path.
• PR #13916: Backport PR #13850 on branch v3.1.x (Cleanup STIX Font Demo)
• PR #13915: Backport PR #13835 on branch v3.1.x (Improve Connectionstyle Demo)
• PR #13850: Cleanup STIX Font Demo

• PR #12748: Use the builtin GTK3 FileChooser rather than our custom subclass.
• PR #12781: Lazy import of private modules
• PR #11218: fix pkg-config handling to make cross-compiling work
• PR #13531: Backport PR #11964 on branch v3.1.x (Simplify extension setup.)
• PR #11964: Simplify extension setup.
• PR #13529: Backport PR #13525 on branch v3.1.x (Move some links in rst out of running text.)
• PR #13528: Backport PR #13526 on branch v3.1.x (DOC: fix Subplot calls)
• PR #13525: Move some links in rst out of running text.
• PR #13526: DOC: fix Subplot calls
• PR #13523: Backport PR #13521 on branch v3.1.x (Small cleanup to headings of 3d examples.)
• PR #13521: Small cleanup to headings of 3d examples.
• PR #13519: Backport PR #12716 on branch v3.1.x (FIX: return the actual ax.get_window_extent)
• PR #13518: Backport PR #12839 on branch v3.1.x (BUG: Prevent Tick params calls from overwriting visibility without being told to)
• PR #12716: FIX: return the actual ax.get_window_extent
• PR #12839: BUG: Prevent Tick params calls from overwriting visibility without being told to
• PR #13517: Fix heading hierarchy in annotation tutorial.
• PR #13516: Backport PR #13514 on branch v3.1.x (Add missing show() at end of example.)
• PR #13514: Add missing show() at end of example.
• PR #13512: Backport PR #13511 on branch v3.1.x (Add missing plt.show() at end of example.)
• PR #13511: Add missing plt.show() at end of example.
• PR #13508: Backport PR #13413 on branch v3.1.x (Simplify decade up- and down-rounding, and symmetrize expansion of degenerate log scales.)
• PR #13509: Backport PR #13492 on branch v3.1.x (Doc more release updates)
• PR #13492: Doc more release updates
• PR #13413: Simplify decade up- and down-rounding, and symmetrize expansion of degenerate log scales.
• PR #13507: Backport PR #13488 on branch v3.1.x (Animation: interactive zoom/pan with blitting does not work)
• PR #13488: Animation: interactive zoom/pan with blitting does not work
• PR #13505: Backport PR #13459 on branch v3.1.x (Document histogramming pre-binned data.)
• PR #13503: Backport PR #10776 on branch v3.1.x (fix FancyArrowPatch picker fails depending on arrowstyle)
• PR #13504: Backport PR #13123 on branch v3.1.x (Add shading to Axes3D.voxels, and enable it by default)
• PR #13502: Backport PR #13180 on branch v3.1.x (Various TextPath cleanups.)
• PR #13459: Document histogramming pre-binned data.
• PR #13501: Backport PR #13209 on branch v3.1.x (Deprecate support for (n, 1)-shaped error arrays in errorbar().)
• PR #13500: Backport PR #12763 on branch v3.1.x (Remove deprecated rcParams.)
• PR #13123: Add shading to Axes3D.voxels, and enable it by default
• PR #13499: Backport PR #13303 on branch v3.1.x (Unify checking of executable info.)
• PR #10776: fix FancyArrowPatch picker fails depending on arrowstyle
• PR #13180: Various TextPath cleanups.
• PR #13498: Backport PR #13314 on branch v3.1.x (Move major/minor tick overstrike logic to Axis.)
• PR #13209: Deprecate support for (n, 1)-shaped error arrays in errorbar().
• PR #12763: Remove deprecated rcParams.
• PR #13303: Unify checking of executable info.
• PR #13497: Backport PR #13057 on branch v3.1.x (Simplify callable(self._contains) checks)
• PR #13314: Move major/minor tick overstrike logic to Axis.
• PR #13057: Simplify callable(self._contains) checks
• PR #13496: Backport PR #13465 on branch v3.1.x (FIX: polar set_rlim allow bottom-only call)
• PR #13465: FIX: polar set_rlim allow bottom-only call
• PR #13495: Backport PR #12232 on branch v3.1.x (Add helper function to check that an argument is in a list of strings.)
• PR #12232: Add helper function to check that an argument is in a list of strings.
• PR #11708: Revert “Skip wx interactive tests on OSX.”
• PR #13062: Update FAQ re: batch/webserver use.
• PR #12904: Support forward/backward mouse buttons
• PR #12150: Deprecate stackrel.
• PR #13449: Let boxplot() defer rcParams application to bxp()
• PR #13425: API: un-deprecate keyword only args to set_xlim, set_ylim
• PR #13447: Update axes_grid docs
• PR #13473: Deprecate backend_wx.IDLE_DELAY.
• PR #13476: Add font to pyplot.xkcd()
• PR #13475: Cleanup titles of embedding examples.
• PR #13468: Suppress chaining of cache lookup failure in color conversion.
• PR #13467: Add “c” shorthand for “color” for the Text class.
• PR #13398: FIX: let pandas IndexInt64 work for boxplot
• PR #13375: Improve Axes selection in Qt figure options.
• PR #13421: DOC: update release guide
• PR #13275: Simple logging interface.
• PR #13427: Simplify check for tight-bbox finiteness.
• PR #13444: Allow constructing boxplots over multiple calls.
• PR #13385: Remove/rework uses of np.where where possible.
• PR #13441: Make AFM parser both more compliant and less strict.
• PR #13384: Replace np.compress by boolean indexing.
• PR #13422: Clarify IndexError for out-of-bounds indexing of gridspec.
• PR #13443: Remove some outdated comments from rcsetup.py.
• PR #13357: Inherit some docstrings in backend code.
• PR #12380: Stem speedup2
• PR #13368: FIX: Fix shape of hist output when input is multidimensional empty list
• PR #5590: [mpl_toolkits] Fix picking for things drawn on parasite axes
• PR #13323: Move the call to Formatter.set_locs into Formatter.format_ticks.
• PR #13424: Deprecate Quiver.color in favor of Quiver.get_facecolor().
• PR #13434: More smoketesting of pcolorfast.
• PR #13395: Cleanup demo_curvelinear_grid.
• PR #13411: Deemphasize numeric locations for legend() in docs.
• PR #13419: FIX: secondary_axis resize
• PR #13020: Deprecate proj3d.mod.
• PR #13030: Deprecate internal functions exposed in the public API of mplot3d
• PR #13408: test_figure style fixes.
• PR #11127: Legend for Scatter
• PR #11855: Adding the possible to add full command line in animation
• PR #13409: Add nonsingular to the locator base class, and use it in set_*lim too.
• PR #11859: ENH: add secondary x/y axis
• PR #13235: Vectorize mplot3d.art3d.zalpha.
• PR #10411: New “accepts units” decorator
• PR #13403: FIX: remove idle_event
• PR #13069: 5 minor divisions when major ticks are 2.5 units apart
• PR #13402: Fix empty reshape2d
• PR #11683: Reuse axes_grid1’s AxisDict in axisartist, instead of duplicating it.
• PR #12141: Let digits toggle axes nav only if they correspond to an existing axes.
• PR #9845: Add inaxes method to FigureCanvas to check whether point is in an axes.
• PR #13396: mpl_toolkits style fixes.
• PR #11497: Make CI fail if interactive toolkits can’t be tested
• PR #11595: test doc rendering
• PR #13393: Deprecate Spine.is_frame_like.
• PR #13391: Remove colour specification from some examples
• PR #13386: Replace use of np.<ufunc> by operators (</&/|).
• PR #13389: Inherit more docstrings.
• PR #13387: Fix regression in docstring.dedent_interpd.
• PR #13383: Replace np.take by normal indexing.
• PR #13381: Avoid unneeded copies from flatten().
• PR #13354: Properly deprecate non-1D inputs to pie().
• PR #13379: Remove citation entry from FAQ.
• PR #13380: Minor simplifications to scatter3d.
• PR #13173: Decorator for deleting a parameter with a deprecation period.
• PR #8205: [MRG+1] plot_date() after axhline() doesn’t rescale axes
• PR #11027: Specify custom tick space heuristic in MaxNLocator
• PR #13262: Shorten setupext and remove uninformative build log entries.
• PR #13377: Add private helper to internally suppress deprecations.
• PR #13376: Undeprecate case-insensitive “long” colormenames.
• PR #13373: Deprecate axis3d.Axis.get_tick_positions.
• PR #13362: Kill the unused, private _get_pixel_distance_along_axis.
• PR #12772: Improve plot() docstring.
• PR #13359: DOC: change language a bit
• PR #13351: Fix: Log Colorbar minorticks_off reverted if ticks set
• PR #13356: More spelling fixes.
• PR #13125: Simplify and tighten the docstring handling API.
• PR #13346: Simplify parsing of tuple in C extension code.
• PR #13282: MAINT install of pinned vers for travis
• PR #13234: FIX: allow colorbar mappable norm to change and do right thing
• PR #13269: Rework a bit axes addition.
• PR #13330: Add Axis.get_inverted and Axis.set_inverted.
• PR #13117: Cleanup matplotlib.use
• PR #13335: Update and factor out Axis.get_tick_positions.
• PR #13324: Cleanup ScalarFormatter; preparatory to moving it to format_ticks.
• PR #13322: Update Axis docs
• PR #13342: Update some (mostly internal) docstrings in image.py.
• PR #11848: Country specific characters in Windows user folder name when locating .tfm-file
• PR #13309: bezier cleanups.
• PR #13334: Inherit some docstrings.
• PR #13332: Rewrite convert_to_string using std::string
• PR #13336: Update imshow docs.
• PR #13331: Try forcing font cache rebuild in flaky ttc test.
• PR #12105: API: make MaxNLocator trim out-of-view ticks before returning
• PR #13329: Pin flake8<3.7 to mitigate issues with flake8-per-file-ignores
• PR #13319: Deprecate dates.{str,bytes}pdate2num.
• PR #13320: Kill some private, unused functions in dates.py.
• PR #12909: Let Formatters format all ticks at once.
• PR #13313: Better explanation of ticks
• PR #13310: Replace *kw by *args.
• PR #13285: Defer checking of tex install to when it is actually used.
• PR #13128: Parameter-renaming decorator
• PR #13307: Spelling fixes.
• PR #13304: TST: deregister pandas
• PR #13300: Trivial bezier cleanups.
• PR #11664: FIX: clean up unit conversion unpacking of data, particularly for dates and pandas series
• PR #9639: Unify querying of executable versions
• PR #13224: numpydocify (some of) mpl_toolkits.
• PR #13301: Replace np.empty + ndarray.fill by np.full.
• PR #13229: Prevent exception when running animation on Agg backend.
• PR #13263: In imsave()’s Pillow-handled case, don’t create a temporary figure.
• PR #13294: Simplify some calculations in polar.py.
• PR #13295: Kill some commented-out code.
• PR #13298: Add note about thread safety to FAQ.
• PR #13299: Don’t emit a non-GUI warning when building the docs on Linux.
• PR #13297: Minor cleanup to OSX FAQ.
• PR #13283: Fix doc style in add_gridspec()
• PR #13129: ENH: add a user-friendly verbose interface
• PR #13279: Remove a useless catch_warnings() from example.
• PR #13268: Select RadioButtons by closest in position.
• PR #13271: Fix animation speed in double_pendulum example
• PR #13265: Allow turning off minor ticks on Colorbar with LogNorm
• PR #13260: Improve docs for format determination in savefig()/imsave().
• PR #12379: MAINT Use np.full when possible
• PR #12905: Add optional parameter use_default_template to rc_file()
• PR #13218: Fix checking of ‘labels’ argument to Sankey.add.
• PR #13256: DOC: reject MEP25 due to being stalled
• PR #13255: TST pandas support bar
• PR #13251: DEBUG-log font-matching results, and print failing logs on CI.
• PR #12818: Enh arbitrary scale
- PR #13187: FIX: bar mixed units, allow ValueError as well
- PR #13232: Fix incorrect kwarg being passed to TextPath.
- PR #13250: Replace safezip() by more informative error message in errorbar().
- PR #13239: Improve sankey logging.
- PR #13247: Simplify and optimize png writing in backend_pdf.
- PR #12455: Warn when “best” loc of legend is used with lots of data
- PR #13233: Remove warning in image_annotated_heatmap, and numpydocify it.
- PR #13248: Remove an unused local variable in backend_gtk3.
- PR #13249: Deprecate an unused “internal” API.
- PR #13243: Rewrite subplots_demo
- PR #13240: FIX: spelling error of local variable in category
- PR #13026: MNT: add a logging call if a categorical string array is all convertible
- PR #13225: Fix a warning in the doc build.
- PR #13227: Make color lowercase in example to avoid warning.
- PR #13217: numpydocify Sankey.add.
- PR #10209: Various backend cleanups.
- PR #13113: Globally cache single TexManager instances.
- PR #13213: Broadcast ‘orientations’ arg to Sankey.add.
- PR #13219: Fix some backend_bases docstrings.
- PR #13214: Reformat Sankey exceptions.
- PR #13211: Deprecate case-insensitive colors.
- PR #13210: Suppress a warning in the test suite.
- PR #13189: Remove cairo-based backends from backend fallback.
- PR #13207: Allow saving PNGs through Pillow instead of the builtin _png module.
- PR #13124: Simplify parsing of errorbar input.
- PR #13162: DOC: better argcheck bar
- PR #8531: Added compression option to save TIFF images
- PR #13094: Allow passing arguments to PIL.Image.save().
- PR #13202: Avoid private API in some examples.
- PR #13197: Cleanup the text of two mpl_toolkits examples.
- PR #13198: Cleanup SkewT example.
- PR #11914: Remove the system_monitor example.
- PR #13196: Deemphasize comment about extremely old Matplotlib versions in example.
- PR #13190: Show returncode when subprocess test fails
- PR #13163: Add explanatory comment to annotation box example
- PR #13104: Remove some more 1-tuples.
• PR #13105: Make GridSpec.update docstring match behavior.
• PR #13127: Deprecate add_subplot(<no positional args>) silently doing nothing.
• PR #13166: Simplify Text.get_usetex.
• PR #13188: Remove an outdated doc point regarding backend selection.
• PR #13107: Cleanup BboxBase docstrings.
• PR #13108: Capitalize some docstrings.
• PR #13115: Check for sphinx_copybutton when building the docs
• PR #13151: Update RadioButtons docs numpydoc style
• PR #13178: Remove :func: markup from mlab docstrings.
• PR #7461: [WIP] add matrix checking function for quiver input
• PR #13089: Ensure that arguments to quiver() are not matrices.
• PR #13179: Avoid calling a deprecated API in axis_artist.
• PR #13170: Don’t try to find TeX-only fonts when layingout TeX text.
• PR #12957: Search also for user fonts on Windows (#12954)
• PR #12951: Make Text._get_layout simpler to follow.
• PR #11385: Add a get_zaxis method for 3d axes.
• PR #13172: Hyperlink DOIs to preferred resolver
• PR #13171: Document how to make colorbars “without“ a ScalarMappable.
• PR #12903: FIX: (broken)bar(h) math before units
• PR #13167: Typos on subplot comments and example
• PR #13005: Improve error messages for unit conversion
• PR #13147: Extend joinstyle example
• PR #13165: Change doc string for Axes.arrow()
• PR #13155: Let ffmpeg report errors.
• PR #13149: Update errorbar limits example
• PR #13074: Move_windowing extension into _tkagg.
• PR #13146: Remove an outdated comment in backend_wx.
• PR #13126: FIX: minor log ticks overwrite
• PR #13148: Update example Step Demo
• PR #13138: API: Use class-based directive in sphinxext
• PR #11894: add cache_frame_data kwarg into FuncAnimation. fixes #8528.
• PR #13136: Small cleanups.
• PR #13140: Remove an “cannot show figure in agg” warning in test suite.
• PR #13134: Simplify color conversion backcompat shim.
• PR #13141: Unpin pytest (pytest-cov’s latest release is compatible with it).
• PR #13133: Simplify the polys3d example.
• PR #12158: MNT: simplify valid tick logic
• PR #9867: Factor out common code between pdf and ps backends.
• PR #10111: Add set_data_3d and get_data_3d to Line3d
• PR #12245: Remove (some) features deprecated in mpl2.2
• PR #13119: Deprecate TextToPath.glyph_to_path.
• PR #13122: Pin pytest<4.1 to unbreak CI tests
• PR #13100: Restore the font cache on Travis.
• PR #12792: BUG: Ensure that distinct polygon collections are shaded identically
• PR #13070: cairo backend: default to pycairo
• PR #13114: BUG: calculate colorbar boundaries correctly from values
• PR #13111: Delete an unused private method.
• PR #10841: ENH: new date formatter
• PR #13093: Remove unused fontconfig conf file.
• PR #13063: Use default colour cycle in more examples
• PR #13103: Remove tight_bbox_test example.
• PR #13097: Replace 1-tuples by scalars where possible.
• PR #13027: Qt5 reset signals after non-interactive plotting
• PR #9787: Support (first font of) TTC files.
• PR #11780: ENH: Allow arbitrary coordinates for ConnectionPatch
• PR #12943: Update the font_table example.
• PR #13091: Improve MouseEvent str().
• PR #13095: Remove a duplicate attribute setting.
• PR #13090: Cleanup unused non-public imports.
• PR #13060: Move doc-requirements from root folder
• PR #13078: Convert streamplot to numpydoc
• PR #13088: Don’t use deprecated np.random.random_integers.
• PR #13073: Drop pytest version check in setupext.py.
• PR #12933: Deprecate backend_pgf.LatexManagerFactory.
• PR #12969: Clarify the implementation of _process_plot_var_args.
• PR #12472: Make FontManager.defaultFont a property, to avoid hardcoding the prefix.
• PR #11806: Allow to not draw the labels on pie chart
• PR #11983: Simplify version checks for freetype and libpng.
• PR #13050: FIX: always eraseRect in Qt widget
• PR #13065: FIX: print out the correct ip address when starting webagg
• PR #13061: Make examples that load msft.csv robust against locale changes.
• PR #13042: cairo: remove the append_path() fast path
- PR #13058: pathlibify/cleanup triage_tests.py.
- PR #12995: Don’t split creation of deprecation message and choice of warning class.
- PR #12998: Init MaxNLocator params only once
- PR #11691: Make Figure.frameon a thin wrapper for the patch visibility.
- PR #11735: Change {FigureCanvasAgg,RendererAgg}.buffer_rgba to return a memoryview.
- PR #12831: Reuse scale from sharing axis when calling cla().
- PR #12962: Deprecate setting the same property under two different aliases.
- PR #12973: Fix item check for pandas Series
- PR #13049: Add boxplot.flierprops.markeredgewidth rcParam
- PR #13048: Fix section names for numpydoc
- PR #10928: Simplify (quite a bit...) _preprocess_data
- PR #13039: Speed up Path.iter_segments()
- PR #12992: Adding rcParams[‘scatter.edgecolors’] defaulting to ‘face’
- PR #13014: Drop pgf support for the GTK3 backend
- PR #12215: Cleanup initialization in text()
- PR #13029: Fix vertical alignment of text
- PR #12968: Simpler and stricter process_plot_format.
- PR #12989: Avoid spamming tests with warnings re: deprecation of pprint_val.
- PR #13032: fix typo in docstring in axis_artist.py
- PR #13025: MNT: add one more alias for tacaswell to mailmap
- PR #13010: Fix a format error in documenting_mpl.rst
- PR #12997: Add sphinx-copybutton to docs
- PR #12422: Scatter color: moving #10809 forward
- PR #12999: Format MaxNLocator with numpydoc
- PR #12991: Canonicalize weights extracted for AFM fonts.
- PR #12955: Cleanup cursor_demo.
- PR #12984: Cleanup GTK examples.
- PR #12986: Minor cleanup to double_pendulum example.
- PR #12959: Update the documentation of Cursor
- PR #12945: Correctly get weight & style hints from certain newer Microsoft fonts
- PR #12976: ENH: replace deprecated numpy header
- PR #12975: Fail-fast when trying to run tests with too-old pytest.
- PR #12970: Minor simplifications.
- PR #12974: Remove some checks for Py<3.6 in the test suite.
- PR #12779: Include scatter plots in Qt figure options editor.
• PR #12459: Improve formatting of imshow() cursor data when a colorbar exists.
• PR #12927: MAINT: Correctly handle empty lists in zip unpacking in mplot3d.art3d
• PR #12919: Suppress deprecation warning when testing drawstyle conflict
• PR #12956: Misc. cleanups.
• PR #12924: Deprecate public use of Formatter.pprint_val.
• PR #12947: Support ~ as nonbreaking space in mathtext.
• PR #12944: Fix the title of testing_api
• PR #12136: MAINT: Unify calculation of normal vectors from polygons
• PR #12880: More table documentation
• PR #12940: Avoid pyplot in showcase examples.
• PR #12935: os.PathLike exists on all supported Pythons now.
• PR #12936: Minor updates following bump to Py3.6+.
• PR #12932: Simplify argument checking in Table._getitem_.
• PR #12930: Shorten an argument check.
• PR #12538: MNT: drop 3.5 testing for 3.1 branch
• PR #12868: Simplify use of Path._fast_from_codes_and_verts.
• PR #12300: API: Polar: allow flipped y/rlims....
• PR #12861: Don’t use deprecated wx.NewId().
• PR #12908: Allow all valid hist.bins strings to be set in the rcparams
• PR #12902: Kill dead code in textpath.
• PR #12885: Improve margins in formlayout
• PR #12877: fooImage -> foo_image in testing/compare.py
• PR #12845: Deprecate silent dropping of unknown arguments to TextPath().
• PR #12852: Cleanup collections docs.
• PR #12888: Properly enable forward/backward buttons on GTK3
• PR #12865: Avoid 1-tick or 0-tick log-scaled axis.
• PR #12844: Remove unused, private _process_text_args.
• PR #12881: Fix string comparison
• PR #12863: FIX: translate timedeltas in _to_ordinalf
• PR #12640: Introduce MouseButton enum for MouseEvent.
• PR #12897: Reword a bit the contour docs.
• PR #12898: Validate rcParams[“image.origin”].
• PR #12882: Write error messages to logger instead of stderr
• PR #12889: Deprecate public access to the vendored formlayout module.
• PR #12891: Add Azure Pipelines build badge
• PR #12883: MAINT Use list comprehension

6.1. Previous GitHub Stats

• PR #12886: Properly enable forward/backward buttons on Qt
• PR #12858: Bump oldest supported numpy to 1.11.
• PR #12876: Fix a typo
• PR #12739: make Axes._parse_scatter_color_args static
• PR #12846: Deprecate Path.has_nonfinite.
• PR #12829: Remove unused variables
• PR #12872: Inline references to RendererPS in backend_ps.
• PR #12800: documenting dtype of hist counts
• PR #12842: Fix message in nbagg connection_info()
• PR #12855: Cleanup axes/_base.py.
• PR #12826: Minor code cleanup
• PR #12866: Simplify stride calculations in loglocator.
• PR #12867: Drop compat code for outdated MSVC.
• PR #12218: Improve table docs
• PR #12847: correctly format ticklabels when EngFormatter is used with usetex = True
• PR #12851: Keep Collections and Patches property aliases in sync.
• PR #12849: Update docstrings in path.py, and small cleanups.
• PR #12805: Don’t insert spurious newlines by joining tex.preamble.
• PR #12827: Remove unused imports
• PR #12560: Add matplotlib.testing to the documentation
• PR #12821: MNT: remove debug from update_title_pos
• PR #12764: Cleanup Renderer/GraphicsContext docs.
• PR #12759: Warn on FreeType missing glyphs.
• PR #12799: Reword some colorbar docs.
• PR #12633: Added support for MacOSX backend for PyPy
• PR #12798: Replace assignments to array.shape by calls to reshape().
• PR #11851: Simpler check for whether a Framework Python build is being used.
• PR #12259: BUG: Fix face orientations of bar3d
• PR #12565: Make FontManager.score_weight less lenient.
• PR #12674: Allow “real” LaTeX code for pgf.preamble in matplotlibrc
• PR #12770: Simplify implementation of FontProperties.copy().
• PR #12753: MNT: remove _hold shims to support basemap + cartopy
• PR #12450: Attach a FigureCanvasBase by default to Figures.
• PR #12643: Allow unit input to FancyArrowPatch
• PR #12767: Make colorbars constructible with dataless ScalarMappable.
• PR #12526: Rename jquery files
• PR #12552: Update docs for writing image comparison tests.
• PR #12746: Use skipif, not xfail, for uncomparable image formats.
• PR #12747: Prefer log.warning("%s", ...) to log.warning("%s" % ...).
• PR #11753: FIX: Apply aspect before drawing starts
• PR #12749: Move toolmanager warning from logging to warning.
• PR #12598: Support Cn colors with n>=10.
• PR #12727: Reorder API docs: separate file per module
• PR #12738: Add unobtrusive deprecation note to the first line of the docstring.
• PR #11663: Refactor color parsing of Axes.scatter
• PR #12736: Move deprecation note to end of docstring
• PR #12704: Rename tkinter import from Tk to tk.
• PR #12715: Cleanup dviread.
• PR #12717: Delete some if __name__ == "__main__" clauses.
• PR #10575: FIX patch.update_from to also copy _original_edge/facecolor
• PR #12537: Improve error message on failing test pyplot_up_to_date
• PR #12721: Make get_scale_docs() internal
• PR #12706: Extend sphinx Makefile to cleanup completely
• PR #12481: Warn if plot_surface Z values contain NaN
• PR #12685: Make ticks in demo_axes_rgb.py visible
• PR #12523: Run flake8 before pytest on travis
• PR #12691: DOC: Link to "How to make a PR" tutorials as badge and in contributing
• PR #11974: Make code match comment in sankey.
• PR #12440: Make arguments to @deprecated/warn_deprecated keyword-only.
• PR #12470: Update AutoDateFormatter with locator
• PR #12586: Improve linestyles example
• PR #12006: Replace warnings.warn with cbook.warn_external or logging.warning
• PR #12659: Add note that developer discussions are private
• PR #12543: Make rcsetup.py flake8 compliant
• PR #12642: Don’t silence TypeErrors in fmt_{x,y}data.
• PR #12442: Deprecate passing drawstyle with linestyle as single string.
• PR #12625: Shorten some docstrings.
• PR #12627: Be a bit more stringent on invalid inputs.
• PR #12629: Fix issue with PyPy on macOS
• PR #10933: Remove “experimental” fontconfig font_manager backend.
• PR #12600: Minor style fixes.
• PR #12570: Fix mathtext tutorial for build with Sphinx 1.8.
• PR #12487: Update docs/tests for the deprecation of aname and label1On/label2On/etc.
• PR #12521: Improve docstring of draw_idle()
• PR #12574: Remove some unused imports
• PR #12568: Add note regarding builds of old Matplotlibs.
• PR #12547: Disable sticky edge accumulation if no autoscaling.
• PR #12546: Avoid quadratic behavior when accumulating stickies.
• PR #11789: endless looping GIFs with PillowWriter
• PR #12525: Fix some flake8 issues
• PR #12516: Don’t handle impossible values for align in hist()
• PR #12500: Adjust the widths of the messages during the build.
• PR #12492: Simplify radar_chart example.
• PR #11984: Strip out pkg-config machinery for agg and libqhull.
• PR #12463: Document Artist.cursor_data() parameter
• PR #12482: Test slider orientation
• PR #12317: Always install mpl_toolkits.
• PR #12246: Be less tolerant of broken installs.
• PR #12477: Use \text{\Large MICRO SIGN} instead of \text{\Large GREEK SMALL LETTER MU} in EngFormatter.
• PR #12483: Kill FontManager.update_fonts.
• PR #12474: Throw ValueError when irregularly gridded data is passed to streamplot.
• PR #12466: np.fromstring -> np.frombuffer.
• PR #12369: Improved exception handling on animation failure
• PR #12460: Deprecate RendererBase.strip_math.
• PR #12453: Rollback erroneous commit to whats_new.rst from #10746
• PR #12452: Minor updates to the FAQ.
• PR #10746: Adjusted matplotlib.widgets.Slider to have optional vertical orientation
• PR #12441: Get rid of a signed-compare warning.
• PR #12430: Deprecate Axes3D.plot_surface(shade=None)
• PR #12435: Fix numpydoc parameter formatting
• PR #12434: Clarify documentation for textprops keyword parameter of TextArea
• PR #12427: Document Artist.get_cursor_data
• PR #10322: Use np.hypot whereever possible.
• PR #10809: Fix for scatter not showing points with valid x/y but invalid color
• PR #12423: Minor simplifications to backend_svg.
• PR #10356: fix detecting which artist(s) the mouse is over
• PR #10268: Dvi caching
• PR #10238: Call kpsewhich with more arguments at one time
• PR #10236: Cache kpsewhich results persistently
• PR #4675: Deprecate color keyword argument in scatter
• PR #5054: Diverging norm
• PR #12416: Move font cache rebuild out of exception handler
• PR #4762: Traitlets
• PR #5414: WIP: New FreeType wrappers
• PR #3875: ENH: passing colors (and other optional keyword arguments) to violinplot()
• PR #1959: PS backend optionally jpeg-compresses the embedded images
• PR #11891: Group some print()s in backend_ps.
• PR #12165: Remove deprecated mlab code
• PR #12387: Update HTML animation as slider is dragged
• PR #12333: ENH: add colorbar method to axes
• PR #10088: Deprecate Tick.{gridOn,tick1On,label1On,...} in favor of set_visible.
• PR #12393: Deprecate to-days converters in matplotlib dates
• PR #11232: FIX: fix figure.set_dpi when pixel ratio not 1
• PR #12247: Machinery for deprecating properties.
• PR #12371: Move check for ImageMagick Windows path to bin_path().
• PR #12384: Cleanup axislines style.
• PR #9565: Stem performance boost
• PR #12368: Don’t use stdlib private API in animation.py.
• PR #12351: dviread: find_tex_file: Ensure the encoding on windows
• PR #12372: Remove two examples.
• PR #12356: Fix stripping of CRLF on Windows.
• PR #12283: FIX: errorbar xywhere should return ndarray
• PR #12304: TST: Merge Qt tests into one file.
• PR #12340: Catch test deprecation warnings for mlab.demean
• PR #12296: Make FooConverter inherit from ConversionInterface in examples
• PR #12309: Deduplicate implementations of FooNorm.autoscale{,_None}
• PR #7716: [NF] Add ‘truncate’ and ‘join’ methods to colormaps.
• PR #12314: Deprecate axis(‘normal’) in favor of axis(‘auto’).
• PR #12307: Clarify missing-property error message.
• PR #12260: Fix docs : change from issue #12191, remove ”if 1:” blocks in examples
• PR #12253: Handle utf-8 output by kpathsea on Windows.
• PR #12292: TST: Modify the bar3d test to show three more angles
• PR #12284: Don’t try to autoscale if no data present to autoscale to
• PR #12255: Deduplicate inherited docstrings.
• PR #12222: Remove extraneous if 1 statements in demo_axisline_style.py
• PR #12137: MAINT: Vectorize bar3d
• PR #12219: Merge OSXInstalledFonts into findSystemFonts.
• PR #12229: Less ACCEPTS, more numpydoc.
• PR #11621: TST: make E402 a universal flake8 ignore
• PR #12231: CI: Speed up Appveyor repository cloning
• PR #11661: Update blocking_input.py
• PR #12199: Allow disabling specific mouse actions in blocking_input
• PR #12210: Axes.tick_params() argument checking
• PR #12211: Fix typo
• PR #12200: Slightly clarify some invalid shape exceptions for image data.
• PR #12151: Don’t pretend @deprecated applies to classmethods.
• PR #12190: Remove some unused variables and imports
• PR #12192: Exclude examples from lgtm analysis
• PR #12196: Give Carreau the ability to mention the backport bot.
• PR #12171: Remove internal warning due to zsort deprecation
• PR #12030: Speed up canvas redraw for GTK3Agg backend.
• PR #12156: Cleanup the GridSpec demos.
• PR #12144: Add explicit getters and setters for Annotation.anncoords.
• PR #12152: Use _warn_external for deprecations warnings.
• PR #12147: DOC: update the gh_stats code
• PR #12139: Unbreak build re: mplot3d style.
• PR #11367: Raise TypeError on unsupported kwargs of spy()
• PR #9990: Fix and document lightsource argument in mplot3d
• PR #12124: Correctly infer units from empty arrays
• PR #11994: Cleanup unused variables and imports
• PR #12122: MNT: re-add chook import art3d
• PR #12086: FIX: make MaxNLocator only follow visible ticks for order of magnitude
• PR #12032: Remove unused imports
• PR #12093: Correct the removal of -Wstrict-prototypes from compiler flags.
• PR #12069: Style fixes for mplot3d.
• PR #11997: Cleanup some axes_grid1 examples
• PR #12098: Improve layout of HTML animation
• PR #12094: Fine-tune logging notes in contributing.rst.
• PR #12079: Clarifications to im_show() doc regarding interpolation=’none’.
• PR #12068: More style fixes.
• PR #11499: FIX: layout for mixed descent multiline text objects
• PR #11921: FIX: allow reshape 2-D to return a bare 1-d list
• PR #12070: Avoid some uses of np.isscalar.
• PR #12067: DOC: make Line2D docstring definition easier to find
• PR #12054: More style fixes.
• PR #12066: fix indentation in docstring interpolation for spy.
• PR #11931: Remove separate autosummary_inher template.
• PR #12049: Make Poly3DCollection.set_zsort less lenient.
• PR #12050: Various cleanups.
• PR #12038: Modernize ArtistInspector a bit...
• PR #12033: DOC: formatting fixes to mplot3d
• PR #12051: Is bool
• PR #12045: Fix 999.9... edge case in ticker.EngFormatter for negative numbers
• PR #12044: Update doc on the progressive and optimize keywords in savefig
• PR #12061: Small refactor/simplification.
• PR #12060: INSTALL.rst fixes
• PR #12055: Fix invalid escape in docstring.
• PR #12026: whitespace(-mostly) style cleanup.
• PR #12043: Deprecate get_py2exe_datafiles.
• PR #12046: Make HTMLWriter constructor a bit more strict.
• PR #12034: Doc markup fixes.
• PR #11972: FIX: close mem leak for repeated draw
• PR #12024: Fix typos
• PR #11996: Minor javascript cleanup
• PR #11989: Remove support for ghostscript 8.60.
• PR #12004: Update acorr and xcorr docs to match numpy docs
• PR #11998: No clf() needed after creating a figure
• PR #12001: Do not use an explicit figum in plt.figure(1, ...) in simple cases
• PR #11999: Do not use an explicit fignum plt.figure(1) in simple cases
• PR #11995: Don’t use bare except statements
• PR #11993: DOC: fixed typos
• PR #11992: Use pytest.warns instead of home-baked warnings capture.
• PR #11975: Derive plt.figlegend._doc__ from Figure.legend._doc__.
• PR #11980: Remove __version__numpy__; simplify dependencies check.
• PR #11982: Remove and old keyword documentation.
• PR #11981: Some extra typos
• PR #11979: Fix a couple of typos.
• PR #11959: cbook.iterable -> np.iterable.
• PR #11965: Move the removal of the -Wstrict-prototypes flag to setup.py.
• PR #11958: Remove unused code
• PR #11960: Make jpl_units a bit less painful to read.
• PR #11951: Improve Artist docstrings
• PR #11954: No need to define _log twice in matplotlib.dates.
• PR #11948: Minor fixes to docs and gitignore.
• PR #11777: Avoid incorrect warning in savefig
• PR #11942: Deprecate Artist.aname and Axes.aname
• PR #11935: Remove ginput demo example
• PR #11939: Improve alias signatures
• PR #11940: Do not use aliases of properties in internal code
• PR #11941: Fix test_large_subscript_title()
• PR #11934: More docstring cleanup of Line2D.
• PR #11922: Add LGTM.com code quality badge
• PR #11941: Improve docstrings of Line2D
• PR #11926: Minor fix to ginput_demo.
• PR #11912: BLD: update PR template for flake8
• PR #11909: Simplify linestyle and fillstyle reference docs.
• PR #11502: FIX: move title(s) up if subscripts hang too low.
• PR #11906: fix format of bar_of_pie example
• PR #11741: Factor out common code between Patch.draw and FancyArrowPatch.draw.
• PR #11784: Argument checking for grid()
• PR #11888: Factor out a subprocess log-and-check helper.
• PR #11740: Deprecate support for 3rd-party backends without set_hatch_color.
• PR #11884: Deprecate the tk_window_focus function.
• PR #11689: Don’t cache the renderer on the Axes instance.
• PR #11698: For property, use decorator or lambdas.
• PR #11872: Make all builtin cmaps picklable.
• PR #11870: More style fixes.
• PR #11873: Remove mention of deprecated/removed methods from mlab’s docstring.
• PR #11869: Style fixes.
• PR #11874: Remove some remnants of Py2-handling in test_rcparams.
• PR #11865: example file for making a bar of pie chart
• PR #11868: mathtext.py style fixes.
• PR #11854: Accept anything that’s not a directory for $MATPLOTLIBRC.
• PR #11589: WIP ENH secondary axes:
• PR #8449: Including Additional Metadata using the SVG Backend
• PR #11465: ENH: optimize Collection non-affine transform to call transform once

Issues (161):
• #4001: Qt5 Backend: dblclick is always False on ‘mouse_release_event’
• #14152: qt_compat.py performing wrong test for PyQt5
• #10875: Annotation.contains and FancyArrow.contains return incorrect values
• #458: JPG quality keyword in savefig
• #4354: scatter not showing valid x/y points with invalid color
• #14113: scatter could not raise when colors are provided but position data are empty
• #14003: numpydoc 0.9 breaks doc build
• #14054: ticks sometimes disappear when zooming interactively
• #10189: The data decorator does not integrate well with numpydoc
• #14034: pyplot plot raises ValueError when plotting NaN against datetime dates
• #14039: bar plot yerr lines/caps should respect zorder
• #14042: dynamic_image.py + saving animation broken
• #14013: osx backend not usable with ipython/jupyter from conda?
• #13993: Tests files installed by default?
• #13991: MaxNLocator.default_params deprecation may break Cartopy
• #5045: Axes.grid() not honoring specified “zorder” kwarg
• #4371: LaTeX and PGF preambles do not allow commas
• #13982: hist() no longer respects range=... when density=True
• #13963: Dataless colorbars break when updated
• #10381: Issue when setting scatter color in separate method call
• #13618: Minor ticklabels are missing at positions of major ticks.
• #13880: Adding documentation for Text.fontfamily default, set_fontfamily(None)?
• #13865: Appveyor broken
• #8636: plt.hist chooses improper range when using string-based bin options
• #7300: weird mathtext doc markup
• #8862: Replace mathcircled by textcircled
• #13759: DOC: matplotlib.patches.Arc
• #13785: imshow gives values out of the extent
• #13786: Cannot import matplotlib.animation
• #13561: Progress of animation.save (for long animations)
• #13735: title doesn’t move for ticklables....
• #12175: Example link near markevery in the “What’s new in 3.0” page is malformed/broken
• #13713: Boxplot xlim not correctly calculated
• #11070: Add a “density” kwarg to hist2d
• #11337: Cannot plot fully masked array against datetimes
• #10165: Adapt stem plot
• #10976: ENH: secondary axis for a x or y scale.
• #10763: Cairo in 2.2.0 not working for new backends
• #9737: setupext should not explicitly add /usr/\{,local/\}include to the include path
• #11217: Crash on zero-length FancyArrow
• #13623: do not cause warning in seaborn
• #13480: Segfault on help(‘modules’) command when matplotlib is installed
• #13604: legend’s framealpha kwarg does not apply when writing to an eps file
• #12311: ’off’ vs. False bug
• #10237: Setting an alpha value to a Poly3DCollection
• #11781: fill_between interpolation & nan issue
• #1077: 3d plots with aspect=’equal’
• #11761: Still naming inconsistency in API on axes limits
• #11623: Regression: “TypeError: Period(‘2000-12-31’, ‘D’) is not a string” when a Series with date index was plotted
• #12655: auto-ticks do not handle values near bounds gracefully
• #13487: labelfpad is not the spacing between the axis and the label
• #13540: Docs for matplotlib.pyplot.specgram() reference an unsupported mode setting
• #8997: Proposal: Grid arrangement by number of plots
• #6928: Cannot run setup.py build with numpy master
• #12697: Axes are drawn at wrong positions
• #13478: FuncAnimation: interactive zoom/pan with blitting does not work
• #11575: Setting axis ticks in log scale produces duplicate tick labels.
• #13464: set_rlim(bottom=...) no longer works
• #12628: Write canonical example of how to use Matplotlib inside a webserver
• #10022: boxplot: positions used to take Int64Index
• #11647: Disable buttons in ginput
• #12987: issues parsing AFM fonts
• #12667: Colorbar ticks....
• #13137: Travis for Python 3.7 sometimes fails due to missing font
• #7969: Stem is slow and will crash if I try to close the window
• #13002: Hist color kwarg broken for multiple empty datasets
• #5581: [mpl_toolkits] Things drawn on parasite axes don’t fire pick events
• #13417: Secondary axis doesn’t resize properly
• #8120: Inconsistent inset_axes position between show(), savefig(format=’png’) and savefig(format=’pdf’)
• #8947: Different result, slower runtime of heatmap between 2.0.0 and 2.0.1
• #13264: Use of logging in matplotlib
• #11602: animation error
• #12925: Python pandas datetime plot xticks in unexpected location
• #11025: AxesGrid ticks missing on x-axis
• #10974: Examples not shown in API docs for many methods.
• #13392: boxplot broken for empty inputs
• #12345: Need more tests for units and errorbar
• #10361: FigureCanvas.draw() with tight_layout() needs to be called twice with Matplotlib 2.1.0
• #11376: Temporary styling ignores color cycle
• #11546: import time
• #13286: AttributeError: ‘float’ object has no attribute ‘deg2rad’
• #11508: bi-directional perceptually flat colormaps in matplotlib?
• #12918: Mac shows an icon in the dock when using matplotlib.pyplot.
• #13339: Log Colorbar minorticks_off reverted if ticks set...
• #13228: MPL 3 + Colorbar + PowerNorm bug
• #13096: Matplotlib.get_backend()/matplotlib.use() cause NSException with Anaconda
• #7712: Number of ticks for dates still gives overlapping labels
• #9978: General poor default formatting of datetimes on plot x-axis
• #13253: imsave outputs JPEG with wrong dimension
• #11391: Use data argument for scatter plotting timestamps from pandas
• #13145: widgets.RadioButtons: select by closest in position
• #13267: “double-pendulum” example’s speed not correct / varying
• #13257: Allow turning off minorticks for Colorbar with LogNorm?
• #13237: Sankey basic gallery example is not rendered properly.
• #12836: matplotlib.rc_file resets to default template before updating rcparams
• #13186: ax.bar throws when x axis is pandas datetime
• #5397: Expose compression and filter PNG options through savefig
• #13142: Cannot plot bar graph with dates: “TypeError: ufunc subtract cannot use operands with types dtype(’<M8[ns]’) and dtype(’float64’)”
• #8530: Feature request: TIFF LZW compression support in savefig()
• #13139: font family ['serif'] not found. Falling back to DejaVu Sans
• #1558: Graceful handling of a numpy matrix
• #12954: Fonts installed in the user directory are not detected (Windows 1809)
• #3644: Feature Request: manually set colorbar without mappable
• #12862: broken_barh appears not to work with datetime/timedelta objects
• #11290: ax.bar doesn’t work correctly when width is a timedelta64 object
• #13156: DOC: matplotlib.pyplot.arrow
• #12990: Unclear error message for plt.xticks(names)
• #12769: Failing to save an animated graph with matplotlib.animation
• #13112: LogNorm colorbar prints double tick labels after set_ticks()
• #13132: BUG: matplotlib.sphinxext.plot_directive uses old function-based API
• #8528: Funcanimation memory leak?
• #8914: line3D set_data only takes in x and y data
• #8768: One one tick in a log-scale axis
• #13121: Tests fail with pytest 4.1
• #13098: Likely incorrect code(?) in colorbar.py
• #12562: Clean up unused imports
• #12106: plt.plot does not plot anything with named arguments
• #5145: Python [Error 17]No usable Temporary file name found
• #13012: qt5agg image quality changes when window is out of focus
• #13055: 127.0.0.1 hardcoded in webagg backend server
• #12971: Pandas Series not supported as data kwarg
• #13022: boxplot not showing symbols with seaborn style sheet
• #13028: Bad rotation_mode/center_baseline combination even if rotation=0
• #12745: Sphinx copy button for code block
• #12801: scatter() should not drop data points at nonfinite coordinates
• #12358: Dropping support for Py3.5 and numpy 1.10
• #12994: Axes range with set_xticks with categoricals
• #12993: Semantics of set_xticks for categoricals
• #12946: ~ in mathrm leads to Unknown symbol: mathrm
• #10704: Add documentation for set_rlim
• #11202: Using of ax.set_ylim() for polar plot leads to “posx and posy should be finite values” error
• #12859: DeprecationWarning: NewId() is deprecated in wxPython.
• #12817: Multiple places where Type Errors on cbook.warn_deprecated will happen
- #12308: #12253 FIX: Handle utf-8 output by kpathsea on Windows – possibly causing issues
- #12804: Usetex produces preamble with one character per line
- #12808: Issue with minor tick spacing in colorbar with custom Normalize class
- #12138: Faces of Axes3d.bar3d are not oriented correctly
- #12591: Adding FancyArrowPatch with datetime coordinates fails
- #11139: ”make clean” doesn’t remove all the build doc files
- #11908: Improve linestyle documentation
- #10643: Most warnings calls do not set the stacklevel
- #12532: Incorrect rendering of math symbols
- #11787: Looping gifs with PillowWriter
- #9205: after the animation encoder (e.g. ffmpeg) fails, the animation framework itself fails internally in various ways while trying to report the error
- #11154: Unexpected behavior for Axes3D.plot_surface(shade=None)
- #12121: Documentation of TextArea’s fontprops keyword argument is misleading
- #12191: ”if 1:” blocks in examples
- #12107: warnings re: deprecated pytest API with pytest 3.8
- #12010: Popover over plot is very slow
- #12118: Scatter: empty np.arrays with non-numeric dtypes cause TypeError
- #12072: MaxNLocator changes the scientific notation exponent with different number of tick labels
- #11795: Un-align animations created with to_jshtml()?
- #10201: Available fonts are ignored by font_manager
- #12065: Keyword interpolation behaving improperly while saving to SVG with savefig()
- #11498: Test layout with big descenders and multiple lines inconsistent.
- #11468: Layout managers have problems with titles containing MathText
- #11899: Histogram of list of datetimes
- #11956: apparent memory leak with live plotting
- #11587: Missing filled contours when using contourf
- #11716: errorbar pickling fails when specifying y error bars
- #11557: Hoping add a drawing function ’patch’ in matplotlib

GitHub issues and pull requests:

Pull Requests (120):

- **PR #14636**: Don’t capture stderr in _check_and_log_subprocess.
- **PR #14655**: Backport PR #14649 on branch v3.1.x (Fix appveyor conda py37)
• PR #14649: Fix appveyor conda py37
• PR #14646: Backport PR #14640 on branch v3.1.x (FIX: allow secondary axes to be non-linear)
• PR #14640: FIX: allow secondary axes to be non-linear
• PR #14643: Second attempt at fixing axis inversion (for mpl3.1).
• PR #14623: Fix axis inversion with loglocator and logitlocator.
• PR #14619: Backport PR #14598 on branch v3.1.x (Fix inversion of shared axes.)
• PR #14621: Backport PR #14613 on branch v3.1.x (Cleanup DateFormatter docstring.)
• PR #14622: Backport PR #14611 on branch v3.1.x (Update some axis docstrings.)
• PR #14611: Update some axis docstrings.
• PR #14613: Cleanup DateFormatter docstring.
• PR #14598: Fix inversion of shared axes.
• PR #14610: Backport PR #14579 on branch v3.1.x (Fix inversion of 3d axis.)
• PR #14579: Fix inversion of 3d axis.
• PR #14600: Backport PR #14599 on branch v3.1.x (DOC: Add numpngw to third party packages.)
• PR #14574: Backport PR #14568 on branch v3.1.x (Don’t assume tk canvas have a manager attached.)
• PR #14568: Don’t assume tk canvas have a manager attached.
• PR #14571: Backport PR #14566 on branch v3.1.x (Move setting of AA_EnableHighDpiScaling before creating QApplication.)
• PR #14566: Move setting of AA_EnableHighDpiScaling before creating QApplication.
• PR #14541: Backport PR #14535 on branch v3.1.x (Invalidate FT2Font cache when fork/ting.)
• PR #14535: Invalidate FT2Font cache when fork/ting.
• PR #14522: Backport PR #14040 on branch v3.1.x (Gracefully handle non-finite z in tricontour (issue #10167))
• PR #14434: Backport PR #14296 on branch v3.1.x (Fix barbs to accept array of bool for flip_barb)
• PR #14518: Backport PR #14509 on branch v3.1.x (Fix too large icon spacing in Qt5 on non-HiDPI screens)
• PR #14509: Fix too large icon spacing in Qt5 on non-HiDPI screens
• PR #14514: Backport PR #14256 on branch v3.1.x (Improve docstring of Axes.barbs)
• PR #14256: Improve docstring of Axes.barbs
• PR #14505: Backport PR #14395 on branch v3.1.x (MAINT: work around non-zero exit status of "pdftops -v" command.)
• PR #14504: Backport PR #14445 on branch v3.1.x (FIX: fastpath clipped artists)
• PR #14502: Backport PR #14451 on branch v3.1.x (FIX: return points rather than path to fix regression)
• PR #14445: FIX: fastpath clipped artists
• PR #14497: Backport PR #14491 on branch v3.1.x (Fix uses of PyObject_IsTrue.)
• PR #14491: Fix uses of PyObject_IsTrue.
• PR #14492: Backport PR #14490 on branch v3.1.x (Fix links of parameter types)
• PR #14490: Fix links of parameter types
• PR #14489: Backport PR #14459 on branch v3.1.x (Cleanup docstring of DraggableBase.)
• PR #14459: Cleanup docstring of DraggableBase.
• PR #14485: Backport #14429 on v3.1.x
• PR #14486: Backport #14403 on v3.1.
• PR #14429: FIX: if the first elements of an array are masked keep checking
• PR #14481: Backport PR #14475 on branch v3.1.x (change ginoput docstring to match behavior)
• PR #14482: Backport PR #14464 on branch v3.1.x (Mention origin and extent tutorial in API docs for origin kwarg)
• PR #14464: Mention origin and extent tutorial in API docs for origin kwarg
• PR #14468: Backport PR #14449: Improve docs on gridspec
• PR #14475: change ginoput docstring to match behavior
• PR #14477: Backport PR #14461 on branch v3.1.x (Fix out of bounds read in backend_tk.)
• PR #14476: Backport PR #14474 on branch v3.1.x (Fix default value in docstring of errorbar func)
• PR #14461: Fix out of bounds read in backend_tk.
• PR #14474: Fix default value in docstring of errorbar func
• PR #14473: Backport PR #14472 on branch v3.1.x (Fix NameError in example code for setting label via method)
• PR #14472: Fix NameError in example code for setting label via method
• PR #14449: Improve docs on gridspec
• PR #14450: Backport PR #14422 on branch v3.1.x (Fix ReST note in span selector example)
• PR #14446: Backport PR #14438 on branch v3.1.x (Issue #14372 - Add degrees to documentation)
• PR #14438: Issue #14372 - Add degrees to documentation
• PR #14437: Backport PR #14387 on branch v3.1.x (Fix clearing rubberband on nbagg)
• PR #14387: Fix clearing rubberband on nbagg
• PR #14435: Backport PR #14425 on branch v3.1.x (Lic restore license paint)
• PR #14296: Fix barbs to accept array of bool for flip_barb
• PR #14430: Backport PR #14397 on branch v3.1.x (Correctly set clip_path on pcolorfast return artist.)
• PR #14397: Correctly set clip_path on pcolorfast return artist.

• PR #14409: Backport PR #14335 on branch v3.1.x (Add explanation of animation.embed_limit to matplotlibrc.template)

• PR #14335: Add explanation of animation.embed_limit to matplotlibrc.template

• PR #14403: Revert “Preserve whitespace in svg output.”

• PR #14407: Backport PR #14406 on branch v3.1.x (Remove extra iint in math_symbol_table for document)

• PR #14398: Backport PR #14394 on branch v3.1.x (Update link to ”MathML torture test”.)

• PR #14394: Update link to ”MathML torture test”.

• PR #14389: Backport PR #14388 on branch v3.1.x (Fixed one little spelling error)

• PR #14385: Backport PR #14316 on branch v3.1.x (Improve error message for kiwisolver import error (DLL load failed))

• PR #14388: Fixed one little spelling error

• PR #14384: Backport PR #14369 on branch v3.1.x (Don’t use deprecated mathcircled in docs.)

• PR #14316: Improve error message for kiwisolver import error (DLL load failed)

• PR #14369: Don’t use deprecated mathcircled in docs.

• PR #14375: Backport PR #14374 on branch v3.1.x (Check that the figure patch is in bbox_artists before trying to remove.)

• PR #14374: Check that the figure patch is in bbox_artists before trying to remove.

• PR #14040: Gracefully handle non-finite z in tricontour (issue #10167)

• PR #14342: Backport PR #14326 on branch v3.1.x (Correctly apply PNG palette when building ImageBase through Pillow.)

• PR #14326: Correctly apply PNG palette when building ImageBase through Pillow.

• PR #14341: Backport PR #14337 on branch v3.1.x (Docstring cleanup)

• PR #14337: Docstring cleanup

• PR #14325: Backport PR #14126 on branch v3.1.x (Simplify grouped bar chart example)

• PR #14324: Backport PR #14139 on branch v3.1.x (TST: be more explicit about identifying qt4/qt5 imports)

• PR #14126: Simplify grouped bar chart example

• PR #14323: Backport PR #14290 on branch v3.1.x (Convert SymmetricalLogScale to numpydoc)

• PR #14139: TST: be more explicit about identifying qt4/qt5 imports

• PR #14290: Convert SymmetricalLogScale to numpydoc

• PR #14321: Backport PR #14313 on branch v3.1.x

• PR #14313: Support masked array inputs for to_rgba and to_rgba_array.

• PR #14320: Backport PR #14319 on branch v3.1.x (Don’t set missing history buttons.)

• PR #14319: Don’t set missing history buttons.
• PR #14317: Backport PR #14295: Fix bug in SymmetricalLogTransform.
• PR #14302: Backport PR #14255 on branch v3.1.x (Improve docsstring of Axes.streamplot)
• PR #14255: Improve docsstring of Axes.streamplot
• PR #14295: Fix bug in SymmetricalLogTransform.
• PR #14294: Backport PR #14282 on branch v3.1.x (Fix toolmanager’s destroy subplots in tk)
• PR #14282: Fix toolmanager’s destroy subplots in tk
• PR #14292: Backport PR #14289 on branch v3.1.x (BUG: Fix performance regression when plotting values from Numpy array sub-classes)
• PR #14289: BUG: Fix performance regression when plotting values from Numpy array sub-classes
• PR #14287: Backport PR #14286 on branch v3.1.x (fix minor typo)
• PR #14284: Backport PR #14279 on branch v3.1.x (In case fallback to Agg fails, let the exception propagate out.)
• PR #14254: Merge up 30x
• PR #14279: In case fallback to Agg fails, let the exception propagate out.
• PR #14268: Backport PR #14261 on branch v3.1.x (Updated polar documentation)
• PR #14261: Updated polar documentation
• PR #14264: Backport PR #14260 on branch v3.1.x (Remove old OSX FAQ page)
• PR #14260: Remove old OSX FAQ page
• PR #14249: Backport PR #14243 on branch v3.1.x (Update docstring of makeMappingArray)
• PR #14250: Backport PR #14149 on branch v3.1.x
• PR #14252: Backport PR #14248 on branch v3.1.x (Fix TextBox not respecting events)
• PR #14253: Backport PR #13596 on branch v3.1.x (Normalize properties passed to bxp().)
• PR #14251: Backport PR #14241 on branch v3.1.x (Fix linear segmented colormap with one element)
• PR #13596: Normalize properties passed to bxp().
• PR #14248: Fix TextBox not respecting events
• PR #14241: Fix linear segmented colormap with one element
• PR #14243: Update docstring of makeMappingArray
• PR #14238: Backport PR #14164 on branch v3.1.x (Fix regexp for dvipng version detection)
• PR #14149: Avoid using axis([xlo, xhi, ylo, yhi]) in examples.
• PR #14164: Fix regexp for dvipng version detection
• PR #13739: Fix pressing tab breaks keymap in CanvasTk

Issues (30):
• #14620: Plotting on a log/logit scale overwrites axis inverting
• #14615: Inverting an axis using its limits does not work for log scale
• #14577: Calling invert_yaxis() on a 3D plot has either no effect or removes ticks
• #14602: NavigationToolbar2Tk save_figure function bug
• #1219: Show fails on figures created with the object-oriented system
• #10167: Segmentation fault with tricontour
• #13723: RuntimeError when saving PDFs via parallel processes (not threads!)
• #14315: Improvement: Better error message if kiwisolver fails to import
• #14356: matplotlib.units.ConversionError on scatter of dates with a NaN in the first position
• #14467: Docs for plt.ginput() have the wrong default value for show_clicks keyword argument.
• #14225: Matplotlib crashes on windows while maximizing plot window when using Multicursor
• #14458: DOC: small inconsistency in errobar docstring
• #14372: Document that view_init() arguments should be in degrees
• #12201: issues clearing rubberband on nbagg at non-default browser zoom
• #13576: pcolorfast misbehaves when changing axis limits
• #14303: Unable to import matplotlib on Windows 10 v1903
• #14283: RendererSVG CSS ‘white-space’ property conflicts with default HTML CSS
• #14293: imshow() producing “inverted” colors since 3.0.3
• #14322: Cannot import matplotlib with Python 3.7.x on Win10Pro
• #14137: Qt5 test auto-skip is not working correctly
• #14301: scatter() fails on nan-containing input when providing edgecolor
• #14318: Don’t try to set missing history buttons.
• #14265: symlog looses some points since 3.1.0 (example given)
• #14274: BUG: plotting with Numpy array subclasses is slow with Matplotlib 3.1.0 (regression)
• #14263: import pyplot issue -
• #14227: Update “working with Mpl on OSX” docs
• #13448: boxplot doesn’t normalize properties before applying them
• #14226: Modify matplotlib TextBox value without triggering callback
• #14232: LinearSegmentedColormap with N=1 gives confusing error message
• #10365: Scatter plot with non-sequence ‘c’ color should give a better Error message.
7.1 List of changes to Matplotlib prior to 2015

This is a list of the changes made to Matplotlib from 2003 to 2015. For more recent changes, please refer to the what's new or the API changes.

2015-11-16 Levels passed to contour(f) and tricontour(f) must be in increasing order.

2015-10-21 Added TextBox widget

2015-10-21 Added get_ticks_direction()

2015-02-27 Added the rcParam ‘image.composite_image’ to permit users to decide whether they want the vector graphics backends to combine all images within a set of axes into a single composite image. (If images do not get combined, users can open vector graphics files in Adobe Illustrator or Inkscape and edit each image individually.)

2015-02-19 Rewrite of C++ code that calculates contours to add support for corner masking. This is controlled by the ‘corner_mask’ keyword in plotting commands ‘contour’ and ‘contourf’. - IMT

2015-01-23 Text bounding boxes are now computed with advance width rather than ink area. This may result in slightly different placement of text.

2014-10-27 Allowed selection of the backend using the MPLBACKEND environment variable. Added documentation on backend selection methods.

2014-09-27 Overhauled colors.LightSource. Added LightSource.hillshade to allow the independent generation of illumination maps. Added new types of blending for creating more visually appealing shaded relief plots (e.g. blend_mode="overlay", etc, in addition to the legacy "hsv" mode).

2014-06-10 Added Colorbar.remove()

2014-06-07 Fixed bug so radial plots can be saved as ps in py3k.

2014-06-01 Changed the fmt kwarg of errorbar to support the mpl convention that “none” means “don't draw it”, and to default to the empty string, so that plotting of data points is done with the plot() function defaults. Deprecated use of the None object in place “none”.

2014-05-22 Allow the linscale keyword parameter of symlog scale to be smaller than one.

2014-05-20 Added logic to in FontManager to invalidate font-cache if font-family rcparams have changed.
2014-05-16 Fixed the positioning of multi-line text in the PGF backend.

2014-05-14 Added `Axes.add_image()` as the standard way to add AxesImage instances to Axes. This improves the consistency with `add_artist()`, `add_collection()`, `add_container()`, `add_line()`, `add_patch()`, and `add_table()`.

2014-04-27 Improved input clean up in `Axes.{h|v}lines` Coerce input into a 1D ndarrays (after dealing with units).

2014-04-27 removed un-needed cast to float in stem

2014-04-23 Updated references to “ipython -pylab” The preferred method for invoking pylab is now using the “%pylab” magic. -Chris G.

2014-04-22 Added (re-)generate a simple automatic legend to “Figure Options” dialog of the Qt4Agg backend.

2014-04-22 Added an example showing the difference between `interpolation = 'none'` and `interpolation = 'nearest'` in `imshow()` when saving vector graphics files.

2014-04-10 Fixed the triangular marker rendering error. The “Up” triangle was rendered instead of “Right” triangle and vice-versa.

2014-04-08 Fixed a bug in parasite_axes.py by making a list out of a generator at line 263.

2014-04-02 Added `clipon=False` to patch creation of wedges and shadows in `pie`.

2014-02-25 In backend_qt4agg changed from using update -> repaint under windows. See comment in source near `self._priv_update` for longer explanation.

2014-03-24 Changed the behaviour of axes to not ignore leading or trailing patches of height 0 (or width 0) while calculating the x and y axis limits. Patches having both height == 0 and width == 0 are ignored.

2014-03-24 Added `bool kwarg (manage_xticks)` to `boxplot` to enable/disable the managemnet of the xlimits and ticks when making a boxplot. Default in True which maintains current behavior by default.

2014-03-23 Fixed a bug in projections/polar.py by making sure that the `theta` value being calculated when given the mouse coordinates stays within the range of 0 and 2 * pi.

2014-03-22 Added the keyword arguments `wedgeprops` and `textprops` to `pie`. Users can control the wedge and text properties of the pie in more detail, if they choose.

2014-03-17 Bug was fixed in `append_axes` from the AxesDivider class would not append axes in the right location with respect to the reference locator axes

2014-03-13 Add parameter ‘clockwise’ to function `pie`, True by default.

2014-02-28 Added ‘origin’ kwarg to `spy`

2014-02-27 Implemented separate horizontal/vertical axes padding to the ImageGrid in the AxesGrid toolkit
2014-02-27 Allowed markevery property of matplotlib.lines.Line2D to be, an int
numpy fancy index, slice object, or float. The float behaviour turns on markers at
approximately equal display-coordinate-distances along the line.

2014-02-25 In backend_qt4agg changed from using update -> repaint under
windows. See comment in source near self._priv_update for longer explanation.

2014-01-02 triplot now returns the artist it adds and support of line and marker
kwargs has been improved. GBY

2013-12-30 Made streamplot grid size consistent for different types of density
argument. A 30x30 grid is now used for both density=1 and density=(1, 1).

2013-12-03 Added a pure boxplot-drawing method that allow a more complete
customization of boxplots. It takes a list of dicts contains stats. Also created a function
(cbook.boxplot_stats) that generates the stats needed.

2013-11-28 Added qhull extension module to perform Delaunay triangulation more
robustly than before. It is used by tri.Triangulation (and hence all pyplot.tri* methods)
and mlab.griddata. Deprecated matplotlib.delaunay module. - IMT

2013-11-05 Add power-law normalization method. This is useful for, e.g., showing
small populations in a "hist2d" histogram.

2013-10-27 Added get_rlabel_position and set_rlabel_position methods to PolarAxes
to control angular position of radial tick labels.

2013-10-06 Add stride-based functions to mlab for easy creation of 2D arrays with
less memory.

2013-10-06 Improve window and detrend functions in mlab, particularart support for
2D arrays.

2013-10-06 Improve performance of all spectrum-related mlab functions and plots.

2013-10-06 Added support for magnitude, phase, and angle spectrums to
axes.specgram, and support for magnitude, phase, angle, and complex spectrums
to mlab-specgram.

2013-10-06 Added magnitude_spectrum, angle_spectrum, and phase_spectrum plots,
as well as magnitude_spectrum, angle_spectrum, phase_spectrum, and com-
plex_spectrum functions to mlab

2013-07-12 Added support for datetime axes to 2d plots. Axis values are passed
through Axes.convert_xunits/Axes.convert_yunits before being used by con-
tour/contourf, pcolormesh and pcolor.

2013-07-12 Allowed matplotlib.dates.date2num, matplotlib.dates.num2date, and
matplotlib.dates.datestr2num to accept n-d inputs. Also factored in support for n-d
arrays to matplotlib.dates.DateConverter and matplotlib.units.Registry.

2013-06-26 Refactored the axes module: the axes module is now a folder,
containing the following submodule:

• _subplots.py, containing all the subplots helper methods
• _base.py, containing several private methods and a new _AxesBase class. This
  _AxesBase class contains all the methods that are not directly linked to plots of
  the "old" Axes
• _axes.py contains the Axes class. This class now inherits from _AxesBase: it
  contains all "plotting" methods and labelling methods.
This refactoring should not affect the API. Only private methods are not importable from the axes module anymore.

**2013-05-18 Added support for arbitrary rasterization resolutions to the SVG backend.** Previously the resolution was hard coded to 72 dpi. Now the backend class takes a `image_dpi` argument for its constructor, adjusts the image bounding box accordingly and forwards a magnification factor to the image renderer. The code and results now resemble those of the PDF backend. - MW

**2013-05-08 Changed behavior of hist when given stacked=True and normed=True.** Histograms are now stacked first, then the sum is normalized. Previously, each histogram was normalized, then they were stacked.

2013-04-25 Changed all instances of:

from matplotlib import MatplotlibDeprecationWarning as mplDeprecation to:

from cbook import mplDeprecation

and removed the import into the matplotlib namespace in `__init__.py` Thomas Caswell

**2013-04-15 Added 'axes.xmargin' and 'axes.ymargin' to rcParams to set default margins on auto-scaling.** - TAC

2013-04-16 Added patheffect support for Line2D objects. - JLL

**2013-03-31 Added support for arbitrary unstructured user-specified triangulations to Axes3D.tricontourf** - Damon McDougall

2013-03-19 Added support for passing `linestyle` `kwarg` to `step` so all `plot` `kwargs` are passed to the underlying `plot` call. - TAC

2013-02-25 Added classes `CubicTriInterpolator`, `UniformTriRefiner`, `TriAnalyzer` to `matplotlib.tri` module. - GBY

2013-01-23 Add 'savefig.directory' to rcParams to remember and fill in the last directory saved to for figure save dialogs - Martin Spacek

2013-01-13 Add eventplot method to axes and pyplot and EventCollection class to collections.

2013-01-08 Added two extra titles to axes which are flush with the left and right edges of the plot respectively. Andrew Dawson

2013-01-07 Add framealpha keyword argument to legend - PO

2013-01-16 Till Stensitzki added a baseline feature to stackplot

**2012-12-22 Added classes for interpolation within triangular grids** (LinearTriInterpolator) and to find the triangles in which points lie (TrapezoidMap-TriFinder) to matplotlib.tri module. - IMT

**2012-12-05 Added MatplotlibDeprecationWarning class for signaling deprecation.** Matplotlib developers can use this class as follows:

from matplotlib import MatplotlibDeprecationWarning as mplDeprecation

In light of the fact that Python builtin DeprecationWarnings are ignored by default as of Python 2.7, this class was put in to allow for the signaling of deprecation, but via UserWarnings which are not ignored by default. - PI
2012-11-27 **Added the mtext parameter for supplying matplotlib.text.Text instances to RendererBase.draw_text and RendererBase.draw_text.** This allows backends to utilize additional text attributes, like the alignment of text elements. - pwuertz

2012-11-26 **deprecate matplotlib/mpl.py, which was used only in pylab.py and is now replaced by the more suitable import matplotlib as mpl.** - PI

2012-11-25 Make rc_context available via pyplot interface - PI

2012-11-16 **plt.set_cmap no longer throws errors if there is not already an active colorable artist, such as an image, and just sets up the colormap to use from that point forward.** - PI

2012-11-16 **Added the function get_rgba_face, which is identical to _get_rgb_face except it return a (r,g,b,a) tuble, to line2D. Modified Line2D.draw to use _get_rgbga_face to get the markerface color so that any alpha set by markerfacecolor will respected.** - Thomas Caswell

2012-11-13 **Add a symmetric log normalization class to colors.py.** Also added some tests for the normalization class. Till Stensitzki

2012-11-12 **Make axes.stem take at least one argument.** Uses a default range(n) when the first arg not provided. Damon McDougall

2012-11-09 Make plt.subplot() without arguments act as subplot(111) - PI

2012-11-08 **Replaced plt.figure and plt.subplot calls by the newer, more convenient single call to plt.subplots() in the documentation examples** - PI

2012-10-05 Add support for saving animations as animated GIFs. - JVDP

2012-08-11 **Fix path-closing bug in patches.Polygon, so that regardless of whether the path is the initial one or was subsequently set by set_xy(), get_xy() will return a closed path if and only if get_closed() is True. Thanks to Jacob Vanderplas.** - EF

2012-08-05 **When a norm is passed to contourf, either or both of the vmin, vmax attributes of that norm are now respected. Formerly they were respected only if both were specified. In addition, vmin and/or vmax can now be passed to contourf directly as kwargs.** - EF

2012-07-24 **Contourf handles the extend kwarg by mapping the extended ranges outside the normed 0-1 range so that they are handled by colormap colors determined by the set_under and set_over methods. Previously the extended ranges were mapped to 0 or 1 so that the “under” and “over” colormap colors were ignored. This change also increases slightly the color contrast for a given set of contour levels.** - EF

2012-06-24 Make use of mathtext in tick labels configurable - DSD

2012-06-05 Images loaded through PIL are now ordered correctly - CG

2012-06-02 Add new Axes method and pyplot function, hist2d. - PO

2012-05-31 **Remove support for ‘cairo.<format>’ style of backend specification.** Deprecate ‘cairo.format’ and ‘savefig.extension’ rcParams and replace with ‘savefig.format’. - Martin Spacek

2012-05-29 **pcolormesh now obeys the passed in “edgecolor” kwarg.** To support this, the “shading” argument to pcolormesh now only takes “flat” or “gouraud”. To achieve the old “faceted” behavior, pass “edgecolors=’k’”. - MGD

2012-05-22 Added radius kwarg to pie charts. - HH
2012-05-22 Collections now have a setting “offset_position” to select whether the offsets are given in “screen” coordinates (default, following the old behavior) or “data” coordinates. This is currently used internally to improve the performance of hexbin.

As a result, the “draw_path_collection” backend methods have grown a new argument “offset_position”. - MGD

2012-05-04 Add a new argument to pie charts - startingangle - that allows one to specify the angle offset for the first wedge of the chart. - EP

2012-05-03 symlog scale now obeys the logarithmic base. Previously, it was completely ignored and always treated as base e. - MGD

2012-05-03 Allow linscale/x/y keyword to symlog scale that allows the size of the linear portion relative to the logarithmic portion to be adjusted. - MGD

2012-04-14 Added new plot style: stackplot. This new feature supports stacked area plots. - Damon McDougall

2012-04-06 When path clipping changes a LINETO to a MOVETO, it also changes any CLOSEPOLY command to a LINETO to the initial point. This fixes a problem with pdf and svg where the CLOSEPOLY would then draw a line to the latest MOVETO position instead of the intended initial position. - JKS

2012-03-27 Add support to ImageGrid for placing colorbars only at one edge of each column/row. - RMM

2012-03-07 Refactor movie writing into useful classes that make use of pipes to write image data to ffmpeg or mencoder. Also improve settings for these and the ability to pass custom options. - RMM

2012-02-29 errorevery keyword added to errorbar to enable errorbar subsampling. fixes issue #600.

2012-02-28 Added plot_trisurf to the mplot3d toolkit. This supports plotting three dimensional surfaces on an irregular grid. - Damon McDougall

2012-01-23 The radius labels in polar plots no longer use a fixed padding, but use a different alignment depending on the quadrant they are in. This fixes numerical problems when (rmax - rmin) gets too small. - MGD

2012-01-08 Add axes.streamplot to plot streamlines of a velocity field. Adapted from Tom Flannaghan streamplot implementation. - TSY

2011-12-29 ps and pdf markers are now stroked only if the line width is nonzero for consistency with agg, fixes issue #621. - JKS

2011-12-27 Work around an EINTR bug in some versions of subprocess. - JKS

2011-10-25 added support for operatorname to mathtext, including the ability to insert spaces, such as $operatorname{arg,max}$ - PI

2011-08-18 Change api of Axes.get_tightbbox and add an optional keyword parameter call_axes_locator. - JJK

2011-07-29 A new rcParam “axes.formatter.use_locale” was added, that, when True, will use the current locale to format tick labels. This means that, for example, in the fr_FR locale, ',' will be used as a decimal separator. - MGD

2011-07-15 The set of markers available in the plot() and scatter() commands has been unified. In general, this gives more options to both than were previously available, however, there is one backward-incompatible change to the markers in scatter:
“d” used to mean “diamond”, it now means “narrow diamond”. “D” can be used for a “diamond”.

-MGD

2011-07-13 Fix numerical problems in symlog scale, particularly when linthresh \leq 1.0. Symlog plots may look different if one was depending on the old broken behavior - MGD

2011-07-10 Fixed argument handling error in tripcolor/triplot/tricontour, issue #203. - IMT

2011-07-08 Many functions added to mplot3d.axes3d to bring Axes3D objects more feature-parity with regular Axes objects. Significant revisions to the documentation as well. - BVR

2011-07-07 Added compatibility with IPython strategy for picking a version of Qt4 support, and an rcParam for making the choice explicitly: backend.qt4. - EF

2011-07-07 Modified AutoMinorLocator to improve automatic choice of the number of minor intervals per major interval, and to allow one to specify this number via a kwarg. - EF

2011-06-28 3D versions of scatter, plot, plot_wireframe, plot_surface, bar3d, and some other functions now support empty inputs. - BVR

2011-06-22 Add set_theta_offset, set_theta_direction and set_theta_zero_location to polar axes to control the location of 0 and directionality of theta. - MGD

2011-06-22 Add axes.labelweight parameter to set font weight to axis labels - MGD.

2011-06-20 Add pause function to pyplot. - EF

2011-06-16 Added bottom keyword parameter for the stem command. Also, implemented a legend handler for the stem plot. - JJL

2011-06-16 Added legend.frameon rcParams. - Mike Kaufman

2011-05-31 Made backend_qt4 compatible with PySide. - Gerald Storer

2011-04-17 Disable keyboard auto-repeat in qt4 backend by ignoring key events resulting from auto-repeat. This makes constrained zoom/pan work. - EF

2011-04-14 interpolation="nearest" always interpolate images. A new mode "none" is introduced for no interpolation - JJL

2011-04-03 Fixed broken pick interface to AsteriskCollection objects used by scatter. - EF

2011-04-01 The plot directive Sphinx extension now supports all of the features in the Numpy fork of that extension. These include doctest formatting, an ‘include-source’ option, and a number of new configuration options. - MGD

2011-03-29 Wrapped ViewVCCachedServer definition in a factory function. This class now inherits from urllib2.HTTPSHandler in order to fetch data from github, but HTTPSHandler is not defined if python was built without SSL support. - DSD

2011-03-10 Update pytz version to 2011c, thanks to Simon Cross. - JKS

2011-03-06 Add standalone tests.py test runner script. - JKS

2011-03-06 Set edgecolor to ‘face’ for scatter asterisk-type symbols; this fixes a bug in which these symbols were not responding to the c kwarg. The symbols have no face area, so only the edgecolor is visible. - EF
2011-02-27 Support libpng version 1.5.x; suggestion by Michael Albert. Changed installation specification to a minimum of libpng version 1.2. - EF

2011-02-20 clabel accepts a callable as an fmt kwarg; modified patch by Daniel Hyams. - EF

2011-02-18 scatter([], []) is now valid. Also fixed issues with empty collections - BVR

2011-02-07 Quick workaround for dviread bug #3175113 - JKS

2011-02-05 Add cbook memory monitoring for Windows, using tasklist. - EF

2011-02-05 Speed up Normalize and LogNorm by using in-place operations and by using float32 for float32 inputs and for ints of 2 bytes or shorter; based on patch by Christoph Gohlke. - EF

2011-02-04 Changed imshow to use rgba as uint8 from start to finish, instead of going through an intermediate step as double precision; thanks to Christoph Gohlke. - EF

2011-01-13 Added zdir and offset arguments to contourf3d to bring contourf3d in feature parity with contour3d. - BVR

2011-01-04 Tag 1.0.1 for release at r8896

2011-01-03 Added display of ticker offset to 3d plots. - BVR

2011-01-03 Turn off tick labeling on interior subplots for pyplots.subplots when sharex/sharey is True. - JDH

2010-12-29 Implement axes_divider:HBox and VBox. -JJL

2010-11-22 Fixed error with Hammer projection. - BVR

2010-11-12 Fixed the placement and angle of axis labels in 3D plots. - BVR

2010-11-07 New rc parameters examples.download and examples.directory allow bypassing the download mechanism in get_sample_data. - JKS

2010-10-04 Fix JPEG saving bug: only accept the kwargs documented by PIL for JPEG files. - JKS

2010-09-15 Remove unused _wxagg extension and numerix.h. - EF

2010-08-25 Add new framework for doing animations with examples.- RM

2010-08-21 Change Axis.set_view_interval() so that when updating an existing interval, it respects the orientation of that interval, and can enlarge but not reduce the interval. This fixes a bug in which Axis.set_ticks would change the view limits of an inverted axis. Whether set_ticks should be affecting the viewLim at all remains an open question. - EF

2010-08-16 Handle NaN's correctly in path analysis routines. Fixes a bug where the best location for a legend was not calculated correctly when the line contains NaNs. - MGD

2010-08-14 Fix bug in patch alpha handling, and in bar color kwarg - EF

2010-08-12 Removed all traces of numerix module after 17 months of deprecation warnings. - EF
2010-08-05 Added keyword arguments ‘thetanunits’ and ‘runits’ for polar plots.
   Fixed PolarAxes so that when it set default Formatters, it marked them as such.
   Fixed semilogx and semilogy to no longer blindly reset the ticker information on the
   non-log axis. Axes.arrow can now accept unitized data. - JRE

2010-08-03 Add support for MPLSETUPCFG variable for custom setup.cfg filename.
   Used by sage buildbot to build an mpl w/ no gui support - JDH

2010-08-01 Create directory specified by MPLCONFIGDIR if it does not exist. - ADS

2010-07-20 Return Qt4’s default cursor when leaving the canvas - DSD

2010-07-06 Tagging for mpl 1.0 at r8502

2010-07-05 Added Ben Root’s patch to put 3D plots in arbitrary axes, allowing you to
   mix 3d and 2d in different axes/subplots or to have multiple 3D plots in one figure. See
   examples/mplot3d/subplot3d_demo.py - JDH

2010-07-05 Preferred kwarg names in set_xlim are now ’left’ and ’right’;
   in set_ylim, ’bottom’ and ’top’; original kwargs are still accepted without complaint. - EF

2010-07-05 TkAgg and FltkAgg backends are now consistent with other interactive
   backends: when used in scripts from the command line (not from ipython -pylab), show
   blocks, and can be called more than once. - EF

2010-07-02 Modified CXX/WrapPython.h to fix “swab bug” on solaris so mpl can compile on Solaris with CXX6 in the trunk. Closes tracker bug 3022815 - JDH

2010-06-30 Added autoscale convenience method and corresponding pyplot function
   for simplified control of autoscaling; and changed axis, set_xlim, and set_ylim so that by
   default, they turn off the autoscaling on the relevant axis or axes. Therefore one can call
   set_xlim before plotting a line, for example, and the limits will be retained. - EF

2010-06-20 Added Axes.tick_params and corresponding pyplot function to control
   tick and tick label appearance after an Axes has been created. - EF

2010-06-09 Allow Axes.grid to control minor gridlines; allow Axes.grid and Axis.grid
to control major and minor gridlines in the same method call. - EF

2010-06-06 Change the way we do split/dividend adjustments in finance.py to handle dividends and fix the zero division bug reported in sf bug 2949906 and 2123566. Note that volume is not adjusted because the Yahoo CSV does not distinguish between share split and dividend adjustments making it near impossible to get volume adjustment right (unless we want to guess based on the size of the adjustment or scrape the html tables, which we don’t) - JDH

2010-06-06 Updated dateutil to 1.5 and pytz to 2010h.

2010-06-02 Add error_kw kwarg to Axes.bar(). - EF

2010-06-01 Fix pcolormesh() and QuadMesh to pass on kwargs as appropriate. - RM

2010-05-18 Merge mpl_toolkits.gridspec into the main tree. - J JL

2010-05-04 Improve backend_qt4 so it displays figures with the correct size - DSD

2010-04-20 Added generic support for connecting to a timer for events. This adds
   TimerBase, TimerGTK, TimerQT, TimerWx, and TimerTk to the backends and a new_timer() method to each backend’s canvas to allow ease of creating a new timer. - RM

2010-04-20 Added margins() Axes method and pyplot function. - EF

2010-04-18 update the axes_grid documentation. - J JL
2010-04-18 **Control MaxNLocator parameters after instantiation**, and 
Axes.locator_params method, with corresponding pyplot function. -EF

2010-04-18 **Control ScalarFormatter offsets directly and via the**
Axes.ticklabel_format() method, and add that to pyplot. -EF

2010-04-16 Add a close_event to the backends. -RM

2010-04-06 modify axes_grid examples to use axes_grid1 and axisartist. -JJL

2010-04-06 rebase axes_grid using axes_grid1 and axisartist modules. -JJL

2010-04-06 **axes_grid toolkit is splitted into two separate modules**, axes_grid1 and
axisartist. -JJL

2010-04-05 **Speed up import: import pytz only if and when it is** needed. It is not
needed if the rc timezone is UTC. -EF

2010-04-03 **Added color kwarg to Axes.hist(), based on work by** Jeff Klukas. -EF

2010-03-24 **refactor colorbar code so that no cla() is necessary when** mappable is
changed. -JJL

2010-03-22 **fix incorrect rubber band during the zoom mode when mouse** leaves the
axes. -JJL

2010-03-21 x/y key during the zoom mode only changes the x/y limits. -JJL

2010-03-20 Added pyplot.sca() function suggested by JJL. -EF

2010-03-20 Added conditional support for new Tooltip API in gtk backend. -EF

2010-03-20 **Changed plt.fig_subplot() to plt.subplots() after discussion on** list, and
changed its API to return axes as a numpy object array (with control of dimensions via
squeeze keyword). FP

2010-03-13 Manually brought in commits from branch:

```
-- r8191 | leejjoon | 2010-03-13 17:27:57 -0500 (Sat, 13 Mar 2010) | 1 line
fix the bug that handles for scatter are incorrectly set when dpi!=72.
Thanks to Ray Speth for the bug report.
```

2010-03-03 Manually brought in commits from branch via diff/patch (svnmerge is broken):

```
-- r8175 | leejjoon | 2010-03-03 10:03:30 -0800 (Wed, 03 Mar 2010) | 1 line
fix arguments of allow_rasterization.draw_wrapper
```

```
-- r8174 | jdh2358 | 2010-03-03 09:15:58 -0800 (Wed, 03 Mar 2010) | 1 line
added support for favicon in docs build
```

```
-- r8173 | jdh2358 | 2010-03-03 08:56:16 -0800 (Wed, 03 Mar 2010) | 1 line
applied Mattias get_bounds patch
```

```
-- r8172 | jdh2358 | 2010-03-03 08:31:42 -0800 (Wed, 03 Mar 2010) | 1 line
```

(continues on next page)
fix svnmerge download instructions

2010-02-25 add annotation_demo3.py that demonstrates new functionality. -J JL

2010-02-25 refactor Annotation to support arbitrary Transform as xycoords or textcoords. Also, if a tuple of two coordinates is provided, they are interpreted as coordinates for each x and y position. -JJL

2010-02-24 Added pyplot.fig_subplot(), to create a figure and a group of subplots in a single call. This offers an easier pattern than manually making figures and calling add_subplot() multiple times. -FP

2010-02-17 Added Gokhan’s and Mattias’ customizable keybindings patch for the toolbar. You can now set the keymap.* properties in the matplotlibrc file. Newbindings were added for toggling log scaling on the x-axis. JDH

2010-02-16 Committed TJ’s filled marker patch for left|right|bottom|top|full filled markers. See examples/pylab_examples/filledmarker_demo.py. JDH

2010-02-11 Added ‘bootstrap’ option to boxplot. This allows bootstrap estimates of median confidence intervals. Based on an initial patch by Paul Hobson. -ADS

2010-02-06 Added setup.cfg “basedirlist” option to override setting in setupext.py “basedir” dictionary; added “gnu0” platform requested by Benjamin Drung. -EF

2010-02-03 Made plot directive use a custom PlotWarning category, so that warnings can be turned into fatal errors easily if desired. -FP

2010-01-29 Added draggable method to Legend to allow mouse drag placement. Thanks Adam Fraser. JDH

2010-01-25 Fixed a bug reported by Olle Engdegard, when using histograms with stepfilled and log=True - MM

2010-01-16 Upgraded CXX to 6.1.1 - JDH

2009-01-24 Don’t create minor ticks on top of existing major ticks. Patch by Neil Crighton. -ADS

2009-01-16 Ensure three minor ticks always drawn (SF# 2924245). Patch by Neil Crighton. -ADS

2010-01-16 Applied patch by Ian Thomas to fix two contouring problems: now contourf handles interior masked regions, and the boundaries of line and filled contours coincide. - EF

2009-01-11 The color of legend patch follows the rc parameters axes.facecolor and axes.edgecolor. -JJL

2009-01-11 adjustable of Axes can be “box-forced” which allow sharing axes. -JJL

2009-01-11 Add add_click and pop_click methods in BlockingContourLabeler. -JJL

2010-01-03 Added rcParams[‘axes.color_cycle’] - EF

2009-12-31 Add support for using math text as marker symbols (Thanks to tcb)

7.1. List of changes to Matplotlib prior to 2015
• MGD

2009-12-31 Commit a workaround for a regression in PyQt4-4.6.{0,1} - DSD

2009-12-22 Fix cmap data for gist_earth_r, etc. - JJL

2009-12-20 spines: put spines in data coordinates, add set_bounds() call. - ADS

2009-12-18 Don’t limit notch size in boxplot to q1-q3 range, as this is effectively making the data look better than it is. - ADS

2009-12-18 mlab.prctile handles even-length data, such that the median is the mean of the two middle values. - ADS

2009-12-15 Add raw-image (unsampled) support for the ps backend. - JJL

2009-12-14 Add patch_artist kwarg to boxplot, but keep old default. Convert boxplot_demo2.py to use the new patch_artist. - ADS

2009-12-06 axes_grid: reimplemented AxisArtist with FloatingAxes support. Added new examples. - JJL

2009-12-01 Applied Laurent Dufrechou’s patch to improve blitting with the qt4 backend - DSD

2009-11-13 The pdf backend now allows changing the contents of a pdf file’s information dictionary via PdfPages.infodict. - JKS

2009-11-12 font_manager.py should no longer cause EINTR on Python 2.6 (but will on the 2.5 version of subprocess). Also the fc-list command in that file was fixed so now it should actually find the list of fontconfig fonts. - JKS

2009-11-10 Single images, and all images in renderers with option image_nocomposite (i.e. agg, macosx and the svg backend when rc-Params[‘svg.image_noscale’] is True), are now drawn respecting the zorder relative to other artists. (Note that there may now be inconsistencies across backends when more than one image is drawn at varying zorders, but this change introduces correct behavior for the backends in which it’s easy to do so.)

2009-10-21 Make AutoDateLocator more configurable by adding options to control the maximum and minimum number of ticks. Also add control of the intervals to be used for ticking. This does not change behavior but opens previously hard-coded behavior to runtime modification’. - RMM

2009-10-19 Add “path_effects” support for Text and Patch. See examples/pylab_examples/patheffect_demo.py - JJL

2009-10-19 Add “use_clabeltext” option to clabel. If True, clabels will be created with ClabelText class, which recalculates rotation angle of the label during the drawing time. - JJL

2009-10-16 Make AutoDateFormatter actually use any specified timezone setting. This was only working correctly when no timezone was specified. - RMM

2009-09-27 Beginnings of a capability to test the pdf backend. - JKS

2009-09-27 Add a savefig.extension rcparam to control the default extension used by savefig. - JKS

2009-09-21 Tagged for release 0.99.1

2009-09-20 Fix usetex spacing errors in pdf backend. - JKS
2009-09-20 Add Sphinx extension to highlight IPython console sessions, originally authored (I think) by Michael Droetboom. - FP

2009-09-20 Fix off-by-one error in dviread.Tfm, and additionally protect against exceptions in case a dvi font is missing some metrics. - JKS

2009-09-15 Implement draw_text and draw_tex method of backend base using the textpath module. Implement draw_tex method of the svg backend. - JKL

2009-09-15 Don’t fail on AFM files containing floating-point bounding boxes - JKS

2009-09-13 AxesGrid [add modified version of colorbar. Add colorbar] location howto. - JKL

2009-09-07 AxesGrid [implemented axisline style.] Added a demo examples/axes_grid/demo_axisline_style.py- JKL

2009-09-04 Make the textpath class as a separate module (textpath.py). Add support for mathtext and tex.- JKL

2009-09-01 Added support for Gouraud interpolated triangles. pcolormesh now accepts shading=’gouraud’ as an option. - MGD

2009-08-29 Added matplotlib.testing package, which contains a Nose plugin and a decorator that lets tests be marked as KnownFailures - ADS

2009-08-20 Added scaled dict to AutoDateFormatter for customized scales - JDH

2009-08-15 Pyplot interface: the current image is now tracked at the figure and axes level, addressing tracker item 1656374. - EF

2009-08-15 Docstrings are now manipulated with decorators defined in a new module, docstring.py, thanks to Jason Coombs. - EF

2009-08-14 Add support for image filtering for agg back end. See the example demo_agg_filter.py. -JL

2009-08-09 AnnotationBbox added. Similar to Annotation, but works with OffsetBox instead of Text. See the example demo_annotation_box.py. -JL

2009-08-07 BboxImage implemented. Two examples, demo_bboximage.py and demo_ribbon_box.py added. - JKL

2009-08-07 In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:

```python
draw_path_collection(self, master_transform, cliprect, clippath,
    clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors,
    edgecolors, linewidths, linestyles, antialiaseds, urls)
```

becomes:

```python
draw_path_collection(self, gc, master_transform, paths, all_transforms,
    offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls)
```

```python
draw_quad_mesh(self, master_transform, cliprect, clippath,
    clippath_trans, meshWidth, meshHeight, coordinates, offsets, offsetTrans, facecolors, antialiased, showedges)
```

becomes:

```python
draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight,
    coordinates, offsets, offsetTrans, facecolors, antialiased, showedges)
```
draw_image(self, x, y, im, bbox, clippath=None, clippath_trans=None)
becomes:
draw_image(self, gc, x, y, im)
• MGD

2009-08-06 Tagging the 0.99.0 release at svn r7397 - JDH
• fixed an alpha colormapping bug posted on sf 2832575
• fix typo in axes_divider.py. use nanmin, nanmax in angle_helper.py (patch by Christoph Gohlke)
• remove dup gui event in enter/leave events in gtk
• lots of fixes for os x binaries (Thanks Russell Owen)
• attach gtk events to mpl events - fixes sf bug 2816580
• applied sf patch 2815064 (middle button events for wx) and patch 2818092 (resize events for wx)
• fixed boilerplate.py so it doesn’t break the ReST docs.
• removed a couple of cases of mlab.load
• fixed rec2csv win32 file handle bug from sf patch 2831018
• added two examples from Josh Hemann: examples/pylab_examples/barchart_demo2.py and examples/pylab_examples/boxplot_demo2.py
• handled sf bugs 2831556 and 2830525; better bar error messages and backend driver configs
• added miktex win32 patch from sf patch 2820194
• apply sf patches 2830233 and 2823885 for osx setup and 64 bit; thanks Michiel

2009-08-04 Made cbook.get_sample_data make use of the ETag and Last-Modified headers of mod_dav_svn. - JKS

2009-08-03 Add PathCollection; modify contourf to use complex paths instead of simple paths with cuts. - EF

2009-08-03 Fixed boilerplate.py so it doesn’t break the ReST docs. - JKS

2009-08-03 pylab no longer provides a load and save function. These are available in matplotlib.mlab, or you can use numpy.loadtxt and numpy.savetxt for text files, or np.save and np.load for binary numpy arrays. - JDH

2009-07-31 Added cbook.get_sample_data for urllib enabled fetching and caching of data needed for examples. See examples/misc/sample_data_demo.py - JDH

2009-07-31 Tagging 0.99.0.rc1 at 7314 - MGD

2009-07-30 Add set_cmap and register_cmap, and improve get_cmap, to provide convenient handling of user-generated colormaps. Reorganized _cm and cm modules. - EF

2009-07-28 Quiver speed improved, thanks to tip by Ray Speth. - EF

2009-07-27 Simplify argument handling code for plot method. - EF

2009-07-25 Allow “plot(1, 2, ‘r*’)” to work. - EF
2009-07-22 Added an ‘interp’ keyword to griddata so the faster linear interpolation method can be chosen. Default is ‘nn’, so default behavior (using natural neighbor method) is unchanged (JSW)

2009-07-22 Improved boilerplate.py so that it generates the correct signatures for pyplot functions. - JKS

2009-07-19 Fixed the docstring of Axes.step to reflect the correct meaning of the kwargs ”pre” and ”post” - See SF bug https://sourceforge.net/tracker/index.php?func=detail&amp;aid=2823304&amp;group_id=80706&amp;atid=560720 - JDH

2009-07-18 Fix support for hatches without color fills to pdf and svg backends. Add an example of that to hatch_demo.py. - JKS

2009-07-17 Removed fossils from swig version of agg backend. - EF

2009-07-14 initial submission of the annotation guide. -JL

2009-07-14 axes_grid [minor improvements in anchored_artists and] inset_locator. -JJL

2009-07-14 Fix a few bugs in ConnectionStyle algorithms. Add ConnectionPatch class. -JJL

2009-07-11 Added a fillstyle Line2D property for half filled markers – see examples/pylab_examples/fillstyle_demo.py JDH

2009-07-08 Attempt to improve performance of qt4 backend, do not call qApp.processEvents while processing an event. Thanks Ole Streicher for tracking this down - DSD

2009-06-24 Add withheader option to mlab.rec2csv and changed use_mrecords default to False in mlab.csv2rec since this is partially broken - JDH

2009-06-24 backend_agg.draw_marker quantizes the main path (as in the draw_path). - JJL

2009-06-24 axes_grid: floating axis support added. - JJL

2009-06-14 Add new command line options to backend_driver.py to support running only some directories of tests - JKS

2009-06-13 partial cleanup of mlab and its importation in pylab - EF

2009-06-13 Introduce a rotation_mode property for the Text artist. See examples/pylab_examples/demo_text_rotation_mode.py -JJL

2009-06-07 add support for bz2 files per sf support request 2794556 - JDH

2009-06-06 added a properties method to the artist and inspector to return a dict mapping property name -> value; see sf feature request 2792183 - JDH

2009-06-06 added Neil’s auto minor tick patch; sf patch #2789713 - JDH

2009-06-06 do not apply alpha to rgba color conversion if input is already rgba - JDH

2009-06-03 axes_grid [Initial check-in of curvelinear grid support. See] examples/axes_grid/demo_curvilinear_grid.py -JJL

2009-06-01 Add set_color method to Patch - EF

2009-06-01 Spine is now derived from Patch - ADS

2009-06-01 use cbook.is_string_like() instead of isinstance() for spines - ADS

2009-06-01 cla() support for spines - ADS
2009-06-01 Removed support for gtk < 2.4. - EF

2009-05-29 Improved the animation_blit_qt4 example, which was a mix of the object-oriented and pylab interfaces. It is now strictly object-oriented - DSD

2009-05-28 Fix axes.grid toolkit to work with spine patch by ADS. - J JL

2009-05-28 Applied fbianco’s patch to handle scroll wheel events in the qt4 backend - DSD

2009-05-26 Add support for “axis spines” to have arbitrary location. - ADS

2009-05-20 Add an empty matplotlibrc to the tests/directory so that running tests will use the default set of rcparams rather than the user’s config. - RMM

2009-05-19 Axis.grid(): allow use of which=’major,minor’ to have grid on major and minor ticks. - ADS

2009-05-18 Make psd(), csd(), and cohere() wrap properly for complex/two-sided versions, like specgram() (SF #2791686) - RMM

2009-05-18 Fix the linespacing bug of multiline text (#1239682). See examples/pylab_examples/multiline.py - J JL

2009-05-18 Add annotation_clip attr. for text.Annotation class. If True, annotation is only drawn when the annotated point is inside the axes area. - J JL

2009-05-17 Fix bug(#2749174) that some properties of minor ticks are not conserved. - J JL

2009-05-17 applied Michiel’s sf patch 2790075 to turn off gtk event loop in setupext for pygtk>=2.15.10 - JDH

2009-05-17 applied Michiel’s sf patch 2792742 to speed up Cairo and macosx collections; speedups can be 20x. Also fixes some bugs in which gc got into inconsistent state

2008-05-17 Release 0.98.5.3 at r7107 from the branch - JDH

2009-05-13 An optional offset and bbox support in restore_bbox. Add animation_blit_gtk2.py. - J JL

2009-05-13 psfrag in backend_ps now uses baseline-alignment when preview.sty is used ((default is bottom-alignment). Also, a small api improvement in OffsetBox-J JL

2009-05-13 When the x-coordinate of a line is monotonically increasing, it is now automatically clipped at the stage of generating the transformed path in the draw method; this greatly speeds up zooming and panning when one is looking at a short segment of a long time series, for example. - EF

2009-05-11 aspect=1 in log-log plot gives square decades. - J JL

2009-05-08 clabel takes new kwarg, rightside_up; if False, labels will not be flipped to keep them rightside-up. This allows the use of clabel to make streamfunction arrows, as requested by Evan Mason. - EF

2009-05-07 'labelpad’ can now be passed when setting x/y labels. This allows controlling the spacing between the label and its axis. - RMM

2009-05-06 print_ps now uses mixed-mode renderer. Axes.draw rasterize artists whose zorder smaller than rasterization_zorder. - J JL

2009-05-06 Per-artist Rasterization, originally by Eric Bruning. - J J
2009-05-05 Add an example that shows how to make a plot that updates using data from another process. Thanks to Robert Cimrman - RMM

2009-05-05 Add Axes.get legend handles labels method. - JJL

2009-05-04 Fix bug that Text.Annotation is still drawn while set to not visible. - JJL

2009-05-04 Added TJ's fill_betweenx patch - JDH

2009-05-02 Added options to plotfile based on question from Joseph Smidt and patch by Matthias Michler. - EF

2009-05-01 Changed add_artist and similar Axes methods to return their argument. - EF

2009-04-30 Incorrect eps bbox for landscape mode fixed - JJL

2009-04-28 Fixed incorrect bbox of eps output when usetex=True. - JJL

2009-04-24 Changed use of os.open* to instead use subprocess.Popen. os.popen* are deprecated in 2.6 and are removed in 3.0. - RMM

2009-04-20 Worked on axes_grid documentation. Added axes_grid.inset_locator. - JJL

2009-04-17 Initial check-in of the axes_grid toolkit. - JJL

2009-04-17 Added a support for bbox_to_anchor in offsetbox.AnchoredOffsetbox. Improved a documentation. - JJL

2009-04-16 Fixed a offsetbox bug that multiline texts are not correctly aligned. - JJL

2009-04-16 Fixed a bug in mixed mode renderer that images produced by an rasterizing backend are placed with incorrect size. - JJL

2009-04-14 Added Jonathan Taylor’s Reinier Heeres’ port of John Porters’ mplot3d to svn trunk. Package in mpl_toolkits.mplot3d and demo is examples/mplot3d/demo.py. Thanks Reiner

2009-04-06 The pdf backend now escapes newlines and linefeeds in strings. Fixes sf bug #2708559; thanks to Tiago Pereira for the report.

2009-04-06 texmanager.make_dvi now raises an error if LaTeX failed to create an output file. Thanks to Joao Luis Silva for reporting this. - JKS

2009-04-05 _png.read_png() reads 12 bit PNGs (patch from Tobias Wood) - ADS

2009-04-04 Allow log axis scale to clip non-positive values to small positive value; this is useful for errorbars. - EF

2009-03-28 Make images handle nan in their array argument. A helper, cbook.safe_masked_invalid() was added. - EF

2009-03-25 Make contour and contourf handle nan in their Z argument. - EF

2009-03-20 Add AuxTransformBox in offsetbox.py to support some transformation. anchored_text.py example is enhanced and renamed (anchored_artists.py). - JJL

2009-03-20 Add “bar” connection style for annotation - JJL

2009-03-17 Fix bugs in edge color handling by contour, found by Jae-Joon Lee. - EF

2009-03-14 Added ‘LightSource‘ class to colors module for creating shaded relief maps. shading_example.py added to illustrate usage. - JSW

2009-03-11 Ensure wx version >= 2.8; thanks to Sandro Tosi and Chris Barker. - EF

7.1. List of changes to Matplotlib prior to 2015
2009-03-10 Fix join style bug in pdf. - JKS
2009-03-07 Add pyplot access to figure number list - EF
2009-02-28 hashing of FontProperties accounts current rcParams - JJL
2009-02-28 Prevent double-rendering of shared axis in twinx, twiny - EF
2009-02-26 Add optional bbox_to_anchor argument for legend class - JJL
2009-02-26 Support image clipping in pdf backend. - JKS
2009-02-25 Improve tick location subset choice in FixedLocator. - EF
2009-02-24 Deprecate numerix, and strip out all but the numpy part of the code. - EF
2009-02-21 Improve scatter argument handling; add an early error message, allow inputs to have more than one dimension. - EF
2009-02-16 Move plot_directive.py to the installed source tree. Add support for in-line code content - MGD
2009-02-16 Move mathmpl.py to the installed source tree so it is available to other projects. - MGD
2009-02-14 Added the legend title support - JJL
2009-02-10 Fixed a bug in backend_pdf so it doesn’t break when the setting pdf.use14corefonts=True is used. Added test case in unit/test_pdf_use14corefonts.py. - NGR
2009-02-08 Added a new imsavetext function to image.py and exposed it in the pyplot interface - GR
2009-02-04 Some reorganization of the legend code. anchored_text.py added as an example. - JJL
2009-02-04 Add extent keyword arg to hexbin - ADS
2009-02-04 Fix bug in mathtext related to dots and ldots - MGD
2009-02-03 Change default joinstyle to round - MGD
2009-02-02 Reduce number of marker XObjects in pdf output - JKS
2009-02-02 Change default resolution on polar plot to 1 - MGD
2009-02-02 Avoid malloc errors in ttconv for fonts that don’t have e.g., PostName (a version of Tahoma triggered this) - JKS
2009-01-30 Remove support for pyExcelerator in exceltools - use xlwt instead - JDL
2009-01-29 Document ‘resolution’ kwarg for polar plots. Support it when using pyplot.polar, not just Figure.add_axes. - MGD
2009-01-29 Rework the nan-handling/clipping/quantizing/simplification framework so each is an independent part of a pipeline. Expose the C++-implementation of all of this so it can be used from all Python backends. Add rcParam “path.simplify_threshold” to control the threshold of similarity below which vertices will be removed.
2009-01-26 Improved tight bbox option of the savefig. - JJL
2009-01-26 Make curves and NaNs play nice together - MGD
2009-01-21 Changed the defaults of acorr and xcorr to use usevlines=True, maxlags=10 and normed=True since these are the best defaults
2009-01-19 Fix bug in quiver argument handling. - EF
2009-01-19 Fix bug in backend_gtk: don’t delete nonexistent toolbar. - EF

2009-01-16 Implement bbox_inches option for savefig. If bbox_inches is “tight”, try to determine the tight bounding box. - JJL

2009-01-16 Fix bug in is_string_like so it doesn’t raise an unnecessary exception. - EF

2009-01-16 Fix an infinite recursion in the unit registry when searching for a converter for a sequence of strings. Add a corresponding test. - RM

2009-01-16 Bugfix of C typedef of MPL_Int64 that was failing on Windows XP 64 bit, as reported by George Goussard on numpy mailing list. - ADS

2009-01-16 Added helper function LinearSegmentedColormap.from_list to facilitate building simple custom colormaps. See examples/pylab_examples/custom_cmap_fromlist.py - JDH

2009-01-16 Applied Michiel’s patch for macosx backend to fix rounding bug. Closed sf bug 2508440 - JSW

2009-01-10 Applied Michiel’s hatch patch for macosx backend and draw_idle patch for qt. Closes sf patched 2497785 and 2468809 - JDH

2009-01-10 Fix bug in pan/zoom with log coordinates. - EF
2009-01-06 Fix bug in setting of dashed negative contours. - EF
2009-01-06 Be fault tolerant when len(linestyles)>NLev in contour. - MM

2009-01-06 Added marginals kwarg to hexbin to plot marginal densities -JDH

2009-01-06 Change user-visible multipage pdf object to PdfPages to avoid accidents with the file-like PdfFile. - JKS
2009-01-05 Fix a bug in pdf usetex: allow using non-embedded fonts. - JKS
2009-01-05 optional use of preview.sty in usetex mode. - JJL
2009-01-02 Allow multipage pdf files. - JKS

2008-12-31 Improve pdf usetex by adding support for font effects (slanting and extending). - JKS

2008-12-29 Fix a bug in pdf usetex support, which occurred if the same Type-1 font was used with different encodings, e.g., with Minion Pro and MnSymbol. - JKS
2008-12-20 fix the dpi-dependent offset of Shadow. - JJL

2008-12-20 fix the hatch bug in the pdf backend. minor update in docs and example -JJL

2008-12-19 Add axes Locator attribute in Axes. Two examples are added.

• JJL

2008-12-19 Update Axes.legend documentation. /api/api_changes.rst is also updated to describe changes in keyword parameters. Issue a warning if old keyword parameters are used. - JJL

2008-12-18 add new arrow style, a line + filled triangles. -JJL

2008-12-18 Re-Released 0.98.5.2 from v0_98_5 maint at r6679 Released 0.98.5.2 from v0_98_5 maint at r6667

7.1. List of changes to Matplotlib prior to 2015 463
2008-12-18 Removed configobj, experimental traits and doc/mpl_data link - JDH

**2008-12-18** Fix bug where a line with NULL data limits prevents subsequent data limits from calculating correctly - MGD

2008-12-17 Major documentation generator changes - MGD

**2008-12-17** Applied macOSx backend patch with support for path collections, quadmesh, etc... - JDH

**2008-12-17** fix dpi-dependent behavior of text bbox and arrow in annotate - JJL

2008-12-17 Add group id support in artist. Two examples which demonstrate svg filter are added. - JJL

2008-12-16 Another attempt to fix dpi-dependent behavior of Legend. - JJL

2008-12-16 Fixed dpi-dependent behavior of Legend and fancybox in Text.

**2008-12-16** Added markevery property to Line2D to support subsampling of markers - JDH

**2008-12-15** Removed mpl_data symlink in docs. On platforms that do not support symlinks, these become copies, and the font files are large, so the distro becomes unnecessarily bloated. Keeping the mpl_examples dir because relative links are harder for the plot directive and the *.py files are not so large. - JDH

**2008-12-15** Fix $ in non-math text with usetex off. Document differences between usetex on/off - MGD

2008-12-15 Fix anti-aliasing when auto-snapping - MGD

2008-12-15 Fix grid lines not moving correctly during pan and zoom - MGD

**2008-12-12** Preparations to eliminate maskedarray rcParams key: its use will now generate a warning. Similarly, importing the obsolete numerix.numpy will generate a warning. - EF

**2008-12-12** Added support for the numpy.histogram() weights parameter to the axes hist() method. Docs taken from numpy - MM

2008-12-12 Fixed warning in hist() with numpy 1.2 - MM

**2008-12-12** Removed external packages: configobj and enthought.traits which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently, see:

http://code.enthought.com/pages/traits.html

and:

http://www.voidspace.org.uk/python/configobj.html

**2008-12-12** Added support to assign labels to histograms of multiple data. - MM

2008-12-11 Released 0.98.5 at svn r6573

**2008-12-11** Use subprocess.Popen instead of os.popen in dviread (Windows problem reported by Jorgen Stenarson) - JKS

**2008-12-10** Added Michael’s font_manager fix and Jae-Joon’s figure/subplot fix. Bumped version number to 0.98.5 - JDH
2008-12-09 Released 0.98.4 at svn r6536

2008-12-08 Added mdehoon’s native macosx backend from sf patch 2179017 - JDH

**2008-12-08 Removed the prints in the set_*style commands. Return the** 
list of printed strings instead - JDH

**2008-12-08 Some of the changes Michael made to improve the output of** 
the property tables in the rest docs broke of made difficult to use some of the interactive doc 
helpers, e.g., setp and getp. Having all the rest markup in the ipython shell also 
confused the docstrings. I added a new rc param docstring.harcopy, to format the 
docstrings differently for hardcopy and other use. Ther ArtistInspector could use a little 
refactoring now since there is duplication of effort between the rest out put and the 
non-rest output - JDH

**2008-12-08 Updated spectral methods (psd, csd, etc.) to scale one-sided** 
densities by a factor of 2 and, optionally, scale all densities by the sampling frequency. This gives 
better MatLab compatibility. -RM

2008-12-08 Fixed alignment of ticks in colorbars. -MGD

**2008-12-07 drop the deprecated “new” keyword of np.histogram() for** 
numpy 1.2 or later. -JDL

**2008-12-06 Fixed a bug in svg backend that new_figure_manager() ignores keywords** 
arguments such as figsize, etc. -JDL

**2008-12-05 Fixed a bug that the handlelength of the new legend class set too short** 
when numpoints=1 -JDL

**2008-12-04 Added support for data with units (e.g., dates) to** 
Axes.fill_between. -RM

**2008-12-04 Added fancybox keyword to legend. Also applied some changes for** 
better look, including baseline adjustment of the multiline texts so that it is center aligned. 
-JDL

**2008-12-02 The transmuter classes in the patches.py are reorganized as** 
subclasses of the Style classes. A few more box and arrow styles are added. -JDL

**2008-12-02 Fixed a bug in the new legend class that didn’t allowed** 
a tuple of coordinate vlaues as loc. -JDL

**2008-12-02 Improve checks for external dependencies, using subprocess** 
(instead of deprecated popen*) and distutils (for version checking) - DSD

**2008-11-30 Reimplementation of the legend which supports baseline alignement,** 
multi-column, and expand mode. -JDL

**2008-12-01 Fixed histogram autoscaling bug when bins or range are given** 
explicitly (fixes Debian bug 503148) - MM

**2008-11-25 Added rcParam axes.unicode_minus which allows plain hyphen** 
for minus when False - JDH

**2008-11-25 Added scatterpoints support in Legend. patch by Erik Tollerud - JDL**

2008-11-24 Fix crash in log ticking. -MGD

**2008-11-20 Added static helper method BrokenHBarCollection.span_where and** 
Axes/Pyplot method fill_between. See examples/pylab/fill_between.py - JDH

---

7.1. List of changes to Matplotlib prior to 2015
2008-11-12 Add _x_isdata and _y_isdata attributes to Artist instances, and use them to determine whether either or both coordinates are used when updating dataLim. This is used to fix autoscaling problems that had been triggered by axhline, axhspan, axvline, axvspan. - EF

2008-11-11 Update the psd(), csd(), cohere(), and specgram() methods of Axes and the csd() cohere(), and specgram() functions in mlab to be in sync with the changes to psd(). In fact, under the hood, these all call the same core to do computations. - RM

2008-11-11 Add ‘pad_to’ and ‘sides’ parameters to mlab.psd() to allow controlling of zero padding and returning of negative frequency components, respectively. These are added in a way that does not change the API. - RM

2008-11-10 Fix handling of c kwarg by scatter; generalize is_string_like to accept numpy and numpy.ma string array scalars. - RM and EF

2008-11-09 Fix a possible EINVAL problem in dviread, which might help when saving pdf files from the qt backend. - JKS

2008-11-05 Fix bug with zoom to rectangle and twin axes - MGD

2008-10-24 Added Jae Joon’s fancy arrow, box and annotation enhancements – see examples/pylab_examples/annotation_demo2.py

2008-10-23 Autoscaling is now supported with shared axes - EF

2008-10-23 Fixed exception in dviread that happened with Minion - JKS

2008-10-21 set_xlim, ylim now return a copy of the viewlim array to avoid modify in-place surprises

2008-10-20 Added image thumbnail generating function matplotlib.image.thumbnail. See examples/misc/image_thumbnail.py - JDH

2008-10-20 Applied scatleg patch based on ideas and work by Erik Tollerud and Jae-Joon Lee. - MM

2008-10-11 Fixed bug in pdf backend: if you pass a file object for output instead of a filename, e.g., in a wep app, we now flush the object at the end. - JKS

2008-10-08 Add path simplification support to paths with gaps. - EF

2008-10-05 Fix problem with AFM files that don’t specify the font’s full name or family name. - JKS

2008-10-04 Added ‘scilimits’ kwarg to Axes.ticklabel_format() method, for easy access to the set_powerlimits method of the major ScalarFormatter. - EF

2008-10-04 Experimental new kwarg borderpad to replace pad in legend, based on suggestion by Jae-Joon Lee. - EF

2008-09-27 Allow spy to ignore zero values in sparse arrays, based on patch by Tony Yu. Also fixed plot to handle empty data arrays, and fixed handling of markers in figlegend. - EF

2008-09-24 Introduce drawstyles for lines. Transparently split linestyles like ‘steps-’ into drawstyle ‘steps’ and linestyle ‘-‘. Legends always use drawstyle ‘default’. - MM

2008-09-18 Fixed quiver and quiverkey bugs (failure to scale properly when resizing) and added additional methods for determining the arrow angles - EF

2008-09-18 Fix polar interpolation to handle negative values of theta - MGD
2008-09-14 **Reorganized cbook and mlab methods related to numerical** calculations that have little to do with the goals of those two modules into a separate module numerical_methods.py Also, added ability to select points and stop point selection with keyboard in ginput and manual contour labeling code. Finally, fixed contour labeling bug. - DMK

2008-09-11 Fix backtick in Postscript output. - MGD

2008-09-10 **Path simplification for vector output backends** Leverage the simplification code exposed through path_to_polygons to simplify certain well-behaved paths in the vector backends (PDF, PS and SVG). “path.simplify” must be set to True in matplotlibrc for this to work. - MGD

2008-09-10 **Add “filled” kwarg to Path.intersects_path and Path.intersects_bbox.** - MGD

2008-09-07 **Changed full arrows slightly to avoid an xpdf rendering problem** reported by Friedrich Hagedorn. - JKS

2008-09-07 **Fix conversion of quadratic to cubic Bezier curves in PDF and PS backends.** Patch by Jae-Joon Lee. - JKS

2008-09-06 **Added 5-point star marker to plot command** - EF

2008-09-05 **Fix hatching in PS backend** - MGD

2008-09-03 **Fix log with base 2** - MGD

2008-09-01 **Added support for bilinear interpolation in NonUniformImage; patch by Gregory Lielens.** - EF

2008-08-28 **Added support for multiple histograms with data of different length** - MM

2008-08-28 **Fix step plots with log scale** - MGD

2008-08-28 **Fix masked arrays with markers in non-Agg backends** - MGD

2008-08-28 **Fix clip_on kwarg so it actually works correctly** - MGD

2008-08-25 **Fix locale problems in SVG backend** - MGD

2008-08-22 **fix quiver so masked values are not plotted** - JSW

2008-08-18 **improve interactive pan/zoom in qt4 backend on windows** - DSD

2008-08-11 **Fix more bugs in NaN/inf handling. In particular, path simplification (which does not handle NaNs or infs) will be turned off automatically when infs or NaNs are present. Also masked arrays are now converted to arrays with NaNs for consistent handling of masks and NaNs** - MGD and EF

2008-08-03 Released 0.98.3 at svn r5947

2008-08-01 Backported memory leak fixes in _ttconv.cpp - MGD

2008-07-31 **Added masked array support to griddata.** - JSW

2008-07-26 **Added optional C and reduce_C_function arguments to axes.hexbin().** This allows hexbin to accumulate the values of C based on the x,y coordinates and display in hexagonal bins. - ADS

2008-07-24 **Deprecated (raise Not Implemented Error) all the mlab2 functions from matplotlib.mlab out of concern that some of them were not clean room implementations.** JDH

---

7.1. List of changes to Matplotlib prior to 2015
2008-07-24 Rewrite of a significant portion of the clabel code (class ContourLabeler) to improve inlining. - DMK

2008-07-22 Added Barbs polygon collection (similar to Quiver) for plotting wind barbs. Added corresponding helpers to Axes and pyplot as well. (examples/pylab_examples/barb_demo.py shows it off.) - RMM

2008-07-21 Added scikits.delaunay as matplotlib.delaunay. Added griddata function in matplotlib.mlab, with example (griddata_demo.py) in pylab_examples. griddata function will use mpl_toolkits._natgrid if installed. - JSW

2008-07-21 Re-introduced offset_copy that works in the context of the new transforms. - MGD

2008-07-21 Committed patch by Ryan May to add get_offsets and set_offsets to Collections base class - EF

2008-07-21 Changed the “asarray” strategy in image.py so that colormapping of masked input should work for all image types (thanks Klaus Zimmerman) - EF

2008-07-20 Rewrote cbook.delete_masked_points and corresponding unit test to support rgb color array inputs, datetime inputs, etc. - EF

2008-07-20 Renamed unit/axes_unit.py to cbook_unit.py and modified in accord with Ryan’s move of delete_masked_points from axes to cbook. - EF

2008-07-18 Check for nan and inf in axes.delete_masked_points(). This should help hexbin and scatter deal with nans. - ADS

2008-07-17 Added ability to manually select contour label locations. Also added a waitforbuttonpress function. - DMK

2008-07-17 Fix bug with NaNs at end of path (thanks, Andrew Straw for the report) - MGD

2008-07-16 Improve error handling in texmanager, thanks to Ian Henry for reporting - DSD

2008-07-12 Added support for external backends with the "module://my_backend" syntax - JDH

2008-07-11 Fix memory leak related to shared axes. Grouper should store weak references. - MGD

2008-07-10 Bugfix: crash displaying fontconfig pattern - MGD

2008-07-10 Bugfix: [2013963] update_datalim_bounds in Axes not works - MGD

2008-07-10 Bugfix: [2014183] multiple imshow() causes gray edges - MGD

2008-07-09 Fix rectangular axes patch on polar plots bug - MGD

2008-07-09 Improve mathtext radical rendering - MGD

2008-07-08 Improve mathtext superscript placement - MGD

2008-07-07 Fix custom scales in pcolormesh (thanks Matthew Turk) - MGD

2008-07-03 Implemented findobj method for artist and pyplot - see examples/pylab_examples/findobj_demo.py - JDH

2008-06-30 Another attempt to fix TextWithDash - DSD

2008-06-30Removed Qt4 NavigationToolbar2.destroy - it appears to have been unnecessary and caused a bug reported by P. Raybaut - DSD
2008-06-27 Fixed tick positioning bug - MM

2008-06-27 **Fix dashed text bug where text was at the wrong end of the** dash - MGD

2008-06-26 Fix mathtext bug for expressions like $x_{\Leftarrow}$ - MGD

2008-06-26 Fix direction of horizontal/vertical hatches - MGD

2008-06-25 **Figure.figurePatch renamed Figure.patch, Axes.axesPatch renamed Axes.patch, Axes.axesFrame renamed Axes.frame, Axes.get_frame, which returns Axes.patch, is deprecated. Examples and users guide updated** - JDH

2008-06-25 Fix rendering quality of pcolor - MGD

---

2008-06-24 Released 0.98.2 at svn r5667 - (source only for debian) JDH

2008-06-24 Added “transparent” kwarg to savefig. - MGD

2008-06-24 **Applied Stefan’s patch to draw a single centered marker over a line with numpoints==1** - JDH

2008-06-23 Use splines to render circles in scatter plots - MGD

---

2008-06-22 Released 0.98.1 at revision 5637

2008-06-22 **Removed axes3d support and replaced it with a NotImplementedError for one release cycle**

2008-06-21 fix marker placement bug in backend_ps - DSD

2008-06-20 **Added closed kwarg to PolyCollection. Fixes bug [1994535] still missing lines on graph with svn (r 5548).** - MGD

2008-06-20 **Added set/get_closed method to Polygon; fixes error in hist** - MM

2008-06-19 **Use relative font sizes (e.g., ‘medium’ and ‘large’) in rcsetup.py and matplotlibrc.template so that text will be scaled by default when changing rc-Params[‘font.size’]** - EF

2008-06-17 **Add a generic PatchCollection class that can contain any kind of patch.** - MGD

2008-06-13 **Change pie chart label alignment to avoid having labels overwrite the pie** - MGD

2008-06-12 **Added some helper functions to the mathtext parser to return bitmap arrays or write pngs to make it easier to use mathtext outside the context of an mpl figure. modified the mathpng sphinxext to use the mathtext png save functionality - see examples/api/mathtext_asarray.py** - JDH

2008-06-11 **Use matplotlib.mathtext to render math expressions in online docs** - MGD

2008-06-11 **Move PNG loading/saving to its own extension module, and remove duplicate code in _backend_agg.cpp and _image.cpp that does the same thing** - MGD

2008-06-11 **Numerous mathtext bugfixes, primarily related to dpi-independence** - MGD

---

7.1. List of changes to Matplotlib prior to 2015
2008-06-10 Bar now applies the label only to the first patch only, and
sets _nolegend_ for the other patch labels. This lets
autolegend work as expected for hist and bar - see
JDH

2008-06-10 Fix text baseline alignment bug. [ 1985420 ] Repair of baseline alignment in Text._get_layout. Thanks Stan West - MGD

2008-06-09 Committed Gregor's image resample patch to downsampling images with new rcparam image.resample - JDH

2008-06-09 Don't install Enthought.Traits along with matplotlib. For matplotlib developers convenience, it can still be installed by setting an option in setup.cfg while we figure decide if there is a future for the traited config - DSD

2008-06-09 Added range keyword arg to hist() - MM

2008-06-07 Moved list of backends to rcsetup.py; made use of lower case for backend names consistent; use validate_backend when importing backends subpackage - EF

2008-06-06 hist() revision, applied ideas proposed by Erik Tollerud and Olle Engde-gard: make histtype='step' unfilled by default and introduce histtype='stepfilled'; use default color cycle; introduce reverse cumulative histogram; new align keyword - MM

2008-06-06 Fix closed polygon patch and also provide the option to not close the polygon - MGD

2008-06-05 Fix some dpi-changing-related problems with PolyCollection, as called by Axes.scatter() - MGD

2008-06-05 Fix image drawing so there is no extra space to the right or bottom - MGD

2006-06-04 Added a figure title command suptitle as a Figure method and pyplot command - see examples/figure_title.py - JDH

2008-06-02 Added support for log to hist with histtype='step' and fixed a bug for log-scale stacked histograms - MM

2008-05-29 Released 0.98.0 at revision 5314

2008-05-29 matplotlib.image.imread now no longer always returns RGBA - if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also uint8 is no longer always forced to float.

2008-05-29 Implement path clipping in PS backend - JDH

2008-05-29 Fixed two bugs in texmanager.py: improved comparison of dvipng versions fixed a bug introduced when get_grey method was added - DSD

2008-05-28 Fix crashing of PDFs in xpdf and ghostscript when two-byte characters are used with Type 3 fonts - MGD

2008-05-28 zero width/height Rectangles no longer influence the autoscaler. Useful for log histograms with empty bins - JDH

2008-05-28 Fix rendering of composite glyphs in Type 3 conversion (particularly as evidenced in the Eunjin.ttf Korean font) Thanks Jae-Joon Lee for finding this!

2008-05-27 Rewrote the cm.ScalarMappable callback infrastructure to use cbook.CallbackRegistry rather than custom callback handling. Amy users of add_observer/notify of the cm.ScalarMappable should use the cm.ScalarMappable.callbacksSM CallbackRegistry instead. JDH

2008-05-27 Fix TkAgg build on Ubuntu 8.04 (and hopefully a more general solution for other platforms, too.)

2008-05-24 Added PIL support for loading images to imread (if PIL is available) - JDH

2008-05-23 Provided a function and a method for controlling the plot color cycle. - EF

2008-05-23 Major revision of hist(). Can handle 2D arrays and create stacked histogram plots; keyword ‘width’ deprecated and rwidth (relative width) introduced; align=’edge’ changed to center of bin - MM

2008-05-22 AddedsupportforReST-baseddoumentationusingSphinx. Documents are located in doc/, and are broken up into a users guide and an API reference. To build, run the make.py files. Sphinx-0.4 is needed to build generate xml, which will be useful for rendering equations with mathml, use sphinx from svn until 0.4 is released - DSD

2008-05-21 Fix segfault in TkAgg backend - MGD

2008-05-21 Fix a “local variable unreferenced” bug in plotfile - MM

2008-05-19 Fix crash when Windows can not access the registry to determine font path [Bug 1966974, thanks Patrik Simons] - MGD

2008-05-16 removed some unneeded code w/ the python 2.4 requirement. cbook no longer provides compatibility for reversed, enumerate, set or izip. removed lib/subprocess, mpl1, sandbox/units, and the swig code. This stuff should remain on the maintenance branch for archival purposes. JDH

2008-05-16 Reorganized examples dir - JDH

2008-05-16 Added 'elinewidth' keyword arg to errorbar, based on patch by Christopher Brown - MM

2008-05-16 Added 'cumulative' keyword arg to hist to plot cumulative histograms. For normed hists, this is normalized to one - MM

2008-05-15 Fix Tk backend segfault on some machines - MGD

2008-05-14 Don’t use stat on Windows (fixes font embedding problem) - MGD

2008-05-09 Fix /singlequote (’) in Postscript backend - MGD

2008-05-08 Fix kerning in SVG when embedding character outlines - MGD

2008-05-07 Switched to future numpy histogram semantic in hist - MM

2008-05-06 Fix strange colors when blitting in QtAgg and Qt4Agg - MGD

2008-05-05 pass notify axes change to the figure’s add axobserver in the qt backends, like we do for the other backends. Thanks Glenn Jones for the report - DSD

2008-05-02 Added step histograms, based on patch by Erik Tollerud. - MM
2008-05-02 On PyQt <= 3.14 there is no way to determine the underlying Qt version. [1851364] - MGD

2008-05-02 Don’t call sys.exit() when pyemf is not found [1924199] - MGD

2008-05-02 Update_subprocess.c from upstream Python 2.5.2 to get a few memory and reference-counting-related bugfixes. See bug 1949978. - MGD

2008-04-30 Added some record array editing widgets for gtk - see examples/rec_edit*.py - JDH

2008-04-29 Fix bug in mlab.sqrtm - MM

2008-04-28 Fix bug in SVG text with Mozilla-based viewers (the symbol tag is not supported) - MGD

2008-04-27 Applied patch by Michiel de Hoon to add hexbin axes method and pyplot function - EF

2008-04-25 Enforce python >= 2.4; remove subprocess build - EF

2008-04-25 Enforce the numpy requirement at build time - JDH

2008-04-24 Make numpy 1.1 and python 2.3 required when importing matplotlib - EF

2008-04-24 Fix compilation issues on VS2003 (Thanks Martin Spacek for all the help) - MGD

2008-04-24 Fix sub/superscripts when the size of the font has been changed - MGD

2008-04-22 Use “svg.embed_char_paths” consistently everywhere - MGD

2008-04-20 Add support to MaxNLocator for symmetric axis autoscaling. - EF

2008-04-20 Fix double-zoom bug. - MM

2008-04-15 Speed up color mapping. - EF

2008-04-12 Speed up zooming and panning of dense images. - EF

2008-04-11 Fix global font rcParam setting after initialization time. - MGD

2008-04-11 Revert commits 5002 and 5031, which were intended to avoid an unnecessary call to draw(). 5002 broke saving figures before show(). 5031 fixed the problem created in 5002, but broke interactive plotting. Unnecessary call to draw still needs resolution - DSD

2008-04-07 Improve color validation in rc handling, suggested by Lev Givon - EF

2008-04-02 Allow to use both linestyle definition arguments, ‘-‘ and ‘solid’ etc. in plots/collections - MM

2008-03-27 Fix saving to Unicode filenames with Agg backend (other backends appear to already work...) (Thanks, Christopher Barker) - MGD

2008-03-26 Fix SVG backend bug that prevents copying and pasting in Inkscape (thanks Kaushik Ghose) - MGD

2008-03-24 Removed an unnecessary call to draw() in the backend_qt* mouseReleaseEvent. Thanks to Ted Drain - DSD

2008-03-23 Fix a pdf backend bug which sometimes caused the outermost gsave to not be balanced with a grestore. - JKS
2008-03-20 Fixed a minor bug in ContourSet._process_linestyles when
len(linestyles)==Nlev - MM

2008-03-19 Changed ma import statements to “from numpy import ma”; this should
work with past and future versions of numpy, whereas “import numpy.ma as ma” will
work only with numpy >= 1.05, and “import numerix.npyma as ma” is obsolete now that
maskedarray is replacing the earlier implementation, as of numpy 1.05.

2008-03-14 Removed an apparently unnecessary call to FigureCanvasAgg.draw in
backend_qt*agg. Thanks to Ted Drain - DSD

2008-03-10 Workaround a bug in backend_qt4agg’s blitting due to a buffer
width/bbox width mismatch in _backend_agg’s copy_from_bbox - DSD

2008-02-29 Fix class Wx toolbar pan and zoom functions (Thanks Jeff Peery) - MGD

2008-02-16 Added some new rec array functionality to mlab (rec_summarize, rec2txt
and rec_groupby). See examples/rec_groupby_demo.py. Thanks to Tim M for rec2txt.

2008-02-12 Applied Erik Tollerud’s span selector patch - JDH

2008-02-11 Update plotting() doc string to refer to getp/setp. - JKS

2008-02-10 Fixed a problem with square roots in the pdf backend withusetex. - JKS

2008-02-08 Fixed minor _str_ bugs so getp(gca()) works. - JKS

2008-02-05 Added getters for title, xlabel, ylabel, as requested by Brandon Kieth - EF

2008-02-05 Applied Gael’s ginput patch and created examples/ginput_demo.py - JDH

2008-02-03 Expose interpnames, a list of valid interpolation methods, as an AxesIm-
age class attribute. - EF

2008-02-03 Added BoundaryNorm, with examples in colorbar_only.py and image_masked.py. - EF

2008-02-03 Force dpi=72 in pdf backend to fix picture size bug. - JKS

2008-02-01 Fix doubly-included font problem in Postscript backend - MGD

2008-02-01 Fix reference leak in ft2font Glyph objects. - MGD

2008-01-31 Don’t use unicode strings with usetex by default - DSD

2008-01-31 Fix text spacing problems in PDF backend with some fonts, such as STIXGeneral.

2008-01-31 Fix sqrt with radical number (broken by making [ and ] work below) - MGD

2008-01-27 Applied Martin Teichmann’s patch to improve the Qt4 backend. Uses Qt’s builtin toolbars and statusbars. See bug 1828848 - DSD

2008-01-10 Moved toolkits to mpl_toolkits, made mpl_toolkits a namespace package - JSWHIT

2008-01-10 Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

2008-01-10 Fix bug displaying [ and ] in mathtext - MGD

2008-01-10 Fix bug when displaying a tick value offset with scientific notation.
(Manifests itself as a warning that the times symbol can not be found). - MGD
2008-01-10 Use setup.cfg to set the default parameters (tkagg, numpy) when building windows installers - DSD

2008-01-06 Released 0.91.2 at revision 4802

2007-12-26 Reduce too-late use of matplotlib.use() to a warning instead of an exception, for backwards compatibility - EF

2007-12-25 Fix bug in errorbar, identified by Noriko Minakawa - EF

2007-12-25 Changed masked array importing to work with the upcoming numpy 1.05 (now the maskedarray branch) as well as with earlier versions. - EF

2007-12-16 rec2csv saves doubles without losing precision. Also, it does not close filehandles passed in open. - JDH,ADS

2007-12-13 Moved rec2gtk to matplotlib.toolkits.gtktools and rec2excel to matplotlib.toolkits.exceltools - JDH

2007-12-12 Support alpha-blended text in the Agg and Svg backends - MGD

2007-12-10 Fix SVG text rendering bug. - MGD

2007-12-10 Increase accuracy of circle and ellipse drawing by using an 8-piece bezier approximation, rather than a 4-piece one. Fix PDF, SVG and Cairo backends so they can draw paths (meaning ellipses as well). - MGD

2007-12-07 Issue a warning when drawing an image on a non-linear axis. - MGD

2007-12-06 let widgets.Cursor initialize to the lower x and y bounds rather than 0,0, which can cause havoc for dates and other transforms - DSD

2007-12-06 updated references to mpl data directories for py2exe - DSD

2007-12-06 fixed a bug in rcsetup, see bug 1845057 - DSD

2007-12-05 Fix how fonts are cached to avoid loading the same one multiple times. (This was a regression since 0.90 caused by the refactoring of font_manager.py) - MGD

2007-12-05 Support arbitrary rotation of usetex text in Agg backend. - MGD

2007-12-04 Support '|' as a character in mathtext - MGD

2007-11-27 Released 0.91.1 at revision 4517

2007-11-27 Released 0.91.0 at revision 4478

2007-11-13 All backends now support writing to a file-like object, not just a regular file. savefig() can be passed a file-like object in place of a file path. - MGD

2007-11-13 Improved the default backend selection at build time: SVG -> Agg -> Tk-Agg -> WXAgg -> GTK -> GTKAgg. The last usable backend in this progression will be chosen in the default config file. If a backend is defined in setup.cfg, that will be the default backend - DSD

2007-11-13 Improved creation of default config files at build time for traited config package - DSD
2007-11-12 Exposed all the build options in setup.cfg. These options are read into a dict called "options" by setupext.py. Also, added "-mpl" tags to the version strings for packages provided by matplotlib. Versions provided by mpl will be identified and updated on subsequent installs - DSD

2007-11-12 Added support for STIX fonts. A new rcParam, mathtext.fontset, can be used to choose between:

‘cm’: The TeX/LaTeX Computer Modern fonts
‘stix’: The STIX fonts (see stixfonts.org)
‘stixsans’: The STIX fonts, using sans-serif glyphs by default
‘custom’: A generic Unicode font, in which case the mathtext font must be specified using mathtext.bf, mathtext.it, mathtext.sf etc.

Added a new example, stix_fonts_demo.py to show how to access different fonts and unusual symbols.

• MGD

2007-11-12 Options to disable building backend extension modules moved from setup.py to setup.cfg - DSD

2007-11-09 Applied Martin Teichmann's patch 1828813: a QPainter is used in paintEvent, which has to be destroyed using the method end(). If matplotlib raises an exception before the call to end - and it does if you feed it with bad data - this method end() is never called and Qt4 will start spitting error messages

2007-11-09 Moved pyparsing back into matplotlib namespace. Don't use system pyparsing, API is too variable from one release to the next - DSD

2007-11-08 Made pylab use straight numpy instead of oldnumeric by default - EF

2007-11-08 Added additional record array utilities to mlab (rec2excel, rec2gtk, rec_join, rec_append_field, rec_drop_field) - JDH

2007-11-08 Updated pytz to version 2007g - DSD

2007-11-08 Updated pyparsing to version 1.4.8 - DSD

2007-11-08 Moved csv2rec to recutils and added other record array utilities - JDH

2007-11-08 If available, use existing pyparsing installation - DSD

2007-11-07 Removed old enthought.traits from lib/matplotlib, added Gael Varoquaux's enthought.traits-2.6b1, which is stripped of setuptools. The package is installed to site-packages if not already available - DSD

2007-11-05 Added easy access to minor tick properties; slight mod of patch by Pierre G-M - EF

2007-11-02 Commited Phil Thompson’s patch 1599876, fixes to Qt4Agg backend and qt4 blitting demo - DSD

2007-11-02 Commited Phil Thompson’s patch 1599876, fixes to Qt4Agg backend and qt4 blitting demo - DSD

2007-10-31 Made log color scale easier to use with contourf; automatic level generation now works. - EF

2007-10-29 TRANSFORMS REFACTORYING
The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is primarily an internal improvement, and the possible user-visible changes it allows are yet to come.

The transformation framework was completely rewritten in Python (with Numpy). This will make it easier to add new kinds of transformations without writing C/C++ code.

Transforms are composed into a ‘transform tree’, made of transforms whose value depends on other transforms (their children). When the contents of children change, their parents are automatically updated to reflect those changes. To do this an “invalidation” method is used: when children change, all of their ancestors are marked as “invalid”. When the value of a transform is accessed at a later time, its value is recomputed only if it is invalid, otherwise a cached value may be used. This prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:

\[
\text{full transform} = \text{non-affine} + \text{affine}
\]

Much of the drawing has been refactored in terms of compound paths. Therefore, many methods have been removed from the backend interface and replaced with a handful to draw compound paths. This will make updating the backends easier, since there is less to update. It also should make the backends more consistent in terms of functionality.

User visible changes:

- **POLAR PLOTS**: Polar plots are now interactively zoomable, and the r-axis labels can be interactively rotated. Straight line segments are now interpolated to follow the curve of the r-axis.

- Non-rectangular clipping works in more backends and with more types of objects.

- Sharing an axis across figures is now done in exactly the same way as sharing an axis between two axes in the same figure:

  ```python
  fig1 = figure()
  fig2 = figure()

  ax1 = fig1.add_subplot(111)
  ax2 = fig2.add_subplot(111, sharex=ax1, sharey=ax1)
  ```

- linestyles now include steps-pre, steps-post and steps-mid. The old step still works and is equivalent to step-pre.

- Multiple line styles may be provided to a collection.

See API_CHANGES for more low-level information about this refactoring.

2007-10-24 Added ax kwarg to Figure.colorbar and pyplot.colorbar - EF

2007-10-19 Removed a gsave/grestore pair surrounding _draw_ps, which was causing a loss graphics state info (see “EPS output problem - scatter & edgecolors” on mpl-dev, 2007-10-29) - DSD
2007-10-15 Fixed a bug in patches. Ellipse that was broken for aspect=’auto’. Scale free ellipses now work properly for equal and auto on Agg and PS, and they fall back on a polygonal approximation for nonlinear transformations until we convince ourselves that the spline approximation holds for nonlinear transformations. Added unit/ellipse_compare.py to compare spline with vertex approx for both aspects. JDH

2007-10-05 remove generator expressions from texmanager and mpltraits. generator expressions are not supported by python-2.3 - DSD

2007-10-01 Made matplotlib.use() raise an exception if called after backends has been imported. - EF

2007-09-30 Modified update* methods of Bbox and Interval so they work with reversed axes. Prior to this, trying to set the ticks on a reversed axis failed with an uninformative error message. - EF

2007-09-30 Applied patches to axes3d to fix index error problem - EF

2007-09-24 Applied Eike Welk’s patch reported on mpl-dev on 2007-09-22 Fixes a bug with multiple plot windows in the qt backend, ported the changes to backend_qt4 as well - DSD

2007-09-21 Changed cbook.reversed to yield the same result as the python reversed builtin - DSD

2007-09-13 Theusetex support in the pdf backend is more usable now, so I am enabling it. - JKS

2007-09-12 Fixed a Axes.bar unit bug - JDH

2007-09-10 Made skiprows=1 the default on csv2rec - JDH

2007-09-09 Split out the plotting part of pylab and put it in pyplot.py; removed numerix from the remaining pylab.py, which imports everything from pyplot.py. The intention is that apart from cleanups, the result of importing from pylab is nearly unchanged, but there is the new alternative of importing from pyplot to get the state-engine graphics without all the numeric functions. Numpified examples; deleted two that were obsolete; modified some to use pyplot. - EF

2007-09-08 Eliminated gd and paint backends - EF

2007-09-06 .bmp file format is now longer an alias for .raw

2007-09-07 Added clip path support to pdf backend. - JKS

2007-09-06 Fixed a bug in the embedding of Type 1 fonts in PDF. Now it doesn’t crash Preview.app. - JKS

2007-09-06 Refactored image saving code so that all GUI backends can save most image types. See FILETYPES for a matrix of backends and their supported file types. Backend canvases should no longer write their own print_figure() method – instead they should write a print_xxx method for each filetype they can output and add an entry to their class-scoped filetypes dictionary. - MGD

2007-09-05 Fixed Qt version reporting in setupext.py - DSD

2007-09-04 Embedding Type 1 fonts in PDF, and thususetex support via dviread, sort of works. To test, enable it by renaming _draw_tex to draw_tex. - JKS

2007-09-03 Added ability of errorbar show limits via caret or arrowhead ends on the bars; patch by Manual Metz. - EF
2007-09-03 Created type1font.py, added features to AFM and FT2Font (see API_CHANGES), started work on embedding Type 1 fonts in pdf files. - JKS

2007-09-02 Continued work on dviread.py. - JKS

2007-08-16 Added a set_extent method to AxesImage, allow data extent to be modified after initial call to imshow - DSD

2007-08-14 Fixed a bug in pyqt4 subplots-adjust. Thanks to Xavier Gnata for the report and suggested fix - DSD

2007-08-13 Use pickle to cache entire fontManager; change to using font_manager module-level function findfont wrapper for the fontManager.findfont method - EF

2007-08-11 Numpification and cleanup of mlab.py and some examples - EF

2007-08-06 Removed mathtext2

2007-07-31 Refactoring of distutils scripts.

- Will not fail on the entire build if an optional Python package (e.g., Tkinter) is installed but its development headers are not (e.g., tk-devel). Instead, it will continue to build all other extensions.

- Provide an overview at the top of the output to display what dependencies and their versions were found, and (by extension) what will be built.

- Use pkg-config, when available, to find freetype2, since this was broken on Mac OS-X when using MacPorts in a non-standard location.

2007-07-30 Reorganized configuration code to work with traited config objects. The new config system is located in the matplotlib.config package, but it is disabled by default. To enable it, set NEWCONFIG=True in matplotlib.__init__.py. The new configuration system will still use the old matplotlibrc files by default. To switch to the experimental, traited configuration, set USE_TRAITED_CONFIG=True in config.__init__.py.

2007-07-29 Changed default pcolor shading to flat; added aliases to make collection kwargs agree with setter names, so updating works; related minor cleanups. Removed quiver_classic, scatter_classic, pcolor_classic. - EF

2007-07-26 Major rewrite of mathtext.py, using the TeX box layout model.

There is one (known) backward incompatible change. The font commands (cal, rm, it, tt) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of $\mathcal{R}$ should be changed to $\{\mathcal{R}\}$. Alternatively, you may use the new LaTeX-style font commands (mathcal, mathrm, mathit, mathtt) which do affect the following group, e.g., $\mathcal{R}$.

Other new features include:

- Math may be interspersed with non-math text. Any text with an even number of $`s (non-escaped) will be sent to the mathtext parser for layout.

- Sub/superscripts are less likely to accidentally overlap.

- Support for sub/superscripts in either order, e.g., $x^{i_j}$ and $x_{j^i}$ are equivalent.

- Double sub/superscripts (e.g., $x_{i_j}$) are considered ambiguous and raise an exception. Use braces to disambiguate.

- $\frac{\{\{x\}}{\{y\}}$ can be used for displaying fractions.
• $\sqrt[3]{x}$ can be used to display the radical symbol with a root number and body.
• $\left(\frac{x}{y}\right)$ may be used to create parentheses and other delimiters that automatically resize to the height of their contents.
• Spacing around operators etc. is now generally more like TeX.
• Added support (and fonts) for boldface (bf) and sans-serif (sf) symbols.
• Log-like function name shortcuts are supported. For example, $\sin(x)$ may be used instead of $\mathrm{sin}(x)$.
• Limited use of kerning for the easy case (same font)

Behind the scenes, the pyparsing.py module used for doing the math parsing was updated to the latest stable version (1.4.6). A lot of duplicate code was refactored out of the Font classes.

• MGD

2007-07-19 completed numpification of most trivial cases - NN
2007-07-19 converted non-numpy relicts throughout the code - NN

2007-07-19 replaced the Python code in numerix/ by a minimal wrapper around numpy that explicitly mentions all symbols that need to be addressed for further numpification - NN

2007-07-18 make usetex respect changes to rcParams. texmanager used to only configure itself when it was created, now it reconfigures when rcParams are changed. Thank you Alexander Schmolck for contributing a patch - DSD

2007-07-17 added validation to setting and changing rcParams - DSD

2007-07-17 bugfix segfault in transforms module. Thanks Ben North for the patch. - ADS

2007-07-16 clean up some code in ticker.ScalarFormatter, use unicode to render multiplication sign in offset ticklabel - DSD

2007-07-16 fixed a formatting bug in ticker.ScalarFormatter's scientific notation (10^0 was being rendered as 10 in some cases) - DSD

2007-07-13 Add MPL_isfinite64() and MPL_isinf64() for testing doubles in (the now misnamed) MPL_isnan.h. - ADS

2007-07-13 The matplotlib.isnan module removed (use numpy.isnan) - ADS
2007-07-13 Some minor cleanups in _transforms.cpp - ADS

2007-07-13 Removed the rest of the numerix extension code detritus, numpified axes.py, and cleaned up the imports in axes.py - JDH

2007-07-13 Added legend.loc as configurable option that could in future default to 'best'. - NN

2007-07-12 Bugfixes in mlab.py to coerce inputs into numpy arrays. -ADS
2007-07-11 Added linespacing kwarg to text.Text - EF
2007-07-11 Added code to store font paths in SVG files. - MGD
2007-07-10 Store subset of TTF font as a Type 3 font in PDF files. - MGD
2007-07-09 Store subset of TTF font as a Type 3 font in PS files. - MGD
2007-07-09 Applied Paul’s pick restructure pick and add pickers, sourceforge patch 1749829 - JDH

2007-07-09 Applied Allan’s draw_lines agg optimization. JDH

2007-07-08 Applied Carl Worth’s patch to fix cairo draw_arc - SC

2007-07-07 fixed bug 1712099: xpdf distiller on windows - DSD

2007-06-30 Applied patches to tkagg, gtk, and wx backends to reduce memory leakage. Patches supplied by Mike Droettboom; see tracker numbers 1745400, 1745406, 1745408. Also made unit/memleak_gui.py more flexible with command-line options. - EF

2007-06-30 Split defaultParams into separate file rcdefaults (together with validation code). Some heavy refactoring was necessary to do so, but the overall behavior should be the same as before. - NN

2007-06-27 Added MPLCONFIGDIR for the default location for mpl data and configuration. useful for some apache installs where HOME is not writable. Tried to clean up the logic in _get_config_dir to support non-writable HOME where are writable HOME/.matplotlib already exists - JDH

2007-06-27 Patch for get_py2exe_datafiles() to work with new directory layout. (Thanks Tocer and also Werner Bruhin.) -ADS

2007-06-27 Added a scroll event to the mpl event handling system and implemented it for backends GTK* - other backend users/developers/maintainers, please add support for your backend. - JDH

2007-06-25 Changed default to clip=False in colors.Normalize; modified Colorbar-Base for easier colormap display - EF

2007-06-13 Added maskedarray option to rc, numerix - EF

2007-06-11 Python 2.5 compatibility fix for mlab.py - EF

2007-06-10 In matplotlibrc file, use ‘dashed’ | ‘solid’ instead of a pair of floats for contour.negative_linestyle - EF

2007-06-08 Allow plot and fill fmt string to be any mpl string colorspec - EF

2007-06-08 Added gnuplot file plotfile function to pylab - see examples/plotfile_demo.py - JDH

2007-06-07 Disable build of numarray and Numeric extensions for internal MPL use and the numerix layer. - ADS

2007-06-07 Added csv2rec to matplotlib.mlab to support automatically converting csv files to record arrays using type introspection, and turned on native datetime support using the new units support in matplotlib.dates. See examples/loaddrec.py ! JDH

2007-06-07 Simplified internal code of _auto_legend_data - NN

2007-06-04 Added labeldistance arg to Axes.pie to control the raidal distance of the wedge labels - JDH
2007-06-03 Turned mathtext in SVG into single <text> with multiple <tspan>
objects (easier to edit in inkscape). - NN

2007-06-02 Released 0.90.1 at revision 3352
2007-06-02 Display only meaningful labels when calling legend() without args. - NN
2007-06-02 Have errorbar follow the color cycle even if line is not plotted. Suppress
plotting of errorbar caps for capsize=0. - NN
2007-06-02 Set markers to same alpha value as line. - NN
2007-06-02 Fix mathtext position in svg backend. - NN
2007-06-01 Deprecate Numeric and numarray for use as numerix. Props to Travis -
job well done. - ADS
2007-05-18 Added LaTeX unicode support. Enable with the `text.latex.unicode` rc-
Param. This requires the ucs and inputenc LaTeX packages. - ADS
2007-04-23 Fixed some problems with polar - added general polygon clipping to clip
the lines a nd grids to the polar axes. Added support for set_rmax to easily change the
maximum radial grid. Added support for polar legend - JDH
2007-04-16 Added Figure.autofmt_xdate to handle adjusting the bottom and rotating the tick labels for date plots when the ticks often overlap - JDH
2007-04-09 Beginnings of usetex support for pdf backend. - JKS
2007-04-07 Fixed legend/LineCollection bug. Added label support to collections. - EF
2007-04-06 Removed deprecated support for a float value as a gray-scale; now it
must be a string, like '0.5'. Added alpha kwarg to ColorConverter.to_rgba_list. - EF
2007-04-06 Fixed rotation of ellipses in pdf backend (sf bug #1690559) -JKS
2007-04-04 More matshow tweaks; documentation updates; new method
set_bounds() for formatters and locators. - EF
2007-04-02 Fixed problem with imshow and matshow of integer arrays; fixed problems with changes to color autoscaling. - EF
2007-04-01 Made image color autoscaling work correctly with a tracking colorbar;
norm.autoscale now scales unconditionally, while norm.autoscale_None changes only
None-valued vmin, vmax. - EF
2007-03-31 Added a qt-based subplot-adjustment dialog - DSD
2007-03-30 Fixed a bug in backend_qt4, reported on mpl-dev - DSD
2007-03-26 Removed colorbar_classic from figure.py; fixed bug in Figure.clf() in which _axobservers was not getting cleared. Modernization and cleanups. - EF
2007-03-26 Refactored some of the units support - units now live in the respective x and y Axis instances. See also API_CHANGES for some alterations to the conversion interface. JDH
2007-03-25 Fix masked array handling in quiver.py for numpy. (Numeric and numarray support for masked arrays is broken in other ways when using quiver. I didn't pursue that.) - ADS
2007-03-23 Made font_manager.py close opened files. - JKS
2007-03-22 Made imshow default extent match matshow - EF
2007-03-22 Some more niceties for xcorr - a maxlags option, normed now works for xcorr as well as axorr, usevlines is supported, and a zero correlation hline is added. See examples/xcorr_demo.py. Thanks Sameer for the patch. - JDH

2007-03-21 Axes.vlines and Axes.hlines now create and returns a LineCollection, not a list of lines. This is much faster. The kwarg signature has changed, so consult the docs. Modified Axes.errorbar which uses vlines and hlines. See API_CHANGES; the return signature for these three functions is now different.

2007-03-20 Refactored units support and added new examples - JDH

2007-03-19 Added Mike’s units patch - JDH

2007-03-18 Matshow as an Axes method; test version matshow1() in pylab; added ‘integer’ Boolean kwarg to MaxNLocator initializer to force ticks at integer locations. - EF

2007-03-17 Preliminary support for clipping to paths agg - JDH

2007-03-17 Text.set_text() accepts anything convertible with ‘%s’ - EF

2007-03-14 Add masked-array support to hist. - EF

2007-03-03 Change barh to take a kwargs dict and pass it to bar. Fixes sf bug #1669506.

2007-03-02 Add rc parameter pdf.inheritcolor, which disables all color-setting operations in the pdf backend. The idea is that you include the resulting file in another program and set the colors (both stroke and fill color) there, so you can use the same pdf file for e.g., a paper and a presentation and have them in the surrounding color. You will probably not want to draw figure and axis frames in that case, since they would be filled in the same color. - JKS

2007-02-26 Prevent building _wxagg.so with broken Mac OS X wxPython. - ADS

2007-02-23 Require setuptools for Python 2.3 - ADS

2007-02-22 WXAgg accelerator updates - KM WXAgg’s C++ accelerator has been fixed to use the correct wxBitmap constructor.

The backend has been updated to use new wxPython functionality to provide fast blit() animation without the C++ accelerator. This requires wxPython 2.8 or later. Previous versions of wxPython can use the C++ accelerator or the old pure Python routines.

setup.py no longer builds the C++ accelerator when wxPython >= 2.8 is present.

The blit() method is now faster regardless of which agg/wxPython conversion routines are used.

2007-02-21 Applied the PDF backend patch by Nicolas Grilly. This impacts several files and directories in matplotlib:

- Created the directory lib/matplotlib/mpl-data/fonts/pdfcorefonts, holding AFM files for the 14 PDF core fonts. These fonts are embedded in every PDF viewing application.
- setup.py: Added the directory pdfcorefonts to package_data.
- lib/matplotlib/__init__.py: Added the default parameter ‘pdf.use14corefonts’. When True, the PDF backend uses only the 14 PDF core fonts.
- lib/matplotlib/afm.py: Added some keywords found in recent AFM files. Added a little workaround to handle Euro symbol.
• lib/matplotlib/fontmanager.py: Added support for the 14 PDF core fonts. These fonts have a dedicated cache (file pdfcorefont.cache), not the same as for other AFM files (file .afmfont.cache). Also cleaned comments to conform to CODING_GUIDE.

• lib/matplotlib/backends/backend_pdf.py: Added support for 14 PDF core fonts. Fixed some issues with incorrect character widths and encodings (works only for the most common encoding, WinAnsiEncoding, defined by the official PDF Reference). Removed parameter ‘dpi’ because it causes alignment issues.

-JKS (patch by Nicolas Grilly)

2007-02-17 Changed ft2font.get_charmap, and updated all the files where get_charmap is mentioned - ES

2007-02-13 Added barcode demo - JDH

2007-02-13 Added binary colormap to cm - JDH

2007-02-13 Added twiny to pylab - JDH

2007-02-12 Moved data files into lib/matplotlib so that setuptools’ develop mode works. Re-organized the mpl-data layout so that this source structure is maintained in the installation. (i.e., the ‘fonts’ and ‘images’ sub-directories are maintained in site-packages.) Suggest removing site-packages/matplotlib/mpl-data and ~/.matplotlib/ttffont.cache before installing - ADS

2007-02-07 Committed Rob Hetland’s patch for qt4: remove references to text()/latin1(), plus some improvements to the toolbar layout - DSD

2007-02-06 Released 0.90.0 at revision 3003

2007-01-22 Extended the new picker API to text, patches and patch collections. Added support for user customizable pick hit testing and attribute tagging of the PickEvent - Details and examples in examples/pick_event_demo.py - JDH

2007-01-16 Begun work on a new pick API using the mpl event handling framework. Artists will define their own pick method with a configurable epsilon tolerance and return pick attrs. All artists that meet the tolerance threshold will fire a PickEvent with artist dependent attrs; e.g., a Line2D can set the indices attribute that shows the indices into the line that are within epsilon of the pick point. See examples/pick_event_demo.py. The implementation of pick for the remaining Artists remains to be done, but the core infrastructure at the level of event handling is in place with a proof-of-concept implementation for Line2D - JDH

2007-01-16 src/_image.cpp: update to use Py_ssize_t (for 64-bit systems). Use return value of fread() to prevent warning messages - SC.

2007-01-15 src/_image.cpp: combine buffer_argb32() and buffer_bgra32() into a new method color_conv(format) - SC

2007-01-14 backend_cairo.py: update draw_arc() so that examples/arctest.py looks correct - SC

2007-01-12 backend_cairo.py: enable clipping. Update draw_image() so that examples/contour_demo.py looks correct - SC

2007-01-12 backend_cairo.py: fix draw_image() so that examples/image_demo.py now looks correct - SC
2007-01-11 Added `Axes.xcorr` and `Axes.acorr` to plot the cross correlation of x vs y or the autocorrelation of x. pylab wrappers also provided. See examples/xcorr_demo.py - JDH

2007-01-10 Added “Subplot.label_outer” method. It will set the visibility of the ticklabels so that yticklabels are only visible in the first column and xticklabels are only visible in the last row - JDH

2007-01-02 Added additional kwarg documentation - JDH

2006-12-28 Improved error message for nonpositive input to log transform; added log kwarg to bar, barh, and hist, and modified bar method to behave sensibly by default when the ordinate has a log scale. (This only works if the log scale is set before or by the call to bar, hence the utility of the log kwarg.) - EF

2006-12-27 backend_cairo.py: update draw_image() and _draw_mathtext() to work with numpy - SC

2006-12-20 Fixed xpdf dependency check, which was failing on windows. Removed ps2eps dependency check. - DSD

2006-12-19 Added Tim Leslie’s spectral patch - JDH

2006-12-17 Added rc param ‘axes.formatter.limits’ to control the default threshold for switching to scientific notation. Added convenience method Axes.ticklabel_format() for turning scientific notation on or off on either or both axes. - EF

2006-12-16 Added ability to turn control scientific notation in ScalarFormatter - EF

2006-12-16 Enhanced boxplot to handle more flexible inputs - EF

2006-12-13 Replaced calls to where() in colors.py with much faster clip() and putmask() calls; removed inappropriate uses of getmaskorNone (which should be needed only very rarely); all in response to profiling by David Cournapeau. Also fixed bugs in my 2-D array support from 12-09. - EF

2006-12-09 Replaced spy and spy2 with the new spy that combines marker and image capabilities - EF

2006-12-09 Added support for plotting 2-D arrays with plot: columns are plotted as in Matlab - EF

2006-12-09 Added linewidth kwarg to bar and barh; fixed arg checking bugs - EF

2006-12-07 Made pcolormesh argument handling match pcolor; fixed kwarg handling problem noted by Pierre GM - EF

2006-12-06 Made pcolor support vector X and/or Y instead of requiring 2-D arrays - EF

2006-12-05 Made the default Artist._transform None (rather than invoking identity_transform for each artist only to have it overridden later). Use artist.get_transform() rather than artist._transform, even in derived classes, so that the default transform will be created lazily as needed - JDH

2006-12-03 Added LogNorm to colors.py as illustrated by examples/pcolor_log.py, based on suggestion by Jim McDonald. Colorbar modified to handle LogNorm. Norms have additional “inverse” method. - EF

2006-12-02 Changed class names in colors.py to match convention: normalize -> Normalize, no_norm -> NoNorm. Old names are still available. Changed __init__.py rc defaults to match those in matplotlibrc - EF
2006-11-22 Fixed bug in set_*lim that I had introduced on 11-15 - EF

2006-11-22 Added examples/clippedline.py, which shows how to clip line data based on view limits - it also changes the marker style when zoomed in - JDH

2006-11-21 Some spy bug-fixes and added precision arg per Robert C's suggestion - JDH

2006-11-19 Added semi-automatic docstring generation detailing all the kwargs that functions take using the artist introspection tools; e.g., 'help text now details the scatter kwargs that control the Text properties - JDH

2006-11-17 Removed obsolete scatter_classic, leaving a stub to raise NotImplementedError; same for pcolor_classic - EF

2006-11-15 Removed obsolete pcolor_classic - EF

2006-11-15 Fixed 1588908 reported by Russel Owen; factored nonsingular method out of ticker.py, put it into transforms.py as a function, and used it in set_xlim and set_ylim. - EF

2006-11-14 Applied patch 1591716 by Ulf Larssen to fix a bug in apply_aspect. Modified and applied patch 1594894 by mdehoon to fix bugs and improve formatting in lines.py. Applied patch 1573008 by Greg Willden to make psd etc. plot full frequency range for complex inputs. - EF

2006-11-14 Improved the ability of the colorbar to track changes in corresponding image, pcolor, or contourf. - EF

2006-11-11 Fixed bug that broke Numeric compatibility; added support for alpha to colorbar. The alpha information is taken from the mappable object, not specified as a kwarg. - EF

2006-11-05 Added broken_barh function for makring a sequence of horizontal bars broken by gaps - see examples/broken_barh.py

2006-11-05 Removed lineprops and markerprops from the Annotation code and replaced them with an arrow configurable with kwarg arrowprops. See examples/annotation_demo.py - JDH

2006-11-02 Fixed a pylab subplot bug that was causing axes to be deleted with hspace or wspace equals zero in subplots_adjust - JDH

2006-10-25 Made “tiny” kwarg in Locator.nonsingular much smaller - EF

2006-10-17 Closed sf bug 1562496 update line props dash/solid/cap/join styles - JDH

2006-10-17 Complete overhaul of the annotations API and example code - See matplotlib.text.Annotation and examples/annotation_demo.py - JDH

2006-10-12 Committed Manuel Metz's StarPolygon code and examples/scatter_star_poly.py - JDH

2006-10-11 commented out all default values in matplotlibrc.template Default values should generally be taken from defaultParam in __init__.py - the file matplotlib should only contain those values that the user wants to explicitly change from the default. (see thread “marker color handling” on matplotlib-devel)

7.1. List of changes to Matplotlib prior to 2015
2006-10-10 Changed default comment character for load to ‘#’ - JDH

2006-10-10 deactivated rcfile-configurability of markerfacecolor and markeredge-color. Both are now hardcoded to the special value ‘auto’ to follow the line color. Configurability at run-time (using function arguments) remains functional. - NN

2006-10-07 introduced dummy argument magnification=1.0 to FigImage.make_image to satisfy unit test figimage_demo.py The argument is not yet handled correctly, which should only show up when using non-standard DPI settings in PS backend, introduced by patch #1562394. - NN

2006-10-06 add backend-agnostic example: simple3d.py - NN

2006-09-29 fix line-breaking for SVG-inline images (purely cosmetic) - NN

2006-09-29 reworked set_linestyle and set_marker markeredgecolor and markerface-color now default to a special value “auto” that keeps the color in sync with the line color further; the intelligence of axes.plot is cleaned up, improved and simplified. Complete compatibility cannot be guaranteed, but the new behavior should be much more predictable (see patch #1104615 for details) - NN

2006-09-29 changed implementation of clip-path in SVG to work around a limitation in inkscape - NN

2006-09-29 added two options to matplotlibrc: svg.image_inline svg.image_noscale see patch #1533010 for details - NN

2006-09-29 axes.py: cleaned up kwargs checking - NN

2006-09-29 setup.py: cleaned up setup logic - NN

2006-09-29 setup.py: check for required pygtk versions, fixes bug #1460783 - SC

2006-09-27 Released 0.87.6 at revision 2783

2006-09-24 Added line pointers to the Annotation code, and a pylab interface. See matplotlib.text.Annotation, examples/annotation_demo.py and examples/annotation_demo_pylab.py - JDH

2006-09-18 mathtext2.py: The SVG backend now supports the same things that the AGG backend does. Fixed some bugs with rendering, and out of bounds errors in the AGG backend - ES. Changed the return values of math_parse_s_ft2font_svg to support lines (fractions etc.)

2006-09-17 Added an Annotation class to facilitate annotating objects and an examples file examples/annotation_demo.py. I want to add dash support as in TextWithDash, but haven’t decided yet whether inheriting from TextWithDash is the right base class or if another approach is needed - JDH

2006-09-05 Released 0.87.5 at revision 2761

2006-09-04 Added nxutils for some numeric add-on extension code - specifically a better/more efficient inside polygon tester (see unit/inside_poly_*.py) - JDH

2006-09-04 Made bitstream fonts the rc default - JDH

2006-08-31 Fixed alpha-handling bug in ColorConverter, affecting collections in general and contour/contourf in particular. - EF
2006-08-30 ft2font.cpp: Added draw_rect_filled method (now used by mathtext2 to draw the fraction bar) to FT2Font - ES

2006-08-29 setupext.py: wrap calls to tk.getvar() with str(). On some systems, getvar returns a Tcl_Obj instead of a string - DSD

2006-08-28 mathtext2.py: Sub/superscripts can now be complex (i.e. fractions etc.). The demo is also updated - ES

2006-08-28 font_manager.py: Added /usr/local/share/fonts to list of X11 font directories - DSD

2006-08-28 mathtext2.py: Initial support for complex fractions. Also, rendering is now completely separated from parsing. The sub/superscripts now work better. Updated the mathtext2_demo.py - ES

2006-08-27 qt backends: don’t create a QApplication when backend is imported, do it when the FigureCanvasQt is created. Simplifies applications where mpl is embedded in qt. Updated embedding_in_qt* examples - DSD

2006-08-27 mathtext2.py: Now the fonts are searched in the OS font dir and in the mpl-data dir. Also env is not a dict anymore. - ES

2006-08-26 minor changes to __init__.py, mathtex2_demo.py. Added matplotlibrc key “mathtext.mathtext2” (removed the key “mathtext2”) - ES

2006-08-21 mathtext2.py: Initial support for fractions. Updated the mathtext2_demo.py _mathtext_data.py: removed “” from the unicode dicts mathtext.py: Minor modification (because of _mathtext_data.py) - ES

2006-08-20 Added mathtext2.py: Replacement for mathtext.py. Supports _, ^, r^, r, m, c, etc., sin, cos etc., unicode, recursive nestings, inline math mode. The only backend currently supported is Agg __init__.py: added new rc params for mathtext2 added mathtext2_demo.py example - ES

2006-08-19 Added embedding_in_qt4.py example - DSD

2006-08-11 Added scale free Ellipse patch for Agg - CM

2006-08-10 Added converters to and from julian dates to matplotlib.dates (num2julian and julian2num) - JDH

2006-08-08 Fixed widget locking so multiple widgets could share the event handling - JDH

2006-08-07 Added scale free Ellipse patch to SVG and PS - CM

2006-08-05 Re-organized imports in numerix for numpy 1.0b2 - TEO

2006-08-04 Added draw_markers to PDF backend. - JKS

2006-08-01 Fixed a bug in postscript’s rendering of dashed lines - DSD

2006-08-01 figure.py: savefig() update docstring to add support for ‘format’ argument. backend_cairo.py: print_figure() add support ‘format’ argument. - SC

2006-07-31 Don’t let postscript’s xpdf distiller compress images - DSD

2006-07-31 Added shallowcopy() methods to all Transformations; removed copy_bbox_transform and copy_bbox_transform_shallow from transforms.py; added offset_copy() function to transforms.py to facilitate positioning artists with offsets. See examples/transoffset.py. - EF

2006-07-31 Don’t let postscript’s xpdf distiller compress images - DSD
2006-07-29 Fixed numerix polygon bug reported by Nick Fotopoulos. Added inverse_numerix_xy() transform method. Made autoscale_view() preserve axis direction (e.g., increasing down). - EF

2006-07-28 Added shallow bbox copy routine for transforms - mainly useful for copying transforms to apply offset to. - JDH

2006-07-28 Added resize method to FigureManager class for Qt and Gtk backend - CM

2006-07-28 Added subplots_adjust button to Qt backend - CM

2006-07-26 Use numerix more in collections. Quiver now handles masked arrays. - EF

2006-07-22 Fixed bug #1209354 - DSD

2006-07-22 make scatter() work with the kwarg “color”. Closes bug 1285750 - DSD

2006-07-20 backend_cairo.py: require pycairo 1.2.0. print_figure() update to output SVG using cairo.

2006-07-19 Added blitting for Qt4Agg - CM

2006-07-19 Added lasso widget and example examples/lasso_demo.py - JDH

2006-07-18 Added blitting for QtAgg backend - CM

2006-07-17 Fixed bug #1523585: skip nans in semilog plots - DSD

2006-07-12 Add support to render the scientific notation label over the right-side y-axis - DSD

2006-07-11 Released 0.87.4 at revision 2558

2006-07-07 Fixed a usetex bug with older versions of latex - DSD

2006-07-07 Add compatibility for NumPy 1.0 - TEO

2006-06-29 Added a Qt4Agg backend. Thank you James Amundson - DSD

2006-06-26 Fixed a usetex bug. On windows, usetex will process postscript output in the current directory rather than in a temp directory. This is due to the use of spaces and tildes in windows paths, which cause problems with latex. The subprocess module is no longer used. - DSD

2006-06-22 Various changes to bar(), barh(), and hist(). Added ‘edgecolor’ keyword arg to bar() and barh(). The x and y args in barh() have been renamed to width and bottom respectively, and their order has been swapped to maintain a (position, value) order ala matlab. left, height, width and bottom args can now all be scalars or sequences. barh() now defaults to edge alignment instead of center alignment. Added a keyword arg ‘align’ to bar(), barh() and hist() that controls between edge or center bar alignment. Fixed ignoring the rcParams['patch.facecolor'] for bar color in bar() and barh(). Fixed ignoring the rcParams['lines.color'] for error bar color in bar() and barh(). Fixed a bug where patches would be cleared when error bars were plotted if rcParams['axes.hold'] was False. - MAS

2006-06-22 Added support for numerix 2-D arrays as alternatives to a sequence of (x,y) tuples for specifying paths in collections, quiver, contour, pcolor, transforms. Fixed contour bug involving setting limits for color mapping. Added numpy-style all() to numerix. - EF

2006-06-20 Added custom FigureClass hook to pylab interface - see examples/custom_figure_class.py
2006-06-16 Added colormaps from gist (gist_earth, gist_stern, gist_rainbow, gist_gray, gist_yarg, gist_heat, gist_nnar) - JW

2006-06-16 Added a pointer to parent in figure canvas so you can access the container with fig.canvas.manager. Useful if you want to set the window title, e.g., in gtk fig.canvas.manager.window.set_title, though a GUI neutral method would be preferable - JDH

2006-06-16 Fixed colorbar.py to handle indexed colors (i.e., norm = no_norm()) by centering each colored region on its index. - EF

2006-06-15 Added scalex and scaley to Axes.autoscale_view to support selective autoscaling just the x or y axis, and supported these command in plot so you can say plot(something, scaley=False) and just the x axis will be autoscaled. Modified axvline and axhline to support this, so for example axvline will no longer autoscale the y axis. - JDH

2006-06-13 Fix so numpy updates are backward compatible - TEO

2006-06-12 Updated numerix to handle numpy restructuring of oldnumeric - TEO

2006-06-12 Updated numerix.fft to handle numpy restructuring Added ImportError to numerix.linear_algebra for numpy - TEO

2006-06-11 Added quiverkey command to pylab and Axes, using QuiverKey class in quiver.py. Changed pylab and Axes to use quiver2 if possible, but drop back to the newly-renamed quiver_classic if necessary. Modified examples/quiver_key.py to illustrate the new quiver and quiverkey. Changed LineCollection implementation slightly to improve compatibility with PolyCollection. - EF

2006-06-11 Fixed ausetex bug for windows, running latex on files with spaces in their names or paths was failing - DSD

2006-06-09 Made additions to numerix, changes to quiver to make it work with all numeric flavors. - EF

2006-06-09 Added quiver2 function to pylab and method to axes, with implementation via a Quiver class in quiver.py. quiver2 will replace quiver before the next release; it is placed alongside it initially to facilitate testing and transition. See also examples/quiver2_demo.py. - EF

2006-06-08 Minor bug fix to make ticker.py draw proper minus signs withusetex - DSD

2006-06-06 Released 0.87.3 at revision 2432

2006-05-30 More partial support for polygons with outline or fill, but not both. Made LineCollection inherit from ScalarMappable. - EF

2006-05-29 Yet another revision of aspect-ratio handling. - EF

2006-05-27 Committed a patch to prevent stroking zero-width lines in the svg backend - DSD

2006-05-24 Fixed colorbar positioning bug identified by Helge Avlesen, and improved the algorithm; added a ‘pad’ kwarg to control the spacing between colorbar and parent axes. - EF

2006-05-23 Changed color handling so that collection initializers can take any mpl color arg or sequence of args; deprecated float as grayscale, replaced by string representation of float. - EF

7.1. List of changes to Matplotlib prior to 2015
2006-05-19 Fixed bug: plot failed if all points were masked - EF
2006-05-19 Added custom symbol option to scatter - JDH

2006-05-18 New example, multi_image.py: colorbar fixed to show offset text when the ScalarFormatter is used; FixedFormatter augmented to accept and display offset text. - EF

2006-05-14 New colorbar; old one is renamed to colorbar_classic. New colorbar code is in colorbar.py, with wrappers in figure.py and pylab.py. Fixed aspect-handling bug reported by Michael Mossey. Made backend_bases.draw_quad_mesh() run. - EF

2006-05-08 Changed handling of end ranges in contourf: replaced "clip-ends" kwarg with "extend". See docstring for details. -EF

2006-05-08 Added axisbelow to rc - JDH
2006-05-08 If using PyGTK require version 2.2+ - SC

2006-04-19 Added compression support to PDF backend, controlled by new pdf.compression rc setting. - JKS

2006-04-19 Added Jouni's PDF backend

2006-04-18 Fixed a bug that caused agg to not render long lines

2006-04-16 Masked array support for pcolormesh; made pcolormesh support the same combinations of X,Y,C dimensions as pcolor does; improved (I hope) description of grid used in pcolor; pcolormesh. - EF

2006-04-14 Reorganized axes.py - EF

2006-04-13 Fixed a bug Ryan found using usetex with sans-serif fonts and exponential tick labels - DSD

2006-04-11 Refactored backend_ps and backend_agg to prevent module-level texmanager imports. Now these imports only occur if text.usetex rc setting is true - DSD

2006-04-10 Committed changes required for building mpl on win32 platforms with visual studio. This allows wxpython blitting for fast animations. - CM

2006-04-10 Fixed an off-by-one bug in Axes.change_geometry.

2006-04-10 Fixed bug in pie charts where wedge wouldn’t have label in legend. Submitted by Simon Hildebrandt. - ADS

2006-05-06 Usetex makes temporary latex and dvi files in a temporary directory, rather than in the user’s current working directory - DSD

2006-04-05 Applied Ken’s wx deprecation warning patch closing sf patch #1465371 - JDH

2006-04-05 Added support for the new API in the postscript backend. Allows values to be masked using nan’s, and faster file creation - DSD

2006-04-05 Use python’s subprocess module for usetex calls to external programs. subprocess catches when they exit abnormally so an error can be raised. - DSD

2006-04-03 Fixed the bug in which widgets would not respond to events. This regressed the twinx functionality, so I also updated subplots_adjust to update axes that share an x or y with a subplot instance. - CM

2006-04-02 Moved PBox class to transforms and deleted pbox.py; made pylab axis command a thin wrapper for Axes.axis; more tweaks to aspect-ratio handling; fixed
Axes.specgram to account for the new imshow default of unit aspect ratio; made contour set the Axes.dataLim. - EF

2006-03-31 Fixed the Qt “Underlying C/C++ object deleted” bug. - JRE

2006-03-31 Applied Vasily Sulatskov’s Qt Navigation Toolbar enhancement. - JRE

**2006-03-31 Ported Norbert’s rewriting of Halldor’s stineman_interp algorithm** to make it numerix compatible and added code to matplotlib.mlab. See examples/interp_demo.py - JDH

2006-03-30 Fixed a bug in aspect ratio handling; blocked potential crashes when panning with button 3; added axis(’image’) support. - EF

2006-03-28 More changes to aspect ratio handling; new PBox class in new file pbox.py to facilitate resizing and repositioning axes; made PolarAxes maintain unit aspect ratio. - EF

2006-03-23 Refactored TextWithDash class to inherit from, rather than delegate to, the Text class. Improves object inspection and closes bug # 1357969 - DSD

2006-03-22 Improved aspect ratio handling, including pylab interface. Interactive resizing, pan, zoom of images and plots (including panels with a shared axis) should work. Additions and possible refactoring are still likely. - EF

2006-03-21 Added another colorbrewer colormaps (RdYlBu) - JSWHIT

2006-03-21 Fixed tickmarks for logscale plots over very large ranges. Closes bug # 1232920 - DSD

2006-03-21 Added Rob Knight’s arrow code; see examples/arrow_demo.py - JDH

2006-03-20 Added support for masking values with nan’s, using ADS’s isnan module and the new API. Works for *Agg backends - DSD

2006-03-20 Added contour.negative_linestyle rcParam - ADS

2006-03-20 Added _isnan extension module to test for nan with Numeric

- ADS

2006-03-17 Added Paul and Alex’s support for faceting with quadmesh in sf patch 1411223 - JDH

2006-03-17 Added Charle Twardy’s pie patch to support colors=None. Closes sf patch 1387861 - JDH

2006-03-17 Applied sophana’s patch to support overlapping axes with toolbar navigation by toggling activation with the ‘a’ key. Closes sf patch 1432252 - JDH

2006-03-17 Applied Aarre’s linestyle patch for backend EMF; closes sf patch 1449279 - JDH

2006-03-17 Applied Jordan Dawe’s patch to support kwarg properties for grid lines in the grid command. Closes sf patch 1451661 - JDH

2006-03-17 Center postscript output on page when using usetex - DSD

2006-03-17 subprocess module built if Python <2.4 even if subprocess can be imported from an egg - ADS

2006-03-17 Added _subprocess.c from Python upstream and hopefully enabled building (without breaking) on Windows, although not tested. - ADS
2006-03-17 **Updated subprocess.py to latest Python upstream and reverted name back to subprocess.py** - ADS

2006-03-16 Added John Porter’s 3D handling code

2006-03-16 Released 0.87.2 at revision 2150

2006-03-15 **Fixed bug in MaxNLocator revealed by daigos@infinito.it.** The main change is that Locator.nonsingular now adjusts vmin and vmax if they are nearly the same, not just if they are equal. A new kwarg, “tiny”, sets the threshold. - EF

2006-03-14 **Added import of compatibility library for newer numpy linear_algebra** - TEO

2006-03-12 **Extended “load” function to support individual columns and moved “load” and “save” into matplotlib.mlab so they can be used outside of pylab** - see examples/load_converter.py - JDH

2006-03-12 **Added AutoDateFormatter and AutoDateLocator submitted by James Evans. Try the load_converter.py example for a demo.** - ADS

2006-03-11 **Added subprocess module from python-2.4** - DSD

2006-03-11 **Fixed landscape orientation support with the usetex option. The backend_ps print_figure method was getting complicated, I added a _print_figure_tex method to maintain some degree of sanity** - DSD

2006-03-11 **Added “papertype” savefig kwarg for setting postscript papersizes. papertype and ps.papersize rc setting can also be set to “auto” to autoscale pagesizes** - DSD

2006-03-09 **Apply P-J’s patch to make pstoeps work on windows patch report #1445612** - DSD

2006-03-09 **Make backend rc parameter case-insensitive** - DSD

2006-03-07 **Fixed bug in backend_ps related to C0-C6 papersizes, which were causing problems with postscript viewers. Supported page sizes include letter, legal, ledger, A0-A10, and B0-B10** - DSD

2006-03-07 Released 0.87.1

2006-03-04 **backend_cairo.py: fix get_rgb() bug reported by Keith Briggs. Require pycairo 1.0.2. Support saving png to file-like objects.** - SC

2006-03-03 **Fixed pcolor handling of vmin, vmax** - EF

2006-03-02 **Improve page sizing with usetex with the latex geometry package. Closes bug # 1441629** - DSD

2006-03-02 **Fixed dpi problem with usetex png output. Accepted a modified version of patch # 1441809** - DSD

2006-03-01 **Fixed axis(‘scaled’) to deal with case xmax < xmin** - JSWHIT

2006-03-01 **Added reversed colormaps (with ‘_r’ appended to name)** - JSWHIT

2006-02-27 **Improved eps bounding boxes with usetex** - DSD

2006-02-27 **Test svn commit, again!**

2006-02-27 **Fixed two dependency checking bugs related to usetex on Windows** - DSD
2006-02-27 Made the rc deprecation warnings a little more human readable.
2006-02-26 Update the previous gtk.main_quit() bug fix to use gtk.main_level()
   • SC
2006-02-24 Implemented alpha support in contour and contourf - EF
2006-02-22 Fixed gtk main quit bug when quit was called before mainloop. - JDH
2006-02-22 Small change to colors.py to workaround apparent bug in numpy masked array module - JSWHIT
2006-02-22 Fixed bug in ScalarMappable.to_rgba() reported by Ray Jones, and fixed incorrect fix found by Jeff Whitaker - EF

2006-02-22 Released 0.87
2006-02-21 Fixed portrait/landscape orientation in postscript backend - DSD
2006-02-21 Fix bug introduced in yesterday's bug fix - SC
2006-02-20 backend_gtk.py FigureCanvasGTK.draw(): fix bug reported by David Tremouilles - SC
2006-02-20 Remove the “pygtk.require(‘2.4’)“ error from examples/embedding_in_gtk2.py - SC
2006-02-18 backend_gtk.py FigureCanvasGTK.draw(): simplify to use (rather than duplicate) the expose_event() drawing code - SC
2006-02-12 Added stagger or waterfall plot capability to LineCollection; illustrated in examples/collections.py. - EF
2006-02-11 Massive cleanup of the usetex code in the postscript backend. Possibly fixed the clipping issue users were reporting with older versions of ghostscript - DSD
2006-02-11 Added autolim kwarg to axes.add_collection. Changed collection get_verts() methods accordingly. - EF
2006-02-09 added a temporary rc parameter text.dvipnghack, to allow Mac users to get nice results with the usetex option. - DSD
2006-02-09 Fixed a bug related to setting font sizes with the usetex option. - DSD
2006-02-09 Fixed a bug related to usetex’s latex code. - DSD
2006-02-09 Modified behavior of font.size rc setting. You should define font.size in pts, which will set the “medium” or default fontsize. Special text sizes like axis labels or tick labels can be given relative font sizes like small, large, x-large, etc. and will scale accordingly. - DSD
2006-02-08 Added py2exe specific datapath check again. Also added new py2exe helper function get_py2exe_datafiles for use in py2exe setup.py scripts. - CM
2006-02-02 Added box function to pylab
2006-02-02 Fixed a problem in setupext.py, tk library formatted in unicode caused build problems - DSD
2006-02-01 Dropped TeX engine support in usetex to focus on LaTeX. - DSD

7.1. List of changes to Matplotlib prior to 2015
2006-01-29 Improved use\texttt{tex} option to respect the serif, sans-serif, monospace, and cursive rc settings. Removed the font.\texttt{latex.package} rc setting, it is no longer required - DSD

2006-01-29 Fixed tex’s caching to include font.f\texttt{amily} rc information - DSD

2006-01-29 Fixed subpixel rendering bug in *Agg that was causing uneven gridlines - JDH

2006-01-28 Added font\texttt{cmd} to \texttt{backend_ps\_ps\_RendererPS.draw\_tex}, to support other font families in eps output - DSD

2006-01-28 Added \texttt{MaxNLocator} to \texttt{ticker.py}, and changed \texttt{contour.py} to use it by default. - EF

2006-01-28 Added font\texttt{cmd} to \texttt{backend_ps\_ps\_RendererPS.draw\_tex}, to support other font families in eps output - DSD

2006-01-27 Buffered reading of mat\texttt{plotlibrc} parameters in order to allow ‘verbose’ settings to be processed first (allows verbose.report during rc validation process) - DSD

2006-01-27 Removed \texttt{setup\_tools support from setup.py and created a separate setuppegg.py file to replace it}. - CM

2006-01-26 Replaced the ugly datapath logic with a cleaner approach from http://wiki.python.org/moin/DistutilsInstallDataScattered. Overrides the install\_data command. - CM

2006-01-24 Don’t use character typecodes in cntr.c — changed to use defined type-numbers instead. - TEO

2006-01-24 Fixed some bugs in use\texttt{tex’s and ps\_usedistiller’s dependency}

2006-01-24 Added masked array support to scatter - EF

2006-01-24 Fixed some bugs in use\texttt{tex’s and ps\_usedistiller’s dependency} checking - DSD

2006-01-24 Released 0.86.2

2006-01-20 Added a converters dict to pylab load to convert selected columns to float - especially useful for files with date strings, uses a datestr2num converter - JDH

2006-01-20 Added datestr2num to mat\texttt{plotlib dates to convert a string} or sequence of strings to a mat\texttt{plotlib datenum}

2006-01-18 Added quadrilateral pcolor\texttt{mesh patch 1409190 by Alex Mont} and Paul Kienzle - this is *Agg only for now. See examples/quadmesh\_demo.py - JDH

2006-01-18 Added Jouni’s boxplot patch - JDH

2006-01-18 Added comma delimiter for pylab save - JDH

2006-01-12 Added Ryan’s legend patch - JDH

2006-1-12 Fixed numpy / numeric to use .\texttt{dtype.char} to keep in SYNC with numpy SVN

2006-1-11 Released 0.86.1

2006-1-11 Fixed setup.py for win32 build and added rc template to the MANIFEST.in
2006-1-10 Added xpdf distiller option. matplotlibrc ps.usedistiller can now be none, false, ghostscript, or xpdf. Validation checks for dependencies. This needs testing, but the xpdf option should produce the highest-quality output and small file sizes - DSD

2006-01-10 For the usetex option, backend_ps now does all the LaTeX work in the os’s temp directory - DSD

2006-1-10 Added checks for usetex dependencies. - DSD

2006-1-9 Released 0.86

2006-1-4 Changed to support numpy (new name for scipy_core) - TEO

2006-1-4 Added Mark’s scaled axes patch for shared axis

2005-12-28 Added Chris Barker’s build_wxagg patch - JDH

2005-12-27 Altered numerix/scipy to support new scipy package structure - TEO

2005-12-20 Fixed Jame’s Boyles date tick reversal problem - JDH

2005-12-20 Added Jouni’s rc patch to support lists of keys to set on - JDH

2005-12-12 Updated pyparsing and mathtext for some speed enhancements (Thanks Paul McGuire) and minor fixes to scipy numerix and setuptools

2005-12-12 Matplotlib data is now installed as package_data in the matplotlib module. This gets rid of checking the many possibilities in matplotlib._get_data_path() - CM

2005-12-11 Support for setuptools/pkg_resources to build and use matplotlib as an egg. Still allows matplotlib to exist using a traditional distutils install. - ADS

2005-12-03 Modified setup to build matplotlibrc based on compile time findings. It will set numerix in the order of scipy, numarray, Numeric depending on which are founds, and backend as in preference order GTKAgg, WXAgg, TkAgg, GTK, Agg, PS

2005-12-03 Modified scipy patch to support Numeric, scipy and numarray Some work remains to be done because some of the scipy imports are broken if only the core is installed. e.g., apparently we need from scipy.basic.fftpack import * rather than from scipy.fftpack import *

2005-12-03 Applied some fixes to Nicholas Young’s nonuniform image patch

2005-12-01 Applied Alex Gontmakher hatch patch - PS only for now

2005-11-30 Added Rob McMullen’s EMF patch

2005-11-30 Added Daishi’s patch for scipy

2005-11-30 Fixed out of bounds draw markers segfault in agg

2005-11-28 Got TkAgg blitting working 100% (cross fingers) correctly. - CM

2005-11-27 Multiple changes in cm.py, colors.py, figure.py, image.py, contour.py, contour_demo.py; new _cm.py, examples/image_masked.py. 1) Separated the color table data from cm.py out into a new file, _cm.py, to make it easier to find the actual code in cm.py and to add new colormaps. Also added some line breaks to the color data dictionaries. Everything from _cm.py is imported by cm.py, so the split should be transparent. 2) Enabled automatic generation of a colormap from a list of colors in contour; see modified examples/contour_demo.py. 3) Support for imshow of a masked array, with the ability to specify colors (or no color at all) for masked regions, and for regions that are above or below the normally mapped region. See examples/image_masked.py.
4) In support of the above, added two new classes, ListedColormap, and no_norm, to colors.py, and modified the Colormap class to include common functionality. Added a clip kwarg to the normalize class. Reworked color handling in contour.py, especially in the ContourLabeller mixin. - EF

2005-11-25 Changed text.py to ensure color is hashable. EF

2005-11-16 Released 0.85
2005-11-16 Changed the default default linewidth in rc to 1.0

2005-11-16 Replaced agg_to_gtk_drawable with pure pygtk pixbuf code in backend gtkagg. When the equivalent is doe for blit, the agg extension code will no longer be needed

2005-11-16 Added a maxdict item to cbook to prevent caches from growing w/o bounds

2005-11-15 Fixed a colorup/colordown reversal bug in finance.py - Thanks Gilles

2005-11-15 Applied Jouni K Steppanen’s boxplot patch SF patch#1349997
  • JDH

2005-11-09 added axisbelow attr for Axes to determine whether ticks and such are above or below the actors

2005-11-08 Added Nicolas’ irregularly spaced image patch

2005-11-08 Deprecated HorizontalSpanSelector and replaced with SpanSelection that takes a third arg, direction. The new SpanSelector supports horizontal and vertical span selection, and the appropriate min/max is returned. - CM

2005-11-08 Added lineprops dialog for gtk

2005-11-03 Added FIFOBuffer class to mlab to support real time feeds and examples/fifo_buffer.py

2005-11-01 Contributed Nickolas Young’s patch for afm mathtext to support mathtext based upon the standard postscript Symbol font when psusetex = True.

2005-10-26 Added support for scatter legends - thanks John Gill

2005-10-20 Fixed image clipping bug that made some tex labels disappear. JDH

2005-10-14 Removed sqrt from dvipng 1.6 alpha channel mask.

2005-10-14 Added width kwarg to hist function

2005-10-10 Replaced all instances of os.rename with shutil.move

2005-10-05 Added Michael Brady’s ydate patch

2005-10-04 Added rkern’s texmanager patch

2005-09-25 contour.py modified to use a single ContourSet class that handles filled contours, line contours, and labels; added keyword arg (clip_ends) to contour. Colorbar modified to work with new ContourSet object; if the ContourSet has lines rather than polygons, the colorbar will follow suit. Fixed a bug introduced in 0.84, in which contourf(...,colors=...) was broken - EF

2005-09-19 Released 0.84
2005-09-14 Added a new ‘resize_event’ which triggers a callback with a
backend_bases.ResizeEvent object - JDH
2005-09-14 font_manager.py: removed chkfontpath from x11fontDirectory() - SC
2005-09-14 Factored out auto date locator/formatter factory code into
matplotlib.date.date_ticker_factory; applies John Bryne’s quiver patch.
2005-09-13 Added Mark’s axes positions history patch #1286915
2005-09-09 Added support for auto canvas resizing with fig.set_figsize_inches(9,5,forward=True)
# inches OR fig.resize(400,300) # pixels
2005-09-07 figure.py: update Figure.draw() to use the updated
renderer.draw_image() so that examples/figimage_demo.py works again. exam-
ples/stock_demo.py: remove data_clipping (which no longer exists) - SC
2005-09-06 Added Eric’s tick.direction patch: in or out in rc
2005-09-06 Added Martin’s rectangle selector widget
2005-09-04 Fixed a logic err in text.py that was preventing rgxsuper from matching -
JDH
2005-08-29 Committed Ken’s wx blit patch #1275002
2005-08-26 colorbar modifications - now uses contourf instead of imshow so that
colors used by contourf are displayed correctly. Added two new keyword args (cspacing and clabels) that are only relevant for ContourMappable images - JSWHIT
2005-08-24 Fixed a PS image bug reported by Darren - JDH
2005-08-23 colors.py: change hex2color() to accept unicode strings as well as
normal strings. Use isinstance() instead of types.IntType etc - SC
2005-08-16 removed data_clipping line and rc property - JDH
2005-08-22 backend_svg.py: Remove redundant “x=0.0 y=0.0” from svg element.
Increase svg version from 1.0 to 1.1. Add viewBox attribute to svg element to allow SVG
documents to scale-to-fit into an arbitrary viewport - SC
2005-08-16 Added Eric’s dot marker patch - JDH
2005-08-08 Added blitting/animation for TkAgg - CM
2005-08-05 Fixed duplicate tickline bug - JDH
2005-08-05 Fixed a GTK animation bug that cropped up when doing animations in
gtk//gtkagg canvases that had widgets packed above them
2005-08-05 Added Clovis Goldemberg patch to the tk save dialog
2005-08-04 Removed origin kwarg from backend.draw_image. origin is handled entirely by the frontend now.
2005-07-03 Fixed a bug related to TeX commands in backend_ps
2005-08-03 Fixed SVG images to respect upper and lower origins.
2005-08-03 Added flipud method to image and removed it from to_str.
2005-07-29 Modified figure.figaspect to take an array or number; modified back-
end_svg to write utf-8 - JDH
2005-07-30 backend_svg.py: embed png image files in svg rather than linking to a
separate png file, fixes bug #1245306 (thanks to Norbert Nemec for the patch) - SC
2005-07-29 Released 0.83.2

2005-07-27 **Applied SF patch 1242648: minor rounding error in** IndexDateFormatter in dates.py

2005-07-27 **Applied sf patch 1244732: Scale axis such that circle looks like circle - JDH**

2005-07-29 Improved message reporting in texmanager and backend_ps - DSD

2005-07-28 backend_gtk.py: update FigureCanvasGTK.draw() (needed due to the recent expose_event() change) so that examples/anim.py works in the usual way - SC

2005-07-26 Added new widgets Cursor and HorizontalSpanSelector to matplotlib.widgets. See examples/widgets/cursor.py and examples/widgets/span_selector.py - JDH

2005-07-26 **added draw event to mpl event hierarchy - triggered on** figure.draw

2005-07-26 backend_gtk.py: allow ‘f’ key to toggle window fullscreen mode

2005-07-26 backend_svg.py: **write “<.../>” elements all on one line and remove surplus spaces** - SC

2005-07-25 backend_svg.py: **simplify code by deleting GraphicsContextSVG and RendererSVG.new_gc(), and moving the gc.get_capstyle() code into RendererSVG._get_gc_props_svg()** - SC

2005-07-24 backend_gtk.py: **call FigureCanvasBase.motion_notify_event() on all motion-notify-events, not just ones where a modifier key or button has been pressed** (fixes bug report from Niklas Volbers) - SC

2005-07-24 backend_gtk.py: **modify print_figure() use own pixmap, fixing problems where print_figure() overwrites the display pixmap. return False from all button/key etc events - to allow the event to propagate further** - SC

2005-07-23 backend_gtk.py: **change expose_event from using set_back_pixmap(); clear() to draw_drawable()** - SC

2005-07-23 backend_gtk.py: **removed pygtk.require() matplotlib/_init__.py: delete ‘FROZEN’ and ‘McPLError’ which are no longer used** - SC

2005-07-22 backend_gdk.py: removed pygtk.require() - SC

2005-07-21 backend_svg.py: **Remove unused imports. Remove methods doc strings which just duplicate the docs from backend_bases.py. Rename draw_mathtext to _draw_mathtext.** - SC

2005-07-17 examples/embedding_in_gtk3.py: **new example demonstrating placing a FigureCanvas in a gtk.ScrolledWindow** - SC

2005-07-14 Fixed a Windows related bug (#1238412) in texmanager - DSD

2005-07-11 **Fixed color kwarg bug, setting color=1 or 0 caused an exception** - DSD

2005-07-07 Added Eric’s MA set_xdata Line2D fix - JDH

2005-07-06 **Made HOME/.matplotlib the new config dir where the** matplotlibrc file, the ttf.cache, and the tex.cache live. The new default filenames in .matplotlib have no leading dot and are not hidden. e.g., the new names are matplotlibrc tex.cache ttffont.cache. This is how ipython does it so it must be right. If old files are found, a warning is issued and they are moved to the new location. Also fixed texmanager to put
all files, including temp files in ~/.matplotlib/tex.cache, which allows you to usetex in non-writable dirs.

**2005-07-05 Fixed bug #1231611 in subplots adjust layout. The problem was** that the text caching mechanism was not using the transformation affine in the key. - JDH

**2005-07-05 Fixed default backend import problem when using API (SF bug #1209354)** - see API CHANGES for more info - JDH

**2005-07-04 backend_gtk.py: require PyGTK version 2.0.0 or higher** - SC

**2005-06-30 setupext.py: added numarray_inc_dirs for building against numarray when not installed in standard location** - ADS

**2005-06-27 backend_svg.py: write figure width, height as int, not float.** Update to fix some of the pychecker warnings - SC

**2005-06-23 Updated examples/agg_test.py to demonstrate curved paths** and fills - JDH

**2005-06-21 Moved some texmanager and backend_agg tex caching to class level rather than instance level** - JDH

**2005-06-20 setupext.py: fix problem where _nc_backend_gdk is installed to the wrong directory** - SC

**2005-06-19 Added 10.4 support for CocoaAgg.** - CM

**2005-06-18 Move Figure.get_width_height() to FigureCanvasBase and return int instead of float.** - SC

**2005-06-18 Applied Ted Drain’s QtAgg patch: 1) Changed the toolbar to be a horizontal bar of push buttons instead of a QToolBar and updated the layout algorithms in the main window accordingly. This eliminates the ability to drag and drop the toolbar and detach it from the window. 2) Updated the resize algorithm in the main window to show the correct size for the plot widget as requested. This works almost correctly right now. It looks to me like the final size of the widget is off by the border of the main window but I haven’t figured out a way to get that information yet. We could just add a small margin to the new size but that seems a little hacky. 3) Changed the x/y location label to be in the toolbar like the Tk backend instead of as a status line at the bottom of the widget. 4) Changed the toolbar pixmaps to use the ppm files instead of the png files. I noticed that the Tk backend buttons looked much nicer and it uses the ppm files so I switched them.**

**2005-06-17 Modified the gtk backend to not queue mouse motion events.** This allows for live updates when dragging a slider. - CM

**2005-06-17 Added starter CocoaAgg backend. Only works on OS 10.3 for now and requires PyObjC. (10.4 is high priority)** - CM

**2005-06-17 Upgraded pyparsing and applied Paul McGuire’s suggestions for speeding things up.** This more than doubles the speed of mathtext in my simple tests. JDH

**2005-06-16 Applied David Cooke’s subplot make_key patch**

**2005-06-15 0.82 released**

**2005-06-15 Added subplot config tool to GTK* backends - note you must now import the NavigationToolbar2 from your backend of choice rather than from backend_gtk because it needs to know about the backend specific canvas**
- see examples/embedding_in_gtk2.py. Ditto for wx backend - see examples/embedding_in_wxagg.py

2005-06-15 backend_cairo.py: updated to use pycairo 0.5.0 - SC

2005-06-14 Wrote some GUI neutral widgets (Button, Slider, RadioButtons, CheckButtons) in matplotlib.widgets. See examples/widgets/*.py - JDH

2005-06-14 Exposed subplot parameters as rc vars and as the fig SubplotParams instance subplotpars. See figure.SubplotParams, figure.Figure.subplots_adjust and the pylab method subplots_adjust and examples/subplots_adjust.py. Also added a GUI neutral widget for adjusting subplots, see examples/subplot_toolbar.py - JDH

2005-06-13 Exposed cap and join style for lines with new rc params and
line properties

    lines.dash_joindstyle : miter # miter|round|bevel
    lines.dash_capstyle : butt # butt|round|projecting
    lines.solid_joindstyle : miter # miter|round|bevel
    lines.solid_capstyle : projecting # butt|round|projecting

2005-06-13 Added kwargs to Axes init

2005-06-13 Applied Baptiste’s tick patch - JDH

2005-06-13 Fixed rc alias ‘l’ bug reported by Fernando by removing aliases for main-level rc options. - JDH

2005-06-10 Fixed bug #1217637 in ticker.py - DSD

2005-06-07 Fixed a bug in texmanager.py: .aux files not being removed - DSD

2005-06-08 Added Sean Richard’s hist binning fix - see API_CHANGES - JDH

2005-06-07 Added kwargs to Axes init

• DSD

2005-06-06 Added autoscale_on prop to axes

2005-06-05 Added Nick’s picker “among” patch - JDH

2005-06-05 Fixed a TeX/LaTeX font discrepancy in backend_ps. - DSD

2005-06-05 Added a ps.distill option in rc settings. If True, postscript output will be distilled using ghostscript, which should trim the file size and allow it to load more quickly. Hopefully this will address the issue of large ps files due to font definitions. Tested with gnu-ghostscript-8.16. - DSD

2005-06-03 Improved support for tex handling of text in backend_ps. - DSD

2005-06-03 Added rc options to render text with tex or latex, and to select the latex font package. - DSD

2005-06-03 Fixed a bug in ticker.py causing a ZeroDivisionError

2005-06-02 backend_gtk.py remove DBL_BUFFER, add line to expose_event to try to fix pygtk 2.6 redraw problem - SC

2005-06-01 The default behavior of ScalarFormatter now renders scientific notation and large numerical offsets in a label at the end of the axis. - DSD
2005-06-01 Added Nicholas’ frombyte image patch - JDH
2005-05-31 Added vertical TeX support for agg - JDH
2005-05-31 Applied Eric’s cntr patch - JDH

2005-05-27 **Finally found the pesky agg bug (which Maxim was kind enough to fix within hours)** that was causing a segfault in the win32 cached marker drawing. Now windows users can get the enormous performance benefits of caced markers w/o those occasional pesky screenshots. - JDH

2005-05-27 **Got win32 build system working again, using a more recent** version of gtk and pygtk in the win32 build, gtk 2.6 from https://web.archive.org/web/20050527002647/https://www.gimp.org/~tml/gimp/win32/downloads.html (you will also need libpng12.dll to use these). I haven’t tested whether this binary build of mpl for win32 will work with older gtk runtimes, so you may need to upgrade.

2005-05-27 **Fixed bug where 2nd wxapp could be started if using wxagg** backend. - ADS

2005-05-26 Added Daishi text with dash patch – see examples/dashtick.py

2005-05-26 **Moved backend_latex functionality into backend_ps. If**
text.usetex=True, the PostScript backend will use LaTeX to generate the .ps or .eps file. Ghostscript is required for eps output. - DSD

2005-05-24 Fixed alignment and color issues in latex backend. - DSD

2005-05-21 **Fixed raster problem for small rasters with dvipng - looks** like it was a premultiplied alpha problem - JDH

2005-05-20 **Added linewidth and faceted kwarg to scatter to control** edgewidth and color. Also added autolegend patch to inspect line segments.

2005-05-18 Added Orsay and JPL qt fixes - JDH

2005-05-17 **Added a psfrag latex backend - some alignment issues need** to be worked out. Run with -dLaTeX and a .tex file and *.eps file are generated. latex and dvips the generated latex file to get ps output. Note xdvi *does not work, you must generate ps-. - JDH

2005-05-13 **Added Florent Rougon’s Axis set_label1 patch**

2005-05-17 pcolor optimization, fixed bug in previous pcolor patch - JSWHIT

2005-05-16 Added support for masked arrays in pcolor - JSWHIT

2005-05-12 **Started work on TeX text for antigrain using pngdvi - see** examples/tex demo.py and the new module matplotlib.texmanager. Rotated text not supported and rendering small glyps is not working right yet. But large fontsizes and/or high dpi saved figs work great.

2005-05-10 **New image resize options interpolation options. New values** for the interp kwarg are

   See help(imshow) for details, particularly the interpolation, filternorm and filterrad kwargs

2005-05-10 Applied Eric’s contour mem leak fixes - JDH
<table>
<thead>
<tr>
<th>Date</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2005-05-10</td>
<td><strong>Extended python agg wrapper and started implementing</strong> backend_agg2, an agg renderer based on the python wrapper. This will be more flexible and easier to extend than the current backend_agg. See also examples/agg_test.py - JDH</td>
</tr>
<tr>
<td>2005-05-09</td>
<td><strong>Added Marcin's no legend patch to exclude lines from the</strong> autolegend builder</td>
</tr>
<tr>
<td></td>
<td>plot(x, y, label='nolegend')</td>
</tr>
<tr>
<td>2005-05-05</td>
<td>Upgraded to agg23</td>
</tr>
<tr>
<td>2005-05-05</td>
<td>Added newscalarformatter_demo.py to examples. -DSD</td>
</tr>
<tr>
<td>2005-05-04</td>
<td><strong>Added NewScalarFormatter. Improved formatting of ticklabels,</strong> scientific notation, and the ability to plot large large numbers with small ranges, by determining a numerical offset. See ticker.NewScalarFormatter for more details. -DSD</td>
</tr>
<tr>
<td>2005-05-03</td>
<td>Added the option to specify a delimiter in pylab.load -DSD</td>
</tr>
<tr>
<td>2005-04-28</td>
<td>Added Darren’s line collection example</td>
</tr>
<tr>
<td>2005-04-28</td>
<td>Fixed aa property in agg - JDH</td>
</tr>
<tr>
<td>2005-04-27</td>
<td>Set postscript page size in .matplotlibrc - DSD</td>
</tr>
<tr>
<td>2005-04-26</td>
<td>Added embedding in qt example. - JDH</td>
</tr>
<tr>
<td>2005-04-14</td>
<td><strong>Applied Michael Brady’s qt backend patch: 1) fix a bug</strong> where keyboard input was grabbed by the figure and not released 2) turn on cursor changes 3) clean up a typo and commented-out print statement. - JDH</td>
</tr>
<tr>
<td>2005-04-14</td>
<td><strong>Applied Eric Firing’s masked data lines patch and contour</strong> patch. Support for masked arrays has been added to the plot command and to the Line2D object. Only the valid points are plotted. A “valid only” kwarg was added to the get_xdata() and get_ydata() methods of Line2D; by default it is False, so that the original data arrays are returned. Setting it to True returns the plottable points. - see examples/masked_demo.py - JDH</td>
</tr>
<tr>
<td>2005-04-13</td>
<td>Applied Tim Leslie’s arrow key event handling patch - JDH</td>
</tr>
<tr>
<td>0.80 released</td>
<td></td>
</tr>
<tr>
<td>2005-04-11</td>
<td><strong>Applied a variant of rick’s xlim/ylim/axis patch. These</strong> functions now take kwargs to let you selectively alter only the min or max if desired. e.g., xlim(xmin=2) or axis(ymax=3). They always return the new lim. - JDH</td>
</tr>
<tr>
<td>2005-04-11</td>
<td><strong>Incorporated Werner’s wx patch - wx backend should be</strong> compatible with wxpython2.4 and recent versions of 2.5. Some early versions of wxpython 2.5 will not work because there was a temporary change in the dc API that was rolled back to make it 2.4 compliant</td>
</tr>
<tr>
<td>2005-04-11</td>
<td><strong>modified tkagg show so that new figure window pops up on</strong> call to figure</td>
</tr>
<tr>
<td>2005-04-11</td>
<td>fixed wxapp init bug</td>
</tr>
<tr>
<td>2005-04-02</td>
<td>Updated backend_ps.draw_lines, draw_markers for use with the new API - DSD</td>
</tr>
<tr>
<td>2005-04-01</td>
<td>Added editable polygon example</td>
</tr>
</tbody>
</table>

2005-03-31 0.74 released
2005-03-30 Fixed and added checks for floating point inaccuracy in ticker.Base - DSD
2005-03-30 updated /ellipse definition in backend_ps.py to address bug #1122041 - DSD
2005-03-29 Added unicode support for Agg and PS - JDH
2005-03-28 Added Jarrod’s svg patch for text - JDH
2005-03-28 Added Ludal’s arrow and quiver patch - JDH
2005-03-28 Added label kwarg to Axes to facilitate forcing the creation of new Axes with otherwise identical attributes
2005-03-28 Applied boxplot and OSX font search patches
2005-03-27 Added ft2font NULL check to fix Japanese font bug - JDH
2005-03-27 Added sprint legend patch plus John Gill’s tests and fix - see examples/legend_auto.py - JDH

2005-03-19 0.73.1 released
2005-03-19 Reverted wxapp handling because it crashed win32 - JDH
2005-03-18 Add .number attribute to figure objects returned by figure() - FP

2005-03-18 0.73 released
2005-03-16 Fixed labelsep bug
2005-03-16 Applied Darren’s ticker fix for small ranges - JDH
2005-03-16 Fixed tick on horiz colorbar - JDH
2005-03-16 Added Japanses winreg patch - JDH
2005-03-15 backend_gtkagg.py: changed to use double buffering, this fixes the problem reported Joachim Berdal Haga - "Parts of plot lagging from previous frame in animation". Tested with anim.py and it makes no noticeable difference to performance (23.7 before, 23.6 after) - SC
2005-03-14 add src/_backend_gdk.c extension to provide a substitute function for pixbuf.get_pixels_array(). Currently pixbuf.get_pixels_array() only works with Numeric, and then only works if pygtk has been compiled with Numeric support. The change provides a function pixbuf.get_pixels_array() which works with Numeric and numarray and is always available. It means that backend_gtk should be able to display images and mathtext in all circumstances. - SC
2005-03-11 Upgraded CXX to 5.3.1
2005-03-10 remove GraphicsContextPS.set_linestyle() and GraphicsContextSVG.set_linestyle() since they do no more than the base class GraphicsContext.set_linestyle() - SC
2005-03-09 Refactored contour functionality into dedicated module
2005-03-09 Added Eric’s contourf updates and Nadia’s clabel functionality
2005-03-09 Moved colorbar to figure. Figure to expose it for API developers
• JDH

2005-03-09 backend_cairo.py: implemented draw_markers() - SC

2005-03-09 cbook.py: only use enumerate() (the python version) if the builtin version is not available. Add new function ‘izip’ which is set to itertools.izip if available and the python equivalent if not available. - SC

2005-03-07 backend_gdk.py: remove PIXELS_PER_INCH from points_to_pixels(), but still use it to adjust font sizes. This allows the GTK version of line_styles.py to more closely match GTKAgg, previously the markers were being drawn too large. - SC

2005-03-01 Added Eric’s contourf routines

2005-03-01 Added start of proper agg SWIG wrapper. I would like to expose agg functionality directly at the user level and this module will serve that purpose eventually, and will hopefully take over most of the functionality of the current _image and _backend_agg modules. - JDH

2005-02-28 Fixed polyfit / polyval to convert input args to float arrays - JDH

2005-02-25 Add experimental feature to backend_gtk.py to enable/disable double buffering (DBL_BUFFER=True/False) - SC

2005-02-24 colors.py change ColorConverter.to_rgb() so it always returns rgb (and not rgba), allow cnames keys to be cached, change the exception raised from Run-timeError to ValueError (like hex2color()) hex2color() use a regular expression to check the color string is valid - SC

2005-02-23 Added rc param ps.useafm so backend ps can use native afm fonts or truetype. afme breaks mathtext but causes much smaller font sizes and may result in images that display better in some contexts (e.g., pdfs incorporated into latex docs viewed in acrobat reader). I would like to extend this approach to allow the user to use truetype only for mathtext, which should be easy.

2005-02-23 Used sequence protocol rather than tuple in agg collection drawing routines for greater flexibility - JDH

2005-02-22 0.72.1 released

2005-02-21 fixed linestyles for collections - contour now dashes for levels <0

2005-02-21 fixed ps color bug - JDH

2005-02-15 fixed missing qt file

2005-02-15 banished error_msg and report_error. Internal backend methods like error_msg_gtk are preserved. backend writers, check your backends, and diff against 0.72 to make sure I did the right thing! - JDH

2005-02-14 Added enthought traits to matplotlib tree - JDH

2005-02-14 0.72 released

2005-02-14 fix bug in cbook alltrue() and onetrue() - SC

2005-02-11 updated qtagg backend from Ted - JDH
2005-02-11 matshow fixes for figure numbering, return value and docs - FP
2005-02-09 new zorder example for fine control in zorder_demo.py - FP

**2005-02-09 backend renderer draw_lines now has transform in backend, as in draw_markers; use numerix in _backend_agg, added small line optimization to agg**

2005-02-09 subplot now deletes axes that it overlaps

**2005-02-08 Added transparent support for gzipped files in load/save - Fernando Perez (FP from now on).**

2005-02-08 Small optimizations in PS backend. They may have a big impact for large plots, otherwise they don’t hurt - FP

**2005-02-08 Added transparent support for gzipped files in load/save - Fernando Perez (FP from now on).**

**2005-02-07 Added newstyle path drawing for markers - only implemented in agg currently - JDH**

2005-02-05 Some superscript text optimizations for ticking log plots

**2005-02-05 Added some default key press events to pylab figures: \texttt{g} toggles grid - JDH**

**2005-02-05 Added some support for handling log switching for lines that have non-pos data - JDH**

**2005-02-04 Added Nadia’s contour patch - contour now has matlab compatible syntax; this also fixed an unequal sized contour array bug - JDH**

**2005-02-04 Modified GTK backends to allow the FigureCanvas to be resized smaller than its original size - SC**

2005-02-02 Fixed a bug in dates mx2num - JDH

2005-02-02 Incorporated Fernando’s matshow - JDH

**2005-02-01 Added Fernando’s figure num patch, including experemental support for pylab backend switching, LineCOLlection.color warns, savefig now a figure method, fixed a close(fig) bug - JDH**

2005-01-31 updated datalim in contour - JDH

2005-01-30 Added backend_qtagg.py provided by Sigve Tjora - SC

**2005-01-28 Added tk.inspect rc param to .matplotlibrc. IDLE users should set tk.pythoninspect:True and interactive:True and backend:TkAgg**

**2005-01-28 Replaced examples/interactive.py with an updated script from Fernando Perez - SC**

2005-01-27 Added support for shared x or y axes. See examples/shared_axis_demo.py and examples/ganged_plots.py

**2005-01-27 Added Lee’s patch for missing symbols leq and LEFTbracket to _mathtext_data - JDH**

**2005-01-26 Added Baptiste’s two scales patch - see help(twinx) in the pylab interface for more info. See also examples/two_scales.py**

2005-01-24 Fixed a mathtext parser bug that prevented font changes in sub-superscripts - JDH

---

**7.1. List of changes to Matplotlib prior to 2015**
2005-01-24 Fixed contour to work w/ interactive changes in colormaps, clim, etc - JDH

2005-01-21 matplotlib-0.71 released
2005-01-21 Refactored numerix to solve vexing namespace issues - JDH
2005-01-21 Applied Nadia’s contour bug fix - JDH

2005-01-20 Made some changes to the contour routine - particularly region=1 seems to fix a lot of the zigzag strangeness. Added colormaps as default for contour - JDH

2005-01-19 Restored builtin names which were overridden (min, max, abs, round, and sum) in pylab. This is a potentially significant change for those who were relying on an array version of those functions that previously overrode builtin function names. - ADS

2005-01-18 Added accents to mathtext: hat, breve, grave, bar, acute, tilde, vec, dot, ddot. All of them have the same syntax, e.g., to make an overbar you do bar{o} or to make an o umlaut you do ddot{o}. The shortcuts are also provided, e.g., "o ‘e ‘e ~n .x ^y - JDH

2005-01-18 Plugged image resize memory leaks - JDH
2005-01-18 Fixed some mathtext parser problems relating to superscripts

2005-01-17 Fixed a yticklabel problem for colorbars under change of clim - JDH

2005-01-17 Cleaned up Destroy handling in wx reducing memleak/fig from approx 800k to approx 6k - JDH

2005-01-17 Added kappa to latex_to_bakoma - JDH
2005-01-15 Support arbitrary colorbar axes and horizontal colorbars - JDH

2005-01-15 Fixed colormap number of colors bug so that the colorbar has the same discretization as the image - JDH

2005-01-15 Added Nadia’s x,y contour fix - JDH

2005-01-15 backend_cairo: added PDF support which requires pycairo 0.1.4. Its not usable yet, but is ready for when the Cairo PDF backend matures - SC

2005-01-15 Added Nadia’s x,y contour fix

2005-01-12 Fixed set clip_on bug in artist - JDH
2005-01-11 Reverted pythoninspect in tkagg - JDH

2005-01-09 Fixed a backend_bases event bug caused when an event is triggered when location is None - JDH

2005-01-07 Add patch from Stephen Walton to fix bug in pylab.load() when the % character is included in a comment. - ADS

2005-01-07 Added markerscale attribute to Legend class. This allows the marker size in the legend to be adjusted relative to that in the plot. - ADS

2005-01-06 Add patch from Ben Vanhaeren to make the FigureManagerGTK vbox a public attribute - SC
2004-12-30 Release 0.70

2004-12-28 Added coord location to key press and added a examples/picker_demo.py
2004-12-28 Fixed coords notification in wx toolbar - JDH

2004-12-28 Moved connection and disconnection event handling to the FigureCanvasBase. Backends now only need to connect one time for each of the button press, button release and key press/release functions. The base class deals with callbacks and multiple connections. This fixes flakiness on some backends (tk, wx) in the presence of multiple connections and/or disconnect - JDH

2004-12-27 Fixed PS mathtext bug where color was not set - Jochen please verify correct - JDH

2004-12-27 Added Shadow class and added shadow kwarg to legend and pie for shadow effect - JDH

2004-12-27 Added pie charts and new example/pie_demo.py

2004-12-23 Fixed an agg text rotation alignment bug, fixed some text kwarg processing bugs, and added examples/text_rotation.py to explain and demonstrate how text rotations and alignment work in matplotlib. - JDH

2004-12-22 0.65.1 released - JDH

2004-12-22 Fixed colorbar bug which caused colorbar not to respond to changes in colormap in some instances - JDH

2004-12-22 Refactored NavigationToolbar in tkagg to support app embedding, init now takes (canvas, window) rather than (canvas, figman) - JDH

2004-12-21 Refactored axes and subplot management - removed add_subplot and add axes from the FigureManager. classic toolbar updates are done via an observer pattern on the figure using add axobserver. Figure now maintains the axes stack (for gca) and supports axes deletion. Ported changes to GTK, Tk, Wx, and FLTK. Please test! Added delaxes - JDH

2004-12-21 Lots of image optimizations - 4x performance boost over 0.65 JDH

2004-12-20 Fixed a figimage bug where the axes is shown and modified tkagg to move the destroy binding into the show method.

2004-12-18 Minor refactoring of NavigationToolbar2 to support embedding in an application - JDH

2004-12-14 Added linestyle to collections (currently broken) - JDH

2004-12-14 Applied Nadia’s setupext patch to fix libstdc++ link problem with contour and solaris - JDH

2004-12-14 A number of pychecker inspired fixes, including removal of True and False from chook which I erroneously thought was needed for python2.2 - JDH

2004-12-14 Finished porting doc strings for set introspection. Used silent_list for many get funcs that return lists. JDH

2004-12-13 dates.py: removed all timezone() calls, except for UTC - SC

7.1. List of changes to Matplotlib prior to 2015
2004-12-13 0.65 released - JDH

2004-12-13 colors.py: rgb2hex(), hex2color() made simpler (and faster), also
rgb2hex() - added round() instead of integer truncation hex2color() - changed 256.0
divisor to 255.0, so now ‘#ffffff’ becomes (1.0,1.0,1.0) not (0.996,0.996,0.996) - SC

2004-12-11 Added ion and ioff to pylab interface - JDH

2004-12-11 backend_template.py: delete FigureCanvasTemplate.realize() - most
backends don’t use it and its no longer needed

backend_ps.py, backend_svg.py: delete show() and draw_if_interactive() - they are not
needed for image backends

backend_svg.py: write direct to file instead of StringIO - SC

2004-12-10 Added zorder to control drawing order of lines, patches and
text in axes. See examples/zorder_demo.py - JDH

2004-12-10 Fixed colorbar bug with scatter - JDH

2004-12-10 Added Nadia Dencheva <dencheva@stsci.edu> contour code - JDH

2004-12-10 backend_cairo.py: got mathtext working - SC

2004-12-09 Added Norm Peterson’s svg clipping patch

2004-12-09 Added Matthew Newville’s wx printing patch

2004-12-09 Migrated matlab to pylab - JDH

2004-12-09 backend_gtk.py: split into two parts

• backend_gdk.py - an image backend
• backend_gtk.py - A GUI backend that uses GDK - SC

2004-12-08 backend_gtk.py: remove quit_after_print_xvfb(*args), show_xvfb(),
Dialog_MeasureTool(gtk.Dialog) one month after sending mail to matplotlib-users
asking if anyone still uses these functions - SC

2004-12-02 backend_bases.py, backend_template.py: updated some of the method
documentation to make them consistent with each other - SC

2004-12-04 Fixed multiple bindings per event for TkAgg mpl_connect and
mpl_disconnect. Added a “test_disconnect” command line parameter to coords_demo.py
JTM

2004-12-04 Fixed some legend bugs JDH

2004-11-30 Added over command for oneoff over plots. e.g., over(plot, x, y, lw=2).
Works with any plot function.

2004-11-30 Added bbox property to text - JDH

2004-11-29 Zoom to rect now respect reversed axes limits (for both linear and log
axes). - GL

2004-11-29 Added the over command to the matlab interface. over allows you to add
an overlay plot regardless of hold state. - JDH

2004-11-25 Added Printf to mplutils for printf style format string
(formatting in C++)
(should help write better exceptions)

2004-11-24 IMAGE_FORMAT: remove from agg and gtkagg backends as its no longer
used - SC
2004-11-23 Added matplotlib compatible set and get introspection. See
set_and_get.py

2004-11-23 applied Norbert's patched and exposed legend configuration to kwargs -
JDH

2004-11-23 backend_gtk.py: added a default exception handler - SC

2004-11-18 backend_gtk.py: change so that the backend knows about all image
formats and does not need to use IMAGE_FORMAT in other backends - SC

2004-11-18 Fixed some report_error bugs in string interpolation as reported on SF
bug tracker - JDH

2004-11-17 backend_gtkcairo.py: change so all print_figure() calls render using
Cairo and get saved using backend_gtk.print_figure() - SC

2004-11-13 backend_cairo.py: Discovered the magic number (96) required for
Cairo PS plots to come out the right size. Restored Cairo PS output and added support
for landscape mode - SC

2004-11-13 Added ishold - JDH

2004-11-12 Added many new matlab colormaps - autumn bone cool copper flag gray
hot hsv jet pink prism spring summer winter - PG

2004-11-11 greatly simplify the emitted postscript code - JV

2004-11-12 Added new plotting functions spy, spy2 for sparse matrix visualization -
JDH

2004-11-11 Added rgrids, thetragrids for customizing the grid locations and labels
for polar plots - JDH

2004-11-11 make the Gtk backends build without an X-server connection - JV

2004-11-10 matplotlib/__init__.py: Added FROZEN to signal we are running under
py2exe (or similar) - is used by backend_gtk.py - SC

2004-11-09 backend_gtk.py: Made fix suggested by maffew@cat.org.au to prevent
problems when py2exe calls pygtk.require(). - SC

2004-11-09 backend_cairo.py: Added support for printing to a fileobject. Disabled
cairo PS output which is not working correctly. - SC

2004-11-08 matplotlib-0.64 released

2004-11-04 Changed -dbackend processing to only use known backends, so we
don’t clobber other non-matplotlib uses of -d, like -debug.

2004-11-04 backend_agg.py: added IMAGE_FORMAT to list the formats that the
backend can save to. backend_gtkagg.py: added support for saving JPG files by using
the GTK backend - SC

2004-10-31 backend_cairo.py: now produces png and ps files (although the figure
sizing needs some work). pycairo did not wrap all the necessary functions, so I wrapped
them myself, they are included in the backend_cairo.py doc string. - SC

2004-10-31 backend_ps.py: clean up the generated PostScript code, use the
PostScript stack to hold intermediate values instead of storing them in the dictionary. -
JV
2004-10-30 backend_ps.py, ft2font.cpp, ft2font.h: fix the position of text in the PostScript output. The new FT2Font method get_descent gives the distance between the lower edge of the bounding box and the baseline of a string. In backend_ps the text is shifted upwards by this amount. - JV

2004-10-30 backend_ps.py: clean up the code a lot. Change the PostScript output to be more DSC compliant. All definitions for the generated PostScript are now in a PostScript dictionary ‘mpldict’. Moved the long comment about drawing ellipses from the PostScript output into a Python comment. - JV

2004-10-30 backend_gtk.py: removed FigureCanvasGTK.realize() as its no longer needed. Merged ColorManager into GraphicsContext backend_bases.py: For set_capstyle/joinstyle() only set cap or joinstyle if there is no error. - SC

2004-10-30 backend_gtk.py: tidied up print_figure() and removed some of the dependency on widget events - SC

2004-10-28 backend_cairo.py: The renderer is complete except for mathtext, draw_image() and clipping. gtkcairo works reasonably well. cairo does not yet create any files since I can’t figure how to set the ‘target surface’, I don’t think pycairo wraps the required functions - SC

2004-10-28 backend_gtk.py: Improved the save dialog (GTK 2.4 only) so it presents the user with a menu of supported image formats - SC

2004-10-28 backend_svg.py: change print_figure() to restore original face/edge colors backend_ps.py: change print_figure() to ensure original face/edge colors are restored even if there’s an IOError - SC

2004-10-27 Applied Norbert’s errorbar patch to support barsabove kwarg

2004-10-27 Applied Norbert’s legend patch to support None handles

2004-10-27 Added two more backends: backend_cairo.py, backend_gtkcairo.py They are not complete yet, currently backend_gtkcairo just renders polygons, rectangles and lines - SC

2004-10-21 Added polar axes and plots - JDH

2004-10-20 Fixed corrcoef bug exposed by corrcoef(X) where X is matrix

• JDH

2004-10-19 Added kwarg support to xticks and yticks to set ticklabel text properties - thanks to T. Edward Whalen for the suggestion

2004-10-19 Added support for PIL images in imshow(), image.py - ADS

2004-10-19 Re-worked exception handling in _image.py and _transforms.py to avoid masking problems with shared libraries. - JTM

2004-10-16 Streamlined the matlab interface wrapper, removed the noplot option to hist - just use mlab.hist instead.

2004-09-30 Added Andrew Dalke’s strftime code to extend the range of dates supported by the DateFormatter - JDH

2004-09-30 Added barh - JDH

2004-09-30 Removed fallback to alternate array package from numerix so that ImportErrors are easier to debug. JTM

2004-09-30 Add GTK+ 2.4 support for the message in the toolbar. SC
2004-09-30 Made some changes to support python22 - lots of doc fixes. - JDH
2004-09-29 Added a Verbose class for reporting - JDH

2004-09-28 Released 0.63.0

2004-09-28 Added save to file object for agg - see examples/print_stdout.py

2004-09-24 Reorganized all py code to lib subdir

2004-09-24 Fixed axes resize image edge effects on interpolation - required upgrade to agg22 which fixed an agg bug related to this problem

2004-09-20 Added toolbar2 message display for backend_tkagg. JTM

2004-09-17 Added coords formatter attributes. These must be callable,

and return a string for the x or y data. These will be used to format the x and y data for the coords box. Default is the axis major formatter. e.g.:

```
# format the coords message box
def price(x):
    return '$%1.2f'%x
ax.format_xdata = DateFormatter('%Y-%m-%d')
ax.format_ydata = price
```

2004-09-17 Total rewrite of dates handling to use python datetime with num2date, date2num and drange. pytz for timezone handling, dateutils for sophisticated ticking. date ranges from 0001-9999 are supported. rrules allow arbitrary date ticking. examples/date* demo* .py converted to show new usage. new example examples/date demo rrule. py shows how to use rrules in date plots. The date locators are much more general and almost all of them have different constructors. See matplotlib. dates for more info.

2004-09-15 Applied Fernando’s backend __init__ patch to support easier backend maintenance. Added his numutils to mlab. JDH

2004-09-16 Re-designated all files in matplotlib/images as binary and w/o keyword substitution using “cvs admin -kb *.svg ...”. See binary files in “info cvs” under Linux. This was messing up builds from CVS on windows since CVS was doing If -> cr/lf and keyword substitution on the bitmaps. - JTM

2004-09-15 Modified setup to build array-package-specific extensions for those extensions which are array-aware. Setup builds extensions automatically for either Numeric, numarray, or both, depending on what you have installed. Python proxy modules for the array-aware extensions import the version optimized for numarray or Numeric determined by numerix. - JTM

2004-09-15 Moved definitions of infinity from mlab to numerix to avoid divide by zero warnings for numarray - JTM

2004-09-09 Added axhline, axvline, axhspan and axvspan

2004-08-30 matplotlib 0.62.4 released

2004-08-30 Fixed a multiple images with different extent bug, Fixed markerfacecolor as RGB tuple

2004-08-27 Mathtext now more than 5x faster. Thanks to Paul Mcguire for fixes both to pyparsing and to the matplotlib grammar! mathtext broken on python2.2

2004-08-25 Exposed Darren’s and Greg’s log ticking and formatting options to semilogx and friends
2004-08-23 Fixed grid w/o args to toggle grid state - JDH
2004-08-11 Added Gregory’s log patches for major and minor ticking
2004-08-18 Some pixel edge effects fixes for images
2004-08-18 Fixed TTF files reads in backend_ps on win32.

**2004-08-18 Added base and subs properties for logscale plots,** **user modifiable using**
\[
\text{set}_{\[x,y\]} \text{scale}('\text{log}', \text{base}=b, \text{subs}=[\text{mt1,mt2,\ldots}])
\] - GL

**2004-08-18 fixed a bug exposed by trying to find the HOME dir on win32** thanks to
Alan Issacc for pointing to the light - JDH
2004-08-18 fixed errorbar bug in setting ecolor - JDH
2004-08-12 Added Darren Dale’s exponential ticking patch
2004-08-11 Added Gregory’s fltkagg backend

2004-08-09 matplotlib-0.61.0 released

**2004-08-08 backend_gtk.py: get rid of the final PyGTK deprecation warning by**
replacing gtkOptionMenu with gtkMenu in the 2.4 version of the classic toolbar.

**2004-08-06 Added Tk zoom to rect rectangle,** **proper idle drawing,** **and keybinding -**
JDH
2004-08-05 Updated installing.html and INSTALL - JDH
2004-08-01 backend_gtk.py: move all drawing code into the expose_event()
2004-07-28 Added Greg’s toolbar2 and backend_*agg patches - JDH

**2004-07-28 Added image.imread with support for loading png into** numerix arrays
**2004-07-28 Added key modifiers to events - implemented dynamic updates and rubber banding for interactive pan/zoom - JDH
2004-07-27 did a readthrough of SVG, replacing all the string additions with string interps for efficiency, fixed some layout problems, added font and image support (through external pngs) - JDH

**2004-07-25 backend_gtk.py: modify toolbar2 to make it easier to support GTK+ 2.4. Add GTK+ 2.4 toolbar support. - SC
2004-07-24 backend_gtk.py: Simplified classic toolbar creation - SC
2004-07-24 Added images/matplotlib.svg to be used when GTK+ windows are minimised - SC

**2004-07-22 Added right mouse click zoom for NavigationToolbar2 panning mode. -**
JTM

**2004-07-22 Added NavigationToolbar2 support to backend_tkagg. Minor tweak to**
backend_bases. - JTM

**2004-07-22 Incorporated Gergory’s renderer cache and buffer object cache - JDH
2004-07-22 Backend_gtk.py: Added support for GtkFileChooser, changed**
FileSelection/FileChooser so that only one instance pops up, and made them both modal. - SC

512 Chapter 7. Previous What’s New
2004-07-21 Applied backend_agg memory leak patch from hayden - jocallo@online.no. Found and fixed a leak in binary operations on transforms. Moral of the story: never incref where you meant to decref! Fixed several leaks in ft2font: moral of story: almost always return Py::asObject over Py::Object - JDH

2004-07-21 Fixed a to string memory allocation bug in agg and image modules - JDH

2004-07-21 Added mpl_connect and mpl_disconnect to matlab interface - JDH

2004-07-21 Added beginnings of users_guide to CVS - JDH

2004-07-20 ported toolbar2 to wx

2004-07-20 upgraded to agg21 - JDH

2004-07-20 Added new icons for toolbar2 - JDH

2004-07-19 Added vertical mathtext for *Agg and GTK - thanks Jim Benson! - JDH

2004-07-16 Added ps/eps/svg savefig options to wx and gtk JDH

2004-07-15 Fixed python framework tk finder in setupext.py - JDH

2004-07-14 Fixed layer images demo which was broken by the 07/12 image extent fixes - JDH

2004-07-13 Modified line collections to handle arbitrary length segments for each line segment. - JDH

2004-07-13 Fixed problems with image extent and origin - set_image_extent deprecated. Use imshow(blah, blah, extent=(xmin, xmax, ymin, ymax) instead - JDH

2004-07-12 Added prototype for new nav bar with codified event handling. Use mpl_connect rather than connect for matplotlib event handling. toolbar style determined by rc toolbar param. backend status: gtk: prototype, wx: in progress, tk: not started - JDH

   • SC

2004-07-10 Added embedding_in_wx3 example - ADS

2004-07-09 Added dynamic_image_wxagg to examples - ADS

2004-07-09 added support for embedding TrueType fonts in PS files - PEB

2004-07-09 fixed a sfnt bug exposed if font cache is not built

2004-07-09 added default arg None to matplotlib.matlab grid command to toggle current grid state

2004-07-08 0.60.2 released

2004-07-08 fixed a mathtext bug for ‘6’

2004-07-08 added some numarray bug workarounds

2004-07-07 0.60 released

2004-07-07 Fixed a bug in dynamic_demo_wx

2004-07-07 backend_gtk.py: raise SystemExit immediately if ‘import pygtk’ fails - SC
2004-07-05 Added new mathtext commands over\{sym1\}\{sym2\} and
under\{sym1\}\{sym2\}

2004-07-05 Unified image and patch collections colormapping and scaling args. Updated
docstrings for all - JDH

2004-07-05 Fixed a figure legend bug and added examples/figlegend_demo.py - JDH
2004-07-05 Fixed a memory leak in image and agg to string methods

2004-06-25 Fixed fonts_demo spacing problems and added a kwargs version of the
fonts_demo fonts_demo_kw.py - JDH
2004-06-25 finance.py: handle case when urlopen() fails - SC

2004-06-24 Support for multiple images on axes and figure, with blending. Support
for upper and lower image origins. clim, jet and gray functions in matlab interface operate
on current image - JDH

2004-06-23 ported code to Perry’s new colormap and norm scheme. Added new rc
attributes image.aspect, image.interpolation, image.cmap, image.lut, image.origin

2004-06-20 backend gtk.py: replace gtk.TRUE/FALSE with True/False. simplified
_make_axis_menu(). - SC

2004-06-19 anim tk.py: Updated to use TkAgg by default (not GTK)
backend gtk.py: Added ‘_’ in front of private widget creation functions - SC

2004-06-17 backend gtk.py: Create a GC once in realise(), not every time draw() is
called. - SC

2004-06-16 Added new py2exe FAQ entry and added frozen support in get_data_path
for py2exe - JDH

2004-06-16 Removed GTKGD, which was always just a proof-of-concept backend -
JDH

2004-06-16 backend gtk.py updates to replace deprecated functions
gtk.mainquit(), gtk.mainloop(). Update NavigationToolbar to use the new GtkTool-
bar API - SC

2004-06-15 removed set_default_font from font manager to unify font customization
using the new function rc. See API_CHANGES for more info. The examples
fonts_demo.py and fonts_demo_kw.py are ported to the new API - JDH

2004-06-15 Improved (yet again!) axis scaling to properly handle singleton plots -
JDH

2004-06-15 Restored the old FigureCanvasGTK.draw() - SC
2004-06-11 More memory leak fixes in transforms and ft2font - JDH

2004-06-11 Eliminated numerix .numerix file and environment variable NUMERIX.
Fixed bug which prevented command line overrides: –numarray or –numeric. - JTM

2004-06-10 Added rc configuration function rc; deferred all rc param setting until
object creation time; added new rc attrs: lines.markerfacecolor, lines.markeredgecolor,
lines.markeredgewidth, patch.linewidth, patch.facecolor, patch.edgecolor;
patch.antialiased; see examples/customize_rc.py for usage - JDH

2004-06-09 0.54.2 released
Rewrote ft2font using CXX as part of general memory leak fixes; also fixed transform memory leaks - JDH

Fixed several problems with log ticks and scaling - JDH

Fixed width/height issues for images - JDH

Fixed draw_if_interactive bug for semilogx;

Fixed text clipping to clip to axes - JDH

Fixed leading newline text and multiple newline text - JDH

Fixed plot date to return lines - JDH

Fixed plot to work with x or y having shape N,1 or 1,N - JDH

Fixed plot_date to return lines - JDH

Fixed leading newline text and multiple newline text - JDH

Added renderer markeredgewidth attribute of Line2D. - ADS

Fixed, this time I really mean it, the singleton plot plot([0]) scaling bug; Fixed Flavio’s shape = N,1 bug - JDH

Added colorbar - JDH

Made some changes to the matplotlib.colors.Colormap to properly support clim - JDH

0.54.1 released

Lots of small bug fixes: rotated text at negative angles, errorbar capsize and autoscaling, right tick label position, gkagg on win98, alpha of figure background, singleton plots - JDH

Added Gary’s errorbar stuff and made some fixes for length one plots and constant data plots - JDH

Tweaked TkAgg backend so that canvas.draw() works more like the other backends. Fixed a bug resulting in 2 draws per figure manager show(). - JTM

0.54 released

Added newline separated text with rotations to text.Text layout - JDH

Added fast pcolor using PolyCollections. - JDH

Added fast polygon collections - changed scatter to use them. Added multiple symbols to scatter. 10x speedup on large scatters using *Agg and 5X speedup for ps. - JDH

On second thought... created an “nx” namespace in numerix which maps type names onto typecodes the same way for both numarray and Numeric. This undoes my previous change immediately below. To get a typename for Int16 useable in a Numeric extension: say nx.Int16. - JTM

Rewrote transformation class in extension code, simplified all the artist constructors - JDH
2004-05-14 Modified the type definitions in the numarray side of numerix so that they are Numeric typecodes and can be used with Numeric complex extensions. The original numarray types were renamed to type<old_name>. - JTM

2004-05-06 Gary Ruben sent me a bevy of new plot symbols and markers. See matplotlib.matlab.plot - JDH

2004-05-06 Total rewrite of mathtext - factored ft2font stuff out of layout engine and defined abstract class for font handling to lay groundwork for ps mathtext. Rewrote parser and made layout engine much more precise. Fixed all the layout hacks. Added spacing commands / and hspace. Added composite chars and defined angstrom. - JDH

2004-05-05 Refactored text instances out of backend; aligned text with arbitrary rotations is now supported - JDH

2004-05-05 Added a Matrix capability for numarray to numerix. JTM

2004-05-04 Updated whats_new.html.template to use dictionary and template loop, added anchors for all versions and items; updated goals.txt to use those for links. PG

2004-05-04 Added fonts_demo.py to backend_driver, and AFM and TTF font caches to font_manager.py - PEW

2004-05-03 Redid goals.html.template to use a goals.txt file that has a pseudo restructured text organization. PG

2004-05-03 Removed the close buttons on all GUIs and added the python #! bang line to the examples following Steve Chaplin’s advice on matplotlib dev

2004-04-29 Added CXX and rewrote backend_agg using it; tracked down and fixed agg memory leak - JDH

2004-04-29 Added stem plot command - JDH

2004-04-28 Fixed PS scaling and centering bug - JDH

2004-04-26 Fixed errorbar autoscale problem - JDH

2004-04-22 Fixed copy tick attribute bug, fixed singular datalim ticker bug; fixed mathtext fontsize interactive bug. - JDH

2004-04-21 Added calls to draw_if_interactive to axes(), legend(), and pcolor(). Deleted duplicate pcolor(). - JTM

2004-04-21 matplotlib 0.53 release

2004-04-19 Fixed vertical alignment bug in PS backend - JDH

2004-04-17 Added support for two scales on the “same axes” with tick different tick- ing and labeling left right or top bottom. See examples/two_scales.py - JDH

2004-04-17 Added default dirs as list rather than single dir in setupext.py - JDH

2004-04-16 Fixed wx exception swallowing bug (and there was much rejoicing!) - JDH

2004-04-16 Added new ticker locator a formatter, fixed default font return - JDH

2004-04-16 Added get_name method to FontProperties class. Fixed font lookup in GTK and WX backends. - PEW
2004-04-16 Added get- and set_fontstyle msethods. - PEB
2004-04-10 Mathtext fixes: scaling with dpi, - JDH
2004-04-09 Improved font detection algorithm. - PEB
2004-04-09 Move deprecation warnings from text.py to __init__.py - PEB
2004-04-09 Added default font customization - JDH
2004-04-08 Fixed viewlim set problem on axes and axis. - JDH

**2004-04-07 Added validate comma sep_str and font properties paramaters to**

**__init__.** Removed font families and added rcParams to FontProperties __init__ arguments in font_manager. Added default font property parameters to .matplotlibrc file with descriptions. Added deprecation warnings to the get__ - and set_fontXXX methods of the Text object. - PEB

2004-04-06 Added load and save commands for ASCII data - JDH

**2004-04-05 Improved font caching by not reading AFM fonts until needed.** Added better documentation. Changed the behaviour of the get_family, set_family, and set_name methods of FontProperties. - PEB

2004-04-05 Added WXAgg backend - JDH

**2004-04-04 Improved font caching in backend_agg with changes to font_manager** - JDH

**2004-03-29 Fixed fontdicts and kwargs to work with new font manager** - JDH

This is the Old, stale, never used changelog

**2002-12-10 - Added a TODO file and CHANGELOG. Lots to do - get**

```
  crackin'!
  • Fixed y zoom tool bug
  • Adopted a compromise fix for the y data clipping problem. The problem was that
    for solid lines, the y data clipping (as opposed to the gc clipping) caused artifac-
    tual horizontal solid lines near the ylim boundaries. I did a 5% offset hack in Axes
    set_ylim functions which helped, but didn’t cure the problem for very high gain y
    zooms. So I disabled y data clipping for connected lines. If you need extensive y
    clipping, either plot(y,x) because x data clipping is always enabled, or change the
    _set_clip code to ‘if 1’ as indicated in the lines.py src. See _set_clip in lines.py and
    set_ylim in figure.py for more information.
```

**2002-12-11 - Added a measurement dialog to the figure window to**

```
  measure axes position and the delta x delta y with a left mouse drag. These defaults can be overridden by deriving from Figure and overrriding
  button_press_event, button_release_event, and motion_notify_event, and _dia-
  log_measure_tool.
  • fixed the navigation dialog so you can check the axes the navigation buttons apply
    to.
```

2003-04-23 Released matplotlib v0.1

**2003-04-24 Added a new line style PixelLine2D which is the plots the markers as pix-
  els (as small as possible) with format symbol ‘,’**

```
  Added a new class Patch with derived classes Rectangle, RegularPolygon and Circle
```
2003-04-25 Implemented new functions errorbar, scatter and hist

   Added a new line type '|' which is a vline. syntax is plot(x, Y, '|') where y.shape = len(x),2 and each row gives the ymin,ymax for the respective values of x. Previously I had implemented vlines as a list of lines, but I needed the efficiency of the numeric clipping for large numbers of vlines outside the viewport, so I wrote a dedicated class Vline2D which derives from Line2D

2003-05-01

   Fixed ytick bug where grid and tick show outside axis viewport with gc clip

2003-05-14

   Added new ways to specify colors 1) matlab format string 2) html-style hex string, 3) rgb tuple. See examples/color_demo.py

2003-05-28

   Changed figure rendering to draw form a pixmap to reduce flicker. See examples/system_monitor.py for an example where the plot is continuously updated w/o flicker. This example is meant to simulate a system monitor that shows free CPU, RAM, etc...

2003-08-04

   Added Jon Anderson’s GTK shell, which doesn’t require pygtk to have threading built-in and looks nice!

2003-08-25

   Fixed deprecation warnings for python2.3 and pygtk-1.99.18

2003-08-26

   Added figure text with new example examples/figtext.py

2003-08-27

   Fixed bugs i figure text with font override dictionairies and fig text that was placed outside the window bounding box

2003-09-1 thru 2003-09-15

   Added a postscript and a GD module backend

2003-09-16

   Fixed font scaling and point scaling so circles, squares, etc on lines will scale with DPI as will fonts. Font scaling is not fully implemented on the gtk backend because I have not figured out how to scale fonts to arbitrary sizes with GTK

2003-09-17

   Fixed figure text bug which crashed X windows on long figure text extending beyond display area. This was, I believe, due to the vestigial erase functionality that was no longer needed since I began rendering to a pixmap

2003-09-30 Added legend

**2003-10-01** Fixed bug when colors are specified with rgb tuple or hex string.

**2003-10-21** Andrew Straw provided some legend code which I modifed and incorporated. Thanks Andrew!
2003-10-27 Fixed a bug in \texttt{axis.get\_view\_distance} that affected zoom in versus out with interactive scrolling, and a bug in the axis text reset system that prevented the text from being redrawn on an interactive gtk view lim set with the widget.

Fixed a bug in that prevented the manual setting of ticklabel strings from working properly.

2003-11-02 - Do a nearest neighbor color pick on GD when allocate fails

2003-11-02
- Added \texttt{pcolor} plot
- Added MRI example
- Fixed bug that screwed up label position if xticks or yticks were empty
- Added nearest neighbor color picker when GD max colors exceeded
- Fixed figure background color bug in GD backend

2003-11-10 - 2003-11-11
- major refactoring.
  - Ticks (with labels, lines and grid) handled by dedicated class
  - Artist now know bounding box and dpi
  - Bounding boxes and transforms handled by dedicated classes
  - legend in dedicated class. Does a better job of alignment and bordering. Can be initialized with specific line instances. See examples/legend\_demo2.py

2003-11-14 Fixed legend positioning bug and added new position args

2003-11-16 Finished porting GD to new axes API

2003-11-20 - add TM for matlab on website and in docs

2003-11-20 - make a nice errorbar and scatter screenshot

2003-11-20 - auto line style cycling for multiple line types broken

2003-11-18 (using inkrect) logical rect too big on gtk backend

2003-11-18 ticks don’t reach edge of axes in gtk mode - rounding error?

2003-11-20 - port Gary’s errorbar code to new API before 0.40

2003-11-20 - problem with \texttt{stale\_set\_font}. legend axes box doesn’t resize on save in GTK backend - see htdocs legend\_demo.py

2003-11-21 - make a dash-dot dict for the GC

2003-12-15 - fix install path bug

7.2 New in matplotlib 0.98.4

Table of Contents

- \textit{New in matplotlib 0.98.4}
It’s been four months since the last matplotlib release, and there are a lot of new features and bug-fixes.

Thanks to Charlie Moad for testing and preparing the source release, including binaries for OS X and Windows for python 2.4 and 2.5 (2.6 and 3.0 will not be available until numpy is available on those releases). Thanks to the many developers who contributed to this release, with contributions from Jae-Joon Lee, Michael Droettboom, Ryan May, Eric Firing, Manuel Metz, Jouni K. Seppänen, Jeff Whitaker, Darren Dale, David Kaplan, Michiel de Hoon and many others who submitted patches.

### 7.2.1 Legend enhancements

Jae-Joon has rewritten the legend class, and added support for multiple columns and rows, as well as fancy box drawing. See `legend()` and `matplotlib.legend.Legend`.

![Legend](image)

**Fig. 1: What's New 98 4 Legend**

### 7.2.2 Fancy annotations and arrows

Jae-Joon has added lots of support to annotations for drawing fancy boxes and connectors in annotations. See `annotate()` and `BoxStyle, ArrowStyle, and ConnectionStyle`.

![Annotations](image)
7.2.3 Native OS X backend

Michiel de Hoon has provided a native Mac OSX backend that is almost completely implemented in C. The backend can therefore use Quartz directly and, depending on the application, can be orders of magnitude faster than the existing backends. In addition, no third-party libraries are needed other than Python and NumPy. The backend is interactive from the usual terminal application on Mac using regular Python. It hasn’t been tested with ipython yet, but in principle it should work there as well. Set ‘backend : macosx’ in your matplotlibrc file, or run your script with:

```bash
> python myfile.py -dmacosx
```

7.2.4 psd amplitude scaling

Ryan May did a lot of work to rationalize the amplitude scaling of `psd()` and friends. See /gallery/lines_bars_and_markers/psd_demo. The changes should increase MATLAB compatibility and increase scaling options.

7.2.5 Fill between

Added a `fill_between()` function to make it easier to do shaded region plots in the presence of masked data. You can pass an x array and a `ylower` and `yupper` array to fill between, and an optional `where` argument which is a logical mask where you want to do the filling.
Fig. 3: What's New 98.4 Fill Between

7.2.6 Lots more

Here are the 0.98.4 notes from the CHANGELOG:

Added mdehoon's native macosx backend from sf patch 2179017 - JDH

Removed the prints in the set_*style commands. Return the list of pretty-printed strings instead - JDH

Some of the changes Michael made to improve the output of the property tables in the rest docs broke or made difficult to use some of the interactive doc helpers, e.g., setp and getp. Having all the rest markup in the ipython shell also confused the docstrings. I added a new rc param docstring harcopy, to format the docstrings differently for hardcopy and other use. The ArtistInspector could use a little refactoring now since there is duplication of effort between the rest output and the non-rest output - JDH

Updated spectral methods (psd, csd, etc.) to scale one-sided densities by a factor of 2 and, optionally, scale all densities by the sampling frequency. This gives better MATLAB compatibility. -RM

Fixed alignment of ticks in colorbars. -MGD

drop the deprecated "new" keyword of np.histogram() for numpy 1.2 or later. -J JL

Fixed a bug in svg backend that new_figure_manager() ignores keywords arguments such as figsize, etc. -J JL

Fixed a bug that the handlelength of the new legend class set too short when numpoints=1 -J JL

Added support for data with units (e.g., dates) to
Axes.fill_between. -RM

Added fancybox keyword to legend. Also applied some changes for
better look, including baseline adjustment of the multiline texts
so that it is center aligned. -JJL

The transmuter classes in the patches.py are reorganized as
subclasses of the Style classes. A few more box and arrow styles
are added. -JJL

Fixed a bug in the new legend class that didn't allowed a tuple of
coordinate values as loc. -JJL

Improve checks for external dependencies, using subprocess
(instead of deprecated popen*) and distutils (for version
checking) - DSD

Reimplementation of the legend which supports baseline alignment,
multi-column, and expand mode. - J JL

Fixed histogram autoscaling bug when bins or range are given
explicitly (fixes Debian bug 503148) - MM

Added rcParam axes.unicode_minus which allows plain hyphen for
minus when False - JDH

Added scatterpoints support in Legend. patch by Erik Tollerud -
J JL

Fix crash in log ticking. - MGD

Added static helper method BrokenHBarCollection.span_where and
Axes/pyplot method fill_between. See
elements/pylab/fill_between.py - JDH

Add x_isdata and y_isdata attributes to Artist instances, and use
them to determine whether either or both coordinates are used when
updating dataLim. This is used to fix autoscaling problems that
had been triggered by axhline, axhspan, axvline, axvspan. - EF

Update the psd(), csd(), cohere(), and specgram() methods of Axes
and the csd() cohere(), and specgram() functions in mlab to be in
sync with the changes to psd(). In fact, under the hood, these
all call the same core to do computations. - RM

Add 'pad_to' and 'sides' parameters to mlab.psd() to allow
controlling of zero padding and returning of negative frequency
components, respectively. These are added in a way that does not
change the API. - RM

Fix handling of c kwarg by scatter; generalize is_string_like to
accept numpy and numpy.ma string array scalars. - RM and EF

(continues on next page)
Fix a possible EINTR problem in dviread, which might help when saving pdf files from the qt backend - JKS

Fix bug with zoom to rectangle and twin axes - MGD

Added Jae Joon's fancy arrow, box and annotation enhancements -- see examples/pylab_examples/annotation_demo2.py

Autoscaling is now supported with shared axes - EF

Fixed exception in dviread that happened with Minion - JKS

set_xlim, ylim now return a copy of the viewlim array to avoid modify inplace surprises

Added image thumbnail generating function matplotlib.image.thumbnail. See examples/misc/image_thumbnail.py - JDH

Applied scatleg patch based on ideas and work by Erik Tollerud and Jae-Joon Lee. - MM

Fixed bug in pdf backend: if you pass a file object for output instead of a filename, e.g., in a wep app, we now flush the object at the end. - JKS

Add path simplification support to paths with gaps. - EF

Fix problem with AFM files that don't specify the font's full name or family name. - JKS

Added 'scilimits' kwarg to Axes.ticklabel_format() method, for easy access to the set_powerlimits method of the major ScalarFormatter. - EF

Experimental new kwarg borderpad to replace pad in legend, based on suggestion by Jae-Joon Lee. - EF

Allow spy to ignore zero values in sparse arrays, based on patch by Tony Yu. Also fixed plot to handle empty data arrays, and fixed handling of markers in figlegend. - EF

Introduce drawstyles for lines. Transparently split linestyles like 'steps--' into drawstyle 'steps' and linestyle '--'. Legends always use drawstyle 'default'. - MM

Fixed quiver and quiverkey bugs (failure to scale properly when resizing) and added additional methods for determining the arrow angles - EF

Fix polar interpolation to handle negative values of theta - MGD
Reorganized cbook and mlab methods related to numerical calculations that have little to do with the goals of those two modules into a separate module numerical_methods.py. Also, added ability to select points and stop point selection with keyboard in ginput and manual contour labeling code. Finally, fixed contour labeling bug. — DMK

Fix backtick in Postscript output. — MGD

[2089958] Path simplification for vector output backends
Leverage the simplification code exposed through path_to_polygons to simplify certain well-behaved paths in the vector backends (PDF, PS and SVG). "path.simplify" must be set to True in matplotlibrc for this to work. — MGD

Add "filled" kwarg to Path.intersects_path and Path.intersects_bbox. — MGD

Changed full arrows slightly to avoid an xpdf rendering problem reported by Friedrich Hagedorn. — JKS

Fix conversion of quadratic to cubic Bezier curves in PDF and PS backends. Patch by Jae-Joon Lee. — JKS

Added 5-point star marker to plot command q—EF

Fix hatching in PS backend — MGD

Fix log with base 2 — MGD

Added support for bilinear interpolation in NonUniformImage; patch by Gregory Lielens. — EF

Added support for multiple histograms with data of different length — MM

Fix step plots with log scale — MGD

Fix masked arrays with markers in non-Agg backends — MGD

Fix clip_on kwarg so it actually works correctly — MGD

Fix locale problems in SVG backend — MGD

fix quiver so masked values are not plotted — JSW

improve interactive pan/zoom in qt4 backend on windows — DSD

Fix more bugs in NaN/inf handling. In particular, path simplification (which does not handle NaNs or infs) will be turned off automatically when infs or NaNs are present. Also masked

(continues on next page)
arrays are now converted to arrays with NaNs for consistent handling of masks and NaNs. - MGD and EF

Added support for arbitrary rasterization resolutions to the SVG backend. - MW

7.3 New in matplolib 0.99

Table of Contents

• New in matplotlib 0.99
  • New documentation
  • mplot3d
  • axes grid toolkit
  • Axis spine placement

7.3.1 New documentation

Jae-Joon Lee has written two new guides Legend guide and Advanced Annotation. Michael Sarahan has written Image tutorial. John Hunter has written two new tutorials on working with paths and transformations: Path Tutorial and Transformations Tutorial.

7.3.2 mplot3d

Reinier Heeres has ported John Porter’s mplot3d over to the new matplotlib transformations framework, and it is now available as a toolkit mpl_toolkits.mplot3d (which now comes standard with all mpl installs). See mplot3d-examples-index and Getting started

7.3.3 axes grid toolkit

Jae-Joon Lee has added a new toolkit to ease displaying multiple images in matplotlib, as well as some support for curvilinear grids to support the world coordinate system. The toolkit is included standard with all new mpl installs. See axes_grid1-examples-index, axisartist-examples-index, What is axes_grid1 toolkit? and axisartist

7.3.4 Axis spine placement

Andrew Straw has added the ability to place “axis spines” – the lines that denote the data limits – in various arbitrary locations. No longer are your axis lines constrained to be a simple rectangle around the figure – you can turn on or off left, bottom, right and top, as well as “detach” the spine to offset it away from the data. See /gallery/ticks_and_spines/spine_placement_demo and matplotlib.spines.Spine.
Fig. 4: Whats New 99 Mplot3d

Fig. 5: Whats New 99 Axes Grid

Fig. 6: Whats New 99 Spines
7.4 New in matplotlib 1.0

Table of Contents

- New in matplotlib 1.0
  - HTML5/Canvas backend
  - Sophisticated subplot grid layout
  - Easy pythonic subplots
  - Contour fixes and and triplot
  - multiple calls to show supported
  - mplot3d graphs can be embedded in arbitrary axes
  - tick_params
  - Lots of performance and feature enhancements
  - Much improved software carpentry
  - Bugfix marathon

7.4.1 HTML5/Canvas backend

Simon Ratcliffe and Ludwig Schwardt have released an HTML5/Canvas backend for matplotlib. The backend is almost feature complete, and they have done a lot of work comparing their html5 rendered images with our core renderer Agg. The backend features client/server interactive navigation of matplotlib figures in an html5 compliant browser.

7.4.2 Sophisticated subplot grid layout

Jae-Joon Lee has written gridspec, a new module for doing complex subplot layouts, featuring row and column spans and more. See Customizing Figure Layouts Using GridSpec and Other Functions for a tutorial overview.

7.4.3 Easy pythonic subplots

Fernando Perez got tired of all the boilerplate code needed to create a figure and multiple subplots when using the matplotlib API, and wrote a subplots() helper function. Basic usage allows you to create the figure and an array of subplots with numpy indexing (starts with 0).

```python
fig, axarr = plt.subplots(2, 2)
axarr[0,0].plot([1,2,3])  # upper, left
```

See /gallery/subplots_axes_and_figures/subplot_demo for several code examples.
7.4.4 Contour fixes and and triplot

Ian Thomas has fixed a long-standing bug that has vexed our most talented developers for years. `contourf()` now handles interior masked regions, and the boundaries of line and filled contours coincide.

Additionally, he has contributed a new module `tri` and helper function `triplot()` for creating and plotting unstructured triangular grids.

Fig. 8: Triplot Demo

7.4.5 multiple calls to show supported

A long standing request is to support multiple calls to `show()`. This has been difficult because it is hard to get consistent behavior across operating systems, user interface toolkits and versions. Eric Firing has done a lot of work on rationalizing show across backends, with the desired behavior to make show raise all newly created figures and block execution until they are closed. Repeated calls to show should raise newly created figures since the last call. Eric has done a lot of testing on the user interface toolkits and versions and platforms he has
access to, but it is not possible to test them all, so please report problems to the mailing list and bug tracker.

7.4.6 mplot3d graphs can be embedded in arbitrary axes

You can now place an mplot3d graph into an arbitrary axes location, supporting mixing of 2D and 3D graphs in the same figure, and/or multiple 3D graphs in a single figure, using the “projection” keyword argument to add_axes or add_subplot. Thanks Ben Root.

Fig. 9: Whats New 1 Subplot3d

7.4.7 tick_params

Eric Firing wrote tick_params, a convenience method for changing the appearance of ticks and tick labels. See pyplot function `tick_params()` and associated Axes method `tick_params()`.

7.4.8 Lots of performance and feature enhancements

• Faster magnification of large images, and the ability to zoom in to a single pixel
• Local installs of documentation work better
• Improved “widgets” – mouse grabbing is supported
• More accurate snapping of lines to pixel boundaries
• More consistent handling of color, particularly the alpha channel, throughout the API

7.4.9 Much improved software carpentry

The matplotlib trunk is probably in as good a shape as it has ever been, thanks to improved software carpentry. We now have a buildbot which runs a suite of nose regression tests on every svn commit, auto-generating a set of images and comparing them against a set of
known-goods, sending emails to developers on failures with a pixel-by-pixel image comparison. Releases and release bugfixes happen in branches, allowing active new feature development to happen in the trunk while keeping the release branches stable. Thanks to Andrew Straw, Michael Droettboom and other matplotlib developers for the heavy lifting.

### 7.4.10 Bugfix marathon

Eric Firing went on a bug fixing and closing marathon, closing over 100 bugs on the [bug tracker](https://github.com/matplotlib/matplotlib) with help from Jae-Joon Lee, Michael Droettboom, Christoph Gohlke and Michiel de Hoon.

### 7.5 New in matplotlib 1.1

#### Table of Contents

- New in matplotlib 1.1
  - Sankey Diagrams
  - Animation
  - Tight Layout
  - PyQt4, PySide, and IPython
  - Legend
  - mplot3d
  - Numerix support removed
  - Markers
  - Other improvements

**Note:** matplotlib 1.1 supports Python 2.4 to 2.7

#### 7.5.1 Sankey Diagrams

Kevin Davies has extended Yannick Copin’s original Sankey example into a module (`sankey`) and provided new examples (`/gallery/specialty_plots/sankeyBasics`, `/gallery/specialty_plots/sankey_links`, `/gallery/specialty_plots/sankey_rankine`).

#### 7.5.2 Animation

Ryan May has written a backend-independent framework for creating animated figures. The `animation` module is intended to replace the backend-specific examples formerly in the...
Fig. 10: Sankey Rankine
Examples using the new framework are in animation-examples-index; see the entrancing double pendulum <gallery/animation/double_pendulum_sgskip.py> which uses `matplotlib.animation.Animation.save()` to create the movie below.

This should be considered as a beta release of the framework; please try it and provide feedback.

### 7.5.3 Tight Layout

A frequent issue raised by users of matplotlib is the lack of a layout engine to nicely space out elements of the plots. While matplotlib still adheres to the philosophy of giving users complete control over the placement of plot elements, Jae-Joon Lee created the `tight_layout` module and introduced a new command `tight_layout()` to address the most common layout issues.
The usage of this functionality can be as simple as

```python
plt.tight_layout()
```

and it will adjust the spacing between subplots so that the axis labels do not overlap with neighboring subplots. A *Tight Layout guide* has been created to show how to use this new tool.

### 7.5.4 PyQT4, PySide, and IPython

Gerald Storer made the Qt4 backend compatible with PySide as well as PyQT4. At present, however, PySide does not support the PyOS_InputHook mechanism for handling gui events while waiting for text input, so it cannot be used with the new version 0.11 of IPython. Until this feature appears in PySide, IPython users should use the PyQT4 wrapper for QT4, which remains the matplotlib default.

An rcParam entry, “backend.qt4”, has been added to allow users to select PyQt4, PyQt4v2, or PySide. The latter two use the Version 2 Qt API. In most cases, users can ignore this rcParam variable; it is available to aid in testing, and to provide control for users who are embedding matplotlib in a PyQt4 or PySide app.

### 7.5.5 Legend

Jae-Joon Lee has improved plot legends. First, legends for complex plots such as `stem()` plots will now display correctly. Second, the 'best' placement of a legend has been improved in the presence of NANs.

See the *Legend guide* for more detailed explanation and examples.

![Legend Demo4](image)

**Fig. 11: Legend Demo4**

### 7.5.6 mplot3d

In continuing the efforts to make 3D plotting in matplotlib just as easy as 2D plotting, Ben Root has made several improvements to the *mplot3d* module.
• *Axes3D* has been improved to bring the class towards feature-parity with regular Axes objects
• Documentation for *Getting started* was significantly expanded
• Axis labels and orientation improved
• Most 3D plotting functions now support empty inputs
• Ticker offset display added:

![Fig. 12: Offset](image)

• *contourf()* gains *zdir* and *offset* kwargs. You can now do this:

![Fig. 13: Contourf3d 2](image)

### 7.5.7 Numerix support removed

After more than two years of deprecation warnings, Numerix support has now been completely removed from matplotlib.
7.5.8 Markers

The list of available markers for `plot()` and `scatter()` has now been merged. While they were mostly similar, some markers existed for one function, but not the other. This merge did result in a conflict for the ‘d’ diamond marker. Now, ‘d’ will be interpreted to always mean “thin” diamond while ‘D’ will mean “regular” diamond.

Thanks to Michael Droettboom for this effort.

7.5.9 Other improvements

- Unit support for polar axes and `arrow()`
- `PolarAxes` gains getters and setters for “theta_direction”, and “theta_offset” to allow for theta to go in either the clock-wise or counter-clockwise direction and to specify where zero degrees should be placed. `set_theta_zero_location()` is an added convenience function.
- Fixed error in argument handling for tri-functions such as `tripcolor()`
- `axes.labelweight` parameter added to rcParams.
- For `imshow()`, `interpolation='nearest'` will now always perform an interpolation. A “none” option has been added to indicate no interpolation at all.
- An error in the Hammer projection has been fixed.
- `clabel` for `contour()` now accepts a callable. Thanks to Daniel Hyams for the original patch.
- Jae-Joon Lee added the `HBox` and `VBox` classes.
- Christoph Gohlke reduced memory usage in `imshow()`.
- `scatter()` now accepts empty inputs.
- The behavior for ‘symlog’ scale has been fixed, but this may result in some minor changes to existing plots. This work was refined by ssyr.
- Peter Butterworth added named figure support to `figure()`.
- Michiel de Hoon has modified the MacOSX backend to make its interactive behavior consistent with the other backends.
- Pim Schellart added a new colormap called “cubehelix”. Sameer Grover also added a colormap called “coolwarm”. See it and all other colormaps here.
- Many bug fixes and documentation improvements.

7.6 New in matplotlib 1.2

Table of Contents

- New in matplotlib 1.2
  - Python 3.x support
7.6.1 Python 3.x support

Matplotlib 1.2 is the first version to support Python 3.x, specifically Python 3.1 and 3.2. To make this happen in a reasonable way, we also had to drop support for Python versions earlier than 2.6.

This work was done by Michael Droettboom, the Cape Town Python Users’ Group, many others and supported financially in part by the SAGE project.

The following GUI backends work under Python 3.x: Gtk3Cairo, Qt4Agg, TkAgg and MacOSX. The other GUI backends do not yet have adequate bindings for Python 3.x, but continue to work on Python 2.6 and 2.7, particularly the Qt and QtAgg backends (which have been deprecated). The non-GUI backends, such as PDF, PS and SVG, work on both Python 2.x and 3.x.

Features that depend on the Python Imaging Library, such as JPEG handling, do not work, since the version of PIL for Python 3.x is not sufficiently mature.

7.6.2 PGF/TikZ backend

Peter Würtz wrote a backend that allows matplotlib to export figures as drawing commands for LaTeX. These can be processed by PdLaTeX, XeLaTeX or LuaLaTeX using the PGF/TikZ package. Usage examples and documentation are found in *Typesetting With XeLaTeX/LuaLaTeX*.
7.6.3 Locator interface

Philip Elson exposed the intelligence behind the tick Locator classes with a simple interface. For instance, to get no more than 5 sensible steps which span the values 10 and 19.5:

```python
>>> import matplotlib.ticker as mticker
>>> locator = mticker.MaxNLocator(nbins=5)
>>> print(locator.tick_values(10, 19.5))
```

7.6.4 Tri-Surface Plots

Damon McDougall added a new plotting method for the `mplot3d` toolkit called `plot_trisurf()`.
7.6.5 Control the lengths of colorbar extensions

Andrew Dawson added a new keyword argument `extendfrac` to `colorbar()` to control the length of minimum and maximum colorbar extensions.

7.6.6 Figures are picklable

Philip Elson added an experimental feature to make figures picklable for quick and easy short-term storage of plots. Pickle files are not designed for long term storage, are unsupported when restoring a pickle saved in another matplotlib version and are insecure when restoring a pickle from an untrusted source. Having said this, they are useful for short term storage for later modification inside matplotlib.

7.6.7 Set default bounding box in matplotlibrc

Two new defaults are available in the matplotlibrc configuration file: `savefig.bbox`, which can be set to 'standard' or 'tight', and `savefig.pad_inches`, which controls the bounding box padding.
7.6.8 New Boxplot Functionality

Users can now incorporate their own methods for computing the median and its confidence intervals into the `boxplot()` method. For every column of data passed to boxplot, the user can specify an accompanying median and confidence interval.

![Boxplot Demo3](image)

**Fig. 15: Boxplot Demo3**

7.6.9 New RC parameter functionality

Matthew Emmett added a function and a context manager to help manage RC parameters: `rc_file()` and `rc_context`. To load RC parameters from a file:

```python
>>> mpl.rc_file('mpl.rc')
```

To temporarily use RC parameters:

```python
>>> with mpl.rc_context(fname='mpl.rc', rc={'text.usetex': True}):
>>>     ...
```

7.6.10 Streamplot

Tom Flannaghan and Tony Yu have added a new `streamplot()` function to plot the streamlines of a vector field. This has been a long-requested feature and complements the existing `quiver()` function for plotting vector fields. In addition to simply plotting the streamlines of the vector field, `streamplot()` allows users to map the colors and/or line widths of the streamlines to a separate parameter, such as the speed or local intensity of the vector field.
Fig. 16: Plot Streamplot
7.6.11 New hist functionality

Nic Eggert added a new `stacked` kwarg to `hist()` that allows creation of stacked histograms using any of the histogram types. Previously, this functionality was only available by using the `barstacked` histogram type. Now, when `stacked=True` is passed to the function, any of the histogram types can be stacked. The `barstacked` histogram type retains its previous functionality for backwards compatibility.

7.6.12 Updated shipped dependencies

The following dependencies that ship with matplotlib and are optionally installed alongside it have been updated:

- `pytz` 2012d
- `dateutil` 1.5 on Python 2.x, and 2.1 on Python 3.x

7.6.13 Face-centred colors in tripcolor plots

Ian Thomas extended `tripcolor()` to allow one color value to be specified for each triangular face rather than for each point in a triangulation.

![Fig. 17: Tripcolor Demo](image)

7.6.14 Hatching patterns in filled contour plots, with legends

Phil Elson added support for hatching to `contourf()`, together with the ability to use a legend to identify contoured ranges.

7.6.15 Known issues in the matplotlib 1.2 release

- When using the Qt4Agg backend with IPython 0.11 or later, the save dialog will not display. This should be fixed in a future version of IPython.
7.7 New in matplotlib 1.2.2

Table of Contents

- New in matplotlib 1.2.2
  - Improved collections
  - Multiple images on same axes are correctly transparent

7.7.1 Improved collections

The individual items of a collection may now have different alpha values and be rendered correctly. This also fixes a bug where collections were always filled in the PDF backend.

7.7.2 Multiple images on same axes are correctly transparent

When putting multiple images onto the same axes, the background color of the axes will now show through correctly.

7.8 New in matplotlib 1.3

Table of Contents

- New in matplotlib 1.3
  - New in 1.3.1
  - New plotting features
Note: matplotlib 1.3 supports Python 2.6, 2.7, 3.2, and 3.3

7.8.1 New in 1.3.1

1.3.1 is a bugfix release, primarily dealing with improved setup and handling of dependencies, and correcting and enhancing the documentation.

The following changes were made in 1.3.1 since 1.3.0.

Enhancements

- Added a context manager for creating multi-page pdfs (see matplotlib.backends.backend_pdf.PdfPages).
- The WebAgg backend should now have lower latency over heterogeneous Internet connections.

Bug fixes

- Histogram plots now contain the endline.
- Fixes to the Molleweide projection.
- Handling recent fonts from Microsoft and Macintosh-style fonts with non-ascii metadata is improved.
- Hatching of fill between plots now works correctly in the PDF backend.
- Tight bounding box support now works in the PGF backend.
- Transparent figures now display correctly in the Qt4Agg backend.
- Drawing lines from one subplot to another now works.
- Unit handling on masked arrays has been improved.

Setup and dependencies

- Now works with any version of pyparsing 1.5.6 or later, without displaying hundreds of warnings.
• Now works with 64-bit versions of Ghostscript on MS-Windows.
• When installing from source into an environment without Numpy, Numpy will first be downloaded and built and then used to build matplotlib.
• Externally installed backends are now always imported using a fully-qualified path to the module.
• Works with newer version of wxPython.
• Can now build with a PyCXX installed globally on the system from source.
• Better detection of Gtk3 dependencies.

Testing

• Tests should now work in non-English locales.
• PEP8 conformance tests now report on locations of issues.

7.8.2 New plotting features

xkcd-style sketch plotting

To give your plots a sense of authority that they may be missing, Michael Droettboom (inspired by the work of many others in PR #1329) has added an xkcd-style sketch plotting mode. To use it, simply call `matplotlib.pyplot.xkcd()` before creating your plot. For really fine control, it is also possible to modify each artist’s sketch parameters individually with `matplotlib.artist.Artist.set_sketch_params()`.

![xkcd](image)

Fig. 19: xkcd

7.8.3 Updated Axes3D.contour methods

Damon McDougall updated the `tricontour()` and `tricontourf()` methods to allow 3D contour plots on arbitrary unstructured user-specified triangulations.
Fig. 20: Tricontour3d

**New eventplot plot type**

Todd Jennings added a `eventplot()` function to create multiple rows or columns of identical line segments.

As part of this feature, there is a new `EventCollection` class that allows for plotting and manipulating rows or columns of identical line segments.

**Triangular grid interpolation**

Geoffroy Billotey and Ian Thomas added classes to perform interpolation within triangular grids: (`LinearTriInterpolator` and `CubicTriInterpolator`) and a utility class to find the triangles in which points lie (`TrapezoidMapTriFinder`). A helper class to perform mesh refinement and smooth contouring was also added (`UniformTriRefiner`). Finally, a class implementing some basic tools for triangular mesh improvement was added (`TriAnalyzer`).
Baselines for stackplot

Till Stensitzki added non-zero baselines to `stackplot()`. They may be symmetric or weighted.

Rectangular colorbar extensions

Andrew Dawson added a new keyword argument `extendrect` to `colorbar()` to optionally make colorbar extensions rectangular instead of triangular.

More robust boxplots

Paul Hobson provided a fix to the `boxplot()` method that prevent whiskers from being drawn inside the box for oddly distributed data sets.

Fig. 22: Tricontour Smooth User

Fig. 23: Stackplot Demo2
Calling subplot() without arguments

A call to subplot() without any arguments now acts the same as subplot(111) or subplot(1,1,1) – it creates one axes for the whole figure. This was already the behavior for both axes() and subplots(), and now this consistency is shared with subplot().

7.8.4 Drawing

Independent alpha values for face and edge colors

Wes Campagne modified how Patch objects are drawn such that (for backends supporting transparency) you can set different alpha values for faces and edges, by specifying their colors in RGBA format. Note that if you set the alpha attribute for the patch object (e.g. using set_alpha() or the alpha keyword argument), that value will override the alpha components set in both the face and edge colors.

Path effects on lines

Thanks to Jae-Joon Lee, path effects now also work on plot lines.

Easier creation of colormap and normalizer for levels with colors

Phil Elson added the matplotlib.colors.from_levels_and_colors() function to easily create a colormap and normalizer for representation of discrete colors for plot types such as matplotlib.pyplot.pcolormesh(), with a similar interface to that of contourf().

Full control of the background color

Wes Campagne and Phil Elson fixed the Agg backend such that PNGs are now saved with the correct background color when fig.patch.get_alpha() is not 1.

Improved bbox_inches="tight" functionality

Passing bbox_inches="tight" through to plt.save() now takes into account all artists on a figure - this was previously not the case and led to several corner cases which did not function as expected.
Initialize a rotated rectangle

Damon McDougall extended the Rectangle constructor to accept an angle kwarg, specifying the rotation of a rectangle in degrees.

7.8.5 Text

Anchored text support

The svg and pgf backends are now able to save text alignment information to their output formats. This allows to edit text elements in saved figures, using Inkscape for example, while preserving their intended position. For svg please note that you’ll have to disable the default text-to-path conversion (mpl.rc('svg', fonttype='none')).

Better vertical text alignment and multi-line text

The vertical alignment of text is now consistent across backends. You may see small differences in text placement, particularly with rotated text.

If you are using a custom backend, note that the draw_text renderer method is now passed the location of the baseline, not the location of the bottom of the text bounding box.

Multi-line text will now leave enough room for the height of very tall or very low text, such as superscripts and subscripts.

Left and right side axes titles

Andrew Dawson added the ability to add axes titles flush with the left and right sides of the top of the axes using a new keyword argument loc to title().

Improved manual contour plot label positioning

Brian Mattern modified the manual contour plot label positioning code to interpolate along line segments and find the actual closest point on a contour to the requested position. Previously, the closest path vertex was used, which, in the case of straight contours was sometimes quite distant from the requested location. Much more precise label positioning is now possible.

7.8.6 Configuration (rcParams)

Quickly find rcParams

Phil Elson made it easier to search for rcParameters by passing a valid regular expression to matplotlib.RcParams.find_all(). matplotlib.RcParams now also has a pretty repr and str representation so that search results are printed prettily:
axes.xmargin and axes.ymargin added to rcParams

rcParam values (axes.xmargin and axes.ymargin) were added to configure the default margins used. Previously they were hard-coded to default to 0, default value of both rcParam values is 0.

Changes to font rcParams

The font.* rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.

savefig.jpeg_quality added to rcParams

rcParam value savefig.jpeg_quality was added so that the user can configure the default quality used when a figure is written as a JPEG. The default quality is 95; previously, the default quality was 75. This change minimizes the artifacting inherent in JPEG images, particularly with images that have sharp changes in color as plots often do.

7.8.7 Backends

WebAgg backend

Michael Droettboom, Phil Elson and others have developed a new backend, WebAgg, to display figures in a web browser. It works with animations as well as being fully interactive.
Future versions of matplotlib will integrate this backend with the IPython notebook for a fully web browser based plotting frontend.

**Remember save directory**

Martin Spacek made the save figure dialog remember the last directory saved to. The default is configurable with the new `savefig.directory` rcParam in `matplotlibrc`.

### 7.8.8 Documentation and examples

**Numpydoc docstrings**

Nelle Varoquaux has started an ongoing project to convert matplotlib’s docstrings to numpydoc format. See MEP10 for more information.

**Example reorganization**

Tony Yu has begun work reorganizing the examples into more meaningful categories. The new gallery page is the fruit of this ongoing work. See MEP12 for more information.
Examples now use subplots()

For the sake of brevity and clarity, most of the examples now use the newer `subplots()`, which creates a figure and one (or multiple) axes object(s) in one call. The old way involved a call to `figure()`, followed by one (or multiple) `subplot()` calls.

7.8.9 Infrastructure

Housecleaning

A number of features that were deprecated in 1.2 or earlier, or have not been in a working state for a long time have been removed. Highlights include removing the Qt version 3 backends, and the FltkAgg and Emf backends. See *Changes in 1.3.x* for a complete list.

New setup script

matplotlib 1.3 includes an entirely rewritten setup script. We now ship fewer dependencies with the tarballs and installers themselves. Notably, `pytz`, `dateutil`, `pyparsing` and `six` are no longer included with matplotlib. You can either install them manually first, or let `pip` install them as dependencies along with matplotlib. It is now possible to not include certain subcomponents, such as the unit test data, in the install. See `setup.cfg.template` for more information.

XDG base directory support

On Linux, matplotlib now uses the XDG base directory specification to find the `matplotlibrc` configuration file. `matplotlibrc` should now be kept in `config/matplotlib`, rather than `matplotlib`. If your configuration is found in the old location, it will still be used, but a warning will be displayed.

Catch opening too many figures using pyplot

Figures created through `pyplot.figure` are retained until they are explicitly closed. It is therefore common for new users of matplotlib to run out of memory when creating a large series of figures in a loop without closing them.

matplotlib will now display a `RuntimeWarning` when too many figures have been opened at once. By default, this is displayed for 20 or more figures, but the exact number may be controlled using the `figure.max_open_warning` rcParam.

7.9 New in matplotlib 1.4

Thomas A. Caswell served as the release manager for the 1.4 release.
• **New in matplotlib 1.4**
  - New colormap
  - The nbagg backend
  - New plotting features
  - Date handling
  - Configuration (rcParams)
  - style package added
  - Backends
  - Text
  - Sphinx extensions
  - Legend and PathEffects documentation
  - Widgets
  - GAE integration

**Note:** matplotlib 1.4 supports Python 2.6, 2.7, 3.3, and 3.4

### 7.9.1 New colormap

In heatmaps, a green-to-red spectrum is often used to indicate intensity of activity, but this can be problematic for the red/green colorblind. A new, colorblind-friendly colormap is now available at `matplotlib.cm.Wistia`. This colormap maintains the red/green symbolism while achieving deuteranopic legibility through brightness variations. See [here](#) for more information.

### 7.9.2 The nbagg backend

Phil Elson added a new backend, named “nbagg”, which enables interactive figures in a live IPython notebook session. The backend makes use of the infrastructure developed for the webagg backend, which itself gives standalone server backed interactive figures in the browser, however nbagg does not require a dedicated matplotlib server as all communications are handled through the IPython Comm machinery.

As with other backends nbagg can be enabled inside the IPython notebook with:

```python
import matplotlib
matplotlib.use('nbagg')
```

Once figures are created and then subsequently shown, they will placed in an interactive widget inside the notebook allowing panning and zooming in the same way as any other matplotlib backend. Because figures require a connection to the IPython notebook server for their interactivity, once the notebook is saved, each figure will be rendered as a static image - thus allowing non-interactive viewing of figures on services such as nbviewer.
7.9.3 New plotting features

Power-law normalization

Ben Gamari added a power-law normalization method, `PowerNorm`. This class maps a range of values to the interval $[0,1]$ with power-law scaling with the exponent provided by the constructor’s `gamma` argument. Power law normalization can be useful for, e.g., emphasizing small populations in a histogram.

Fully customizable boxplots

Paul Hobson overhauled the `boxplot()` method such that it is now completely customizable in terms of the styles and positions of the individual artists. Under the hood, `boxplot()` relies on a new function (`boxplot_stats()`), which accepts any data structure currently compatible with `boxplot()`, and returns a list of dictionaries containing the positions for each element of the boxplots. Then a second method, `bxp()` is called to draw the boxplots based on the stats.

The `boxplot()` function can be used as before to generate boxplots from data in one step. But now the user has the flexibility to generate the statistics independently, or to modify the output of `boxplot_stats()` prior to plotting with `bxp()`.

Lastly, each artist (e.g., the box, outliers, cap, notches) can now be toggled on or off and their styles can be passed in through individual kwargs. See the examples: /gallery/statistics/boxplot and /gallery/statistics/bxp

Added a bool kwarg, `manage_xticks`, which if False disables the management of the ticks and limits on the x-axis by `bxp()`.

Support for datetime axes in 2d plots

Andrew Dawson added support for datetime axes to `contour()`, `contourf()`, `pcolormesh()` and `pcolor()`.

Support for additional spectrum types

Todd Jennings added support for new types of frequency spectrum plots: `magnitude_spectrum()`, `phase_spectrum()`, and `angle_spectrum()`, as well as corresponding functions in `mlab`.

He also added these spectrum types to `specgram()`, as well as adding support for linear scaling there (in addition to the existing dB scaling). Support for additional spectrum types was also added to `specgram()`.

He also increased the performance for all of these functions and plot types.

Support for detrending and windowing 2D arrays in `mlab`

Todd Jennings added support for 2D arrays in the `detrend_mean()`, `detrend_none()`, and `detrend()`, as well as adding `apply_window()` which support windowing 2D arrays.
Support for strides in mlab

Todd Jennings added some functions to mlab to make it easier to use numpy strides to create memory-efficient 2D arrays. This includes `stride_repeat()`, which repeats an array to create a 2D array, and `stride_windows()`, which uses a moving window to create a 2D array from a 1D array.

Formatter for new-style formatting strings

Added `FormatStrFormatterNewStyle` which does the same job as `FormatStrFormatter`, but accepts new-style formatting strings instead of printf-style formatting strings.

Consistent grid sizes in streamplots

`streamplot()` uses a base grid size of 30x30 for both `density=1` and `density=(1, 1)`. Previously, a grid size of 30x30 was used for `density=1`, but a grid size of 25x25 was used for `density=(1, 1)`.

Get a list of all tick labels (major and minor)

Added the kwarg ‘which’ to `get_xticklabels()`, `get_yticklabels()` and `get_ticklabels()`. ‘which’ can be ‘major’, ‘minor’, or ‘both’ select which ticks to return, like `set_ticks_position()`. If ‘which’ is `None` then the old behaviour (controlled by the bool minor).

Separate horizontal/vertical axes padding support in ImageGrid

The kwarg ‘axes_pad’ to `mpl_toolkits.axes_grid1.ImageGrid` can now be a tuple if separate horizontal/vertical padding is needed. This is supposed to be very helpful when you have a labelled legend next to every subplot and you need to make some space for legend’s labels.

Support for skewed transformations

The `Affine2D` gained additional methods `skew` and `skew_deg` to create skewed transformations. Additionally, matplotlib internals were cleaned up to support using such transforms in `Axes`. This transform is important for some plot types, specifically the Skew-T used in meteorology.

Support for specifying properties of wedge and text in pie charts.

Added the kwarg `wedgeprops` and `textprops` to `pie()` to accept properties for wedge and text objects in a pie. For example, one can specify `wedgeprops = {'linewidth':3}` to specify the width of the borders of the wedges in the pie. For more properties that the user can specify, look at the docs for the wedge and text objects.

Fixed the direction of errorbar upper/lower limits

Larry Bradley fixed the `errorbar()` method such that the upper and lower limits (lolims, uplims, xlolims, xuplims) now point in the correct direction.
More consistent add-object API for Axes

Added the Axes method `add_image` to put image handling on a par with artists, collections, containers, lines, patches, and tables.

Violin Plots

Per Parker, Gregory Kelsie, Adam Ortiz, Kevin Chan, Geoffrey Lee, Deokjae Donald Seo, and Taesu Terry Lim added a basic implementation for violin plots. Violin plots can be used to represent the distribution of sample data. They are similar to box plots, but use a kernel density estimation function to present a smooth approximation of the data sample used. The added features are:

- `violin()` - Renders a violin plot from a collection of statistics. `violin_stats()` - Produces a collection of statistics suitable for rendering a violin plot. `violinplot()` - Creates a violin plot from a set of sample data. This method makes use of `violin_stats()` to process the input data, and `violin_stats()` to do the actual rendering. Users are also free to modify or replace the output of `violin_stats()` in order to customize the violin plots to their liking.

This feature was implemented for a software engineering course at the University of Toronto, Scarborough, run in Winter 2014 by Anya Tafliovich.

More `markevery` options to show only a subset of markers

Rohan Walker extended the `markevery` property in `Line2D`. You can now specify a subset of markers to show with an int, slice object, numpy fancy indexing, or float. Using a float shows markers at approximately equal display-coordinate-distances along the line.
Added size related functions to specialized Collections

Added the `get_size` and `set_size` functions to control the size of elements of specialized collections (`AsteriskPolygonCollection BrokenBarHCollection CircleCollection PathCollection PolyCollection RegularPolyCollection StarPolygonCollection`).

Fixed the mouse coordinates giving the wrong theta value in Polar graph

Added code to `transform_non_affine()` to ensure that the calculated theta value was between the range of 0 and 2 * pi since the problem was that the value can become negative after applying the direction and rotation to the theta calculation.

Simple quiver plot for mplot3d toolkit

A team of students in an Engineering Large Software Systems course, taught by Prof. Anya Tafliovich at the University of Toronto, implemented a simple version of a quiver plot in 3D space for the mplot3d toolkit as one of their term project. This feature is documented in `quiver()`. The team members are: Ryan Steve D’Souza, Victor B, xbtsw, Yang Wang, David, Caradec Bisesar and Vlad Vassilovski.

![Fig. 26: Quiver3d](image)

polar-plot r-tick locations

Added the ability to control the angular position of the r-tick labels on a polar plot via `set_rlabel_position()`.

7.9.4 Date handling

n-d array support for date conversion

Andrew Dawson added support for n-d array handling to `matplotlib.dates.num2date()`, `matplotlib.dates.date2num()` and `matplotlib.dates.datestr2num()`. Support is also added to the unit conversion interfaces `matplotlib.dates.DateConverter` and `matplotlib.units.Registry`.  

7.9. New in matplotlib 1.4
7.9.5 Configuration (rcParams)

savefig.transparent added

Controls whether figures are saved with a transparent background by default. Previously
savefig always defaulted to a non-transparent background.

axes.titleweight

Added rcParam to control the weight of the title

axes.formatter.useoffset added

Controls the default value of useOffset in ScalarFormatter. If True and the data range is much
smaller than the data average, then an offset will be determined such that the tick labels are
meaningful. If False then the full number will be formatted in all conditions.

nbagg.transparent added

Controls whether nbagg figures have a transparent background. nbagg.transparent is True by
default.

XDG compliance

Matplotlib now looks for configuration files (both rcparams and style) in XDG compliant loca-
tions.

7.9.6 style package added

You can now easily switch between different styles using the new style package:

```
>>> from matplotlib import style
>>> style.use('dark_background')
```

Subsequent plots will use updated colors, sizes, etc. To list all available styles, use:

```
>>> print style.available
```

You can add your own custom <style name>.mplstyle files to ~/.matplotlib/stylelib or call use
with a URL pointing to a file with matplotlibrc settings.

Note that this is an experimental feature, and the interface may change as users test out this
new feature.
7.9.7 Backends

Qt5 backend

Martin Fitzpatrick and Tom Badran implemented a Qt5 backend. The differences in namespaces locations between Qt4 and Qt5 was dealt with by shimming Qt4 to look like Qt5, thus the Qt5 implementation is the primary implementation. Backwards compatibility for Qt4 is maintained by wrapping the Qt5 implementation.

The Qt5Agg backend currently does not work with IPython’s %matplotlib magic.

The 1.4.0 release has a known bug where the toolbar is broken. This can be fixed by:

```
cd path/to/installed/matplotlib
wget https://github.com/matplotlib/matplotlib/pull/3322.diff
# unix2dos 3322.diff (if on windows to fix line endings)
patch -p2 < 3322.diff
```

Qt4 backend

Rudolf Höfler changed the appearance of the subplottool. All sliders are vertically arranged now, buttons for tight layout and reset were added. Furthermore, the subplottool is now implemented as a modal dialog. It was previously a QMainWindow, leaving the SPT open if one closed the plot window.

In the figure options dialog one can now choose to (re-)generate a simple automatic legend. Any explicitly set legend entries will be lost, but changes to the curves’ label, linestyle, et cetera will now be updated in the legend.

Interactive performance of the Qt4 backend has been dramatically improved under windows.

The mapping of key-signals from Qt to values matplotlib understands was greatly improved (For both Qt4 and Qt5).

Cairo backends

The Cairo backends are now able to use the cairocffi bindings which are more actively maintained than the pycairo bindings.

Gtk3Agg backend

The Gtk3Agg backend now works on Python 3.x, if the cairocffi bindings are installed.

PDF backend

Added context manager for saving to multi-page PDFs.
7.9.8 Text

Text URLs supported by SVG backend

The `svg` backend will now render `Text` objects' url as a link in output SVGs. This allows one to make clickable text in saved figures using the `url` kwarg of the `Text` class.

Anchored sizebar font

Added the `fontproperties` kwarg to `AnchoredSizeBar` to control the font properties.

7.9.9 Sphinx extensions

The `:context:` directive in the `plot_directive` Sphinx extension can now accept an optional `reset` setting, which will cause the context to be reset. This allows more than one distinct context to be present in documentation. To enable this option, use `:context: reset` instead of `:context:` any time you want to reset the context.

7.9.10 Legend and PathEffects documentation

The `Legend guide` and `Path effects guide` have both been updated to better reflect the full potential of each of these powerful features.

7.9.11 Widgets

Span Selector

Added an option `span_stays` to the `SpanSelector` which makes the selector rectangle stay on the axes after you release the mouse.

7.9.12 GAE integration

Matplotlib will now run on google app engine.

7.10 New in matplotlib 1.5

<table>
<thead>
<tr>
<th>Table of Contents</th>

<tbody>
<tr>
<td>- New in matplotlib 1.5</td>
</tr>
<tr>
<td>- Interactive OO usage</td>
</tr>
<tr>
<td>- Working with labeled data like pandas DataFrames</td>
</tr>
<tr>
<td>- Added <code>axes.prop_cycle</code> key to rcParams</td>
</tr>
</tbody>
</table>
- New Colormaps
- Styles
- Backends
- Configuration (rcParams)
- Widgets
- New plotting features
- ToolManager
- cbook.is_sequence_of_strings recognizes string objects
- New close-figs argument for plot directive
- Support for URL string arguments to imread
- Display hook for animations in the IPython notebook
- Prefixed pkg-config for building

**Note:** matplotlib 1.5 supports Python 2.7, 3.4, and 3.5

### 7.10.1 Interactive OO usage

All Artists now keep track of if their internal state has been changed but not reflected in the display ('stale') by a call to draw. It is thus possible to pragmatically determine if a given Figure needs to be re-drawn in an interactive session.

To facilitate interactive usage a draw_all method has been added to pyplot which will redraw all of the figures which are 'stale'.

To make this convenient for interactive use matplotlib now registers a function either with IPython’s `post_execute` event or with the displayhook in the standard python REPL to automatically call `plt.draw_all` just before control is returned to the REPL. This ensures that the draw command is deferred and only called once.

The upshot of this is that for interactive backends (including `%matplotlib notebook`) in interactive mode (with `plt.ion()`)

```python
import matplotlib.pyplot as plt
def ax = plt.subplots()
ln, = ax.plot([0, 1, 4, 9, 16])
plt.show()
ln.set_color('g')
```

will automatically update the plot to be green. Any subsequent modifications to the Artist objects will do likewise.

This is the first step of a larger consolidation and simplification of the pyplot internals.
7.10.2 Working with labeled data like pandas DataFrames

Plot methods which take arrays as inputs can now also work with labeled data and unpack such data.

This means that the following two examples produce the same plot:

Example

```python
df = pandas.DataFrame({'var1':[1,2,3,4,5,6], 'var2':[1,2,3,4,5,6]})
plt.plot(df['var1'], df['var2'])
```

Example

```python
plt.plot('var1', 'var2', data=df)
```

This works for most plotting methods, which expect arrays/sequences as inputs. data can be anything which supports __getitem__ (dict, pandas.DataFrame, h5py, ...) to access array like values with string keys.

In addition to this, some other changes were made, which makes working with labeled data (ex pandas.Series) easier:

- For plotting methods with label keyword argument, one of the data inputs is designated as the label source. If the user does not supply a label that value object will be introspected for a label, currently by looking for a name attribute. If the value object does not have a name attribute but was specified by as a key into the data kwargs, then the key is used. In the above examples, this results in an implicit label="var2" for both cases.

- plot() now uses the index of a Series instead of np.arange(len(y)), if no x argument is supplied.

7.10.3 Added axes.prop_cycle key to rcParams

This is a more generic form of the now-deprecated axes.color_cycle param. Now, we can cycle more than just colors, but also linestyles, hatches, and just about any other artist property. Cycler notation is used for defining property cycles. Adding cyclers together will be like you are zip()-ing together two or more property cycles together:

```python
axes.prop_cycle: cycler('color', 'rgb') + cycler('lw', [1, 2, 3])
```

You can even multiply cyclers, which is like using itertools.product() on two or more property cycles. Remember to use parentheses if writing a multi-line prop_cycle parameter.

7.10.4 New Colormaps

All four of the colormaps proposed as the new default are available as 'viridis' (the new default in 2.0), 'magma', 'plasma', and 'inferno'

7.10.5 Styles

Several new styles have been added, including many styles from the Seaborn project. Additionally, in order to prep for the upcoming 2.0 style-change release, a 'classic' and 'default'
Fig. 27: Color Cycle

viridis

magma

plasma

inferno
style has been added. For this release, the ‘default’ and ‘classic’ styles are identical. By using them now in your scripts, you can help ensure a smooth transition during future upgrades of matplotlib, so that you can upgrade to the snazzy new defaults when you are ready!

```python
import matplotlib.style
matplotlib.style.use('classic')
```

The ‘default’ style will give you matplotlib’s latest plotting styles:

```python
matplotlib.style.use('default')
```

### 7.10.6 Backends

#### New backend selection

The environment variable `MPLBACKEND` can now be used to set the matplotlib backend.

**wx backend has been updated**

The wx backend can now be used with both wxPython classic and Phoenix.

wxPython classic has to be at least version 2.8.12 and works on Python 2.x. As of May 2015 no official release of wxPython Phoenix is available but a current snapshot will work on Python 2.7+ and 3.4+.

If you have multiple versions of wxPython installed, then the user code is responsible setting the wxPython version. How to do this is explained in the comment at the beginning of the example `examples/user_interfaces/embedding_in_wx2.py`.

#### 7.10.7 Configuration (rcParams)

Some parameters have been added, others have been improved.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>{x, y}axis.labelpad</td>
<td>mplot3d now respects these parameters</td>
</tr>
<tr>
<td>axes.labelpad</td>
<td>Default space between the axis and the label</td>
</tr>
<tr>
<td>errorbar.capsize</td>
<td>Default length of end caps on error bars</td>
</tr>
<tr>
<td>{x, y}tick.minor.visible</td>
<td>Default visibility of minor x/y ticks</td>
</tr>
<tr>
<td>legend.framealpha</td>
<td>Default transparency of the legend frame box</td>
</tr>
<tr>
<td>legend.facecolor</td>
<td>Default facecolor of legend frame box (or 'inherit' from axes.facecolor)</td>
</tr>
<tr>
<td>legend.edgecolor</td>
<td>Default edgcolor of legend frame box (or 'inherit' from axes.edgecolor)</td>
</tr>
<tr>
<td>figure.titlesize</td>
<td>Default font size for figure suptitles</td>
</tr>
<tr>
<td>figure.titleweight</td>
<td>Default font weight for figure suptitles</td>
</tr>
<tr>
<td>image.composite_image</td>
<td>Whether a vector graphics backend should composite several images into a single image or not when saving. Useful when needing to edit the files further in Inkscape or other programs.</td>
</tr>
<tr>
<td>markers.fillstyle</td>
<td>Default fillstyle of markers. Possible values are 'full' (the default), 'left', 'right', 'bottom', 'top' and 'none'</td>
</tr>
<tr>
<td>toolbar</td>
<td>Added 'toolmanager' as a valid value, enabling the experimental ToolManager feature.</td>
</tr>
</tbody>
</table>

### 7.10.8 Widgets

**Active state of Selectors**

All selectors now implement set_active and get_active methods (also called when accessing the active property) to properly update and query whether they are active.

**Moved ignore, set_active, and get_active methods to base class Widget**

Pushes up duplicate methods in child class to parent class to avoid duplication of code.

**Adds enable/disable feature to MultiCursor**

A MultiCursor object can be disabled (and enabled) after it has been created without destroying the object. Example:

```python
multi_cursor.active = False
```
Improved RectangleSelector and new EllipseSelector Widget

Adds an interactive keyword which enables visible handles for manipulating the shape after it has been drawn.

Adds keyboard modifiers for:

- Moving the existing shape (default key = 'space')
- Making the shape square (default 'shift')
- Make the initial point the center of the shape (default 'control')
- Square and center can be combined

Allow Artists to Display Pixel Data in Cursor

Adds `get_pixel_data` and `format_pixel_data` methods to artists which can be used to add zdata to the cursor display in the status bar. Also adds an implementation for Images.

7.10.9 New plotting features

Auto-wrapping Text

Added the keyword argument "wrap" to Text, which automatically breaks long lines of text when being drawn. Works for any rotated text, different modes of alignment, and for text that are either labels or titles. This breaks at the Figure, not Axes edge.

Contour plot corner masking

Ian Thomas rewrote the C++ code that calculates contours to add support for corner masking. This is controlled by a new keyword argument `corner_mask` in the functions `contour()` and `contourf()`. The previous behaviour, which is now obtained using `corner_mask=False`, was for a single masked point to completely mask out all four quads touching that point. The new behaviour, obtained using `corner_mask=True`, only masks the corners of those quads touching the point; any triangular corners comprising three unmasked points are contoured as usual. If the `corner_mask` keyword argument is not specified, the default value is taken from rcParams.

Mostly unified linestyles for Line2D, Patch and Collection

The handling of linestyles for Lines, Patches and Collections has been unified. Now they all support defining linestyles with short symbols, like "--", as well as with full names, like "dashed". Also the definition using a dash pattern ((0., [3., 3.])) is supported for all methods using Line2D, Patch or Collection.

Legend marker order

Added ability to place the label before the marker in a legend box with `markerfirst` keyword
This is a really long string that should be wrapped so that it does not go outside the figure.

Fig. 28: Contour Corner Mask
Support for legend for PolyCollection and stackplot

Added a legend_handler for PolyCollection as well as a labels argument to stackplot().

Support for alternate pivots in mplot3d quiver plot

Added a pivot kwarg to quiver() that controls the pivot point around which the quiver line rotates. This also determines the placement of the arrow head along the quiver line.

Logit Scale

Added support for the ‘logit’ axis scale, a nonlinear transformation

\[ x - > \log_{10}(x/(1-x)) \]

for data between 0 and 1 excluded.

Add step kwargs to fill_between

Added step kwarg to Axes.fill_between to allow to fill between lines drawn using the ‘step’ draw style. The values of step match those of the where kwarg of Axes.step. The asymmetry of the kwarg names is not ideal, but Axes.fill_between already has a where kwarg. This is particularly useful for plotting pre-binned histograms.

![Filled Step Square Plot](image)

**Fig. 29: Filled Step**

Square Plot

Implemented square plots feature as a new parameter in the axis function. When argument ‘square’ is specified, equal scaling is set, and the limits are set such that xmax-xmin == ymax-ymin.
Updated figimage to take optional resize parameter

Added the ability to plot simple 2D-Array using `plt.figimage(X, resize=True)`. This is useful for plotting simple 2D-Array without the Axes or whitespacing around the image.

Updated Figure.savefig() can now use figure’s dpi

Added support to save the figure with the same dpi as the figure on the screen using `dpi='figure'`.
Example:
```
f = plt.figure(dpi=25)       # dpi set to 25
S = plt.scatter([1,2,3],[4,5,6])
f.savefig('output.png', dpi='figure')  # output savefig dpi set to 25 (same as figure)
```

Updated Table to control edge visibility

Added the ability to toggle the visibility of lines in Tables. Functionality added to the `pyplot.table()` factory function under the keyword argument “edges”. Values can be the strings “open”, “closed”, “horizontal”, “vertical” or combinations of the letters “L”, “R”, “T”, “B” which represent left, right, top, and bottom respectively.
Example:
Zero r/cstride support in plot_wireframe

Adam Hughes added support to mplot3d’s plot_wireframe to draw only row or column line plots.

| table(..., edges="open") # No line visible |
| table(..., edges="closed") # All lines visible |
| table(..., edges="horizontal") # Only top and bottom lines visible |
| table(..., edges="LT") # Only left and top lines visible |

Plot bar and barh with labels

Added kwarg "tick_label" to bar and barh to support plotting bar graphs with a text label for each bar.

Added center and frame kwargs to pie

These control where the center of the pie graph are and if the Axes frame is shown.
Fixed 3D filled contour plot polygon rendering

Certain cases of 3D filled contour plots that produce polygons with multiple holes produced improper rendering due to a loss of path information between `PolyCollection` and `Poly3DCollection`. A function `set_verts_and_codes()` was added to allow path information to be retained for proper rendering.

Dense colorbars are rasterized

Vector file formats (pdf, ps, svg) are efficient for many types of plot element, but for some they can yield excessive file size and even rendering artifacts, depending on the renderer used for screen display. This is a problem for colorbars that show a large number of shades, as is most commonly the case. Now, if a colorbar is showing 50 or more colors, it will be rasterized in vector backends.

DateFormatter strftime

`strftime` method will format a `datetime.datetime` object with the format string passed to the formatter’s constructor. This method accepts datetimes with years before 1900, unlike `datetime.datetime.strftime()`.
Artist-level {get,set}_usetex for text

Add {get,set}_usetex methods to Text objects which allow artist-level control of LaTeX rendering vs the internal mathtex rendering.

ax.remove() works as expected

As with artists added to an Axes, Axes objects can be removed from their figure via remove().

API Consistency fix within Locators set_params() function

set_params() function, which sets parameters within a Locator type instance, is now available to all Locator types. The implementation also prevents unsafe usage by strictly defining the parameters that a user can set.

To use, call set_params() on a Locator instance with desired arguments:

```python
loc = matplotlib.ticker.LogLocator()
# Set given attributes for loc.
loc.set_params(numticks=8, numdecs=8, subs=[2.0], base=8)
# The below will error, as there is no such parameter for LogLocator
# named foo
# loc.set_params(foo='bar')
```

Date Locators

Date Locators (derived from DateLocator) now implement the tick_values() method. This is expected of all Locators derived from Locator.

The Date Locators can now be used easily without creating axes

```python
from datetime import datetime
from matplotlib.dates import YearLocator
t0 = datetime(2002, 10, 9, 12, 10)
tf = datetime(2005, 10, 9, 12, 15)
loc = YearLocator()
values = loc.tick_values(t0, tf)
```

OffsetBoxes now support clipping

Artists draw onto objects of type OffsetBox through DrawingArea and TextArea. The TextArea calculates the required space for the text and so the text is always within the bounds, for this nothing has changed.

However, DrawingArea acts as a parent for zero or more Artists that draw on it and may do so beyond the bounds. Now child Artists can be clipped to the bounds of the DrawingArea.
OffsetBoxes now considered by tight_layout

When `tight_layout()` or `Figure.tight_layout()` or `GridSpec.tight_layout()` is called, OffsetBoxes that are anchored outside the axes will not get chopped out. The OffsetBoxes will also not get overlapped by other axes in case of multiple subplots.

Per-page pdf notes in multi-page pdfs (PdfPages)

Add a new method `attach_note()` to the PdfPages class, allowing the attachment of simple text notes to pages in a multi-page pdf of figures. The new note is visible in the list of pdf annotations in a viewer that has this facility (Adobe Reader, OSX Preview, Skim, etc.). Per default the note itself is kept off-page to prevent it to appear in print-outs.

PdfPages.attach_note needs to be called before `savefig()` in order to be added to the correct figure.

Updated fignum_exists to take figure name

Added the ability to check the existence of a figure using its name instead of just the figure number. Example:

```python
figure('figure')
fignum_exists('figure') #true
```

7.10.10 ToolManager

Federico Ariza wrote the new ToolManager that comes as replacement for NavigationToolbar2.

ToolManager offers a new way of looking at the user interactions with the figures. Before we had the NavigationToolbar2 with its own tools like zoom/pan/home/save/... and also we had the shortcuts like yscale/grid/quit/.... Toolmanager relocate all those actions as Tools (located in backend_tools), and defines a way to access/trigger/reconfigure them.

The Toolbars are replaced for ToolContainers that are just GUI interfaces to trigger the tools. But don’t worry the default backends include a ToolContainer called toolbar.

**Note:** At the moment, we release this primarily for feedback purposes and should be treated as experimental until further notice as API changes will occur. For the moment the ToolManager works only with the GTK3 and Tk backends. Make sure you use one of those. Port for the rest of the backends is comming soon.

To activate the ToolManager include the following at the top of your file

```python
>>> matplotlib.rcParams['toolbar'] = 'toolmanager'
```

Interact with the ToolContainer

The most important feature is the ability to easily reconfigure the ToolContainer (aka toolbar). For example, if we want to remove the "forward" button we would just do.
New Tools for ToolManager

It is possible to add new tools to the ToolManager

A very simple tool that prints “You’re awesome” would be:

```python
from matplotlib.backend_tools import ToolBase
class AwesomeTool(ToolBase):
    def trigger(self, *args, **kwargs):
        print("You're awesome")
```

To add this tool to ToolManager

```python
>>> fig.canvas.manager.toolmanager.add_tool('Awesome', AwesomeTool)
```

If we want to add a shortcut ("d") for the tool

```python
>>> fig.canvas.manager.toolmanager.update_keymap('Awesome', 'd')
```

To add it to the toolbar inside the group ‘foo’

```python
>>> fig.canvas.manager.toolbar.add_tool('Awesome', 'foo')
```

There is a second class of tools, "Toggleable Tools", this are almost the same as our basic tools, just that belong to a group, and are mutually exclusive inside that group. For tools derived from ToolToggleBase there are two basic methods enable and disable that are called automatically whenever it is toggled.

A full example is located in /gallery/user_interfaces/toolmanager_sgskip

7.10.11 cbook.is_sequence_of_strings recognizes string objects

This is primarily how pandas stores a sequence of strings

```python
import pandas as pd
import matplotlib.cbook as cbook

a = np.array(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(a))  # True

a = np.array(['a', 'b', 'c'], dtype=object)
print(cbook.is_sequence_of_strings(a))  # True

s = pd.Series(['a', 'b', 'c'])
print(cbook.is_sequence_of_strings(s))  # True
```

Previously, the last two prints returned false.
7.10.12 New close-figs argument for plot directive

Matplotlib has a sphinx extension plotDirective that creates plots for inclusion in sphinx
documents. Matplotlib 1.5 adds a new option to the plot directive - close-figs - that closes
any previous figure windows before creating the plots. This can help avoid some surprising
duplicates of plots when using plotDirective.

7.10.13 Support for URL string arguments to imread

The imread() function now accepts URL strings that point to remote PNG files. This circum-
vents the generation of a HTTPResponse object directly.

7.10.14 Display hook for animations in the IPython notebook

Animation instances gained a _repr_html_ method to support inline display of animations in
the notebook. The method used to display is controlled by the animation.html rc parameter,
which currently supports values of none and html5. none is the default, performing no display.
html5 converts the animation to an h264 encoded video, which is embedded directly in the
notebook.

Users not wishing to use the _repr_html_ display hook can also manually call the to_html5_video
method to get the HTML and display using IPython’s HTML display class:

```python
from IPython.display import HTML
HTML(anim.to_html5_video())
```

7.10.15 Prefixed pkg-config for building

Handling of pkg-config has been fixed in so far as it is now possible to set it using the envi-
ronment variable PKG_CONFIG. This is important if your toolchain is prefixed. This is done in a
simpilar way as setting CC or CXX before building. An example follows.

    export PKG_CONFIG=x86_64-pc-linux-gnu-pkg-config

7.11 New in matplotlib 2.0

Note: matplotlib 2.0 supports Python 2.7, and 3.4+

7.11.1 Default style changes

The major changes in v2.0 are related to overhauling the default styles.
Changes to the default style

The most important changes in matplotlib 2.0 are the changes to the default style. While it is impossible to select the best default for all cases, these are designed to work well in the most common cases.

A 'classic' style sheet is provided so reverting to the 1.x default values is a single line of python

```python
import matplotlib.style
import matplotlib as mpl
mpl.style.use('classic')
```

See *The matplotlibrc file* for details about how to persistently and selectively revert many of these changes.

Colors, color cycles, and color maps

Colors in default property cycle

The colors in the default property cycle have been changed from ['b', 'g', 'r', 'c', 'm', 'y', 'k'] to the category10 color palette used by Vega and d3 originally developed at Tableau.

In addition to changing the colors, an additional method to specify colors was added. Previously, the default colors were the single character short-hand notations for red, green, blue, cyan, magenta, yellow, and black. This made them easy to type and usable in the abbreviated style string in plot, however the new default colors are only specified via hex values. To access these colors outside of the property cycling the notation for colors 'CN', where \(N\) takes values 0-9, was added to denote the first 10 colors in mpl.rcParams['axes.prop_cycle'].

See Specifying Colors for more details.

To restore the old color cycle use

```python
from cycler import cycler
mpl.rcParams['axes.prop_cycle'] = cycler(color='bgrcmky')
```

or set

```python
from cycler import cycler
mpl.rcParams['axes.prop_cycle'] = cycler(color=['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])
```
axes.prop_cycle : cycler('color', 'bgrcmyk')

in your matplotlibrc file.

Colormap

The new default color map used by matplotlib.cm.ScalarMappable instances is 'viridis' (aka option D).

For an introduction to color theory and how 'viridis' was generated watch Nathaniel Smith and Stéfan van der Walt’s talk from SciPy2015. See here for many more details about the other alternatives and the tools used to create the color map. For details on all of the color maps available in matplotlib see Choosing Colormaps in Matplotlib.

The previous default can be restored using

mpl.rcParams['image.cmap'] = 'jet'

or setting

image.cmap : 'jet'

in your matplotlibrc file; however this is strongly discouraged.

Interactive figures

The default interactive figure background color has changed from grey to white, which matches the default background color used when saving.

The previous defaults can be restored by

mpl.rcParams['figure.facecolor'] = '0.75'

or by setting
Grid lines

The default style of grid lines was changed from black dashed lines to thicker solid light grey lines.

The previous default can be restored by using:

```python
mpl.rcParams['grid.color'] = 'k'
mpl.rcParams['grid.linestyle'] = ':'
mpl.rcParams['grid.linewidth'] = 0.5
```

or by setting:

```python
grid.color : k       # grid color
grid.linestyle : :   # dotted
grid.linewidth : 0.5  # in points
```

in your `matplotlibrc` file.

Figure size, font size, and screen dpi

The default dpi used for on-screen display was changed from 80 dpi to 100 dpi, the same as the default dpi for saving files. Due to this change, the on-screen display is now more what-you-see-is-what-you-get for saved files. To keep the figure the same size in terms of pixels, in order to maintain approximately the same size on the screen, the default figure size was reduced from 8x6 inches to 6.4x4.8 inches. As a consequence of this the default font sizes used for the title, tick labels, and axes labels were reduced to maintain their size relative to the overall size of the figure. By default the dpi of the saved image is now the dpi of the `Figure` instance being saved.
This will have consequences if you are trying to match text in a figure directly with external text.

The previous defaults can be restored by

```python
mpl.rcParams['figure.figsize'] = [8.0, 6.0]
mpl.rcParams['figure.dpi'] = 80
mpl.rcParams['savefig.dpi'] = 100
mpl.rcParams['font.size'] = 12
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['figure.titlesize'] = 'medium'
```

or by setting:

```python
figure.figsize : [8.0, 6.0]
figure.dpi : 80
savefig.dpi : 100
font.size : 12.0
legend.fontsize : 'large'
figure.titlesize : 'medium'
```

In your matplotlibrc file.

In addition, the forward kwarg to set_size_inches now defaults to `True` to improve the interactive experience. Backend canvases that adjust the size of their bound `matplotlib.figure.Figure` must pass `forward=False` to avoid circular behavior. This default is not configurable.

**Plotting functions**

*scatter*

The following changes were made to the default behavior of *scatter*

- The default size of the elements in a scatter plot is now based on the rcParam `lines.markersize` so it is consistent with `plot(x, y, 'o')`. The old value was 20, and the new value is 36 ($6^2$).
- Scatter markers no longer have a black edge.
- If the color of the markers is not specified it will follow the property cycle, pulling from the 'patches' cycle on the `Axes`.

The classic default behavior of *scatter* can only be recovered through `mpl.style.use('classic')`. The marker size can be recovered via

```python
mpl.rcParams['lines.markersize'] = np.sqrt(20)
```

however, this will also affect the default marker size of *plot*. To recover the classic behavior on a per-call basis pass the following kwargs:

```python
classic_kwargs = {'s': 20, 'edgecolors': 'k', 'c': 'b'}
```
The following changes were made to the default behavior of `plot`:

- The default linewidth increased from 1 to 1.5.
- The dash patterns associated with `--`, `:` and `-.` have changed.
- The dash patterns now scale with line width.

The previous defaults can be restored by setting:

```python
mpl.rcParams['lines.linewidth'] = 1.0
mpl.rcParams['lines.dashed_pattern'] = [6, 6]
mpl.rcParams['lines.dashdot_pattern'] = [3, 5, 1, 5]
```
or by setting:

```python
classic

By default, caps on the ends of errorbars are not present.

This also changes the return value of `errorbar()` as the list of 'caplines' will be empty by default.

The previous defaults can be restored by setting:

```python
     errorbar.capsize : 3
```

in your `matplotlibrc` file.
Previously, boxplots were composed of a mish-mash of styles that were, for better for worse, inherited from Matlab. Most of the elements were blue, but the medians were red. The fliers (outliers) were black plus-symbols (+) and the whiskers were dashed lines, which created ambiguity if the (solid and black) caps were not drawn.

For the new defaults, everything is black except for the median and mean lines (if drawn), which are set to the first two elements of the current color cycle. Also, the default flier markers are now hollow circles, which maintain the ability of the plus-symbols to overlap without obscuring data too much.

The previous defaults can be restored by setting:

```python
mpl.rcParams['boxplot.flierprops.color'] = 'k'
mpl.rcParams['boxplot.flierprops.marker'] = '+'
mpl.rcParams['boxplot.flierprops.markerfacecolor'] = 'none'
mpl.rcParams['boxplot.flierprops.markeredgecolor'] = 'k'
mpl.rcParams['boxplot.boxprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.color'] = 'b'
mpl.rcParams['boxplot.whiskerprops.linestyle'] = '--'
mpl.rcParams['boxplot.medianprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.color'] = 'r'
mpl.rcParams['boxplot.meanprops.marker'] = '^'
mpl.rcParams['boxplot.meanprops.markerfacecolor'] = 'r'
mpl.rcParams['boxplot.meanprops.markeredgecolor'] = 'k'
```

(continues on next page)
or by setting:

```python
mpl.rcParams['boxplot.meanprops.markersize'] = 6
mpl.rcParams['boxplot.meanprops.linestyle'] = '--'
mpl.rcParams['boxplot.meanprops.linewidth'] = 1.0
```

in your `matplotlibrc` file.

**fill_between and fill_betweenx**

`fill_between` and `fill_betweenx` both follow the patch color cycle.

![Diagram](attachment:image.png)

If the facecolor is set via the `facecolors` or `color` keyword argument, then the color is not cycled.

To restore the previous behavior, explicitly pass the keyword argument `facecolors='C0'` to the method call.
Patch edges and color

Most artists drawn with a patch (~matplotlib.axes.Axes.bar, ~matplotlib.axes.Axes.pie, etc) no longer have a black edge by default. The default face color is now 'C0' instead of 'b'.

The previous defaults can be restored by setting:

```python
mpl.rcParams['patch.force_edgecolor'] = True
mpl.rcParams['patch.facecolor'] = 'b'
```

or by setting:

```python
patch.facecolor : b
patch.force_edgecolor : True
```

in your matplotlibrc file.
hexbin

The default value of the `linecolor` kwarg for `hexbin` has changed from 'none' to 'face'. If 'none' is now supplied, no line edges are drawn around the hexagons.

bar and barh

The default value of the `align` kwarg for both `bar` and `barh` is changed from 'edge' to 'center'.

To restore the previous behavior explicitly pass the keyword argument `align='edge'` to the method call.

Hatching

The color of the lines in the hatch is now determined by

- If an edge color is explicitly set, use that for the hatch color
- If the edge color is not explicitly set, use `rcParam['hatch.color']` which is looked up at artist creation time.
The width of the lines in a hatch pattern is now configurable by the \texttt{rcParams hatch.linewidth}, which defaults to 1 point. The old behavior for the line width was different depending on backend:

- PDF: 0.1 pt
- SVG: 1.0 pt
- PS: 1 px
- Agg: 1 px

The old line width behavior can not be restored across all backends simultaneously, but can be restored for a single backend by setting:

```python
mpl.rcParams['hatch.linewidth'] = 0.1  # previous pdf hatch linewidth
mpl.rcParams['hatch.linewidth'] = 1.0  # previous svg hatch linewidth
```

The behavior of the PS and Agg backends was DPI dependent, thus:

```python
mpl.rcParams['figure.dpi'] = dpi
mpl.rcParams['savefig.dpi'] = dpi  # or leave as default 'figure'
mpl.rcParams['hatch.linewidth'] = 1.0 / dpi  # previous ps and Agg hatch linewidth
```

There is no direct API level control of the hatch color or linewidth.

Hatching patterns are now rendered at a consistent density, regardless of DPI. Formerly, high DPI figures would be more dense than the default, and low DPI figures would be less dense. This old behavior cannot be directly restored, but the density may be increased by repeating

The hatch specifier.

**Fonts**

**Normal text**

The default font has changed from “Bitstream Vera Sans” to “DejaVu Sans”. DejaVu Sans has additional international and math characters, but otherwise has the same appearance as Bitstream Vera Sans. Latin, Greek, Cyrillic, Armenian, Georgian, Hebrew, and Arabic are all supported (but right-to-left rendering is still not handled by matplotlib). In addition, DejaVu contains a sub-set of emoji symbols.

See the DejaVu Sans PDF sample for full coverage.

**Math text**

The default math font when using the built-in math rendering engine (mathtext) has changed from ”Computer Modern” (i.e. \LaTeX-like) to ”DejaVu Sans”. This change has no effect if the \TeX backend is used (i.e. \textit{\texttt{text.usetex}} is True).

To revert to the old behavior set the:

```python
mpl.rcParams['mathtext.fontset'] = 'cm'
mpl.rcParams['mathtext.rm'] = 'serif'
```

or set:
7.11. New in matplotlib 2.0

- Функция `int`: Рисунок интеграла от 0 до бесконечности.
- Диаграмма со смайликами, включая символы `α`, `κ`, `zzz`, `ψ` и `R`.

Дополнительная информация о новых функциях и возможностях в версии 2.0.
Matplotlib, Release 3.1.3

### Legends

- By default, the number of points displayed in a legend is now 1.
- The default legend location is `'best'`, so the legend will be automatically placed in a location to minimize overlap with data.
- The legend defaults now include rounded corners, a lighter boundary, and partially transparent boundary and background.

The previous defaults can be restored by setting:

```python
mpl.rcParams['legend.fancybox'] = False
mpl.rcParams['legend.loc'] = 'upper right'
mpl.rcParams['legend.numpoints'] = 2
mpl.rcParams['legend.fontsize'] = 'large'
mpl.rcParams['legend.framealpha'] = None
mpl.rcParams['legend.scatterpoints'] = 3
mpl.rcParams['legend.edgecolor'] = 'inherit'
```

or by setting:

```python
legend.fancybox : False
legend.loc : upper right
legend.numpoints : 2 # the number of points in the legend line
legend.fontsize : large
```

(continues on next page)

590 Chapter 7. Previous What’s New
in your matplotlibrc file.

**Image**

**Interpolation**

The default interpolation method for `imshow` is now 'nearest' and by default it resamples the data (both up and down sampling) before color mapping.

To restore the previous behavior set:

```python
mpl.rcParams['image.interpolation'] = 'bilinear'
mpl.rcParams['image.resample'] = False
```

or set:

```python
image.interpolation : bilinear  # see help(imshow) for options
image.resample : False
```

in your matplotlibrc file.

**Colormapping pipeline**

Previously, the input data was normalized, then color mapped, and then resampled to the resolution required for the screen. This meant that the final resampling was being done in color space. Because the color maps are not generally linear in RGB space, colors not in the
color map may appear in the final image. This bug was addressed by an almost complete overhaul of the image handling code.

The input data is now normalized, then resampled to the correct resolution (in normalized dataspace), and then color mapped to RGB space. This ensures that only colors from the color map appear in the final image. (If your viewer subsequently resamples the image, the artifact may reappear.)

The previous behavior cannot be restored.

Shading

• The default shading mode for light source shading, in `matplotlib.colors.LightSource.shade`, is now `overlay`. Formerly, it was `hsv`.

Plot layout

Auto limits

The previous auto-scaling behavior was to find ‘nice’ round numbers as view limits that enclosed the data limits, but this could produce bad plots if the data happened to fall on a vertical or horizontal line near the chosen ‘round number’ limit. The new default sets the view limits to 5% wider than the data range.

The size of the padding in the x and y directions is controlled by the `axes.xmargin` and `axes.ymargin` rcParams respectively. Whether the view limits should be ‘round numbers’ is controlled by the `axes.autolimit_mode` rcParam. In the original ‘round_number’ mode, the view limits coincide with ticks.

The previous default can be restored by using:
Z-order

• Ticks and grids are now plotted above solid elements such as filled contours, but below lines. To return to the previous behavior of plotting ticks and grids above lines, set `rcParams['axes.axisbelow'] = False`.

Ticks

Direction

To reduce the collision of tick marks with data, the default ticks now point outward by default. In addition, ticks are now drawn only on the bottom and left spines to prevent a porcupine appearance, and for a cleaner separation between subplots.

To restore the previous behavior set:

```
mpl.rcParams['xtick.direction'] = 'in'
mpl.rcParams['ytick.direction'] = 'in'
```
mpl.rcParams['xtick.top'] = True
mpl.rcParams['ytick.right'] = True

or set:

xtick.top: True
xtick.direction: in

ytick.right: True
ytick.direction: in

in your matplotlibrc file.

Number of ticks

The default Locator used for the x and y axis is AutoLocator which tries to find, up to some maximum number, ‘nicely’ spaced ticks. The locator now includes an algorithm to estimate the maximum number of ticks that will leave room for the tick labels. By default it also ensures that there are at least two ticks visible.

There is no way, other than using mpl.style.use('classic'), to restore the previous behavior as the default. On an axis-by-axis basis you may either control the existing locator via:

```python
ax.xaxis.get_major_locator().set_params(nbins=9, steps=[1, 2, 5, 10])
```

or create a new MaxNLocator:

```python
import matplotlib.ticker as mticker
ax.set_major_locator(mticker.MaxNLocator(nbins=9, steps=[1, 2, 5, 10]))
```

The algorithm used by MaxNLocator has been improved, and this may change the choice of tick locations in some cases. This also affects AutoLocator, which uses MaxNLocator internally.
For a log-scaled axis the default locator is the `LogLocator`. Previously the maximum number of ticks was set to 15, and could not be changed. Now there is a `numticks` kwarg for setting the maximum to any integer value, to the string 'auto', or to its default value of None which is equivalent to 'auto'. With the 'auto' setting the maximum number will be no larger than 9, and will be reduced depending on the length of the axis in units of the tick font size. As in the case of the AutoLocator, the heuristic algorithm reduces the incidence of overlapping tick labels but does not prevent it.

**Tick label formatting**

`LogFormatter` labeling of minor ticks

Minor ticks on a log axis are now labeled when the axis view limits span a range less than or equal to the interval between two major ticks. See `LogFormatter` for details. The minor tick labeling is turned off when using `mpl.style.use('classic')`, but cannot be controlled independently via rcParams.

**ScalarFormatter** tick label formatting with offsets

With the default of `rcParams['axes.formatter.useoffset']` = True, an offset will be used when it will save 4 or more digits. This can be controlled with the new rcParam, `axes.formatter.offset_threshold`. To restore the previous behavior of using an offset to save 2 or more digits, use `rcParams['axes.formatter.offset_threshold']` = 2.

**AutoDateFormatter** format strings

The default date formats are now all based on ISO format, i.e., with the slowest-moving value first. The date formatters are configurable through the `date.autoformatter.*` rcParams.
Threshold (tick interval >= than) | rcParam | classic | v2.0 |
---|---|---|---|
365 days | 'date.autoformatter.year' | '%Y' | '%Y'
30 days | 'date.autoformatter.month' | '%b %Y' | '%Y-%m'
1 day | 'date.autoformatter.day' | '%b %d %Y' | '%Y-%m-%d'
1 hour | 'date.autoformatter.hour' | '%H:%M:%S' | '%H:%M'
1 minute | 'date.autoformatter.minute' | '%H:%M:%S.%f' | '%H:%M:%S'
1 second | 'date.autoformatter.second' | '%H:%M:%S.%f' | '%H:%M:%S'
1 microsecond | 'date.autoformatter.microsecond' | '%H:%M:%S.%f' | '%H:%M:%S.%f'

Python’s %x and %X date formats may be of particular interest to format dates based on the current locale.

The previous default can be restored by:

```python
mpl.rcParams['date.autoformatter.year'] = '%Y'
mpl.rcParams['date.autoformatter.month'] = '%b %Y'
mpl.rcParams['date.autoformatter.day'] = '%b %d %Y'
mpl.rcParams['date.autoformatter.hour'] = '%H:%M:%S'
mpl.rcParams['date.autoformatter.minute'] = '%H:%M:%S.%f'
mpl.rcParams['date.autoformatter.second'] = '%H:%M:%S.%f'
mpl.rcParams['date.autoformatter.microsecond'] = '%H:%M:%S.%f'
```

or setting

```python
date.autoformatter.year : %Y
date.autoformatter.month : %b %Y
date.autoformatter.day : %b %d %Y
date.autoformatter.hour : %H:%M:%S
date.autoformatter.minute : %H:%M:%S.%f
```

(continues on next page)
in your matplotlibrc file.

**mplot3d**

- mplot3d now obeys some style-related rcParams, rather than using hard-coded defaults. These include:
  - xtick.major.width
  - ytick.major.width
  - xtick.color
  - ytick.color
  - axes.linewidth
  - axes.edgecolor
  - grid.color
  - grid.linewidth
  - grid.linestyle

### 7.11.2 Improved color conversion API and RGBA support

The `colors` gained a new color conversion API with full support for the alpha channel. The main public functions are `is_color_like()`, `matplotlib.colors.to_rgba()`, `matplotlib.colors.to_rgba_array()` and `to_hex()`. RGBA quadruplets are encoded in hex format as #rrggbbaa.

A side benefit is that the Qt options editor now allows setting the alpha channel of the artists as well.

### 7.11.3 New Configuration (rcParams)

New rcparams added
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>date.autoformatter.year</td>
<td>format string for 'year' scale dates</td>
</tr>
<tr>
<td>date.autoformatter.month</td>
<td>format string for 'month' scale dates</td>
</tr>
<tr>
<td>date.autoformatter.day</td>
<td>format string for 'day' scale dates</td>
</tr>
<tr>
<td>date.autoformatter.hour</td>
<td>format string for 'hour' scale times</td>
</tr>
<tr>
<td>date.autoformatter.minute</td>
<td>format string for 'minute' scale times</td>
</tr>
<tr>
<td>date.autoformatter.second</td>
<td>format string for 'second' scale times</td>
</tr>
<tr>
<td>date.autoformatter.microsecond</td>
<td>format string for 'microsecond' scale times</td>
</tr>
<tr>
<td>scatter.marker</td>
<td>default marker for scatter plot</td>
</tr>
<tr>
<td>svg.hashsalt</td>
<td>see note</td>
</tr>
<tr>
<td>xtick.top, xtick.minor.top, xtick.major.top xtick.bottom, xtick.minor.bottom, xtick.major.bottom ytick.left, ytick.minor.left, ytick.major.left ytick.right, ytick.minor.right, ytick.major.right</td>
<td>Control where major and minor ticks are drawn. The global values are added with the corresponding major/minor values.</td>
</tr>
<tr>
<td>hist.bins</td>
<td>The default number of bins to use in hist. This can be an int, a list of floats, or 'auto' if numpy &gt;= 1.11 is installed.</td>
</tr>
<tr>
<td>lines.scale_dashes</td>
<td>Whether the line dash patterns should scale with linewidth.</td>
</tr>
<tr>
<td>axes.formatter.offset_threshold</td>
<td>Minimum number of digits saved in tick labels that triggers using an offset.</td>
</tr>
</tbody>
</table>

**Added svg.hashsalt key to rcParams**

If **svg.hashsalt** is `None` (which it is by default), the svg backend uses `uuid4` to generate the hash salt. If it is not `None`, it must be a string that is used as the hash salt instead of `uuid4`. This allows for deterministic SVG output.

**Removed the svg.image_noscale rcParam**

As a result of the extensive changes to image handling, the `svg.image_noscale` rcParam has been removed. The same functionality may be achieved by setting `interpolation='none'` on individual images or globally using the `image.interpolation` rcParam.

**7.11.4 Qualitative colormaps**

ColorBrewer’s “qualitative” colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") were intended for discrete categorical data, with no implication of value, and therefore have been converted to `ListedColormap` instead of `LinearSegmentedColormap`, so the colors will no longer be interpolated and they can be used for choropleths, labeled image features, etc.
7.11.5 Axis offset label now responds to labelcolor

Axis offset labels are now colored the same as axis tick markers when labelcolor is altered.

7.11.6 Improved offset text choice

The default offset-text choice was changed to only use significant digits that are common to all ticks (e.g. 1231..1239 -> 1230, instead of 1231), except when they straddle a relatively large multiple of a power of ten, in which case that multiple is chosen (e.g. 1999..2001->2000).

7.11.7 Style parameter blacklist

In order to prevent unexpected consequences from using a style, style files are no longer able to set parameters that affect things unrelated to style. These parameters include:

```
'interactive', 'backend', 'backend.qt4', 'webagg.port',
'webagg.port_retries', 'webagg.open_in_browser', 'backend_fallback',
'toolbar', 'timezone', 'datapath', 'figure.max_open_warning',
'savefig.directory', 'tk.window_focus', 'docstring.hardcopy'
```

7.11.8 Change in default font

The default font used by matplotlib in text has been changed to DejaVu Sans and DejaVu Serif for the sans-serif and serif families, respectively. The DejaVu font family is based on the previous matplotlib default –Bitstream Vera– but includes a much wider range of characters.

The default mathtext font has been changed from Computer Modern to the DejaVu family to maintain consistency with regular text. Two new options for the mathtext.fontset configuration parameter have been added: dejavusans (default) and dejavuserif. Both of these options use DejaVu glyphs whenever possible and fall back to STIX symbols when a glyph is not found in DejaVu. To return to the previous behavior, set the rcParam mathtext.fontset to cm.

7.11.9 Faster text rendering

Rendering text in the Agg backend is now less fuzzy and about 20% faster to draw.

7.11.10 Improvements for the Qt figure options editor

Various usability improvements were implemented for the Qt figure options editor, among which:

- Line style entries are now sorted without duplicates.
- The colormap and normalization limits can now be set for images.
- Line edits for floating values now display only as many digits as necessary to avoid precision loss. An important bug was also fixed regarding input validation using Qt5 and a locale where the decimal separator is ",".

600 Chapter 7. Previous What’s New
• The axes selector now uses shorter, more user-friendly names for axes, and does not crash if there are no axes.
• Line and image entries using the default labels ("_lineX", "_imageX") are now sorted numerically even when there are more than 10 entries.

7.11.11 Improved image support

Prior to version 2.0, matplotlib resampled images by first applying the color map and then resizing the result. Since the resampling was performed on the colored image, this introduced colors in the output image that didn’t actually exist in the color map. Now, images are resampled first (and entirely in floating-point, if the input image is floating-point), and then the color map is applied.

In order to make this important change, the image handling code was almost entirely rewritten. As a side effect, image resampling uses less memory and fewer datatype conversions than before.

The experimental private feature where one could “skew” an image by setting the private member `_image_skew_coordinate` has been removed. Instead, images will obey the transform of the axes on which they are drawn.

Non-linear scales on image plots

`imshow()` now draws data at the requested points in data space after the application of non-linear scales.

The image on the left demonstrates the new, correct behavior. The old behavior can be recreated using `pcolormesh()` as demonstrated on the right.

This can be understood by analogy to plotting a histogram with linearly spaced bins with a logarithmic x-axis. Equal sized bins will be displayed as wider for small x and narrower for large x.
7.11.12 Support for HiDPI (Retina) displays in the NbAgg and WebAgg backends

The NbAgg and WebAgg backends will now use the full resolution of your high-pixel-density display.

7.11.13 Change in the default animation codec

The default animation codec has been changed from mpeg4 to h264, which is more efficient. It can be set via the animation.codec rcParam.

7.11.14 Deprecated support for mencoder in animation

The use of mencoder for writing video files with mpl is problematic; switching to ffmpeg is strongly advised. All support for mencoder will be removed in version 2.2.

7.11.15 Boxplot Zorder Keyword Argument

The zorder parameter now exists for boxplot(). This allows the zorder of a boxplot to be set in the plotting function call.

```python
boxplot(np.arange(10), zorder=10)
```

7.11.16 Filled + and x markers

New fillable plus and x markers have been added. See the markers module and marker reference examples.

7.11.17 rcount and ccount for plot_surface()

As of v2.0, mplot3d’s plot_surface() now accepts rcount and ccount arguments for controlling the sampling of the input data for plotting. These arguments specify the maximum number of evenly spaced samples to take from the input data. These arguments are also the new default sampling method for the function, and is considered a style change.

The old rstride and cstride arguments, which specified the size of the evenly spaced samples, become the default when ‘classic’ mode is invoked, and are still available for use. There are no plans for deprecating these arguments.

7.11.18 Streamplot Zorder Keyword Argument Changes

The zorder parameter for streamplot() now has default value of None instead of 2. If None is given as zorder, streamplot() has a default zorder of matplotlib.lines.Line2D.zorder.
7.11.19 Extension to matplotlib.backend_bases.GraphicsContextBase

To support standardizing hatch behavior across the backends we ship the `matplotlib.backend_bases.GraphicsContextBase.get_hatch_color` method as added to `matplotlib.backend_bases.GraphicsContextBase`. This is only used during the render process in the backends we ship so will not break any third-party backends.

If you maintain a third-party backend which extends `GraphicsContextBase` this method is now available to you and should be used to color hatch patterns.

7.12 New in Matplotlib 2.1.0

7.12.1 Documentation

The examples have been migrated to use `sphinx gallery`. This allows better mixing of prose and code in the examples, provides links to download the examples as both a Python script and a Jupyter notebook, and improves the thumbnail galleries. The examples have been re-organized into *Tutorials* and a gallery.

Many docstrings and examples have been clarified and improved.

7.12.2 New features

String categorical values

All plotting functions now support string categorical values as input. For example:

```python
data = {'apples': 10, 'oranges': 15, 'lemons': 5, 'limes': 20}
fig, ax = plt.subplots()
ax.bar(data.keys(), data.values(), color='lightgray')
```

Interactive JS widgets for animation

Jake Vanderplas' JSAnimation package has been merged into Matplotlib. This adds to Matplotlib the `HTMLWriter` class for generating a JavaScript HTML animation, suitable for the IPython notebook. This can be activated by default by setting the `animation.html` rc parameter to `jshtml`. One can also call the `to_jshtml` method to manually convert an animation. This can be displayed using IPython's `HTML` display class:

```python
from IPython.display import HTML
HTML(animation.to_jshtml())
```

The `HTMLWriter` class can also be used to generate an HTML file by asking for the `html` writer.

Enhancements to polar plot

The polar axes transforms have been greatly re-factored to allow for more customization of view limits and tick labelling. Additional options for view limits allow for creating an annulus, a sector, or some combination of the two.
The `set_rorigin()` method may be used to provide an offset to the minimum plotting radius, producing an annulus.

The `set_theta_zero_location()` method now has an optional `offset` argument. This argument may be used to further specify the zero location based on the given anchor point.

The `set_thetamin()` and `set_thetamax()` methods may be used to limit the range of angles plotted, producing sectors of a circle.

Previous releases allowed plots containing negative radii for which the negative values are simply used as labels, and the real radius is shifted by the configured minimum. This release also allows negative radii to be used for grids and ticks, which were previously silently ignored.

Radial ticks have been modified to be parallel to the circular grid line, and angular ticks have been modified to be parallel to the grid line. It may also be useful to rotate tick labels to match the boundary. Calling `ax.tick_params(rotation='auto')` will enable the new behavior: radial tick labels will be parallel to the circular grid line, and angular tick labels will be perpendicular to the grid line (i.e., parallel to the outer boundary). Additionally, tick labels now obey the padding settings that previously only worked on Cartesian plots. Consequently, the `frac` argument to `PolarAxes.set_thetagrids` is no longer applied. Tick padding can be modified with the `pad` argument to `Axes.tick_params` or `Axis.set_tick_params`.

```python
apples oranges lemons limes
0.0
2.5
5.0
7.5
10.0
12.5
15.0
17.5
20.0
```

Radial tick labels will be parallel to the circular grid line, and angular tick labels will be perpendicular to the grid line (i.e., parallel to the outer boundary). Additionally, tick labels now obey the padding settings that previously only worked on Cartesian plots. Consequently, the `frac` argument to `PolarAxes.set_thetagrids` is no longer applied. Tick padding can be modified with the `pad` argument to `Axes.tick_params` or `Axis.set_tick_params`. 

Radial tick labels will be parallel to the circular grid line, and angular tick labels will be perpendicular to the grid line (i.e., parallel to the outer boundary). Additionally, tick labels now obey the padding settings that previously only worked on Cartesian plots. Consequently, the `frac` argument to `PolarAxes.set_thetagrids` is no longer applied. Tick padding can be modified with the `pad` argument to `Axes.tick_params` or `Axis.set_tick_params`.

Consequently, the `frac` argument to `PolarAxes.set_thetagrids` is no longer applied. Tick padding can be modified with the `pad` argument to `Axes.tick_params` or `Axis.set_tick_params`.
Fig. 30: Polar Offset Demo

Fig. 31: Polar Sector Demo
Figure class now has subplots method

The `Figure` class now has a `subplots()` method which behaves the same as `pyplot.subplots()` but on an existing figure.

Metadata savefig keyword argument

`savfig()` now accepts `metadata` as a keyword argument. It can be used to store key/value pairs in the image metadata.

- ‘png’ with Agg backend
- ‘pdf’ with PDF backend (see `writeInfoDict()` for a list of supported keywords)
- ‘eps’ and ‘ps’ with PS backend (only ‘Creator’ key is accepted)

```python
plt.savefig('test.png', metadata={'Software': 'My awesome software'})
```

Busy Cursor

The interactive GUI backends will now change the cursor to busy when Matplotlib is rendering the canvas.

PolygonSelector

A `PolygonSelector` class has been added to `matplotlib.widgets`. See `/gallery/widgets/polygon_selector_demo` for details.

Added `matplotlib.ticker.PercentFormatter`

The new `PercentFormatter` formatter has some nice features like being able to convert from arbitrary data scales to percents, a customizable percent symbol and either automatic or manual control over the decimal points.

Reproducible PS, PDF and SVG output

The `SOURCE_DATE_EPOCH` environment variable can now be used to set the timestamp value in the PS and PDF outputs. See `source date epoch`.

Alternatively, calling `savefig` with `metadata={'CreationDate': None}` will omit the timestamp altogether for the PDF backend.

The reproducibility of the output from the PS and PDF backends has so far been tested using various plot elements but only default values of options such as `{ps,pdf}.fonttype` that can affect the output at a low level, and not with the mathtext or usetex features. When Matplotlib calls external tools (such as PS distillers or LaTeX) their versions need to be kept constant for reproducibility, and they may add sources of nondeterminism outside the control of Matplotlib.

For SVG output, the `svg.hashsalt` rc parameter has been added in an earlier release. This parameter changes some random identifiers in the SVG file to be deterministic. The downside
of this setting is that if more than one file is generated using deterministic identifiers and they end up as parts of one larger document, the identifiers can collide and cause the different parts to affect each other.

These features are now enabled in the tests for the PDF and SVG backends, so most test output files (but not all of them) are now deterministic.

**Orthographic projection for mplot3d**

Axes3D now accepts `proj_type` keyword argument and has a method `set_proj_type()`. The default option is `'persp'` as before, and supplying `'ortho'` enables orthographic view.

Compare the z-axis which is vertical in orthographic view, but slightly skewed in the perspective view.

```python
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

fig = plt.figure(figsize=(4, 6))
ax1 = fig.add_subplot(2, 1, 1, projection='3d')
ax1.set_proj_type('persp')
ax1.set_title('Perspective (default)')

ax2 = fig.add_subplot(2, 1, 2, projection='3d')
ax2.set_proj_type('ortho')
ax2.set_title('Orthographic')

plt.show()
```

**voxels function for mplot3d**

Axes3D now has a `voxels` method, for visualizing boolean 3D data. Uses could include plotting a sparse 3D heat map, or visualizing a volumetric model.

7.12.3 Improvements

**CheckButtons widget get_status function**

A `get_status()` method has been added to the `matplotlib.widgets.CheckButtons` class. This `get_status` method allows user to query the status (True/False) of all of the buttons in the CheckButtons object.

**Add fill_bar argument to AnchoredSizeBar**

The mpl_toolkits class `AnchoredSizeBar` now has an additional `fill_bar` argument, which makes the size bar a solid rectangle instead of just drawing the border of the rectangle. The default is `None`, and whether or not the bar will be filled by default depends on the value of `size_vertical`. If `size_vertical` is nonzero, `fill_bar` will be set to True. If `size_vertical` is zero then `fill_bar`
Perspective (default)

Orthographic
will be set to False. If you wish to override this default behavior, set fill_bar to True or False to unconditionally always or never use a filled patch rectangle for the size bar.

```python
import matplotlib.pyplot as plt
from mpl_toolkits.axes_grid1.anchored_artists import AnchoredSizeBar

fig, ax = plt.subplots(figsize=(3, 3))

bar0 = AnchoredSizeBar(ax.transData, 0.3, 'unfilled', loc='lower left',
                       frameon=False, size_vertical=0.05, fill_bar=False)
ap.add_artist(bar0)

bar1 = AnchoredSizeBar(ax.transData, 0.3, 'filled', loc='lower right',
                       frameon=False, size_vertical=0.05, fill_bar=True)
ap.add_artist(bar1)

plt.show()
```

Annotation can use a default arrow style

Annotations now use the default arrow style when setting arrowprops={}, rather than no arrow (the new behavior actually matches the documentation).

Barbs and Quiver Support Dates

When using the `quiver()` and `barbs()` plotting methods, it is now possible to pass dates, just like for other methods like `plot()`. This also allows these functions to handle values that need unit-conversion applied.
Hexbin default line color

The default linecolor keyword argument for `hexbin()` is now `face`, and supplying `none` now prevents lines from being drawn around the hexagons.

Figure.legend() can be called without arguments

Calling `Figure.legend()` can now be done with no arguments. In this case a legend will be created that contains all the artists on all the axes contained within the figure.

Multiple legend keys for legend entries

A legend entry can now contain more than one legend key. The extended `HandlerTuple` class now accepts two parameters: `ndivide` divides the legend area in the specified number of sections; `pad` changes the padding between the legend keys.

New parameter clear for figure()

When the pyplot’s function `figure()` is called with a `num` parameter, a new window is only created if no existing window with the same value exists. A new bool parameter `clear` was added for explicitly clearing its existing contents. This is particularly useful when utilized in interactive sessions. Since `subplots()` also accepts keyword arguments from `figure()`, it can also be used there:

```python
import matplotlib.pyplot as plt

fig0 = plt.figure(num=1)
fig0.suptitle("A fancy plot")
print("fig0.texts: ", [t.get_text() for t in fig0.texts])
```

(continues on next page)
fig1 = plt.figure(num=1, clear=False)  # do not clear contents of window
fig1.text(0.5, 0.5, "Really fancy!")
print("fig0 is fig1: ", fig0 is fig1)
print("fig1.texts: ", [t.get_text() for t in fig1.texts])

fig2, ax2 = plt.subplots(2, 1, num=1, clear=True)  # clear contents
print("fig0 is fig2: ", fig0 is fig2)
print("fig2.texts: ", [t.get_text() for t in fig2.texts])

# The output:
# fig0.texts: ['A fancy plot']
# fig0 is fig1: True
# fig1.texts: ['A fancy plot', 'Really fancy!]'
# fig0 is fig2: True
# fig2.texts: []

Specify minimum value to format as scalar for LogFormatterMathtext

LogFormatterMathtext now includes the option to specify a minimum value exponent to format as a scalar (i.e., 0.001 instead of $10^{-3}$).

New quiverkey angle keyword argument

Plotting a quiverkey() now admits the angle keyword argument, which sets the angle at which to draw the key arrow.
Colormap reversed method

The methods `matplotlib.colors.LinearSegmentedColormap.reversed()` and `matplotlib.colors.ListedColormap.reversed()` return a reversed instance of the Colormap. This implements a way for any Colormap to be reversed.

**Artist.setp (and pyplot.setp) accept a file argument**

The argument is keyword-only. It allows an output file other than `sys.stdout` to be specified. It works exactly like the `file` argument to `print`.

**streamplot streamline generation more configurable**

The starting point, direction, and length of the stream lines can now be configured. This allows to follow the vector field for a longer time and can enhance the visibility of the flow pattern in some use cases.

**Axis.set_tick_params now responds to rotation**

Bulk setting of tick label rotation is now possible via `tick_params()` using the `rotation` keyword.

```python
ax.tick_params(which='both', rotation=90)
```

**Ticklabels are turned off instead of being invisible**

Internally, the Tick’s `label1On()` attribute is now used to hide tick labels instead of setting the visibility on the tick label objects. This improves overall performance and fixes some issues. As a consequence, in case those labels ought to be shown, `tick_params()` needs to be used, e.g.

```python
ax.tick_params(labelbottom=True)
```

**Shading in 3D bar plots**

A new `shade` parameter has been added the 3D `bar` plotting method. The default behavior remains to shade the bars, but now users have the option of setting `shade` to `False`.

```python
import numpy as np
import matplotlib.pyplot as plt
from mpl_toolkits.mplot3d import Axes3D

x = np.arange(2)
y = np.arange(3)
x2d, y2d = np.meshgrid(x, y)
x, y = x2d.ravel(), y2d.ravel()
z = np.zeros_like(x)
dz = x + y
```
```python
fig = plt.figure(figsize=(4, 6))
av1 = fig.add_subplot(2, 1, 1, projection='3d')
av1.bar3d(x, y, z, 1, 1, dz, shade=True)
av1.set_title('Shading On')

ax2 = fig.add_subplot(2, 1, 2, projection='3d')
av2.bar3d(x, y, z, 1, 1, dz, shade=False)
av2.set_title('Shading Off')

plt.show()
```
New which Parameter for autofmt_xdate

A which parameter now exists for the method `autofmt_xdate()`. This allows a user to format major, minor or both tick labels selectively. The default behavior will rotate and align the major tick labels.

```python
fig.autofmt_xdate(bottom=0.2, rotation=30, ha='right', which='minor')
```

New Figure Parameter for subplot2grid

A fig parameter now exists for the function `subplot2grid()`. This allows a user to specify the figure where the subplots will be created. If `fig` is `None` (default) then the method will use the current figure retrieved by `gcf()`.

```python
subplot2grid(shape, loc, rowspan=1, colspan=1, fig=myfig)
```

Interpolation in fill_betweenx

The interpolate parameter now exists for the method `fill_betweenx()`. This allows a user to interpolate the data and fill the areas in the crossover points, similarly to `fill_between()`.

New keyword argument sep for EngFormatter

A new sep keyword argument has been added to `EngFormatter` and provides a means to define the string that will be used between the value and its unit. The default string is " ", which preserves the former behavior. Additionally, the separator is now present between the value and its unit even in the absence of SI prefix. There was formerly a bug that was causing strings like "3.14V" to be returned instead of the expected "3.14 V" (with the default behavior).

Extend MATPLOTLIBRC behavior

The environmental variable can now specify the full file path or the path to a directory containing a `matplotlibrc` file.

density kwarg to hist

The `hist()` method now prefers `density` to `normed` to control if the histogram should be normalized, following a change upstream to NumPy. This will reduce confusion as the behavior has always been that the integral of the histogram is 1 (rather than sum or maximum value).

7.12.4 Internals

New TransformedPatchPath caching object

A newly added `TransformedPatchPath` provides a means to transform a `Patch` into a `Path` via a `Transform` while caching the resulting path. If neither the patch nor the transform have changed, a cached copy of the path is returned.
This class differs from the older `TransformedPath` in that it is able to refresh itself based on the underlying patch while the older class uses an immutable path.

**Abstract base class for movie writers**

The new `AbstractMovieWriter` class defines the API required by a class that is to be used as the writer in the `matplotlib.animation.Animation.save()` method. The existing `MovieWriter` class now derives from the new abstract base class.

**Stricter validation of line style rcParams**

The validation of rcParams that are related to line styles (`lines.linestyle`, `boxplot.*.linestyle`, `grid.linestyle` and `contour.negative_linestyle`) now effectively checks that the values are valid line styles. Strings like `'dashed'` or `'--'` are accepted, as well as even-length sequences of on-off ink like `[1, 1.65]`. In this latter case, the offset value is handled internally and should **not** be provided by the user.

The new validation scheme replaces the former one used for the `contour.negative_linestyle` rcParams, that was limited to 'solid' and 'dashed' line styles.

The validation is case-insensitive. The following are now valid:

```
grid.linestyle : (1, 3)  # loosely dotted grid lines
contour.negative_linestyle : dashdot  # previously only solid or dashed
```

**pytest**

The automated tests have been switched from `nose` to `pytest`.

**7.12.5 Performance**

**Path simplification updates**

Line simplification controlled by the `path.simplify` and `path.simplify_threshold` parameters has been improved. You should notice better rendering performance when plotting large amounts of data (as long as the above parameters are set accordingly). Only the line segment portion of paths will be simplified – if you are also drawing markers and experiencing problems with rendering speed, you should consider using the `markevery` option to `plot`. See the `Performance` section in the usage tutorial for more information.

The simplification works by iteratively merging line segments into a single vector until the next line segment’s perpendicular distance to the vector (measured in display-coordinate space) is greater than the `path.simplify_threshold` parameter. Thus, higher values of `path.simplify_threshold` result in quicker rendering times. If you are plotting just to explore data and not for publication quality, pixel perfect plots, then a value of `1.0` can be safely used. If you want to make sure your plot reflects your data exactly, then you should set `path.simplify` to `false` and/or `path.simplify_threshold` to `0`. Matplotlib currently defaults to a conservative value of `1/9`, smaller values are unlikely to cause any visible differences in your plots.
Implement `intersects_bbox` in C++

`intersects_bbox()` has been implemented in C++ which improves the performance of automatically placing the legend.

## 7.13 New in Matplotlib 2.2

### 7.13.1 Constrained Layout Manager

**Warning:** Constrained Layout is experimental. The behaviour and API are subject to change, or the whole functionality may be removed without a deprecation period.

A new method to automatically decide spacing between subplots and their organizing GridSpec instances has been added. It is meant to replace the venerable `tight_layout` method. It is invoked via a new `constrained_layout=True` kwarg to `Figure` or subplots.

There are new `rcParams` for this package, and spacing can be more finely tuned with the new `set_constrained_layout_pads`.

Features include:

- Automatic spacing for subplots with a fixed-size padding in inches around subplots and all their decorators, and space between as a fraction of subplot size between subplots.
- Spacing for `suptitle`, and colorbars that are attached to more than one axes.
- Nested GridSpec layouts using `GridSpecFromSubplotSpec`.

For more details and capabilities please see the new tutorial: [Constrained Layout Guide](#).

Note the new API to access this:

**New `plt.figure` and `plt.subplots` kwarg: `constrained_layout`**

`figure()` and `subplots()` can now be called with `constrained_layout=True` kwarg to enable `constrained_layout`.

**New `ax.set_position` behaviour**

`set_position()` now makes the specified axis no longer responsive to `constrained_layout`, consistent with the idea that the user wants to place an axis manually.

Internally, this means that old `ax.set_position` calls `inside` the library are changed to private `ax._set_position` calls so that `constrained_layout` will still work with these axes.
New figure kwarg for GridSpec

In order to facilitate constrained_layout, GridSpec now accepts a figure keyword. This is backwards compatible, in that not supplying this will simply cause constrained_layout to not operate on the subplots organized by this GridSpec instance. Routines that use GridSpec (e.g. fig.subplots) have been modified to pass the figure to GridSpec.

7.13.2 xlabels and ylabels can now be automatically aligned

Subplot axes ylabels can be misaligned horizontally if the tick labels are very different widths. The same can happen to xlabels if the ticklabels are rotated on one subplot (for instance). The new methods on the Figure class: Figure.align_xlabels and Figure.align_ylabels will now align these labels horizontally or vertically. If the user only wants to align some axes, a list of axes can be passed. If no list is passed, the algorithm looks at all the labels on the figure.

Only labels that have the same subplot locations are aligned. i.e. the ylabels are aligned only if the subplots are in the same column of the subplot layout.

Alignment is persistent and automatic after these are called.

A convenience wrapper Figure.align_labels calls both functions at once.

7.13.3 Axes legends now included in tight_bbox

Legends created via ax.legend can sometimes overspill the limits of the axis. Tools like fig.tight_layout() and fig.savefig(bbox_inches='tight') would clip these legends. A change was made to include them in the tight calculations.

7.13.4 Cividis colormap

A new dark blue/yellow colormap named ‘cividis’ was added. Like viridis, cividis is perceptually uniform and colorblind friendly. However, cividis also goes a step further: not only
is it usable by colorblind users, it should actually look effectively identical to colorblind and non-colorblind users. For more details see Nuñez J, Anderton C, and Renslow R: “Optimizing colormaps with consideration for color vision deficiency to enable accurate interpretation of scientific data”.

### 7.13.5 New style colorblind-friendly color cycle

A new style defining a color cycle has been added, tableau-colorblind10, to provide another option for colorblind-friendly plots. A demonstration of this new style can be found in the reference of style sheets. To load this color cycle in place of the default one:

```python
import matplotlib.pyplot as plt
plt.style.use('tableau-colorblind10')
```

### 7.13.6 Support for numpy.datetime64

Matplotlib has supported `datetime.datetime` dates for a long time in `matplotlib.dates`. We now support `numpy.datetime64` dates as well. Anywhere that `datetime.datetime` could be used, `numpy.datetime64` can be used. eg:

```python
time = np.arange('2005-02-01', '2005-02-02', dtype='datetime64[h]')
plt.plot(time)
```
7.13.7 Writing animations with Pillow

It is now possible to use Pillow as an animation writer. Supported output formats are currently gif (Pillow>=3.4) and webp (Pillow>=5.0). Use e.g. as

```python
from __future__ import division
from matplotlib import pyplot as plt
from matplotlib.animation import FuncAnimation, PillowWriter

fig, ax = plt.subplots()
line, = plt.plot([0, 1])

def animate(i):
    line.set_ydata([0, i / 20])
    return [line]

anim = FuncAnimation(fig, animate, 20, blit=True)
anim.save("movie.gif", writer=PillowWriter(fps=24))
plt.show()
```

7.13.8 Slider UI widget can snap to discrete values

The slider UI widget can take the optional argument `valstep`. Doing so forces the slider to take on only discrete values, starting from `valmin` and counting up to `valmax` with steps of size `valstep`.

If `closedmax==True`, then the slider will snap to `valmax` as well.

7.13.9 capstyle and joinstyle attributes added to Collection

The `Collection` class now has customizable `capstyle` and `joinstyle` attributes. This allows the user for example to set the `capstyle` of errorbars.

7.13.10 pad kwarg added to ax.set_title

The method `axes.set_title` now has a `pad` kwarg, that specifies the distance from the top of an axes to where the title is drawn. The units of `pad` is points, and the default is the value of the (already-existing) `rcParams['axes.titlepad']`.

7.13.11 Comparison of 2 colors in Matplotlib

As the colors in Matplotlib can be specified with a wide variety of ways, the `matplotlib.colors.same_color` method has been added which checks if two `colors` are the same.
7.13.12 Autoscaling a polar plot snaps to the origin

Setting the limits automatically in a polar plot now snaps the radial limit to zero if the automatic limit is nearby. This means plotting from zero doesn’t automatically scale to include small negative values on the radial axis.

The limits can still be set manually in the usual way using set_ylim.

7.13.13 PathLike support

On Python 3.6+, savefig, imsave, imread, and animation writers now accept os.PathLike as input.

7.13.14 Axes.tick_params can set gridline properties

Tick objects hold gridlines as well as the tick mark and its label. Axis.set_tick_params, Axes.tick_params and pyplot.tick_params now have keyword arguments ‘grid_color’, ‘grid_alpha’, ‘grid_linewidth’, and ‘grid_linestyle’ for overriding the defaults in rcParams: ‘grid.color’, etc.

7.13.15 Axes.imshow clips RGB values to the valid range

When Axes.imshow is passed an RGB or RGBA value with out-of-range values, it now logs a warning and clips them to the valid range. The old behaviour, wrapping back in to the range, often hid outliers and made interpreting RGB images unreliable.

7.13.16 Properties in matplotlibrc to place xaxis and yaxis tick labels

Introducing four new boolean properties in matplotlibrc for default positions of xaxis and yaxis tick labels, namely, xtick.labeltop, xtick.labelbottom, ytick.labelright and ytick.labelleft. These can also be changed in rcParams.

7.13.17 PGI bindings for gtk3

The GTK3 backends can now use PGI instead of PyGObject. PGI is a fairly incomplete binding for GObject, thus its use is not recommended; its main benefit is its availability on Travis (thus allowing CI testing for the gtk3agg and gtk3cairo backends).

The binding selection rules are as follows: - if gi has already been imported, use it; else - if pgi has already been imported, use it; else - if gi can be imported, use it; else - if pgi can be imported, use it; else - error out.

Thus, to force usage of PGI when both bindings are installed, import it first.

7.13.18 Cairo rendering for Qt, WX, and Tk canvases

The new Qt4Cairo, Qt5Cairo, WXCairo, and TkCairo backends allow Qt, Wx, and Tk canvases to use Cairo rendering instead of Agg.
7.13.19 Added support for QT in new ToolManager

Now it is possible to use the ToolManager with Qt5 For example

```python
import matplotlib
matplotlib.use('QT5AGG')
matplotlib.rcParams['toolbar'] = 'toolmanager'
import matplotlib.pyplot as plt
plt.plot([1,2,3]) plt.show()
```

Treat the new Tool classes experimental for now, the API will likely change and perhaps the rcParam as well

The main example examples/userInterfaces/toolmanager_sgskip.py shows more details, just adjust the header to use QT instead of GTK3

7.13.20 TkAgg backend reworked to support PyPy

PyPy can now plot using the TkAgg backend, supported on PyPy 5.9 and greater (both PyPy for python 2.7 and PyPy for python 3.5).

7.13.21 Python logging library used for debug output

Matplotlib has in the past (sporadically) used an internal verbose-output reporter. This version converts those calls to using the standard python logging library.

Support for the old rcParams verbose.level and verbose.fileo is dropped.

The command-line options --verbose-helpful and --verbose-debug are still accepted, but deprecated. They are now equivalent to setting logging.INFO and logging.DEBUG.

The logger’s root name is matplotlib and can be accessed from programs as:

```python
import logging
mlog = logging.getLogger('matplotlib')
```

Instructions for basic usage are in Troubleshooting and for developers in Contributing.

7.13.22 Improved repr for Transforms

Transforms now indent their reprs in a more legible manner:

```
In [1]: l, = plt.plot([]); l.get_transform()
Out[1]:
CompositeGenericTransform(
    TransformWrapper(
        BlendedAffine2D(
            IdentityTransform(),
            IdentityTransform())),
    CompositeGenericTransform(
        BboxTransformFrom(
            TransformedBbox(
                Bbox(x0=-0.05500000000000001, y0=-0.05500000000000001, x1=0.05500000000000001, y1=0.05500000000000001),
                0.05500000000000001, y1=0.05500000000000001),
```
TransformWrapper(
    BlendedAffine2D(
        IdentityTransform(),
        IdentityTransform()))),
BboxTransformTo(
    TransformedBbox(
        Bbox(x0=0.125, y0=0.10999999999999999, x1=0.9, y1=0.88),
        BboxTransformTo(
            TransformedBbox(
                Bbox(x0=0.0, y0=0.0, x1=6.4, y1=4.8),
                Affine2D(
                    [[ 100.  0.  0.],
                      [  0. 100.  0.],
                      [  0.   0.  1.]]))))))

7.14 New in Matplotlib 3.0

7.14.1 Improved default backend selection

The default backend no longer must be set as part of the build process. Instead, at run time, the built-in backends are tried in sequence until one of them imports.

Headless Linux servers (identified by the DISPLAY env not being defined) will not select a GUI backend.

7.14.2 Cyclic colormaps

Two new colormaps named ‘twilight’ and ‘twilight_shifted’ have been added. These colormaps start and end on the same color, and have two symmetric halves with equal lightness, but diverging color. Since they wrap around, they are a good choice for cyclic data such as phase angles, compass directions, or time of day. Like viridis and cividis, twilight is perceptually uniform and colorblind friendly.

7.14.3 Ability to scale axis by a fixed order of magnitude

To scale an axis by a fixed order of magnitude, set the scilimits argument of Axes.ticklabel_format to the same (non-zero) lower and upper limits. Say to scale the y axis by a million (1e6), use

```
ax.ticklabel_format(style='sci', scilimits=(6, 6), axis='y')
```

The behavior of scilimits=(0, 0) is unchanged. With this setting, Matplotlib will adjust the order of magnitude depending on the axis values, rather than keeping it fixed. Previously, setting scilimits=(m, m) was equivalent to setting scilimits=(0, 0).
7.14.4 Add AnchoredDirectionArrows feature to mpl_toolkits

A new mpl_toolkits class AnchoredDirectionArrows draws a pair of orthogonal arrows to indicate directions on a 2D plot. A minimal working example takes in the transformation object for the coordinate system (typically ax.transAxes), and arrow labels. There are several optional parameters that can be used to alter layout. For example, the arrow pairs can be rotated and the color can be changed. By default the labels and arrows have the same color, but the class may also pass arguments for customizing arrow and text layout, these are passed to matplotlib.text.TextPath and matplotlib.patches.FancyArrowPatch. Location, length and width for both arrow tail and head can be adjusted, the the direction arrows and labels can have a frame. Padding and separation parameters can be adjusted.

7.14.5 Add minorticks_on()/off() methods for colorbar

A new method colorbar.Colobar.minorticks_on() has been added to correctly display minor ticks on a colorbar. This method doesn’t allow the minor ticks to extend into the regions beyond vmin and vmax when the extend kwarg (used while creating the colorbar) is set to ‘both’, ‘max’ or ‘min’. A complementary method colorbar.Colobar.minorticks_off() has also been added to remove the minor ticks on the colorbar.

7.14.6 Colorbar ticks can now be automatic

The number of ticks placed on colorbars was previously appropriate for a large colorbar, but looked bad if the colorbar was made smaller (i.e. via the shrink kwarg). This has been changed so that the number of ticks is now responsive to how large the colorbar is.

7.14.7 Don’t automatically rename duplicate file names

Previously, when saving a figure to a file using the GUI’s save dialog box, if the default filename (based on the figure window title) already existed on disk, Matplotlib would append a suffix (e.g. Figure_1-1.png), preventing the dialog from prompting to overwrite the file. This behaviour has been removed. Now if the file name exists on disk, the user is prompted whether or not to overwrite it. This eliminates guesswork, and allows intentional overwriting, especially when the figure name has been manually set using figure.Figure.canvas.set_window_title().

7.14.8 Legend now has a title_fontsize kwarg (and rcParam)

The title for a Figure.legend and Axes.legend can now have its fontsize set via the title_fontsize kwarg. There is also a new rcParams["legend.title_fontsize"] (default: None). Both default to None, which means the legend title will have the same fontsize as the axes default fontsize (not the legend fontsize, set by the fontsize kwarg or rcParams["legend.fontsize"] (default: ‘medium’)).

7.14.9 Support for axes.prop_cycle property markevery in rcParams

The Matplotlib rcParams settings object now supports configuration of the attribute axes.prop_cycle with cyclers using the markevery Line2D object property. An example of this feature
is provided at /gallery/lines_bars_and_markers марkevery_prop_cycle.

### 7.14.10 Multipage PDF support for pgf backend

The pgf backend now also supports multipage PDF files.

```python
from matplotlib.backends.backend_pdf import PdfPages
import matplotlib.pyplot as plt

with PdfPages('multipage.pdf') as pdf:
    # page 1
    plt.plot([2, 1, 3])
    pdf.savefig()

    # page 2
    plt.cla()
    plt.plot([3, 1, 2])
    pdf.savefig()
```

### 7.14.11 Pie charts are now circular by default

We acknowledge that the majority of people do not like egg-shaped pies. Therefore, an axes to which a pie chart is plotted will be set to have equal aspect ratio by default. This ensures that the pie appears circular independent on the axes size or units. To revert to the previous behaviour set the axes’ aspect ratio to automatic by using `ax.set_aspect("auto")` or `plt.axis("auto")`.

### 7.14.12 Add `ax.get_gridspec` to `SubplotBase`

New method `SubplotBase.get_gridspec` is added so that users can easily get the gridspec that went into making an axes:

```python
import matplotlib.pyplot as plt

fig, axs = plt.subplots(3, 2)
gs = axs[0, -1].get_gridspec()

# remove the last column
for ax in axs[:, -1].flatten():
    ax.remove()

# make a subplot in last column that spans rows.
ax = fig.add_subplot(gs[:, -1])
plt.show()
```

### 7.14.13 Axes titles will no longer overlap xaxis

Previously an axes title had to be moved manually if an xaxis overlapped (usually when the xaxis was put on the top of the axes). Now, the title will be automatically moved above the
xaxis and its decorators (including the xlabel) if they are at the top.

If desired, the title can still be placed manually. There is a slight kludge; the algorithm checks if the y-position of the title is 1.0 (the default), and moves if it is. If the user places the title in the default location (i.e. ax.title.set_position(0.5, 1.0)), the title will still be moved above the xaxis. If the user wants to avoid this, they can specify a number that is close (i.e. ax.title.set_position(0.5, 1.01)) and the title will not be moved via this algorithm.

### 7.14.14 New convenience methods for GridSpec

There are new convenience methods for `gridspec.GridSpec` and `gridspec.GridSpecFromSubplotSpec`. Instead of the former we can now call `Figure.add_gridspec` and for the latter `SubplotSpec.subgridspec`.

```python
import matplotlib.pyplot as plt

fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

### 7.14.15 Figure has an add_artist method

A method `add_artist` has been added to the `Figure` class, which allows artists to be added directly to a figure. E.g.

```python
circ = plt.Circle((.7, .5), .05)
fig.add_artist(circ)
```

In case the added artist has no transform set previously, it will be set to the figure transform (fig.transFigure). This new method may be useful for adding artists to figures without axes or to easily position static elements in figure coordinates.

### 7.14.16 :math: directive renamed to :mathmpl:

The :math: rst role provided by `matplotlib.sphinxext.mathmpl` has been renamed to :mathmpl: to avoid conflicting with the :math: role that Sphinx 1.8 provides by default. (:mathmpl: uses Matplotlib to render math expressions to images embedded in html, whereas Sphinx uses MathJax.)

When using Sphinx<1.8, both names (:math: and :mathmpl:) remain available for backcompatibility.

### 7.15 What’s new in Matplotlib 3.1

For a list of all of the issues and pull requests since the last revision, see the GitHub Stats.
# What's new in Matplotlib 3.1

## New Features

- ConciseDateFormatter
- Secondary x/y Axis support
- FuncScale for arbitrary axes scales
- Legend for scatter
- Matplotlib no longer requires framework app build on MacOSX backend

## Figure, FigureCanvas, and Backends

- Figure.frameon is now a direct proxy for the Figure patch visibility state
- pil_kwargs argument added to savefig
- Add inaxes method to FigureCanvasBase
- cairo backend defaults to pycairo instead of cairocffi

## Axes and Artists

- axes_grid1 and axisartist Axes no longer draw spines twice
- Return type of ArtistInspector.get_aliases changed
- ConnectionPatch accepts arbitrary transforms
- mplot3d Line3D now allows {set,get}_data_3d
- Axes3D.voxels now shades the resulting voxels

## Axis and Ticks

- Added Axis.get_inverted and Axis.set_inverted
- Adjust default minor tick spacing
- EngFormatter now accepts usetex, useMathText as keyword only arguments

## Animation and Interactivity

- Support for forward/backward mouse buttons
- progress_callback argument to save()
- Add cache_frame_data keyword-only argument into animation.FuncAnimation
- Endless Looping GIFs with PillowWriter
- Adjusted matplotlib.widgets.Slider to have vertical orientation
- Improved formatting of image values under cursor when a colorbar is present
- MouseEvent button attribute is now an IntEnum

## Configuration, Install, and Development

- The MATPLOTLIBRC environment variable can now point to any “file” path
- Allow LaTeX code \text\pgf\preamble and \text\latex\preamble in MATPLOTLIBRC file
- New logging API
7.15.1 New Features

ConciseDateFormatter

The automatic date formatter used by default can be quite verbose. A new formatter can be accessed that tries to make the tick labels appropriately concise.

Secondary x/y Axis support

A new method provides the ability to add a second axis to an existing axes via `Axes.secondary_xaxis` and `Axes.secondary_yaxis`. See /gallery/subplots_axes_and_figures/secondary_axis for examples.

FuncScale for arbitrary axes scales

A new `FuncScale` class was added (and `FuncTransform`) to allow the user to have arbitrary scale transformations without having to write a new subclass of `ScaleBase`. This can be accessed by:
ax.set_yscale('function', functions=(forward, inverse))

where forward and inverse are callables that return the scale transform and its inverse. See the last example in /gallery/scales/scales.

Legend for scatter

A new method for creating legends for scatter plots has been introduced. Previously, in order to obtain a legend for a scatter() plot, one could either plot several scatters, each with an individual label, or create proxy artists to show in the legend manually. Now, PathCollection provides a method legend_elements() to obtain the handles and labels for a scatter plot in an automated way. This makes creating a legend for a scatter plot as easy as.

An example can be found in automatedlegendcreation.

Matplotlib no longer requires framework app build on MacOSX backend

Previous versions of matplotlib required a Framework build of python to work. The app type was updated to no longer require this, so the MacOSX backend should work with non-framework python.

This also adds support for the MacOSX backend for PyPy3.

7.15.2 Figure, FigureCanvas, and Backends

Figure.frameon is now a direct proxy for the Figure patch visibility state

Accessing Figure.frameon (including via get_frameon and set_frameon now directly forwards to the visibility of the underlying Rectangle artist (Figure.patch.get_frameon, Figure.patch.set_frameon).
pil_kwargs argument added to savefig

Matplotlib uses Pillow to handle saving to the JPEG and TIFF formats. The `savefig()` function gained a `pil_kwargs` keyword argument, which can be used to forward arguments to Pillow’s `pillow.Image.save()`.

The `pil_kwargs` argument can also be used when saving to PNG. In that case, Matplotlib also uses Pillow’s `pillow.Image.save()` instead of going through its own builtin PNG support.

Add inaxes method to FigureCanvasBase

The `FigureCanvasBase` class has now an `inaxes` method to check whether a point is in an axes and returns the topmost axes, else None.

cairo backend defaults to pycairo instead of cairocffi

This leads to faster import/runtime performance in some cases. The backend will fall back to cairocffi in case pycairo isn’t available.

7.15.3 Axes and Artists
axes_grid1 and axisartist Axes no longer draw spines twice

Previously, spines of axes_grid1 and axisartist Axes would be drawn twice, leading to a "bold" appearance. This is no longer the case.

Return type of ArtistInspector.get_aliases changed

`ArtistInspector.get_aliases` previously returned the set of aliases as `{fullname: {alias1: None, alias2: None, ...}}`. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. `{fullname: {alias1, alias2, ...}}`. This value is also stored in `ArtistInspector.aliasd`, which has likewise changed.

ConnectionPatch accepts arbitrary transforms

Alternatively to strings like "data" or "axes fraction" ConnectionPatch now accepts any `Transform` as input for the `coordsA` and `coordsB` argument. This allows to draw lines between points defined in different user defined coordinate systems. Also see the Connect Simple01 example.

mplot3d Line3D now allows `{set.get}_data_3d

Lines created with the 3d projection in mplot3d can now access the data using `get_data_3d()` which returns a tuple of array_likes containing the (x, y, z) data. The equivalent `set_data_3d` can be used to modify the data of an existing Line3D.

Axes3D.voxels now shades the resulting voxels

The `voxels()` method now takes a `shade` parameter that defaults to `True`. This shades faces based on their orientation, behaving just like the matching parameters to `trisurf()` and `bar3d()`. The plot below shows how this affects the output.

7.15.4 Axis and Ticks

Added `Axis.get_inverted` and `Axis.set_inverted`

The `Axis.get_inverted` and `Axis.set_inverted` methods query and set whether the axis uses "inverted" orientation (i.e. increasing to the left for the x-axis and to the bottom for the y-axis).

They perform tasks similar to `Axes.xaxis_inverted`, `Axes.yaxis_inverted`, `Axes.invert_xaxis`, and `Axes.invert_yaxis`, with the specific difference that `Axes...set_inverted` makes it easier to set the invertedness of an axis regardless of whether it had previously been inverted before.

Adjust default minor tick spacing

Default minor tick spacing was changed from 0.625 to 0.5 for major ticks spaced 2.5 units apart.
EngFormatter now accepts usetex, useMathText as keyword only arguments

A public API has been added to EngFormatter to control how the numbers in the ticklabels will be rendered. By default, useMathText evaluates to `rcParams["axes.formatter.use_mathtext"]` and usetex evaluates to `rcParams["text.usetex"]`.

If either is True then the numbers will be encapsulated by $ signs. When using TeX this implies that the numbers will be shown in TeX’s math font. When using mathtext, the $ signs around numbers will ensure unicode rendering (as implied by mathtext). This will make sure that the minus signs in the ticks are rendered as the unicode=minus (U+2212) when using mathtext (without relying on the fix_minus method).

7.15.5 Animation and Interactivity

Support for forward/backward mouse buttons

Figure managers now support a button_press event for mouse buttons, similar to the key_press events. This allows binding actions to mouse buttons (see MouseButton). The first application of this mechanism is support of forward/backward mouse buttons in figures created with the Qt5 backend.

progress_callback argument to save()

The method Animation.save gained an optional progress_callback argument to notify the saving progress.

Add cache_frame_data keyword-only argument into animation.FuncAnimation

matplotlib.animation.FuncAnimation has been caching frame data by default; however, this caching is not ideal in certain cases e.g. When FuncAnimation needs to be only drawn(not
Matplotlib, Release 3.1.3

saved) interactively and memory required by frame data is quite large. By adding `cache_frame_data` keyword-only argument, users can now disable this caching; thereby, this new argument provides a fix for issue #8528.

Endless Looping GIFs with PillowWriter

We acknowledge that most people want to watch a gif more than once. Saving an animation as a gif with PillowWriter now produces an endless looping gif.

Adjusted `matplotlib.widgets.Slider` to have vertical orientation

The `matplotlib.widgets.Slider` widget now takes an optional argument `orientation` which indicates the direction ('horizontal' or 'vertical') that the slider should take.

Improved formatting of image values under cursor when a colorbar is present

When a colorbar is present, its formatter is now used to format the image values under the mouse cursor in the status bar. For example, for an image displaying the values 10,000 and 10,001, the statusbar will now (using default settings) display the values as 10000 and 10001), whereas both values were previously displayed as $1e+04$.

MouseEvent button attribute is now an IntEnum

The `button` attribute of `MouseEvent` instances can take the values None, 1 (left button), 2 (middle button), 3 (right button), "up" (scroll), and "down" (scroll). For better legibility, the 1, 2, and 3 values are now represented using the `IntEnum` class with the values `MouseButton.LEFT` (== 1), `MouseButton.MIDDLE` (== 2), and `MouseButton.RIGHT` (== 3).

7.15.6 Configuration, Install, and Development

The `MATPLOTLIBRC` environment variable can now point to any "file" path

This includes device files; in particular, on Unix systems, one can set `MATPLOTLIBRC` to /dev/null to ignore the user's matplotlibrc file and fall back to Matplotlib's defaults.

As a reminder, if `MATPLOTLIBRC` points to a directory, Matplotlib will try to load the matplotlibrc file from `$MATPLOTLIBRC/matplotlibrc`.

Allow LaTeX code `pgf.preamble` and `text.latex.preamble` in `MATPLOTLIBRC` file

Previously, the rc file keys `rcParams["pgf.preamble"]` (default: ") and `rcParams["text.latex.preamble"]` (default: ") were parsed using commas as separators. This would break valid LaTeX code, such as:

```
\usepackage[protrusion=true, expansion=false]{microtype}
```
The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to.

New logging API

`matplotlib.set_loglevel` / `pyplot.set_loglevel` can be called to display more (or less) detailed logging output.
Matplotlib only uses BSD compatible code, and its license is based on the PSF license. See the Open Source Initiative licenses page for details on individual licenses. Non-BSD compatible licenses (e.g., LGPL) are acceptable in matplotlib toolkits. For a discussion of the motivations behind the licencing choice, see Licenses.

8.1 Copyright Policy

John Hunter began matplotlib around 2003. Since shortly before his passing in 2012, Michael Droettboom has been the lead maintainer of matplotlib, but, as has always been the case, matplotlib is the work of many.

Prior to July of 2013, and the 1.3.0 release, the copyright of the source code was held by John Hunter. As of July 2013, and the 1.3.0 release, matplotlib has moved to a shared copyright model.

matplotlib uses a shared copyright model. Each contributor maintains copyright over their contributions to matplotlib. But, it is important to note that these contributions are typically only changes to the repositories. Thus, the matplotlib source code, in its entirety, is not the copyright of any single person or institution. Instead, it is the collective copyright of the entire matplotlib Development Team. If individual contributors want to maintain a record of what changes/contributions they have specific copyright on, they should indicate their copyright in the commit message of the change, when they commit the change to one of the matplotlib repositories.

The Matplotlib Development Team is the set of all contributors to the matplotlib project. A full list can be obtained from the git version control logs.

8.2 License agreement for matplotlib 3.1.3

1. This LICENSE AGREEMENT is between the Matplotlib Development Team (“MDT”), and the Individual or Organization (“Licensee”) accessing and otherwise using matplotlib software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, MDT hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use matplotlib 3.1.3 alone or in any derivative version, provided, however, that MDT’s License Agreement and MDT’s notice of copyright, i.e., “Copyright (c) 2012-2013 Matplotlib Development Team;
All Rights Reserved” are retained in matplotlib 3.1.3 alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates matplotlib 3.1.3 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to matplotlib 3.1.3.

4. MDT is making matplotlib 3.1.3 available to Licensee on an “AS IS” basis. MDT MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, MDT MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB 3.1.3 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. MDT SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB 3.1.3 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING MATPLOTLIB 3.1.3, OR ANY DERIVATIVE THEREOF, EVEN IF ADVISED OF THE POSSIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between MDT and Licensee. This License Agreement does not grant permission to use MDT trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib 3.1.3, Licensee agrees to be bound by the terms and conditions of this License Agreement.

8.3 License agreement for matplotlib versions prior to 1.3.0

1. This LICENSE AGREEMENT is between John D. Hunter (“JDH”), and the Individual or Organization (“Licensee”) accessing and otherwise using matplotlib software in source or binary form and its associated documentation.

2. Subject to the terms and conditions of this License Agreement, JDH hereby grants Licensee a nonexclusive, royalty-free, world-wide license to reproduce, analyze, test, perform and/or display publicly, prepare derivative works, distribute, and otherwise use matplotlib 3.1.3 alone or in any derivative version, provided, however, that JDH’s License Agreement and JDH’s notice of copyright, i.e., “Copyright (c) 2002-2009 John D. Hunter; All Rights Reserved” are retained in matplotlib 3.1.3 alone or in any derivative version prepared by Licensee.

3. In the event Licensee prepares a derivative work that is based on or incorporates matplotlib 3.1.3 or any part thereof, and wants to make the derivative work available to others as provided herein, then Licensee hereby agrees to include in any such work a brief summary of the changes made to matplotlib 3.1.3.

4. JDH is making matplotlib 3.1.3 available to Licensee on an “AS IS” basis. JDH MAKES NO REPRESENTATIONS OR WARRANTIES, EXPRESS OR IMPLIED. BY WAY OF EXAMPLE, BUT NOT LIMITATION, JDH MAKES NO AND DISCLAIMS ANY REPRESENTATION OR WARRANTY OF MERCHANTABILITY OR FITNESS FOR ANY PARTICULAR PURPOSE OR THAT THE USE OF MATPLOTLIB 3.1.3 WILL NOT INFRINGE ANY THIRD PARTY RIGHTS.

5. JDH SHALL NOT BE LIABLE TO LICENSEE OR ANY OTHER USERS OF MATPLOTLIB 3.1.3 FOR ANY INCIDENTAL, SPECIAL, OR CONSEQUENTIAL DAMAGES OR LOSS AS A
RESULT OF MODIFYING, DISTRIBUTING, OR OTHERWISE USING MATPLOTLIB 3.1.3, OR ANY DERivative THEREOF, EVEN IF ADVISED OF THE POSsIBILITY THEREOF.

6. This License Agreement will automatically terminate upon a material breach of its terms and conditions.

7. Nothing in this License Agreement shall be deemed to create any relationship of agency, partnership, or joint venture between JDH and Licensee. This License Agreement does not grant permission to use JDH trademarks or trade name in a trademark sense to endorse or promote products or services of Licensee, or any third party.

8. By copying, installing or otherwise using matplotlib 3.1.3, Licensee agrees to be bound by the terms and conditions of this License Agreement.
Matplotlib was written by John D. Hunter, with contributions from an ever-increasing number of users and developers. The current lead developer is Thomas A. Caswell; they are assisted by many active developers.

The following is a list of contributors extracted from the git revision control history of the project:

Élie Gouzien, Андрей Парамонов

Some earlier contributors not included above are (with apologies to any we have missed):

Charles Twardy, Gary Ruben, John Gill, David Moore, Paul Barrett, Jared Wahlstrand, Jim Benson, Paul Mcguire, Andrew Dalke, Nadia Dencheva, Baptiste Carvello, Sigve Tjoraand, Ted Drain, James Amundson, Daishi Harada, Nicolas Young, Paul Kienzle, John Porter, and Jonathon Taylor.

Thanks to Tony Yu for the original logo design.

We also thank all who have reported bugs, commented on proposed changes, or otherwise contributed to Matplotlib’s development and usefulness.

10.1 Report a compilation problem

See Getting help.

10.2 Matplotlib compiled fine, but nothing shows up when I use it

The first thing to try is a clean install and see if that helps. If not, the best way to test your install is by running a script, rather than working interactively from a python shell or an integrated development environment such as IDLE which add additional complexities. Open up a UNIX shell or a DOS command prompt and run, for example:

```
python -c "from pylab import *; plot(); show()" --verbose--helpful
```

This will give you additional information about which backends Matplotlib is loading, version information, and more. At this point you might want to make sure you understand Matplotlib's
configuration process, governed by the matplotlibrc configuration file which contains instructions within and the concept of the Matplotlib backend.

If you are still having trouble, see Getting help.

10.3 How to completely remove Matplotlib

Occasionally, problems with Matplotlib can be solved with a clean installation of the package. In order to fully remove an installed Matplotlib:

1. Delete the caches from your Matplotlib configuration directory.
2. Delete any Matplotlib directories or eggs from your installation directory.

10.4 Linux Notes

To install Matplotlib at the system-level, we recommend that you use your distribution’s package manager. This will guarantee that Matplotlib’s dependencies will be installed as well.

If, for some reason, you cannot use the package manager, you may use the wheels available on PyPI:

```
python -mpip install matplotlib
```

or build Matplotlib from source.

10.5 OSX Notes

10.5.1 Which python for OSX?

Apple ships OSX with its own Python, in /usr/bin/python, and its own copy of Matplotlib. Unfortunately, the way Apple currently installs its own copies of NumPy, Scipy and Matplotlib means that these packages are difficult to upgrade (see system python packages). For that reason we strongly suggest that you install a fresh version of Python and use that as the basis for installing libraries such as NumPy and Matplotlib. One convenient way to install Matplotlib with other useful Python software is to use one of the excellent Python scientific software collections that are now available:

- Anaconda from Continuum Analytics
- Canopy from Enthought

These collections include Python itself and a wide range of libraries; if you need a library that is not available from the collection, you can install it yourself using standard methods such as pip. Continuum and Enthought offer their own installation support for these collections; see the Anaconda and Canopy web pages for more information.

Other options for a fresh Python install are the standard installer from python.org, or installing Python using a general OSX package management system such as homebrew or macports. Power users on OSX will likely want one of homebrew or macports on their system to install open source software packages, but it is perfectly possible to use these systems with another source for your Python binary, such as Anaconda, Canopy or Python.org Python.
### 10.5.2 Installing OSX binary wheels

If you are using Python from [https://www.python.org](https://www.python.org), Homebrew, or Macports, then you can use the standard pip installer to install Matplotlib binaries in the form of wheels.

pip is installed by default with python.org and Homebrew Python, but needs to be manually installed on Macports with

```
sudo port install py36-pip
```

Once pip is installed, you can install Matplotlib and all its dependencies with from the Terminal.app command line:

```
python3 -mpip install matplotlib
```

(sudo python3.6 ... on Macports).

You might also want to install IPython or the Jupyter notebook (python3 -mpip install ipython notebook).

### pip problems

If you get errors with pip trying to run a compiler like gcc or clang, then the first thing to try is to install xcode and retry the install. If that does not work, then check [Getting help](https://matplotlib.org/users/installing.html).

### 10.5.3 Checking your installation

The new version of Matplotlib should now be on your Python “path”. Check this at the Terminal.app command line:

```
python3 -c "import matplotlib; print(matplotlib.__version__, matplotlib.__file__)"
```

You should see something like

```
3.0.0 /Library/Frameworks/Python.framework/Versions/3.6/lib/python3.6/site-packages/__init__.py
```

where 3.0.0 is the Matplotlib version you just installed, and the path following depends on whether you are using Python.org Python, Homebrew or Macports. If you see another version, or you get an error like

```
Traceback (most recent call last):
  File "<string>", line 1, in <module>
ImportError: No module named matplotlib
```

then check that the Python binary is the one you expected by running

```
which python3
```

If you get a result like /usr/bin/python..., then you are getting the Python installed with OSX, which is probably not what you want. Try closing and restarting Terminal.app before running the check again. If that doesn’t fix the problem, depending on which Python you wanted to use, consider reinstalling Python.org Python, or check your homebrew or macports setup.
Remember that the disk image installer only works for Python.org Python, and will not get picked up by other Pythons. If all these fail, please let us know.

## 10.6 Install from source

Clone the main source using one of:

```bash
git clone git@github.com:matplotlib/matplotlib.git
```

or:

```bash
git clone git://github.com/matplotlib/matplotlib.git
```

and build and install as usual with:

```bash
cd matplotlib
python -mpip install .
```

**Note:** If you are on Debian/Ubuntu, you can get all the dependencies required to build Matplotlib with:

```bash
sudo apt-get build-dep python-matplotlib
```

If you are on Fedora/RedHat, you can get all the dependencies required to build Matplotlib by first installing `yum-builddep` and then running:

```bash
su -c 'yum-builddep python-matplotlib'
```

This does not build Matplotlib, but it does get all of the build dependencies, which will make building from source easier.

If you want to be able to follow the development branch as it changes just replace the last step with:

```bash
python -mpip install -e .
```

This creates links and installs the command line script in the appropriate places.

**Note:** OSX users please see the [Building on macOS](#) guide.

Windows users please see the [Building on Windows](#) guide.

Then, if you want to update your Matplotlib at any time, just do:

```bash
git pull
```

When you run `git pull`, if the output shows that only Python files have been updated, you are all set. If C files have changed, you need to run `pip install -e` again to compile them.

There is more information on using `git` in the developer docs.

    * Request a new feature
    * Reporting a bug or submitting a patch
    * Contribute to Matplotlib documentation
  - How to use Matplotlib in a web application server
11.1 How-to: Plotting

11.1.1 Plot numpy.datetime64 values

As of Matplotlib 2.2, numpy.datetime64 objects are handled the same way as `datetime.datetime` objects.

If you prefer the pandas converters and locators, you can register their converter with the `matplotlib.units` module:

```python
from pandas.tseries import converter as pdtc
pdtc.register()
```

If you only want to use the pandas converter for datetime64 values:

```python
from pandas.tseries import converter as pdtc
import matplotlib.units as munits
import numpy as np

munits.registry[np.datetime64] = pdtc.DatetimeConverter()
```

11.1.2 Check whether a figure is empty

Empty can actually mean different things. Does the figure contain any artists? Does a figure with an empty `Axes` still count as empty? Is the figure empty if it was rendered pure white (there may be artists present, but they could be outside the drawing area or transparent)?

For the purpose here, we define empty as: “The figure does not contain any artists except it’s background patch.” The exception for the background is necessary, because by default every figure contains a `Rectangle` as it’s background patch. This definition could be checked via:

```python
def is_empty(figure):
    """
    Return whether the figure contains no Artists (other than the default background patch).
    """
    contained_artists = figure.get_children()
    return len(contained_artists) <= 1
```

We’ve decided not to include this as a figure method because this is only one way of defining empty, and checking the above is only rarely necessary. Usually the user or program handling the figure know if they have added something to the figure.

Checking whether a figure would render empty cannot be reliably checked except by actually rendering the figure and investigating the rendered result.
11.1.3 Find all objects in a figure of a certain type

Every Matplotlib artist (see Artist tutorial) has a method called `findobj()` that can be used to recursively search the artist for any artists it may contain that meet some criteria (e.g., match all `Line2D` instances or match some arbitrary filter function). For example, the following snippet finds every object in the figure which has a `set_color` property and makes the object blue:

```python
def myfunc(x):
    return hasattr(x, 'set_color')
for o in fig.findobj(myfunc):
    o.set_color('blue')
```

You can also filter on class instances:

```python
import matplotlib.text as text
for o in fig.findobj(text.Text):
    o.set_fontstyle('italic')
```

11.1.4 How to prevent ticklabels from having an offset

The default formatter will use an offset to reduce the length of the ticklabels. To turn this feature off on a per-axis basis:

```python
ax.get_xaxis().get_major_formatter().set_useOffset(False)
```

set the rcParam `axes.formatter.useoffset`, or use a different formatter. See `ticker` for details.

11.1.5 Save transparent figures

The `savefig()` command has a keyword argument `transparent` which, if ‘True’, will make the figure and axes backgrounds transparent when saving, but will not affect the displayed image on the screen.

If you need finer grained control, e.g., you do not want full transparency or you want to affect the screen displayed version as well, you can set the alpha properties directly. The figure has a `Rectangle` instance called `patch` and the axes has a `Rectangle` instance called `patch`. You can set any property on them directly (facecolor, edgecolor, linewidth, linestyle, alpha). e.g.:

```python
fig = plt.figure()
fig.patch.set_alpha(0.5)
ax = fig.add_subplot(111)
ax.patch.set_alpha(0.5)
```

If you need all the figure elements to be transparent, there is currently no global alpha setting, but you can set the alpha channel on individual elements, e.g.:

```python
ax.plot(x, y, alpha=0.5)
ax.set_xlabel('volts', alpha=0.5)
```
11.1.6 Save multiple plots to one pdf file

Many image file formats can only have one image per file, but some formats support multi-page files. Currently only the pdf backend has support for this. To make a multi-page pdf file, first initialize the file:

```python
from matplotlib.backends.backend_pdf import PdfPages
pp = PdfPages('multipage.pdf')
```

You can give the `PdfPages` object to `savefig()`, but you have to specify the format:

```python
plt.savefig(pp, format='pdf')
```

An easier way is to call `PdfPages.savefig`:

```python
pp.savefig()
```

Finally, the multipage pdf object has to be closed:

```python
pp.close()
```

The same can be done using the pgf backend:

```python
from matplotlib.backends.backend_pdf import PdfPages
```

11.1.7 Move the edge of an axes to make room for tick labels

For subplots, you can control the default spacing on the left, right, bottom, and top as well as the horizontal and vertical spacing between multiple rows and columns using the `matplotlib.figure.Figure.subplots_adjust()` method (in pyplot it is `subplots_adjust()`). For example, to move the bottom of the subplots up to make room for some rotated x tick labels:

```python
fig = plt.figure()
fig.subplots_adjust(bottom=0.2)
ax = fig.add_subplot(111)
```

You can control the defaults for these parameters in your `matplotlibrc` file; see *Customizing Matplotlib with style sheets and rcParams*. For example, to make the above setting permanent, you would set:

```bash
figure.subplot.bottom : 0.2  # the bottom of the subplots of the figure
```

The other parameters you can configure are, with their defaults

- `left = 0.125` the left side of the subplots of the figure
- `right = 0.9` the right side of the subplots of the figure
- `bottom = 0.1` the bottom of the subplots of the figure
- `top = 0.9` the top of the subplots of the figure
- `wspace = 0.2` the amount of width reserved for space between subplots, expressed as a fraction of the average axis width
- `hspace = 0.2` the amount of height reserved for space between subplots, expressed as a fraction of the average axis height
If you want additional control, you can create an `Axes` using the `axes()` command (or equivalently the figure `add_axes()` method), which allows you to specify the location explicitly:

```python
ax = fig.add_axes([left, bottom, width, height])
```

where all values are in fractional (0 to 1) coordinates. See /gallery/subplots_axes_and_figures/axes_demo for an example of placing axes manually.

### 11.1.8 Automatically make room for tick labels

**Note:** This is now easier to handle than ever before. Calling `tight_layout()` or alternatively using `constrained_layout=True` argument in `subplots()` can fix many common layout issues. See the [Tight Layout guide](https://matplotlib.org/stable/tutorials/tight_layout_guide.html) and [Constrained Layout Guide](https://matplotlib.org/stable/tutorials/constrained_layout_guide.html) for more details.

The information below is kept here in case it is useful for other purposes.

In most use cases, it is enough to simply change the subplots adjust parameters as described in *Move the edge of an axes to make room for tick labels*. But in some cases, you don’t know ahead of time what your tick labels will be, or how large they will be (data and labels outside your control may be being fed into your graphing application), and you may need to automatically adjust your subplot parameters based on the size of the tick labels. Any `Text` instance can report its extent in window coordinates (a negative x coordinate is outside the window), but there is a rub.

The `RendererBase` instance, which is used to calculate the text size, is not known until the figure is drawn (`draw()`). After the window is drawn and the text instance knows its renderer, you can call `get_window_extent()`. One way to solve this chicken and egg problem is to wait until the figure is draw by connecting (`mpl_connect()`) to the “on_draw” signal (`DrawEvent`) and get the window extent there, and then do something with it, e.g., move the left of the canvas over; see [Event handling and picking](https://matplotlib.org/stable/tutorials/event_handling.html).

Here is an example that gets a bounding box in relative figure coordinates (0..1) of each of the labels and uses it to move the left of the subplots over so that the tick labels fit in the figure:

![Fig. 1: Auto Subplots Adjust](image)
11.1.9 Configure the tick widths

Wherever possible, it is recommended to use the `tick_params()` or `set_tick_params()` methods to modify tick properties:

```python
import matplotlib.pyplot as plt

fig, ax = plt.subplots()
ax.plot(range(10))

ax.tick_params(width=10)
plt.show()
```

For more control of tick properties that are not provided by the above methods, it is important to know that in Matplotlib, the ticks are markers. All `Line2D` objects support a line (solid, dashed, etc) and a marker (circle, square, tick). The tick width is controlled by the "markeredgewidth" property, so the above effect can also be achieved by:

```python
import matplotlib.pyplot as plt

fig, ax = plt.subplots()
ax.plot(range(10))

for line in ax.get_xticklines() + ax.get_yticklines():
    line.set_markeredgewidth(10)
plt.show()
```

The other properties that control the tick marker, and all markers, are `markerfacecolor`, `markeredgecolor`, `markeredgewidth`, `markersize`. For more information on configuring ticks, see `Axis containers` and `Tick containers`.

11.1.10 Align my ylabels across multiple subplots

If you have multiple subplots over one another, and the y data have different scales, you can often get ylabels that do not align vertically across the multiple subplots, which can be unattractive. By default, Matplotlib positions the x location of the ylabel so that it does not overlap any of the y ticks. You can override this default behavior by specifying the coordinates of the label. The example below shows the default behavior in the left subplots, and the manual setting in the right subplots.

11.1.11 Skip dates where there is no data

When plotting time series, e.g., financial time series, one often wants to leave out days on which there is no data, e.g., weekends. By passing in dates on the x-axis, you get large horizontal gaps on periods when there is not data. The solution is to pass in some proxy x-data, e.g., evenly sampled indices, and then use a custom formatter to format these as dates. The example below shows how to use an ‘index formatter’ to achieve the desired plot:
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.mlab as mlab
import matplotlib.ticker as ticker

r = mlab.csv2rec('./data/aapl.csv')
r.sort()
r = r[-30:]  # get the last 30 days

N = len(r)
ind = np.arange(N)  # the evenly spaced plot indices

def format_date(x, pos=None):
    thisind = np.clip(int(x+0.5), 0, N-1)
    return r.date[thisind].strftime('%Y-%m-%d')

fig = plt.figure()
ax = fig.add_subplot(111)
ax.plot(ind, r.adj_close, 'o-')
ax.xaxis.set_major_formatter(ticker.FuncFormatter(format_date))
fig.autofmt_xdate()

plt.show()

### 11.1.12 Control the depth of plot elements

Within an axes, the order that the various lines, markers, text, collections, etc appear is determined by the `set_zorder()` property. The default order is patches, lines, text, with collections of lines and collections of patches appearing at the same level as regular lines and patches, respectively:

```python
line, = ax.plot(x, y, zorder=10)
```

You can also use the Axes property `set_axisbelow()` to control whether the grid lines are placed...
above or below your other plot elements.

11.1.13 Make the aspect ratio for plots equal

The Axes property `set_aspect()` controls the aspect ratio of the axes. You can set it to be ‘auto’, ‘equal’, or some ratio which controls the ratio:

```python
ax = fig.add_subplot(111, aspect='equal')
```

11.1.14 Multiple y-axis scales

A frequent request is to have two scales for the left and right y-axis, which is possible using `twinx()` (more than two scales are not currently supported, though it is on the wish list). This works pretty well, though there are some quirks when you are trying to interactively pan and zoom, because both scales do not get the signals.

The approach uses `twinx()` (and its sister `twiny()`) to use 2 different axes, turning the axes rectangular frame off on the 2nd axes to keep it from obscuring the first, and manually setting the tick locs and labels as desired. You can use separate `matplotlib.ticker` formatters and locators as desired because the two axes are independent.
11.1.15 Generate images without having a window appear

Simply do not call `show`, and directly save the figure to the desired format:

```python
import matplotlib.pyplot as plt
plt.plot([1, 2, 3])
plt.savefig('myfig.png')
```

See also:

*How to use Matplotlib in a web application server* for information about running matplotlib inside of a web application.

11.1.16 Use `show()`

When you want to view your plots on your display, the user interface backend will need to start the GUI mainloop. This is what `show()` does. It tells Matplotlib to raise all of the figure windows created so far and start the mainloop. Because this mainloop is blocking by default (i.e., script execution is paused), you should only call this once per script, at the end. Script execution is resumed after the last window is closed. Therefore, if you are using Matplotlib to generate only images and do not want a user interface window, you do not need to call `show` (see *Generate images without having a window appear* and *What is a backend?).

**Note:** Because closing a figure window unregisters it from pyplot, you must call `savefig` before calling `show` if you wish to save the figure as well as view it.

Whether `show` blocks further execution of the script or the python interpreter depends on whether Matplotlib is set to use interactive mode. In non-interactive mode (the default setting), execution is paused until the last figure window is closed. In interactive mode, the execution is not paused, which allows you to create additional figures (but the script won’t finish until the last figure window is closed).

Because it is expensive to draw, you typically will not want Matplotlib to redraw a figure many times in a script such as the following:

```python
plot([1, 2, 3])    # draw here?
xlabel('time')    # and here?
ylabel('volts')   # and here?
title('a simple plot')  # and here?
show()
```

However, it is possible to force Matplotlib to draw after every command, which might be what you want when working interactively at the python console (see *Using matplotlib in a python shell*), but in a script you want to defer all drawing until the call to `show`. This is especially important for complex figures that take some time to draw. `show()` is designed to tell Matplotlib that you’re all done issuing commands and you want to draw the figure now.

**Note:** `show()` should typically only be called at most once per script and it should be the last line of your script. At that point, the GUI takes control of the interpreter. If you want to force a figure draw, use `draw()` instead.
New in version v1.0.0: Matplotlib 1.0.0 and 1.0.1 added support for calling `show` multiple times per script, and harmonized the behavior of interactive mode, across most backends.

11.1.17 Interpreting box plots and violin plots

Tukey’s box plots (Robert McGill, John W. Tukey and Wayne A. Larsen: “The American Statistician” Vol. 32, No. 1, Feb., 1978, pp. 12-16) are statistical plots that provide useful information about the data distribution such as skewness. However, bar plots with error bars are still the common standard in most scientific literature, and thus, the interpretation of box plots can be challenging for the unfamiliar reader. The figure below illustrates the different visual features of a box plot.

![Box Plot Diagram]

Violin plots are closely related to box plots but add useful information such as the distribution of the sample data (density trace). Violin plots were added in Matplotlib 1.4.

11.1.18 Working with threads

Matplotlib is not thread-safe: in fact, there are known race conditions that affect certain artists. Hence, if you work with threads, it is your responsibility to set up the proper locks to serialize access to Matplotlib artists.

Note that (for the case where you are working with an interactive backend) most GUI backends require being run from the main thread as well.

11.2 How-to: Contributing

11.2.1 Request a new feature

Is there a feature you wish Matplotlib had? Then ask! The best way to get started is to email the developer mailing list for discussion. This is an open source project developed primarily in the contributors free time, so there is no guarantee that your feature will be added. The best way to get the feature you need added is to contribute it yourself.
11.2.2 Reporting a bug or submitting a patch

The development of Matplotlib is organized through github. If you would like to report a bug or submit a patch please use that interface.

To report a bug create an issue on github (this requires having a github account). Please include a Short, Self Contained, Correct (Compileable), Example demonstrating what the bug is. Including a clear, easy to test example makes it easy for the developers to evaluate the bug. Expect that the bug reports will be a conversation. If you do not want to register with github, please email bug reports to the mailing list.

The easiest way to submit patches to Matplotlib is through pull requests on github. Please see the The Matplotlib Developers’ Guide for the details.

11.2.3 Contribute to Matplotlib documentation

Matplotlib is a big library, which is used in many ways, and the documentation has only scratched the surface of everything it can do. So far, the place most people have learned all these features are through studying the examples (How to search for examples), which is a recommended and great way to learn, but it would be nice to have more official narrative documentation guiding people through all the dark corners. This is where you come in.

There is a good chance you know more about Matplotlib usage in some areas, the stuff you do every day, than many of the core developers who wrote most of the documentation. Just pulled your hair out compiling Matplotlib for Windows? Write a FAQ or a section for the Installation page. Are you a digital signal processing wizard? Write a tutorial on the signal analysis plotting functions like xcorr(), psd() and specgram(). Do you use Matplotlib with django or other popular web application servers? Write a FAQ or tutorial and we’ll find a place for it in the User’s Guide. And so on... I think you get the idea.

Matplotlib is documented using the sphinx extensions to restructured text (ReST). sphinx is an extensible python framework for documentation projects which generates HTML and PDF, and is pretty easy to write; you can see the source for this document or any page on this site by clicking on the Show Source link at the end of the page in the sidebar.

The sphinx website is a good resource for learning sphinx, but we have put together a cheat-sheet at Writing documentation which shows you how to get started, and outlines the Matplotlib conventions and extensions, e.g., for including plots directly from external code in your documents.

Once your documentation contributions are working (and hopefully tested by actually building the docs) you can submit them as a patch against git. See Install git and Reporting a bug or submitting a patch. Looking for something to do? Search for TODO or look at the open issues on github.

11.3 How to use Matplotlib in a web application server

In general, the simplest solution when using Matplotlib in a web server is to completely avoid using pyplot (pyplot maintains references to the opened figures to make show work, but this will cause memory leaks unless the figures are properly closed). Since Matplotlib 3.1, one can directly create figures using the Figure constructor and save them to in-memory buffers. The following example uses Flask, but other frameworks work similarly:
import base64
from io import BytesIO

from flask import Flask
from matplotlib.figure import Figure

app = Flask(__name__)

@app.route("/")
def hello():
    # Generate the figure **without using pyplot**.
    fig = Figure()
    ax = fig.subplots()
    ax.plot([1, 2])
    # Save it to a temporary buffer.
    buf = BytesIO()
    fig.savefig(buf, format="png")
    # Embed the result in the html output.
    data = base64.b64encode(buf.getbuffer()).decode("ascii")
    return f"<img src='data:image/png;base64,{data}'>"

When using Matplotlib versions older than 3.1, it is necessary to explicitly instantiate an Agg canvas; see e.g. /gallery/user_interfaces/canvasagg.

11.3.1 Clickable images for HTML

Andrew Dalke of Dalke Scientific has written a nice article on how to make html click maps with Matplotlib agg PNGs. We would also like to add this functionality to SVG. If you are interested in contributing to these efforts that would be great.

11.4 How to search for examples

The nearly 300 code examples-index included with the Matplotlib source distribution are full-text searchable from the search page, but sometimes when you search, you get a lot of results from the The object-oriented API or other documentation that you may not be interested in if you just want to find a complete, free-standing, working piece of example code. To facilitate example searches, we have tagged every code example page with the keyword codex for code example which shouldn’t appear anywhere else on this site except in the FAQ. So if you want to search for an example that uses an ellipse, search for codex ellipse.
CHAPTER
TWELVE

TROUBLESHOOTING

Contents

- Troubleshooting
  - Obtaining Matplotlib version
  - matplotlib install location
  - matplotlib configuration and cache directory locations
  - Getting help
  - Problems with recent git versions

12.1 Obtaining Matplotlib version

To find out your Matplotlib version number, import it and print the __version__ attribute:

```python
>>> import matplotlib
>>> matplotlib.__version__
'0.98.0'
```

12.2 matplotlib install location

You can find what directory Matplotlib is installed in by importing it and printing the __file__ attribute:

```python
>>> import matplotlib
>>> matplotlib.__file__
'/home/jdhunter/dev/lib64/python2.5/site-packages/matplotlib/__init__.pyc'
```

12.3 matplotlib configuration and cache directory locations

Each user has a Matplotlib configuration directory which may contain a matplotlibrc file. To locate your matplotlib/ configuration directory, use matplotlib.get_configdir():

```python
```
>>> import matplotlib as mpl
>>> mpl.get_configdir()
'/home/darren/.config/matplotlib'

On unix-like systems, this directory is generally located in your `HOME` directory under the `.config/` directory.

In addition, users have a cache directory. On unix-like systems, this is separate from the configuration directory by default. To locate your `.cache/` directory, use `matplotlib.get_cachefile()`:

>>> import matplotlib as mpl
>>> mpl.get_cachefile()
'/home/darren/.cache/matplotlib'

On windows, both the config directory and the cache directory are the same and are in your `Documents and Settings` or `Users` directory by default:

>>> import matplotlib as mpl
>>> mpl.get_configdir()
'C:\Documents and Settings\jdhunter\.matplotlib'
>>> mpl.get_cachefile()
'C:\Documents and Settings\jdhunter\.matplotlib'

If you would like to use a different configuration directory, you can do so by specifying the location in your `MPLCONFIGDIR` environment variable – see Setting environment variables in `Linux and OS-X`. Note that `MPLCONFIGDIR` sets the location of both the configuration directory and the cache directory.

### 12.4 Getting help

There are a number of good resources for getting help with Matplotlib. There is a good chance your question has already been asked:

- The mailing list archive.
- Github issues.
- Stackoverflow questions tagged `matplotlib`.

If you are unable to find an answer to your question through search, please provide the following information in your e-mail to the mailing list:

- Your operating system (Linux/UNIX users: post the output of `uname -a`).
- Matplotlib version:

```
python -c "import matplotlib; print matplotlib.__version__"
```

- Where you obtained Matplotlib (e.g., your Linux distribution’s packages, Github, PyPi, or Anaconda or Enthought Canopy).
- Any customizations to your `matplotlibrc` file (see Customizing Matplotlib with style sheets and `rcParams`).
• If the problem is reproducible, please try to provide a minimal, standalone Python script that demonstrates the problem. This is the critical step. If you can’t post a piece of code that we can run and reproduce your error, the chances of getting help are significantly diminished. Very often, the mere act of trying to minimize your code to the smallest bit that produces the error will help you find a bug in your code that is causing the problem.

• Matplotlib provides debugging information through the logging library, and a helper function to set the logging level: one can call

```python
plt.set_loglevel("info")  # or "debug" for more info
```

to obtain this debugging information.

Standard functions from the logging module are also applicable; e.g., one could call

```python
logging.basicConfig(level="DEBUG")
```

even before importing Matplotlib (this is in particular necessary to get the logging info emitted during Matplotlib’s import), or attach a custom handler to the “matplotlib” logger. This may be useful if you use a custom logging configuration.

If you compiled Matplotlib yourself, please also provide:

• any changes you have made to setup.py or setupext.py.

• the output of:

```bash
rm -rf build
python setup.py build
```

The beginning of the build output contains lots of details about your platform that are useful for the Matplotlib developers to diagnose your problem.

• your compiler version - e.g., gcc --version.

Including this information in your first e-mail to the mailing list will save a lot of time.

You will likely get a faster response writing to the mailing list than filing a bug in the bug tracker. Most developers check the bug tracker only periodically. If your problem has been determined to be a bug and can not be quickly solved, you may be asked to file a bug in the tracker so the issue doesn’t get lost.

### 12.5 Problems with recent git versions

First make sure you have a clean build and install (see *How to completely remove Matplotlib*), get the latest git update, install it and run a simple test script in debug mode:

```bash
rm -rf /path/to/site-packages/matplotlib*
git clean -xdf
git pull
python -mpip install -v . > build.out
python examples/pylab_examples/simple_plot.py --verbose-debug > run.out
```

and post build.out and run.out to the matplotlib-devel mailing list (please do not post git problems to the users list).

Of course, you will want to clearly describe your problem, what you are expecting and what you are getting, but often a clean build and install will help. See also *Getting help*. 
13.1 Setting environment variables in Linux and OS-X

To list the current value of `PYTHONPATH`, which may be empty, try:

```
echo $PYTHONPATH
```

The procedure for setting environment variables in depends on what your default shell is. `BASH` seems to be the most common, but `CSH` is also common. You should be able to determine which by running at the command prompt:
13.1.1 BASH/KSH

To create a new environment variable:

```
export PYTHONPATH=~/.Python
```

To prepend to an existing environment variable:

```
export PATH=~/.bin:${PATH}
```

The search order may be important to you, do you want `~/.bin` to be searched first or last? To append to an existing environment variable:

```
export PATH=${PATH}:~/.bin
```

To make your changes available in the future, add the commands to your `~/.bashrc` file.

13.1.2 CSH/TCSH

To create a new environment variable:

```
setenv PYTHONPATH ~/.Python
```

To prepend to an existing environment variable:

```
setenv PATH ~/.bin:${PATH}
```

The search order may be important to you, do you want `~/.bin` to be searched first or last? To append to an existing environment variable:

```
setenv PATH ${PATH}:~/.bin
```

To make your changes available in the future, add the commands to your `~/.cshrc` file.

13.2 Setting environment variables in windows

Open the Control Panel (Start → Control Panel), start the System program. Click the Advanced tab and select the Environment Variables button. You can edit or add to the User Variables.
While Matplotlib itself runs fine in a virtual environment (venv), some of the GUI frameworks that Matplotlib uses for interactive figures are tricky to install in a venv. Everything below assumes some familiarity with the Matplotlib backends as found in *What is a backend*?

If you only use the IPython and Jupyter Notebook’s inline and notebook backends, or non-interactive backends, you should not have any issues and can ignore everything below.

Likewise, the Tk framework (TkAgg backend) does not require any external dependencies and is normally always available. On certain Linux distributions, a package named python-tk (or similar) needs to be installed.

Otherwise, the situation (at the time of writing) is as follows:

<table>
<thead>
<tr>
<th>framework</th>
<th>bindings</th>
<th>pip-installable?</th>
<th>conda or conda-forge-installable?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Qt5</td>
<td>PyQt5</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>Qt5</td>
<td>PySide2</td>
<td>yes</td>
<td>yes</td>
</tr>
<tr>
<td>Qt4</td>
<td>PyQt4</td>
<td>no</td>
<td>yes</td>
</tr>
<tr>
<td>Qt4</td>
<td>PySide</td>
<td>OSX and Windows</td>
<td>yes</td>
</tr>
<tr>
<td>GTK3</td>
<td>PyGObject</td>
<td>yes(^1)</td>
<td>Linux and OSX</td>
</tr>
<tr>
<td>wxWidgets</td>
<td>wxPython</td>
<td>yes(^2)</td>
<td>yes</td>
</tr>
</tbody>
</table>

For cases where the framework is not installable in a venv, it needs to be installed in the global (system) site-packages, and then made available from within the venv. This can be achieved by either of the following methods (in all cases, the system-wide Python and the venv Python must be of the same version):

- **vext** allows controlled access from within the venv to specific system-wide packages. A specific package needs to be installed for each framework, e.g. `vext.pyqt5`, etc. It is recommended to use `vext>=0.7.0` as earlier versions misconfigure the logging system.

- Using the `--system-site-packages` option when creating an environment adds all system-wide packages to the virtual environment. However, this breaks the isolation between the virtual environment and the system install. Among other issues it results in hard to debug problems with system packages shadowing the environment packages. If you use `virtualenv` (rather than the stdlib’s `venv`) together with `virtualenvwrapper`, this can be toggled with the `toggleglobalsitepackages` command.

---

\(^1\) No wheels available, see https://pygobject.readthedocs.io/en/latest/devguide/dev_environ.html for build instructions.

\(^2\) OSX and Windows wheels available on PyPI. Linux wheels available but not on PyPI, see https://wxpython.org/pages/downloads/.
Part III

API Overview
If updating Matplotlib breaks your scripts, this list may help you figure out what caused the breakage and how to fix it by updating your code.

For API changes in older versions see

15.1 Old API Changes

15.1.1 Changes for 0.40

- Artist
  * `__init__` takes a DPI instance and a Bound2D instance which is the bounding box of the artist in display coords
  * `get_window_extent` returns a Bound2D instance
  * `set_size` is removed; replaced by `bbox` and `dpi`
  * the `clip(gc)` method is removed. Artists now clip themselves with their box
  * added `_clipOn` boolean attribute. If True, gc clip to `bbox`.

- AxisTextBase
  * Initialized with a `transx`, `transy` which are Transform instances
  * `set_drawing_area` removed
  * `get_left_right` and `get_top_bottom` are replaced by `get_window_extent`

- Line2D Patches now take `transx`, `transy`
  * Initialized with a `transx`, `transy` which are Transform instances

- Patches
  * Initialized with a `transx`, `transy` which are Transform instances

- FigureBase attributes `dpi` is a DPI instance rather than scalar and new attribute `bbox` is a Bound2D in display coords, and I got rid of the `left`, `width`, `height`, etc... attributes. These are now accessible as, for example, `bbox.x.min` is `left`, `bbox.x.interval()` is `width`, `bbox.y.max` is `top`, etc...

- GcfBase attribute `pagesize` renamed to `figsize`

- Axes

(continues on next page)
* removed figbg attribute
* added fig instance to __init__
* resizing is handled by figure call to resize.

- Subplot
  * added fig instance to __init__

- Renderer methods for patches now take gcEdge and gcFace instances.
  gcFace=None takes the place of filled=False

- True and False symbols provided by cbook in a python2.3 compatible way

- new module transforms supplies Bound1D, Bound2D and Transform instances and more

- Changes to the MATLAB helpers API
  * _matlab_helpers.GcfBase is renamed by Gcf. Backends no longer need to derive from this class. Instead, they provide a factory function new_figure_manager(num, figsize, dpi). The destroy method of the GcfDerived from the backends is moved to the derived FigureManager.
  * FigureManagerBase moved to backend_bases
  * Gcf.get_all_figwins renamed to Gcf.get_all_fig_managers

Jeremy:

Make sure to self._reset = False in AxisTextWX._set_font. This was something missing in my backend code.

15.1.2 Changes for 0.42

* Refactoring AxisText to be backend independent. Text drawing and get_window_extent functionality will be moved to the Renderer.

* backend_bases.AxisTextBase is now text.Text module

* All the erase and reset functionality removed from AxisText - not needed with double buffered drawing. Ditto with state change. Text instances have a get_prop_tup method that returns a hashable tuple of text properties which you can use to see if text props have changed, e.g., by caching a font or layout instance in a dict with the prop tup as a key -- see RendererGTK.get_pango_layout in backend_gtk for an example.

* Text._get_xy_display renamed Text.get_xy_display

(continues on next page)
* Artist set_renderer and wash_brushes methods removed

* Moved Legend class from matplotlib.axes into matplotlib.legend

* Moved Tick, XTick, YTick, Axis, XAxis, YAxis from matplotlib.axes to matplotlib.axis

* moved process_text_args to matplotlib.text

* After getting Text handled in a backend independent fashion, the import process is much cleaner since there are no longer cyclic dependencies

* matplotlib.matlab._get_current_fig_manager renamed to matplotlib.matlab.get_current_fig_manager to allow user access to the GUI window attribute, e.g., figManager.window for GTK and figManager.frame for wx

### 15.1.3 Changes for 0.50

* refactored Figure class so it is no longer backend dependent. FigureCanvasBackend takes over the backend specific duties of the Figure. matplotlib.backend_bases.FigureBase moved to matplotlib.figure.Figure.

* backends must implement FigureCanvasBackend (the thing that controls the figure and handles the events if any) and FigureManagerBackend (wraps the canvas and the window for MATLAB interface). FigureCanvasBase implements a backend switching mechanism

* Figure is now an Artist (like everything else in the figure) and is totally backend independent

* GDFONTPATH renamed to TTFPATH

* backend faceColor argument changed to rgbFace

* colormap stuff moved to colors.py

* arg_to_rgb in backend_bases moved to class ColorConverter in colors.py

* GD users must upgrade to gd-2.0.22 and gdmodule-0.52 since new gd features (clipping, antialiased lines) are now used.

* Renderer must implement points_to_pixels

Migrating code:
MATLAB interface:

The only API change for those using the MATLAB interface is in how you call figure redraws for dynamically updating figures. In the old API, you did

```python
fig.draw()
```

In the new API, you do

```python
manager = get_current_fig_manager()
manager.canvas.draw()
```

See the examples `system_monitor.py`, `dynamic_demo.py`, and `anim.py`

API

There is one important API change for application developers. Figure instances used subclass GUI widgets that enabled them to be placed directly into figures. e.g., FigureGTK subclassed `gtk.DrawingArea`. Now the Figure class is independent of the backend, and FigureCanvas takes over the functionality formerly handled by Figure. In order to include figures into your apps, you now need to do, for example

```python
# gtk example
fig = Figure(figsize=(5,4), dpi=100)
canvas = FigureCanvasGTK(fig) # a gtk.DrawingArea
canvas.show()
 vbox.pack_start(canvas)
```

If you use the NavigationToolbar, this is now initialized with a FigureCanvas, not a Figure. The examples `embedding_in_gtk.py`, `embedding_in_gtk2.py`, and `mpl_with_glade.py` all reflect the new API so use these as a guide.

All prior calls to

```python
figure.draw() and
figure.print_figure(args)
```

should now be

```python
canvas.draw() and
canvas.print_figure(args)
```

Apologies for the inconvenience. This refactorization brings significant more freedom in developing matplotlib and should bring better plotting capabilities, so I hope the inconvenience is worth it.
15.1.4 Changes for 0.54

MATLAB interface

dpi

Several of the backends used a PIXELS_PER_INCH hack that I added to try and make images render consistently across backends. This just complicated matters. So you may find that some font sizes and line widths appear different than before. Apologies for the inconvenience. You should set the dpi to an accurate value for your screen to get true sizes.

pcolor and scatter

There are two changes to the MATLAB interface API, both involving the patch drawing commands. For efficiency, pcolor and scatter have been rewritten to use polygon collections, which are a new set of objects from matplotlib.collections designed to enable efficient handling of large collections of objects. These new collections make it possible to build large scatter plots or pcolor plots with no loops at the python level, and are significantly faster than their predecessors. The original pcolor and scatter functions are retained as pcolor_classic and scatter_classic.

The return value from pcolor is a PolyCollection. Most of the properties that are available on rectangles or other patches are also available on PolyCollections, e.g., you can say:

```python
c = scatter(blah, blah)
c.set linewidth(1.0)
c.set facecolor('r')
c.set alpha(0.5)
```

or:

```python
c = scatter(blah, blah)
set(c, 'linewidth', 1.0, 'facecolor', 'r', 'alpha', 0.5)
```

Because the collection is a single object, you no longer need to loop over the return value of scatter or pcolor to set properties for the entire list.

If you want the different elements of a collection to vary on a property, e.g., to have different line widths, see matplotlib.collections for a discussion on how to set the properties as a sequence.

For scatter, the size argument is now in points^2 (the area of the symbol in points) as in MATLAB and is not in data coords as before. Using sizes in data coords caused several problems. So you will need to adjust your size arguments accordingly or use scatter_classic.

mathtext spacing

For reasons not clear to me (and which I’ll eventually fix) spacing no longer works in font groups. However, I added three new spacing commands which compensate for this ” (regular space), ‘/’ (small space) and ‘hspace{frac}’ where frac is a fraction of fontsize in points. You will need to quote spaces in font strings, is:
Object interface - Application programmers

Autoscaling

The x and y axis instances no longer have autoscale view. These are handled by axes.autoscale_view

Axes creation

You should not instantiate your own Axes any more using the OO API. Rather, create a Figure as before and in place of:

```python
f = Figure(figsize=(5,4), dpi=100)
a = Subplot(f, 111)
f.add_axis(a)
```

use:

```python
f = Figure(figsize=(5,4), dpi=100)
a = f.add_subplot(111)
```

That is, add_axis no longer exists and is replaced by:

```python
add_axes(rect, axisbg=defaultcolor, frameon=True)
add_subplot(num, axisbg=defaultcolor, frameon=True)
```

Artist methods

If you define your own Artists, you need to rename the _draw method to draw

Bounding boxes

matplotlib.transforms.Bound2D is replaced by matplotlib.transforms.Bbox. If you want to construct a bbox from left, bottom, width, height (the signature for Bound2D), use matplotlib.transforms.lbwh_to_bbox, as in

```python
bbox = clickBBox = lbwh_to_bbox(left, bottom, width, height)
```

The Bbox has a different API than the Bound2D. e.g., if you want to get the width and height of the bbox

- **OLD::** width = fig.bbox.x.interval() height = fig.bbox.y.interval()
- **New::** width = fig.bbox.width() height = fig.bbox.height()
Object constructors

You no longer pass the bbox, dpi, or transforms to the various Artist constructors. The old way or creating lines and rectangles was cumbersome because you had to pass so many attributes to the Line2D and Rectangle classes not related directly to the geometry and properties of the object. Now default values are added to the object when you call axes.add_line or axes.add_patch, so they are hidden from the user.

If you want to define a custom transformation on these objects, call o.set_transform(trans) where trans is a Transformation instance.

In prior versions of you wanted to add a custom line in data coords, you would have to do

```python
l = Line2D(dpi, bbox, x, y, color = color, transx = transx, transy = transy, )
```

now all you need is

```python
l = Line2D(x, y, color=color)
```

and the axes will set the transformation for you (unless you have set your own already, in which case it will eave it unchanged)

Transformations

The entire transformation architecture has been rewritten. Previously the x and y transformations where stored in the xaxis and yaxis instances. The problem with this approach is it only allows for separable transforms (where the x and y transformations don’t depend on one another). But for cases like polar, they do. Now transformations operate on x,y together. There is a new base class matplotlib.transforms.Transformation and two concrete implementations, matplotlib.transforms.SeparableTransformation and matplotlib.transforms.Affine. The SeparableTransformation is constructed with the bounding box of the input (this determines the rectangular coordinate system of the input, i.e., the x and y view limits), the bounding box of the display, and possibly nonlinear transformations of x and y. The 2 most frequently used transformations, data coordinates -> display and axes coordinates -> display are available as ax.transData and ax.transAxes. See alignment_demo.py which uses axes coords.

Also, the transformations should be much faster now, for two reasons

• they are written entirely in extension code

• because they operate on x and y together, they can do the entire transformation in one loop. Earlier I did something along the lines of:

```python
xt = sx*func(x) + tx
yt = sy*func(y) + ty
```

Although this was done in numerix, it still involves 6 length(x) for-loops (the multiply, add, and function evaluation each for x and y). Now all of that is done in a single pass.

If you are using transformations and bounding boxes to get the cursor position in data coordinates, the method calls are a little different now. See the updated examples/coords_demo.py which shows you how to do this.
Likewise, if you are using the artist bounding boxes to pick items on the canvas with the GUI, the bbox methods are somewhat different. You will need to see the updated examples/object_picker.py.

See unit/transforms_unit.py for many examples using the new transformations.

15.1.5 Changes for 0.54.3

removed the set_default_font / get_default_font scheme from the font_manager to unify customization of font defaults with the rest of the rc scheme. See examples/font_properties_demo.py and help(rc) in matplotlib.matlab.

15.1.6 Changes for 0.60

ColormapJet and Grayscale are deprecated. For backwards compatibility, they can be obtained either by doing

    from matplotlib.cm import ColormapJet

or

    from matplotlib.matlab import *

They are replaced by cm.jet and cm.grey

15.1.7 Changes for 0.61

canvas.connect is now deprecated for event handling. use mpl_connect and mpl_disconnect instead. The callback signature is func(event) rather than func(widget, event)

15.1.8 Changes for 0.63

Dates are now represented internally as float days since 0001-01-01, UTC.

All date tickers and formatters are now in matplotlib.dates, rather than matplotlib.tickers

collectors have been abolished from all functions and classes. num2date and date2num are now the converter functions for all date plots

Most of the date tick locators have a different meaning in their constructors. In the prior implementation, the first argument was a

(continues on next page)
base and multiples of the base were ticked. e.g.,

    HourLocator(5)  # old: tick every 5 minutes

In the new implementation, the explicit points you want to tick are provided as a number or sequence

    HourLocator(range(0,5,61))  # new: tick every 5 minutes

This gives much greater flexibility. I have tried to make the default constructors (no args) behave similarly, where possible.

Note that YearLocator still works under the base/multiple scheme. The difference between the YearLocator and the other locators is that years are not recurrent.

Financial functions:

    matplotlib.finance.quotes_historical_yahoo(ticker, date1, date2)

date1, date2 are now datetime instances. Return value is a list of quotes where the quote time is a float - days since gregorian start, as returned by date2num

    See examples/finance_demo.py for example usage of new API

15.1.9 Changes for 0.65

mpl_connect and mpl_disconnect in the MATLAB interface renamed to connect and disconnect

Did away with the text methods for angle since they were ambiguous. fontangle could mean fontstyle (oblique, etc) or the rotation of the text. Use style and rotation instead.

15.1.10 Changes for 0.65.1

removed add_axes and add_subplot from backend_bases. Use figure.add_axes and add_subplot instead. The figure now manages the current axes with gca and sca for get and set current axes. If you have code you are porting which called, e.g., figmanager.add_axes, you can now simply do figmanager.canvas.figure.add_axes.
15.1.11 Changes for 0.70

- MplEvent factored into a base class Event and derived classes MouseEvent and KeyEvent
- Removed definct set_measurement in wx toolbar

15.1.12 Changes for 0.71

- Significant numerix namespace changes, introduced to resolve namespace clashes between python built-ins and mlab names.
  Refactored numerix to maintain separate modules, rather than folding all these names into a single namespace. See the following mailing list threads for more information and background
    

OLD usage

    from matplotlib.numerix import array, mean, fft

NEW usage

    from matplotlib.numerix import array
    from matplotlib.numerix.mlab import mean
    from matplotlib.numerix.fft import fft

numerix dir structure mirrors numarray (though it is an incomplete implementation)

    numerix
    numerix/mlab
    numerix/linear_algebra
    numerix/fft
    numerix/random_array

but of course you can use 'numerix : Numeric' and still get the symbols.

pylab still imports most of the symbols from Numerix, MLab, fft, etc, but is more cautious. For names that clash with python names (min, max, sum), pylab keeps the builtins and provides the numeric versions with an a* prefix, e.g., (amin, amax, asum)
15.1.13 Changes for 0.72

- Line2D, Text, and Patch copy_properties renamed update_from and moved into artist base class
- LineCollection.color renamed to LineCollections.set_color for consistency with set/get introspection mechanism,
- pylab figure now defaults to num=None, which creates a new figure with a guaranteed unique number
- contour method syntax changed - now it is MATLAB compatible
  unchanged: contour(Z)
  old: contour(Z, x=Y, y=Y)
  new: contour(X, Y, Z)

  see http://matplotlib.sf.net/matplotlib.pylab.html#contour

- Increased the default resolution for save command.
- Renamed the base attribute of the ticker classes to _base to avoid conflict with the base method. Sitt for subs

- subs=none now does autosubbing in the tick locator.
- New subplots that overlap old will delete the old axes. If you do not want this behavior, use fig.add_subplot or the axes command

15.1.14 Changes for 0.73

- Removed deprecated ColormapJet and friends
- Removed all error handling from the verbose object
- figure num of zero is now allowed

15.1.15 Changes for 0.80

- xlim/ylim/axis always return the new limits regardless of arguments. They now take kwargs which allow you to selectively change the upper or lower limits while leaving unnamed limits unchanged. See help(xlim) for example
15.1.16 Changes for 0.81

- pylab and artist "set" functions renamed to setp to avoid clash with python2.4 built-in set. Current version will issue a deprecation warning which will be removed in future versions

- imshow interpolation arguments changes for advanced interpolation schemes. See help imshow, particularly the interpolation, filternorm and filterrad kwargs

- Support for masked arrays has been added to the plot command and to the Line2D object. Only the valid points are plotted. A "valid_only" kwarg was added to the get_xdata() and get_ydata() methods of Line2D; by default it is False, so that the original data arrays are returned. Setting it to True returns the plottable points.

- contour changes:

  Masked arrays: contour and contourf now accept masked arrays as the variable to be contoured. Masking works correctly for contour, but a bug remains to be fixed before it will work for contourf. The "badmask" kwarg has been removed from both functions.

  Level argument changes:

  Old version: a list of levels as one of the positional arguments specified the lower bound of each filled region; the upper bound of the last region was taken as a very large number. Hence, it was not possible to specify that z values between 0 and 1, for example, be filled, and that values outside that range remain unfilled.

  New version: a list of N levels is taken as specifying the boundaries of N-1 z ranges. Now the user has more control over what is colored and what is not. Repeated calls to contourf (with different colormaps or color specifications, for example) can be used to color different ranges of z. Values of z outside an expected range are left uncolored.

  Example:
  Old: contourf(z, [0, 1, 2]) would yield 3 regions: 0-1, 1-2, and >2.
  New: it would yield 2 regions: 0-1, 1-2. If the same 3 regions were desired, the equivalent list of levels would be [0, 1, 2, 1e38].

15.1.17 Changes for 0.82

- toolbar import change in GTKAgg, GTKCairo and WXAgg

(continues on next page)
Matplotlib, Release 3.1.3

(continued from previous page)

- Added subplot config tool to GTK+ backends -- note you must now import the NavigationToolbar2 from your backend of choice rather than from backend_gtk because it needs to know about the backend specific canvas -- see examples/embedding_in_gtk2.py. Ditto for wx backend -- see examples/embedding_in_wxagg.py

- hist bin change

Sean Richards notes there was a problem in the way we created the binning for histogram, which made the last bin underrepresented. From his post:

I see that hist uses the linspace function to create the bins and then uses searchsorted to put the values in their correct bin. That's all good but I am confused over the use of linspace for the bin creation. I wouldn't have thought that it does what is needed, to quote the docstring it creates a "Linear spaced array from min to max". For it to work correctly shouldn't the values in the bins array be the same bound for each bin? (i.e. each value should be the lower bound of a bin). To provide the correct bins for hist would it not be something like

```python
def bins(xmin, xmax, N):
    if N==1: return xmax
    dx = (xmax-xmin)/N # instead of N-1
    return xmin + dx*arange(N)
```

This suggestion is implemented in 0.81. My test script with these changes does not reveal any bias in the binning

```python
from matplotlib.numerix.mlab import randn, rand, zeros, Float
from matplotlib.mlab import hist, mean

Nbins = 50
Ntests = 200
results = zeros((Ntests,Nbins), typecode=Float)
for i in range(Ntests):
    print 'computing', i
    x = rand(10000)
    n, bins = hist(x, Nbins)
    results[i] = n
print mean(results)
```

15.1.18 Changes for 0.83

- Made HOME/.matplotlib the new config dir where the matplotlibrc file, the ttf.cache, and the tex.cache live. The new default
filenames in .matplotlib have no leading dot and are not hidden.  
e.g., the new names are matplotlibrc, tex.cache, and ttffont.cache.  
This is how ipython does it so it must be right.

If old files are found, a warning is issued and they are moved to  
the new location.

- backends/__init__.py no longer imports new_figure_manager,  
draw_if_interactive and show from the default backend, but puts  
these imports into a call to pylab_setup. Also, the Toolbar is no  
longer imported from WX/WXAgg. New usage:

```python
from backends import pylab_setup
new_figure_manager, draw_if_interactive, show = pylab_setup()
```

- Moved Figure.get_width_height() to FigureCanvasBase. It now  
returns int instead of float.

### 15.1.19 Changes for 0.84

Unified argument handling between hlines and vlines. Both now  
take optionally a fmt argument (as in plot) and a keyword args  
that can be passed onto Line2D.

Removed all references to "data clipping" in rc and lines.py since  
these were not used and not optimized. I'm sure they'll be  
resurrected later with a better implementation when needed.

'set' removed - no more deprecation warnings. Use 'setp' instead.

Backend developers: Added flipud method to image and removed it  
from to_str. Removed origin kwarg from backend.draw_image.  
origin is handled entirely by the frontend now.

### 15.1.20 Changes for 0.85

Made xtick and ytick separate props in rc  

made pos=None the default for tick formatters rather than 0 to  
indicate "not supplied"

Removed "feature" of minor ticks which prevents them from  
overlapping major ticks. Often you want major and minor ticks at  
the same place, and can offset the major ticks with the pad. This  
could be made configurable

Changed the internal structure of contour.py to a more OO style.  
Calls to contour or contourf in axes.py or pylab.py now return  

(continues on next page)
a ContourSet object which contains references to the
LineCollections or PolyCollections created by the call,
as well as the configuration variables that were used.
The ContourSet object is a "mappable" if a colormap was used.

Added a clip_ends kwarg to contourf. From the docstring:
* clip_ends = True
  If False, the limits for color scaling are set to the
  minimum and maximum contour levels.
  True (default) clips the scaling limits. Example:
  if the contour boundaries are V = [-100, 2, 1, 0, 1, 2, 100],
  then the scaling limits will be [-100, 100] if clip_ends
  is False, and [-3, 3] if clip_ends is True.

Added kwargs linewidths, antialiased, and nchunk to contourf. These
are experimental; see the docstring.

Changed Figure.colorbar():
  kw argument order changed;
  if mappable arg is a non-filled ContourSet, colorbar() shows
  lines instead hof polygons.
  if mappable arg is a filled ContourSet with clip_ends=True,
  the endpoints are not labelled, so as to give the
  correct impression of open-endedness.

Changed LineCollection.get_linewidths to get_linewidth, for
consistency.

15.1.21 Changes for 0.86

Matplotlib data is installed into the matplotlib module.
This is similar to package_data. This should get rid of
having to check for many possibilities in _get_data_path().
The MATPLOTLIBDATA env key is still checked first to allow
for flexibility.

1) Separated the color table data from cm.py out into
a new file, _cm.py, to make it easier to find the actual
code in cm.py and to add new colormaps. Everything
from _cm.py is imported by cm.py, so the split should be
transparent.
2) Enabled automatic generation of a colormap from
a list of colors in contour; see modified
examples/contour_demo.py.
3) Support for imshow of a masked array, with the
ability to specify colors (or no color at all) for
masked regions, and for regions that are above or
below the normally mapped region. See
examples/image_masked.py.
4) In support of the above, added two new classes,
ListedColormap, and no_norm, to colors.py, and modified
the Colormap class to include common functionality. Added a clip kwarg to the normalize class.

15.1.22 Changes for 0.87.7

Completely reworked the annotations API because I found the old API cumbersome. The new design is much more legible and easy to read. See matplotlib.text.Annotation and examples/annotation_demo.py

markeredgecolor and markerfacecolor cannot be configured in matplotlibrc any more. Instead, markers are generally colored automatically based on the color of the line, unless marker colors are explicitly set as kwargs - NN

Changed default comment character for load to '#' - JDH

math_parse_s_ft2font_svg from mathtext.py & mathtext2.py now returns width, height, svg_elements. svg_elements is an instance of Bunch (cmbook.py) and has the attributes svg_glyphs and svg_lines, which are both lists.

Renderer.draw_arc now takes an additional parameter, rotation. It specifies to draw the artist rotated in degrees anti-clockwise. It was added for rotated ellipses.

Renamed Figure.set figsize_inches to Figure.set size_inches to better match the get method, Figure.get size_inches.

Removed the copy_bbox_transform from transforms.py; added shallowcopy methods to all transforms. All transforms already had deepcopy methods.

FigureManager.resize(width, height): resize the window specified in pixels

barh: x and y args have been renamed to width and bottom respectively, and their order has been swapped to maintain a (position, value) order.

bar and barh: now accept kwarg 'edgecolor'.

bar and barh: The left, height, width and bottom args can now all be scalars or sequences; see docstring.

barh: now defaults to edge aligned instead of center aligned bars

bar, barh and hist: Added a keyword arg 'align' that controls between edge or center bar alignment.
Collections: PolyCollection and LineCollection now accept
vertices or segments either in the original form [(x,y),
(x,y), ...] or as a 2D numerix array, with X as the first column
and Y as the second. Contour and quiver output the numerix
form. The transforms methods Bbox.update() and
Transformation.seq_xy_tups() now accept either form.

Collections: LineCollection is now a ScalarMappable like
PolyCollection, etc.

Specifying a grayscale color as a float is deprecated; use
a string instead, e.g., 0.75 -> '0.75'.

Collections: initializers now accept any mpl color arg, or
sequence of such args; previously only a sequence of rgba
tuples was accepted.

Colorbar: completely new version and api; see docstring. The
original version is still accessible as colorbar_classic, but
is deprecated.

Contourf: "extend" kwarg replaces "clip_ends"; see docstring.
Masked array support added to pcolormesh.

Modified aspect-ratio handling:
Removed aspect kwarg from imshow
Axes methods:
    set_aspect(self, aspect, adjustable=None, anchor=None)
    set_adjustable(self, adjustable)
    set_anchor(self, anchor)
Pylab interface:
    axis('image')

Backend developers: ft2font’s load_char now takes a flags
argument, which you can OR together from the LOAD_XXX
constants.

15.1.23 Changes for 0.90.0

All artists now implement a "pick" method which users should not
call. Rather, set the "picker" property of any artist you want to
pick on (the epsilon distance in points for a hit test) and
register with the "pick_event" callback. See
examples/pick_event_demo.py for details

Bar, barh, and hist have "log" binary kwarg: log=True
sets the ordinate to a log scale.

Boxplot can handle a list of vectors instead of just
an array, so vectors can have different lengths.

Plot can handle 2-D x and/or y; it plots the columns.

Added linewidth kwarg to bar and barh.

Made the default Artist._transform None (rather than invoking identity_transform for each artist only to have it overridden later). Use artist.get_transform() rather than artist._transform, even in derived classes, so that the default transform will be created lazily as needed.

New LogNorm subclass of Normalize added to colors.py. All Normalize subclasses have new inverse() method, and the _call__() method has a new clip kwarg.

Changed class names in colors.py to match convention: normalize -> Normalize, no_norm -> NoNorm. Old names are still available for now.

Removed obsolete pcolor_classic command and method.

Removed lineprops and markerprops from the Annotation code and replaced them with an arrow configurable with kwarg arrowprops. See examples/annotation_demo.py - JDH

15.1.24 Changes for 0.90.1

The file dviread.py has a (very limited and fragile) dvi reader for usetex support. The API might change in the future so don’t depend on it yet.

Removed deprecated support for a float value as a gray-scale; now it must be a string, like ‘0.5’. Added alpha kwarg to ColorConverter.to_rgba_list.

New method set_bounds(vmin, vmax) for formatters, locators sets the viewInterval and dataInterval from floats.

Removed deprecated colorbar_classic.

Line2D.get_xdata and get_ydata valid_only=False kwarg is replaced by orig=True. When True, it returns the original data, otherwise the processed data (masked, converted)

Some modifications to the units interface. units.ConversionInterface.tickers renamed to units.ConversionInterface.axisinfo and it now returns a units.AxisInfo object rather than a tuple. This will make it easier to add axis info functionality (e.g., I added a default label
Axes.errorbar uses Axes.vlines and Axes.hlines to draw its error limits int he vertical and horizontal direction. As you'll see in the changes below, these functions now return a LineCollection rather than a list of lines. The new return signature for errorbar is ylins, caplines, errorcollections where errorcollections is a xerrcollection, yerrcollection

Axes.vlines and Axes.hlines now create and returns a LineCollection, not a list of lines. This is much faster. The kwarg signature has changed, so consult the docs

MaxNLocator accepts a new Boolean kwarg ('integer') to force ticks to integer locations.

Commands that pass an argument to the Text constructor or to Text.set_text() now accept any object that can be converted with '%s'. This affects xlabel(), title(), etc.

Barh now takes a **kwargs dict instead of most of the old arguments. This helps ensure that bar and barh are kept in sync, but as a side effect you can no longer pass e.g., color as a positional argument.

ft2font.get_charmap() now returns a dict that maps character codes to glyph indices (until now it was reversed)

Moved data files into lib/matplotlib so that setuptools' develop mode works. Re-organized the mpl-data layout so that this source structure is maintained in the installation. (i.e., the 'fonts' and 'images' sub-directories are maintained in site-packages.). Suggest removing site-packages/matplotlib/mpl-data and ~/.matplotlib/ttffont.cache before installing

15.1.25 Changes for 0.91.0

- Changed cbook.is_file_like() to cbook.is_writable_file_like() and corrected behavior.
- Added ax kwarg to pyplot.colorbar() and Figure.colorbar() so that one can specify the axes object from which space for the colorbar is to be taken, if one does not want to make the colorbar axes manually.
- Changed cbook.reversed() so it yields a tuple rather than a (index, tuple). This agrees with the python reversed builtin, and cbook only defines reversed if python doesn't provide the builtin.
- Made skiprows=1 the default on csv2rec()
- The gd and paint backends have been deleted.
• The errorbar method and function now accept additional kwargs so that upper and lower limits can be indicated by capping the bar with a caret instead of a straight line segment.

• The `matplotlib.dviread` file now has a parser for files like `psfonts.map` and `pdftex.map`, to map TeX font names to external files.

• The file `matplotlib.type1font` contains a new class for Type 1 fonts. Currently it simply reads pfa and pfb format files and stores the data in a way that is suitable for embedding in pdf files. In the future the class might actually parse the font to allow e.g., subsetting.

• `matplotlib.FT2Font` now supports `FT_Attach_File()`. In practice this can be used to read an afm file in addition to a pfa/pfb file, to get metrics and kerning information for a Type 1 font.

• The `AFM` class now supports querying CapHeight and stem widths. The `get_name_char` method now has an `isord` kwarg like `get_width_char`.

• Changed `pcolor()` default to `shading='flat'`; but as noted now in the docstring, it is preferable to simply use the `edgecolor` kwarg.

• The mathtext font commands (\cal, \rm, \it, \tt) now behave as TeX does: they are in effect until the next font change command or the end of the grouping. Therefore uses of \$\cal(R)\$ should be changed to \$\cal R\$$. Alternatively, you may use the new LaTeX-style font commands (\mathcal, \mathrm, \mathit, \mathtt) which do affect the following group, e.g., \$\mathcal{R}\$.

• Text creation commands have a new default linespacing and a new `linespacing` kwarg, which is a multiple of the maximum vertical extent of a line of ordinary text. The default is 1.2; `linespacing=2` would be like ordinary double spacing, for example.

• Changed default kwarg in `matplotlib.colors.Normalize.__init__()` to `clip=False`; clipping silently defeats the purpose of the special over, under, and bad values in the colormap, thereby leading to unexpected behavior. The new default should reduce such surprises.

• Made the emit property of `set_xlim()` and `set_ylim()` True by default; removed the Axes custom callback handling into a ``callbacks` attribute which is a `CallbackRegistry` instance. This now supports the `xlim_changed` and `ylim_changed` Axes events.

### 15.1.26 Changes for 0.91.2

• For `csv2rec()`, `checkrows=0` is the new default indicating all rows will be checked for type inference.

• A warning is issued when an image is drawn on log-scaled axes, since it will not log-scale the image data.

• Moved `rec2gtk()` to `matplotlib.toolkits.gtktools`

• Moved `rec2excel()` to `matplotlib.toolkits.exceltools`

• Removed, dead/experimental ExampleInfo, Namespace and Importer code from `matplotlib.__init__`

### 15.1.27 Changes for 0.98.0

• `matplotlib.image.imread()` now no longer always returns RGBA data—if the image is luminance or RGB, it will return a MxN or MxNx3 array if possible. Also `uint8` is no longer
always forced to float.

- New axes function and Axes method provide control over the plot color cycle: `matplotlib.axes.set_default_color_cycle()` and `matplotlib.axes.Axes.set_color_cycle()`.

- Matplotlib now requires Python 2.4, so `matplotlib.cbook` will no longer provide `set`, `enumerate()`, `reversed()` or `izip()` compatibility functions.

- In Numpy 1.0, bins are specified by the left edges only. The axes method `matplotlib.axes.Axes.hist()` now uses future Numpy 1.3 semantics for histograms. Providing `binedges`, the last value gives the upper-right edge now, which was implicitly set to `+infinity` in Numpy 1.0. This also means that the last bin doesn’t contain upper outliers any more by default.

- New axes method and pyplot function, `hexbin()`, is an alternative to `scatter()` for large datasets. It makes something like a `pcolor()` of a 2-D histogram, but uses hexagonal bins.

- New kwarg, `symmetric`, in `matplotlib.ticker.MaxNLocator` allows one require an axis to be centered around zero.

- Toolkits must now be imported from `mpl_toolkits` (not `matplotlib.toolkits`)

Notes about the transforms refactoring

A major new feature of the 0.98 series is a more flexible and extensible transformation infrastructure, written in Python/Numpy rather than a custom C extension.

The primary goal of this refactoring was to make it easier to extend matplotlib to support new kinds of projections. This is mostly an internal improvement, and the possible user-visible changes it allows are yet to come.

See `matplotlib.transforms` for a description of the design of the new transformation framework.

For efficiency, many of these functions return views into Numpy arrays. This means that if you hold on to a reference to them, their contents may change. If you want to store a snapshot of their current values, use the Numpy array method `copy()`.

The view intervals are now stored only in one place – in the `matplotlib.axes.Axes` instance, not in the locator instances as well. This means locators must get their limits from their `matplotlib.axis.Axis`, which in turn looks up its limits from the `Axes`. If a locator is used temporarily and not assigned to an Axis or Axes, (e.g., in `matplotlib.contour`), a dummy axis must be created to store its bounds. Call `matplotlib.ticker.Locator.create_dummy_axis()` to do so.

The functionality of `Pbox` has been merged with `Bbox`. Its methods now all return copies rather than modifying in place.

The following lists many of the simple changes necessary to update code from the old transformation framework to the new one. In particular, methods that return a copy are named with a verb in the past tense, whereas methods that alter an object in place are named with a verb in the present tense.

1 The Bbox is bound by the points (x0, y0) to (x1, y1) and there is no defined order to these points, that is, x0 is not necessarily the left edge of the box. To get the left edge of the bbox, use the read-only property xmin.
The Polar class has moved to `matplotlib.projections.polar`.

**matplotlib.artist**

<td>matplotlib.figure.Figure.dpi (a property)</td>
</tr>
</tbody>
</table>

---

\(^2\) `matplotlib.axes.Axes.get_position()` used to return a list of points, now it returns a `matplotlib.transforms.Bbox` instance.

\(^3\) `matplotlib.axes.Axes.set_position()` now accepts either four scalars or a `matplotlib.transforms.Bbox` instance.

\(^4\) Since the refactoring allows for more than two scale types (’log’ or ’linear’), it no longer makes sense to have a toggle. `Axes.toggle_log_linear()` has been removed.

\(^5\) `matplotlib.artist.Artist.set_clip_path()` now accepts a `matplotlib.path.Path` instance and a `matplotlib.transforms.Transform` that will be applied to the path immediately before clipping.

\(^6\) Linestyles are now treated like all other collection attributes, i.e. a single value or multiple values may be provided.
matplotlib.patches

RendererBase

New methods:

- `draw_path(self, gc, path, transform, rgbFace)`
- `draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace)`
- `draw_path_collection(self, master_transform, cliprect, clippath, clippath_trans, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds) [optional]`

Changed methods:

- `draw_image(self, x, y, im, bbox)` is now `draw_image(self, x, y, im, bbox, clippath, clippath_trans)`

Removed methods:

- `draw_arc`
- `draw_line_collection`
- `draw_line`
- `draw_lines`
- `draw_point`
- `draw_quad_mesh`
- `draw_poly_collection`
- `draw_polygon`
- `draw_rectangle`
- `draw_regpoly_collection`

---

7 `matplotlib.backend_bases.GraphicsContext.get_clip_path()` returns a tuple of the form (path, affine_transform), where path is a `matplotlib.path.Path` instance and affine_transform is a `matplotlib.transforms.Affine2D` instance.

8 `matplotlib.backend_bases.GraphicsContext.set_clip_path()` now only accepts a `matplotlib.transforms.TransformedPath` instance.
15.1.28 Changes for 0.98.1

- Removed broken `matplotlib.axes3d` support and replaced it with a non-implemented error pointing to 0.91.x

15.1.29 Changes for 0.98.x

- `psd()`, `csd()`, and `cohere()` will now automatically wrap negative frequency components to the beginning of the returned arrays. This is much more sensible behavior and makes them consistent with `specgram()`. The previous behavior was more of an oversight than a design decision.

- Added new keyword parameters `nonposx`, `nonposy` to `matplotlib.axes.Axes` methods that set log scale parameters. The default is still to mask out non-positive values, but the kwargs accept ‘clip’, which causes non-positive values to be replaced with a very small positive value.

- Added new `matplotlib.pyplot.fignum_exists()` and `matplotlib.pyplot.get_fignums()`; they merely expose information that had been hidden in `matplotlib._pylab_helpers`.

- Deprecated numerix package.

- Added new `matplotlib.image.imsave()` and exposed it to the `matplotlib.pyplot` interface.

- Remove support for pyExcelerator in exceltools – use xlwt instead

- Changed the defaults of `acorr` and `xcorr` to use `usevlines=True`, `maxlags=10` and `normed=True` since these are the best defaults

- Following keyword parameters for `matplotlib.label.Label` are now deprecated and new set of parameters are introduced. The new parameters are given as a fraction of the font-size. Also, `scatteryoffsets`, `fancybox` and `columnspacing` are added as keyword parameters.

</tr>
</tbody>
</table>

- Removed the configobj and experimental traits rc support

- Modified `matplotlib.mlab.psd()`, `matplotlib.mlab.csd()`, `matplotlib.mlab.cohere()`, and `matplotlib.mlab.specgram()` to scale one-sided densities by a factor of 2. Also, optionally scale the densities by the sampling frequency, which gives true values of densities that can be integrated by the returned frequency values. This also gives better MATLAB compatibility. The corresponding `matplotlib.axes.Axes` methods and `matplotlib.pyplot` functions were updated as well.

- Font lookup now uses a nearest-neighbor approach rather than an exact match. Some fonts may be different in plots, but should be closer to what was requested.

• `matplotlib.afm.AFM.get_fullname()` and `matplotlib.afm.AFM.get_familyname()` no longer raise an exception if the AFM file does not specify these optional attributes, but returns a guess based on the required FontName attribute.

• Changed precision kwarg in `matplotlib.pyplot.spy()`; default is 0, and the string value ‘present’ is used for sparse arrays only to show filled locations.

• `matplotlib.collections.EllipseCollection` added.

• Added angles kwarg to `matplotlib.pyplot.quiver()` for more flexible specification of the arrow angles.

• Deprecated (raise `NotImplementedError`) all the mlab2 functions from `matplotlib.mlab` out of concern that some of them were not clean room implementations.

• Methods `matplotlib.collections.Collection.get_offsets()` and `matplotlib.collections.Collection.set_offsets()` added to `Collection` base class.

• `matplotlib.figure.Figure.figurePatch` renamed `matplotlib.figure.Figure.patch`; `matplotlib.axes.Axes.axesPatch` renamed `matplotlib.axes.Axes.patch`; `matplotlib.axes.Axes.axesFrame` renamed `matplotlib.axes.Axes.frame`. `matplotlib.axes.Axes.get_frame()`, which returns `matplotlib.axes.Axes.axesPatch`, is deprecated.

• Changes in the `matplotlib.contour.ContourLabeler` attributes (`matplotlib.pyplot.clabel()` function) so that they all have a form like `.labelAttribute`. The three attributes that are most likely to be used by end users, `.cl`, `.cl_xy` and `.cl_cvalues` have been maintained for the moment (in addition to their renamed versions), but they are deprecated and will eventually be removed.

• Moved several functions in `matplotlib.mlab` and `matplotlib.cbook` into a separate module `matplotlib.numerical_methods` because they were unrelated to the initial purpose of mlab or cbook and appeared more coherent elsewhere.

15.1.30 Changes in 0.99

• `pylab` no longer provides a load and save function. These are available in `matplotlib.mlab`, or you can use `numpy.loadtxt` and `numpy.savetxt` for text files, or `np.save` and `np.load` for binary numpy arrays.

• User-generated colormaps can now be added to the set recognized by `matplotlib.cm.get_cmap()`. Colormaps can be made the default and applied to the current image using `matplotlib.pyplot.set_cmap()`.

• changed use_mrecords default to False in `mlab.csv2rec` since this is partially broken

• Axes instances no longer have a “frame” attribute. Instead, use the new “spines” attribute. Spines is a dictionary where the keys are the names of the spines (e.g., ‘left’, ‘right’ and so on) and the values are the artists that draw the spines. For normal (rectilinear) axes, these artists are `Line2D` instances. For other axes (such as polar axes), these artists may be `Patch` instances.

• Polar plots no longer accept a resolution kwarg. Instead, each Path must specify its own number of interpolation steps. This is unlikely to be a user-visible change – if interpolation of data is required, that should be done before passing it to Matplotlib.
15.1.31 Changes beyond 0.99.x

- The default behavior of `matplotlib.axes.Axes.set_xlim()`, `matplotlib.axes.Axes.set_ylim()`, and `matplotlib.axes.Axes.axis()`, and their corresponding pyplot functions, has been changed: when view limits are set explicitly with one of these methods, autoscaling is turned off for the matching axis. A new `auto` kwarg is available to control this behavior. The limit kwargs have been renamed to `left` and `right` instead of `xmin` and `xmax`, and `bottom` and `top` instead of `ymin` and `ymax`. The old names may still be used, however.

- There are five new Axes methods with corresponding pyplot functions to facilitate autoscaling, tick location, and tick label formatting, and the general appearance of ticks and tick labels:
  - `matplotlib.axes.Axes.autoscale()` turns autoscaling on or off, and applies it.
  - `matplotlib.axes.Axes.margins()` sets margins used to autoscale the `matplotlib.axes.Axes.viewLim` based on the `matplotlib.axes.Axes.dataLim`.
  - `matplotlib.axes.Axes.locator_params()` allows one to adjust axes locator parameters such as `nbins`.
  - `matplotlib.axes.Axes.ticklabel_format()` is a convenience method for controlling the `matplotlib.ticker.ScalarFormatter` that is used by default with linear axes.
  - `matplotlib.axes.Axes.tick_params()` controls direction, size, visibility, and color of ticks and their labels.

- The `matplotlib.axes.Axes.bar()` method accepts a `error_kw` kwarg; it is a dictionary of kwargs to be passed to the errorbar function.

- The `matplotlib.axes.Axes.hist()` `color` kwarg now accepts a sequence of color specs to match a sequence of datasets.

- The `EllipseCollection` has been changed in two ways:
  - There is a new `units` option, ‘xy’, that scales the ellipse with the data units. This matches the :class:`~matplotlib.patches.Ellipse` scaling.
  - The `height` and `width` kwargs have been changed to specify the height and width, again for consistency with `Ellipse`, and to better match their names; previously they specified the half-height and half-width.

- There is a new rc parameter `axes.color_cycle`, and the color cycle is now independent of the rc parameter `lines.color`. `matplotlib.Axes.set_default_color_cycle()` is deprecated.

- You can now print several figures to one pdf file and modify the document information dictionary of a pdf file. See the docstrings of the class `matplotlib.backends.backend_pdf.PdfPages` for more information.

- Removed `configobj` and `enthought.traits` packages, which are only required by the experimental traited config and are somewhat out of date. If needed, install them independently.

- The new rc parameter `savefig.extension` sets the filename extension that is used by `matplotlib.figure.Figure.savefig()` if its `fname` argument lacks an extension.

- In an effort to simplify the backend API, all clipping rectangles and paths are now passed in using GraphicsContext objects, even on collections and images. Therefore:
• There are four new Axes methods with corresponding pyplot functions that deal with unstructured triangular grids:
  - `matplotlib.axes.Axes.tricontour()` draws contour lines on a triangular grid.
  - `matplotlib.axes.Axes.tricontourf()` draws filled contours on a triangular grid.
  - `matplotlib.axes.Axes.tripcolor()` draws a pseudocolor plot on a triangular grid.
  - `matplotlib.axes.Axes.triplot()` draws a triangular grid as lines and/or markers.

### 15.1.32 Changes in 1.1.x

• Added new `matplotlib.sankey.Sankey` for generating Sankey diagrams.
• In `imshow()`, setting `interpolation` to 'nearest' will now always mean that the nearest-neighbor interpolation is performed. If you want the no-op interpolation to be performed, choose 'none'.
• There were errors in how the tri-functions were handling input parameters that had to be fixed. If your tri-plots are not working correctly anymore, or you were working around apparent mistakes, please see issue #203 in the github tracker. When in doubt, use `kwargs`.
• The 'symlog' scale had some bad behavior in previous versions. This has now been fixed and users should now be able to use it without frustrations. The fixes did result in some
minor changes in appearance for some users who may have been depending on the bad behavior.

- There is now a common set of markers for all plotting functions. Previously, some markers existed only for `scatter()` or just for `plot()`. This is now no longer the case. This merge did result in a conflict. The string ‘d’ now means “thin diamond” while ‘D’ will mean “regular diamond”.

### 15.1.33 Changes in 1.2.x

- The classic option of the rc parameter `toolbar` is deprecated and will be removed in the next release.
- The `isvector()` method has been removed since it is no longer functional.
- The `rasterization_zorder` property on `Axes` a zorder below which artists are rasterized. This has defaulted to -30000.0, but it now defaults to `None`, meaning no artists will be rasterized. In order to rasterize artists below a given zorder value, `set_rasterization_zorder` must be explicitly called.
- In `scatter()`, and `scatter`, when specifying a marker using a tuple, the angle is now specified in degrees, not radians.
- Using `twinx()` or `twiny()` no longer overrides the current locaters and formatters on the axes.
- In `contourf()`, the handling of the `extend` kwarg has changed. Formerly, the extended ranges were mapped after to 0, 1 after being normed, so that they always corresponded to the extreme values of the colormap. Now they are mapped outside this range so that they correspond to the special colormap values determined by the `set_under()` and `set_over()` methods, which default to the colormap end points.
- The new rc parameter `savefig.format` replaces `cairo.format` and `savefig.extension`, and sets the default file format used by `matplotlib.figure.Figure.savefig()`.
- In `pse()` and `pie()`, one can now set the radius of the pie; setting the `radius` to ‘None’ (the default value), will result in a pie with a radius of 1 as before.
- Use of `projection_factory()` is now deprecated in favour of axes class identification using `process_projection_requirements()` followed by direct axes class invocation (at the time of writing, functions which do this are: `add_axes()`, `add_subplot()` and `gca()`). Therefore:

```python
key = figure._make_key(*args, **kwargs)
ispolar = kwargs.pop('polar', False)
projection = kwargs.pop('projection', None)
if ispolar:
    if projection is not None and projection != 'polar':
        raise ValueError('polar and projection args are inconsistent')
    projection = 'polar'
ax = projection_factory(projection, self, rect, **kwargs)
key = self._make_key(*args, **kwargs)

# is now

projection_class, kwargs, key = \
    process_projection_requirements(self, *args, **kwargs)
ax = projection_class(self, rect, **kwargs)
```
This change means that third party objects can expose themselves as Matplotlib axes by providing a \_as\_mpl\_axes method. See Developer’s guide for creating scales and transformations for more detail.

- A new keyword extendfrac in colorbar() and ColorbarBase allows one to control the size of the triangular minimum and maximum extensions on colorbars.

- A new keyword capthick in errorbar() has been added as an intuitive alias to the markeredgewidth and mew keyword arguments, which indirectly controlled the thickness of the caps on the errorbars. For backwards compatibility, specifying either of the original keyword arguments will override any value provided by capthick.

- Transform subclassing behaviour is now subtly changed. If your transform implements a non-affine transformation, then it should override the transform\_non\_affine method, rather than the generic transform method. Previously transforms would define transform and then copy the method into transform\_non\_affine:

  ```python
class MyTransform(mtrans.Transform):
    def transform(self, xy):
        ...

    transform\_non\_affine = transform
  
  This approach will no longer function correctly and should be changed to:

  ```python
class MyTransform(mtrans.Transform):
    def transform\_non\_affine(self, xy):
        ...
  ```

- Artists no longer have x\_isdata or y\_isdata attributes; instead any artist’s transform can be interrogated with artist\_instance.get\_transform().contains\_branch(ax.transData)

- Lines added to an axes now take into account their transform when updating the data and view limits. This means transforms can now be used as a pre-transform. For instance:

  ```python
  >>> import matplotlib.pyplot as plt
  >>> import matplotlib.transforms as mtrans
  >>> ax = plt.axes()
  >>> ax.plot(range(10), transform=mtrans.Affine2D().scale(10) + ax.transData)
  >>> print(ax.viewLim)
  Bbox('array([[ 0., 0.],
     [ 90., 90.]])')
  ```

- One can now easily get a transform which goes from one transform’s coordinate system to another, in an optimized way, using the new subtract method on a transform. For instance, to go from data coordinates to axes coordinates:

  ```python
  >>> import matplotlib.pyplot as plt
  >>> ax = plt.axes()
  >>> data2ax = ax.transData - ax.transAxes
  >>> print(ax.transData.depth, ax.transAxes.depth)
  3, 1
  >>> print(data2ax.depth)
  2
  ```

  for versions before 1.2 this could only be achieved in a sub-optimal way, using ax.transData + ax.transAxes.inverted() (depth is a new concept, but had it existed it would return 4 for this example).
• `twinx` and `twiny` now return an instance of `SubplotBase` if parent axes is an instance of `SubplotBase`.

• All Qt3-based backends are now deprecated due to the lack of py3k bindings. Qt and QtAgg backends will continue to work in v1.2.x for py2.6 and py2.7. It is anticipated that the Qt3 support will be completely removed for the next release.

• `ColorConverter`, `Colormap` and `Normalize` now subclasses `object`

• ContourSet instances no longer have a `transform` attribute. Instead, access the transform with the `get_transform` method.

### 15.1.34 Changes in 1.3.x

#### Changes in 1.3.1

It is rare that we make an API change in a bugfix release, however, for 1.3.1 since 1.3.0 the following change was made:

• `text.Text.cached` (used to cache font objects) has been made into a private variable. Among the obvious encapsulation benefit, this removes this confusing-looking member from the documentation.

• The method `hist()` now always returns bin occupancies as an array of type `float`. Previously, it was sometimes an array of type `int`, depending on the call.

#### Code removal

• The following items that were deprecated in version 1.2 or earlier have now been removed completely:
  - The Qt 3.x backends (`qt` and `qtagg`) have been removed in favor of the Qt 4.x backends (`qt4` and `qt4agg`).
  - The FltkAgg and Emf backends have been removed.
  - The `matplotlib.nxutils` module has been removed. Use the functionality on `matplotlib.path.Path.contains_point` and friends instead.
  - The following kwargs to the `legend` function have been renamed:
    * `pad` -> `borderpad`
    * `labelsep` -> `labelspacing`
    * `handlelen` -> `handlelength`
    * `handletextsep` -> `handletextpad`
    * `axespad` -> `borderaxespad`

  Related to this, the following rcParams have been removed:

    * `legend.pad`, `legend.labelsep`, `legend.handlelen`, `legend.handletextsep` and `legend.axespad`

  - For the `hist` function, instead of `width`, use `rwidth` (relative width).
- On `patches.Circle`, the resolution kwarg has been removed. For a circle made up of line segments, use `patches.CirclePolygon`.

- The printing functions in the Wx backend have been removed due to the burden of keeping them up-to-date.

- `mlab.liapunov` has been removed.

- `mlab.save`, `mlab.load`, `pylab.save` and `pylab.load` have been removed. We recommend using `numpy.savetxt` and `numpy.loadtxt` instead.

- `widgets.HorizontalSpanSelector` has been removed. Use `widgets.SpanSelector` instead.

**Code deprecation**

- The CocoaAgg backend has been deprecated, with the possibility for deletion or resurrection in a future release.

- The top-level functions in `matplotlib.path` that are implemented in C++ were never meant to be public. Instead, users should use the Pythonic wrappers for them in the `path.Path` and `collections.Collection` classes. Use the following mapping to update your code:

  - `point_in_path` -> `path.Path.contains_point`
  - `get_path_extents` -> `path.Path.get_extents`
  - `point_in_path_collection` -> `collection.Collection.contains`
  - `path_in_path` -> `path.Path.contains_path`
  - `path_intersects_path` -> `path.Path.intersects_path`
  - `convert_path_to_polygons` -> `path.Path.to_polygons`
  - `cleanup_path` -> `path.Path.cleaned`
  - `points_in_path` -> `path.Path.contains_points`
  - `clip_path_to_rect` -> `path.Path.clip_to_bbox`

- `matplotlib.colors.normalize` and `matplotlib.colors.no_norm` have been deprecated in favour of `matplotlib.colors.Normalize` and `matplotlib.colors.NoNorm` respectively.

- The `ScalarMappable` class’ `set_colorbar` is now deprecated. Instead, the `matplotlib.cm.ScalarMappable.colorbar` attribute should be used. In previous Matplotlib versions this attribute was an undocumented tuple of `(colorbar_instance, colorbar_axes)` but is now just `colorbar_instance`. To get the colorbar axes it is possible to just use the `ax` attribute on a colorbar instance.

- The `mpl` module is now deprecated. Those who relied on this module should transition to simply using `import matplotlib as mpl`.

**Code changes**

- `Patch` now fully supports using RGBA values for its `facecolor` and `edgecolor` attributes, which enables faces and edges to have different alpha values. If the `Patch` object’s `alpha` attribute is set to anything other than `None`, that value will override any alpha-channel
value in both the face and edge colors. Previously, if Patch had alpha=None, the alpha component of edgecolor would be applied to both the edge and face.

- The optional isRGB argument to set_foreground() (and the other GraphicsContext classes that descend from it) has been renamed to isRGBA, and should now only be set to True if the fg color argument is known to be an RGBA tuple.

- For Patch, the capstyle used is now butt, to be consistent with the default for most other objects, and to avoid problems with non-solid linestyle appearing solid when using a large linewidth. Previously, Patch used capstyle='projecting'.

- Path objects can now be marked as readonly by passing readonly=True to its constructor. The built-in path singletons, obtained through Path.unit* class methods return readonly paths. If you have code that modified these, you will need to make a deepcopy first, using either:

```python
import copy
path = copy.deepcopy(Path.unit_circle())

# or
path = Path.unit_circle().deepcopy()
```

Deep copying a Path always creates an editable (i.e. non-readonly) Path.

- The list at Path.NUM_VERTICES was replaced by a dictionary mapping Path codes to the number of expected vertices at NUM_VERTICES_FOR_CODE.

- To support XKCD style plots, the matplotlib.path.cleanup_path() method’s signature was updated to require a sketch argument. Users of matplotlib.path.cleanup_path() are encouraged to use the new cleaned() Path method.

- Data limits on a plot now start from a state of having “null” limits, rather than limits in the range (0, 1). This has an effect on artists that only control limits in one direction, such as axvline and axhline, since their limits will not longer also include the range (0, 1). This fixes some problems where the computed limits would be dependent on the order in which artists were added to the axes.

- Fixed a bug in setting the position for the right/top spine with data position type. Previously, it would draw the right or top spine at +1 data offset.

- In FancyArrow, the default arrow head width, head_width, has been made larger to produce a visible arrow head. The new value of this kwarg is head_width = 20 * width.

- It is now possible to provide number of levels + 1 colors in the case of extend='both' for contourf (or just number of levels colors for an extend value min or max) such that the resulting colormap’s set_under and set_over are defined appropriately. Any other number of colors will continue to behave as before (if more colors are provided than levels, the colors will be unused). A similar change has been applied to contour, where extend='both' would expect number of levels + 2 colors.

- A new keyword extendrect in colorbar() and ColorbarBase allows one to control the shape of colorbar extensions.

- The extension of MultiCursor to both vertical (default) and/or horizontal cursor implied that self.line is replaced by self.vline for vertical cursors lines and self.hline is added for the horizontal cursors lines.

- On POSIX platforms, the report_memory() function raises NotImplementedError instead of OSError if the ps command cannot be run.
• The `matplotlib.cbook.check_output()` function has been moved to `matplotlib.compat.subprocess()`.

Configuration and rcParams

• On Linux, the user-specific `matplotlibrc` configuration file is now located in `config/matplotlib/matplotlibrc` to conform to the XDG Base Directory Specification.

• The `font.*` rcParams now affect only text objects created after the rcParam has been set, and will not retroactively affect already existing text objects. This brings their behavior in line with most other rcParams.

• Removed call of `grid()` in `plotfile()`. To draw the axes grid, set the `axes.grid` rcParam to `True`, or explicitly call `grid()`.

15.1.35 Changes in 1.4.x

Code changes

• A major refactoring of the axes module was made. The axes module has been split into smaller modules:
  
  - the `_base` module, which contains a new private `_AxesBase` class. This class contains all methods except plotting and labelling methods.
  
  - the `axes` module, which contains the Axes class. This class inherits from `_AxesBase`, and contains all plotting and labelling methods.
  
  - the `_subplot` module, with all the classes concerning subplotting.

There are a couple of things that do not exists in the `axes` module’s namespace anymore. If you use them, you need to import them from their original location:

• `math` -> import `math`

• `ma` -> from `numpy` import `ma`

• `cbook` -> from `matplotlib` import `cbook`

• `docstring` -> from `matplotlib` import `docstring`

• `is_sequence_of_strings` -> from `matplotlib.cbook` import `is_sequence_of_strings`

• `is_string_like` -> from `matplotlib.cbook` import `is_string_like`

• `iterable` -> from `matplotlib.cbook` import `iterable`

• `itertools` -> import `itertools`

• `martist` -> from `matplotlib` import `artist` as `martist`

• `matplotlib` -> import `matplotlib`

• `mcoll` -> from `matplotlib` import `collections` as `mcoll`

• `mcolors` -> from `matplotlib` import `colors` as `mcolors`

• `mcontour` -> from `matplotlib` import `contour` as `mcontour`

• `mpatches` -> from `matplotlib` import `patches` as `mpatches`

• `mpath` -> from `matplotlib` import `path` as `mpath`
• mquiver -> from matplotlib import quiver as mquiver
• mstack -> from matplotlib import stack as mstack
• mstream -> from matplotlib import stream as mstream
• mtable -> from matplotlib import table as mtable

As part of the refactoring to enable Qt5 support, the module matplotlib.backends.qt4_compat was renamed to matplotlib.qt_compat. qt4_compat is deprecated in 1.4 and will be removed in 1.5.

• The errorbar() method has been changed such that the upper and lower limits (lolims, uplims, xlolims, xuplims) now point in the correct direction.

• The fmt kwarg for plot() defaults.

• A bug has been fixed in the path effects rendering of fonts, which now means that the font size is consistent with non-path effect fonts. See https://github.com/matplotlib/matplotlib/issues/2889 for more detail.

• The Sphinx extensions ipython_directive and ipython_console_highlighting have been moved to the IPython project itself. While they remain in Matplotlib for this release, they have been deprecated. Update your extensions in conf.py to point to IPython.sphinxext.ipython_directive instead of matplotlib.sphinxext.ipython_directive.

• In finance, almost all functions have been deprecated and replaced with a pair of functions name *_ochl and *_ohlc. The former is the ‘open-close-high-low’ order of quotes used previously in this module, and the latter is the ‘open-high-low-close’ order that is standard in finance.

• For consistency the face_alpha keyword to matplotlib.path_effects.SimplePatchShadow has been deprecated in favour of the alpha keyword. Similarly, the keyword offset_xy is now named offset across all _Base has been renamed to matplotlib.path_effects.AbstractPathEffect. matplotlib.path_effects.ProxyRenderer has been renamed to matplotlib.path_effects.PathEffectRenderer and is now a full RendererBase subclass.

• The artist used to draw the outline of a colorbar has been changed from a matplotlib.lines.Line2D to matplotlib.patches.Polygon, thus colorbar.ColorbarBase.outline is now a matplotlib.patches.Polygon object.

• The legend handler interface has changed from a callable, to any object which implements the legend_artists method (a deprecation phase will see this interface be maintained for v1.4). See Legend guide for further details. Further legend changes include:
  - matplotlib.axes.Axes._get_legend_handles() now returns a generator of handles, rather than a list.
  - The legend() function’s “loc” positional argument has been deprecated. Use the “loc” keyword instead.

• The rcParams savefig.transparent has been added to control default transparency when saving figures.

• Slightly refactored the Annotation family. The text location in Annotation is now handled entirely handled by the underlying Text object so set_position works as expected. The attributes xytext and textcoords have been deprecated in favor of xyann and anncoords so that Annotation and Annotabox can share a common sensibly named api for getting/setting the location of the text or box.
  - xyann -> set the location of the annotation
  - xy -> set where the arrow points to
- `anncoords` -> set the units of the annotation location
- `xycoords` -> set the units of the point location
- `set_position()` -> Annotation only set location of annotation

- `matplotlib.mlab.specgram`, `matplotlib.mlab.psd`, `matplotlib.mlab.csd`, `matplotlib.mlab.cohere`, `matplotlib.mlab.coherence`, `matplotlib.pyplot.specgram`, `matplotlib.pyplot.psd`, `matplotlib.pyplot.csd`, and `matplotlib.pyplot.cohere` now raise `ValueError` where they previously raised `AssertionError`.

- For `matplotlib.mlab.psd`, `matplotlib.mlab.csd`, `matplotlib.mlab.cohere`, `matplotlib.mlab.coherence_pairs`, `matplotlib.pyplot.specgram`, `matplotlib.pyplot.psd`, `matplotlib.pyplot.csd`, and `matplotlib.pyplot.cohere`, in cases where a shape (n, 1) array is returned, this is now converted to a (n, ) array. Previously, (n, m) arrays were averaged to an (n, ) array, but (n, 1) arrays were returned unchanged. This change makes the dimensions consistent in both cases.

- Added the rcParam `axes.formatter.useoffset` to control the default value of `useOffset` in `ticker.ScalarFormatter`.

- Added Formatter sub-class `StrMethodFormatter` which does the exact same thing as `FormatStrFormatter`, but for new-style formatting strings.

- Deprecated `matplotlib.testing.image_util` and the only function within, `matplotlib.testing.image_util.autocontrast`. These will be removed completely in v1.5.0.

- The `fmt` argument of `plot_date()` has been changed from `bo` to just `o`, so color cycling can happen by default.

- Removed the class `FigureManagerQTAgg` and deprecated `NavigationToolBar2QTAgg` which will be removed in 1.5.

- Removed formerly public (non-prefixed) attributes `rect` and `drawRect` from `FigureCanvasQTAgg`; they were always an implementation detail of the (preserved) `drawRectangle()` function.

- The function signatures of `tight_bbox.adjust_bbox` and `tight_bbox.process_figure_for_rasterizing` have been changed. A new `fixed_dpi` parameter allows for overriding the `figure.dpi` setting instead of trying to deduce the intended behaviour from the file format.

- Added support for horizontal/vertical axes padding to `mpl_toolkits.axes_grid1.ImageGrid` — argument `axes_pad` can now be tuple-like if separate axis padding is required. The original behavior is preserved.

- Added support for skewed transforms to `matplotlib.transforms.Affine2D`, which can be created using the `skew` and `skew_deg` methods.

- Added clockwise parameter to control sectors direction in `axes.pie`.

- In `matplotlib.lines.Line2D` the `markevery` functionality has been extended. Previously an integer start-index and stride-length could be specified using either a two-element-list or a two-element-tuple. Now this can only be done using a two-element-tuple. If a two-element-list is used then it will be treated as numpify fancy indexing and only the two markers corresponding to the given indexes will be shown.

- Removed `prop` kwarg from `mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar` call. It was passed through to the base-class `__init__` and is only used for setting padding. Now `fontproperties` (which is what is really used to set the font properties of `AnchoredSizeBar`) is passed through in place of `prop`. If `fontproperties` is not passed
in, but prop is, then prop is used inplace of fontproperties. If both are passed in, prop is
silently ignored.

- The use of the index 0 in plt.subplot and related commands is deprecated. Due to a lack
  of validation calling plt.subplots(2, 2, 0) does not raise an exception, but puts an axes
  in the _last_ position. This is due to the indexing in subplot being 1-based (to mirror
  MATLAB) so before indexing into the GridSpec object used to determine where the axes
  should go, 1 is subtracted off. Passing in 0 results in passing -1 to GridSpec which results
  in getting the last position back. Even though this behavior is clearly wrong and not
  intended, we are going through a deprecation cycle in an abundance of caution that any
  users are exploiting this ‘feature’. The use of 0 as an index will raise a warning in 1.4
  and an exception in 1.5.

- Clipping is now off by default on offset boxes.

- Matplotlib now uses a less-aggressive call to gc.collect(1) when closing figures to avoid
  major delays with large numbers of user objects in memory.

- The default clip value of all pie artists now defaults to False.

Code removal

- Removed mlab.levypdf. The code raised a numpy error (and has for a long time) and was
  not the standard form of the Levy distribution. scipy.stats.levy should be used instead

15.1.36 Changes in 1.5.0

Code Changes

Reversed matplotlib.cbook.ls_mapper, added ls_mapper_r

Formerly, matplotlib.cbook.ls_mapper was a dictionary with the long-form line-style names
("solid") as keys and the short forms ("-")) as values. This long-to-short mapping is now done
by ls_mapper_r, and the short-to-long mapping is done by the ls_mapper.

Prevent moving artists between Axes, Property-ify Artist.axes, deprecate Artist.{get,set}._axes

This was done to prevent an Artist that is already associated with an Axes from being
moved/added to a different Axes. This was never supported as it causes havoc with the trans-
form stack. The apparent support for this (as it did not raise an exception) was the source of
multiple bug reports and questions on SO.

For almost all use-cases, the assignment of the axes to an artist should be taken care of by
the axes as part of the Axes.add_** method, hence the deprecation of {get,set}._axes.

Removing the set_axes method will also remove the ‘axes’ line from the ACCEPTS kwarg
Tables (assuming that the removal date gets here before that gets overhauled).

Tightened input validation on ‘pivot’ kwarg to quiver

Tightened validation so that only {'tip', 'tail', 'mid', and 'middle'} (but any capitalization)
are valid values for the ‘pivot’ kwarg in the Quiver._**init__ (and hence Axes.quiver and plt.
quiver which both fully delegate to Quiver). Previously any input matching ‘mid.*’ would be
interpreted as ‘middle’, ‘tip.*’ as ‘tip’ and any string not matching one of those patterns as
‘tail’.

The value of Quiver.pivot is normalized to be in the set {'tip', 'tail', 'middle'} in Quiver._init__.

Reordered Axes.get_children

The artist order returned by Axes.get_children did not match the one used by Axes.draw. They
now use the same order, as Axes.draw now calls Axes.get_children.

Changed behaviour of contour plots

The default behaviour of contour() and contourf() when using a masked array is now de-
determined by the new keyword argument corner_mask, or if this is not specified then the
new rcParam contour.corner_mask instead. The new default behaviour is equivalent to us-
ing corner_mask=True; the previous behaviour can be obtained using corner_mask=False or by
changing the rcParam. The example http://matplotlib.org/examples/pylab_examples/contour_
corner_mask.html demonstrates the difference. Use of the old contouring algorithm, which
is obtained with corner_mask='legacy', is now deprecated.

Contour labels may now appear in different places than in earlier versions of Matplotlib.

In addition, the keyword argument nchunk now applies to contour() as well as contourf(), and it
subdivides the domain into subdomains of exactly nchunk by nchunk quads, whereas previously
it was only roughly nchunk by nchunk quads.

The C/C++ object that performs contour calculations used to be stored in the public attribute
QuadContourSet.Cntr; but is now stored in a private attribute and should not be accessed by
end users.

Added set_params function to all Locator types

This was a bug fix targeted at making the api for Locators more consistent.

In the old behavior, only locators of type MaxNLocator have set_params() defined, causing
its use on any other Locator to raise an AttributeError (aside: set_params(args) is a function
that sets the parameters of a Locator instance to be as specified within args). The fix involves
moving set_params() to the Locator class such that all subtypes will have this function defined.

Since each of the Locator subtypes have their own modifiable parameters, a universal
set_params() in Locator isn’t ideal. Instead, a default no-operation function that raises a
warning is implemented in Locator. Subtypes extending Locator will then override with their
own implementations. Subtypes that do not have a need for set_params() will fall back onto
their parent’s implementation, which raises a warning as intended.

In the new behavior, Locator instances will not raise an AttributeError when set_params() is
called. For Locators that do not implement set_params(), the default implementation in
Locator is used.
Disallow None as x or y value in ax.plot

Do not allow None as a valid input for the x or y args in ax.plot. This may break some user code, but this was never officially supported (ex documented) and allowing None objects through can lead to confusing exceptions downstream.

To create an empty line use

```python
ln1, = ax.plot([], [], ...)  
ln2, = ax.plot([], [], ...)
```

In either case to update the data in the Line2D object you must update both the x and y data.

Removed args and kwargs from MicrosecondLocator.__call__

The call signature of __call__() has changed from __call__(self, *args, **kwargs) to __call__(self). This is consistent with the superclass Locator and also all the other Locators derived from this superclass.

No ValueError for the MicrosecondLocator and YearLocator

The MicrosecondLocator and YearLocator objects when called will return an empty list if the axes have no data or the view has no interval. Previously, they raised a ValueError. This is consistent with all the Date Locators.

'OffsetBox.DrawingArea' respects the 'clip' keyword argument

The call signature was OffsetBox.DrawingArea(..., clip=True) but nothing was done with the clip argument. The object did not do any clipping regardless of that parameter. Now the object can and does clip the child Artists if they are set to be clipped.

You can turn off the clipping on a per-child basis using child.set_clip_on(False).

Add salt to clipPath id

Add salt to the hash used to determine the id of the clipPath nodes. This is to avoid conflicts when two svg documents with the same clip path are included in the same document (see https://github.com/ipython/ipython/issues/8133 and https://github.com/matplotlib/matplotlib/issues/4349), however this means that the svg output is no longer deterministic if the same figure is saved twice. It is not expected that this will affect any users as the current ids are generated from an md5 hash of properties of the clip path and any user would have a very difficult time anticipating the value of the id.

Changed snap threshold for circle markers to inf

When drawing circle markers above some marker size (previously 6.0) the path used to generate the marker was snapped to pixel centers. However, this ends up distorting the marker away from a circle. By setting the snap threshold to inf snapping is never done on circles.

This change broke several tests, but is an improvement.
Preserve units with Text position

Previously the ‘get_position’ method on Text would strip away unit information even though the units were still present. There was no inherent need to do this, so it has been changed so that unit data (if present) will be preserved. Essentially a call to ‘get_position’ will return the exact value from a call to ‘set_position’.

If you wish to get the old behaviour, then you can use the new method called ‘get_unitless_position’.

New API for custom Axes view changes

Interactive pan and zoom were previously implemented using a Cartesian-specific algorithm that was not necessarily applicable to custom Axes. Three new private methods, _get_view(), _set_view(), and _set_view_from_bbox(), allow for custom Axes classes to override the pan and zoom algorithms. Implementors of custom Axes who override these methods may provide suitable behaviour for both pan and zoom as well as the view navigation buttons on the interactive toolbars.

MathTex visual changes

The spacing commands in mathtext have been changed to more closely match vanilla TeX.

Improved spacing in mathtext

The extra space that appeared after subscripts and superscripts has been removed.

No annotation coordinates wrap

In #2351 for 1.4.0 the behavior of ['axes points', 'axes pixel', 'figure points', 'figure pixel'] as coordinates was change to no longer wrap for negative values. In 1.4.3 this change was reverted for 'axes points' and 'axes pixel' and in addition caused 'axes fraction' to wrap. For 1.5 the behavior has been reverted to as it was in 1.4.0-1.4.2, no wrapping for any type of coordinate.

Deprecation

Deprecated GraphicsContextBase.set_graylevel

The GraphicsContextBase.set_graylevel function has been deprecated in 1.5 and will be removed in 1.6. It has been unused. The GraphicsContextBase.set_foreground could be used instead.
deprecated idle_event

The idle_event was broken or missing in most backends and causes spurious warnings in some cases, and its use in creating animations is now obsolete due to the animations module. Therefore code involving it has been removed from all but the wx backend (where it partially works), and its use is deprecated. The animations module may be used instead to create animations.

color_cycle deprecated

In light of the new property cycling feature, the Axes method set_color_cycle is now deprecated. Calling this method will replace the current property cycle with one that cycles just the given colors.

Similarly, the rc parameter axes.color_cycle is also deprecated in lieu of the new axes.prop_cycle parameter. Having both parameters in the same rc file is not recommended as the result cannot be predicted. For compatibility, setting axes.color_cycle will replace the cycler in axes.prop_cycle with a color cycle. Accessing axes.color_cycle will return just the color portion of the property cycle, if it exists.

Timeline for removal has not been set.

Bundled jquery

The version of jquery bundled with the webagg backend has been upgraded from 1.7.1 to 1.11.3. If you are using the version of jquery bundled with webagg you will need to update your html files as such

```
-  <script src="_static/jquery/js/jquery-1.7.1.min.js"></script>
+  <script src="_static/jquery/js/jquery-1.11.3.min.js"></script>
```

Code Removed

Removed Image from main namespace

Image was imported from PIL/pillow to test if PIL is available, but there is no reason to keep Image in the namespace once the availability has been determined.

Removed lod from Artist

Removed the method set_lod and all references to the attribute _lod as the are not used anywhere else in the code base. It appears to be a feature stub that was never built out.

Removed threading related classes from cbook

The classes Scheduler, Timeout, and Idle were in cbook, but are not used internally. They appear to be a prototype for the idle event system which was not working and has recently been pulled out.
**Matplotlib, Release 3.1.3**

**Removed Lena images from sample_data**

The `lena.png` and `lena.jpg` images have been removed from Matplotlib’s sample data directory. The images are also no longer available from `matplotlib.cbook.get_sample_data`. We suggest using `matplotlib.cbook.get_sample_data('grace_hopper.png')` or `matplotlib.cbook.get_sample_data('grace_hopper.jpg')` instead.

**Legend**

 Removed handling of `loc` as a positional argument to `Legend`

**Legend handlers**

Remove code to allow legend handlers to be callable. They must now implement a method `legend_artist`.

**Axis**

Removed method `set_scale`. This is now handled via a private method which should not be used directly by users. It is called via `Axes.set_{x,y}scale` which takes care of ensuring the related changes are also made to the Axes object.

**finance.py**

Removed functions with ambiguous argument order from `finance.py`.

**Annotation**

Removed `textcoords` and `xytext` properties from Annotation objects.

**spinxext.ipython_*.*py**

Both `ipython_console_highlighting` and `ipython_directive` have been moved to IPython.
Change your import from `matplotlib.sphinxext.ipython_directive` to `IPython.sphinxext.ipython_directive` and from `matplotlib.sphinxext.ipython_directive` to `IPython.sphinxext.ipython_directive`.

**LineCollection.color**

Deprecated in 2005, use `set_color`

*remove 'faceted' as a valid value for shading in tri.tripcolor*

Use `edgecolor` instead. Added validation on `shading` to only be valid values.
Remove faceted kwarg from scatter

Remove support for the faceted kwarg. This was deprecated in d48b34288e9651ff95c3b8a071ef5ac5cf50bae7 (2008-04-18!) and replaced by edgecolor.

Remove set_colorbar method from ScalarMappable

Remove set_colorbar method, use colorbar attribute directly.

patheffects.svg

- remove get_proxy_renderer method from AbstractPathEffect class
- remove patch_alpha and offset_xy from SimplePatchShadow

Remove testing.image_util.py

Contained only a no-longer used port of functionality from PIL

Remove mlab.FIFOBuffer

Not used internally and not part of core mission of mpl.

Remove mlab.prepca

Deprecated in 2009.

Remove NavigationToolbar2QTAgg

Added no functionality over the base NavigationToolbar2Qt

mpl.py

Remove the module matplotlib.mpl. Deprecated in 1.3 by PR #1670 and commit 78ce67d161625833cacff23cfe5d74920248c5b2

15.1.37 Changes in 1.5.2

Default Behavior Changes
**Changed default autorange behavior in boxplots**

Prior to v1.5.2, the whiskers of boxplots would extend to the minimum and maximum values if the quartiles were all equal (i.e., Q1 = median = Q3). This behavior has been disabled by default to restore consistency with other plotting packages.

To restore the old behavior, simply set autorange=True when calling plt.boxplot.

**15.1.38 Changes in 1.5.3**

`ax.plot(..., marker=None)` gives default marker

Prior to 1.5.3 kwargs passed to `plot` were handled in two parts – default kwargs generated internal to `plot` (such as the cycled styles) and user supplied kwargs. The internally generated kwargs were passed to the matplotlib.lines.Line2D.__init__ and the user kwargs were passed to `ln.set(**kwargs)` to update the artist after it was created. Now both sets of kwargs are merged and passed to `__init__`. This change was made to allow `None` to be passed in via the user kwargs to mean 'do the default thing' as is the convention through out mpl rather than raising an exception.

Unlike most `Line2D` setter methods `set_marker` did accept `None` as a valid input which was mapped to 'no marker'. Thus, by routing this marker=\`None through `__init__` rather than set(\...) the meaning of `ax.plot(..., marker=None)` changed from 'no markers' to 'default markers from rcparams'.

This is change is only evident if `mpl.rcParams['lines.marker']` has a value other than 'None' (which is string 'None' which means 'no marker').

**15.1.39 API Changes in 2.0.0**

**Deprecation and removal**

**Color of Axes**

The `axisbg` and `axisbgcolor` properties on `Axes` have been deprecated in favor of `facecolor`.

**GTK and GDK backends deprecated**

The GDK and GTK backends have been deprecated. These obsolete backends allow figures to be rendered via the GDK API to files and GTK2 figures. They are untested and known to be broken, and their use has been discouraged for some time. Instead, use the `GTKAgg` and `GTKCairo` backends for rendering to GTK2 windows.

**WX backend deprecated**

The WX backend has been deprecated. It is untested, and its use has been discouraged for some time. Instead, use the `WXAgg` backend for rendering figures to WX windows.
CocoaAgg backend removed

The deprecated and not fully functional CocoaAgg backend has been removed.

round removed from TkAgg Backend

The TkAgg backend had its own implementation of the round function. This was unused internally and has been removed. Instead, use either the round builtin function or numpy.round.

'hold' functionality deprecated

The 'hold' keyword argument and all functions and methods related to it are deprecated, along with the 'axes.hold' rcParams entry. The behavior will remain consistent with the default hold=True state that has long been in place. Instead of using a function or keyword argument (hold=False) to change that behavior, explicitly clear the axes or figure as needed prior to subsequent plotting commands.

Artist.update has return value

The methods matplotlib.artist.Artist.set, matplotlib.Artist.update, and the function matplotlib.artist.Artist.setp now use a common codepath to look up how to update the given artist properties (either using the setter methods or an attribute/property).

The behavior of matplotlib.Artist.update is slightly changed to return a list of the values returned from the setter methods to avoid changing the API of matplotlib.Artist.set and matplotlib.artist.setp.

The keys passed into matplotlib.Artist.update are now converted to lower case before being processed, to match the behavior of matplotlib.Artist.set and matplotlib.artist.setp. This should not break any user code because there are no set methods with capitals in their names, but this puts a constraint on naming properties in the future.

Legend initializers gain edgecolor and facecolor kwargs

The Legend background patch (or 'frame') can have its edgecolor and facecolor determined by the corresponding keyword arguments to the matplotlib.legend.Legend initializer, or to any of the methods or functions that call that initializer. If left to their default values of None, their values will be taken from matplotlib.rcParams. The previously-existing framealpha kwarg still controls the alpha transparency of the patch.

Qualitative colormaps

Colorbrewer's qualitative/discrete colormaps ("Accent", "Dark2", "Paired", "Pastel1", "Pastel2", "Set1", "Set2", "Set3") are now implemented as ListedColormap instead of LinearSegmentedColormap.

To use these for images where categories are specified as integers, for instance, use:

```python
plt.imshow(x, cmap='Dark2', norm=colors.NoNorm())
```
**Matplotlib, Release 3.1.3**

**Change in the `draw_image` backend API**

The `draw_image` method implemented by backends has changed its interface. This change is only relevant if the backend declares that it is able to transform images by returning `True` from `option_scale_image`. See the `draw_image` docstring for more information.

**`matplotlib.ticker.LinearLocator` algorithm update**

The `matplotlib.ticker.LinearLocator` is used to define the range and location of axis ticks when the user wants an exact number of ticks. `LinearLocator` thus differs from the default locator `MaxNLocator`, for which the user specifies a maximum number of intervals rather than a precise number of ticks.

The view range algorithm in `matplotlib.ticker.LinearLocator` has been changed so that more convenient tick locations are chosen. The new algorithm returns a plot view range that is a multiple of the user-requested number of ticks. This ensures tick marks will be located at whole integers more consistently. For example, when both y-axes of a “twinx” plot use `matplotlib.ticker.LinearLocator` with the same number of ticks, their y-tick locations and grid lines will coincide.

**`matplotlib.ticker.LogLocator` gains `numticks` kwarg**

The maximum number of ticks generated by the `LogLocator` can now be controlled explicitly via setting the new ‘`numticks`’ kwarg to an integer. By default the kwarg is `None` which internally sets it to the ‘`auto`’ string, triggering a new algorithm for adjusting the maximum according to the axis length relative to the ticklabel font size.

**`matplotlib.ticker.LogFormatter`: two new kwargs**

Previously, minor ticks on log-scaled axes were not labeled by default. An algorithm has been added to the `LogFormatter` to control the labeling of ticks between integer powers of the base. The algorithm uses two parameters supplied in a kwarg tuple named ‘`minor_thresholds`’. See the docstring for further explanation.

To improve support for axes using `SymmetricLogLocator`, a ‘`linthresh`’ kwarg was added.

**New defaults for 3D quiver function in `mpl_toolkits.mplot3d.axes3d.py`**

Matplotlib has both a 2D and a 3D quiver function. These changes affect only the 3D function and make the default behavior of the 3D function match the 2D version. There are two changes:

1) The 3D quiver function previously normalized the arrows to be the same length, which makes it unusable for situations where the arrows should be different lengths and does not match the behavior of the 2D function. This normalization behavior is now controlled with the `normalize` keyword, which defaults to `False`.

2) The `pivot` keyword now defaults to `tail` instead of `tip`. This was done in order to match the default behavior of the 2D quiver function.

To obtain the previous behavior with the 3D quiver function, one can call the function with
Matplotlib, Release 3.1.3

```python
ax = plt.subplot(111, projection='3d')
```

where “ax” is an `Axes3d` object created with something like

```python
import mpl_toolkits.mplot3d.axes3d
ax = plt.subplot(111, projection='3d')
```

**Stale figure behavior**

Attempting to draw the figure will now mark it as not stale (independent if the draw succeeds). This change is to prevent repeatedly trying to re-draw a figure which is raising an error on draw. The previous behavior would only mark a figure as not stale after a full re-draw succeeded.

**The spectral colormap is now nipy_spectral**

The colormaps formerly known as `spectral` and `spectral_r` have been replaced by `nipy_spectral` and `nipy_spectral_r` since Matplotlib 1.3.0. Even though the colormap was deprecated in Matplotlib 1.3.0, it never raised a warning. As of Matplotlib 2.0.0, using the old names raises a deprecation warning. In the future, using the old names will raise an error.

**Default install no longer includes test images**

To reduce the size of wheels and source installs, the tests and baseline images are no longer included by default.

To restore installing the tests and images, use a `setup.cfg` with

```ini
[packages]
tests = True
toolkits_tests = True
```

in the source directory at build/install time.

**15.1.40 API Changes in 2.0.1**

**Extensions to `matplotlib.backend_bases.GraphicsContextBase`**

To better support controlling the color of hatches, the method `matplotlib.backend_bases.GraphicsContextBase.set_hatch_color` was added to the expected API of `GraphicsContext` classes. Calls to this method are currently wrapped with a `try:...except AttributeError:` block to preserve back-compatibility with any third-party backends which do not extend `GraphicsContextBase`.

This value can be accessed in the backends via `matplotlib.backend_bases.GraphicsContextBase.get_hatch_color` (which was added in 2.0 see Extension to `matplotlib.backend_bases.GraphicsContextBase`) and should be used to color the hatches.

In the future there may also be `hatch_linewidth` and `hatch_density` related methods added. It is encouraged, but not required that third-party backends extend `GraphicsContextBase` to make adapting to these changes easier.
afm.get_fontconfig_fonts returns a list of paths and does not check for existence

afm.get_fontconfig_fonts used to return a set of paths encoded as a \{key: 1, ...\} dict, and checked for the existence of the paths. It now returns a list and dropped the existence check, as the same check is performed by the caller (afm.findSystemFonts) as well.

bar now returns rectangles of negative height or width if the corresponding input is negative

plt.bar used to normalize the coordinates of the rectangles that it created, to keep their height and width positives, even if the corresponding input was negative. This normalization has been removed to permit a simpler computation of the correct \texttt{sticky_edges} to use.

Do not clip line width when scaling dashes

The algorithm to scale dashes was changed to no longer clip the scaling factor: the dash patterns now continue to shrink at thin line widths. If the line width is smaller than the effective pixel size, this may result in dashed lines turning into solid gray-ish lines. This also required slightly tweaking the default patterns for ‘-‘, ’:’, and ’.-’ so that with the default line width the final patterns would not change.

There is no way to restore the old behavior.

Deprecate ‘Vega’ color maps

The “Vega” colormaps are deprecated in Matplotlib 2.0.1 and will be removed in Matplotlib 2.2. Use the “tab” colormaps instead: “tab10”, “tab20”, “tab20b”, “tab20c”.

15.1.41 API Changes in 2.1.0

Default behavior of log scales changed to mask $\leq 0$ values

Calling \texttt{matplolib.axes.Axes.set_xscale} or \texttt{matplolib.axes.Axes.set_yscale} now uses ‘mask’ as the default method to handle invalid values (as opposed to ‘clip’). This means that any values $\leq 0$ on a log scale will not be shown.

Previously they were clipped to a very small number and shown.

\texttt{matplolib.cbook.CallbackRegistry.process()} suppresses exceptions by default

Matplotlib uses instances of \texttt{CallbackRegistry} as a bridge between user input event from the GUI and user callbacks. Previously, any exceptions raised in a user call back would bubble out of the \texttt{process} method, which is typically in the GUI event loop. Most GUI frameworks simple print the traceback to the screen and continue as there is not always a clear method of getting the exception back to the user. However PyQt5 now exits the process when it receives an un-handled python exception in the event loop. Thus, \texttt{process()} now suppresses and prints tracebacks to stderr by default.

What \texttt{process()} does with exceptions is now user configurable via the \texttt{exception_handler} attribute and kwarg. To restore the previous behavior pass \texttt{None}
cb = CallbackRegistry(exception_handler=None)

A function which take and Exception as its only argument may also be passed

```python
def maybe_reraise(exc):
    if isinstance(exc, RuntimeError):
        pass
    else:
        raise exc
```

```python
cb = CallbackRegistry(exception_handler=maybe_reraise)
```

**Improved toggling of the axes grids**

The g key binding now switches the states of the x and y grids independently (by cycling through all four on/off combinations).

The new G key binding switches the states of the minor grids.

Both bindings are disabled if only a subset of the grid lines (in either direction) is visible, to avoid making irreversible changes to the figure.

**Ticklabels are turned off instead of being invisible**

Internally, the Tick’s label1On() attribute is now used to hide tick labels instead of setting the visibility on the tick label objects. This improves overall performance and fixes some issues. As a consequence, in case those labels ought to be shown, tick_params() needs to be used, e.g.

```python
ax.tick_params(labelbottom=True)
```

**Removal of warning on empty legends**

plt.legend used to issue a warning when no labeled artist could be found. This warning has been removed.

**More accurate legend autopositioning**

Automatic positioning of legends now prefers using the area surrounded by a Line2D rather than placing the legend over the line itself.

**Cleanup of stock sample data**

The sample data of stocks has been cleaned up to remove redundancies and increase portability. The AAPL.dat.gz, INTC.dat.gz and aapl.csv files have been removed entirely and will also no longer be available from matplotlib.cbook.get_sample_data. If a CSV file is required, we suggest using the msft.csv that continues to be shipped in the sample data. If a NumPy binary file is acceptable, we suggest using one of the following two new files. The aapl.npy.gz and goog.npy files have been replaced by aapl.npz and goog.npz, wherein the first column’s type
has changed from `datetime.date` to `np.datetime64` for better portability across Python versions. Note that Matplotlib does not fully support `np.datetime64` as yet.

Updated qhull to 2015.2

The version of qhull shipped with Matplotlib, which is used for Delaunay triangulation, has been updated from version 2012.1 to 2015.2.

Improved Delaunay triangulations with large offsets

Delaunay triangulations now deal with large x,y offsets in a better way. This can cause minor changes to any triangulations calculated using Matplotlib, i.e. any use of `matplotlib.tri.Triangulation` that requests that a Delaunay triangulation is calculated, which includes `matplotlib.pyplot.tricontour`, `matplotlib.pyplot.tricontourf`, `matplotlib.pyplot.tripcolor`, `matplotlib.pyplot.triplot`, `matplotlib.mlab.griddata` and `mpl_toolkits.mplot3d.axes3d.Axes3D.plot_trisurf`.

Use `backports.functools_lru_cache` instead of `functools32`

It’s better maintained and more widely used (by pylint, jaraco, etc).

cbook.is_numlike only performs an instance check

`is_numlike()` now only checks that its argument is an instance of `(numbers.Number, np.Number)`. In particular, this means that arrays are now not num-like.

Elliptical arcs now drawn between correct angles

The `matplotlib.patches.Arc` patch is now correctly drawn between the given angles.

Previously a circular arc was drawn and then stretched into an ellipse, so the resulting arc did not lie between `theta1` and `theta2`.

`-d$backend` no longer sets the backend

It is no longer possible to set the backend by passing `-d$backend` at the command line. Use the `MPLBACKEND` environment variable instead.

Path.intersects_bbox always treats the bounding box as filled

Previously, when `Path.intersects_bbox` was called with `filled` set to False, it would treat both the path and the bounding box as unfilled. This behavior was not well documented and it is usually not the desired behavior, since bounding boxes are used to represent more complex shapes located inside the bounding box. This behavior has now been changed: when `filled` is False, the path will be treated as unfilled, but the bounding box is still treated as filled. The old behavior was arguably an implementation bug.
When `Path.intersects_bbox` is called with `filled` set to `True` (the default value), there is no change in behavior. For those rare cases where `Path.intersects_bbox` was called with `filled` set to `False` and where the old behavior is actually desired, the suggested workaround is to call `Path.intersects_path` with a rectangle as the path:

```python
from matplotlib.path import Path
from matplotlib.transforms import Bbox, BboxTransformTo
rect = Path.unit_rectangle().transformed(BboxTransformTo(bbox))
result = path.intersects_path(rect, filled=False)
```

**WX no longer calls `generates IdleEvent` events or calls `idle_event`**

Removed unused private method `_onIdle` from `FigureCanvasWx`.
The `IdleEvent` class and `FigureCanvasBase.idle_event` method will be removed in 2.2

**Correct scaling of `magnitude_spectrum()`**

The functions `matplotlib.mlab.magnitude_spectrum()` and `matplotlib.pyplot.magnitude_spectrum()` implicitly assumed the sum of windowing function values to be one. In Matplotlib and Numpy the standard windowing functions are scaled to have maximum value of one, which usually results in a sum of the order of n/2 for a n-point signal. Thus the amplitude scaling `magnitude_spectrum()` was off by that amount when using standard windowing functions ([Bug 8417](#)). Now the behavior is consistent with `matplotlib.pyplot.psd()` and `scipy.signal.welch()`. The following example demonstrates the new and old scaling:

```python
import matplotlib.pyplot as plt
import numpy as np

tau, n = 10, 1024  # 10 second signal with 1024 points
T = tau/n         # sampling interval
t = np.arange(n)*T

a = 4             # amplitude
x = a*np.sin(40*np.pi*t)  # 20 Hz sine with amplitude a

# New correct behavior: Amplitude at 20 Hz is a/2
plt.magnitude_spectrum(x, Fs=1/T, sides='onesided', scale='linear')

# Original behavior: Amplitude at 20 Hz is (a/2)*(n/2) for a Hanning window
w = np.hanning(n)   # default window is a Hanning window
plt.magnitude_spectrum(x*np.sum(w), Fs=1/T, sides='onesided', scale='linear')
```

**Change to signatures of `bar()` & `barh()`**

For 2.0 the default value of `*align*` changed to `center`. However this caused the signature of `bar()` and `barh()` to be misleading as the first parameters were still `left` and `bottom` respectively:

```python
bar(left, height, *, align='center', **kwargs)
barh(bottom, width, *, align='center', **kwargs)
```
Matplotlib, Release 3.1.3

despite behaving as the center in both cases. The methods now take *args, **kwargs as input
and are documented to have the primary signatures of:

```
bar(x, height, *, align='center', **kwargs)
barh(y, width, *, align='center', **kwargs)
```

Passing left and bottom as keyword arguments to bar() and barh() respectively will warn.
Support will be removed in Matplotlib 3.0.

Font cache as json

The font cache is now saved as json, rather than a pickle.

Invalid (Non-finite) Axis Limit Error

When using set_xlim() and set_ylim(), passing non-finite values now results in a ValueError.
The previous behavior resulted in the limits being erroneously reset to (-0.001, 0.001).

scatter and Collection offsets are no longer implicitly flattened

Collection (and thus both 2D scatter and 3D scatter) no longer implicitly flattens its offsets.
As a consequence, scatter’s x and y arguments can no longer be 2+-dimensional arrays.

Deprecations

`GraphicsContextBase's linestyle property`.

The GraphicsContextBase.get_linestyle and GraphicsContextBase.set_linestyle methods,
which had no effect, have been deprecated. All of the backends Matplotlib ships use
GraphicsContextBase.get_dashes and GraphicsContextBase.set_dashes which are more general.
Third-party backends should also migrate to the *_dashes methods.

NavigationToolbar2.dynamic_update

Use draw_idle() method on the Canvas instance instead.

Testing

matplotlib.testing.noseclasses is deprecated and will be removed in 2.3

EngFormatter num arg as string

Passing a string as num argument when calling an instance of matplotlib.ticker.EngFormatter
is deprecated and will be removed in 2.3.
mpl_toolkits.axes_grid module

All functionally from mpl_toolkits.axes_grid can be found in either mpl_toolkits.axes_grid1 or mpl_toolkits.axisartist. Axes classes from mpl_toolkits.axes_grid based on Axis from mpl_toolkits.axisartist can be found in mpl_toolkits.axisartist.

Axes collision in Figure.add_axes

Adding an axes instance to a figure by using the same arguments as for a previous axes instance currently reuses the earlier instance. This behavior has been deprecated in Matplotlib 2.1. In a future version, a new instance will always be created and returned. Meanwhile, in such a situation, a deprecation warning is raised by AxesStack.

This warning can be suppressed, and the future behavior ensured, by passing a unique label to each axes instance. See the docstring of add_axes() for more information.

Additional details on the rationale behind this deprecation can be found in #7377 and #9024.

Former validators for contour.negative_linestyle

The former public validation functions validate_negative_linestyle and validate_negative_linestyle_legacy will be deprecated in 2.1 and may be removed in 2.3. There are no public functions to replace them.

cbook

Many unused or near-unused matplotlib.cbook functions and classes have been deprecated: converter, tostr, todatetime, todate, tofloat, toint, unique, is_string_like, is_sequence_of_strings, is_scalar, Sorter, Xlator, soundex, Null, dict_delall, RingBuffer, get_split_ind, wrap, get_recursive_filelist, pieces, exception_to_str, allequal, alltrue, onetrue, allpairs, finddir, reverse_dict, restrict_dict, issubclass_safe, recursive_remove, unmasked_index_ranges.

Code Removal

qt4_compat.py

Moved to qt_compat.py. Renamed because it now handles Qt5 as well.

Previously Deprecated methods

The GraphicsContextBase.set_graylevel, FigureCanvasBase.onHilite and mpl_toolkits.axes_grid1.mpl_axes.Axes.toggle_axisline methods have been removed.

The ArtistInspector.findobj method, which was never working due to the lack of a get_children method, has been removed.
The deprecated `point_in_path`, `get_path_extents`, `point_in_path_collection`, `path_intersects_path`, `convert_path_to_polygons`, `cleanup_path` and `clip_path_to_rect` functions in the `matplotlib.path` module have been removed. Their functionality remains exposed as methods on the `Path` class.

The deprecated `Artist.get_axes` and `Artist.set_axes` methods have been removed.

The `matplotlib.backends.backend_ps.seq_allequal` function has been removed. Use `np.array_equal` instead.

The deprecated `matplotlib.rcsetup.validate_maskedarray`, `matplotlib.rcsetup.deprecate_savefig_extension` and `matplotlib.rcsetup.validate_tkpythoninspect` functions, and associated `savefig.extension` and `tk.pythoninspect.rcparams` entries have been removed.

The kwarg `resolution` of `matplotlib.projections.polar.PolarAxes` has been removed. It has deprecation with no effect from version 0.98.x.

```python
Axes.set_aspect("normal")
```

Support for setting an `Axes`’s aspect to "normal" has been removed, in favor of the synonym "auto".

```python
shading kwarg to pcolor
```

The `shading kwarg` to `pcolor` has been removed. Set `edgecolors` appropriately instead.

Functions removed from the `lines` module

The `matplotlib.lines` module no longer imports the `pts_to_prestep`, `pts_to_midstep` and `pts_to_poststep` functions from `matplotlib.cbook`.

PDF backend functions

The methods `embedTeXFont` and `tex_font_mapping` of `matplotlib.backend_pdf.PdfFile` have been removed. It is unlikely that external users would have called these methods, which are related to the font system internal to the PDF backend.

`matplotlib.delaunay`

Remove the delaunay triangulation code which is now handled by Qhull via `matplotlib.tri`.

**15.1.42 API Changes in 2.1.1**

Default behavior of log scales reverted to clip $\leq 0$ values

The change it 2.1.0 to mask in logscale by default had more disruptive changes than anticipated and has been reverted, however the clipping is now done in a way that fixes the issues that motivated changing the default behavior to ‘mask’.
As a side effect of this change, error bars which go negative now work as expected on log scales.

### 15.1.43 API Changes in 2.1.2

**Figure.legend no longer checks for repeated lines to ignore**

`matplotlib.Figure.legend` used to check if a line had the same label as an existing legend entry. If it also had the same line color or marker color legend didn’t add a new entry for that line. However, the list of conditions was incomplete, didn’t handle RGB tuples, didn’t handle linewidths or linestyles etc.

This logic did not exist in `Axes.legend`. It was included (erroneously) in Matplotlib 2.1.1 when the legend argument parsing was unified [#9324](https://github.com/matplotlib/matplotlib/pull/9324). This change removes that check in `Axes.legend` again to restore the old behavior.

This logic has also been dropped from `Figure.legend`, where it was previously undocumented. Repeated lines with the same label will now each have an entry in the legend. If you do not want the duplicate entries, don’t add a label to the line, or prepend the label with an underscore.

### 15.1.44 API Changes in 2.2.0

**New dependency**

`kiwisolver` is now a required dependency to support the new constrained_layout, see `Constrained Layout Guide` for more details.

**Deprecations**

**Classes, functions, and methods**

The unused and untested `Artist.onRemove` and `Artist.hitlist` methods have been deprecated.

The now unused `mlab.less_simple_linear_interpolation` function is deprecated.

The unused `ContourLabeler.get_real_label_width` method is deprecated.

The unused `FigureManagerBase.show_popup` method is deprecated. This introduced in e945059b327d42a99938b939a1be867fa023e7ba in 2005 but never built out into any of the backends.

`backend_tkagg.AxesMenu` is deprecated, as it has become unused since the removal of “classic” toolbars.

**Changed function signatures**

`kwarg fig to GridSpec.get_subplot_params` is deprecated, use `figure` instead.

Using `pyplot.axes` with an `Axes` as argument is deprecated. This sets the current axes, i.e. it has the same effect as `pyplot.sca`. For clarity `plt.sca(ax)` should be preferred over `plt.axes(ax)`.
Using strings instead of booleans to control grid and tick visibility is deprecated. Using "on", "off", "true", or "false" to control grid and tick visibility has been deprecated. Instead, use normal booleans (True/False) or boolean-likes. In the future, all non-empty strings may be interpreted as True.

When given 2D inputs with non-matching numbers of columns, `plot` currently cycles through the columns of the narrower input, until all the columns of the wider input have been plotted. This behavior is deprecated; in the future, only broadcasting (1 column to n columns) will be performed.

**rcparams**

The `rcParams["backend.qt4"]` and `rcParams["backend.qt5"]` rcParams were deprecated in version 2.2. In order to force the use of a specific Qt binding, either import that binding first, or set the `QT_API` environment variable.

Deprecation of the `nbagg.transparent` rcParam. To control transparency of figure patches in the nbagg (or any other) backend, directly set `figure.patch.facecolor`, or the `figure.facecolor` rcParam.

**Deprecated** `Axis.unit_data`

Use `Axis.units` (which has long existed) instead.

**Removals**

**Function Signatures**

Contouring no longer supports legacy corner masking. The deprecated `ContourSet.vmin` and `ContourSet.vmax` properties have been removed.

Passing `None` instead of "none" as format to `errorbar` is no longer supported.

The `bgcolor` keyword argument to `Axes` has been removed.

**Modules, methods, and functions**

The `matplotlib.finance`, `mpl_toolkits.exceltools` and `mpl_toolkits.gtktools` modules have been removed. `matplotlib.finance` remains available at https://github.com/matplotlib/mpl_finance.

The `mpl_toolkits.mplot3d.art3d.iscolor` function has been removed.

The `Axes.get_axis_bgcolor`, `Axes.set_axis_bgcolor`, `Bbox.update_from_data`, `Bbox.update_datalim_numerix`, `MaxNLocator.bin_boundaries` methods have been removed.

`mencoder` can no longer be used to encode animations.

The unused `FONT_SCALE` and `fontd` attributes of the `RendererSVG` class have been removed.
color maps

The spectral colormap has been removed. The Vega* colormaps, which were aliases for the tab* colormaps, have been removed.

rcparams

The following deprecated rcParams have been removed:

• axes.color_cycle (see axes.prop_cycle),
• legend.isaxes,
• svg.embed_char_paths (see svg.fonttype),
• text.fontstyle, text.fontangle, text.fontvariant, text.fontweight, text.fontsize (renamed to text.style, etc.),
• tick.size (renamed to tick.major.size).

Only accept string-like for Categorical input

Do not accept mixed string / float / int input, only strings are valid categoricals.

Removal of unused imports

Many unused imports were removed from the codebase. As a result, trying to import certain classes or functions from the “wrong” module (e.g. Figure from matplotlib.backends.backend_agg instead of matplotlib.figure) will now raise an ImportError.

Axes3D.get_xlim, get_ylim and get_zlim now return a tuple

They previously returned an array. Returning a tuple is consistent with the behavior for 2D axes.

Exception type changes

If MovieWriterRegistry can’t find the requested MovieWriter, a more helpful RuntimeError message is now raised instead of the previously raised KeyError.

auto_adjust_subplotpars now raises ValueError instead of RuntimeError when sizes of input lists don’t match

Figure.set_figwidth and Figure.set_figheight default forward to True

matplotlib.Figure.set_figwidth and matplotlib.Figure.set_figheight had the kwarg forward=False by default, but Figure.set_size_inches now defaults to forward=True. This makes these functions consistent.
Do not truncate svg sizes to nearest point

There is no reason to size the SVG output in integer points, change to outputting floats for the `height`, `width`, and `viewBox` attributes of the `svg` element.

Fonts sizes less than 1 pt are clipped to be 1 pt.

FreeType doesn’t allow fonts to get smaller than 1 pt, so all Agg backends were silently rounding up to 1 pt. PDF (other vector backends?) were letting us write fonts that were less than 1 pt, but they could not be placed properly because position information comes from FreeType. This change makes it so no backends can use fonts smaller than 1 pt, consistent with FreeType and ensuring more consistent results across backends.

Changes to Qt backend class MRO

To support both Agg and cairo rendering for Qt backends all of the non-Agg specific code previously in `backend_qt5agg.FigureCanvasQTAggBase` has been moved to `backend_qt5.FigureCanvasQT` so it can be shared with the cairo implementation. The `FigureCanvasQTAggBase.paintEvent()`, `FigureCanvasQTAggBase.blit()`, and `FigureCanvasQTAggBase.print_figure()` methods have moved to `FigureCanvasQTAgg.paintEvent()`, `FigureCanvasQTAgg.blit()`, and `FigureCanvasQTAgg.print_figure()`. The first two methods assume that the instance is also a QWidget so to use `FigureCanvasQTAggBase` it was required to multiple inherit from a QWidget sub-class.

Having moved all of its methods either up or down the class hierarchy `FigureCanvasQTAggBase` has been deprecated. To do this with out warning and to preserve as much API as possible, `backend_qt5.FigureCanvasQTAggBase` now inherits from `backend_qt5.FigureCanvasQTAgg`.

The MRO for `FigureCanvasQTAgg` and `FigureCanvasQTAggBase` used to be

```python
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backends.backend_qt5.FigureCanvasQT,
 PyQt5.QtWidgets.QWidget,
 PyQt5.QtCore.QObject,
 sip.wrapper,
 PyQt5.QtGui.QPaintDevice,
 sipimensionalwrapper,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

and

```python
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAggBase,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 matplotlib.backend_bases.FigureCanvasBase,
 object]
```

respectively. They are now

```python
[matplotlib.backends.backend_qt5agg.FigureCanvasQTAgg,
 matplotlib.backends.backend_agg.FigureCanvasAgg,
 object]
```

(continues on next page)
Axes.imshow clips RGB values to the valid range

When `Axes.imshow` is passed an RGB or RGBA value with out-of-range values, it now logs a warning and clips them to the valid range. The old behaviour, wrapping back in to the range, often hid outliers and made interpreting RGB images unreliable.

GTKAgg and GTKCairo backends deprecated

The GTKAgg and GTKCairo backends have been deprecated. These obsolete backends allow figures to be rendered via the GTK+ 2 toolkit. They are untested, known to be broken, will not work with Python 3, and their use has been discouraged for some time. Instead, use the GTK3Agg and GTK3Cairo backends for rendering to GTK+ 3 windows.

15.1.45 API Changes for 3.0.0

Drop support for python 2

Matplotlib 3 only supports python 3.5 and higher.

Changes to backend loading

Failure to load backend modules (`macosx` on non-framework builds and `gtk3` when running headless) now raises `ImportError` (instead of `RuntimeError` and `TypeError`, respectively).

15.1. Old API Changes
Third-party backends that integrate with an interactive framework are now encouraged to define the `required_interactive_framework` global value to one of the following values: "qt5", "qt4", "gtk3", "wx", "tk", or "macosx". This information will be used to determine whether it is possible to switch from a backend to another (specifically, whether they use the same interactive framework).

**Axes.hist2d now uses pcolormesh instead of pcolorfast**

Axes.hist2d now uses `pcolormesh` instead of `pcolorfast`, which will improve the handling of log-axes. Note that the returned `image` now is of type `QuadMesh` instead of `AxesImage`.

**Matplotlib.axes.Axes.get_tightbbox now includes all artists**

For Matplotlib 3.0, all artists are now included in the bounding box returned by `matplotlib.axes.Axes.get_tightbbox`.

`matplotlib.axes.Axes.get_tightbbox` adds a new kwarg `bbox_extra_artists` to manually specify the list of artists on the axes to include in the tight bounding box calculation. Layout tools like `Figure.tight_layout`, `constrained_layout`, and `fig.savefig('fname.png', bbox_inches="tight")` use `matplotlib.axes.Axes.get_tightbbox` to determine the bounds of each axes on a figure and adjust spacing between axes.

In Matplotlib 2.2 `get_tightbbox` started to include legends made on the axes, but still excluded some other artists, like text that may overspill an axes. This has been expanded to include all artists.

This new default may be overridden in either of three ways:

1. Make the artist to be excluded a child of the figure, not the axes. E.g., call `fig.legend()` instead of `ax.legend()` (perhaps using `get_legend_handles_labels` to gather handles and labels from the parent axes).

2. If the artist is a child of the axes, set the artist property `artist.set_in_layout(False)`.

3. Manually specify a list of artists in the new kwarg `bbox_extra_artists`.

**Text.set_text with string argument None sets string to empty**

Text.set_text when passed a string value of `None` would set the string to "None", so subsequent calls to Text.get_text would return the ambiguous "None" string.

This change sets text objects passed `None` to have empty strings, so that Text.get_text returns an empty string.

**Axes3D.get_xlim, get_ylim and get_zlim now return a tuple**

They previously returned an array. Returning a tuple is consistent with the behavior for 2D axes.

**font_manager.list_fonts now follows the platform’s casefolding semantics**

i.e., it behaves case-insensitively on Windows only.
bar / barh no longer accepts left / bottom as first named argument

These arguments were renamed in 2.0 to x / y following the change of the default alignment from edge to center.

Different exception types for undocumented options

- Passing style='comma' to ticklabel_format() was never supported. It now raises ValueError like all other unsupported styles, rather than NotImplementedError.
- Passing the undocumented xmin or xmax arguments to set_xlim() would silently override the left and right arguments. set_ylim() and the 3D equivalents (e.g. set_zlim3d()) had a corresponding problem. A TypeError will be raised if they would override the earlier limit arguments. In 3.0 these were kwargs were deprecated, but in 3.1 the deprecation was undone.

Improved call signature for Axes.margins

matplotlib.axes.Axes.margins() and mpl_toolkits.mplot3d.Axes3D.margins() no longer accept arbitrary keywords. TypeError will therefore be raised if unknown kwargs are passed; previously they would be silently ignored.

If too many positional arguments are passed, TypeError will be raised instead of ValueError, for consistency with other call-signature violations.

Axes3D.margins now raises TypeError instead of emitting a deprecation warning if only two positional arguments are passed. To supply only x and y margins, use keyword arguments.

Explicit arguments instead of *args, **kwargs

PEP 3102 describes keyword-only arguments, which allow Matplotlib to provide explicit call signatures - where we previously used *args, **kwargs and kwargs.pop, we can now expose named arguments. In some places, unknown kwargs were previously ignored but now raise TypeError because **kwargs has been removed.

- matplotlib.axes.Axes.stem() no longer accepts unknown keywords, and raises TypeError instead of emitting a deprecation.
- matplotlib.axes.Axes.stem() now raises TypeError when passed unhandled positional arguments. If two or more arguments are passed (i.e. X, Y, [linefmt], ...) and Y cannot be cast to an array, an error will be raised instead of treating X as Y and Y as linefmt.
- mpl_toolkits.axes_grid1.axes_divider.SubPlotDivider() raises TypeError instead of Exception when passed unknown kwargs.

Cleanup decorators and test classes no longer destroy warnings filter on exit

The decorators and classes in matplotlib.testing.decorators no longer destroy the warnings filter on exit. Instead, they restore the warnings filter that existed before the test started using warnings.catch_warnings.
Non-interactive FigureManager classes are now aliases of FigureManagerBase

The FigureManagerPdf, FigureManagerPS, and FigureManagerSVG classes, which were previously empty subclasses of FigureManagerBase (i.e., not adding or overriding any attribute or method), are now direct aliases for FigureManagerBase.

Change to the output of image.thumbnail

When called with preview=False, image.thumbnail previously returned an figure whose canvas class was set according to the output file extension. It now returns a figure whose canvas class is the base FigureCanvasBase (and relies on FigureCanvasBase.print_figure to handle the canvas switching properly).

As a side effect of this change, image.thumbnail now also supports .ps, .eps, and .svgz output.

FuncAnimation now draws artists according to their zorder when blitting

FuncAnimation now draws artists returned by the user- function according to their zorder when using blitting, instead of using the order in which they are being passed. However, note that only zorder of passed artists will be respected, as they are drawn on top of any existing artists (see #11369).

Contour color autoscaling improvements

Selection of contour levels is now the same for contour and contourf; previously, for contour, levels outside the data range were deleted. (Exception: if no contour levels are found within the data range, the levels attribute is replaced with a list holding only the minimum of the data range.)

When contour is called with levels specified as a target number rather than a list, and the ‘extend’ kwarg is used, the levels are now chosen such that some data typically will fall in the extended range.

When contour is called with a LogNorm or a LogLocator, it will now select colors using the geometric mean rather than the arithmetic mean of the contour levels.

Streamplot last row and column fixed

A bug was fixed where the last row and column of data in streamplot were being dropped.

Changed default AutoDateLocator kwarg interval_multiples to True

The default value of the tick locator for dates, dates.AutoDateLocator kwarg interval_multiples was set to False which leads to not-nice looking automatic ticks in many instances. The much nicer interval_multiples=True is the new default. See below to get the old behavior back:
**Axes.get_position** now returns actual position if aspect changed

**Axes.get_position** used to return the original position unless a draw had been triggered or **Axes.apply_aspect** had been called, even if the kwarg *original* was set to False. Now **Axes.apply_aspect** is called so **ax.get_position()** will return the new modified position. To get the old behavior use **ax.get_position(original=True)**.

**The ticks for colorbar now adjust for the size of the colorbar**

Colorbar ticks now adjust for the size of the colorbar if the colorbar is made from a mappable that is not a contour or doesn’t have a BoundaryNorm, or boundaries are not specified. If boundaries, etc are specified, the colorbar maintains the original behavior.

**Colorbar for log-scaled hexbin**

When using `hexbin` and plotting with a logarithmic color scale, the colorbar ticks are now correctly log scaled. Previously the tick values were linear scaled log(number of counts).

**PGF backend now explicitly makes black text black**

Previous behavior with the pgf backend was for text specified as black to actually be the default color of whatever was rendering the pgf file (which was of course usually black). The
new behavior is that black text is black, regardless of the default color. However, this means that there is no way to fall back on the default color of the renderer.

**Blacklisted rcparams no longer updated by rcdefaults, rc_file_defaults, rc_file**

The rc modifier functions rcdefaults, rc_file_defaults and rc_file now ignore rcParams in the matplotlib.style.core.STYLE_BLACKLIST set. In particular, this prevents the backend and interactive rcParams from being incorrectly modified by these functions.

**CallbackRegistry now stores callbacks using stdlib’s WeakMethods**

In particular, this implies that CallbackRegistry.callbacks[signal] is now a mapping of callback ids to WeakMethods (i.e., they need to be first called with no arguments to retrieve the method itself).

**Changes regarding the text.latex.unicode rcParam**

The rcParam now defaults to True and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported).

Moreover, the underlying implementation now uses \usepackage[utf8]{inputenc} instead of \usepackage[ucs]\usepackage[utf8x]{inputenc}.

**Return type of ArtistInspector.get_aliases changed**

ArtistInspector.get_aliases previously returned the set of aliases as {fullname: {alias1: None, alias2: None, ...}}. The dict-to-None mapping was used to simulate a set in earlier versions of Python. It has now been replaced by a set, i.e. {fullname: {alias1, alias2, ...}}.

This value is also stored in ArtistInspector.aliases, which has likewise changed.

**Removed pytz as a dependency**

Since dateutil and pytz both provide time zones, and matplotlib already depends on dateutil, matplotlib will now use dateutil time zones internally and drop the redundant dependency on pytz. While dateutil time zones are preferred (and currently recommended in the Python documentation), the explicit use of pytz zones is still supported.

**Deprecations**

**Modules**

The following modules are deprecated:

- matplotlib.compat.subprocess. This was a python 2 workaround, but all the functionality can now be found in the python 3 standard library subprocess.

- matplotlib.backends.wx_compat. Python 3 is only compatible with wxPython 4, so support for wxPython 3 or earlier can be dropped.
Classes, methods, functions, and attributes

The following classes, methods, functions, and attributes are deprecated:

- RcParams.msg_depr, RcParams.msg_depr_ignore, RcParams.msg_depr_set, RcParams.msg_obsolete, RcParams.msg_backend_obsolete
- afm.parse_afm
- backend_pdf.PdfFile.texFontMap
- backend_pgf.get_texcommand
- backend_ps.get_bbox
- backend_qt5.FigureCanvasQT.keyAutoRepeat (directly check event.guiEvent.isAutoRepeat() in the event handler to decide whether to handle autorepeated key presses).
- backend_qt5.error_msg_qt, backend_qt5.exception_handler
- backend_wx.FigureCanvasWx.macros
- backends.pylab_setup
- cbook.GetRealpathAndStat, cbook.Locked
- cbook.is_numlike (use isinstance(..., numbers.Number) instead), cbook.listFiles, cbook.unicode_safe
- container.Container.set_remove_method,
- contour.ContourLabeler.cl, .cl_xy, and .cl_cvalues
- dates.DateFormatter.strftime_pre_1900, dates.DateFormatter.strftime
- font_manager.TempCache
- image._ImageBase.iterpnames, use the interpolation_names property instead. (this affects classes that inherit from _ImageBase including FigureImage, BboxImage, and AxesImage)
- mathtext.unichr_safe (use chr instead)
- patches.Polygon.xy
- table.Table.get_child_artists (use get_children instead)
- testing.compare.ImageComparisonTest, testing.compare.compare_float
- testing.decorators.CleanupTest, testing.decorators.skip_if_command_unavailable
- FigureCanvasQT.keyAutoRepeat (directly check event.guiEvent.isAutoRepeat() in the event handler to decide whether to handle autorepeated key presses)
- FigureCanvasWx.macros
- _ImageBase.iterpnames, use the interpolation_names property instead. (this affects classes that inherit from _ImageBase including FigureImage, BboxImage, and AxesImage)
- patches.Polygon.xy
- texmanager.dvipng_hack_alpha
- text.Annotation.arrow
- Legend.draggable(), in favor of Legend.set_draggable() (Legend.draggable may be reintroduced as a property in future releases)
- textpath.TextToPath.tex_font_map
**Matplotlib, Release 3.1.3**

- `matplotlib.cbook.deprecation.mplDeprecation` will be removed in future versions. It is just an alias for `matplotlib.cbook.deprecation.MatplotlibDeprecationWarning`. Please use the `MatplotlibDeprecationWarning` directly if necessary.

- The `matplotlib.cbook.Bunch` class has been deprecated. Instead, use `types.SimpleNamespace` from the standard library which provides the same functionality.

- `Axes.mouseover_set` is now a frozenset, and deprecated. Directly manipulate the artist’s `.mouseover` attribute to change their mouseover status.

The following keyword arguments are deprecated:

- passing `verts` to `Axes.scatter` (use `marker` instead)
- passing `obj_type` to `cbook.deprecated`

The following call signatures are deprecated:

- passing a `wx.EVTHandler` as first argument to `backend_wx.TimerWx`

**rcParams**

The following `rcParams` are deprecated:

- `examples.directory` (use `datapath` instead)
- `pgf.debug` (the pgf backend relies on logging)
- `text.latex.unicode` (always True now)

**marker styles**

- Using `(n, 3)` as marker style to specify a circle marker is deprecated. Use "o" instead.

- Using `[(x0, y0), (x1, y1), ...], 0)` as marker style to specify a custom marker path is deprecated. Use `[(x0, y0), (x1, y1), ...]` instead.

**Deprecation of LocatableAxes in toolkits**

The `LocatableAxes` classes in toolkits have been deprecated. The base `Axes` classes provide the same functionality to all subclasses, thus these mixins are no longer necessary. Related functions have also been deprecated. Specifically:

- `mpl_toolkits.axes_grid1.axes_divider.LocatableAxesBase`: no specific replacement; use any other `Axes`-derived class directly instead.

- `mpl_toolkits.axes_grid1.axes_grid1.locatable_axes_factory`: no specific replacement; use any other `Axes`-derived class directly instead.

Removals

Hold machinery

Setting or unsetting hold (deprecated in version 2.0) has now been completely removed. Matplotlib now always behaves as if hold=True. To clear an axes you can manually use cla(), or to clear an entire figure use clf().

Removal of deprecated backends

Deprecated backends have been removed:
• GTKAgg
• GTKCairo
• GTK
• GDK

Deprecated APIs

The following deprecated API elements have been removed:
• The deprecated methods knownfailureif and remove_text have been removed from matplotlib.testing.decorators.
• The entire contents of testing.noseclasses have also been removed.
• matplotlib.checkdep_tex, matplotlib.checkdep_xmlint
• backend_bases.IdleEvent
• cbook.converter, cbook.tostr, cbook.todatet ime, cbook.todate, cbook.tofloat, cbook.toint, cbook.unique, cbook.is_string_like, cbook.is_sequence_of_strings, cbook.is_scalar, cbook.soundex, cbook.dict_delall, cbook.get_split_ind, cbook.wrap, cbook.get_recursive_filelist, cbook.pieces, cbook.exception_to_str, cbook.allequal, cbook.alltrue, cbook.onetrue, cbook.allpairs, cbook.finddir, cbook.reverse_dict, cbook.restrict_dict, cbook.issubclass_safe, cbook.recursive_remove, cbook.unmasked_index_ranges, cbook.Null, cbook.RingBuffer, cbook.Sorter, cbook.Xlator,
• font_manager.weight_as_number, font_manager.ttfdict_to_fnames
• pyplot.colors, pyplot.spectral
• rcsetup.validate_negative_linestyle, rcsetup.validate_negative_linestyle_legacy,
• testing.compare.verifiers, testing.compare.verify
• testing.decorators.knownfailureif, testing.decorators.ImageComparisonTest.remove_text
• tests.assert_str_equal, tests.test_tinypages.file_same
• texmanager.dvipng_hack_alpha,

15.1. Old API Changes
Matplotlib, Release 3.1.3

- `_AxesBase.axesPatch`, `_AxesBase.set_color_cycle`, `_AxesBase.get_cursor_props`, `_AxesBase.set_cursor_props`
- `_ImageBase.iterpnames`
- `FigureCanvasBase.start_event_loop_default`
- `FigureCanvasBase.stop_event_loop_default`
- `Figure.figurePatch`
- `FigureCanvasBase.dynamic_update`, `FigureCanvasBase.idle_event`, `FigureCanvasBase.get_linestyle`, `FigureCanvasBase.set_linestyle`
- `FigureCanvasQTAggBase`
- `FigureCanvasQTAgg.blitbox`
- `FigureCanvasTk.show` (alternative: `FigureCanvasTk.draw`)
- `FigureManagerTkAgg` (alternative: `FigureManagerTk`)
- `NavigationToolbar2TkAgg` (alternative: `NavigationToolbar2Tk`)
- `RendererAgg.debug()`
- passing non-numbers to `EngFormatter.format_eng`
- passing `frac` to `PolarAxes.set_theta_grids`
- any mention of idle events

The following API elements have been removed:
- `backend_cairo.HAS_CAIRO_CFFI`
- `sphinxext.sphinx_version`

Proprietary sphinx directives

The matplotlib documentation used the proprietary sphinx directives `htmlonly::`, and `latexonly::`. These have been replaced with the standard sphinx directives `only::html` and `only::latex`. This change will not affect any users. Only downstream package maintainers, who have used the proprietary directives in their docs, will have to switch to the sphinx directives.

lib/mpl_examples symlink

The symlink from `lib/mpl_examples` to `../examples` has been removed. This is not installed as an importable package and should not affect end users, however this may require downstream packagers to adjust. The content is still available top-level examples directory.

15.1.46 API Changes for 3.0.1

tight_layout.auto_adjust_subplotpars can return `None` now if the new subplotparams will collapse axes to zero width or height. This prevents `tight_layout` from being executed. Similarly `tight_layout.get_tight_layout_figure` will return `None`. 
To improve import (startup) time, private modules are now imported lazily. These modules are no longer available at these locations:

- matplotlib.backends.backend_agg._png
- matplotlib.contour._contour
- matplotlib.image._png
- matplotlib.mathtext._png
- matplotlib.testing.compare._png
- matplotlib.texmanager._png
- matplotlib.tri.triangulation._tri
- matplotlib.tri.triangulation._qhull
- matplotlib.tri.tricontour._tri
- matplotlib.tri.trifinder._tri

15.1.47 API Changes for 3.1.0

- Behavior changes
- pgf support dropped
- rcParam changes
- Exception changes
- Removals
  - matplotlib.mlab removals
  - matplotlib.pylab removals
- mplot3d changes
- Testing
- Dependency changes
- Mathtext changes
- Signature deprecations
- Changes in parameter names
- Class/method/attribute deprecations
- Undeprecations
- New features
- Invalid inputs

Behavior changes
Matplotlib, Release 3.1.3

Matplotlib.use

Switching backends via `matplotlib.use` is now allowed by default, regardless of whether `matplotlib.pyplot` has been imported. If the user tries to switch from an already-started interactive backend to a different interactive backend, an `ImportError` will be raised.

mplot3d auto-registration

`mpl_toolkits.mplot3d` is always registered by default now. It is no longer necessary to import mplot3d to create 3d axes with

```python
ax = fig.add_subplot(111, projection="3d")
```

Invalid points in PathCollections

PathCollections created with `scatter` now keep track of invalid points. Previously, points with nonfinite (infinite or nan) coordinates would not be included in the offsets (as returned by `PathCollection.get_offsets`) of a PathCollection created by `scatter`, and points with nonfinite values (as specified by the `c` kwarg) would not be included in the array (as returned by `PathCollection.get_array`).

Such points are now included, but masked out by returning a masked array.

If the `plotnonfinite` kwarg to `scatter` is set, then points with nonfinite values are plotted using the bad color of the `collections.PathCollection`'s colormap (as set by `colors.Colormap.set_bad()`).

Alpha blending in imshow of RBGA input

The alpha-channel of RBGA images is now re-sampled independently of RGB channels. While this is a bug fix, it does change the output and may result in some down-stream image comparison tests to fail.

Autoscaling

On log-axes where a single value is plotted at a “full” decade (1, 10, 100, etc.), the autoscaling now expands the axis symmetrically around that point, instead of adding a decade only to the right.

Log-scaled axes

When the default `LogLocator` would generate no ticks for an axis (e.g., an axis with limits from 0.31 to 0.39) or only a single tick, it now instead falls back on the linear `AutoLocator` to pick reasonable tick positions.
Figure.add_subplot with no arguments

Calling `Figure.add_subplot()` with no positional arguments used to do nothing; this now is equivalent to calling `add_subplot(111)` instead.

bxp and rcparams

`bxp` now respects `rcParams["boxplot.boxprops.linewidth"]` (default: 1.0) even when `patch_artist` is set. Previously, when the `patch_artist` parameter was set, `bxp` would ignore `rcParams["boxplot.boxprops.linewidth"]` (default: 1.0). This was an oversight – in particular, `boxplot` did not ignore it.

Major/minor tick collisions

Minor ticks that collide with major ticks are now hidden by default. Previously, certain locator classes (`LogLocator`, `AutoMinorLocator`) contained custom logic to avoid emitting tick locations that collided with major ticks when they were used as minor locators. This logic has now moved to the `Axis` class, and is used regardless of the locator class. You can control this behavior via the `remove_overlapping_locs` attribute on `Axis`.

If you were relying on both the major and minor tick labels to appear on the same tick, you may need to update your code. For example, the following snippet

```python
import numpy as np
import matplotlib.dates as mdates
import matplotlib.pyplot as plt

t = np.arange("2018-11-03", "2018-11-06", dtype="datetime64")
x = np.random.rand(len(t))

fig, ax = plt.subplots()
ax.plot(t, x)
ax.xaxis.set(
    major_locator=mdates.DayLocator(),
    major_formatter=mdates.DateFormatter("\n%a"),
    minor_locator=mdates.HourLocator((0, 6, 12, 18)),
    minor_formatter=mdates.DateFormatter("%H:%M"),
)
# disable removing overlapping locations
ax.xaxis.remove_overlapping_locs = False
plt.show()
```

labeled days using major ticks, and hours and minutes using minor ticks and added a newline to the major ticks labels to avoid them crashing into the minor tick labels. Setting the `remove_overlapping_locs` property (also accessible via `set_remove_overlapping_locs / get_remove_overlapping_locs` and `setp`) disables removing overlapping tick locations.

The major tick labels could also be adjusted include hours and minutes, as the minor ticks are gone, so the `major_formatter` would be:

```python
mdates.DateFormatter("%H:%M\n%a")
```
usetex support

Previously, if rcParams["text.usetex"] (default: False) was True, then constructing a TextPath on a non-mathtext string with usetex=False would rely on the mathtext parser (but not on usetex support!) to parse the string. The mathtext parser is not invoked anymore, which may cause slight changes in glyph positioning.

get_window_extents

matplotlib.axes.Axes.get_window_extent used to return a bounding box that was slightly larger than the axes, presumably to take into account the ticks that may be on a spine. However, it was not scaling the tick sizes according to the dpi of the canvas, and it did not check if the ticks were visible, or on the spine.

Now matplotlib.axes.Axes.get_window_extent just returns the axes extent with no padding for ticks.

This affects matplotlib.axes.Axes.get_tightbbox in cases where there are outward ticks with no tick labels, and it also removes the (small) pad around axes in that case.

spines.Spine.get_window_extent now takes into account ticks that are on the spine.

Sankey

Previously, Sankey.add would only accept a single string as the labels argument if its length is equal to the number of flows, in which case it would use one character of the string for each flow.

The behavior has been changed to match the documented one: when a single string is passed, it is used to label all the flows.

FontManager scores

font_manager.FontManager.score_weight is now more strict with its inputs. Previously, when a weight string was passed to font_manager.FontManager.score_weight,

• if the weight was the string representation of an integer, it would be converted to that integer,

• otherwise, if the weight was not a standard weight name, it would be silently replaced by a value of 500 ("normal" weight).

font_manager.FontManager.score_weight now raises an exception on such inputs.

Text alignment

Text alignment was previously incorrect, in particular for multiline text objects with large descenders (i.e. subscripts) and rotated text. These have been fixed and made more consistent, but could make old code that has compensated for this no longer have the correct alignment.
Upper case color strings

Support for passing single-letter colors (one of “rgbcmykw”) as UPPERCASE characters is deprecated; these colors will become case-sensitive (lowercase) after the deprecation period has passed.

The goal is to decrease the number of ambiguous cases when using the data keyword to plotting methods; e.g. plot("X", "Y", data={"X": ..., "Y": ...}) will not warn about “Y” possibly being a color anymore after the deprecation period has passed.

Degenerate limits

When bounds passed to set_xlim are degenerate (i.e. the lower and upper value are equal), the method used to “expand” the bounds now matches the expansion behavior of autoscaling when the plot contains a single x-value, and should in particular produce nicer limits for non-linear scales.

plot format string parsing

In certain cases, plot would previously accept format strings specifying more than one linestyle (e.g. "---." which specifies both "--" and "-."); only use one of them would be used. This now raises a ValueError instead.

HTMLWriter

The HTMLWriter constructor is more strict: it no longer normalizes unknown values of default_mode to ‘loop’, but errors out instead.

AFM parsing

In accordance with the AFM spec, the AFM parser no longer truncates the UnderlinePosition and UnderlineThickness fields to integers.

The Notice field (which can only be publicly accessed by the deprecated afm.parse_afm API) is no longer decoded to a str, but instead kept as bytes, to support non-conformant AFM files that use non-ASCII characters in that field.

Artist.set keyword normalisation

Artist.set now normalizes keywords before sorting them. Previously it sorted its keyword arguments in reverse alphabetical order (with a special-case to put color at the end) before applying them.

It now normalizes aliases (and, as above, emits a warning on duplicate properties) before doing the sorting (so c goes to the end too).
Axes.tick_params argument checking

Previously Axes.tick_params silently did nothing when an invalid axis parameter was supplied. This behavior has been changed to raise a ValueError instead.

Axes.hist output

Input that consists of multiple empty lists will now return a list of histogram values for each one of the lists. For example, an input of [[]] will return 2 lists of histogram values. Previously, a single list was returned.

backend_bases.Timer.remove_callback future signature change

Currently, backend_bases.Timer.remove_callback(func, *args, **kwargs) removes a callback previously added by backend_bases.Timer.add_callback(func, *args, **kwargs), but if *args, **kwargs is not passed in (ex, Timer.remove_callback(func)), then the first callback with a matching func is removed, regardless of whether it was added with or without *args, **kwargs.

In a future version, Timer.remove_callback will always use the latter behavior (not consider *args, **kwargs); to specifically consider them, add the callback as a functools.partial object

```python
cb = timer.add_callback(functools.partial(func, *args, **kwargs))
# ...
# later
timer.remove_callback(cb)
```

backend_bases.Timer.add_callback was modified to return func to simplify the above usage (previously it returned None); this also allows using it as a decorator.

The new API is modelled after atexit.register / atexit.unregister.

StemContainer performance increase

StemContainer objects can now store a LineCollection object instead of a list of Line2D objects for stem lines plotted using stem. This gives a very large performance boost to displaying and moving stem plots.

This will become the default behaviour in Matplotlib 3.3. To use it now, the use_line_collection keyword argument to stem can be set to True

```python
ax.stem(..., use_line_collection=True)
```

Individual line segments can be extracted from the LineCollection using get_segments(). See the LineCollection documentation for other methods to retrieve the collection properties.

ColorbarBase inheritance

matplotlib.colorbar.ColorbarBase is no longer a subclass of cm.ScalarMappable. This inheritance lead to a confusing situation where the cm.ScalarMappable passed to matplotlib.colorbar.Colorbar (colorbar) had a set_norm method, as did the colorbar. The colorbar is now purely a follower to the ScalarMappable norm and colormap, and the old inherited methods
set_norm, set_cmap, set_clim are deprecated, as are the getter versions of those calls. To set
the norm associated with a colorbar do colorbar.mappable.set_norm() etc.

**FreeType and libpng search paths**

The MPLBASEDIRLIST environment variables and basedirlist entry in setup.cfg have no effect
anymore. Instead, if building in situations where FreeType or libpng are not in the compiler
or linker’s default path, set the standard environment variables CFLAGS/LDFLAGS on Linux or
OSX, or CL/LINK on Windows, to indicate the relevant paths.

See details in Installing.

**Setting artist properties twice or more in the same call**

Setting the same artist property multiple time via aliases is deprecated. Previously, code such as

```python
plt.plot([0, 1], c="red", color="blue")
```

would emit a warning indicating that c and color are aliases of one another; and only keep
the color kwarg. This behavior has been deprecated; in a future version, this will raise a
TypeError, similar to Python’s behavior when a keyword argument is passed twice

```python
plt.plot([0, 1], c="red", c="blue")
```

This warning is raised by `normalize_kwargs`.

**Path code types**

Path code types like Path.MOVETO are now np.uint8 instead of int Path.STOP, Path.MOVETO, Path.
LINETO, Path.CURVE3, Path.CURVE4 and Path.CLOSEPOLY are now of the type Path.code_type (np.
uint8 by default) instead of plain int. This makes their type match the array value type of the
Path.codes array.

**LaTeX code in matplotlibrc file**

Previously, the rc file keys pgf.preamble and text.latex.preamble were parsed using commmas
as separators. This would break valid LaTeX code, such as:

```latex
\usepackage[protrusion=true, expansion=false]{microtype}
```

The parsing has been modified to pass the complete line to the LaTeX system, keeping all
commas. Passing a list of strings from within a Python script still works as it used to. Passing
a list containing non-strings now fails, instead of coercing the results to strings.

**Axes.spy**

The method `Axes.spy` now raises a `TypeError` for the keyword arguments `interpolation` and
`linestyle` instead of silently ignoring them.
Furthermore, `Axes.spy` spy does now allow for an `extent` argument (was silently ignored so far).

A bug with `Axes.spy(..., origin='lower')` is fixed. Previously this flipped the data but not the y-axis resulting in a mismatch between axes labels and actual data indices. Now, `origin='lower'` flips both the data and the y-axis labels.

**Boxplot tick methods**

The `manage_xticks` parameter of `boxplot` and `bxp` has been renamed (with a deprecation period) to `manage_ticks`, to take into account the fact that it manages either x or y ticks depending on the `vert` parameter.

When `manage_ticks=True` (the default), these methods now attempt to take previously drawn boxplots into account when setting the axis limits, ticks, and tick labels.

**MouseEvents**

MouseEvents now include the event name in their `str()`. Previously they contained the prefix “MPL MouseEvent”.

**RGBA buffer return type**

`FigureCanvasAgg.buffer_rgba` and `RendererAgg.buffer_rgba` now return a memoryview. The `buffer_rgba` method now allows direct access to the renderer's underlying buffer (as a `(m, n, 4)`-shape memoryview) rather than copying the data to a new bytestring. This is consistent with the behavior on Py2, where a buffer object was returned.

**matplotlib.font_manager.win32InstalledFonts return type**

`matplotlib.font_manager.win32InstalledFonts` returns an empty list instead of None if no fonts are found.

**Axes.fmt_xdata and Axes.fmt_ydata error handling**

Previously, if the user provided a `Axes.fmt_xdata` or `Axes.fmt_ydata` function that raised a `TypeError` (or set them to a non-callable), the exception would be silently ignored and the default formatter be used instead. This is no longer the case; the exception is now propagated out.

**Deprecation of redundant Tick attributes**

The `gridOn`, `tick1On`, `tick2On`, `label1On`, and `label2On` `Tick` attributes have been deprecated. Directly get and set the visibility on the underlying artists, available as the `gridline`, `tick1line`, `tick2line`, `label1`, and `label2` attributes.

The `label` attribute, which was an alias for `label1`, has been deprecated.
Subclasses that relied on setting the above visibility attributes needs to be updated; see e.g. examples/api/skewt.py.

**Passing a Line2D’s drawstyle together with the linestyle is deprecated**

Instead of `plt.plot(..., linestyle="steps--")`, use `plt.plot(..., linestyle="--", drawstyle="steps")`. `ds` is now an alias for `drawstyle`.

**pgi support dropped**

Support for `pgi` in the GTK3 backends has been dropped. `pgi` is an alternative implementation to `PyGObject`. `PyGObject` should be used instead.

**rcParam changes**

**Removed**

The following deprecated rcParams have been removed:

- `text.dvipnghack`
- `nbagg.transparent` (use `rcParams["figure.facecolor"]` (default: ‘white’) instead)
- `plugins.directory`
- `axes.hold`
- `backend.qt4` and `backend.qt5` (set the `QT_API` environment variable instead)

**Deprecated**

The associated validator functions `rcsetup.validate_qt4` and `validate_qt5` are deprecated.

The `verbose.fileo` and `verbose.level` rcParams have been deprecated. These have had no effect since the switch from Matplotlib’s old custom Verbose logging to the stdlib’s `logging` module. In addition the `rcsetup.validate_verbose` function is deprecated.

The `text.latex.unicode` rcParam now defaults to `True` and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported). Moreover, the underlying implementation now uses \usepackage[utf8]{inputenc} instead of \usepackage[utf8x]{inputenc}.

**Exception changes**

- Previously, subprocess failures in the animation framework would raise either in a `RuntimeError` or a `ValueError` depending on when the error occurred. They now raise a `subprocess.CalledProcessError` with attributes set as documented by the exception class.
In certain cases, Axes methods (and pyplot functions) used to raise a RuntimeError if they were called with a data kwarg and otherwise mismatched arguments. They now raise a TypeError instead.

Axes.streamplot does not support irregularly gridded x and y values. So far, it used to silently plot an incorrect result. This has been changed to raise a ValueError instead.

The streamplot.Grid class, which is internally used by streamplot code, also throws a ValueError when irregularly gridded values are passed in.

Removals

The following deprecated APIs have been removed:

Classes and methods

- Verbose (replaced by python logging library)
- artist.Artist.hitlist (no replacement)
- artist.Artist.is_figure_set (use artist.figure is not None instead)
- axis.Axis.unit_data (use axis.Axis.units instead)
- backend_bases.FigureCanvasBase.onRemove (no replacement) backend_bases.FigureManagerBase.show_popup (this never did anything)
- backend_wx.SubplotToolWx (no replacement)
- backend_wx.Toolbar (use backend_wx.NavigationToolbar2Wx instead)
- cbook.align_iterators (no replacement)
- contour.ContourLabeler.get_real_label_width (no replacement)
- legend.Legend.draggable (use legend.Legend.set_draggable() instead)
- texmanager.TexManager.postscriptd, texmanager.TexManager.pscnt, texmanager.TexManager.make_ps, texmanager.TexManager.get_ps_bbox (no replacements)

Arguments

- The fig kwarg to GridSpec.get_subplot_params and GridSpecFromSubplotSpec.get_subplot_params (use the argument figure instead)
- Passing 'box-forced' to Axes.set_adjustable (use 'box' instead)
- Support for the strings 'on'/'true'/'off'/'false' to mean True / False (directly use True / False instead). The following functions are affected:
  - axes.Axes.grid
  - Axes3D.grid
  - Axis.set_tick_params
  - pyplot.box
- Using pyplot.axes with an axes.Axes type argument (use pyplot.sca instead)
Other

The following miscellaneous API elements have been removed

- svgfont support (in rcParams['svg.fonttype'] (default: 'path'))
- Logging is now done with the standard python logging library. matplotlib.verbose and the command line switches --verbose-LEVEL have been removed.

To control the logging output use:

```python
import logging
logger = logging.getLogger('matplotlib')
logger.set_level(logging.INFO)
```

- __version__.numpy__
- collections.CIRCLE_AREA_FACTOR
- font_manager.USE_FONTCONFIG
- font_manager.cachedir

matplotlib.mlab removals

Lots of code inside the matplotlib.mlab module which was deprecated in Matplotlib 2.2 has been removed. See below for a list:

- mlab.exp_safe (use numpy.exp instead)
- mlab.amap
- mlab.logspace (use numpy.logspace instead)
- mlab.rms_flat
- mlab.l1norm (use numpy.linalg.norm(a, ord=1) instead)
- mlab.l2norm (use numpy.linalg.norm(a, ord=2) instead)
- mlab.norm_flat (use numpy.linalg.norm(a.flat, ord=2) instead)
- mlab.frange (use numpy.arange instead)
- mlab.identity (use numpy.identity instead)
- mlab.base_repr
- mlab.binary_repr
- mlab.ispower2
- mlab.log2 (use numpy.log2 instead)
- mlab.isvector
- mlab.movavg
- mlab.safe_isinf (use numpy.isinf instead)
- mlab.safe_isnan (use numpy.isnan instead)
- mlab.cohere_pairs (use scipy.signal.cohere instead)
- mlab.entropy (use scipy.stats.entropy instead)
- `mlab.normpdf` (use `scipy.stats.norm.pdf` instead)
- `mlab.find` (use `np.nonzero(np.ravel(condition))` instead)
- `mlab.longest_contiguous_ones`
- `mlab.longest_ones`
- `mlab.PCA`
- `mlab.prctile` (use `numpy.percentile` instead)
- `mlab.prctile_rank`
- `mlab.center_matrix`
- `mlab.rk4` (use `scipy.integrate.ode` instead)
- `mlab.bivariate_normal`
- `mlab.get_xyz_where`
- `mlab.get_sparse_matrix`
- `mlab.dist` (use `numpy.hypot` instead)
- `mlab.dist_point_to_segment`
- `mlab.griddata` (use `scipy.interpolate.griddata`)
- `mlab.less_simple_linear_interpolation` (use `numpy.interp`)
- `mlab.slopes`
- `mlab.stineman_interp`
- `mlab.segments_intersect`
- `mlab.fftsurr`
- `mlab.offset_line`
- `mlab.quad2cubic`
- `mlab.vector_lengths`
- `mlab.distances_along_curve`
- `mlab.path_length`
- `mlab.cross_from_above`
- `mlab.cross_from_below`
- `mlab.contiguous_regions` (use `cbook.contiguous_regions` instead)
- `mlab.is_closed_polygon`
- `mlab.poly_between`
- `mlab.poly_below`
- `mlab.inside_poly`
- `mlab.csv2rec`
- `mlab.rec2csv` (use `numpy.recarray.tofile` instead)
- `mlab.rec2text` (use `numpy.recarray.tofile` instead)
- `mlab.rec_summarize`
• mlab.rec_join
• mlab.recs_join
• mlab.rec_groupby
• mlab.rec_keep_fields
• mlab.rec_drop_fields
• mlab.rec_append_fields
• mlab.csvformat_factory
• mlab.get_formatd
• mlab.FormatDatetime (use `datetime.datetime.strftime` instead)
• mlab.FormatDate (use `datetime.date.strftime` instead)
• mlab.donothing_callback

**matplotlib.pylab removals**

Lots of code inside the `matplotlib.mlab` module which was deprecated in Matplotlib 2.2 has been removed. This means the following functions are no longer available in the `matplotlib.pylab` module:

• amap
• base_repr
• binary_repr
• bivariate_normal
• center_matrix
• csv2rec (use `numpy.recarray.tofile` instead)
• dist (use `numpy.hypot` instead)
• dist_point_to_segment
• distances_along_curve
• entropy (use `scipy.stats.entropy` instead)
• exp_safe (use `numpy.exp` instead)
• fftsurr
• find (use `np.nonzero(np.ravel(condition))` instead)
• frange (use `numpy.arange` instead)
• get_sparse_matrix
• get_xyz_where
• griddata (use `scipy.interpolate.griddata` instead)
• identity (use `numpy.identity` instead)
• inside_poly
• `is_closed_polygon`
• `ispower2`
• `isvector`
• `l1norm` (use `numpy.linalg.norm(a, ord=1)` instead)
• `l2norm` (use `numpy.linalg.norm(a, ord=2)` instead)
• `log2` (use `numpy.log2` instead)
• `longest_contiguous_ones`
• `longest_ones`
• `movavg`
• `norm_flat` (use `numpy.linalg.norm(a.flat, ord=2)` instead)
• `normpdf` (use `scipy.stats.norm.pdf` instead)
• `path_length`
• `poly_below`
• `poly_between`
• `prctile` (use `numpy.percentile` instead)
• `prctile_rank`
• `rec2csv` (use `numpy.recarray.tofile` instead)
• `rec_append_fields`
• `rec_drop_fields`
• `rec_join`
• `rk4` (use `scipy.integrate.ode` instead)
• `rms_flat`
• `segments_intersect`
• `slopes`
• `stineman_interp`
• `vector_lengths`

**mplot3d changes**

**Voxel shading**

`Axes3D.voxels` now shades the resulting voxels; for more details see What’s new. The previous behavior can be achieved by passing

```python
ax.voxels(..., shade=False)
```
Equal aspect axes disabled

Setting the aspect on 3D axes previously returned non-sensical results (e.g. see #1077). Calling `ax.set_aspect('equal')` or `ax.set_aspect(num)` on a 3D axes now raises a `NotImplementedError`.

`Poly3DCollection.set_zsort`

`Poly3DCollection.set_zsort` no longer silently ignores invalid inputs, or `False` (which was always broken). Passing `True` to mean "average" is deprecated.

Testing

The `--no-network` flag to `tests.py` has been removed (no test requires internet access anymore). If it is desired to disable internet access both for old and new versions of Matplotlib, use `tests.py -m 'not network'` (which is now a no-op).

The image comparison test decorators now skip (rather than xfail) the test for uncomparable formats. The affected decorators are `image_comparison` and `check_figures_equal`. The deprecated `ImageComparisonTest` class is likewise changed.

Dependency changes

`numpy`

Matplotlib 3.1 now requires `numpy>=1.11`.

`ghostscript`

Support for ghostscript 8.60 (released in 2007) has been removed. The oldest supported version of ghostscript is now 9.0 (released in 2010).

Mathtext changes

- In constructs such as "$1-2$", `mathtext` now interprets the tilde as a space, consistently with TeX (this was previously a parse error).

Deprecations

- The \stackrel `mathtext` command has been deprecated (it behaved differently from LaTeX's \stackrel. To stack two `mathtext` expressions, use \genfrac{left-delim}{right-delim}{fraction-bar-thickness}{}{top}{bottom}.
- The `mathcircled` `mathtext` command (which is not a real TeX command) is deprecated. Directly use unicode characters (e.g. "\N{CIRCLED LATIN CAPITAL LETTER A}" or "\u24b6") instead.
- Support for setting `rcParams["mathtext.default"]` (default: 'it') to circled is deprecated.
Signature deprecations

The following signature related behaviours are deprecated:

- The *withdash* keyword argument to *Axes.text()*. Consider using *Axes.annotate()* instead.
- Passing (n, 1)-shaped error arrays to *Axes.errorbar()* , which was not documented and did not work for \( n = 2 \). Pass a 1D array instead.
- The *frameon* kwarg to *savefig* and the *rcParams["savefig.frameon"]* (default: True) rc-Param. To emulate *frameon = False*, set *facecolor* to fully transparent (*"none"*, or \((0, 0, 0, 0)\)).
- Passing a non-1D (typically, (n, 1)-shaped) input to *Axes.pie*. Pass a 1D array instead.
- The *TextPath* constructor used to silently drop ignored arguments; this behavior is dep- recated.
- The *usetex* parameter of *TextToPath.get_text_path* is deprecated and folded into the *is-math* parameter, which can now take the values *False*, *True*, and *"TeX"*, consistently with other low-level text processing functions.
- Passing *'normal'* to *axes.Axes.axis()* is deprecated, use *ax.axis('auto')* instead.
- Passing the *block* argument of *pyplot.show* positionally is deprecated; it should be passed by keyword.
- When using the nbagg backend, *pyplot.show* used to silently accept and ignore all combinations of positional and keyword arguments. This behavior is deprecated.
- The unused *shape* and *imlim* parameters to *Axes.imshow* are deprecated. To avoid trig- ger ing the deprecation warning, the *filternorm*, *filterrad*, *resample*, and *url* arguments should be passed by keyword.
- The *interp_at_native* parameter to *BboxImage*, which has had no effect since Matplotlib 2.0, is deprecated.
- All arguments to the *cbook.deprecated* decorator and *cbook.warn_deprecated* function, ex- cept the first one (the version where the deprecation occurred), are now keyword-only. The goal is to avoid accidentally setting the “message” argument when the “name” (or “alternative”) argument was intended, as this has repeatedly occurred in the past.
- The arguments of *matplotlib.testing.compare.calculate_rms* have been renamed from *expectedImage*, *actualImage*, to *expected_image*, *actual_image*.
- Passing positional arguments to *Axes.set_ticklabels* beyond *ticklabels* itself has no ef- fect, and support for them is deprecated.
- Passing *shade=None* to *plot_surface* is deprecated. This was an unintended implementa- tion detail with the same semantics as *shade=False*. Please use the latter code instead.
- *matplotlib.ticker.MaxNLocator* and its *set_params* method will issue a warning on un- known keyword arguments instead of silently ignoring them. Future versions will raise an error.

Changes in parameter names

- The *arg* parameter to *matplotlib.use* has been renamed to *backend*.
This will only affect cases where that parameter has been set as a keyword argument.
The common usage pattern as a positional argument `matplotlib.use('Qt5Agg')` is not affected.

- The `normed` parameter to `Axes.hist2d` has been renamed to `density`.
- The `s` parameter to `Annotation` (and indirectly `Axes.annotation`) has been renamed to `text`.
- The `tolerance` parameter to `bezier.find_bezier_t_intersecting_with_closedpath`, `bezier.split_bezier_intersecting_with_closedpath`, `bezier.find_r_to_boundary_of_closedpath`, `bezier.split_path_inout` and `bezier.check_if_parallel` has been renamed to `tolerance`.

In each case, the old parameter name remains supported (it cannot be used simultaneously with the new name), but support for it will be dropped in Matplotlib 3.3.

### Class/method/attribute deprecations

Support for custom backends that do not provide a `GraphicsContextBase.set_hatch_color` method is deprecated. We suggest that custom backends let their `GraphicsContext` class inherit from `GraphicsContextBase`, to at least provide stubs for all required methods.

- `spine.Spine.is_frame_like`  
This has not been used in the codebase since its addition in 2009.

- `axis3d.Axes.get_tick_positions`  
This has never been used internally, there is no equivalent method exists on the 2D Axis classes, and despite the similar name, it has a completely different behavior from the 2D Axis’ `axis.Axis.get_ticks_position` method.
- `backend_pgf.LatexManagerFactory`
- `mpl_toolkits.axisartist.axislines.SimpleChainedObjects`
- `mpl_toolkits.Axes.AxisDict`

### Internal Helper Functions

- `checkdep_dvipng`
- `checkdep_ghostscript`
- `checkdep_pdftops`
- `checkdep_inkscape`
- `ticker.decade_up`
- `ticker.decade_down`
- `cbook.dedent`
- `docstring.Appender`
- `docstring.dedent`
- `docstring.copy_dedent`

Use the standard library’s docstring manipulation tools instead, such as `inspect.cleandoc` and `inspect.getdoc`.

- `matplotlib.scale.get_scale_docs()`
• `matplotlib.pyplot.get_scale_docs()`

These are considered internal and will be removed from the public API in a future version.

• `projections.process_projection_requirements`
• `backend_ps.PsBackendHelper`
• `backend_ps.ps_backend_helper`,
• `cbook.iterable`
• `cbook.get_label`
• `cbook.safezip` Manually check the lengths of the inputs instead, or rely on numpy to do it.
• `cbook.is_hashable` Use `isinstance(..., collections.abc.Hashable)` instead.
• The `backend_bases.RendererBase.strip_math`. Use `cbook.strip_math` instead.

Multiple internal functions that were exposed as part of the public API of `mpl_toolkits.mplot3d` are deprecated,

`mpl_toolkits.mplot3d.art3d`

• `mpl_toolkits.mplot3d.art3d.norm_angle()`
• `mpl_toolkits.mplot3d.art3d.norm_text_angle()`
• `mpl_toolkits.mplot3d.art3d.path_to_3d_segment()`
• `mpl_toolkits.mplot3d.art3d.paths_to_3d_segments()`
• `mpl_toolkits.mplot3d.art3d.path_to_3d_segment_with_codes()`
• `mpl_toolkits.mplot3d.art3d.paths_to_3d_segments_with_codes()`
• `mpl_toolkits.mplot3d.art3d.get_patch_verts()`
• `mpl_toolkits.mplot3d.art3d.get_colors()`
• `mpl_toolkits.mplot3d.art3d.zalpha()`

`mpl_toolkits.mplot3d.proj3d`

• `mpl_toolkits.mplot3d.proj3d.line2d()`
• `mpl_toolkits.mplot3d.proj3d.line2d_dist()`
• `mpl_toolkits.mplot3d.proj3d.line2d_seg_dist()`
• `mpl_toolkits.mplot3d.proj3d.mod()`
• `mpl_toolkits.mplot3d.proj3d.proj_transform_vec()`
• `mpl_toolkits.mplot3d.proj3d.proj_transform_vec_clip()`
• `mpl_toolkits.mplot3d.proj3d.vec_pad_ones()`
• `mpl_toolkits.mplot3d.proj3d.proj_trans_clip_points()`

If your project relies on these functions, consider vendoring them.
Font Handling

- `backend_pdf.RendererPdf.afm_font_cache`
- `backend_ps.RendererPS.afmfontd`
- `font_manager.OSXInstalledFonts`
- `TextToPath.glyph_to_path` (Instead call `font.get_path()` and manually transform the path.)

Date related functions

- `dates.seconds()`
- `dates.minutes()`
- `dates.hours()`
- `dates.weeks()`
- `dates.strpdate2num`
- `dates.bytespdate2num`

These are brittle in the presence of locale changes. Use standard datetime parsers such as `time.strptime` or `dateutil.parser.parse`, and additionally call `matplotlib.dates.date2num` if you need to convert to Matplotlib’s internal datetime representation; or use `dates.datestr2num`.

Axes3D

- `axes3d.Axes3D.w_xaxis`
- `axes3d.Axes3D.w_yaxis`
- `axes3d.Axes3D.w_zaxis`

Testing

- `matplotlib.testing.decorators.switch_backend` decorator

Test functions should use `pytest.mark.backend(...)`, and the mark will be picked up by the `matplotlib.testing.conftest.mpl_test_settings` fixture.

Quiver

- `.color` attribute of `Quiver` objects

Instead, use (as for any `Collection`) the `get_facecolor` method. Note that setting to the `.color` attribute did not update the quiver artist, whereas calling `set_facecolor` does.
GUI / backend details

- `get_py2exe_datafiles`
- `tk_window_focus`
- `backend_gtk3FileChooserDialog`
- `backend_gtk3.NavigationToolbar2GTK3.get_filechooser`
- `backend_gtk3.SaveFigureGTK3.get_filechooser`
- `NavigationToolbar2QT.adj_window` attribute. This is unused and always `None`.
- `backend_wx.IDLE_DELAY` global variable. This is unused and only relevant to the now removed `wx` “idling” code (note that as it is a module-level global, no deprecation warning is emitted when accessing it).
- `mlab.demean`
- `backend_gtk3cairo.FigureCanvasGTK3Cairo`
- `backend_wx.debug_on_error`, `backend_wx.fake_stderr`, `backend_wx.raise_msg_to_str`, `backend_wx.MenuButtonWx`, `backend_wx.PrintoutWx`,
- `matplotlib.backends.qt_editor.formlayout` module

This module is a vendored, modified version of the official `formlayout` module available on PyPI. Install that module separately if you need it.

- `GraphicsContextPS.shouldstroke`

Transforms / scales

- `LogTransformBase`
- `Log10Transform`
- `Log2Transform`,
- `NaturalLogTransformLog`
- `InvertedLogTransformBase`
- `InvertedLog10Transform`
- `InvertedLog2Transform`
- `InvertedNaturalLogTransform`

These classes defined in `matplotlib.scales` are deprecated. As a replacement, use the general `LogTransform` and `InvertedLogTransform` classes, whose constructors take a `base` argument.

Locators / Formatters

- `OldScalarFormatter.pprint_val`
- `ScalarFormatter.pprint_val`
- `LogFormatter.pprint_val`

These are helper methods that do not have a consistent signature across formatter classes.
Path tools

- `path.get_paths_extents`
  Use `get_path_collection_extents` instead.
- `Path.has_nonfinite` attribute
  Use `not np.isfinite(path.vertices).all()` instead.
- `bezier.find_r_to_boundary_of_closedpath` function is deprecated
  This has always returned None instead of the requested radius.

Text

- `text.TextWithDash`
- `Text.is_math_text`
- `TextPath.is_math_text`
- `TextPath.text_get_vertices_codes` (As an alternative, construct a new `TextPath` object.)

Unused attributes

- `NavigationToolbar2QT.buttons`
- `Line2D.verticalOffset`
- `Quiver.keytext`
- `Quiver.keyvec`
- `SpanSelector.buttonDown`

These are unused and never updated.

Sphinx extensions

- `matplotlib.sphinxext.mathmpl.math_directive`
- `matplotlib.sphinxext.plot_directive.plot_directive`

This is because the `matplotlib.sphinxext.mathmpl` and `matplotlib.sphinxext.plot_directive` interfaces have changed from the (Sphinx-)deprecated function-based interface to a class-based interface; this should not affect end users.

- `mpl_toolkits.axisartist.axis_artist.UnimplementedException`

Environmental Variables

- The `MATPLOTLIBDATA` environment variable
Axis

• Axis.iter_ticks

This only served as a helper to the private Axis._update_ticks

Undeprecations

The following API elements have bee un-deprecated:

• The obj_type kwarg to the cbook.deprecated decorator.
• xmin, xmax kwargs to Axes.set_xlim and ymin, ymax kwargs to Axes.set_ylim

New features

Text now has a c alias for the color property

For consistency with Line2D, the Text class has gained the c alias for the color property. For example, one can now write

```python
ax.text(.5, .5, "foo", c="red")
```

Cn colors now support n>=10

It is now possible to go beyond the tenth color in the property cycle using Cn syntax, e.g.

```python
plt.plot([1, 2], color="C11")
```

now uses the 12th color in the cycle.

Note that previously, a construct such as:

```python
plt.plot([1, 2], "C11")
```

would be interpreted as a request to use color C1 and marker 1 (an "inverted Y"). To obtain such a plot, one should now use

```python
plt.plot([1, 2], "1C1")
```

(so that the first "1" gets correctly interpreted as a marker specification), or, more explicitly:

```python
plt.plot([1, 2], marker="1", color="C1")
```

New Formatter.format_ticks method

The Formatter class gained a new format_ticks method, which takes the list of all tick locations as a single argument and returns the list of all formatted values. It is called by the axis tick handling code and, by default, first calls set_locs with all locations, then repeatedly calls __call__ for each location.
Tick-handling code in the codebase that previously performed this sequence (\texttt{set_locs} followed by repeated \texttt{__call__}) have been updated to use \texttt{format_ticks}.

\texttt{format_ticks} is intended to be overridden by \texttt{Formatter} subclasses for which the formatting of a tick value depends on other tick values, such as \texttt{ConciseDateFormatter}.

**Added support for RGB(A) images in pcolorfast**

\texttt{pcolorfast} now accepts 3D images (RGB or RGBA) arrays if the X and Y specifications allow image or pcolorimage rendering; they remain unsupported by the more general quadmesh rendering.

**Invalid inputs**

Passing invalid locations to \texttt{legend} and \texttt{table} used to fallback on a default location. This behavior is deprecated and will throw an exception in a future version.

\texttt{offsetbox.AnchoredText} is unable to handle the \texttt{horizontalalignment} or \texttt{verticalalignment} kwargs, and used to ignore them with a warning. This behavior is deprecated and will throw an exception in a future version.

Passing steps less than 1 or greater than 10 to \texttt{MaxNLocator} used to result in undefined behavior. It now throws a \texttt{ValueError}.

The signature of the (private) \texttt{Axis._update_ticks} has been changed to not take the renderer as argument anymore (that argument is unused).

**15.1.48 API Changes for 3.1.1**

- \textit{Behavior changes}

**Behavior changes**

**Locator.nonsingular return order**

\texttt{Locator.nonsingular} (introduced in mpl 3.1) now returns a range \(v_0, v_1\) with \(v_0 \leq v_1\). This behavior is consistent with the implementation of \texttt{nonsingular} by the \texttt{LogLocator} and \texttt{LogitLocator} subclasses.

Changes for the latest version are listed below. For new features that were added to Matplotlib, see \textit{Whats New}.

**15.2 API Changes for 3.1.1**
• Behavior changes

15.2.1 Behavior changes

Locator.nonsingular return order

Locator.nonsingular (introduced in mpl 3.1) now returns a range v0, v1 with v0 <= v1. This behavior is consistent with the implementation of nonsingular by the LogLocator and LogitLocator subclasses.

15.3 API Changes for 3.1.0

• Behavior changes
• pgi support dropped
• rcParam changes
• Exception changes
• Removals
• matplotlib.mlab removals
• matplotlib.pylab removals
• mplot3d changes
• Testing
• Dependency changes
• Mathtext changes
• Signature deprecations
• Changes in parameter names
• Class/method/attribute deprecations
• Undeprecations
• New features
• Invalid inputs

15.3.1 Behavior changes

Matplotlib.use

Switching backends via matplotlib.use is now allowed by default, regardless of whether matplotlib.pyplot has been imported. If the user tries to switch from an already-started interactive backend to a different interactive backend, an ImportError will be raised.
mplot3d auto-registration

`mpl_toolkits.mplot3d` is always registered by default now. It is no longer necessary to import mplot3d to create 3d axes with

```python
ax = fig.add_subplot(111, projection="3d")
```

Invalid points in PathCollections

PathCollections created with `scatter` now keep track of invalid points. Previously, points with nonfinite (infinite or nan) coordinates would not be included in the offsets (as returned by `PathCollection.get_offsets`) of a PathCollection created by `scatter`, and points with nonfinite values (as specified by the `c` kwarg) would not be included in the array (as returned by `PathCollection.get_array`).

Such points are now included, but masked out by returning a masked array.

If the `plotnonfinite` kwarg to `scatter` is set, then points with nonfinite values are plotted using the bad color of the `collections.PathCollection`'s colormap (as set by `colors.Colormap.set_bad()`).

Alpha blending in imshow of RBGA input

The alpha-channel of RBGA images is now re-sampled independently of RGB channels. While this is a bug fix, it does change the output and may result in some down-stream image comparison tests to fail.

Autoscaling

On log-axes where a single value is plotted at a “full” decade (1, 10, 100, etc.), the autoscaling now expands the axis symmetrically around that point, instead of adding a decade only to the right.

Log-scaled axes

When the default `LogLocator` would generate no ticks for an axis (e.g., an axis with limits from 0.31 to 0.39) or only a single tick, it now instead falls back on the linear `AutoLocator` to pick reasonable tick positions.

Figure.add_subplot with no arguments

Calling `Figure.add_subplot()` with no positional arguments used to do nothing; this now is equivalent to calling `add_subplot(111)` instead.
bxp and rcparams

`bxp` now respects `rcParams["boxplot.boxprops.linewidth"]` (default: 1.0) even when `patch_artist` is set. Previously, when the `patch artist` parameter was set, `bxp` would ignore `rcParams["boxplot.boxprops.linewidth"]` (default: 1.0). This was an oversight – in particular, `boxplot` did not ignore it.

Major/minor tick collisions

Minor ticks that collide with major ticks are now hidden by default. Previously, certain locator classes (`LogLocator`, `AutoMinorLocator`) contained custom logic to avoid emitting tick locations that collided with major ticks when they were used as minor locators. This logic has now moved to the `Axis` class, and is used regardless of the locator class. You can control this behavior via the `remove_overlapping_locs` attribute on `Axis`.

If you were relying on both the major and minor tick labels to appear on the same tick, you may need to update your code. For example, the following snippet

```python
import numpy as np
import matplotlib.dates as mdates
import matplotlib.pyplot as plt

t = np.arange("2018-11-03", "2018-11-06", dtype="datetime64")
x = np.random.randn(len(t))

fig, ax = plt.subplots()
ax.plot(t, x)
ax.xaxis.set(
    major_locator=mdates.DayLocator(),
    major_formatter=mdates.DateFormatter("\n%a"),
    minor_locator=mdates.HourLocator((0, 6, 12, 18)),
    minor_formatter=mdates.DateFormatter("%H:%M"),
)

# disable removing overlapping locations
ax.xaxis.remove_overlapping_locs = False
plt.show()
```
labeled days using major ticks, and hours and minutes using minor ticks and added a newline to the major ticks labels to avoid them crashing into the minor tick labels. Setting the `remove_overlapping_locs` property (also accessible via `set_remove_overlapping_locs` / `get_remove_overlapping_locs` and `setp`) disables removing overlapping tick locations.

The major tick labels could also be adjusted include hours and minutes, as the minor ticks are gone, so the `major_formatter` would be:

```python
mdates.DateFormatter("%H:%M\n%a")
```

usetex support

Previously, if `rcParams["text.usetex"]` (default: False) was True, then constructing a `TextPath` on a non-mathtext string with `usetex=False` would rely on the mathtext parser (but not on usetex support!) to parse the string. The mathtext parser is not invoked anymore, which may cause slight changes in glyph positioning.
get_window_extent

`matplotlib.axes.Axes.get_window_extent` used to return a bounding box that was slightly larger than the axes, presumably to take into account the ticks that may be on a spine. However, it was not scaling the tick sizes according to the dpi of the canvas, and it did not check if the ticks were visible, or on the spine.

Now `matplotlib.axes.Axes.get_window_extent` just returns the axes extent with no padding for ticks.

This affects `matplotlib.axes.Axes.get_tightbbox` in cases where there are outward ticks with no tick labels, and it also removes the (small) pad around axes in that case.

`spines.Spine.get_window_extent` now takes into account ticks that are on the spine.

Sankey

Previously, `Sankey.add` would only accept a single string as the `labels` argument if its length is equal to the number of flows, in which case it would use one character of the string for each flow.

The behavior has been changed to match the documented one: when a single string is passed, it is used to label all the flows.

FontManager scores

`font_manager.FontManager.score_weight` is now more strict with its inputs. Previously, when a weight string was passed to `font_manager.FontManager.score_weight`,

- if the weight was the string representation of an integer, it would be converted to that integer,
- otherwise, if the weight was not a standard weight name, it would be silently replaced by a value of 500 ("normal" weight).

`font_manager.FontManager.score_weight` now raises an exception on such inputs.

Text alignment

Text alignment was previously incorrect, in particular for multiline text objects with large descenders (i.e. subscripts) and rotated text. These have been fixed and made more consistent, but could make old code that has compensated for this no longer have the correct alignment.

Upper case color strings

Support for passing single-letter colors (one of "rgbcmykw") as UPPERCASE characters is deprecated; these colors will become case-sensitive (lowercase) after the deprecation period has passed.

The goal is to decrease the number of ambiguous cases when using the `data` keyword to plotting methods; e.g. `plot("X", "Y", data={"X": ..., "Y": ...})` will not warn about "Y" possibly being a color anymore after the deprecation period has passed.
Degenerate limits

When bounds passed to `set_xlim` are degenerate (i.e. the lower and upper value are equal), the method used to “expand” the bounds now matches the expansion behavior of autoscaling when the plot contains a single x-value, and should in particular produce nicer limits for non-linear scales.

**plot format string parsing**

In certain cases, `plot` would previously accept format strings specifying more than one linestyle (e.g. "---." which specifies both "--" and "-."); only use one of them would be used. This now raises a `ValueError` instead.

**HTMLWriter**

The HTMLWriter constructor is more strict: it no longer normalizes unknown values of `default_mode` to ‘loop’, but errors out instead.

**AFM parsing**

In accordance with the AFM spec, the AFM parser no longer truncates the `UnderlinePosition` and `UnderlineThickness` fields to integers.

The `Notice` field (which can only be publicly accessed by the deprecated `afm.parse_afm` API) is no longer decoded to a `str`, but instead kept as `bytes`, to support non-conformant AFM files that use non-ASCII characters in that field.

**Artist.set keyword normalisation**

`Artist.set` now normalizes keywords before sorting them. Previously it sorted its keyword arguments in reverse alphabetical order (with a special-case to put `color` at the end) before applying them.

It now normalizes aliases (and, as above, emits a warning on duplicate properties) before doing the sorting (so `c` goes to the end too).

**Axes.tick_params argument checking**

Previously `Axes.tick_params` silently did nothing when an invalid `axis` parameter was supplied. This behavior has been changed to raise a `ValueError` instead.

**Axes.hist output**

Input that consists of multiple empty lists will now return a list of histogram values for each one of the lists. For example, an input of `[[], []]` will return 2 lists of histogram values. Previously, a single list was returned.
backend_bases.Timer.remove_callback future signature change

Currently, backend_bases.Timer.remove_callback(func, *args, **kwargs) removes a callback previously added by backend_bases.Timer.add_callback(func, *args, **kwargs), but if *args, **kwargs is not passed in (ex, Timer.remove_callback(func)), then the first callback with a matching func is removed, regardless of whether it was added with or without *args, **kwargs.

In a future version, Timer.remove_callback will always use the latter behavior (not consider *args, **kwargs); to specifically consider them, add the callback as a functools.partial object

```python
cb = timer.add_callback(functools.partial(func, *args, **kwargs))
#
# later
timer.remove_callback(cb)
```

backend_bases.Timer.add_callback was modified to return func to simplify the above usage (previously it returned None); this also allows using it as a decorator.

The new API is modelled after `atexit.register` / `atexit.unregister`.

StemContainer performance increase

StemContainer objects can now store a LineCollection object instead of a list of Line2D objects for stem lines plotted using `stem`. This gives a very large performance boost to displaying and moving stem plots.

This will become the default behaviour in Matplotlib 3.3. To use it now, the use_line_collection keyword argument to `stem` can be set to `True`

```python
ax.stem(..., use_line_collection=True)
```

Individual line segments can be extracted from the LineCollection using get_segments(). See the LineCollection documentation for other methods to retrieve the collection properties.

ColorbarBase inheritance

`matplotlib.colorbar.ColorbarBase` is no longer a subclass of `cm.ScalarMappable`. This inheritance lead to a confusing situation where the `cm.ScalarMappable` passed to `matplotlib.colorbar.Colorbar (colorbar)` had a set_norm method, as did the colorbar. The colorbar is now purely a follower to the ScalarMappable norm and colormap, and the old inherited methods set_norm, set_cmap, set_clim are deprecated, as are the getter versions of those calls. To set the norm associated with a colorbar do `colorbar.mappable.set_norm()` etc.

FreeType and libpng search paths

The MPLBASEDIRLIST environment variables and basedirlist entry in setup.cfg have no effect anymore. Instead, if building in situations where FreeType or libpng are not in the compiler or linker’s default path, set the standard environment variables CFLAGS/LDFLAGS on Linux or OSX, or CL/LINK on Windows, to indicate the relevant paths.

See details in Installing.

15.3. API Changes for 3.1.0
Setting artist properties twice or more in the same call

Setting the same artist property multiple time via aliases is deprecated. Previously, code such as

```python
plt.plot([0, 1], c="red", color="blue")
```

would emit a warning indicating that `c` and `color` are aliases of one another, and only keep the `color` kwarg. This behavior has been deprecated; in a future version, this will raise a TypeError, similar to Python’s behavior when a keyword argument is passed twice

```python
plt.plot([0, 1], c="red", c="blue")
```

This warning is raised by `normalize_kwargs`.

Path code types

Path code types like `Path.MOVETO` are now `np.uint8` instead of `int` `Path.STOP`, `Path.MOVETO`, `Path.LINETO`, `Path.CURVE3`, `Path.CURVE4` and `Path.CLOSEPOLY` are now of the type `Path.code_type` (np. `uint8` by default) instead of plain `int`. This makes their type match the array value type of the `Path.codes` array.

LaTeX code in matplotlibrc file

Previously, the rc file keys `pgf.preamble` and `text.latex.preamble` were parsed using commas as separators. This would break valid LaTeX code, such as:

```
\usepackage[protrusion=true, expansion=false]{microtype}
```

The parsing has been modified to pass the complete line to the LaTeX system, keeping all commas. Passing a list of strings from within a Python script still works as it used to. Passing a list containing non-strings now fails, instead of coercing the results to strings.

Axes.spy

The method `Axes.spy` now raises a `TypeError` for the keyword arguments `interpolation` and `linestyle` instead of silently ignoring them.

Furthermore, `Axes.spy` spy does now allow for an `extent` argument (was silently ignored so far).

A bug with `Axes.spy(..., origin='lower')` is fixed. Previously this flipped the data but not the y-axis resulting in a mismatch between axes labels and actual data indices. Now, `origin='lower'` flips both the data and the y-axis labels.

Boxplot tick methods

The `manage_xticks` parameter of `boxplot` and `bxp` has been renamed (with a deprecation period) to `manage_ticks`, to take into account the fact that it manages either x or y ticks depending on the `vert` parameter.
When `manage_ticks=True` (the default), these methods now attempt to take previously drawn boxplots into account when setting the axis limits, ticks, and tick labels.

**MouseEvents**

MouseEvents now include the event name in their `str()`. Previously they contained the prefix “MPL MouseEvent”.

**RGBA buffer return type**

`FigureCanvasAgg.buffer_rgba` and `RendererAgg.buffer_rgba` now return a memoryview. The `buffer_rgba` method now allows direct access to the renderer’s underlying buffer (as a `(m, n, 4)`-shape memoryview) rather than copying the data to a new bytestring. This is consistent with the behavior on Py2, where a buffer object was returned.

**matplotlib.font_manager.win32InstalledFonts return type**

`matplotlib.font_manager.win32InstalledFonts` returns an empty list instead of None if no fonts are found.

**Axes.fmt_xdata and Axes.fmt_ydata error handling**

Previously, if the user provided a `Axes.fmt_xdata` or `Axes.fmt_ydata` function that raised a `TypeError` (or set them to a non-callable), the exception would be silently ignored and the default formatter be used instead. This is no longer the case; the exception is now propagated out.

**Deprecation of redundant Tick attributes**

The `gridOn`, `tick1On`, `tick2On`, `label1On`, and `label2On` `Tick` attributes have been deprecated. Directly get and set the visibility on the underlying artists, available as the `gridline`, `tick1line`, `tick2line`, `label1`, and `label2` attributes.

The `label` attribute, which was an alias for `label1`, has been deprecated.

Subclasses that relied on setting the above visibility attributes needs to be updated; see e.g. `examples/api/skewt.py`.

**Passing a Line2D’s drawstyle together with the linestyle is deprecated**

Instead of `plt.plot(..., linestyle="steps--")`, use `plt.plot(..., linestyle="--", drawstyle="steps")`. `ds` is now an alias for `drawstyle`.

**15.3.2 pgi support dropped**

Support for `pgi` in the GTK3 backends has been dropped. `pgi` is an alternative implementation to `PyGObject`. `PyGObject` should be used instead.
15.3.3 rcParam changes

Removed

The following deprecated rcParams have been removed:

- `text.dvipnghack`
- `nbagg.transparent` (use `rcParams["figure.facecolor"]` (default: 'white') instead)
- `plugins.directory`
- `axes.hold`
- `backend.qt4` and `backend.qt5` (set the QT_API environment variable instead)

Deprecated

The associated validator functions `rcsetup.validate_qt4` and `validate_qt5` are deprecated.

The `verbose.fileo` and `verbose.level` rcParams have been deprecated. These have had no effect since the switch from Matplotlib’s old custom Verbose logging to the stdlib’s `logging` module. In addition the `rcsetup.validate_verbose` function is deprecated.

The `text.latex.unicode` rcParam now defaults to `True` and is deprecated (i.e., in future versions of Matplotlib, unicode input will always be supported). Moreover, the underlying implementation now uses `\usepackage[utf8]{inputenc}` instead of `\usepackage[utf8x]{inputenc}`.

15.3.4 Exception changes

- Previously, subprocess failures in the animation framework would raise either in a `RuntimeError` or a `ValueError` depending on when the error occurred. They now raise a `subprocess.CalledProcessError` with attributes set as documented by the exception class.

- In certain cases, Axes methods (and pyplot functions) used to raise a `RuntimeError` if they were called with a `data` kwarg and otherwise mismatched arguments. They now raise a `TypeError` instead.

- `Axes.streamplot` does not support irregularly gridded x and y values. So far, it used to silently plot an incorrect result. This has been changed to raise a `ValueError` instead.

- The `streamplot.Grid` class, which is internally used by streamplot code, also throws a `ValueError` when irregularly gridded values are passed in.

15.3.5 Removals

The following deprecated APIs have been removed:
Classes and methods

- Verbose (replaced by python logging library)
- artist.Artist.hitlist (no replacement)
- artist.Artist.is_figure_set (use artist.figure is not None instead)
- axis.Axis.unit_data (use axis.Axis.units instead)
- backend_bases.FigureCanvasBase.onRemove (no replacement)  backend_bases.FigureManagerBase.show_popup (this never did anything)
- backend_wx.SubplotToolWx (no replacement)
- backend_wx.Toolbar (use backend_wx.NavigationToolbar2Wx instead)
- cbook.align_iterators (no replacement)
- contour.ContourLabeler.get_real_label_width (no replacement)
- legend.Legend.draggable (use legend.Legend.set_draggable() instead)
- texmanager.TexManager.postscriptd, texmanager.TexManager.pscnt, texmanager.TexManager.make_ps, texmanager.TexManager.get_ps_bbox (no replacements)

Arguments

- The `fig` kwarg to `GridSpec.get_subplot_params` and `GridSpecFromSubplotSpec.get_subplot_params` (use the argument `figure` instead)
- Passing 'box-forced' to `Axes.set_adjustable` (use 'box' instead)
- Support for the strings 'on'/true'/off'/false' to mean True / False (directly use True / False instead). The following functions are affected:
  - `axes.Axes.grid`
  - `Axes3D.grid`
  - `Axis.set_tick_params`
  - `pyplot.box`
- Using `pyplot.axes` with an `axes.Axes` type argument (use `pyplot.sca` instead)

Other

The following miscellaneous API elements have been removed
- svgfont support (in `rcParams["svg.fonttype"]` (default: 'path'))
- Logging is now done with the standard python logging library. matplotlib.verbose and the command line switches --verbose-LEVEL have been removed.

To control the logging output use:

```python
import logging
logger = logging.getLogger('matplotlib')
logger.set_level(logging.INFO)
```

- `__version__numpy__`
collections.CIRCLE_AREA_FACTOR
font_manager.USE_FONTCONFIG
font_manager.cachedir

15.3.6 matplotlib.mlab removals

Lots of code inside the matplotlib.mlab module which was deprecated in Matplotlib 2.2 has been removed. See below for a list:

- mlab.exp_safe (use numpy.exp instead)
- mlab.amap
- mlab.logspace (use numpy.logspace instead)
- mlab.rms_flat
- mlab.l1norm (use numpy.linalg.norm(a, ord=1) instead)
- mlab.l2norm (use numpy.linalg.norm(a, ord=2) instead)
- mlab.norm_flat (use numpy.linalg.norm(a.flat, ord=2) instead)
- mlab.frange (use numpy.arange instead)
- mlab.identity (use numpy.identity instead)
- mlab.base_repr
- mlab.binary_repr
- mlab.ispower2
- mlab.log2 (use numpy.log2 instead)
- mlab.isvector
- mlab.movavg
- mlab.safe_isinf (use numpy.isinf instead)
- mlab.safeisnan (use numpy.isnan instead)
- mlab.cohere_pairs (use scipy.signal.coherence instead)
- mlab.entropy (use scipy.stats.entropy instead)
- mlab.normpdf (use scipy.stats.norm.pdf instead)
- mlab.find (use np.nonzero(np.ravel(condition)) instead)
- mlab.longest_contiguous_ones
- mlab.longest_ones
- mlab.PCA
- mlab.prctile (use numpy.percentile instead)
- mlab.prctile_rank
- mlab.center_matrix
- mlab.rk4 (use scipy.integrate.ode instead)
- mlab.bivariate_normal
• mlab.get_xyz_where
• mlab.get_sparse_matrix
• mlab.dist (use numpy.hypot instead)
• mlab.dist_point_to_segment
• mlab.griddata (use scipy.interpolate.griddata)
• mlab.less_simple_linear_interpolation (use numpy.interp)
• mlab.slopes
• mlab.stineman_interp
• mlab.segments_intersect
• mlab.fftsurr
• mlab.offset_line
• mlab.quad2cubic
• mlab.vector_lengths
• mlab.distances_along_curve
• mlab.path_length
• mlab.cross_from_above
• mlab.cross_from_below
• mlab.contiguous_regions (use cbook.contiguous_regions instead)
• mlab.is_closed_polygon
• mlab.poly_between
• mlab.poly_below
• mlab.inside_poly
• mlab.csv2rec
• mlab.rec2csv (use numpy.recarray.tofile instead)
• mlab.rec2text (use numpy.recarray.tofile instead)
• mlab.rec_summarize
• mlab.rec_join
• mlab.recs_join
• mlab.rec_groupby
• mlab.rec_keep_fields
• mlab.rec_drop_fields
• mlab.rec_append_fields
• mlab.csvformat_factory
• mlab.get_formatd
• mlab.FormatDatetime (use datetime.datetime.strftime instead)
• mlab.FormatDate (use datetime.date.strftime instead)
• mlab.donothing_callback

15.3.7 matplotlib.pylab removals

Lots of code inside the matplotlib.mlab module which was deprecated in Matplotlib 2.2 has been removed. This means the following functions are no longer available in the matplotlib.pylab module:

• amap
• base_repr
• binary_repr
• bivariate_normal
• center_matrix
• csv2rec (use numpy.recarray.tofile instead)
• dist (use numpy.hypot instead)
• dist_point_to_segment
• distances_along_curve
• entropy (use scipy.stats.entropy instead)
• exp_safe (use numpy.exp instead)
• fftsurr
• find (use np.nonzero(np.ravel(condition)) instead)
• frange (use numpy.arange instead)
• get_sparse_matrix
• get_xyz_where
• griddata (use scipy.interpolate.griddata instead)
• identity (use numpy.identity instead)
• inside_poly
• is_closed_polygon
• ispower2
• isvector
• l1norm (use numpy.linalg.norm(a, ord=1) instead)
• l2norm (use numpy.linalg.norm(a, ord=2) instead)
• log2 (use numpy.log2 instead)
• longest_contiguous_ones
• longest_ones
• movavg
• norm_flat (use numpy.linalg.norm(a.flat, ord=2) instead)
• normpdf (use scipy.stats.norm.pdf instead)
• path_length
• poly_below
• poly_between
• prctile (use numpy.percentile instead)
• prctile_rank
• rec2csv (use numpy.recarray.tofile instead)
• rec_append_fields
• rec_drop_fields
• rec_join
• rk4 (use scipy.integrate.ode instead)
• rms_flat
• segments_intersect
• slopes
• stineman_interp
• vector_lengths

15.3.8 mplot3d changes

Voxel shading

Axes3D.voxels now shades the resulting voxels; for more details see What’s new. The previous behavior can be achieved by passing

```
ax.voxels(., shade=False)
```

Equal aspect axes disabled

Setting the aspect on 3D axes previously returned non-sensical results (e.g. see #1077). Calling ax.set_aspect('equal') or ax.set_aspect(num) on a 3D axes now raises a NotImplemented error.

Poly3DCollection.set_zsort

Poly3DCollection.set_zsort no longer silently ignores invalid inputs, or False (which was always broken). Passing True to mean "average" is deprecated.
15.3.9 Testing

The --no-network flag to tests.py has been removed (no test requires internet access anymore). If it is desired to disable internet access both for old and new versions of Matplotlib, use tests.py -m 'not network' (which is now a no-op).

The image comparison test decorators now skip (rather than xfail) the test for uncomparable formats. The affected decorators are image_comparison and check_figures_equal. The deprecated ImageComparisonTest class is likewise changed.

15.3.10 Dependency changes

numpy

Matplotlib 3.1 now requires numpy>=1.11.

ghostscript

Support for ghostscript 8.60 (released in 2007) has been removed. The oldest supported version of ghostscript is now 9.0 (released in 2010).

15.3.11 Mathtext changes

- In constructs such as "$1-2$", mathtext now interprets the tilde as a space, consistently with TeX (this was previously a parse error).

Deprecations

- The \texttt{\textbackslash stackrel} mathtext command has been deprecated (it behaved differently from LaTeX's \texttt{\textbackslash stackrel}). To stack two mathtext expressions, use \texttt{\textbackslash genfrac}{left-delim}{right-delim}{\textbackslash fraction-bar-thickness}{}{top}{bottom}.
- The \texttt{\textbackslash mathcircled} mathtext command (which is not a real TeX command) is deprecated. Directly use unicode characters (e.g. "\textbackslash N{CIRCLED LATIN CAPITAL LETTER A}" or "\textbackslash u24b6") instead.
- Support for setting rcParams["mathtext.default"] (default: 'it') to circled is deprecated.

15.3.12 Signature deprecations

The following signature related behaviours are deprecated:

- The \texttt{withdash} keyword argument to Axes.text(). Consider using Axes.annotate() instead.
- Passing (n, 1)-shaped error arrays to Axes.errorbar(), which was not documented and did not work for n = 2. Pass a 1D array instead.
- The \texttt{frameon} kwarg to savefig and the rcParams["savefig.frameon"] (default: True) rcParam. To emulate frameon = False, set facecolor to fully transparent ("none", or (0, 0, 0, 0)).
• Passing a non-1D (typically, (n, 1)-shaped) input to `Axes.pie`. Pass a 1D array instead.

• The `TextPath` constructor used to silently drop ignored arguments; this behavior is deprecated.

• The `usetex` parameter of `TextToPath.get_text_path` is deprecated and folded into the `is-math` parameter, which can now take the values `False`, `True`, and "TeX", consistently with other low-level text processing functions.

• Passing 'normal' to `axes.Axes.axis()` is deprecated, use `ax.axis('auto')` instead.

• Passing the `block` argument of `pyplot.show` positionally is deprecated; it should be passed by keyword.

• When using the nbagg backend, `pyplot.show` used to silently accept and ignore all combinations of positional and keyword arguments. This behavior is deprecated.

• The unused `shape` and `imlim` parameters to `Axes.imshow` are deprecated. To avoid triggering the deprecation warning, the `filternorm`, `filterrad`, `resample`, and `url` arguments should be passed by keyword.

• The `interp_at_native` parameter to `BboxImage`, which has had no effect since Matplotlib 2.0, is deprecated.

• All arguments to the `cbook.deprecated` decorator and `cbook.warn_deprecated` function, except the first one (the version where the deprecation occurred), are now keyword-only. The goal is to avoid accidentally setting the “message” argument when the “name” (or “alternative”) argument was intended, as this has repeatedly occurred in the past.

• The arguments of `matplotlib.testing.compare.calculate_rms` have been renamed from `expectedImage, actualImage` to `expected_image, actual_image`.

• Passing positional arguments to `Axes.set_ticklabels` beyond `ticklabels` itself has no effect, and support for them is deprecated.

• Passing `shade=None` to `plot_surface` is deprecated. This was an unintended implementation detail with the same semantics as `shade=False`. Please use the latter code instead.

• `matplotlib.ticker.MaxNLocator` and its `set_params` method will issue a warning on unknown keyword arguments instead of silently ignoring them. Future versions will raise an error.

15.3.13 Changes in parameter names

• The `arg` parameter to `matplotlib.use` has been renamed to `backend`.

This will only affect cases where that parameter has been set as a keyword argument. The common usage pattern as a positional argument `matplotlib.use('Qt5Agg')` is not affected.

• The `normed` parameter to `Axes.hist2d` has been renamed to `density`.

• The `s` parameter to `Annotation` (and indirectly `Axes.annotation`) has been renamed to `text`.

• The `tolerence` parameter to `bezier.find_bezier_t_intersecting_with_closedpath`, `bezier.split_bezier_intersecting_with_closedpath`, `bezier.find_r_to_boundary_of_closedpath`, `bezier.split_path_inout` and `bezier.check_if_parallel` has been renamed to `tolerance`.

In each case, the old parameter name remains supported (it cannot be used simultaneously with the new name), but support for it will be dropped in Matplotlib 3.3.
15.3.14 Class/method/attribute deprecations

Support for custom backends that do not provide a `GraphicsContextBase.set_hatch_color` method is deprecated. We suggest that custom backends let their `GraphicsContext` class inherit from `GraphicsContextBase`, to at least provide stubs for all required methods.

- `spine.Spine.is_frame_like`

This has not been used in the codebase since its addition in 2009.

- `axis3d.Axis.get_tick_positions`
  
  This has never been used internally, there is no equivalent method exists on the 2D Axis classes, and despite the similar name, it has a completely different behavior from the 2D Axis' `axis.Axes.get_ticks_position` method.

- `backend_pgf.LatexManagerFactory`
- `mpl_toolkits.axisartist.axislines.SimpleChainedObjects`
- `mpl_toolkits.Axes.AxisDict`

**Internal Helper Functions**

- `checkdep_dvipng`
- `checkdep_ghostscript`
- `checkdep_pdftops`
- `checkdep_inkscape`
- `ticker.decade_up`
- `ticker.decade_down`
- `cbook.dedent`
- `docstring.Appender`
- `docstring.dedent`
- `docstring.copy_dedent`

Use the standard library’s docstring manipulation tools instead, such as `inspect.cleandoc` and `inspect.getdoc`.

- `matplotlib.scale.get_scale_docs()`
- `matplotlib.pyplot.get_scale_docs()`

These are considered internal and will be removed from the public API in a future version.

- `projections.process_projection_requirements`
- `backend_ps.PsBackendHelper`
- `backend_ps.ps_backend_helper`
- `cbook.iterable`
- `cbook.get_label`
- `cbook.safezip` Manually check the lengths of the inputs instead, or rely on numpy to do it.
• `cbook.is_hashable` Use `isinstance(..., collections.abc.Hashable)` instead.

• The `backend_bases.RendererBase.strip_math` Use `cbook.strip_math` instead.

Multiple internal functions that were exposed as part of the public API of `mpl_toolkits.mplot3d` are deprecated,

**mpl_toolkits.mplot3d.art3d**

- `mpl_toolkits.mplot3d.art3d.norm_angle()`
- `mpl_toolkits.mplot3d.art3d.norm_text_angle()`
- `mpl_toolkits.mplot3d.art3d.path_to_3d_segment()`
- `mpl_toolkits.mplot3d.art3d.paths_to_3d_segments()`
- `mpl_toolkits.mplot3d.art3d.path_to_3d_segment_with_codes()`
- `mpl_toolkits.mplot3d.art3d.paths_to_3d_segments_with_codes()`
- `mpl_toolkits.mplot3d.art3d.get_patch_verts()`
- `mpl_toolkits.mplot3d.art3d.get_colors()`
- `mpl_toolkits.mplot3d.art3d.zalpha()`

**mpl_toolkits.mplot3d.proj3d**

- `mpl_toolkits.mplot3d.proj3d.line2d()`
- `mpl_toolkits.mplot3d.proj3d.line2d_dist()`
- `mpl_toolkits.mplot3d.proj3d.line2d_seg_dist()`
- `mpl_toolkits.mplot3d.proj3d.mod()`
- `mpl_toolkits.mplot3d.proj3d.proj_transform_vec()`
- `mpl_toolkits.mplot3d.proj3d.proj_transform_vec_clip()`
- `mpl_toolkits.mplot3d.proj3d.vec_pad_ones()`
- `mpl_toolkits.mplot3d.proj3d.proj_trans_clip_points()`

If your project relies on these functions, consider vendoring them.

**Font Handling**

- `backend_pdf.RendererPdf.afm_font_cache`
- `backend_ps.RendererPS.afmfontd`
- `font_manager.OSXInstalledFonts`
- `TextToPath.glyph_to_path` (Instead call `font.get_path()` and manually transform the path.)

**Date related functions**

- `dates.seconds()`
- `dates.minutes()`
- `dates.hours()`
- `dates.weeks()`
Matplotlib, Release 3.1.3

- dates.strptime2num
- dates.bytespdate2num

These are brittle in the presence of locale changes. Use standard datetime parsers such as time.strptime or dateutil.parser.parse, and additionally call matplotlib.dates.date2num if you need to convert to Matplotlib’s internal datetime representation; or use dates.datestr2num.

Axes3D

- axes3d.Axes3D.w_xaxis
- axes3d.Axes3D.w_yaxis
- axes3d.Axes3D.w_zaxis

Testing

- matplotlib.testing.decorators.switch_backend decorator

Test functions should use pytest.mark.backend(...), and the mark will be picked up by the matplotlib.testing.conftest.mpl_test_settings fixture.

Quiver

- .color attribute of Quiver objects

Instead, use (as for any Collection) the get_facecolor method. Note that setting to the .color attribute did not update the quiver artist, whereas calling set_facecolor does.

GUI / backend details

- get_py2exe_datafiles`
- tk_window_focus`
- backend_gtk3.FileChooserDialog
- backend_gtk3.NavigationToolbar2GTK3.get_filechooser
- backend_gtk3.SaveFigureGTK3.get_filechooser
- NavigationToolbar2QT.adj_window attribute. This is unused and always None.
- backend_wx.IDLE_DELAY global variable This is unused and only relevant to the now removed wx “idling” code (note that as it is a module-level global, no deprecation warning is emitted when accessing it).
- mlab.demean
- backend_gtk3cairo.FigureCanvasGTK3Cairo,
- backend_wx.debug_on_error, backend_wx.fakestderr, backend_wx.raise_msg_to_str, backend_wx.MenuButtonWx, backend_wx.PrintoutWx,
- matplotlib.backends.qt_editor.formlayout module
This module is a vendored, modified version of the official `formlayout` module available on PyPI. Install that module separately if you need it.

- `GraphicsContextPS.shouldstroke`

### Transforms / scales

- `LogTransformBase`
- `Log10Transform`
- `Log2Transform`
- `NaturalLogTransformLog`
- `InvertedLogTransformBase`
- `InvertedLog10Transform`
- `InvertedLog2Transform`
- `InvertedNaturalLogTransform`

These classes defined in `matplotlib.scales` are deprecated. As a replacement, use the general `LogTransform` and `InvertedLogTransform` classes, whose constructors take a `base` argument.

### Locators / Formatters

- `OldScalarFormatter.pprint_val`
- `ScalarFormatter.pprint_val`
- `LogFormatter.pprint_val`

These are helper methods that do not have a consistent signature across formatter classes.

### Path tools

- `path.get_paths_extents`

Use `get_path_collection_extents` instead.

- `Path.has_nonfinite` attribute

Use `not np.isfinite(path.vertices).all()` instead.

- `bezier.find_r_to_boundary_of_closedpath` function is deprecated

This has always returned None instead of the requested radius.

### Text

- `text.TextWithDash`
- `Text.is_math_text`
- `TextPath.is_math_text`
- `TextPath.text_get_vertices_codes` (As an alternative, construct a new `TextPath` object.)
Unused attributes

- NavigationToolbar2QT.buttons
- Line2D.verticalOffset
- Quiver.keytext
- Quiver.keyvec
- SpanSelector.buttonDown

These are unused and never updated.

Sphinx extensions

- matplotlib.sphinxext.mathmpl.math_directive
- matplotlib.sphinxext.plot_directive.plot_directive

This is because the matplotlib.sphinxext.mathmpl and matplotlib.sphinxext.plot_directive interfaces have changed from the (Sphinx-)deprecated function-based interface to a class-based interface; this should not affect end users.

- mpl_toolkits.axisartist.axis_artist.UnimplementedException

Environmental Variables

- The MATPLOTLIBDATA environment variable

Axis

- Axis.iter_ticks

This only served as a helper to the private Axis._update_ticks

15.3.15 Undeprecations

The following API elements have bee un-deprecated:

- The obj_type kwarg to the cbook.deprecated decorator.
- xmin, xmax kwargs to Axes.set_xlim and ymin, ymax kwargs to Axes.set_ylim

15.3.16 New features

Text now has a c alias for the color property

For consistency with Line2D, the Text class has gained the c alias for the color property. For example, one can now write

```
ax.text(.5,.5, "foo", c="red")
```
Cn colors now support $n \geq 10$

It is now possible to go beyond the tenth color in the property cycle using Cn syntax, e.g.

```python
plt.plot([1, 2], color="C11")
```

now uses the 12th color in the cycle.

Note that previously, a construct such as:

```python
plt.plot([1, 2], "C11")
```

would be interpreted as a request to use color C1 and marker 1 (an "inverted Y"). To obtain such a plot, one should now use

```python
plt.plot([1, 2], "1C1")
```

(so that the first "1" gets correctly interpreted as a marker specification), or, more explicitly:

```python
plt.plot([1, 2], marker="1", color="C1")
```

**New Formatter.format_ticks method**

The Formatter class gained a new format_ticks method, which takes the list of all tick locations as a single argument and returns the list of all formatted values. It is called by the axis tick handling code and, by default, first calls set_locs with all locations, then repeatedly calls __call__ for each location.

Tick-handling code in the codebase that previously performed this sequence (set_locs followed by repeated __call__) have been updated to use format_ticks.

format_ticks is intended to be overridden by Formatter subclasses for which the formatting of a tick value depends on other tick values, such as ConciseDateFormatter.

**Added support for RGB(A) images in pcolorfast**

pcolorfast now accepts 3D images (RGB or RGBA) arrays if the X and Y specifications allow image or pcolorimage rendering; they remain unsupported by the more general quadmesh rendering

**15.3.17 Invalid inputs**

Passing invalid locations to legend and table used to fallback on a default location. This behavior is deprecated and will throw an exception in a future version.

offsetbox.AnchoredText is unable to handle the horizontalalignment or verticalalignment kwargs, and used to ignore them with a warning. This behavior is deprecated and will throw an exception in a future version.

Passing steps less than 1 or greater than 10 to MaxNLocator used to result in undefined behavior. It now throws a ValueError.

The signature of the (private) Axis._update_ticks has been changed to not take the renderer as argument anymore (that argument is unused).
• Usage patterns
  - The pyplot API
  - The object-oriented API
  - The pylab API (disapproved)

• Modules
• Toolkits

See also the API Changes.
Below we describe several common approaches to plotting with Matplotlib.

### 16.1 The pyplot API

`matplotlib.pyplot` is a collection of command style functions that make Matplotlib work like MATLAB. Each pyplot function makes some change to a figure: e.g., creates a figure, creates a plotting area in a figure, plots some lines in a plotting area, decorates the plot with labels, etc.

`pyplot` is mainly intended for interactive plots and simple cases of programmatic plot generation.

Further reading:
- The `matplotlib.pyplot` function reference
- Pyplot tutorial
- Pyplot examples

### 16.2 The object-oriented API

At its core, Matplotlib is object-oriented. We recommend directly working with the objects, if you need more control and customization of your plots.

In many cases you will create a `Figure` and one or more `Axes` using `pyplot.subplots` and from then on only work on these objects. However, it’s also possible to create `Figures` explicitly (e.g. when including them in GUI applications).

Further reading:
- `matplotlib.axes.Axes` and `matplotlib.figure.Figure` for an overview of plotting functions.
- Most of the examples use the object-oriented approach (except for the pyplot section)
16.3 The pylab API (disapproved)

**Warning:** Since heavily importing into the global namespace may result in unexpected behavior, the use of pylab is strongly discouraged. Use `matplotlib.pyplot` instead.

pylab is a module that includes `matplotlib.pyplot`, `numpy` and some additional functions within a single namespace. Its original purpose was to mimic a MATLAB-like way of working by importing all functions into the global namespace. This is considered bad style nowadays.
Matplotlib consists of the following submodules:

### 17.1 matplotlib

```python
matplotlib.use(backend, warn=False, force=True)
```

Select the backend used for rendering and GUI integration.

**Parameters**

- **backend** [str] The backend to switch to. This can either be one of the standard backend names, which are case-insensitive:
  - interactive backends: GTK3Agg, GTK3Cairo, MacOSX, nbAgg, Qt4Agg, Qt4Cairo, Qt5Agg, Qt5Cairo, TkAgg, TkCairo, WebAgg, WX, WXAgg, WXcairo
  - non-interactive backends: agg, cairo, pdf, pgf, ps, svg, template
  or a string of the form: module://my.module.name.

- **warn** [bool, optional, default: False] If True and not force, warn that the call will have no effect if this is called after pyplot has been imported and a backend is set up.

- **force** [bool, optional, default: True] If True, attempt to switch the backend. An ImportError is raised if an interactive backend is selected, but another interactive backend has already started.

**See also:**

- **Backends**
  - `matplotlib.get_backend`

```python
matplotlib.get_backend()
```

Return the name of the current backend.

**See also:**

- `matplotlib.use`

```python
matplotlib.rcParams
```

An instance of `RcParams` for handling default matplotlib values.
### matplotlib.rc_context(rc=None, fname=None)

Return a context manager for managing rc settings.

This allows one to do:

```python
with mpl.rc_context(fname='screen.rc'):
    plt.plot(x, a)

with mpl.rc_context(fname='print.rc'):
    plt.plot(x, b)
    plt.plot(x, c)
```

The 'a' vs 'x' and 'c' vs 'x' plots would have settings from 'screen.rc', while the 'b' vs 'x' plot would have settings from 'print.rc'.

A dictionary can also be passed to the context manager:

```python
with mpl.rc_context(rc={'text.usetex': True}, fname='screen.rc'):
    plt.plot(x, a)
```

The 'rc' dictionary takes precedence over the settings loaded from 'fname'. Passing a dictionary only is also valid. For example a common usage is:

```python
with mpl.rc_context(rc={'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('A.png', format='png')
    plt.close(fig)
```

### matplotlib.rc(group, **kwargs)

Set the current rc params. `group` is the grouping for the rc, e.g., for lines.linewidth the group is lines, for axes.facecolor the group is axes, and so on. `Group` may also be a list or tuple of group names, e.g., (xtick, ytick). `kwargs` is a dictionary attribute name/value pairs, e.g.,:

```python
cr('lines', linewidth=2, color='r')
```

sets the current rc params and is equivalent to:

```python
rcParams['lines.linewidth'] = 2
rcParams['lines.color'] = 'r'
```

The following aliases are available to save typing for interactive users:

<table>
<thead>
<tr>
<th>Alias</th>
<th>Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>'lw'</td>
<td>'linewidth'</td>
</tr>
<tr>
<td>'ls'</td>
<td>'linestyle'</td>
</tr>
<tr>
<td>'c'</td>
<td>'color'</td>
</tr>
<tr>
<td>'fc'</td>
<td>'facecolor'</td>
</tr>
<tr>
<td>'ec'</td>
<td>'edgecolor'</td>
</tr>
<tr>
<td>'mew'</td>
<td>'markeredgewidth'</td>
</tr>
<tr>
<td>'aa'</td>
<td>'antialiased'</td>
</tr>
</tbody>
</table>

Thus you could abbreviate the above rc command as:
rc('lines', lw=2, c='r')

Note you can use python's kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```python
defaults = {'family': 'monospace',
            'weight': 'bold',
            'size': 'larger'}
rc('font', **font)  # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or `rcdefaults()` to restore the default rc params after changes.

```python
matplotlib.rc_file(fname, *, use_default_template=True)
```

Update rc params from file.

Style-blacklisted rc params (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

**Parameters**

- **fname** [str] Name of file parsed for matplotlib settings.
- **use_default_template** [bool] If True, initialize with default parameters before updating with those in the given file. If False, the current configuration persists and only the parameters specified in the file are updated.

```python
matplotlib.rcdefaults()
```

Restore the rc params from Matplotlib’s internal default style.

Style-blacklisted rc params (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

**See also:**

- `rc_file_defaults` Restore the rc params from the rc file originally loaded by Matplotlib.
- `matplotlib.style.use` Use a specific style file. Call `style.use('default')` to restore the default style.

```python
matplotlib.rc_file_defaults()
```

Restore the rc params from the original rc file loaded by Matplotlib.

Style-blacklisted rc params (defined in `matplotlib.style.core.STYLE_BLACKLIST`) are not updated.

```python
class matplotlib.RcParams(*args, **kwargs)
```

A dictionary object including validation

validating functions are defined and associated with rc parameters in `matplotlib.rcsetup`

```python
copy(self)
```

```python
find_all(self, pattern)
```

Return the subset of this RcParams dictionary whose keys match, using `re.search()`, the given pattern.
Note: Changes to the returned dictionary are not propagated to the parent RcParams dictionary.

```python
msg_backend_obsolete
msg_depr
msg_depr_ignore
msg_depr_set
msg_obsolete
```

```python
validate = {'_internal.classic_mode': <function validate_bool>, 'agg.path.chunksize': <function validate_int>, ...
```

```python
matplotlib.rc_params(fail_on_error=False)
```

Return a `matplotlib.RcParams` instance from the default matplotlib rc file.

```python
matplotlib.rc_params_from_file(fname, fail_on_error=False, use_default_template=True)
```

Return `matplotlib.RcParams` from the contents of the given file.

**Parameters**

- **fname** [str] Name of file parsed for matplotlib settings.
- **fail_on_error** [bool] If True, raise an error when the parser fails to convert a parameter.
- **use_default_template** [bool] If True, initialize with default parameters before updating with those in the given file. If False, the configuration class only contains the parameters specified in the file. (Useful for updating dicts.)

```python
matplotlib.matplotlib_fname()
```

Get the location of the config file.

The file location is determined in the following order:

- `$PWD/matplotlibrc`
- `$MATPLOTLIBRC` if it is not a directory
- `$MATPLOTLIBRC/matplotlibrc`
- `$MPLCONFIGDIR/matplotlibrc`
- On Linux,
  - `$XDG_CONFIG_HOME/matplotlib/matplotlibrc` (if $XDG_CONFIG_HOME is defined)
  - or `$HOME/.config/matplotlib/matplotlibrc` (if $XDG_CONFIG_HOME is not defined)
- On other platforms,  
  - `$HOME/.matplotlib/matplotlibrc` if $HOME is defined
- Lastly, it looks in `$MATPLOTLIBDATA/matplotlibrc`, which should always exist.

```python
matplotlib.interactive(b)
```

Set interactive mode to boolean `b`.

If `b` is True, then draw after every plotting command, e.g., after xlabel

```python
matplotlib.is_interactive()
```

Return true if plot mode is interactive
**matplotlib.set_loglevel(level)**

Sets the Matplotlib's root logger and root logger handler level, creating the handler if it does not exist yet.

Typically, one should call `set_loglevel("info")` or `set_loglevel("debug")` to get additional debugging information.

**Parameters**

- **level** [{"notset", "debug", "info", "warning", "error", "critical"}] The log level of the handler.

**Notes**

The first time this function is called, an additional handler is attached to Matplotlib's root handler; this handler is reused every time and this function simply manipulates the logger and handler's level.

### 17.2 matplotlib.afm

This is a python interface to Adobe Font Metrics Files. Although a number of other python implementations exist, and may be more complete than this, it was decided not to go with them because they were either:

1) copyrighted or used a non-BSD compatible license
2) had too many dependencies and a free standing lib was needed
3) Did more than needed and it was easier to write afresh rather than figure out how to get just what was needed.

It is pretty easy to use, and requires only built-in python libs:

```python
>>> from matplotlib import rcParams
>>> import os.path
>>> afm_fname = os.path.join(rcParams['datapath'], ...
... 'fonts', 'afm', 'ptmr8a.afm')
>>> from matplotlib.afm import AFM
>>> with open(afm_fname, 'rb') as fh:
...     afm = AFM(fh)
>>> afm.string_width_height('What the heck?')
(6220.0, 694)
>>> afm.get_fontname()
'Times-Roman'
>>> afm.get_kern_dist('A', 'f')
0
>>> afm.get_kern_dist('A', 'y')
-92.0
>>> afm.get_bbox_char('!')
[130, -9, 238, 676]
```

As in the Adobe Font Metrics File Format Specification, all dimensions are given in units of 1/1000 of the scale factor (point size) of the font being used.
class matplotlib.afm.AFM(fh)
    Bases: object
    Parse the AFM file in file object fh.

    family_name
        The font family name, e.g., 'Times'.

    get_angle(self)
        Return the fontangle as float.

    get_bbox_char(self, c, isord=False)

    get_capheight(self)
        Return the cap height as float.

    get_familyname(self)
        Return the font family name, e.g., 'Times'.

    get_fontname(self)
        Return the font name, e.g., 'Times-Roman'.

    get_fullname(self)
        Return the font full name, e.g., 'Times-Roman'.

    get_height_char(self, c, isord=False)
        Get the bounding box (ink) height of character c (space is 0).

    get_horizontal_stem_width(self)
        Return the standard horizontal stem width as float, or None if not specified in AFM file.

    get_kern_dist(self, c1, c2)
        Return the kerning pair distance (possibly 0) for chars c1 and c2.

    get_kern_dist_from_name(self, name1, name2)
        Return the kerning pair distance (possibly 0) for chars name1 and name2.

    get_name_char(self, c, isord=False)
        Get the name of the character, i.e., ';' is 'semicolon'.

    get_str_bbox(self, s)
        Return the string bounding box.

    get_str_bbox_and_descent(self, s)
        Return the string bounding box and the maximal descent.

    get_underline_thickness(self)
        Return the underline thickness as float.

    get_vertical_stem_width(self)
        Return the standard vertical stem width as float, or None if not specified in AFM file.

    get_weight(self)
        Return the font weight, e.g., 'Bold' or 'Roman'.

    get_width_char(self, c, isord=False)
        Get the width of the character from the character metric WX field.

    get_width_from_char_name(self, name)
        Get the width of the character from a type1 character name.
get_xheight(self)
    Return the xheight as float.

string_width_height(self, s)
    Return the string width (including kerning) and string height as a (w, h) tuple.

class matplotlib.afm.CharMetrics
    Bases: tuple
    
    Represents the character metrics of a single character.

Notes

The fields do currently only describe a subset of character metrics information defined in the AFM standard.

Create new instance of CharMetrics(width, name, bbox)

bbox
    The bbox of the character (B) as a tuple (llx, lly, urx, ury).

ame
    The character name (N).

width
    The character width (WX).

class matplotlib.afm.CompositePart
    Bases: tuple
    
    Represents the information on a composite element of a composite char.

Create new instance of CompositePart(name, dx, dy)

dx
    x-displacement of the part from the origin.

dy
    y-displacement of the part from the origin.

name
    Name of the part, e.g. ‘acute’.

matplotlib.afm.parse_afm(fh)

[Deprecated]

Notes

Deprecation since version 3.0:

17.3 matplotlib.animation

Table of Contents
- Animation
17.3.1 Animation

The easiest way to make a live animation in matplotlib is to use one of the Animation classes.

<table>
<thead>
<tr>
<th>Animation</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FuncAnimation</td>
<td>Makes an animation by repeatedly calling a function <code>func</code>.</td>
</tr>
<tr>
<td>ArtistAnimation</td>
<td>Animation using a fixed set of Artist objects.</td>
</tr>
</tbody>
</table>

`matplotlib.animation.Animation`

class `matplotlib.animation.Animation(fig, event_source=None, blit=False)`

This class wraps the creation of an animation using matplotlib. It is only a base class which should be subclassed to provide needed behavior. This class is not typically used directly.

**Parameters**

- **fig** [Figure] The figure object that is used to get draw, resize, and any other needed events.
- **event_source** [object, optional] A class that can run a callback when desired events are generated, as well as be stopped and started. Examples include timers (see `TimedAnimation`) and file system notifications.
- **blit** [bool, optional] controls whether blitting is used to optimize drawing. Defaults to False.

**See also:**

- `FuncAnimation`, `ArtistAnimation`

```
def __init__(self, fig[, event_source, blit])
    Initialize self. See help(type(self)) for accurate signature.
```

**Methods**

```
def __init__(self, fig[, event_source, blit])
    Initialize self.
def new_frame_seq(self)
    Return a new sequence of frame information.
```

Continued on next page
**Table 2 – continued from previous page**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>new_saved_frame_seq(self)</td>
<td>Return a new sequence of saved/cached frame information.</td>
</tr>
<tr>
<td>save(self, filename[, writer, fps, dpi, ...])</td>
<td>Save the animation as a movie file by drawing every frame.</td>
</tr>
<tr>
<td>to_html5_video(self[, embed_limit])</td>
<td>Convert the animation to an HTML5 <code>&lt;video&gt;</code> tag.</td>
</tr>
<tr>
<td>to_jshtml(self[, fps, embed_frames, ...])</td>
<td>Generate HTML representation of the animation.</td>
</tr>
</tbody>
</table>

new_frame_seq(self)

Return a new sequence of frame information.

new_saved_frame_seq(self)

Return a new sequence of saved/cached frame information.

save(self, filename[, writer=None, fps=None, dpi=None, codec=None, bitrate=None, extra_args=None, metadata=None, extra_anim=None, savefig_kwargs=None, *, progress_callback=None])

Save the animation as a movie file by drawing every frame.

**Parameters**

- **filename** [str] The output filename, e.g., mymovie.mp4.
- **writer** [MovieWriter or str, optional] A MovieWriter instance to use or a key that identifies a class to use, such as ‘ffmpeg’. If None, defaults to rcParams["animation.writer"] (default: ‘ffmpeg’).
- **fps** [number, optional] Frames per second in the movie. Defaults to None, which will use the animation’s specified interval to set the frames per second.
- **dpi** [number, optional] Controls the dots per inch for the movie frames. This combined with the figure’s size in inches controls the size of the movie. If None, defaults to rcParams["savefig.dpi"] (default: ‘figure’).
- **codec** [str, optional] The video codec to be used. Not all codecs are supported by a given MovieWriter. If None, default to rcParams["animation.codec"] (default: ‘h264’).
- **bitrate** [number, optional] Specifies the number of bits used per second in the compressed movie, in kilobits per second. A higher number means a higher quality movie, but at the cost of increased file size. If None, defaults to rcParams["animation.bitrate"] (default: -1) = -1.
- **extra_args** [list, optional] List of extra string arguments to be passed to the underlying movie utility. If None, defaults to rcParams["animation.extra_args"].
- **metadata** [Dict[str, str], optional] Dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.
- **extra_anim** [list, optional] Additional Animation objects that should be included in the saved movie file. These need to be from the same matplotlib.figure.Figure instance. Also, animation frames will just be simply combined, so there should be a 1:1 correspondence between the frames from the different animations.
savefig_kwargs [dict, optional] Is a dictionary containing keyword arguments to be passed on to the `savefig` command which is called repeatedly to save the individual frames.

progress_callback [function, optional] A callback function that will be called for every frame to notify the saving progress. It must have the signature

```python
def func(current_frame: int, total_frames: int) -> Any
```

where `current_frame` is the current frame number and `total_frames` is the total number of frames to be saved. `total_frames` is set to `None`, if the total number of frames can not be determined. Return values may exist but are ignored.

Example code to write the progress to stdout:

```python
progress_callback = lambda i, n: print(f'Saving frame {i} of {n}')
```

Notes

`fps`, `codec`, `bitrate`, `extra_args` and `metadata` are used to construct a `MovieWriter` instance and can only be passed if `writer` is a string. If they are passed as non-`None` and `writer` is a `MovieWriter`, a `RuntimeError` will be raised.

to_html5_video(self, embed_limit=None)

Convert the animation to an HTML5 `<video>` tag.

This saves the animation as an h264 video, encoded in base64 directly into the HTML5 video tag. This respects the rc parameters for the writer as well as the bitrate. This also makes use of the `interval` to control the speed, and uses the `repeat` parameter to decide whether to loop.

Parameters

- `embed_limit` [float, optional] Limit, in MB, of the returned animation. No animation is created if the limit is exceeded. Defaults to `rcParams["animation.embed_limit"]` (default: 20.0) = 20.0.

Returns

- `video_tag` [str] An HTML5 video tag with the animation embedded as base64 encoded h264 video. If the `embed_limit` is exceeded, this returns the string “Video too large to embed.”

to_jshtml(self, fps=None, embed_frames=True, default_mode=None)

Generate HTML representation of the animation

```
matplotlib.animation.FuncAnimation
```

Class `matplotlib.animation.FuncAnimation(fig, func, frames=None, init_func=None, fargs=None, save_count=None, *, cache_frame_data=True, **kwargs)

Makes an animation by repeatedly calling a function `func`.

Parameters
**fig** [Figure] The figure object that is used to get draw, resize, and any other needed events.

**func** [callable] The function to call at each frame. The first argument will be the next value in `frames`. Any additional positional arguments can be supplied via the `fargs` parameter.

The required signature is:

```python
def func(frame, *fargs) -> iterable_of_artists
```

If `blit == True`, `func` must return an iterable of all artists that were modified or created. This information is used by the blitting algorithm to determine which parts of the figure have to be updated. The return value is unused if `blit == False` and may be omitted in that case.

**frames** [iterable, int, generator function, or None, optional] Source of data to pass `func` and each frame of the animation

- If an iterable, then simply use the values provided. If the iterable has a length, it will override the `save_count` kwarg.
- If an integer, then equivalent to passing `range(frames)`
- If a generator function, then must have the signature:

```python
def gen_function() -> obj
```

- If `None`, then equivalent to passing `itertools.count`.

In all of these cases, the values in `frames` is simply passed through to the user-supplied `func` and thus can be of any type.

**init_func** [callable, optional] A function used to draw a clear frame. If not given, the results of drawing from the first item in the frames sequence will be used. This function will be called once before the first frame.

The required signature is:

```python
def init_func() -> iterable_of_artists
```

If `blit == True`, `init_func` must return an iterable of artists to be re-drawn. This information is used by the blitting algorithm to determine which parts of the figure have to be updated. The return value is unused if `blit == False` and may be omitted in that case.

**fargs** [tuple or None, optional] Additional arguments to pass to each call to `func`.

**save_count** [int, optional] The number of values from `frames` to cache.

**interval** [number, optional] Delay between frames in milliseconds. Defaults to 200.

**repeat_delay** [number, optional] If the animation in repeated, adds a delay in milliseconds before repeating the animation. Defaults to `None`.

**repeat** [bool, optional] Controls whether the animation should repeat when the sequence of frames is completed. Defaults to `True`. 

---

17.3. matplotlib.animation 797
blit [bool, optional] Controls whether blitting is used to optimize drawing.
Note: when using blitting any animated artists will be drawn according to their zorder. However, they will be drawn on top of any previous artists, regardless of their zorder. Defaults to False.

cache_frame_data [bool, optional] Controls whether frame data is cached. Defaults to True. Disabling cache might be helpful when frames contain large objects.

__init__ (self, fig, func[, frames=None, init_func=None, fargs=None, save_count=None, *, cache_frame_data=True, **kwargs)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__ (self, fig, func[, frames, ...]) Initialize self.

new_frame_seq(self) Return a new sequence of frame information.

new_saved_frame_seq(self) Return a new sequence of saved/cached frame information.

save(self, filename[, writer, fps, dpi, ...]) Save the animation as a movie file by drawing every frame.

to_html5_video(self[, embed_limit]) Convert the animation to an HTML5 <video> tag.

to_jshtml(self[, fps, embed_frames, ...]) Generate HTML representation of the animation

new_frame_seq(self)
Return a new sequence of frame information.

new_saved_frame_seq(self)
Return a new sequence of saved/cached frame information.

matplotlib.animation.ArtistAnimation

class matplotlib.animation.ArtistAnimation(fig, artists, *args, **kwargs)
Animation using a fixed set of Artist objects.

Before creating an instance, all plotting should have taken place and the relevant artists saved.

Parameters

fig [Figure] The figure object that is used to get draw, resize, and any other needed events.

artists [list] Each list entry a collection of artists that represent what needs to be enabled on each frame. These will be disabled for other frames.

repeat_delay [number, optional] If the animation in repeated, adds a delay in milliseconds before repeating the animation. Defaults to None.
repeat [bool, optional] Controls whether the animation should repeat when the sequence of frames is completed. Defaults to True.

blit [bool, optional] Controls whether blitting is used to optimize drawing. Defaults to False.

__init__(self, fig, artists, *args, **kwargs)

Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self, fig, artists, *args, **kwargs) Initialize self.

new_frame_seq(self) Return a new sequence of frame information.

new_saved_frame_seq(self) Return a new sequence of saved/cached frame information.

save(self, filename[, writer, fps, dpi, ...]) Save the animation as a movie file by drawing every frame.

to_html5_video(self[, embed_limit]) Convert the animation to an HTML5 <video> tag.

to_jshtml(self[, fps, embed_frames, ...]) Generate HTML representation of the animation.

In both cases it is critical to keep a reference to the instance object. The animation is advanced by a timer (typically from the host GUI framework) which the Animation object holds the only reference to. If you do not hold a reference to the Animation object, it (and hence the timers), will be garbage collected which will stop the animation.

To save an animation to disk use Animation.save or Animation.to_html5_video

See Helper Classes below for details about what movie formats are supported.

FuncAnimation

The inner workings of FuncAnimation is more-or-less:

```python
for d in frames:
    artists = func(d, *fargs)
    fig.canvas.draw_idle()
    fig.canvas.start_event_loop(interval)
```

with details to handle ‘blitting’ (to dramatically improve the live performance), to be non-blocking, not repeatedly start/stop the GUI event loop, handle repeats, multiple animated axes, and easily save the animation to a movie file.

‘Blitting’ is a old technique in computer graphics. The general gist is to take an existing bit map (in our case a mostly rasterized figure) and then ‘blit’ one more artist on top. Thus, by managing a saved ‘clean’ bitmap, we can only re-draw the few artists that are changing at each frame and possibly save significant amounts of time. When we use blitting (by passing blit=True), the core loop of FuncAnimation gets a bit more complicated:

```python
ax = fig.gca()
```

(continues on next page)
def update_blit(artists):
    fig.canvas.restore_region(bg_cache)
    for a in artists:
        a.axes.draw_artist(a)

        ax.figure.canvas.blit(ax.bbox)

artists = init_func()

for a in artists:
    a.set_animated(True)

fig.canvas.draw()
bg_cache = fig.canvas.copy_from_bbox(ax.bbox)

for f in frames:
    artists = func(f, *fargs)
    update_blit(artists)
    fig.canvas.start_event_loop(interval)

This is of course leaving out many details (such as updating the background when the figure
is resized or fully re-drawn). However, this hopefully minimalist example gives a sense of how
init_func and func are used inside of FuncAnimation and the theory of how ‘blitting’ works.

The expected signature on func and init_func is very simple to keep FuncAnimation out of your
book keeping and plotting logic, but this means that the callable objects you pass in must
know what artists they should be working on. There are several approaches to handling this,
of varying complexity and encapsulation. The simplest approach, which works quite well in
the case of a script, is to define the artist at a global scope and let Python sort things out. For example

import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

fig, ax = plt.subplots()
xdata, ydata = [], []
ln, = plt.plot([], [], 'ro')

def init():
    ax.set_xlim(0, 2*np.pi)
    ax.set_ylim(-1, 1)
    return ln,

def update(frame):
    xdata.append(frame)
    ydata.append(np.sin(frame))
    ln.set_data(xdata, ydata)
    return ln,

ani = FuncAnimation(fig, update, frames=np.linspace(0, 2*np.pi, 128),
                    init_func=init, blit=True)
plt.show()
The second method is to use `functools.partial` to ‘bind’ artists to function. A third method is to use closures to build up the required artists and functions. A fourth method is to create a class.

Examples

**Note:** Click [here](#) to download the full example code

**Decay**

This example showcases: - using a generator to drive an animation, - changing axes limits during an animation.

```python
import numpy as np
import matplotlib.pyplot as plt
import matplotlib.animation as animation

def data_gen(t=0):
    (continues on next page)
```
cnt = 0
while cnt < 1000:
    cnt += 1
    t += 0.1
    yield t, np.sin(2*np.pi*t) * np.exp(-t/10.)

def init():
    ax.set_ylim(-1.1, 1.1)
    ax.set_xlim(0, 10)
    del xdata[:]
    del ydata[:]
    line.set_data(xdata, ydata)
    return line,

fig, ax = plt.subplots()
line, = ax.plot([], [], lw=2)
ax.grid()
xdata, ydata = [], []

def run(data):
    # update the data
    t, y = data
    xdata.append(t)
    ydata.append(y)
    xmin, xmax = ax.get_xlim()

    if t >= xmax:
        ax.set_xlim(xmin, 2*xmax)
        ax.figure.canvas.draw()
    line.set_data(xdata, ydata)

    return line,

ani = animation.FuncAnimation(fig, run, data_gen, blit=False, interval=10,
                               repeat=False, init_func=init)
plt.show()

Note: Click here to download the full example code

The Bayes update

This animation displays the posterior estimate updates as it is refitted when new data arrives. The vertical line represents the theoretical value to which the plotted distribution should converge.
import math
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

def beta_pdf(x, a, b):
    return (x**(a-1) * (1-x)**(b-1) * math.gamma(a + b)
            / (math.gamma(a) * math.gamma(b)))

class UpdateDist(object):
    def __init__(self, ax, prob=0.5):
        self.success = 0
        self.prob = prob
        self.line, = ax.plot([], [], 'k-')
        self.x = np.linspace(0, 1, 200)
        self.ax = ax

        # Set up plot parameters
        self.ax.set_xlim(0, 1)
        self.ax.set_ylim(0, 15)
self.ax.grid(True)

# This vertical line represents the theoretical value, to
# which the plotted distribution should converge.
self.ax.axvline(prob, linestyle='--', color='black')

def init(self):
    self.success = 0
    self.line.set_data([], [])
    return self.line,

def __call__(self, i):
    # This way the plot can continuously run and we just keep
    # watching new realizations of the process
    if i == 0:
        return self.init()

    # Choose success based on exceed a threshold with a uniform pick
    if np.random.rand(1) < self.prob:
        self.success += 1
    y = beta_pdf(self.x, self.success + 1, (i - self.success) + 1)
    self.line.set_data(self.x, y)
    return self.line,

# Fixing random state for reproducibility
np.random.seed(19680801)

fig, ax = plt.subplots()
ud = UpdateDist(ax, prob=0.7)
anim = FuncAnimation(fig, ud, frames=np.arange(100), init_func=ud.init,
                     interval=100, blit=True)
plt.show()

The double pendulum problem

This animation illustrates the double pendulum problem.

from numpy import sin, cos
import numpy as np
import matplotlib.pyplot as plt
import scipy.integrate as integrate
import matplotlib.animation as animation
G = 9.8  # acceleration due to gravity, in m/s^2
L1 = 1.0  # length of pendulum 1 in m
L2 = 1.0  # length of pendulum 2 in m
M1 = 1.0  # mass of pendulum 1 in kg
M2 = 1.0  # mass of pendulum 2 in kg

def derivs(state, t):
    dydx = np.zeros_like(state)
    dydx[0] = state[1]
    delta = state[2] - state[0]
    den1 = (M1+M2) * L1 - M2 * L1 * cos(delta) * cos(delta)
    den2 = (L2/L1) * den1
    return dydx

# create a time array from 0..100 sampled at 0.05 second steps
dt = 0.05
t = np.arange(0, 20, dt)

# th1 and th2 are the initial angles (degrees)
# w10 and w20 are the initial angular velocities (degrees per second)
th1 = 120.0
w1 = 0.0
th2 = -10.0
w2 = 0.0

# initial state
state = np.radians([th1, w1, th2, w2])

# integrate your ODE using scipy.integrate.
y = integrate.odeint(derivs, state, t)
x1 = L1*sin(y[:, 0])
y1 = -L1*cos(y[:, 0])
x2 = L2*sin(y[:, 2]) + x1
y2 = -L2*cos(y[:, 2]) + y1

fig = plt.figure()
ax = fig.add_subplot(111, autoscale_on=False, xlim=(-2, 2), ylim=(-2, 2))
ax.set_aspect('equal')
ax.grid()

line, = ax.plot([], [], 'o-', lw=2)
time_template = 'time = %.1fs'
time_text = ax.text(0.05, 0.9, '', transform=ax.transAxes)

def init():
    line.set_data([], [])
    time_text.set_text('')
    return line, time_text

def animate(i):
    thisx = [0, x1[i], x2[i]]
    thisy = [0, y1[i], y2[i]]

    line.set_data(thisx, thisy)
    time_text.set_text(time_template % (i*dt))
    return line, time_text

ani = animation.FuncAnimation(fig, animate, range(1, len(y)), interval=dt*1000, blit=True, init_func=init)
plt.show()

Note: Click here to download the full example code

Animated histogram

Use a path patch to draw a bunch of rectangles for an animated histogram.

import numpy as np
import matplotlib.pyplot as plt
import matplotlib.patches as patches
import matplotlib.path as path
import matplotlib.animation as animation

# Fixing random state for reproducibility
np.random.seed(19680801)

# histogram our data with numpy
data = np.random.randn(1000)
n, bins = np.histogram(data, 100)

# get the corners of the rectangles for the histogram
left = np.array(bins[:-1])
right = np.array(bins[1:])
bottom = np.zeros(len(left))
top = bottom + n
nrects = len(left)

Here comes the tricky part – we have to set up the vertex and path codes arrays using plt.Path.MOVETO, plt.Path.LINETO and plt.Path.CLOSEPOLY for each rect.

- We need 1 MOVETO per rectangle, which sets the initial point.
- We need 3 LINETO’s, which tell Matplotlib to draw lines from vertex 1 to vertex 2, v2 to v3, and v3 to v4.
- We then need one CLOSEPOLY which tells Matplotlib to draw a line from the v4 to our initial vertex (the MOVETO vertex), in order to close the polygon.

Note: The vertex for CLOSEPOLY is ignored, but we still need a placeholder in the verts array to keep the codes aligned with the vertices.

nverts = nrects * (1 + 3 + 1)
verts = np.zeros((nverts, 2))
codes = np.ones(nverts, int) * path.Path.LINETO
codes[0::5] = path.Path.MOVETO
codes[4::5] = path.Path.CLOSEPOLY
verts[0::5, 0] = left
verts[0::5, 1] = bottom
verts[1::5, 0] = left
verts[1::5, 1] = top
verts[2::5, 0] = right
verts[2::5, 1] = top
verts[3::5, 0] = right
verts[3::5, 1] = bottom

To animate the histogram, we need an animate function, which generates a random set of numbers and updates the locations of the vertices for the histogram (in this case, only the heights of each rectangle). patch will eventually be a Patch object.

def animate(i):
    # simulate new data coming in
    data = np.random.randn(1000)
    n, bins = np.histogram(data, 100)
    top = bottom + n
    verts[1::5, 1] = top
    verts[2::5, 1] = top
    return [patch, ]
And now we build the `Path` and `Patch` instances for the histogram using our vertices and codes. We add the patch to the `Axes` instance, and setup the `FuncAnimation` with our animate function.

```python
fig, ax = plt.subplots()
barpath = path.Path(verts, codes)
patch = patches.PathPatch(
    barpath, facecolor='green', edgecolor='yellow', alpha=0.5)
ax.add_patch(patch)

ax.set_xlim(left[0], right[-1])
ax.set_ylim(bottom.min(), top.max())

ani = animation.FuncAnimation(fig, animate, 100, repeat=False, blit=True)
plt.show()
```

**Rain simulation**

Simulates rain drops on a surface by animating the scale and opacity of 50 scatter points.

Author: Nicolas P. Rougier
```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.animation import FuncAnimation

# Fixing random state for reproducibility
np.random.seed(19680801)

# Create new Figure and an Axes which fills it.
fig = plt.figure(figsize=(7, 7))
ax = fig.add_axes([0, 0, 1, 1], frameon=False)
ax.set_xlim(0, 1), ax.set_xticks([])
ax.set_ylim(0, 1), ax.set_yticks([])
```

(continues on next page)
# Create rain data
n_drops = 50
rain_drops = np.zeros(n_drops, dtype=[('position', float, 2),
                                      ('size', float, 1),
                                      ('growth', float, 1),
                                      ('color', float, 4)])

plt.show()

### 17.3.2 Writer Classes

The provided writers fall into a few broad categories.
The Pillow writer relies on the Pillow library to write the animation, keeping all data in memory.

**PillowWriter**

```python
matplotlib.animation.PillowWriter

class matplotlib.animation.PillowWriter(*args, **kwargs)

    __init__(self, *args, **kwargs)
    MovieWriter

    Parameters

    fps [int] Framerate for movie.

    codec [string or None, optional] The codec to use. If None (the default)
    the animation.codec rcParam is used.

    bitrate [int or None, optional] The bitrate for the saved movie file, which
    is one way to control the output file size and quality. The default value
```
is None, which uses the `animation.bitrate rcParam`. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

**extra_args** [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the `animation.extra_args rcParam`.

**metadata** [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

### Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
</table>
| `__init__`(self, \*args, \*
| kwargs) MovieWriter    |
| bin_path()              | Return the binary path to the command-line tool used by a specific subclass. |
| cleanup(self)           | Clean-up and collect the process used to write the movie file. |
| `finish`(self)          | Finish any processing for writing the movie. |
| `grab_frame`(self, \*
| savefig_kwargs) Grab the image information from the figure and save as a movie frame. |
| isAvailable()           | Check to see if a MovieWriter subclass is actually available. |
| saving(self, fig, outfil
| e, dpi, \*args, ...) Context manager to facilitate writing the movie file. |
| setup(self, fig, outfil
| e[, dpi]) Perform setup for writing the movie file. |

### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>frame_size</td>
<td>A tuple (width, height) in pixels of a movie frame.</td>
</tr>
</tbody>
</table>

### Parameters

- **fig** [Figure] The figure object that contains the information for frames
- **outfile** [str] The filename of the resulting movie file
**dpi** [int, optional] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file. Default is fig.dpi.

The pipe-based writers stream the captured frames over a pipe to an external process. The pipe-based variants tend to be more performant, but may not work on all systems.

<table>
<thead>
<tr>
<th>Writer</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FFmpegWriter</td>
<td>Pipe-based ffmpeg writer.</td>
</tr>
<tr>
<td>ImageMagickWriter</td>
<td>Pipe-based animated gif.</td>
</tr>
<tr>
<td>AVConvWriter</td>
<td>Pipe-based avconv writer.</td>
</tr>
</tbody>
</table>

**matplotlib.animation.FFmpegWriter**

```python
class matplotlib.animation.FFmpegWriter(fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)
```

Pipe-based ffmpeg writer.

Frames are streamed directly to ffmpeg via a pipe and written in a single pass.

**Parameters**

- **fps** [int] Framerate for movie.
- **codec** [string or None, optional] The codec to use. If None (the default) the animation.codec rcParam is used.
- **bitrate** [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the animation.bitrate rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.
- **extra_args** [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the animation.extra_args rcParam.
- **metadata** [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

```python
__init__(self, fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)
```

**Parameters**

- **fps** [int] Framerate for movie.
- **codec** [string or None, optional] The codec to use. If None (the default) the animation.codec rcParam is used.
- **bitrate** [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the animation.bitrate rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.
- **extra_args** [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the animation.extra_args rcParam.
**metadata** [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

```
matplotlib.animation.ImageMagickWriter
```

class matplotlib.animation.ImageMagickWriter(fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)

Pipe-based animated gif. Frames are streamed directly to ImageMagick via a pipe and written in a single pass.

**Parameters**

- **fps** [int] Framerate for movie.
- **codec** [string or None, optional] The codec to use. If None (the default) the animation.codec rcParam is used.
- **bitrate** [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the animation.bitrate rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.
- **extra_args** [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the animation.extra_args rcParam.
metadata [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

```python
__init__(self, fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)
```

**Parameters**

- **fps** [int] Framerate for movie.
- **codec** [string or None, optional] The codec to use. If None (the default) the animation.codec rcParam is used.
- **bitrate** [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the animation.bitrate rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

`matplotlib.animation.AVConvWriter`

class `matplotlib.animation.AVConvWriter(fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)`

Pipe-based avconv writer.

Frames are streamed directly to avconv via a pipe and written in a single pass.

**Parameters**

- `fps` [int] Framerate for movie.
- `codec` [string or None, optional] The codec to use. If `None` (the default) the `animation.codec` rcParam is used.
- `bitrate` [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is `None`, which uses the `animation.bitrate` rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.
- `extra_args` [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is `None`, which passes the additional arguments in the `animation.extra_args` rcParam.
- `metadata` [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

`__init__`(self, fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)

MovieWriter

**Parameters**

- `fps` [int] Framerate for movie.
- `codec` [string or None, optional] The codec to use. If `None` (the default) the `animation.codec` rcParam is used.
- `bitrate` [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is `None`, which uses the `animation.bitrate` rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.
- `extra_args` [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is `None`, which passes the additional arguments in the `animation.extra_args` rcParam.
- `metadata` [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

The file-based writers save temporary files for each frame which are stitched into a single file at the end. Although slower, these writers can be easier to debug.

- **FFMpegFileWriter**
  - File-based ffmpeg writer.
- **ImageMagickFileWriter**
  - File-based animated gif writer.
- **AVConvFileWriter**
  - File-based avconv writer.

**matplotlib.animation.FFMpegFileWriter**

```python
class matplotlib.animation.FFMpegFileWriter(*args, **kwargs)
```

File-based ffmpeg writer.

Frames are written to temporary files on disk and then stitched together at the end.

```python
__init__ (self, *args, **kwargs)
```

MovieWriter

**matplotlib.animation.ImageMagickFileWriter**

Class **matplotlib.animation.ImageMagickFileWriter(*args, **kwargs)**

File-based animated gif writer.

Frames are written to temporary files on disk and then stitched together at the end.
__init__(self, *args, **kwargs)
MovieWriter

Parameters

fps [int] Framerate for movie.

codec [string or None, optional] The codec to use. If None (the default) the animation.codec rcParam is used.

bitrate [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the animation.bitrate rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the animation.extra_args rcParam.

metadata [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, *args, **kwargs) MovieWriter

bin_path() Return the binary path to the command-line tool used by a specific subclass.

cleanup(self) Clean-up and collect the process used to write the movie file.

finish(self) Finish any processing for writing the movie.

grab_frame(self, **savefig_kwargs) Grab the image information from the figure and save as a movie frame.

isAvailable() Check to see if a MovieWriter subclass is actually available.

saving(self, fig, outfile, dpi, *args, ...) Context manager to facilitate writing the movie file.

setup(self, fig, outfile[, dpi, ...]) Perform setup for writing the movie file.

Attributes

args_key
delay
exec_key
frame_format Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.

frame_size A tuple (width, height) in pixels of a movie frame.

output_args

```
supported_formats = ['png', 'jpeg', 'ppm', 'tiff', 'sgi', 'bmp', 'pbm', 'raw', 'rgba']
```

matplotlib.animation.AVConvFileWriter

class matplotlib.animation.AVConvFileWriter(*args, **kwargs)

File-based avconv writer.

__init__(self, *args, **kwargs)

MovieWriter

Parameters

fps [int] Framerate for movie.

codec [string or None, optional] The codec to use. If None (the default) the animation.codec rcParam is used.

bitrate [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is None, which uses the animation.bitrate rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.

extra_args [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the animation.extra_args rcParam.

metadata [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, *args, **kwargs) MovieWriter

bin_path() Return the binary path to the command-line tool used by a specific subclass.

cleanup(self) Clean-up and collect the process used to write the movie file.

finish(self) Finish any processing for writing the movie.

grab_frame(self, **savefig_kwargs) Grab the image information from the figure and save as a movie frame.

isAvailable() Check to see if a MovieWriter subclass is actually available.

saving(self, fig, outfile, dpi, *args, ...) Context manager to facilitate writing the movie file.

setup(self, fig, outfile[, dpi, ...]) Perform setup for writing the movie file.

</table>

Fundamentally, a MovieWriter provides a way to grab sequential frames from the same underlying Figure object. The base class MovieWriter implements 3 methods and a context manager. The only difference between the pipe-based and file-based writers is in the arguments to their respective setup methods.

The setup() method is used to prepare the writer (possibly opening a pipe), successive calls to grab_frame() capture a single frame at a time and finish() finalizes the movie and writes the output file to disk. For example

```python
moviewriter = MovieWriter(...) 
moviewriter.setup(fig=fig, 'my_movie.ext', dpi=100) 
for j in range(n): 
    update_figure(n) 
    moviewriter.grab_frame() 
moviewriter.finish()
```

If using the writer classes directly (not through Animation.save), it is strongly encouraged to use the saving context manager

```python
with moviewriter.saving(fig, 'myfile.mp4', dpi=100): 
    for j in range(n): 
        update_figure(n) 
        moviewriter.grab_frame()
```

to ensure that setup and cleanup are performed as necessary.

Examples

**Note:** Click here to download the full example code

Frame grabbing

Use a MovieWriter directly to grab individual frames and write them to a file. This avoids any event loop integration, and thus works even with the Agg backend. This is not recommended for use in an interactive setting.
import numpy as np
import matplotlib
matplotlib.use("Agg")
import matplotlib.pyplot as plt
from matplotlib.animation import FFMpegWriter

# Fixing random state for reproducibility
np.random.seed(19680801)

metadata = dict(title='Movie Test', artist='Matplotlib',
                comment='Movie support!')
writer = FFMpegWriter(fps=15, metadata=metadata)

fig = plt.figure()
l, = plt.plot([], [], 'k-o')

plt.xlim(-5, 5)
plt.ylim(-5, 5)

x0, y0 = 0, 0

with writer.saving(fig, "writer_test.mp4", 100):
    for i in range(100):
        x0 += 0.1 * np.random.randn()
        y0 += 0.1 * np.random.randn()
        l.set_data(x0, y0)
        writer.grab_frame()

17.3.3 Helper Classes

Animation Base Classes

<table>
<thead>
<tr>
<th>Animation</th>
<th>This class wraps the creation of an animation using matplotlib.</th>
</tr>
</thead>
<tbody>
<tr>
<td>TimedAnimation</td>
<td>Animation subclass for time-based animation.</td>
</tr>
</tbody>
</table>

matplotlib.animation.TimedAnimation
class matplotlib.animation.TimedAnimation(fig, interval=200, repeat_delay=None,
repeat=True, event_source=None, *args, **kwargs)

Animation subclass for time-based animation.

A new frame is drawn every interval milliseconds.

Parameters

fig [Figure] The figure object that is used to get draw, resize, and any other needed events.

repeat_delay [number, optional] If the animation in repeated, adds a delay in milliseconds before repeating the animation. Defaults to None.

repeat [bool, optional] Controls whether the animation should repeat when the sequence of frames is completed. Defaults to True.

blit [bool, optional] Controls whether blitting is used to optimize drawing. Defaults to False.

__init__ (self, fig, interval=200, repeat_delay=None, repeat=True, event_source=None, *args, **kwargs)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__ (self, fig[, interval, ...]) Initialize self.
new_frame_seq(self) Return a new sequence of frame information.
new_saved_frame_seq(self) Return a new sequence of saved/cached frame information.
save(self, filename[, writer, fps, dpi, ...]) Save the animation as a movie file by drawing every frame.
to_html5_video(self[, embed_limit]) Convert the animation to an HTML5 <video> tag.
to_jshtml(self[, fps, embed_frames, ...]) Generate HTML representation of the animation

Writer Registry

A module-level registry is provided to map between the name of the writer and the class to allow a string to be passed to Animation.save instead of a writer instance.

MovieWriterRegistry
Registry of available writer classes by human readable name.

matplotlib.animation.MovieWriterRegistry

class matplotlib.animation.MovieWriterRegistry
Registry of available writer classes by human readable name.

__init__(self)
Initialize self. See help(type(self)) for accurate signature.

Methods

__init__(self) Initialize self.
Table 25 – continued from previous page

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>

<td>Reset the available state of all registered writers</td>
</tr>
<tr>
<td><code>set_dirty(self)</code></td>
<td>Sets a flag to re-setup the writers.</td>
</tr>
</tbody>
</table>

```python
ensure_not_dirty(self)
    If dirty, reasks the writers if they are available

is_available(self, name)
    Check if given writer is available by name.

Parameters

- name [str]

Returns

- available [bool]

list(self)
    Get a list of available MovieWriters.

register(self, name)
    Decorator for registering a class under a name.

Example use:

```python
@registry.register(name)
class Foo:
    pass
```

reset_available_writers(self)
    Reset the available state of all registered writers

set_dirty(self)
    Sets a flag to re-setup the writers.
```

Writer Base Classes

To reduce code duplication base classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>AbstractMovieWriter</code></td>
<td>Abstract base class for writing movies.</td>
</tr>
<tr>
<td><code>MovieWriter</code></td>
<td>Base class for writing movies.</td>

<tr>
<td><code>FileMovieWriter</code></td>
<td>MovieWriter for writing to individual files and stitching at the end.</td>
</tr>
</tbody>
</table>

17.3. matplotlib.animation  

833
**matplotlib.animation.AbstractMovieWriter**

**class matplotlib.animation.AbstractMovieWriter**

Abstract base class for writing movies. Fundamentally, what a MovieWriter does is provide a way to grab frames by calling `grab_frame()`.

setup() is called to start the process and finish() is called afterwards.

This class is set up to provide for writing movie frame data to a pipe. `saving()` is provided as a context manager to facilitate this process as:

```python
with moviewriter.saving(fig, outfile='myfile.mp4', dpi=100):
    # Iterate over frames
    moviewriter.grab_frame(**savefig_kwargs)
```

The use of the context manager ensures that setup() and finish() are performed as necessary.

An instance of a concrete subclass of this class can be given as the `writer` argument of `Animation.save()`.

```
__init__(self, /, *args, **kwargs)
    Initialize self. See help(type(self)) for accurate signature.
```

**Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>finish(self)</code></td>
<td>Finish any processing for writing the movie.</td>
</tr>
<tr>
<td><code>grab_frame(self, **savefig_kwargs)</code></td>
<td>Grab the image information from the figure and save as a movie frame.</td>
</tr>
<tr>
<td><code>saving(self, fig, outfile, dpi, *args, ...)</code></td>
<td>Context manager to facilitate writing the movie file.</td>
</tr>
<tr>
<td><code>setup(self, fig, outfile[, dpi])</code></td>
<td>Perform setup for writing the movie file.</td>
</tr>
</tbody>
</table>

```
finish(self)
    Finish any processing for writing the movie.

grab_frame(self, **savefig_kwargs)
    Grab the image information from the figure and save as a movie frame.
    
    All keyword arguments in savefig_kwargs are passed on to the `savefig` command that saves the figure.

saving(self, fig, outfile, dpi, *args, **kwargs)
    Context manager to facilitate writing the movie file.
    
    *args, **kwargs are any parameters that should be passed to `setup`.

setup(self, fig, outfile, dpi=None)
    Perform setup for writing the movie file.
```

**Parameters**

- `fig` [Figure] The figure object that contains the information for frames
- `outfile` [string] The filename of the resulting movie file
**dpi** [int, optional] The DPI (or resolution) for the file. This controls the size in pixels of the resulting movie file. Default is `fig dpi`.

`matplotlib.animation.MovieWriter`

class `matplotlib.animation.MovieWriter(fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)`

Base class for writing movies.

This is a base class for MovieWriter subclasses that write a movie frame data to a pipe. You cannot instantiate this class directly. See examples for how to use its subclasses.

Attributes

- **frame_format** [str] The format used in writing frame data, defaults to 'rgba'
- **fig** [Figure] The figure to capture data from. This must be provided by the sub-classes.

Parameters

- **fps** [int] Framerate for movie.
- **codec** [string or None, optional] The codec to use. If `None` (the default) the `animation.codec` rcParam is used.
- **bitrate** [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is `None`, which uses the `animation.bitrate` rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.
- **extra_args** [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is `None`, which passes the additional arguments in the `animation.extra_args` rcParam.
- **metadata** [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

```
__init__(self, fps=5, codec=None, bitrate=None, extra_args=None, metadata=None)
```

MovieWriter

Parameters

- **fps** [int] Framerate for movie.
- **codec** [string or None, optional] The codec to use. If `None` (the default) the `animation.codec` rcParam is used.
- **bitrate** [int or None, optional] The bitrate for the saved movie file, which is one way to control the output file size and quality. The default value is `None`, which uses the `animation.bitrate` rcParam. A value of -1 implies that the bitrate should be determined automatically by the underlying utility.
- **extra_args** [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is `None`,
which passes the additional arguments in the animation.

**metadata** [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

### Attributes

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>frame_size</td>
<td>A tuple (width, height) in pixels of a movie frame.</td>
</tr>
</tbody>
</table>

**classmethod bin_path()**

Return the binary path to the commandline tool used by a specific subclass. This is a class method so that the tool can be looked for before making a particular MovieWriter subclass available.

**cleanup(self)**

Clean-up and collect the process used to write the movie file.

**finish(self)**

Finish any processing for writing the movie.

**frame_size**

A tuple (width, height) in pixels of a movie frame.

**grab_frame(self, **savefig_kwargs)**

Grab the image information from the figure and save as a movie frame.

All keyword arguments in savefig_kwargs are passed on to the savefig command that saves the figure.

**classmethod isAvailable()**

Check to see if a MovieWriter subclass is actually available.

**setup(self, fig, outfile, dpi=None)**

Perform setup for writing the movie file.
Parameters

fig [Figure] The figure object that contains the information for frames
outfile [str] The filename of the resulting movie file
dpi [int, optional] The DPI (or resolution) for the file. This controls the
size in pixels of the resulting movie file. Default is fig.dpi.

matplotlib.animation.FileMovieWriter

class matplotlib.animation.FileMovieWriter(*args, **kwargs)
MovieWriter for writing to individual files and stitching at the end.

This must be sub-classed to be useful.

__init__(self, *args, **kwargs)
MovieWriter

Parameters

fps [int] Framerate for movie.
codec [string or None, optional] The codec to use. If None (the default)
the animation.codec rcParam is used.
bitrate [int or None, optional] The bitrate for the saved movie file, which
is one way to control the output file size and quality. The default value
is None, which uses the animation.bitrate rcParam. A value of -1 implies
that the bitrate should be determined automatically by the underlying
utility.
extra_args [list of strings or None, optional] A list of extra string arguments to be passed to the underlying movie utility. The default is None, which passes the additional arguments in the animation.extra_args rcParam.
metadata [Dict[str, str] or None] A dictionary of keys and values for metadata to include in the output file. Some keys that may be of use include: title, artist, genre, subject, copyright, srcform, comment.

Methods

__init__(self, *args, **kwargs) MovieWriter
bin_path() Return the binary path to the command-line tool used by a specific subclass.
cleanup(self) Clean-up and collect the process used to write the movie file.
finish(self) Finish any processing for writing the movie.
grab_frame(self, **savefig_kwargs) Grab the image information from the figure and save as a movie frame.
isAvailable() Check to see if a MovieWriter subclass is actually available.

<tbody>
<tr>
<td><code>frame_format</code></td>
<td>Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.</td>
</tr>
<tr>
<td><code>frame_size</code></td>
<td>A tuple <code>(width, height)</code> in pixels of a movie frame.</td>
</tr>
</tbody>
</table>

**Methods**

- `cleanup(self)`
  Clean-up and collect the process used to write the movie file.

- `finish(self)`
  Finish any processing for writing the movie.

- `frame_format`
  Format (png, jpeg, etc.) to use for saving the frames, which can be decided by the individual subclasses.

- `grab_frame(self, **savefig_kwargs)`
  Grab the image information from the figure and save as a movie frame. All keyword arguments in savefig_kwargs are passed on to the `savefig` command that saves the figure.

- `setup(self, fig, outfile, dpi=None, frame_prefix='_tmp', clear_temp=True)`
  Perform setup for writing the movie file.

**Parameters**

- `fig` [Figure] The figure to grab the rendered frames from.
- `outfile` [str] The filename of the resulting movie file.
- `dpi` [number, optional] The dpi of the output file. This, with the figure size, controls the size in pixels of the resulting movie file. Default is `fig.dpi`.
- `frame_prefix` [str, optional] The filename prefix to use for temporary files. Defaults to `'_tmp'`.
- `clear_temp` [bool, optional] If the temporary files should be deleted after stitching the final result. Setting this to `False` can be useful for debugging. Defaults to `True`.

**Mixins**

- `AVConvBase` Mixin class for avconv output.
- `FFMpegBase` Mixin class for FFMpeg output.
- `ImageMagickBase` Mixin class for ImageMagick output.
**matplotlib.animation.AVConvBase**

**class matplotlib.animation.AVConvBase**  
Mixin class for avconv output.  
To be useful this must be multiply-inherited from with a MovieWriterBase sub-class.

```python
__init__(self, *, args, **kwargs)
```
Initialize self. See help(type(self)) for accurate signature.

**Methods**

- `isAvailable()`  
  Check to see if a MovieWriter subclass is actually available.

**Attributes**

- `args_key`  
- `exec_key`  
- `output_args`

```python
args_key = 'animation.avconv_args'
eexec_key = 'animation.avconv_path'
classmethod isAvailable()
```
Check to see if a MovieWriter subclass is actually available.

**matplotlib.animation.FFMpegBase**

**class matplotlib.animation.FFMpegBase**  
Mixin class for FFMpeg output.  
To be useful this must be multiply-inherited from with a MovieWriterBase sub-class.

```python
__init__(self, *, args, **kwargs)
```
Initialize self. See help(type(self)) for accurate signature.

**Methods**

- `isAvailable()`

**Attributes**

- `args_key`  
- `exec_key`  
- `output_args`
Matplotlib, Release 3.1.3

```python
args_key = 'animation.ffmpegs_args'
exec_key = 'animation.ffmpegs_path'
classmethod isAvailable()
output_args

matplotlib.animation.ImageMagickBase

class matplotlib.animation.ImageMagickBase
    Mixin class for ImageMagick output.
    To be useful this must be multiply-inherited from with a MovieWriterBase sub-class.
    __init__(self, /, *args, **kwargs)
        Initialize self. See help(type(self)) for accurate signature.

Methods

    bin_path()
    isAvailable()

Attributes

    args_key
delay
exec_key
output_args

args_key = 'animation.convert_args'
classmethod bin_path()
delay
exec_key = 'animation.convert_path'
classmethod isAvailable()
output_args

are provided.
See the source code for how to easily implement new MovieWriter classes.

17.4 matplotlib.artist

17.4.1 Artist class

class matplotlib.artist.Artist
    Abstract base class for objects that render into a FigureCanvas.

    Typically, all visible elements in a figure are subclasses of Artist.
## Interactive

</tr>
</tbody>
</table>

**matplotlib.artist.Artist.add_callback**

Add a callback function that will be called whenever one of the `Artist`'s properties changes.

**Parameters**

- `func` [callable] The callback function. It must have the signature:

  ```python
def func(artist: Artist) -> Any
  ```

  where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

- `oid` [int] The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

- `remove_callback`

**matplotlib.artist.Artist.remove_callback**

Remove a callback based on its observer id.

**See also:**

- `add_callback`
matplotlib.artist.Artist.pchanged

Artist.pchanged(self)

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

matplotlib.artist.Artist.get_cursor_data

Artist.get_cursor_data(self, event)

Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters

   event [matplotlib.backend_bases.MouseEvent]

See also:

format_cursor_data

matplotlib.artist.Artist.format_cursor_data

Artist.format_cursor_data(self, data)

Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data
matplotlib.artist.Artist.mouseover

Artist.mouseover

matplotlib.artist.Artist.contains

Artist.contains(self, mouseevent)
   Test whether the artist contains the mouse event.

   Parameters
   mouseevent [matplotlib.backend_bases.MouseEvent]

   Returns
   contains [bool] Whether any values are within the radius.
   details [dict] An artist-specific dictionary of details of the event context,
   such as which points are contained in the pick radius. See the individual
   Artist subclasses for details.

   See also:
   set_contains, get_contains

matplotlib.artist.Artist.set_contains

Artist.set_contains(self, picker)
   Define a custom contains test for the artist.
   The provided callable replaces the default contains method of the artist.

   Parameters
   picker [callable] A custom picker function to evaluate if an event is within
   the artist. The function must have the signature:

   def contains(artist: Artist, event: MouseEvent) -> bool, dict

   that returns:
   • a bool indicating if the event is within the artist
   • a dict of additional information. The dict should at least return the
     same information as the default contains() implementation of the re-
     spective artist, but may provide additional information.

matplotlib.artist.Artist.get_contains

Artist.get_contains(self)
   Return the custom contains function of the artist if set, or None.

   See also:
   set_contains
matplotlib.artist.Artist.pick

Artist.pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

    See also:

        set_picker, get_picker, pickable

matplotlib.artist.Artist.pickable

Artist.pickable(self)
    Return whether the artist is pickable.

    See also:

        set_picker, get_picker, pick

matplotlib.artist.Artist.set_picker

Artist.set_picker(self, picker)
    Define the picking behavior of the artist.

    Parameters

        picker [None or bool or float or callable] This can be one of the following:
        • None: Picking is disabled for this artist (default).
        • A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
        • A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
        • A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

            hit, props = picker(artist, mouseevent)

            to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

matplotlib.artist.Artist.get_picker

Artist.get_picker(self)
    Return the picking behavior of the artist.
The possible values are described in `set_picker`.

**See also:**

`set_picker`, `pickable`, `pick`
• a `Patch` (or subclass) instance; or
• a `Path` instance, in which case a `Transform` instance, which will be applied to the path before using it for clipping, must be provided; or
• `None`, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

ACCEPTS: `[Path, Transform] | Patch | None`

```python
matplotlib.artist.Artist.get_clip_path

Artist.get_clip_path(self)
    Return the clip path.
```

**Bulk Properties**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Artist.update</code></td>
<td>Update this artist’s properties from the dictionary <code>props</code>.</td>
</tr>
<tr>
<td><code>Artist.update_from</code></td>
<td>Copy properties from <code>other</code> to <code>self</code>.</td>
</tr>
<tr>
<td><code>Artist.properties</code></td>
<td>Return a dictionary of all the properties of the artist.</td>
</tr>
<tr>
<td><code>Artist.set</code></td>
<td>A property batch setter.</td>
</tr>
</tbody>
</table>

```python
matplotlib.artist.Artist.update

Artist.update(self, props)
    Update this artist’s properties from the dictionary `props`.                |
```

```python
matplotlib.artist.Artist.update_from

Artist.update_from(self, other)
    Copy properties from `other` to `self`.                                     |
```

```python
matplotlib.artist.Artist.properties

Artist.properties(self)
    Return a dictionary of all the properties of the artist.                   |
```

```python
matplotlib.artist.Artist.set

Artist.set(self, **kwargs)
    A property batch setter. Pass `kwargs` to set properties.                   |
```
Drawing

**Artist.draw**

Draw the Artist using the given renderer.

**Artist.set_animated**

Set the artist’s animation state.

**Artist.get_animated**

Return the animated state.

**Artist.set_alpha**

Set the alpha value used for blending - not supported on all backends.

**Artist.get_alpha**

Return the alpha value used for blending - not supported on all backends.

**Artist.set_snap**

Set the snapping behavior.

**Artist.get_snap**

Returns the snap setting.

**Artist.set_visible**

Set the artist’s visibility.

**Artist.get_visible**

Return the visibility.

**Artist.zorder**

Set the zorder for the artist.

**Artist.get_zorder**

Return the artist’s zorder.

**Artist.set_agg_filter**

Set the agg filter.

**Artist.set_sketch_params**

Sets the sketch parameters.

**Artist.get_sketch_params**

Returns the sketch parameters for the artist.

**Artist.set_rasterized**

Force rasterized (bitmap) drawing in vector backend output.

**Artist.get_rasterized**

Return whether the artist is to be rasterized.

**Artist.set_path_effects**

Set the path effects.

**Artist.get_path_effects**

Return filter function to be used for agg filter.

**Artist.get_window_extent**

Get the axes bounding box in display space.

**Artist.get_transformed_clip_path_and_affine**

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

```python
matplotlib.artist.Artist.draw

**Artist.draw**(self, renderer, *args, **kwargs)

Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (**Artist.get_visible** is False).

**Parameters**

- **renderer** [RendererBase subclass.]

matplotlib.artist.Artist.set_animated

**Artist.set_animated**(self, b)

Set the artist’s animation state.

**Parameters**

- **b** [bool]
**matplotlib.artist.Artist.get_animated**

`Artist.get_animated(self)`

Return the animated state.

**matplotlib.artist.Artist.set_alpha**

`Artist.set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.

**Parameters**

alpha [float]

**matplotlib.artist.Artist.get_alpha**

`Artist.get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

**matplotlib.artist.Artist.set_snap**

`Artist.set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

snap [bool or None] Possible values:

- True: Snap vertices to the nearest pixel center.
- False: Do not modify vertex positions.
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**matplotlib.artist.Artist.get_snap**

`Artist.get_snap(self)`

Returns the snap setting.

See `set_snap` for details.
matplotlib.artist.Artist.set_visible

Artist.set_visible(self, b)
   Set the artist’s visibility.
   
   **Parameters**
   
   b [bool]

matplotlib.artist.Artist.get_visible

Artist.get_visible(self)
   Return the visibility.

matplotlib.artist.Artist.zorder

Artist.zorder = 0

matplotlib.artist.Artist.set_zorder

Artist.set_zorder(self, level)
   Set the zorder for the artist. Artists with lower zorder values are drawn first.
   
   **Parameters**
   
   level [float]

matplotlib.artist.Artist.get_zorder

Artist.get_zorder(self)
   Return the artist’s zorder.

matplotlib.artist.Artist.set_agg_filter

Artist.set_agg_filter(self, filter_func)
   Set the agg filter.
   
   **Parameters**
   
   filter_func [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

matplotlib.artist.Artist.set_sketch_params

Artist.set_sketch_params(self, scale=None, length=None, randomness=None)
   Sets the sketch parameters.
   
   **Parameters**
scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.artist.Artist.get_sketch_params

Artist.get_sketch_params(self)

Returns the sketch parameters for the artist.

Returns

sketch_params [tuple or None] A 3-tuple with the following elements:

• scale: The amplitude of the wiggle perpendicular to the source line.
• length: The length of the wiggle along the line.
• randomness: The scale factor by which the length is shrunken or expanded.

Returns None if no sketch parameters were set.

matplotlib.artist.Artist.set_rasterized

Artist.set_rasterized(self, rasterized)

Force rasterized (bitmap) drawing in vector backend output. Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

matplotlib.artist.Artist.get_rasterized

Artist.get_rasterized(self)

Return whether the artist is to be rasterized.

matplotlib.artist.Artist.set_path_effects

Artist.set_path_effects(path_effects)

Set the path effects.

Parameters

path_effects [AbstractPathEffect]
matplotlib.artist.Artist.get_path_effects

Artist.get_path_effects(self)

matplotlib.artist.Artist.get_agg_filter

Artist.get_agg_filter(self)
    Return filter function to be used for agg filter.

matplotlib.artist.Artist.get_window_extent

Artist.get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box "tight" calculation. Default
    is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent
    of the artist changes. The extent can change due to any changes in the transform stack,
    such as changing the axes limits, the figure size, or the canvas used (as is done when
    saving a figure). This can lead to unexpected behavior where interactive figures will look
    fine on the screen, but will save incorrectly.

matplotlib.artist.Artist.get_transformed_clip_path_and_affine

Artist.get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the re-
    maining affine part of its transformation.

Figure and Axes

<table>
<thead>
<tr>
<th>Artist.remove</th>
<th>Remove the artist from the figure if possible.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Artist.axes</td>
<td>The Axes instance the artist resides in, or None.</td>
</tr>
<tr>
<td>Artist.set_figure</td>
<td>Set the Figure instance the artist belongs to.</td>
</tr>
<tr>
<td>Artist.get_figure</td>
<td>Return the Figure instance the artist belongs to.</td>
</tr>
</tbody>
</table>

matplotlib.artist.Artist.remove

Artist.remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.
    draw_idle. Call relim to update the axes limits if desired.
    Note: relim will not see collections even if the collection was added to the axes with autolim = True.
Note: there is no support for removing the artist’s legend entry.

**matplotlib.artist.Artist.axes**

`Artist.axes`

The *Axes* instance the artist resides in, or *None*.

**matplotlib.artist.Artist.set_figure**

`Artist.set_figure(self, fig)`

Set the *Figure* instance the artist belongs to.

**Parameters**

- **fig** [Figure]

**matplotlib.artist.Artist.get_figure**

`Artist.get_figure(self)`

Return the *Figure* instance the artist belongs to.

**Children**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Artist.get_children</code></td>
<td>Return a list of the child <em>Artists</em> of this <em>Artist</em>.</td>
</tr>
<tr>
<td><code>Artist.findobj</code></td>
<td>Find artist objects.</td>
</tr>
</tbody>
</table>

**matplotlib.artist.Artist.get_children**

`Artist.get_children(self)`

Return a list of the child *Artists* of this *Artist*.

**matplotlib.artist.Artist.findobj**

`Artist.findobj(self, match=None, include_self=True)`

Find artist objects. Recursively find all *Artist* instances contained in the artist.

**Parameters**

- **match** A filter criterion for the matches. This can be:
  - *None*: Return all objects contained in artist.
  - A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
  - A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (isinstance check).
include_self  [bool] Include self in the list to be checked for a match.

Returns

artists  [list of Artist]

Transform

Artist.set_transform     Set the artist transform.
Artist.get_transform     Return the Transform instance used by this artist.
Artist.is_transform_set  Return whether the Artist has an explicitly set transform.

matplotlib.artist.Artist.set_transform

Artist.set_transform(self, t)
    Set the artist transform.

Parameters

t  [Transform]

matplotlib.artist.Artist.get_transform

Artist.get_transform(self)
    Return the Transform instance used by this artist.

matplotlib.artist.Artist.is_transform_set

Artist.is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

Units

Artist.convert_xunits     Convert x using the unit type of the xaxis.
Artist.convert_yunits     Convert y using the unit type of the yaxis.
Artist.have_units         Return True if units are set on the x or y axes.

matplotlib.artist.Artist.convert_xunits

Artist.convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.
**matplotlib.artist.Artist.convert_yunits**

`Artist.convert_yunits(self, y)`

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

**matplotlib.artist.Artist.have_units**

`Artist.have_units(self)`

Return `True` if units are set on the x or y axes.

**Metadata**

**matplotlib.artist.Artist.set_gid**

`Artist.set_gid(self, gid)`

Set the (group) id for the artist.

**Parameters**

- `gid` [str]

**matplotlib.artist.Artist.get_gid**

`Artist.get_gid(self)`

Return the group id.

**matplotlib.artist.Artist.set_label**

`Artist.set_label(self, s)`

Set a label that will be displayed in the legend.

**Parameters**

- `s` [object] s will be converted to a string by calling `str`. 
matplotlib.artist.Artist.get_label

```
Artist.get_label(self)
    Return the label used for this artist in the legend.
```

matplotlib.artist.Artist.set_url

```
Artist.set_url(self, url)
    Set the url for the artist.

Parameters

    url [str]
```

matplotlib.artist.Artist.get_url

```
Artist.get_url(self)
    Return the url.
```

Miscellaneous

```
<table>

<tr>
<td>Artist.stale</td>
<td>Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.</td>
</tr>
</tbody>
</table>
```

matplotlib.artist.Artist.sticky_edges

```
Artist.sticky_edges
    x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit “sticks” to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```
**matplotlib.artist.Artist.set_in_layout**

*Artist.set_in_layout(self, in_layout)*

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, *Figure.tight_layout()* and *fig.savefig(fname, bbox_inches='tight')*.

**Parameters**

- *in_layout* [bool]

**matplotlib.artist.Artist.get_in_layout**

*Artist.get_in_layout(self)*

Return boolean flag, True if artist is included in layout calculations.

E.g. *Constrained Layout Guide*, *Figure.tight_layout()* and *fig.savefig(fname, bbox_inches='tight')*.

**matplotlib.artist.Artist.stale**

*Artist.stale*

Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

### 17.4.2 Functions

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>allow_rasterization</td>
<td>Decorator for Artist.draw method.</td>
</tr>
<tr>
<td>get</td>
<td>Return the value of object’s property.</td>
</tr>
<tr>
<td>getp</td>
<td>Return the value of object’s property.</td>
</tr>
<tr>
<td>setp</td>
<td>Set a property on an artist object.</td>
</tr>
<tr>
<td>kwdoc</td>
<td>Inspect an <em>Artist</em> class (using <em>ArtistInspector</em>) and return information about its settable properties and their current values.</td>
</tr>
<tr>
<td>ArtistInspector</td>
<td>A helper class to inspect an <em>Artist</em> and return information about its settable properties and their current values.</td>
</tr>
</tbody>
</table>

**matplotlib.artist.allow_rasterization**

*matplotlib.artist.allow_rasterization(draw)*

Decorator for Artist.draw method. Provides routines that run before and after the draw call. The before and after functions are useful for changing artist-dependent renderer attributes or making other setup function calls, such as starting and flushing a mixed-mode renderer.
matplotlib.artist.get

matplotlib.artist.get(obj, property=None)

Return the value of object’s property. property is an optional string for the property you want to return

Example usage:

```python
getp(obj)  # get all the object properties
getp(obj, 'linestyle')  # get the linestyle property
```

obj is a Artist instance, e.g., Line2D or an instance of a Axes or matplotlib.text.Text. If the property is 'somename', this function returns

```python
obj.get_somename()
```

getp() can be used to query all the gettable properties with getp(obj). Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

```python
property or alias = value
```

e.g.:

```python
linewidth or lw = 2
```

matplotlib.artist.getp

matplotlib.artist.getp(obj, property=None)

Return the value of object’s property. property is an optional string for the property you want to return

Example usage:

```python
getp(obj)  # get all the object properties
getp(obj, 'linestyle')  # get the linestyle property
```

obj is a Artist instance, e.g., Line2D or an instance of a Axes or matplotlib.text.Text. If the property is 'somename', this function returns

```python
obj.get_somename()
```

getp() can be used to query all the gettable properties with getp(obj). Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

```python
property or alias = value
```

e.g.:

```python
linewidth or lw = 2
```

matplotlib.artist.setp

matplotlib.artist.setp(obj, *args, **kwargs)

Set a property on an artist object.
matplotlib supports the use of `setp()` ("set property") and `getp()` to set and get object properties, as well as to do introspection on the object. For example, to set the linestyle of a line to be dashed, you can do:

```python
>>> line, = plot([1,2,3])
>>> setp(line, linestyle='--')
```

If you want to know the valid types of arguments, you can provide the name of the property you want to set without a value:

```python
>>> setp(line, 'linestyle')
linestyle: [ '-' | '--' | '-.' | ':' | 'steps' | 'None' ]
```

If you want to see all the properties that can be set, and their possible values, you can do:

```python
>>> setp(line)
... long output listing omitted
```

You may specify another output file to `setp` if `sys.stdout` is not acceptable for some reason using the `file` keyword-only argument:

```python
>>> with fopen('output.log') as f:
...     setp(line, file=f)
```

`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. e.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```python
>>> x = arange(0,1.0,0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r')  # MATLAB style
>>> setp(lines, linewidth=2, color='r')       # python style
```

`matplotlib.artist.kwdoc`

`matplotlib.artist.kwdoc(artist)`
Inspect an `Artist` class (using `ArtistInspector`) and return information about its settable properties and their current values.

**Parameters**

- `artist` ([`Artist` or an iterable of `Artists`]

**Returns**
string The settable properties of artist, as plain text if 
rcParams["docstring.
hardcopy"] (default: False) is False and as a rst table (intended for use in 
Sphinx) if it is True.

matplotlib.artist.ArtistInspector
class matplotlib_artist.ArtistInspector(o)
A helper class to inspect an Artist and return information about its settable properties
and their current values.

Initialize the artist inspector with an Artist or an iterable of Artists. If an iterable is
used, we assume it is a homogeneous sequence (all Artists are of the same type) and it
is your responsibility to make sure this is so.

__init__(self, o)
Initialize the artist inspector with an Artist or an iterable of Artists. If an iterable
is used, we assume it is a homogeneous sequence (all Artists are of the same type)
and it is your responsibility to make sure this is so.

Methods

__init__(self, o) Initialize the artist inspector with an Artist or an iterable of Artists.

aliased_name(self, s) Return ‘PROPNAME or alias’ if s has an alias, else return ‘PROPNAME’.

aliased_name_rest(self, s, target) Return ‘PROPNAME or alias’ if s has an alias, else return ‘PROPNAME’, formatted for ReST.

get_aliases(self) Get a dict mapping property fullnames to sets of aliases for each alias in the
ArtistInspector.

get_setters(self) Get the attribute strings with setters for object.

get_valid_values(self, attr) Get the legal arguments for the setter associated with attr.

is_alias(self, o) Return whether method object o is an alias for another method.

pprint_getters(self) Return the getters and actual values as list of strings.

pprint_setters(self[, prop, leadingspace]) If prop is None, return a list of strings of all settable properties and their valid values.

pprint_setters_rest(self[, prop, leadingspace]) If prop is None, return a list of strings of all settable properties and their valid values.

properties(self) Return a dictionary mapping property name -> value.

aliased_name(self, s) Return ‘PROPNAME or alias’ if s has an alias, else return ‘PROPNAME’.

e.g., for the line markerfacecolor property, which has an alias, return ‘markerface-
color or mfc' and for the transform property, which does not, return 'transform'.

```python
class aliased_name_rest:
    def __init__(self, s, target):
        # Implementation

e.g., for the line markerfacecolor property, which has an alias, return 'markerfacecolor or mfc' and for the transform property, which does not, return 'transform'.

class get_aliases:
    def __init__(self):
        # Implementation
e.g., for lines:

```

```python
dict = {
    'markerfacecolor': {'mfc'},
    'linewidth': {'lw'},
}
```

```python
class get_setters:
    def __init__(self):
        # Implementation
e.g., for a line, return ['markerfacecolor', 'linewidth', ....].

17.5.1 The Axes class

class matplotlib.axes.Axes(fig, rect, facecolor=None, frameon=True, sharex=None, sharey=None, label='', xscale=None, yscale=None, **kwargs)

Bases: matplotlib.axes._base._AxesBase

The Axes contains most of the figure elements: Axis, Tick, Line2D, Text, Polygon, etc., and sets the coordinate system.

The Axes instance supports callbacks through a callbacks attribute which is a CallbackRegistry instance. The events you can connect to are ‘xlim_changed’ and ‘ylim_changed’ and the callback will be called with func(ax) where ax is the Axes instance.

Attributes

dataLim [BBox] The bounding box enclosing all data displayed in the Axes.

viewLim [BBox] The view limits in data coordinates.

Build an axes in a figure.

Parameters

fig [Figure] The axes is build in the Figure fig.

rect [[left, bottom, width, height]] The axes is build in the rectangle rect. rect is in Figure coordinates.

sharex, sharey [Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.

frameon [bool, optional] True means that the axes frame is visible.

**kwargs Other other optional keyword arguments:

### Returns

- **axes** [Axes] The new `Axes` object.

### 17.5.2 Subplots

**SubplotBase**

Base class for subplots, which are `Axes` instances with additional methods to facilitate generating and manipulating a set of `Axes` within a figure.

**subplot_class_factory**

This makes a new class that inherits from `SubplotBase` and the given `axes_class` (which is assumed to be a subclass of `axes.Axes`).
class matplotlib.axes.SubplotBase(fig, *args, **kwargs)

Bases: object

Base class for subplots, which are Axes instances with additional methods to facilitate generating and manipulating a set of Axes within a figure.

fig is a matplotlib.figure.Figure instance.

args is the tuple (numRows, numCols, plotNum), where the array of subplots in the figure has dimensions numRows, numCols, and where plotNum is the number of the subplot being created. plotNum starts at 1 in the upper left corner and increases to the right.

If numRows <= numCols <= plotNum < 10, args can be the decimal integer numRows * 100 + numCols * 10 + plotNum.

change_geometry(self, numrows, numcols, num)

change subplot geometry, e.g., from 1,1,1 to 2,2,3

get_geometry(self)

get the subplot geometry, e.g., 2,2,3

get_gridspec(self)

get the GridSpec instance associated with the subplot

get_subplotspec(self)

get the SubplotSpec instance associated with the subplot

is_first_col(self)

is_first_row(self)

is_last_col(self)

is_last_row(self)

label_outer(self)

Only show “outer” labels and tick labels.

x-labels are only kept for subplots on the last row; y-labels only for subplots on the first column.

set_subplotspec(self, subplotspec)

set the SubplotSpec instance associated with the subplot

update_params(self)

update the subplot position from fig.subplotpars

matplotlib.axes.subplot_class_factory

axes.subplot_class_factory(axes_class=None)

This makes a new class that inherits from `SubplotBase` and the given axes_class (which is assumed to be a subclass of `axes.Axes`). This is perhaps a little bit roundabout to make a new class on the fly like this, but it means that a new Subplot class does not have to be created for every type of Axes.

17.5.3 Plotting

Basic

<table>

</tbody>
</table>

matplotlib.axes.Axes

Axes.plot(self, *args, scalex=True, scaley=True, data=None, **kwargs)

Plot y versus x as lines and/or markers.

Call signatures:

```python
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by x, y.

The optional parameter fmt is a convenient way for defining basic formatting like color,
marker and linestyle. It’s a shortcut string notation described in the Notes section below.

```python
>>> plot(x, y)  # plot x and y using default line style and color
>>> plot(x, y, 'bo')  # plot x and y using blue circle markers
>>> plot(y)  # plot y using x as index array 0..N-1
>>> plot(y, 'r+')  # ditto, but with red plusses
```

You can use `Line2D` properties as keyword arguments for more control on the appearance. Line properties and `fmt` can be mixed. The following two calls yield identical results:

```python
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',...
      linewidth=2, markersize=12)
```

When conflicting with `fmt`, keyword arguments take precedence.

**Plotting labelled data**

There’s a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index `obj['y']`). Instead of giving the data in `x` and `y`, you can provide the object in the `data` parameter and just give the labels for `x` and `y`:

```python
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a `dict`, a pandas `DataFrame` or a structured numpy array.

**Plotting multiple sets of data**

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call `plot` multiple times. Example:

  ```python
  >>> plot(x1, y1, 'bo')
  >>> plot(x2, y2, 'go')
  ```

- Alternatively, if your data is already a 2d array, you can pass it directly to `x`, `y`. A separate data set will be drawn for every column.

  Example: an array `a` where the first column represents the `x` values and the other columns are the `y` columns:

  ```python
  >>> plot(a[0], a[1:])
  ```

- The third way is to specify multiple sets of `[x], y, [fmt]` groups:

  ```python
  >>> plot(x1, y1, 'g^', x2, y2, 'g-')
  ```

  In this case, any additional keyword argument applies to all datasets. Also this syntax cannot be combined with the `data` parameter.

By default, each line is assigned a different style specified by a ‘style cycle’. The `fmt` and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using the ‘axes.prop_cycle’ `rcParam`.

**Parameters**

- `x, y` [array-like or scalar] The horizontal / vertical coordinates of the data points. `x` values are optional and default to `range(len(y))`. 
Commonly, these parameters are 1D arrays.
They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).
These arguments cannot be passed as keywords.

**fmt** [str, optional] A format string, e.g. ‘ro’ for red circles. See the Notes section for a full description of the format strings.
Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.
This argument cannot be passed as keyword.

**data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.

**Note:** Technically there’s a slight ambiguity in calls where the second label is a valid fmt. plot('n', 'o', data=obj) could be plt(x, y) or plt(y, fmt). In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string plot('n', 'o', '', data=obj).

**Returns**
- **lines** A list of Line2D objects representing the plotted data.

**Other Parameters**
- **scalex, scaley** [bool, optional, default: True] These parameters determined if the view limits are adapted to the data limits. The values are passed on to autoscale_view.

****kwargs** [Line2D properties, optional] kwargs are used to specify properties like a line label (for auto legends), linewidth, antialiasing, marker face color. Example:

```python
>>> plot([1,2,3], [1,2,3], 'go-', label='line 1', linewidth=2)
>>> plot([1,2,3], [1,4,9], 'rs', label='line 2')
```

If you make multiple lines with one plot command, the kwargs apply to all those lines.

Here is a list of available Line2D properties:

<table>

**See also:**

**scatter** XY scatter plot with markers of varying size and/or color (sometimes also called bubble chart).

**Notes**

**Format Strings**

A format string consists of a part for color, marker and line:

```
fmt = '[marker][line][color]'  
```

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If line is given, but no marker, the data will be a line without markers.

Other combinations such as [color][marker][line] are also supported, but note that their parsing may be ambiguous.
Markers

<table>
<thead>
<tr>
<th>character</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'.'</td>
<td>point marker</td>
</tr>
<tr>
<td>','</td>
<td>pixel marker</td>
</tr>
<tr>
<td>'o'</td>
<td>circle marker</td>
</tr>
<tr>
<td>'v'</td>
<td>triangle_down marker</td>
</tr>
<tr>
<td>'^'</td>
<td>triangle_up marker</td>
</tr>
<tr>
<td>'&lt;'</td>
<td>triangle_left marker</td>
</tr>
<tr>
<td>'&gt;'</td>
<td>triangle_right marker</td>
</tr>
<tr>
<td>'1'</td>
<td>tri_down marker</td>
</tr>
<tr>
<td>'2'</td>
<td>tri_up marker</td>
</tr>
<tr>
<td>'3'</td>
<td>tri_left marker</td>
</tr>
<tr>
<td>'4'</td>
<td>tri_right marker</td>
</tr>
<tr>
<td>'s'</td>
<td>square marker</td>
</tr>
<tr>
<td>'p'</td>
<td>pentagon marker</td>
</tr>
<tr>
<td>'*'</td>
<td>star marker</td>
</tr>
<tr>
<td>'h'</td>
<td>hexagon1 marker</td>
</tr>
<tr>
<td>'H'</td>

</tbody>
</table>

Line Styles

<table>
<thead>
<tr>
<th>character</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>solid line style</td>
</tr>
<tr>
<td>'--'</td>
<td>dashed line style</td>
</tr>
<tr>
<td>'-.'</td>
<td>dash-dot line style</td>
</tr>
<tr>
<td>':'</td>
<td>dotted line style</td>
</tr>
</tbody>
</table>

Example format strings:

'b'  # blue markers with default shape
'or' # red circles
'-g' # green solid line
'--'  # dashed line with default color
'^k:'  # black triangle_up markers connected by a dotted line

Colors

The supported color abbreviations are the single letter codes
and the ‘CN’ colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any `matplotlib.colors` spec, e.g. full names (‘green’) or hex strings (‘#008000’).

Axes.errorbar(self, x, y, yerr=None, xerr=None, fmt="", ecolor=None, elinewidth=None, capsize=None, barsabove=False, lolims=False, uplims=False, xlolims=False, xuplims=False, errorevery=1, capthick=None, *, data=None, **kwargs)  
Plot y versus x as lines and/or markers with attached errorbars. x, y define the data locations, xerr, yerr define the errorbar sizes. By default, this draws the data markers/lines as well the errorbars. Use fmt=’none’ to draw errorbars without any data markers.

**Parameters**

- **x, y** [scalar or array-like] The data positions.
- **xerr, yerr** [scalar or array-like, shape(N,) or shape(2,N), optional] The errorbar sizes:
  - scalar: Symmetric +/- values for all data points.
  - shape(N,): Symmetric +/- values for each data point.
  - **shape(2,N): Separate - and + values for each bar. First row** contains the lower errors, the second row contains the upper errors.
  - **None**: No errorbar.

Note that all error arrays should have positive values.

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

- **fmt** [plot format string, optional, default: “] The format for the data points / data lines. See plot for details.

Use ‘none’ (case insensitive) to plot errorbars without any data markers.

- **ecolor** [mpl color, optional, default: None] A matplotlib color arg which gives the color the errorbar lines. If None, use the color of the line connecting the markers.

- **elinewidth** [scalar, optional, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.
** capacsize ** [scalar, optional, default: None] The length of the error bar caps in points. If None, it will take the value from rcParams["errorbar.capsize"] (default: 0.0).

** capthick ** [scalar, optional, default: None] An alias to the keyword argument markeredgewidth (a.k.a. mew). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if mew or markeredgewidth are given, then they will over-ride capthick. This may change in future releases.

** barsabove ** [bool, optional, default: False] If True, will plot the errorbars above the plot symbols. Default is below.

** lolims, uplims, xlolims, xuplims ** [bool, optional, default: False] These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. lims-arguments may be of the same type as xerr and yerr. To use limits with inverted axes, set_xlim() or set_ylim() must be called before errorbar().

** errorevery ** [positive integer, optional, default: 1] Subsamples the errorbars. e.g., if errorevery=5, errorbars for every 5-th datapoint will be plotted. The data plot itself still shows all data points.

Returns

** container ** [ErrorbarContainer] The container contains:

- plotline: Line2D instance of x, y plot markers and/or line.
- caplines: A tuple of Line2D instances of the error bar caps.
- barlinecols: A tuple of LineCollection with the horizontal and vertical error ranges.

Other Parameters

** kwags ** All other keyword arguments are passed on to the plot command for the markers. For example, this code makes big red squares with thick green edges:

```python
x,y,yerr = rand(3,10)
errorbar(x, y, yerr, marker='s', mfc='red', mec='green', ms=20, mew=4)
```

where mfc, mec, ms and mew are aliases for the longer property names, markerfacecolor, markeredgecolor, markersize and markeredgewidth.

Valid kwargs for the marker properties are Lines2D properties:

### Notes

**Note:** In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘x’, ‘xerr’, ‘y’, ‘yerr’.

Objects passed as **data** must support item access (data[<arg>]) and membership test (<arg> in data).
Examples using `matplotlib.axes.Axes.errorbar`

- `sphx_glr_gallery_lines_bars_and_markers_errorbar_limits_simple.py`
- `sphx_glr_gallery_lines_bars_and_markers_errorbar_subsample.py`
- `sphx_glr_gallery_statistics_errorbar_features.py`
- `sphx_glr_gallery_statistics_errorbar_limits.py`
- `sphx_glr_gallery_statistics_errorbars_and_boxes.py`
- `sphx_glr_gallery_text_labels_and_annotations_legend_demo.py`
- `sphx_glr_gallery_scales_log_demo.py`

`matplotlib.axes.Axes.scatter`

```python
Axes.scatter(self, x, y, s=None, c=None, marker=None, cmap=None, norm=None, vmin=None, vmax=None, alpha=None, linewidths=None, verts=None, edgecolors=None, *, plotnonfinite=False, data=None, **kwargs)
```

A scatter plot of $y$ vs $x$ with varying marker size and/or color.

**Parameters**

- **x, y** [array_like, shape (n, )] The data positions.
- **s** [scalar or array_like, shape (n, ), optional] The marker size in points**2. Default is `rcParams['lines.markersize']**2`.
- **c** [color, sequence, or sequence of color, optional] The marker color. Possible values:
  - A single color format string.
  - A sequence of color specifications of length $n$.
  - A sequence of $n$ numbers to be mapped to colors using `cmap` and `norm`.
  - A 2-D array in which the rows are RGB or RGBA. Note that `c` should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormaped. If you want to specify the same RGB or RGBA value for all points, use a 2-D array with a single row. Otherwise, value-matching will have precedence in case of a size matching with `x` and `y`.
- **marker** [MarkerStyle, optional] The marker style. `marker` can be either an instance of the class or the text shorthand for a particular marker.
Defaults to `None`, in which case it takes the value of `rcParams["scatter.marker"]` (default: ‘o’) = ‘o’. See `markers` for more information about marker styles.

`cmap` [`Colormap`, optional, default: `None`] A `Colormap` instance or registered colormap name. `cmap` is only used if `c` is an array of floats. If `None`, defaults to `rcParams["image.cmap"]`.

`norm` [`Normalize`, optional, default: `None`] A `Normalize` instance is used to scale luminance data to 0, 1. `norm` is only used if `c` is an array of floats. If `None`, use the default `colors.Normalize`.

`vmin, vmax` [scalar, optional, default: `None`] `vmin` and `vmax` are used in conjunction with `norm` to normalize luminance data. If `None`, the respective min and max of the color array is used. `vmin` and `vmax` are ignored if you pass a `norm` instance.

`alpha` [scalar, optional, default: `None`] The alpha blending value, between 0 (transparent) and 1 (opaque).

`linewidths` [scalar or array_like, optional, default: `None`] The linewidth of the marker edges. Note: The default `edgecolors` is ‘face’. You may want to change this as well. If `None`, defaults to `rcParams["lines.linewidth"]`.

`edgecolors` [{‘face’, ‘none’, `None`} or color or sequence of color, optional.] The edge color of the marker. Possible values:

- ‘face’: The edge color will always be the same as the face color.
- ‘none’: No patch boundary will be drawn.
- A Matplotlib color or sequence of color.

Defaults to `None`, in which case it takes the value of `rcParams["scatter.edgecolors"]` (default: ‘face’) = ‘face’.

For non-filled markers, the `edgecolors` kwarg is ignored and forced to ‘face’ internally.

`plotnonfinite` [boolean, optional, default: `False`] Set to plot points with non-finite `c`, in conjunction with `set_bad`.

Returns

`paths` [`PathCollection`]

Other Parameters

**kwargs [`Collection` properties]

See also:

`plot` To plot scatter plots when markers are identical in size and color.

Notes

- The `plot` function will be faster for scatterplots where markers don’t vary in size or color.
- Any or all of `x, y, s, and c` may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.
• Fundamentally, scatter works with 1-D arrays; \(x\), \(y\), \(s\), and \(c\) may be input as 2-D arrays, but within scatter they will be flattened. The exception is \(c\), which will be flattened only if its size matches the size of \(x\) and \(y\).

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Examples using `matplotlib.axes.Axes.scatter`**

• **Choosing Colormaps in Matplotlib**
Axes.plot_date(self, x, y, fmt='o', tz=None, xdate=True, ydate=False, *, data=None, **kwargs)

Plot data that contains dates.

Similar to plot, this plots y vs. x as lines or markers. However, the axis labels are formatted as dates depending on xdate and ydate.

Parameters

x, y [array-like] The coordinates of the data points. If xdate or ydate is True, the respective values x or y are interpreted as Matplotlib dates.

fmt [str, optional] The plot format string. For details, see the corresponding parameter in plot.

tz [[None | timezone string | tzinfo instance]] The time zone to use in labeling dates. If None, defaults to rcParam timezone.

xdate [bool, optional, default: True] If True, the x-axis will be interpreted as Matplotlib dates.

ydate [bool, optional, default: False] If True, the y-axis will be interpreted as Matplotlib dates.

Returns

lines A list of Line2D objects representing the plotted data.

Other Parameters

**kwargs Keyword arguments control the Line2D properties:

**See also:**

- matplotlib.dates Helper functions on dates.
- matplotlib.dates.date2num Convert dates to num.
- matplotlib.dates.num2date Convert num to dates.
- matplotlib.dates.drange Create an equally spaced sequence of dates.

**Notes**

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to `plot_date`. `plot_date` will set the default tick locator to `AutoDateLocator` (if the tick locator is not already set to a `DateLocator` instance) and the default tick formatter to `AutoDateFormatter` (if the tick formatter is not already set to a `DateFormatter` instance).

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All arguments with the following names: ‘x’, ‘y’.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Examples using** matplotlib.axes.Axes.plot_date

- sphx_glr_gallery_ticks_and_spines_date_demo_convert.py
**Axes.step**

```python
Axes.step(self, x, y, *args, where='pre', data=None, **kwargs)
```

Make a step plot.

Call signatures:

```python
step(x, y, [fmt], *, data=None, where='pre', **kwargs)
step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)
```

This is just a thin wrapper around :func:`plot` which changes some formatting options. Most of the concepts and parameters of plot can be used here as well.

**Parameters**

- **x** [array_like] 1-D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.
- **y** [array_like] 1-D sequence of y levels.
- **fmt** [str, optional] A format string, e.g. ‘g’ for a green line. See :func:`plot` for a more detailed description.
  
  Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument *linestyle* instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.
- **data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.
- **where** [‘pre’, ‘post’, ‘mid’], optional, default ‘pre’ Define where the steps should be placed:
  
  - ‘pre’: The y value is continued constantly to the left from every x position, i.e. the interval \((x[i-1], x[i])\] has the value \(y[i]\).
  
  - ‘post’: The y value is continued constantly to the right from every x position, i.e. the interval \([x[i], x[i+1))\] has the value \(y[i]\).
  
  - ‘mid’: Steps occur half-way between the x positions.

**Returns**

- **lines** A list of :class:`Line2D` objects representing the plotted data.

**Other Parameters**

- ****kwargs Additional parameters are the same as those for :func:`plot`.

**Notes**

**Examples using matplotlib.axes.Axes.step**

- sphx_glr_gallery_lines_bars_and_markers_step_demo.py
Axes.loglog(self, *args, **kwargs)

Make a plot with log scaling on both the x and y axis.

Call signatures:

```python
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes both the x-axis and the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters `basex`, `subsx` and `nonposx` control the x-axis properties. They are just forwarded to `Axes.set_xscale`.

Parameters

- **basex**, `basey` [scalar, optional, default 10] Base of the x/y logarithm.
- **subsx**, `subsy` [sequence, optional] The location of the minor x/y ticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale`/`Axes.set_yscale` for details.
- **nonposx**, `nonposy` [{‘mask’, ‘clip’}, optional, default ‘mask’] Non-positive values in x or y can be masked as invalid, or clipped to a very small positive number.

Returns

- **lines** A list of `Line2D` objects representing the plotted data.

Other Parameters

- **kwargs** All parameters supported by `plot`.

Examples using `matplotlib.axes.Axes.loglog`

- `sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py`
- `sphx_glr_gallery_scales_log_demo.py`

Axes.semilogx(self, *args, **kwargs)

Make a plot with log scaling on the x axis.

Call signatures:

```python
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the x-axis to log scaling. All of the concepts and parameters of plot can be used here as well.
The additional parameters `basex`, `subsx` and `nonposx` control the x-axis properties. They are just forwarded to `Axes.set_xscale`.

**Parameters**

- `basex` [scalar, optional, default 10] Base of the x logarithm.
- `subsx` [array_like, optional] The location of the minor xticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale` for details.
- `nonposx` [{'mask', 'clip'}, optional, default 'mask'] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

**Returns**

- `lines` A list of `Line2D` objects representing the plotted data.

**Other Parameters**

- `**kwargs` All parameters supported by `plot`.

**Examples using matplotlib.axes.Axes.semilogx**

- sphx_glr_gallery_scales_log_demo.py
- sphx_glr_gallery_scales_log_test.py

**matplotlib.axes.Axes.semilogy**

`Axes.semilogy(self, *args, **kwargs)`

Make a plot with log scaling on the y axis.

Call signatures:

```python
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters `basey`, `subsy` and `nonposy` control the y-axis properties. They are just forwarded to `Axes.set_yscale`.

**Parameters**

- `basey` [scalar, optional, default 10] Base of the y logarithm.
- `subsy` [array_like, optional] The location of the minor yticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_yscale` for details.
- `nonposy` [{'mask', 'clip'}, optional, default 'mask'] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

**Returns**

- `lines` A list of `Line2D` objects representing the plotted data.

**Other Parameters**
**kwargs All parameters supported by plot.

Examples using matplotlib.axes.Axes.semilogy

- sphx_glr_gallery_scales_log_demo.py
- sphx_glr_gallery_specialty_plots_skewt.py

matplotlib.axes.Axes.fill_between

Axes.fill_between(self, x, y1, y2=0, where=None, interpolate=False, step=None, *, data=None, **kwargs)

Fill the area between two horizontal curves.

The curves are defined by the points (x, y1) and (x, y2). This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using where.

By default, the edges connect the given points directly. Use step if the filling should be a step function, i.e. constant in between x.

Parameters

x [array (length N)] The x coordinates of the nodes defining the curves.

y1 [array (length N) or scalar] The y coordinates of the nodes defining the first curve.

y2 [array (length N) or scalar, optional, default: 0] The y coordinates of the nodes defining the second curve.

where [array of bool (length N), optional, default: None] Define where to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates x[where]. More precisely, fill between x[i] and x[i+1] if where[i] and where[i+1]. Note that this definition implies that an isolated True value between two False values in where will not result in filling. Both sides of the True position remain unfilled due to the adjacent False values.

interpolate [bool, optional] This option is only relevant if where is used and the two curves are crossing each other.

Semantically, where is often used for y1 > y2 or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the x array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting interpolate to True will calculate the actual intersection point and extend the filled region up to this point.

step [{‘pre’, ‘post’, ‘mid’}, optional] Define step if the filling should be a step function, i.e. constant in between x. The value determines where the step will occur:

- ‘pre’: The y value is continued constantly to the left from every x position, i.e. the interval (x[i-1], x[i]) has the value y[i].
- 'post': The y value is continued constantly to the right from every x position, i.e. the interval \( [x[i], x[i+1]) \) has the value \( y[i] \).

- 'mid': Steps occur half-way between the x positions.

**Returns**

\texttt{PolyCollection}  A \texttt{PolyCollection} containing the plotted polygons.

**Other Parameters**

**kwargs  All other keyword arguments are passed on to \texttt{PolyCollection}.

They control the \texttt{Polygon} properties:

<table>

- sphx_glr_gallery_lines_bars_and_markers_filled_step.py
- sphx_glr_gallery_pyplots_whats_new_98_4_fill_between.py
- sphx_glr_gallery_recipes_fill_between_alpha.py

matplotlib.axes.Axes.fill_betweenx

Axes.fill_betweenx(self, y, x1, x2=0, where=None, step=None, interpolate=False, *, data=None, **kwargs)

Fill the area between two vertical curves.

The curves are defined by the points (x1, y) and (x2, y). This creates one or multiple polygons describing the filled area.

You may exclude some vertical sections from filling using where.

By default, the edges connect the given points directly. Use step if the filling should be a step function, i.e. constant in between y.

Parameters

y  [array (length N)] The y coordinates of the nodes defining the curves.

x1  [array (length N) or scalar] The x coordinates of the nodes defining the first curve.

x2  [array (length N) or scalar, optional, default: 0] The x coordinates of the nodes defining the second curve.

where  [array of bool (length N), optional, default: None] Define where to exclude some vertical regions from being filled. The filled regions are defined by the coordinates y[where]. More precisely, fill between y[i] and y[i+1] if where[i] and where[i+1]. Note that this definition implies that an isolated True value between two False values in where will not result in filling. Both sides of the True position remain unfilled due to the adjacent False values.
**interpolate** [bool, optional] This option is only relevant if where is used and the two curves are crossing each other.

Semantically, where is often used for \(x_1 > x_2\) or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the \(y\) array. Such a polygon cannot describe the above semantics close to the intersection. The \(y\)-sections containing the intersection are simply clipped.

Setting interpolate to True will calculate the actual intersection point and extend the filled region up to this point.

**step** [{‘pre’, ‘post’, ‘mid’}, optional] Define step if the filling should be a step function, i.e. constant in between \(y\). The value determines where the step will occur:

- ‘pre’: The \(y\) value is continued constantly to the left from every \(x\) position, i.e. the interval \((x[i-1], x[i])\] has the value \(y[i]\).
- ‘post’: The \(y\) value is continued constantly to the right from every \(x\) position, i.e. the interval \([x[i], x[i+1)]\) has the value \(y[i]\).
- ‘mid’: Steps occur half-way between the \(x\) positions.

**Returns**

*PolyCollection* A *PolyCollection* containing the plotted polygons.

**Other Parameters**

**kwargs** All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

<table>

*fill_between* Fill between two sets of y-values.

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All arguments with the following names: `where`, `x1`, `x2`, `y`.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

Examples using `matplotlib.axes.Axes.fill_betweenx`

- sphx_glr_gallery_lines_bars_and_markers_fill_betweenx_demo.py
- sphx_glr_gallery_lines_bars_and_markers_filled_step.py

`matplotlib.axes.Axes.bar`

`Axes.bar(self, x, height, width=0.8, bottom=None, *, align='center', data=None, **kwargs)`

Make a bar plot.

The bars are positioned at `x` with the given `alignment`. Their dimensions are given by `width` and `height`. The vertical baseline is `bottom` (default 0).

Each of `x`, `height`, `width`, and `bottom` may either be a scalar applying to all bars, or it may be a sequence of length N providing a separate value for each bar.

Parameters
x [sequence of scalars] The x coordinates of the bars. See also align for the alignment of the bars to the coordinates.

height [scalar or sequence of scalars] The height(s) of the bars.

width [scalar or array-like, optional] The width(s) of the bars (default: 0.8).

bottom [scalar or array-like, optional] The y coordinate(s) of the bars bases (default: 0).

align [{‘center’, ‘edge’}, optional, default: ‘center’] Alignment of the bars to the x coordinates:
• ‘center’: Center the base on the x positions.
• ‘edge’: Align the left edges of the bars with the x positions.

To align the bars on the right edge pass a negative width and align=’edge’.

Returns

container [BarContainer] Container with all the bars and optionally error-bars.

Other Parameters

color [scalar or array-like, optional] The colors of the bar faces.

edgecolor [scalar or array-like, optional] The colors of the bar edges.

linewidth [scalar or array-like, optional] Width of the bar edge(s). If 0, don’t draw edges.

tick_label [string or array-like, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

xerr, yerr [scalar or array-like of shape(N,) or shape(2,N), optional] If not None, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:
• scalar: symmetric +/- values for all bars
• shape(N,): symmetric +/- values for each bar
• shape(2,N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
• None: No errorbar. (Default)

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

ecolor [scalar or array-like, optional, default: ‘black’] The line color of the errorbars.

capsizesize [scalar, optional] The length of the error bar caps in points. Default: None, which will take the value from rcParams["errorbar.capsize"] (default: 0.0).

error_kw [dict, optional] Dictionary of kwargs to be passed to the errorbar method. Values of ecolor or capsizesize defined here take precedence over the independent kwargs.

log [bool, optional, default: False] If True, set the y-axis to be log scale.
**orientation** [{‘vertical’, ‘horizontal’}, optional] *This is for internal use only.*

Please use *barh* for horizontal bar plots. Default: ‘vertical’.

**See also:**

*barh* Plot a horizontal bar plot.

**Notes**

The optional arguments *color*, *edgecolor*, *linewidth*, *xerr*, and *yerr* can be either scalars or sequences of length equal to the number of bars. This enables you to use *bar* as the basis for stacked bar charts, or candlestick plots. Detail: *xerr* and *yerr* are passed directly to *errorbar()* , so they can also have shape 2x*N* for independent specification of lower and upper errors.

Other optional kwargs:

matplotlib.axes.Axes.barh

Axes.barh(self, y, width, height=0.8, left=None, *, align='center', **kwargs)

Make a horizontal bar plot.

The bars are positioned at y with the given alignment. Their dimensions are given by width and height. The horizontal baseline is left (default 0).

Each of y, width, height, and left may either be a scalar applying to all bars, or it may be a sequence of length N providing a separate value for each bar.

Parameters

- y [scalar or array-like] The y coordinates of the bars. See also align for the alignment of the bars to the coordinates.
- width [scalar or array-like] The width(s) of the bars.
- height [sequence of scalars, optional, default: 0.8] The heights of the bars.
- left [sequence of scalars] The x coordinates of the left sides of the bars (default: 0).
- align [{‘center’, ‘edge’}, optional, default: ‘center’] Alignment of the base to the y coordinates*:
  - ‘center’: Center the bars on the y positions.
• ‘edge’: Align the bottom edges of the bars with the \( y \) positions. To align the bars on the top edge pass a negative \( \text{height} \) and \( \text{align} = \text{'edge'} \).

Returns

- \text{container} [BarContainer] Container with all the bars and optionally error-bars.

Other Parameters

- \text{color} [scalar or array-like, optional] The colors of the bar faces.
- \text{edgecolor} [scalar or array-like, optional] The colors of the bar edges.
- \text{linewidth} [scalar or array-like, optional] Width of the bar edge(s). If 0, don’t draw edges.
- \text{tick_label} [string or array-like, optional] The tick labels of the bars. Default: None (Use default numeric labels.)
- \text{xerr}, \text{yerr} [scalar or array-like of shape(\( N \)) or shape(2,\( N \)), optional] If not \text{None}, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:
  
  - scalar: symmetric +/- values for all bars
  - shape(\( N \)): symmetric +/- values for each bar
  - \text{shape(2,\( N \))}: \text{Separate - and + values for each bar. First row} contains the lower errors, the second row contains the upper errors.
  - \text{None}: No errorbar. (default)

See /gallery/statistics/errorbar_features for an example on the usage of \text{xerr} and \text{yerr}.

- \text{ecolor} [scalar or array-like, optional, default: ‘black’] The line color of the errorbars.
- \text{capsize} [scalar, optional] The length of the error bar caps in points. Default: None, which will take the value from \text{rcParams["errorbar.capsize"]} (default: 0.0).
- \text{error_kw} [dict, optional] Dictionary of kwargs to be passed to the \text{errorbar} method. Values of \text{ecolor} or \text{capsize} defined here take precedence over the independent kwargs.
- \text{log} [bool, optional, default: False] If True, set the x-axis to be log scale.

See also:

- \text{bar} Plot a vertical bar plot.

Notes

The optional arguments \text{color}, \text{edgecolor}, \text{linewidth}, \text{xerr}, and \text{yerr} can be either scalars or sequences of length equal to the number of bars. This enables you to use bar as the basis for stacked bar charts, or candlestick plots. Detail: \text{xerr} and \text{yerr} are passed directly to \text{errorbar()}, so they can also have shape 2x\( N \) for independent specification of lower and upper errors.

Other optional kwargs:

**Examples using** matplotlib.axes.Axes.barh

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_horizontal_barchart_distribution.py
- sphx_glr_gallery_statistics_multiple_histograms_side_by_side.py
- *The Lifecycle of a Plot*

**matplotlib.axes.Axes.stem**

```python
Axes.stem(self, *args, linefmt=None, markerfmt=None, basefmt=None, bottom=0, label=None, use_line_collection=False, data=None)
```

Create a stem plot.

A stem plot plots vertical lines at each \(x\) location from the baseline to \(y\), and places a marker there.
Call signature:

\[
\text{stem(} \{x,\} \ y, \ \text{linefmt=}\text{None}, \ \text{markerfmt=}\text{None}, \ \text{basefmt=}\text{None})
\]

The x-positions are optional. The formats may be provided either as positional or as keyword-arguments.

**Parameters**

- **x** [array-like, optional] The x-positions of the stems. Default: (0, 1, ..., len(y) - 1).
- **y** [array-like] The y-values of the stem heads.
- **linefmt** [str, optional] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

```
<table>
<thead>
<tr>
<th>Character</th>
<th>Line Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.'</td>
<td>dash-dot line</td>
</tr>
<tr>
<td>':'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>
```

Default: 'C0-', i.e. solid line with the first color of the color cycle.

Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

- **markerfmt** [str, optional] A string defining the properties of the markers at the stem heads. Default: 'C0o', i.e. filled circles with the first color of the color cycle.
- **basefmt** [str, optional] A format string defining the properties of the baseline. Default: 'C3-' ('C2-' in classic mode).
- **bottom** [float, optional, default: 0] The y-position of the baseline.
- **label** [str, optional, default: None] The label to use for the stems in legends.
- **use_line_collection** [bool, optional, default: False] If True, store and plot the stem lines as a `LineCollection` instead of individual lines. This significantly increases performance, and will become the default option in Matplotlib 3.3. If False, defaults to the old behavior of using a list of `Line2D` objects.

**Returns**

- **container** [`StemContainer`] The container may be treated like a tuple (`markerline`, `stemlines`, `baseline`)

**Notes**

**See also:**

The MATLAB function `stem` which inspired this method.
**Note:** In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:  
- All positional and all keyword arguments.

Objects passed as **data** must support item access (**data[<arg>]**) and membership test (**<arg> in data**).

### Examples using matplotlib.axes.Axes.stem

- sphx_glr_gallery_lines_bars_and_markers_stem_plot.py
- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_text_labels_and_annotations_legend_demo.py

### matplotlib.axes.Axes.eventplot

```
Axes.eventplot(self, positions, orientation='horizontal', lineoffsets=1, linelengths=1, linewidths=None, colors=None, linestyles='solid', *, data=None, **kwargs)
```

Plot identical parallel lines at the given positions.

**positions** should be a 1D or 2D array-like object, with each row corresponding to a row or column of lines.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

#### Parameters

- **positions** [1D or 2D array-like object] Each value is an event. If **positions** is a 2D array-like, each row corresponds to a row or a column of lines (depending on the **orientation** parameter).

- **orientation** [{‘horizontal’, ‘vertical’}, optional] Controls the direction of the event collections:
  - ‘horizontal’ : the lines are arranged horizontally in rows, and are vertical.
  - ‘vertical’ : the lines are arranged vertically in columns, and are horizontal.

- **lineoffsets** [scalar or sequence of scalars, optional, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to **orientation**.

- **linelengths** [scalar or sequence of scalars, optional, default: 1] The total height of the lines (i.e. the lines stretches from lineoffset - linelength/2 to lineoffset + linelength/2).
lineweights [scalar, scalar sequence or None, optional, default: None] The line width(s) of the event lines, in points. If it is None, defaults to its rcParams setting.

colors [color, sequence of colors or None, optional, default: None] The color(s) of the event lines. If it is None, defaults to its rcParams setting.

linestyles [str or tuple or a sequence of such values, optional] Default is 'solid'. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '–', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where onoffseq is an even length tuple of on and off ink in points.

**kwargs [optional] Other keyword arguments are line collection properties. See LineCollection for a list of the valid properties.

**Returns**

list [A list of EventCollection objects.] Contains the EventCollection that were added.

**Notes**

For linelengths, lineweights, colors, and linestyles, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as positions, and each value will be applied to the corresponding row of the array.

**Examples**

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

matplotlib.axes.Axes.pie

Axes.pie(self, x, explode=None, labels=None, colors=None, autopct=None, pctdistance=0.6, shadow=False, labeldistance=1.1, startangle=None, radius=None, counterclock=True, wedgeprops=None, textprops=None, center=(0, 0), frame=False, rotatelabels=False, *, data=None)

Plot a pie chart.

Make a pie chart of array x. The fractional area of each wedge is given by x/sum(x). If sum(x) < 1, then the values of x give the fractional area directly and the array will not be normalized. The resulting pie will have an empty wedge of size 1 - sum(x).

The wedges are plotted counterclockwise, by default starting from the x-axis.
Parameters

x [array-like] The wedge sizes.

explode [array-like, optional, default: None] If not None, is a len(x) array which specifies the fraction of the radius with which to offset each wedge.

labels [list, optional, default: None] A sequence of strings providing the labels for each wedge

colors [array-like, optional, default: None] A sequence of matplotlib color args through which the pie chart will cycle. If None, will use the colors in the currently active cycle.

autopct [None (default), string, or function, optional] If not None, is a string or function used to label the wedges with their numeric value. The label will be placed inside the wedge. If it is a format string, the label will be fmt%pct. If it is a function, it will be called.

cdctdistance [float, optional, default: 0.6] The ratio between the center of each pie slice and the start of the text generated by autopct. Ignored if autopct is None.

shadow [bool, optional, default: False] Draw a shadow beneath the pie.

labeldistance [float or None, optional, default: 1.1] The radial distance at which the pie labels are drawn. If set to None, label are not drawn, but are stored for use in legend()
**startangle** [float, optional, default: None] If not None, rotates the start of the pie chart by angle degrees counterclockwise from the x-axis.

**radius** [float, optional, default: None] The radius of the pie, if radius is None it will be set to 1.

**counterclock** [bool, optional, default: True] Specify fractions direction, clockwise or counterclockwise.

**wedgeprops** [dict, optional, default: None] Dict of arguments passed to the wedge objects making the pie. For example, you can pass in wedgeprops = {'linewidth': 3} to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default clip_on=False.

**textprops** [dict, optional, default: None] Dict of arguments to pass to the text objects.

**center** [list of float, optional, default: (0, 0)] Center position of the chart. Takes value (0, 0) or is a sequence of 2 scalars.

**frame** [bool, optional, default: False] Plot axes frame with the chart if true.

**rotatelabels** [bool, optional, default: False] Rotate each label to the angle of the corresponding slice if true.

**Returns**

- **patches** [list] A sequence of `matplotlib.patches.Wedge` instances
- **texts** [list] A list of the label `matplotlib.text.Text` instances.
- **autotexts** [list] A list of `Text` instances for the numeric labels. This will only be returned if the parameter autopct is not None.

**Notes**

The pie chart will probably look best if the figure and axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to “equal”. The axes aspect ratio can be controlled with `Axes.set_aspect`.

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘colors’, ‘explode’, ‘labels’, ‘x’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

**Examples using matplotlib.axes.Axes.pie**

- sphx_glr_gallery_pie_and_polar_charts_pie_features.py
- sphx_glr_gallery_pie_and_polar_charts_pie_demo2.py
- sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py
Axes.stackplot

Axes.stackplot(axes, x, *args, labels=(), colors=None, baseline='zero', data=None, **kwargs)

Draw a stacked area plot.

Parameters

- **x** [1d array of dimension N]
- **y** [2d array (dimension MxN), or sequence of 1d arrays (each dimension 1xN)] The data is assumed to be unstacked. Each of the following calls is legal:
  - `stackplot(x, y) # where y is MxN`
  - `stackplot(x, y1, y2, y3, y4) # where y1, y2, y3, y4, are all 1xNm`

- **baseline** [{‘zero’, ‘sym’, ‘wiggle’, ‘weighted_wiggle’}] Method used to calculate the baseline:
  - ‘zero’: Constant zero baseline, i.e. a simple stacked plot.
  - ‘sym’: Symmetric around zero and is sometimes called ‘ThemeRiver’.
  - ‘wiggle’: Minimizes the sum of the squared slopes.
  - ‘weighted_wiggle’: Does the same but weights to account for size of each layer. It is also called ‘Streamgraph’-layout. More details can be found at http://leebyron.com/streamgraph/.

- **labels** [Length N sequence of strings] Labels to assign to each data series.

- **colors** [Length N sequence of colors] A list or tuple of colors. These will be cycled through and used to colour the stacked areas.

- **kwargs** All other keyword arguments are passed to Axes.fill_between()

Returns

- **list** [list of PolyCollection] A list of PolyCollection instances, one for each element in the stacked area plot.

Notes

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All positional and all keyword arguments.
Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Examples using `matplotlib.axes.Axes.stackplot`**

- sphx_glr_gallery_lines_bars_and_markers_stackplot_demo.py

`matplotlib.axes.Axes.broken_barh`

`Axes.broken_barh(self, xranges, yrange, *, data=None, **kwargs)`

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of `xranges`. All rectangles have the same vertical position and size defined by `yrange`.

This is a convenience function for instantiating a `BrokenBarHCollection`, adding it to the axes and autoscaling the view.

**Parameters**

- `xranges` [sequence of tuples `((xmin, xwidth))`] The x-positions and extends of the rectangles. For each tuple `((xmin, xwidth))` a rectangle is drawn from `xmin` to `xmin + xwidth`.

- `yranges` [(`ymin, ymax`)] The y-position and extend for all the rectangles.

**Returns**

- `collection` [A `BrokenBarHCollection`]

**Other Parameters**

- `**kwargs` [`BrokenBarHCollection` properties] Each `kwarg` can be either a single argument applying to all rectangles, e.g.:

  ```
  facecolors='black'
  ```

  or a sequence of arguments over which is cycled, e.g.:

  ```
  facecolors=('black', 'blue')
  ```

  would create interleaving black and blue rectangles.

### Notes

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All positional and all keyword arguments.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

### Examples using matplotlib.axes.Axes.broken_barh

- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py
Axes.vlines(self, x, y1, y2, colors='k', linestyles='solid', label='', *, data=None, **kwargs)
Plot vertical lines.
Plot vertical lines at each x from y1 to y2.

Parameters

- **x** [scalar or 1D array_like] x-indexes where to plot the lines.
- **y1, y2** [scalar or 1D array_like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.
- **colors** [array_like of colors, optional, default: 'k']
- **linestyles** [{‘solid’, ‘dashed’, ‘dashdot’, ‘dotted’}, optional]
- **label** [string, optional, default: '']

Returns

- **lines** [LineCollection]

Other Parameters

- **kwargs** [LineCollection properties.]

See also:

- hlines horizontal lines
- axvline vertical line across the axes

Notes

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘colors’, ‘x’, ‘y1’, ‘y2’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.axes.Axes.vlines

- sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py
- sphx_glr_gallery_statistics_customized_violin.py
Axes.hlines

Axes.hlines(self, y, xmin, xmax, colors='k', linestyles='solid', label='', *, data=None, **kwargs)
Plot horizontal lines at each y from xmin to xmax.

Parameters
- y [scalar or sequence of scalar] y-indexes where to plot the lines.
- xmin, xmax [scalar or 1D array_like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.
- colors [array_like of colors, optional, default: ‘k’]
- linestyles [{‘solid’, ‘dashed’, ‘dashdot’, ‘dotted’}, optional]
- label [string, optional, default: ']

Returns
- lines [LineCollection]

Other Parameters
- **kwargs [LineCollection properties.]

See also:
- vlines vertical lines
- axhline horizontal line across the axes

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:
  - All arguments with the following names: ‘colors’, ‘xmax’, ‘xmin’, ‘y’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.axes.Axes.hlines

- sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py
- sphx_glr_gallery_color_named_colors.py

Axes.fill

Axes.fill(self, *args, data=None, **kwargs)
Plot filled polygons.

Parameters
*args [sequence of x, y, [color]] Each polygon is defined by the lists of x and y positions of its nodes, optionally followed by a color specifier. See matplotlib.colors for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple x, y, [color] groups.

For example, each of the following is legal:

```
ax.fill(x, y)       # a polygon with default color
ax.fill(x, y, "b") # a blue polygon
ax.fill(x, y, x2, y2) # two polygons
ax.fill(x, y, "b", x2, y2, "r") # a blue and a red polygon
```

**data** [indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y, e.g.:

```
ax.fill("time", "signal",
        data={"time": [0, 1, 2], "signal": [0, 1, 0])
```

Returns

- a list of Polygon

Other Parameters

**kwargs [Polygon properties]

Notes

Use fill_between() if you would like to fill the region between two curves.

Examples using matplotlib.axes.Axes.fill

- sphx_glr_gallery_lines_bars_and_markers_fill.py
- sphx_glr_gallery_shapes_and_collections_hatch_demo.py
- sphx_glr_gallery_units_ellipse_with_units.py

Spans

<table>
<thead>
<tr>
<th>Axes.azhline</th>
<th>Add a horizontal line across the axis.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.azhspan</td>
<td>Add a horizontal span (rectangle) across the axis.</td>
</tr>
<tr>
<td>Axes.azvline</td>
<td>Add a vertical line across the axes.</td>
</tr>
<tr>
<td>Axes.azvspan</td>
<td>Add a vertical span (rectangle) across the axes.</td>
</tr>
</tbody>
</table>

matplotlib.axes.Axes.axhline

```
Axes.axhline(self, y=0, xmin=0, xmax=1, **kwargs)
Add a horizontal line across the axis.
```
### Parameters

- **y** [scalar, optional, default: 0] y position in data coordinates of the horizontal line.
- **xmin** [scalar, optional, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.
- **xmax** [scalar, optional, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

### Returns

- **line** [Line2D]

### Other Parameters

**kwargs Valid kwargs are Line2D properties, with the exception of ‘transform’:

<table>

**See also:**

- `hlines` Add horizontal lines in data coordinates.
- `axhspan` Add a horizontal span (rectangle) across the axis.

**Examples**

- draw a thick red hline at ‘y’ = 0 that spans the xrange:
  ```
  >>> axhline(linewidth=4, color='r')
  ```
- draw a default hline at ‘y’ = 1 that spans the xrange:
  ```
  >>> axhline(y=1)
  ```
- draw a default hline at ‘y’ = .5 that spans the middle half of the xrange:
  ```
  >>> axhline(y=.5, xmin=0.25, xmax=0.75)
  ```

**Examples using `matplotlib.axes.Axes.axhline`**

- sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py
- sphx_glr_gallery_lines_bars_and_markers_span_regions.py
- sphx_glr_gallery_statistics_confidence_ellipse.py
- sphx_glr_gallery_text_labels_and_annotations_usetex_baseline_test.py
- sphx_glr_gallery_color_color_cycle_default.py
- *Specifying Colors*

**`matplotlib.axes.Axes.axhspan`**

```python
Axes.axhspan(self, ymin, ymax, xmin=0, xmax=1, **kwargs)
```

Add a horizontal span (rectangle) across the axis.

Draw a horizontal span (rectangle) from `ymin` to `ymax`. With the default values of `xmin` = 0 and `xmax` = 1, this always spans the xrange, regardless of the xlim settings, even if you change them, e.g., with the `set_xlim()` command. That is, the horizontal extent is in axes coords: 0=left, 0.5=middle, 1.0=right but the y location is in data coordinates.
Parameters

**ymin** [float] Lower limit of the horizontal span in data units.

**ymax** [float] Upper limit of the horizontal span in data units.

**xmin** [float, optional, default: 0] Lower limit of the vertical span in axes (relative 0-1) units.

**xmax** [float, optional, default: 1] Upper limit of the vertical span in axes (relative 0-1) units.

Returns

**Polygon** *(Polygon)*

Other Parameters

**kwargs** *(Polygon properties.)*

**axvspan** Add a vertical span across the axes.
Axes.axvline

Add a vertical line across the axes.

**Parameters**

- **x** [scalar, optional, default: 0] x position in data coordinates of the vertical line.
- **ymin** [scalar, optional, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.
- **ymax** [scalar, optional, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

**Returns**

- **line** [Line2D]

**Other Parameters**

**kwargs Valid kwarg are Line2D properties, with the exception of 'transform':

- *The Lifecycle of a Plot*

**matplotlib.axes.Axes.axvspan**

```python
Axes.axvspan(self, xmin, xmax, ymin=0, ymax=1, **kwargs)
```

Add a vertical span (rectangle) across the axes.
Draw a vertical span (rectangle) from $x_{\text{min}}$ to $x_{\text{max}}$. With the default values of $y_{\text{min}} = 0$ and $y_{\text{max}} = 1$. This always spans the yrange, regardless of the ylim settings, even if you change them, e.g., with the `set_ylim()` command. That is, the vertical extent is in axes coords: 0=bottom, 0.5=middle, 1.0=top but the x location is in data coordinates.

**Parameters**

- **xmin** [scalar] Number indicating the first X-axis coordinate of the vertical span rectangle in data units.
- **xmax** [scalar] Number indicating the second X-axis coordinate of the vertical span rectangle in data units.
- **ymin** [scalar, optional] Number indicating the first Y-axis coordinate of the vertical span rectangle in relative Y-axis units (0-1). Default to 0.
- **ymax** [scalar, optional] Number indicating the second Y-axis coordinate of the vertical span rectangle in relative Y-axis units (0-1). Default to 1.

**Returns**

- **rectangle** [Polygon] Vertical span (rectangle) from $(x_{\text{min}}, y_{\text{min}})$ to $(x_{\text{max}}, y_{\text{max}})$.

**Other Parameters**

- ****kwargs** Optional parameters are properties of the class Polygon.

See also:

- **axhspan** Add a horizontal span across the axes.

**Examples**

Draw a vertical, green, translucent rectangle from $x = 1.25$ to $x = 1.55$ that spans the yrange of the axes.

```python
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

**Spectral**

</tr>
</tbody>
</table>

**matplotlib.axes.Axes.acorr**

```python
Axes.acorr(self, x, *, data=None, **kwargs)
```

Plot the autocorrelation of x.
Parameters

- \( x \) [array-like]

  - \textbf{detrend} [callable, optional, default: mlab.detrend_none] \( x \) is detrended by the \textit{detrend} callable. This must be a function \( x = \text{detrend}(x) \) accepting and returning an \texttt{numpy.array}. Default is no normalization.

- \textbf{normed} [bool, optional, default: True] If True, input vectors are normalised to unit length.

- \textbf{usevlines} [bool, optional, default: True] Determines the plot style.

  - If True, vertical lines are plotted from 0 to the \textit{acorr} value using \texttt{Axes.vlines}. Additionally, a horizontal line is plotted at \( y=0 \) using \texttt{Axes.axhline}.

  - If False, markers are plotted at the \textit{acorr} values using \texttt{Axes.plot}.

- \textbf{maxlags} [int, optional, default: 10] Number of lags to show. If None, will return all \( 2 \times \text{len}(x) - 1 \) lags.

Returns

- \textbf{lags} [array (length \( 2 \times \text{maxlags} + 1 \))] The lag vector.

- \textbf{c} [array (length \( 2 \times \text{maxlags} + 1 \))] The auto correlation vector.

- \textbf{line} [\texttt{LineCollection} or \texttt{Line2D}] \texttt{Artist} added to the axes of the correlation:

  - \texttt{LineCollection} if \textit{usevlines} is True.

  - \texttt{Line2D} if \textit{usevlines} is False.

- \textbf{b} [\texttt{Line2D} or None] Horizontal line at 0 if \textit{usevlines} is True None \textit{usevlines} is False.

Other Parameters

- \textbf{linestyle} [\texttt{Line2D} property, optional] The linestyle for plotting the data points. Only used if \textit{usevlines} is False.

- \textbf{marker} [str, optional, default: ‘o’] The marker for plotting the data points. Only used if \textit{usevlines} is False.

Notes

The cross correlation is performed with \texttt{numpy.correlate()} with \texttt{mode = "full"}.

\textbf{Note:} In addition to the above described arguments, this function can take a \textbf{data} keyword argument. If such a \textbf{data} argument is given, the following arguments are replaced by \textbf{data[<arg>]}:

- All arguments with the following names: ‘\( x \)’.

Objects passed as \textbf{data} must support item access (\texttt{data[<arg>]}) and membership test (\texttt{<arg> in data}).
Examples using `matplotlib.axes.Axes.acorr`

- `sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py`

`matplotlib.axes.Axes.angle_spectrum`

```
Axes.angle_spectrum(self, x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)
```

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of `x`. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

**Parameters**

- `x` [1-D array or sequence] Array or sequence containing the data.
- `Fs` [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.
- `window` [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- `sides` [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns onesided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.
- `pad_to` [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to the length of the input signal (i.e. no padding).
- `Fc` [int] The center frequency of `x` (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**Returns**

- `spectrum` [1-D array] The values for the angle spectrum in radians (real valued).
- `freqs` [1-D array] The frequencies corresponding to the elements in `spectrum`.
- `line` [a `Line2D` instance] The line created by this function.

**Other Parameters**

- `**kwargs` Keyword arguments control the `Line2D` properties:

**See also:**

- `magnitude_spectrum()` `angle_spectrum()` plots the magnitudes of the corresponding frequencies.
- `phase_spectrum()` `phase_spectrum()` plots the unwrapped version of this function.
- `specgram()` `specgram()` can plot the angle spectrum of segments within the signal in a colormap.
Notes

**Note:** In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'x'.

Objects passed as **data** must support item access (**data[<arg>]**) and membership test (**<arg> in data**).

---

**matplotlib.axes.Axes.coherence**

`Axes.coherence(self, x, y, NFFT=256, Fs=2, Fc=0, detrend=<function detrend_none at 0x7f0f90419700>, window=<function window_hanning at 0x7f0f904193a0>, noverlap=0, pad_to=None, sides='default', scale_by_freq=None, *, data=None, **kwargs)`

Plot the coherence between x and y. Coherence is the normalized cross spectral density:

\[ C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}} \]

**Parameters**

- **Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

- **window** [callable or ndarray] A function or a vector of length **NFFT**. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

- **sides** [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

- **pad_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from **NFFT**, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the **n** parameter in the call to fft(). The default is None, which sets **pad_to** equal to **NFFT**

- **NFFT** [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use **pad_to** for this instead.
**detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the `detrend` parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls `detrend_none`, ‘mean’ calls `detrend_mean`, ‘linear’ calls `detrend_linear`.

**scale_by_freq** [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap** [int] The number of points of overlap between blocks. The default value is 0 (no overlap).

**Fc** [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**Returns**

**Cxy** [1-D array] The coherence vector.

**freqs** [1-D array] The frequencies for the elements in Cxy.

**Other Parameters**

****kwargs** Keyword arguments control the `Line2D` properties:

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘x’, ‘y’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

References

matplotlib.axes.Axes.csd

Axes.csd(self, x, y, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)

Plot the cross-spectral density.

The cross spectral density $P_{xy}$ by Welch’s average periodogram method. The vectors x and y are divided into NFFT length segments. Each segment is detrended by function detrend and windowed by function window. noverlap gives the length of the overlap between segments. The product of the direct FFTs of x and y are averaged over each segment to compute $P_{xy}$, with a scaling to correct for power loss due to windowing.

If len(x) < NFFT or len(y) < NFFT, they will be zero padded to NFFT.

17.5. matplotlib.axes 929
Parameters

\(x, y\) [1-D arrays or sequences] Arrays or sequences containing the data.

\(Fs\) [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.

\(window\) [callable or ndarray] A function or a vector of length \(NFFT\). To create window vectors see \(\text{window}'\text{hanning}, \text{window}'\text{none}, \text{numpy}'\text{blackman}, \text{numpy}'\text{hamming}, \text{numpy}'\text{bartlett}, \text{scipy}'\text{signal}, \text{scipy}'\text{signal}'\text{get_window}, \text{etc.} The default is \(\text{window}'\text{hanning}\). If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

\(sides\) ['default', 'onesided', 'twosided'] Specifies which sides of the spectrum to return. Default gives the default behavior; which returns one-sided for real data and both for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

\(pad\_to\) [int] The number of points to which the data segment is padded when performing the FFT. This can be different from \(NFFT\), which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the \(n\) parameter in the call to \(\text{fft}()\). The default is None, which sets \(pad\_to\) equal to \(NFFT\).

\(NFFT\) [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use \(pad\_to\) for this instead.

\(\text{detrend}\) ['none', 'mean', 'linear'] or callable, default 'none'] The function applied to each segment before \(\text{fft}\)-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the \(\text{detrend}\) parameter is a vector, in Matplotlib it is a function. The \(\text{mlab}\) module defines \(\text{detrend}'\text{none}, \text{detrend}'\text{mean}, \text{and detrend}'\text{linear}, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls \(\text{detrend}'\text{none}\). 'mean' calls \(\text{detrend}'\text{mean}\). 'linear' calls \(\text{detrend}'\text{linear}\).

\(\text{scale\ by\ freq}\) [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz\(^{-1}\). This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

\(\text{nooverlap}\) [int] The number of points of overlap between segments. The default value is 0 (no overlap).

\(Fc\) [int] The center frequency of \(x\) (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

\(\text{return\ line}\) [bool] Whether to include the line object plotted in the returned values. Default is False.

Returns

\(Pxy\) [1-D array] The values for the cross spectrum \(P_{xy}\) before scaling (complex valued).
**freqs** [1-D array] The frequencies corresponding to the elements in \(P_{xy}\).

**line** [a Line2D instance] The line created by this function. Only returned if return_line is True.

**Other Parameters**

**kwargs** Keyword arguments control the Line2D properties:

**Warning** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: 'x', 'y'.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

**Examples using matplotlib.axes.Axes.csd**

- sphx_glr_gallery_lines_bars_and_markers_csd_demo.py

**matplotlib.axes.Axes.magnitude_spectrum**

`Axes.magnitude_spectrum(self, x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, scale=None, *, data=None, **kwargs)`

Plot the magnitude spectrum.

Compute the magnitude spectrum of $x$. Data is padded to a length of $pad_to$ and the windowing function $window$ is applied to the signal.

**Parameters**

- `x` [1-D array or sequence] Array or sequence containing the data.
- `Fs` [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- `window` [callable or ndarray] A function or a vector of length $NFFT$. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
sides [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

pad_to [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to the length of the input signal (i.e. no padding).

scale [{‘default’, ‘linear’, ‘dB’}] The scaling of the values in the spec. ‘linear’ is no scaling. ‘dB’ returns the values in dB scale, i.e., the dB amplitude (20 * log10). ‘default’ is ‘linear’.

Fc [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

spectrum [1-D array] The values for the magnitude spectrum before scaling (real valued).

freqs [1-D array] The frequencies corresponding to the elements in spectrum.

line [a Line2D instance] The line created by this function.

See also:

- `psd()` plots the power spectral density.
- `angle_spectrum()` plots the angles of the corresponding frequencies.
- `phase_spectrum()` plots the phase (unwrapped angle) of the corresponding frequencies.
- `specgram()` can plot the magnitude spectrum of segments within the signal in a colormap.

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]:`

- All arguments with the following names: 'x'.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

```python
Axes.phase_spectrum(self, x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)
```

Plot the phase spectrum.
Compute the phase spectrum (unwrapped angle spectrum) of \(x\). Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

**Parameters**

- **x** [1-D array or sequence] Array or sequence containing the data
- **Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit. The default value is 2.
- **window** [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides** [{'default', 'onesided', 'twosided'}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **pad_to** [int] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to the length of the input signal (i.e. no padding).
- **Fc** [int] The center frequency of \(x\) (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

**Returns**

- **spectrum** [1-D array] The values for the phase spectrum in radians (real valued).
- **freqs** [1-D array] The frequencies corresponding to the elements in `spectrum`.
- **line** [a `Line2D` instance] The line created by this function.

**Other Parameters**

Notes

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: ‘x’.
Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**matplotlib.axes.Axes.psd**

`Axes.psd(self, x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)`

Plot the power spectral density.

The power spectral density $P_{xx}$ by Welch's average periodogram method. The vector $x$ is divided into $NFFT$ length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The $|\text{fft}(i)|^2$ of each segment $i$ are averaged to compute $P_{xx}$, with a scaling to correct for power loss due to windowing.

If len($x$) < $NFFT$, it will be zero padded to $NFFT$.

**Parameters**

- **x** [1-D array or sequence] Array or sequence containing the data
- **Fs** [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- **window** [callable or ndarray] A function or a vector of length $NFFT$. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- **sides** [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- **noverlap** [int] The number of points used in each block for the FFT. This can be different from $NFFT$, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the $n$ parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to $NFFT$
- **pad_to** [int] The number of points to which the data segment is padded when performing the FFT. This can be different from $NFFT$, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the $n$ parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to $NFFT$
- **NFFT** [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should NOT be used to get zero padding, or the scaling of the result will be incorrect. Use `pad_to` for this instead.
- **detrend** [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before `fft`-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the `detrend` parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as
well. You can also use a string to choose one of the functions: ‘none’ calls detrend_none, ‘mean’ calls detrend_mean, ‘linear’ calls detrend_linear.

scale_by_freq [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap [int] The number of points of overlap between segments. The default value is 0 (no overlap).

Fc [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

return_line [bool] Whether to include the line object plotted in the returned values. Default is False.

**Returns**

Pxx [1-D array] The values for the power spectrum $P_{xx}$ before scaling (real valued).

freqs [1-D array] The frequencies corresponding to the elements in Pxx.

line [a Line2D instance] The line created by this function. Only returned if return_line is True.

**Other Parameters**

**kwargs Keyword arguments control the Line2D properties:

**See also:**

*specgram()* *specgram()* differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

*magnitude_spectrum()* *magnitude_spectrum()* plots the magnitude spectrum.

*csd()* *csd()* plots the spectral density between two signals.

**Notes**

For plotting, the power is plotted as $10 \log_{10}(P_{xx})$ for decibels, though $P_{xx}$ itself is returned.

**References**

**Note:** In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘x’.

Objects passed as **data** must support item access (**data[<arg>]**) and membership test (**<arg> in data**).
Examples using `matplotlib.axes.Axes.psd`:

- `sphx_glr_gallery_lines_bars_and_markers_psd_demo.py`

`matplotlib.axes.Axes.specgram`:

```python
Axes.specgram(self, x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, cmap=None, xextent=None, pad_to=None, sides=None, scale_by_freq=None, mode=None, scale=None, vmin=None, vmax=None, *, data=None, **kwargs)
```

Plot a spectrogram.

Compute and plot a spectrogram of data in `x`. Data are split into `NFFT` length segments and the spectrum of each section is computed. The windowing function `window` is applied to each segment, and the amount of overlap of each segment is specified with `noverlap`. The spectrogram is plotted as a colormap (using `imshow`).

**Parameters**

- `x` [1-D array or sequence] Array or sequence containing the data.
- `Fs` [scalar] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit. The default value is 2.
- `window` [callable or ndarray] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. The default is `window_hanning`. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.
- `sides` [{‘default’, ‘onesided’, ‘twosided’}] Specifies which sides of the spectrum to return. Default gives the default behavior, which returns one-sided for real data and both for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.
- `pad_to` [int] The number of points to which the data segment is padded when performing the FFT. This can be different from `NFFT`, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to `NFFT`
- `NFFT` [int] The number of data points used in each block for the FFT. A power 2 is most efficient. The default value is 256. This should \textit{NOT} be used to get zero padding, or the scaling of the result will be incorrect. Use `pad_to` for this instead.
- `detrend` [{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before `fft`-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the `detrend` parameter is a vector, in Matplotlib it is a function. The `mlab` module defines `detrend_none`, `detrend_mean`, and `detrend_linear`, but you can use a custom function as well. You can also use a string to choose one of the functions: ‘none’ calls `detrend_none`, ‘mean’ calls `detrend_mean`, ‘linear’ calls `detrend_linear`.
scale_by_freq [bool, optional] Specifies whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

mode [{‘default’, ‘psd’, ‘magnitude’, ‘angle’, ‘phase’}] What sort of spectrum to use. Default is ‘psd’, which takes the power spectral density. ‘magnitude’ returns the magnitude spectrum. ‘angle’ returns the phase spectrum without unwrapping. ‘phase’ returns the phase spectrum with unwrapping.

noverlap [int] The number of points of overlap between blocks. The default value is 128.

scale [{‘default’, ‘linear’, ‘dB’}] The scaling of the values in the spec. ‘linear’ is no scaling. ‘dB’ returns the values in dB scale. When mode is ‘psd’, this is dB power (10 * log10). Otherwise this is dB amplitude (20 * log10). ‘default’ is ‘dB’ if mode is ‘psd’ or ‘magnitude’ and ‘linear’ otherwise. This must be ‘linear’ if mode is ‘angle’ or ‘phase’.

Fc [int] The center frequency of x (defaults to 0), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

cmap A matplotlib.colors.Colormap instance; if None, use default determined by rc

xextent [None or (xmin, xmax)] The image extent along the x-axis. The default sets xmin to the left border of the first bin (spectrum column) and xmax to the right border of the last bin. Note that for noverlap>0 the width of the bins is smaller than those of the segments.

**kwargs Additional kwargs are passed on to imshow which makes the specgram image.

Returns

spectrum [2-D array] Columns are the periodograms of successive segments.

freqs [1-D array] The frequencies corresponding to the rows in spectrum.

t [1-D array] The times corresponding to midpoints of segments (i.e., the columns in spectrum).

im [instance of class AxesImage] The image created by imshow containing the spectrogram

See also:

psd() psd() differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

magnitude_spectrum() A single spectrum, similar to having a single segment when mode is ‘magnitude’. Plots a line instead of a colormap.

angle_spectrum() A single spectrum, similar to having a single segment when mode is ‘angle’. Plots a line instead of a colormap.

phase_spectrum() A single spectrum, similar to having a single segment when mode is ‘phase’. Plots a line instead of a colormap.
Notes

The parameters *detrend* and *scale_by_freq* do only apply when *mode* is set to 'psd'.

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: 'x'.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.axes.Axes.specgram

- sphx_glr_gallery_images_contours_and_fields_specgram_demo.py

matplotlib.axes.Axes.xcorr

```python
Axes.xcorr(self, x, y, normed=True, detrend=<function detrend_none at 0x7f0f90419700>, usevlines=True, maxlags=10, *, data=None, **kwargs)
```

Plot the cross correlation between *x* and *y*.

The correlation with lag *k* is defined as $\sum_n x[n+k]\cdot y^*[n]$, where $y^*$ is the complex conjugate of *y*.

**Parameters**

- **x** [array-like of length *n*]
- **y** [array-like of length *n*]
- **detrend** [callable, optional, default: mlab.detrend_none] *x* and *y* are detrended by the detrend callable. This must be a function *x = detrend(x)* accepting and returning an numpy.array. Default is no normalization.
- **normed** [bool, optional, default: True] If True, input vectors are normalised to unit length.
- **usevlines** [bool, optional, default: True] Determines the plot style.
  - If True, vertical lines are plotted from 0 to the xcorr value using Axes.vlines. Additionally, a horizontal line is plotted at *y=0* using Axes.axhline.
  - If False, markers are plotted at the xcorr values using Axes.plot.
- **maxlags** [int, optional, default: 10] Number of lags to show. If None, will return all $2 \cdot \text{len}(x) - 1$ lags.

**Returns**

- **lags** [array (length 2*maxlags+1)] The lag vector.
- **c** [array (length 2*maxlags+1)] The auto correlation vector.
- **line** [LineCollection or Line2D] Artist added to the axes of the correlation:
• \texttt{LineCollection} if \texttt{usevlines} is True.
• \texttt{Line2D} if \texttt{usevlines} is False.

\textbf{b} [\texttt{Line2D} or None] Horizontal line at 0 if \texttt{usevlines} is True None \texttt{usevlines} is False.

\textbf{Other Parameters}

\textbf{linestyle} [\texttt{Line2D} property, optional] The linestyle for plotting the data points. Only used if \texttt{usevlines} is False.

\textbf{marker} [str, optional, default: 'o'] The marker for plotting the data points. Only used if \texttt{usevlines} is False.

\textbf{Notes}

The cross correlation is performed with \texttt{numpy.correlate()} with \texttt{mode = "full"}.

\textbf{Note:} In addition to the above described arguments, this function can take a \texttt{data} keyword argument. If such a \texttt{data} argument is given, the following arguments are replaced by \texttt{data[<arg>]}:

• All arguments with the following names: 'x', 'y'.

Objects passed as \texttt{data} must support item access (\texttt{data[<arg>]}) and membership test (\texttt{<arg> in data}).

\textbf{Examples using} \texttt{matplotlib.axes.Axes.xcorr}

• \texttt{sphx\_glr\_gallery\_lines\_bars\_and\_markers\_xcorr\_acorr\_demo.py}

\texttt{Axes.boxplot} & Make a box and whisker plot. \\
\texttt{Axes.violinplot} & Make a violin plot. \\
\texttt{Axes.violin} & Drawing function for violin plots. \\
\texttt{Axes.bxp} & Drawing function for box and whisker plots. \\
\end{tabular}

\texttt{matplotlib.axes.Axes.boxplot}

\texttt{Axes.boxplot(self, x, notch=None, sym=None, vert=None, whis=None, positions=None, widths=None, patch_artist=None, bootstrap=None, usermedians=None, conf_intervals=None, meanline=None, showmeans=None, showcaps=None, showbox=None, showfliers=None, boxprops=None, labels=None, flierprops=None, medianprops=None, meanprops=None, capprops=None, whiskerprops=None, manage_ticks=True, autorange=False, zorder=None, *, data=None)}

Make a box and whisker plot.

Make a box and whisker plot for each column of \texttt{x} or each vector in sequence \texttt{x}. The box extends from the lower to upper quartile values of the data, with a line at the median.
The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

**Parameters**

- **x** [Array or a sequence of vectors.] The input data.
- **notch** [bool, optional (False)] If True, will produce a notched box plot. Otherwise, a rectangular boxplot is produced. The notches represent the confidence interval (CI) around the median. See the entry for the bootstrap parameter for information regarding how the locations of the notches are computed.

**Note:** In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive “flipped” appearance. This is expected behavior and consistent with other statistical visualization packages.

- **sym** [str, optional] The default symbol for flier points. Enter an empty string (") if you don’t want to show fliers. If None, then the fliers default to 'b+' If you want more control use the flierprops kwarg.
- **vert** [bool, optional (True)] If True (default), makes the boxes vertical. If False, everything is drawn horizontally.
- **whis** [float, sequence, or string (default = 1.5)] As a float, determines the reach of the whiskers to the beyond the first and third quartiles. In other words, where IQR is the interquartile range (Q3–Q1), the upper whisker will extend to last datum less than Q3 + whis*IQR. Similarly, the lower whisker will extend to the first datum greater than Q1 - whis*IQR. Beyond the whiskers, data are considered outliers and are plotted as individual points. Set this to an unreasonably high value to force the whiskers to show the min and max values. Alternatively, set this to an ascending sequence of percentile (e.g., [5, 95]) to set the whiskers at specific percentiles of the data. Finally, whis can be the string 'range' to force the whiskers to the min and max of the data.
- **bootstrap** [int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If bootstrap is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.
- **usermedians** [array-like, optional] An array or sequence whose first dimension (or length) is compatible with x. This overrides the medians computed by matplotlib for each element of usermedians that is not None. When an element of usermedians is None, the median will be computed by matplotlib as normal.
- **conf_intervals** [array-like, optional] Array or sequence whose first dimension (or length) is compatible with x and whose second dimension is 2. When the an element of conf_intervals is not None, the notch locations computed by matplotlib are overridden (provided notch is True). When
an element of conf_intervals is None, the notches are computed by the
method specified by the other kwargs (e.g., bootstrap).

**positions** [array-like, optional] Sets the positions of the boxes. The ticks
and limits are automatically set to match the positions. Defaults to
range(1, N+1) where N is the number of boxes to be drawn.

**widths** [scalar or array-like] Sets the width of each box either with a scalar
or a sequence. The default is 0.5, or 0.15*(distance between extreme
positions), if that is smaller.

**patch_artist** [bool, optional (False)] If False produces boxes with the
Line2D artist. Otherwise, boxes and drawn with Patch artists.

**labels** [sequence, optional] Labels for each dataset. Length must be com-
patible with dimensions of x.

**manage_ticks** [bool, optional (True)] If True, the tick locations and labels
will be adjusted to match the boxplot positions.

**autorange** [bool, optional (False)] When True and the data are distributed
such that the 25th and 75th percentiles are equal, whis is set to 'range'
such that the whisker ends are at the minimum and maximum of the data.

**meanline** [bool, optional (False)] If True (and showmeans is True), will try to
render the mean as a line spanning the full width of the box according
to meanprops (see below). Not recommended if shownotches is also True.
Otherwise, means will be shown as points.

**zorder** [scalar, optional (None)] Sets the zorder of the boxplot.

**Returns**

result [dict] A dictionary mapping each component of the boxplot to a list of
the matplotlib.lines.Line2D instances created. That dictionary has the
following keys (assuming vertical boxplots):

- boxes: the main body of the boxplot showing the quartiles and the me-
dian’s confidence intervals if enabled.
- medians: horizontal lines at the median of each box.
- whiskers: the vertical lines extending to the most extreme, non-outlier
data points.
- caps: the horizontal lines at the ends of the whiskers.
- fliers: points representing data that extend beyond the whiskers
  (fliers).
- means: points or lines representing the means.

**Other Parameters**

**showcaps** [bool, optional (True)] Show the caps on the ends of whiskers.

**showbox** [bool, optional (True)] Show the central box.

**showfliers** [bool, optional (True)] Show the outliers beyond the caps.

**showmeans** [bool, optional (False)] Show the arithmetic means.

**capprops** [dict, optional (None)] Specifies the style of the caps.

**boxprops** [dict, optional (None)] Specifies the style of the box.
**whiskerprops** [dict, optional (None)] Specifies the style of the whiskers.

**flierprops** [dict, optional (None)] Specifies the style of the fliers.

**medianprops** [dict, optional (None)] Specifies the style of the median.

**meanprops** [dict, optional (None)] Specifies the style of the mean.

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]:`

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

**Examples using** `matplotlib.axes.Axes.boxplot`

- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_pyplots_boxplot_demo_pyplot.py

**matplotlib.axes.Axes.violinplot**

```python
Axes.violinplot(self, dataset, positions=None, vert=True, widths=0.5, showmeans=False, showextrema=True, showmedians=False, points=100, bw_method=None, *, data=None)
```

Make a violin plot.

Make a violin plot for each column of `dataset` or each vector in sequence `dataset`. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, and the maximum.

**Parameters**

- **dataset** [Array or a sequence of vectors.] The input data.
- **positions** [array-like, default = [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.
- **vert** [bool, default = True.] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.
- **widths** [array-like, default = 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.
- **showmeans** [bool, default = False] If `True`, will toggle rendering of the means.
- **showextrema** [bool, default = True] If `True`, will toggle rendering of the extrema.
**showmedians** [bool, default = False] If `True`, will toggle rendering of the medians.

**points** [scalar, default = 100] Defines the number of points to evaluate each of the gaussian kernel density estimations at.

**bw_method** [str, scalar or callable, optional] The method used to calculate the estimator bandwidth. This can be ‘scott’, ‘silverman’, a scalar constant or a callable. If a scalar, this will be used directly as `kde.factor`. If a callable, it should take a `GaussianKDE` instance as its only parameter and return a scalar. If None (default), ‘scott’ is used.

**Returns**

**result** [dict] A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- **bodies**: A list of the `matplotlib.collections.PolyCollection` instances containing the filled area of each violin.
- **cmeans**: A `matplotlib.collections.LineCollection` instance created to identify the mean values of each of the violin’s distribution.
- **cmins**: A `matplotlib.collections.LineCollection` instance created to identify the bottom of each violin’s distribution.
- **cmaxes**: A `matplotlib.collections.LineCollection` instance created to identify the top of each violin’s distribution.
- **cbars**: A `matplotlib.collections.LineCollection` instance created to identify the centers of each violin’s distribution.
- **cmedians**: A `matplotlib.collections.LineCollection` instance created to identify the median values of each of the violin’s distribution.

**Notes**

**Note**: In addition to the above described arguments, this function can take a **data** key-word argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: ‘dataset’.

Objects passed as **data** must support item access (data[<arg>]) and membership test (<arg> in data).

**Examples using** matplotlib.axes.Axes.violinplot

- sphx_glr_gallery_statistics_customized_violin.py
Axes.violin

Axes.violin(self, vpstats, positions=None, vert=True, widths=0.5, showmeans=False, showextrema=True, showmedians=False)

Drawing function for violin plots.

Draw a violin plot for each column of vpstats. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, and the maximum.

Parameters

vpstats [list of dicts] A list of dictionaries containing stats for each violin plot. Required keys are:
  • coords: A list of scalars containing the coordinates that the violin’s kernel density estimate were evaluated at.
  • vals: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in coords.
  • mean: The mean value for this violin’s dataset.
  • median: The median value for this violin’s dataset.
  • min: The minimum value for this violin’s dataset.
  • max: The maximum value for this violin’s dataset.

positions [array-like, default = [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

vert [bool, default = True.] If true, plots the violins vertically. Otherwise, plots the violins horizontally.

widths [array-like, default = 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

showmeans [bool, default = False] If true, will toggle rendering of the means.

showextrema [bool, default = True] If true, will toggle rendering of the extrema.

showmedians [bool, default = False] If true, will toggle rendering of the medians.

Returns

result [dict] A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:
  • bodies: A list of the matplotlib.collections.PolyCollection instances containing the filled area of each violin.
  • cmeans: A matplotlib.collections.LineCollection instance created to identify the mean values of each of the violin’s distribution.
  • cmins: A matplotlib.collections.LineCollection instance created to identify the bottom of each violin’s distribution.
• cmaxes: A `matplotlib.collections.LineCollection` instance created to identify the top of each violin’s distribution.
• cbars: A `matplotlib.collections.LineCollection` instance created to identify the centers of each violin’s distribution.
• cmedians: A `matplotlib.collections.LineCollection` instance created to identify the median values of each of the violin’s distribution.

`matplotlib.axes.Axes.bxp`

`Axes.bxp(self, bxpstats, positions=None, widths=None, vert=True, patch_artist=False, shownotches=False, showmeans=False, showcaps=True, showbox=True, showfliers=True, boxprops=None, whiskerprops=None, flierprops=None, medianprops=None, capprops=None, meanprops=None, meanline=False, manage_ticks=True, zorder=None)`

Drawing function for box and whisker plots.

Make a box and whisker plot for each column of x or each vector in sequence x. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

**Parameters**

**bxpstats** [list of dicts] A list of dictionaries containing stats for each boxplot. Required keys are:
- **med**: The median (scalar float).
- **q1**: The first quartile (25th percentile) (scalar float).
- **q3**: The third quartile (75th percentile) (scalar float).
- **whislo**: Lower bound of the lower whisker (scalar float).
- **whishi**: Upper bound of the upper whisker (scalar float).

Optional keys are:
- **mean**: The mean (scalar float). Needed if `showmeans=True`.
- **fliers**: Data beyond the whiskers (sequence of floats). Needed if `showfliers=True`.
- **cilo & cihi**: Lower and upper confidence intervals about the median. Needed if `shownotches=True`.
- **label**: Name of the dataset (string). If available, this will be used a tick label for the boxplot

**positions** [array-like, default = [1, 2, ..., n]] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions.

**widths** [array-like, default = None] Either a scalar or a vector and sets the width of each box. The default is 0.15*(distance between extreme positions), clipped to no less than 0.15 and no more than 0.5.

**vert** [bool, default = True] If True (default), makes the boxes vertical. If False, makes horizontal boxes.
**patch_artist** [bool, default = False] If `False` produces boxes with the `Line2D` artist. If `True` produces boxes with the `Patch` artist.

**shownotches** [bool, default = False] If `False` (default), produces a rectangular box plot. If `True`, will produce a notched box plot.

**showmeans** [bool, default = False] If `True`, will toggle on the rendering of the means.

**showcaps** [bool, default = True] If `True`, will toggle on the rendering of the caps.

**showbox** [bool, default = True] If `True`, will toggle on the rendering of the box.

**showfliers** [bool, default = True] If `True`, will toggle on the rendering of the fliers.

**boxprops** [dict or None (default)] If provided, will set the plotting style of the boxes.

**whiskerprops** [dict or None (default)] If provided, will set the plotting style of the whiskers.

**capprops** [dict or None (default)] If provided, will set the plotting style of the caps.

**flierprops** [dict or None (default)] If provided will set the plotting style of the fliers.

**medianprops** [dict or None (default)] If provided, will set the plotting style of the medians.

**meanprops** [dict or None (default)] If provided, will set the plotting style of the means.

**meanline** [bool, default = False] If `True` (and `showmeans` is `True`), will try to render the mean as a line spanning the full width of the box according to `meanprops`. Not recommended if `shownotches` is also `True`. Otherwise, means will be shown as points.

**manage_ticks** [bool, default = True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

**zorder** [scalar, default = None] The zorder of the resulting boxplot.

**Returns**

**result** [dict] A dictionary mapping each component of the boxplot to a list of the `matplotlib.lines.Line2D` instances created. That dictionary has the following keys (assuming vertical boxplots):

- `boxes`: the main body of the boxplot showing the quartiles and the median’s confidence intervals if enabled.
- `medians`: horizontal lines at the median of each box.
- `whiskers`: the vertical lines extending to the most extreme, non-outlier data points.
- `caps`: the horizontal lines at the ends of the whiskers.
- `fliers`: points representing data that extend beyond the whiskers (fliers).
- **means**: points or lines representing the means.

**Examples**

```

Custom medianprops and flierprops

Custom mean as point

Custom mean as line
Axes.hexbin(self, x, y, C=None, gridsize=100, bins=None, xscale='linear', yscale='linear', extent=None, cmap=None, norm=None, vmin=None, vmax=None, alpha=None, linewidths=None, edgecolors='face', reduce_C_function=<function mean at 0x7f0f7fe67ee0>, mincnt=None, marginals=False, *, data=None, **kwargs)

Make a 2D hexagonal binning plot of points x, y.

If C is None, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, C specifies values at the coordinate (x[i], y[i]). For each hexagon, these values are reduced using reduce_C_function.

Parameters

- **x**, **y** [array-like] The data positions. x and y must be of the same length.
- **C** [array-like, optional] If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as x and y.
- **gridsize** [int or (int, int), default: 100] If a single int, the number of hexagons in the x-direction. The number of hexagons in the y-direction is chosen such that the hexagons are approximately regular.
  Alternatively, if a tuple (nx, ny), the number of hexagons in the x-direction and the y-direction.
- **bins** ['log' or int or sequence, default: None] Discretization of the hexagon values.
  - If None, no binning is applied; the color of each hexagon directly corresponds to its count value.
  - If 'log', use a logarithmic scale for the color map. Internally, \( \log_{10}(i + 1) \) is used to determine the hexagon color. This is equivalent to norm=LogNorm().
  - If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
  - If a sequence of values, the values of the lower bound of the bins to be used.
- **xscale** [{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.
- **yscale** [{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.
- **mincnt** [int > 0, default: None] If not None, only display cells with more than mincnt number of points in the cell.
- **marginals** [bool, default: False] If marginals is True, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.
- **extent** [float, default: None] The limits of the bins. The default assigns the limits based on gridsize, x, y, xscale and yscale.
If `xscale` or `yscale` is set to ‘log’, the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in ‘linear’ scale and y-limits of 10 and 1000 in ‘log’ scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

**Returns**

- **polycollection** [PolyCollection] A PolyCollection defining the hexagonal bins.
  - PolyCollection.get_offset contains a Mx2 array containing the x, y positions of the M hexagon centers.
  - PolyCollection.get_array contains the values of the M hexagons.

If `marginals` is True, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes `hbar` and `vbar`.

**Other Parameters**

- **cmap** [str or Colormap, optional] The Colormap instance or registered colormap name used to map the bin values to colors. Defaults to rcParams["image.cmap"] (default: ‘viridis’).

- **norm** [Normalize, optional] The Normalize instance scales the bin values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

- **vmin, vmax** [float, optional, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of the bins in case of the default linear scaling). This is ignored if norm is given.

- **alpha** [float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

- **linewidths** [float, default: None] If None, defaults to 1.0.

- **edgecolors** [{‘face’, ‘none’, None} or color, default: ‘face’] The color of the hexagon edges. Possible values are:
  - ‘face’: Draw the edges in the same color as the fill color.
  - ‘none’: No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
  - None: Draw outlines in the default color.
  - An explicit matplotlib color.

- **reduce_C_function** [callable, default is numpy.mean] The function to aggregate C within the bins. It is ignored if C is not given. This must have the signature:

  ```python
def reduce_C_function(C: array) -> float
  ```

Commonly used functions are:

- `numpy.mean`: average of the points
- `numpy.sum`: integral of the point values
- `numpy.max`: value taken from the largest point
**kwargs [PolyCollection properties] All other keyword arguments are passed on to PolyCollection:

**Notes**

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

- All arguments with the following names: 'x', 'y'.

Objects passed as data must support item access (data[<arg>]) and membership test.
Examples using matplotlib.axes.Axes.hexbin

- sphx_glr_gallery_statistics_hexbin_demo.py

matplotlib.axes.Axes.hist

Axis.hist(self, x, bins=None, range=None, density=None, weights=None, cumulative=False, bottom=None, histtype='bar', align='mid', orientation='vertical', rwidth=None, log=False, color=None, label=None, stacked=False, normed=None, *, data=None, **kwargs)

Plot a histogram.

Compute and draw the histogram of x. The return value is a tuple (n, bins, patches) or ([n0, n1, ...], bins, [patches0, patches1,...]) if the input contains multiple data. See the documentation of the weights parameter to draw a histogram of already-binned data.

Multiple data can be provided via x as a list of datasets of potentially different length ([x0, x1, ...]), or as a 2-D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported at present.

Parameters

- x [(n,)] array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

- bins [int or sequence or str, optional] If an integer is given, bins + 1 bin edges are calculated and returned, consistent with numpy.histogram.

  If bins is a sequence, gives bin edges, including left edge of first bin and right edge of last bin. In this case, bins is returned unmodified.

  All but the last (righthand-most) bin is half-open. In other words, if bins is:

  ```
  [1, 2, 3, 4]
  ```

  then the first bin is [1, 2) (including 1, but excluding 2) and the second [2, 3). The last bin, however, is [3, 4], which includes 4.

  Unequally spaced bins are supported if bins is a sequence.

  With Numpy 1.11 or newer, you can alternatively provide a string describing a binning strategy, such as 'auto', 'sturges', 'fd', 'doane', 'scott', 'rice' or 'sqrt', see numpy.histogram.

  The default is taken from rcParams["hist.bins"] (default: 10).

- range [tuple or None, optional] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, range is (x.min(), x.max()). Range has no effect if bins is a sequence.
If `bins` is a sequence or `range` is specified, autoscaling is based on the specified bin range instead of the range of x.

Default is `None`.

**density** [bool, optional] If `True`, the first element of the return tuple will be the counts normalized to form a probability density, i.e., the area (or integral) under the histogram will sum to 1. This is achieved by dividing the count by the number of observations times the bin width and not dividing by the total number of observations. If `stacked` is also `True`, the sum of the histograms is normalized to 1.

Default is `None` for both `normed` and `density`. If either is set, then that value will be used. If neither are set, then the args will be treated as `False`.

If both `density` and `normed` are set an error is raised.

**weights** [(n,) array_like or None, optional] An array of weights, of the same shape as x. Each value in x only contributes its associated weight towards the bin count (instead of 1). If `normed` or `density` is `True`, the weights are normalized, so that the integral of the density over the range remains 1.

Default is `None`.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using `np.histogram` (by treating each bin as a single point with a weight equal to its count)

```python
counts, bins = np.histogram(data)
plt.hist(bins[:-1], bins, weights=counts)
```
(or you may alternatively use `bar()`).

**cumulative** [bool, optional] If `True`, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints. If `normed` or `density` is also `True` then the histogram is normalized such that the last bin equals 1. If `cumulative` evaluates to less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if `normed` and/or `density` is also `True`, then the histogram is normalized such that the first bin equals 1.

Default is `False`.

**bottom** [array_like, scalar, or `None`] Location of the bottom baseline of each bin. If a scalar, the base line for each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If `None`, defaults to 0.

Default is `None`.

- ‘bar’ is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- ‘barstacked’ is a bar-type histogram where multiple data are stacked on top of each other.
- ‘step’ generates a lineplot that is by default unfilled.
• ‘stepfilled’ generates a lineplot that is by default filled.

Default is ‘bar’

**align** [{‘left’, ‘mid’, ‘right’}, optional] Controls how the histogram is plotted.

• ‘left’: bars are centered on the left bin edges.
• ‘mid’: bars are centered between the bin edges.
• ‘right’: bars are centered on the right bin edges.

Default is ‘mid’

**orientation** [{‘horizontal’, ‘vertical’}, optional] If ‘horizontal’, *barh* will be used for bar-type histograms and the *bottom* kwarg will be the left edges.

**rwidth** [scalar or None, optional] The relative width of the bars as a fraction of the bin width. If None, automatically compute the width.

Ignored if histtype is ‘step’ or ‘stepfilled’.

Default is None

**log** [bool, optional] If True, the histogram axis will be set to a log scale. If log is True and x is a 1D array, empty bins will be filtered out and only the non-empty (n, bins, patches) will be returned.

Default is False

**color** [color or array_like of colors or None, optional] Color spec or sequence of color specs, one per dataset. Default (None) uses the standard line color sequence.

Default is None

**label** [str or None, optional] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that the legend command will work as expected.

Default is None

**stacked** [bool, optional] If True, multiple data are stacked on top of each other. If False, multiple data are arranged side by side if histtype is ‘bar’ or on top of each other if histtype is ‘step’.

Default is False

**normed** [bool, optional] Deprecated; use the density keyword argument instead.

**Returns**

- **n** [array or list of arrays] The values of the histogram bins. See density and weights for a description of the possible semantics. If input x is an array, then this is an array of length nbins. If input is a sequence of arrays [data1, data2, ...], then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array n (or of its element arrays) will always be float even if no weighting or normalization is used.

- **bins** [array] The edges of the bins. Length nbins + 1 (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.
patches [list or list of lists] Silent list of individual patches used to create the histogram or list of such list if multiple input datasets.

**Other Parameters**

**kwargs [Patch properties]

See also:

hist2d 2D histograms

Notes

**Note:** In addition to the above described arguments, this function can take a **data** keyword argument. If such a data argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'weights', 'x'.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

matplotlib.axes.Axes.hist2d

Axes.hist2d(self, x, y, bins=10, range=None, density=False, weights=None, cmin=None, cmax=None, *, data=None, **kwargs)

Make a 2D histogram plot.

Parameters

x, y [array_like, shape (n, )] Input values

bins [None or int or [int, int] or array_like or [array, array]] The bin specification:
  • If int, the number of bins for the two dimensions (nx=ny=bins).
  • If [int, int], the number of bins in each dimension (nx, ny = bins).
  • If array_like, the bin edges for the two dimensions (x_edges=y_edges=bins).
  • If [array, array], the bin edges in each dimension (x_edges, y_edges = bins).

The default value is 10.

range [array_like shape(2, 2), optional, default: None] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): [[xmin, xmax], [ymin, ymax]]. All values outside of this range will be considered outliers and not tallied in the histogram.

density [bool, optional, default: False] Normalize histogram. normed is a deprecated synonym for this parameter.

weights [array_like, shape (n, ), optional, default: None] An array of values w_i weighing each sample (x_i, y_i).

ccmin [scalar, optional, default: None] All bins that has count less than cmin will not be displayed and these count values in the return value count histogram will also be set to nan upon return

ccmax [scalar, optional, default: None] All bins that has count more than cmax will not be displayed (set to none before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return

Returns

h [2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

xedges [1D array] The bin edges along the x axis.

yedges [1D array] The bin edges along the y axis.

image [QuadMesh]

Other Parameters

norm [Normalize, optional] A colors.Normalize instance is used to scale luminance data to [0, 1]. If not set, defaults to colors.Normalize().

vmin/vmax [None or scalar, optional] Arguments passed to the Normalize instance.

alpha [0 <= scalar <= 1 or None, optional] The alpha blending value.

See also:

hist 1D histogram plotting

Notes

• Currently hist2d calculates it’s own axis limits, and any limits previously set are ignored.

• Rendering the histogram with a logarithmic color scale is accomplished by passing a colors.LogNorm instance to the norm keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with colors.PowerNorm.

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data[<arg>]:

• All arguments with the following names: ‘weights’, ‘x’, ‘y’.

Objects passed as data must support item access (data[<arg>]) and membership test (<arg> in data).

Examples using matplotlib.axes.Axes.hist2d

• sphx_glr_gallery_statistics_hist.py
• sphx_glr_gallery_scales_power_norm.py

Contours

Axes.clabel

Axes.contour

Axes.contourf

matplotlib.axes.Axes.clabel

Axes.clabel(self, CS, *args, **kwargs)

Label a contour plot.

Call signature:
clabel(cs, [levels,] **kwargs)

Adds labels to line contours in `cs`, where `cs` is a `ContourSet` object returned by `contour()`.

**Parameters**

- **cs** `[ContourSet]` The ContourSet to label.
- **levels** `[array-like, optional]` A list of level values, that should be labeled. The list must be a subset of `cs.levels`. If not given, all levels are labeled.
- **fontsize** `[string or float, optional]` Size in points or relative size e.g., ‘smaller’, ‘x-large’. See `Text.set_size` for accepted string values.
- **colors** `[color-spec, optional]` The label colors:
  - If `None`, the color of each label matches the color of the corresponding contour.
  - If one string color, e.g., `colors = 'r'` or `colors = 'red'`, all labels will be plotted in this color.
  - If a tuple of matplotlib color args (string, float, rgb, etc), different labels will be plotted in different colors in the order specified.
- **inline** `[bool, optional]` If `True` the underlying contour is removed where the label is placed. Default is `True`.
- **inline_spacing** `[float, optional]` Space in pixels to leave on each side of label when placing inline. Defaults to 5.
  
  This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.
- **fmt** `[string or dict, optional]` A format string for the label. Default is ‘%.1f’
  
  Alternatively, this can be a dictionary matching contour levels with arbitrary strings to use for each contour level (i.e., `fmt[level]=string`), or it can be any callable, such as a `Formatter` instance, that returns a string when called with a numeric contour level.
- **manual** `[bool or iterable, optional]` If `True`, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).
  
  `manual` can also be an iterable object of x,y tuples. Contour labels will be created as if mouse is clicked at each x,y positions.
- **rightside_up** `[bool, optional]` If `True`, label rotations will always be plus or minus 90 degrees from level. Default is `True`.
- **use_clabeltext** `[bool, optional]` If `True`, `ClabelText` class (instead of `Text`) is used to create labels. `ClabelText` recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes. Default is `False`.

**Returns**
labels A list of Text instances for the labels.

Examples using matplotlib.axes.Axes.clabel

- sphx_glr_gallery_images_contours_and_fields_contour_demo.py
- sphx_glr_gallery_images_contours_and_fields_contour_label_demo.py
- sphx_glr_gallery_images_contours_and_fields_contourf_demo.py
- sphx_glr_gallery_misc_demo_agg_filter.py
- sphx_glr_gallery_misc_patheffect_demo.py

matplotlib.axes.Axes.contour

Axes.contour(self, *args, data=None, **kwargs)
Plot contours.

Call signature:

contour([X, Y], Z, [levels], **kwargs)

contour and contourf draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

X, Y [array-like, optional] The coordinates of the values in Z.
X and Y must both be 2-D with the same shape as Z (e.g. created via numpy.meshgrid), or they must both be 1-D such that len(X) == M is the number of columns in Z and len(Y) == N is the number of rows in Z.
If not given, they are assumed to be integer indices, i.e. X = range(M), Y = range(N).

Z [array-like(N, M)] The height values over which the contour is drawn.

levels [int or array-like, optional] Determines the number and positions of the contour lines / regions.
If an int n, use n data intervals; i.e. draw n+1 contour lines. The level heights are automatically chosen.
If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns

c [QuadContourSet]

Other Parameters

corner_mask [bool, optional] Enable/disable corner masking, which only has an effect if Z is a masked array. If False, any quad touching a masked point is masked out. If True, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.
Defaults to `rcParams["contour.corner_mask"]` (default: True), which defaults to True.

**colors** [color string or sequence of colors, optional] The colors of the levels, i.e. the lines for `contour` and the areas for `contourf`.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it’s repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. `red` instead of `['red']` to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value `None`), the colormap specified by `cmap` will be used.

**alpha** [float, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap** [str or `Colormap`, optional] A `Colormap` instance or registered colormap name. The colormap maps the level values to colors. Defaults to `rcParams["image.cmap"]` (default: ‘viridis’).

If both `colors` and `cmap` are given, an error is raised.

**norm** [`Normalize`, optional] If a colormap is used, the `Normalize` instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax** [float, optional] If not `None`, either or both of these values will be supplied to the `Normalize` instance, overriding the default color scaling based on `levels`.

**origin** [{None, ‘upper’, ‘lower’, ‘image’}, optional] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.

- None: Z[0, 0] is at X=0, Y=0 in the lower left corner.
- ‘lower’: Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- ‘upper’: Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- ‘image’: Use the value from `rcParams["image.origin"]` (default: ‘upper’).

**extent** [{x0, x1, y0, y1}, optional] If `origin` is not `None`, then `extent` is interpreted as in `imshow`; it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If `origin` is `None`, then (x0, y0) is the position of Z[0,0], and (x1, y1) is the position of Z[-1,-1].

This argument is ignored if X and Y are specified in the call to contour.

**locator** [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via `levels`. Defaults to `MaxNLocator`.

**extend** [{‘neither’, ‘both’, ‘min’, ‘max’}, optional, default: ‘neither’] Determines the `contourf`-coloring of values that are outside the `levels` range.
If ‘neither’, values outside the levels range are not colored. If ‘min’, ‘max’ or ‘both’, color the values below, above or below and above the levels range.

Values below min(levels) and above max(levels) are mapped to the under/over values of the Colormap. Note, that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using Colormap.set_under and Colormap.set_over.

**Note:** An existing QuadContourSet does not get notified if properties of its colormap are changed. Therefore, an explicit call QuadContourSet.changed() is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the QuadContourSet because it internally calls QuadContourSet.changed().

Example:

```python
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                 colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')

cs.cmap.set_over('red')

xs, ys = cs.get_paths()

cs.cmap.set_under('blue')

for path in xs:
    path.vertices = path.vertices * 1.5

plt.show()
```

**xunits, yunits** [registered units, optional] Override axis units by specifying an instance of a matplotlib.units.ConversionInterface.

**antialiased** [bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is True. For line contours, it is taken from rcParams["lines.antialiased"] (default: True).

**Nchunk** [int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of nchunk by nchunk quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the antialiased flag and value of alpha.

**linewidths** [float or sequence of float, optional] Only applies to contour.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

Defaults to rcParams["lines.linewidth"] (default: 1.5).

...
If *linestyles* is *None*, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams['contour.negative_linestyle']` (default: 'dashed') setting.

*linestyles* can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**hatches** [List[str], optional] *Only applies to contourf.*

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

**Notes**

1. *contourf* differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to *contour*.
2. *contourf* fills intervals that are closed at the top; that is, for boundaries *z1* and *z2*, the filled region is:

   $Z_1 < Z <= Z_2$

   except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

- sphx_glr_gallery_misc_patheffect_demo.py

**matplotlib.axes.Axes.contourf**

`Axes.contourf(self, *args, data=None, **kwargs)`

Plot contours.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```
contour and contourf draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

**Parameters**

- **X, Y** [array-like, optional] The coordinates of the values in Z.
  
  X and Y must both be 2-D with the same shape as Z (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in Z and `len(Y) == N` is the number of rows in Z.
  
  If not given, they are assumed to be integer indices, i.e. `X = range(M)`, `Y = range(N)`.

- **Z** [array-like(N, M)] The height values over which the contour is drawn.

- **levels** [int or array-like, optional] Determines the number and positions of the contour lines / regions.
  
  If an int `n`, use `n` data intervals; i.e. draw `n+1` contour lines. The level heights are automatically chosen.
  
  If array-like, draw contour lines at the specified levels. The values must be in increasing order.

**Returns**

- **c** [QuadContourSet]

**Other Parameters**

- **corner_mask** [bool, optional] Enable/disable corner masking, which only has an effect if Z is a masked array. If False, any quad touching a masked point is masked out. If True, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.
  
  Defaults to `rcParams["contour.corner_mask"]` (default: True), which defaults to True.

- **colors** [color string or sequence of colors, optional] The colors of the levels, i.e. the lines for contour and the areas for contourf.
  
  The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it’s repeated.
  
  As a shortcut, single color strings may be used in place of one-element lists, i.e. ‘red’ instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.
  
  By default (value None), the colormap specified by cmap will be used.

- **alpha** [float, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

- **cmap** [str or Colormap, optional] A Colormap instance or registered colormap name. The colormap maps the level values to colors. Defaults to `rcParams["image.cmap"]` (default: ‘viridis’).
  
  If both colors and cmap are given, an error is raised.
norm [Normalize, optional] If a colormap is used, the Normalize instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

vmin, vmax [float, optional] If not None, either or both of these values will be supplied to the Normalize instance, overriding the default color scaling based on levels.

origin [{None, ‘upper’, ‘lower’, ‘image’}, optional] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.
• None: Z[0, 0] is at X=0, Y=0 in the lower left corner.
• ‘lower’: Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
• ‘upper’: Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
• ‘image’: Use the value from rcParams["image.origin"] (default: ‘upper’).

extent [(x0, x1, y0, y1), optional] If origin is not None, then extent is interpreted as in imshow: it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If origin is None, then (x0, y0) is the position of Z[0,0], and (x1, y1) is the position of Z[-1,-1].

This argument is ignored if X and Y are specified in the call to contour.

locator [ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via levels. Defaults to MaxNLocator.

extend [{‘neither’, ‘both’, ‘min’, ‘max’}, optional, default: ‘neither’] Determines the contourf-coloring of values that are outside the levels range.

If ‘neither’, values outside the levels range are not colored. If ‘min’, ‘max’ or ‘both’, color the values below, above or below and above the levels range.

Values below min(levels) and above max(levels) are mapped to the under/over values of the Colormap. Note, that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using Colormap.set_under and Colormap.set_over.

Note: An existing QuadContourSet does not get notified if properties of its colormap are changed. Therefore, an explicit call QuadContourSet.changed() is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the QuadContourSet because it internally calls QuadContourSet.changed().

Example:

```python
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y
```
xunits, yunits [registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

antialiased [bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is True. For line contours, it is taken from `rcParams["lines.antialiased"]` (default: True).

Nchunk [int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of nchunk by nchunk quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the antialiased flag and value of alpha.

linewidths [float or sequence of float, optional] Only applies to contour.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

Defaults to `rcParams["lines.linewidth"]` (default: 1.5).

linestyles [{None, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] Only applies to contour.

If linestyles is None, the default is ‘solid’ unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: 'dashed') setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

hatches [List[st]], optional] Only applies to contourf.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Notes

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.

2. `contourf` fills intervals that are closed at the top; that is, for boundaries z1 and z2, the filled region is:
except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

- sphx_glr_gallery_frontpage_contour.py

Array

- `Axes.imshow` Display an image, i.e.
- `Axes.matshow` Plot the values of a 2D matrix or array as color-coded image.
- `Axes.pcolor` Create a pseudocolor plot with a non-regular rectangular grid.
- `Axes.pcolorfast` Create a pseudocolor plot with a non-regular rectangular grid.
- `Axes.pcolormesh` Create a pseudocolor plot with a non-regular rectangular grid.
- `Axes.spy` Plot the sparsity pattern of a 2D array.

`matplotlib.axes.Axes.imshow`

`Axes.imshow(self, X, cmap=None, norm=None, aspect=None, interpolation=None, alpha=None, vmin=None, vmax=None, origin=None, extent=None, shape=<deprecated parameter>, filternorm=1, filterrad=4.0, imlim=<deprecated parameter>, resample=None, url=None, *, data=None, **kwargs)`

Display an image, i.e. data on a 2D regular raster.

**Parameters**

- `X` [array-like or PIL image] The image data. Supported array shapes are:
  - (M, N): an image with scalar data. The data is visualized using a colormap.
  - (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
  - (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.
The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

cmap [str or Colormap, optional] The Colormap instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data. Defaults to rcParams["image.cmap"] (default: 'viridis').

norm [Normalize, optional] The Normalize instance used to scale scalar data to the [0, 1] range before mapping to colors using cmap. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

aspect [{‘equal’, ‘auto’} or float, optional] Controls the aspect ratio of the axes. The aspect is of particular relevance for images since it may distort the image, i.e. pixel will not be square.

This parameter is a shortcut for explicitly calling Axes.set_aspect. See there for further details.

• ‘equal’: Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using extent).

• ‘auto’: The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.

If not given, use rcParams["image.aspect"] (default: ‘equal’) (default: ‘equal’).

interpolation [str, optional] The interpolation method used. If None rcParams["image.interpolation"] (default: ‘nearest’) is used, which defaults to ‘nearest’.

If interpolation is ‘none’, then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to ‘nearest’. Note that most SVG renders perform interpolation at rendering and that the default interpolation method they implement may differ.

See /gallery/images_contours_and_fields/interpolation_methods for an overview of the supported interpolation methods.

Some interpolation methods require an additional radius parameter, which can be set by filterrad. Additionally, the antigrain image resize filter is controlled by the parameter filternorm.

alpha [scalar, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). This parameter is ignored for RGBA input data.

vmin, vmax [scalar, optional] When using scalar data and no explicit norm, vmin and vmax define the data range that the colormap covers. By default, the colormap covers the complete value range of the supplied data. vmin, vmax are ignored if the norm parameter is used.

origin [{‘upper’, ‘lower’}, optional] Place the [0,0] index of the array in the upper left or lower left corner of the axes. The convention ‘upper’ is typically used for matrices and images. If not given, rcParams["image.origin"] (default: ‘upper’) is used, defaulting to ‘upper’.
Note that the vertical axes points upward for ‘lower’ but downward for ‘upper’.

See the origin and extent in imshow tutorial for examples and a more detailed description.

**extent** [scalars (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on origin:

- For origin == ‘upper’ the default is (-0.5, numcols-0.5, numrows-0.5, -0.5).
- For origin == 'lower' the default is (-0.5, numcols-0.5, -0.5, numrows-0.5).

See the origin and extent in imshow tutorial for examples and a more detailed description.

**filternorm** [bool, optional, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If filternorm is set, the filter normalizes integer values and corrects the rounding errors. It doesn’t do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

**filterrad** [float > 0, optional, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: ‘sinc’, ‘lanczos’ or ‘blackman’.

**resample** [bool, optional] When True, use a full resampling method. When False, only resample when the output image is larger than the input image.

**url** [str, optional] Set the url of the created *AxesImage*. See *Artist.set_url*.

**Returns**

*image* [*AxesImage*]

**Other Parameters**

**kwargs** [Artist properties] These parameters are passed on to the constructor of the *AxesImage* artist.

**See also:**

*matshow* Plot a matrix or an array as an image.
Notes

Unless *extent* is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

*imshow* expects RGB images adopting the straight (unassociated) alpha representation.

**Note:** In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All positional and all keyword arguments.

Objects passed as **data** must support item access (**data[<arg>]**) and membership test (**<arg> in data**).

• Choosing Colormaps in Matplotlib

matplotlib.axes.Axes.matshow

Axes.matshow(self, Z, **kwargs)
Plot the values of a 2D matrix or array as color-coded image.
The matrix will be shown the way it would be printed, with the first row at the top. Row
and column numbering is zero-based.

Parameters
Z [array-like(M, N)] The matrix to be displayed.

Returns
image [AxesImage]

Other Parameters
**kwargs [imshow arguments]

See also:

imshow More general function to plot data on a 2D regular raster.
Notes

This is just a convenience function wrapping `imshow` to set useful defaults for a displaying a matrix. In particular:

- Set `origin='upper'`.
- Set `interpolation='nearest'`.
- Set `aspect='equal'`.
- Ticks are placed to the left and above.
- Ticks are formatted to show integer indices.

Examples using `matplotlib.axes.Axes.matshow`

- `sphx_glr_gallery_images_contours_and_fields_matshow.py`

`matplotlib.axes.Axes.pcolor`

`Axes.pcolor(self, *args, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)`

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y,] C, **kwargs)
```

`X` and `Y` can be used to specify the corners of the quadrilaterals.

**Hint:** `pcolor()` can be very slow for large arrays. In most cases you should use the similar but much faster `pcolormesh` instead. See there for a discussion of the differences.

**Parameters**

- `C` [array_like] A scalar 2-D array. The values will be color-mapped.
- `X, Y` [array_like, optional] The coordinates of the quadrilateral corners. The quadrilateral for `C[i,j]` has corners at:

```
(X[i+1, j], Y[i+1, j])    (X[i+1, j+1], Y[i+1, j+1])
+---------+                   +---------+
| C[i,j] |
+---------+
(X[i, j], Y[i, j])    (X[i, j+1], Y[i, j+1]),
```

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the `Notes` section below.

The dimensions of `X` and `Y` should be one greater than those of `C`. Alternatively, `X`, `Y` and `C` may have equal dimensions, in which case the last row and column of `C` will be ignored.

If `X` and/or `Y` are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.
**cmap** [str or *Colormap*, optional] A Colormap instance or registered colormap name. The colormap maps the $C$ values to colors. Defaults to `rcParams[“image.cmap”]` (default: ‘viridis’).

**norm** [*Normalize*, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax** [scalar, optional, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the *Normalize* instance (defaults to the respective min/max values of $C$ in case of the default linear scaling).

**edgecolors** [{‘none’, None, ‘face’, color, color sequence}, optional] The color of the edges. Defaults to ‘none’. Possible values:

- ‘none’ or “”: No edge.
- **None**: `rcParams[“patch.edgecolor”]` (default: ‘black’) will be used. Note that currently `rcParams[“patch.force_edgecolor”]` (default: False) has to be True for this to work.
- ‘face’: Use the adjacent face color.
- An mpl color or sequence of colors will set the edge color.

The singular form `edgecolor` works as an alias.

**alpha** [scalar, optional, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edgecolor is currently not affected by this.

**snap** [bool, optional, default: False] Whether to snap the mesh to pixel boundaries.

**Returns**

**collection** [*matplotlib.collections.Collection*]

**Other Parameters**

**antialiaseds** [bool, optional, default: False] The default `antialiaseds` is False if the default `edgecolors=“none”` is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If `edgecolors` is not “none”, then the default `antialiaseds` is taken from `rcParams[“patch.antialiased”]` (default: True), which defaults to True. Stroking the edges may be preferred if `alpha` is 1, but will cause artifacts otherwise.

**kwargs** Additionally, the following arguments are allowed. They are passed along to the `PolyCollection` constructor:

<table>

pcolormesh for an explanation of the differences between pcolor and pcolormesh.

imshow If X and Y are each equidistant, imshow can be a faster alternative.

Notes

Masked arrays

X, Y and C may be masked arrays. If either C[i, j], or one of the vertices surrounding C[i, j] (X or Y at [i, j], [i+1, j], [i, j+1], [i+1, j+1]) is masked, nothing is plotted.

Grid orientation

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

Handling of pcolor() end-cases
pcolor() displays all columns of \( C \) if \( X \) and \( Y \) are not specified, or if \( X \) and \( Y \) have one more column than \( C \). If \( X \) and \( Y \) have the same number of columns as \( C \) then the last column of \( C \) is dropped. Similarly for the rows.

Note: This behavior is different from MATLAB’s `pcolor()`, which always discards the last row and column of \( C \).

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

Examples using `matplotlib.axes.Axes.pcolor`

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
- sphx_glr_gallery_subplots_axes_and_figures_axesMargins.py

`matplotlib.axes.Axes.pcolorfast`

```python
Axes.pcolorfast(self, *args, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)
```

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```python
ax.pcolorfast([X, Y], C, /, **kwargs)
```

This method is similar to `~.Axes.pcolor` and `pcolormesh`. It’s designed to provide the fastest pcolor-type plotting with the Agg backend. To achieve this, it uses different algorithms internally depending on the complexity of the input grid (regular rectangular, non-regular rectangular or arbitrary quadrilateral).

**Warning:** This method is experimental. Compared to `pcolor` or `pcolormesh` it has some limitations:

- It supports only flat shading (no outlines)
- It lacks support for log scaling of the axes.
- It does not have a have a pyplot wrapper.

**Parameters**

- \( C \) [array-like(M, N)] A 2D array or masked array. The values will be color-mapped. This argument can only be passed positionally.

\( C \) can in some cases be 3D with the last dimension as rgb(a). This is available when \( C \) qualifies for image or pcolorimage type, will throw a TypeError if \( C \) is 3D and quadmesh.
X, Y [tuple or array-like, default: (0, N), (0, M)] X and Y are used to specify the coordinates of the quadrilaterals. There are different ways to do this:

- Use tuples $X=(x_{\text{min}}, x_{\text{max}})$ and $Y=(y_{\text{min}}, y_{\text{max}})$ to define a uniform rectangular grid.

  The tuples define the outer edges of the grid. All individual quadrilaterals will be of the same size. This is the fastest version.

- Use 1D arrays $X, Y$ to specify a non-uniform rectangular grid.

  In this case $X$ and $Y$ have to be monotonic 1D arrays of length $N+1$ and $M+1$, specifying the x and y boundaries of the cells.

  The speed is intermediate. Note: The grid is checked, and if found to be uniform the fast version is used.

- Use 2D arrays $X, Y$ if you need an arbitrary quadrilateral grid (i.e. if the quadrilaterals are not rectangular).

  In this case $X$ and $Y$ are 2D arrays with shape $(M, N)$, specifying the x and y coordinates of the corners of the colored quadrilaterals. See `pcolormesh` for details.

  This is the most general, but the slowest to render. It may produce faster and more compact output using ps, pdf, and svg backends, however.

These arguments can only be passed positionally.

cmap [str or `Colormap`, optional] A Colormap instance or registered colormap name. The colormap maps the $C$ values to colors. Defaults to `rcParams["image.cmap"]` (default: ‘viridis’).

norm [`Normalize`, optional] The Normalize instance scales the data values to the canonical colormap range $[0, 1]$ for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax [scalar, optional, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the `Normalize` instance (defaults to the respective min/max values of $C$ in case of the default linear scaling).

alpha [scalar, optional, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

snap [bool, optional, default: False] Whether to snap the mesh to pixel boundaries.

Returns

image [`AxesImage` or `PcolorImage` or `QuadMesh`] The return type depends on the type of grid:

- `AxesImage` for a regular rectangular grid.
- `PcolorImage` for a non-regular rectangular grid.
- `QuadMesh` for a non-rectangular grid.

Notes
Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments are replaced by data:<arg>:

- All positional and all keyword arguments.

Objects passed as data must support item access (data:<arg>) and membership test (<arg> in data).

Examples using matplotlib.axes.Axes.pcolorfast

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py

matplotlib.axes.Axes.pcolormesh

Axes.pcolormesh(self, *args, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, shading='flat', antialiased=False, data=None, **kwargs)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```python
pcolor([X, Y], C, **kwargs)
```

X and Y can be used to specify the corners of the quadrilaterals.

Note: pcolormesh() is similar to pcolor(). It’s much faster and preferred in most cases. For a detailed discussion on the differences see Differences between pcolor() and pcolormesh().

Parameters

- C [array_like] A scalar 2-D array. The values will be color-mapped.
- X, Y [array_like, optional] The coordinates of the quadrilateral corners. The quadrilateral for C[i,j] has corners at:

  \[
  \begin{align*}
  & (X[i+1, j], Y[i+1, j]) \\
  \end{align*}
  \]

  \[
  \begin{align*}
  & (X[i+1, j+1], Y[i+1, j+1]) \\
  \end{align*}
  \]

  \[
  \begin{align*}
  & (X[i, j], Y[i, j]) \\
  \end{align*}
  \]

  \[
  \begin{align*}
  & (X[i, j+1], Y[i, j+1])
  \end{align*}
  \]

Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the Notes section below.

The dimensions of X and Y should be one greater than those of C. Alternatively, X, Y and C may have equal dimensions, in which case the last row and column of C will be ignored.

If X and/or Y are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.
cmap [str or Colormap, optional] A Colormap instance or registered colormap name. The colormap maps the $C$ values to colors. Defaults to rcParams["image.cmap"] (default: ‘viridis’).

norm [Normalize, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

vmin, vmax [scalar, optional, default: None] The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of $C$ in case of the default linear scaling).

decorators [false, None, ‘face’, color, color sequence], optional] The color of the edges. Defaults to ‘none’. Possible values:
- ‘none’ or ‘": No edge.
- None: rcParams["patch.edgecolor"] (default: ‘black’) will be used. Note that currently rcParams["patch.force_edgecolor"] (default: False) has to be True for this to work.
- ‘face’: Use the adjacent face color.
- An mpl color or sequence of colors will set the edge color.

The singular form edgecolor works as an alias.

alpha [scalar, optional, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

shading [{‘flat’, ‘gouraud’}, optional] The fill style, Possible values:
- ‘flat’: A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by $C[i,j]$.
- ‘gouraud’: Each quad will be Gouraud shaded: The color of the corners ($i', j'$) are given by $C[i', j']$. The color values of the area in between is interpolated from the corner values. When Gouraud shading is used, edgecolors is ignored.

snap [bool, optional, default: False] Whether to snap the mesh to pixel boundaries.

Returns

mesh [matplotlib.collections.QuadMesh]

Other Parameters

**kwargs Additionally, the following arguments are allowed. They are passed along to the QuadMesh constructor:

<table>

See also:

`pcolor` An alternative implementation with slightly different features. For a detailed discussion on the differences see `Differences between pcolor() and pcolormesh()`.
`imshow` If `X` and `Y` are each equidistant, `imshow` can be a faster alternative.

Notes

Masked arrays

`C` may be a masked array. If `C[i, j]` is masked, the corresponding quadrilateral will be transparent. Masking of `X` and `Y` is not supported. Use `pcolor` if you need this functionality.

Grid orientation

The grid orientation follows the standard matrix convention: An array `C` with shape `(nrows, ncolumns)` is plotted with the column number as `X` and the row number as `Y`.

Differences between pcolor() and pcolormesh()
Both methods are used to create a pseudocolor plot of a 2-D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While `pcolor` returns a `PolyCollection`, `pcolormesh` returns a `QuadMesh`. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both `pcolor` and `pcolormesh` support masked arrays for `C`. However, only `pcolor` supports masked arrays for `X` and `Y`. The reason lies in the internal handling of the masked values. `pcolor` leaves out the respective polygons from the `PolyCollection`. `pcolormesh` sets the facecolor of the masked elements to transparent. You can see the difference when using `edgecolors`. While all edges are drawn irrespective of masking in a `QuadMesh`, the edge between two adjacent masked quadrilaterals in `pcolor` is not drawn as the corresponding polygons do not exist in the `PolyCollection`.

Another difference is the support of Gouraud shading in `pcolormesh`, which is not available with `pcolor`.

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

---

**matplotlib.axes.Axes.spy**

```python
Axes.spy(self, Z, precision=0, marker=None, markersize=None, aspect='equal', origin='upper', **kwargs)
```

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.
Image style

If marker and markersize are None, imshow is used. Any extra remaining kwars are passed to this method.

Marker style

If Z is a scipy.sparse.spmatrix or marker or markersize are None, a Line2D object will be returned with the value of marker determining the marker type, and any remaining kwars passed to plot.

Parameters

Z [array-like (M, N)] The array to be plotted.

precision [float or 'present', optional, default: 0] If precision is 0, any non-zero value will be plotted. Otherwise, values of |Z| > precision will be plotted.

For scipy.sparse.spmatrix instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

origin [{‘upper’, ‘lower’}, optional] Place the [0,0] index of the array in the upper left or lower left corner of the axes. The convention ‘upper’ is typically used for matrices and images. If not given, rcParams["image.origin"] (default: ‘upper’) is used, defaulting to ‘upper’.

aspect [{‘equal’, ‘auto’, None} or float, optional] Controls the aspect ratio of the axes. The aspect is of particular relevance for images since it may distort the image, i.e. pixel will not be square.

This parameter is a shortcut for explicitly calling Axes.set_aspect. See there for further details.

• ‘equal’: Ensures an aspect ratio of 1. Pixels will be square.
• ‘auto’: The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.
• None: Use rcParams["image.aspect"] (default: ‘equal’) (default: ‘equal’).

Default: ‘equal’

Returns

ret [AxesImage or Line2D] The return type depends on the plotting style (see above).

Other Parameters

**kwars The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of imshow:

• cmap
• alpha
• url
• any Artist properties (passed on to the AxesImage)
For the marker style, you can pass any *Line2D* property except for *linestyle*:

**Examples using matplotlib.axes.Axes.spy**

- sphx_glr_gallery_images_contours_and_fields_spy_demos.py

17.5. matplotlib.axes 985
Unstructured Triangles

Axes.tripcolor
Create a pseudocolor plot of an unstructured triangular grid.

Axes.triplot
Draw a unstructured triangular grid as lines and/or markers.

Axes.tricontour
Draw contours on an unstructured triangular grid.

Axes.tricontourf
Draw contours on an unstructured triangular grid.

matplotlib.axes.Axes.tripcolor

Axes.tripcolor(ax, *args, alpha=1.0, norm=None, cmap=None, vmin=None, vmax=None, shading='flat', facecolors=None, **kwargs)
Create a pseudocolor plot of an unstructured triangular grid.

The triangulation can be specified in one of two ways; either:

tripcolor(triangulation, ...)

where triangulation is a matplotlib.tri.Triangulation object, or

tripcolor(x, y, ...)
tripcolor(x, y, triangles, ...)
tripcolor(x, y, triangles=triangles, ...)
tripcolor(x, y, mask=mask, ...)
tripcolor(x, y, triangles, mask=mask, ...)

in which case a Triangulation object will be created. See Triangulation for a explanation of these possibilities.

The next argument must be C, the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the kwarg facecolors=C instead of just C.

shading may be 'flat' (the default) or 'gouraud'. If shading is 'flat' and C values are defined at points, the color values used for each triangle are from the mean C of the triangle’s three points. If shading is 'gouraud' then color values must be defined at points.

The remaining kwargs are the same as for pcolor().

Examples using matplotlib.axes.Axes.tripcolor

• sphx_glr_gallery_images_contours_and_fields_tripcolor_demo.py

matplotlib.axes.Axes.triplot

Axes.triplot(ax, *args, **kwargs)
Draw a unstructured triangular grid as lines and/or markers.
The triangulation to plot can be specified in one of two ways; either:

```python
triplot(triangulation, ...)
```

where `triangulation` is a `matplotlib.tri.Triangulation` object, or

```python
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See `Triangulation` for an explanation of these possibilities.

The remaining args and kwargs are the same as for `plot()`.

Return a list of 2 `Line2D` containing respectively:
- the lines plotted for triangles edges
- the markers plotted for triangles nodes

### Examples using `matplotlib.axes.Axes.triplot`

- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_demo.py

### `matplotlib.axes.Axes.tricontour`

`Axes.tricontour(ax, *args, **kwargs)`

Draw contours on an unstructured triangular grid.

`tricontour` and `tricontourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

The triangulation can be specified in one of two ways; either:

```python
tricontour(triangulation, ...)
```

where `triangulation` is a `matplotlib.tri.Triangulation` object, or

```python
tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)
```
in which case a *Triangulation* object will be created. See that class’ docstring for an explanation of these cases.

The remaining arguments may be:

```python
tricontour(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```python
tricontour(..., Z, N)
```

countour up to \(N+1\) automatically chosen contour levels (\(N\) intervals).

```python
tricontour(..., Z, V)
```

draw contour lines at the values specified in sequence *V*, which must be in increasing order.

```python
tricontourf(..., Z, V)
```

fill the \((\text{len}(V)-1)\) regions between the values in *V*, which must be in increasing order.

```python
tricontour(Z, **kwargs)
```

Use keyword args to control colors, linewidth, origin, cmap ... see below for more details.

`tricontour(...)` returns a `TriContourSet` object.

Optional keyword arguments:

- `colors`: [None | string | (mpl_colors)] If None, the colormap specified by cmap will be used. If a string, like ‘r’ or ‘red’, all levels will be plotted in this color. If a tuple of matplotlib color args (string, float, rgb, etc), different levels will be plotted in different colors in the order specified.
- `alpha`: float The alpha blending value
- `cmap`: [None | Colormap] A cm *Colormap* instance or None. If cmap is None and colors is None, a default Colormap is used.
- `norm`: [None | Normalize] A *matplotlib.colors.Normalize* instance for scaling data values to colors. If norm is None and colors is None, the default linear scaling is used.
- `levels` [level0, level1, ..., leveln] A list of floating point numbers indicating the level curves to draw, in increasing order; e.g., to draw just the zero contour pass `levels=[0]`
- `origin`: [None | ‘upper’ | ‘lower’ | ‘image’] If None, the first value of *Z* will correspond to the lower left corner, location (0,0). If ‘image’, the rc value for image.origin will be used.

This keyword is not active if *X* and *Y* are specified in the call to contour.

- `extent`: [None | (x0,x1,y0,y1)]

If origin is not None, then extent is interpreted as in *matplotlib.pyplot.imshow()*: it gives the outer pixel boundaries. In this case, the position of *Z*[0,0] is the
center of the pixel, not a corner. If origin is None, then \((x0, y0)\) is the position of \(Z[0,0]\), and \((x1, y1)\) is the position of \(Z[-1,-1]\).

This keyword is not active if \(X\) and \(Y\) are specified in the call to contour.

**locator:** [ None | ticker.Locator subclass ] If locator is None, the default MaxNLocator is used. The locator is used to determine the contour levels if they are not given explicitly via the \(V\) argument.

**extend:** [ ‘neither’ | ‘both’ | ‘min’ | ‘max’ ] Unless this is ‘neither’, contour levels are automatically added to one or both ends of the range so that all data are included. These added ranges are then mapped to the special colormap values which default to the ends of the colormap range, but can be set via matplotlib.colors.Colormap.set_under() and matplotlib.colors.Colormap.set_over() methods.

**xunits, yunits:** [ None | registered units ] Override axis units by specifying an instance of a matplotlib.units.ConversionInterface.

**tricontour-only keyword arguments:**

**linewidths:** [ None | number | tuple of numbers ] If linewidths is None, defaults to rc:lines.linewidth.

If a number, all levels will be plotted with this linewidth.

If a tuple, different levels will be plotted with different linewidths in the order specified

**linestyles:** [ None | ‘solid’ | ‘dashed’ | ‘dashdot’ | ‘dotted’ ] If linestyles is None, the ‘solid’ is used.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

If contour is using a monochrome colormap and the contour level is less than 0, then the linestyle specified in rcParams["contour.negative_linestyle"] (default: ‘dashed’) will be used.

**tricontourf-only keyword arguments:**

**antialiased:** bool enable antialiasing

**Examples using** matplotlib.axes.Axes.tricontour

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_demo.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
- sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
**Axes.tricontourf**

*Axes.tricontourf(ax, *args, **kwargs)*

Draw contours on an unstructured triangular grid.

*tricontour* and *tricontourf* draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

The triangulation can be specified in one of two ways; either

```python
tricontour(triangulation, ...)
```

where *triangulation* is a *matplotlib.tri.Triangulation* object, or

```python
tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)
```

in which case a *Triangulation* object will be created. See that class’ docstring for an explanation of these cases.

The remaining arguments may be:

```python
tricontour(..., Z)
```

where *Z* is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```python
tricontour(..., Z, N)
```

contour up to *N+1* automatically chosen contour levels (*N* intervals).

```python
tricontour(..., Z, V)
```

draw contour lines at the values specified in sequence *V*, which must be in increasing order.

```python
tricontourf(..., Z, V)
```

fill the (len(*V*)-1) regions between the values in *V*, which must be in increasing order.

```python
tricontour(Z, **kwargs)
```

Use keyword args to control colors, linewidth, origin, cmap ... see below for more details. *tricontour(...)* returns a *TriContourSet* object.

Optional keyword arguments:

- **colors**: [ *None* | string | (mpl_colors) ] If *None*, the colormap specified by *cmap* will be used.
  - If a string, like ‘r’ or ‘red’, all levels will be plotted in this color.
If a tuple of matplotlib color args (string, float, rgb, etc), different levels will be plotted in different colors in the order specified.

**alpha**: float The alpha blending value

**cmap**: [ None | Colormap ] A cm Colormap instance or None. If cmap is None and colors is None, a default Colormap is used.

**norm**: [ None | Normalize ] A matplotlib.colors.Normalize instance for scaling data values to colors. If norm is None and colors is None, the default linear scaling is used.

**levels** [level0, level1, ..., leveln] A list of floating point numbers indicating the level curves to draw, in increasing order; e.g., to draw just the zero contour pass levels=[0]

**origin**: [ None | ‘upper’ | ‘lower’ | ‘image’ ] If None, the first value of Z will correspond to the lower left corner, location (0,0). If ‘image’, the rc value for image.origin will be used.

This keyword is not active if X and Y are specified in the call to contour.

**extent**: [ None | (x0,x1,y0,y1) ]

If origin is not None, then extent is interpreted as in matplotlib.pyplot.imshow(): it gives the outer pixel boundaries. In this case, the position of Z[0,0] is the center of the pixel, not a corner. If origin is None, then (x0, y0) is the position of Z[0,0], and (x1, y1) is the position of Z[-1,-1].

This keyword is not active if X and Y are specified in the call to contour.

**locator**: [ None | ticker.Locator subclass ] If locator is None, the default MaxNLocator is used. The locator is used to determine the contour levels if they are not given explicitly via the V argument.

**extend**: [ ‘neither’ | ‘both’ | ‘min’ | ‘max’ ] Unless this is ‘neither’, contour levels are automatically added to one or both ends of the range so that all data are included. These added ranges are then mapped to the special colormap values which default to the ends of the colormap range, but can be set via matplotlib.colors.Colormap.set_under() and matplotlib.colors.Colormap.set_over() methods.

**xunits, yunits**: [ None | registered units ] Override axis units by specifying an instance of a matplotlib.units.ConversionInterface.

tricontour-only keyword arguments:

**linewidths**: [ None | number | tuple of numbers ] If linewidths is None, defaults to rc:lines.linewidth.

If a number, all levels will be plotted with this linewidth.

If a tuple, different levels will be plotted with different linewidths in the order specified

**linestyles**: [ None | ‘solid’ | ‘dashed’ | ‘dashdot’ | ‘dotted’ ] If linestyles is None, the ‘solid’ is used.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.
If contour is using a monochrome colormap and the contour level is less than 0, then the linestyle specified in `rcParams["contour.negative_linestyle"]` (default: ‘dashed’) will be used.

```
tricontourf-only keyword arguments:
    antialiased: bool enable antialiasing
```

Note: `tricontourf` fills intervals that are closed at the top; that is, for boundaries `z1` and `z2`, the filled region is:

```
z1 < Z <= z2
```

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

<tr>
<td><strong>Axes.indicate_inset_zoom</strong></td>
<td>Add an inset indicator rectangle to the axes based on the axis limits for an inset_ax and draw connectors between inset_ax and the rectangle.</td>
</tr>
<tr>
<td><strong>Axes.secondary_xaxis</strong></td>
<td>Add a second x-axis to this axes.</td>
</tr>
<tr>
<td><strong>Axes.secondary_yaxis</strong></td>
<td>Add a second y-axis to this axes.</td>
</tr>
</tbody>
</table>

**matplotlib.axes.Axes.annotate**

```
Axes.annotate(self, s, xy, *args, **kwargs)
```

Annotate the point `xy` with text `text`.

In the simplest form, the text is placed at `xy`.

Optionally, the text can be displayed in another position `xytext`. An arrow pointing from the text to the annotated point `xy` can then be added by defining `arrowprops`.

**Parameters**

`text` [str] The text of the annotation. `s` is a deprecated synonym for this
The point $(x,y)$ to annotate.

- **xytext** [(float, float), optional] The position $(x,y)$ to place the text at. If `None`, defaults to `xy`.

- **xycoords** [str, Artist, Transform, callable or tuple, optional] The coordinate system that `xy` is given in. The following types of values are supported:

  - One of the following strings:

    | Value         | Description                                      |
    |---------------|--------------------------------------------------|
    | 'figure points' | Points from the lower left of the figure         |
    | 'figure pixels' | Pixels from the lower left of the figure         |
    | 'figure fraction' | Fraction of figure from lower left             |
    | 'axes points'  | Points from lower left corner of axes            |
    | 'axes pixels'  | Pixels from lower left corner of axes            |
    | 'axes fraction' | Fraction of axes from lower left               |
    | 'data'        | Use the coordinate system of the object being annotated (default) |
    | 'polar'       | $(\theta, r)$ if not native 'data' coordinates |

  - An **Artist**: `xy` is interpreted as a fraction of the artist's `Bbox`. E.g. $(0, 0)$ would be the lower left corner of the bounding box and $(0.5, 1)$ would be the center top of the bounding box.

  - A **Transform** to transform `xy` to screen coordinates.

  - A function with one of the following signatures:

    ```python
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
    ```

    where `renderer` is a `RendererBase` subclass.

    The result of the function is interpreted like the **Artist** and **Transform** cases above.

  - A tuple $(xcoords, ycoords)$ specifying separate coordinate systems for $x$ and $y$. `xcoords` and `ycoords` must each be of one of the above described types.

    See **Advanced Annotation** for more details.

    Defaults to ‘data’.

- **textcoords** [str, Artist, Transform, callable or tuple, optional] The coordinate system that `xytext` is given in.

    All `xycoords` values are valid as well as the following strings:

    | Value         | Description                                      |
    |---------------|--------------------------------------------------|
    | 'offset points' | Offset (in points) from the `xy` value         |
    | 'offset pixels' | Offset (in pixels) from the `xy` value          |
Defaults to the value of `xycoords`, i.e. use the same coordinate system for annotation point and text position.

**arrowprops** [dict, optional] The properties used to draw a `FancyArrowPatch` arrow between the positions `xy` and `xytext`.

If `arrowprops` does not contain the key ‘arrowstyle’ the allowed keys are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>The width of the arrow in points</td>
</tr>
<tr>
<td>headwidth</td>
<td>The width of the base of the arrow head in points</td>
</tr>
<tr>
<td>headlength</td>
<td>The length of the arrow head in points</td>
</tr>
<tr>
<td>shrink</td>
<td>Fraction of total length to shrink from both ends</td>
</tr>
<tr>
<td>?</td>
<td>Any key to <code>matplotlib.patches.FancyArrowPatch</code></td>
</tr>
</tbody>
</table>

If `arrowprops` contains the key ‘arrowstyle’ the above keys are forbidden. The allowed values of ‘arrowstyle’ are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>None</td>
</tr>
<tr>
<td>'--&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'-&lt;-'</td>
<td>widthA=1.0,lengthB=0.2,angleB=None</td>
</tr>
<tr>
<td>'-</td>
<td>-'</td>
</tr>
<tr>
<td>'-</td>
<td>&gt;'</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;</td>
<td>-'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>--&gt;'</td>
</tr>
<tr>
<td>'fancy'</td>
<td>head_length=0.4,head_width=0.4,tail_width=0.4</td>
</tr>
<tr>
<td>'simple'</td>
<td>head_length=0.5,head_width=0.5,tail_width=0.2</td>
</tr>
<tr>
<td>'wedge'</td>
<td>tail_width=0.3,shrink_factor=0.5</td>
</tr>
</tbody>
</table>

Valid keys for `FancyArrowPatch` are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>mutation_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>mutation_aspect</td>
<td>default is 1.</td>
</tr>
<tr>
<td>?</td>
<td>any key for <code>matplotlib.patches.PathPatch</code></td>
</tr>
</tbody>
</table>

Defaults to None, i.e. no arrow is drawn.

**annotation_clip** [bool or None, optional] Whether to draw the annotation when the annotation point `xy` is outside the axes area.

- If `True`, the annotation will only be drawn when `xy` is within the axes.
- If `False`, the annotation will always be drawn.
• If *None*, the annotation will only be drawn when *xy* is within the axes and *xycoords* is ‘data’.

  Defaults to *None*.

  **kwargs Additional kwargs are passed to `Text`.

Returns

  *annotation* [Annotation]

Axes.text

```
Axes.text(self, x, y, s, fontdict=None, withdash=<deprecated parameter>, **kwargs)
```

Add text to the axes.

Parameters

- **x, y** [scalars] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the `transform` parameter.
- **s** [str] The text.
- **fontdict** [dictionary, optional, default: None] A dictionary to override the default text properties. If `fontdict` is None, the defaults are determined by your rc parameters.
- **withdash** [boolean, optional, default: False] Creates a `TextWithDash` instance instead of a `Text` instance.

Returns

- **text** [Text] The created `Text` instance.

Other Parameters

- ****kwargs [Text properties.] Other miscellaneous text parameters.

Examples

Individual keyword arguments can be used to override any given parameter:

```python
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords (0,0 is lower-left and 1,1 is upper-right). The example below places text in the center of the axes:

```python
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
...       verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword `bbox`. `bbox` is a dictionary of `Rectangle` properties. For example:

```python
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

`matplotlib.axes.Axes.table`

`Axes.table(ax, cellText=None, cellColours=None, cellLoc='right', colWidths=None, rowLabels=None, rowColours=None, rowLoc='left', colLabels=None, colColours=None, colLoc='center', loc='bottom', bbox=None, edges='closed', **kwargs)`

Add a table to an `Axes`.

At least one of `cellText` or `cellColours` must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using `rowLabels`, `rowColours`, `rowLoc` and `colLabels`, `colColours`, `colLoc` respectively.

For finer grained control over tables, use the `Table` class and add it to the axes with `Axes.add_table`.

**Parameters**

- **cellText** [2D list of str, optional] The texts to place into the table cells.
  
  *Note:* Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

- **cellColours** [2D list of matplotlib color specs, optional] The background colors of the cells.

- **cellLoc** [{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

- **colWidths** [list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of `1 / ncols`.

- **rowLabels** [list of str, optional] The text of the row header cells.

- **rowColours** [list of matplotlib color specs, optional] The colors of the row header cells.

- **rowLoc** [{'left', 'center', 'right'}, optional, default: 'left'] The text alignment of the row header cells.

- **colLabels** [list of str, optional] The text of the column header cells.

- **colColours** [list of matplotlib color specs, optional] The colors of the column header cells.

- **colLoc** [{'left', 'center', 'right'}, optional, default: 'left'] The text alignment of the column header cells.

**loc** [str, optional] The position of the cell with respect to *ax*. This must be one of the *codes*.

**bbox** [Bbox, optional] A bounding box to draw the table into. If this is not *None*, this overrides *loc*.

**edges** [substring of ‘BRTL’ or {'open', ‘closed’, ‘horizontal’, ‘vertical’}] The cell edges to be drawn with a line. See also *visible_edges*.

**Returns**

**table** [Table] The created table.

**Other Parameters**

****kwargs* Table properties.

**matplotlib.axes.Axes.arrow**

*Axes.arrow*(self, x, y, dx, dy, **kwargs)

Add an arrow to the axes.

This draws an arrow from (x, y) to (x+dx, y+dy).

**Parameters**

**x, y** [float] The x and y coordinates of the arrow base.

**dx, dy** [float] The length of the arrow along x and y direction.

**Returns**

**arrow** [FancyArrow] The created FancyArrow object.
Other Parameters

**kwargs  Optional kwargs (inherited from FancyArrow patch) control the arrow construction and properties:

Constructor arguments

- **width**: float (default: 0.001)  width of full arrow tail
- **length_includes_head**: bool (default: False)  True if head is to be counted in calculating the length.
- **head_width**: float or None (default: 3*width)  total width of the full arrow head
- **head_length**: float or None (default: 1.5 * head_width)  length of arrow head
- **shape**: ['full', 'left', 'right'] (default: 'full')  draw the left-half, right-half, or full arrow
- **overhang**: float (default: 0)  fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.
- **head_starts_at_zero**: bool (default: False)  if True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

Other valid kwargs (inherited from class:`Patch`) are:

Notes

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use `annotate()` for example:

```python
>>> ax.annotate("", xy=(0.5, 0.5), xytext=(0, 0),
...       arrowprops=dict(arrowstyle="->"))
```

Examples using `matplotlib.axes.Axes.arrow`

- sphx_glr_gallery_text_labels_and_annotations_arrow_simple_demo.py

`matplotlib.axes.Axes.inset_axes`

`Axes.inset_axes(self, bounds, *, transform=None, zorder=5, **kwargs)`

Add a child inset axes to this existing axes.

**Parameters**

- **bounds** [[x0, y0, width, height]] Lower-left corner of inset axes, and its width and height.
- **transform** [Transform] Defaults to `ax.transAxes`, i.e. the units of `rect` are in axes-relative coordinates.
- **zorder** [number] Defaults to 5 (same as `Axes.legend`). Adjust higher or lower to change whether it is above or below data plotted on the parent axes.
- **kwargs** Other `kwargs` are passed on to the `axes.Axes` child axes.

**Returns**

- `Axes` The created `axes.Axes` instance.

**Warning:** This method is experimental as of 3.0, and the API may change.

Examples

This example makes two inset axes, the first is in axes-relative coordinates, and the second in data-coordinates:
```python
fig, ax = plt.subplots()
ax.plot(range(10))
axin1 = ax.inset_axes([0.8, 0.1, 0.15, 0.15])
axin2 = ax.inset_axes([5, 7, 2.3, 2.3], transform=ax.transData)
```

**Examples using** `matplotlib.axes.Axes.inset_axes`

- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py

`matplotlib.axes.Axes.indicate_inset`

`Axes.indicate_inset(self, bounds, inset_ax=None, *, transform=None, facecolor='none', edgecolor='0.5', alpha=0.5, zorder=4.99, **kwargs)`

Add an inset indicator to the axes. This is a rectangle on the plot at the position indicated by `bounds` that optionally has lines that connect the rectangle to an inset axes (Axes.inset_axes).

**Parameters**

- `bounds`  
  Lower-left corner of rectangle to be marked, and its width and height.

- `inset_ax`  
  An optional inset axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset axes on corners chosen so as to not overlap with the indicator box.

- `transform`  
  Transform for the rectangle co-ordinates. Defaults to ax.transAxes, i.e. the units of rect are in axes-relative coordinates.

- `facecolor`  
  Facecolor of the rectangle (default ‘none’).

- `edgecolor`  
  Color of the rectangle and color of the connecting lines. Default is ‘0.5’.

- `alpha`  
  Transparency of the rectangle and connector lines. Default is 0.5.

- `zorder`  
  Drawing order of the rectangle and connector lines. Default is 4.99 (just below the default level of inset axes).

- `**kwargs`  
  Other `kwargs` are passed on to the rectangle patch.

**Returns**

- `rectangle_patch`  

- `connector_lines`  
  [4-tuple of Patches.ConnectionPatch] One for each of four connector lines. Two are set with visibility to `False`, but the user can set the visibility to `True` if the automatic choice is not deemed correct.

**Warning:** This method is experimental as of 3.0, and the API may change.
Axes.indicate_inset_zoom(self, inset_ax, **kwargs)

Add an inset indicator rectangle to the axes based on the axis limits for an `inset_ax` and draw connectors between `inset_ax` and the rectangle.

**Parameters**

- **inset_ax** [Axes] Inset axes to draw connecting lines to. Two lines are drawn connecting the indicator box to the inset axes on corners chosen so as to not overlap with the indicator box.

- **kwargs** Other `kwargs` are passed on to `Axes.inset_rectangle`

**Returns**

- `connector_lines` [4-tuple of Patches.ConnectionPatch] One for each of four connector lines. Two are set with visibility to `False`, but the user can set the visibility to `True` if the automatic choice is not deemed correct.

**Warning:** This method is experimental as of 3.0, and the API may change.

**Examples using `matplotlib.axes.Axes.indicate_inset_zoom`**

- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py

```
Axes.secondary_xaxis(self, location, *, functions=None, **kwargs)
```

Add a second x-axis to this axes.

For example if we want to have a second scale for the data plotted on the xaxis.

**Parameters**

- **location** [string or scalar] The position to put the secondary axis. Strings can be ‘top’ or ‘bottom’, for x-oriented axises or ‘left’ or ‘right’ for y-oriented axises or a scalar can be a float indicating the relative position on the axes to put the new axes (0 being the bottom (left), and 1.0 being the top (right)).

- **functions** [2-tuple of func, or Transform with an inverse] If a 2-tuple of functions, the user specifies the transform function and its inverse. i.e. `functions=(lambda x: 2 / x, lambda x: 2 / x)` would be an reciprocal transform with a factor of 2.

  The user can also directly supply a subclass of `transforms.Transform` so long as it has an inverse.

  See `/gallery/subplots_axes_and_figures/secondary_axis` for examples of making these conversions.

**Returns**

- `ax` [axes._secondary_axes.SecondaryAxis]
**Other Parameters**

**kwargs [Axes properties.] Other miscellaneous axes parameters.

**Warning:** This method is experimental as of 3.1, and the API may change.

**Examples**

The main axis shows frequency, and the secondary axis shows period.

Examples using `matplotlib.axes.Axes.secondary_xaxis`

- `sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py`

`matplotlib.axes.Axes.secondary_yaxis`

`Axes.secondary_yaxis(self, location, *, functions=None, **kwargs)`

Add a second y-axis to this axes.

For example if we want to have a second scale for the data plotted on the yaxis.

`%(secax_docstring)s`
Examples

Add a secondary axes that converts from radians to degrees

```
Examples using matplotlib.axes.Axes.secondary_yaxis

- sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py

Fields

| Axes.barbs | Plot a 2D field of barbs. |
| Axes.quiver | Plot a 2D field of arrows. |
| Axes.quiverkey | Add a key to a quiver plot. |
| Axes.streamplot | Draw streamlines of a vector flow. |

matplotlib.axes.Axes.barbs

Axes.barbs(self, *args, data=None, **kw)

Plot a 2D field of barbs.

Call signature:
barbs([X, Y], U, V, [C], **kw)

Where \(X, Y\) define the barb locations, \(U, V\) define the barb directions, and \(C\) optionally sets the color.

All arguments may be 1D or 2D. \(U, V, C\) may be masked arrays, but masked \(X, Y\) are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as shown schematically below:

```
  \/
  /\ \\
 /  \\
/ \\
---------
```

The largest increment is given by a triangle (or “flag”). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

**Parameters**

- **X, Y** [1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.
  
  If not given, they will be generated as a uniform integer meshgrid based on the dimensions of \(U\) and \(V\).

  If \(X\) and \(Y\) are 1D but \(U, V\) are 2D, \(X, Y\) are expanded to 2D using \(X, Y = \text{np.meshgrid}(X, Y)\). In this case \(\text{len}(X)\) and \(\text{len}(Y)\) must match the column and row dimensions of \(U\) and \(V\).

- **U, V** [1D or 2D array-like] The x and y components of the barb shaft.

- **C** [1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

  This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

- **length** [float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

- **pivot** [{‘tip’, ‘middle’} or float, default: ‘tip’] The part of the arrow that is anchored to the \(X, Y\) grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

- **barbcolor** [color or color sequence] Specifies the color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor*
parameter for polygons, which can be used instead. However this parameter will override facecolor.

**flagcolor** [color or color sequence] Specifies the color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.

**sizes** [dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- ‘spacing’ - space between features (flags, full/half barbs)
- ‘height’ - height (distance from shaft to top) of a flag or full barb
- ‘width’ - width of a flag, twice the width of a full barb
- ‘emptybarb’ - radius of the circle used for low magnitudes

**fill_empty** [bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding** [bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb_increments** [dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- ‘half’ - half barbs (Default is 5)
- ‘full’ - full barbs (Default is 10)
- ‘flag’ - flags (default is 50)

**flip_barb** [bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as *U* and *V*.

**Returns**

*barbs* [Barbs]

**Other Parameters**

****kwargs** The barbs can further be customized using *PolyCollection* keyword arguments:

</table>

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments are replaced by `data[<arg>]`:

- All positional and all keyword arguments.

Objects passed as `data` must support item access (`data[<arg>]`) and membership test (`<arg> in data`).

1008 Chapter 17. Modules
Examples using `matplotlib.axes.Axes.barbs`

- `sphx_glr_gallery_images_contours_and_fields_barb_demo.py`

`matplotlib.axes.Axes.quiver`

```python
Axes.quiver(self, *args, data=None, **kw)

Plot a 2D field of arrows.

Call signature:
```
quiver([X, Y], U, V, [C], **kw)
```

Where X, Y define the arrow locations, U, V define the arrow directions, and C optionally sets the color.

**Arrow size**

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the `scale` and `scale_units` parameters.

**Arrow shape**

The defaults give a slightly swept-back arrow; to make the head a triangle, make `headaxislength` the same as `headlength`. To make the arrow more pointed, reduce `headwidth` or increase `headlength` and `headaxislength`. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave `minshaft` alone.

**Arrow outline**

`linelengths` and `edgecolors` can be used to customize the arrow outlines.

**Parameters**

- **X, Y** [1D or 2D array-like, optional] The x and y coordinates of the arrow locations. If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

  If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of U and V.

- **U, V** [1D or 2D array-like] The x and y direction components of the arrow vectors.

- **C** [1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via `norm` and `cmap`.

  This does not support explicit colors. If you want to set colors directly, use `color` instead.

- **units** [{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, default: 'width'] The arrow dimensions (except for `length`) are measured in multiples of this unit.

  The following values are supported:

  - 'width', 'height': The width or height of the axis.
  - 'dots', 'inches': Pixels or inches based on the figure dpi.
• ‘x’, ‘y’, ‘xy’: X, Y or $\sqrt{X^2 + Y^2}$ in data units.

The arrows scale differently depending on the units. For ‘x’ or ‘y’, the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For ‘width’ or ‘height’, the arrow size increases with the width and height of the axes, respectively, when the window is resized; for ‘dots’ or ‘inches’, resizing does not change the arrows.

**angles** [{‘uv’, ‘xy’} or array-like, optional, default: ‘uv’] Method for determining the angle of the arrows.

• ‘uv’: The arrow axis aspect ratio is 1 so that if $U == V$ the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on X, Y data coordinates.

• ‘xy’: Arrows point from (x,y) to (x+u, y+v). Use this for plotting a gradient field, for example.

• Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

In this case $U, V$ is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with angles='xy'.

**scale** [float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is None.

If None, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the **scale_units** parameter.

**scale_units** [{'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'}, optional] If the scale kwarg is None, the arrow length unit. Default is None.

e.g. scale_units is ‘inches’, scale is 2.0, and (u,v) = (1,0), then the vector will be 0.5 inches long.

If scale_units is ‘width’ or ‘height’, then the vector will be half the width/height of the axes.

If scale_units is ‘x’ then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use angles='xy', scale_units='xy', scale=1.

**width** [float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth** [float, optional, default: 3] Head width as multiple of shaft width.

**headlength** [float, optional, default: 5] Head length as multiple of shaft width.

**headaxislength** [float, optional, default: 4.5] Head length at shaft intersection.
minshaft [float, optional, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

minlength [float, optional, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

pivot [{‘tail’, ‘mid’, ‘middle’, ‘tip’}, optional, default: ‘tail’] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

‘mid’ is a synonym for ‘middle’.

color [color or color sequence, optional] Explicit color(s) for the arrows. If C has been set, color has no effect.

This is a synonym for the PolyCollection facecolor parameter.

Other Parameters

**kwargs [PolyCollection properties, optional] All other keyword arguments are passed on to PolyCollection:

quiverkey Add a key to a quiver plot.

Examples using matplotlib.axes.Axes.quiver

- sphx_glr_gallery_images_contours_and_fields_quiverDemo.py
- sphx_glr_gallery_images_contours_and_fields_quiverSimpleDemo.py
- sphx_glr_gallery_images_contours_and_fields_trigradientDemo.py

matplotlib.axes.Axes.quiverkey

Axes.quiverkey(self, Q, X, Y, U, label, **kw)

Add a key to a quiver plot.

Call signature:

```
quiverkey(Q, X, Y, U, label, **kw)
```

Arguments:

- **Q**: The Quiver instance returned by a call to quiver.
- **X, Y**: The location of the key; additional explanation follows.
- **U**: The length of the key
- **label**: A string with the length and units of the key

Keyword arguments:

- **angle**: The angle of the key arrow. Measured in degrees anti-clockwise from the x-axis.
- **coordinates**: Coordinate system and units for X, Y: ‘axes’ and ‘figure’ are normalized coordinate systems with 0,0 in the lower left and 1,1 in the upper right; ‘data’ are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); ‘inches’ is position in the figure in inches, with 0,0 at the lower left corner.
- **color**: overrides face and edge colors from Q.
- **labelpos**: Position the label above, below, to the right, to the left of the arrow, respectively.
- **labelsep**: Distance in inches between the arrow and the label. Default is 0.1
**labelcolor**: defaults to default *Text* color.

**fontproperties**: A dictionary with keyword arguments accepted by the *FontProperties* initializer: *family, style, variant, size, weight*

Any additional keyword arguments are used to override vector properties taken from *Q*.

The positioning of the key depends on *X, Y, coordinates*, and *labelpos*. If *labelpos* is ‘N’ or ‘S’, *X, Y* give the position of the middle of the key arrow. If *labelpos* is ‘E’, *X, Y* positions the head, and if *labelpos* is ‘W’, *X, Y* positions the tail; in either of these two cases, *X, Y* is somewhere in the middle of the arrow+label key object.

**Examples using** *matplotlib.axes.Axes.quiverkey*

- *sphx_glr_gallery_images_contours_and_fields_quiver_demo.py*
- *sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py*

**matplotlib.axes.Axes.streamplot**

*Axes.streamplot*(*axes, x, y, u, v, density=1, linewidth=None, color=None, cmap=None, norm=None, arrowstyle='-|>', minlength=0.1, transform=None, zorder=None, start_points=None, maxlength=4.0, integration_direction='both', *, data=None)*

Draw streamlines of a vector flow.

**Parameters**

- *x, y* [1D arrays] An evenly spaced grid.
- *u, v* [2D arrays] *x* and *y*-velocities. The number of rows and columns must match the length of *y* and *x*, respectively.
- *density* [float or (float, float)] Controls the closeness of streamlines. When *density* = 1, the domain is divided into a 30x30 grid. *density* linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (density_x, density_y).
- *linewidth* [float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as *u* and *v*.
- *color* [matplotlib color code, or 2D array] The streamline color. If given an array, its values are converted to colors using *cmap* and *norm*. The array must have the same shape as *u* and *v*.
- *cmap* [Colormap] Colormap used to plot streamlines and arrows. This is only used if *color* is an array.
- *norm* [Normalize] Normalize object used to scale luminance data to 0, 1. If *None*, stretch (min, max) to (0, 1). This is only used if *color* is an array.
- *arrowsize* [float] Scaling factor for the arrow size.
**start_points** [Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the x and y arrays).

**zorder** [int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

**maxlength** [float] Maximum length of streamline in axes coordinates.

**integration_direction** [{'forward', 'backward', 'both'}] Integrate the streamline in forward, backward or both directions. default is 'both'.

**Returns**

**stream_container** [StreamplotSet] Container object with attributes

- **lines**: LineCollection of streamlines
- **arrows**: PatchCollection containing FancyArrowPatch objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

**Notes**

**Note:** In addition to the above described arguments, this function can take a **data** keyword argument. If such a **data** argument is given, the following arguments are replaced by **data[<arg>]**:

- All arguments with the following names: 'start_points', 'u', 'v', 'x', 'y'.

Objects passed as **data** must support item access (data[<arg>]) and membership test (<arg> in data).

**Examples using matplotlib.axes.Axes.streamplot**

- sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py

matplotlib.axes.Axes.axis

Axes.axis(self, *args, **kwargs)
    Convenience method to get or set some axis properties.

Call signatures:

```python
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymim, ymax = axis([xmin, xmax, ymim, ymax])
xmin, xmax, ymim, ymax = axis(option)
xmin, xmax, ymim, ymax = axis(**kwargs)
```

Parameters

- **xmin, xmax, ymim, ymax** [float, optional] The axis limits to be set. Either none or all of the limits must be given. This can also be achieved using

```python
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```
**option** [bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>’on’</td>
<td>Turn on axis lines and labels. Same as True.</td>
</tr>
<tr>
<td>’off’</td>
<td>Turn off axis lines and labels. Same as False.</td>
</tr>
<tr>
<td>’equal’</td>
<td>Set equal scaling (i.e., make circles circular) by changing axis limits.</td>
</tr>
<tr>
<td>’scaled’</td>
<td>Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box.</td>
</tr>
<tr>
<td>’tight’</td>
<td>Set limits just large enough to show all data.</td>
</tr>
<tr>
<td>’auto’</td>
<td>Automatic scaling (fill plot box with data).</td>
</tr>
<tr>
<td>’normal’</td>
<td>Same as ‘auto’; deprecated.</td>
</tr>
<tr>
<td>’image’</td>
<td>‘scaled’ with axis limits equal to data limits.</td>
</tr>
<tr>
<td>’square’</td>
<td>Square plot; similar to ‘scaled’, but initially forcing ( \frac{\text{xmax}-\text{xmin}}{\text{ymax}-\text{ymin}} ) = 1.</td>
</tr>
</tbody>
</table>

**emit** [bool, optional, default True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

**See also:**

- `matplotlib.axes.Axes.set_xlim`
- `matplotlib.axes.Axes.set_ylim`

**Examples using** `matplotlib.axes.Axes.axis`

- Specifying Colors
- Text in Matplotlib Plots
**matplotlib.axes.Axes.set_axis_off**

`Axes.set_axis_off(self)`

Turn the x- and y-axis off.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

**Examples using `matplotlib.axes.Axes.set_axis_off`**

- `sphx_glr_gallery_lines_bars_and_markers_marker_fillstyle_reference.py`
- `sphx_glr_gallery_lines_bars_and_markers_marker_reference.py`
- `sphx_glr_gallery_images_contours_and_fields_barcode_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_image_transparency_blend.py`
- `sphx_glr_gallery_pie_and_polar_charts_nested_pie.py`
- `sphx_glr_gallery_pyplots_text_layout.py`
- `sphx_glr_gallery_color_colormap_reference.py`
- *Choosing Colormaps in Matplotlib*
- *Text properties and layout*

**matplotlib.axes.Axes.set_axis_on**

`Axes.set_axis_on(self)`

Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

**matplotlib.axes.Axes.set_frame_on**

`Axes.set_frame_on(self, b)`

Set whether the axes rectangle patch is drawn.

**Parameters**

- `b` [bool]

**Examples using `matplotlib.axes.Axes.set_frame_on`**

- `sphx_glr_gallery_misc_demo_agg_filter.py`

**matplotlib.axes.Axes.get_frame_on**

`Axes.get_frame_on(self)`

Get whether the axes rectangle patch is drawn.
Axes.set_axisbelow(self, b)

Set whether axis ticks and gridlines are above or below most artists.
This controls the zorder of the ticks and gridlines. For more information on the zorder
see /gallery/misc/zorder_demo.

Parameters

b [bool or 'line'] Possible values:

- True (zorder = 0.5): Ticks and gridlines are below all Artists.
- 'line' (zorder = 1.5): Ticks and gridlines are above patches (e.g. rectangles, with default zorder = 1) but still below lines and markers (with their default zorder = 2).
- False (zorder = 2.5): Ticks and gridlines are above patches and lines / markers.

See also:

get_axisbelow

Examples using matplotlib.axes.Axes.set_axisbelow

- sphx_glr_gallery_statistics_boxplot_demo.py

Axes.get_axisbelow(self)

Get whether axis ticks and gridlines are above or below most artists.

Returns

axisbelow [bool or 'line']

See also:

set_axisbelow

Axes.grid(self, b=None, which='major', axis='both', **kwargs)

Configure the grid lines.

Parameters

b [bool or None, optional] Whether to show the grid lines. If any kwargs are supplied, it is assumed you want the grid on and b will be set to True.

If b is None and there are no kwargs, this toggles the visibility of the lines.

which [{'major', 'minor', 'both'}, optional] The grid lines to apply the changes on.
**axis** [{‘both’, ‘x’, ‘y’}, optional] The axis to apply the changes on.

**kwargs [Line2D properties] Define the line properties of the grid, e.g.:

```python
grid(color='r', linestyle='-', linewidth=2)
```

Valid kwargs are

</tbody>
</table>
Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the `Line2D` objects comprising the grid. Therefore, to set grid zorder, use `set_axisbelow` or, for more control, call the `set_zorder` method of each axis.

- sphx_glr_gallery_units_artist_tests.py
matplotlib.axes.Axes.get_facecolor

Axes.get_facecolor(self)
   Get the facecolor of the Axes.

matplotlib.axes.Axes.get_fc

Axes.get_fc(self)
   Get the facecolor of the Axes.

matplotlib.axes.Axes.set_facecolor

Axes.set_facecolor(self, color)
   Set the facecolor of the Axes.

   **Parameters**

   **color** [color]

   **Examples using** matplotlib.axes.Axes.set_facecolor

   - sphx_glr_gallery_color_color_demo.py
   - sphx_glr_gallery_color_color_cycle_default.py

matplotlib.axes.Axes.set_fc

Axes.set_fc(self, color)
   Set the facecolor of the Axes.

   **Parameters**

   **color** [color]

**17.5.6 Property cycle**

Axes.set_prop_cycle

Set the property cycle of the Axes.

matplotlib.axes.Axes.set_prop_cycle

Axes.set_prop_cycle(self, *args, **kwargs)
   Set the property cycle of the Axes.

   The property cycle controls the style properties such as color, marker and linestyle of future plot commands. The style properties of data already added to the Axes are not modified.

   Call signatures:
set_prop_cycle(cycler)
set_prop_cycle(label=values[, label2=values2[, ...]])
set_prop_cycle(label, values)

Form 1 sets given Cycler object.
Form 2 creates a Cycler which cycles over one or more properties simultaneously and set it as the property cycle of the axes. If multiple properties are given, their value lists must have the same length. This is just a shortcut for explicitly creating a cycler and passing it to the function, i.e. it’s short for set_prop_cycle(cycler(label=values label2=values2, ...)).

Form 3 creates a Cycler for a single property and set it as the property cycle of the axes. This form exists for compatibility with the original cycler.cycler interface. Its use is discouraged in favor of the kwarg form, i.e. set_prop_cycle(label=values).

Parameters

cycler [Cycler] Set the given Cycler. None resets to the cycle defined by the current style.

label [str] The property key. Must be a valid Artist property. For example, ‘color’ or ‘linestyle’. Aliases are allowed, such as ‘c’ for ‘color’ and ’lw’ for ‘linewidth’.

values [iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

See also:

matplotlib.rcsetup.cycler Convenience function for creating validated cyclers for properties.
cycler.cycler The original function for creating unvalidated cyclers.

Examples

Setting the property cycle for a single property:

```python
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'])
```

Setting the property cycle for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```python
>>> ax.set_prop_cycle(color=['red', 'green', 'blue'],
... marker=['o', '+', 'x'])
```

Examples using matplotlib.axes.Axes.set_prop_cycle

- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py
- Styling with cycler
17.5.7 Axis / limits

Axes.get_xaxis
Return the XAxis instance.

Axes.get_yaxis
Return the YAxis instance.

Examples using matplotlib.axes.Axes.get_xaxis
• sphx_glr_gallery_lines_bars_and_markers_timeline.py
• sphx_glr_gallery_statistics_customized_violin.py
• sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py

Examples using matplotlib.axes.Axes.get_yaxis
• sphx_glr_gallery_lines_bars_and_markers_timeline.py
• sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py

Axis Limits and direction

Axes.invert_xaxis
Invert the x-axis.

Axes.xaxis_inverted
Return whether the x-axis is inverted.

Axes.invert_yaxis
Invert the y-axis.

Axes.yaxis_inverted
Return whether the y-axis is inverted.

Axes.set_xlim
Set the x-axis view limits.

Axes.get_xlim
Return the x-axis view limits.

Axes.set_ylim
Set the y-axis view limits.

Axes.get_ylim
Return the y-axis view limits.

Axes.update_datalim
Extend the datalim BBox to include the given points.

Axes.update_datalim_bounds
Extend the datalim BBox to include the given Bbox.

Axes.set_xbound
Set the lower and upper numerical bounds of the x-axis.

Axes.get_xbound
Return the lower and upper x-axis bounds, in increasing order.
Table 92 – continued from previous page

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.set_ybound</code></td>
<td>Set the lower and upper numerical bounds of the y-axis.</td>
</tr>
<tr>
<td><code>Axes.get_ybound</code></td>
<td>Return the lower and upper y-axis bounds, in increasing order.</td>
</tr>
</tbody>
</table>

```
matplotlib.axes.Axes.invert_xaxis

Axes.invert_xaxis(self)
Invert the x-axis.

See also:
- xaxis_inverted
- get_xlim, set_xlim
- get_xbound, set_xbound
```

```
matplotlib.axes.Axes.xaxis_inverted

Axes.xaxis_inverted(self)
Return whether the x-axis is inverted.
The axis is inverted if the left value is larger than the right value.

See also:
- invert_xaxis
- get_xlim, set_xlim
- get_xbound, set_xbound
```

```
matplotlib.axes.Axes.invert_yaxis

Axes.invert_yaxis(self)
Invert the y-axis.

See also:
- yaxis_inverted
- get_ylim, set_ylim
- get_ybound, set_ybound
```

**Examples using** `matplotlib.axes.Axes.invert_yaxis`

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_marker_reference.py
matplotlib.axes.Axes.yaxis_inverted

Axes.yaxis_inverted(self)
Return whether the y-axis is inverted.
The axis is inverted if the bottom value is larger than the top value.

See also:

invert_yaxis
get_ylim, set_ylim
get_ybound, set_ybound

matplotlib.axes.Axes.set_xlim

Axes.set_xlim(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)
Set the x-axis view limits.

Parameters

left [scalar, optional] The left xlim in data coordinates. Passing None leaves the limit unchanged.
The left and right xlims may be passed as the tuple (left, right) as the first positional argument (or as the left keyword argument).

right [scalar, optional] The right xlim in data coordinates. Passing None leaves the limit unchanged.

emit [bool, optional] Whether to notify observers of limit change (default: True).

auto [bool or None, optional] Whether to turn on autoscaling of the x-axis. True turns on, False turns off (default action), None leaves unchanged.

xmin, xmax [scalar, optional] They are equivalent to left and right respectively, and it is an error to pass both xmin and left or xmax and right.

Returns

left, right [(float, float)] The new x-axis limits in data coordinates.

See also:

get_xlim
set_xbound, get_xbound
invert_xaxis, xaxis_inverted

Notes

The left value may be greater than the right value, in which case the x-axis values will decrease from left to right.
Examples

```python
>>> set_xlim(left, right)
>>> set_xlim((left, right))
>>> left, right = set_xlim(left, right)
```

One limit may be left unchanged.

```python
>>> set_xlim(right=right_limit)
```

Limits may be passed in reverse order to flip the direction of the x-axis. For example, suppose x represents the number of years before present. The x-axis limits might be set like the following so 5000 years ago is on the left of the plot and the present is on the right.

```python
>>> set_xlim(5000, 0)
```

matplotlib.axes.Axes.get_xlim

Axes.get_xlim(self)
Return the x-axis view limits.

Returns
- left, right [float, float] The current x-axis limits in data coordinates.

See also:
- set_xlim
- set_xbound, get_xbound
- invert_xaxis, xaxis_inverted

Notes
The x-axis may be inverted, in which case the left value will be greater than the right value.

Examples using matplotlib.axes.Axes.get_xlim

- sphx_glr_gallery_lines_bars_and_markers_scatter_hist.py
- Decay

matplotlib.axes.Axes.set_ylim

Axes.set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
Set the y-axis view limits.

Parameters
- bottom [scalar, optional] The bottom ylim in data coordinates. Passing None leaves the limit unchanged.
  The bottom and top ylims may be passed as the tuple (bottom, top) as the first positional argument (or as the bottom keyword argument).
- top [scalar, optional] The top ylim in data coordinates. Passing None leaves the limit unchanged.
- emit [bool, optional] Whether to notify observers of limit change (default: True).
auto [bool or None, optional] Whether to turn on autoscaling of the y-axis. 
   True turns on, False turns off (default action), None leaves unchanged.

ymin, ymax [scalar, optional] They are equivalent to bottom and top respectively, and it is an error to pass both ymin and bottom or ymax and top.

Returns
   bottom, top [(float, float)] The new y-axis limits in data coordinates.

See also:
    get_ylim
    set_ybound, get_ybound
    invert_yaxis, yaxis_inverted

Notes

The bottom value may be greater than the top value, in which case the y-axis values will decrease from bottom to top.

Examples

>>> set_ylim(bottom, top)
>>> set_ylim((bottom, top))
>>> bottom, top = set_ylim(bottom, top)

One limit may be left unchanged.

>>> set_ylim(top=top_lim)

Limits may be passed in reverse order to flip the direction of the y-axis. For example, suppose y represents depth of the ocean in m. The y-axis limits might be set like the following so 5000 m depth is at the bottom of the plot and the surface, 0 m, is at the top.

>>> set_ylim(5000, 0)

Examples using matplotlib.axes.Axes.set_ylim

• sphx_glr_gallery_lines_bars_and_markers_broken_barh.py
• sphx_glr_gallery_lines_bars_and_markers_eventcollection_demo.py

Axes.get_ylim

Axes.get_ylim(self)

Return the y-axis view limits.

Returns

bottom, top [[float, float]] The current y-axis limits in data coordinates.

See also:

set_ylim

set_ybound, get_ybound

invert_yaxis, yaxis_inverted

Notes

The y-axis may be inverted, in which case the bottom value will be greater than the top value.
Examples using `matplotlib.axes.Axes.get_ylim`

- sphx_glr_gallery_lines_bars_and_markers_scatter_hist.py
- sphx_glr_gallery_subplots_axes_and_figures_fahrenheit_celsius_scales.py
- sphx_glr_gallery_shapes_and_collections_collections.py

`matplotlib.axes.Axes.update_datalim`

```python
Axes.update_datalim(self, xys, updatex=True, updatey=True)
```

Extend the dataLim BBox to include the given points.

If no data is set currently, the BBox will ignore its limits and set the bound to be the bounds of the xydata (xys). Otherwise, it will compute the bounds of the union of its current data and the data in xys.

**Parameters**

- `xys` [2D array-like] The points to include in the data limits BBox. This can be either a list of (x, y) tuples or a Nx2 array.
- `updatex`, `updatey` [bool, optional, default `True`] Whether to update the x/y limits.

`matplotlib.axes.Axes.update_datalim_bounds`

```python
Axes.update_datalim_bounds(self, bounds)
```

Extend the datalim BBox to include the given BBox.

**Parameters**

- `bounds` [Bbox]

`matplotlib.axes.Axes.set_xbound`

```python
Axes.set_xbound(self, lower=None, upper=None)
```

Set the lower and upper numerical bounds of the x-axis.

This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (`Axes._ autoscaleXon`).

**Parameters**

- `lower`, `upper` [float or None] The lower and upper bounds. If None, the respective axis bound is not modified.

**See also:**

- `get_xbound`
- `get_xlim, set_xlim`
- `invert_xaxis, xaxis_inverted`
Matplotlib, Release 3.1.3

matplotlib.axes.Axes.get_xbound

Axes.get_xbound(self)
    Return the lower and upper x-axis bounds, in increasing order.

    See also:
    set_xbound
    get_xlim, set_xlim
    invert_xaxis, xaxis_inverted

matplotlib.axes.Axes.set_ybound

Axes.set_ybound(self, lower=None, upper=None)
    Set the lower and upper numerical bounds of the y-axis.
    This method will honor axes inversion regardless of parameter order. It will not change
    the autoscaling setting (Axes._autoscaleYon).

    Parameters
    lower, upper [float or None] The lower and upper bounds. If None, the
    respective axis bound is not modified.

    See also:
    get_ybound
    get_ylim, set_ylim
    invert_yaxis, yaxis_inverted

matplotlib.axes.Axes.get_ybound

Axes.get_ybound(self)
    Return the lower and upper y-axis bounds, in increasing order.

    See also:
    set_ybound
    get_ylim, set_ylim
    invert_yaxis, yaxis_inverted

```
matplotlib.axes.Axes.set_xlabel
```

Set the label for the x-axis.

**Parameters**

- `xlabel` [str] The label text.
- `labelpad` [scalar, optional, default: `None`] Spacing in points from the axes bounding box including ticks and tick labels.

**Other Parameters**

- `**kwargs` [Text properties] Text properties control the appearance of the label.

**See also:**

matplotlib.axes.Axes.get_xlabel

Axes.get_xlabel(self)
Get the xlabel text string.

matplotlib.axes.Axes.set_ylabel

Axes.set_ylabel(self, ylabel, fontdict=None, labelpad=None, **kwargs)
Set the label for the y-axis.

Parameters

ylabel [str] The label text.
labelpad [scalar, optional, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

Other Parameters

**kwargs [Text properties] Text properties control the appearance of the label.

**matplotlib.axes.Axes.get_ylabel**

`Axes.get_ylabel(self)`

Get the ylabel text string.
Axes.set_title(self, label, fontdict=None, loc='center', pad=None, **kwargs)

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

Parameters

- **label** [str] Text to use for the title
- **fontdict** [dict] A dictionary controlling the appearance of the title text, the default fontdict is:

```
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'verticalalignment': 'baseline',
 'horizontalalignment': 'center'}
```

- **loc** [{'center', 'left', 'right'}, str, optional] Which title to set, defaults to 'center'
- **pad** [float] The offset of the title from the top of the axes, in points. Default is None to use rcParams['axes.titlepad'].

Returns

- **text** [Text] The matplotlib text instance representing the title

Other Parameters

- **kwargs** [Text properties] Other keyword arguments are text properties, see Text for a list of valid text properties.

**matplotlib.axes.Axes.get_title**

```python
Axes.get_title(self, loc='center')
```

Get an axes title.

Get one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.
Parameters

Returns

title  [str] The title text string.

matplotlib.axes.Axes.legend

Axes.legend(self, *args, **kwargs)
Place a legend on the axes.

Call signatures:

legend()
legend(labels)
legend(handles, labels)

The call signatures correspond to three different ways how to use this method.

1. Automatic detection of elements to be shown in the legend

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.

In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the set_label() method on the artist:

```python
line, = ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```python
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling Axes.legend without any arguments and without setting the labels manually will result in no legend being drawn.

2. Labeling existing plot elements

To make a legend for lines which already exist on the axes (via plot for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```python
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This way of using is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:
Parameters

handles [sequence of Artist, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with labels, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels [sequence of strings, optional] A list of labels to show next to the artists. Use this together with handles, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

Returns

matplotlib.legend.Legend instance

Other Parameters

loc [str or pair of floats, default: rcParams["legend.loc"] (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case bbox_to_anchor will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:
<table>
<thead>
<tr>
<th>Location String</th>

</table>

**bbox_to_anchor** [BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc. Defaults to axes.bbox (if called as a method to Axes.legend) or figure.bbox (if Figure.legend). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by bbox_transform, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or BboxBase is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0.5, 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by loc at x, y. For example, to put the legend’s upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol** [integer] The number of columns that the legend has. Default is 1.

**prop** [None or matplotlib.font_manager.FontProperties or dict] The font properties of the legend. If None (default), the current matplotlib.rcParams will be used.

**fontsize** [int or float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] Controls the font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if prop is not specified.

**numpoints** [None or int] The number of marker points in the legend when creating a legend entry for a Line2D (line). Default is None, which will take the value from rcParams["legend.numpoints"] (default: 1).

**scatterpoints** [None or int] The number of marker points in the legend when creating a legend entry for a PathCollection (scatter plot). Default is None, which will take the value from rcParams["legend.scatterpoints"] (default: 1).

**scatteryoffsets** [iterable of floats] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the
base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5]. Default is [0.375, 0.5, 0.3125].

**markerscale** [None or int or float] The relative size of legend markers compared with the originally drawn ones. Default is None, which will take the value from rcParams["legend.markerscale"] (default: 1.0).

**markerfirst** [bool] If True, legend marker is placed to the left of the legend label. If False, legend marker is placed to the right of the legend label. Default is True.

**frameon** [None or bool] Control whether the legend should be drawn on a patch (frame). Default is None, which will take the value from rcParams["legend.frameon"] (default: True).

**fancybox** [None or bool] Control whether round edges should be enabled around the FancyBboxPatch which makes up the legend’s background. Default is None, which will take the value from rcParams["legend.fancybox"] (default: True).

**shadow** [None or bool] Control whether to draw a shadow behind the legend. Default is None, which will take the value from rcParams["legend.shadow"] (default: False).

**framealpha** [None or float] Control the alpha transparency of the legend’s background. Default is None, which will take the value from rcParams["legend.framealpha"] (default: 0.8). If shadow is activated and framealpha is None, the default value is ignored.

**facecolor** [None or “inherit” or a color spec] Control the legend’s background color. Default is None, which will take the value from rcParams["legend.facecolor"] (default: ‘inherit’). If “inherit”, it will take rcParams["axes.facecolor"] (default: ‘white’).

**edgecolor** [None or “inherit” or a color spec] Control the legend’s background patch edge color. Default is None, which will take the value from rcParams["legend.edgecolor"] (default: 0.8) If “inherit”, it will take rcParams["axes.edgecolor"] (default: ‘black’).

**mode** [{"expand", None}] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or bbox_to_anchor if defines the legend’s size).

**bbox_transform** [None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor). For a value of None (default) the Axes’ transAxes transform will be used.

**title** [str or None] The legend’s title. Default is no title (None).

**title_fontsize**: str or None The fontsize of the legend’s title. Default is the default fontsize.

**borderpad** [float or None] The fractional whitespace inside the legend border. Measured in font-size units. Default is None, which will take the value from rcParams["legend.borderpad"] (default: 0.4).

**labelspacing** [float or None] The vertical space between the legend entries. Measured in font-size units. Default is None, which will take the value from rcParams["legend.labelspacing"] (default: 0.5).
**handlelength** [float or None] The length of the legend handles. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.handlelength"]` (default: 2.0).

**handletextpad** [float or None] The pad between the legend handle and text. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.handletextpad"]` (default: 0.8).

**borderaxespad** [float or None] The pad between the axes and legend border. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.borderaxespad"]` (default: 0.5).

**columnspacing** [float or None] The spacing between columns. Measured in font-size units. Default is `None`, which will take the value from `rcParams["legend.columnspacing"]` (default: 2.0).

**handler_map** [dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map()`.

**Notes**

Not all kinds of artist are supported by the legend command. See *Legend guide* for details.

*Constrained Layout Guide*

*Specifying Colors*
matplotlib.axes.Axes.get_legend

Axes.get_legend(self)
    Return the Legend instance, or None if no legend is defined.

matplotlib.axes.Axes.get_legend_handles_labels

Axes.get_legend_handles_labels(self, legend_handler_map=None)
    Return handles and labels for legend
    ax.legend() is equivalent to
    
    h, l = ax.get_legend_handles_labels()
    ax.legend(h, l)

Axis scales

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.set_xscale</td>
<td>Set the x-axis scale.</td>
</tr>
<tr>
<td>Axes.get_xscale</td>
<td>Return the x-axis scale as string.</td>

<tr>
<td>Axes.set_yscale</td>
<td>Set the y-axis scale.</td>
</tr>
<tr>
<td>Axes.get_yscale</td>
<td>Return the y-axis scale as string.</td>
</tr>
</tbody>
</table>

matplotlib.axes.Axes.set_xscale

Axes.set_xscale(self, value, **kwargs)
    Set the x-axis scale.

    **Parameters**

    value [{“linear”, “log”, “symlog”, “logit”, ...}] The axis scale type to apply.

    **kwargs Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

    • matplotlib.scale.LinearScale
    • matplotlib.scale.LogScale
    • matplotlib.scale.SymmetricalLogScale
    • matplotlib.scale.LogitScale

    **Notes**

    By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using matplotlib.scale.register_scale. These scales can then also be used here.

    **Examples using** matplotlib.axes.Axes.set_xscale

    • sphx_glr_gallery_text_labels_and_annotations_engineering_formatter.py
matplotlib.axes.Axes.get_xscale

Axes.get_xscale(self)
Return the x-axis scale as string.

See also:

set_xscale

matplotlib.axes.Axes.set_yscale

Axes.set_yscale(self, value, **kwargs)
Set the y-axis scale.

Parameters

value [{“linear”, “log”, “symlog”, “logit”, ...}] The axis scale type to apply.

**kwargs Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

• matplotlib.scale.LinearScale
• matplotlib.scale.LogScale
• matplotlib.scale.SymmetricalLogScale
• matplotlib.scale.LogitScale

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using matplotlib.scale.register_scale. These scales can then also be used here.

Examples using matplotlib.axes.Axes.set_yscale

</tr>
</tbody>
</table>

matplotlib.axes.Axes.use_sticky_edges

Axes.use_sticky_edges
    When autoscaling, whether to obey all Artist.sticky_edges.

    Default is True.

    Setting this to False ensures that the specified margins will be applied, even if the plot includes an image, for example, which would otherwise force a view limit to coincide with its data limit.

    The changing this property does not change the plot until autoscale or autoscale_view is called.
Axes.margins(self, *margins, x=None, y=None, tight=True)

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the margin times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a TypeError. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if xmargin is not None, then xmargin times the X data interval will be added to each end of that interval before it is used in autoscaling.

Parameters

*margins [float, optional] If a single positional argument is provided, it specifies both margins of the x-axis and y-axis limits. If two positional arguments are provided, they will be interpreted as xmargin, ymargin. If setting the margin on a single axis is desired, use the keyword arguments described below.

x, y [float, optional] Specific margin values for the x-axis and y-axis, respectively. These cannot be used with positional arguments, but can be used individually to alter e.g., only the y-axis.

tight [bool or None, default is True] The tight parameter is passed to autoscale_view(), which is executed after a margin is changed; the default here is True, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Set tight to None will preserve the previous setting.

Returns

xmargin, ymargin [float]

Notes

If a previously used Axes method such as pcolor() has set use_sticky_edges to True, only the limits not set by the “sticky artists” will be modified. To force all of the margins to be set, set use_sticky_edges to False before calling margins().

Examples using matplotlib.axes.Axes.margins

• sphx_glr_gallery_lines_bars_and_markers_marker_reference.py
• sphx_glr_gallery_lines_bars_and_markers_timeline.py
• sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
• sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py
• sphx_glr_gallery_style_sheets_ggplot.py
• sphx_glr_gallery_widgets_slider_demo.py
**matplotlib.axes.Axes.set_xmargin**

`Axes.set_xmargin(self, m)`

Set padding of X data limits prior to autoscaling.

$m$ times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of $m = 0.1$ will result in a range [-0.2, 2.2].

Negative values $-0.5 < m < 0$ will result in clipping of the data range. I.e. for a data range [0, 2], a factor of $m = -0.1$ will result in a range [0.2, 1.8].

**Parameters**

- **m** [float greater than -0.5]

**matplotlib.axes.Axes.set_ymargin**

`Axes.set_ymargin(self, m)`

Set padding of Y data limits prior to autoscaling.

$m$ times the data interval will be added to each end of that interval before it is used in autoscaling. For example, if your data is in the range [0, 2], a factor of $m = 0.1$ will result in a range [-0.2, 2.2].

Negative values $-0.5 < m < 0$ will result in clipping of the data range. I.e. for a data range [0, 2], a factor of $m = -0.1$ will result in a range [0.2, 1.8].

**Parameters**

- **m** [float greater than -0.5]

**matplotlib.axes.Axes.relim**

`Axes.relim(self, visible_only=False)`

Recompute the data limits based on current artists.

At present, `Collection` instances are not supported.

**Parameters**

- **visible_only** [bool] Whether to exclude invisible artists. Defaults to False.

**matplotlib.axes.Axes.autoscale**

`Axes.autoscale(self, enable=True, axis='both', tight=None)`

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

**Parameters**

- **enable** [bool or None, optional] True (default) turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.
**axis** [{‘both’, ‘x’, ‘y’}, optional] which axis to operate on; default is ‘both’

**tight** [bool or None, optional] If True, set view limits to data limits; if False, let the locator and margins expand the view limits; if None, use tight scaling if the only artist is an image, otherwise treat tight as False. The tight setting is retained for future autoscaling until it is explicitly changed.

**matplotlib.axes.Axes.autoscale_view**

```
Axes.autoscale_view(self, tight=None, scalex=True, scaley=True)
```

Autoscale the view limits using the data limits.

You can selectively autoscale only a single axis, e.g., the xaxis by setting scaley to False. The autoscaling preserves any axis direction reversal that has already been done.

If tight is False, the axis major locator will be used to expand the view limits if rc-Params[‘axes.autolimit_mode’] is ‘round numbers’. Note that any margins that are in effect will be applied first, regardless of whether tight is True or False. Specifying tight as True or False saves the setting as a private attribute of the Axes; specifying it as None (the default) applies the previously saved value.

The data limits are not updated automatically when artist data are changed after the artist has been added to an Axes instance. In that case, use `matplotlib.axes.Axes.relim()` prior to calling autoscale_view.

**Examples using matplotlib.axes.Axes.autoscale_view**

- sphx_glr_gallery_shapes_and_collections_collections.py
- sphx_glr_gallery_shapes_and_collections_compound_path.py
- sphx_glr_gallery_shapes_and_collections_ellipse_collection.py
- sphx_glr_gallery_units_bar_unit_demo.py

**matplotlib.axes.Axes.set_autoscale_on**

```
Axes.set_autoscale_on(self, b)
```

Set whether autoscaling is applied on plot commands

**Parameters**

- **b** [bool]

**Examples using matplotlib.axes.Axes.set_autoscale_on**

- sphx_glr_gallery_event_handling_resample.py

**matplotlib.axes.Axes.get_autoscale_on**

```
Axes.get_autoscale_on(self)
```

Get whether autoscaling is applied for both axes on plot commands
**Matplotlib, Release 3.1.3**

```python
Axes.set_autoscalex_on

Axes.set_autoscalex_on(self, b)
    Set whether autoscaling for the x-axis is applied on plot commands
    
    **Parameters**
    
    b [bool]
```

```python
Axes.get_autoscalex_on

Axes.get_autoscalex_on(self)
    Get whether autoscaling for the x-axis is applied on plot commands
```

```python
Axes.set_autoscaley_on

Axes.set_autoscaley_on(self, b)
    Set whether autoscaling for the y-axis is applied on plot commands

Axes.get_autoscaley_on

Axes.get_autoscaley_on(self)
    Get whether autoscaling for the y-axis is applied on plot commands
```

**Aspect ratio**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.apply_aspect</code></td>
<td>Adjust the Axes for a specified data aspect ratio.</td>
</tr>
<tr>
<td><code>Axes.set_aspect</code></td>
<td>Set the aspect of the axis scaling, i.e.</td>
</tr>
<tr>
<td><code>Axes.get_aspect</code></td>
<td></td>
</tr>
<tr>
<td><code>Axes.set_adjustable</code></td>
<td>Define which parameter the Axes will change to achieve a given aspect.</td>
</tr>
<tr>
<td><code>Axes.get_adjustable</code></td>
<td></td>
</tr>
</tbody>
</table>

```python
Axes.apply_aspect

Axes.apply_aspect(self, position=None)
    Adjust the Axes for a specified data aspect ratio.
    
    Depending on `get_adjustable` this will modify either the Axes box (position) or the view limits. In the former case, `get_anchor` will affect the position.

    **See also:**
    
    `Axes.set_aspect` for a description of aspect ratio handling.
```
matplotlib.axes.Axes.set_adjustable defining the parameter to adjust in order to meet
the required aspect.

matplotlib.axes.Axes.set_anchor defining the position in case of extra space.

Notes

This is called automatically when each Axes is drawn. You may need to call it yourself if
you need to update the Axes position and/or view limits before the Figure is drawn.

matplotlib.axes.Axes.set_aspect

Axes.set_aspect(self, aspect, adjustable=None, anchor=None, share=False)

Set the aspect of the axis scaling, i.e. the ratio of y-unit to x-unit.

Parameters

aspect [{‘auto’, ‘equal’} or num] Possible values:

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘auto’</td>
<td>automatic; fill the position rectangle with data</td>
</tr>
<tr>
<td>‘equal’</td>
<td>same scaling from data to plot units for x and y</td>
</tr>
<tr>
<td>num</td>
<td>a circle will be stretched such that the height is num times the width. aspect=1 is the same as aspect=’equal’.</td>
</tr>
</tbody>
</table>

adjustable [None or {‘box’, ‘datalim’}, optional] If not None, this defines
which parameter will be adjusted to meet the required aspect. See
set_adjustable for further details.

anchor [None or str or 2-tuple of float, optional] If not None, this defines
where the Axes will be drawn if there is extra space due to aspect con-
straints. The most common way to to specify the anchor are abbrevia-
tions of cardinal directions:

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>‘C’</td>
<td>centered</td>
</tr>
<tr>
<td>‘SW’</td>
<td>lower left corner</td>
</tr>
<tr>
<td>‘S’</td>
<td>middle of bottom edge</td>
</tr>
<tr>
<td>‘SE’</td>
<td>lower right corner</td>
</tr>
<tr>
<td>etc.</td>
<td></td>
</tr>
</tbody>
</table>

See set_anchor for further details.

share [bool, optional] If True, apply the settings to all shared Axes. Default
is False.

See also:

`Colormap Normalization`

`matplotlib.axes.Axes.get_aspect`

`Axes.get_aspect(self)`

`matplotlib.axes.Axes.set_adjustable`

`Axes.set_adjustable(self, adjustable, share=False)`

Define which parameter the Axes will change to achieve a given aspect.

**Parameters**

- `adjustable` [{‘box’, ‘datalim’}] If ‘box’, change the physical dimensions of the Axes. If ‘datalim’, change the x or y data limits.

- `share` [bool, optional] If True, apply the settings to all shared Axes. Default is False.

**See also:**
Shared Axes (of which twinned Axes are a special case) impose restrictions on how aspect ratios can be imposed. For twinned Axes, use ‘datalim’. For Axes that share both x and y, use ‘box’. Otherwise, either ‘datalim’ or ‘box’ may be used. These limitations are partly a requirement to avoid over-specification, and partly a result of the particular implementation we are currently using, in which the adjustments for aspect ratios are done sequentially and independently on each Axes as it is drawn.

Examples using matplotlib.axes.Axes.set_adjustable

- sphx_glr_gallery_scales_aspect_loglog.py

matplotlib.axes.Axes.get_adjustable

Axes.get_adjustable(self)

### matplotlib.axes.Axes.set_xticks

```python
Axes.set_xticks(self, ticks, minor=False)
```

Set the x ticks with list of `ticks`

**Parameters**

- `ticks` [list] List of x-axis tick locations.
- `minor` [bool, optional] If False sets major ticks, if True sets minor ticks. Default is False.

### Examples using matplotlib.axes.Axes.set_xticks

- `sphx_glr_gallery_lines_bars_and_markers_barchart.py`
- `sphx_glr_gallery_lines_bars_and_markers_psd_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_image.annotated.heatmap.py`
- `sphx_glr_gallery_subplots_axes_and_figures_axes_demo.py`
- `sphx_glr_gallery_statistics_boxplot_vs_violin.py`
- `sphx_glr_gallery_statistics_customized_violin.py`
- `sphx_glr_gallery_statistics_multiple_histograms_side_by_side.py`
- `sphx_glr_gallery_shapes_and_collections_hatch_demo.py`
- `sphx_glr_gallery_style_sheets_ggplot.py`
- `sphx_glr_gallery_axes_grid1_scatter_hist_locatable_axes.py`
- `sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py`
- `sphx_glr_gallery_showcase_firefox.py`
- `sphx_glr_gallery_showcase_integral.py`
- `sphx_glr_gallery_showcase_mandelbrot.py`
- `sphx_glr_gallery_showcase_xkcd.py`

- `sphx_glr_gallery_frontpage_contour.py`
- `sphx_glr_gallery_frontpage_histogram.py`
matplotlib.axes.Axes.get_xticks

Axes.get_xticks(self, minor=False)

Return the x ticks as a list of locations

matplotlib.axes.Axes.set_xticklabels

Axes.set_xticklabels(self, labels, fontdict=None, minor=False, **kwargs)

Set the x-tick labels with list of string labels.

Parameters

- **labels** [List[str]] List of string labels.
- **fontdict** [dict, optional] A dictionary controlling the appearance of the tick-labels. The default fontdict is:

  ```
  {'fontsize': rcParams['axes.titlesize'],
   'fontweight': rcParams['axes.titleweight'],
   'verticalalignment': 'baseline',
   'horizontalalignment': 'loc'}
  ```

- **minor** [bool, optional] Whether to set the minor ticklabels rather than the major ones.

Returns

- A list of Text instances.

Other Parameters

- **kwargs** [Text properties.]

Examples using `matplotlib.axes.Axes.set_xticklabels`
- sphxglomer_gallery_statistics_boxplot_demo.py
- sphxglomer_gallery_statistics_customized_violin.py
- sphxglomer_gallery_statistics_multiple_histograms_side_by_side.py
- sphxglomer_gallery_style_sheets_ggplot.py
- sphxglomer_gallery_showcase_integral.py
- sphxglomer_gallery_showcase_xkcd.py
- sphxglomer_gallery_ticks_and_spines_spines_bounds.py
- sphxglomer_gallery_units_bar_unit_demo.py
- *Constrained Layout Guide*

matplotlib.axes.Axes.get_xticklabels

Axes.get_xticklabels(*self, minor=False, which=None*)
Get the x tick labels as a list of *Text* instances.

**Parameters**

- **minor** [bool, optional] If True return the minor ticklabels, else return the major ticklabels.
- **which** [None, ('minor', 'major', 'both')] Overrides minor.

**Returns**

- **ret** [list] List of *Text* instances.

**Examples using** matplotlib.axes.Axes.get_xticklabels

- sphxglomer_gallery_lines_bars_and_markers_timeline.py
- sphxglomer_gallery_images_contours_and_fields_image_annotated_heatmap.py
- sphxglomer_gallery_subplots_axes_and_figures_align_labels_demo.py
- sphxglomer_gallery_subplots_axes_and_figures_shared_axis_demo.py
- sphxglomer_gallery_statistics_boxplot_demo.py
- sphxglomer_gallery_ticks_and_spines_spines_bounds.py
- sphxglomer_gallery_units_bar_unit_demo.py
- *The Lifecycle of a Plot*

matplotlib.axes.Axes.get_xmajorticklabels

Axes.get_xmajorticklabels(*self*)
Get the major x tick labels.

**Returns**

- **labels** [list] List of *Text* instances
matplotlib.axes.Axes.get_xminorticklabels

```python
Axes.get_xminorticklabels(self)
Get the minor x tick labels.

Returns

labels [list] List of Text instances
```

matplotlib.axes.Axes.get_xgridlines

```python
Axes.get_xgridlines(self)
Get the x grid lines as a list of Line2D instances.
```

matplotlib.axes.Axes.get_xticklines

```python
Axes.get_xticklines(self)
Get the x tick lines as a list of Line2D instances.
```

matplotlib.axes.Axes.xaxis_date

```python
Axes.xaxis_date(self, tz=None)
Sets up x-axis ticks and labels that treat the x data as dates.

Parameters

tz [string or tzinfo instance, optional] Timezone. Defaults to rcParams["timezone"] (default: 'UTC').
```

matplotlib.axes.Axes.set_yticks

```python
Axes.set_yticks(self, ticks, minor=False)
Set the y ticks with list of ticks

Parameters

ticks [list] List of y-axis tick locations

minor [bool, optional] If False sets major ticks, if True sets minor ticks. Default is False.
```

Examples using matplotlib.axes.Axes.set_yticks

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py
- sphx_glr_gallery_lines_bars_and_markers_psd_demo.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py
- sphx_glr_gallery_subplots_axes_and_figures_axes_demo.py
matplotlib.axes.Axes.get_yticks

Axes.get_yticks(self, minor=False)
   Return the y ticks as a list of locations

matplotlib.axes.Axes.set_yticklabels

Axes.set_yticklabels(self, labels, fontdict=None, minor=False, **kwargs)
   Set the y-tick labels with list of strings labels.

Parameters

   labels [List[str]] list of string labels

   fontdict [dict, optional] A dictionary controlling the appearance of the tick-
   labels. The default fontdict is:

   ```
   {'fontsize': rcParams['axes.titlesize'],
    'fontweight': rcParams['axes.titleweight'],
    'verticalalignment': 'baseline',
    'horizontalalignment': 'loc'}
   ```

   minor [bool, optional] Whether to set the minor ticklabels rather than the
   major ones.

Returns

   A list of Text instances.
Other Parameters

**kwargs [Text properties.]

Examples using matplotlib.axes.Axes.set_yticklabels

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py
- sphx_glr_gallery_subplots_axes_and_figures_zoom_inset_axes.py
- sphx_glr_gallery_statistics_boxplot.py
- sphx_glr_gallery_statistics_bxp.py
- sphx_glr_gallery_statistics_violinplot.py
- sphx_glr_gallery_pyplots_auto_subplots_adjust.py
- sphx_glr_gallery_specialty_plots_mri_with_eeg.py

Constrained Layout Guide

matplotlib.axes.Axes.get_yticklabels

Axes.get_yticklabels(self, minor=False, which=None)

Get the y tick labels as a list of Text instances.

Parameters

- minor [bool] If True return the minor ticklabels, else return the major ticklabels
- which [None, ('minor', 'major', 'both')] Overrides minor. Selects which ticklabels to return

Returns

- ret [list] List of Text instances.

Examples using matplotlib.axes.Axes.get_yticklabels

- sphx_glr_gallery_recipes_fill_between_alpha.py

matplotlib.axes.Axes.get_ymajorticklabels

Axes.get_ymajorticklabels(self)

Get the major y tick labels.

Returns

- labels [list] List of Text instances
Axes.get_yminorticklabels

Get the minor y tick labels.

Returns

labels [list] List of Text instances

Axes.get_ygridlines

Get the y grid lines as a list of Line2D instances.

Axes.get_yticklines

Get the y tick lines as a list of Line2D instances.

Axes.yaxis_date

Sets up y-axis ticks and labels that treat the y data as dates.

Parameters

tz [string or tzinfo instance, optional] Timezone. Defaults to rcParams["timezone"] (default: 'UTC').

Axes.minorticks_off

Remove minor ticks from the axes.

Axes.minorticks_on

Display minor ticks on the axes.

Displaying minor ticks may reduce performance; you may turn them off using minorticks_off() if drawing speed is a problem.

Examples using matplotlib.axes.Axes.minorticks_on

• sphx_glr_gallery_specialty_plots_mri_with_eeg.py
Axes.ticklabel_format(self, *, axis='both', style='', scilimits=None, useOffset=None, useLocale=None, useMathText=None)

Change the ScalarFormatter used by default for linear axes.

Optional keyword arguments:

<table>
<thead>
<tr>
<th>Keyword</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>axis</td>
<td>[‘x’</td>
</tr>
<tr>
<td>style</td>
<td>[‘sci’ (or ‘scientific’)</td>
</tr>
<tr>
<td>scilimits</td>
<td>(m, n), pair of integers; if style is ‘sci’, scientific notation will be used for numbers outside the range $10^m$ to $10^n$. Use (0,0) to include all numbers. Use (m,m) where m &lt;&gt; 0 to fix the order of magnitude to $10^m$.</td>
</tr>
<tr>
<td>useOffset</td>
<td>[ bool</td>
</tr>
<tr>
<td>useLocale</td>
<td>If True, format the number according to the current locale. This affects things such as the character used for the decimal separator. If False, use C-style (English) formatting. The default setting is controlled by the axes.formatter.use_locale rcparam.</td>
</tr>
<tr>
<td>useMathText</td>
<td>If True, render the offset and scientific notation in mathtext</td>
</tr>
</tbody>
</table>

Only the major ticks are affected. If the method is called when the ScalarFormatter is not the Formatter being used, an AttributeError will be raised.

Axes.tick_params(self, axis='both', **kwargs)

Change the appearance of ticks, tick labels, and gridlines.

Parameters

- **axis** [{‘x’, ‘y’, ‘both’}, optional] Which axis to apply the parameters to.

Other Parameters

- **axis** [{‘x’, ‘y’, ‘both’}] Axis on which to operate; default is ‘both’.
- **reset** [bool] If True, set all parameters to defaults before processing other keyword arguments. Default is False.
- **which** [{‘major’, ‘minor’, ‘both’}] Default is ‘major’; apply arguments to which ticks.
- **direction** [{‘in’, ‘out’, ‘inout’}] Puts ticks inside the axes, outside the axes, or both.
- **length** [float] Tick length in points.
- **width** [float] Tick width in points.
- **color** [color] Tick color; accepts any mpl color spec.
pad [float] Distance in points between tick and label.
lablesiz [float or str] Tick label font size in points or as a string (e.g., 'large').
labellcolor [color] Tick label color; mpl color spec.
colors [color] Changes the tick color and the label color to the same value: mpl color spec.
zorder [float] Tick and label zorder.
bottom, top, left, right [bool] Whether to draw the respective ticks.
lablebottom, labeltop, labelleft, labelright [bool] Whether to draw the respective tick labels.
labellerotation [float] Tick label rotation
grid_color [color] Changes the gridline color to the given mpl color spec.
grid_alpha [float] Transparency of gridlines: 0 (transparent) to 1 (opaque).
grid_linewidth [float] Width of gridlines in points.
grid_linestyle [string] Any valid Line2D line style spec.

Examples

Usage

```python
ax.tick_params(direction='out', length=6, width=2, colors='r',
                grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

Examples using matplotlib.axes.Axes.tick_params

- sphx_glr_gallery_lines_bars_and_markers_scatter_hist.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py
- sphx_glr_gallery_subplots_axes_and_figures_axes_props.py
- sphx_glr_gallery_subplots_axes_and_figures_broken_axis.py
- sphx_glr_gallery_subplots_axes_and_figures_two_scales.py
- sphx_glr_gallery_color_color_demo.py
- sphx_glr_gallery_axes_grid1_inset_locator_demo.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider2.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider3.py
- sphx_glr_gallery_showcase_anatomy.py
- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py
- sphx_glr_gallery_ticks_and_spines_major_minor_demo.py
Axes.locator_params

Axes.locator_params(self, axis='both', tight=None, **kwargs)
Control behavior of major tick locators.

Because the locator is involved in autoscaling, autoscale_view is called automatically after the parameters are changed.

Parameters

axis [{‘both’, ‘x’, ‘y’}, optional] The axis on which to operate.
tight [bool or None, optional] Parameter passed to autoscale_view. Default is None, for no change.

Other Parameters

**kwargs Remaining keyword arguments are passed to directly to the set_params() method of the locator. Supported keywords depend on the type of the locator. See for example set_params for the ticker.MaxNLocator used by default for linear axes.

Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```python
ax.locator_params(tight=True, nbins=4)
```

Examples using matplotlib.axes.Axes.locator_params

- sphx_glr_gallery_images_contours_and_fields_contourf_demo.py
- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py
- Constrained Layout Guide

17.5.8 Units

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.convert_xunits</td>
<td>Convert x using the unit type of the xaxis.</td>
</tr>
<tr>
<td>Axes.convert_yunits</td>
<td>Convert y using the unit type of the yaxis.</td>
</tr>
<tr>
<td>Axes.have_units</td>
<td>Return True if units are set on the x or y axes.</td>
</tr>
</tbody>
</table>
Matplotlib, Release 3.1.3

```python
matplotlib.axes.Axes.convert_xunits

Axes.convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.
```

```python
matplotlib.axes.Axes.convert_yunits

Axes.convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.
```

```python
matplotlib.axes.Axes.have_units

Axes.have_units(self)
    Return True if units are set on the x or y axes.
```

### 17.5.9 Adding Artists

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.add_artist(a)</td>
<td>Add an Artist to the axes, and return the artist.</td>
</tr>
<tr>
<td>Axes.add_child_axes</td>
<td>Add an AxesBase to the axes’ children; return the child axes.</td>
</tr>
<tr>
<td>Axes.add_collection</td>
<td>Add a Collection to the axes’ collections; return the collection.</td>
</tr>
<tr>
<td>Axes.add_container</td>
<td>Add a Container to the axes’ containers; return the container.</td>
</tr>
<tr>
<td>Axes.add_image</td>
<td>Add an AxesImage to the axes’ images; return the image.</td>
</tr>
<tr>
<td>Axes.add_line</td>
<td>Add a Line2D to the axes’ lines; return the line.</td>
</tr>
<tr>
<td>Axes.add_patch</td>
<td>Add a Patch to the axes’ patches; return the patch.</td>
</tr>
<tr>
<td>Axes.add_table</td>
<td>Add a Table to the axes’ tables; return the table.</td>
</tr>
</tbody>
</table>

```python
matplotlib.axes.Axes.add_artist

Axes.add_artist(self, a)
    Add an Artist to the axes, and return the artist.
    Use add_artist only for artists for which there is no dedicated “add” method; and if necessary, use a method such as update_dataLim to manually update the dataLim if the artist is to be included in autoscaling.
    If no transform has been specified when creating the artist (e.g. artist.get_transform() == None) then the transform is set to ax.transData.
```
Examples using `matplotlib.axes.Axes.add_artist`

- `sphx_glr_gallery_lines_bars_and_markers_scatter_with_legend.py`
- `sphx_glr_gallery_images_contours_and_fields_demo_bboximage.py`

- `sphx_glr_gallery_userdemo_anchored_box02.py`
- `sphx_glr_gallery_userdemo_anchored_box03.py`
- `sphx_glr_gallery_userdemo_anchored_box04.py`
- `sphx_glr_gallery_userdemo_annotate_explain.py`
- `sphx_glr_gallery_userdemo_connect_simple01.py`
- `sphx_glr_gallery_userdemo_simple_annotate01.py`
- `sphx_glr_gallery_userdemo_simple_animate01.py`
- `sphx_glr_gallery_userdemo_simple_legend02.py`

### matplotlib.axes.Axes.add_child_axes

```python
Axes.add_child_axes(self, ax)
```

Add an `AxesBase` to the axes’ children; return the child axes.

This is the low-level version. See `axes.Axes.inset_axes`.

### matplotlib.axes.Axes.add_collection

```python
Axes.add_collection(self, collection, autolim=True)
```

Add a `Collection` to the axes’ collections; return the collection.
Examples using `matplotlib.axes.Axes.add_collection`

- `sphx_glr_gallery_lines_bars_and_markers_eventcollection_demo.py`
- `sphx_glr_gallery_lines_bars_and_markers_span_regions.py`
- `sphx_glr_gallery_statistics_errorbars_and_boxes.py`
- `sphx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphx_glr_gallery_shapes_and_collections_collections.py`
- `sphx_glr_gallery_shapes_and_collections_ellipse_collection.py`
- `sphx_glr_gallery_shapes_and_collections_line_collection.py`
- `sphx_glr_gallery_shapes_and_collections_patch_collection.py`
- `sphx_glr_gallery_event_handling_lasso_demo.py`
- `sphx_glr_gallery_specialty_plots_mri_with_eeg.py`
- `sphx_glr_gallery_units_artist_tests.py`

`matplotlib.axes.Axes.add_container`

`Axes.add_container(self, container)`

Add a `Container` to the axes’ containers; return the container.

`matplotlib.axes.Axes.add_image`

`Axes.add_image(self, image)`

Add an `AxesImage` to the axes’ images; return the image.

`matplotlib.axes.Axes.add_line`

`Axes.add_line(self, line)`

Add a `Line2D` to the axes’ lines; return the line.

Examples using `matplotlib.axes.Axes.add_line`

- `sphx_glr_gallery_text_labels_and_annotations_line_with_text.py`
- `sphx_glr_gallery_shapes_and_collections_artist_reference.py`
- `sphx_glr_gallery_units_artist_tests.py`

`matplotlib.axes.Axes.add_patch`

`Axes.add_patch(self, p)`

Add a `Patch` to the axes’ patches; return the patch.
Examples using `matplotlib.axes.Axes.add_patch`

- sphx_glr_gallery_images_contours_and_fields_image_demo.py
- sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py

Matplotlib, Release 3.1.3

matplotlib.axes.Axes.add_table

Axes.add_table(self, tab)
Add a Table to the axes’ tables; return the table.

17.5.10 Twinning

<table>
<thead>
<tr>
<th>Axes.twinx</th>
<th>Create a twin Axes sharing the xaxis</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.twiny</td>
<td>Create a twin Axes sharing the yaxis</td>
</tr>
<tr>
<td>Axes.get_shared_x_axes</td>
<td>Return a reference to the shared axes Grouper object for x axes.</td>
</tr>
<tr>
<td>Axes.get_shared_y_axes</td>
<td>Return a reference to the shared axes Grouper object for y axes.</td>
</tr>
</tbody>
</table>

matplotlib.axes.Axes.twinx

Axes.twinx(self)
Create a twin Axes sharing the xaxis
Create a new Axes instance with an invisible x-axis and an independent y-axis positioned opposite to the original one (i.e. at right). The x-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both y-axes align, see LinearLocator

Returns

ax_twin [Axes] The newly created Axes instance

Notes

For those who are ‘picking’ artists while using twinx, pick events are only called for the artists in the top-most axes.

Examples using matplotlib.axes.Axes.twinx

- sphx_glr_gallery_subplots_axes_and_figures_fahrenheit_celsius_scales.py
- sphx_glr_gallery_subplots_axes_and_figures_two_scales.py
- sphx_glr_gallery_statistics_barchart_demo.py
- sphx_glr_gallery_ticks_and_spines_multiple_yaxis_with_spines.py

matplotlib.axes.Axes.twiny

Axes.twiny(self)
Create a twin Axes sharing the yaxis
Create a new Axes instance with an invisible y-axis and an independent x-axis positioned opposite to the original one (i.e. at top). The y-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both x-axes align, see LinearLocator
Returns

**ax_twin**  [Axes] The newly created Axes instance

Notes

For those who are ‘picking’ artists while using twiny, pick events are only called for the artists in the top-most axes.

Examples using `matplotlib.axes.Axes.twiny`

- sphx_glr_gallery_subplots_axes_and_figures_two_scales.py

```
Axes.set_anchor(self, anchor, share=False)

Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

Parameters

anchor [2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}] The anchor position may be either:
- a sequence (cx, cy). cx and cy may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
- a string using cardinal directions as abbreviation:
  - 'C' for centered
  - 'S' (south) for bottom-center
  - 'SW' (south west) for bottom-left
  - etc.

Here is an overview of the possible positions:

<table>
<thead>
<tr>
<th>'NW'</th>
<th>'N'</th>
<th>'NE'</th>
</tr>
</thead>
<tbody>
<tr>
<td>'W'</td>
<td>'C'</td>
<td>'E'</td>
</tr>
<tr>
<td>'SW'</td>
<td>'S'</td>
<td>'SE'</td>
</tr>
</tbody>
</table>

share [bool, optional] If True, apply the settings to all shared Axes. Default is False.

See also:

Examples using matplotlib.axes.Axes.set_axes_locator

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider1.py

matplotlib.axes.Axes.reset_position

Axes.reset_position(self)
Reset the active position to the original position.
This resets the a possible position change due to aspect constraints. For an explanation of the positions see set_position.

matplotlib.axes.Axes.get_position

Axes.get_position(self, original=False)
Get a copy of the axes rectangle as a Bbox.

Parameters

original [bool] If True, return the original position. Otherwise return the active position. For an explanation of the positions see set_position.

Returns

pos [Bbox]

Examples using matplotlib.axes.Axes.get_position

- sphx_glr_gallery_images_contours_and_fields_contour_demo.py
- Choosing Colormaps in Matplotlib

matplotlib.axes.Axes.set_position

Axes.set_position(self, pos, which='both')
Set the axes position.
Axes have two position attributes. The ‘original’ position is the position allocated for the Axes. The ‘active’ position is the position the Axes is actually drawn at. These positions are usually the same unless a fixed aspect is set to the Axes. See set_aspect for details.

Parameters

pos [[left, bottom, width, height] or Bbox] The new position of the in Figure coordinates.

which [{‘both’, ‘active’, ‘original’}, optional] Determines which position variables to change.

Examples using matplotlib.axes.Axes.set_position

- sphx_glr_gallery_images_contours_and_fields_contour_demo.py
17.5.12 Async/Event based

**Axes.stale**
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

**Axes.pchanged**
Call all of the registered callbacks.

**Axes.add_callback**
Add a callback function that will be called whenever one of the *Artist’s* properties changes.

**Axes.remove_callback**
Remove a callback based on its observer id.

```python
import matplotlib.pyplot as plt

fig, ax = plt.subplots()
ax.plot([1, 2, 3, 4])
ax.set_xlabel('value')
ax.set_ylabel('important')

# Add callback function
fig.canvas.draw_idle()
fig.canvas.callbacks,.pchanged(fig)
```

**matplotlib.axes.Axes.stale**

Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

**matplotlib.axes.Axes.pchanged**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

**See also:**

- `add_callback`
- `remove_callback`

**matplotlib.axes.Axes.add_callback**

Add a callback function that will be called whenever one of the *Artist’s* properties changes.

**Parameters**

- **func** [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns**

- **oid** [int] The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

- `remove_callback`

```python
fig, ax = plt.subplots()
ax.plot([1, 2, 3, 4])
ax.set_xlabel('value')
ax.set_ylabel('important')

# Add callback function
fig.canvas.draw_idle()
fig.canvas.callbacks,.pchanged(fig)
```

<tr>
<td><code>Axes.get_cursor_data</code></td>
<td>Return the cursor data for a given event.</td>
</tr>
</tbody>
</table>
matplotlib.axes.Axes.can_pan

Axes.can_pan(self)
    Return True if this axes supports any pan/zoom button functionality.

matplotlib.axes.Axes.can_zoom

Axes.can_zoom(self)
    Return True if this axes supports the zoom box button functionality.

matplotlib.axes.Axes.get_navigate

Axes.get_navigate(self)
    Get whether the axes responds to navigation commands

matplotlib.axes.Axes.set_navigate

Axes.set_navigate(self, b)
    Set whether the axes responds to navigation toolbar commands

    Parameters
    ----------
    b  [bool]

matplotlib.axes.Axes.get_navigate_mode

Axes.get_navigate_mode(self)
    Get the navigation toolbar button status: ‘PAN’, ‘ZOOM’, or None

matplotlib.axes.Axes.set_navigate_mode

Axes.set_navigate_mode(self, b)
    Set the navigation toolbar button status;

    Warning: this is not a user-API function.

matplotlib.axes.Axes.start_pan

Axes.start_pan(self, x, y, button)
    Called when a pan operation has started.
    x, y are the mouse coordinates in display coords. button is the mouse button number:
    - 1: LEFT
    - 2: MIDDLE
    - 3: RIGHT
Matplotlib, Release 3.1.3

Note: Intended to be overridden by new projection types.

matplotlib.axes.Axes.drag_pan

Axes.drag_pan(self, button, key, x, y)
Called when the mouse moves during a pan operation.
button is the mouse button number:
• 1: LEFT
• 2: MIDDLE
• 3: RIGHT
key is a “shift” key
x, y are the mouse coordinates in display coords.

Note: Intended to be overridden by new projection types.

matplotlib.axes.Axes.end_pan

Axes.end_pan(self)
Called when a pan operation completes (when the mouse button is up.)

Note: Intended to be overridden by new projection types.

matplotlib.axes.Axes.format_coord

Axes.format_coord(self, x, y)
Return a format string formatting the x, y coordinates.

Examples using matplotlib.axes.Axes.format_coord

• sphx_glr_gallery_images_contours_and_fields_image_zcoord.py

matplotlib.axes.Axes.format_cursor_data

Axes.format_cursor_data(self, data)
Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.
The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

`matplotlib.axes.Axes.format_xdata`

```python
Axes.format_xdata(self, x)
```

Return `x` formatted as an x-value.

This function will use the `fmt_xdata` attribute if it is not None, else will fall back on the xaxis major formatter.

**Examples using `matplotlib.axes.Axes.format_xdata`**

- sphx_glr_gallery_text_labels_and_annotations_date.py

`matplotlib.axes.Axes.format_ydata`

```python
Axes.format_ydata(self, y)
```

Return `y` formatted as an y-value.

This function will use the `fmt_ydata` attribute if it is not None, else will fall back on the yaxis major formatter.

**Examples using `matplotlib.axes.Axes.format_ydata`**

- sphx_glr_gallery_text_labels_and_annotations_date.py

`matplotlib.axes.Axes.mouseover`

```python
Axes.mouseover
```

`matplotlib.axes.Axes.in_axes`

```python
Axes.in_axes(self, mouseevent)
```

Return `True` if the given `mouseevent` (in display coords) is in the Axes

`matplotlib.axes.Axes.pick`

```python
Axes.pick(self, mouseevent)
```

Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

**See also:**
**set_picker, get_picker, pickable**

```python
class Axes:
    def pickable(self):
        """Return whether the artist is pickable."""
        # See also:
        set_picker, get_picker, pick
```

**Matplotlib.axes.Axes.get_picker**

```python
class Axes:
    def get_picker(self):
        """Return the picking behavior of the artist.
        The possible values are described in `set_picker`.
        """
        # See also:
        set_picker, pickable, pick
```

**Matplotlib.axes.Axes.set_picker**

```python
class Axes:
    def set_picker(self, picker):
        """Define the picking behavior of the artist.
        Parameters
        picker [None or bool or float or callable] This can be one of the following:
        • None: Picking is disabled for this artist (default).
        • A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
        • A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
        • A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:
```

```python
    hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.
Axes.set_contains

Axes.set_contains(self, picker)

Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

**Parameters**

picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

Axes.get_contains

Axes.get_contains(self)

Return the custom contains function of the artist if set, or None.

See also:

set_contains

Axes.contains

Axes.contains(self, mouseevent)

Test whether the artist contains the mouse event.

**Parameters**

mouseevent [matplotlib.backend_bases.MouseEvent]

**Returns**

contains [bool] Whether any values are within the radius.

details [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

See also:

set_contains, get_contains

Axes.contains_point

Axes.contains_point(self, point)

Return whether point (pair of pixel coordinates) is inside the axes patch.
Axes.get_cursor_data

Axes.get_cursor_data(self, event)

Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- **event** ([`matplotlib.backend_bases.MouseEvent`]

**See also:**

`format_cursor_data`

### 17.5.14 Children

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.get_children</code></td>
<td>Return a list of the child <em>Artists</em> of this <em>Artist</em>.</td>
</tr>
<tr>
<td><code>Axes.get_images</code></td>
<td>Return a list of Axes images contained by the Axes</td>
</tr>
<tr>
<td><code>Axes.get_lines</code></td>
<td>Return a list of lines contained by the Axes</td>
</tr>
<tr>
<td><code>Axes.findobj</code></td>
<td>Find artist objects.</td>
</tr>
</tbody>
</table>

Axes.get_children

Axes.get_children(self)

Return a list of the child *Artists* of this *Artist*.

Axes.get_images

Axes.get_images(self)

return a list of Axes images contained by the Axes

Axes.get_lines

Axes.get_lines(self)

Return a list of lines contained by the Axes

Axes.findobj

Axes.findobj(self)

Find artist objects.
matplotlib.axes.Axes.findobj

Axes.findobj(self, match=None, include_self=True)

Find artist objects.

Recursively find all Artist instances contained in the artist.

Parameters

match A filter criterion for the matches. This can be

- None: Return all objects contained in artist.
- A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
- A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self [bool] Include self in the list to be checked for a match.

Returns

artists [list of Artist]

17.5.15 Drawing

| Axes.draw | Draw everything (plot lines, axes, labels) |
| Axes.draw_artist | This method can only be used after an initial draw which caches the renderer. |
| Axes.redraw_in_frame | This method can only be used after an initial draw which caches the renderer. |
| Axes.get_renderer_cache | Return the zorder value below which artists will be rasterized. |
| Axes.get_rasterization_zorder | Return the zorder value below which artists will be rasterized. |

Parameters

Axes.get_window_extent | Return the axes bounding box in display space; args and kwargs are empty. |
| Axes.get_tightbbox | Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc). |

matplotlib.axes.Axes.draw

Axes.draw(self, renderer=None, inframe=False)

Draw everything (plot lines, axes, labels)

matplotlib.axes.Axes.draw_artist

Axes.draw_artist(self, a)

This method can only be used after an initial draw which caches the renderer. It is used to efficiently update Axes data (axis ticks, labels, etc are not updated)
Axes.redraw_in_frame

Axes.redraw_in_frame(self)

This method can only be used after an initial draw which caches the renderer. It is used to efficiently update Axes data (axis ticks, labels, etc are not updated)

Axes.get_renderer_cache

Axes.get_renderer_cache(self)

Axes.get_rasterization_zorder

Axes.get_rasterization_zorder(self)

Return the zorder value below which artists will be rasterized.

Axes.set_rasterization_zorder

Axes.set_rasterization_zorder(self, z)

Parameters

z [float or None] zorder below which artists are rasterized. None means that artists do not get rasterized based on zorder.

Examples using matplotlib.axes.Axes.set_rasterization_zorder

• sphx_glr_gallery_misc_rasterization_demo.py

Axes.get_window_extent

Axes.get_window_extent(self, *args, **kwargs)

Return the axes bounding box in display space; args and kwargs are empty.

This bounding box does not include the spines, ticks, ticklables, or other labels. For a bounding box including these elements use get_tightbbox.

See also:

matplotlib.axes.Axes.get_tightbbox
matplotlib.axis.Axis.get_tightbbox
matplotlib.spines.get_window_extent

Axes.get_tightbbox

Axes.get_tightbbox(self, renderer, call_axes_locator=True, bbox_extra_artists=None)

Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

Artists that have artist.set_in_layout(False) are not included in the bbox.
Parameters

- **renderer** [RendererBase instance] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

- **bbox_extra_artists** [list of Artist or None] List of artists to include in the tight bounding box. If None (default), then all artist children of the axes are included in the tight bounding box.

- **call_axes_locator** [boolean (default True)] If call_axes_locator is False, it does not call the _axes_locator attribute, which is necessary to get the correct bounding box. call_axes_locator=False can be used if the caller is only interested in the relative size of the tightbbox compared to the axes bbox.

Returns

- **bbox** [BboxBase] bounding box in figure pixel coordinates.

See also:

- matplotlib.axes.Axes.get_window_extent
- matplotlib.axis.Axis.get_tightbbox
- matplotlib.spines.Spine.get_window_extent

17.5.16 Bulk property manipulation

<table>
<thead>
<tr>
<th>Axes.set</th>
<th>A property batch setter.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.update</td>
<td>Update this artist’s properties from the dictionary props.</td>
</tr>
<tr>
<td>Axes.properties</td>
<td>Return a dictionary of all the properties of the artist.</td>
</tr>
<tr>
<td>Axes.update_from</td>
<td>Copy properties from other to self.</td>
</tr>
</tbody>
</table>

.matplotlib.axes.Axes.set

Axes.set(self, **kwargs)

A property batch setter. Pass kwargs to set properties.

Examples using matplotlib.axes.Axes.set

- sphx_glr_gallery_lines_bars_and_markers_gradient_bar.py
- sphx_glr_gallery_lines_bars_and_markers_simple_plot.py
- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
- sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py
- sphx_glr_gallery_subplots_axes_and_figures_subplot_demo.py
- sphx_glr_gallery_subplots_axes_and_figures_subplots_demo.py
- sphx_glr_gallery_statistics_hexbin_demo.py
Matplotlib, Release 3.1.3

- sphx_glr_gallery_pie_and_polar_charts_nested_pie.py
- sphx_glr_gallery_text_labels_and_annotations_annotation_demo.py
- sphx_glr_gallery_text_labels_and_annotations_dashpointlabel.py
- sphx_glr_gallery_pyplots_text_commands.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_axes_grid1_inset_locator_demo.py
- sphx_glr_gallery_event_handling_zoom_window.py
- sphx_glr_gallery_misc_contour_manual.py
- sphx_glr_gallery_misc_keyword_plotting.py
- sphx_glr_gallery_scales_log_demo.py
- sphx_glr_gallery_userdemo_annotate_explain.py
- sphx_glr_gallery_userdemo_connectionstyle_demo.py
- sphx_glr_gallery_userdemo_simple_annotate01.py
- sphx_glr_gallery_widgets_span_selector.py
- *The Lifecycle of a Plot*

**matplotlib.axes.Axes.update**

`Axes.update(self, props)`

Update this artist’s properties from the dictionary *props*.

**matplotlib.axes.Axes.properties**

`Axes.properties(self)`

Return a dictionary of all the properties of the artist.

**matplotlib.axes.Axes.update_from**

`Axes.update_from(self, other)`

Copy properties from *other* to *self*.

### 17.5.17 General Artist Properties

<table>

</tr>
<tr>
<td><code>Axes.get_figure</code></td>
<td>Return the <code>Figure</code> instance the artist belongs to.</td>
</tr>
</tbody>
</table>

**matplotlib.axes.Axes.set_agg_filter**

```python
Axes.set_agg_filter(self, filter_func)
```

Set the agg filter.

**Parameters**

- `filter_func` ([callable]) A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**matplotlib.axes.Axes.set_alpha**

```python
Axes.set_alpha(self, alpha)
```

Set the alpha value used for blending - not supported on all backends.
Parameters

alpha [float]

matplotlib.axes.Axes.set_animated

Axes.set_animated(self, b)
Set the artist’s animation state.

Parameters

b [bool]

matplotlib.axes.Axes.set_clip_box

Axes.set_clip_box(self, clipbox)
Set the artist’s clip Bbox.

Parameters

clipbox [Bbox]

matplotlib.axes.Axes.set_clip_on

Axes.set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible out side of the axes which can lead to unexpected results.

Parameters

b [bool]

matplotlib.axes.Axes.set_clip_path

Axes.set_clip_path(self, path, transform=None)
Set the artist’s clip path, which may be:
- a Patch (or subclass) instance; or
- a Path instance, in which case a Transform instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.
For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(Path, Transform) | Patch | None]
matplotlib.axes.Axes.set_gid

Axes.set_gid(self, gid)
    Set the (group) id for the artist.

Parameters

gid [str]

matplotlib.axes.Axes.set_label

Axes.set_label(self, s)
    Set a label that will be displayed in the legend.

Parameters

s [object] s will be converted to a string by calling str.

matplotlib.axes.Axes.set_path_effects

Axes.set_path_effects(self, path_effects)
    Set the path effects.

Parameters

path_effects [AbstractPathEffect]

matplotlib.axes.Axes.set_rasterized

Axes.set_rasterized(self, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.
    Defaults to None, which implies the backend’s default behavior.

Parameters

rasterized [bool or None]

matplotlib.axes.Axes.set_sketch_params

Axes.set_sketch_params(self, scale=None, length=None, randomness=None)
    Sets the sketch parameters.

Parameters

scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)
**Axes.set_snap**

```python
Axes.set_snap(self, snap)
```

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

- `snap` [bool or None] Possible values:
  - `True`: Snap vertices to the nearest pixel center.
  - `False`: Do not modify vertex positions.
  - `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**matplotlib.axes.Axes.set_transform**

```python
Axes.set_transform(self, t)
```

Set the artist transform.

**Parameters**

- `t` [Transform]

**matplotlib.axes.Axes.set_url**

```python
Axes.set_url(self, url)
```

Set the url for the artist.

**Parameters**

- `url` [str]

**matplotlib.axes.Axes.set_visible**

```python
Axes.set_visible(self, b)
```

Set the artist’s visibility.

**Parameters**

- `b` [bool]
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

- **level** [float]

Return filter function to be used for agg filter.

Return the alpha value used for blending - not supported on all backends

Return the animated state.

Return the clipbox.

Return whether the artist uses clipping.

Return the clip path.

Return the group id.
matplotlib.axes.Axes.get_label

Axes.get_label(self)
    Return the label used for this artist in the legend.

matplotlib.axes.Axes.get_path_effects

Axes.get_path_effects(self)

matplotlib.axes.Axes.get_rasterized

Axes.get_rasterized(self)
    Return whether the artist is to be rasterized.

matplotlib.axes.Axes.get_sketch_params

Axes.get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns
    sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or expanded.
    Returns None if no sketch parameters were set.

matplotlib.axes.Axes.get_snap

Axes.get_snap(self)
    Returns the snap setting.
    See set_snap for details.

matplotlib.axes.Axes.get_transform

Axes.get_transform(self)
    Return the Transform instance used by this artist.

matplotlib.axes.Axes.get_url

Axes.get_url(self)
    Return the url.
matplotlib.axes.Axes.get_visible

Axes.get_visible(self)
    Return the visibility.

matplotlib.axes.Axes.get_zorder

Axes.get_zorder(self)
    Return the artist's zorder.

matplotlib.axes.Axes.axes

Axes.axes
    The Axes instance the artist resides in, or None.

matplotlib.axes.Axes.set_figure

Axes.set_figure(self, fig)
    Set the Figure for this Axes.

    Parameters
    fig [Figure]

matplotlib.axes.Axes.get_figure

Axes.get_figure(self)
    Return the Figure instance the artist belongs to.

17.5.18 Artist Methods

<table>
<thead>
<tr>
<th>Axes.remove</th>
<th>Remove the artist from the figure if possible.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.is_transform_set</td>
<td>Return whether the Artist has an explicitly set transform.</td>
</tr>
</tbody>
</table>

matplotlib.axes.Axes.remove

Axes.remove(self)
    Remove the artist from the figure if possible.

    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

    Note: relim will not see collections even if the collection was added to the axes with autolim = True.

    Note: there is no support for removing the artist’s legend entry.
Examples using `matplotlib.axes.Axes.remove`

- `sphx_glr_gallery_subplots_axes_and_figures_gridspec_and_subplots.py`
- *Customizing Figure Layouts Using GridSpec and Other Functions*

`matplotlib.axes.Axes.is_transform_set`

```python
Axes.is_transform_set(self)
Return whether the Artist has an explicitly set transform.
This is True after `set_transform` has been called.
```

### 17.5.19 Projection

Methods used by `Axis` that must be overridden for non-rectilinear Axes.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.name</code></td>
<td>Get the transformation used for drawing x-axis labels, ticks and gridlines.</td>
</tr>
<tr>
<td><code>Axes.get_xaxis_transform</code></td>
<td>Get the transformation used for drawing x-axis labels, ticks and gridlines.</td>
</tr>
<tr>
<td><code>Axes.get_yaxis_transform</code></td>
<td>Get the transformation used for drawing y-axis labels, ticks and gridlines.</td>
</tr>
<tr>
<td><code>Axes.get_data_ratio</code></td>
<td>Return the aspect ratio of the raw data.</td>
</tr>
<tr>
<td><code>Axes.get_data_ratio_log</code></td>
<td>Return the aspect ratio of the raw data in log scale.</td>
</tr>
</tbody>
</table>

```
Axes.get_xaxis_text1_transform
```

```
Axes.get_xaxis_text2_transform
```

```
Axes.get_yaxis_text1_transform
```

```
Axes.get_yaxis_text2_transform
```

`matplotlib.axes.Axes.name`

```python
Axes.name = 'rectilinear'
```

`matplotlib.axes.Axes.get_xaxis_transform`

```python
Axes.get_xaxis_transform(self, which='grid')
Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.
```

**Note:** This transformation is primarily used by the `Axis` class, and is meant to be over-
ridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_xaxis_transform`

- `sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py`
- `sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py`
- `sphx_glr_gallery_statistics_boxplot_demo.py`
- `Transformations Tutorial`

`matplotlib.axes.Axes.get_yaxis_transform`

```python
Axes.get_yaxis_transform(self, which='grid')
```

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

**Note:** This transformation is primarily used by the `Axes` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_yaxis_transform`

- `sphx_glr_gallery_userdemo_connect_simple01.py`
- `Transformations Tutorial`

`matplotlib.axes.Axes.get_data_ratio`

```python
Axes.get_data_ratio(self)
```

Return the aspect ratio of the raw data.

**Notes**

This method is intended to be overridden by new projection types.

`matplotlib.axes.Axes.get_data_ratio_log`

```python
Axes.get_data_ratio_log(self)
```

Return the aspect ratio of the raw data in log scale.

**Notes**

Will be used when both axis are in log scale.
Axes.get_xaxis_text1_transform

Returns

transform [Transform] The transform used for drawing x-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates.

valign [\{'center', 'top', 'bottom', 'baseline', 'center_baseline'\}] The text vertical alignment.

halign [\{'center', 'left', 'right'\}] The text horizontal alignment.

Notes

This transformation is primarily used by the Axis class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Axes.get_xaxis_text2_transform

Returns

transform [Transform] The transform used for drawing secondary x-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates.

valign [\{'center', 'top', 'bottom', 'baseline', 'center_baseline'\}] The text vertical alignment.

halign [\{'center', 'left', 'right'\}] The text horizontal alignment.

Notes

This transformation is primarily used by the Axis class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Axes.get_yaxis_text1_transform

Returns

transform [Transform] The transform used for drawing y-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates.

valign [\{'center', 'top', 'bottom', 'baseline', 'center_baseline'\}] The text vertical alignment.
**halign**  [{‘center’, ‘left’, ‘right’}] The text horizontal alignment.

**valign**  [{‘center’, ‘top’, ‘bottom’, ‘baseline’, ‘center_baseline’}] The text vertical alignment.

**halign**  [{‘center’, ‘left’, ‘right’}] The text horizontal alignment.

**Notes**

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

**matplotlib.axes.Axes.get_yaxis_text2_transform**

*Axes.get_yaxis_text2_transform*(self, *pad_points*)

**Returns**

- **transform**  [Transform] The transform used for drawing secondart y-axis labels, which will add *pad_points* of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates.
- **valign**  [{‘center’, ‘top’, ‘bottom’, ‘baseline’, ‘center_baseline’}] The text vertical alignment.
- **halign**  [{‘center’, ‘left’, ‘right’}] The text horizontal alignment.

**Notes**

This transformation is primarily used by the *Axis* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

17.5.20 Other

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Axes.zorder</em></td>
<td>Return a default list of artists that are used for the bounding box calculation.</td>
</tr>
<tr>
<td><em>Axes.get_default_bbox_extra_artists</em></td>
<td>Return a default list of artists that are used for the bounding box calculation.</td>
</tr>
<tr>
<td><em>Axes.get_transformed_clip_path_and_affine</em></td>
<td>Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.</td>
</tr>
<tr>
<td><em>Axes.has_data</em></td>
<td>Return <em>True</em> if any artists have been added to axes.</td>
</tr>
</tbody>
</table>

**matplotlib.axes.Axes.zorder**

*Axes.zorder* = 0

**matplotlib.axes.Axes.get_default_bbox_extra_artists**

*Axes.get_default_bbox_extra_artists*(self)

Return a default list of artists that are used for the bounding box calculation. Artists are excluded either by not being visible or *artist.set_in_layout*(False).
Axes.get_transformed_clip_path_and_affine(self)

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

Axes.has_data(self)

Return True if any artists have been added to axes.

This should not be used to determine whether the dataLim need to be updated, and may not actually be useful for anything.

17.5.21 Inheritance

    * `Ticks`
    * `Axis`

Classes for the ticks and x and y axis.

### 17.6.1 Inheritance

### 17.6.2 Axis objects

```
class matplotlib.axis.Axis(axes, pickradius=15)
    Base class for `XAxis` and `YAxis`.

    Attributes

    isDefault_label [bool]

    axes [matplotlib.axes.Axes] The Axes instance the artist resides in, or None.

    major [matplotlib.axis.Ticker] Determines the major tick positions and their label format.

    minor [matplotlib.axis.Ticker] Determines the minor tick positions and their label format.
```
callbacks [matplotlib.cbook.CallbackRegistry]

label [Text] The axis label.

labelpad [float] The distance between the axis label and the tick labels. Defaults to rcParams["axes.labelpad"] (default: 4.0) = 4.

offsetText [Text] A Text object containing the data offset of the ticks (if any).

pickradius [float] The acceptance radius for containment tests. See also Axes.contains.

majorTicks [list of Tick] The major ticks.

minorTicks [list of Tick] The minor ticks.

Parameters

pickradius [float] The acceptance radius for containment tests. See also Axes.contains.

class matplotlib.axis.XAxis(axes, pickradius=15)

Parameters

pickradius [float] The acceptance radius for containment tests. See also Axes.contains.

class matplotlib.axis.YAxis(axes, pickradius=15)

Parameters

pickradius [float] The acceptance radius for containment tests. See also Axes.contains.

class matplotlib.axis.Ticker

A container for the objects defining tick position and format.

Attributes

locator [matplotlib.ticker.Locator subclass] Determines the positions of the ticks.

formatter [matplotlib.ticker.Formatter subclass] Determines the format of the tick labels.

Axis.cla clear the current axis
Axis.get_scale

mathtplotlib.axis.Axis.cla

Axis.cla(self) clear the current axis
Matplotlib, Release 3.1.3

**matplotlib.axis.Axis.get_scale**

```
Axis.get_scale(self)
```

**Formatters and Locators**

<table>

</table>

**matplotlib.axis.Axis.get_major_formatter**

```
Axis.get_major_formatter(self)
```

- Get the formatter of the major ticker

**matplotlib.axis.Axis.get_major_locator**

```
Axis.get_major_locator(self)
```

- Get the locator of the major ticker

**matplotlib.axis.Axis.get_minor_formatter**

```
Axis.get_minor_formatter(self)
```

- Get the formatter of the minor ticker

**matplotlib.axis.Axis.get_minor_locator**

```
Axis.get_minor_locator(self)
```

- Get the locator of the minor ticker

**matplotlib.axis.Axis.set_major_formatter**

```
Axis.set_major_formatter(self, formatter)
```

- Set the formatter of the major ticker

**Parameters**

- `formatter` [Formatter]
Examples using matplotlib.axis.Axis.set_major_formatter

- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_pyplots_dollar_ticks.py

matplotlib.axis.Axis.set_major_locator

Axis.set_major_locator(self, locator)
Set the locator of the major ticker.

Parameters

- locator [Locator]

Examples using matplotlib.axis.Axis.set_major_locator

- sphx_glr_gallery_lines_bars_and_markers_filled_step.py
- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_scales_scales.py

matplotlib.axis.Axis.set_minor_formatter

Axis.set_minor_formatter(self, formatter)
Set the formatter of the minor ticker.

Parameters

- formatter [Formatter]

Examples using matplotlib.axis.Axis.set_minor_formatter

- sphx_glr_gallery_pyplots_pyplot_scales.py

matplotlib.axis.Axis.set_minor_locator

Axis.set_minor_locator(self, locator)
Set the locator of the minor ticker.

Parameters

- locator [Locator]

matplotlib.axis.Axis.remove_overlapping_locs

Axis.remove_overlapping_locs
If minor ticker locations that overlap with major ticker locations should be trimmed.
matplotlib.axis.Axis.get_remove_overlapping_locs

Axis.get_remove_overlapping_locs(self)

matplotlib.axis.Axis.set_remove_overlapping_locs

Axis.set_remove_overlapping_locs(self, val)

Axis Label

<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis.set_label_coords</td>
<td>Set the coordinates of the label.</td>
</tr>
<tr>
<td>Axis.set_label_position</td>
<td>Set the label position (top or bottom)</td>
</tr>
<tr>
<td>Axis.set_label_text</td>
<td>Set the text value of the axis label.</td>
</tr>
<tr>
<td>Axis.get_label_position</td>
<td>Return the label position (top or bottom)</td>
</tr>
<tr>
<td>Axis.get_label_text</td>
<td>Get the text of the label</td>
</tr>
</tbody>
</table>

matplotlib.axis.Axis.set_label_coords

Axis.set_label_coords(self, x, y, transform=None)

Set the coordinates of the label.

By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coordinate of the x label.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc

Examples using matplotlib.axis.Axis.set_label_coords

- sphx_glr_gallery_pyplots_align_ylables.py

matplotlib.axis.Axis.set_label_position

Axis.set_label_position(self, position)

Set the label position (top or bottom)

Parameters

position [{‘top’, ‘bottom’}]

matplotlib.axis.Axis.set_label_text

Axis.set_label_text(self, label, fontdict=None, **kwargs)

Set the text value of the axis label.

Parameters
**label** [str] Text string.

**fontdict** [dict] Text properties.

**kwargs** Merged into fontdict.

```python
import matplotlib

matplotlib.axis.Axis.get_label_position

Axis.get_label_position(self)
Return the label position (top or bottom)
```

```python
import matplotlib

matplotlib.axis.Axis.get_label_text

Axis.get_label_text(self)
Get the text of the label
```

**Ticks, tick labels and Offset text**

<table>
<thead>
<tr>

<td>Configure the grid lines.</td>
</tr>
<tr>
<td>Axis.set_tick_params</td>
<td>Set appearance parameters for ticks, ticklabels, and gridlines.</td>
</tr>
<tr>
<td>Axis.axis_date</td>
<td>Sets up axis ticks and labels treating data along this axis as dates.</td>
</tr>
</tbody>
</table>
Get the tick instances; grow as necessary.

**Examples using** `matplotlib.axis.Axis.get_major_ticks`

- `sphx_glr_gallery_pyplots_dollar_ticks.py`

Get a list of Text instances for the major ticklabels.

Return the major tick lines as a list of Line2D instances.

Get the array of major tick locations in data coordinates.

Get the minor tick instances; grow as necessary.

Return a list of Text instances for the minor ticklabels.

Return the minor tick lines as a list of Line2D instances.

Get the array of minor tick locations in data coordinates.
matplotlib.axis.Axis.get_offset_text

Axis.get_offset_text(self)
    Return the axis offsetText as a Text instance

matplotlib.axis.Axis.get_tick_padding

Axis.get_tick_padding(self)

matplotlib.axis.Axis.get_ticklabels

Axis.get_ticklabels(self, minor=False, which=None)
    Get the tick labels as a list of Text instances.

Parameters

    minor [bool] If True return the minor ticklabels, else return the major tick-
            labels
    which [None, (‘minor’, ‘major’, ‘both’)] Overrides minor.
            Selects which ticklabels to return

Returns

    ret [list] List of Text instances.

Examples using matplotlib.axis.Axis.get_ticklabels

    • sphx_glr_gallery_pyplots_fig_axes_customize_simple.py

matplotlib.axis.Axis.get_ticklines

Axis.get_ticklines(self, minor=False)
    Return the tick lines as a list of Line2D instances

Examples using matplotlib.axis.Axis.get_ticklines

    • sphx_glr_gallery_pyplots_fig_axes_customize_simple.py

matplotlib.axis.Axis.get_ticklocs

Axis.get_ticklocs(self, minor=False)
    Get the array of tick locations in data coordinates.
Matplotlib, Release 3.1.3

```
matplotlib.axis.Axis.get_gridlines

Axis.get_gridlines(self)
    Return the grid lines as a list of Line2D instance

matplotlib.axis.Axis.grid

Axis.grid(self, b=None, which='major', **kwargs)
    Configure the grid lines.
    
    **Parameters**
    
    b  [bool or None] Whether to show the grid lines. If any kwargs are supplied, it is assumed you want the grid on and b will be set to True.
    If b is None and there are no kwargs, this toggles the visibility of the lines.

    which  [{‘major’, ‘minor’, ‘both’}] The grid lines to apply the changes on.

    **kwargs  [Line2D properties] Define the line properties of the grid, e.g.:

```
grid(color='r', linestyle='-', linewidth=2)
```

matplotlib.axis.Axis.set_tick_params

Axis.set_tick_params(self, which='major', reset=False, **kw)
    Set appearance parameters for ticks, ticklabels, and gridlines.
    
    For documentation of keyword arguments, see matplotlib.axes.Axes.tick_params().

matplotlib.axis.Axis.axis_date

Axis.axis_date(self, tz=None)
    Sets up axis ticks and labels treating data along this axis as dates.
    
    **Parameters**
    
    tz  [tzinfo or str or None] The timezone used to create date labels.

Data and view intervals

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis.get_data_interval</td>
<td>Return the Interval instance for this axis data limits.</td>
</tr>
<tr>
<td>Axis.get_view_interval</td>
<td>Return the Interval instance for this axis view limits.</td>
</tr>
<tr>
<td>Axis.set_data_interval</td>
<td>Set the axis data limits.</td>
</tr>
<tr>
<td>Axis.set_view_interval</td>
<td>Set the axis view limits.</td>
</tr>
</tbody>
</table>
```
matplotlib.axis.Axis.get_data_interval

Axis.get_data_interval(self)
    Return the Interval instance for this axis data limits.

matplotlib.axis.Axis.get_view_interval

Axis.get_view_interval(self)
    Return the Interval instance for this axis view limits.

matplotlib.axis.Axis.set_data_interval

Axis.set_data_interval(self, vmin, vmax, ignore=False)
    Set the axis data limits. This method is for internal use.
    If ignore is False (the default), this method will never reduce the preexisting data limits, only expand them if vmin or vmax are not within them. Moreover, the order of vmin and vmax does not matter; the orientation of the axis will not change.
    If ignore is True, the data limits will be set exactly to (vmin, vmax) in that order.

matplotlib.axis.Axis.set_view_interval

Axis.set_view_interval(self, vmin, vmax, ignore=False)
    Set the axis view limits. This method is for internal use; Matplotlib users should typically use e.g. set_xlim and set_ylim.
    If ignore is False (the default), this method will never reduce the preexisting view limits, only expand them if vmin or vmax are not within them. Moreover, the order of vmin and vmax does not matter; the orientation of the axis will not change.
    If ignore is True, the view limits will be set exactly to (vmin, vmax) in that order.

Rendering helpers

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis.get_minpos</td>
<td>Return the estimated number of ticks that can fit on the axis.</td>
</tr>
<tr>
<td>Axis.get_tick_space</td>
<td>Get the extents of the tick labels on either side of the axes.</td>
</tr>
<tr>
<td>Axis.get_ticklabel_extents</td>
<td>Return a bounding box that encloses the axis.</td>
</tr>
</tbody>
</table>

matplotlib.axis.Axis.get_minpos

Axis.get_minpos(self)
**matplotlib.axis.Axis.get_tick_space**

*Axis.get_tick_space(self)*

Return the estimated number of ticks that can fit on the axis.

**matplotlib.axis.Axis.get_ticklabel_extents**

*Axis.get_ticklabel_extents(self, renderer)*

Get the extents of the tick labels on either side of the axes.

**matplotlib.axis.Axis.get_tightbbox**

*Axis.get_tightbbox(self, renderer)*

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

### Interactive

<table>
<thead>
<tr>
<th><strong>Axis.get_pickradius</strong></th>
<th>Return the depth of the axis used by the picker</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Axis.set_pickradius</strong></td>
<td>Set the depth of the axis used by the picker:</td>
</tr>
</tbody>
</table>

**matplotlib.axis.Axis.get_pickradius**

*Axis.get_pickradius(self)*

Return the depth of the axis used by the picker

**matplotlib.axis.Axis.set_pickradius**

*Axis.set_pickradius(self, pickradius)*

Set the depth of the axis used by the picker.

**Parameters**

pickradius [float]

### Units

<table>
<thead>
<tr>
<th><strong>Axis.convert_units</strong></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Axis.set_units</strong></td>
<td>Set the units for axis.</td>
</tr>
<tr>
<td><strong>Axis.get_units</strong></td>
<td>Return the units for axis.</td>
</tr>
<tr>
<td><strong>Axis.update_units</strong></td>
<td>introspect data for units converter and update the axis.converter instance if necessary.</td>
</tr>
</tbody>
</table>
matplotlib.axis.Axis.convert_units

Axis.convert_units(self, x)

matplotlib.axis.Axis.set_units

Axis.set_units(self, u)
   Set the units for axis.

   Parameters
   u [units tag]

matplotlib.axis.Axis.get_units

Axis.get_units(self)
   Return the units for axis.

matplotlib.axis.Axis.update_units

Axis.update_units(self, data)
   introspect data for units converter and update the axis.converter instance if necessary. Return True if data is registered for unit conversion.

Incremental navigation

<table>
<thead>
<tr>
<th>Axis.pan</th>
<th>Pan by numsteps (can be positive or negative).</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis.zoom</td>
<td>Zoom in/out on axis; if direction is &gt;0 zoom in, else zoom out.</td>
</tr>
</tbody>
</table>

matplotlib.axis.Axis.pan

Axis.pan(self, numsteps)
   Pan by numsteps (can be positive or negative).

matplotlib.axis.Axis.zoom

Axis.zoom(self, direction)
   Zoom in/out on axis; if direction is >0 zoom in, else zoom out.

YAxis Specific

<table>
<thead>
<tr>
<th>YAxis.axis_name</th>
<th>Continued on next page</th>
</tr>
</thead>
</table>
Table 120 – continued from previous page

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>YAxis.get_text_widths</code></td>
<td>Return the ticks position (&quot;left&quot;, &quot;right&quot;, &quot;default&quot;, or &quot;unknown&quot;).</td>
</tr>
<tr>
<td><code>YAxis.get_ticks_position</code></td>
<td></td>
</tr>
<tr>
<td><code>YAxis.set_offset_position</code></td>
<td></td>
</tr>
<tr>
<td><code>YAxis.set_ticks_position</code></td>
<td>Set the ticks position (left, right, both, default or none) 'both' sets the ticks to appear on both positions, but does not change the tick labels.</td>
</tr>
<tr>
<td><code>YAxis.tick_left</code></td>
<td>Move ticks and ticklabels (if present) to the left of the axes.</td>
</tr>
<tr>
<td><code>YAxis.tick_right</code></td>
<td>Move ticks and ticklabels (if present) to the right of the axes.</td>
</tr>
</tbody>
</table>

**matplotlib.axis.YAxis.axis_name**

`YAxis.axis_name = 'y'`

**matplotlib.axis.YAxis.get_text_widths**

`YAxis.get_text_widths(self, renderer)`

**matplotlib.axis.YAxis.get_ticks_position**

`YAxis.get_ticks_position(self)`

Return the ticks position ("left", "right", "default", or "unknown").

**matplotlib.axis.YAxis.set_offset_position**

`YAxis.set_offset_position(self, position)`

**Parameters**

- **position** [{‘left’, ‘right’}]

**matplotlib.axis.YAxis.set_ticks_position**

`YAxis.set_ticks_position(self, position)`

Set the ticks position (left, right, both, default or none) 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at left. 'none' can be used if you don’t want any ticks. 'none' and 'both' affect only the ticks, not the labels.

**Parameters**

- **position** [{‘left’, ‘right’, ‘both’, ‘default’, ‘none’}]
Examples using `matplotlib.axis.YAxis.set_ticks_position`

- `sphx_glr_gallery_pyplots_whats_new_99_spines.py`

`matplotlib.axis.YAxis.tick_left`

`YAxis.tick_left(self)`
Move ticks and ticklabels (if present) to the left of the axes.

`matplotlib.axis.YAxis.tick_right`

`YAxis.tick_right(self)`
Move ticks and ticklabels (if present) to the right of the axes.

**XAxis Specific**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>XAxis.axis_name</code></td>
<td>Returns the amount of space one should reserve for text above and below the axes.</td>
</tr>
<tr>
<td><code>XAxis.get_text_heights</code></td>
<td>Returns the amount of space one should reserve for text above and below the axes.</td>
</tr>
<tr>
<td><code>XAxis.get_ticks_position</code></td>
<td>Return the ticks position (&quot;top&quot;, &quot;bottom&quot;, &quot;default&quot;, or &quot;unknown&quot;).</td>
</tr>
<tr>
<td><code>XAxis.set_ticks_position</code></td>
<td>Set the ticks position (top, bottom, both, default or none) both sets the ticks to appear on both positions, but does not change the tick labels.</td>
</tr>
<tr>
<td><code>XAxis.tick_bottom</code></td>
<td>Move ticks and ticklabels (if present) to the bottom of the axes.</td>
</tr>
<tr>
<td><code>XAxis.tick_top</code></td>
<td>Move ticks and ticklabels (if present) to the top of the axes.</td>
</tr>
</tbody>
</table>

`matplotlib.axis.XAxis.axis_name`

`XAxis.axis_name = 'x'`

`matplotlib.axis.XAxis.get_text_heights`

`XAxis.get_text_heights(self, renderer)`
Returns the amount of space one should reserve for text above and below the axes. Returns a tuple (above, below)

`matplotlib.axis.XAxis.get_ticks_position`

`XAxis.get_ticks_position(self)`
Return the ticks position ("top", "bottom", "default", or "unknown").
**matplotlib.axis.XAxis.set_ticks_position**

XAxis.set_ticks_position(self, position)

Set the ticks position (top, bottom, both, default or none) both sets the ticks to appear on both positions, but does not change the tick labels. ‘default’ resets the tick positions to the default: ticks on both positions, labels at bottom. ‘none’ can be used if you don’t want any ticks. ‘none’ and ‘both’ affect only the ticks, not the labels.

**Parameters**

position [{'top', 'bottom', 'both', 'default', 'none'}]

**Examples using matplotlib.axis.XAxis.set_ticks_position**

- sphx_glr_gallery_pyplots_whats_new_99_spines.py

**matplotlib.axis.XAxis.tick_bottom**

XAxis.tick_bottom(self)

Move ticks and ticklabels (if present) to the bottom of the axes.

**matplotlib.axis.XAxis.tick_top**

XAxis.tick_top(self)

Move ticks and ticklabels (if present) to the top of the axes.

**Other**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis.OFFSETTEXTPAD</td>
<td>Re-initialize the major and minor Tick lists.</td>
</tr>
<tr>
<td>Axis.limit_range_for_scale</td>
<td>Set the default limits for the axis data and view interval if they have not been mutated yet.</td>
</tr>
<tr>
<td>Axis.reset_ticks</td>
<td></td>
</tr>
<tr>
<td>Axis.set_default_intervals</td>
<td>Return whether the axis has smart bounds.</td>
</tr>
<tr>
<td>Axis.get_smart_bounds</td>
<td>Set the axis to have smart bounds.</td>
</tr>
</tbody>
</table>

**matplotlib.axis.Axis.OFFSETTEXTPAD**

Axis.OFFSETTEXTPAD = 3

**matplotlib.axis.Axis.limit_range_for_scale**

Axis.limit_range_for_scale(self, vmin, vmax)
`Axis.reset_ticks`  

Re-initialize the major and minor Tick lists. 
Each list starts with a single fresh Tick.

`Axis.set_default_intervals`  

Set the default limits for the axis data and view interval if they have not been not mutated yet.

`Axis.get_smart_bounds`  

Return whether the axis has smart bounds.

`Axis.set_smart_bounds`  

Set the axis to have smart bounds.

Discouraged  

These methods implicitly use `FixedLocator` and `FixedFormatter`. They can be convenient, but if not used together may de-couple your tick labels from your data.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axis.set_ticklabels</code></td>
<td>Set the text values of the tick labels.</td>
</tr>
<tr>
<td><code>Axis.set_ticks</code></td>
<td>Set the locations of the tick marks from sequence ticks</td>
</tr>
</tbody>
</table>

`Axis.set_ticklabels`  

Set the text values of the tick labels.

**Parameters**  

- `ticklabels` [sequence of str or of Texts] List of texts for tick labels; must include values for non-visible labels.  
- `minor` [bool] If True, set minor ticks instead of major ticks.  
- `**kwargs` Text properties.

**Returns**  

- `labels` [list of Texts] For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.
Axes.set_ticks

Set the locations of the tick marks from sequence ticks

**Parameters**

- **ticks** [sequence of floats]
- **minor** [bool]

**Examples using** matplotlib.axis.Axis.set_ticks

- sphx_glr_gallery_pyplots_whats_new_99_spines.py

### 17.6.3 Tick objects

**class** matplotlib.axis.Tick(axes, loc, label, size=None, width=None, color=None, tickdir=None, pad=None, labelsize=None, labelcolor=None, zorder=None, gridOn=None, tick1On=True, tick2On=True, label1On=True, label2On=False, major=True, labelrotation=0, grid_color=None, grid_linestyle=None, grid_linewidth=None, grid_alpha=None, **kw)

Abstract base class for the axis ticks, grid lines and labels.

Ticks mark a position on an Axis. They contain two lines as markers and two labels; one each for the bottom and top positions (in case of an XAxis) or for the left and right positions (in case of a YAxis).

**Attributes**

- **tick1line** [Line2D] The left/bottom tick marker.
- **tick2line** [Line2D] The right/top tick marker.
- **gridline** [Line2D] The grid line associated with the label position.
- **label1** [Text] The left/bottom tick label.
- **label2** [Text] The right/top tick label.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

**class** matplotlib.axis.XTick(axes, loc, label, size=None, width=None, color=None, tickdir=None, pad=None, labelsize=None, labelcolor=None, zorder=None, gridOn=None, tick1On=True, tick2On=True, label1On=True, label2On=False, major=True, labelrotation=0, grid_color=None, grid_linestyle=None, grid_linewidth=None, grid_alpha=None, **kw)

Contains all the Artists needed to make an x tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points
class matplotlib.axis.YTick(axes, loc, label, size=None, width=None, color=None, tickdir=None, pad=None, labelsize=None, labelcolor=None, zorder=None, gridOn=None, tick1On=True, tick2On=True, label1On=True, label2On=False, major=True, labelrotation=0, grid_color=None, grid_linestyle=None, grid_linewidth=None, grid_alpha=None, **kw)

Contains all the Artists needed to make a Y tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

Tick.apply_tickdir
   Calculate self._pad and self._tickmarkers.

Tick.get_loc
   Return the tick location (data coords) as a scalar

Tick.get_pad
   Get the value of the tick label pad in points

Tick.get_pad_pixels
   Get the length of the tick outside of the axes.

Tick.get_tickdir
   return the view Interval instance for the axis this tick is ticking

Tick.set_label1
   Set the label1 text.

Tick.set_label2
   Set the label2 text.

Tick.set_pad
   Set the tick label pad in points

Tick.update_position
   Set the location of tick in data coords with scalar loc

matplotlib.axis.Tick.apply_tickdir

Tick.apply_tickdir(self, tickdir)
   Calculate self._pad and self._tickmarkers.

matplotlib.axis.Tick.get_loc

Tick.get_loc(self)
   Return the tick location (data coords) as a scalar

matplotlib.axis.Tick.get_pad

Tick.get_pad(self)
   Get the value of the tick label pad in points

matplotlib.axis.Tick.get_pad_pixels

Tick.get_pad_pixels(self)
matplotlib.axis.Tick.get_tick_padding

Tick.get_tick_padding(self)
    Get the length of the tick outside of the axes.

matplotlib.axis.Tick.get_tickdir

Tick.get_tickdir(self)

matplotlib.axis.Tick.get_view_interval

Tick.get_view_interval(self)
    return the view Interval instance for the axis this tick is ticking

matplotlib.axis.Tick.set_label1

Tick.set_label1(self, s)
    Set the label1 text.

    Parameters
    s [str]

matplotlib.axis.Tick.set_label2

Tick.set_label2(self, s)
    Set the label2 text.

    Parameters
    s [str]

matplotlib.axis.Tick.set_pad

Tick.set_pad(self, val)
    Set the tick label pad in points

    Parameters
    val [float]

matplotlib.axis.Tick.update_position

Tick.update_position(self, loc)
    Set the location of tick in data coords with scalar loc
17.6.4 Common and inherited methods

XTick

<table>
<thead>
<tr>

</tbody>
</table>

```python
class XTick:
    # Implementation of methods as per the documentation
```
matplotlib.axis.XTick.get_view_interval

`XTick.get_view_interval(self)`
 return the view Interval instance for the axis this tick is ticking

matplotlib.axis.XTick.set_label1

`XTick.set_label1(self, s)`
 Set the label1 text.

**Parameters**

- `s` [str]

matplotlib.axis.XTick.set_label2

`XTick.set_label2(self, s)`
 Set the label2 text.

**Parameters**

- `s` [str]

matplotlib.axis.XTick.set_pad

`XTick.set_pad(self, val)`
 Set the tick label pad in points

**Parameters**

- `val` [float]

matplotlib.axis.XTick.update_position

`XTick.update_position(self, loc)`
 Set the location of tick in data coords with scalar `loc`.

**YTick**

- `YTick.apply_tickdir` Calculate self._pad and self._tickmarkers.
- `YTick.get_loc` Return the tick location (data coords) as a scalar.
- `YTick.get_pad` Get the value of the tick label pad in points.
- `YTick.get_pad_pixels` Get the length of the tick outside of the axes.
- `YTick.get_tick_padding` Return the Interval instance for this axis view limits.
- `YTick.set_label1` Set the label1 text.

```python
matplotlib.axis.YTick.get_tickdir

YTick.get_tickdir(self)
```

```python
matplotlib.axis.YTick.get_view_interval

YTick.get_view_interval(self)
    Return the Interval instance for this axis view limits.
```

```python
matplotlib.axis.YTick.set_label1

YTick.set_label1(self, s)
    Set the label1 text.
```

**Parameters**
**s** [str]

```python
matplotlib.axis.YTick.set_label2

YTick.set_label2(self, s)
    Set the label2 text.

Parameters

- **s** [str]
```

**val** [float]

```python
matplotlib.axis.YTick.set_pad

YTick.set_pad(self, val)
    Set the tick label pad in points

Parameters

- **val** [float]
```

```python
matplotlib.axis.YTick.update_position

YTick.update_position(self, loc)
    Set the location of tick in data coords with scalar loc.
```

<td>Zoom in/out on axis; if direction is &gt;0 zoom in, else zoom out.</td>
</tr>
</tbody>
</table>

```python
matplotlib.axis.YAxis.OFFSETTEXTPAD

YAxis.OFFSETTEXTPAD = 3
```

```python
matplotlib.axis.YAxis.axis_date

YAxis.axis_date(self, tz=None)

Sets up axis ticks and labels treating data along this axis as dates.

Parameters

- `tz` [tzinfo or str or None] The timezone used to create date labels.
```

```python
matplotlib.axis.YAxis.cla

YAxis.cla(self)

clear the current axis
```

```python
matplotlib.axis.YAxis.convert_units

YAxis.convert_units(self, x)
```

```python
matplotlib.axis.YAxis.get_data_interval

YAxis.get_data_interval(self)
```

```python
matplotlib.axis.YAxis.get_gridlines

YAxis.get_gridlines(self)

Return the grid lines as a list of Line2D instance
```

```python
matplotlib.axis.YAxis.get_label_position

YAxis.get_label_position(self)

Return the label position (top or bottom)
```
Matplotlib, YAxis.get_label_text

YAxis.get_label_text(self)
    Get the text of the label

Matplotlib, YAxis.get_major_formatter

YAxis.get_major_formatter(self)
    Get the formatter of the major ticker

Matplotlib, YAxis.get_major_locator

YAxis.get_major_locator(self)
    Get the locator of the major ticker

Matplotlib, YAxis.get_major_ticks

YAxis.get_major_ticks(self, numticks=None)
    Get the tick instances; grow as necessary.

Matplotlib, YAxis.get_majorticklabels

YAxis.get_majorticklabels(self)
    Return a list of Text instances for the major ticklabels.

Matplotlib, YAxis.get_majorticklines

YAxis.get_majorticklines(self)
    Return the major tick lines as a list of Line2D instances

Matplotlib, YAxis.get_majorticklocs

YAxis.get_majorticklocs(self)
    Get the array of major tick locations in data coordinates.

Matplotlib, YAxis.get_minor_formatter

YAxis.get_minor_formatter(self)
    Get the formatter of the minor ticker

Matplotlib, YAxis.get_minor_locator

YAxis.get_minor_locator(self)
    Get the locator of the minor ticker
matplotlib.axis.YAxis.get_minor_ticks

YAxis.get_minor_ticks(self, numticks=None)
    Get the minor tick instances; grow as necessary.

matplotlib.axis.YAxis.get_minorticklabels

YAxis.get_minorticklabels(self)
    Return a list of Text instances for the minor ticklabels.

matplotlib.axis.YAxis.get_minorticklines

YAxis.get_minorticklines(self)
    Return the minor tick lines as a list of Line2D instances

matplotlib.axis.YAxis.get_minorticklocs

YAxis.get_minorticklocs(self)
    Get the array of minor tick locations in data coordinates.

matplotlib.axis.YAxis.get_minpos

YAxis.get_minpos(self)

matplotlib.axis.YAxis.get_offset_text

YAxis.get_offset_text(self)
    Return the axis offsetText as a Text instance

matplotlib.axis.YAxis.get_pickradius

YAxis.get_pickradius(self)
    Return the depth of the axis used by the picker

matplotlib.axis.YAxis.get_scale

YAxis.get_scale(self)

matplotlib.axis.YAxis.get_smart_bounds

YAxis.get_smart_bounds(self)
    Return whether the axis has smart bounds.
matplotlib.axis.YAxis.get_tick_padding

YAxis.get_tick_padding(self)

matplotlib.axis.YAxis.get_tick_space

YAxis.get_tick_space(self)
    Return the estimated number of ticks that can fit on the axis.

matplotlib.axis.YAxis.get_ticklabel_extents

YAxis.get_ticklabel_extents(self, renderer)
    Get the extents of the tick labels on either side of the axes.

matplotlib.axis.YAxis.get_ticklabels

YAxis.get_ticklabels(self, minor=False, which=None)
    Get the tick labels as a list of Text instances.

    **Parameters**
    
    minor [bool] If True return the minor ticklabels, else return the major ticklabels
    
    which [None, ('minor', 'major', 'both')] Overrides minor.
    Selects which ticklabels to return

    **Returns**
    
    ret [list] List of Text instances.

matplotlib.axis.YAxis.get_ticklines

YAxis.get_ticklines(self, minor=False)
    Return the tick lines as a list of Line2D instances

matplotlib.axis.YAxis.get_ticklocs

YAxis.get_ticklocs(self, minor=False)
    Get the array of tick locations in data coordinates.

matplotlib.axis.YAxis.get_tightbbox

YAxis.get_tightbbox(self, renderer)
    Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.
matplotlib.axis.YAxis.get_units

YAxis.get_units(self)
    Return the units for axis.

matplotlib.axis.YAxis.get_view_interval

YAxis.get_view_interval(self)

matplotlib.axis.YAxis.grid

YAxis.grid(self, b=None, which='major', **kwargs)
    Configure the grid lines.

    Parameters
    ----------
    b : bool or None
        Whether to show the grid lines. If any kwargs are supplied, it is assumed you want the grid on and b will be set to True.
        If b is None and there are no kwargs, this toggles the visibility of the lines.
    which : {'major', 'minor', 'both'}
        The grid lines to apply the changes on.
    **kwargs : [Line2D properties]
        Define the line properties of the grid, e.g.:
        
        grid(color='r', linestyle='-', linewidth=2)

matplotlib.axis.YAxis.limit_range_for_scale

YAxis.limit_range_for_scale(self, vmin, vmax)

matplotlib.axis.YAxis.pan

YAxis.pan(self, numsteps)
    Pan by numsteps (can be positive or negative).

matplotlib.axis.YAxis.reset_ticks

YAxis.reset_ticks(self)
    Re-initialize the major and minor Tick lists.
    Each list starts with a single fresh Tick.

matplotlib.axis.YAxis.set_data_interval

YAxis.set_data_interval(self, vmin, vmax, ignore=False)
matplotlib.axis.YAxis.set_default_intervals

YAxis.set_default_intervals(self)
Set the default limits for the axis data and view interval if they have not been not mutated yet.

matplotlib.axis.YAxis.set_label_coords

YAxis.set_label_coords(self, x, y, transform=None)
Set the coordinates of the label.
By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coordinate of the x label.
You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc.

matplotlib.axis.YAxis.set_label_position

YAxis.set_label_position(self, position)
Set the label position (left or right)
Parameters
position ['left', 'right']

matplotlib.axis.YAxis.set_label_text

YAxis.set_label_text(self, label, fontdict=None, **kwargs)
Set the text value of the axis label.
Parameters
label [str] Text string.
fontdict [dict] Text properties.
**kwargs Merged into fontdict.

matplotlib.axis.YAxis.set_major_formatter

YAxis.set_major_formatter(self, formatter)
Set the formatter of the major ticker.
Parameters
formatter [Formatter]
Matplotlib, Release 3.1.3

```
matplotlib.axis.YAxis.set_major_locator

YAxis.set_major_locator(self, locator)
    Set the locator of the major ticker.

    Parameters
    locator [Locator]

matplotlib.axis.YAxis.set_minor_formatter

YAxis.set_minor_formatter(self, formatter)
    Set the formatter of the minor ticker.

    Parameters
    formatter [Formatter]

matplotlib.axis.YAxis.set_minor_locator

YAxis.set_minor_locator(self, locator)
    Set the locator of the minor ticker.

    Parameters
    locator [Locator]

matplotlib.axis.YAxis.set_pickradius

YAxis.set_pickradius(self, pickradius)
    Set the depth of the axis used by the picker.

    Parameters
    pickradius [float]

matplotlib.axis.YAxis.set_smart_bounds

YAxis.set_smart_bounds(self, value)
    Set the axis to have smart bounds.

matplotlib.axis.YAxis.set_tick_params

YAxis.set_tick_params(self, which='major', reset=False, **kw)
    Set appearance parameters for ticks, ticklabels, and gridlines.

    For documentation of keyword arguments, see matplotlib.axes.Axes.tick_params().
```
matplotlib.axis.YAxis.set_ticklabels

YAxis.set_ticklabels(self, ticklabels, *args, minor=False, **kwargs)
   Set the text values of the tick labels.

   Parameters
   
   ticklabels [sequence of str or of Texts] List of texts for tick labels; must
   include values for non-visible labels.
   
   minor [bool] If True, set minor ticks instead of major ticks.
   
   **kwargs Text properties.

   Returns
   
   labels [list of Texts] For each tick, includes tick.label1 if it is visible, then
   tick.label2 if it is visible, in that order.

matplotlib.axis.YAxis.set_ticks

YAxis.set_ticks(self, ticks, minor=False)
   Set the locations of the tick marks from sequence ticks

   Parameters
   
   ticks [sequence of floats]
   
   minor [bool]

matplotlib.axis.YAxis.set_units

YAxis.set_units(self, u)
   Set the units for axis.

   Parameters
   
   u [units tag]

matplotlib.axis.YAxis.set_view_interval

YAxis.set_view_interval(self, vmin, vmax, ignore=False)

matplotlib.axis.YAxis.update_units

YAxis.update_units(self, data)
   introspect data for units converter and update the axis.converter instance if necessary.
   Return True if data is registered for unit conversion.

matplotlib.axis.YAxis.zoom

YAxis.zoom(self, direction)
   Zoom in/out on axis; if direction is >0 zoom in, else zoom out.
XAxis

XAxis.OFFSETTEXTPAD
XAxis.axis_date
Sets up axis ticks and labels treating data along this axis as dates.
XAxis.cla
clear the current axis
XAxis.convert_units
XAxis.get_data_interval
Return the grid lines as a list of Line2D instance
XAxis.get_label_position
Return the label position (top or bottom)
XAxis.get_label_text
Get the text of the label
XAxis.get_major_formatter
Get the formatter of the major ticker
XAxis.get_major_locator
Get the locator of the major ticker
XAxis.get_major_ticks
Get the tick instances; grow as necessary.
XAxis.get_major_ticklabels
Return a list of Text instances for the major ticklabels.
XAxis.get_major_ticklines
Return the major tick lines as a list of Line2D instances
XAxis.get_major_ticklocs
Get the array of major tick locations in data coordinates.
XAxis.get_minor_formatter
Get the formatter of the minor ticker
XAxis.get_minor_locator
Get the locator of the minor ticker
XAxis.get_minor_ticks
Get the minor tick instances; grow as necessary.
XAxis.get_minor_ticklabels
Return a list of Text instances for the minor ticklabels.
XAxis.get_minor_ticklines
Return the minor tick lines as a list of Line2D instances
XAxis.get_minor_ticklocs
Get the array of minor tick locations in data coordinates.
XAxis.get_minpos
XAxis.get_offset_text
Return the axis offsetText as a Text instance
XAxis.get_pickradius
Return the depth of the axis used by the picker
XAxis.get_scale
Return whether the axis has smart bounds.
XAxis.get_smart_bounds
XAxis.get_tick_padding
Return the estimated number of ticks that can fit on the axis.
XAxis.get_tick_space
Get the extents of the tick labels on either side of the axes.
XAxis.get_ticklabel_extents
Get the tick labels as a list of Text instances.
XAxis.get_ticklabels
Return the tick lines as a list of Line2D instances
XAxis.get_ticklocs
Get the array of tick locations in data coordinates.
XAxis.get_tightbbox
Return a bounding box that encloses the axis.
XAxis.get_units
Return the units for axis.
XAxis.get_view_interval

</table>

```
17.6. matplotlib.axis
```
matplotlib.axis.XAxis.convert_units

XAxis.convert_units(self, x)

matplotlib.axis.XAxis.get_data_interval

XAxis.get_data_interval(self)

matplotlib.axis.XAxis.get_gridlines

XAxis.get_gridlines(self)
   Return the grid lines as a list of Line2D instance

matplotlib.axis.XAxis.get_label_position

XAxis.get_label_position(self)
   Return the label position (top or bottom)

matplotlib.axis.XAxis.get_label_text

XAxis.get_label_text(self)
   Get the text of the label

matplotlib.axis.XAxis.get_major_formatter

XAxis.get_major_formatter(self)
   Get the formatter of the major ticker

matplotlib.axis.XAxis.get_major_locator

XAxis.get_major_locator(self)
   Get the locator of the major ticker

matplotlib.axis.XAxis.get_major_ticks

XAxis.get_major_ticks(self, numticks=None)
   Get the tick instances; grow as necessary.

matplotlib.axis.XAxis.get_majorticklabels

XAxis.get_majorticklabels(self)
   Return a list of Text instances for the major ticklabels.
matplotlib.axis.XAxis.get_majorticklines

XAxis.get_majorticklines(self)
    Return the major tick lines as a list of Line2D instances

matplotlib.axis.XAxis.get_majorticklocs

XAxis.get_majorticklocs(self)
    Get the array of major tick locations in data coordinates.

matplotlib.axis.XAxis.get_minor_formatter

XAxis.get_minor_formatter(self)
    Get the formatter of the minor ticker

matplotlib.axis.XAxis.get_minor_locator

XAxis.get_minor_locator(self)
    Get the locator of the minor ticker

matplotlib.axis.XAxis.get_minor_ticks

XAxis.get_minor_ticks(self, numticks=None)
    Get the minor tick instances; grow as necessary.

matplotlib.axis.XAxis.get_minorticklabels

XAxis.get_minorticklabels(self)
    Return a list of Text instances for the minor ticklabels.

matplotlib.axis.XAxis.get_minorticklines

XAxis.get_minorticklines(self)
    Return the minor tick lines as a list of Line2D instances

matplotlib.axis.XAxis.get_minorticklocs

XAxis.get_minorticklocs(self)
    Get the array of minor tick locations in data coordinates.

matplotlib.axis.XAxis.get_minpos

XAxis.get_minpos(self)
matplotlib.axis.XAxis.get_offset_text

XAxis.get_offset_text(self)
   Return the axis offsetText as a Text instance

matplotlib.axis.XAxis.get_pickradius

XAxis.get_pickradius(self)
   Return the depth of the axis used by the picker

matplotlib.axis.XAxis.get_scale

XAxis.get_scale(self)

matplotlib.axis.XAxis.get_smart_bounds

XAxis.get_smart_bounds(self)
   Return whether the axis has smart bounds.

matplotlib.axis.XAxis.get_tick_padding

XAxis.get_tick_padding(self)

matplotlib.axis.XAxis.get_tick_space

XAxis.get_tick_space(self)
   Return the estimated number of ticks that can fit on the axis.

matplotlib.axis.XAxis.get_ticklabel_extents

XAxis.get_ticklabel_extents(self, renderer)
   Get the extents of the tick labels on either side of the axes.

matplotlib.axis.XAxis.get_ticklabels

XAxis.get_ticklabels(self, minor=False, which=None)
   Get the tick labels as a list of Text instances.

   Parameters

   *minor* [bool] If True return the minor ticklabels, else return the major ticklabels

   *which* [None, ('minor', 'major', 'both')] Overrides *minor*. Selects which ticklabels to return

   Returns
**Examples using matplotlib.axis.XAxis.get_ticklabels**

- Artist tutorial

**matplotlib.axis.XAxis.get_ticklines**

`XAxis.get_ticklines(self, minor=False)`

Return the tick lines as a list of Line2D instances

**Examples using matplotlib.axis.XAxis.get_ticklines**

- Artist tutorial

**matplotlib.axis.XAxis.get_ticklocs**

`XAxis.get_ticklocs(self, minor=False)`

Get the array of tick locations in data coordinates.

**Examples using matplotlib.axis.XAxis.get_ticklocs**

- Artist tutorial

**matplotlib.axis.XAxis.get_tightbbox**

`XAxis.get_tightbbox(self, renderer)`

Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

**matplotlib.axis.XAxis.get_units**

`XAxis.get_units(self)`

Return the units for axis.

**matplotlib.axis.XAxis.get_view_interval**

`XAxis.get_view_interval(self)`
Matplotlib, Release 3.1.3

**matplotlib.axis.XAxis.grid**

XAxis.grid(self, b=None, which='major', **kwargs)

Configure the grid lines.

**Parameters**

- **b** [bool or None] Whether to show the grid lines. If any *kwargs* are supplied, it is assumed you want the grid on and *b* will be set to True.
  
  If *b* is *None* and there are no *kwargs*, this toggles the visibility of the lines.

- **which** [{‘major’, ‘minor’, ‘both’}] The grid lines to apply the changes on.

- ****kwargs** [Line2D properties] Define the line properties of the grid, e.g.:

  ```
  grid(color='r', linestyle='-', linewidth=2)
  ```

**matplotlib.axis.XAxis.limit_range_for_scale**

XAxis.limit_range_for_scale(self, vmin, vmax)

**matplotlib.axis.XAxis.pan**

XAxis.pan(self, numsteps)

Pan by *numsteps* (can be positive or negative).

**matplotlib.axis.XAxis.reset_ticks**

XAxis.reset_ticks(self)

Re-initialize the major and minor Tick lists.

Each list starts with a single fresh Tick.

**matplotlib.axis.XAxis.set_data_interval**

XAxis.set_data_interval(self, vmin, vmax, ignore=False)

**matplotlib.axis.XAxis.set_default_intervals**

XAxis.set_default_intervals(self)

Set the default limits for the axis data and view interval if they have not been not mutated yet.
matplotlib.axis.XAxis.set_label_coords

XAxis.set_label_coords(self, x, y, transform=None)
   Set the coordinates of the label.

   By default, the x coordinate of the y label is determined by the tick label bounding boxes, but this can lead to poor alignment of multiple ylabels if there are multiple axes. Ditto for the y coordinate of the x label.

   You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system (0,0) is (left,bottom), (0.5, 0.5) is middle, etc

matplotlib.axis.XAxis.set_label_position

XAxis.set_label_position(self, position)
   Set the label position (top or bottom)

   Parameters
   position [{'top', 'bottom'}]

matplotlib.axis.XAxis.set_label_text

XAxis.set_label_text(self, label, fontdict=None, **kwargs)
   Set the text value of the axis label.

   Parameters
   label [str] Text string.
   fontdict [dict] Text properties.
   **kwargs Merged into fontdict.

matplotlib.axis.XAxis.set_major_formatter

XAxis.set_major_formatter(self, formatter)
   Set the formatter of the major ticker.

   Parameters
   formatter [Formatter]

matplotlib.axis.XAxis.set_major_locator

XAxis.set_major_locator(self, locator)
   Set the locator of the major ticker.

   Parameters
   locator [Locator]
matplotlib.axis.XAxis.set_minor_formatter

XAxis.set_minor_formatter(self, formatter)
Set the formatter of the minor ticker.

Parameters
formatter [Formatter]

matplotlib.axis.XAxis.set_minor_locator

XAxis.set_minor_locator(self, locator)
Set the locator of the minor ticker.

Parameters
locator [Locator]

matplotlib.axis.XAxis.set_pickradius

XAxis.set_pickradius(self, pickradius)
Set the depth of the axis used by the picker.

Parameters
pickradius [float]

matplotlib.axis.XAxis.set_smart_bounds

XAxis.set_smart_bounds(self, value)
Set the axis to have smart bounds.

matplotlib.axis.XAxis.set_tick_params

XAxis.set_tick_params(self, which='major', reset=False, **kw)
Set appearance parameters for ticks, ticklabels, and gridlines.

For documentation of keyword arguments, see matplotlib.axes.Axes.tick_params().

matplotlib.axis.XAxis.set_ticklabels

XAxis.set_ticklabels(self, ticklabels, *args, minor=False, **kwargs)
Set the text values of the tick labels.

Parameters
ticklabels [sequence of str or of Texts] List of texts for tick labels; must include values for non-visible labels.
minor [bool] If True, set minor ticks instead of major ticks.
**kwargs Text properties.
Returns

**labels** [list of Texts] For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.

```python
matplotlib.axis.XAxis.set_ticks
```

```
XAxis.set_ticks(self, ticks, minor=False)
```

Set the locations of the tick marks from sequence `ticks`

**Parameters**

- `ticks` [sequence of floats]
- `minor` [bool]

```python
matplotlib.axis.XAxis.set_units
```

```
XAxis.set_units(self, u)
```

Set the units for axis.

**Parameters**

- `u` [units tag]

```python
matplotlib.axis.XAxis.set_view_interval
```

```
XAxis.set_view_interval(self, vmin, vmax, ignore=False)
```

```python
matplotlib.axis.XAxis.update_units
```

```
XAxis.update_units(self, data)
```

introspect `data` for units converter and update the axis.converter instance if necessary. Return True if `data` is registered for unit conversion.

```python
matplotlib.axis.XAxis.zoom
```

```
XAxis.zoom(self, direction)
```

Zoom in/out on axis; if `direction` is >0 zoom in, else zoom out.

**Inherited from artist**

**Ticks**

```python
Tick.add_callback
```

Add a callback function that will be called whenever one of the `Artist`s properties changes.

<td><code>YTick.zorder</code></td>
<td></td>
</tr>
</tbody>
</table>
Tick.add_callback(
    self, func
)
Add a callback function that will be called whenever one of the Artist's properties changes.

**Parameters**

- **func** [callable] The callback function. It must have the signature:

  ```python
  def func(artist: Artist) -> Any
  ```

  where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns**

- **old** [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

**See also:**

- remove_callback

Tick.axes

The Axes instance the artist resides in, or *None*.

Tick.contains

Tick.contains(
    self, mouseevent
)
Test whether the mouse event occurred in the Tick marks.

This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

Tick.convert_xunits

Tick.convert_xunits(
    self, x
)
Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

Tick.convert_yunits

Tick.convert_yunits(
    self, y
)
Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.
matplotlib.axis.Tick.draw

```
Tick.draw(self, renderer)
```

Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to
not have any effect if the Artist is not visible (``Artist.get_visible`` is False).

**Parameters**

- **renderer** [``RendererBase`` subclass.]

matplotlib.axis.Tick.findobj

```
Tick.findobj(self, match=None, include_self=True)
```

Find artist objects.

Recursively find all ``Artist`` instances contained in the artist.

**Parameters**

- **match** A filter criterion for the matches. This can be
  - None: Return all objects contained in artist.
  - A function with signature `def match(artist: Artist) -> bool`. The re-
    sult will only contain artists for which the function returns `True`.
  - A class instance: e.g., ``Line2D``. The result will only contain artists of this
    class or its subclasses (`isinstance` check).

- **include_self** [bool] Include `self` in the list to be checked for a match.

**Returns**

- **artists** [list of ``Artist``]

matplotlib.axis.Tick.format_cursor_data

```
Tick.format_cursor_data(self, data)
```

Return a string representation of `data`.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of
Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a
comma-separated string enclosed in square brackets.

**See also:**

- `get_cursor_data`
matplotlib.axis.Tick.get_agg_filter

Tick.get_agg_filter(self)
    Return filter function to be used for agg filter.

matplotlib.axis.Tick.get_alpha

Tick.get_alpha(self)
    Return the alpha value used for blending - not supported on all backends

matplotlib.axis.Tick.get_animated

Tick.get_animated(self)
    Return the animated state.

matplotlib.axis.Tick.get_children

Tick.get_children(self)
    Return a list of the child Artists of this Artist.

matplotlib.axis.Tick.get_clip_box

Tick.get_clip_box(self)
    Return the clipbox.

matplotlib.axis.Tick.get_clip_on

Tick.get_clip_on(self)
    Return whether the artist uses clipping.

matplotlib.axis.Tick.get_clip_path

Tick.get_clip_path(self)
    Return the clip path.

matplotlib.axis.Tick.get_contains

Tick.get_contains(self)
    Return the custom contains function of the artist if set, or None.

See also:

set_contains
Tick.get_cursor_data

Tick.get_cursor_data(self, event)
    Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- **event** [matplotlib.backend_bases.MouseEvent]

**See also:**

- `format_cursor_data`

Tick.get_figure

Tick.get_figure(self)
    Return the `Figure` instance the artist belongs to.

Tick.get_gid

Tick.get_gid(self)
    Return the group id.

Tick.get_label

Tick.get_label(self)
    Return the label used for this artist in the legend.

Tick.get_path_effects

Tick.get_path_effects(self)

Tick.get_picker

Tick.get_picker(self)
    Return the picking behavior of the artist.
The possible values are described in \textit{set\_picker}.

\textbf{See also:}

\textit{set\_picker}, \textit{pickable}, \textit{pick}

\texttt{matplotlib.axis.Tick.get\_rasterized}

\texttt{Tick.get\_rasterized(self)}

Return whether the artist is to be rasterized.

\texttt{matplotlib.axis.Tick.get\_sketch\_params}

\texttt{Tick.get\_sketch\_params(self)}

Returns the sketch parameters for the artist.

\textbf{Returns}

\texttt{sketch\_params} [tuple or None] A 3-tuple with the following elements:

\begin{itemize}
  \item \textit{scale}: The amplitude of the wiggle perpendicular to the source line.
  \item \textit{length}: The length of the wiggle along the line.
  \item \textit{randomness}: The scale factor by which the length is shrunken or expanded.
\end{itemize}

Returns \texttt{None} if no sketch parameters were set.

\texttt{matplotlib.axis.Tick.get\_snap}

\texttt{Tick.get\_snap(self)}

Returns the snap setting.

See \textit{set\_snap} for details.

\texttt{matplotlib.axis.Tick.get\_transform}

\texttt{Tick.get\_transform(self)}

Return the \texttt{Transform} instance used by this artist.

\texttt{matplotlib.axis.Tick.get\_transformed\_clip\_path\_and\_affine}

\texttt{Tick.get\_transformed\_clip\_path\_and\_affine(self)}

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

\texttt{matplotlib.axis.Tick.get\_url}

\texttt{Tick.get\_url(self)}

Return the url.
matplotlib.axis.Tick.get_visible

Tick.get_visible(self)
    Return the visibility.

matplotlib.axis.Tick.get_window_extent

Tick.get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box “tight” calculation. Default
    is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent
    of the artist changes. The extent can change due to any changes in the transform stack,
    such as changing the axes limits, the figure size, or the canvas used (as is done when
    saving a figure). This can lead to unexpected behavior where interactive figures will look
    fine on the screen, but will save incorrectly.

matplotlib.axis.Tick.get_zorder

Tick.get_zorder(self)
    Return the artist's zorder.

matplotlib.axis.Tick.have_units

Tick.have_units(self)
    Return True if units are set on the x or y axes.

matplotlib.axis.Tick.is_transform_set

Tick.is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

matplotlib.axis.Tick.mouseover

Tick.mouseover

matplotlib.axis.Tick.pchanged

Tick.pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.

    See also:
add_callback
remove_callback

matplotlib.axis.Tick.pick

Tick.pick(self, mouseevent)
Process a pick event.
Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

See also:
set_picker, get_picker, pickable

matplotlib.axis.Tick.pickable

Tick.pickable(self)
Return whether the artist is pickable.

See also:
set_picker, get_picker, pick

matplotlib.axis.Tick.properties

Tick.properties(self)
Return a dictionary of all the properties of the artist.

matplotlib.axis.Tick.remove

Tick.remove(self)
Remove the artist from the figure if possible.
The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
Note: relim will not see collections even if the collection was added to the axes with autolim = True.
Note: there is no support for removing the artist’s legend entry.

matplotlib.axis.Tick.remove_callback

Tick.remove_callback(self, oid)
Remove a callback based on its observer id.

See also:
add_callback
**matplotlib.axis.Tick.set**

```python
tick.set(self, **kwargs)
```

A property batch setter. Pass `kwargs` to set properties.

**matplotlib.axis.Tick.set_agg_filter**

```python
tick.set_agg_filter(self, filter_func)
```

Set the agg filter.

**Parameters**

- `filter_func` [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**matplotlib.axis.Tick.set_alpha**

```python
tick.set_alpha(self, alpha)
```

Set the alpha value used for blending - not supported on all backends.

**Parameters**

- `alpha` [float]

**matplotlib.axis.Tick.set_animated**

```python
tick.set_animated(self, b)
```

Set the artist's animation state.

**Parameters**

- `b` [bool]

**matplotlib.axis.Tick.set_clip_box**

```python
tick.set_clip_box(self, clipbox)
```

Set the artist’s clip (bbox).

**Parameters**

- `clipbox` [Bbox]

**matplotlib.axis.Tick.set_clip_on**

```python
tick.set_clip_on(self, b)
```

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

- `b` [bool]
(matplotlib.axis.Tick.set_clip_path)

Tick.set_clip_path(self, clippath, transform=None)
Set the artist’s clip path, which may be:

- a Patch (or subclass) instance; or
- a Path instance, in which case a Transform instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [((Path, Transform) | Patch | None]

(matplotlib.axis.Tick.set_contains)

Tick.set_contains(self, picker)
Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

- picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

(matplotlib.axis.Tick.set_figure)

Tick.set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

- fig [Figure]

(matplotlib.axis.Tick.set_gid)

Tick.set_gid(self, gid)
Set the (group) id for the artist.

Parameters

- gid [str]
matplotlib.axis.Tick.set_label

Tick.set_label(self, s)
    Set the label1 text.

    Parameters
    s [str]

matplotlib.axis.Tick.set_path_effects

Tick.set_path_effects(self, path_effects)
    Set the path effects.

    Parameters
    path_effects [AbstractPathEffect]

matplotlib.axis_Tick.set_picker

Tick.set_picker(self, picker)
    Define the picking behavior of the artist.

    Parameters
    picker [None or bool or float or callable] This can be one of the following:
    • None: Picking is disabled for this artist (default).
    • A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
    • A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
    • A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

        hit, props = picker(artist, mouseevent)

    to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

matplotlib.axis.Tick.set_rasterized

Tick.set_rasterized(self, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.
    Defaults to None, which implies the backend’s default behavior.

    Parameters
    rasterized [bool or None]
matplotlib.axis.Tick.set_sketch_params

```
Tick.set_sketch_params(self, scale=None, length=None, randomness=None)
```
Sets the sketch parameters.

**Parameters**

- **scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.
- **length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
- **randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.axis.Tick.set_snap

```
Tick.set_snap(self, snap)
```
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

- **snap** [bool or None] Possible values:
  - `True`: Snap vertices to the nearest pixel center.
  - `False`: Do not modify vertex positions.
  - `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

matplotlib.axis.Tick.set_transform

```
Tick.set_transform(self, t)
```
Set the artist transform.

**Parameters**

- **t** `Transform`

matplotlib.axis.Tick.set_url

```
Tick.set_url(self, url)
```
Set the url for the artist.

**Parameters**
Matplotlib, Release 3.1.3

```python
url [str]

matplotlib.axis.Tick.set_visible

Tick.set_visible(self, b)
    Set the artist’s visibility.

Parameters

b [bool]

matplotlib.axis.Tick.set_zorder

Tick.set_zorder(self, level)
    Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level [float]

matplotlib.axis.Tick.stale

Tick.stale
    Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal
    state of the artist.

matplotlib.axis.Tick.update

Tick.update(self, props)
    Update this artist’s properties from the dictionary props.

matplotlib.axis.Tick.update_from

Tick.update_from(self, other)
    Copy properties from other to self.

matplotlib.axis.Tick.zorder

Tick.zorder = 0

matplotlib.axis.XTick.add_callback

XTick.add_callback(self, func)
    Add a callback function that will be called whenever one of the Artist’s properties
    changes.

Parameters
**func** [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns**

*oid* [int] The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

**See also:**

*remove_callback*

**matplotlib.axis.XTick.axes**

*XTick.axes*

The *Axes* instance the artist resides in, or *None*.

**matplotlib.axis.XTick.contains**

*XTick.contains(self, mouseevent)*

Test whether the mouse event occurred in the Tick marks.

This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

**matplotlib.axis.XTick.convert_xunits**

*XTick.convert_xunits(self, x)*

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

**matplotlib.axis.XTick.convert_yunits**

*XTick.convert_yunits(self, y)*

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

**matplotlib.axis.XTick.draw**

*XTick.draw(self, renderer)*

Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (*Artist.get_visible* is *False*).
Parameters

renderer [RendererBase subclass.]

matplotlib.axis.XTick.findobj

XTick.findobj(self, match=None, include_self=True)

Find artist objects.

Recursively find all Artist instances contained in the artist.

Parameters

match A filter criterion for the matches. This can be

• None: Return all objects contained in artist.
• A function with signature def match(artist: Artist) -> bool. The re-
sult will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this
class or its subclasses (isinstance check).

include_self [bool] Include self in the list to be checked for a match.

Returns

artists [list of Artist]

matplotlib.axis.XTick.format_cursor_data

XTick.format_cursor_data(self, data)

Return a string representation of data.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

get_cursor_data

matplotlib.axis.XTick.get_agg_filter

XTick.get_agg_filter(self)

Return filter function to be used for agg filter.

matplotlib.axis.XTick.get_alpha

XTick.get_alpha(self)

Return the alpha value used for blending - not supported on all backends
matplotlib.axis.XTick.get_animated

`XTick.get_animated(self)`
Return the animated state.

matplotlib.axis.XTick.get_children

`XTick.get_children(self)`
Return a list of the child Artists of this Artist.

matplotlib.axis.XTick.get_clip_box

`XTick.get_clip_box(self)`
Return the clipbox.

matplotlib.axis.XTick.get_clip_on

`XTick.get_clip_on(self)`
Return whether the artist uses clipping.

matplotlib.axis.XTick.get_clip_path

`XTick.get_clip_path(self)`
Return the clip path.

matplotlib.axis.XTick.get_contains

`XTick.get_contains(self)`
Return the custom contains function of the artist if set, or None.

**See also:**

`set_contains`

matplotlib.axis.XTick.get_cursor_data

`XTick.get_cursor_data(self, event)`
Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.
Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation. The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- `event` [`matplotlib.backend_bases.MouseEvent`]

**See also:**

`format_cursor_data`

```python
matplotlib.axis.XTick.get_figure

XTick.get_figure(self)
    Return the `Figure` instance the artist belongs to.
```

```python
matplotlib.axis.XTick.get_gid

XTick.get_gid(self)
    Return the group id.
```

```python
matplotlib.axis.XTick.get_label

XTick.get_label(self)
    Return the label used for this artist in the legend.
```

```python
matplotlib.axis.XTick.get_path_effects

XTick.get_path_effects(self)
```

```python
matplotlib.axis.XTick.get_picker

XTick.get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in `set_picker`.

**See also:**

`set_picker`, `pickable`, `pick`
```

```python
matplotlib.axis.XTick.get_rasterized

XTick.get_rasterized(self)
    Return whether the artist is to be rasterized.
```
matplotlib.axis.XTick.get_sketch_params

XTick.get_sketch_params(self)
Returns the sketch parameters for the artist.

**Returns**

**sketch_params** [tuple or None] A 3-tuple with the following elements:
- *scale*: The amplitude of the wiggle perpendicular to the source line.
- *length*: The length of the wiggle along the line.
- *randomness*: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

matplotlib.axis.XTick.get_snap

XTick.get_snap(self)
Returns the snap setting.
See *set_snap* for details.

matplotlib.axis.XTick.get_transform

XTick.get_transform(self)
Return the *Transform* instance used by this artist.

matplotlib.axis.XTick.get_transformed_clip_path_and_affine

XTick.get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.XTick.get_url

XTick.get_url(self)
Return the url.

matplotlib.axis.XTick.get_visible

XTick.get_visible(self)
Return the visibility.
matplotlib.axis.XTick.get_window_extent

XTick.get_window_extent(self, renderer)
Get the axes bounding box in display space.

The bounding box’ width and height are nonnegative.

Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.XTick.get_zorder

XTick.get_zorder(self)
Return the artist’s zorder.

matplotlib.axis.XTick.have_units

XTick.have_units(self)
Return True if units are set on the x or y axes.

matplotlib.axis.XTick.is_transform_set

XTick.is_transform_set(self)
Return whether the Artist has an explicitly set transform.

This is True after set_transform has been called.

matplotlib.axis.XTick.mouseover

XTick.mouseover

matplotlib.axis.XTick.pchanged

XTick.pchanged(self)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback
matplotlib.axis.XTick.pick

XTick.pick(self, mouseevent)
   Process a pick event.
   Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.
   
See also:

   set_picker, get_picker, pickable

matplotlib.axis.XTick.pickable

XTick.pickable(self)
   Return whether the artist is pickable.

See also:

   set_picker, get_picker, pick

matplotlib.axis.XTick.properties

XTick.properties(self)
   Return a dictionary of all the properties of the artist.

matplotlib.axis.XTick.remove

XTick.remove(self)
   Remove the artist from the figure if possible.
   The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
   Note: relim will not see collections even if the collection was added to the axes with autolim = True.
   Note: there is no support for removing the artist’s legend entry.

matplotlib.axis.XTick.remove_callback

XTick.remove_callback(self, oid)
   Remove a callback based on its observer id.

See also:

   add_callback
matplotlib.axis.XTick.set

`XTick.set(self, **kwargs)`
A property batch setter. Pass `kwargs` to set properties.

matplotlib.axis.XTick.set_agg_filter

`XTick.set_agg_filter(self, filter_func)`
Set the agg filter.

**Parameters**

- `filter_func` [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

matplotlib.axis.XTick.set_alpha

`XTick.set_alpha(self, alpha)`
Set the alpha value used for blending - not supported on all backends.

**Parameters**

- `alpha` [float]

matplotlib.axis.XTick.set_animated

`XTick.set_animated(self, b)`
Set the artist’s animation state.

**Parameters**

- `b` [bool]

matplotlib.axis.XTick.set_clip_box

`XTick.set_clip_box(self, clipbox)`
Set the artist’s clip `Bbox`.

**Parameters**

- `clipbox` [Bbox]

matplotlib.axis.XTick.set_clip_on

`XTick.set_clip_on(self, b)`
Set whether the artist uses clipping.

When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

- `b` [bool]
matplotlib.axis.XTick.set_clip_path

```
XTick.set_clip_path(self, clippath, transform=None)
```

Set the artist’s clip path, which may be:

- a `Patch` (or subclass) instance; or
- a `Path` instance, in which case a `Transform` instance, which will be applied to the path before using it for clipping, must be provided; or
- `None`, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

**ACCEPTS:** `[(Path, Transform) | Patch | None]`

matplotlib.axis.XTick.set_contains

```
XTick.set_contains(self, picker)
```

Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters**

- **picker** [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

  ```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
  ```

  that returns:
  - a bool indicating if the event is within the artist
  - a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

matplotlib.axis.XTick.set_figure

```
XTick.set_figure(self, fig)
```

Set the `Figure` instance the artist belongs to.

**Parameters**

- **fig** `Figure`

matplotlib.axis.XTick.set_gid

```
XTick.set_gid(self, gid)
```

Set the (group) id for the artist.

**Parameters**

- **gid** [str]
**matplotlib.axis.XTick.set_label**

```python
def set_label(self, s)
    Set the label text.
```

**Parameters**

- `s` [str]

**matplotlib.axis.XTick.set_path_effects**

```python
def set_path_effects(self, path_effects)
    Set the path effects.
```

**Parameters**

- `path_effects` [AbstractPathEffect]

**matplotlib.axis.XTick.set_picker**

```python
def set_picker(self, picker)
    Define the picking behavior of the artist.
```

**Parameters**

- `picker` [None or bool or float or callable]
  This can be one of the following:
  - `None`: Picking is disabled for this artist (default).
  - A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
  - A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.
  - A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

    ```python
    hit, props = picker(artist, mouseevent)
    ```

    to determine the hit test. if the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.

**matplotlib.axis.XTick.set_rasterized**

```python
def set_rasterized(self, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.
```

**Parameters**

- `rasterized` [bool or None]

Defaults to `None`, which implies the backend’s default behavior.
matplotlib.axis.XTick.set_sketch_params

XTick.set_sketch_params(self, scale=None, length=None, randomness=None)

Sets the sketch parameters.

**Parameters**

- **scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.
- **length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
- **randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

matplotlib.axis.XTick.set_snap

XTick.set_snap(self, snap)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

- **snap** [bool or None] Possible values:
  - True: Snap vertices to the nearest pixel center.
  - False: Do not modify vertex positions.
  - None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

matplotlib.axis.XTick.set_transform

XTick.set_transform(self, t)

Set the artist transform.

**Parameters**

- **t** [Transform]

matplotlib.axis.XTick.set_url

XTick.set_url(self, url)

Set the url for the artist.

**Parameters**
url [str]

matplotlib.axis.XTick.set_visible

XTick.set_visible(self, b)
Set the artist’s visibility.

Parameters

b [bool]

matplotlib.axis.XTick.set_zorder

XTick.set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level [float]

matplotlib.axis.XTick.stale

XTick.stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axis.XTick.update

XTick.update(self, props)
Update this artist’s properties from the dictionary props.

matplotlib.axis.XTick.update_from

XTick.update_from(self, other)
Copy properties from other to self.

matplotlib.axis.XTick.zorder

XTick.zorder = 0

matplotlib.axis.YTick.add_callback

YTick.add_callback(self, func)
Add a callback function that will be called whenever one of the Artist’s properties changes.

Parameters
**func** [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where *artist* is the calling *Artist*. Return values may exist but are ignored.

**Returns**

**oid** [int] The observer id associated with the callback. This id can be used for removing the callback with *remove_callback* later.

**See also:**

*remove_callback*

(matplotlib.axis.YTick.axes)

**YTick.axes**

The *Axes* instance the artist resides in, or *None*.

(matplotlib.axis.YTick.contains)

**YTick.contains**(*self*, *mouseevent*)

Test whether the mouse event occurred in the Tick marks.

This function always returns false. It is more useful to test if the axis as a whole contains the mouse rather than the set of tick marks.

(matplotlib.axis.YTick.convert_xunits)

**YTick.convert_xunits**(*self*, *x*)

Convert *x* using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

(matplotlib.axis.YTick.convert_yunits)

**YTick.convert_yunits**(*self*, *y*)

Convert *y* using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

(matplotlib.axis.YTick.draw)

**YTick.draw**(*self*, *renderer*)

Draw the Artist using the given renderer.

This method will be overridden in the Artist subclasses. Typically, it is implemented to not have any effect if the Artist is not visible (*Artist.get_visible* is *False*).
Parameters

**renderer** [*RendererBase subclass.*]

```
matplotlib.axis.YTick.findobj
```

**matplotlib.axis.YTick.findobj**

```
YTick.findobj(self, match=None, include_self=True)
```

Find artist objects.

Recursively find all *Artist* instances contained in the artist.

**Parameters**

**match** A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns *True*.
- A class instance: e.g., *Line2D*. The result will only contain artists of this class or its subclasses (*isinstance* check).

**include_self** [bool] Include *self* in the list to be checked for a match.

**Returns**

**artists** [list of *Artist*]

```
matplotlib.axis.YTick.format_cursor_data
```

**matplotlib.axis.YTick.format_cursor_data**

```
YTick.format_cursor_data(self, data)
```

Return a string representation of *data*.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

```
matplotlib.axis.YTick.get_agg_filter
```

**matplotlib.axis.YTick.get_agg_filter**

```
YTick.get_agg_filter(self)
```

Return filter function to be used for agg filter.

```
matplotlib.axis.YTick.get_alpha
```

**matplotlib.axis.YTick.get_alpha**

```
YTick.get_alpha(self)
```

Return the alpha value used for blending - not supported on all backends.
matplotlib.axis.YTick.get_animated

YTick.get_animated(self)
   Return the animated state.

matplotlib.axis.YTick.get_children

YTick.get_children(self)
   Return a list of the child Artists of this Artist.

matplotlib.axis.YTick.get_clip_box

YTick.get_clip_box(self)
   Return the clipbox.

matplotlib.axis.YTick.get_clip_on

YTick.get_clip_on(self)
   Return whether the artist uses clipping.

matplotlib.axis.YTick.get_clip_path

YTick.get_clip_path(self)
   Return the clip path.

matplotlib.axis.YTick.get_contains

YTick.get_contains(self)
   Return the custom contains function of the artist if set, or None.

   **See also:**
   
   set_contains

matplotlib.axis.YTick.get_cursor_data

YTick.get_cursor_data(self, event)
   Return the cursor data for a given event.

   **Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

   Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.
Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

`event` [matplotlib.backend_bases.MouseEvent]

**See also:**

`format_cursor_data`

### `matplotlib.axis.YTick.get_figure`

`YTick.get_figure(self)`

Return the `Figure` instance the artist belongs to.

### `matplotlib.axis.YTick.get_gid`

`YTick.get_gid(self)`

Return the group id.

### `matplotlib.axis.YTick.get_label`

`YTick.get_label(self)`

Return the label used for this artist in the legend.

### `matplotlib.axis.YTick.get_path_effects`

`YTick.get_path_effects(self)`

### `matplotlib.axis.YTick.get_picker`

`YTick.get_picker(self)`

Return the picking behavior of the artist.

The possible values are described in `set_picker`.

**See also:**

`set_picker`, `pickable`, `pick`

### `matplotlib.axis.YTick.get_rasterized`

`YTick.get_rasterized(self)`

Return whether the artist is to be rasterized.
matplotlib.axis.YTick.get_sketch_params

YTick.get_sketch_params(self)
Returns the sketch parameters for the artist.

Returns

sketch_params [tuple or None] A 3-tuple with the following elements:
- scale: The amplitude of the wiggle perpendicular to the source line.
- length: The length of the wiggle along the line.
- randomness: The scale factor by which the length is shrunken or expanded.

Returns None if no sketch parameters were set.

matplotlib.axis.YTick.get_snap

YTick.get_snap(self)
Returns the snap setting.
See set_snap for details.

matplotlib.axis.YTick.get_transform

YTick.get_transform(self)
Return the Transform instance used by this artist.

matplotlib.axis.YTick.get_transformed_clip_path_and_affine

YTick.get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.YTick.get_url

YTick.get_url(self)
Return the url.

matplotlib.axis.YTick.get_visible

YTick.get_visible(self)
Return the visibility.
matplotlib.axis.YTick.get_window_extent

YTick.get_window_extent(self, renderer)
Get the axes bounding box in display space.

The bounding box’ width and height are nonnegative.

Subclasses should override for inclusion in the bounding box “tight” calculation. Default
is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent
of the artist changes. The extent can change due to any changes in the transform stack,
such as changing the axes limits, the figure size, or the canvas used (as is done when
saving a figure). This can lead to unexpected behavior where interactive figures will look
fine on the screen, but will save incorrectly.

matplotlib.axis.YTick.get_zorder

YTick.get_zorder(self)
Return the artist’s zorder.

matplotlib.axis.YTick.have_units

YTick.have_units(self)
Return True if units are set on the x or y axes.

matplotlib.axis.YTick.is_transform_set

YTick.is_transform_set(self)
Return whether the Artist has an explicitly set transform.

This is True after set_transform has been called.

matplotlib.axis.YTick.mouseover

YTick.mouseover

matplotlib.axis.YTick.pchanged

YTick.pchanged(self)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback
matplotlib.axis.YTick.pick

YTick.pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.
    
    See also:
    
    set_picker, get_picker, pickable

matplotlib.axis.YTick.pickable

YTick.pickable(self)
    Return whether the artist is pickable.
    
    See also:
    
    set_picker, get_picker, pick

matplotlib.axis.YTick.properties

YTick.properties(self)
    Return a dictionary of all the properties of the artist.

matplotlib.axis.YTick.remove

YTick.remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
    
    Note: relim will not see collections even if the collection was added to the axes with autolim = True.
    
    Note: there is no support for removing the artist’s legend entry.

matplotlib.axis.YTick.remove_callback

YTick.remove_callback(self, oid)
    Remove a callback based on its observer id.
    
    See also:
    
    add_callback
matplotlib.axis.YTick.set

YTick.set(self, **kwargs)
   A property batch setter. Pass kwargs to set properties.

matplotlib.axis.YTick.set_agg_filter

YTick.set_agg_filter(self, filter_func)
   Set the agg filter.

   Parameters
   filter_func [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

matplotlib.axis.YTick.set_alpha

YTick.set_alpha(self, alpha)
   Set the alpha value used for blending - not supported on all backends.

   Parameters
   alpha [float]

matplotlib.axis.YTick.set_animated

YTick.set_animated(self, b)
   Set the artist's animation state.

   Parameters
   b [bool]

matplotlib.axis.YTick.set_clip_box

YTick.set_clip_box(self, clipbox)
   Set the artist's clip Bbox.

   Parameters
   clipbox [Bbox]

matplotlib.axis.YTick.set_clip_on

YTick.set_clip_on(self, b)
   Set whether the artist uses clipping.
   When False artists will be visible out side of the axes which can lead to unexpected results.

   Parameters
   b [bool]
**Matplotlib, Release 3.1.3**

**matplotlib.axis.YTick.set_clip_path**

```
YTick.set_clip_path(self, clippath, transform=None)
```

Set the artist’s clip path, which may be:

- a `Patch` (or subclass) instance; or
- a `Path` instance, in which case a `Transform` instance, which will be applied to the path before using it for clipping, must be provided; or
- `None`, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to `None`.

**ACCEPTS:** `[Path, Transform] | Patch | None`

**matplotlib.axis.YTick.set_contains**

```
YTick.set_contains(self, picker)
```

Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters**

- `picker` [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**matplotlib.axis.YTick.set_figure**

```
YTick.set_figure(self, fig)
```

Set the `Figure` instance the artist belongs to.

**Parameters**

- `fig` [Figure]

**matplotlib.axis.YTick.set_gid**

```
YTick.set_gid(self, gid)
```

Set the (group) id for the artist.

**Parameters**

- `gid` [str]
**Matplotlib, Release 3.1.3**

**matplotlib.axis.YTick.set_label**

```
YTick.set_label(self, s)
```

Set the label1 text.

**Parameters**

- `s` [str]

**matplotlib.axis.YTick.set_path_effects**

```
YTick.set_path_effects(self, path_effects)
```

Set the path effects.

**Parameters**

- `path_effects` [AbstractPathEffect]

**matplotlib.axis.YTick.set_picker**

```
YTick.set_picker(self, picker)
```

Define the picking behavior of the artist.

**Parameters**

- `picker` [None or bool or float or callable] This can be one of the following:
  - `None`: Picking is disabled for this artist (default).
  - A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
  - A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event
  - A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.

**matplotlib.axis.YTick.set_rasterized**

```
YTick.set_rasterized(self, rasterized)
```

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

**Parameters**

- `rasterized` [bool or None]
**matplotlib.axis.YTick.set_sketch_params**

set_sketch_params(self, scale=None, length=None, randomness=None)

Sets the sketch parameters.

**Parameters**

- **scale** [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.
- **length** [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
- **randomness** [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**matplotlib.axis.YTick.set_snap**

set_snap(self, snap)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

- **snap** [bool or None] Possible values:
  - `True`: Snap vertices to the nearest pixel center.
  - `False`: Do not modify vertex positions.
  - `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**matplotlib.axis.YTick.set_transform**

set_transform(self, t)

Set the artist transform.

**Parameters**

- **t** [Transform]

**matplotlib.axis.YTick.set_url**

set_url(self, url)

Set the url for the artist.

**Parameters**
url [str]

matplotlib.axis.YTick.set_visible

YTick.set_visible(self, b)
   Set the artist’s visibility.
   **Parameters**
   b [bool]

matplotlib.axis.YTick.set_zorder

YTick.set_zorder(self, level)
   Set the zorder for the artist. Artists with lower zorder values are drawn first.
   **Parameters**
   level [float]

matplotlib.axis.YTick.stale

YTick.stale
   Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

matplotlib.axis.YTick.update

YTick.update(self, props)
   Update this artist’s properties from the dictionary props.

matplotlib.axis.YTick.update_from

YTick.update_from(self, other)
   Copy properties from other to self.

matplotlib.axis.YTick.zorder

YTick.zorder = 0

Axis

Axis.add_callback
   Add a callback function that will be called whenever one of the Artist’s properties changes.

YAxis.zorder

```
YAxis.zorder

matplotlib.axis.Axis.add_callback

Axis.add_callback(self, func)
Add a callback function that will be called whenever one of the Artist’s properties changes.

Parameters

func [callable] The callback function. It must have the signature:

def func(artist: Artist) -> Any

where artist is the calling Artist. Return values may exist but are ignored.

Returns

oid [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback

matplotlib.axis.Axis.axes

Axis.axes
The Axes instance the artist resides in, or None.

matplotlib.axis.Axis.contains

Axis.contains(self, mouseevent)
Test whether the artist contains the mouse event.

Parameters

mouseevent [matplotlib.backend_bases.MouseEvent]

Returns

contains [bool] Whether any values are within the radius.
details [dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

See also:

set_contains, get_contains
matplotlib.axis.Axis.convert_xunits

Axis.convert_xunits(self, x)
Convert x using the unit type of the xaxis.
If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

matplotlib.axis.Axis.convert_yunits

Axis.convert_yunits(self, y)
Convert y using the unit type of the yaxis.
If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

matplotlib.axis.Axis.draw

Axis.draw(self, renderer, *args, **kwargs)
Draw the axis lines, grid lines, tick lines and labels

matplotlib.axis.Axis.findobj

Axis.findobj(self, match=None, include_self=True)
Find artist objects.
Recursively find all Artist instances contained in the artist.

Parameters

match A filter criterion for the matches. This can be
• None: Return all objects contained in artist.
• A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self [bool] Include self in the list to be checked for a match.

Returns

artists [list of Artist]

matplotlib.axis.Axis.format_cursor_data

Axis.format_cursor_data(self, data)
Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.
The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

`matplotlib.axis.Axis.get_agg_filter`

```
Axis.get_agg_filter(self)
    Return filter function to be used for agg filter.
```

`matplotlib.axis.Axis.get_alpha`

```
Axis.get_alpha(self)
    Return the alpha value used for blending - not supported on all backends
```

`matplotlib.axis.Axis.get_animated`

```
Axis.get_animated(self)
    Return the animated state.
```

`matplotlib.axis.Axis.get_children`

```
Axis.get_children(self)
    Return a list of the child `Artist`
    `s of this `Artist`
```

`matplotlib.axis.Axis.get_clip_box`

```
Axis.get_clip_box(self)
    Return the clipbox.
```

`matplotlib.axis.Axis.get_clip_on`

```
Axis.get_clip_on(self)
    Return whether the artist uses clipping.
```

`matplotlib.axis.Axis.get_clip_path`

```
Axis.get_clip_path(self)
    Return the clip path.
```
matplotlib.axis.Axis.get_contains

Axis.get_contains(self)
Return the custom contains function of the artist if set, or None.

See also:
set_contains

matplotlib.axis.Axis.get_cursor_data

Axis.get_cursor_data(self, event)
Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters

event [matplotlib.backend_bases.MouseEvent]

See also:
format_cursor_data

matplotlib.axis.Axis.get_figure

Axis.get_figure(self)
Return the Figure instance the artist belongs to.

matplotlib.axis.Axis.get_gid

Axis.get_gid(self)
Return the group id.

matplotlib.axis.Axis.get_label

Axis.get_label(self)
Return the axis label as a Text instance
matplotlib.axis.Axis.get_path_effects

Axis.get_path_effects(self)

matplotlib.axis.Axis.get_picker

Axis.get_picker(self)
   Return the picking behavior of the artist.
   The possible values are described in set_picker.
   See also:

       set_picker, pickable, pick

matplotlib.axis.Axis.get_rasterized

Axis.get_rasterized(self)
   Return whether the artist is to be rasterized.

matplotlib.axis.Axis.get_sketch_params

Axis.get_sketch_params(self)
   Returns the sketch parameters for the artist.

   Returns

       sketch_params [tuple or None] A 3-tuple with the following elements:
       • scale: The amplitude of the wiggle perpendicular to the source line.
       • length: The length of the wiggle along the line.
       • randomness: The scale factor by which the length is shrunken or expanded.
   Returns None if no sketch parameters were set.

matplotlib.axis.Axis.get_snap

Axis.get_snap(self)
   Returns the snap setting.
   See set_snap for details.

matplotlib.axis.Axis.get_transform

Axis.get_transform(self)
   Return the Transform instance used by this artist.
matplotlib.axis.Axis.get_transformed_clip_path_and_affine

Axis.get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.Axis.get_url

Axis.get_url(self)
Return the url.

matplotlib.axis.Axis.get_visible

Axis.get_visible(self)
Return the visibility.

matplotlib.axis.Axis.get_window_extent

Axis.get_window_extent(self, renderer)
Get the axes bounding box in display space.
The bounding box’ width and height are nonnegative.
Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.
Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.Axis.get_zorder

Axis.get_zorder(self)
Return the artist’s zorder.

matplotlib.axis.Axis.have_units

Axis.have_units(self)
Return True if units are set on the x or y axes.

matplotlib.axis.Axis.is_transform_set

Axis.is_transform_set(self)
Return whether the Artist has an explicitly set transform.
This is True after set_transform has been called.
matplotlib.axis.Axis.mouseover

Axis.mouseover

matplotlib.axis.Axis.pchanged

Axis.pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    
    See also:
    
    add_callback
    remove_callback

matplotlib.axis.Axis.pick

Axis.pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has
    picker set.
    
    See also:
    
    set_picker, get_picker, pickable

matplotlib.axis.Axis.pickable

Axis.pickable(self)
    Return whether the artist is pickable.
    
    See also:
    
    set_picker, get_picker, pick

matplotlib.axis.Axis.properties

Axis.properties(self)
    Return a dictionary of all the properties of the artist.

matplotlib.axis.Axis.remove

Axis.remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase. 
    draw_idle. Call relim to update the axes limits if desired.
Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist’s legend entry.

**matplotlib.axis.Axis.remove_callback**

`Axis.remove_callback(self, oid)`
Remove a callback based on its observer id.

**See also:**

`add_callback`

**matplotlib.axis.Axis.set**

`Axis.set(self, **kwargs)`
A property batch setter. Pass `kwargs` to set properties.

**matplotlib.axis.Axis.set_agg_filter**

`Axis.set_agg_filter(self, filter_func)`
Set the agg filter.

**Parameters**

- `filter_func` [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**matplotlib.axis.Axis.set_alpha**

`Axis.set_alpha(self, alpha)`
Set the alpha value used for blending - not supported on all backends.

**Parameters**

- `alpha` [float]

**matplotlib.axis.Axis.set_animated**

`Axis.set_animated(self, b)`
Set the artist’s animation state.

**Parameters**

- `b` [bool]
**matplotlib.axis.Axis.set_clip_box**

`Axis.set_clip_box(self, clipbox)`  
Set the artist's clip Bbox.  

**Parameters**  
  clipbox [Bbox]

**matplotlib.axis.Axis.set_clip_on**

`Axis.set_clip_on(self, b)`  
Set whether the artist uses clipping.  
When False artists will be visible outside of the axes which can lead to unexpected results.  

**Parameters**  
  b [bool]

**matplotlib.axis.Axis.set_clip_path**

`Axis.set_clip_path(self, clippath, transform=None)`  
Set the artist's clip path, which may be:  
- a `Path` (or subclass) instance; or  
- a `Path` instance, in which case a `Transform` instance, which will be applied to the path before using it for clipping, must be provided; or  
- None, to remove a previously set clipping path.  

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.  

**ACCEPTS:** [(`Path`, `Transform`) | `Path` | None]

**matplotlib.axis.Axis.set_contains**

`Axis.set_contains(self, picker)`  
Define a custom contains test for the artist.  
The provided callable replaces the default `contains` method of the artist.  

**Parameters**  
  picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:  
```python  
def contains(artist: Artist, event: MouseEvent) -> bool, dict  ```  

that returns:  
- a bool indicating if the event is within the artist
• a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

`matplotlib.axis.Axis.set_figure`

```python
Axis.set_figure(self, fig)
```

Set the `Figure` instance the artist belongs to.

**Parameters**

- `fig` [*Figure*]

`matplotlib.axis.Axis.set_gid`

```python
Axis.set_gid(self, gid)
```

Set the (group) id for the artist.

**Parameters**

- `gid` [*str*]

`matplotlib.axis.Axis.set_label`

```python
Axis.set_label(self, s)
```

Set a label that will be displayed in the legend.

**Parameters**

- `s` [*object*] `s` will be converted to a string by calling `str`.

`matplotlib.axis.Axis.set_path_effects`

```python
Axis.set_path_effects(self, path_effects)
```

Set the path effects.

**Parameters**

- `path_effects` [*AbstractPathEffect*]

`matplotlib.axis.Axis.set_picker`

```python
Axis.set_picker(self, picker)
```

Define the picking behavior of the artist.

**Parameters**

- `picker` [None or bool or float or callable] This can be one of the following:
  - `None`: Picking is disabled for this artist (default).
  - A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
• A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. If the mouse event is over the artist, return `hit=True` and `props` is a dictionary of properties you want added to the PickEvent attributes.

---

**matplotlib.axis.Axis.set_rasterized**

`Axis.set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

**Parameters**

- `rasterized` [bool or None]

---

**matplotlib.axis.Axis.set_sketch_params**

`Axis.set_sketch_params(self, scale=None, length=128.0, randomness=16.0)`

Sets the sketch parameters.

**Parameters**

- `scale` [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.
- `length` [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
- `randomness` [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

---

**matplotlib.axis.Axis.set_snap**

`Axis.set_snap(self, snap)`

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.
Parameters

snap [bool or None] Possible values:

• True: Snap vertices to the nearest pixel center.
• False: Do not modify vertex positions.
• None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

matplotlib.axis.Axis.set_transform

Axis.set_transform(self, t)
Set the artist transform.

Parameters

t [Transform]

matplotlib.axis.Axis.set_url

Axis.set_url(self, url)
Set the url for the artist.

Parameters

url [str]

matplotlib.axis.Axis.set_visible

Axis.set_visible(self, b)
Set the artist’s visibility.

Parameters

b [bool]

matplotlib.axis.Axis.set_zorder

Axis.set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level [float]

matplotlib.axis.Axis.stale

Axis.stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.
**matplotlib.axis.Axis.update**

Axis.update(self, props)

Update this artist’s properties from the dictionary props.

**matplotlib.axis.Axis.update_from**

Axis.update_from(self, other)

Copy properties from other to self.

**matplotlib.axis.Axis.zorder**

Axis.zorder = 0

**matplotlib.axis.XAxis.add_callback**

XAxis.add_callback(self, func)

Add a callback function that will be called whenever one of the Artist’s properties changes.

**Parameters**

- **func** [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

**Returns**

- **oid** [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

**See also:**

remove_callback

**matplotlib.axis.XAxis.axes**

XAxis.axes

The Axes instance the artist resides in, or None.

**matplotlib.axis.XAxis.contains**

XAxis.contains(self, mouseevent)

Test whether the mouse event occurred in the x axis.
matplotlib.axis.XAxis.convert_xunits

XAxis.convert_xunits(self, x)
Convert x using the unit type of the xaxis.
If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

matplotlib.axis.XAxis.convert_yunits

XAxis.convert_yunits(self, y)
Convert y using the unit type of the yaxis.
If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

matplotlib.axis.XAxis.draw

XAxis.draw(self, renderer, *args, **kwargs)
Draw the axis lines, grid lines, tick lines and labels

matplotlib.axis.XAxis.findobj

XAxis.findobj(self, match=None, include_self=True)
Find artist objects.
Recursively find all Artist instances contained in the artist.

Parameters

match A filter criterion for the matches. This can be
• None: Return all objects contained in artist.
• A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self [bool] Include self in the list to be checked for a match.

Returns

artists [list of Artist]

matplotlib.axis.XAxis.format_cursor_data

XAxis.format_cursor_data(self, data)
Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.
The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

```python
matplotlib.axis.XAxis.get_agg_filter
```

`XAxis.get_agg_filter(self)`

Return filter function to be used for agg filter.

```python
matplotlib.axis.XAxis.get_alpha
```

`XAxis.get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

```python
matplotlib.axis.XAxis.get_animated
```

`XAxis.get_animated(self)`

Return the animated state.

```python
matplotlib.axis.XAxis.get_children
```

`XAxis.get_children(self)`

Return a list of the child *Artists* of this *Artist*.

```python
matplotlib.axis.XAxis.get_clip_box
```

`XAxis.get_clip_box(self)`

Return the clipbox.

```python
matplotlib.axis.XAxis.get_clip_on
```

`XAxis.get_clip_on(self)`

Return whether the artist uses clipping.

```python
matplotlib.axis.XAxis.get_clip_path
```

`XAxis.get_clip_path(self)`

Return the clip path.
matplotlib.axis.XAxis.get_contains

XAxis.get_contains(self)
    Return the custom contains function of the artist if set, or None.

See also:
    set_contains

matplotlib.axis.XAxis.get_cursor_data

XAxis.get_cursor_data(self, event)
    Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters
    event [matplotlib.backend_bases.MouseEvent]

See also:
    format_cursor_data

matplotlib.axis.XAxis.get_figure

XAxis.get_figure(self)
    Return the Figure instance the artist belongs to.

matplotlib.axis.XAxis.get_gid

XAxis.get_gid(self)
    Return the group id.

matplotlib.axis.XAxis.get_label

XAxis.get_label(self)
    Return the axis label as a Text instance
**matplotlib.axis.XAxis.get_path_effects**

* XAxis.get_path_effects(self)

**matplotlib.axis.XAxis.get_picker**

* XAxis.get_picker(self)
  
  Return the picking behavior of the artist.
  
  The possible values are described in *set_picker*.

  See also:

  * set_picker, pickable, pick

**matplotlib.axis.XAxis.get_rasterized**

* XAxis.get_rasterized(self)
  
  Return whether the artist is to be rasterized.

**matplotlib.axis.XAxis.get_sketch_params**

* XAxis.get_sketch_params(self)
  
  Returns the sketch parameters for the artist.

  Returns

  **sketch_params** [tuple or None] A 3-tuple with the following elements:

  - *scale*: The amplitude of the wiggle perpendicular to the source line.
  - *length*: The length of the wiggle along the line.
  - *randomness*: The scale factor by which the length is shrunken or expanded.
  
  Returns *None* if no sketch parameters were set.

**matplotlib.axis.XAxis.get_snap**

* XAxis.get_snap(self)
  
  Returns the snap setting.

  See *set_snap* for details.

**matplotlib.axis.XAxis.get_transform**

* XAxis.get_transform(self)
  
  Return the *Transform* instance used by this artist.
matplotlib.axis.XAxis.get_transformed_clip_path_and_affine

XAxis.get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

matplotlib.axis.XAxis.get_url

XAxis.get_url(self)
Return the url.

matplotlib.axis.XAxis.get_visible

XAxis.get_visible(self)
Return the visibility.

matplotlib.axis.XAxis.get_window_extent

XAxis.get_window_extent(self, renderer)
Get the axes bounding box in display space.
The bounding box’ width and height are nonnegative.
Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.
Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

matplotlib.axis.XAxis.get_zorder

XAxis.get_zorder(self)
Return the artist’s zorder.

matplotlib.axis.XAxis.have_units

XAxis.have_units(self)
Return True if units are set on the x or y axes.

matplotlib.axis.XAxis.is_transform_set

XAxis.is_transform_set(self)
Return whether the Artist has an explicitly set transform.
This is True after set_transform has been called.
matplotlib.axis.XAxis.mouseover

XAxis.mouseover

matplotlib.axis.XAxis.pchanged

XAxis.pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.

    See also:

    add_callback
    remove_callback

matplotlib.axis.XAxis.pick

XAxis.pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

    See also:

    set_picker, get_picker, pickable

matplotlib.axis.XAxis.pickable

XAxis.pickable(self)
    Return whether the artist is pickable.

    See also:

    set_picker, get_picker, pick

matplotlib.axis.XAxis.properties

XAxis.properties(self)
    Return a dictionary of all the properties of the artist.

matplotlib.axis.XAxis.remove

XAxis.remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist’s legend entry.

```
matplotlib.axis.XAxis.remove_callback

XAxis.remove_callback(self, oid)
    Remove a callback based on its observer id.

    See also:
    add_callback
```

```
matplotlib.axis.XAxis.set

XAxis.set(self, **kwargs)
    A property batch setter. Pass `kwargs` to set properties.
```

```
matplotlib.axis.XAxis.set_agg_filter

XAxis.set_agg_filter(self, filter_func)
    Set the agg filter.

    Parameters
    ----------
    filter_func [callable] A filter function, which takes a (m, n, 3) float array
    and a dpi value, and returns a (m, n, 3) array.
```

```
matplotlib.axis.XAxis.set_alpha

XAxis.set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.

    Parameters
    ----------
    alpha [float]
```

```
matplotlib.axis.XAxis.set_animated

XAxis.set_animated(self, b)
    Set the artist’s animation state.

    Parameters
    ----------
    b [bool]
```
Matplotlib, Release 3.1.3

matplotlib.axis.XAxis.set_clip_box

XAxis.set_clip_box(self, clipbox)
Set the artist’s clip Bbox.

Parameters
clipbox [Bbox]

matplotlib.axis.XAxis.set_clip_on

XAxis.set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible out side of the axes which can lead to unexpected results.

Parameters
b [bool]

matplotlib.axis.XAxis.set_clip_path

XAxis.set_clip_path(self, clippath, transform=None)
Set the artist’s clip path, which may be:
• a Patch (or subclass) instance; or
• a Path instance, in which case a Transform instance, which will be applied to the path before using it for clipping, must be provided; or
• None, to remove a previously set clipping path.
For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

ACCEPTS: [(Path, Transform) | Patch | None]

matplotlib.axis.XAxis.set_contains

XAxis.set_contains(self, picker)
Define a custom contains test for the artist.
The provided callable replaces the default contains method of the artist.

Parameters
picker [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

def contains(artist: Artist, event: MouseEvent) -> bool, dict

that returns:
• a bool indicating if the event is within the artist
• a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

```python
matplotlib.axis.XAxis.set_figure
```

```python
XAxis.set_figure(self, fig)
```

Set the `Figure` instance the artist belongs to.

**Parameters**

- `fig` [Figure]

```python
matplotlib.axis.XAxis.set_gid
```

```python
XAxis.set_gid(self, gid)
```

Set the (group) id for the artist.

**Parameters**

- `gid` [str]

```python
matplotlib.axis.XAxis.set_label
```

```python
XAxis.set_label(self, s)
```

Set a label that will be displayed in the legend.

**Parameters**

- `s` [object] `s` will be converted to a string by calling `str`.

```python
matplotlib.axis.XAxis.set_path_effects
```

```python
XAxis.set_path_effects(self, path_effects)
```

Set the path effects.

**Parameters**

- `path_effects` [AbstractPathEffect]

```python
matplotlib.axis.XAxis.set_picker
```

```python
XAxis.set_picker(self, picker)
```

Define the picking behavior of the artist.

**Parameters**

- `picker` [None or bool or float or callable] This can be one of the following:
  - `None`: Picking is disabled for this artist (default).
  - A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
• A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it’s data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.

```python
matplotlib.axis.XAxis.set_rasterized
```

```python
XAxis.set_rasterized(self, rasterized)
```

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

**Parameters**

- `rasterized` [bool or None]

```python
matplotlib.axis.XAxis.set_sketch_params
```

```python
XAxis.set_sketch_params(self, scale=None, length=None, randomness=None)
```

Sets the sketch parameters.

**Parameters**

- `scale` [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

- `length` [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

- `randomness` [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

```python
matplotlib.axis.XAxis.set_snap
```

```python
XAxis.set_snap(self, snap)
```

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.
Parameters

snap  [bool or None] Possible values:

- True: Snap vertices to the nearest pixel center.
- False: Do not modify vertex positions.
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

matplotlib.axis.XAxis.set_transform

XAxis.set_transform(self, t)
Set the artist transform.

Parameters

  t  [Transform]

matplotlib.axis.XAxis.set_url

XAxis.set_url(self, url)
Set the url for the artist.

Parameters

  url  [str]

matplotlib.axis.XAxis.set_visible

XAxis.set_visible(self, b)
Set the artist’s visibility.

Parameters

  b  [bool]

matplotlib.axis.XAxis.set_zorder

XAxis.set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

  level  [float]

matplotlib.axis.XAxis.stale

XAxis.stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.
matplotlib.axis.XAxis.update

XAxis.update(self, props)
    Update this artist’s properties from the dictionary props.

matplotlib.axis.XAxis.update_from

XAxis.update_from(self, other)
    Copy properties from other to self.

matplotlib.axis.XAxis.zorder

XAxis.zorder = 0

matplotlib.axis.YAxis.add_callback

YAxis.add_callback(self, func)
    Add a callback function that will be called whenever one of the Artist’s properties changes.

    Parameters

    func [callable] The callback function. It must have the signature:
        def func(artist: Artist) -> Any

        where artist is the calling Artist. Return values may exist but are ignored.

    Returns

    oid [int] The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

    See also:

    remove_callback

matplotlib.axis.YAxis.axes

YAxis.axes
    The Axes instance the artist resides in, or None.

matplotlib.axis.YAxis.contains

YAxis.contains(self, mouseevent)
    Test whether the mouse event occurred in the y axis.
    Returns True | False
**matplotlib.axis.YAxis.convert_xunits**

`YAxis.convert_xunits(self, x)`

Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

**matplotlib.axis.YAxis.convert_yunits**

`YAxis.convert_yunits(self, y)`

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

**matplotlib.axis.YAxis.draw**

`YAxis.draw(self, renderer, *args, **kwargs)`

Draw the axis lines, grid lines, tick lines and labels

**matplotlib.axis.YAxis.findobj**

`YAxis.findobj(self, match=None, include_self=True)`

Find artist objects. Recursively find all `Artist` instances contained in the artist.

**Parameters**

- **match** A filter criterion for the matches. This can be
  - `None`: Return all objects contained in artist.
  - A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
  - A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

- **include_self** [bool] Include `self` in the list to be checked for a match.

**Returns**

- **artists** [list of `Artist`]

**matplotlib.axis.YAxis.format_cursor_data**

`YAxis.format_cursor_data(self, data)`

Return a string representation of `data`.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.
The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

**`matplotlib.axis.YAxis.get_agg_filter`**

`YAxis.get_agg_filter(self)`
Return filter function to be used for agg filter.

**`matplotlib.axis.YAxis.get_alpha`**

`YAxis.get_alpha(self)`
Return the alpha value used for blending - not supported on all backends

**`matplotlib.axis.YAxis.get_animated`**

`YAxis.get_animated(self)`
Return the animated state.

**`matplotlib.axis.YAxis.get_children`**

`YAxis.get_children(self)`
Return a list of the child `Artist`s of this `Artist`.

**`matplotlib.axis.YAxis.get_clip_box`**

`YAxis.get_clip_box(self)`
Return the clipbox.

**`matplotlib.axis.YAxis.get_clip_on`**

`YAxis.get_clip_on(self)`
Return whether the artist uses clipping.

**`matplotlib.axis.YAxis.get_clip_path`**

`YAxis.get_clip_path(self)`
Return the clip path.
matplotlib.axis.YAxis.get_contains

YAxis.get_contains(self)
    Return the custom contains function of the artist if set, or None.

See also:
    set_contains

matplotlib.axis.YAxis.get_cursor_data

YAxis.get_cursor_data(self, event)
    Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None. Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation. The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters
    event  [matplotlib.backend_bases.MouseEvent]

See also:
    format_cursor_data

matplotlib.axis.YAxis.get_figure

YAxis.get_figure(self)
    Return the Figure instance the artist belongs to.

matplotlib.axis.YAxis.get_gid

YAxis.get_gid(self)
    Return the group id.

matplotlib.axis.YAxis.get_label

YAxis.get_label(self)
    Return the axis label as a Text instance
Matplotlib, Release 3.1.3

matplotlib.axis.YAxis.get_pathEffects

YAxis.get_pathEffects(self)

matplotlib.axis.YAxis.get_picker

YAxis.get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.
    See also:

    set_picker, pickable, pick

matplotlib.axis.YAxis.get_rasterized

YAxis.get_rasterized(self)
    Return whether the artist is to be rasterized.

matplotlib.axis.YAxis.get_sketch_params

YAxis.get_sketch_params(self)
    Returns the sketch parameters for the artist.

    Returns

    sketch_params [tuple or None] A 3-tuple with the following elements:

    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or expanded.
    Returns None if no sketch parameters were set.

matplotlib.axis.YAxis.get_snap

YAxis.get_snap(self)
    Returns the snap setting.
    See set_snap for details.

matplotlib.axis.YAxis.get_transform

YAxis.get_transform(self)
    Return the Transform instance used by this artist.
`matplotlib.axis.YAxis.get_transformed_clip_path_and_affine`

`YAxis.get_transformed_clip_path_and_affine(self)`

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

`matplotlib.axis.YAxis.get_url`

`YAxis.get_url(self)`

Return the url.

`matplotlib.axis.YAxis.get_visible`

`YAxis.get_visible(self)`

Return the visibility.

`matplotlib.axis.YAxis.get_window_extent`

`YAxis.get_window_extent(self, renderer)`

Get the axes bounding box in display space.

The bounding box’ width and height are nonnegative.

Subclasses should override for inclusion in the bounding box “tight” calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`matplotlib.axis.YAxis.get_zorder`

`YAxis.get_zorder(self)`

Return the artist’s zorder.

`matplotlib.axis.YAxis.have_units`

`YAxis.have_units(self)`

Return `True` if units are set on the x or y axes.

`matplotlib.axis.YAxis.is_transform_set`

`YAxis.is_transform_set(self)`

Return whether the Artist has an explicitly set transform.

This is `True` after `set_transform` has been called.
Matplotlib, Release 3.1.3

matplotlib.axis.YAxis.mouseover

YAxis.mouseover

matplotlib.axis.YAxis.pchanged

YAxis.pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.

    See also:

        add_callback
        remove_callback

matplotlib.axis.YAxis.pick

YAxis.pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

    See also:

        set_picker, get_picker, pickable

matplotlib.axis.YAxis.pickable

YAxis.pickable(self)
    Return whether the artist is pickable.

    See also:

        set_picker, get_picker, pick

matplotlib.axis.YAxis.properties

YAxis.properties(self)
    Return a dictionary of all the properties of the artist.

matplotlib.axis.YAxis.remove

YAxis.remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
Note: `relim` will not see collections even if the collection was added to the axes with `autolim` = True.
Note: there is no support for removing the artist’s legend entry.

```python
matplotlib.axis.YAxis.remove_callback
```

`YAxis.remove_callback(self, oid)`
Remove a callback based on its observer id.

**See also:**
`add_callback`

```python
matplotlib.axis.YAxis.set
```

`YAxis.set(self, **kwargs)`
A property batch setter. Pass `kwargs` to set properties.

```python
matplotlib.axis.YAxis.set_agg_filter
```

`YAxis.set_agg_filter(self, filter_func)`
Set the agg filter.

**Parameters**
- `filter_func` [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

```python
matplotlib.axis.YAxis.set_alpha
```

`YAxis.set_alpha(self, alpha)`
Set the alpha value used for blending - not supported on all backends.

**Parameters**
- `alpha` [float]

```python
matplotlib.axis.YAxis.set_animated
```

`YAxis.set_animated(self, b)`
Set the artist’s animation state.

**Parameters**
- `b` [bool]
**Matplotlib, Release 3.1.3**

```python
matplotlib.axis.YAxis.set_clip_box

YAxis.set_clip_box(self, clipbox)
Set the artist’s clip Bbox.

**Parameters**

- *clipbox [Bbox]*

matplotlib.axis.YAxis.set_clip_on

YAxis.set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible out side of the axes which can lead to unexpected results.

**Parameters**

- *b [bool]*

matplotlib.axis.YAxis.set_clip_path

YAxis.set_clip_path(self, clippath, transform=None)
Set the artist’s clip path, which may be:

- a Patch (or subclass) instance; or
- a Path instance, in which case a Transform instance, which will be applied to the path before using it for clipping, must be provided; or
- None, to remove a previously set clipping path.

For efficiency, if the path happens to be an axis-aligned rectangle, this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

**ACCEPTS:** [(Path, Transform) | Patch | None]

matplotlib.axis.YAxis.set_contains

YAxis.set_contains(self, picker)
Define a custom contains test for the artist.
The provided callable replaces the default contains method of the artist.

**Parameters**

- *picker [callable]* A custom picker function to evaluate if an event is within the artist. The function must have the signature:

  ```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
  ```

  that returns:

  - a bool indicating if the event is within the artist
```
• a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

```python
matplotlib.axis.YAxis.set_figure

YAxis.set_figure(self, fig)
Set the `Figure` instance the artist belongs to.

**Parameters**

- `fig` [Figure]

matplotlib.axis.YAxis.set_gid

YAxis.set_gid(self, gid)
Set the (group) id for the artist.

**Parameters**

- `gid` [str]

matplotlib.axis.YAxis.set_label

YAxis.set_label(self, s)
Set a label that will be displayed in the legend.

**Parameters**

- `s` [object] `s` will be converted to a string by calling `str`.

matplotlib.axis.YAxis.set_path_effects

YAxis.set_path_effects(self, path_effects)
Set the path effects.

**Parameters**

- `path_effects` [AbstractPathEffect]

matplotlib.axis.YAxis.set_picker

YAxis.set_picker(self, picker)
Define the picking behavior of the artist.

**Parameters**

- `picker` [None or bool or float or callable] This can be one of the following:
  - None: Picking is disabled for this artist (default).
  - A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
• A float: If picker is a number it is interpreted as an epsilon tolerance in points and the artist will fire off an event if it's data is within epsilon of the mouse event. For some artists like lines and patch collections, the artist may provide additional data to the pick event that is generated, e.g., the indices of the data within epsilon of the pick event

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.

```python
matplotlib.axis.YAxis.set_rasterized
```

```python
YAxis.set_rasterized(self, rasterized)
```

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

**Parameters**

- `rasterized` [bool or None]

```python
matplotlib.axis.YAxis.set_sketch_params
```

```python
YAxis.set_sketch_params(self, scale=None, length=None, randomness=None)
```

Sets the sketch parameters.

**Parameters**

- `scale` [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.
- `length` [float, optional] The length of the wiggle along the line, in pixels (default 128.0)
- `randomness` [float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

```python
matplotlib.axis.YAxis.set_snap
```

```python
YAxis.set_snap(self, snap)
```

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.
Parameters

**snap** [bool or None] Possible values:

- **True**: Snap vertices to the nearest pixel center.
- **False**: Do not modify vertex positions.
- **None**: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```python
matplotlib.axis.YAxis.set_transform
```

```python
YAxis.set_transform(self, t)
```

Set the artist transform.

**Parameters**

- **t** [Transform]

```python
matplotlib.axis.YAxis.set_url
```

```python
YAxis.set_url(self, url)
```

Set the url for the artist.

**Parameters**

- **url** [str]

```python
matplotlib.axis.YAxis.set_visible
```

```python
YAxis.set_visible(self, b)
```

Set the artist’s visibility.

**Parameters**

- **b** [bool]

```python
matplotlib.axis.YAxis.set_zorder
```

```python
YAxis.set_zorder(self, level)
```

Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

- **level** [float]

```python
matplotlib.axis.YAxis.stale
```

```python
YAxis.stale
```

Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.
**17.7 matplotlib.backend_bases**

Abstract base classes define the primitives that renderers and graphics contexts must implement to serve as a matplotlib backend.

*RendererBase*  An abstract base class to handle drawing/rendering operations.

*FigureCanvasBase*  The abstraction layer that separates the `matplotlib.figure.Figure` from the backend specific details like a user interface drawing area.

*GraphicsContextBase*  An abstract base class that provides color, line styles, etc...

*Event*  The base class for all of the matplotlib event handling. Derived classes such as `KeyEvent` and `MouseEvent` store the meta data like keys and buttons pressed, x and y locations in pixel and `Axes` coordinates.

*ShowBase*  The base class for the Show class of each interactive backend; the `show` callable is then set to `Show.__call__`, inherited from `ShowBase`.

*ToolContainerBase*  The base class for the Toolbar class of each interactive backend.

*StatusbarBase*  The base class for the messaging area.

```python
class matplotlib.backend_bases.CloseEvent(name, canvas, guiEvent=None)
    Bases: matplotlib.backend_bases.Event

    An event triggered by a figure being closed.

class matplotlib.backend_bases.DrawEvent(name, canvas, renderer)
    Bases: matplotlib.backend_bases.Event

    An event triggered by a draw operation on the canvas
```

In most backends callbacks subscribed to this callback will be fired after the rendering is complete but before the screen is updated. Any extra artists drawn to the canvas’s renderer will be reflected without an explicit call to `blit`.

**Warning:** Calling `canvas.draw` and `canvas.blit` in these callbacks may not be safe with all backends and may cause infinite recursion.
In addition to the `Event` attributes, the following event attributes are defined:

**Attributes**

- `renderer` [*RendererBase*] the renderer for the draw event

```python
class matplotlib.backend_bases.Event(name, canvas, guiEvent=None)
Bases: object
```

A matplotlib event. Attach additional attributes as defined in *FigureCanvasBase*. `.mpl_connect()`.

**Attributes**

- `name` [str] the event name
- `canvas` [*FigureCanvasBase*] the backend-specific canvas instance generating the event
- `guiEvent` the GUI event that triggered the matplotlib event

```python
class matplotlib.backend_bases.FigureCanvasBase(figure)
Bases: object
```

The canvas the figure renders into.

Public attributes

**Attributes**

- `figure` [*matplotlib.figure.Figure*] A high-level figure instance

```python
blit(self, bbox=None)
```

Blit the canvas in bbox (default entire canvas).

```python
button_press_event(self, x, y, button, dblclick=False, guiEvent=None)
```

Backend derived classes should call this function on any mouse button press. x,y are the canvas coords: 0,0 is lower, left. button and key are as defined in `MouseEvent`.

This method will be call all functions connected to the `button_press_event` with a `MouseEvent` instance.

```python
button_release_event(self, x, y, button, guiEvent=None)
```

Backend derived classes should call this function on any mouse button release.

This method will call all functions connected to the `button_release_event` with a `MouseEvent` instance.

**Parameters**

- `x` [scalar] the canvas coordinates where 0=left
- `y` [scalar] the canvas coordinates where 0=bottom
- `guiEvent` the native UI event that generated the mpl event

```python
close_event(self, guiEvent=None)
```

Pass a `CloseEvent` to all functions connected to `close_event`.

```python
draw(self, *args, **kwargs)
```

Render the `Figure`.

```python
draw_cursor(self, event)
```

Draw a cursor in the event.axes if inaxes is not None. Use native GUI drawing for efficiency if possible.
draw_event(self, renderer)
    Pass a DrawEvent to all functions connected to draw_event.

draw_idle(self, *args, **kwargs)
    Request a widget redraw once control returns to the GUI event loop.
    Even if multiple calls to draw_idle occur before control returns to the GUI event loop, the figure will only be rendered once.

Notes

Backends may choose to override the method and implement their own strategy to prevent multiple renderings.

enter_notify_event(self, guiEvent=None, xy=None)
    Backend derived classes should call this function when entering canvas

Parameters

    guiEvent the native UI event that generated the mpl event
    xy [(float, float)] the coordinate location of the pointer when the canvas is entered

events = ['resize_event', 'draw_event', 'key_press_event', 'key_release_event', 'button_press_event', ...
filetypes = {'eps': 'Encapsulated Postscript', 'jpeg': 'Joint Photographic Experts Group', 'jpg': ...
fixed_dpi = None
flush_events(self)
    Flush the GUI events for the figure.
    Interactive backends need to reimplement this method.

get_default_filename(self)
    Return a string, which includes extension, suitable for use as a default filename.

classmethod get_default_filetype()
    Get the default savefig file format as specified in rcParam savefig.format. Returned string excludes period. Overridden in backends that only support a single file type.

classmethod get_supported_filetypes()
    Return dict of savefig file formats supported by this backend

classmethod get_supported_filetypes_grouped()
    Return a dict of savefig file formats supported by this backend, where the keys are a file type name, such as 'Joint Photographic Experts Group', and the values are a list of filename extensions used for that filetype, such as ['jpg', 'jpeg'].

get_width_height(self)
    Return the figure width and height in points or pixels (depending on the backend), truncated to integers

get_window_title(self)
    Get the title text of the window containing the figure. Return None if there is no window (e.g., a PS backend).

grab_mouse(self, ax)
    Set the child axes which are currently grabbing the mouse events. Usually called by the widgets themselves. It is an error to call this if the mouse is already grabbed by another axes.
inaxes(self, xy)
    Check if a point is in an axes.

    Parameters
    xy [tuple or list] (x,y) coordinates. x position - pixels from left of canvas.
    y position - pixels from bottom of canvas.

    Returns
    axes: topmost axes containing the point, or None if no axes.

is_saving(self)
    Returns whether the renderer is in the process of saving to a file, rather than ren-
    dering for an on-screen buffer.

key_press_event(self, key, guiEvent=None)
    Pass a KeyEvent to all functions connected to key_press_event.

key_release_event(self, key, guiEvent=None)
    Pass a KeyEvent to all functions connected to key_release_event.

leave_notify_event(self, guiEvent=None)
    Backend derived classes should call this function when leaving canvas

    Parameters
    guiEvent the native UI event that generated the mpl event

motion_notify_event(self, x, y, guiEvent=None)
    Backend derived classes should call this function on any motion-notify-event.

    This method will call all functions connected to the 'motion_notify_event' with a
MouseEvent instance.

    Parameters
    x [scalar] the canvas coordinates where 0=left
    y [scalar] the canvas coordinates where 0=bottom
    guiEvent the native UI event that generated the mpl event

mpl_connect(self, s, func)
    Connect event with string s to func. The signature of func is:

    def func(event)

where event is a matplotlib.backend_bases.Event. The following events are recog-

ized

    • 'button_press_event'
    • 'button_release_event'
    • 'draw_event'
    • 'key_press_event'
    • 'key_release_event'
    • 'motion_notify_event'
    • 'pick_event'
    • 'resize_event'
• ‘scroll_event’
• ‘figure_enter_event’,
• ‘figure_leave_event’,
• ‘axes_enter_event’,
• ‘axes_leave_event’
• ‘close_event’

For the location events (button and key press/release), if the mouse is over the axes, the variable event.inaxes will be set to the Axes the event occurs over, and additionally, the variables event.xdata and event.ydata will be defined. This is the mouse location in data coords. See KeyEvent and MouseEvent for more info.

Return value is a connection id that can be used with mpl_disconnect().

Examples

Usage:

```python
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

```python
mpl_disconnect(self, cid)
```
Disconnected callback id cid

Examples

Usage:

```python
cid = canvas.mpl_connect('button_press_event', on_press)
#...later
canvas.mpl_disconnect(cid)
```

```python
new_timer(self, *args, **kwargs)
```
Creates a new backend-specific subclass of backend_bases.Timer. This is useful for getting periodic events through the backend’s native event loop. Implemented only for backends with GUIs.

Other Parameters

- **interval** [scalar] Timer interval in milliseconds
- **callbacks** [List[Tuple[callable, Tuple, Dict]]] Sequence of (func, args, kwargs) where func(*args, **kwargs) will be executed by the timer every interval.
  callbacks which return False or 0 will be removed from the timer.
Examples

```python
>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1, ), {'a': 3}),])
```

`pick(self, mouseevent)`

`pick_event(self, mouseevent, artist, **kwargs)`

This method will be called by artists who are picked and will fire off `PickEvent` callbacks registered listeners.

`print_figure(self, filename, dpi=None, facecolor=None, edgecolor=None, orientation='portrait', format=None, *, bbox_inches=None, **kwargs)`

Render the figure to hardcopy. Set the figure patch face and edge colors. This is useful because some of the GUIs have a gray figure face color background and you’ll probably want to override this on hardcopy.

**Parameters**

- `filename` can also be a file object on image backends
- `orientation` [{‘landscape’, ‘portrait’}, optional] only currently applies to PostScript printing.
- `dpi` [scalar, optional] the dots per inch to save the figure in; if None, use `savefig.dpi`
- `facecolor` [color or None, optional] the facecolor of the figure; if None, defaults to `savefig.facecolor`
- `edgecolor` [color or None, optional] the edgecolor of the figure; if None, defaults to `savefig.edgecolor`
- `format` [str, optional] when set, forcibly set the file format to save to
- `bbox_inches` [str or `Bbox`, optional] Bbox in inches. Only the given portion of the figure is saved. If ‘tight’, try to figure out the tight bbox of the figure. If None, use `savefig.bbox`
- `pad_inches` [scalar, optional] Amount of padding around the figure when `bbox_inches` is ‘tight’. If None, use `savefig.pad_inches`
- `bbox_extra_artists` [list of `Artist`, optional] A list of extra artists that will be considered when the tight bbox is calculated.

`release_mouse(self, ax)`

Release the mouse grab held by the axes, ax. Usually called by the widgets. It is ok to call this even if you ax doesn’t have the mouse grab currently.

`resize(self, w, h)`

Set the canvas size in pixels.

`resize_event(self)`

Pass a `ResizeEvent` to all functions connected to `resize_event`.

`scroll_event(self, x, y, step, guiEvent=None)`

Backend derived classes should call this function on any scroll wheel event. x,y are the canvas coords: 0,0 is lower, left. button and key are as defined in `MouseEvent`.

This method will be call all functions connected to the ‘scroll_event’ with a `MouseEvent` instance.
**set_window_title**(self, title)
Set the title text of the window containing the figure. Note that this has no effect if there is no window (e.g., a PS backend).

**start_event_loop**(self, timeout=0)
Start a blocking event loop.

Such an event loop is used by interactive functions, such as `ginput` and `waitforbuttonpress`, to wait for events.

The event loop blocks until a callback function triggers `stop_event_loop`, or timeout is reached.

If timeout is negative, never timeout.

Only interactive backends need to reimplement this method and it relies on `flush_events` being properly implemented.

Interactive backends should implement this in a more native way.

**stop_event_loop**(self)
Stop the current blocking event loop.

Interactive backends need to reimplement this to match `start_event_loop`

**supports_blit** = True

**switch_backends**(self, FigureCanvasClass)
Instantiate an instance of FigureCanvasClass

This is used for backend switching, e.g., to instantiate a FigureCanvasPS from a FigureCanvasGTK. Note, deep copying is not done, so any changes to one of the instances (e.g., setting figure size or line props), will be reflected in the other

class matplotlib.backend_bases.FigureManagerBase(canvas, num)
Bases: object

Helper class for pyplot mode, wraps everything up into a neat bundle

**Attributes**

- **canvas** [FigureCanvasBase] The backend-specific canvas instance
- **num** [int or str] The figure number
- **key_press_handler_id** [int] The default key handler cid, when using the toolmanager. To disable the default key press handling use:

  ```python
  figure.canvas.mpl_disconnect(figure.canvas.manager.key_press_handler_id)
  ```

- **button_press_handler_id** [int] The default mouse button handler cid, when using the toolmanager. To disable the default button press handling use:

  ```python
  figure.canvas.mpl_disconnect(figure.canvas.manager.button_press_handler_id)
  ```

- **button_press**(self, event)
The default Matplotlib button actions for extra mouse buttons.

- **destroy**(self)

- **full_screen_toggle**(self)
get_window_title(self)
    Get the title text of the window containing the figure.
    Return None for non-GUI (e.g., PS) backends.
key_press(self, event)
    Implement the default mpl key bindings defined at Navigation Keyboard Shortcuts
resize(self, w, h)
    "For GUI backends, resize the window (in pixels).
set_window_title(self, title)
    Set the title text of the window containing the figure.
    This has no effect for non-GUI (e.g., PS) backends.
show(self)
    For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception to be caught by show(), for an optional warning.

class matplotlib.backend_bases.GraphicsContextBase
    Bases: object
    An abstract base class that provides color, line styles, etc.
    
copy_properties(self, gc)
        Copy properties from gc to self
    
get_alpha(self)
        Return the alpha value used for blending - not supported on all backends.
    
get_antialiased(self)
        Return whether the object should try to do antialiased rendering.
    
get_capstyle(self)
        Return the capstyle as a string in ('butt', 'round', 'projecting').
    
get_clip_path(self)
        Return the clip path in the form (path, transform), where path is a Path instance, and transform is an affine transform to apply to the path before clipping.
    
get_clip_rectangle(self)
        Return the clip rectangle as a Bbox instance.
    
get_dashes(self)
        Return the dash information as an offset dashlist tuple.
        The dash list is a even size list that gives the ink on, ink off in pixels.
        See p107 of to PostScript BLUEBOOK for more info.
        Default value is None
    
get_forced_alpha(self)
        Return whether the value given by get_alpha() should be used to override any other alpha-channel values.
    
get_gid(self)
        Return the object identifier if one is set, None otherwise.
    
get_hatch(self)
        Get the current hatch style.
    
get_hatch_color(self)
        Get the hatch color.
get_hatch_linewidth(self)
    Get the hatch linewidth.

get_hatch_path(self, density=6.0)
    Return a Path for the current hatch.

get_joinstyle(self)
    Return the line join style as one of ('miter', 'round', 'bevel').

g_get linewidth(self)
    Return the line width in points.

g_get rgb(self)
    Return a tuple of three or four floats from 0-1.

g_get sketch params(self)
    Return the sketch parameters for the artist.

    Returns

    sketch_params [tuple or None] A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or expanded.
    May return None if no sketch parameters were set.

g_get snap(self)
    Returns the snap setting, which can be:
    • True: snap vertices to the nearest pixel center
    • False: leave vertices as-is
    • None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

g_get url(self)
    Return a url if one is set, None otherwise.

restore(self)
    Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack.

set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.
    If alpha=None (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, alpha will override them.

set_antialiased(self, b)
    Set whether object should be drawn with antialiased rendering.

set_capstyle(self, cs)
    Set the capstyle to be one of ('butt', 'round', 'projecting').

set_clip_path(self, path)
    Set the clip path and transformation. Path should be a TransformedPath instance.
set_clip_rectangle(self, rectangle)
Set the clip rectangle with sequence (left, bottom, width, height)

set_dashes(self, dash_offset, dash_list)
Set the dash style for the gc.

Parameters

    dash_offset [float] is the offset (usually 0).
    dash_list [array_like] specifies the on-off sequence as points. (None, None) specifies a solid line

set_foreground(self, fg, isRGBA=False)
Set the foreground color.

Parameters

    fg [color]
    isRGBA [bool] If fg is known to be an (r, g, b, a) tuple, isRGBA can be set to True to improve performance.

set_gid(self, id)
Set the id.

set_hatch(self, hatch)
Set the hatch style (for fills).

set_hatch_color(self, hatch_color)
Set the hatch color.

set_joinstyle(self, js)
Set the join style to be one of ('miter', 'round', 'bevel').

set_linewidth(self, w)
Set the linewidth in points.

set_sketch_params(self, scale=None, length=None, randomness=None)
Set the sketch parameters.

Parameters

    scale [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

    length [float, optional] The length of the wiggle along the line, in pixels (default 128).

    randomness [float, optional] The scale factor by which the length is shrunken or expanded (default 16).

set_snap(self, snap)
Set the snap setting which may be:

    • True: snap vertices to the nearest pixel center
    • False: leave vertices as-is
    • None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

set_url(self, url)
Set the url for links in compatible backends.
class matplotlib.backend_bases.KeyCode(name, canvas, key, x=0, y=0, guiEvent=None)
Bases: matplotlib.backend_bases.LocationEvent

A key event (key press, key release).
Attach additional attributes as defined in FigureCanvasBase.mpl_connect().
In addition to the Event and LocationEvent attributes, the following attributes are defined:

**Notes**

Modifier keys will be prefixed to the pressed key and will be in the order “ctrl”, “alt”, “super”. The exception to this rule is when the pressed key is itself a modifier key, therefore “ctrl+alt” and “alt+control” can both be valid key values.

**Examples**

Usage:

```python
def on_key(event):
    print('you pressed', event.key, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('key_press_event', on_key)
```

**Attributes**

key [None or str] the key(s) pressed. Could be **None**, a single case sensitive ascii character ("g", "G", ", etc.), a special key ("control", "shift", "f1", "up", etc.) or a combination of the above (e.g., "ctrl+alt+g", "ctrl+alt+G").

class matplotlib.backend_bases.LocationEvent(name, canvas, x, y, guiEvent=None)
Bases: matplotlib.backend_bases.Event

An event that has a screen location.
The following additional attributes are defined and shown with their default values.
In addition to the Event attributes, the following event attributes are defined:

**Attributes**

x [scalar] x position - pixels from left of canvas
y [scalar] y position - pixels from bottom of canvas
inaxes [bool] the Axes instance if mouse is over axes
xdata [scalar] x coord of mouse in data coords
ydata [scalar] y coord of mouse in data coords
x, y in figure coords, 0,0 = bottom, left
lastevent = None

class matplotlib.backend_bases.MouseEvent
Bases: enum.IntEnum

An enumeration.
Matplotlib, Release 3.1.3

BACK = 8
FORWARD = 9
LEFT = 1
MIDDLE = 2
RIGHT = 3

class matplotlib.backend_bases.MouseEvent(name, canvas, x, y, button=None,
key=None, step=0, dblclick=False,
guiEvent=None)

Bases: matplotlib.backend_bases.LocationEvent

A mouse event ('button_press_event', 'button_release_event', 'scroll_event', 'motion_notify_event')

In addition to the Event and LocationEvent attributes, the following attributes are defined:

Examples

Usage:

def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('button_press_event', on_press)

Attributes

button [{None, MouseButton.LEFT, MouseButton.MIDDLE, MouseButton.RIGHT, ‘up’, ‘down’}] The button pressed. ‘up’ and ‘down’ are used for scroll events. Note that in the nbagg backend, both the middle and right clicks return RIGHT since right clicking will bring up the context menu in some browsers. Note that LEFT and RIGHT actually refer to the "primary" and "secondary" buttons, i.e. if the user inverts their left and right buttons ("left-handed setting") then the LEFT button will be the one physically on the right.

key [None or str] The key pressed when the mouse event triggered, e.g. ‘shift’. See KeyEvent.

step [scalar] The number of scroll steps (positive for ‘up’, negative for ‘down’). This applies only to ‘scroll_event’ and defaults to 0 otherwise.

dblclick [bool] Whether the event is a double-click. This applies only to ‘button_press_event’ and is False otherwise. In particular, it’s not used in ‘button_release_event’.

x, y in figure coords, 0,0 = bottom, left button pressed None, 1, 2, 3, ‘up’, ‘down’

class matplotlib.backend_bases.NavigationToolbar2(canvas)

Bases: object

Base class for the navigation cursor, version 2

backends must implement a canvas that handles connections for ‘button_press_event’ and ‘button_release_event’. See FigureCanvasBase.mpl_connect() for more information
They must also define

- `save_figure()` to save the current figure
- `set_cursor()` if you want the pointer icon to change
- `_init_toolbar()` to create your toolbar widget
- `draw_rubberband()` (optional) to draw the zoom to rect “rubberband” rectangle
- `press()` (optional) whenever a mouse button is pressed, you’ll be notified with the event
- `release()` (optional) whenever a mouse button is released, you’ll be notified with the event
- `set_message()` (optional) to display message
- `set_history_buttons()` (optional) you can change the history back / forward buttons to indicate disabled / enabled state.

That’s it, we’ll do the rest!

```python
back(self, *args)
    move back up the view lim stack

drag_pan(self, event)
    Callback for dragging in pan/zoom mode.

drag_zoom(self, event)
    Callback for dragging in zoom mode.

draw(self)
    Redraw the canvases, update the locators.

draw_rubberband(self, event, x0, y0, x1, y1)
    Draw a rectangle rubberband to indicate zoom limits.
    Note that it is not guaranteed that x0 <= x1 and y0 <= y1.

forward(self, *args)
    Move forward in the view lim stack.

home(self, *args)
    Restore the original view.

mouse_move(self, event)

pan(self, *args)
    Activate the pan/zoom tool. pan with left button, zoom with right

press(self, event)
    Called whenever a mouse button is pressed.

press_pan(self, event)
    Callback for mouse button press in pan/zoom mode.

press_zoom(self, event)
    Callback for mouse button press in zoom to rect mode.

push_current(self)
    Push the current view limits and position onto the stack.

release(self, event)
    Callback for mouse button release.
```
release_pan(self, event)
    Callback for mouse button release in pan/zoom mode.

release_zoom(self, event)
    Callback for mouse button release in zoom to rect mode.

remove_rubberband(self)
    Remove the rubberband.

save_figure(self, *args)
    Save the current figure.

set_cursor(self, cursor)
    Set the current cursor to one of the Cursors enums values.
    If required by the backend, this method should trigger an update in the backend event loop after the cursor is set, as this method may be called e.g. before a long-running task during which the GUI is not updated.

set_history_buttons(self)
    Enable or disable the back/forward button.

set_message(self, s)
    Display a message on toolbar or in status bar.
    
    Examples
    
    Usage:
    
    ax.plot(np.rand(100), 'o', picker=5) # 5 points tolerance
    
    def on_pick(event):
        line = event.artist
        xdata, ydata = line.get_data()
        ind = event.ind
        print('on pick line:', np.array([xdata[ind], ydata[ind]]).T)
    
    cid = fig.canvas.mpl_connect('pick_event', on_pick)

Attributes
**mouseevent** [MouseEvent] the mouse event that generated the pick

**artist** [matplotlib.artist.Artist] the picked artist

**other** extra class dependent attrs - e.g., a Line2D pick may define different extra attributes than a PatchCollection pick event

class matplotlib.backend_bases.RendererBase
Bases: object

An abstract base class to handle drawing/rendering operations.

The following methods must be implemented in the backend for full functionality (though just implementing `draw_path()` alone would give a highly capable backend):

- `draw_path()`
- `draw_image()`
- `draw_gouraud_triangle()`

The following methods *should* be implemented in the backend for optimization reasons:

- `draw_text()`
- `draw_markers()`
- `draw_path_collection()`
- `draw_quad_mesh()`

close_group(self, s)

Close a grouping element with label s

Only used by the SVG renderer.

draw_gouraud_triangle(self, gc, points, colors, transform)

Draw a Gouraud-shaded triangle.

**Parameters**

- **points** [array_like, shape=(3, 2)] Array of (x, y) points for the triangle.
- **colors** [array_like, shape=(3, 4)] RGBA colors for each point of the triangle.
- **transform** [matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_gouraud_triangles(self, gc, triangles_array, colors_array, transform)

Draws a series of Gouraud triangles.

**Parameters**

- **points** [array_like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.
- **colors** [array_like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.
- **transform** [matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_image(self, gc, x, y, im, transform=None)

Draw an RGBA image.

**Parameters**
**gc** [GraphicsContextBase] a graphics context with clipping information.

**x** [scalar] the distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y** [scalar] the distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im** [array_like, shape=(N, M, 4), dtype=np.uint8] An array of RGBA pixels.

**transform** [matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation may be passed to `draw_image()`. It takes the form of a Affine2DBase instance. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by transform).

draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)

Draws a marker at each of the vertices in path. This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

**Parameters**

**gc** [GraphicsContextBase] The graphics context

**marker_trans** [matplotlib.transforms.Transform] An affine transform applied to the marker.

**trans** [matplotlib.transforms.Transform] An affine transform applied to the path.

draw_path(self, gc, path, transform, rgbFace=None)

Draws a `Path` instance using the given affine transform.

draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)

Draws a collection of paths selecting drawing properties from the lists facecolors, edgecolors, linewidths, linestyles, antialiaseds. offsets is a list of offsets to apply to each of the paths. The offsets in offsets are first transformed by offsetTrans before being applied. offset_position may be either “screen” or “data” depending on the space that the offsets are in.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.
draw_quad_mesh(self, gc, master_transform, meshWidth, meshHeight, coordinates,
    offsets, offsetTrans, facecolors, antialiased, edgecolors)
This provides a fallback implementation of draw_quad_mesh() that generates paths
and then calls draw_path_collection().

draw_tex(self, gc, x, y, s, prop, angle, ismath=’TeX’, mtext=None)
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
Draw the text instance.

Parameters

    x [scalar] The x location of the text in display coords.
    y [scalar] The y location of the text baseline in display coords.
    s [str] The text string.
    angle [scalar] The rotation angle in degrees.
    mtext [matplotlib.text.Text] The original text object to be rendered.

Notes

backend implementers note
When you are trying to determine if you have gotten your bounding box right (which
is what enables the text layout/alignment to work properly), it helps to change the
line in text.py:

```
if 0: bbox_artist(self, renderer)
```
to if 1, and then the actual bounding box will be plotted along with your text.

flipy(self)
    Return whether y values increase from top to bottom.

Note that this only affects drawing of texts and images.

get_canvas_width_height(self)
    Return the canvas width and height in display coords.

get_image_magnification(self)
    Get the factor by which to magnify images passed to draw_image(). Allows a backend
to have images at a different resolution to other artists.

get_texmanager(self)
    Return the TexManager instance.

get_text_width_height_descent(self, s, prop, ismath)
    Get the width, height, and descent (offset from the bottom to the baseline), in display
coords, of the string s with FontProperties prop

new_gc(self)
    Return an instance of a GraphicsContextBase.

open_group(self, s, gid=None)
    Open a grouping element with label s and gid (if set) as id.
Only used by the SVG renderer.

```python
option_image_nocomposite(self)
```
Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not rcParams["image composite_image"].

```python
option_scale_image(self)
```
Return whether arbitrary affine transformations in `draw_image()` are supported (True for most vector backends).

```python
points_to_pixels(self, points)
```
Convert points to display units.

You need to override this function (unless your backend doesn’t have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```python
points to pixels = points * pixels_per_inch/72.0 * dpi/72.0
```

**Parameters**
- `points` [scalar or array_like] a float or a numpy array of float

**Returns**
- `points converted to pixels`

```python
start_filter(self)
```
Switch to a temporary renderer for image filtering effects.

Currently only supported by the agg renderer.

```python
start_rasterizing(self)
```
Switch to the raster renderer.

Used by MixedModeRenderer.

```python
stop_filter(self, filter_func)
```
Switch back to the original renderer. The contents of the temporary renderer is processed with the `filter_func` and is drawn on the original renderer as an image.

Currently only supported by the agg renderer.

```python
stop_rasterizing(self)
```
Switch back to the vector renderer and draw the contents of the raster renderer as an image on the vector renderer.

Used by MixedModeRenderer.

```python
strip_math(self, s)
```
[Deprecated]

**Notes**

Deprecated since version 3.1:

```python
class matplotlib.backend_bases.ResizeEvent(name, canvas)
```
Bases: `matplotlib.backend_bases.Event`

An event triggered by a canvas resize

17.7. `matplotlib.backend_bases` 1241
In addition to the `Event` attributes, the following event attributes are defined:

**Attributes**

- **width** [scalar] width of the canvas in pixels
- **height** [scalar] height of the canvas in pixels

```python
class matplotlib.backend_bases.ShowBase
    Bases: matplotlib.backend_bases._Backend
    Simple base class to generate a show() callable in backends.
    Subclass must override mainloop() method.

class matplotlib.backend_bases.StatusbarBase(toolmanager)
    Bases: object
    Base class for the statusbar

    `set_message(self, s)`
    Display a message on toolbar or in status bar

    **Parameters**

    - **s** [str] Message text

class matplotlib.backend_bases.TimerBase(interval=None, callbacks=None)
    Bases: object
    A base class for providing timer events, useful for things animations. Backends need to implement a few specific methods in order to use their own timing mechanisms so that the timer events are integrated into their event loops.

    Mandatory functions that must be implemented:

    - `_timer_start`: Contains backend-specific code for starting the timer
    - `_timer_stop`: Contains backend-specific code for stopping the timer

    Optional overrides:

    - `_timer_set_single_shot`: Code for setting the timer to single shot operating mode, if supported by the timer object. If not, the Timer class itself will store the flag and the `_on_timer` method should be overridden to support such behavior.
    - `_timer_set_interval`: Code for setting the interval on the timer, if there is a method for doing so on the timer object.
    - `_on_timer`: This is the internal function that any timer object should call, which will handle the task of running all callbacks that have been set.

**Attributes**

- **interval** [scalar] The time between timer events in milliseconds. Default is 1000 ms.
- **single_shot** [bool] Boolean flag indicating whether this timer should operate as single shot (run once and then stop). Defaults to `False`.
- **callbacks** [List[Tuple[Callable, Tuple, Dict]]] Stores list of (func, args, kwargs) tuples that will be called upon timer events. This list can be manipulated directly, or the functions `add_callback` and `remove_callback` can be used.
add_callback(self, func, *args, **kwargs)
    Register func to be called by timer when the event fires. Any additional arguments
    provided will be passed to func.

    This function returns func, which makes it possible to use it as a decorator.

interval
remove_callback(self, func, *args, **kwargs)
    Remove func from list of callbacks.

    args and kwargs are optional and used to distinguish between copies of the same
    function registered to be called with different arguments. This behavior is depre-
    cated. In the future, *args, **kwargs won’t be considered anymore; to keep a specific
    callback removable by itself, pass it to add_callback as a functools.partial object.

single_shot
start(self, interval=None)
    Start the timer object.

    Parameters
    
    interval [int, optional] Timer interval in milliseconds; overrides a previ-
    ously set interval if provided.

stop(self)
    Stop the timer.

class matplotlib.backend_bases.ToolContainerBase(toolmanager)
Bases: object
    Base class for all tool containers, e.g. toolbars.

    Attributes

    toolmanager [ToolManager] The tools with which this ToolContainer wants
to communicate.

add_tool(self, tool, group, position=-1)
    Adds a tool to this container

    Parameters

    tool [tool_like] The tool to add, see ToolManager.get_tool.

    group [str] The name of the group to add this tool to.

    position [int (optional)] The position within the group to place this tool.
    Defaults to end.

add_toolitem(self, name, group, position, image, description, toggle)
    Add a toolitem to the container

    This method must get implemented per backend

    The callback associated with the button click event, must be EXACTLY self.
    trigger_tool(name)

    Parameters

    name [string] Name of the tool to add, this gets used as the tool’s ID and
    as the default label of the buttons

    group [String] Name of the group that this tool belongs to
**position** [Int] Position of the tool within its group, if -1 it goes at the End

**image_file** [String] Filename of the image for the button or None

**description** [String] Description of the tool, used for the tooltips

**toggle** [Bool]
- **True**: The button is a toggle (change the pressed/unpressed state between consecutive clicks)
- **False**: The button is a normal button (returns to unpressed state after release)

`remove_toolitem(self, name)`
Remove a toolitem from the ToolContainer
This method must get implemented per backend
Called when ToolManager emits a tool_removed_event

**Parameters**

**name** [string] Name of the tool to remove

`toggle_toolitem(self, name, toggled)`
Toggle the toolitem without firing event

**Parameters**

**name** [String] Id of the tool to toggle

**toggled** [bool] Whether to set this tool as toggled or not.

`trigger_tool(self, name)`
Trigger the tool

**Parameters**

**name** [string] Name (id) of the tool triggered from within the container

`matplotlib.backend_bases.button_press_handler(event, canvas, toolbar=None)`
The default Matplotlib button actions for extra mouse buttons.

`matplotlib.backend_bases.get_registered_canvas_class(format)`
Return the registered default canvas for given file format. Handles deferred import of required backend.

`matplotlib.backend_bases.key_press_handler(event, canvas, toolbar=None)`
Implement the default mpl key bindings for the canvas and toolbar described at Navigation Keyboard Shortcuts

**Parameters**

**event** [KeyEvent] a key press/release event

**canvas** [FigureCanvasBase] the backend-specific canvas instance

**toolbar** [NavigationToolbar2] the navigation cursor toolbar

`matplotlib.backend_bases.register_backend(format, backend, description=None)`
Register a backend for saving to a given file format.

**Parameters**

**format** [str] File extension

**backend** [module string or canvas class] Backend for handling file output
description [str, optional] Description of the file type. Defaults to an empty string

### 17.8 matplotlib.backend_managers

class matplotlib.backend_managers.ToolEvent(name, sender, tool, data=\None)

Bases: object

Event for tool manipulation (add/remove).

class matplotlib.backend_managers.ToolManager(\figure=\None)

Bases: object

Manager for actions triggered by user interactions (key press, toolbar clicks, ...) on a Figure.

**Attributes**

- `\figure` [Figure] Figure that holds the canvas.
- `\keypresslock` [widgets.LockDraw] LockDraw object to know if the \canvas\_key\_press\_event is locked
- `\messagelock` [widgets.LockDraw] LockDraw object to know if the message is available to write

- `active_toggle` Currently toggled tools.

- `add_tool(self, name, tool, \*args, **kwargs)`

  Add tool to \ToolManager. If successful, adds a new event \tool\_trigger\_\{name\} where \{name\} is the name of the tool; the event is fired everytime the tool is triggered.

  **Parameters**

  - `\name` [str] Name of the tool, treated as the ID, has to be unique.
  - `\tool` [class\_like, i.e. str or type] Reference to find the class of the Tool to added.

  **See also:**

  matplotlib.backend_tools.ToolBase The base class for tools.

  **Notes**

  args and kwargs get passed directly to the tools constructor.

- `\canvas` Canvas managed by FigureManager.

- `\figure` Figure that holds the canvas.

- `\get\_tool(self, name, warn=\True)`

  Return the tool object, also accepts the actual tool for convenience.

  **Parameters**
name [str, ToolBase] Name of the tool, or the tool itself
warn [bool, optional] If this method should give warnings.

get_tool_keymap(self, name)
    Get the keymap associated with the specified tool.

Parameters
    name [string] Name of the Tool

Returns
    list [list of keys associated with the Tool]

message_event(self, message, sender=None)
    Emit a ToolManagerMessageEvent.

remove_tool(self, name)
    Remove tool named name.

Parameters
    name [string] Name of the Tool

set_figure(self, figure, update_tools=True)
    Bind the given figure to the tools.

Parameters
    figure [Figure]
    update_tools [bool] Force tools to update figure

toolmanager_connect(self, s, func)
    Connect event with string s to func.

Parameters
    s [String] Name of the event
    The following events are recognized
    • ‘tool_message_event’
    • ‘tool_removed_event’
    • ‘tool_added_event’
    For every tool added a new event is created
    • ‘tool_trigger_TOOLNAME’ Where TOOLNAME is the id of the tool.

    func [function] Function to be called with signature def func(event)

toolmanager_disconnect(self, cid)
    Disconnect callback id cid.

Example usage:

    cid = toolmanager.toolmanager_connect('tool_trigger_zoom', onpress)
    #...later
    toolmanager.toolmanager_disconnect(cid)

tools
    A dict mapping tool name -> controlled tool.
trigger_tool(self, name, sender=None, canvasevent=None, data=None)
    Trigger a tool and emit the tool_trigger_{name} event.

    Parameters
    name [string] Name of the tool
    sender [object] Object that wishes to trigger the tool
    canvasevent [Event] Original Canvas event or None
    data [Object] Extra data to pass to the tool when triggering

update_keymap(self, name, *keys)
    Set the keymap to associate with the specified tool.

    Parameters
    name [string] Name of the Tool
    keys [keys to associate with the Tool]

class matplotlib.backend_managers.ToolManagerMessageEvent(name, sender, message)
    Bases: object
    
    Event carrying messages from toolmanager.
    Messages usually get displayed to the user by the toolbar.

class matplotlib.backend_managers.ToolTriggerEvent(name, sender, tool, canvasevent=None, data=None)
    Bases: matplotlib.backend_managers.ToolEvent
    
    Event to inform that a tool has been triggered.

17.9 matplotlib.backend_tools

Abstract base classes define the primitives for Tools. These tools are used by matplotlib.backend_managers.ToolManager

ToolBase Simple stateless tool

ToolToggleBase Tool that has two states, only one Toggle tool can be active at any given time for the same matplotlib.backend_managers.ToolManager

class matplotlib.backend_tools.AxisScaleBase(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolToggleBase
    
    Base Tool to toggle between linear and logarithmic

disable(self, toggle, event)
    Disable the toggle tool

    trigger call this method when toggled is True.

    This can happen in different circumstances
    • Click on the toolbar tool button
    • Call to matplotlib.backend_managers.ToolManager.trigger_tool
    • Another ToolToggleBase derived tool is triggered (from the same ToolManager)
enable(self, event)
    Enable the toggle tool
    
    trigger calls this method when toggled is False

trigger(self, sender, event, data=None)
    Calls enable or disable based on toggled value

class matplotlib.backend_tools.ConfigureSubplotsBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase

    Base tool for the configuration of subplots
    
    description = 'Configure subplots'
    
    image = 'subplots'

class matplotlib.backend_tools.Cursors
    Bases: object

    Simple namespace for cursor reference
    
    HAND = 0
    MOVE = 3
    POINTER = 1
    SELECT_REGION = 2
    WAIT = 4

class matplotlib.backend_tools.RubberbandBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase

    Draw and remove rubberband
    
    draw_rubberband(self, *data)
        Draw rubberband
        
        This method must get implemented per backend
    
    remove_rubberband(self)
        Remove rubberband
        
        This method should get implemented per backend
    
    trigger(self, sender, event, data)
        Call draw_rubberband or remove_rubberband based on data

class matplotlib.backend_tools.SaveFigureBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase

    Base tool for figure saving
    
    default_keymap = ['s', 'ctrl+s']
    
    description = 'Save the figure'
    
    image = 'filesave'

class matplotlib.backend_tools.SetCursorBase(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolBase

    Change to the current cursor while inaxes
    
    This tool, keeps track of all ToolToggleBase derived tools, and calls set_cursor when a tool
    gets triggered
set_cursor(self, cursor)
    Set the cursor
    This method has to be implemented per backend

set_figure(self, figure)
    Assign a figure to the tool

Parameters
    figure [Figure]

class matplotlib.backend_tools.ToolBack(toolmanager, name)
    Bases: matplotlib.backend_tools.ViewsPositionsBase
    Move back up the view lim stack
    default_keymap = ['left', 'c', 'backspace', 'MouseButton.BACK']
    description = 'Back to previous view'
    image = 'back'

class matplotlib.backend_tools.ToolBase(toolmanager, name)
    Bases: object
    Base tool class
    A base tool, only implements trigger method or not method at all. The tool is instantiated
    by matplotlib.backend_managers.ToolManager

Attributes
    toolmanager [matplotlib.backend_managers.ToolManager] ToolManager that
    controls this Tool
    figure [FigureCanvas] Figure instance that is affected by this Tool
    name [string] Tool Id

canvas
default_keymap = None
    Keymap to associate with this tool
    String: List of comma separated keys that will be used to call this tool when the
    keypress event of self.figure.canvas is emitted

description = None
    Description of the Tool
    String: If the Tool is included in the Toolbar this text is used as a Tooltip

destroy(self)
    Destroy the tool
    This method is called when the tool is removed by matplotlib.backend_managers.
    ToolManager.remove_tool

figure

default_keymap = None
    Filenname of the image
    String: Filename of the image to use in the toolbar. If None, the name is used as a
    label in the toolbar button
name

Tool Id

set_figure(self, figure)
Assign a figure to the tool

**Parameters**

- **figure** [figure]

toolmanager

trigger(self, sender, event, data=None)
Called when this tool gets used

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`

**Parameters**

- **event** [Event] The Canvas event that caused this tool to be called
- **sender** [object] Object that requested the tool to be triggered
- **data** [object] Extra data

```python
matplotlib.backend_tools.ToolCopyToClipboard
alias of matplotlib.backend_tools.ToolCopyToClipboardBase
```

```python
class matplotlib.backend_tools.ToolCopyToClipboardBase(toolmanager, name)
Bases: matplotlib.backend_tools.ToolBase
```

Tool to copy the figure to the clipboard

default_keymap = ['ctrl+c', 'cmd+c']

description = 'Copy the canvas figure to clipboard'

trigger(self, *args, **kwargs)
Called when this tool gets used

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`

**Parameters**

- **event** [Event] The Canvas event that caused this tool to be called
- **sender** [object] Object that requested the tool to be triggered
- **data** [object] Extra data

class matplotlib.backend_tools.ToolCursorPosition(*args, **kwargs)
Bases: matplotlib.backend_tools.ToolBase

Send message with the current pointer position

This tool runs in the background reporting the position of the cursor

send_message(self, event)
Call `matplotlib.backend_managers.ToolManager.message_event`

set_figure(self, figure)
Assign a figure to the tool

**Parameters**

- **figure** [figure]
class matplotlib.backend_tools.ToolEnableAllNavigation(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase

    Tool to enable all axes for toolmanager interaction
    default_keymap = ['a']
    description = 'Enable all axes toolmanager'
    trigger(self, sender, event, data=None)
        Called when this tool gets used
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool

        Parameters
        event [Event] The Canvas event that caused this tool to be called
        sender [object] Object that requested the tool to be triggered
        data [object] Extra data

class matplotlib.backend_tools.ToolEnableNavigation(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase

    Tool to enable a specific axes for toolmanager interaction
    default_keymap = (1, 2, 3, 4, 5, 6, 7, 8, 9)
    description = 'Enable one axes toolmanager'
    trigger(self, sender, event, data=None)
        Called when this tool gets used
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool

        Parameters
        event [Event] The Canvas event that caused this tool to be called
        sender [object] Object that requested the tool to be triggered
        data [object] Extra data

class matplotlib.backend_tools.ToolForward(toolmanager, name)
    Bases: matplotlib.backend_tools.ViewsPositionsBase

    Move forward in the view lim stack
    default_keymap = ['right', 'v', 'MouseButton.FORWARD']
    description = 'Forward to next view'
    image = 'forward'

class matplotlib.backend_tools.ToolFullScreen(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolToggleBase

    Tool to toggle full screen
    default_keymap = ['f', 'ctrl+f']
    description = 'Toggle fullscreen mode'
    disable(self, event)
        Disable the toggle tool
    trigger call this method when toggled is True.
This can happen in different circumstances

- Click on the toolbar tool button
- Call to `matplotlib.backend_managers.ToolManager.trigger_tool`
- Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`)

```python
def enable(self, event):
    Enable the toggle tool

toggle calls this method when toggled is False
```

class matplotlib.backend_tools.ToolGrid(toolmanager, name):
Bases: matplotlib.backend_tools._ToolGridBase

Tool to toggle the major grids of the figure

default_keymap = ['g']
description = 'Toggle major grids'

class matplotlib.backend_tools.ToolHelpBase(toolmanager, name):
Bases: matplotlib.backend_tools.ToolBase

default_keymap = ['f1']
description = 'Print tool list, shortcuts and description'

static formatShortcut(key_sequence)
Converts a shortcut string from the notation used in rc config to the standard notation
for displaying shortcuts, e.g. 'ctrl+a' -> 'Ctrl+A'.

image = 'help.png'

class matplotlib.backend_tools.ToolHome(toolmanager, name):
Bases: matplotlib.backend_tools.ViewsPositionsBase

Restore the original view lim

default_keymap = ['h', 'r', 'home']
description = 'Reset original view'

image = 'home'

class matplotlib.backend_tools.ToolMinorGrid(toolmanager, name):
Bases: matplotlib.backend_tools._ToolGridBase

Tool to toggle the major and minor grids of the figure

default_keymap = ['G']
description = 'Toggle major and minor grids'

```

class matplotlib.backend_tools.ToolPan(*args):
Bases: matplotlib.backend_tools.ZoomPanBase

Pan axes with left mouse, zoom with right

cursor = 3

default_keymap = ['p']
description = 'Pan axes with left mouse, zoom with right'

image = 'move'

radio_group = 'default'
```
class matplotlib.backend_tools.ToolQuit(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Tool to call the figure manager destroy method
    default_keymap = ['ctrl+w', 'cmd+w', 'q']
    description = 'Quit the figure'
    trigger(self, sender, event, data=None)
        Called when this tool gets used
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool
        Parameters
            event [Event] The Canvas event that caused this tool to be called
            sender [object] Object that requested the tool to be triggered
            data [object] Extra data

class matplotlib.backend_tools.ToolQuitAll(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Tool to call the figure manager destroy method
    default_keymap = ['W', 'cmd+W', 'Q']
    description = 'Quit all figures'
    trigger(self, sender, event, data=None)
        Called when this tool gets used
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool
        Parameters
            event [Event] The Canvas event that caused this tool to be called
            sender [object] Object that requested the tool to be triggered
            data [object] Extra data

class matplotlib.backend_tools.ToolToggleBase(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolBase
    Toggleable tool
    Every time it is triggered, it switches between enable and disable
    Parameters
        """*args"" Variable length argument to be used by the Tool
        """**kwargs"" toggled if present and True, sets the initial state of the Tool
        Arbitrary keyword arguments to be consumed by the Tool

cursor = None
    Cursor to use when the tool is active

default_toggled = False
    Default of toggled state

disable(self, event=None)
    Disable the toggle tool
    trigger call this method when toggled is True.
This can happen in different circumstances

- Click on the toolbar tool button
- Call to `matplotlib.backend_managers.ToolManager.trigger_tool`
- Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`)

```python
enable(self, event=None)
   Enable the toggle tool

   trigger calls this method when toggled is False
```

```python
radio_group = None
   Attribute to group ‘radio’ like tools (mutually exclusive)

   String that identifies the group or None if not belonging to a group
```

```python
set_figure(self, figure)
   Assign a figure to the tool

   Parameters
      figure [Figure]

   toggled
      State of the toggled tool

   trigger(self, sender, event, data=None)
      Calls enable or disable based on toggled value
```

```python
class matplotlib.backend_tools.ToolViewsPositions(*args, **kwargs)
   Bases: matplotlib.backend_tools.ToolBase
   Auxiliary Tool to handle changes in views and positions
   Runs in the background and should get used by all the tools that need to access
   the figure’s history of views and positions, e.g.

   - ToolZoom
   - ToolPan
   - ToolHome
   - ToolBack
   - ToolForward

   add_figure(self, figure)
      Add the current figure to the stack of views and positions

   back(self)
      Back one step in the stack of views and positions

   clear(self, figure)
      Reset the axes stack

   forward(self)
      Forward one step in the stack of views and positions

   home(self)
      Recall the first view and position from the stack

   push_current(self, figure=None)
      Push the current view limits and position onto their respective stacks
```
refresh_locators(self)
    Redraw the canvases, update the locators

update_home_views(self, figure=None)
    Make sure that self.home_views has an entry for all axes present in the figure

update_view(self)
    Update the view limits and position for each axes from the current stack position. If
    any axes are present in the figure that aren’t in the current stack position, use the
    home view limits for those axes and don’t update any positions.

class matplotlib.backend_tools.ToolXScale(*args, **kwargs)
    Bases: matplotlib.backend_tools.AxisScaleBase
    Tool to toggle between linear and logarithmic scales on the X axis
    default_keymap = ['k', 'L']
    description = 'Toggle scale X axis'
    set_scale(self, ax, scale)

class matplotlib.backend_tools.ToolYScale(*args, **kwargs)
    Bases: matplotlib.backend_tools.AxisScaleBase
    Tool to toggle between linear and logarithmic scales on the Y axis
    default_keymap = ['l']
    description = 'Toggle scale Y axis'
    set_scale(self, ax, scale)

class matplotlib.backend_tools.ToolZoom(*args)
    Bases: matplotlib.backend_tools.ZoomPanBase
    Zoom to rectangle
    cursor = 2
    default_keymap = ['o']
    description = 'Zoom to rectangle'
    image = 'zoom_to_rect'
    radio_group = 'default'

class matplotlib.backend_tools.ViewsPositionsBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Base class for ToolHome, ToolBack and ToolForward
    trigger(self, sender, event, data=None)
        Called when this tool gets used
        This method is called by matplotlib.backend_managers.ToolManager.trigger_tool

    Parameters
        event [Event] The Canvas event that caused this tool to be called
        sender [object] Object that requested the tool to be triggered
        data [object] Extra data
class matplotlib.backend_tools.ZoomPanBase(*args)
Bases: matplotlib.backend_tools.ToolToggleBase

Base class for ToolZoom and ToolPan

disable(self, event)
   Release the canvas and disconnect press/release events
enable(self, event)
   Connect press/release events and lock the canvas
scroll_zoom(self, event)
trigger(self, sender, event, data=None)
   Calls enable or disable based on toggled value

matplotlib.backend_tools.add_tools_to_container(container, tools=[['navigation', 'home', 'back', 'forward'], ['zoom-pan', ['pan', 'zoom', 'subplots']], ['io', ['save', 'help']]])

Add multiple tools to the container.

Parameters

  container [Container] backend_bases.ToolContainerBase object that will get the tools added

  tools [list, optional] List in the form [[group1, [tool1, tool2 ...]], [group2, [...]]] Where the tools given by tool1, and tool2 will display in group1. See add_tool for details.
Add multiple tools to ToolManager

**Parameters**

- **toolmanager** [ToolManager] backend_managers.ToolManager object that will get the tools added

- **tools** [{str: class_like}, optional] The tools to add in a {name: tool} dict, see add_tool for more info.

```python
matplotlib.backend_tools.add_tools_to_manager(toolmanager, tools={
    'home': <class 'matplotlib.backend_tools.ToolHome'>,
    'back': <class 'matplotlibbackend_tools.ToolBack'>,
    'forward': <class 'matplotlib.backend_tools.ToolForward'>,
    'zoom': <class 'matplotlib.backend_tools.ToolZoom'>,
    'pan': <class 'matplotlib.backend_tools.ToolPan'>,
    'subplots': 'ToolConfigureSubplots',
    'save': 'ToolSaveFigure',
    'grid': <class 'matplotlib.backend_tools.ToolGrid'>,
    'grid_minor': <class 'matplotlib.backend_tools.ToolMinorGrid'>,
    'fullscreen': <class 'matplotlib.backend_tools.ToolFullScreen'>,
    'quit': <class 'matplotlib.backend_tools.ToolQuit'>,
    'quit_all': <class 'matplotlib.backend_tools.ToolQuitAll'>,
    'allnav': <class 'matplotlibbackend_tools.ToolEnableAllNavigation'>,
    'nav': <class 'matplotlibbackend_tools.ToolEnableNavigation'>,
    'xscale': <class 'matplotlib.backend_tools.ToolXScale'>,
    'yscale': <class 'matplotlib.backend_tools.ToolYScale'>,
    'position': <class 'matplotlibbackend_tools.ToolCursorPosition'>,
    'viewpos': <class 'matplotlibbackend_tools.ToolViewsPositions'>,
    'cursor': 'ToolSetCursor',
    'rubberband': 'ToolRubberband',
    'help': 'ToolHelp',
    'copy': 'ToolCopyToClipboard'})
```

Default tools in the toolbar

```python
matplotlib.backend_tools.default_toolbar_tools = [['navigation', ['home', 'back', 'forward']], ['zoompan', ['pan', 'zoom', 'subplots']], ['io', ['save', 'help']]]
```

Default tools

```python
matplotlib.backend_tools.default_tools = {'allnav': <class 'matplotlib.backend_tools.ToolEnableAllNavigation'>,
                                          'nav': <class 'matplotlibbackend_tools.ToolEnableNavigation'>,
                                          'xscale': <class 'matplotlib.backend_tools.ToolXScale'>,
                                          'yscale': <class 'matplotlib.backend_tools.ToolYScale'>,
                                          'position': <class 'matplotlibbackend_tools.ToolCursorPosition'>,
                                          'viewpos': <class 'matplotlibbackend_tools.ToolViewsPositions'>,
                                          'cursor': 'ToolSetCursor',
                                          'rubberband': 'ToolRubberband',
                                          'help': 'ToolHelp',
                                          'copy': 'ToolCopyToClipboard'}
```
17.10 matplotlib.backends

17.10.1 matplotlib.backends.backend_mixed

class matplotlib.backends.backend_mixed.MixedModeRenderer(figure, width, height, dpi, vector_renderer, raster_renderer_class=None, bbox_inches_restore=None)

Bases: object

A helper class to implement a renderer that switches between vector and raster drawing. An example may be a PDF writer, where most things are drawn with PDF vector commands, but some very complex objects, such as quad meshes, are rasterised and then output as images.

Parameters

figure [matplotlib.figure.Figure] The figure instance.

width [scalar] The width of the canvas in logical units

height [scalar] The height of the canvas in logical units

dpi [scalar] The dpi of the canvas

vector_renderer [matplotlib.backend_bases.RendererBase] An instance of a subclass of RendererBase that will be used for the vector drawing.

raster_renderer_class [matplotlib.backend_bases.RendererBase] The renderer class to use for the raster drawing. If not provided, this will use the Agg backend (which is currently the only viable option anyway.)

start_rasterizing(self)

Enter “raster” mode. All subsequent drawing commands (until stop_rasterizing is called) will be drawn with the raster backend.

If start_rasterizing is called multiple times before stop_rasterizing is called, this method has no effect.

stop_rasterizing(self)

Exit “raster” mode. All of the drawing that was done since the last start_rasterizing command will be copied to the vector backend by calling draw_image.

If stop_rasterizing is called multiple times before start_rasterizing is called, this method has no effect.

17.10.2 matplotlib.backends.backend_agg

An agg http://antigrain.com/ backend

Features that are implemented

- capstyles and join styles
- dashes
- linewidth
- lines, rectangles, ellipses
- clipping to a rectangle
• output to RGBA and PNG, optionally JPEG and TIFF
• alpha blending
• DPI scaling properly - everything scales properly (dashes, linewidths, etc)
• draw polygon
• freetype2 w/ ft2font

TODO:
• integrate screen dpi w/ ppi and text

matplotlib.backends.backend_agg.FigureCanvas
alias of matplotlib.backends.backend_agg.FigureCanvasAgg
class matplotlib.backends.backend_agg.FigureCanvasAgg(figure)
  Bases: matplotlib.backend_bases.FigureCanvasBase
  The canvas the figure renders into. Calls the draw and print fig methods, creates the
  renderers, etc...

  Attributes
    figure [matplotlib.figure.Figure] A high-level Figure instance

  buffer_rgba(self)
  Get the image as a memoryview to the renderer’s buffer.

  draw must be called at least once before this function will work and to update the
  renderer for any subsequent changes to the Figure.

  Returns

    memoryview

copy_from_bbox(self, bbox)
draw(self)
  Draw the figure using the renderer.

get_renderer(self, cleared=False)
print_jpeg(self, filename_or_obj, *args, dryrun=False, pil_kwvars=None, **kwargs)
  Write the figure to a JPEG file.

  Parameters

    filename_or_obj [str or PathLike or file-like object] The file to write to.

  Other Parameters

    quality [int] The image quality, on a scale from 1 (worst) to 100 (best).
    The default is rcParams["savefig.jpeg_quality"] (default: 95). Values
    above 95 should be avoided; 100 completely disables the JPEG quanti-
