<tr>
<td><code>Axes.set_adjustable</code></td>
<td>Set how the Axes adjusts to achieve the required aspect ratio.</td>
</tr>
<tr>
<td><code>Axes.get_adjustable</code></td>
<td>Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.</td>
</tr>
</tbody>
</table>
Axes.apply_aspect

Axes.apply_aspect(self, position=None)
Adjust the Axes for a specified data aspect ratio.
Depending on get_adjustable this will modify either the Axes box (position) or the view limits. In the former case, get_anchor will affect the position.

See also:

Axes.set_aspect
For a description of aspect ratio handling.

Axes.set_adjustable
Set how the Axes adjusts to achieve the required aspect ratio.

Axes.set_anchor
Set the position in case of extra space.

Notes
This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

Examples using matplotlib.axes.Axes.apply_aspect

Axes.set_aspect

Axes.set_aspect(self, aspect, adjustable=None, anchor=None, share=False)
Set the aspect of the axis scaling, i.e. the ratio of y-unit to x-unit.

Parameters

aspect

[{'auto'} or num] Possible values:

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'auto'</td>
<td>automatic; fill the position rectangle with data.</td>
</tr>
<tr>
<td>num</td>
<td>a circle will be stretched such that the height is num times the width. 'equal' is a synonym for aspect=1, i.e. same scaling for x and y.</td>
</tr>
</tbody>
</table>

adjustable
[None or {'box', 'datalim'}, optional] If not None, this defines which parameter will be adjusted to meet the required aspect. See set_adjustable for further details.

**anchor**

[None or str or 2-tuple of float, optional] If not None, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to specify the anchor are abbreviations of cardinal directions:

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'C'</td>
<td>centered</td>
</tr>
<tr>
<td>'SW'</td>
<td>lower left corner</td>
</tr>
<tr>
<td>'S'</td>
<td>middle of bottom edge</td>
</tr>
<tr>
<td>'SE'</td>
<td>lower right corner</td>
</tr>
<tr>
<td>etc.</td>
<td></td>
</tr>
</tbody>
</table>

See set_anchor for further details.

**share**

[bool, default: False] If True, apply the settings to all shared Axes.

**See also:**

*matplotlib.axes.Axes.set_adjustable*

Set how the Axes adjusts to achieve the required aspect ratio.

*matplotlib.axes.Axes.set_anchor*

Set the position in case of extra space.

**Examples using matplotlib.axes.Axes.set_aspect**

- sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py
matplotlib.axes.Axes.get_aspect

Axes.get_aspect(self)

Examples using matplotlib.axes.Axes.get_aspect

matplotlib.axes.Axes.set_box_aspect

Axes.set_box_aspect(self, aspect=None)

Set the axes box aspect. The box aspect is the ratio of the axes height to the axes width in physical units. This is not to be confused with the data aspect, set via set_aspect.

Parameters

aspect

[None, or a number] Changes the physical dimensions of the Axes, such that the ratio of the axes height to the axes width in physical units is equal to aspect. If None, the axes geometry will not be adjusted.
Note that calling this function with a number changes the *adjustable* to *datalim*.

See also:

```
matplotlib.axes.Axes.set_aspect
```

for a description of aspect handling.

Examples using `matplotlib.axes.Axes.set_box_aspect`

- sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py

```
matplotlib.axes.Axes.get_box_aspect
```

Axes.get_box_aspect(self)

Get the axes box aspect. Will be None if not explicitly specified.

See also:

```
matplotlib.axes.Axes.set_box_aspect
```

for a description of box aspect.

```
matplotlib.axes.Axes.set_aspect
```

for a description of aspect handling.

Examples using `matplotlib.axes.Axes.get_box_aspect`

```
matplotlib.axes.Axes.set_adjustable
```

Axes.set_adjustable(self, adjustable, share=False)

Set how the Axes adjusts to achieve the required aspect ratio.

Parameters

- **adjustable**

  [{box', 'datalim'}] If 'box', change the physical dimensions of the Axes. If 'datalim', change the x or y data limits.

- **share**

  [bool, default: False] If True, apply the settings to all shared Axes.

See also:
Matplotlib, Release 3.3.3

```
matplotlib.axes.Axes.set_aspect

For a description of aspect handling.
```

Notes

Shared Axes (of which twinned Axes are a special case) impose restrictions on how aspect ratios can be imposed. For twinned Axes, use 'datalim'. For Axes that share both x and y, use 'box'. Otherwise, either 'datalim' or 'box' may be used. These limitations are partly a requirement to avoid over-specification, and partly a result of the particular implementation we are currently using, in which the adjustments for aspect ratios are done sequentially and independently on each Axes as it is drawn.

Examples using matplotlib.axes.Axes.set_adjustable

- sphx_glr_gallery_scales_aspect_loglog.py

```
matplotlib.axes.Axes.get_adjustable

Axes.get_adjustable(self)

Return whether the Axes will adjust its physical dimension ('box') or its data limits ('datalim') to achieve the desired aspect ratio.

See also:
```

```
matplotlib.axes.Axes.set_adjustable

Set how the Axes adjusts to achieve the required aspect ratio.
```

• *The Lifecycle of a Plot*

`matplotlib.axes.Axes.get_xticks`

```python
Axes.get_xticks(self, *, minor=False)
```
Return the xaxis' tick locations in data coordinates.

**Examples using** `matplotlib.axes.Axes.get_xticks`

`matplotlib.axes.Axes.set_xticklabels`

```python
Axes.set_xticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)
```
Set the xaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using `Axes.set_xticks`. Otherwise, the labels may end up in unexpected positions.

**Parameters**

- `labels`
  - [list of str] The label texts.
- `fontdict`
  - [dict, optional] A dictionary controlling the appearance of the ticklabels. The default `fontdict` is:
    ```python
    {'fontsize': rcParams['axes.titlesize'],
     'fontweight': rcParams['axes.titleweight'],
     'verticalalignment': 'baseline',
     'horizontalalignment': 'loc'}
    ```
- `minor`
  - [bool, default: False] Whether to set the minor ticklabels rather than the major ones.

**Returns**

- list of `Text`
  - The labels.

**Other Parameters**
**kwargs

[Text properties.]

Examples using `matplotlib.axes.Axes.set_xticklabels`

- sphx_glr_gallery_lines_bars_and_markers_barchart.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py

Constrained Layout Guide

matplotlib.axes.Axes.get_xticklabels

`Axes.get_xticklabels(self, minor=False, which=None)`

Get the xaxis' tick labels.

**Parameters**

- `minor`

  [bool] Whether to return the minor or the major ticklabels.
which

[None, ('minor', 'major', 'both')] Overrides minor.
Selects which ticklabels to return

Returns

list of Text

Notes

The tick label strings are not populated until a draw method has been called.
See also: draw and draw.

Examples using matplotlib.axes.Axes.get_xticklabels

- sphx_glr_gallery_lines_bars_and_markers_timeline.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py

- The Lifecycle of a Plot

matplotlib.axes.Axes.get_xmajorticklabels

Axes.get_xmajorticklabels(self)
Return the xaxis' major tick labels, as a list of Text.
Examples using `matplotlib.axes.Axes.get_xminorticklabels`

`matplotlib.axes.Axes.get_xminorticklabels`

`Axes.get_xminorticklabels(self)`

Return the xaxis' minor tick labels, as a list of `Text`.

Examples using `matplotlib.axes.Axes.get_xminorticklabels`

`matplotlib.axes.Axes.get_xgridlines`

`Axes.get_xgridlines(self)`

Return the xaxis' grid lines as a list of `Line2D`.

Examples using `matplotlib.axes.Axes.get_xgridlines`

`matplotlib.axes.Axes.get_xticklines`

`Axes.get_xticklines(self, minor=False)`

Return the xaxis' tick lines as a list of `Line2D`.

Examples using `matplotlib.axes.Axes.get_xticklines`

`matplotlib.axes.Axes.xaxis_date`

`Axes.xaxis_date(self, tz=None)`

Sets up axis ticks and labels to treat data along the xaxis as dates.

Parameters

`tz`

[str or datetime.tzinfo, default: rcParams["timezone"] (default: 'UTC')] The timezone used to create date labels.
Examples using `matplotlib.axes.Axes.xaxis_date`

`matplotlib.axes.Axes.set_yticks`

`Axes.set_yticks(self, ticks, *, minor=False)`
Set the yaxis' tick locations.

**Parameters**

- **ticks**
  
  [list of floats] List of tick locations.

- **minor**

  [bool, default: False] If False, set the major ticks; if True, the minor ticks.

Examples using `matplotlib.axes.Axes.set_yticks`

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py

matplotlib.axes.Axes.get_yticks

Axes.get_yticks(self, *, minor=False)
Return the yaxis' tick locations in data coordinates.

Examples using matplotlib.axes.Axes.get_yticks

matplotlib.axes.Axes.set_yticklabels

Axes.set_yticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)
Set the yaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using Axes.set_yticks. Otherwise, the labels may end up in unexpected positions.

**Parameters**

- **labels**
  - [list of str] The label texts.

- **fontdict**
  - [dict, optional] A dictionary controlling the appearance of the ticklabels. The default fontdict is:

    ```python
    {'fontsize': rcParams['axes.titlesize'],
     'fontweight': rcParams['axes.titleweight'],
     'verticalalignment': 'baseline',
     'horizontalalignment': 'loc'}
    ```

- **minor**
  - [bool, default: False] Whether to set the minor ticklabels rather than the major ones.
Returns

list of Text

The labels.

Other Parameters

**kwargs

[Text properties.]

Examples using matplotlib.axes.Axes.set_yticklabels

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_lines_bars_and_markers_broken_barh.py
- sphx_glr_gallery_images_contours_and_fields_image_annotated_heatmap.py

- sphx_glr_gallery_ticks_and_spines_colorbar_tick_labelling_demo.py
- Constrained Layout Guide

matplotlib.axes.Axes.get_yticklabels

Axes.get_yticklabels(self, minor=False, which=None)

Get the yaxis' tick labels.

Parameters

min

[bool] Whether to return the minor or the major ticklabels.
which

[None, ('minor', 'major', 'both')] Overrides minor.

Selects which ticklabels to return

Returns

list of Text

Notes

The tick label strings are not populated until a draw method has been called.

See also: draw and draw.

Examples using matplotlib.axes.Axes.get_yticklabels

• sphx_glr_gallery_axes_grid1_inset_locator_demo2.py
• sphx_glr_gallery_recipes_fill_between_alpha.py

matplotlib.axes.Axes.get_ymajorticklabels

Axes.get_ymajorticklabels(self)

Return the yaxis' major tick labels, as a list of Text.

Examples using matplotlib.axes.Axes.get_ymajorticklabels

matplotlib.axes.Axes.get_yminorticklabels

Axes.get_yminorticklabels(self)

Return the yaxis' minor tick labels, as a list of Text.

Examples using matplotlib.axes.Axes.get_yminorticklabels

matplotlib.axes.Axes.get_ygridlines

Axes.get_ygridlines(self)

Return the yaxis' grid lines as a list of Line2Ds.
Examples using `matplotlib.axes.Axes.get_ygridlines`

`matplotlib.axes.Axes.get_yticklines`

`Axes.get_yticklines(self, minor=False)`
Return the yaxis' tick lines as a list of `Line2D`s.

Examples using `matplotlib.axes.Axes.get_yticklines`

`matplotlib.axes.Axes.yaxis_date`

`Axes.yaxis_date(self, tz=None)`
Sets up axis ticks and labels to treat data along the yaxis as dates.

**Parameters**

- `tz`  
  [str or datetime.tzinfo, default: `rcParams['timezone']` (default: 'UTC')] The timezone used to create date labels.

Examples using `matplotlib.axes.Axes.yaxis_date`

`matplotlib.axes.Axes.minorticks_off`

`Axes.minorticks_off(self)`
Remove minor ticks from the axes.

Examples using `matplotlib.axes.Axes.minorticks_off`

`matplotlib.axes.Axes.minorticks_on`

`Axes.minorticks_on(self)`
Display minor ticks on the axes.
Displaying minor ticks may reduce performance; you may turn them off using `minorticks_off()` if drawing speed is a problem.
Matplotlib, Release 3.3.3

Examples using `matplotlib.axes.Axes.minorticks_on`

- `sphx_glr_gallery_specialty_plots_mri_with_eeg.py`

`matplotlib.axes.Axes.ticklabel_format`

```python
Axes.ticklabel_format(self, *, axis='both', style='', scilimits=None, useOffset=None, useLocale=None, useMathText=None)
```

Configure the `ScalarFormatter` used by default for linear axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

**Parameters**

- **axis**
  
  [{‘x’, ‘y’, ‘both’}, default: ‘both’] The axes to configure. Only major ticks are affected.

- **style**
  
  [{‘sci’, ‘scientific’, ‘plain’}] Whether to use scientific notation.
  The formatter default is to use scientific notation.

- **scilimits**
  
  [pair of ints (m, n)] Scientific notation is used only for numbers outside the range $10^m$ to $10^n$ (and only if the formatter is configured to use scientific notation at all). Use (0, 0) to include all numbers. Use (m, m) where m != 0 to fix the order of magnitude to $10^m$. The formatter default is `rcParams[“axes.formatter.limits”]` (default: [-5, 6]).

- **useOffset**
  
  [bool or float] If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is `rcParams[“axes.formatter.useoffset”]` (default: True).

- **useLocale**
  
  [bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is `rcParams[“axes.formatter.use_locale”]` (default: False).

- **useMathText**
  
  [bool] Render the offset and scientific notation in mathtext. The formatter default is `rcParams[“axes.formatter.use_mathtext”]` (default: False).
Raises

AttributeError
If the current formatter is not a ScalarFormatter.

Examples using matplotlib.axes.Axes.ticklabel_format

- sphx_glr_gallery_ticks_and_spines_scalarformatter.py

matplotlib.axes.Axes.tick_params

Axes.tick_params(self, axis='both', **kwargs)
Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless reset is True.

Parameters

axis

[{‘x’, ‘y’, ‘both’}, default: ‘both’] The axis to which the parameters are applied.

which

[{‘major’, ‘minor’, ‘both’}, default: ‘major’] The group of ticks to which the parameters are applied.

reset

[bool, default: False] Whether to reset the ticks to defaults before updating them.

Other Parameters

direction

[{‘in’, ‘out’, ‘inout’}] Puts ticks inside the axes, outside the axes, or both.

length

[float] Tick length in points.

width

[float] Tick width in points.

color

[color] Tick color.
**pad**

[float] Distance in points between tick and label.

**labelsize**

[float or str] Tick label font size in points or as a string (e.g., 'large').

**labelcolor**

[color] Tick label color.

**colors**

[color] Tick color and label color.

**zorder**

[float] Tick and label zorder.

**bottom, top, left, right**

[bool] Whether to draw the respective ticks.

**labelbottom, labeltop, labelleft, labelright**

[bool] Whether to draw the respective tick labels.

**labelrotation**

[float] Tick label rotation

**grid_color**

[color] Gridline color.

**grid_alpha**

[float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

**grid_linewidth**

[float] Width of gridlines in points.

**grid_linestyle**

[str] Any valid Line2D line style spec.

**Examples**

```python
ax.tick_params(direction='out', length=6, width=2, colors='r',
               grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

Text in Matplotlib Plots

`matplotlib.axes.Axes.locator_params`

`Axes.locator_params(self, axis='both', tight=None, **kwargs)`

Control behavior of major tick locators.

Because the locator is involved in autoscaling, `autoscale_view` is called automatically after the parameters are changed.

**Parameters**

`axis`

`{'both', 'x', 'y'}, default: 'both'` The axis on which to operate.

`tight`

`[bool or None, optional] Parameter passed to autoscale_view. Default is None, for no change.`

**Other Parameters**
**kwargs

Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example `set_params` for the `ticker.MaxNLocator` used by default for linear axes.

Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```python
ax.locator_params(tight=True, nbins=4)
```

Examples using `matplotlib.axes.Axes.locator_params`

- `sphx_glr_gallery_images_contours_and_fields_contourf_demo.py`

- *Tight Layout guide*

18.5.9 Units

<table>
<thead>
<tr>
<th><code>Axes.convert_xunits</code></th>
<th>Convert $x$ using the unit type of the x-axis.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.convert_yunits</code></td>
<td>Convert $y$ using the unit type of the y-axis.</td>
</tr>
<tr>
<td><code>Axes.have_units</code></td>
<td>Return <code>True</code> if units are set on any axis.</td>
</tr>
</tbody>
</table>

`matplotlib.axes.Axes.convert_xunits`

```python
Axes.convert_xunits(self, x)
```

Convert $x$ using the unit type of the x-axis.

If the artist is not in contained in an `Axes` or if the xaxis does not have units, $x$ itself is returned.
Examples using `matplotlib.axes.Axes.convert_yunits`

```python
Axes.convert_yunits(self, y)
```

Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, `y` itself is returned.

Examples using `matplotlib.axes.Axes.convert_yunits`

`matplotlib.axes.Axes.have_units`

```python
Axes.have_units(self)
```

Return `True` if units are set on any axis.

Examples using `matplotlib.axes.Axes.have_units`

### 18.5.10 Adding Artists

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.add_artist</code></td>
<td>Add an <code>Artist</code> to the axes, and return the artist.</td>
</tr>
<tr>
<td><code>Axes.add_child_axes</code></td>
<td>Add an <code>AxesBase</code> to the axes' children; return the child axes.</td>
</tr>
<tr>
<td><code>Axes.add_collection</code></td>
<td>Add a <code>Collection</code> to the axes' collections; return the collection.</td>
</tr>
<tr>
<td><code>Axes.add_container</code></td>
<td>Add a <code>Container</code> to the axes' containers; return the container.</td>
</tr>
<tr>
<td><code>Axes.add_image</code></td>
<td>Add an <code>AxesImage</code> to the axes' images; return the image.</td>
</tr>
<tr>
<td><code>Axes.add_line</code></td>
<td>Add a <code>Line2D</code> to the axes' lines; return the line.</td>
</tr>
<tr>
<td><code>Axes.add_patch</code></td>
<td>Add a <code>Patch</code> to the axes' patches; return the patch.</td>
</tr>
<tr>
<td><code>Axes.add_table</code></td>
<td>Add a <code>Table</code> to the axes' tables; return the table.</td>
</tr>
</tbody>
</table>
matplotlib.axes.Axes.add_artist

Axes.add_artist(self, a)

Add an Artist to the axes, and return the artist.

Use add_artist only for artists for which there is no dedicated "add" method; and if necessary, use a method such as update_datalim to manually update the dataLim if the artist is to be included in autoscaling.

If no transform has been specified when creating the artist (e.g. artist.get_transform() == None) then the transform is set to ax.transData.

Examples using matplotlib.axes.Axes.add_artist

• sphx_glr_gallery_lines_bars_and_markers_scatter_with_legend.py
• sphx_glr_gallery_images_contours_and_fields_demo_bboximage.py

• sphx_glr_gallery_userdemo_simple_annotate01.py
matplotlib.axes.Axes.add_child_axes

Axes.add_child_axes(self, ax)
   Add an AxesBase to the axes' children; return the child axes.
   This is the lowlevel version. See axes.Axes.inset_axes.

Examples using matplotlib.axes.Axes.add_child_axes

matplotlib.axes.Axes.add_collection

Axes.add_collection(self, collection, autolim=True)
   Add a Collection to the axes' collections; return the collection.

Examples using matplotlib.axes.Axes.add_collection

- sphx_glr_gallery_lines_bars_and_markers_eventcollection_demo.py
- sphx_glr_gallery_lines_bars_and_markers_span_regions.py
- sphx_glr_gallery_statistics_errorbars_and_boxes.py
- sphx_glr_gallery_shapes_and_collections_artist_reference.py
- sphx_glr_gallery_shapes_and_collections_collections.py
- sphx_glr_gallery_shapes_and_collections_ellipse_collection.py

- sphx_glr_gallery_event_handling_lasso_demo.py
- sphx_glr_gallery_specialty_plots_mri_with_eeg.py
- sphx_glr_gallery_units_artist_tests.py

matplotlib.axes.Axes.add_container

Axes.add_container(self, container)
   Add a Container to the axes' containers; return the container.
Examples using `matplotlib.axes.Axes.add_container`

`matplotlib.axes.Axes.add_image`

\[\text{Axes.add_image}(\text{self, image})\]
Add an `AxesImage` to the axes' images; return the image.

Examples using `matplotlib.axes.Axes.add_image`

`matplotlib.axes.Axes.add_line`

\[\text{Axes.add_line}(\text{self, line})\]
Add a `Line2D` to the axes' lines; return the line.

Examples using `matplotlib.axes.Axes.add_line`

- sphx_glr_gallery_text_labels_and_annotations_line_with_text.py
- sphx_glr_gallery_shapes_and_collections_artist_reference.py
- sphx_glr_gallery_units_artist_tests.py
- *Artist tutorial*

`matplotlib.axes.Axes.add_patch`

\[\text{Axes.add_patch}(\text{self, p})\]
Add a `Patch` to the axes' patches; return the patch.

Examples using `matplotlib.axes.Axes.add_patch`

- sphx_glr_gallery_lines_bars_and_markers_curve_error_band.py
- sphx_glr_gallery_images_contours_and_fields_image_demo.py

**Axes.add_table**

`Axes.add_table(self, tab)`

Add a *Table* to the axes' tables; return the table.

**Examples using matplotlib.axes.Axes.add_table**

### 18.5.11 Twinning and sharing

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.twinx</code></td>
<td>Create a twin Axes sharing the xaxis.</td>
</tr>
<tr>
<td><code>Axes.twiny</code></td>
<td>Create a twin Axes sharing the yaxis.</td>
</tr>
<tr>
<td><code>Axes.sharex</code></td>
<td>Share the x-axis with <em>other</em>.</td>
</tr>
<tr>
<td><code>Axes.sharey</code></td>
<td>Share the y-axis with <em>other</em>.</td>
</tr>
<tr>
<td><code>Axes.get_shared_x_axes</code></td>
<td>Return a reference to the shared axes Grouper object for x axes.</td>
</tr>
<tr>
<td><code>Axes.get_shared_y_axes</code></td>
<td>Return a reference to the shared axes Grouper object for y axes.</td>
</tr>
</tbody>
</table>

**matplotlib.axes.Axes.twinx**

`Axes.twinx(self)`

Create a twin Axes sharing the xaxis.

Create a new Axes with an invisible x-axis and an independent y-axis positioned opposite to the original one (i.e. at right). The x-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both y-axes align, see *LinearLocator*.

**Returns**

`Axes`

The newly created Axes instance

**Notes**

For those who are 'picking' artists while using twinx, pick events are only called for the artists in the top-most axes.
Examples using `matplotlib.axes.Axes.twinx`

- `sphx_glr_gallery_subplots_axes_and_figures_axes_box_aspect.py`
- `sphx_glr_gallery_subplots_axes_and_figures_two_scales.py`
- `sphx_glr_gallery_statistics_barchart_demo.py`
- `sphx_glr_gallery_axes_grid1_parasite_simple.py`
- `sphx_glr_gallery_axisartist_demo_parasite_axes2.py`
- `sphx_glr_gallery_ticks_and_spines_multiple_yaxis_with_spines.py`

`matplotlib.axes.Axes.twiny`

`Axes.twiny(self)`

Create a twin Axes sharing the yaxis.

Create a new Axes with an invisible y-axis and an independent x-axis positioned opposite to the original one (i.e. at top). The y-axis autoscale setting will be inherited from the original Axes. To ensure that the tick marks of both x-axes align, see `LinearLocator`.

Returns

`Axes`

The newly created Axes instance

Notes

For those who are 'picking' artists while using twiny, pick events are only called for the artists in the top-most axes.

Examples using `matplotlib.axes.Axes.twiny`

- `sphx_glr_gallery_subplots_axes_and_figures_two_scales.py`
Axes.sharex

Axes.sharex(self, other)
Share the x-axis with other.
This is equivalent to passing sharex=other when constructing the axes, and cannot be used if the x-axis is already being shared with another axes.

Examples using matplotlib.axes.Axes.sharex

Axes.sharey

Axes.sharey(self, other)
Share the y-axis with other.
This is equivalent to passing sharey=other when constructing the axes, and cannot be used if the y-axis is already being shared with another axes.

Examples using matplotlib.axes.Axes.sharey

Axes.get_shared_x_axes

Axes.get_shared_x_axes(self)
Return a reference to the shared axes Grouper object for x axes.

Examples using matplotlib.axes.Axes.get_shared_x_axes

Axes.get_shared_y_axes

Axes.get_shared_y_axes(self)
Return a reference to the shared axes Grouper object for y axes.

Examples using matplotlib.axes.Axes.get_shared_y_axes

18.5.12 Axes Position

<table>
<thead>
<tr>
<th>Axes.get_anchor</th>
<th>Get the anchor location.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.set_anchor</td>
<td>Define the anchor location.</td>
</tr>
<tr>
<td>Axes.get_axes_locator</td>
<td>Return the axes locator.</td>
</tr>
<tr>
<td>Axes.set_axes_locator</td>
<td>Set the axes locator.</td>
</tr>
</tbody>
</table>
### Table 108 – continued from previous page

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.reset_position</code></td>
<td>Reset the active position to the original position.</td>
</tr>
<tr>
<td><code>Axes.get_position</code></td>
<td>Get a copy of the axes rectangle as a <code>Bbox</code>.</td>
</tr>
<tr>
<td><code>Axes.set_position</code></td>
<td>Set the axes position.</td>
</tr>
</tbody>
</table>

#### `matplotlib.axes.Axes.get_anchor`

`Axes.get_anchor(self)`

Get the anchor location.

**See also:**

- `matplotlib.axes.Axes.set_anchor`
  - for a description of the anchor.
- `matplotlib.axes.Axes.set_aspect`
  - for a description of aspect handling.

#### `matplotlib.axes.Axes.set_anchor`

`Axes.set_anchor(self, anchor, share=False)`

Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

**Parameters**

- **anchor**
  - `[2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}]` The anchor position may be either:
    - a sequence `(cx, cy)`. `cx` and `cy` may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
    - a string using cardinal directions as abbreviation:
      - `C` for centered
      - `S` (south) for bottom-center
      - `SW` (south west) for bottom-left
As - etc.

Here is an overview of the possible positions:

<table>
<thead>
<tr>
<th></th>
<th>'NW'</th>
<th>'N'</th>
<th>'NE'</th>
</tr>
</thead>
<tbody>
<tr>
<td>'W'</td>
<td>'C'</td>
<td>'E'</td>
<td></td>
</tr>
<tr>
<td>'SW'</td>
<td>'S'</td>
<td>'SE'</td>
<td></td>
</tr>
</tbody>
</table>

**share**

[bool, default: False] If True, apply the settings to all shared Axes.

See also:

`matplotlib.axes.Axes.set_aspect`

for a description of aspect handling.

Examples using `matplotlib.axes.Axes.set_anchor`

`matplotlib.axes.Axes.get_axes_locator`

`Axes.get_axes_locator(self)`

Return the axes_locator.

Examples using `matplotlib.axes.Axes.get_axes_locator`

`matplotlib.axes.Axes.set_axes_locator`

`Axes.set_axes_locator(self, locator)`

Set the axes locator.

**Parameters**

**locator**

[Callable[[Axes, Renderer], Bbox]]
Examples using `matplotlib.axes.Axes.set_axes_locator`

- `sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py`

`matplotlib.axes.Axes.reset_position`

`Axes.reset_position(self)`

Reset the active position to the original position.

This resets the possible position change due to aspect constraints. For an explanation of the positions see `set_position`.

Examples using `matplotlib.axes.Axes.reset_position`

`matplotlib.axes.Axes.get_position`

`Axes.get_position(self, original=False)`

Get a copy of the axes rectangle as a `Bbox`.

**Parameters**

`original`

[bool] If True, return the original position. Otherwise return the active position. For an explanation of the positions see `set_position`.

**Returns**

`Bbox`

Examples using `matplotlib.axes.Axes.get_position`

- `sphx_glr_gallery_images_contours_and_fields_contour_demo.py`
- *Choosing Colormaps in Matplotlib*
Axes.set_position

Axes.set_position(self, pos, which='both')

Set the axes position.

Axes have two position attributes. The 'original' position is the position allocated for the Axes. The 'active' position is the position the Axes is actually drawn at. These positions are usually the same unless a fixed aspect is set to the Axes. See set_aspect for details.

**Parameters**

- **pos**
  
  [[[left, bottom, width, height] or Bbox] The new position of the in
  Figure coordinates.]

- **which**
  
  [{'both', 'active', 'original'}, default: 'both'] Determines which position variables to change.

**Examples using matplotlib.axes.Axes.set_position**

- sphx_glr_gallery_images_contours_and_fields_contour_demo.py

### 18.5.13 Async/Event based

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.stale</td>
<td>Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.</td>
</tr>
<tr>
<td>Axes.pchanged</td>
<td>Call all of the registered callbacks.</td>
</tr>
<tr>
<td>Axes.add_callback</td>
<td>Add a callback function that will be called whenever one of the Artist's properties changes.</td>
</tr>
<tr>
<td>Axes.remove_callback</td>
<td>Remove a callback based on its observer id.</td>
</tr>
</tbody>
</table>
**matplotlib.axes.Axes.stale**

Property `Axes.stale`  
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**matplotlib.axes.Axes.pchanged**

`Axes.pchanged(self)`  
Call all of the registered callbacks.  
This function is triggered internally when a property is changed.  

**See also:**  
`add_callback`  
`remove_callback`

**Examples using** `matplotlib.axes.Axes.pchanged`

**matplotlib.axes.Axes.add_callback**

`Axes.add_callback(self, func)`  
Add a callback function that will be called whenever one of the `Artist`'s properties changes.

**Parameters**

`func`
[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

`int`

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**  
`remove_callback`
Examples using `matplotlib.axes.Axes.add_callback`

`matplotlib.axes.Axes.remove_callback`

```python
Axes.remove_callback(self, oid)
```
Remove a callback based on its observer id.

**See also:**

`add_callback`

Examples using `matplotlib.axes.Axes.remove_callback`

### 18.5.14 Interactive

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.can_pan</code></td>
<td>Return <code>True</code> if this axes supports any pan/zoom button functionality.</td>
</tr>

<tr>
<td><code>Axes.format_coord</code></td>
<td>Return a format string formatting the x, y coordinates.</td>
</tr>
<tr>
<td><code>Axes.format_cursor_data</code></td>
<td>Return a string representation of <code>data</code>.</td>
</tr>
<tr>
<td><code>Axes.format_xdata</code></td>
<td>Return x formatted as an x-value.</td>
</tr>
<tr>
<td><code>Axes.format_ydata</code></td>
<td>Return y formatted as an y-value.</td>
</tr>
<tr>
<td><code>Axes.mouseover</code></td>
<td>If this property is set to <code>True</code>, the artist will be queried for custom context information when the mouse cursor moves over it.</td>
</tr>
<tr>
<td><code>Axes.in_axes</code></td>
<td>Return <code>True</code> if the given <code>mouseevent</code> (in display coords) is in the Axes</td>
</tr>
<tr>
<td><code>Axes.pick</code></td>
<td>Process a pick event.</td>
</tr>
<tr>
<td><code>Axes.pickable</code></td>
<td>Return whether the artist is pickable.</td>
</tr>
</tbody>
</table>

continues on next page
<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.get_picker</code></td>
<td>Return the picking behavior of the artist.</td>
</tr>
<tr>
<td><code>Axes.set_picker</code></td>
<td>Define the picking behavior of the artist.</td>
</tr>
<tr>
<td><code>Axes.set_contains</code></td>
<td>[Deprecated] Define a custom contains test for the artist.</td>
</tr>
<tr>
<td><code>Axes.get_contains</code></td>
<td>[Deprecated] Return the custom contains function of the artist if set, or None</td>
</tr>
<tr>
<td><code>Axes.contains</code></td>
<td>Test whether the artist contains the mouse event.</td>
</tr>
<tr>
<td><code>Axes.contains_point</code></td>
<td>Return whether point (pair of pixel coordinates) is inside the axes patch.</td>
</tr>
<tr>
<td><code>Axes.get_cursor_data</code></td>
<td>Return the cursor data for a given event.</td>
</tr>
</tbody>
</table>

**matplotlib.axes.Axes.can_pan**

```
Axes.can_pan(self)
```

Return `True` if this axes supports any pan/zoom button functionality.

**Examples using matplotlib.axes.Axes.can_pan**

**matplotlib.axes.Axes.can_zoom**

```
Axes.can_zoom(self)
```

Return `True` if this axes supports the zoom box button functionality.

**Examples using matplotlib.axes.Axes.can_zoom**

**matplotlib.axes.Axes.get_navigate**

```
Axes.get_navigate(self)
```

Get whether the axes responds to navigation commands

**Examples using matplotlib.axes.Axes.get_navigate**

**matplotlib.axes.Axes.set_navigate**

```
Axes.set_navigate(self, b)
```

Set whether the axes responds to navigation toolbar commands

**Parameters**
Examples using `matplotlib.axes.Axes.set_navigate`

```python
matplotlib.axes.Axes.set_navigate_mode
```

`Axes.set_navigate_mode(self, b)`

Set the navigation toolbar button status;

**Warning**: this is not a user-API function.

Examples using `matplotlib.axes.Axes.set_navigate_mode`

`matplotlib.axes.Axes.start_pan`

```python
Axes.start_pan(self, x, y, button)
```

Called when a pan operation has started.

**Parameters**

- `x, y`
  - [float] The mouse coordinates in display coords.
- `button`
  - [MouseButton] The pressed mouse button.
Notes
This is intended to be overridden by new projection types.

Examples using matplotlib.axes.Axes.start_pan

matplotlib.axes.Axes.drag_pan

`Axes.drag_pan(self, button, key, x, y)`
Called when the mouse moves during a pan operation.

Parameters

- **button**
  
  `[MouseButton]` The pressed mouse button.

- **key**
  
  `[str or None]` The pressed key, if any.

- **x, y**
  
  `[float]` The mouse coordinates in display coords.

Notes
This is intended to be overridden by new projection types.

Examples using matplotlib.axes.Axes.drag_pan

matplotlib.axes.Axes.end_pan

`Axes.end_pan(self)`
Called when a pan operation completes (when the mouse button is up.)

Notes
This is intended to be overridden by new projection types.
Examples using `matplotlib.axes.Axes.end_pan`

`matplotlib.axes.Axes.format_coord`

`Axes.format_coord(self, x, y)`

Return a format string formatting the x, y coordinates.

Examples using `matplotlib.axes.Axes.format_coord`

- sphx_glr_gallery_images_contours_and_fields_image_zcoord.py

`matplotlib.axes.Axes.format_cursor_data`

`Axes.format_cursor_data(self, data)`

Return a string representation of data.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

Examples using `matplotlib.axes.Axes.format_cursor_data`

`matplotlib.axes.Axes.format_xdata`

`Axes.format_xdata(self, x)`

Return x formatted as an x-value.

This function will use the fmt_xdata attribute if it is not None, else will fall back on the xaxis major formatter.
Examples using `matplotlib.axes.Axes.format_xdata`

`matplotlib.axes.Axes.format_ydata`

`Axes.format_ydata(self, y)`
    Return y formatted as an y-value.
    This function will use the fmt_ydata attribute if it is not None, else will fall back on the yaxis major formatter.

Examples using `matplotlib.axes.Axes.format_ydata`

`matplotlib.axes.Axes.mouseover`

**property Axes.mouseover**
    If this property is set to `True`, the artist will be queried for custom context information when the mouse cursor moves over it.
    See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`matplotlib.axes.Axes.in_axes`

`Axes.in_axes(self, mouseevent)`
    Return `True` if the given `mouseevent` (in display coords) is in the Axes

Examples using `matplotlib.axes.Axes.in_axes`

`matplotlib.axes.Axes.pick`

`Axes.pick(self, mouseevent)`
    Process a pick event.
    Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.
    See also:

    `set_picker`, `get_picker`, `pickable`
Examples using `matplotlib.axes.Axes.pick`

`matplotlib.axes.Axes.pickable`

`Axes.pickable(self)`
Return whether the artist is pickable.

See also:

`set_picker`, `get_picker`, `pick`

Examples using `matplotlib.axes.Axes.pickable`

`matplotlib.axes.Axes.get_picker`

`Axes.get_picker(self)`
Return the picking behavior of the artist.

The possible values are described in `set_picker`.

See also:

`set_picker`, `pickable`, `pick`

Examples using `matplotlib.axes.Axes.get_picker`

`matplotlib.axes.Axes.set_picker`

`Axes.set_picker(self, picker)`
Define the picking behavior of the artist.

Parameters

`picker`

[None or bool or callable] This can be one of the following:

- `None`: Picking is disabled for this artist (default).
- A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

\[
\text{hit, props} = \text{picker(\text{artist, mouseevent})}
\]
to determine the hit test. If the mouse event is over the artist, return \textit{hit=True} and \textit{props} is a dictionary of properties you want added to the PickEvent attributes.

- \textit{deprecated}: For \texttt{Line2D} only, \textit{picker} can also be a float that sets the tolerance for checking whether an event occurred “on” the line; this is deprecated. Use \texttt{Line2D.set_pickradius} instead.

\textbf{Examples using \texttt{matplotlib.axes.Axes.set_picker}}

\texttt{matplotlib.axes.Axes.set\_contains}

\texttt{Axes.set\_contains(self, picker)}

\texttt{[Deprecated]} Define a custom contains test for the artist.

The provided callable replaces the default \texttt{contains} method of the artist.

\textbf{Parameters}

- \texttt{picker}

  [callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

  \begin{verbatim}
  def contains(artist: Artist, event: MouseEvent) -> bool, dict
  \end{verbatim}

  that returns:

  - a bool indicating if the event is within the artist
  - a dict of additional information. The dict should at least return the same information as the default \texttt{contains()} implementation of the respective artist, but may provide additional information.

\textbf{Notes}

Deprecated since version 3.3.

\textbf{Examples using \texttt{matplotlib.axes.Axes.set\_contains}}

\texttt{matplotlib.axes.Axes.get\_contains}

\texttt{Axes.get\_contains(self)}

\texttt{[Deprecated]} Return the custom contains function of the artist if set, or \texttt{None}.

\textbf{See also:}
set_contains

Notes

Deprecated since version 3.3.

Examples using matplotlib.axes.Axes.get_contains

matplotlib.axes.Axes.contains

Axes.contains(self, mouseevent)
Test whether the artist contains the mouse event.

Parameters

mouseevent

[matplotlib.backend_bases.MouseEvent]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

Examples using matplotlib.axes.Axes.contains

matplotlib.axes.Axes.contains_point

Axes.contains_point(self, point)
Return whether point (pair of pixel coordinates) is inside the axes patch.
Examples using matplotlib.axes.Axes.contains_point

matplotlib.axes.Axes.get_cursor_data

Axes.get_cursor_data(self, event)

Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- `event`
  - `matplotlib.backend_bases.MouseEvent`

**See also:**

`format_cursor_data`

Examples using matplotlib.axes.Axes.get_cursor_data

18.5.15 Children

<table>
<thead>
<tr>
<th>Axes.get_children</th>
<th>Return a list of the child Artists of this Artist.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.get_images</td>
<td>Return a list of AxesImages contained by the Axes.</td>
</tr>
<tr>
<td>Axes.get_lines</td>
<td>Return a list of lines contained by the Axes.</td>
</tr>
<tr>
<td>Axes.findobj</td>
<td>Find artist objects.</td>
</tr>
</tbody>
</table>

18.5. matplotlib.axes
Axes.get_children

Axes.get_children(self)
    Return a list of the child Artists of this Artist.

Examples using matplotlib.axes.Axes.get_children

Axes.get_images

Axes.get_images(self)
    Return a list of AxesImages contained by the Axes.

Examples using matplotlib.axes.Axes.get_images

Axes.get_lines

Axes.get_lines(self)
    Return a list of lines contained by the Axes.

Examples using matplotlib.axes.Axes.get_lines

Axes.findobj

Axes.findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- None: Return all objects contained in artist.
- A function with signature def match(artist: Artist) \rightarrow bool. The result will only contain artists for which the function returns True.
- A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self

[bool] Include self in the list to be checked for a match.

Returns
### list of Artist

Examples using `matplotlib.axes.Axes.findobj`

#### 18.5.16 Drawing

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.draw</code></td>
<td>Draw the Artist (and its children) using the given renderer.</td>
</tr>
<tr>
<td><code>Axes.draw_artist</code></td>
<td>Efficiently redraw a single artist.</td>
</tr>
<tr>
<td><code>Axes.redraw_in_frame</code></td>
<td>Efficiently redraw Axes data, but not axis ticks, labels, etc.</td>
</tr>
<tr>
<td><code>Axes.get_renderer_cache</code></td>
<td></td>
</tr>
<tr>
<td><code>Axes.get_rasterization_zorder</code></td>
<td>Return the zorder value below which artists will be rasterized.</td>
</tr>
<tr>
<td><code>Axes.set_rasterization_zorder</code></td>
<td></td>
</tr>
</tbody>
</table>

#### Parameters

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.get_window_extent</code></td>
<td>Return the axes bounding box in display space; <code>args</code> and <code>kwargs</code> are empty.</td>
</tr>
<tr>
<td><code>Axes.get_tightbbox</code></td>
<td>Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).</td>
</tr>
</tbody>
</table>

`matplotlib.axes.Axes.draw`

```python
Axes.draw(self, renderer=None, inframe=<deprecated parameter>)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

#### Parameters

- **renderer**
  ```python
  [RendererBase subclass.]
  ```

#### Notes

This method is overridden in the Artist subclasses.
Examples using `matplotlib.axes.Axes.draw`  

`matplotlib.axes.Axes.draw_artist`  

`Axes.draw_artist(self, a)`  
Efficiently redraw a single artist.  
This method can only be used after an initial draw which caches the renderer.  

Examples using `matplotlib.axes.Axes.draw_artist`  

- *Blitting tutorial*  

`matplotlib.axes.Axes.redraw_in_frame`  

`Axes.redraw_in_frame(self)`  
Efficiently redraw Axes data, but not axis ticks, labels, etc.  
This method can only be used after an initial draw which caches the renderer.  

Examples using `matplotlib.axes.Axes.redraw_in_frame`  

`matplotlib.axes.Axes.get_renderer_cache`  

`Axes.get_renderer_cache(self)`  

Examples using `matplotlib.axes.Axes.get_renderer_cache`  

`matplotlib.axes.Axes.get_rasterization_zorder`  

`Axes.get_rasterization_zorder(self)`  
Return the zorder value below which artists will be rasterized.  

Examples using `matplotlib.axes.Axes.get_rasterization_zorder`  

`matplotlib.axes.Axes.set_rasterization_zorder`  

`Axes.set_rasterization_zorder(self, z)`

Parameters
z

[float or None] zorder below which artists are rasterized. None means that artists do not get rasterized based on zorder.

Examples using matplotlib.axes.Axes.set_rasterization_zorder

- sphx_glr_gallery_misc_rasterization_demo.py

matplotlib.axes.Axes.get_window_extent

Axes.get_window_extent(self, *args, **kwargs)

Return the axes bounding box in display space; args and kwargs are empty. This bounding box does not include the spines, ticks, ticklables, or other labels. For a bounding box including these elements use get_tightbbox.

See also:

matplotlib.axes.Axes.get_tightbbox
matplotlib.axis.Axis.get_tightbbox
matplotlib.spines.get_window_extent

Examples using matplotlib.axes.Axes.get_window_extent

matplotlib.axes.Axes.get_tightbbox

Axes.get_tightbbox(self, renderer, call_axes_locator=True, bbox_extra_artists=None, *, for_layout_only=False)

Return the tight bounding box of the axes, including axis and their decorators (xlabel, title, etc).

Artists that have artist.set_in_layout(False) are not included in the bbox.

Parameters

renderer

[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

bbox_extra_artists

[list of Artist or None] List of artists to include in the tight bounding box. If None (default), then all artist children of the axes are included in the tight bounding box.
call_axes_locator

[bool, default: True] If call_axes_locator is False, it does not call
the _axes_locator attribute, which is necessary to get the correct
bounding box. call_axes_locator=False can be used if the caller
is only interested in the relative size of the tightbbox compared
to the axes bbox.

for_layout_only

[default: False] The bounding box will not include the x-extent
of the title and the xlabel, or the y-extent of the ylabel.

Returns

BboxBase

Bounding box in figure pixel coordinates.

See also:

matplotlib.axes.Axes.get_window_extent
matplotlib.axis.Axis.get_tightbbox
matplotlib.spines.Spine.get_window_extent

Examples using matplotlib.axes.Axes.get_tightbbox

18.5.17 Projection

Methods used by Axes that must be overridden for non-rectilinear Axes.

<table>
<thead>
<tr>
<th>Axes.name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axes.get_xaxis_transform</td>
<td>Get the transformation used for drawing x-axis labels, ticks and gridlines.</td>
</tr>
<tr>
<td>Axes.get_yaxis_transform</td>
<td>Get the transformation used for drawing y-axis labels, ticks and gridlines.</td>
</tr>
<tr>
<td>Axes.get_data_ratio</td>
<td>Return the aspect ratio of the scaled data.</td>
</tr>
<tr>
<td>Axes.get_data_ratio_log</td>
<td>[Deprecated] Return the aspect ratio of the raw data in log scale.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Axes.get_xaxis_text1_transform</th>
<th>Returns</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Axes.get_xaxis_text2_transform</th>
<th>Returns</th>
</tr>
</thead>
</table>

<table>
<thead>
<tr>
<th>Function</th>
<th>Returns</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axes.get_yaxis_text1_transform</code></td>
<td></td>
</tr>
<tr>
<td><code>Axes.get_yaxis_text2_transform</code></td>
<td></td>
</tr>
</tbody>
</table>

**matplotlib.axes.Axes.name**

```
Axes.name = 'rectilinear'
```

**matplotlib.axes.Axes.get_xaxis_transform**

```python
Axes.get_xaxis_transform(self, which='grid')
```

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

**Note:** This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

**Examples using matplotlib.axes.Axes.get_xaxis_transform**

- sphx_glr_gallery_lines_bars_and_markers_fill_between_demo.py
- sphx_glr_gallery_lines_bars_and_markers_vline_hline_demo.py
- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_recipes_centered_spines_with_arrows.py
- Transformations Tutorial

**matplotlib.axes.Axes.get_yaxis_transform**

```python
Axes.get_yaxis_transform(self, which='grid')
```

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.

**Note:** This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

18.5. matplotlib.axes
in different locations.

Examples using `matplotlib.axes.Axes.get_yaxis_transform`

- `sphx_glr_gallery_recipes_centered_spines_with_arrows.py`
- `sphx_glr_gallery_userdemo_connect_simple01.py`
- *Transformations Tutorial*

### `matplotlib.axes.Axes.get_data_ratio`

```python
Axes.get_data_ratio(self)
```

Return the aspect ratio of the scaled data.

**Notes**

This method is intended to be overridden by new projection types.

Examples using `matplotlib.axes.Axes.get_data_ratio`

### `matplotlib.axes.Axes.get_data_ratio_log`

```python
Axes.get_data_ratio_log(self)
```

[Deprecated] Return the aspect ratio of the raw data in log scale.

**Notes**

Will be used when both axis are in log scale.

Deprecated since version 3.2.

Examples using `matplotlib.axes.Axes.get_data_ratio_log`

### `matplotlib.axes.Axes.get_xaxis_text1_transform`

```python
Axes.get_xaxis_text1_transform(self, pad_points)
```

**Returns**
transform

[Transform] The transform used for drawing x-axis labels, which will add `pad_points` of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates.

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the `Axes` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

Examples using `matplotlib.axes.Axes.get_xaxis_text1_transform`

`matplotlib.axes.Axes.get_xaxis_text2_transform`

`Axes.get_xaxis_text2_transform(self, pad_points)`

Returns

transform

[Transform] The transform used for drawing secondary x-axis labels, which will add `pad_points` of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates.

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.
Notes

This transformation is primarily used by the \texttt{Axis} class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

\textbf{Examples using} \texttt{matplotlib.axes.Axes.get_xaxis_text2_transform} 

\texttt{matplotlib.axes.Axes.get_yaxis_text1_transform} 

\texttt{Axes.get_yaxis_text1_transform(self, pad_points)}

\textbf{Returns}

\texttt{transform} 

\texttt{[Transform]} The transform used for drawing y-axis labels, which will add \texttt{pad_points} of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

\texttt{valign} 

\texttt{[\{'center', 'top', 'bottom', 'baseline', 'center_baseline'\}]} The text vertical alignment.

\texttt{halign} 

\texttt{[\{'center', 'left', 'right'\}]} The text horizontal alignment.

Notes

This transformation is primarily used by the \texttt{Axis} class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

\textbf{Examples using} \texttt{matplotlib.axes.Axes.get_yaxis_text1_transform} 

\texttt{matplotlib.axes.Axes.get_yaxis_text2_transform} 

\texttt{Axes.get_yaxis_text2_transform(self, pad_points)}

\textbf{Returns}

\texttt{transform} 

\texttt{[Transform]} The transform used for drawing secondart y-axis labels, which will add \texttt{pad_points} of padding (in points) between
the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates.

**valign**

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

**halign**

[{'center', 'left', 'right'}] The text horizontal alignment.

**Notes**

This transformation is primarily used by the *Axes* class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

**Examples using matplotlib.axes.Axes.get_yaxis_text2_transform**

### 18.5.18 Other

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><em>Axes.zorder</em></td>
<td>Return a default list of artists that are used for the bounding box calculation.</td>
</tr>
<tr>
<td><em>Axes.get_default_bbox_extra_artists</em></td>
<td>Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.</td>
</tr>
<tr>
<td><em>Axes.has_data</em></td>
<td>Return <em>True</em> if any artists have been added to axes.</td>
</tr>
</tbody>
</table>

**matplotlib.axes.Axes.zorder**

*Axes.zorder* = 0
Axes.get_default_bbox_extra_artists

Axes.get_default_bbox_extra_artists(self)
    Return a default list of artists that are used for the bounding box calculation.
    Artists are excluded either by not being visible or artist.set_in_layout(False).

Examples using matplotlib.axes.Axes.get_default_bbox_extra_artists

Axes.get_transformed_clip_path_and_affine

Axes.get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and
    the remaining affine part of its transformation.

Examples using matplotlib.axes.Axes.get_transformed_clip_path_and_affine

Axes.has_data

Axes.has_data(self)
    Return True if any artists have been added to axes.
    This should not be used to determine whether the dataLim need to be updated,
    and may not actually be useful for anything.

Examples using matplotlib.axes.Axes.has_data

18.6 matplotlib.axis

Table of Contents

• Tick objects

Classes for the ticks and x and y axis.

18.6.1 Inheritance

18.6.2 Axis objects

class matplotlib.axis.Axis(axes, pickradius=15)
Base class for XAxis and YAxis.

Attributes

isDefault_label

[bool]

axes

[matplotlib.axes.Axes] The Axes instance the artist resides in, or None.

major
Determines the major tick positions and their label format.

**minor**

Determines the minor tick positions and their label format.

**callbacks**

A `CallbackRegistry` object that contains callback functions.

**label**

The axis label.

**labelpad**

The distance between the axis label and the tick labels. Defaults to `rcParams["axes.labelpad"]` (default: 4.0) = 4.

**offsetText**

A `Text` object containing the data offset of the ticks (if any).

**pickradius**

The acceptance radius for containment tests. See also `Axis.contains`.

**majorTicks**

The major ticks.

**minorTicks**

The minor ticks.

### Parameters

**axes**

The `Axes` to which the created Axis belongs.

**pickradius**

The acceptance radius for containment tests. See also `Axis.contains`.

### class matplotlib.axis.XAxis(*args, **kwargs)

**Parameters**

**axes**

The `Axes` to which the created Axis belongs.
**pickradius**

[float] The acceptance radius for containment tests. See also _Axis.contains._

```python
class matplotlib.axis.YAxis(*args, **kwargs)
```

**Parameters**

**axes**

[float] The acceptance radius for containment tests. See also _Axis.contains._

```python
class matplotlib.axis.Ticker
A container for the objects defining tick position and format.
```

**Attributes**

- **locator**
  ```python
  [matplotlib.ticker.Locator subclass] Determines the positions of the ticks.
  ```

- **formatter**
  ```python
  [matplotlib.ticker.Formatter subclass] Determines the format of the tick labels.
  ```

<table>
<thead>
<tr>
<th>Method</th>

</tr>
</thead>
<tbody>
<tr>
<td><code>Axis.cla</code></td>
<td>Clear this axis.</td>
</tr>
<tr>
<td><code>Axis.get_scale</code></td>
<td>Return this Axis' scale (as a str).</td>
</tr>
</tbody>
</table>

```python
matplotlib.axis.Axis.cla
```

Axis.cla(self)

Clear this axis.
Examples using `matplotlib.axis.Axis.cla`

`matplotlib.axis.Axis.get_scale`

`Axis.get_scale(self)`
    Return this Axis' scale (as a str).

Examples using `matplotlib.axis.Axis.get_scale`

Formatters and Locators

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axis.get_major_formatter</code></td>
<td>Get the formatter of the major ticker.</td>
</tr>
<tr>
<td><code>Axis.get_major_locator</code></td>

</thead>
<tbody>
<tr>
<td><code>Axis.get_remove_overlapping_locs</code></td>
<td></td>
</tr>
<tr>
<td><code>Axis.set_remove_overlapping_locs</code></td>
<td></td>
</tr>
</tbody>
</table>

`matplotlib.axis.Axis.get_major_formatter`

`Axis.get_major_formatter(self)`
    Get the formatter of the major ticker.

Examples using `matplotlib.axis.Axis.get_major_formatter`

`matplotlib.axis.Axis.get_major_locator`

`Axis.get_major_locator(self)`
    Get the locator of the major ticker.
Examples using matplotlib.axis.Axis.get_major_locator

- sphx_glr_gallery_axes_grid1_inset_locator_demo2.py

matplotlib.axis.Axis.get_minor_formatter

Axis.get_minor_formatter(self)
Get the formatter of the minor ticker.

Examples using matplotlib.axis.Axis.get_minor_formatter

matplotlib.axis.Axis.get_minor_locator

Axis.get_minor_locator(self)
Get the locator of the minor ticker.

Examples using matplotlib.axis.Axis.get_minor_locator

matplotlib.axis.Axis.set_major_formatter

Axis.set_major_formatter(self, formatter)
Set the formatter of the major ticker.
In addition to a Formatter instance, this also accepts a str or function.
For a str a StrMethodFormatter is used. The field used for the value must be labeled 'x' and the field used for the position must be labeled 'pos'. See the StrMethodFormatter documentation for more information.
For a function, a FuncFormatter is used. The function must take two inputs (a tick value x and a position pos), and return a string containing the corresponding tick label. See the FuncFormatter documentation for more information.

Parameters

   formatter

   [Formatter, str, or function]
Examples using `matplotlib.axis.Axis.set_major_formatter`

- `sphx_glr_gallery_lines_bars_and_markers_timeline.py`
- `sphx_glr_gallery_text_labels_and_annotations_date.py`
- `sphx_glr_gallery_text_labels_and_annotations_date_index_formatter.py`
- `sphx_glr_gallery_text_labels_and_annotations_engineering_formatter.py`
- `sphx_glr_gallery_pyplots_dollar_ticks.py`

- *Artist tutorial*
- *Choosing Colormaps in Matplotlib*
- *Text in Matplotlib Plots*

`matplotlib.axis.Axis.set_major_locator`

`Axis.set_major_locator(self, locator)`

Set the locator of the major ticker.

**Parameters**

**locator**

`[Locator]`
Examples using `matplotlib.axis.Axis.set_major_locator`

- `sphx_glr_gallery_lines_bars_and_markers_filled_step.py`
- `sphx_glr_gallery_lines_bars_and_markers_timeline.py`
- `sphx_glr_gallery_text_labels_and_annotations_date.py`

- *Choosing Colormaps in Matplotlib*
- *Text in Matplotlib Plots*

`matplotlib.axis.Axis.set_minor_formatter`

`Axis.set_minor_formatter(self, formatter)`

Set the formatter of the minor ticker.

In addition to a `Formatter` instance, this also accepts a `str` or function. See `Axis.set_major_formatter` for more information.

**Parameters**

`formatter`

`[Formatter, str, or function]`
Examples using `matplotlib.axis.Axis.set_minor_formatter`

- `sphx_glr_gallery_showcase_anatomy.py`
- `sphx_glr_gallery_scales_scales.py`
- `sphx_glr_gallery_specialty_plots_skewt.py`
- `sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py`

`matplotlib.axis.Axis.set_minor_locator`

`Axis.set_minor_locator(self, locator)`

Set the locator of the minor ticker.

**Parameters**

- `locator`
  
  `[Locator]`

Examples using `matplotlib.axis.Axis.set_minor_locator`

- `sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py`
- `sphx_glr_gallery_text_labels_and_annotations_date.py`

- `sphx_glr_gallery_ticks_and_spines_tick-formatters.py`

`matplotlib.axis.Axis.remove_overlapping_locs`

**property** `Axis.remove_overlapping_locs`

If minor ticker locations that overlap with major ticker locations should be trimmed.
matplotlib.axis.Axis.get_remove_overlapping_locs

Axis.get_remove_overlapping_locs(self)

Examples using matplotlib.axis.Axis.get_remove_overlapping_locs

matplotlib.axis.Axis.set_remove_overlapping_locs

Axis.set_remove_overlapping_locs(self, val)

Examples using matplotlib.axis.Axis.set_remove_overlapping_locs

**Axis Label**

<table>
<thead>
<tr>
<th>Axis.set_label_coords</th>
<th>Set the coordinates of the label.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis.set_label_position</td>
<td>Set the label position (top or bottom)</td>
</tr>
<tr>
<td>Axis.set_label_text</td>
<td>Set the text value of the axis label.</td>
</tr>
<tr>
<td>Axis.get_label_position</td>
<td>Return the label position (top or bottom)</td>
</tr>
<tr>
<td>Axis.get_label_text</td>
<td>Get the text of the label.</td>
</tr>
</tbody>
</table>

matplotlib.axis.Axis.set_label_coords

Axis.set_label_coords(self, x, y, transform=None)
Set the coordinates of the label.

By default, the x coordinate of the y label and the y coordinate of the x label are determined by the tick label bounding boxes, but this can lead to poor alignment of multiple labels if there are multiple axes.

You can also specify the coordinate system of the label with the transform. If None, the default coordinate system will be the axes coordinate system: (0, 0) is bottom left, (0.5, 0.5) is center, etc.

Examples using matplotlib.axis.Axis.set_label_coords

- sphx_glr_gallery_pyplots_align_ylabels.py
matplotlib.axis.Axis.set_label_position

Axis.set_label_position(self, position)
Set the label position (top or bottom)

**Parameters**

- **position**
  - [{'top', 'bottom'}]

Examples using `matplotlib.axis.Axis.set_label_position`

- sphx_glr_gallery_text_labels_and_annotations_titles_demo.py

matplotlib.axis.Axis.set_label_text

Axis.set_label_text(self, label, fontdict=None, **kwargs)
Set the text value of the axis label.

**Parameters**

- **label**
  - [str] Text string.
- **fontdict**
  - [dict] Text properties.
- ****kwargs
  - Merged into fontdict.

Examples using `matplotlib.axis.Axis.set_label_text`

matplotlib.axis.Axis.get_label_position

Axis.get_label_position(self)
Return the label position (top or bottom)
Examples using `matplotlib.axis.Axis.get_label_position`

`matplotlib.axis.Axis.get_label_text`

```python
Axis.get_label_text(self)
Get the text of the label.
```

Examples using `matplotlib.axis.Axis.get_label_text`

**Ticks, tick labels and Offset text**

<table>

<td>Sets up axis ticks and labels to treat data along this Axis as dates.</td>
</tr>
</tbody>
</table>
matplotlib.axis.Axis.get_major_ticks

Axis.get_major_ticks(self, numticks=None)
Return the list of major Ticks.

Examples using matplotlib.axis.Axis.get_major_ticks

- sphx_glr_gallery_pyplots_dollar_ticks.py
- Artist tutorial

matplotlib.axis.Axis.get_major_ticklabels

Axis.get_major_ticklabels(self)
Return this Axis' major tick labels, as a list of Text.

Examples using matplotlib.axis.Axis.get_major_ticklabels

- sphx_glr_gallery_ticks_and_spines_date_precision_and_epochs.py

matplotlib.axis.Axis.get_major_ticklines

Axis.get_major_ticklines(self)
Return this Axis' major tick lines as a list of Line2Ds.

Examples using matplotlib.axis.Axis.get_major_ticklines

matplotlib.axis.Axis.get_major_ticklocs

Axis.get_major_ticklocs(self)
Return this Axis' major tick locations in data coordinates.

Examples using matplotlib.axis.Axis.get_major_ticklocs

matplotlib.axis.Axis.get_minor_ticks

Axis.get_minor_ticks(self, numticks=None)
Return the list of minor Ticks.

Examples using matplotlib.axis.Axis.get_minor_ticks
Examples using `matplotlib.axis.Axis.get_minorticks`

- `sphx_glr_gallery_ticks_and_spines_centered_ticklabels.py`

`matplotlib.axis.Axis.get_minorticklabels`

```python
Axis.get_minorticklabels(self)
    Return this Axis' minor tick labels, as a list of `Text`
```

Examples using `matplotlib.axis.Axis.get_minorticklabels`

`matplotlib.axis.Axis.get_minorticklines`

```python
Axis.get_minorticklines(self)
    Return this Axis' minor tick lines as a list of `Line2D`
```

Examples using `matplotlib.axis.Axis.get_minorticklines`

`matplotlib.axis.Axis.get_minorticklocs`

```python
Axis.get_minorticklocs(self)
    Return this Axis' minor tick locations in data coordinates.
```

Examples using `matplotlib.axis.Axis.get_minorticklocs`

`matplotlib.axis.Axis.get_offset_text`

```python
Axis.get_offset_text(self)
    Return the axis offsetText as a Text instance.
```

Examples using `matplotlib.axis.Axis.get_offset_text`

`matplotlib.axis.Axis.get_tick_padding`

```python
Axis.get_tick_padding(self)
```
Examples using `matplotlib.axis.Axis.get_tick_labels`

`matplotlib.axis.Axis.get_tick_labels`

`Axis.get_ticklabels(self, minor=False, which=None)`  
Get this Axis' tick labels.

**Parameters**

- **minor**  
  [bool] Whether to return the minor or the major ticklabels.

- **which**  
  [None, ('minor', 'major', 'both')] Overrides `minor`.  
  Selects which ticklabels to return

**Returns**

- list of `Text`

**Notes**

The tick label strings are not populated until a `draw` method has been called.  
See also: `draw` and `draw`.

Examples using `matplotlib.axis.Axis.get_ticklabels`

- `sphinx_gallery_images_contours_and_fields_image_masked.py`
- `sphinx_gallery_pyplotgs_fig_axes_customize_simple.py`
- **Artist tutorial**

`matplotlib.axis.Axis.get_ticklines`

`Axis.get_ticklines(self, minor=False)`  
Return this Axis' tick lines as a list of `Line2Ds`. 
Examples using `matplotlib.axis.Axis.get_ticklines`

- sphx_glr_gallery_pyplots_fig_axes_customize_simple.py
- Artist tutorial

`matplotlib.axis.Axis.get_ticklocs`

```
Axis.get_ticklocs(self, *, minor=False)
```

Return this Axis' tick locations in data coordinates.

Examples using `matplotlib.axis.Axis.get_ticklocs`

- Artist tutorial

`matplotlib.axis.Axis.get_gridlines`

```
Axis.get_gridlines(self)
```

Return this Axis' grid lines as a list of `Line2D`
s.

Examples using `matplotlib.axis.Axis.get_gridlines`

`matplotlib.axis.Axis.grid`

```
Axis.grid(self, b=None, which='major', **kwargs)
```

Configure the grid lines.

**Parameters**

- **b**
  
  [bool or None] Whether to show the grid lines. If any `kwargs` are supplied, it is assumed you want the grid on and `b` will be set to True.
  
  If `b` is `None` and there are no `kwargs`, this toggles the visibility of the lines.

- **which**
  
  [‘major’, ‘minor’, ‘both’] The grid lines to apply the changes on.

- **kwargs**
  
  [Line2D properties] Define the line properties of the grid, e.g.:
grid(color='r', linestyle='-', linewidth=2)

Examples using matplotlib.axis.Axis.grid

- sphx_glr_gallery_statistics_boxplot_color.py
- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_statistics_boxplot_vs_violin.py

matplotlib.axis.Axis.set_tick_params

Axis.set_tick_params(self, which='major', reset=False, **kw)
Set appearance parameters for ticks, ticklabels, and gridlines.

For documentation of keyword arguments, see matplotlib.axes.Axes.
tick_params().

Examples using matplotlib.axis.Axis.set_tick_params

- sphx_glr_gallery_pyplots_dollar_ticks.py
- sphx_glr_gallery_axes_grid1_scatter_hist_locatable_axes.py
- sphx_glr_gallery_misc_pythonic_matplotlib.py
- sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py
- Choosing Colormaps in Matplotlib

matplotlib.axis.Axis.axis_date

Axis.axis_date(self, tz=None)
Sets up axis ticks and labels to treat data along this Axis as dates.

Parameters

tz

[str or datetime.tzinfo, default: rcParams["timezone"] (default: 'UTC')] The timezone used to create date labels.
Examples using `matplotlib.axis.Axis.axis_date`

Data and view intervals

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axis.get_data_interval</code></td>
<td>Return the Interval instance for this axis data limits.</td>
</tr>
<tr>
<td><code>Axis.get_view_interval</code></td>
<td>Return the view limits ((min, max)) of this axis.</td>
</tr>
<tr>
<td><code>Axis.set_data_interval</code></td>
<td>Set the axis data limits.</td>
</tr>
<tr>
<td><code>Axis.set_view_interval</code></td>
<td>Set the axis view limits.</td>
</tr>
</tbody>
</table>

`matplotlib.axis.Axis.get_data_interval`

```python
Axis.get_data_interval(self)
```

Return the Interval instance for this axis data limits.

Examples using `matplotlib.axis.Axis.get_data_interval`

`matplotlib.axis.Axis.get_view_interval`

```python
Axis.get_view_interval(self)
```

Return the view limits \((min, max)\) of this axis.

Examples using `matplotlib.axis.Axis.get_view_interval`

`matplotlib.axis.Axis.set_data_interval`

```python
Axis.set_data_interval(self, vmin, vmax, ignore=False)
```

Set the axis data limits. This method is for internal use.

If `ignore` is False (the default), this method will never reduce the preexisting data limits, only expand them if `vmin` or `vmax` are not within them. Moreover, the order of `vmin` and `vmax` does not matter; the orientation of the axis will not change.

If `ignore` is True, the data limits will be set exactly to \((vmin, vmax)\) in that order.
Examples using `matplotlib.axis.Axis.set_data_interval`

`matplotlib.axis.Axis.set_view_interval`

```
Axis.set_view_interval(self, vmin, vmax, ignore=False)
```

Set the axis view limits. This method is for internal use; Matplotlib users should typically use e.g. `set_xlim` or `set_ylim`.

If `ignore` is False (the default), this method will never reduce the preexisting view limits, only expand them if `vmin` or `vmax` are not within them. Moreover, the order of `vmin` and `vmax` does not matter; the orientation of the axis will not change.

If `ignore` is True, the view limits will be set exactly to `(vmin, vmax)` in that order.

Examples using `matplotlib.axis.Axis.set_view_interval`

Rendering helpers

- `Axis.get_minpos`
- `Axis.get_tick_space`
- `Axis.get_ticklabel_extents`
- `Axis.get_tightbbox`

```
Axis.get_minpos(self)
```

Return the estimated number of ticks that can fit on the axis.

```
Axis.get_tick_space(self)
```

Return the estimated number of ticks that can fit on the axis.

```
Axis.get_ticklabel_extents(self)
```

Get the extents of the tick labels on either side of the axes.

```
Axis.get_tightbbox(self)
```

Return a bounding box that encloses the axis.

`matplotlib.axis.Axis.get_minpos`

```
Axis.get_minpos(self)
```

Examples using `matplotlib.axis.Axis.get_minpos`

`matplotlib.axis.Axis.get_tick_space`

```
Axis.get_tick_space(self)
```

Return the estimated number of ticks that can fit on the axis.
Examples using `matplotlib.axis.Axis.get_tick_space`

`matplotlib.axis.Axis.get_ticklabel_extents`

`Axis.get_ticklabel_extents(self, renderer)`
Get the extents of the tick labels on either side of the axes.

Examples using `matplotlib.axis.Axis.get_ticklabel_extents`

`matplotlib.axis.Axis.get_tightbbox`

`Axis.get_tightbbox(self, renderer, *, for_layout_only=False)`
Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

If `for_layout_only` is True, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained_layout to ignore too-long labels when doing their layout.

Examples using `matplotlib.axis.Axis.get_tightbbox`

Interactive

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axis.contains</code></td>
<td>Test whether the artist contains the mouse event.</td>
</tr>
<tr>
<td><code>Axis.get_pickradius</code></td>
<td>Return the depth of the axis used by the picker.</td>
</tr>
<tr>
<td><code>Axis.set_pickradius</code></td>
<td>Set the depth of the axis used by the picker.</td>
</tr>
</tbody>
</table>

`matplotlib.axis.Axis.contains`

`Axis.contains(self, mouseevent)`
Test whether the artist contains the mouse event.

Parameters

- `mouseevent`
  `matplotlib.backend_bases.MouseEvent`

Returns
contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

Examples using matplotlib.axis.Axis.contains

matplotlib.axis.Axis.get_pickradius

Axis.get_pickradius(self)

Return the depth of the axis used by the picker.

Examples using matplotlib.axis.Axis.get_pickradius

matplotlib.axis.Axis.set_pickradius

Axis.set_pickradius(self, pickradius)

Set the depth of the axis used by the picker.

Parameters

pickradius

[float]

Examples using matplotlib.axis.Axis.set_pickradius

Units

<table>
<thead>
<tr>
<th>Axis.convert_units</th>
<th>Set the units for axis.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Axis.set_units</td>
<td>Set the units for axis.</td>
</tr>
<tr>
<td>Axis.get_units</td>
<td>Return the units for axis.</td>
</tr>
<tr>
<td>Axis.update_units</td>
<td>Introspect data for units converter and update the axis.converter instance if necessary.</td>
</tr>
</tbody>
</table>
Axis.convert_units(self, x)

Examples using matplotlib.axis.Axis.convert_units

Axis.set_units(self, u)
    Set the units for axis.

    Parameters
    ----------
    u
        [units tag]

Examples using matplotlib.axis.Axis.set_units

- sphx_glr_gallery_units_artist_tests.py
- sphx_glr_gallery_units_bar_unit_demo.py
- sphx_glr_gallery_units_units_scatter.py

Axis.get_units(self)
    Return the units for axis.

Examples using matplotlib.axis.Axis.get_units

Axis.update_units(self, data)
    Introspect data for units converter and update the axis.converter instance if necessary. Return True if data is registered for unit conversion.
Examples using `matplotlib.axis.Axis.update_units`

Incremental navigation

<table>
<thead>
<tr>
<th><code>Axis.pan</code></th>
<th>[Deprecated] Pan by <code>numsteps</code> (can be positive or negative).</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axis.zoom</code></td>
<td>[Deprecated] Zoom in/out on axis; if <code>direction</code> is &gt;0 zoom in, else zoom out.</td>
</tr>
</tbody>
</table>

`matplotlib.axis.Axis.pan`

`Axis.pan(self, numsteps)`

[Deprecated] Pan by `numsteps` (can be positive or negative).

Notes

Deprecated since version 3.3.

Examples using `matplotlib.axis.Axis.pan`

`matplotlib.axis.Axis.zoom`

`Axis.zoom(self, direction)`

[Deprecated] Zoom in/out on axis; if `direction` is >0 zoom in, else zoom out.

Notes

Deprecated since version 3.3.

Examples using `matplotlib.axis.Axis.zoom`

**XAxis Specific**

<table>
<thead>
<tr>
<th><code>XAxis.axis_name</code></th>
<th>Read-only name identifying the axis.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>XAxis.get_text_heights</code></td>
<td>Return how much space should be reserved for text above and below the axes, as a pair of floats.</td>
</tr>
</tbody>
</table>
Table 124 – continued from previous page

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>XAxis.get_ticks_position</code></td>
<td>Return the ticks position (&quot;top&quot;, &quot;bottom&quot;, &quot;default&quot;, or &quot;unknown&quot;).</td>
</tr>
<tr>
<td><code>XAxis.set_ticks_position</code></td>
<td>Set the ticks position.</td>
</tr>
<tr>
<td><code>XAxis.tick_bottom</code></td>
<td>Move ticks and ticklabels (if present) to the bottom of the axes.</td>
</tr>
<tr>
<td><code>XAxis.tick_top</code></td>
<td>Move ticks and ticklabels (if present) to the top of the axes.</td>
</tr>
</tbody>
</table>

```python

matplotlib.axis.XAxis.axis_name

XAxis.axis_name = 'x'
    Read-only name identifying the axis.
```

```python

matplotlib.axis.XAxis.get_text_heights

XAxis.get_text_heights(self, renderer)
    Return how much space should be reserved for text above and below the axes, as a pair of floats.
```

**Examples using matplotlib.axis.XAxis.get_text_heights**

```python

matplotlib.axis.XAxis.get_ticks_position

XAxis.get_ticks_position(self)
    Return the ticks position ("top", "bottom", "default", or "unknown").
```

**Examples using matplotlib.axis.XAxis.get_ticks_position**

```python

matplotlib.axis.XAxis.set_ticks_position

XAxis.set_ticks_position(self, position)
    Set the ticks position.

**Parameters**

**position**

[{'top', 'bottom', 'both', 'default', 'none'}] 'both' sets the ticks to appear on both positions, but does not change the tick labels. 'default' resets the tick positions to the default: ticks on both positions, labels at bottom. 'none' can be used if you don't want any ticks. 'none' and 'both' affect only the ticks, not the labels.
```
Examples using `matplotlib.axis.XAxis.set_ticks_position`

- sphx_glr_gallery_statistics_customized_violin.py

- `sphx_glr_gallery_ticks_and_spines_tick-formatters.py`
matplotlib.axis.YAxis.tick_left

YAxis.tick_left(self)
   Move ticks and ticklabels (if present) to the left of the axes.

Examples using matplotlib.axis.YAxis.tick_left

- sphx_glr_gallery_showcase_bachelors_degrees_by_gender.py
- sphx_glr_gallery_ticks_and_spines_tick_label_right.py

matplotlib.axis.YAxis.tick_right

YAxis.tick_right(self)
   Move ticks and ticklabels (if present) to the right of the axes.

Examples using matplotlib.axis.YAxis.tick_right

matplotlib.axis.Axis.OFFSETTEXTPAD

Axis.OFFSETTEXTPAD = 3

matplotlib.axis.Axis.axes

property Axis.axes
    The Axes instance the artist resides in, or None.

matplotlib.axis.Axis.limit_range_for_scale

Axis.limit_range_for_scale(self, vmin, vmax)

Examples using matplotlib.axis.Axis.limit_range_for_scale

matplotlib.axis.Axis.reset_ticks

Axis.reset_ticks(self)
    Re-initialize the major and minor Tick lists.
    Each list starts with a single fresh Tick.

Examples using matplotlib.axis.Axis.reset_ticks

matplotlib.axis.Axis.set_default_intervals

Axis.set_default_intervals(self)
    Set the default limits for the axis data and view interval if they have not been
    not mutated yet.

Examples using matplotlib.axis.Axis.set_default_intervals

matplotlib.axis.Axis.get_smart_bounds

Axis.get_smart_bounds(self)
    [Deprecated] Return whether the axis has smart bounds.
Notes

Deprecated since version 3.2.

Examples using `matplotlib.axis.Axis.get_smart_bounds`

`matplotlib.axis.Axis.set_smart_bounds`

`Axis.set_smart_bounds(self, value)`

[Deprecated] Set the axis to have smart bounds.

Notes

Deprecated since version 3.2.

Examples using `matplotlib.axis.Axis.set_smart_bounds`

Discouraged

These methods should be used together with care, calling `set_ticks` to specify the desired tick locations **before** calling `set_ticklabels` to specify a matching series of labels. Calling `set_ticks` makes a `FixedLocator`; it's list of locations is then used by `set_ticklabels` to make an appropriate `FuncFormatter`.

<table>
<thead>
<tr>
<th><code>Axis.set_ticks</code></th>
<th>Set this Axis' tick locations.</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>Axis.set_ticklabels</code></td>
<td>Set the text values of the tick labels.</td>
</tr>
</tbody>
</table>

`matplotlib.axis.Axis.set_ticks`

`Axis.set_ticks(self, ticks, *, minor=False)`

Set this Axis' tick locations.

**Parameters**

- `ticks`
  
  [list of floats] List of tick locations.

- `minor`
  
  [bool, default: False] If False, set the major ticks; if True, the minor ticks.
Examples using `matplotlib.axis.Axis.set_ticks`

- `sphx_glr_gallery_pyplots_whats_new_99_spines.py`
- `sphx_glr_gallery_ticks_and_spines_spine_placement_demo.py`

`matplotlib.axis.Axis.set_ticklabels`

```python
Axis.set_ticklabels(self, ticklabels, *, minor=False, **kwargs)
```

Set the text values of the tick labels.

**Warning:** This method should only be used after fixing the tick positions using `Axis.set_ticks`. Otherwise, the labels may end up in unexpected positions.

**Parameters**

**ticklabels**

[sequence of str or of `Texts`] Texts for labeling each tick location in the sequence set by `Axis.set_ticks`; the number of labels must match the number of locations.

**minor**

[bool] If True, set minor ticks instead of major ticks.

**kwargs**

Text properties.

**Returns**

**list of `Texts`**

For each tick, includes `tick.label1` if it is visible, then `tick.label2` if it is visible, in that order.
Examples using `matplotlib.axis.Axis.set_ticklabels`

18.6.3 Tick objects

```python
class matplotlib.axis.Tick(axes, loc, label=<deprecated parameter>, size=None, width=None, color=None, tickdir=None, pad=None, labelsize=None, labelcolor=None, zorder=None, gridOn=None, tick1On=True, tick2On=True, label1On=True, label2On=False, major=True, labelrotation=0, grid_color=None, grid_linestyle=None, grid_linewidth=None, grid_alpha=None, **kw)
```

Abstract base class for the axis ticks, grid lines and labels.

Ticks mark a position on an Axis. They contain two lines as markers and two labels; one each for the bottom and top positions (in case of an `XAxis`) or for the left and right positions (in case of a `YAxis`).

**Attributes**

- `tick1line`  
  `[Line2D]` The left/bottom tick marker.

- `tick2line`  
  `[Line2D]` The right/top tick marker.

- `gridline`  
  `[Line2D]` The grid line associated with the label position.

- `label1`  
  `[Text]` The left/bottom tick label.

- `label2`  
  `[Text]` The right/top tick label.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

```python
class matplotlib.axis.XTick(*args, **kwargs)
```

Contains all the Artists needed to make an x tick - the tick line, the label text and the grid line

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

```python
class matplotlib.axis.YTick(*args, **kwargs)
```

Contains all the Artists needed to make a Y tick - the tick line, the label text and the grid line
bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

<table>

<td>Set the location of tick in data coords with scalar loc.</td>
</tr>
</tbody>
</table>

**Examples using `matplotlib.axis.Tick.apply_tickdir`**

```python
import matplotlib.pyplot as plt

fig, ax = plt.subplots()

# Use Tick.apply_tickdir to calculate tick positions

fig, ax = plt.subplots()

# Use Tick.get_loc to get the tick location

fig, ax = plt.subplots()

# Use Tick.get_pad to get the tick label pad
```

**Examples using `matplotlib.axis.Tick.get_loc`**

```python
import matplotlib.pyplot as plt

fig, ax = plt.subplots()

# Use Tick.get_loc to get the tick location

fig, ax = plt.subplots()

# Use Tick.get_pad to get the tick label pad
```

**Examples using `matplotlib.axis.Tick.get_pad`**

```python
import matplotlib.pyplot as plt

fig, ax = plt.subplots()

# Use Tick.get_pad to get the tick label pad
```
Examples using `matplotlib.axis.Tick.get_pad`

`matplotlib.axis.Tick.get_pad_pixels`

`Tick.get_pad_pixels(self)`

Examples using `matplotlib.axis.Tick.get_pad_pixels`

`matplotlib.axis.Tick.get_tick_padding`

`Tick.get_tick_padding(self)`

Get the length of the tick outside of the axes.

Examples using `matplotlib.axis.Tick.get_tick_padding`

`matplotlib.axis.Tick.get_tickdir`

`Tick.get_tickdir(self)`

Examples using `matplotlib.axis.Tick.get_tickdir`

`matplotlib.axis.Tick.get_view_interval`

`Tick.get_view_interval(self)`

Return the view limits (min, max) of the axis the tick belongs to.

Examples using `matplotlib.axis.Tick.get_view_interval`

`matplotlib.axis.Tick.set_label1`

`Tick.set_label1(self, s)`

Set the label1 text.

**Parameters**

- `s` [str]
Examples using `matplotlib.axis.Tick.set_label1`

`matplotlib.axis.Tick.set_label2`

`Tick.set_label2(self, s)`
Set the label2 text.

**Parameters**

- `s`
  - `[str]`

Examples using `matplotlib.axis.Tick.set_label2`

`matplotlib.axis.Tick.set_pad`

`Tick.set_pad(self, val)`
Set the tick label pad in points

**Parameters**

- `val`
  - `[float]`

Examples using `matplotlib.axis.Tick.set_pad`

`matplotlib.axis.Tick.update_position`

`Tick.update_position(self, loc)`
Set the location of tick in data coords with scalar `loc`.

Examples using `matplotlib.axis.Tick.update_position`

18.7 `matplotlib.backend_bases`

Abstract base classes define the primitives that renderers and graphics contexts must implement to serve as a Matplotlib backend.

`RendererBase`

An abstract base class to handle drawing/rendering operations.
**FigureCanvasBase**

The abstraction layer that separates the *Figure* from the backend specific details like a user interface drawing area.

**GraphicsContextBase**

An abstract base class that provides color, line styles, etc.

**Event**

The base class for all of the Matplotlib event handling. Derived classes such as *KeyEvent* and *MouseEvent* store the meta data like keys and buttons pressed, x and y locations in pixel and *Axes* coordinates.

**ShowBase**

The base class for the *Show* class of each interactive backend; the 'show' callable is then set to *Show.* __call__.

**ToolContainerBase**

The base class for the Toolbar class of each interactive backend.

```python
class matplotlib.backend_bases.CloseEvent(name, canvas, guiEvent=None)
Bases: matplotlib.backend_bases.Event

An event triggered by a figure being closed.

class matplotlib.backend_bases.DrawEvent(name, canvas, renderer)
Bases: matplotlib.backend_bases.Event

An event triggered by a draw operation on the canvas

In most backends callbacks subscribed to this callback will be fired after the rendering is complete but before the screen is updated. Any extra artists drawn to the canvas's renderer will be reflected without an explicit call to *blit*.

**Warning:** Calling canvas.draw and canvas.blit in these callbacks may not be safe with all backends and may cause infinite recursion.
```

In addition to the *Event* attributes, the following event attributes are defined:

**Attributes**

- **renderer**
  
  *[RendererBase]* The renderer for the draw event.

```python
class matplotlib.backend_bases.Event(name, canvas, guiEvent=None)
Bases: object

A Matplotlib event. Attach additional attributes as defined in *FigureCanvasBase.*

**mpl_connect()**. The following attributes are defined and shown with their default values
```
Attributes

name

[str] The event name.

canvas

[FigureCanvasBase] The backend-specific canvas instance generating the event.

guiEvent

The GUI event that triggered the Matplotlib event.

class matplotlib.backend_bases.FigureCanvasBase(figure)

Bases: object

The canvas the figure renders into.

Attributes

figure

[matplotlib.figure.Figure] A high-level figure instance.

blit(self, bbox=None)

Blit the canvas in bbox (default entire canvas).

button_press_event(self, x, y, button, dblclick=False, guiEvent=None)

Callback processing for mouse button press events.

Backend derived classes should call this function on any mouse button press. (x, y) are the canvas coords ((0, 0) is lower left). button and key are as defined in MouseEvent.

This method will call all functions connected to the 'button_press_event' with a MouseEvent instance.

button_release_event(self, x, y, button, guiEvent=None)

Callback processing for mouse button release events.

Backend derived classes should call this function on any mouse button release.

This method will call all functions connected to the 'button_release_event' with a MouseEvent instance.

Parameters

x

[float] The canvas coordinates where 0=left.

y

[float] The canvas coordinates where 0=bottom.
guiEvent

The native UI event that generated the Matplotlib event.

close_event(self, guiEvent=None)
Pass a CloseEvent to all functions connected to close_event.

draw(self, *args, **kwargs)
Render the Figure.

draw_cursor(self, event)
[Deprecated] Draw a cursor in the event.axes if inaxes is not None. Use
native GUI drawing for efficiency if possible.

Notes

Deprecated since version 3.2.

draw_event(self, renderer)
Pass a DrawEvent to all functions connected to draw_event.

draw_idle(self, *args, **kwargs)
Request a widget redraw once control returns to the GUI event loop.

Even if multiple calls to draw_idle occur before control returns to the GUI
event loop, the figure will only be rendered once.

Notes

Backends may choose to override the method and implement their own strat-
tegy to prevent multiple renderings.

enter_notify_event(self, guiEvent=None, xy=None)
Callback processing for the mouse cursor entering the canvas.

Backend derived classes should call this function when entering canvas.

Parameters

  guiEvent
  The native UI event that generated the Matplotlib event.

  xy
  [(float, float)] The coordinate location of the pointer when the
  canvas is entered.

  events = ['resize_event', 'draw_event', 'key_press_event', 'key_release_event', 'button_press_event',
filetypes = {'eps': 'Encapsulated Postscript', 'jpeg': 'Joint Photographic Experts Group'}
fixed_dpi = None
flush_events(self)
    Flush the GUI events for the figure.
    Interactive backends need to reimplement this method.

get_default_filename(self)
    Return a string, which includes extension, suitable for use as a default file-
    name.

classmethod get_default_filetype()
    Return the default savefig file format as specified in rcParams["savefig.
    format"] (default: 'png').
    The returned string does not include a period. This method is overridden in
    backends that only support a single file type.

classmethod get_supported_filetypes()
    Return dict of savefig file formats supported by this backend.

classmethod get_supported_filetypes_grouped()
    Return a dict of savefig file formats supported by this backend, where the
    keys are a file type name, such as 'Joint Photographic Experts Group', and
    the values are a list of filename extensions used for that filetype, such as
    ['jpg', 'jpeg'].

get_width_height(self)
    Return the figure width and height in points or pixels (depending on the
    backend), truncated to integers.

get_window_title(self)
    Return the title text of the window containing the figure, or None if there is
    no window (e.g., a PS backend).

grab_mouse(self, ax)
    Set the child Axes which is grabbing the mouse events.
    Usually called by the widgets themselves. It is an error to call this if the
    mouse is already grabbed by another axes.

inaxes(self, xy)
    Return the topmost visible Axes containing the point xy.

Parameters

xy
    [(float, float)] (x, y) pixel positions from left/bottom of the canvas.

Returns

Axes or None
    The topmost visible axes containing the point, or None if no axes.
is_saving(self)
    Return whether the renderer is in the process of saving to a file, rather than
    rendering for an on-screen buffer.

key_press_event(self, key, guiEvent=None)
    Pass a KeyEvent to all functions connected to key_press_event.

key_release_event(self, key, guiEvent=None)
    Pass a KeyEvent to all functions connected to key_release_event.

leave_notify_event(self, guiEvent=None)
    Callback processing for the mouse cursor leaving the canvas.
    Backend derived classes should call this function when leaving canvas.

    Parameters

    guiEvent
        The native UI event that generated the Matplotlib event.

motion_notify_event(self, x, y, guiEvent=None)
    Callback processing for mouse movement events.
    Backend derived classes should call this function on any motion-notify-event.
    This method will call all functions connected to the 'motion_notify_event'
    with a MouseEvent instance.

    Parameters

    x
        [float] The canvas coordinates where 0=left.

    y
        [float] The canvas coordinates where 0=bottom.

    guiEvent
        The native UI event that generated the Matplotlib event.

mpl_connect(self, s, func)
    Bind function func to event s.

    Parameters

    s
        [str] One of the following events ids:
        • 'button_press_event'
        • 'button_release_event'
        • 'draw_event'
• 'key_press_event'
• 'key_release_event'
• 'motion_notify_event'
• 'pick_event'
• 'resize_event'
• 'scroll_event'
• 'figure_enter_event',
• 'figure_leave_event',
• 'axes_enter_event',
• 'axes_leave_event'
• 'close_event'.

**func**

[callable] The callback function to be executed, which must have the signature:

```
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the axes, the *inaxes* attribute of the event will be set to the `Axes` the event occurs is over, and additionally, the variables *xdata* and *ydata* attributes will be set to the mouse location in data coordinates. See `KeyEvent` and `MouseEvent` for more info.

**Returns**

**cid**

A connection id that can be used with `FigureCanvasBase.mpl_disconnect`.

**Examples**

```python
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

`mpl_disconnect(self, cid)`

Disconnect the callback with id *cid*. 
Examples

cid = canvas.mpl_connect('button_press_event', on_press)
# ... later
canvas.mpl_disconnect(cid)

new_timer(self, interval=None, callbacks=None)
Create a new backend-specific subclass of Timer.

This is useful for getting periodic events through the backend's native event loop. Implemented only for backends with GUIs.

Parameters

interval
[int] Timer interval in milliseconds.

callbacks
[List[Tuple[callable, Tuple, Dict]]] Sequence of (func, args, kwargs) where func(*args, **kwargs) will be executed by the timer every interval.

Callbacks which return False or 0 will be removed from the timer.

Examples

>>> timer = fig.canvas.new_timer(callbacks=[(f1, (1,), {'a': 3})])

pick(self, mouseevent)
pick_event(self, mouseevent, artist, **kwargs)
Callback processing for pick events.

This method will be called by artists who are picked and will fire off PickEvent callbacks registered listeners.

print_figure(self, filename, dpi=None, facecolor=None, edgecolor=None, orientation='portrait', format=None, *, bbox_inches=None, pad_inches=0, bbox_extra_artists=None, backend=None, **kwargs)
Render the figure to hardcopy. Set the figure patch face and edge colors. This is useful because some of the GUIs have a gray figure face color background and you'll probably want to override this on hardcopy.

Parameters

filename
[str or path-like or file-like] The file where the figure is saved.
**dpi**

[\texttt{float}, default: \texttt{rcParams["savefig.dpi"]}] (default: 'figure')] The dots per inch to save the figure in.

**facecolor**

[\texttt{color or 'auto'}, default: \texttt{rcParams["savefig.facecolor"]}] (default: 'auto')] The facecolor of the figure. If 'auto', use the current figure facecolor.

**edgecolor**

[\texttt{color or 'auto'}, default: \texttt{rcParams["savefig.edgecolor"]}] (default: 'auto')] The edgecolor of the figure. If 'auto', use the current figure edgecolor.

**orientation**

[{{'landscape', 'portrait'}, default: 'portrait}] Only currently applies to PostScript printing.

**format**

[\texttt{str}, optional] Force a specific file format. If not given, the format is inferred from the \texttt{filename} extension, and if that fails from \texttt{rcParams["savefig.format"]} (default: 'png').

**bbox_inches**

[\texttt{['tight' or Bbox, default: \texttt{rcParams["savefig.bbox"]}] (default: None)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

**pad_inches**

[\texttt{float}, default: \texttt{rcParams["savefig.pad_inches"]}] (default: 0.1)] Amount of padding around the figure when \texttt{bbox_inches} is 'tight'.

**bbox_extra_artists**

[\texttt{list of Artist}, optional] A list of extra artists that will be considered when the tight bbox is calculated.

**backend**

[\texttt{str}, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See \texttt{The builtin backends} for a list of valid backends for each file format. Custom backends can be referenced as "module://...".
release_mouse(self, ax)
    Release the mouse grab held by the Axes ax.
    Usually called by the widgets. It is ok to call this even if ax doesn't have the
    mouse grab currently.

required_interactive_framework = None

resize(self, w, h)
    Set the canvas size in pixels.

resize_event(self)
    Pass a ResizeEvent to all functions connected to resize_event.

scroll_event(self, x, y, step, guiEvent=None)
    Callback processing for scroll events.
    Backend derived classes should call this function on any scroll wheel event.
    (x, y) are the canvas coords ((0, 0) is lower left). button and key are as
    defined in MouseEvent.
    This method will call all functions connected to the 'scroll_event' with a
    MouseEvent instance.

set_window_title(self, title)
    Set the title text of the window containing the figure. Note that this has no
    effect if there is no window (e.g., a PS backend).

start_event_loop(self, timeout=0)
    Start a blocking event loop.
    Such an event loop is used by interactive functions, such as ginput and
    waitforbuttonpress, to wait for events.
    The event loop blocks until a callback function triggers stop_event_loop, or
    timeout is reached.
    If timeout is 0 or negative, never timeout.
    Only interactive backends need to reimplement this method and it relies on
    flush_events being properly implemented.
    Interactive backends should implement this in a more native way.

stop_event_loop(self)
    Stop the current blocking event loop.
    Interactive backends need to reimplement this to match start_event_loop

supports_blit = False

switch_backends(self, FigureCanvasClass)
    Instantiate an instance of FigureCanvasClass
    This is used for backend switching, e.g., to instantiate a FigureCanvasPS
    from a FigureCanvasGTK. Note, deep copying is not done, so any changes to
one of the instances (e.g., setting figure size or line props), will be reflected in the other

```python
class matplotlib.backend_bases.FigureManagerBase(canvas, num)
```

Bases: `object`

A backend-independent abstraction of a figure container and controller.

The figure manager is used by `pyplot` to interact with the window in a backend-independent way. It's an adapter for the real (GUI) framework that represents the visual figure on screen.

GUI backends define from this class to translate common operations such as `show` or `resize` to the GUI-specific code. Non-GUI backends do not support these operations and can just use the base class.

This following basic operations are accessible:

**Window operations**

- `show`
- `destroy`
- `full_screen_toggle`
- `resize`
- `get_window_title`
- `set_window_title`

**Key and mouse button press handling**

The figure manager sets up default key and mouse button press handling by hooking up the `key_press_handler` to the `matplotlib` event system. This ensures the same shortcuts and mouse actions across backends.

**Other operations**

Subclasses will have additional attributes and functions to access additional functionality. This is of course backend-specific. For example, most GUI backends have `window` and `toolbar` attributes that give access to the native GUI widgets of the respective framework.

**Attributes**

- `canvas`
  
  `[FigureCanvasBase]` The backend-specific canvas instance.

- `num`
  
  `[int or str]` The figure number.

- `key_press_handler_id`
  
  `[int]` The default key handler cid, when using the toolmanager.

To disable the default key press handling use:
button_press_handler_id

[int] The default mouse button handler cid, when using the tool-manager. To disable the default button press handling use:

```python
button_press_handler_id
```

button_press(self, event)
The default Matplotlib button actions for extra mouse buttons.
destroy(self)
full_screen_toggle(self)
get_window_title(self)
    Return the title text of the window containing the figure, or None if there is no window (e.g., a PS backend).
key_press(self, event)
    Implement the default Matplotlib key bindings defined at Navigation Keyboard Shortcuts.
resize(self, w, h)
    For GUI backends, resize the window (in pixels).
set_window_title(self, title)
    Set the title text of the window containing the figure.
    This has no effect for non-GUI (e.g., PS) backends.
show(self)
    For GUI backends, show the figure window and redraw. For non-GUI backends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in Figure.show.

property statusbar

class matplotlib.backend_bases.GraphicsContextBase
    Bases: object
    An abstract base class that provides color, line styles, etc.
copy_properties(self, gc)
    Copy properties from gc to self.
get_alpha(self)
    Return the alpha value used for blending - not supported on all backends.
get_anti_aliased(self)
    Return whether the object should try to do antialiased rendering.
get_capstyle(self)
    Return the capstyle as a string in ('butt', 'round', 'projecting').

get_clip_path(self)
    Return the clip path in the form (path, transform), where path is a Path instance, and transform is an affine transform to apply to the path before clipping.

get_clip_rectangle(self)
    Return the clip rectangle as a Bbox instance.

get_dashes(self)
    Return the dash style as an (offset, dash-list) pair.
    The dash list is a even-length list that gives the ink on, ink off in points. See p. 107 of to PostScript blue book for more info.
    Default value is (None, None).

get_forced_alpha(self)
    Return whether the value given by get_alpha() should be used to override any other alpha-channel values.

get_gid(self)
    Return the object identifier if one is set, None otherwise.

get_hatch(self)
    Get the current hatch style.

get_hatch_color(self)
    Get the hatch color.

get_hatch_linewidth(self)
    Get the hatch linewidth.

get_hatch_path(self, density=6.0)
    Return a Path for the current hatch.

get_joinstyle(self)
    Return the line join style as one of ('miter', 'round', 'bevel').

get_linewidth(self)
    Return the line width in points.

get_rgb(self)
    Return a tuple of three or four floats from 0-1.

get_sketch_params(self)
    Return the sketch parameters for the artist.

Returns

tuple or None
    A 3-tuple with the following elements:
• **scale**: The amplitude of the wiggle perpendicular to the source line.

• **length**: The length of the wiggle along the line.

• **randomness**: The scale factor by which the length is shrunken or expanded.

May return *None* if no sketch parameters were set.

get_snap(self)
Return the snap setting, which can be:

- True: snap vertices to the nearest pixel center
- False: leave vertices as-is
- None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

get_url(self)
Return a url if one is set, None otherwise.

restore(self)
Restore the graphics context from the stack - needed only for backends that save graphics contexts on a stack.

set_alpha(self, alpha)
Set the alpha value used for blending - not supported on all backends.

If alpha=None (the default), the alpha components of the foreground and fill colors will be used to set their respective transparencies (where applicable); otherwise, alpha will override them.

set_antialiased(self, b)
Set whether object should be drawn with antialiased rendering.

set_capstyle(self, cs)
Set the capstyle to be one of ('butt', 'round', 'projecting').

set_clip_path(self, path)
Set the clip path and transformation.

**Parameters**

- **path**

  [TransfigPath or None]

set_clip_rectangle(self, rectangle)
Set the clip rectangle with sequence (left, bottom, width, height)

set_dashes(self, dash_offset, dash_list)
Set the dash style for the gc.

**Parameters**
**dash_offset**

[Float or None] The offset (usually 0).

**dash_list**

[array-like or None] The on-off sequence as points.

**Notes**

(None, None) specifies a solid line.
See p. 107 of to PostScript blue book for more info.

**set_foreground**(self, fg, isRGBA=False)
Set the foreground color.

**Parameters**

**fg**

[Color]

**isRGBA**

[bool] If fg is known to be an (r, g, b, a) tuple, isRGBA can be set to True to improve performance.

**set_gid**(self, id)
Set the id.

**set_hatch**(self, hatch)
Set the hatch style (for fills).

**set_hatch_color**(self, hatch_color)
Set the hatch color.

**set_joinstyle**(self, js)
Set the join style to be one of ('miter', 'round', 'bevel').

**set_linewidth**(self, w)
Set the linewidth in points.

**set_sketch_params**(self, scale=None, length=None, randomness=None)
Set the sketch parameters.

**Parameters**

**scale**

[Float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.
length

[float, default: 128] The length of the wiggle along the line, in pixels.

randomness

[float, default: 16] The scale factor by which the length is shrunken or expanded.

set_snap(self, snap)
Set the snap setting which may be:

• True: snap vertices to the nearest pixel center
• False: leave vertices as-is
• None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center

set_url(self, url)
Set the url for links in compatible backends.

class matplotlib.backend_bases.KeyEvent(name, canvas, key, x=0, y=0, guiEvent=None)
Bases: matplotlib.backend_bases.LocationEvent
A key event (key press, key release).
Attach additional attributes as defined in FigureCanvasBase.mpl_connect().
In addition to the Event and LocationEvent attributes, the following attributes are defined:

Notes

Modifier keys will be prefixed to the pressed key and will be in the order "ctrl", "alt", "super". The exception to this rule is when the pressed key is itself a modifier key, therefore "ctrl+alt" and "alt+control" can both be valid key values.

Examples

```python
def on_key(event):
    print('you pressed', event.key, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('key_press_event', on_key)
```

Attributes

key
[None or str] the key(s) pressed. Could be None, a single case sensitive ascii character ("g", "G", ", etc.), a special key ("control", ", etc.) or a combination of the above (e.g., "ctrl+alt+g", "ctrl+alt+G").

(x, y) in figure coords ((0, 0) = bottom left).

```python
class matplotlib.backend_bases.LocationEvent(name, canvas, x, y, guiEvent=None)
Bases: matplotlib.backend_bases.Event
```

An event that has a screen location.

The following additional attributes are defined and shown with their default values.

In addition to the Event attributes, the following event attributes are defined:

**Attributes**

- **x**
  
  [int] x position - pixels from left of canvas.

- **y**
  
  [int] y position - pixels from bottom of canvas.

- **inaxes**
  
  [Axes or None] The Axes instance over which the mouse is, if any.

- **xdata**
  
  [float or None] x data coordinate of the mouse.

- **ydata**
  
  [float or None] y data coordinate of the mouse.

```
lastevent = None
```

```python
class matplotlib.backend_bases.MouseEventHandler(value)
Bases: enum.IntEnum
```

An enumeration.

- **BACK** = 8
- **FORWARD** = 9
- **LEFT** = 1
- **MIDDLE** = 2
- **RIGHT** = 3
class matplotlib.backend_bases.MouseEvent(
    name, canvas, x, y, button=None,
    key=None, step=0, dblclick=False,
    guiEvent=None)

Bases: matplotlib.backend_bases.LocationEvent

A mouse event ('button_press_event',
    'button_release_event', 'scroll_event', 'motion_notify_event').

In addition to the Event and LocationEvent attributes, the following attributes are defined:

Examples

def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = fig.canvas.mpl_connect('button_press_event', on_press)

Attributes

button

[None or MouseButton or {'up', 'down'}] The button pressed. 'up' and 'down' are used for scroll events. Note that in the nbagg backend, both the middle and right clicks return RIGHT since right clicking will bring up the context menu in some browsers. Note that LEFT and RIGHT actually refer to the "primary" and "secondary" buttons, i.e. if the user inverts their left and right buttons ("left-handed setting") then the LEFT button will be the one physically on the right.

key

[None or str] The key pressed when the mouse event triggered, e.g. 'shift'. See KeyEvent.

Warning: This key is currently obtained from the last 'key_press_event' or 'key_release_event' that occurred within the canvas. Thus, if the last change of keyboard state occurred while the canvas did not have focus, this attribute will be wrong.

step

[float] The number of scroll steps (positive for 'up', negative for 'down'). This applies only to 'scroll_event' and defaults to 0 otherwise.
**dblclick**

[bool] Whether the event is a double-click. This applies only to 'button_press_event' and is False otherwise. In particular, it's not used in 'button_release_event'.

(x, y) in figure coords ((0, 0) = bottom left) button pressed None, 1, 2, 3, 'up', 'down'

class matplotlib.backend_bases.NavigationToolbar2(canvas)
Bases: object

Base class for the navigation cursor, version 2.

Backends must implement a canvas that handles connections for 'button_press_event' and 'button_release_event'. See `FigureCanvasBase.mpl_connect()` for more information.

They must also define

```python
save_figure()
```

save the current figure

```python
set_cursor()
```

if you want the pointer icon to change

```python
draw_rubberband() (optional)
```

draw the zoom to rect "rubberband" rectangle

```python
set_message() (optional)
```

display message

```python
set_history_buttons() (optional)
```

you can change the history back / forward buttons to indicate disabled / enabled state.

and override `__init__` to set up the toolbar -- without forgetting to call the base-class `init`. Typically, `__init__` needs to set up toolbar buttons connected to the `home, back, forward, pan, zoom, and save_figure` methods and using standard icons in the "images" subdirectory of the data path.

That's it, we'll do the rest!

```python
back(self, *args)
```

Move back up the view lim stack.

For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

```python
drag_pan(self, event)
```

Callback for dragging in pan/zoom mode.
drag_zoom(self, event)
Callback for dragging in zoom mode.

draw(self)
[Deprecated] Redraw the canvases, update the locators.

Notes
Deprecation: version 3.3.
draw_rubberband(self, event, x0, y0, x1, y1)
Draw a rectangle rubberband to indicate zoom limits.
Note that it is not guaranteed that x0 <= x1 and y0 <= y1.

forward(self, *args)
Move forward in the view lim stack.
For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

home(self, *args)
Restore the original view.
For convenience of being directly connected as a GUI callback, which often get passed additional parameters, this method accepts arbitrary parameters, but does not use them.

mouse_move(self, event)

pan(self, *args)
Toggle the pan/zoom tool.
Pan with left button, zoom with right.

press(self, event)
[Deprecated] Called whenever a mouse button is pressed.

Notes
Deprecation: version 3.3.

press_pan(self, event)
Callback for mouse button press in pan/zoom mode.

press_zoom(self, event)
Callback for mouse button press in zoom to rect mode.

push_current(self)
Push the current view limits and position onto the stack.
release(self, event)
[Deprecated] Callback for mouse button release.

Notes

Deprecated since version 3.3.

release_pan(self, event)
Callback for mouse button release in pan/zoom mode.

release_zoom(self, event)
Callback for mouse button release in zoom to rect mode.

remove_rubberband(self)
Remove the rubberband.

save_figure(self, *args)
Save the current figure.

set_cursor(self, cursor)
Set the current cursor to one of the Cursors enums values.

If required by the backend, this method should trigger an update in the backend event loop after the cursor is set, as this method may be called e.g. before a long-running task during which the GUI is not updated.

set_history_buttons(self)
Enable or disable the back/forward button.

set_message(self, s)
Display a message on toolbar or in status bar.

toolitems = (('Home', 'Reset original view', 'home', 'home'), ('Back', 'Back to previous view', 'back', 'back'), ...
update(self)
Reset the axes stack.

zoom(self, *args)
Toggle zoom to rect mode.

exception matplotlib.backend_bases.NonGuiException
Bases: Exception

Raised when trying show a figure in a non-GUI backend.

class matplotlib.backend_bases.PickEvent(name, canvas, mouseevent, artist, guiEvent=None, **kwargs)
Bases: matplotlib.backend_bases.Event

A pick event, fired when the user picks a location on the canvas sufficiently close to an artist.

Attrs: all the Event attributes plus
**Examples**

Bind a function `on_pick()` to pick events, that prints the coordinates of the picked data point:

```python
ax.plot(np.rand(100), 'o', picker=5)  # 5 points tolerance

def on_pick(event):
    line = event.artist
    xdata, ydata = line.get_data()
    ind = event.ind
    print('on pick line:', np.array([xdata[ind], ydata[ind]]).T)

cid = fig.canvas.mpl_connect('pick_event', on_pick)
```

**Attributes**

- **mouseevent**
  
  `[MouseEvent]` The mouse event that generated the pick.

- **artist**
  

- **other**
  
  Additional attributes may be present depending on the type of the picked object; e.g., a `Line2D` pick may define different extra attributes than a `PatchCollection` pick.

---

18.7. matplotlib.backend_bases

An abstract base class to handle drawing/rendering operations.

The following methods must be implemented in the backend for full functionality (though just implementing `draw_path()` alone would give a highly capable backend):

- `draw_path()`
- `draw_image()`
- `draw_gouraud_triangle()`

The following methods *should* be implemented in the backend for optimization reasons:

- `draw_text()`
- `draw_markers()`
- `draw_path_collection()`
- `draw_quad_mesh()`
close_group(self, s)
    Close a grouping element with label s.
    Only used by the SVG renderer.

draw_gouraud_triangle(self, gc, points, colors, transform)
    Draw a Gouraud-shaded triangle.

    **Parameters**

    gc

    points
        [array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

    colors
        [array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

    transform
        [matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_gouraud_triangles(self, gc, triangles_array, colors_array, transform)
    Draw a series of Gouraud triangles.

    **Parameters**

    points
        [array-like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.

    colors
        [array-like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.

    transform
        [matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_image(self, gc, x, y, im, transform=None)
    Draw an RGBA image.

    **Parameters**

    gc
x
[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y
[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

transform
[matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation (i.e., an Affine2DBase) may be passed to draw_image(). The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by transform).

draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)
Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to draw_path(). Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

marker_trans

trans
[matplotlib.transforms.Transform] An affine transform applied to the path.
**draw_path**(*self, gc, path, transform, rgbFace=None*)

Draw a `Path` instance using the given affine transform.

**draw_path_collection**(*self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position*)

Draw a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyles` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied.

`offset_position` may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of `draw_path_collection()` that makes multiple calls to `draw_path()`. Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods `_iter_collection_raw_paths()` and `_iter_collection()` are provided to help with (and standardize) the implementation across back-ends. It is highly recommended to use those generators, so that changes to the behavior of `draw_path_collection()` can be made globally.

**draw_quad_mesh**(*self, gc, master_transform, meshWidth, meshHeight, coordinates, offsets, offsetTrans, facecolors, antialiased, edgecolors*)

Fallback implementation of `draw_quad_mesh()` that generates paths and then calls `draw_path_collection()`.

**draw_tex**(*self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None*)

**draw_text**(*self, gc, x, y, s, prop, angle, ismath=False, mtext=None*)

Draw the text instance.

**Parameters**

- **gc**
  

- **x**
  
  [float] The x location of the text in display coords.

- **y**
  
  [float] The y location of the text baseline in display coords.

- **s**
  
  [str] The text string.

- **prop**
  
angle
[Float] The rotation angle in degrees anti-clockwise.

mtext
[matplotlib.text.Text] The original text object to be rendered.

Notes

Note for backend implementers:
When you are trying to determine if you have gotten your bounding box right
(which is what enables the text layout/alignment to work properly), it helps
to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

flipy(self)
Return whether y values increase from top to bottom.
Note that this only affects drawing of texts and images.

get_canvas_width_height(self)
Return the canvas width and height in display coords.

get_image_magnification(self)
Get the factor by which to magnify images passed to draw_image(). Allows a
backend to have images at a different resolution to other artists.

get_texmanager(self)
Return the TexManager instance.

get_text_width_height_descent(self, s, prop, ismath)
Get the width, height, and descent (offset from the bottom to the baseline),
in display coords, of the string s with FontProperties prop.

new_gc(self)
Return an instance of a GraphicsContextBase.

open_group(self, s, gid=None)
Open a grouping element with label s and gid (if set) as id.
Only used by the SVG renderer.

option_image_nocomposite(self)
Return whether image composition by Matplotlib should be skipped.
Raster backends should usually return False (letting the C-level rasterizer
take care of image composition); vector backends should usually return not
rcParams["image.composite_image"].
option_scale_image(self)
    Return whether arbitrary affine transformations in draw_image() are supported (True for most vector backends).

points_to_pixels(self, points)
    Convert points to display units.
    You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

    \[
    \text{points to pixels} = \text{points} \times \frac{\text{pixels per inch}}{72} \times \frac{\text{dpi}}{72}
    \]

    Parameters

    points
      [float or array-like] a float or a numpy array of float

    Returns

    Points converted to pixels

start_filter(self)
    Switch to a temporary renderer for image filtering effects.
    Currently only supported by the agg renderer.

start_rasterizing(self)
    Switch to the raster renderer.
    Used by MixedModeRenderer.

stop_filter(self, filter_func)
    Switch back to the original renderer. The contents of the temporary renderer is processed with the filter_func and is drawn on the original renderer as an image.
    Currently only supported by the agg renderer.

stop_rasterizing(self)
    Switch back to the vector renderer and draw the contents of the raster renderer as an image on the vector renderer.
    Used by MixedModeRenderer.

class matplotlib.backend_bases.ResizeEvent(name, canvas)
    Bases: matplotlib.backend_bases.Event
    An event triggered by a canvas resize
    In addition to the Event attributes, the following event attributes are defined:

    Attributes
**width**

[int] Width of the canvas in pixels.

**height**

[int] Height of the canvas in pixels.

class matplotlib.backend_bases.ShowBase

Bases: matplotlib.backend_bases._Backend

Simple base class to generate a show() function in backends.
Subclass must override mainloop() method.

class matplotlib.backend_bases.StatusbarBase(**kwargs)

Bases: object

[Deprecated] Base class for the statusbar.

**Notes**

Deprecated since version 3.3.

`set_message(self, s)`

Display a message on toolbar or in status bar.

**Parameters**

- `s`

  [str] Message text.

class matplotlib.backend_bases.TimerBase(interval=None, callbacks=None)

Bases: object

A base class for providing timer events, useful for things animations. Backends need to implement a few specific methods in order to use their own timing mechanisms so that the timer events are integrated into their event loops.

Subclasses must override the following methods:

- `_timer_start`: Backend-specific code for starting the timer.
- `_timer_stop`: Backend-specific code for stopping the timer.

Subclasses may additionally override the following methods:

- `_timer_set_single_shot`: Code for setting the timer to single shot operating mode, if supported by the timer object. If not, the Timer class itself will store the flag and the _on_timer method should be overridden to support such behavior.
- `_timer_set_interval`: Code for setting the interval on the timer, if there is a method for doing so on the timer object.
**on_timer**: The internal function that any timer object should call, which will handle the task of running all callbacks that have been set.

**Parameters**

**interval**

[int, default: 1000ms] The time between timer events in milliseconds. Will be stored as `timer.interval`.

**callbacks**

[List[Tuple[callable, Tuple, Dict]]] List of (func, args, kwargs) tuples that will be called upon timer events. This list is accessible as `timer.callbacks` and can be manipulated directly, or the functions `add_callback` and `remove_callback` can be used.

```python
add_callback(self, func, *args, **kwargs)
```

Register `func` to be called by timer when the event fires. Any additional arguments provided will be passed to `func`.

This function returns `func`, which makes it possible to use it as a decorator.

**property interval**

The time between timer events, in milliseconds.

```python
remove_callback(self, func, *args, **kwargs)
```

Remove `func` from list of callbacks.

`args` and `kwargs` are optional and used to distinguish between copies of the same function registered to be called with different arguments. This behavior is deprecated. In the future, `*args`, `**kwargs` won't be considered anymore; to keep a specific callback removable by itself, pass it to `add_callback` as a `functools.partial` object.

**property single_shot**

Whether this timer should stop after a single run.

```python
start(self, interval=None)
```

Start the timer object.

**Parameters**

**interval**

[int, optional] Timer interval in milliseconds; overrides a previously set interval if provided.

```python
stop(self)
```

Stop the timer.

```python
class matplotlib.backend_bases.ToolContainerBase(toolmanager)
```

Bases: `object`
Base class for all tool containers, e.g. toolbars.

**Attributes**

**toolmanager**

[ToolManager] The tools with which this ToolContainer wants to communicate.

```python
add_tool(self, tool, group, position=-1)
```
Add a tool to this container.

**Parameters**

- **tool**
  
  [tool_like] The tool to add, see ToolManager.get_tool.

- **group**
  
  [str] The name of the group to add this tool to.

- **position**
  
  [int, default: -1] The position within the group to place this tool.

```python
add_toolitem(self, name, group, position, image, description, toggle)
```
Add a tool item to the container.

This method must be implemented per backend.

The callback associated with the button click event, must be exactly `self.trigger_tool(name)`.

**Parameters**

- **name**
  
  [str] Name of the tool to add, this gets used as the tool’s ID and as the default label of the buttons.

- **group**
  
  [str] Name of the group that this tool belongs to.

- **position**
  
  [int] Position of the tool within its group, if -1 it goes at the end.

- **image_file**
  
  [str] Filename of the image for the button or None.

- **description**
  
  [str] Description of the tool, used for the tooltips.
**toggle**

[bool]

- **True**: The button is a toggle (change the pressed/unpressed state between consecutive clicks).
- **False**: The button is a normal button (returns to unpressed state after release).

```python
def remove_toolitem(self, name):
    Remove a toolitem from the ToolContainer.
    This method must get implemented per backend.
    Called when ToolManager emits a tool_removed_event.
```

**Parameters**

**name**

[str] Name of the tool to remove.

```python
def set_message(self, s):
    Display a message on the toolbar.
```

**Parameters**

**s**

[str] Message text.

```python
def toggle_toolitem(self, name, toggled):
    Toggle the toolitem without firing event.
```

**Parameters**

**name**

[str] Id of the tool to toggle.

**toggled**

[bool] Whether to set this tool as toggled or not.

```python
def trigger_tool(self, name):
    Trigger the tool.
```

**Parameters**

**name**

[str] Name (id) of the tool triggered from within the container.
matplotlib.backend_bases.button_press_handler(event, canvas=None, toolbar=None)

The default Matplotlib button actions for extra mouse buttons.

Parameters are as for \texttt{key_press_handler}, except that \texttt{event} is a \texttt{MouseEvent}.

matplotlib.backend_bases.get_registered_canvas_class(format)

Return the registered default canvas for given file format. Handles deferred import of required backend.

matplotlib.backend_bases.key_press_handler(event, canvas=None, toolbar=None)

Implement the default Matplotlib key bindings for the canvas and toolbar described at \textit{Navigation Keyboard Shortcuts}.

\textbf{Parameters}

\textbf{event}

\texttt{[KeyEvent]} A key press/release event.

\textbf{canvas}

\texttt{[FigureCanvasBase, default: event.canvas]} The backend-specific canvas instance. This parameter is kept for back-compatibility, but, if set, should always be equal to \texttt{event.canvas}.

\textbf{toolbar}

\texttt{[NavigationToolbar2, default: event.canvas.toolbar]} The navigation cursor toolbar. This parameter is kept for back-compatibility, but, if set, should always be equal to \texttt{event.canvas.toolbar}.

matplotlib.backend_bases.register_backend(format, backend, description=None)

Register a backend for saving to a given file format.

\textbf{Parameters}

\textbf{format}

\texttt{[str]} File extension

\textbf{backend}

\texttt{[module string or canvas class]} Backend for handling file output

\textbf{description}

\texttt{[str, default: "]"]} Description of the file type.
18.8 matplotlib.backend_managers

class matplotlib.backend_managers.ToolEvent(name, sender, tool, data=None)
    Bases: object
    Event for tool manipulation (add/remove).

class matplotlib.backend_managers.ToolManager(figure=None)
    Bases: object
    Manager for actions triggered by user interactions (key press, toolbar clicks, ...) on a Figure.

    Attributes

        figure
            [Figure] Figure that holds the canvas.

        keypresslock
            [LockDraw] LockDraw object to know if the canvas key_press_event is locked.

        messagelock
            [LockDraw] LockDraw object to know if the message is available to write.

    property active_toggle
        Currently toggled tools.

    add_tool(self, name, tool, *args, **kwargs)
        Add tool to ToolManager.
        If successful, adds a new event tool_trigger_{name} where {name} is the name of the tool; the event is fired every time the tool is triggered.

    Parameters

        name
            [str] Name of the tool, treated as the ID, has to be unique.

        tool
            [class_like, i.e. str or type] Reference to find the class of the Tool to added.

    See also:

        matplotlib.backend_tools.ToolBase
            The base class for tools.
Notes

args and kwargs get passed directly to the tools constructor.

property canvas
    Canvas managed by FigureManager.

property figure
    Figure that holds the canvas.

get_tool(self, name, warn=True)
    Return the tool object with the given name.

    For convenience, this passes tool objects through.

Parameters

name
    [str or ToolBase] Name of the tool, or the tool itself.

warn
    [bool, default: True] Whether a warning should be emitted if no tool with the given name exists.

Returns

ToolBase or None
    The tool or None if no tool with the given name exists.

get_tool_keymap(self, name)
    Return the keymap associated with the specified tool.

Parameters

name
    [str] Name of the Tool.

Returns

list of str
    List of keys associated with the tool.

message_event(self, message, sender=None)
    Emit a ToolManagerMessageEvent.

remove_tool(self, name)
    Remove tool named name.

Parameters
name

[str] Name of the tool.

set_figure(self, figure, update_tools=True)

Bind the given figure to the tools.

Parameters

figure

[Figure]

update_tools

[bool, default: True] Force tools to update figure.

toolmanager_connect(self, s, func)

Connect event with string s to func.

Parameters

s

[str] The name of the event. The following events are recognized:

• 'tool_message_event'
• 'tool_removed_event'
• 'tool_added_event'

For every tool added a new event is created

• 'tool_trigger_TOOLNAME', where TOOLNAME is the id of the tool.

func

[callable] Callback function for the toolmanager event with signature:

def func(event: ToolEvent) -> Any

Returns

cid

The callback id for the connection. This can be used in
toolmanager_disconnect.

toolmanager_disconnect(self, cid)

Disconnect callback id cid.
Example usage:

```python
cid = toolmanager.toolmanager_connect('tool_trigger_zoom', onpress)
#...later
toolmanager.toolmanager_disconnect(cid)
```

**property tools**
A dict mapping tool name -> controlled tool.

**trigger_tool**(self, name, sender=None, canvasevent=None, data=None)
Trigger a tool and emit the `tool_trigger_{name}` event.

**Parameters**

- **name**
  [str] Name of the tool.
- **sender**
  [object] Object that wishes to trigger the tool.
- **canvasevent**
  [Event] Original Canvas event or None.
- **data**
  [object] Extra data to pass to the tool when triggering.

**update_keymap**(self, name, key, *args)
Set the keymap to associate with the specified tool.

**Parameters**

- **name**
  [str] Name of the Tool.
- **keys**
  [str or list of str] Keys to associate with the tool.

**class matplotlib.backend_managers.ToolManagerMessageEvent**(name, sender, message)

**Bases:** object

Event carrying messages from toolmanager. Messages usually get displayed to the user by the toolbar.

**class matplotlib.backend_managers.ToolTriggerEvent**(name, sender, tool, canvasevent=None, data=None)

**Bases:** matplotlib.backend_managers.ToolEvent

Event to inform that a tool has been triggered.
18.9 matplotlib.backend_tools

Abstract base classes define the primitives for Tools. These tools are used by
matplotlib.backend_managers.ToolManager

ToolBase
Simple stateless tool

ToolToggleBase
Tool that has two states, only one Toggle tool can be active at any given time for
the same matplotlib.backend_managers.ToolManager
class matplotlib.backend_tools.AxisScaleBase(*args, **kwargs)
Bases: matplotlib.backend_tools.ToolToggleBase
Base Tool to toggle between linear and logarithmic.
disable(self, event)
Disable the toggle tool.

toggle call this method when toggled is True.

This can happen in different circumstances.
• Click on the toolbar tool button.
• Call to matplotlib.backend_managers.ToolManager.trigger_tool.
• Another ToolToggleBase derived tool is triggered (from the same
  ToolManager).

enable(self, event)
Enable the toggle tool.

toggle calls this method when toggled is False.

trigger(self, sender, event, data=None)
Calls enable or disable based on toggled value.
class matplotlib.backend_tools.ConfigureSubplotsBase(toolmanager, name)
Bases: matplotlib.backend_tools.ToolBase
Base tool for the configuration of subplots.
description = 'Configure subplots'
image = 'subplots'
class matplotlib.backend_tools.Cursors(value)
Bases: enum.IntEnum
Backend-independent cursor types.
HAND = 0
MOVE = 3
class matplotlib.backend_tools.RubberbandBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Draw and remove a rubberband.

draw_rubberband(self, *data)
    Draw rubberband.
    
    This method must get implemented per backend.

remove_rubberband(self)
    Remove rubberband.
    
    This method should get implemented per backend.

trigger(self, sender, event, data)
    Call draw_rubberband or remove_rubberband based on data.

class matplotlib.backend_tools.SaveFigureBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Base tool for figure saving.

default_keymap = ['s', 'ctrl+s']

description = 'Save the figure'

image = 'filesave'

class matplotlib.backend_tools.SetCursorBase(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolBase
    Change to the current cursor while inaxes.

    This tool, keeps track of all ToolToggleBase derived tools, and calls set_cursor
    when a tool gets triggered.

set_cursor(self, cursor)
    Set the cursor.
    
    This method has to be implemented per backend.

set_figure(self, figure)
    Assign a figure to the tool.

    Parameters

    figure
        [Figure]
class matplotlib.backend_tools.ToolBack(toolmanager, name)
    Bases: matplotlib.backend_tools.ViewsPositionsBase
    Move back up the view limits stack.
    default_keymap = ['left', 'c', 'backspace', 'MouseButton.BACK']
    description = 'Back to previous view'
    image = 'back'

class matplotlib.backend_tools.ToolBase(toolmanager, name)
    Bases: object
    Base tool class.
    A base tool, only implements trigger method or not method at all. The tool is instantiated by matplotlib.backend_managers.ToolManager.

    Attributes

    toolmanager
        [matplotlib.backend_managers.ToolManager] ToolManager that controls this Tool.

    figure
        [FigureCanvas] Figure instance that is affected by this Tool.

    name
        [str] Tool Id.

    property canvas

default_keymap = None
    Keymap to associate with this tool.

    String: List of comma separated keys that will be used to call this tool when the keypress event of self.figure.canvas is emitted.

    description = None
    Description of the Tool.

    String: If the Tool is included in the Toolbar this text is used as a Tooltip.

def destroy(self)
    Destroy the tool.

    This method is called when the tool is removed by matplotlib.backend_managers.ToolManager.remove_tool.

    property figure

    image = None
        Filename of the image.
**String:** Filename of the image to use in the toolbar. If None, the name is used as a label in the toolbar button.

**property name**
Tool Id.

**set_figure(self, figure)**
Assign a figure to the tool.

**Parameters**

- **figure**
  
  [Figure]

**property toolmanager**

**trigger(self, sender, event, data=None)**
Called when this tool gets used.

- This method is called by matplotlib.backend_managers.ToolManager.trigger_tool.

**Parameters**

- **event**
  
  [Event] The canvas event that caused this tool to be called.

- **sender**
  
  [object] Object that requested the tool to be triggered.

- **data**
  
  [object] Extra data.

**matplotlib.backend_tools.ToolCopyToClipboard**
alias of matplotlib.backend_tools.ToolCopyToClipboardBase

class matplotlib.backend_tools.ToolCopyToClipboardBase(toolmanager, name)
Bases: matplotlib.backend_tools.ToolBase

Tool to copy the figure to the clipboard.

- **default_keymap = ['ctrl+c', 'cmd+c']**
- **description = 'Copy the canvas figure to clipboard'**

**trigger(self, *args, **kwargs)**
Called when this tool gets used.

- This method is called by matplotlib.backend_managers.ToolManager.trigger_tool.

**Parameters**
event

[Event] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.ToolCursorPosition(*args, **kwargs)

Bases: matplotlib.backend_tools.ToolBase

Send message with the current pointer position.
This tool runs in the background reporting the position of the cursor.

send_message(self, event)

Call matplotlib.backend_managers.ToolManager.message_event.

set_figure(self, figure)

Assign a figure to the tool.

Parameters

figure

[Figure]

class matplotlib.backend_tools.ToolEnableAllNavigation(**kwargs)

Bases: matplotlib.backend_tools._ToolEnableAllNavigation

[Deprecated]

Notes

Deprecated since version 3.3:

class matplotlib.backend_tools.ToolEnableNavigation(**kwargs)

Bases: matplotlib.backend_tools._ToolEnableNavigation

[Deprecated]
Notes

Deprecated since version 3.3:

class matplotlib.backend_tools.ToolForward(toolmanager, name)
   Bases: matplotlib.backend_tools.ViewsPositionsBase
Move forward in the view lim stack.
   default_keymap = ['right', 'v', 'MouseButton.FORWARD']
   description = 'Forward to next view'
   image = 'forward'

class matplotlib.backend_tools.ToolFullScreen(*args, **kwargs)
   Bases: matplotlib.backend_tools.ToolToggleBase
   Tool to toggle full screen.
   default_keymap = ['f', 'ctrl+f']
   description = 'Toggle fullscreen mode'
   disable(self, event)
      Disable the toggle tool.
      trigger call this method when toggled is True.
      This can happen in different circumstances.
      • Click on the toolbar tool button.
      • Call to matplotlib.backend_managers.ToolManager.trigger_tool.
      • Another ToolToggleBase derived tool is triggered (from the same ToolManager).
   enable(self, event)
      Enable the toggle tool.
      trigger calls this method when toggled is False.

class matplotlib.backend_tools.ToolGrid(toolmanager, name)
   Bases: matplotlib.backend_tools.ToolBase
   Tool to toggle the major grids of the figure.
   default_keymap = ['g']
   description = 'Toggle major grids'
   trigger(self, sender, event, data=None)
      Called when this tool gets used.
      This method is called by matplotlib.backend_managers.ToolManager.trigger_tool.
      Parameters
event

[Event] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.

data

[object] Extra data.

class matplotlib.backend_tools.ToolHelpBase(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    default_keymap = ['f1']
    description = 'Print tool list, shortcuts and description'
    static formatShortcut(key_sequence)
        Converts a shortcut string from the notation used in rc config to the standard
        notation for displaying shortcuts, e.g. 'ctrl+a' -> 'Ctrl+A'.
    image = 'help'

class matplotlib.backend_tools.ToolHome(toolmanager, name)
    Bases: matplotlib.backend_tools.ViewsPositionsBase
    Restore the original view limits.
    default_keymap = ['h', 'r', 'home']
    description = 'Reset original view'
    image = 'home'

class matplotlib.backend_tools.ToolMinorGrid(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Tool to toggle the major and minor grids of the figure.
    default_keymap = ['G']
    description = 'Toggle major and minor grids'
    trigger(self, sender, event, data=None)
        Called when this tool gets used.
        This method is called by matplotlib.backend_managers.ToolManager.
        trigger_tool.

Parameters

event

[Event] The canvas event that caused this tool to be called.

sender

[object] Object that requested the tool to be triggered.
data

[object] Extra data.

class matplotlib.backend_tools.ToolPan(*args)
    Bases: matplotlib.backend_tools.ZoomPanBase
    Pan axes with left mouse, zoom with right.
    cursor = 3
    default_keymap = ['p']
    description = 'Pan axes with left mouse, zoom with right'
    image = 'move'
    radio_group = 'default'

class matplotlib.backend_tools.ToolQuit(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Tool to call the figure manager destroy method.
    default_keymap = ['ctrl+w', 'cmd+w', 'q']
    description = 'Quit the figure'
    trigger(self, sender, event, data=None)
        Called when this tool gets used.
        This method is called by matplotlib.backend_managers.ToolManager.
        trigger_tool.

    Parameters

    event
        [Event] The canvas event that caused this tool to be called.

    sender
        [object] Object that requested the tool to be triggered.

    data
        [object] Extra data.

class matplotlib.backend_tools.ToolQuitAll(toolmanager, name)
    Bases: matplotlib.backend_tools.ToolBase
    Tool to call the figure manager destroy method.
    default_keymap = []
    description = 'Quit all figures'
trigger(self, sender, event, data=None)
Called when this tool gets used.

This method is called by `matplotlib.backend_managers.ToolManager.trigger_tool`.

**Parameters**

- **event**
  - [Event] The canvas event that caused this tool to be called.
- **sender**
  - [object] Object that requested the tool to be triggered.
- **data**
  - [object] Extra data.

class matplotlib.backend_tools.ToolToggleBase(*args, **kwargs)

Bases: `matplotlib.backend_tools.ToolBase`

Toggleable tool.

Every time it is triggered, it switches between enable and disable.

**Parameters**

- **args**
  - Variable length argument to be used by the Tool.
- **kwargs**
  - `toggled` if present and True, sets the initial state of the Tool

Arbitrary keyword arguments to be consumed by the Tool

cursor = None
  Cursor to use when the tool is active.

default_toggled = False
  Default of toggled state.

disable(self, event=None)
Disable the toggle tool.

  `trigger` call this method when `toggled` is True.

  This can happen in different circumstances.
  
  - Click on the toolbar tool button.
  - Call to `matplotlibbackend_managers.ToolManager.trigger_tool`
  - Another `ToolToggleBase` derived tool is triggered (from the same `ToolManager`).
enable(self, event=None)
    Enable the toggle tool.

    trigger calls this method when toggled is False.

radio_group = None
    Attribute to group 'radio' like tools (mutually exclusive).

    String that identifies the group or None if not belonging to a group.

set_figure(self, figure)
    Assign a figure to the tool.

Parameters

    figure
        [Figure]

property toggled
    State of the toggled tool.

trigger(self, sender, event, data=None)
    Calls enable or disable based on toggled value.

class matplotlib.backend_tools.ToolViewsPositions(*args, **kwargs)
    Bases: matplotlib.backend_tools.ToolBase

    Auxiliary Tool to handle changes in views and positions.

    Runs in the background and should get used by all the tools that need to access
    the figure's history of views and positions, e.g.

    • ToolZoom
    • ToolPan
    • ToolHome
    • ToolBack
    • ToolForward

    add_figure(self, figure)
        Add the current figure to the stack of views and positions.

    back(self)
        Back one step in the stack of views and positions.

    clear(self, figure)
        Reset the axes stack.

    forward(self)
        Forward one step in the stack of views and positions.

    home(self)
        Recall the first view and position from the stack.
push_current(self, figure=None)
    Push the current view limits and position onto their respective stacks.

refresh_locators(self)
    [Deprecated] Redraw the canvases, update the locators.

Notes

Deprecated since version 3.3.

update_home_views(self, figure=None)
    Make sure that self.home_views has an entry for all axes present in the figure.

update_view(self)
    Update the view limits and position for each axes from the current stack position. If any axes are present in the figure that aren't in the current stack position, use the home view limits for those axes and don't update any positions.

class matplotlib.backend_tools.ToolXScale(*args, **kwargs)
    Bases: matplotlib.backend_tools.AxisScaleBase
    Tool to toggle between linear and logarithmic scales on the X axis.
    default_keymap = ['k', 'L']
    description = 'Toggle scale X axis'
    set_scale(self, ax, scale)

class matplotlib.backend_tools.ToolYScale(*args, **kwargs)
    Bases: matplotlib.backend_tools.AxisScaleBase
    Tool to toggle between linear and logarithmic scales on the Y axis.
    default_keymap = ['l']
    description = 'Toggle scale Y axis'
    set_scale(self, ax, scale)

class matplotlib.backend_tools.ToolZoom(*args)
    Bases: matplotlib.backend_tools.ZoomPanBase
    A Tool for zooming using a rectangle selector.
    cursor = 2
    default_keymap = ['o']
    description = 'Zoom to rectangle'
    image = 'zoom_to_rect'
    radio_group = 'default'
class matplotlib.backend_tools.ViewsPositionsBase(toolmanager, name)
Bases: matplotlib.backend_tools.ToolBase

Base class for ToolHome, ToolBack and ToolForward.

trigger(self, sender, event, data=None)
Called when this tool gets used.

This method is called by matplotlib.backend_managers.ToolManager.

trigger_tool

Parameters

event
  [Event] The canvas event that caused this tool to be called.

sender
  [object] Object that requested the tool to be triggered.

data
  [object] Extra data.

class matplotlib.backend_tools.ZoomPanBase(*args)
Bases: matplotlib.backend_tools.ToolToggleBase

Base class for ToolZoom and ToolPan.

disable(self, event)
Release the canvas and disconnect press/release events.

enable(self, event)
Connect press/release events and lock the canvas.

scroll_zoom(self, event)

trigger(self, sender, event, data=None)
Calls enable or disable based on toggled value.

matplotlib.backend_tools.add_tools_to_container(container, tools=[['navigation', ['home', 'back', 'forward']], ['zoom-pan', ['pan', 'zoom', 'subplots']], ['io', ['save', 'help']]])

Add multiple tools to the container.

Parameters

container
  [Container] backend_bases.ToolContainerBase object that will get the tools added.
tools

[list, optional] List in the form `[[group1, [tool1, tool2 ...]],
[group2, [...]]]` where the tools `[tool1, tool2, ...]` will display in group1. See add_tool for details.

```python
matplotlib.backend_tools.add_tools_to_manager(toolmanager,
    tools={'home': <class 'matplotlib.backend_tools.ToolHome'>,
           'back': <class 'matplotlib.backend_tools.ToolBack'>,
           'forward': <class 'matplotlib.backend_tools.ToolForward'>,
           'zoom': <class 'matplotlib.backend_tools.ToolZoom'>,
           'pan': <class 'matplotlib.backend_tools.ToolPan'>,
           'subplots': 'ToolConfigureSubplots', 'save': 'ToolSaveFigure',
           'grid': <class 'matplotlib.backend_tools.ToolGrid'>,
           'grid_minor': <class 'matplotlib.backend_tools.ToolMinorGrid'>,
           'fullscreen': <class 'matplotlib.backend_tools.ToolFullScreen'>,
           'quit': <class 'matplotlib.backend_tools.ToolQuit'>,
           'quit_all': <class 'matplotlib.backend_tools.ToolQuitAll'>,
           'allnav': <class 'matplotlib.backend_tools._ToolEnableAllNavigation'>,
           'nav': <class 'matplotlib.backend_tools._ToolEnableNavigation'>,
           'xscale': <class 'matplotlib.backend_tools.ToolXScale'>,
           'yscale': <class 'matplotlib.backend_tools.ToolYScale'>,
           'position': <class 'matplotlib.backend_tools.ToolCursorPosition'>,
           'viewpos': <class 'matplotlib.backend_tools.ToolViewsPositions'>,
           'cursor': 'ToolSetCursor', 'rubberband': 'ToolRubberband',
           'help': 'ToolHelp', 'copy': 'ToolCopyToClipboard'}
```

Add multiple tools to a `ToolManager`.

**Parameters**
toolmanager

[backend_managers.ToolManager] Manager to which the tools are added.

tools

[{str: class_like}, optional] The tools to add in a {name: tool} dict, see add_tool for more info.

matplotlib.backend_tools.cursors
alias of matplotlib.backend_tools.Cursors

matplotlib.backend_tools.default_toolbar_tools = [['navigation', ['home', 'back', 'forward']],
 Default tools in the toolbar

matplotlib.backend_tools.default_tools = {'allnav': <class 'matplotlib.backend_tools._ToolEnableAllNavigation'>,
 Default tools

18.10 matplotlib.backends

18.10.1 matplotlib.backends.backend_mixed

class matplotlib.backends.backend_mixed.MixedModeRenderer(figure, width,
height, dpi, vector_renderer,
raster_renderer_class=None,
bbox_inches_restore=None)
Bases: object
A helper class to implement a renderer that switches between vector and raster drawing. An example may be a PDF writer, where most things are drawn with PDF vector commands, but some very complex objects, such as quad meshes, are rasterised and then output as images.

Parameters

figure
[matplotlib.figure.Figure] The figure instance.

width
[scalar] The width of the canvas in logical units

height
[scalar] The height of the canvas in logical units

dpi
[float] The dpi of the canvas
**vector_renderer**

[matplotlib.backend_bases_RendererBase] An instance of a subclass of RendererBase that will be used for the vector drawing.

**raster_renderer_class**

[matplotlib.backend_bases_RendererBase] The renderer class to use for the raster drawing. If not provided, this will use the Agg backend (which is currently the only viable option anyway.)

```python
start_rasterizing(self)
```

Enter "raster" mode. All subsequent drawing commands (until **stop_rasterizing** is called) will be drawn with the raster backend.

```python
stop_rasterizing(self)
```

Exit "raster" mode. All of the drawing that was done since the last **start_rasterizing** call will be copied to the vector backend by calling **draw_image**. If **start_rasterizing** has been called multiple times, **stop_rasterizing** must be called the same number of times before "raster" mode is exited.

### 18.10.2 matplotlib.backends.backend_template

A fully functional, do-nothing backend intended as a template for backend writers. It is fully functional in that you can select it as a backend e.g. with

```python
import matplotlib
matplotlib.use("template")
```

and your program will (should!) run without error, though no output is produced. This provides a starting point for backend writers; you can selectively implement drawing methods (**draw_path**, **draw_image**, etc.) and slowly see your figure come to life instead having to have a full blown implementation before getting any results.

Copy this file to a directory outside of the Matplotlib source tree, somewhere where Python can import it (by adding the directory to your **sys.path** or by packaging it as a normal Python package); if the backend is importable as import my.backend you can then select it using

```python
import matplotlib
matplotlib.use("module://my.backend")
```

If your backend implements support for saving figures (i.e. has a **print_xyz** method), you can register it as the default handler for a given file type:

```python
from matplotlib.backend_bases import register_backend
register_backend('xyz', 'my_backend', 'XYZ File Format')
...
plt.savefig("figure.xyz")
The canvas the figure renders into. Calls the draw and print fig methods, creates the renderers, etc.

Note: GUI templates will want to connect events for button presses, mouse movements and key presses to functions that call the base class methods button_press_event, button_release_event, motion_notify_event, key_press_event, and key_release_event. See the implementations of the interactive backends for examples.

**Attributes**

**figure**

[matplotlib.figure.Figure] A high-level Figure instance

draw(self)

Draw the figure using the renderer.

get_default_filetype(self)

Return the default savefig file format as specified in rcParams['savefig.format'] (default: 'png').

The returned string does not include a period. This method is overridden in backends that only support a single file type.

print_foo(self, filename, *args, **kwargs)

Write out format foo. The dpi, facecolor and edgecolor are restored to their original values after this call, so you don’t need to save and restore them.
to it using a dictionary mapping styles to gdk constants. In Postscript, all the work is done by the renderer, mapping line styles to postscript calls.

If it's more appropriate to do the mapping at the renderer level (as in the postscript backend), you don't need to override any of the GC methods. If it's more appropriate to wrap an instance (as in the cairo backend) and do the mapping here, you'll need to override several of the setter methods.

The base GraphicsContext stores colors as a RGB tuple on the unit interval, e.g., (0.5, 0.0, 1.0). You may need to map this to colors appropriate for your backend.

class matplotlib.backends.backend_template.RendererTemplate(dpi)
Bases: matplotlib.backend_bases.RendererBase
The renderer handles drawing/rendering operations.
This is a minimal do-nothing class that can be used to get started when writing a new backend. Refer to backend_bases.RendererBase for documentation of the methods.

draw_image(self, gc, x, y, im)
Draw an RGBA image.

Parameters

- **gc**
  

- **x**
  
  [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

- **y**
  
  [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

- **im**
  

- **transform**
  
  [matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation (i.e., an Affine2DBase) may be passed to draw_image(). The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by transform).
draw_path(self, gc, path, transform, rgbFace=None)
    Draw a Path instance using the given affine transform.

draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
    Draw the text instance.

Parameters

gc

x
    [float] The x location of the text in display coords.

y
    [float] The y location of the text baseline in display coords.

s
    [str] The text string.

prop

angle
    [float] The rotation angle in degrees anti-clockwise.

mtext
    [matplotlib.text.Text] The original text object to be rendered.

Notes

Note for backend implementers:
When you are trying to determine if you have gotten your bounding box right
(which is what enables the text layout/alignment to work properly), it helps
to change the line in text.py:

    if 0: bbox_artist(self, renderer)

to if 1, and then the actual bounding box will be plotted along with your text.

flipy(self)
    Return whether y values increase from top to bottom.
    Note that this only affects drawing of texts and images.

get_canvas_width_height(self)
    Return the canvas width and height in display coords.
get_text_width_height_descent(self, s, prop, ismath)
Get the width, height, and descent (offset from the bottom to the baseline),
in display coords, of the string s with FontProperties prop.

new_gc(self)
Return an instance of a GraphicsContextBase.

points_to_pixels(self, points)
Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

points to pixels = points * pixels_per_inch/72 * dpi/72

Parameters

points
[float or array-like] a float or a numpy array of float

Returns

Points converted to pixels

matplotlib.backends.backend_template.draw_if_interactive()
For image backends - is not required. For GUI backends - this should be over-
ridden if drawing should be done in interactive python mode.

matplotlib.backends.backend_template.new_figure_manager(num, *args, Figure-
Class=<class 'matplotlib.figure.Figure'>, **kwargs)
Create a new figure manager instance.

Create a new figure manager instance for the given figure.

matplotlib.backends.backend_template.show(*, block=None)
For image backends - is not required. For GUI backends - show() is usually
the last line of a pyplot script and tells the backend that it is time to draw. In
interactive mode, this should do nothing.
18.10.3 `matplotlib.backends.backend_agg`

An `agg` backend.

Features that are implemented:

- capstyles and join styles
- dashes
- linewidth
- lines, rectangles, ellipses
- clipping to a rectangle
- output to RGBA and Pillow-supported image formats
- alpha blending
- DPI scaling properly - everything scales properly (dashes, linewidths, etc)
- draw polygon
- freetype2 w/ ft2font

TODO:
- integrate screen dpi w/ ppi and text

```python
matplotlib.backends.backend_agg.FigureCanvas
    alias of `matplotlib.backends.backend_agg.FigureCanvasAgg`

class matplotlib.backends.backend_agg.FigureCanvasAgg(figure)
    Bases: `matplotlib.backend_bases.FigureCanvasBase`

    `buffer_rgba(self)`
        Get the image as a memoryview to the renderer's buffer.

        `draw` must be called at least once before this function will work and to update
        the renderer for any subsequent changes to the Figure.

    `copy_from_bbox(self, bbox)`

    `draw(self)`
        Render the `Figure`.

    `get_renderer(self, cleared=False)`

    `print_jpeg(self, filename_or_obj, *args, dryrun=<deprecated parameter>,
                 pil_kwargs=None, **kwargs)`
        Write the figure to a JPEG file.

        **Parameters**

        **filename_or_obj**
            [str or path-like or file-like] The file to write to.
```
Other Parameters

quality

[int, default: $rcParams['savefig.jpeg_quality']$ (default: 95)]
The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality. This parameter is deprecated.

optimize

[bool, default: False] Whether the encoder should make an extra pass over the image in order to select optimal encoder settings. This parameter is deprecated.

progressive

[bool, default: False] Whether the image should be stored as a progressive JPEG file. This parameter is deprecated.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to `PIL.Image.Image.save` when saving the figure. These take precedence over `quality`, `optimize` and `progressive`.

```
print_jpg(self, filename_or_obj, *args, dryrun=<deprecated parameter>, pil_kwargs=None, **kwargs)
```

Write the figure to a JPEG file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

Other Parameters

quality

[int, default: $rcParams['savefig.jpeg_quality']$ (default: 95)]
The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality. This parameter is deprecated.

optimize

[bool, default: False] Whether the encoder should make an extra pass over the image in order to select optimal encoder settings. This parameter is deprecated.
progressive

[bool, default: False] Whether the image should be stored as a progressive JPEG file. This parameter is deprecated.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to PIL.Image.Image.save when saving the figure. These take precedence over quality, optimize and progressive.

print_png(self, filename_or_obj, *args, metadata=None, pil_kwargs=None)

Write the figure to a PNG file.

Parameters

filename_or_obj

[str or path-like or file-like] The file to write to.

metadata

[dict, optional] Metadata in the PNG file as key-value pairs of bytes or latin-1 encodable strings. According to the PNG specification, keys must be shorter than 79 chars.

The PNG specification defines some common keywords that may be used as appropriate:

• Title: Short (one line) title or caption for image.
• Author: Name of image's creator.
• Description: Description of image (possibly long).
• Copyright: Copyright notice.
• Creation Time: Time of original image creation (usually RFC 1123 format).
• Software: Software used to create the image.
• Disclaimer: Legal disclaimer.
• Warning: Warning of nature of content.
• Source: Device used to create the image.
• Comment: Miscellaneous comment; conversion from other image format.

Other keywords may be invented for other purposes.

If 'Software' is not given, an autogenerated value for Matplotlib will be used. This can be removed by setting it to None.

For more details see the PNG specification.
**pil_kwargs**

If the 'pnginfo' key is present, it completely overrides metadata, including the default 'Software' key.

```python
print_raw(self, filename_or_obj, *args)
print_rgba(self, filename_or_obj, *args)
print_tif(self, filename_or_obj, *, dryrun=<deprecated parameter>, pil_kwargs=None)
print_tiff(self, filename_or_obj, *, dryrun=<deprecated parameter>, pil_kwargs=None)
print_to_buffer(self)
restore_region(self, region, bbox=None, xy=None)
tostring_argb(self)
    Get the image as ARGB bytes.

draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.
tostring_rgb(self)
    Get the image as RGB bytes.

draw must be called at least once before this function will work and to update the renderer for any subsequent changes to the Figure.
```

class matplotlib.backends.backend_agg.RendererAgg(width, height, dpi)

Bases: matplotlib.backend_bases.RendererBase

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles

```python
buffer_rgba(self)
clear(self)
draw_mathtext(self, gc, x, y, s, prop, angle)
    Draw mathtext using `matplotlib.mathtext`.
draw_path(self, gc, path, transform, rgbFace=None)
    Draw a `Path` instance using the given affine transform.
draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)
    Draw a collection of paths selecting drawing properties from the lists `facecolors`, `edgecolors`, `linewidths`, `linestyles` and `antialiaseds`. `offsets` is a list of offsets to apply to each of the paths. The offsets in `offsets` are first transformed by `offsetTrans` before being applied.
```
offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of draw_path_collection() that makes multiple calls to draw_path(). Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods _iter_collection_raw_paths() and _iter_collection() are provided to help with (and standardize) the implementation across back-ends. It is highly recommended to use those generators, so that changes to the behavior of draw_path_collection() can be made globally.

Parameters

gc

x
[float] The x location of the text in display coords.

y
[float] The y location of the text baseline in display coords.

s
[str] The text string.

prop

angle
[float] The rotation angle in degrees anti-clockwise.

mtext
[matplotlib.text.Text] The original text object to be rendered.
Notes

Note for backend implementers:
When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

get_canvas_width_height(self)
Return the canvas width and height in display coords.

get_text_width_height_descent(self, s, prop, ismath)
Get the width, height, and descent (offset from the bottom to the baseline), in display coords, of the string s with FontProperties prop.

lock = <unlocked _thread.RLock object owner=0 count=0>

option_image_nocomposite(self)
Return whether image composition by Matplotlib should be skipped.

Raster backends should usually return False (letting the C-level rasterizer take care of image composition); vector backends should usually return not rcParams["image.composite_image"].

option_scale_image(self)
Return whether arbitrary affine transformations in draw_image() are supported (True for most vector backends).

points_to_pixels(self, points)
Convert points to display units.

You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:

```plaintext
points to pixels = points * pixels_per_inch/72 * dpi/72
```

Parameters

points
[float or array-like] a float or a numpy array of float

Returns

Points converted to pixels
**restore_region(self, region, bbox=None, xy=None)**

Restore the saved region. If bbox (instance of BboxBase, or its extents) is given, only the region specified by the bbox will be restored. xy (a pair of floats) optionally specifies the new position (the LLC of the original region, not the LLC of the bbox) where the region will be restored.

```python
>>> region = renderer.copy_from_bbox()
>>> x1, y1, x2, y2 = region.get_extents()
>>> renderer.restore_region(region, bbox=(x1+dx, y1, x2, y2),
                           xy=(x1-dx, y1))
```

**start_filter(self)**

Start filtering. It simply create a new canvas (the old one is saved).

**stop_filter(self, post_processing)**

Save the plot in the current canvas as a image and apply the post_processing function.

```python
def post_processing(image, dpi):
    # ny, nx, depth = image.shape # image (numpy array) has RGBA channels and has a depth of 4. ... # create a new_image (numpy array of 4 channels, size can be # different). The resulting image may have offsets from # lower-left corner of the original image return new_image, offset_x, offset_y

    The saved renderer is restored and the returned image from post_processing is plotted (using draw_image) on it.
```

**tostring_argb(self)**

**tostring_rgb(self)**

**tostring_rgba_minimized(self)**

```
matplotlib.backends.backend_agg.get_hinting_flag()
```

### 18.10.4 matplotlib.backends.backend_cairo

**A Cairo backend for matplotlib**

**Author**

Steve Chaplin and others

This backend depends on cairocffi or pycairo.

```
matplotlib.backends.backend_cairo.FigureCanvas
    alias of matplotlib.backends.backend_cairo.FigureCanvasCairo

class matplotlib.backends.backend_cairo.FigureCanvasCairo(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase

copy_from_bbox(self, bbox)
```

18.10. matplotlib.backends

1609
print_pdf(self, fobj, *args, **kwargs)
print_png(self, fobj)
print_ps(self, fobj, *args, **kwargs)
print_raw(self, fobj)
print_rgb(self, fobj)
print_rgba(self, fobj)
print_svg(self, fobj, *args, **kwargs)
print_svgz(self, fobj, *args, **kwargs)
restore_region(self, region)

class matplotlib.backends.backend_cairo.GraphicsContextCairo(renderer)
    Bases: matplotlib.backend_bases.GraphicsContextBase

get_rgb(self)
    Return a tuple of three or four floats from 0-1.
restore(self)
    Restore the graphics context from the stack - needed only for backends that
    save graphics contexts on a stack.
set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.
    If alpha=None (the default), the alpha components of the foreground and fill
    colors will be used to set their respective transparencies (where applicable);
    otherwise, alpha will override them.
set_capstyle(self, cs)
    Set the capstyle to be one of ('butt', 'round', 'projecting').
set_clip_path(self, path)
    Set the clip path and transformation.

    Parameters

    path
        [TransformedPath or None]

set_clip_rectangle(self, rectangle)
    Set the clip rectangle with sequence (left, bottom, width, height)

set_dashes(self, offset, dashes)
    Set the dash style for the gc.

    Parameters

    dash_offset
        [float or None] The offset (usually 0).
**dash_list**

[array-like or None] The on-off sequence as points.

**Notes**

(None, None) specifies a solid line.

See p. 107 of to PostScript blue book for more info.

```
set_foreground(self, fg, isRGBA=None)
```

Set the foreground color.

**Parameters**

- **fg**
  - [color]
- **isRGBA**
  - [bool] If `fg` is known to be an (r, g, b, a) tuple, `isRGBA` can be set to True to improve performance.

```
set_joinstyle(self, js)
```

Set the join style to be one of ('miter', 'round', 'bevel').

```
set_linewidth(self, w)
```

Set the linewidth in points.

```
class matplotlib.backends.backend_cairo.RendererCairo
```

Bases: matplotlib.backend_bases.RendererBase

```
draw_image(self, gc, x, y, im)
```

Draw an RGBA image.

**Parameters**

- **gc**
- **x**
  - [scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.
- **y**
  - [scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
im

transform
[matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation (i.e., an Affine2DBase) may be passed to draw_image(). The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override $x$ and $y$, and has to be applied before translating the result by $x$ and $y$ (this can be accomplished by adding $x$ and $y$ to the translation vector defined by transform).

draw_markers(self, gc, marker_path, marker_trans, path, transform, rgbFace=None)
Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to draw_path(). Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

marker_trans

transform
[matplotlib.transforms.Transform] An affine transform applied to the path.

draw_path(self, gc, path, transform, rgbFace=None)
Draw a Path instance using the given affine transform.

draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
Draw the text instance.

Parameters

gc
x
  [float] The x location of the text in display coords.

y
  [float] The y location of the text baseline in display coords.

s
  [str] The text string.

prop

angle
  [float] The rotation angle in degrees anti-clockwise.

mtext
  [matplotlib.text.Text] The original text object to be rendered.

Notes

Note for backend implementers:
When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

    if 0: bbox_artist(self, renderer)

    to if 1, and then the actual bounding box will be plotted along with your text.

property fontangles
property fontweights

gc
    return an instance of a GraphicsContextBase.

points_to_pixels
    Convert points to display units.

    You need to override this function (unless your backend doesn't have a dpi, e.g., postscript or svg). Some imaging systems assume some value for pixels per inch:
points to pixels = points * pixels_per_inch/72 * dpi/72

**Parameters**

**points**

[float or array-like] a float or a numpy array of float

**Returns**

Points converted to pixels

```python
set_ctx_from_surface(self, surface)
set_width_height(self, width, height)
```

18.10.5 matplotlib.backends.backend_gtk3agg

**TODO** We'll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

18.10.6 matplotlib.backends.backend_gtk3cairo

**TODO** We'll add this later, importing the gtk3 backends requires an active X-session, which is not compatible with cron jobs.

18.10.7 matplotlib.backends.backend_nbagg

Interactive figures in the IPython notebook

```python
class matplotlib.backends.backend_nbagg.CommSocket(manager)
    Bases: object
    Manages the Comm connection between IPython and the browser (client).
    Comms are 2 way, with the CommSocket being able to publish a message via
    the send_json method, and handle a message with on_message. On the JS side
    figure.send_message and figure.ws.onmessage do the sending and receiving re-
    spectively.
    is_open(self)
    on_close(self)
    on_message(self, message)
    send_binary(self, blob)
    send_json(self, content)
```
matplotlib.backends.backend_nbagg.

FigureCanvas
alias of matplotlib.backends.backend_nbagg.FigureCanvasNbAgg

class matplotlib.backends.backend_nbagg.FigureCanvasNbAgg(*args, **kwargs)
Bases: matplotlib.backends.backend_webagg_core.FigureCanvasWebAggCore

matplotlib.backends.backend_nbagg.

FigureManager
alias of matplotlib.backends.backend_nbagg.FigureManagerNbAgg

class matplotlib.backends.backend_nbagg.FigureManagerNbAgg(canvas, num)
Bases: matplotlib.backends.backend_webagg_core.FigureManagerWebAgg

ToolbarCls
alias of NavigationIPy

clearup_closed(self)
Clear up any closed Comms.

property connected

destroy(self)

display_js(self)

classmethod get_javascript(stream=None)

remove_comm(self, comm_id)

reshow(self)
A special method to re-show the figure in the notebook.

show(self)
For GUI backends, show the figure window and redraw. For non-GUI back-ends, raise an exception, unless running headless (i.e. on Linux with an unset DISPLAY); this exception is converted to a warning in Figure.show.

class matplotlib.backends.backend_nbagg.NavigationIPy(canvas)
Bases: matplotlib.backends.backend_webagg_core.NavigationToolbar2WebAgg

toolitems = [('Home', 'Reset original view', 'fa fa-home icon-home', 'home'), ('Back', 'Back to previous view', 'fa fa-arrow-left', 'arrow_left')]  

matplotlib.backends.backend_nbagg.

class matplotlib.backends.backend_nbagg.new_figure_manager_given_figure(num, figure)
Create a new figure manager instance for the given figure.

matplotlib.backends.backend_nbagg.show(block=None)
Show all figures.

show blocks by calling mainloop if block is True, or if it is None and we are neither in IPython's %pylab mode, nor in interactive mode.
18.10.8 matplotlib.backends.backend_pdf

A PDF matplotlib backend Author: Jouni K Seppänen <jks@iki.fi>

matplotlib.backends.backend_pdf.FigureCanvas
   alias of matplotlib.backends.backend_pdf.FigureCanvasPdf

class matplotlib.backends.backend_pdf.FigureCanvasPdf(figure)
   Bases: matplotlib.backend_bases.FigureCanvasBase

   The canvas the figure renders into. Calls the draw and print fig methods, creates
   the renderers, etc...

   Attributes

   figure
      [matplotlib.figure.Figure] A high-level Figure instance

   filetypes = {'pdf': 'Portable Document Format'}

   fixed_dpi = 72

   get_default_filetype(self)
      Return the default savefig file format as specified in rcParams["savefig.
      format"] (default: 'png').
      The returned string does not include a period. This method is overridden in
      backends that only support a single file type.

   print_pdf(self, filename, *, dpi=72, bbox_inches_restore=None, meta-
   data=None)

class matplotlib.backends.backend_pdf.GraphicsContextPdf(file)
   Bases: matplotlib.backend_bases.GraphicsContextBase

   alpha_cmd(self, alpha, forced, effective_alphas)

   capstyle_cmd(self, style)

   capstyles = {'butt': 0, 'projecting': 2, 'round': 1}

   clip_cmd(self, cliprect, clippath)
      Set clip rectangle. Calls pop() and push().

   copy_properties(self, other)
      Copy properties of other into self.

   dash_cmd(self, dashes)

   delta(self, other)
      Copy properties of other into self and return PDF commands needed to
      transform self into other.
fill(self, *args)
    Predicate: does the path need to be filled?
    An optional argument can be used to specify an alternative _fillcolor, as
    needed by RendererPdf.draw_markers.

fillcolor_cmd(self, rgb)

finalize(self)
    Make sure every pushed graphics state is popped.

hatch_cmd(self, hatch, hatch_color)

joinstyle_cmd(self, style)
joinstyles = {'bevel': 2, 'miter': 0, 'round': 1}

linewidth_cmd(self, width)

paint(self)
    Return the appropriate pdf operator to cause the path to be stroked, filled,
    or both.

pop(self)
push(self)
rgb_cmd(self, rgb)

stroke(self)
    Predicate: does the path need to be stroked (its outline drawn)? This tests
    for the various conditions that disable stroking the path, in which case it
    would presumably be filled.

class matplotlib.backends.backend_pdf.Name(name)
    Bases: object
    PDF name object.
    static hexify(match)
    name
    pdfRepr(self)

class matplotlib.backends.backend_pdf.Operator(op)
    Bases: object
    PDF operator object.
    op
    pdfRepr(self)

class matplotlib.backends.backend_pdf.PdfFile(filename, metadata=None)
    Bases: object
    PDF file object.
filename

[str or path-like or file-like] Output target; if a string, a file will be opened for writing.

metadata

[dict from strings to strings and dates] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.: {'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to None.

addGouraudTriangles(\texttt{self}, \texttt{points}, \texttt{colors})

Add a Gouraud triangle shading.

Parameters

points

[np.ndarray] Triangle vertices, shape (n, 3, 2) where n = number of triangles, 3 = vertices, 2 = x, y.

colors

[np.ndarray] Vertex colors, shape (n, 3, 1) or (n, 3, 4) as with points, but last dimension is either (gray,) or (r, g, b, alpha).

Returns

Name, Reference

alphaState(\texttt{self}, \texttt{alpha})

Return name of an ExtGState that sets alpha to the given value.

beginStream(\texttt{self}, \texttt{id}, \texttt{len}, \texttt{extra=None}, \texttt{png=None})

close(\texttt{self})

Flush all buffers and free all resources.

createType1Descriptor(\texttt{self}, \texttt{t1font}, \texttt{fontfile})

dviFontName(\texttt{self}, \texttt{dvifont})

Given a dvi font object, return a name suitable for Op.selectfont. This registers the font information in self.dviFontInfo if not yet registered.

embedTTF(\texttt{self}, \texttt{filename}, \texttt{characters})

Embed the TTF font from the named file into the document.

endStream(\texttt{self})
finalize(self)
    Write out the various deferred objects and the pdf end matter.

fontName(self, fontprop)
    Select a font based on fontprop and return a name suitable for Op.selectfont.
    If fontprop is a string, it will be interpreted as the filename of the font.

hatchPattern(self, hatch_style)

imageObject(self, image)
    Return name of an image XObject representing the given image.

markerObject(self, path, trans, fill, stroke, lw, joinstyle, capstyle)
    Return name of a marker XObject representing the given path.

newPage(self, width, height)

newTextnote(self, text, positionRect=[-100, -100, 0, 0])

output(self, *data)

pathCollectionObject(self, gc, path, trans, padding, filled, stroked)

static pathOperations(path, transform, clip=None, simplify=None, sketch=None)

recordXref(self, id)

reserveObject(self, name='')
    Reserve an ID for an indirect object.
    The name is used for debugging in case we forget to print out the object
    with writeObject.

property used_characters

write(self, data)

writeExtGSTATes(self)

writeFonts(self)

writeGouraudTriangles(self)

writeHatches(self)

writeImages(self)

writeInfoDict(self)
    Write out the info dictionary, checking it for good form

writeMarkers(self)

writeObject(self, object, contents)

writePath(self, path, transform, clip=False, sketch=None)

writePathCollectionTemplates(self)
writeTrailer(self)
    Write out the PDF trailer.

writeXref(self)
    Write out the xref table.

class matplotlib.backends.backend_pdf.PdfPages(filename, keep_empty=True, metadata=None)
    Bases: object
    A multi-page PDF file.

Notes

In reality PdfPages is a thin wrapper around PdfFile, in order to avoid confusion when using savefig and forgetting the format argument.

Examples

>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...     # As many times as you like, create a figure fig and save it:
...     fig = plt.figure()
...     pdf.savefig(fig)
...     # When no figure is specified the current figure is saved
...     pdf.savefig()

Create a new PdfPages object.

Parameters

filename
    [str or path-like or file-like] Plots using PdfPages.savefig will be written to a file at this location. The file is opened at once and any older file with the same name is overwritten.

keep_empty
    [bool, optional] If set to False, then empty pdf files will be deleted automatically when closed.

metadata
    [dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.:

    {'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}.

    The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'.

1620 Chapter 18. Modules
Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to None.

```
attach_note(self, text, positionRect=[-100, -100, 0, 0])
```
Add a new text note to the page to be saved next. The optional positionRect specifies the position of the new note on the page. It is outside the page per default to make sure it is invisible on printouts.

```
close(self)
```
Finalize this object, making the underlying file a complete PDF file.

```
get_pagecount(self)
```
Return the current number of pages in the multipage pdf file.

```
infodict(self)
```
Return a modifiable information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary').

```
keep_empty
```

```
savefig(self, figure=None, **kwargs)
```
Save a Figure to this file as a new page.

Any other keyword arguments are passed to savefig.

**Parameters**

**figure**

[Figure or int, optional] Specifies what figure is saved to file. If not specified, the active figure is saved. If a Figure instance is provided, this figure is saved. If an int is specified, the figure instance to save is looked up by number.

```
class matplotlib.backends.backend_pdf.Reference(id)
```
Bases: object

PDF reference object.

Use PdfFile.reserveObject() to create References.

```
pdfRepr(self)
```

```
write(self, contents, file)
```

```
class matplotlib.backends.backend_pdf.RendererPdf(file, image_dpi, height, width)
```
Bases: matplotlib.backends._backend_pdf_ps.RendererPDFPSBase

```
check_gc(self, gc, fillcolor=None)
```

```
draw_gouraud_triangle(self, gc, points, colors, trans)
```
Draw a Gouraud-shaded triangle.

**Parameters**
draw_gouraud_triangles(self, gc, points, colors, trans)
Draw a series of Gouraud triangles.

Parameters

points
[array-like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.

colors
[array-like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.

transform
[matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_image(self, gc, x, y, im, transform=None)
Draw an RGBA image.

Parameters

gc

x
[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y
[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.
im

transform

[matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that `option_scale_image()` returns True, an affine transformation (i.e., an Affine2DBase) may be passed to `draw_image()`. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by `transform`).

draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)

Draw a marker at each of the vertices in path.
This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.
This provides a fallback implementation of `draw_markers` that makes multiple calls to `draw_path()`. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

marker_trans

trans

[matplotlib.transforms.Transform] An affine transform applied to the path.

draw_mathtext(self, gc, x, y, s, prop, angle)

draw_path(self, gc, path, transform, rgbFace=None)

Draw a Path instance using the given affine transform.

draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)

Draw a collection of paths selecting drawing properties from the lists facecolors, edgecolors, linewidths, linestyles and antialiaseds. offsets is a list of
offsets to apply to each of the paths. The offsets in offsets are first transformed by offsetTrans before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of draw_path_collection() that makes multiple calls to draw_path(). Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods _iter_collection_raw_paths() and _iter_collection() are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of draw_path_collection() can be made globally.

draw_text(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None)
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
Draw the text instance.

Parameters

gc
x
[float] The x location of the text in display coords.
y
[float] The y location of the text baseline in display coords.
s
[str] The text string.
prop
age
[float] The rotation angle in degrees anti-clockwise.
mtext
[matplotlib.text.Text] The original text object to be rendered.
Notes

Note for backend implementers:
When you are trying to determine if you have gotten your bounding box right
(which is what enables the text layout/alignment to work properly), it helps
to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

encode_string(self, s, fonttype)
finalize(self)
get_image_magnification(self)
    Get the factor by which to magnify images passed to `draw_image()`. Allows a
    backend to have images at a different resolution to other artists.
merge_used_characters(self, *args, **kwargs)
    [Deprecated]

Notes

Deprecated since version 3.3:

new_gc(self)
    Return an instance of a `GraphicsContextBase`.
track_characters(self, *args, **kwargs)
    [Deprecated] Keep track of which characters are required from each font.

Notes

Deprecated since version 3.3.

class matplotlib.backends.backend_pdf.Stream(id, len, file, extra=None, png=None)
Bases: object
PDF stream object.
This has no pdfRepr method. Instead, call begin(), then output the contents of
the stream by calling write(), and finally call end().

Parameters

id
    [int] Object id of the stream.
len

[Reference or None] An unused Reference object for the length of the stream; None means to use a memory buffer so the length can be inlined.

file

[PdfFile] The underlying object to write the stream to.

extra

[dict from Name to anything, or None] Extra key-value pairs to include in the stream header.

png

[dict or None] If the data is already png encoded, the decode parameters.

compressobj

def end(self):
    Finalize stream.
extra
file
id
len
pdfFile
pos

def write(self, data):
    Write some data on the stream.

class matplotlib.backends.backend_pdf.Verbatim(x):
    Bases: object
    Store verbatim PDF command content for later inclusion in the stream.

def pdfRepr(self):

matplotlib.backends.backend_pdf.fill(strings, linelen=75)
    Make one string from sequence of strings, with whitespace in between.
    The whitespace is chosen to form lines of at most linelen characters, if possible.

def pdfRepr(obj):
    Map Python objects to PDF syntax.
18.10.9 matplotlib.backends.backend_pgf

matplotlib.backends.backend_pgf.FigureCanvas
alias of matplotlib.backends.backend_pgf.FigureCanvasPgf

class matplotlib.backends.backend_pgf.FigureCanvasPgf(figure)
Bases: matplotlib.backend_bases.FigureCanvasBase

filetypes = {'pdf': 'LaTeX compiled PGF picture', 'pgf': 'LaTeX PGF picture', 'png': 'Portable Network Graphics'}

get_default_filetype(self)
Return the default savefig file format as specified in rcParams['savefig.format'] (default: 'png').
The returned string does not include a period. This method is overridden in backends that only support a single file type.

get_renderer(self)

print_pdf(self, fname_or_fh, *args, **kwargs)
Use LaTeX to compile a Pgf generated figure to PDF.

print_pgf(self, fname_or_fh, *args, **kwargs)
Output pgf macros for drawing the figure so it can be included and rendered in latex documents.

print_png(self, fname_or_fh, *args, **kwargs)
Use LaTeX to compile a pgf figure to pdf and convert it to png.

class matplotlib.backends.backend_pgf.GraphicsContextPgf(**kwargs)
Bases: matplotlib.backend_bases.GraphicsContextBase

[Deprecated]

Notes

Deprecated since version 3.3:

extension matplotlib.backends.backend_pgf.LatexError(message, latex_output='')
Bases: Exception

class matplotlib.backends.backend_pgf.LatexManager
Bases: object

The LatexManager opens an instance of the LaTeX application for determining the metrics of text elements. The LaTeX environment can be modified by setting fonts and/or a custom preamble in rcParams.

get_width_height_descent(self, text, prop)
Get the width, total height and descent for a text typeset by the current LaTeX environment.
latex_stdin_utf8(self)
[Deprecated]

Notes

Deprecated since version 3.3:

class matplotlib.backends.backend_pgf.PdfPages(filename, *, keep_empty=True, metadata=None)

Bases: object

A multi-page PDF file using the pgf backend

Examples

```python
>>> import matplotlib.pyplot as plt
>>> # Initialize:
>>> with PdfPages('foo.pdf') as pdf:
...    # As many times as you like, create a figure fig and save it:
...    fig = plt.figure()
...    pdf.savefig(fig)
...    # When no figure is specified the current figure is saved
...    pdf.savefig()
```

Create a new PdfPages object.

Parameters

filename

[str or path-like] Plots using `PdfPages.savefig` will be written to a file at this location. Any older file with the same name is overwritten.

keep_empty

[bool, default: True] If set to False, then empty pdf files will be deleted automatically when closed.

metadata

[dict, optional] Information dictionary object (see PDF reference section 10.2.1 'Document Information Dictionary'), e.g.:

dictionary = {'Creator': 'My software', 'Author': 'Me', 'Title': 'Awesome'}.

The standard keys are 'Title', 'Author', 'Subject', 'Keywords', 'Creator', 'Producer', 'CreationDate', 'ModDate', and 'Trapped'. Values have been predefined for 'Creator', 'Producer' and 'CreationDate'. They can be removed by setting them to None.
close(self)
    Finalize this object, running LaTeX in a temporary directory and moving the
    final pdf file to filename.

get_pagecount(self)
    Return the current number of pages in the multipage pdf file.

keep_empty
    property metadata

savefig(self, figure=None, **kwargs)
    Save a Figure to this file as a new page.

    Any other keyword arguments are passed to savefig.

    Parameters

    figure
        [Figure or int, optional] Specifies what figure is saved to file. If
        not specified, the active figure is saved. If a Figure instance is
        provided, this figure is saved. If an int is specified, the figure
        instance to save is looked up by number:

class matplotlib.backends.backend_pgf.RendererPgf(figure, fh,
         dummy=<deprecated parameter>)

    Bases: matplotlib.backend_bases.RendererBase

    Create a new PGF renderer that translates any drawing instruction into text
    commands to be interpreted in a latex pgfpicture environment.

    Attributes

    figure
        [matplotlib.figure.Figure] Matplotlib figure to initialize height,
        width and dpi from.

    fh
        [file-like] File handle for the output of the drawing commands.

draw_image(self, gc, x, y, im, transform=None)
    Draw an RGBA image.

    Parameters

    gc
        [GraphicsContextBase] A graphics context with clipping informa-
        tion.
\textbf{x}  
[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

\textbf{y}  
[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

\textbf{im}  

\textbf{transform}  
[matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that \texttt{option_scale_image()} returns True, an affine transformation (i.e., an Affine2DBase) may be passed to \texttt{draw_image()}. The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override \texttt{x} and \texttt{y}, and has to be applied \texttt{before} translating the result by \texttt{x} and \texttt{y} (this can be accomplished by adding \texttt{x} and \texttt{y} to the translation vector defined by \texttt{transform}).

\texttt{draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)}  
Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of \texttt{draw_markers} that makes multiple calls to \texttt{draw_path()}. Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

\textbf{Parameters}  

\textbf{gc}  

\textbf{marker_trans}  

\textbf{trans}  
[matplotlib.transforms.Transform] An affine transform applied to the path.
draw_path(self, gc, path, transform, rgbFace=None)
    Draw a Path instance using the given affine transform.

draw_tex(self, gc, x, y, s, prop, angle, ismath='TeX', mtext=None)

draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
    Draw the text instance.

Parameters

gc

x
    [float] The x location of the text in display coords.

y
    [float] The y location of the text baseline in display coords.

s
    [str] The text string.

prop

angle
    [float] The rotation angle in degrees anti-clockwise.

mtext
    [matplotlib.text.Text] The original text object to be rendered.

Notes

Note for backend implementers:
When you are trying to determine if you have gotten your bounding box right
(which is what enables the text layout/alignment to work properly), it helps
to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```

to if 1, and then the actual bounding box will be plotted along with your text.

flipy(self)
    Return whether y values increase from top to bottom.
    Note that this only affects drawing of texts and images.

get_canvas_width_height(self)
    Return the canvas width and height in display coords.
get_text_width_height_descent(self, s, prop, ismath)
    Get the width, height, and descent (offset from the bottom to the baseline),
    in display coords, of the string s with FontProperties prop.

property latexManager

option_image_nocomposite(self)
    Return whether image composition by Matplotlib should be skipped.
    Raster backends should usually return False (letting the C-level rasterizer
    take care of image composition); vector backends should usually return
    not rcParams["image.composite_image"].

option_scale_image(self)
    Return whether arbitrary affine transformations in draw_image() are sup-
    ported (True for most vector backends).

points_to_pixels(self, points)
    Convert points to display units.
    You need to override this function (unless your backend doesn't have a dpi,
    e.g., postscript or svg). Some imaging systems assume some value for pixels
    per inch:

    points to pixels = points * pixels_per_inch/72 * dpi/72

Parameters

points
    [float or array-like] a float or a numpy array of float

Returns

Points converted to pixels

class matplotlib.backends.backend_pgf.TmpDirCleaner
    Bases: object

    static add(tmpdir)

    static cleanup_remaining_tmpdirs()

    remaining_tmpdirs = {}

matplotlib.backends.backend_pgf.common_texification(text)
    Do some necessary and/or useful substitutions for texts to be included in LaTeX
    documents.
    This distinguishes text-mode and math-mode by replacing the math separator $ with \(\displaystyle %s\). Escaped math separators (\$) are ignored.
    The following characters are escaped in text segments: _^$%
Matplotlib, Release 3.3.3

matplotlib.backends.backend_pgf.get_fontspec()
Build fontspec preamble from rc.

matplotlib.backends.backend_pgf.get_preamble()
Get LaTeX preamble from rc.

matplotlib.backends.backend_pgf.make_pdf_to_png_converter()
Return a function that converts a pdf file to a png file.

matplotlib.backends.backend_pgf.repl_escapetext(m)
[Deprecated]

Notes

Deprecated since version 3.2:

matplotlib.backends.backend_pgf.repl_mathdefault(m)
[Deprecated]

Notes

Deprecated since version 3.2:

matplotlib.backends.backend_pgf.writeln(fh, line)

18.10.10 matplotlib.backends.backend_ps

A PostScript backend, which can produce both PostScript .ps and .eps.

class matplotlib.backends.backend_ps.FigureCanvasPS
alias of matplotlib.backends.backend_ps.FigureCanvasPS

Bases: matplotlib.backend_bases.FigureCanvasBase

filetypes = {'eps': 'Encapsulated Postscript', 'ps': 'Postscript'}

fixed_dpi = 72

get_default_filetype(self)
Return the default savefig file format as specified in rcParams["savefig.
format"] (default: 'png').
The returned string does not include a period. This method is overridden in
backends that only support a single file type.

print_eps(self, outfile, *args, **kwargs)

print_ps(self, outfile, *args, **kwargs)

class matplotlib.backends.backend_ps.GraphicsContextPS
Bases: matplotlib.backend_bases.GraphicsContextBase
get_capstyle(self)

Return the capstyle as a string in ('butt', 'round', 'projecting').

get_joinstyle(self)

Return the line join style as one of ('miter', 'round', 'bevel').

class matplotlib.backends.backend_ps.PsBackendHelper
Bases: object

class matplotlib.backends.backend_ps.RendererPS(width, height, pswriter, imagedpi=72)
Bases: matplotlib.backends._backend_pdf_ps.RendererPDFPSBase

The renderer handles all the drawing primitives using a graphics context instance that controls the colors/styles.

create_hatch(self, hatch)

draw_gouraud_triangle(self, gc, points, colors, trans)

Draw a Gouraud-shaded triangle.

**Parameters**

**gc**

**points**

[array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

**colors**

[array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

**transform**

[matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_gouraud_triangles(self, gc, points, colors, trans)

Draw a series of Gouraud triangles.

**Parameters**

**points**

[array-like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.

**colors**

[array-like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.
**transform**

[matplotlib.transforms.Transform] An affine transform to apply to the points.

**draw_image**

```python
def draw_image(self, gc, x, y, im, transform=None):
    Draw an RGBA image.
```

**Parameters**

**gc**

**x**

[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

**y**

[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

**im**

**transform**

[matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation (i.e., an Affine2DBase) may be passed to draw_image(). The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by transform).

**draw_markers**

```python
def draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None):
    Draw a marker at each of the vertices in path.
    This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.
    This provides a fallback implementation of draw_markers that makes multiple calls to draw_path(). Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.
```

**Parameters**
**gc**

**marker_trans**

**trans**

[matplotlib.transforms.Transform] An affine transform applied to the path.

draw_mathtext(self, gc, x, y, s, prop, angle)

Draw the math text using matplotlib.mathtext.

draw_path(self, gc, path, transform, rgbFace=None)

Draw a Path instance using the given affine transform.

draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)

Draw a collection of paths selecting drawing properties from the lists facecolors, edgecolors, linewidths, linestyles and antialiaseds. offsets is a list of offsets to apply to each of the paths. The offsets in offsets are first transformed by offsetTrans before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of draw_path_collection() that makes multiple calls to draw_path(). Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods _iter_collection_raw_paths() and _iter_collection() are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of draw_path_collection() can be made globally.

draw_tex(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None)

draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)

Draw the text instance.

**Parameters**

**gc**

**x**

[float] The x location of the text in display coords.
y
    [float] The y location of the text baseline in display coords.
s
    [str] The text string.
prop
angle
    [float] The rotation angle in degrees anti-clockwise.
mtext
    [matplotlib.text.Text] The original text object to be rendered.

Notes

Note for backend implementers:
When you are trying to determine if you have gotten your bounding box right
(which is what enables the text layout/alignment to work properly), it helps
to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```
to if 1, and then the actual bounding box will be plotted along with your text.

get_image_magnification(self)
    Get the factor by which to magnify images passed to draw_image. Allows a
    backend to have images at a different resolution to other artists.

merge_used_characters(self, *args, **kwargs)
    [Deprecated]

Notes

Deprecated since version 3.3:

new_gc(self)
    Return an instance of a GraphicsContextBase.
set_color(self, r, g, b, store=True)
set_font(self, fontname, fontsize, store=True)
set_linecap(self, linecap, store=True)
set_linedash(self, offset, seq, store=True)
set_linejoin(self, linejoin, store=True)
set_linewidth(self, linewidth, store=True)

track_characters(self, *args, **kwargs)

[Deprecated] Keep track of which characters are required from each font.

Notes

Deprecated since version 3.3.

property used_characters

When we want to use the LaTeX backend with postscript, we write PSFrag tags
to a temporary postscript file, each one marking a position for LaTeX to render
some text. convert_psfrags generates a LaTeX document containing the com-
mmands to convert those tags to text. LaTeX/dvips produces the postscript file
that includes the actual text.

matplotlib.backends.backend_ps.convert_psfrags(tmpfile, psfrags,
font_preamble, custom_preamble, paper_width, paper_height, orientation)

When we want to use the LaTeX backend with postscript, we write PSFrag tags
to a temporary postscript file, each one marking a position for LaTeX to render
some text. convert_psfrags generates a LaTeX document containing the com-
mmands to convert those tags to text. LaTeX/dvips produces the postscript file
that includes the actual text.

matplotlib.backends.backend_ps.get_bbox_header(lbrt, rotated=False)

Return a postscript header string for the given bbox lbrt=(l, b, r, t). Optionally,
return rotate command.

matplotlib.backends.backend_ps.gs_distill(tmpfile, eps=False, ptype='letter',
bbox=None, rotated=False)

Use ghostscript's pswrite or epswrite device to distill a file. This yields smaller
files without illegal encapsulated postscript operators. The output is low-level,
converting text to outlines.

matplotlib.backends.backend_ps.pstoeps(tmpfile, bbox=None, rotated=False)

Convert the postscript to encapsulated postscript. The bbox of the eps file will
be replaced with the given bbox argument. If None, original bbox will be used.

matplotlib.backends.backend_ps.quote_ps_string(s)

Quote dangerous characters of s for use in a PostScript string constant.

matplotlib.backends.backend_ps.xpdf_distill(tmpfile, eps=False, ptype='letter',
bbox=None, rotated=False)

Use ghostscript's ps2pdf and xpdf's/poppler's pdftops to distill a file. This yields
smaller files without illegal encapsulated postscript operators. This distiller is
preferred, generating high-level postscript output that treats text as text.
18.10.11 matplotlib.backends.backend_qt4agg

**NOTE** Not included, to avoid adding a dependency to building the docs.

18.10.12 matplotlib.backends.backend_qt4cairo

**NOTE** Not included, to avoid adding a dependency to building the docs.

18.10.13 matplotlib.backends.backend_qt5agg

**NOTE** Not included, to avoid adding a dependency to building the docs.

18.10.14 matplotlib.backends.backend_qt5cairo

**NOTE** Not included, to avoid adding a dependency to building the docs.

18.10.15 matplotlib.backends.backend_svg

matplotlib.backends.backend_svg.FigureCanvas
    alias of matplotlib.backends.backend_svg.FigureCanvasSVG

class matplotlib.backends.backend_svg.FigureCanvasSVG(figure)
    Bases: matplotlib.backend_bases.FigureCanvasBase

    filetypes = {'svg': 'Scalable Vector Graphics', 'svgz': 'Scalable Vector Graphics'}
    fixed_dpi = 72

    get_default_filetype(self)
    Return the default savefig file format as specified in rcParams["savefig.
        format"] (default: 'png').

    The returned string does not include a period. This method is overridden in
    backends that only support a single file type.

    print_svg(self, filename, *args, **kwargs)

    **Parameters**

    filename
        [str or path-like or file-like] Output target; if a string, a file will
        be opened for writing.

    metadata
        [Dict[str, Any], optional] Metadata in the SVG file de-
        fined as key-value pairs of strings, datetimes, or lists
of strings, e.g., {'Creator': 'My software', 'Contributor': ['Me', 'My Friend'], 'Title': 'Awesome'}.

The standard keys and their value types are:

- **str**: 'Coverage', 'Description', 'Format', 'Identifier', 'Language', 'Relation', 'Source', 'Title', and 'Type'.

- **str or list of str**: 'Contributor', 'Creator', 'Keywords', 'Publisher', and 'Rights'.

- **str, date, datetime, or tuple of same**: 'Date'. If a non-str, then it will be formatted as ISO 8601.

Values have been predefined for 'Creator', 'Date', 'Format', and 'Type'. They can be removed by setting them to **None**.

Information is encoded as **Dublin Core Metadata**.

```python
print_svgz(self, filename, *args, **kwargs)
```

```python
class matplotlib.backends.backend_svg.RendererSVG(
    width, height, svgwriter, 
    basename=None, image_dpi=72, *, metadata=None)
```

Bases: **matplotlib.backend_bases.RendererBase**

```python
close_group(self, s)
    Close a grouping element with label s.
    Only used by the SVG renderer.
```

```python
draw_gouraud_triangle(self, gc, points, colors, trans)
    Draw a Gouraud-shaded triangle.
```

**Parameters**

- **gc**

- **points**
  - [array-like, shape=(3, 2)] Array of (x, y) points for the triangle.

- **colors**
  - [array-like, shape=(3, 4)] RGBA colors for each point of the triangle.

- **transform**
  - [matplotlib.transforms.Transform] An affine transform to apply to the points.

```python
draw_gouraud_triangles(self, gc, triangles_array, colors_array, transform)
    Draw a series of Gouraud triangles.
```
Parameters

points
[array-like, shape=(N, 3, 2)] Array of N (x, y) points for the triangles.

colors
[array-like, shape=(N, 3, 4)] Array of N RGBA colors for each point of the triangles.

transform
[matplotlib.transforms.Transform] An affine transform to apply to the points.

draw_image(self, gc, x, y, im, transform=None)
Draw an RGBA image.

Parameters

gc

x
[scalar] The distance in physical units (i.e., dots or pixels) from the left hand side of the canvas.

y
[scalar] The distance in physical units (i.e., dots or pixels) from the bottom side of the canvas.

im

transform
[matplotlib.transforms.Affine2DBase] If and only if the concrete backend is written such that option_scale_image() returns True, an affine transformation (i.e., an Affine2DBase) may be passed to draw_image(). The translation vector of the transformation is given in physical units (i.e., dots or pixels). Note that the transformation does not override x and y, and has to be applied before translating the result by x and y (this can be accomplished by adding x and y to the translation vector defined by transform).
draw_markers(self, gc, marker_path, marker_trans, path, trans, rgbFace=None)
Draw a marker at each of the vertices in path.
This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.
This provides a fallback implementation of draw_markers that makes multiple calls to draw_path(). Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

marker_trans

trans
[matplotlib.transforms.Transform] An affine transform applied to the path.

draw_path(self, gc, path, transform, rgbFace=None)
Draw a Path instance using the given affine transform.

draw_path_collection(self, gc, master_transform, paths, all_transforms, offsets, offsetTrans, facecolors, edgecolors, linewidths, linestyles, antialiaseds, urls, offset_position)
Draw a collection of paths selecting drawing properties from the lists facecolors, edgecolors, linewidths, linestyles and antialiaseds. offsets is a list of offsets to apply to each of the paths. The offsets in offsets are first transformed by offsetTrans before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of draw_path_collection() that makes multiple calls to draw_path(). Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods _iter_collection_raw_paths() and _iter_collection() are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of draw_path_collection() can be made globally.

draw_text(self, gc, x, y, s, prop, angle, ismath=<deprecated parameter>, mtext=None)
draw_text(self, gc, x, y, s, prop, angle, ismath=False, mtext=None)
Draw the text instance.
Parameters

**gc**

**x**
- [float] The x location of the text in display coords.

**y**
- [float] The y location of the text baseline in display coords.

**s**
- [str] The text string.

**prop**

**angle**
- [float] The rotation angle in degrees anti-clockwise.

**mtext**
- [matplotlib.text.Text] The original text object to be rendered.

Notes

**Note for backend implementers:**
When you are trying to determine if you have gotten your bounding box right (which is what enables the text layout/alignment to work properly), it helps to change the line in text.py:

```python
if 0: bbox_artist(self, renderer)
```
to if 1, and then the actual bounding box will be plotted along with your text.

**finalize(self)**

**flipy(self)**
- Return whether y values increase from top to bottom.
  
  Note that this only affects drawing of texts and images.

**get_canvas_width_height(self)**
- Return the canvas width and height in display coords.

**get_image_magnification(self)**
- Get the factor by which to magnify images passed to `draw_image()`. Allows a backend to have images at a different resolution to other artists.
get_text_width_height_descent(self, s, prop, ismath)
Get the width, height, and descent (offset from the bottom to the baseline),
in display coords, of the string $s$ with FontProperties prop.

open_group(self, s, gid=None)
Open a grouping element with label $s$ and $gid$ (if set) as id.
Only used by the SVG renderer.

option_image_nocomposite(self)
Return whether image composition by Matplotlib should be skipped.
Raster backends should usually return False (letting the C-level rasterizer
take care of image composition); vector backends should usually return not rcParams["image.composite_image"].

option_scale_image(self)
Return whether arbitrary affine transformations in draw_image() are sup-
ported (True for most vector backends).

class matplotlib.backends.backend_svg.XMLWriter(file)
Bases: object

Parameters

file
[writable text file-like object]

close(self, id)
Close open elements, up to (and including) the element identified by the
given identifier.

Parameters

id
Element identifier, as returned by the start() method.

comment(self, comment)
Add a comment to the output stream.

Parameters

comment
[str] Comment text.

data(self, text)
Add character data to the output stream.

Parameters
**text**

[**str**] Character data.

**element**(*self*, *tag*, *text=None*, *attrib={}*, **extra*)

Add an entire element. This is the same as calling **start()**, **data()**, and **end()** in sequence. The **text** argument can be omitted.

**end**(*self*, *tag=None*, *indent=True*)

Close the current element (opened by the most recent call to **start()**).

**Parameters**

**tag**

Element tag. If given, the tag must match the start tag. If omitted, the current element is closed.

**flush**(*self*)

Flush the output stream.

**start**(*self*, *tag*, *attrib={}*, **extra*)

Open a new element. Attributes can be given as keyword arguments, or as a string/string dictionary. The method returns an opaque identifier that can be passed to the **close()** method, to close all open elements up to and including this one.

**Parameters**

**tag**

Element tag.

**attrib**

Attribute dictionary. Alternatively, attributes can be given as keyword arguments.

**Returns**

**An element identifier.**

**matplotlib.backends.backend_svg.escape_attrib**(*s*)

**matplotlib.backends.backend_svg.escape_cdata**(*s*)

**matplotlib.backends.backend_svg.escape_comment**(*s*)

**matplotlib.backends.backend_svg.generate_css**(*attrib={})

**matplotlib.backends.backend_svg.generate_transform**(*transform_list=[]*)

**matplotlib.backends.backend_svg.short_float_fmt**(*x*)

Create a short string representation of a float, which is %f formatting with trailing zeros and the decimal point removed.
18.10.16 matplotlib.backends.backend_tkagg

matplotlib.backends.backend_tkagg.FigureCanvas
alias of matplotlib.backends.backend_tkagg.FigureCanvasTkAgg
class matplotlib.backends.backend_tkagg.FigureCanvasTkAgg(figure, master=None, resize_callback=None)
    Bases: matplotlib.backends.backend_agg.FigureCanvasAgg, matplotlib.backends._backend_tk.FigureCanvasTk

    blit(self, bbox=None)
    Blit the canvas in bbox (default entire canvas).

draw(self)
    Render the Figure.

18.10.17 matplotlib.backends.backend_webagg

Note: The WebAgg backend is not documented here, in order to avoid adding Tornado to the doc build requirements.

18.10.18 matplotlib.backends.backend_wxagg

NOTE Not included, to avoid adding a dependency to building the docs.

18.11 matplotlib.bezier

A module providing some utility functions regarding Bezier path manipulation.
class matplotlib.bezier.BezierSegment(control_points)
    Bases: object
    A d-dimensional Bezier segment.

Parameters

control_points
    [(N, d) array] Location of the N control points.

axisAlignedExtrema(self)
    Return the dimension and location of the curve's interior extrema.
    The extrema are the points along the curve where one of its partial derivatives is zero.
Returns

**dims**

[int, array_like] Index \( i \) of the partial derivative which is zero at each interior extrema.

**dzeros**

[float, array_like] Of same size as dims. The \( t \) such that \( d/dx_i B(t) = 0 \)

**property control_points**

The control points of the curve.

**property degree**

Degree of the polynomial. One less the number of control points.

**property dimension**

The dimension of the curve.

**point_at_t**

\( \text{Evaluate curve at a single point } t. \text{ Returns a Tuple[float}*d]. \)

**property polynomial_coefficients**

The polynomial coefficients of the Bezier curve.

**Warning:** follows opposite convention from \texttt{numpy.polyval}.

**Returns**

**float, (n+1, d) array_like**

Coefficients after expanding in polynomial basis, where \( n \) is the degree of the bezier curve and \( d \) its dimension. These are the numbers (\( C_j \)) such that the curve can be written \( \sum_{j=0}^{n} C_j t^j \).

**Notes**

The coefficients are calculated as

\[
\binom{n}{j} \sum_{i=0}^{j} (-1)^{i+j} \binom{j}{i} P_i
\]

where \( P_i \) are the control points of the curve.

**exception matplotlib.bezier.NonIntersectingPathException**

**Bases:** \texttt{ValueError}
Check if two lines are parallel.

**Parameters**

- **dx1, dy1, dx2, dy2**
  - [float] The gradients $dy/dx$ of the two lines.

- **tolerance**
  - [float] The angular tolerance in radians up to which the lines are considered parallel.

**Returns**

- **is_parallel**
  - 1 if two lines are parallel in same direction.
  - -1 if two lines are parallel in opposite direction.
  - False otherwise.

[Deprecated] Concatenate a list of paths into a single path.

**Notes**

Deprecated since version 3.3.

Find the intersection of the Bezier curve with a closed path.

The intersection point $t$ is approximated by two parameters $t0, t1$ such that $t0 <= t <= t1$.

Search starts from $t0$ and $t1$ and uses a simple bisecting algorithm therefore one of the end points must be inside the path while the other doesn't. The search stops when the distance of the points parametrized by $t0$ and $t1$ gets smaller than the given **tolerance**.

**Parameters**

- **bezier_point_at_t**
[callable] A function returning x, y coordinates of the Bezier at parameter $t$. It must have the signature:

```python
bezier_point_at_t(t: float) -> Tuple[float, float]
```

**inside_closedpath**

[callable] A function returning True if a given point (x, y) is inside the closed path. It must have the signature:

```python
inside_closedpath(point: Tuple[float, float]) -> bool
```

**t0, t1**

[float] Start parameters for the search.

**tolerance**

[float] Maximal allowed distance between the final points.

**Returns**

**t0, t1**

[float] The Bezier path parameters.

```python
matplotlib.bezier.find_control_points(c1x, c1y, mmx, mmy, c2x, c2y)
```

Find control points of the Bezier curve passing through $(c1x, c1y)$, $(mmx, mmy)$, and $(c2x, c2y)$, at parametric values 0, 0.5, and 1.

```python
matplotlib.bezier.get_cos_sin(x0, y0, x1, y1)
```

```python
matplotlib.bezier.get_intersection(cx1, cy1, cos_t1, sin_t1, cx2, cy2, cos_t2, sin_t2)
```

Return the intersection between the line through $(cx1, cy1)$ at angle $t1$ and the line through $(cx2, cy2)$ at angle $t2$.

```python
matplotlib.bezier.get_normal_points(cx, cy, cos_t, sin_t, length)
```

For a line passing through $(cx, cy)$ and having an angle $t$, return locations of the two points located along its perpendicular line at the distance of $length$.

```python
matplotlib.bezier.get_parallels(bezier2, width)
```

Given the quadratic Bezier control points `bezier2`, returns control points of quadratic Bezier lines roughly parallel to given one separated by `width`.

```python
matplotlib.bezier.inside_circle(cx, cy, r)
```

Return a function that checks whether a point is in a circle with center $(cx, cy)$ and radius $r$.

The returned function has the signature:

```python
f(xy: Tuple[float, float]) -> bool
```
matplotlib.bezier.make_path_regular(p)

[Deprecated] If the codes attribute of Path p is None, return a copy of p with codes set to (MOVETO, LINETO, LINETO, ..., LINETO); otherwise return p itself.

Notes

Deprecated since version 3.3.

matplotlib.bezier.make_wedged_bezier2(bezier2, width, w1=1.0, wm=0.5, w2=0.0)

Being similar to get_parallels, returns control points of two quadratic Bezier lines having a width roughly parallel to given one separated by width.

matplotlib.bezier.split_bezier_intersecting_with_closedpath(bezier, inside_closedpath, tolerance=0.01)

Split a Bezier curve into two at the intersection with a closed path.

Parameters

bezier

[array-like(N, 2)] Control points of the Bezier segment. See BezierSegment.

inside_closedpath

[callable] A function returning True if a given point (x, y) is inside the closed path. See also find_bezier_t_intersecting_with_closedpath.

tolerance

[float] The tolerance for the intersection. See also find_bezier_t_intersecting_with_closedpath.

Returns

left, right

Lists of control points for the two Bezier segments.

matplotlib.bezier.split_de_casteljau(beta, t)

Split a Bezier segment defined by its control points beta into two separate segments divided at t and return their control points.

matplotlib.bezier.split_path_inout(path, inside, tolerance=0.01, reorder_inout=False)

Divide a path into two segments at the point where inside(x, y) becomes False.
18.12 matplotlib.blocking_input

Classes used for blocking interaction with figure windows:

*BlockingInput*

Creates a callable object to retrieve events in a blocking way for interactive sessions. Base class of the other classes listed here.

*BlockingKeyMouseInput*

Creates a callable object to retrieve key or mouse clicks in a blocking way for interactive sessions. Used by `waitforbuttonpress`.

*BlockingMouseInput*

Creates a callable object to retrieve mouse clicks in a blocking way for interactive sessions. Used by `ginput`.

*BlockingContourLabeler*

Creates a callable object to retrieve mouse clicks in a blocking way that will then be used to place labels on a `ContourSet`. Used by `clabel`.

class matplotlib.blocking_input.BlockingContourLabeler(cs)

Bases: matplotlib.blocking_input.BlockingMouseInput

Callable for retrieving mouse clicks and key presses in a blocking way. Used to place contour labels.

`add_click(self, event)`

Add the coordinates of an event to the list of clicks.

**Parameters**

- `event`
  - `[MouseEvent]`

`button1(self, event)`

Process an button-1 event (add a label to a contour).

**Parameters**

- `event`
  - `[MouseEvent]`

`button3(self, event)`

Process an button-3 event (remove a label if not in inline mode).

Unfortunately, if one is doing inline labels, then there is currently no way to fix the broken contour - once humpty-dumpty is broken, he can't be put back together. In inline mode, this does nothing.
Parameters

**event**

[MouseEvent]

pop_click(self, event, index=-1)
Remove a click (by default, the last) from the list of clicks.

Parameters

**event**

[MouseEvent]

class matplotlib.blocking_input.BlockingInput(fig, eventslist=())
Bases: object
Callable for retrieving events in a blocking way.

add_event(self, event)
For base class, this just appends an event to events.

cleanup(self)
Disconnect all callbacks.

on_event(self, event)
Event handler; will be passed to the current figure to retrieve events.

pop(self, index=-1)
Remove an event from the event list -- by default, the last.

Note that this does not check that there are events, much like the normal
pop method. If no events exist, this will throw an exception.

pop_event(self, index=-1)
Remove an event from the event list -- by default, the last.

Note that this does not check that there are events, much like the normal
pop method. If no events exist, this will throw an exception.

post_event(self)
For baseclass, do nothing but collect events.

class matplotlib.blocking_input.BlockingKeyMouseInput(fig)
Bases: matplotlib.blocking_input.BlockingInput
Callable for retrieving mouse clicks and key presses in a blocking way.

post_event(self)
Determine if it is a key event.
class matplotlib.blocking_input.BlockingMouseInput(fig,
    mouse_add=<MouseButton.LEFT: 1>,
    mouse_pop=<MouseButton.RIGHT: 3>,
    mouse_stop=<MouseButton.MIDDLE: 2>)

Bases: matplotlib.blocking_input.BlockingInput

Callable for retrieving mouse clicks in a blocking way.

This class will also retrieve keypresses and map them to mouse clicks: delete and backspace are a right click, enter is like a middle click, and all others are like a left click.

add_click(self, event)
    Add the coordinates of an event to the list of clicks.

    Parameters

    event
        [MouseEvent]

    button_add = 1
    button_pop = 3
    button_stop = 2

cleanup(self, event=None)

    Parameters

    event
        [MouseEvent, optional] Not used

key_event(self)
    Process a key press event, mapping keys to appropriate mouse clicks.

mouse_event(self)
    Process a mouse click event.

mouse_event_add(self, event)
    Process an button-1 event (add a click if inside axes).

    Parameters

    event
        [MouseEvent]

mouse_event_pop(self, event)
    Process an button-3 event (remove the last click).
Parameters

```
MouseEvent
```

```
mouse_event_stop(self, event)
Process an button-2 event (end blocking input).

Parameters

```
event

MouseEvent
```

```
pop(self, event, index=-1)
Remove a click and the associated event from the list of clicks.
Defaults to the last click.

pop_click(self, event, index=-1)
Remove a click (by default, the last) from the list of clicks.

Parameters

```
event

MouseEvent
```

```
post_event(self)
Process an event.
```

18.13 matplotlib.category

Plotting of string "category" data: `plot(['d', 'f', 'a'], [1, 2, 3])` will plot three points with x-axis values of 'd', 'f', 'a'.

See /gallery/lines_bars_and_markers/categorical_variables for an example.

The module uses Matplotlib's `matplotlib.units` mechanism to convert from strings to integers and provides a tick locator, a tick formatter, and the `UnitData` class that creates and stores the string-to-integer mapping.

```
class matplotlib.category.StrCategoryConverter
    Bases: matplotlib.units.ConversionInterface

    static axisinfo(unit, axis)
        Set the default axis ticks and labels.

    Parameters
```
unit
[UnitData] object string unit information for value

axis
[Axis] axis for which information is being set

Returns

AxisInfo
Information to support default tick labeling

static convert(value, unit, axis)
Convert strings in value to floats using mapping information stored in the unit object.

Parameters

value
[str or iterable] Value or list of values to be converted.

unit
[UnitData] An object mapping strings to integers.

axis
[Axis] The axis on which the converted value is plotted.

Note: axis is unused.

Returns

float or ndarray[float]

static default_units(data, axis)
Set and update the Axis units.

Parameters

data
[str or iterable of str]

axis
[Axis] axis on which the data is plotted

Returns
**Unidata**

object storing string to integer mapping

class matplotlib.category.StrCategoryFormatter(units_mapping)
    Bases: matplotlib.ticker.Formatter

    String representation of the data at every tick.

    **Parameters**

    **units_mapping**

        [dict] Mapping of category names (str) to indices (int).

    format_ticks(self, values)
        Return the tick labels for all the ticks at once.

class matplotlib.category.StrCategoryLocator(units_mapping)
    Bases: matplotlib.ticker.Locator

    Tick at every integer mapping of the string data.

    **Parameters**

    **units_mapping**

        [dict] Mapping of category names (str) to indices (int).

    tick_values(self, vmin, vmax)
        Return the values of the located ticks given vmin and vmax.

    **Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

    ```
    >>> print(type(loc))
    <type 'Locator'>
    >>> print(loc())
    [1, 2, 3, 4]
    ```

class matplotlib.category.UnitData(data=None)
    Bases: object

    Create mapping between unique categorical values and integer ids.

    **Parameters**

    **data**

        [iterable] sequence of string values
update(self, data)
    Map new values to integer identifiers.

Parameters

data
    [iterable of str or bytes]

Raises

TypeError
    If elements in data are neither str nor bytes.

18.14 matplotlib.cbook

A collection of utility functions and classes. Originally, many (but not all) were from
the Python Cookbook -- hence the name cbook.

This module is safe to import from anywhere within Matplotlib; it imports Matplotlib
only at runtime.

class matplotlib.cbook.CallbackRegistry(exception_handler=<function _exception_printer>)

Bases: object

Handle registering and disconnecting for a set of signals and callbacks:

```python
>>> def oneat(x):
    ...     print('eat', x)
>>> def ondrink(x):
    ...     print('drink', x)

>>> from matplotlib.cbook import CallbackRegistry
>>> callbacks = CallbackRegistry()

>>> id_eat = callbacks.connect('eat', oneat)
>>> id_drink = callbacks.connect('drink', ondrink)

>>> callbacks.process('drink', 123)
drink 123
>>> callbacks.process('eat', 456)
eat 456
>>> callbacks.process('be merry', 456)  # nothing will be called
>>> callbacks.disconnect(id_eat)
>>> callbacks.process('eat', 456)  # nothing will be called
```

In practice, one should always disconnect all callbacks when they are no longer
needed to avoid dangling references (and thus memory leaks). However, real
code in Matplotlib rarely does so, and due to its design, it is rather difficult to place this kind of code. To get around this, and prevent this class of memory leaks, we instead store weak references to bound methods only, so when the destination object needs to die, the CallbackRegistry won't keep it alive.

**Parameters**

**exception_handler**

[callable, optional] If provided must have signature

```python
def handler(exc: Exception) -> None:
```

If not None this function will be called with any `Exception` subclass raised by the callbacks in `CallbackRegistry.process`. The handler may either consume the exception or re-raise.

The callable must be pickle-able.

The default handler is

```python
def h(exc):
    traceback.print_exc()
```

**connect**(self, s, func)

Register `func` to be called when signal `s` is generated.

**disconnect**(self, cid)

Disconnect the callback registered with callback id `cid`.

**process**(self, s, *args, **kwargs)

Process signal `s`.

All of the functions registered to receive callbacks on `s` will be called with `*args` and `**kwargs`.

**class** matplotlib.cbook.Grouper(init=())

**Bases**: `object`

A disjoint-set data structure.

Objects can be joined using `join()`, tested for connectedness using `joined()`, and all disjoint sets can be retrieved by using the object as an iterator.

The objects being joined must be hashable and weak-referenceable.
Examples

```python
>>> from matplotlib.cbook import Grouper
>>> class Foo:
...     def __init__(self, s):
...         self.s = s
...     def __repr__(self):
...         return self.s
...
>>> a, b, c, d, e, f = [Foo(x) for x in 'abcdef']
>>> grp = Grouper()
>>> grp.join(a, b)
>>> grp.join(b, c)
>>> grp.join(d, e)
>>> sorted(map(tuple, grp))
[(a, b, c), (d, e)]
>>> grp.joined(a, b)
True
>>> grp.joined(a, c)
True
>>> grp.joined(a, d)
False
```

clean(self)
Clean dead weak references from the dictionary.

get_siblings(self, a)
Return all of the items joined with a, including itself.

join(self, a, *args)
Join given arguments into the same set. Accepts one or more arguments.

joined(self, a, b)
Return whether a and b are members of the same set.

remove(self, a)

exception matplotlib.cbook.IgnoredKeywordWarning(*args, **kwargs)
Bases: UserWarning

[Deprecated] A class for issuing warnings about keyword arguments that will be ignored by Matplotlib.

Notes

Deprecated since version 3.3.

class matplotlib.cbook.Stack(default=None)
Bases: object
Stack of elements with a movable cursor.
Mimics home/back/forward in a web browser.
back(self)
    Move the position back and return the current element.

bubble(self, o)
    Raise all references of o to the top of the stack, and return it.

    Raises

    ValueError
    If o is not in the stack.

clear(self)
    Empty the stack.

empty(self)
    Return whether the stack is empty.

forward(self)
    Move the position forward and return the current element.

home(self)
    Push the first element onto the top of the stack.
    The first element is returned.

push(self, o)
    Push o to the stack at current position. Discard all later elements.
    o is returned.

remove(self, o)
    Remove o from the stack.

    Raises

    ValueError
    If o is not in the stack.

matplotlib.cbook.boxplot_stats(X, whis=1.5, bootstrap=None, labels=None, autorange=False)
    Return a list of dictionaries of statistics used to draw a series of box and whisker plots using bxp.

    Parameters

    X
        [array-like] Data that will be represented in the boxplots. Should have 2 or fewer dimensions.

    whis
        [float or (float, float), default: 1.5] The position of the whiskers.
If a float, the lower whisker is at the lowest datum above \( q_1 - \text{whis} \cdot (Q_3 - Q_1) \), and the upper whisker at the highest datum below \( Q_3 + \text{whis} \cdot (Q_3 - Q_1) \), where \( Q_1 \) and \( Q_3 \) are the first and third quartiles. The default value of \( \text{whis} = 1.5 \) corresponds to Tukey’s original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data. "range" is a deprecated synonym for (0, 100).

In the edge case where \( Q_1 == Q_3 \), \text{whis} is automatically set to (0, 100) (cover the whole range of the data) if autorange is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

**bootstrap**

[int, optional] Number of times the confidence intervals around the median should be bootstrapped (percentile method).

**labels**

[array-like, optional] Labels for each dataset. Length must be compatible with dimensions of \( X \).

**autorange**

[bool, optional (False)] When True and the data are distributed such that the 25th and 75th percentiles are equal, \text{whis} is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

**Returns**

**list of dict**

A list of dictionaries containing the results for each column of data. Keys of each dictionary are the following:

<table>
<thead>
<tr>
<th>Key</th>
<th>Value Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>label</td>
<td>tick label for the boxplot</td>
</tr>
<tr>
<td>mean</td>
<td>arithmetic mean value</td>
</tr>
<tr>
<td>med</td>
<td>50th percentile</td>
</tr>
<tr>
<td>q1</td>
<td>first quartile (25th percentile)</td>
</tr>
<tr>
<td>q3</td>
<td>third quartile (75th percentile)</td>
</tr>
<tr>
<td>ciho</td>
<td>lower notch around the median</td>
</tr>
<tr>
<td>cihi</td>
<td>upper notch around the median</td>
</tr>
<tr>
<td>whislo</td>
<td>end of the lower whisker</td>
</tr>
<tr>
<td>whishi</td>
<td>end of the upper whisker</td>
</tr>
<tr>
<td>fliers</td>
<td>outliers</td>
</tr>
</tbody>
</table>
Notes

Non-bootstrapping approach to confidence interval uses Gaussian-based asymptotic approximation:

\[ \text{med} \pm 1.57 \times \frac{\text{iqr}}{\sqrt{N}} \]

**matplotlib.cbook.contiguous_regions(mask)**

Return a list of (ind0, ind1) such that mask[ind0:ind1].all() is True and we cover all such regions.

**matplotlib.cbook.delete_masked_points(*args)**

Find all masked and/or non-finite points in a set of arguments, and return the arguments with only the unmasked points remaining.

Arguments can be in any of 5 categories:

1) 1-D masked arrays
2) 1-D ndarrays
3) ndarrays with more than one dimension
4) other non-string iterables
5) anything else

The first argument must be in one of the first four categories; any argument with a length differing from that of the first argument (and hence anything in category 5) then will be passed through unchanged.

Masks are obtained from all arguments of the correct length in categories 1, 2, and 4; a point is bad if masked in a masked array or if it is a nan or inf. No attempt is made to extract a mask from categories 2, 3, and 4 if `numpy.isfinite` does not yield a Boolean array.

All input arguments that are not passed unchanged are returned as ndarrays after removing the points or rows corresponding to masks in any of the arguments.

A vastly simpler version of this function was originally written as a helper for `Axes.scatter()`.

**matplotlib.cbook.file_requires_unicode(x)**

Return whether the given writable file-like object requires Unicode to be written to it.

**matplotlib.cbook.flatten(seq, scalarp=<function is_scalar_or_string at 0x7f543929d1f0>)**

Return a generator of flattened nested containers.

For example:
```python
>>> from matplotlib.cbook import flatten
>>> l = (('John', ['Hunter']), (1, 23), [[[42, (5, 23)], ]])
>>> print(list(flatten(l)))
['John', 'Hunter', 1, 23, 42, 5, 23]
```

By: Composite of Holger Krekel and Luther Blissett From: https://code.activestate.com/recipes/121294/ and Recipe 1.12 in cookbook

`matplotlib.cbook.get_realpath_and_stat(path)`

[Deprecated]

**Notes**

Deprecated since version 3.3:

`matplotlib.cbook.get_sample_data(fname, asfileobj=True, *, np_load=False)`

Return a sample data file. `fname` is a path relative to the `mpl-data/sample_data` directory. If `asfileobj` is True return a file object, otherwise just a file path.

Sample data files are stored in the 'mpl-data/sample_data' directory within the Matplotlib package.

If the filename ends in .gz, the file is implicitly ungzipped. If the filename ends with .npy or .npz, `asfileobj` is True, and `np_load` is True, the file is loaded with `numpy.load`. `np_load` currently defaults to False but will default to True in a future release.

`matplotlib.cbook.index_of(y)`

A helper function to create reasonable x values for the given y.

This is used for plotting (x, y) if x values are not explicitly given.

First try `y.index` (assuming y is a `pandas.Series`), if that fails, use `range(len(y))`.

This will be extended in the future to deal with more types of labeled data.

**Parameters**

`y`

[Float or array-like]

**Returns**

`x, y`

[ndarray] The x and y values to plot.

`matplotlib.cbook.is_math_text(s)`

Return whether the string s contains math expressions.

This is done by checking whether s contains an even number of non-escaped dollar signs.
matplotlib.cbook.is_scalar_or_string(val)
Return whether the given object is a scalar or string like.

matplotlib.cbook.is_writable_file_like(obj)
Return whether obj looks like a file object with a write method.

matplotlib.cbook.local_over_kwdict(local_var, kwargs, *keys)
[Deprecated] Enforces the priority of a local variable over potentially conflicting argument(s) from a kwargs dict. The following possible output values are considered in order of priority:

\[
\text{local}_\text{var} > \text{kwargs}[\text{keys}[0]] > \ldots > \text{kwargs}[\text{keys}[-1]]
\]

The first of these whose value is not None will be returned. If all are None then None will be returned. Each key in keys will be removed from the kwargs dict in place.

Parameters

**local_var**
[any object] The local variable (highest priority).

**kwargs**
[dict] Dictionary of keyword arguments; modified in place.

**keys**
[str(s)] Name(s) of keyword arguments to process, in descending order of priority.

Returns

**any object**
Either local_var or one of kwargs[key] for key in keys.

 Raises

**IgnoredKeywordWarning**
For each key in keys that is removed from kwargs but not used as the output value.
Notes

Deprecated since version 3.3.

```python
class matplotlib.cbook.maxdict(maxsize)
    Bases: dict
    A dictionary with a maximum size.
```

Notes

This doesn't override all the relevant methods to constrain the size, just
```
__setitem__`, so use with caution.
```

```python
matplotlib.cbook.normalize_kwargs(kw, alias_mapping=None, required=<deprecated parameter>, forbidden=<deprecated parameter>, allowed=<deprecated parameter>)
```

Helper function to normalize kwarg inputs.
The order they are resolved are:

1. aliasing
2. required
3. forbidden
4. allowed

This order means that only the canonical names need appear in `allowed, forbidden, required`.

Parameters

- **kw**
  - [dict] A dict of keyword arguments.

- **alias_mapping**
  - [dict or Artist subclass or Artist instance, optional] A mapping between a canonical name to a list of aliases, in order of precedence from lowest to highest.

    If the canonical value is not in the list it is assumed to have the highest priority.

    If an Artist subclass or instance is passed, use its properties alias mapping.

- **required**
  - [list of str, optional] A list of keys that must be in `kws`. This parameter is deprecated.
forbidden

[list of str, optional] A list of keys which may not be in kw. This parameter is deprecated.

allowed

[list of str, optional] A list of allowed fields. If this not None, then raise if kw contains any keys not in the union of required and allowed. To allow only the required fields pass in an empty tuple allowed=(). This parameter is deprecated.

Raises

TypeError

To match what python raises if invalid args/kwargws are passed to a callable.

matplotlib.cbook.open_file_cm(path_or_file, mode='r', encoding=None)

Pass through file objects and context-manage path-likes.

matplotlib.cbook.print_cycles(objects, outstream=<_io.TextIOWrapper name='<stdout>' mode='w' encoding='utf-8'>, show_progress=False)

Print loops of cyclic references in the given objects.

It is often useful to pass in gc.garbage to find the cycles that are preventing some objects from being garbage collected.

Parameters

objects

A list of objects to find cycles in.

outstream

The stream for output.

show_progress

[bool] If True, print the number of objects reached as they are found.

matplotlib.cbook(pts_to_midstep(x, *args)

Convert continuous line to mid-steps.

Given a set of \( N \) points convert to \( 2N \) points which when connected linearly give a step function which changes values at the middle of the intervals.

Parameters

x
[array] The x location of the steps. May be empty.

\texttt{y1, \ldots, yp}

[array] y arrays to be turned into steps; all must be the same length as \texttt{x}.

**Returns**

\texttt{array}

The x and y values converted to steps in the same order as the input; can be unpacked as \texttt{x\_out, y1\_out, \ldots, yp\_out}. If the input is length \(N\), each of these arrays will be length \(2N\).

**Examples**

```python
>>> x_s, y1_s, y2_s = pts_to_midstep(x, y1, y2)
```

\texttt{matplotlib.cbook.pts_to_midstep(x, *args)}

Convert continuous line to mid-steps.

Given a set of \(N\) points convert to \(2N + 1\) points, which when connected linearly give a step function which changes values at the end of the intervals.

**Parameters**

\texttt{x}

[array] The x location of the steps. May be empty.

\texttt{y1, \ldots, yp}

[array] y arrays to be turned into steps; all must be the same length as \texttt{x}.

**Returns**

\texttt{array}

The x and y values converted to steps in the same order as the input; can be unpacked as \texttt{x\_out, y1\_out, \ldots, yp\_out}. If the input is length \(N\), each of these arrays will be length \(2N + 1\). For \(N=0\), the length will be 0.
Examples

```python
>>> x_s, y1_s, y2_s = pts_to_poststep(x, y1, y2)
```

matplotlib.cbookPTS_TO_PRESTEP(x, *args)
Convert continuous line to pre-steps.

Given a set of $N$ points, convert to $2N - 1$ points, which when connected linearly give a step function which changes values at the beginning of the intervals.

Parameters

x
[array] The x location of the steps. May be empty.

$y_1, \ldots, y_p$
[array] $y$ arrays to be turned into steps; all must be the same length as $x$.

Returns

array

The $x$ and $y$ values converted to steps in the same order as the input; can be unpacked as $x_{\text{out}}, y_{1\text{out}}, \ldots, y_{p\text{out}}$. If the input is length $N$, each of these arrays will be length $2N + 1$. For $N=0$, the length will be 0.

Examples

```python
>>> x_s, y1_s, y2_s = pts_to_prestep(x, y1, y2)
```

matplotlib.cbookREPORT_MEMORY(i=0)
Return the memory consumed by the process.

matplotlib.cbookSAFE_FIRST_ELEMENT(obj)
Return the first element in $obj$.

This is an type-independent way of obtaining the first element, supporting both index access and the iterator protocol.

matplotlib.cbookSAFE_MASKED_INVALID(x, copy=False)

matplotlib.cbook.Sanitize_SEQUENCE(data)
Convert dictview objects to list. Other inputs are returned unchanged.

class matplotlib.cbook.SILENT_LIST(type, seq=None)
Bases: list

A list with a short repr().
This is meant to be used for a homogeneous list of artists, so that they don't cause long, meaningless output.

Instead of

```
[[<matplotlib.lines.Line2D object at 0x7f5749fed3c8>,
  <matplotlib.lines.Line2D object at 0x7f5749fed4e0>,
  <matplotlib.lines.Line2D object at 0x7f5758016550>]]
```

one will get

```
<a list of 3 Line2D objects>
```

```
matplotlib.cbook.simple_linear_interpolation(a, steps)
```

Resample an array with \(\text{steps} - 1\) points between original point pairs.

Along each column of \(a\), \((\text{steps} - 1)\) points are introduced between each original values; the values are linearly interpolated.

**Parameters**

- \(a\)
  - array, shape (n, ...)
- \(\text{steps}\)
  - int

**Returns**

- array
  - shape ((\(n - 1\) * \text{steps} + 1, ...)

```
matplotlib.cbook.strip_math(s)
```

Remove latex formatting from mathtext.

Only handles fully math and fully non-math strings.

```
matplotlib.cbook.to_filehandle(fname, flag='r', return_opened=False, encoding=None)
```

Convert a path to an open file handle or pass-through a file-like object.

Consider using `open_file_cm` instead, as it allows one to properly close newly created file objects more easily.

**Parameters**

- \(\text{fname}\)
  - [str or path-like or file-like] If \(\text{str}\) or \(\text{os.PathLike}\), the file is opened using the flags specified by \(\text{flag}\) and \(\text{encoding}\). If a file-like object, it is passed through.
flag

[\text{str}, \text{default 'r'}] \text{Passed as the} mode \text{ argument to} \textit{open} \text{ when} fname \text{ is} \textit{str} \text{ or} \textit{os.PathLike}; \text{ignored if} fname \text{ is} \text{file-like.}

\text{return_opened}

[\text{bool}, \text{default False}] \text{If True, return both the file object and a boolean indicating whether this was a new file (that the caller needs to close). If False, return only the new file.}

\text{encoding}

[\text{str or None}, \text{default None}] \text{Passed as the} mode \text{ argument to} \textit{open} \text{ when} fname \text{ is} \textit{str} \text{ or} \textit{os.PathLike}; \text{ignored if} fname \text{ is} \text{file-like.}

\text{Returns}

\text{fh}

[\text{file-like}]

\text{opened}

[\text{bool}] \text{opened} \text{ is only returned if} \text{return_opened} \text{ is True.}

\text{matplotlib.cbook.violin_stats}(X, \text{method}, \text{points}=100, \text{quantiles}=\text{None})

Return a list of dictionaries of data which can be used to draw a series of violin plots.

See the Returns section below to view the required keys of the dictionary.

Users can skip this function and pass a user-defined set of dictionaries with the same keys to \textit{violinplot} instead of using Matplotlib to do the calculations. See the Returns section below for the keys that must be present in the dictionaries.

\text{Parameters}

\text{X}

[\text{array-like}] \text{Sample data that will be used to produce the gaussian kernel density estimates. Must have 2 or fewer dimensions.}

\text{method}

[\text{callable}] \text{The method used to calculate the kernel density estimate for each column of data. When called via \text{method}(v, \text{coords}), it should return a vector of the values of the KDE evaluated at the values specified in coords.}

\text{points}

[\text{int}, \text{default: 100}] \text{Defines the number of points to evaluate each of the gaussian kernel density estimates at.}
quantiles

[array-like, default: None] Defines (if not None) a list of floats in interval [0, 1] for each column of data, which represents the quantiles that will be rendered for that column of data. Must have 2 or fewer dimensions. 1D array will be treated as a singleton list containing them.

Returns

list of dict

A list of dictionaries containing the results for each column of data. The dictionaries contain at least the following:

- coords: A list of scalars containing the coordinates this particular kernel density estimate was evaluated at.
- vals: A list of scalars containing the values of the kernel density estimate at each of the coordinates given in coords.
- mean: The mean value for this column of data.
- median: The median value for this column of data.
- min: The minimum value for this column of data.
- max: The maximum value for this column of data.
- quantiles: The quantile values for this column of data.

exception matplotlib.cbook.deprecation.MatplotlibDeprecationWarning
Bases: UserWarning

A class for issuing deprecation warnings for Matplotlib users.

In light of the fact that Python builtin DeprecationWarnings are ignored by default as of Python 2.7 (see link below), this class was put in to allow for the signaling of deprecation, but via UserWarnings which are not ignored by default.

https://docs.python.org/dev/whatsnew/2.7.html#the-future-for-python-2-x

matplotlib.cbook.deprecation.deprecated(since, *, message='', name='', alternative='', pending=False, obj_type=None, addendum='', removal='')

Decorator to mark a function, a class, or a property as deprecated.

When deprecating a classmethod, a staticmethod, or a property, the @deprecated decorator should go under @classmethod and @staticmethod (i.e., deprecated should directly decorate the underlying callable), but over @property.
[str] The release at which this API became deprecated.

**message**

[str, optional] Override the default deprecation message. The
%(since)s, %(name)s, %(alternative)s, %(obj_type)s, %(addendum)s,
and %(removal)s format specifiers will be replaced by the values
of the respective arguments passed to this function.

**name**

[str, optional] The name used in the deprecation message; if not
provided, the name is automatically determined from the depre-
cated object.

**alternative**

[str, optional] An alternative API that the user may use in place
of the deprecated API. The deprecation warning will tell the user
about this alternative if provided.

**pending**

[bool, optional] If True, uses a PendingDeprecationWarning in-
stead of a DeprecationWarning. Cannot be used together with
*removal*.

**obj_type**

[str, optional] The object type being deprecated; by default,
'class' if decorating a class, 'attribute' if decorating a property,
'function' otherwise.

**addendum**

[str, optional] Additional text appended directly to the final mes-
sage.

**removal**

[str, optional] The expected removal version. With the default
(an empty string), a removal version is automatically computed
from *since*. Set to other Falsy values to not schedule a removal
date. Cannot be used together with *pending*.
Examples

Basic example:

```python
@deprecated('1.4.0')
def the_function_to_deprecate():
    pass
```

Display a standardized deprecation.

**Parameters**

- `since`:
  [str] The release at which this API became deprecated.

- `message`:
  [str, optional] Override the default deprecation message. The
  `%{(since)s}`, `%{(name)s}`, `%{(alternative)s}`, `%{(obj_type)s}`, `%{(addendum)s}`, and
  `%{(removal)s}` format specifiers will be replaced by the values
  of the respective arguments passed to this function.

- `name`:
  [str, optional] The name of the deprecated object.

- `alternative`:
  [str, optional] An alternative API that the user may use in place
  of the deprecated API. The deprecation warning will tell the user
  about this alternative if provided.

- `pending`:
  [bool, optional] If True, uses a PendingDeprecationWarning in
  stead of a DeprecationWarning. Cannot be used together with
  `removal`.

- `obj_type`:
  [str, optional] The object type being deprecated.

- `addendum`:
  [str, optional] Additional text appended directly to the final mes-
  sage.
removal

[str, optional] The expected removal version. With the default (an empty string), a removal version is automatically computed from since. Set to other Falsy values to not schedule a removal date. Cannot be used together with pending.

Examples

Basic example:

```python
# To warn of the deprecation of "matplotlib.name_of_module"
warn_deprecated('1.4.0', name='matplotlib.name_of_module',
                obj_type='module')
```

18.15 matplotlib.cm

Builtin colormaps, colormap handling utilities, and the ScalarMappable mixin.

See also:
/gallery/color/colormap_reference for a list of builtin colormaps.
Creating Colormaps in Matplotlib for examples of how to make colormaps.
Choosing Colormaps in Matplotlib an in-depth discussion of choosing colormaps.
Colormap Normalization for more details about data normalization.

```python
class matplotlib.cm.ScalarMappable(norm=None, cmap=None)
    Bases: object

    A mixin class to map scalar data to RGBA.

    The ScalarMappable applies data normalization before returning RGBA colors from the given colormap.

    Parameters

    norm

        [matplotlib.colors.Normalize (or subclass thereof)] The normalizing object which scales data, typically into the interval \([0, 1]\). If None, norm defaults to a colors.Normalize object which initializes its scaling based on the first data processed.

    cmap

        [str or Colormap] The colormap used to map normalized data values to RGBA colors.
```
add_checker(self, checker)
    [Deprecated]

Notes

Deprecated since version 3.3:

autoscale(self)
    Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
    Autoscale the scalar limits on the norm instance using the current array,
    changing only limits that are None

changed(self)
    Call this whenever the mappable is changed to notify all the callbackSM
    listeners to the 'changed' signal.

check_update(self, checker)
    [Deprecated]

Notes

Deprecated since version 3.3:

colorbar
    The last colorbar associated with this ScalarMappable. May be None.

get_alpha(self)

    Returns

    float
        Always returns 1.

get_array(self)
    Return the data array.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_cmap(self)
    Return the Colormap instance.

set_array(self, A)
    Set the image array from numpy array A.

Parameters
A

.ndarray

set_clim(self, vmin=None, vmax=None)
Set the norm limits for image scaling.

Parameters

vmin, vmax
[float] The limits.
The limits may also be passed as a tuple (vmin, vmax) as a single
positional argument.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap
[Colormap or str or None]

set_norm(self, norm)
Set the normalization instance.

Parameters

norm
[Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm
of the mappable will reset the norm, locator, and formatters on the colorbar
to default.

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corre-
sponding ndarray of rgba values will be returned, based on the norm and
colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba,
such as might have been read from an image file. If x is an ndarray with 3
dimensions, and the last dimension is either 3 or 4, then it will be treated
as an rgb or rgba array, and no mapping will be done. The array can be
uint8, or it can be floating point with values in the 0-1 range; otherwise a
ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

```
property update_dict

matplotlib.cm.get_cmap(name=None, lut=None)
Get a colormap instance, defaulting to rc values if name is None.

Colormaps added with register_cmap() take precedence over built-in colormaps.

Parameters

name

[matplotlib.colors.Colormap or str or None, default: None] If a Colormap instance, it will be returned. Otherwise, the name of a colormap known to Matplotlib, which will be resampled by lut. The default, None, means rcParams["image.cmap"] (default: 'viridis').

lut

[int or None, default: None] If name is not already a Colormap instance and lut is not None, the colormap will be resampled to have lut entries in the lookup table.

Notes

Currently, this returns the global colormap object, which is deprecated. In Matplotlib 3.5, you will no longer be able to modify the global colormaps in-place.

```

matplotlib.cm.register_cmap(name=None, cmap=None, data=None, lut=None)
Add a colormap to the set recognized by get_cmap().

It can be used in two ways:

```
register_cmap(name='swirly', cmap=swirly_cmap)
register_cmap(name='choppy', data=choppydata, lut=128)
```

In the first case, cmap must be a matplotlib.colors.Colormap instance. The name is optional; if absent, the name will be the name attribute of the cmap.
The second case is deprecated. Here, the three arguments are passed to the `LinearSegmentedColormap` initializer, and the resulting colormap is registered. Instead of this implicit colormap creation, create a `LinearSegmentedColormap` and use the first case: `register_cmap(cmap=LinearSegmentedColormap(name, data, lut))`.

**Notes**

Registering a colormap stores a reference to the colormap object which can currently be modified and inadvertently change the global colormap state. This behavior is deprecated and in Matplotlib 3.5 the registered colormap will be immutable.

```
matplotlib.cm.revcmap(data)
```

*Deprecated* Can only handle specification `data` in dictionary format.

**Notes**

Deprecated since version 3.2.

### 18.16 matplotlib.collections

Classes for the efficient drawing of large collections of objects that share most properties, e.g., a large number of line segments or polygons.

The classes are not meant to be as flexible as their single element counterparts (e.g., you may not be able to select all line styles) but they are meant to be fast for common use cases (e.g., a large set of solid line segments).

```
class matplotlib.collections.AsteriskPolygonCollection(numsides, rotation=0, sizes=1, **kwargs)
```

**Bases:** `matplotlib.collections.RegularPolyCollection`

Draw a collection of regular asterisks with `numsides` points.
Parameters

**numsides**

[int] The number of sides of the polygon.

**rotation**

[float] The rotation of the polygon in radians.

**sizes**

[tuple of float] The area of the circle circumscribing the polygon in points^2.

**kwargs**

Forwarded to `Collection`.

Examples

See /gallery/event_handling/lasso_demo for a complete example:

```python
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(num_sides=5, # a pentagon
rotation=0, sizes=(50,),
facecolors=facecolors,
edgecolors="black",)
linewidths=(1,),
offsets=offsets,
transOffset=ax.transData,
)
```

add_callback(self, func)

Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

**func**

[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

Returns
int

The observer id associated with the callback. This id can be used for removing the callback with \texttt{remove\_callback} later.

See also:

\texttt{remove\_callback}

\texttt{add\_checker}(\textit{self, checker})

\texttt{[Deprecated]}

Notes

Deprecated since version 3.3:

\texttt{autoscale}(\textit{self})

Autoscale the scalar limits on the norm instance using the current array

\texttt{autoscale\_None}(\textit{self})

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

\texttt{property axes}

The \texttt{Axes} instance the artist resides in, or \texttt{None}.

\texttt{changed}(\textit{self})

Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

\texttt{check\_update}(\textit{self, checker})

\texttt{[Deprecated]}

Notes

Deprecated since version 3.3:

\texttt{contains}(\textit{self, mouseevent})

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

\texttt{convert\_xunits}(\textit{self, x})

Convert \textit{x} using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, \textit{x} itself is returned.
convert_yunits(self, y)
    Convert y using the unit type of the yaxis.

    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.

    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

        renderer
            [RendererBase subclass.]

    Notes

    This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)
    Find artist objects.

    Recursively find all Artist instances contained in the artist.

    Parameters

        match
            A filter criterion for the matches. This can be
            • None: Return all objects contained in artist.
            • A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
            • A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

        include_self
            [bool] Include self in the list to be checked for a match.

    Returns

        list of Artist

format_cursor_data(self, data)
    Return a string representation of data.
**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

- `get_cursor_data`

`get_agg_filter(self)`
Return filter function to be used for agg filter.

`get_alpha(self)`
Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`
Return whether the artist is animated.

`get_array(self)`
Return the data array.

`get_capstyle(self)`

`get_children(self)`
Return a list of the child *Artists* of this *Artist*.

`get_clim(self)`
Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`
Return the clipbox.

`get_clip_on(self)`
Return whether the artist uses clipping.

`get_clip_path(self)`
Return the clip path.

`get_cmap(self)`
Return the *Colormap* instance.

`get_contains(self)`
[Deprecated] Return the custom contains function of the artist if set, or *None*.

**See also:**

- `set_contains`
Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

**event**

`matplotlib.backend_bases.MouseEvent`

**See also:**

`format_cursor_data`

get_dashes(self)
Alias for `get_linestyle`.

get_datalim(self, transData)

get_ec(self)
Alias for `get_edgecolor`.

get_edgecolor(self)

get_edgecolors(self)
Alias for `get_edgecolor`.

get_facecolor(self)

get_facecolors(self)
Alias for `get_facecolor`.

get_fc(self)
Alias for `get_facecolor`.

get_figure(self)
Return the `Figure` instance the artist belongs to.
get_fill(self)
    Return whether fill is set.

get_gid(self)
    Return the group id.

get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g.  *Constrained Layout Guide*,  `Figure.tight_layout()`, and  `fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(self)
    Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)
    Alias for `get_linestyle`.

get_linewidth(self)

get_linewidths(self)
    Alias for `get_linewidth`.

get_ls(self)
    Alias for `get_linestyle`.

get_lw(self)
    Alias for `get_linewidth`.

get_num sides(self)

get_offset_position(self)
    `[Deprecated]` Return how offsets are applied for the collection.  If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates.  If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

    **Notes**

    Deprecated since version 3.3.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)
get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in `set_picker`.
    
    **See also:**

    `set_picker`, `pickable`, `pick`

get_pickradius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_rotation(self)

get_sizes(self)
    Return the sizes ('areas') of the elements in the collection.

    **Returns**

    array
        The 'area' of each element.

get_sketch_params(self)
    Return the sketch parameters for the artist.

    **Returns**

    tuple or None
        A 3-tuple with the following elements:
        - `scale`: The amplitude of the wiggle perpendicular to the
          source line.
        - `length`: The length of the wiggle along the line.
        - `randomness`: The scale factor by which the length is
          shrunken or expanded.

        Returns `None` if no sketch parameters were set.

get_snap(self)
    Return the snap setting.
    See `set_snap` for details.

get_tightbbox(self, renderer)
    Like `Artist.get_window_extent`, but includes any clipping.

    **Parameters**
renderer

RendererBase subclass renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
Return the url.

get_urls(self)
Return a list of URLs, one for each element of the collection.

The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)
Return the visibility.

get_window_extent(self, renderer)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
Return the artist's zorder.

have_units(self)
Return True if units are set on any axis.

is_transform_set(self)
Return whether the Artist has an explicitly set transform.
This is True after \texttt{set_transform} has been called.

\textbf{property mouseover}

If this property is set to \textit{True}, the artist will be queried for custom context information when the mouse cursor moves over it.

See also \texttt{get_cursor_data()}, \texttt{ToolCursorPosition} and \texttt{NavigationToolbar2}.

\textbf{pchanged}(\texttt{self})

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

\textbf{See also:}

\texttt{add_callback}

\texttt{remove_callback}

\textbf{pick}(\texttt{self, mouseevent})

Process a pick event.

Each child artist will fire a pick event if \texttt{mouseevent} is over the artist and the artist has picker set.

\textbf{See also:}

\texttt{set_picker, get_picker, pickable}

\textbf{pickable}(\texttt{self})

Return whether the artist is pickable.

\textbf{See also:}

\texttt{set_picker, get_picker, pick}

\textbf{properties}(\texttt{self})

Return a dictionary of all the properties of the artist.

\textbf{remove}(\texttt{self})

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with \texttt{FigureCanvasBase.draw_idle}. Call \texttt{relim} to update the axes limits if desired.

Note: \texttt{relim} will not see collections even if the collection was added to the axes with \texttt{autolim = True}.

Note: there is no support for removing the artist's legend entry.

\textbf{remove_callback}(\texttt{self, oid})

Remove a callback based on its observer id.

\textbf{See also:}
add_callback

set(self, **kwargs)
    A property batch setter. Pass **kwargs to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

    Parameters

    filter_func
        [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.

    Parameters

    alpha
        [float or None]

set_animated(self, b)
    Set the artist’s animation state.

    Parameters

    b
        [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    Parameters

    aa
        [bool or list of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters
A

[ndarray]

set_capstyle(self, cs)
Set the capstyle for the collection (for all its elements).

**Parameters**

- **cs**
  [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
Set the norm limits for image scaling.

**Parameters**

- **vmin, vmax**
  [float] The limits.
  The limits may also be passed as a tuple (vmin, vmax) as a single positional argument.

set_clip_box(self, clipbox)
Set the artist’s clip $B_{box}$.

**Parameters**

- **clipbox**
  [$B_{box}$]

set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

- **b**
  [bool]

set_clip_path(self, path, transform=None)
Set the artist’s clip path.

**Parameters**

- **path**
[Patch or Path or TransformedPath or None] The clip path. If
given a Path, transform must be provided as well. If None, a
previously set clip path is removed.

transform
[Transform, optional] Only used if path is a Path, in which case
the given Path is converted to a TransformedPath using transform.

Notes
For efficiency, if path is a Rectangle this method will set the clipping box to
the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also ac-
cepted as a single positional parameter.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap
[Colormap or str or None]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

c
[color or list of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor

For setting the edge or face color individually.

set_contains(self, picker)
[Deprecated] Define a custom contains test for the artist.
The provided callable replaces the default contains method of the artist.

Parameters

picker
[callable] A custom picker function to evaluate if an event is
within the artist. The function must have the signature:
def contains(artist: Artist, event: MouseEvent) -> bool, dict

that returns:
• a bool indicating if the event is within the artist
• a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(self, ls)
   Alias for set_linestyle.

set_ec(self, c)
   Alias for set_edgecolor.

set_edgecolor(self, c)
   Set the edgecolor(s) of the collection.

   Parameters

   c
       [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)
   Alias for set_edgecolor.

set_facecolor(self, c)
   Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

   If c is 'none', the patch will not be filled.

   Parameters

   c
       [color or list of colors]

set_facecolors(self, c)
   Alias for set_facecolor.
set_fc(self, c)
    Alias for set_facecolor.

set_figure(self, fig)
    Set the Figure instance the artist belongs to.

    Parameters

    fig
        [Figure]

set_gid(self, gid)
    Set the (group) id for the artist.

    Parameters

    gid
        [str]

set_hatch(self, hatch)
    Set the hatching pattern

    hatch can be one of:

    / - diagonal hatching
    \ - back diagonal
    | - vertical
    - - horizontal
    + - crossed
    x - crossed diagonal
    o - small circle
    O - large circle
    . - dots
    * - stars

    Letters can be combined, in which case all the specified hatchings are done.
    If same letter repeats, it increases the density of hatching of that pattern.

    Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

    Unlike other properties such as linewidth and colors, hatching can only be
    specified for the collection as a whole, not separately for each member.

    Parameters

    hatch
        [{', '/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(self, in_layout)
    Set if artist is to be included in layout calculations, E.g. Constrained Layout
    Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').
Parameters

in_layout
[bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s

[object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '---', '-.', ':', '', (offset, on-off-seq)}. See Line2D.

set_linestyles(self, ls)
Alias for set_linestyle.
set_linewidth(self, lw)
    Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if
    it is a sequence the patches will cycle through the sequence

    Parameters

    lw
        [float or list of floats]

set_linewidths(self, lw)
    Alias for set_linewidth.

set_ls(self, ls)
    Alias for set_linestyle.

set_lw(self, lw)
    Alias for set_linewidth.

set_norm(self, norm)
    Set the normalization instance.

    Parameters

    norm
        [Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm
of the mappable will reset the norm, locator, and formatters on the colorbar
to default.

set_offset_position(self, offset_position)
    [Deprecated] Set how offsets are applied. If offset_position is 'screen' (de-
default) the offset is applied after the master transform has been applied, that
is, the offsets are in screen coordinates. If offset_position is 'data', the offset
is applied before the master transform, i.e., the offsets are in data coordi-
nates.

    Parameters

    offset_position
        [{'screen', 'data'}]
Notes

Deprecated since version 3.3.

```
set_offsets(self, offsets)
```

Set the offsets for the collection.

**Parameters**

- **offsets**
  
  [array-like (N, 2) or (2,)]

```
set_path_effects(self, path_effects)
```

Set the path effects.

**Parameters**

- **path_effects**

  [AbstractPathEffect]

```
set_paths(self)
```

```
set_picker(self, picker)
```

Define the picking behavior of the artist.

**Parameters**

- **picker**

  [None or bool or callable] This can be one of the following:

  - **None**: Picking is disabled for this artist (default).
  
  - A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
  
  - A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

    ```
    hit, props = picker(artist, mouseevent)
    ```

    to determine the hit test. If the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

  - **deprecated**: For Line2D only, picker can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use Line2D.set_pickradius instead.
set_pickradius(self, pr)
Set the pick radius used for containment tests.

Parameters

d
[float] Pick radius, in points.

set_rasterized(self, rasterized)
Force rasterized (bitmap) drawing in vector backend output.
Defaults to None, which implies the backend's default behavior.

Parameters

rasterized
[bool or None]

set_sizes(self, sizes, dpi=72.0)
Set the sizes of each member of the collection.

Parameters

sizes
[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi
[float, default: 72] The dpi of the canvas.

set_sketch_params(self, scale=None, length=None, randomness=None)
Sets the sketch parameters.

Parameters

scale
[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length
[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness
[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)
set_snap(self, snap)
    Set the snapping behavior.

    Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

    Snapping is currently only supported by the Agg and MacOSX backends.

    **Parameters**

    snap
        [bool or None] Possible values:
        • True: Snap vertices to the nearest pixel center.
        • False: Do not modify vertex positions.
        • None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(self, t)
    Set the artist transform.

    **Parameters**

    t
        [Transform]

set_url(self, url)
    Set the url for the artist.

    **Parameters**

    url
        [str]

set_urls(self, urls)

    **Parameters**

    urls
        [list of str or None]
Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

```python
set_visible(self, b)
```
Set the artist's visibility.

**Parameters**

- **b**
  - [bool]

```python
set_zorder(self, level)
```
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

- **level**
  - [float]

**property stale**
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky_edges**
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

```python
to_rgba(self, x, alpha=None, bytes=False, norm=True)
```
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.
There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If \( x \) is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the \( \text{alpha} \) kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the \( \text{alpha} \) kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if \( \text{bytes} \) is \( \text{False} \) (default), the rgba array will be floats in the 0-1 range; if it is \( \text{True} \), the returned rgba array will be uint8 in the 0 to 255 range.

If \( \text{norm} \) is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

```python
update(self, props)
```
Update this artist’s properties from the dict \( \text{props} \).

**Parameters**

- **props**
  - [dict]

```python
property update_dict
```

```python
update_from(self, other)
```
Copy properties from other to self.

```python
update_scalarmappable(self)
```
Update colors from the scalar mappable array, if it is not None.

```python
zorder = 0
```

```python
class matplotlib.collections.BrokenBarHCollection(xranges, yrange, **kwargs)
```
Bases: `matplotlib.collections.PolyCollection`
A collection of horizontal bars spanning \( \text{yrange} \) with a sequence of \( \text{xranges} \).

**Parameters**

- **xranges**
  - [list of (float, float)] The sequence of (left-edge-position, width) pairs for each bar.

- **yrange**
  - [(float, float)] The (lower-edge, height) common to all bars.

- ****kwargs
  - Forwarded to `Collection`. 

18.16. `matplotlib.collections`
add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

**Parameters**

func

[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

**Returns**

int

The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

**See also:**

remove_callback

add_checker(self, checker)

[Deprecated]

**Notes**

Deprecated since version 3.3:

autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
The Axes instance the artist resides in, or None.

changed(self)
Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)
[Deprecated]
Notes

Deprecated since version 3.3:

contains(self, mouseevent)
Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)
Find artist objects.

Recursively find all Artist instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

• None: Return all objects contained in artist.

• A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

**include_self**

[bool] Include *self* in the list to be checked for a match.

**Returns**

list of *Artist*

```python
def format_cursor_data(self, data):
    # Return a string representation of data.
```

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

get_cursor_data

get_agg_filter(self)
    # Return filter function to be used for agg filter.

get_alpha(self)
    # Return the alpha value used for blending - not supported on all backends.

get_animated(self)
    # Return whether the artist is animated.

get_array(self)
    # Return the data array.

get_capstyle(self)

get_children(self)
    # Return a list of the child *Artists* of this *Artist*.

get_clim(self)
    # Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    # Return the clipbox.

get_clip_on(self)
    # Return whether the artist uses clipping.

get_clip_path(self)
    # Return the clip path.
get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters

    event
        [matplotlib.backend_bases.MouseEvent]

    See also:

    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self)
    Alias for get_edgecolor.

get_edgecolor(self)
get_edgecolors(self)
    Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)
    Alias for get_facecolor.

get_fc(self)
    Alias for get_facecolor.

get_facecolor(self)

get_facecolors(self)
    Alias for get_facecolor.

get_figure(self)
    Return the Figure instance the artist belongs to.

get_fill(self)
    Return whether fill is set.

get_gid(self)
    Return the group id.

get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.
    savefig(fname, bbox_inches='tight').

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)
    Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
    Alias for get_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.
Notes

Deprecated since version 3.3.

get_offset_transform(self)

get_offsets(self)
   Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
   Return the picking behavior of the artist.
   The possible values are described in set_picker.

See also:

set_picker, pickable, pick

get_pickradius(self)

get_rasterized(self)
   Return whether the artist is to be rasterized.

get_sizes(self)
   Return the sizes ('areas') of the elements in the collection.

Returns

array
   The 'area' of each element.

get_sketch_params(self)
   Return the sketch parameters for the artist.

Returns

tuple or None
   A 3-tuple with the following elements:
   • scale: The amplitude of the wiggle perpendicular to the source line.
   • length: The length of the wiggle along the line.
   • randomness: The scale factor by which the length is shrunken or expanded.

Returns None if no sketch parameters were set.
get_snap(self)
Return the snap setting.

See set_snap for details.

get_tightbbox(self, renderer)
Like Artist.get_window_extent, but includes any clipping.

Parameters

renderer
[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox
The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
Return the url.

get_urls(self)
Return a list of URLs, one for each element of the collection.

The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)
Return the visibility.

get_window_extent(self, renderer)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to
unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist’s zorder.

have_units(self)
    Return True if units are set on any axis.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

property mouseover
    If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.
    See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:

        add_callback
        remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.
    See also:

        set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.
    See also:

        set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.

remove(self)
    Remove the artist from the figure if possible.
The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the axes with autolim = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(self, oid)
Remove a callback based on its observer id.

See also:

add_callback

set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
Alias for set_antialiased.

set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func
	[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha
	[float or None]

set_animated(self, b)
Set the artist's animation state.

Parameters

b
	[bool]

set_antialiased(self, aa)
Set the antialiasing state for rendering.

Parameters
aa

[bool or list of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters

    A

        [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    Parameters

    cs

        [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
    Set the norm limits for image scaling.

    Parameters

    vmin, vmax

        [float] The limits.

        The limits may also be passed as a tuple (vmin, vmax) as a single positional argument.

set_clip_box(self, clipbox)
    Set the artist's clip Bbox.

    Parameters

    clipbox

        [Bbox]

set_clip_on(self, b)
    Set whether the artist uses clipping.

    When False artists will be visible outside of the axes which can lead to unexpected results.

    Parameters
**set_clip_path**

Set the artist's clip path.

**Parameters**

- **path**
  
  [Patch or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.

- **transform**
  
  [Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

**Notes**

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

**set_cmap**

Set the colormap for luminance data.

**Parameters**

- **cmap**
  
  [Colormap or str or None]

**set_color**

Set both the edgecolor and the facecolor.

**Parameters**

- **c**
  
  [color or list of rgba tuples]

**See also:**

- Collection.set_facecolor, Collection.set_edgecolor
  
  For setting the edge or face color individually.
set_contains(self, picker)

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

**Parameters**

**picker**

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

set_dashes(self, ls)

Alias for set_linestyle.

set_ec(self, c)

Alias for set_edgecolor.

set_edgecolor(self, c)

Set the edgecolor(s) of the collection.

**Parameters**

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)

Alias for set_edgecolor.

set_facecolor(self, c)

Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If c is 'none', the patch will not be filled.
Parameters

c
[color or list of colors]

set_facecolors(self, c)
Alias for set_facecolor.

set_fc(self, c)
Alias for set_facecolor.

set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig
[Figure]

set_gid(self, gid)
Set the (group) id for the artist.

Parameters

gid
[str]

set_hatch(self, hatch)
Set the hatching pattern

hatch can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.
Parameters

**hatch**

```python
[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]
```

**set_in_layout(self, in_layout)**

Set if artist is to be included in layout calculations, e.g. *Constrained Layout Guide, Figure.tight_layout()* and *fig.savefig(fname, bbox_inches='tight')*.

Parameters

**in_layout**

[bool]

**set_joinstyle(self, js)**

Set the joinstyle for the collection (for all its elements).

Parameters

**js**

```python
['miter', 'round', 'bevel']
```

**set_label(self, s)**

Set a label that will be displayed in the legend.

Parameters

**s**

[object] s will be converted to a string by calling *str*.

**set_linestyle(self, ls)**

Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'.-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```python
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

Parameters
**set_linestyle**

Set the linestyles for the collection. *ls* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

- **ls**
  
  [str or tuple or list thereof] Valid values for individual linestyles include `{'-', '--', '-.', ':', '', (offset, on-off-seq)}`. See `Line2D.set_linestyle` for a complete description.

- **set_linestyle**
  
  Alias for `set_linestyle`.

**set_linewidth**

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

- **lw**
  
  [float or list of floats]

- **set_linewidths**
  
  Alias for `set_linewidth`.

- **set_ls**
  
  Alias for `set_linestyle`.

- **set_lw**
  
  Alias for `set_linewidth`.

**set_norm**

Set the normalization instance.

**Parameters**

- **norm**
  
  [Normalize or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

**set_offset_position**

[Deprecated] Set how offsets are applied. If *offset_position* is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If *offset_position* is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**
offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

set_offsets(self, offsets)
Set the offsets for the collection.

Parameters

offsets

[array-like (N, 2) or (2,)]

set_path_effects(self, path_effects)
Set the path effects.

Parameters

path_effects

[AbstractPathEffect]

set_paths(self, verts, closed=True)
Set the vertices of the polygons.

Parameters

verts

[list of array-like] The sequence of polygons [verts0, verts1, ...] where each element verts_i defines the vertices of polygon i as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

• None: Picking is disabled for this artist (default).
• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

• deprecated: For Line2D only, picker can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use Line2D.set_pickradius instead.

```python
set_pickradius(self, pr)
```
Set the pick radius used for containment tests.

**Parameters**

**d**

[float] Pick radius, in points.

```python
set_rasterized(self, rasterized)
```
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

**rasterized**

[bool or None]

```python
set_sizes(self, sizes, dpi=72.0)
```
Set the sizes of each member of the collection.

**Parameters**

**sizes**

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi**

[float, default: 72] The dpi of the canvas.
set_sketch_params(self, scale=None, length=None, randomness=None)
Sets the sketch parameters.

Parameters

scale
[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length
[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness
[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap
[bool or None] Possible values:
* True: Snap vertices to the nearest pixel center.
* False: Do not modify vertex positions.
* None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(self, t)
Set the artist transform.

Parameters

t
[Transform]
**set_url**(*self*, *url*)
Set the url for the artist.

**Parameters**

- **url**
  [str]

**set_urls**(*self*, *urls*)

**Parameters**

- **urls**
  [list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set_verts**(*self*, *verts*, *closed=True*)
Set the vertices of the polygons.

**Parameters**

- **verts**
  [list of array-like] The sequence of polygons [verts0, verts1, ...] where each element verts_i defines the vertices of polygon i as a 2D array-like of shape (M, 2).

- **closed**
  [bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

**set_verts_and_codes**(*self*, *verts*, *codes*)
Initialize vertices with path codes.

**set_visible**(*self*, *b*)
Set the artist's visibility.

**Parameters**

- **b**
  [bool]

**set_zorder**(*self*, *level*)
Set the zorder for the artist. Artists with lower zorder values are drawn first.
Parameters

level
[float]

classmethod span_where(x, ymin, ymax, where, **kwargs)

Return a BrokenBarHCollection that plots horizontal bars from over the regions in x where where is True. The bars range on the y-axis from ymin to ymax

kwargs are passed on to the collection.

property stale
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.
In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

```python
update(self, props)
```
Update this artist's properties from the dict `props`.

**Parameters**

- **props**
  - [dict]

```python
property update_dict
```

```python
update_from(self, other)
```
Copy properties from other to self.

```python
update_scalarmappable(self)
```
Update colors from the scalar mappable array, if it is not None.

```python
zorder = 0
```

class matplotlib.collections.CircleCollection(sizes, **kwargs)
Bases: matplotlib.collections._CollectionWithSizes
A collection of circles, drawn using splines.

**Parameters**

- **sizes**
  - [float or array-like] The area of each circle in points^2.

- ****kwargs
  - Forwarded to `Collection`.

```python
add_callback(self, func)
```
Add a callback function that will be called whenever one of the `Artist`'s properties changes.

**Parameters**

- **func**
  - [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.
**Returns**

```
int
```

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

`remove_callback`

`add_checker(self, checker)`  
*Deprecated*

**Notes**

Deprecated since version 3.3:

`autoscale(self)`  
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`  
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`  
The `Axes` instance the artist resides in, or `None`.

`changed(self)`  
Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

`check_update(self, checker)`  
*Deprecated*

**Notes**

Deprecated since version 3.3:

`contains(self, mouseevent)`  
Test whether the mouse event occurred in the collection.

Returns `bool`, `dict(ind=itemlist)`, where every item in itemlist contains the event.

`convert_xunits(self, x)`  
Convert `x` using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, `x` itself is returned.
convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

    renderer
        [RendererBase subclass.]

    Notes

    This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

    Parameters

    match
        A filter criterion for the matches. This can be
        • None: Return all objects contained in artist.
        • A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
        • A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

    include_self
        [bool] Include self in the list to be checked for a match.

    Returns

    list of Artist

format_cursor_data(self, data)
    Return a string representation of data.
**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

* get_cursor_data
* get_agg_filter(*self*)
  Return filter function to be used for agg filter.
* get_alpha(*self*)
  Return the alpha value used for blending - not supported on all backends.
* get_animated(*self*)
  Return whether the artist is animated.
* get_array(*self*)
  Return the data array.
* get_capstyle(*self*)
* get_children(*self*)
  Return a list of the child *Artists* of this *Artist*.
* get_clim(*self*)
  Return the values (min, max) that are mapped to the colormap limits.
* get_clip_box(*self*)
  Return the clipbox.
* get_clip_on(*self*)
  Return whether the artist uses clipping.
* get_clip_path(*self*)
  Return the clip path.
* get_cmap(*self*)
  Return the *Colormap* instance.
* get_contains(*self*)
  *[Deprecated]* Return the custom contains function of the artist if set, or *None*.

**See also:**

* set_contains
Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- `event`  
  `[matplotlib.backend_bases.MouseEvent]`

**See also:**

- `format_cursor_data`

get_dashes(self)
  Alias for `get_linestyle`.

get_datalim(self, transData)

get_ec(self)
  Alias for `get_edgecolor`.

get_edgecolor(self)

get_edgecolors(self)
  Alias for `get_edgecolor`.

get_facecolor(self)

get_facecolors(self)
  Alias for `get_facecolor`.

get_fc(self)
  Alias for `get_facecolor`.

get_figure(self)
  Return the `Figure` instance the artist belongs to.
get_fill(self)
    Return whether fill is set.

def get_gid(self)
    Return the group id.

def get_hatch(self)
    Return the current hatching pattern.

def get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.
         savefig(fname, bbox_inches='tight').

def get_joinstyle(self)

def get_label(self)
    Return the label used for this artist in the legend.

def get_linestyle(self)

def get_linestyles(self)
    Alias for get_linestyle.

def get_linewidth(self)

def get_linewidths(self)
    Alias for get_linewidth.

def get_ls(self)
    Alias for get_linestyle.

def get_lw(self)
    Alias for get_linewidth.

def get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset
    position is 'screen', the offset is applied after the master transform has
    been applied, that is, the offsets are in screen coordinates. If offset_position
    is 'data', the offset is applied before the master transform, i.e., the offsets
    are in data coordinates.

    Notes

    Deprecated since version 3.3.

def get_offset_transform(self)

def get_offsets(self)
    Return the offsets for the collection.

def get_path_effects(self)

def get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

    See also:

    set_picker, pickable, pick

get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.

get_sizes(self)
    Return the sizes ('areas') of the elements in the collection.

    Returns

    array
    The 'area' of each element.

get_sketch_params(self)
    Return the sketch parameters for the artist.

    Returns

    tuple or None
    A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the
      source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is
      shrunken or expanded.

    Returns None if no sketch parameters were set.

get_snap(self)
    Return the snap setting.

    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters

    renderer

    [RendererBase subclass] renderer that will be used to draw the
    figures (i.e. fig.canvas.get_renderer())
**Returns**

*Bbox*

The enclosing bounding box (in figure pixel coordinates).

```python
def get_transform(self):
    """Return the Transform instance used by this artist."""

def get_transformed_clip_path_and_affine(self):
    """Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation."""

def get_transforms(self):

def get_url(self):
    """Return the url."""

def get_urls(self):
    """Return a list of URLs, one for each element of the collection.
    The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example."""

def get_visible(self):
    """Return the visibility."""

def get_window_extent(self, renderer):
    """Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly."""

def get_zorder(self):
    """Return the artist's zorder."""

def have_units(self):
    """Return True if units are set on any axis."""

def is_transform_set(self):
    """Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called."""
```

**property mouseover**

If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.
See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`pchanged(self)`
Call all of the registered callbacks.
This function is triggered internally when a property is changed.

**See also:**

- `add_callback`
- `remove_callback`

`pick(self, mouseevent)`
Process a pick event.
Each child artist will fire a pick event if `mouseevent` is over the artist and
the artist has picker set.

**See also:**

- `set_picker`, `get_picker`, `pickable`

`pickable(self)`
Return whether the artist is pickable.

**See also:**

- `set_picker`, `get_picker`, `pick`

`properties(self)`
Return a dictionary of all the properties of the artist.

`remove(self)`
Remove the artist from the figure if possible.
The effect will not be visible until the figure is redrawn, e.g., with
`FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`
Remove a callback based on its observer id.

**See also:**

- `add_callback`

`set(self, **kwargs)`
A property batch setter. Pass `kwargs` to set properties.
**set_aa**(*self, aa*)

Alias for *set_antialiased*.

**set_agg_filter**(*self, filter_func*)

Set the agg filter.

**Parameters**

**filter_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set_alpha**(*self, alpha*)

Set the alpha value used for blending - not supported on all backends.

**Parameters**

**alpha**

[float or None]

**set_animated**(*self, b*)

Set the artist's animation state.

**Parameters**

**b**

[bool]

**set_antialiased**(*self, aa*)

Set the antialiasing state for rendering.

**Parameters**

**aa**

[bool or list of bools]

**set_antialiaseds**(*self, aa*)

Alias for *set_antialiased*.

**set_array**(*self, A*)

Set the image array from numpy array A.

**Parameters**

**A**

[ndarray]

**set_capstyle**(*self, cs*)

Set the capstyle for the collection (for all its elements).
Parameters

**cs**

[{'butt', 'round', 'projecting'}] The capstyle.

**set_clim**

```python
set_clim(self, vmin=None, vmax=None)
```

Set the norm limits for image scaling.

**Parameters**

**vmin, vmax**

[**float**] The limits.

The limits may also be passed as a tuple (**vmin**, **vmax**) as a single positional argument.

**set_clip_box**

```python
set_clip_box(self, clipbox)
```

Set the artist's clip **Bbox**.

**Parameters**

**clipbox**

[**Bbox**]

**set_clip_on**

```python
set_clip_on(self, b)
```

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b**

[**bool**]

**set_clip_path**

```python
set_clip_path(self, path, transform=None)
```

Set the artist's clip path.

**Parameters**

**path**

[**Patch** or **Path** or **TransformedPath** or **None**] The clip path. If given a **Path**, **transform** must be provided as well. If **None**, a previously set clip path is removed.

**transform**
[Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

Notes

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap
[Colormap or str or None]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

c
[color or list of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor
For setting the edge or face color individually.

set_contains(self, picker)
[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

picker
[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

def contains(artist: Artist, event: MouseEvent) -> bool, dict

that returns:
• a bool indicating if the event is within the artist
• a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(self, ls)
   Alias for set_linestyle.

set_ec(self, c)
   Alias for set_edgecolor.

set_edgecolor(self, c)
   Set the edgecolor(s) of the collection.

   Parameters

   c
       [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)
   Alias for set_edgecolor.

set_facecolor(self, c)
   Set the facecolor(s) of the collection.  c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

   If c is 'none', the patch will not be filled.

   Parameters

   c
       [color or list of colors]

set_facecolors(self, c)
   Alias for set_facecolor.

set_fc(self, c)
   Alias for set_facecolor.

set_figure(self, fig)
   Set the Figure instance the artist belongs to.
```
Parameters

fig

[Figure]

set_gid(self, gid)
Set the (group) id for the artist.

Parameters

gid

[std]

set_hatch(self, hatch)
Set the hatching pattern

hatch can be one of:

| / | - diagonal hatching |
| \ | - back diagonal |
| | - vertical |
| - | - horizontal |
| + | - crossed |
| x | - crossed diagonal |
| o | - small circle |
| O | - large circle |
| . | - dots |
| * | - stars |

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only. Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch

[{{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}}]

set_in_layout(self, in_layout)
Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters

in_layout

[bool]
```
**set_joinstyle**(*self, js*)

Set the joinstyle for the collection (for all its elements).

**Parameters**

*js*

[{'miter', 'round', 'bevel'}] The joinstyle.

**set_label**(*self, s*)

Set a label that will be displayed in the legend.

**Parameters**

*s*

[object] s will be converted to a string by calling `str`.

**set_linestyle**(*self, ls*)

Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

*ls*

[str or tuple or list thereof] Valid values for individual linestyles include {',-', '-', '.', ':', ''}, (offset, on-off-seq)}. See Line2D. `set_linestyle` for a complete description.

**set_linestyles**(*self, ls*)

Alias for `set_linestyle`.

**set_linewidth**(*self, lw*)

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**
lw
[float or list of floats]

set_linewidths(self, lw)
    Alias for set_linewidth.

set_ls(self, ls)
    Alias for set_linestyle.

set_lw(self, lw)
    Alias for set_linewidth.

set_norm(self, norm)
    Set the normalization instance.

Parameters

    norm
        [Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm
of the mappable will reset the norm, locator, and formatters on the colorbar
to default.

set_offset_position(self, offset_position)
    [Deprecated] Set how offsets are applied. If offset_position is 'screen' (de-
default) the offset is applied after the master transform has been applied, that
is, the offsets are in screen coordinates. If offset_position is 'data', the offset
is applied before the master transform, i.e., the offsets are in data coordi-
nates.

Parameters

    offset_position
        [{'screen', 'data'}]

Notes

Deprecated since version 3.3.

set_offsets(self, offsets)
    Set the offsets for the collection.

Parameters
offsets
[array-like (N, 2) or (2,)]

set_path_effects(self, path_effects)
Set the path effects.

Parameters

path_effects
[AbstractPathEffect]

set_paths(self)

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker
[None or bool or callable] This can be one of the following:

• None: Picking is disabled for this artist (default).
• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

hit, props = picker(artist, mouseevent)

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

• deprecated: For Line2D only, picker can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use Line2D.set_pickradius instead.

set_pickradius(self, pr)
Set the pick radius used for containment tests.

Parameters

d
[float] Pick radius, in points.
set_rasterized(self, rasterized)
Force rasterized (bitmap) drawing in vector backend output.
Defaults to None, which implies the backend's default behavior.

Parameters

rasterized
[bool or None]

set_sizes(self, sizes, dpi=72.0)
Set the sizes of each member of the collection.

Parameters

sizes
[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi
[float, default: 72] The dpi of the canvas.

set_sketch_params(self, scale=None, length=None, randomness=None)
Sets the sketch parameters.

Parameters

scale
[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length
[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness
[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest
integer pixel value, so that the resulting image will really contain a 1px wide
black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap**

[bool or None] Possible values:

- **True**: Snap vertices to the nearest pixel center.
- **False**: Do not modify vertex positions.
- **None**: (auto) If the path contains only rectilinear line seg-
  ments, round to the nearest pixel center.

**set_transform**(self, t)

Set the artist transform.

**Parameters**

**t**

[Transform]

**set_url**(self, url)

Set the url for the artist.

**Parameters**

**url**

[str]

**set_urls**(self, urls)

**Parameters**

**urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored
by all other backends.

**set_visible**(self, b)

Set the artist's visibility.

**Parameters**
**b**

[bool]

**set_zorder**(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

**level**

[float]

**property stale**
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky_edges**

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

**to_rgba**(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.
In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
    Update this artist's properties from the dict props.

Parameters

    props
        [dict]

property update_dict

update_from(self, other)
    Copy properties from other to self.

update_scaalarmappable(self)
    Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.Collection(edgecolors=None, facecolors=None, linewdths=None, linestyles='solid', capstyle=None, joinstyle=None, antialiaseds=None, offsets=None, transOffset=None, norm=None, cmap=None, pickradius=5.0, hatch=None, urls=None, off- set_position=<deprecated parameter>, zorder=1, **kwargs)

Bases: matplotlib.artist.Artist, matplotlib.cm.ScalarMappable

Base class for Collections. Must be subclassed to be usable.

A Collection represents a sequence of Patches that can be drawn more efficiently together than individually. For example, when a single path is being drawn repeatedly at different offsets, the renderer can typically execute a draw_marker() call much more efficiently than a series of repeated calls to draw_path() with the offsets put in one-by-one.

Most properties of a collection can be configured per-element. Therefore, Collections have "plural" versions of many of the properties of a Patch (e.g. Collection.get_paths instead of Patch.get_path). Exceptions are the zorder, hatch, pickradius, capstyle and joinstyle properties, which can only be set globally for the whole collection.

Besides these exceptions, all properties can be specified as single values (applying to all elements) or sequences of values. The property of the i-th element of the collection is:
Each Collection can optionally be used as its own `ScalarMappable` by passing the `norm` and `cmap` parameters to its constructor. If the Collection's `ScalarMappable` matrix _A_ has been set (via a call to `Collection.set_array`), then at draw time this internal scalar mappable will be used to set the `facecolors` and `edgecolors`, ignoring those that were manually passed in.

**Parameters**

**edgecolors**

[color or list of colors, default: `rcParams["patch.edgecolor"]` (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edge-color match the facecolor.

**facecolors**

[color or list of colors, default: `rcParams["patch.facecolor"]` (default: 'C0')] Face color for each patch making up the collection.

**linewidths**

[float or list of floats, default: `rcParams["patch.linewidth"]` (default: 1.0)] Line width for each patch making up the collection.

**linestyles**

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink lengths in points. For examples, see /gallery/lines_bars_and_markers/linestyles.

**capstyle**

[str, default: `rcParams["patch.capstyle"]`] Style to use for capping lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

**joinstyle**

[str, default: `rcParams["patch.joinstyle"]`] Style to use for joining lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.
antialiaseds
[bool or list of bool, default: rcParams["patch.antialiased"] (default: True)] Whether each patch in the collection should be drawn with antialiasing.

offsets
[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

transOffset
[Transform, default: IdentityTransform] A single transform which will be applied to each offsets vector before it is used.

offset_position
[{‘screen’ (default), ‘data’ (deprecated)}] If set to ‘data’ (deprecated), offsets will be treated as if it is in data coordinates instead of in screen coordinates.

norm
[Normalize, optional] Forwarded to ScalarMappable. The default of None means that the first draw call will set vmin and vmax using the minimum and maximum values of the data.

cmap
[Colormap, optional] Forwarded to ScalarMappable. The default of None will result in rcParams["image.cmap"] (default: 'viridis') being used.

hatch
[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are ['/', '', '|', '-', '+', 'x', 'o', 'O', '.', '*']. See /gallery/shapes_and_collections/hatch_demo for the meaning of each hatch type.

pickradius
[float, default: 5.0] If pickradius <= 0, then Collection.contains will return True whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width 2*pickradius following any of the Paths in the Collection.

urls
[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See
zorder

[float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder_demo for all defaults and examples.

add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback

add_checker(self, checker)

[Deprecated]

Notes

Deprecated since version 3.3:

autoscale(self)

Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The Axes instance the artist resides in, or None.
changed(self)
    Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)
    [Deprecated]

Notes

 Deprecated since version 3.3:

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

 renderer
    [RendererBase subclass.]

Notes

 This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

Parameters
**match**

A filter criterion for the matches. This can be

- *None*: Return all objects contained in artist.

- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.

- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include_self**

[bool] Include `self` in the list to be checked for a match.

**Returns**

list of `Artist`

**format_cursor_data**(self, data)

Return a string representation of `data`.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

`get_agg_filter`(self)

Return filter function to be used for agg filter.

`get_alpha`(self)

Return the alpha value used for blending - not supported on all backends.

`get_animated`(self)

Return whether the artist is animated.

`get_array`(self)

Return the data array.

`get_capstyle`(self)

`get_children`(self)

Return a list of the child `Artist` of this `Artist`.

`get_clim`(self)

Return the values (min, max) that are mapped to the colormap limits.
get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.
    See also:

    set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

    **Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

    Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

    The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

    Parameters

    event
        [matplotlib.backend_bases.MouseEvent]

    See also:

    format_cursor_data
get_dashes(self)
    Alias for get_linestyle.
get_datalim(self, transData)
get_ec(self)
    Alias for get_edgecolor.
gec(self)
get_edgecolor(self)
gecolor(self)
    Alias for get_edgecolor.
gecolor(self)
get_facecolor(self)
gecolor(self)
    Alias for get_facecolor.
get_facecolors(self)
get_facecolor(self)
get_facecolors(self)
    Alias for get_facecolor.
get_fc(self)
    Alias for get_facecolor.
get_figure(self)
    Return the Figure instance the artist belongs to.
get_fill(self)
    Return whether fill is set.
get_gid(self)
    Return the group id.
gec(self)
get_hatch(self)
    Return the current hatching pattern.
get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.

    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.
    savefig(fname, bbox_inches='tight').
gec(self)
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
gec(self)
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
gec(self)
get_linewidths(self)
    Alias for get_linewidth.
gec(self)
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.

get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

See also:

    set_picker, pickable, pick

get_pickradius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_sketch_params(self)
    Return the sketch parameters for the artist.

Returns

tuple or None
    A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or expanded.

    Returns None if no sketch parameters were set.
get_snap(self)
Return the snap setting.
See set_snap for details.

get_tightbbox(self, renderer)
Like Artist.get_window_extent, but includes any clipping.

Parameters

renderer
[RendererBase subclass] renderer that will be used to draw the
figures (i.e. fig.canvas.get_renderer())

Returns

Bbox
The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied,
and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
Return the url.

get_urls(self)
Return a list of URLs, one for each element of the collection.
The list contains None for elements without a URL. See
gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)
Return the visibility.

get_window_extent(self, renderer)
Get the axes bounding box in display space.
The bounding box' width and height are nonnegative.
Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to
unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

```python
get_zorder(self)
    Return the artist's zorder.
```

```python
have_units(self)
    Return True if units are set on any axis.
```

```python
is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.
```

```python
property mouseover
    If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.
    See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.
```

```python
pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:
    add_callback
    remove_callback
```

```python
pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.
    See also:
    set_picker, get_picker, pickable
```

```python
pickable(self)
    Return whether the artist is pickable.
    See also:
    set_picker, get_picker, pick
```

```python
properties(self)
    Return a dictionary of all the properties of the artist.
```

```python
remove(self)
    Remove the artist from the figure if possible.
```
The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

```python
remove_callback(self, oid)
  Remove a callback based on its observer id.

See also:

  add_callback
```

```python
set(self, **kwargs)
  A property batch setter. Pass `kwargs` to set properties.

set_aa(self, aa)
  Alias for `set_antialiased`.

set_agg_filter(self, filter_func)
  Set the agg filter.

Parameters

  filter_func

    [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.
```

```python
set_alpha(self, alpha)
  Set the alpha value used for blending - not supported on all backends.

Parameters

  alpha

    [float or None]
```

```python
set_animated(self, b)
  Set the artist's animation state.

Parameters

  b

    [bool]
```

```python
set_antialiased(self, aa)
  Set the antialiasing state for rendering.

Parameters
```
aa
[bool or list of bools]

set_antialiaseds(self, aa)
   Alias for set_antialiased.

set_array(self, A)
   Set the image array from numpy array A.

   **Parameters**

   A
   [ndarray]

set_capstyle(self, cs)
   Set the capstyle for the collection (for all its elements).

   **Parameters**

   cs
   [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
   Set the norm limits for image scaling.

   **Parameters**

   vmin, vmax
   [float] The limits.

   The limits may also be passed as a tuple (vmin, vmax) as a single positional argument.

set_clip_box(self, clipbox)
   Set the artist's clip Bbox.

   **Parameters**

   clipbox
   [Bbox]

set_clip_on(self, b)
   Set whether the artist uses clipping.

   When False artists will be visible outside of the axes which can lead to unexpected results.

   **Parameters**
**set_clip_path**

Set the artist’s clip path.

**Parameters**

- **path**
  - [Patch or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.

- **transform**
  - [Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

**Notes**

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

**set_cmap**

Set the colormap for luminance data.

**Parameters**

- **cmap**
  - [Colormap or str or None]

**set_color**

Set both the edgecolor and the facecolor.

**Parameters**

- **c**
  - [color or list of rgba tuples]

**See also:**

Collection.set_facecolor, Collection.set_edgecolor

For setting the edge or face color individually.
set_contains(self, picker)

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

**Parameters**

**picker**

[callback] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

set_dashes(self, ls)

Alias for `set_linestyle`.

set_ec(self, c)

Alias for `set_edgecolor`.

set_edgecolor(self, c)

Set the edgecolor(s) of the collection.

**Parameters**

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)

Alias for `set_edgecolor`.

set_facecolor(self, c)

Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If c is 'none', the patch will not be filled.
Parameters

c
[color or list of colors]

set_facecolors(self, c)
Alias for set_facecolor.

set_fc(self, c)
Alias for set_facecolor.

set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig

[Figure]

set_gid(self, gid)
Set the (group) id for the artist.

Parameters

gid

[str]

set_hatch(self, hatch)
Set the hatching pattern

hatch can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.
Parameters

hatch

```
[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]
```

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, e.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

`in_layout`

[bool]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

Parameters

`js`

```
[{'miter', 'round', 'bevel'}] The joinstyle.
```

`set_label(self, s)`

Set a label that will be displayed in the legend.

Parameters

`s`

[object] s will be converted to a string by calling `str`.

`set_linestyle(self, ls)`

Set the linestyle(s) for the collection.

```
<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'---' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>
```

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters
ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', ''}, (offset, on-off-seq)}. See Line2D.
set linestyle for a complete description.

`set_linestyles(self, ls)`
Alias for `set_linestyle`.

`set_linewidth(self, lw)`
Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**

`lw`

[float or list of floats]

`set_linewidths(self, lw)`
Alias for `set_linewidth`.

`set_ls(self, ls)`
Alias for `set_linestyle`.

`set_lw(self, lw)`
Alias for `set_linewidth`.

`set_norm(self, norm)`
Set the normalization instance.

**Parameters**

`norm`

[Normalize or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`
[Deprecated] Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**
offset_positions

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

**set_offsets**

```python
def set_offsets(self, offsets):
    Set the offsets for the collection.
```

**Parameters**

**offsets**

[array-like (N, 2) or (2,)]

**set_path_effects**

```python
def set_path_effects(self, path_effects):
    Set the path effects.
```

**Parameters**

**path_effects**

[AbstractPathEffect]

**set_paths**

**set_picker**

```python
def set_picker(self, picker):
    Define the picking behavior of the artist.
```

**Parameters**

**picker**

[None or bool or callable] This can be one of the following:

- **None**: Picking is disabled for this artist (default).
- A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. If the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.
• deprecated: For Line2D only, picker can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use Line2D.set_pickradius instead.

```python
set_pickradius(self, pr)
```
Set the pick radius used for containment tests.

**Parameters**

- `d`
  [float] Pick radius, in points.

```python
set_rasterized(self, rasterized)
```
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

- `rasterized`
  [bool or None]

```python
set_sketch_params(self, scale=None, length=None, randomness=None)
```
Sets the sketch parameters.

**Parameters**

- `scale`
  [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

- `length`
  [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

- `randomness`
  [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

```python
set_snap(self, snap)
```
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest
integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap**

[bool or None] Possible values:

- **True**: Snap vertices to the nearest pixel center.
- **False**: Do not modify vertex positions.
- **None**: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```
set_transform(self, t)
```

Set the artist transform.

**Parameters**

**t**

[Transform]

```
set_url(self, url)
```

Set the url for the artist.

**Parameters**

**url**

[str]

```
set_urls(self, urls)
```

**Parameters**

**urls**

[list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

```
set_visible(self, b)
```

Set the artist's visibility.

**Parameters**
b

[bool]

set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level
[bool]

property stale
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.
In either case, if \textit{bytes} is \textit{False} (default), the rgba array will be floats in the 0-1 range; if it is \textit{True}, the returned rgba array will be uint8 in the 0 to 255 range.

If \textit{norm} is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

\texttt{update(self, props)}

Update this artist's properties from the dict \textit{props}.

**Parameters**

- \texttt{props} [dict]

\texttt{property update_dict}

\texttt{update_from(self, other)}

Copy properties from other to self.

\texttt{update_scalarmappable(self)}

Update colors from the scalar mappable array, if it is not None.

\texttt{zorder = 0}

\texttt{class matplotlib.collections.EllipseCollection(widths, heights, angles, units='points', **kwargs)}

\texttt{Bases: matplotlib.collections.Collection}

A collection of ellipses, drawn using splines.

**Parameters**

- \texttt{widths} [array-like] The lengths of the first axes (e.g., major axis lengths).

- \texttt{heights} [array-like] The lengths of second axes.

- \texttt{angles} [array-like] The angles of the first axes, degrees CCW from the x-axis.

- \texttt{units} [\{'points', 'inches', 'dots', 'width', 'height', 'x', 'y', 'xy'\}] The units in which majors and minors are given; 'width' and 'height' refer to the dimensions of the axes, while 'x' and 'y' refer to the \textit{offsets} data units. 'xy' differs from all others in that the angle as plotted varies with the aspect ratio, and equals the specified angle only when the aspect ratio is unity. Hence it behaves the same as the \texttt{Ellipse} with \texttt{axes.transData} as its transform.
**kwargs
Forwarded to `Collection`.

`add_callback(self, func)`
Add a callback function that will be called whenever one of the `Artist`'s properties changes.

**Parameters**

`func`
[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

`int`
The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

`remove_callback`

`add_checker(self, checker)`
[Deprecated]  

**Notes**
Deprecated since version 3.3:

`autoscale(self)`
Autoscale the scalar limits on the norm instance using the current array

`autoscale_None(self)`
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

`property axes`
The `Axes` instance the artist resides in, or `None`.

`changed(self)`
Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.
check_update(self, checker)
    [Deprecated]

Notes

Deprecated since version 3.3:

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

        renderer
            [RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

    Parameters

        match
            A filter criterion for the matches. This can be
                • None: Return all objects contained in artist.
• A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.

• A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (isinstance check).

**include_self**

[bool] Include `self` in the list to be checked for a match.

**Returns**

**list of Artist**

**format_cursor_data**(self, data)
Return a string representation of `data`.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

**get_cursor_data**

**get_agg_filter**(self)
Return filter function to be used for agg filter.

**get_alpha**(self)
Return the alpha value used for blending - not supported on all backends.

**get_animated**(self)
Return whether the artist is animated.

**get_array**(self)
Return the data array.

**get_capstyle**(self)

**get_children**(self)
Return a list of the child `Artist` of this `Artist`.

**get_clim**(self)
Return the values (min, max) that are mapped to the colormap limits.

**get_clip_box**(self)
Return the clipbox.

**get_clip_on**(self)
Return whether the artist uses clipping.
get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

    Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

    The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

    Parameters

    event
        [matplotlib.backend_bases.MouseEvent]

    See also:

    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self)
    Alias for get_edgecolor.
get_edgecolor(self)
get_edgecolors(self)
    Alias for get_edgecolor.
get_facecolor(self)
get_facecolors(self)
    Alias for get_facecolor.
get_fc(self)
    Alias for get_facecolor.
get_figure(self)
    Return the Figure instance the artist belongs to.
get_fill(self)
    Return whether fill is set.
get_gid(self)
    Return the group id.
get_hatch(self)
    Return the current hatching pattern.
get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g.  Constrained Layout Guide, Figure.tight_layout(), and fig.
    savefig(fname, bbox_inches='tight').
get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position
is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

See also:

set_picker, pickable, pick

get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_sketch_params(self)
    Return the sketch parameters for the artist.

Returns

tuple or None
    A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or expanded.
    Returns None if no sketch parameters were set.

get_snap(self)
    Return the snap setting.
    See set_snap for details.
get_tightbbox(self, renderer)

Like Artist.get_window_extent, but includes any clipping.

Parameters

renderer

[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(self)

Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)

Return the url.

get_urls(self)

Return a list of URLs, one for each element of the collection.

The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)

Return the visibility.

g_get_window_extent(self, renderer)

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)

Return the artist's zorder.
have_units(self)
    Return True if units are set on any axis.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

property mouseover
    If this property is set to True, the artist will be queried for custom context
    information when the mouse cursor moves over it.
    See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:
    add_callback
    remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and
    the artist has picker set.
    See also:
    set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.
    See also:
    set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.

remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with
    FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
    Note: relim will not see collections even if the collection was added to the
    axes with autolim = True.
    Note: there is no support for removing the artist's legend entry.
remove_callback(self, oid)
    Remove a callback based on its observer id.

See also:

    add_callback

set(self, **kwargs)
    A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

    Parameters

        filter_func

            [callable] A filter function, which takes a (m, n, 3) float array
            and a dpi value, and returns a (m, n, 3) array.

def set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.

    Parameters

        alpha

            [float or None]

set_animated(self, b)
    Set the artist's animation state.

    Parameters

        b

            [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    Parameters

        aa

            [bool or list of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.
set_array(self, A)

Set the image array from numpy array A.

Parameters

A

[ndarray]

set_capstyle(self, cs)

Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)

Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (vmin, vmax) as a single positional argument.

set_clip_box(self, clipbox)

Set the artist's clip Bbox.

Parameters

clipbox

[Bbox]

set_clip_on(self, b)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b

[bool]

set_clip_path(self, path, transform=None)

Set the artist's clip path.
Parameters

path

[Path or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.

transform

[Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

Notes

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

set_cmap(self, cmap)

Set the colormap for luminance data.

Parameters

cmap

[Colormap or str or None]

set_color(self, c)

Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor

For setting the edge or face color individually.

set_contains(self, picker)

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters
picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(

Alias for `set_linestyle`.

set_ec(

Alias for `set_edgecolor`.

set_edgecolor(

Set the edgecolor(s) of the collection.

Parameters

c

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(

Alias for `set_edgecolor`.

set_facecolor(

Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If c is 'none', the patch will not be filled.

Parameters

c

[color or list of colors]
set_facecolors(self, c)
    Alias for set_facecolor.

set_fc(self, c)
    Alias for set_facecolor.

set_figure(self, fig)
    Set the Figure instance the artist belongs to.

    Parameters

    fig
        [Figure]

set_gid(self, gid)
    Set the (group) id for the artist.

    Parameters

    gid
        [str]

set_hatch(self, hatch)
    Set the hatching pattern

    hatch can be one of:

    / - diagonal hatching
    \ - back diagonal
    | - vertical
    - - horizontal
    + - crossed
    x - crossed diagonal
    o - small circle
    O - large circle
    . - dots
    * - stars

    Letters can be combined, in which case all the specified hatchings are done.
    If same letter repeats, it increases the density of hatching of that pattern.

    Hatching is supported in the PostScript, PDF, SVG and Agg backends only.
    Unlike other properties such as linewidth and colors, hatching can only be
    specified for the collection as a whole, not separately for each member.

    Parameters

    hatch
        [{\', \', |', -', '+', 'x', 'o', 'O', '.', '*'}]
set_in_layout(self, in_layout)
Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters

in_layout
[bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js
[{'miter', 'round', 'bevel'}] The joinstyle.

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s
[object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

Parameters

ls
[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '.', ':', '', (offset, on-off-seq)}. See Line2D.set_linestyle for a complete description.
Matplotlib, Release 3.3.3

```
set_linestyles(self, ls)
    Alias for set_linestyle.

set_linewidth(self, lw)
    Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

    Parameters

    lw
        [float or list of floats]

set_linewidths(self, lw)
    Alias for set_linewidth.

set_ls(self, ls)
    Alias for set_linestyle.

set_lw(self, lw)
    Alias for set_linewidth.

set_norm(self, norm)
    Set the normalization instance.

    Parameters

    norm
        [Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_position(self, offset_position)
    [Deprecated] Set how offsets are applied. If offset_position is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

    Parameters

    offset_position
        ['screen', 'data']
```
Notes

Deprecated since version 3.3.

set_offsets(self, offsets)
Set the offsets for the collection.

Parameters

offsets
[array-like (N, 2) or (2,)]

set_path_effects(self, path_effects)
Set the path effects.

Parameters

path_effects
[AbstractPathEffect]

set_paths(self)

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker
[None or bool or callable] This can be one of the following:

• None: Picking is disabled for this artist (default).

• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```
to determine the hit test. If the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

• deprecated: For Line2D only, picker can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use Line2D.set_pickradius instead.
**set_pickradius**(*self*, *pr*)

Set the pick radius used for containment tests.

**Parameters**

*d*  
[float] Pick radius, in points.

**set_rasterized**(*self*, *rasterized*)

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

*rasterized*  
[bool or None]

**set_sketch_params**(*self*, *scale=None*, *length=None*, *randomness=None*)

Sets the sketch parameters.

**Parameters**

*scale*  
[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

*length*  
[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

*randomness*  
[float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

**set_snap**(*self*, *snap*)

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**
**snap**

[bool or None] Possible values:

- **True**: Snap vertices to the nearest pixel center.
- **False**: Do not modify vertex positions.
- **None** (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```python
set_transform(self, t)
```

Set the artist transform.

**Parameters**

- **t**
  
  [Transform]

```python
set_url(self, url)
```

Set the url for the artist.

**Parameters**

- **url**
  
  [str]

```python
set_urls(self, urls)
```

**Parameters**

- **urls**
  
  [list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

```python
set_visible(self, b)
```

Set the artist's visibility.

**Parameters**

- **b**
  
  [bool]
set_zorder(self, level)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.
If norm is False, no normalization of the input data is performed, and it is
assumed to be in the range (0-1).

update(self, props)
Update this artist's properties from the dict props.

Parameters

props
[dict]

property update_dict

update_from(self, other)
Copy properties from other to self.

update_scalarmappable(self)
Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.EventCollection(positions,
orientation='horizontal', lineoffset=0,
linelength=1, linewidth=None,
color=None, linestyle='solid',
antialiased=None, **kwargs)

Bases: matplotlib.collections.LineCollection

A collection of locations along a single axis at which an "event" occurred.
The events are given by a 1-dimensional array. They do not have an amplitude
and are displayed as parallel lines.

Parameters

positions
[1D array-like] Each value is an event.

orientation
['horizontal', 'vertical'], default: 'horizontal'] The sequence of
events is plotted along this direction. The marker lines of the
single events are along the orthogonal direction.

lineoffset
[float, default: 0] The offset of the center of the markers from
the origin, in the direction orthogonal to orientation.

linelength
[float, default: 1] The total height of the marker (i.e. the
marker stretches from lineoffset - linelength/2 to lineoffset + linelength/2).
 linewidth
 [float or list thereof, default: rcParams["lines.linewidth"] (default: 1.5)] The line width of the event lines, in points.

color
 [color or list of colors, default: rcParams["lines.color"] (default: 'C0')] The color of the event lines.

 linestyle
 [str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

 (offset, onoffseq),

 where onoffseq is an even length tuple of on and off ink in points.

 antialiased
 [bool or list thereof, default: rcParams["lines.antialiased"] (default: True)] Whether to use antialiasing for drawing the lines.

 **kwargs
 Forwarded to LineCollection.

 Examples

 add_callback(self, func)
 Add a callback function that will be called whenever one of the Artist's properties changes.

 Parameters

 func
 [callable] The callback function. It must have the signature:

 def func(artist: Artist) -> Any

 where artist is the calling Artist. Return values may exist but are ignored.

 Returns

 int
 The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.
See also:

remove_callback

add_checker(self, checker)
  [Deprecated]

Notes

Deprecated since version 3.3:

add_positions(self, position)
  Add one or more events at the specified positions.

append_positions(self, position)
  Add one or more events at the specified positions.

autoscale(self)
  Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
  Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None
property axes
    The Axes instance the artist resides in, or None.

changed(self)
    Call this whenever the mappable is changed to notify all the callbackSM
    listeners to the 'changed' signal.

check_update(self, checker)
    [Deprecated]

Notes

Deprecated since version 3.3:

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the
    event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units,
    x itserlf is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units,
    y itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns
    False).

    Parameters

    renderer
        [RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

extend_positions(self, position)
Add one or more events at the specified positions.

findobj(self, match=None, include_self=True)
Find artist objects.
Recursively find all Artist instances contained in the artist.

Parameters

match
A filter criterion for the matches. This can be
• None: Return all objects contained in artist.
• A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self
[bool] Include self in the list to be checked for a match.

Returns

list of Artist

format_cursor_data(self, data)
Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

get_cursor_data

get_agg_filter(self)
Return filter function to be used for agg filter.
get_alpha(self)
    Return the alpha value used for blending - not supported on all backends.

get_animated(self)
    Return whether the artist is animated.

get_array(self)
    Return the data array.

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_color(self)
    Return the color of the lines used to mark each event.

get_colors(self)

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.
Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- **event**
  
  `[matplotlib.backend_bases.MouseEvent]`

**See also:**

`format_cursor_data`

get_dashes(self)
  Alias for `get_linestyle`.

get_datalim(self, transData)

get_ec(self)
  Alias for `get_edgecolor`.

get_edgecolor(self)

get_edgecolors(self)
  Alias for `get_edgecolor`.

get_facecolor(self)

get_facecolors(self)
  Alias for `get_facecolor`.

get_fc(self)
  Alias for `get_facecolor`.

get_figure(self)
  Return the `Figure` instance the artist belongs to.

get_fill(self)
  Return whether fill is set.

gid(self)
  Return the group id.

g_get_hatch(self)
  Return the current hatching pattern.

get_in_layout(self)
  Return boolean flag, True if artist is included in layout calculations.
E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

- `get_joinstyle(self)`: Return the join style used for this artist.
- `get_label(self)`: Return the label used for this artist in the legend.
- `get_linewidth(self)`: Return the width of the lines used to mark each event.
- `get_linewidths(self)`: Alias for `get_linewidth`.
- `get_lw(self)`: Alias for `get_linewidth`.
- `get_linestyle(self)`: Return the linestyle used to mark each event.
- `get_linestyles(self)`: Alias for `get_linestyle`.
- `get_ls(self)`: Alias for `get_linestyle`.
- `get_offset_position(self)`: [Deprecated] Return how offsets are applied for the collection. If `offset_position` is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Notes**

Deprecated since version 3.3.

- `get_offset_transform(self)`: Return the offset transform.
- `get_offsets(self)`: Return the offsets for the collection.
- `get_orientation(self)`: Return the orientation of the event line ('horizontal' or 'vertical').
- `get_path_effects(self)`: Return the path effects.
- `get_paths(self)`: Return the paths.
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

    See also:

    set_picker, clickable, pick

get_pickradius(self)

get_positions(self)
    Return an array containing the floating-point values of the positions.

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_segments(self)

    Returns

    list
    List of segments in the LineCollection. Each list item contains
    an array of vertices.

get_sketch_params(self)
    Return the sketch parameters for the artist.

    Returns

    tuple or None
    A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the
      source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is
      shrunken or expanded.
    Returns None if no sketch parameters were set.

get_snap(self)
    Return the snap setting.
    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters
renderer

[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
Return the url.

get_urls(self)
Return a list of URLs, one for each element of the collection.

The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)
Return the visibility.

get_window_extent(self, renderer)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
Return the artist's zorder.

have_units(self)
Return True if units are set on any axis.

is_horizontal(self)
True if the eventcollection is horizontal, False if vertical.
is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

property mouseover
    If this property is set to True, the artist will be queried for custom context
    information when the mouse cursor moves over it.
    See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:

    add_callback
    remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and
    the artist has picker set.
    See also:

    set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.
    See also:

    set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.

remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with
    FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
    Note: relim will not see collections even if the collection was added to the
    axes with autolim = True.
    Note: there is no support for removing the artist's legend entry.
remove_callback(self, oid)
   Remove a callback based on its observer id.

   See also:

   add_callback

set(self, **kwargs)
   A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
   Alias for set_antialiased.

set_agg_filter(self, filter_func)
   Set the agg filter.

   Parameters

   filter_func
      [callable] A filter function, which takes a (m, n, 3) float array
      and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
   Set the alpha value used for blending - not supported on all backends.

   Parameters

   alpha
      [float or None]

set_animated(self, b)
   Set the artist's animation state.

   Parameters

   b
      [bool]

set_antialiased(self, aa)
   Set the antialiasing state for rendering.

   Parameters

   aa
      [bool or list of bools]

set_antialiaseds(self, aa)
   Alias for set_antialiased.
set_array(self, A)
    Set the image array from numpy array A.

    Parameters

    A
        [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    Parameters

    cs
        [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
    Set the norm limits for image scaling.

    Parameters

    vmin, vmax
        [float] The limits.
        The limits may also be passed as a tuple (vmin, vmax) as a single
        positional argument.

set_clip_box(self, clipbox)
    Set the artist's clip $B_{box}$.

    Parameters

    clipbox
        [$B_{box}$]

set_clip_on(self, b)
    Set whether the artist uses clipping.
    When False artists will be visible outside of the axes which can lead to un-
    expected results.

    Parameters

    b
        [bool]

set_clip_path(self, path, transform=None)
    Set the artist's clip path.
Parameters

path

[Patch or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.

transform

[Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

Notes

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

 cmap

[Colormap or str or None]

set_color(self, c)
Set the color(s) of the LineCollection.

Parameters

 c

[color or list of colors] Single color (all patches have same color), or a sequence of rgba tuples; if it is a sequence the patches will cycle through the sequence.

set_contains(self, picker)
[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

 picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:
def contains(artist: Artist, event: MouseEvent) -> bool, dict

that returns:
• a bool indicating if the event is within the artist
• a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(self, ls)
    Alias for set_linestyle.

set_ec(self, c)
    Alias for set_edgecolor.

set_edgecolor(self, c)
    Set the edgecolor(s) of the collection.

    Parameters

    c
        [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)
    Alias for set_edgecolor.

set_facecolor(self, c)
    Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

    If c is 'none', the patch will not be filled.

    Parameters

    c
        [color or list of colors]

set_facecolors(self, c)
    Alias for set_facecolor.
set_fc(self, c)
    Alias for set_facecolor.

set_figure(self, fig)
    Set the Figure instance the artist belongs to.

    Parameters

    fig
        [Figure]

set_gid(self, gid)
    Set the (group) id for the artist.

    Parameters

    gid
        [str]

set_hatch(self, hatch)
    Set the hatching pattern

    hatch can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only. Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

    Parameters

    hatch

set_in_layout(self, in_layout)
    Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').
Parameters

in_layout
[bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js
[{'miter', 'round', 'bevel'}] The joinstyle.

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s
[object] s will be converted to a string by calling str.

set_linelength(self, linelength)
Set the length of the lines used to mark each event.

set_lineoffset(self, lineoffset)
Set the offset of the lines used to mark each event.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

(heatmap, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

Parameters

ls
[str or tuple or list thereof] Valid values for individual linestyles include {'-', '---', '-', ':', '', (offset, on-off-seq)}. See Line2D. set_linestyle for a complete description.
set_linestyles(self, ls)
    Alias for set_linestyle.

set_linewidth(self, lw)
    Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

    Parameters

    lw
        [float or list of floats]

set_linewidths(self, lw)
    Alias for set_linewidth.

set_ls(self, ls)
    Alias for set_linestyle.

set_lw(self, lw)
    Alias for set_linewidth.

set_norm(self, norm)
    Set the normalization instance.

    Parameters

    norm
        [Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_position(self, offset_position)
    [Deprecated] Set how offsets are applied. If offset_position is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

    Parameters

    offset_position
        [{'screen', 'data'}]
Notes

Deprecated since version 3.3.

```python
set_offsets(self, offsets)
```
Set the offsets for the collection.

**Parameters**

```python
offsets
[array-like (N, 2) or (2,)]
```

```python
set_orientation(self, orientation=None)
```
Set the orientation of the event line.

**Parameters**

```python
orientation
[{'horizontal', 'vertical'}]
```

```python
set_path_effects(self, path_effects)
```
Set the path effects.

**Parameters**

```python
path_effects
[AbstractPathEffect]
```

```python
set_paths(self, segments)
```

```python
set_picker(self, picker)
```
Define the picking behavior of the artist.

**Parameters**

```python
picker
[None or bool or callable] This can be one of the following:

- **None**: Picking is disabled for this artist (default).
- A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:
```
to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.

- **deprecated**: For `Line2D` only, `picker` can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use `Line2D.set_pickradius` instead.

```python
set_pickradius(self, pr)
```
Set the pick radius used for containment tests.

**Parameters**

- **d**
  - [float] Pick radius, in points.

```python
set_positions(self, positions)
```
Set the positions of the events.

```python
set_rasterized(self, rasterized)
```
Force rasterized (bitmap) drawing in vector backend output.
Defaults to None, which implies the backend's default behavior.

**Parameters**

- **rasterized**
  - [bool or None]

```python
set_segments(self, segments)
```

```python
set_sketch_params(self, scale=None, length=None, randomness=None)
```
Sets the sketch parameters.

**Parameters**

- **scale**
  - [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is `None`, or not provided, no sketch filter will be provided.

- **length**
  - [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

- **randomness**
  - [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)
set_snap(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap
[bool or None] Possible values:
• True: Snap vertices to the nearest pixel center.
• False: Do not modify vertex positions.
• None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

set_transform(self, t)
Set the artist transform.

Parameters

t
[Transform]

set_url(self, url)
Set the url for the artist.

Parameters

url
[str]

set_urls(self, urls)

Parameters

urls
[list of str or None]
Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_verts(self, segments)

set_visible(self, b)

Set the artist’s visibility.

Parameters

b

[bool]

set_zorder(self, level)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)

switch_orientation(self)

Switch the orientation of the event line, either from vertical to horizontal or vice versa.
to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
Update this artist's properties from the dict props.

Parameters

props
[dict]

property update_dict
update_from(self, other)
Copy properties from other to self.

update_scalarmappable(self)
Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.LineCollection(segments, linewidths=None, colors=None, antialiaseds=None, linestyles='solid', offsets=None, transOffset=None, norm=None, cmap=None, pickradius=5, zorder=2, facecolors='none', **kwargs)

Bases: matplotlib.collections.Collection

Represents a sequence of Line2Ds that should be drawn together.
This class extends Collection to represent a sequence of Line2Ds instead of just a sequence of Patches. Just as in Collection, each property of a LineCollection may be either a single value or a list of values. This list is then used cyclically for each element of the LineCollection, so the property of the i-th element of the collection is:

\[ \text{prop[i \% \len(prop)]} \]

The properties of each member of a LineCollection default to their values in rcParams["lines.*"] instead of rcParams["patch.*"], and the property colors is added in place of edgecolors.

**Parameters**

- **segments**: list of array-like
  
  A sequence of (line0, line1, line2), where:

  \[
  \text{line}n = (x0, y0), (x1, y1), \ldots (xm, ym)
  \]

  or the equivalent numpy array with two columns. Each line can have a different number of segments.

- **linewdiths**

  [float or list of float, default: rcParams["lines.linewidth"] (default: 1.5)] The width of each line in points.

- **colors**

  [color or list of color, default: rcParams["lines.color"] (default: 'C0')] A sequence of RGBA tuples (e.g., arbitrary color strings, etc, not allowed).

- **antialiaseds**

  [bool or list of bool, default: rcParams["lines.antialiased"] (default: True)] Whether to use antialiasing for each line.

- **zorder**

  [int, default: 2] zorder of the lines once drawn.

- **facecolors**

  [color or list of color, default: 'none'] The facecolors of the LineCollection. Setting to a value other than 'none' will lead to each line being "filled in" as if there was an implicit line segment joining the last and first points of that line back around to each other. In order to manually specify what should count as the "interior" of each line, please use PathCollection instead, where the "interior" can be specified by appropriate usage of CLOSEPOLY.

- ****kwargs

18.16. matplotlib.collections
add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

**Parameters**

_func_
[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where `artist` is the calling `Artist`. Return values may exist but are ignored.

**Returns**

int
The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

See also:

`remove_callback`

add_checker(self, checker)
[Deprecated]

Notes

Deprecated since version 3.3:

autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
The `Axes` instance the artist resides in, or `None`.

changed(self)
Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)
[Deprecated]
Notes

Deprecated since version 3.3:

contains(self, mouseevent)
Test whether the mouse event occurred in the collection.
Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
Convert x using the unit type of the xaxis.
If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
Convert y using the unit type of the yaxis.
If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
Draw the Artist (and its children) using the given renderer.
This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer
[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)
Find artist objects.
Recursively find all Artist instances contained in the artist.

Parameters

match
A filter criterion for the matches. This can be
• None: Return all objects contained in artist.
• A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
• A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

`include_self`

[bool] Include `self` in the list to be checked for a match.

Returns

list of `Artist`

`format_cursor_data(self, data)`

Return a string representation of `data`.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

`get_agg_filter(self)`

Return filter function to be used for agg filter.

`get_alpha(self)`

Return the alpha value used for blending - not supported on all backends.

`get_animated(self)`

Return whether the artist is animated.

`get_array(self)`

Return the data array.

`get_capstyle(self)`

`get_children(self)`

Return a list of the child `Artists` of this `Artist`.

`get_clim(self)`

Return the values (min, max) that are mapped to the colormap limits.

`get_clip_box(self)`

Return the clipbox.

`get_clip_on(self)`

Return whether the artist uses clipping.

`get_clip_path(self)`

Return the clip path.
get_cmap(self)
    Return the Colormap instance.

get_color(self)

get_colors(self)

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.

The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

Parameters

    event
        [matplotlib.backend_bases.MouseEvent]

See also:

    format_cursor_data

get_dashes(self)
    Alias for get_linestyle.

get_datalim(self, transData)
.. _get_ec:

get_ec(self)

   Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)

   Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)

   Alias for get_facecolor.

get_fc(self)

   Alias for get_facecolor.

get_figure(self)

   Return the Figure instance the artist belongs to.

get_fill(self)

   Return whether fill is set.

get_gid(self)

   Return the group id.

get_hatch(self)

   Return the current hatching pattern.

get_in_layout(self)

   Return boolean flag, True if artist is included in layout calculations.

   E.g. :footnote:`Constrained Layout Guide`, :func:`Figure.tight_layout()`, and
   :meth:`fig.savefig(fname, bbox_inches='tight')`.

get_joinstyle(self)

get_label(self)

   Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)

   Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)

   Alias for get_linewidth.

get_ls(self)

   Alias for get_linestyle.

get_lw(self)

   Alias for get_linewidth.

get_offset_position(self)

   [Deprecated] Return how offsets are applied for the collection. If offset_position
   is 'screen', the offset is applied after the master transform has
been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(self)
get_offsets(self)
   Return the offsets for the collection.

get_path_effects(self)
get_paths(self)

get_picker(self)
   Return the picking behavior of the artist.
   The possible values are described in set_picker.

See also:

   set_picker, pickable, pick

get_pickradius(self)
get_rasterized(self)
   Return whether the artist is to be rasterized.

get_segments(self)

   Returns

   list
      List of segments in the LineCollection. Each list item contains an array of vertices.

get_sketch_params(self)
   Return the sketch parameters for the artist.

   Returns

   tuple or None
      A 3-tuple with the following elements:
      • scale: The amplitude of the wiggle perpendicular to the source line.
      • length: The length of the wiggle along the line.
• **randomness**: The scale factor by which the length is shrunken or expanded.

Returns *None* if no sketch parameters were set.

```python
get_snap(self)
Return the snap setting.
See `set_snap` for details.
```

```python
get_tightbbox(self, renderer)
Like `Artist.get_window_extent`, but includes any clipping.

**Parameters**

**renderer**

[RendererBase subclass] renderer that will be used to draw the figures (i.e. `fig.canvas.get_renderer()`)

**Returns**

*Bbox*

The enclosing bounding box (in figure pixel coordinates).

```python
get_transform(self)
Return the `Transform` instance used by this artist.
```

```python
get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.
```

```python
get_transforms(self)
```

```python
get_url(self)
Return the url.
```

```python
get_urls(self)
Return a list of URLs, one for each element of the collection.

The list contains *None* for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.
```

```python
get_visible(self)
Return the visibility.
```

```python
get_window_extent(self, renderer)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.
```
Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist's zorder.

have_units(self)
    Return True if units are set on any axis.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

property mouseover
    If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.

    See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.

    See also:

        add_callback
        remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

    See also:

        set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.

    See also:

        set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.
remove(self)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with
FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the
axes with autolim = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(self, oid)
Remove a callback based on its observer id.

See also:

add_callback

set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
Alias for set_antialiased.

set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func
[callable] A filter function, which takes a (m, n, 3) float array
and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha
[float or None]

set_animated(self, b)
Set the artist's animation state.

Parameters

b
[bool]

set_antialiased(self, aa)
Set the antialiasing state for rendering.
Parameters

aa

[bool or list of bools]

set_antialiaseds(self, aa)
Alias for set_antialiased.

set_array(self, A)
Set the image array from numpy array A.

Parameters

A

[ndarray]

set_capstyle(self, cs)
Set the capstyle for the collection (for all its elements).

Parameters

cs

[{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
Set the norm limits for image scaling.

Parameters

vmin, vmax

[float] The limits.

The limits may also be passed as a tuple (vmin, vmax) as a single positional argument.

set_clip_box(self, clipbox)
Set the artist's clip Bbox.

Parameters

clipbox

[Bbox]

set_clip_on(self, b)
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.
Parameters

b

[bool]

set_clip_path(self, path, transform=None)
Set the artist's clip path.

Parameters

path

[Patch or Path or TransformedPath or None] The clip path. If
given a Path, transform must be provided as well. If None, a
previously set clip path is removed.

transform

[Transform, optional] Only used if path is a Path, in which case
the given Path is converted to a TransformedPath using transform.

Notes

For efficiency, if path is a Rectangle this method will set the clipping box to
the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also ac-
cepted as a single positional parameter.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap

[Colormap or str or None]

set_color(self, c)
Set the color(s) of the LineCollection.

Parameters

c

[color or list of colors] Single color (all patches have same
color), or a sequence of rgba tuples; if it is a sequence the
patches will cycle through the sequence.
set_contains(self, picker)

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters**

**picker**

callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

set_dashes(self, ls)

Alias for `set_linestyle`.

set_ec(self, c)

Alias for `set_edgecolor`.

set_edgecolor(self, c)

Set the edgecolor(s) of the collection.

**Parameters**

**c**

color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)

Alias for `set_edgecolor`.

set_facecolor(self, c)

Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If c is 'none', the patch will not be filled.
**Parameters**

c
[COLOR or list of colors]

`set_facecolors(self, c)`  
Alias for `set_facecolor`.

`set_fc(self, c)`  
Alias for `set_facecolor`.

`set_figure(self, fig)`  
Set the `Figure` instance the artist belongs to.

**Parameters**

dig
[Figure]

`set_gid(self, gid)`  
Set the (group) id for the artist.

**Parameters**

gid
[STR]

`set_hatch(self, hatch)`  
Set the hatching pattern

`hatch` can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.
Parameters

**hatch**
[[ '/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '**']]  

`s.et_in_layout(self, in_layout)`  
Set if artist is to be included in layout calculations, e.g. *Constrained Layout Guide*, *Figure.tight_layout()*, and `fig.savefig(fname, bbox_inches='tight')`.

Parameters

**in_layout**
[bool]

`s.et_joinstyle(self, js)`  
Set the joinstyle for the collection (for all its elements).

Parameters

**js**
[{'miter', 'round', 'bevel'}] The joinstyle.

`s.et_label(self, s)`  
Set a label that will be displayed in the legend.

Parameters

**s**
[object] *s* will be converted to a string by calling `str`.

`s.et_linestyle(self, ls)`  
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

Parameters
ls

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See Line2D
set_linestyle for a complete description.

set_linestyles(self, ls)
   Alias for set_linestyle.

set_linewidth(self, lw)
   Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

Parameters

lw
   [float or list of floats]

set_linewidths(self, lw)
   Alias for set_linewidth.

set_ls(self, ls)
   Alias for set_linestyle.

set_lw(self, lw)
   Alias for set_linewidth.

set_norm(self, norm)
   Set the normalization instance.

Parameters

norm
   [Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_position(self, offset_position)
   [Deprecated] Set how offsets are applied. If offset_position is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Parameters
offset_position

[{'screen', 'data'}]

Notes

Deprecated since version 3.3.

set_offsets(self, offsets)
Set the offsets for the collection.

Parameters

offsets
[array-like (N, 2) or (2,)]

set_path_effects(self, path_effects)
Set the path effects.

Parameters

path_effects
[AbstractPathEffect]

set_paths(self, segments)

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker
[None or bool or callable] This can be one of the following:

• None: Picking is disabled for this artist (default).
• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.
• **deprecated**: For `Line2D` only, `picker` can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use `Line2D.set_pickradius` instead.

```python
set_pickradius(self, pr)
```

Set the pick radius used for containment tests.

**Parameters**

- `d`
  
  [float] Pick radius, in points.

```python
set_rasterized(self, rasterized)
```

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

- `rasterized`
  
  [bool or None]

```python
set_segments(self, segments)
```

```python
set_sketch_params(self, scale=None, length=None, randomness=None)
```

Sets the sketch parameters.

**Parameters**

- `scale`
  
  [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

- `length`
  
  [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

- `randomness`
  
  [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

```python
set_snap(self, snap)
```

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated
value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

`snap`

[bool or None] Possible values:

- **True**: Snap vertices to the nearest pixel center.
- **False**: Do not modify vertex positions.
- **None**: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

`set_transform(self, t)`

Set the artist transform.

**Parameters**

`t`

[Transform]

`set_url(self, url)`

Set the url for the artist.

**Parameters**

`url`

[str]

`set_urls(self, urls)`

**Parameters**

`urls`

[list of str or None]
Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

```python
set_verts(self, segments)
```

```python
set_visible(self, b)
```
Set the artist's visibility.

**Parameters**

- `b` [bool]

```python
set_zorder(self, level)
```
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

- `level` [float]

**property stale**

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

**property sticky_edges**

- `x` and `y` sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding `sticky_edges` list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the `x` and `y` lists can be modified in place as needed.

**Examples**

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

```python
to_rgba(self, x, alpha=None, bytes=False, norm=True)
```
Return a normalized rgba array corresponding to `x`.

In the normal case, `x` is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.
There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If \( x \) is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the \( \text{alpha} \) kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the \( \text{alpha} \) kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if \( \text{bytes} \) is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If \( \text{norm} \) is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

```python
update(self, props)
```
Update this artist's properties from the dict \( \text{props} \).

**Parameters**

- **props**
  - [dict]

```python
property update_dict
```

```python
update_from(self, other)
```
Copy properties from other to self.

```python
update_scalarmappable(self)
```
Update colors from the scalar mappable array, if it is not None.

```python
zorder = 0
```

```python
class matplotlib.collections.PatchCollection(patches, match_original=False, **kwargs)
```
A generic collection of patches.

This makes it easier to assign a color map to a heterogeneous collection of patches.

This also may improve plotting speed, since PatchCollection will draw faster than a large number of patches.

- **patches**
  - a sequence of Patch objects. This list may include a heterogeneous assortment of different patch types.

- **match_original**
If True, use the colors and linewidths of the original patches. If False, new colors may be assigned by providing the standard collection arguments, facecolor, edgecolor, linewidths, norm or cmap.

If any of edgecolors, facecolors, linewidths, antialiaseds are None, they default to their rcParams patch setting, in sequence form.

The use of ScalarMappable functionality is optional. If the ScalarMappable matrix _A has been set (via a call to set_array), at draw time a call to scalar mappable will be made to set the face colors.

add_callback(self, func)
Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

func
[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

Returns

int
The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback

add_checker(self, checker)
[Deprecated]

Notes

Deprecated since version 3.3:

autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None
property axes
    The Axes instance the artist resides in, or None.

changed(self)
    Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)
    [Deprecated]

Notes

Deprecated since version 3.3:

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

    renderer
        [RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`
Find artist objects.

Recursively find all `Artist` instances contained in the artist.

**Parameters**

**match**
A filter criterion for the matches. This can be
- `None`: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include_self**
[bool] Include `self` in the list to be checked for a match.

**Returns**

list of `Artist`

`format_cursor_data(self, data)`
Return a string representation of `data`.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

`get_agg_filter(self)`
Return filter function to be used for agg filter.

`get_alpha(self)`
Return the alpha value used for blending - not supported on all backends.
get_animated(self)
    Return whether the artist is animated.

get_array(self)
    Return the data array.

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

See also:

set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

---

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.
The only current use case is displaying the z-value of an \textit{AxesImage} in the status bar of a plot window, while moving the mouse.

**Parameters**

\begin{itemize}
\item \textbf{event} \\
\texttt{matplotlib.backend_bases.MouseEvent}
\end{itemize}

**See also:**

- \texttt{format\_cursor\_data}

\begin{verbatim}

get\_dashes(self)  
Alias for \texttt{get\_linestyle}.

get\_datalim(self, transData)

get\_ec(self)  
Alias for \texttt{get\_edgecolor}.

get\_edgecolor(self)

get\_edgecolors(self)  
Alias for \texttt{get\_edgecolor}.

get\_facecolor(self)

get\_facecolors(self)  
Alias for \texttt{get\_facecolor}.

get\_fc(self)  
Alias for \texttt{get\_facecolor}.

get\_figure(self)  
Return the \texttt{Figure} instance the artist belongs to.

get\_fill(self)  
Return whether fill is set.

get\_gid(self)  
Return the group id.

get\_hatch(self)  
Return the current hatching pattern.

get\_in\_layout(self)  
Return boolean flag, True if artist is included in layout calculations.

\textbf{E.g.} \textit{Constrained Layout Guide}, \texttt{Figure.tight\_layout()}, and \texttt{fig.savefig(fname, bbox_inches='tight')}.

get\_joinstyle(self)

get\_label(self)  
Return the label used for this artist in the legend.
\end{verbatim}
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecation since version 3.3.

get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

See also:

    set_picker, pickable, pick

get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_sketch_params(self)
    Return the sketch parameters for the artist.

Returns
tuple or None
A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.
- **randomness**: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

```python
def get_snap(self):
    """Return the snap setting."
    See `set_snap` for details.
```

def get_tightbbox(self, renderer):
    """Like `Artist.get_window_extent`, but includes any clipping."

    **Parameters**

    renderer
        `[RendererBase subclass] renderer that will be used to draw the
        figures (i.e. `fig.canvas.get_renderer()`)`

    **Returns**

    **Bbox**
        The enclosing bounding box (in figure pixel coordinates).
```

```python
def get_transform(self):
    """Return the `Transform` instance used by this artist."
```

def get_transformed_clip_path_and_affine(self):
    """Return the clip path with the non-affine part of its transformation applied,
    and the remaining affine part of its transformation.
```

def get transforms(self):
```
get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    
    The bounding box' width and height are nonnegative.
    
    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.
    
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist's zorder.

have_units(self)
    Return True if units are set on any axis.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    
    This is True after set_transform has been called.

property mouseover
    If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.

    See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

pchanged(self)
    Call all of the registered callbacks.
    
This function is triggered internally when a property is changed.

    See also:

    add_callback
    remove_callback

pick(self, mouseevent)
    Process a pick event.
    
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

    See also:

    set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.
See also:

*set_picker, get_picker, pick*

**properties**(self)

Return a dictionary of all the properties of the artist.

**remove**(self)

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

**remove_callback**(self, oid)

Remove a callback based on its observer id.

See also:

*add_callback*

**set**(self, **kwargs)

A property batch setter. Pass `kwargs` to set properties.

**set_aa**(self, aa)

Alias for `set_antialiased`.

**set_agg_filter**(self, filter_func)

Set the agg filter.

**Parameters**

*filter_func*

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

**set_alpha**(self, alpha)

Set the alpha value used for blending - not supported on all backends.

**Parameters**

*alpha*

[float or None]

**set_animated**(self, b)

Set the artist's animation state.

**Parameters**

```
b

[bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    Parameters

    aa
        [bool or list of bools]

set_antialiaseds(self, aa)
    Alias for `set_antialiased`.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters

    A
        [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    Parameters

    cs
        [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
    Set the norm limits for image scaling.

    Parameters

    vmin, vmax
        [float] The limits.

        The limits may also be passed as a tuple (vmin, vmax) as a single positional argument.

set_clip_box(self, clipbox)
    Set the artist's clip Bbox.

    Parameters

    clipbox
        [Bbox]
```
set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible outside of the axes which can lead to unexpected results.

Parameters

b
[bool]

set_clip_path(self, path, transform=None)
Set the artist's clip path.

Parameters

path
[patch or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.

transform
[Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

Notes

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap
[Colormap or str or None]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters
c

[color or list of rgba tuples]

See also:

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

```
set_contains(self, picker)
```

[Deprecated] Define a custom contains test for the artist.
The provided callable replaces the default `contains` method of the artist.

**Parameters**

**picker**

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

```
set_dashes(self, ls)
```

Alias for `set_linestyle`.

```
set_ec(self, c)
```

Alias for `set_edgecolor`.

```
set_edgecolor(self, c)
```

Set the edgecolor(s) of the collection.

**Parameters**

**c**

[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.
set_edgecolors(self, c)
    Alias for set_edgecolor.

set_facecolor(self, c)
    Set the facecolor(s) of the collection. c can be a color (all patches have
    same color), or a sequence of colors; if it is a sequence the patches will
    cycle through the sequence.

    If c is 'none', the patch will not be filled.

    Parameters

    c
        [color or list of colors]

set_facecolors(self, c)
    Alias for set_facecolor.

set_fc(self, c)
    Alias for set_facecolor.

set_figure(self, fig)
    Set the Figure instance the artist belongs to.

    Parameters

    fig
        [Figure]

set_gid(self, gid)
    Set the (group) id for the artist.

    Parameters

    gid
        [str]

set_hatch(self, hatch)
    Set the hatching pattern

    hatch can be one of:

| / - diagonal hatching          |
| \ - back diagonal             |
| | - vertical                   |
| - - horizontal                |
| + - crossed                   |
| x - crossed diagonal          |
| o - small circle              |
| 0 - large circle              |

(continues on next page)
Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only. Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member:

**Parameters**

**hatch**

```
[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]
```

**set_in_layout**(self, in_layout)

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide, Figure.tight_layout()* and *fig.savefig(fname, bbox_inches='tight')*.

**Parameters**

**in_layout**

[bool]

**set_joinstyle**(self, js)

Set the joinstyle for the collection (for all its elements).

**Parameters**

**js**

```
[{'miter', 'round', 'bevel'}] The joinstyle.
```

**set_label**(self, s)

Set a label that will be displayed in the legend.

**Parameters**

**s**

[object] s will be converted to a string by calling *str*.

**set_linestyle**(self, ls)

Set the linestyle(s) for the collection.
<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

**ls**

[ str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

`set_linestyles(self, ls)`

Alias for `set_linestyle`.

`set_linewidth(self, lw)`

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

**lw**

[float or list of floats]

`set_linewidths(self, lw)`

Alias for `set_linewidth`.

`set_ls(self, ls)`

Alias for `set_linestyle`.

`set_lw(self, lw)`

Alias for `set_linewidth`.

`set_norm(self, norm)`

Set the normalization instance.

**Parameters**

**norm**

[Normalize or None]
Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```
set_offset_position(self, offset_position)

[Deprecated] Set how offsets are applied. If offset_position is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.
```

**Parameters**

offset_position

[{‘screen’, ‘data’}]

Notes

Deprecated since version 3.3.

```
set_offsets(self, offsets)

Set the offsets for the collection.
```

**Parameters**

offsets

[array-like (N, 2) or (2,)]

```
set_path_effects(self, path_effects)

Set the path effects.
```

**Parameters**

path_effects

[AbstractPathEffect]

```
set_paths(self, patches)

```

```
set_picker(self, picker)

Define the picking behavior of the artist.
```

**Parameters**

picker

[None or bool or callable] This can be one of the following:
• **None**: Picking is disabled for this artist (default).

• A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```python
hit, props = picker(artist, mouseevent)
```

to determine the hit test, if the mouse event is over the artist, return *hit=True* and *props* is a dictionary of properties you want added to the PickEvent attributes.

• **deprecated**: For Line2D only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use `Line2D.set_pickradius` instead.

```python
set_pickradius(self, pr)
```
Set the pick radius used for containment tests.

**Parameters**

**d**

[float] Pick radius, in points.

```python
set_rasterized(self, rasterized)
```
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

**rasterized**

[bool or None]

```python
set_sketch_params(self, scale=None, length=None, randomness=None)
```
Sets the sketch parameters.

**Parameters**

**scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.

**length**
[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

```python
set_snap(self, snap)
```

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

- **snap**
  
  [bool or None] Possible values:

  - *True*: Snap vertices to the nearest pixel center.
  - *False*: Do not modify vertex positions.
  - *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```python
set_transform(self, t)
```

Set the artist transform.

**Parameters**

- **t**

  [Transform]

```python
set_url(self, url)
```

Set the url for the artist.

**Parameters**

- **url**

  [str]

```python
set_urls(self, urls)
```

**Parameters**

- **urls**
urls

[ list of str or None ]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible( self, b )

Set the artist's visibility.

Parameters

b

[ bool ]

set_zorder( self, level )

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[ float ]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.
Examples

```python
>>> artist.sticky_edges.x[:,:] = (xmin, xmax)
>>> artist.sticky_edges.y[:,:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
Update this artist's properties from the dict props.

Parameters

props
[dict]

property update_dict
dict_update_from(self, other)
Copy properties from other to self.

update_scalarmappable(self)
Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.PathCollection(paths, sizes=None, **kwargs)
Bases: matplotlib.collections._CollectionWithSizes

A collection of Paths, as created by e.g. scatter.
Parameters

paths

[list of path.Path] The paths that will make up the Collection.

sizes

[array-like] The factor by which to scale each drawn Path. One unit squared in the Path's data space is scaled to be sizes**2 points when rendered.

**kwargs

Forwarded to Collection.

add_callback(self, func)

Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback

add_checker(self, checker)

[Deprecated]
Notes

Deprecated since version 3.3:

autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
The Axes instance the artist resides in, or None.

changed(self)
Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)
[Deprecated]

Notes

Deprecated since version 3.3:

contains(self, mouseevent)
Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

\[ \text{findobj}(\text{self}, \text{match}=None, \text{include_self}=True) \]

Find artist objects.

Recursively find all \textit{Artist} instances contained in the artist.

**Parameters**

\textbf{match}

A filter criterion for the matches. This can be

- \textit{None}: Return all objects contained in artist.
- A function with signature \texttt{def match(artist: Artist) -> bool}. The result will only contain artists for which the function returns \textit{True}.
- A class instance: e.g., \texttt{Line2D}. The result will only contain artists of this class or its subclasses (\texttt{isinstance} check).

\textbf{include_self}

[bool] Include \textit{self} in the list to be checked for a match.

**Returns**

\textit{list of Artist}

\[ \text{format_cursor_data}(\text{self}, \text{data}) \]

Return a string representation of \textit{data}.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

\[ \text{get_cursor_data} \]

\[ \text{get_agg_filter}(\text{self}) \]

Return filter function to be used for agg filter.

\[ \text{get_alpha}(\text{self}) \]

Return the alpha value used for blending - not supported on all backends.
get_animated(self)
    Return whether the artist is animated.

get_array(self)
    Return the data array.

get_capstyle(self)

get_children(self)
    Return a list of the child *Artists* of this *Artist*.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the *Colormap* instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or
    *None*.
    
    **See also:**
    
    *set_contains*

    **Notes**

    Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

    **Note:** This method is intended to be overridden by artist subclasses. As an
    end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information
    for a given event. The default implementation just returns *None*.

    Subclasses can override the method and return arbitrary data. However, when
    doing so, they must ensure that *format_cursor_data* can convert the
    data to a string representation.
The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

**event**

`[matplotlib.backend_bases.MouseEvent]`

**See also:**

`format_cursor_data`

`get_dashes(self)`
    Alias for `get_linestyle`.

`get_datalim(self, transData)`

`get_ec(self)`
    Alias for `get_edgecolor`.

`get_edgecolor(self)`

`get_edgecolors(self)`
    Alias for `get_edgecolor`.

`get_facecolor(self)`

`get_facecolors(self)`
    Alias for `get_facecolor`.

`get_fc(self)`
    Alias for `get_facecolor`.

`get_figure(self)`
    Return the `Figure` instance the artist belongs to.

`get_fill(self)`
    Return whether fill is set.

`get_gid(self)`
    Return the group id.

`get_hatch(self)`
    Return the current hatching pattern.

`get_in_layout(self)`
    Return boolean flag, True if artist is included in layout calculations.

    E.g., `Constrained Layout Guide, Figure.tight_layout()`, and `fig.savelfig(fname, bbox_inches='tight')`.

`get_joinstyle(self)`

`get_label(self)`
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

See also:

    set_picker, clickable, pick

get_pickradius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_sizes(self)
    Return the sizes ('areas') of the elements in the collection.

Returns
array

The 'area' of each element.

get_sketch_params(self)

Return the sketch parameters for the artist.

**Returns**

**tuple or None**

A 3-tuple with the following elements:

- **scale**: The amplitude of the wiggle perpendicular to the source line.
- **length**: The length of the wiggle along the line.
- **randomness**: The scale factor by which the length is shrunk or expanded.

Returns *None* if no sketch parameters were set.

g_get_snap(self)

Return the snap setting.

See *set_snap* for details.

g_get_tightbbox(self, renderer)

Like *Artist.get_window_extent*, but includes any clipping.

**Parameters**

**renderer**

[RendererBase subclass] renderer that will be used to draw the figures (i.e. *fig.canvas.get_renderer()*).

**Returns**

**Bbox**

The enclosing bounding box (in figure pixel coordinates).

g_get_transform(self)

Return the *Transform* instance used by this artist.

g_get_transformed_clip_path_and_affine(self)

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

g_get_transforms(self)

g_get_url(self)

Return the url.
get_urls(self)
    Return a list of URLs, one for each element of the collection.

    The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.

    The bounding box' width and height are nonnegative.

    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist's zorder.

have_units(self)
    Return True if units are set on any axis.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.

    This is True after set_transform has been called.

legend_elements(self, prop='colors', num='auto', fmt=None, func=<function PathCollection.<lambda> at 0x7f5434b37af0>, **kwargs)
    Create legend handles and labels for a PathCollection.

    Each legend handle is a Line2D representing the Path that was drawn, and each label is a string what each Path represents.

    This is useful for obtaining a legend for a scatter plot; e.g.:

    >>> scatter = plt.scatter([1, 2, 3], [4, 5, 6], c=[7, 2, 3])
    >>> plt.legend(*scatter.legend_elements())

    creates three legend elements, one for each color with the numerical values passed to c as the labels.

    Also see the automatedlegendcreation example.

Parameters

prop

[{"colors", "sizes"}, default: "colors"] If "colors", the legend handles will show the different colors of the collection. If "sizes", the legend will show the different sizes. To set both, use **kwargs to directly edit the Line2D properties.

**num**

[int, None, "auto" (default), array-like, or Locator.] Target number of elements to create. If None, use all unique elements of the mappable array. If an integer, target to use num elements in the normed range. If "auto", try to determine which option better suits the nature of the data. The number of created elements may slightly deviate from num due to a Locator being used to find useful locations. If a list or array, use exactly those elements for the legend. Finally, a Locator can be provided.

**fmt**

[str, Formatter, or None (default)] The format or formatter to use for the labels. If a string must be a valid input for a StrMethodFormatter. If None (the default), use a ScalarFormatter.

**func**

[function, default lambda x: x] Function to calculate the labels. Often the size (or color) argument to scatter will have been pre-processed by the user using a function \( s = f(x) \) to make the markers visible; e.g. \( \text{size} = \text{np.log10}(x) \). Providing the inverse of this function here allows that pre-processing to be inverted, so that the legend labels have the correct values; e.g. \( \text{func} = \lambda x: 10^{**x} \).

**kwars**

Allowed keyword arguments are color and size. E.g. it may be useful to set the color of the markers if prop="sizes" is used; similarly to set the size of the markers if prop="colors" is used. Any further parameters are passed onto the Line2D instance. This may be useful to e.g. specify a different markeredgecolor or alpha for the legend handles.

**Returns**

**handles**

[list of Line2D] Visual representation of each element of the legend.

**labels**

[list of str] The string labels for elements of the legend.
property mouseover
If this property is set to True, the artist will be queried for custom context
information when the mouse cursor moves over it.

See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

`pchanged(self)`
Call all of the registered callbacks.
This function is triggered internally when a property is changed.

See also:

`add_callback`
`remove_callback`

`pick(self, mouseevent)`
Process a pick event.
Each child artist will fire a pick event if mouseevent is over the artist and
the artist has picker set.

See also:

`set_picker`, `get_picker`, `pickable`

`pickable(self)`
Return whether the artist is pickable.

See also:

`set_picker`, `get_picker`, `pick`

`properties(self)`
Return a dictionary of all the properties of the artist.

`remove(self)`
Remove the artist from the figure if possible.
The effect will not be visible until the figure is redrawn, e.g., with
`FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the
axes with `autolim = True`.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`
Remove a callback based on its observer id.

See also:

`add_callback`
set(self, **kwargs)
    A property batch setter. Pass \textit{kwargs} to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

    \textbf{Parameters}

    \textit{filter_func}

    [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.

    \textbf{Parameters}

    \textit{alpha}

    [float or None]

set_animated(self, b)
    Set the artist's animation state.

    \textbf{Parameters}

    \textit{b}

    [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    \textbf{Parameters}

    \textit{aa}

    [bool or list of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

    \textbf{Parameters}

    \textit{A}

    [ndarray]
set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    Parameters

    cs
        [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
    Set the norm limits for image scaling.

    Parameters

    vmin, vmax
        [float] The limits.
        The limits may also be passed as a tuple (vmin, vmax) as a single positional argument.

set_clip_box(self, clipbox)
    Set the artist’s clip Bbox.

    Parameters

    clipbox
        [Bbox]

set_clip_on(self, b)
    Set whether the artist uses clipping.
    When False artists will be visible outside of the axes which can lead to unexpected results.

    Parameters

    b
        [bool]

set_clip_path(self, path, transform=None)
    Set the artist’s clip path.

    Parameters

    path
        [Patch or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.
transform

[Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

Notes

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap

[Colormap or str or None]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor

For setting the edge or face color individually.

set_contains(self, picker)
[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```
that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

`set_dashes(self, ls)`
Alias for `set_linestyle`.

`set_ec(self, c)`
Alias for `set_edgecolor`.

`set_edgecolor(self, c)`
Set the edgecolor(s) of the collection.

**Parameters**

- `c`
  [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

`set_edgecolors(self, c)`
Alias for `set_edgecolor`.

`set_facecolor(self, c)`
Set the facecolor(s) of the collection. `c` can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If `c` is 'none', the patch will not be filled.

**Parameters**

- `c`
  [color or list of colors]

`set_facecolors(self, c)`
Alias for `set_facecolor`.

`set_fc(self, c)`
Alias for `set_facecolor`. 

18.16. `matplotlib.collections`
set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig
[Figure]

set_gid(self, gid)
Set the (group) id for the artist.

Parameters

gid
[str]

set_hatch(self, hatch)
Set the hatching pattern

hatch can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.
Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch
[{\'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(self, in_layout)
Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters
in_layout
[bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js
[{'miter', 'round', 'bevel'}] The joinstyle.

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s
[object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'.-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

Parameters

ls
[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '.-', ':', '', (offset, on-off-seq)}. See Line2D.

set_linestyles(self, ls)
Alias for set_linestyle.

set_linewidth(self, lw)
Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.
Parameters

**lw**

[float or list of floats]

```python
set_linewidths(self, lw)
```

Alias for `set_linewidth`.

```python
set_ls(self, ls)
```

Alias for `set_linestyle`.

```python
set_lw(self, lw)
```

Alias for `set_linewidth`.

```python
set_norm(self, norm)
```

Set the normalization instance.

**Parameters**

**norm**

[Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```python
set_offset_position(self, offset_position)
```

[Deprecated] Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

**offset_position**

[{'screen', 'data'}]
Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`
Set the offsets for the collection.

**Parameters**

`offsets`

[array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`
Set the path effects.

**Parameters**

`path_effects`

[AbstractPathEffect]

`set_paths(self, paths)`

`set_picker(self, picker)`
Define the picking behavior of the artist.

**Parameters**

`picker`

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

```
hit, props = picker(artist, mouseevent)
```

to determine the hit test. if the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.
set_pickradius(self, pr)
    Set the pick radius used for containment tests.

**Parameters**

    d
    [float] Pick radius, in points.

set_rasterized(self, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.
    Defaults to None, which implies the backend's default behavior.

**Parameters**

    rasterized
    [bool or None]

set_sizes(self, sizes, dpi=72.0)
    Set the sizes of each member of the collection.

**Parameters**

    sizes
    [ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

    dpi
    [float, default: 72] The dpi of the canvas.

set_sketch_params(self, scale=None, length=None, randomness=None)
    Sets the sketch parameters.

**Parameters**

    scale
    [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

    length
    [float, optional] The length of the wiggle along the line, in pixels (default 128.0)

    randomness
    [float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)
**set_snap**(*self, snap*)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

**snap**
[bool or None] Possible values:
• *True*: Snap vertices to the nearest pixel center.
• *False*: Do not modify vertex positions.
• *None*: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set_transform**(*self, t*)
Set the artist transform.

**Parameters**

**t**
[Transform]

**set_url**(*self, url*)
Set the url for the artist.

**Parameters**

**url**
[str]

**set_urls**(*self, urls*)

**Parameters**

**urls**
[list of str or None]
Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

```
set_visible(self, b)
```
Set the artist's visibility.

**Parameters**

- **b**
  *bool*

```
set_zorder(self, level)
```
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**

- **level**
  *float*

```
property stale
```
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

```
property sticky_edges
```
*x and y* sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added—the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the *x* and *y* lists can be modified in place as needed.

**Examples**

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

```
to_rgba(self, x, alpha=None, bytes=False, norm=True)
```
Return a normalized rgba array corresponding to *x*.

In the normal case, *x* is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.
There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If \( x \) is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the \( \text{alpha} \) kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the \( \text{alpha} \) kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if \( \text{bytes} \) is \( \text{False} \) (default), the rgba array will be floats in the 0-1 range; if it is \( \text{True} \), the returned rgba array will be uint8 in the 0 to 255 range.

If norm is \( \text{False} \), no normalization of the input data is performed, and it is assumed to be in the range (0-1).

\[ \text{update}(\text{self}, \text{props}) \]
Update this artist's properties from the dict \( \text{props} \).

**Parameters**

- **props**
  - [dict]

\[ \text{property \: update\_dict} \]

\[ \text{update\_from}(\text{self}, \text{other}) \]
Copy properties from other to self.

\[ \text{update\_scalarmappable}(\text{self}) \]
Update colors from the scalar mappable array, if it is not None.

\[ zorder = 0 \]

**class** matplotlib.collections.PolyCollection\( (\text{verts}, \text{sizes}=\text{None}, \text{closed}=\text{True}, **\text{kwargs}) \)

**Bases:** matplotlib.collections._CollectionWithSizes

**Parameters**

- **verts**
  - [list of array-like] The sequence of polygons \( [\text{verts}0, \text{verts}1, ...] \) where each element \( \text{verts} \_i \) defines the vertices of polygon \( i \) as a 2D array-like of shape \( (M, 2) \).

- **sizes**
  - [array-like, default: None] Squared scaling factors for the polygons. The coordinates of each polygon \( \text{verts} \_i \) are multiplied by the square-root of the corresponding entry in \( \text{sizes} \) (i.e., \( \text{sizes} \).
specify the scaling of areas). The scaling is applied before the Artist master transform.

**closed**

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

**kwargs**

Forwarded to Collection.

add_callback(self, func)

Add a callback function that will be called whenever one of the Artist's properties changes.

**Parameters**

**func**

[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

**Returns**

```
int
```

The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

**See also:**

remove_callback

add_checker(self, checker)

[Deprecated]

**Notes**

Deprecated since version 3.3:

autoscale(self)

Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None
property axes
    The *Axes* instance the artist resides in, or *None*.

called(self)
    Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

calls_update(self, checker)
    [Deprecated]

Notes

Deprecated since version 3.3:

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert *x* using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, *x* itself is returned.

convert_yunits(self, y)
    Convert *y* using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, *y* itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (*Artist.get_visible* returns False).

    Parameters

    renderer
        [RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

```python
findobj(self, match=None, include_self=True)
```

Find artist objects. Recursively find all Artist instances contained in the artist.

**Parameters**

- **match**
  A filter criterion for the matches. This can be
  - `None`: Return all objects contained in artist.
  - A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.
  - A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (isinstance check).

- **include_self**
  [bool] Include `self` in the list to be checked for a match.

**Returns**

- list of Artist

```python
format_cursor_data(self, data)
```

Return a string representation of `data`.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

- `get_cursor_data`
- `get_agg_filter`
- `get_alpha`
get_animated(self)
    Return whether the artist is animated.

get_array(self)
    Return the data array.

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that format_cursor_data can convert the data to a string representation.
The only current use case is displaying the z-value of an AxesImage in the status bar of a plot window, while moving the mouse.

**Parameters**

**event**

matplotlib.backend_bases.MouseEvent

**See also:**

format_cursor_data

get_dashes(self)
  Alias for get_linestyle.

get_datalim(self, transData)

get_ec(self)
  Alias for get_edgecolor.

get_edgecolor(self)

get_edgecolors(self)
  Alias for get_edgecolor.

get_facecolor(self)

get_facecolors(self)
  Alias for get_facecolor.

get_fc(self)
  Alias for get_facecolor.

get_figure(self)
  Return the Figure instance the artist belongs to.

get_fill(self)
  Return whether fill is set.

get_gid(self)
  Return the group id.

get_hatch(self)
  Return the current hatching pattern.

get_in_layout(self)
  Return boolean flag, True if artist is included in layout calculations.

  E.g.  Constrained Layout Guide, Figure.tight_layout(), and fig.
        savefig(fname, bbox_inches='tight').

get_joinstyle(self)

get_label(self)
  Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

See also:

    set_picker, pickable, pick
get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_sizes(self)
    Return the sizes ('areas') of the elements in the collection.

Returns
array

The 'area' of each element.

get_sketch_params(self)
Return the sketch parameters for the artist.

Returns

tuple or None

A 3-tuple with the following elements:

• scale: The amplitude of the wiggle perpendicular to the source line.

• length: The length of the wiggle along the line.

• randomness: The scale factor by which the length is shrunk or expanded.

Returns None if no sketch parameters were set.

get_snap(self)
Return the snap setting.
See set_snap for details.

get_tightbbox(self, renderer)
Like Artist.get_window_extent, but includes any clipping.

Parameters

renderer

RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transfomers(self)

get_url(self)

Return the url.
get_urls(self)
Return a list of URLs, one for each element of the collection.

The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)
Return the visibility.

get_window_extent(self, renderer)
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
Return the artist's zorder.

have_units(self)
Return True if units are set on any axis.

is_transform_set(self)
Return whether the Artist has an explicitly set transform.

This is True after set_transform has been called.

property mouseover
If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.

See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

pchanged(self)
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

add_callback
remove_callback

pick(self, mouseevent)
Process a pick event.
Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

See also:

```
set_picker, get_picker, pickable
```

`pickable(self)`

Return whether the artist is pickable.

See also:

```
set_picker, get_picker, pick
```

`properties(self)`

Return a dictionary of all the properties of the artist.

`remove(self)`

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the axes with autolim = True.

Note: there is no support for removing the artist's legend entry.

`remove_callback(self, oid)`

Remove a callback based on its observer id.

See also:

```
add_callback
```

`set(self, **kwargs)`

A property batch setter. Pass kwargs to set properties.

`set_aa(self, aa)`

Alias for set_antialiased.

`set_agg_filter(self, filter_func)`

Set the agg filter.

Parameters

```
filter_func
```

[callback] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

`set_alpha(self, alpha)`

Set the alpha value used for blending - not supported on all backends.
Parameters

alpha
    [float or None]

set_animated(self, b)
    Set the artist's animation state.

Parameters

b
    [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

Parameters

aa
    [bool or list of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

Parameters

A
    [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

Parameters

cs
    [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
    Set the norm limits for image scaling.

Parameters

vmin, vmax
    [float] The limits.
The limits may also be passed as a tuple \((v_{\text{min}}, v_{\text{max}})\) as a single positional argument.

```python
set_clip_box(self, clipbox)
```
Set the artist’s clip \(Bbox\).

**Parameters**

- **clipbox**
  - \([Bbox]\)

```python
set_clip_on(self, b)
```
Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

- **b**
  - \([\text{bool}]\)

```python
set_clip_path(self, path, transform=None)
```
Set the artist’s clip path.

**Parameters**

- **path**
  - \([\text{Patch or Path or TransformedPath or None}]\) The clip path. If given a \(\text{Path, transform}\) must be provided as well. If \(\text{None}\), a previously set clip path is removed.

- **transform**
  - \([\text{Transform, optional}]\) Only used if \(\text{path}\) is a \(\text{Path}\), in which case the given \(\text{Path}\) is converted to a \(\text{TransformedPath}\) using \(\text{transform}\).

**Notes**

For efficiency, if \(\text{path}\) is a \(\text{Rectangle}\) this method will set the clipping box to the corresponding rectangle and set the clipping path to \(\text{None}\).

For technical reasons (support of \(\text{set}\)), a tuple \((\text{path, transform})\) is also accepted as a single positional parameter.

```python
set_cmap(self, cmap)
```
Set the colormap for luminance data.

**Parameters**
**cmap**

[Colormap or str or None]

**set_color(self, c)**
Set both the edgecolor and the facecolor.

**Parameters**

**c**

[color or list of rgba tuples]

**See also:**

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

**set_contains(self, picker)**

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default `contains` method of the artist.

**Parameters**

**picker**

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist
- a dict of additional information. The dict should at least return the same information as the default `contains()` implementation of the respective artist, but may provide additional information.

**Notes**

Deprecated since version 3.3.

**set_dashes(self, ls)**

Alias for `set_linestyle`.

**set_ec(self, c)**

Alias for `set_edgecolor`.
set_edgecolor(self, c)
   Set the edgecolor(s) of the collection.

   Parameters

   c
       [color or list of colors or 'face'] The collection edgecolor(s). If
       a sequence, the patches cycle through it. If 'face', match the
       facecolor.

set_edgecolors(self, c)
   Alias for set_edgecolor.

set_facecolor(self, c)
   Set the facecolor(s) of the collection. c can be a color (all patches have
   same color), or a sequence of colors; if it is a sequence the patches will
   cycle through the sequence.

   If c is 'none', the patch will not be filled.

   Parameters

   c
       [color or list of colors]

set_facecolors(self, c)
   Alias for set_facecolor.

set_fc(self, c)
   Alias for set_facecolor.

set_figure(self, fig)
   Set the Figure instance the artist belongs to.

   Parameters

   fig
       [Figure]

set_gid(self, gid)
   Set the (group) id for the artist.

   Parameters

   gid
       [str]

set_hatch(self, hatch)
   Set the hatching pattern
**hatch** can be one of:

| /    | - diagonal hatching |
| \    | - back diagonal     |
| |    | - vertical          |
| -    | - horizontal        |
| +    | - crossed           |
| x    | - crossed diagonal  |
| o    | - small circle      |
| O    | - large circle      |
| .    | - dots              |
| *    | - stars             |

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only. Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

- **hatch**
  
  ```python
  [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]
  ```

- **set_in_layout**(self, in_layout)
  
  Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide*, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

  **Parameters**

  - **in_layout**
    
    [bool]

- **set_joinstyle**(self, js)
  
  Set the joinstyle for the collection (for all its elements).

  **Parameters**

  - **js**
    
    [{"miter", 'round', 'bevel'}] The joinstyle.

- **set_label**(self, s)
  
  Set a label that will be displayed in the legend.

  **Parameters**

  - **s**
    
    [object] s will be converted to a string by calling `str`. 
set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

\[(offset, onoffseq),\]

where onoffseq is an even length tuple of on and off ink in points.

**Parameters**

**ls**

[str or tuple or list thereof] Valid values for individual linestyles include {',', '---', '.', ':', '', (offset, on-off-seq)}. See Line2D.

set_linestyles(self, ls)
Alias for set_linestyle.

set_linewidth(self, lw)
Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**

**lw**

[float or list of floats]

set_linewidths(self, lw)
Alias for set_linewidth.

set_ls(self, ls)
Alias for set_linestyle.

set_lw(self, lw)
Alias for set_linewidth.

set_norm(self, norm)
Set the normalization instance.

**Parameters**

**norm**
[Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

`set_offset_position(self, offset_position)`  
*Deprecated* Set how offsets are applied. If `offset_position` is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If `offset_position` is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

- `offset_position`  
  [{'screen', 'data'}]

**Notes**

Deprecated since version 3.3.

`set_offsets(self, offsets)`  
Set the offsets for the collection.

**Parameters**

- `offsets`  
  [array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`  
Set the path effects.

**Parameters**

- `path_effects`  
  [AbstractPathEffect]

`set_paths(self, verts, closed=True)`  
Set the vertices of the polygons.

**Parameters**
verts

[list of array-like] The sequence of polygons [verts0, verts1, ...] where each element verts_i defines the vertices of polygon i as a 2D array-like of shape (M, 2).

closed

[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_picker(self, picker)
Define the picking behavior of the artist.

Parameters

picker

[None or bool or callable] This can be one of the following:

• None: Picking is disabled for this artist (default).
• A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

hit, props = picker(artist, mouseevent)

to determine the hit test. if the mouse event is over the artist, return hit=True and props is a dictionary of properties you want added to the PickEvent attributes.

• deprecated: For Line2D only, picker can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use Line2D.set_pickradius instead.

set_pickradius(self, pr)
Set the pick radius used for containment tests.

Parameters

d

[float] Pick radius, in points.

set_rasterized(self, rasterized)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.
**Parameters**

**rasterized**

[bool or None]

**set_sizes**(self, sizes, dpi=72.0)
Set the sizes of each member of the collection.

**Parameters**

**sizes**

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

**dpi**

[float, default: 72] The dpi of the canvas.

**set_sketch_params**(self, scale=None, length=None, randomness=None)
Sets the sketch parameters.

**Parameters**

**scale**

[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

**set_snap**(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**
**snap**
[bool or None] Possible values:
- **True**: Snap vertices to the nearest pixel center.
- **False**: Do not modify vertex positions.
- **None**: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

**set_transform**(self, t)
Set the artist transform.

**Parameters**

- **t**
  [Transform]

**set_url**(self, url)
Set the url for the artist.

**Parameters**

- **url**
  [str]

**set_urls**(self, urls)

**Parameters**

- **urls**
  [list of str or None]

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

**set_verts**(self, verts, closed=True)
Set the vertices of the polygons.

**Parameters**

- **verts**
  [list of array-like] The sequence of polygons [verts0, verts1, ...] where each element verts_i defines the vertices of polygon i as a 2D array-like of shape (M, 2).
closed
[bool, default: True] Whether the polygon should be closed by adding a CLOSEPOLY connection at the end.

set_verts_and_codes(self, verts, codes)
Initialize vertices with path codes.

set_visible(self, b)
Set the artist's visibility.

Parameters

b
[bool]

set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level
[float]

property stale
Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges
x and y sticky edge lists for autoscaling.
When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.
In the normal case, \( x \) is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If \( x \) is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the `alpha` kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the `alpha` kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if `bytes` is `False` (default), the rgba array will be floats in the 0-1 range; if it is `True`, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is `False`, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

```
update(self, props)
```
Update this artist's properties from the dict `props`.

**Parameters**

- `props`
  [dict]

```
property update_dict
```

```
update_from(self, other)
```
Copy properties from other to self.

```
update_scalarmappable(self)
```
Update colors from the scalar mappable array, if it is not None.

```
zorder = 0
```

class matplotlib.collections.QuadMesh(meshWidth, meshHeight, coordinates, antialiased=True, shading='flat', **kwargs)

```
Bases: matplotlib.collections.Collection
```

Class for the efficient drawing of a quadrilateral mesh.

A quadrilateral mesh consists of a grid of vertices. The dimensions of this array are \((\text{meshWidth} + 1, \text{meshHeight} + 1)\). Each vertex in the mesh has a different set of "mesh coordinates" representing its position in the topology of the mesh. For any values \((m, n)\) such that \(0 \leq m \leq \text{meshWidth}\) and \(0 \leq n \leq \text{meshHeight}\), the vertices at mesh coordinates \((m, n), (m, n + 1), (m + 1, n + 1), \) and \((m + 1, n)\) form one of the quadrilaterals in the mesh. There are thus \((\text{meshWidth} + 1) \times \text{meshHeight} + 1\) vertices.
meshHeight) quadrilaterals in the mesh. The mesh need not be regular and the polygons need not be convex.

A quadrilateral mesh is represented by a \( (2 \times ((\text{meshWidth} + 1) \times (\text{meshHeight} + 1))) \) numpy array coordinates, where each row is the x and y coordinates of one of the vertices. To define the function that maps from a data point to its corresponding color, use the set_cmap() method. Each of these arrays is indexed in row-major order by the mesh coordinates of the vertex (or the mesh coordinates of the lower left vertex, in the case of the colors).

For example, the first entry in coordinates is the coordinates of the vertex at mesh coordinates (0, 0), then the one at (0, 1), then at (0, 2) .. (0, meshWidth), (1, 0), (1, 1), and so on.

**shading** may be 'flat', or 'gouraud'

**Parameters**

**edgecolors**

[color or list of colors, default: rcParams["patch.edgecolor"] (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edge-color match the facecolor.

**facecolors**

[color or list of colors, default: rcParams["patch.facecolor"] (default: 'C0')] Face color for each patch making up the collection.

**linewidths**

[float or list of floats, default: rcParams["patch.linewidth"] (default: 1.0)] Line width for each patch making up the collection.

**linestyles**

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '.', '--', '-.', ':']. Dash tuples should be of the form:

\[
\text{(offset, onoffseq)},
\]

where onoffseq is an even length tuple of on and off ink lengths in points. For examples, see /gallery/lines_bars_and_markers/linestyles.

**capstyle**

[str, default: rcParams["patch.capstyle"]] Style to use for capping lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.
**joinstyle**

[str, default: \texttt{rcParams["patch.joinstyle"]}] Style to use for joining lines for all paths in the collection. See \texttt{/gallery/lines_bars_and_markers/joinstyle} for a demonstration of each of the allowed values.

**antialiaseds**

[bool or list of bool, default: \texttt{rcParams["patch.antialiased"]} (default: \texttt{True})] Whether each patch in the collection should be drawn with antialiasing.

**offsets**

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist's transform is applied).

**transOffset**

[\texttt{Transform}, default: \texttt{IdentityTransform}] A single transform which will be applied to each \texttt{offsets} vector before it is used.

**offset_position**

[\{'screen' (default), 'data' (deprecated)\}] If set to 'data' (deprecated), \texttt{offsets} will be treated as if it is in data coordinates instead of in screen coordinates.

**norm**

[\texttt{Normalize}, optional] Forwarded to ScalarMappable. The default of \texttt{None} means that the first draw call will set \texttt{vmin} and \texttt{vmax} using the minimum and maximum values of the data.

**cmap**

[\texttt{Colormap}, optional] Forwarded to ScalarMappable. The default of \texttt{None} will result in \texttt{rcParams["image.cmap"]} (default: \texttt{'viridis'}) being used.

**hatch**

[str, optional] Hatching pattern to use in filled paths, if any. Valid strings are [\texttt{''}, \texttt{''}, \texttt{'|'}, \texttt{-}, \texttt{'+'}, \texttt{x'}, \texttt{o'}, \texttt{O'}, \texttt{.'}, \texttt{'*'}]. See \texttt{/gallery/shapes_and_collections/hatch_demo} for the meaning of each hatch type.

**pickradius**

[float, default: 5.0] If \texttt{pickradius <= 0}, then \texttt{Collection.contains} will return \texttt{True} whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check
if the test point is contained in a stroke of width 2*\texttt{pickradius} following any of the Paths in the Collection.

**urls**

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See /gallery/misc/hyperlinks_sgskip for examples.

**zorder**

[float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder_demo for all defaults and examples.

**add_callback**

\[\text{add\_callback}(\text{self, func})\]

Add a callback function that will be called whenever one of the \textit{Artist}'s properties changes.

**Parameters**

**func**

[callable] The callback function. It must have the signature:

```
\text{def func(\text{artist: Artist}) \rightarrow Any}
```

where \textit{artist} is the calling \textit{Artist}. Return values may exist but are ignored.

**Returns**

**int**

The observer id associated with the callback. This id can be used for removing the callback with \texttt{remove\_callback} later.

**See also:**

\texttt{remove\_callback}

**add\_checker**

[\texttt{Deprecated}]

```
add_checker(\text{self, checker})
```
Notes

Deprecated since version 3.3:

autoscale(self)
Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
The Axes instance the artist resides in, or None.

changed(self)
Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)
[Deprecated]

Notes

Deprecated since version 3.3:

contains(self, mouseevent)
Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

static convert_mesh_to_paths(meshWidth, meshHeight, coordinates)
Convert a given mesh into a sequence of Path objects.

This function is primarily of use to implementers of backends that do not directly support quadmeshes.

convert_mesh_to_triangles(self, meshWidth, meshHeight, coordinates)
Convert a given mesh into a sequence of triangles, each point with its own color. This is useful for experiments using draw_gouraud_triangle.

convert_xunits(self, x)
Convert x using the unit type of the xaxis.

If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
Convert y using the unit type of the yaxis.

If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.
draw(self, renderer)

Draw the Artist (and its children) using the given renderer.
This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)

Find artist objects.
Recursively find all Artist instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be
• None: Return all objects contained in artist.
• A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
• A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self

[bool] Include self in the list to be checked for a match.

Returns

list of Artist

format_cursor_data(self, data)

Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.
See also:

get_cursor_data

get_agg_filter(self)
    Return filter function to be used for agg filter.

get_alpha(self)
    Return the alpha value used for blending - not supported on all backends.

get_animated(self)
    Return whether the artist is animated.

get_array(self)
    Return the data array.

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.
**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns `None`.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- `event`

  *matplotlib.backend_bases.MouseEvent*

**See also:**

- `format_cursor_data`

- `get_dashes`

  Alias for `get_linestyle`.

- `get_datalim`

  *self*, `transData`

- `get_ec`

  Alias for `get_edgecolor`.

- `get_edgecolor`

- `get_edgecolors`

  Alias for `get_edgecolor`.

- `get_facecolor`

- `get_facecolors`

  Alias for `get_facecolor`.

- `get_fc`

  Alias for `get_facecolor`.

- `get_figure`

  Return the `Figure` instance the artist belongs to.

- `get_fill`

  Return whether fill is set.

- `get_gid`

  Return the group id.
get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.
         savefig(fname, bbox_inches='tight').

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

g_getinestyle(self)

get_linestyles(self)
    Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
    Alias for get_linewidth.

g_getls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen',
    the offset is applied after the master transform has been applied, that is, the offsets are in screen
    coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the
    offsets are in data coordinates.

    Notes

    Deprecated since version 3.3.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

g_getpath_effects(self)

g_getpaths(self)

g_getpicker(self)
    Return the picking behavior of the artist.

    The possible values are described in set_picker.

    See also:
set_picker, pickable, pick

get_pickradius(self)

get_rasterized(self)
    Return whether the artist is to be rasterized.

get_sketch_params(self)
    Return the sketch parameters for the artist.

Returns
tuple or None
    A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the
      source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is
      shrunken or expanded.
    Returns None if no sketch parameters were set.

get_snap(self)
    Return the snap setting.
    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

Parameters

renderer
    [RendererBase subclass] renderer that will be used to draw the
    figures (i.e. fig.canvas.get_renderer())

Returns

Bbox
    The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
    Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied,
    and the remaining affine part of its transformation.

get_transforms(self)
get_url(self)
    Return the url.

get_urls(self)
    Return a list of URLs, one for each element of the collection.
    The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist's zorder.

have_units(self)
    Return True if units are set on any axis.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

property mouseover
    If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.
    See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
    See also:

    add_callback
    remove_callback
pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and the artist has picker set.

See also:

    set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.

See also:

    set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.

remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

    Note: relim will not see collections even if the collection was added to the axes with autolim = True.

    Note: there is no support for removing the artist's legend entry.

remove_callback(self, oid)
    Remove a callback based on its observer id.

See also:

    add_callback

set(self, **kwargs)
    A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

    Parameters

    filter_func
        [callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.
set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.

    **Parameters**

    alpha
        [float or None]

set_animated(self, b)
    Set the artist's animation state.

    **Parameters**

    b
        [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    **Parameters**

    aa
        [bool or list of bools]

set_antialiaseds(self, aa)
    Alias for `set_antialiased`.

set_array(self, A)
    Set the image array from numpy array A.

    **Parameters**

    A
        [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    **Parameters**

    cs
        [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
    Set the norm limits for image scaling.

    **Parameters**
vmin, vmax
[double] The limits.
The limits may also be passed as a tuple (vmin, vmax) as a single
position argument.

set_clip_box(self, clipbox)
Set the artist's clip Bbox.

Parameters

clipbox
[Bbox]

set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible outside of the axes which can lead to un-
expected results.

Parameters

b
[bool]

set_clip_path(self, path, transform=None)
Set the artist's clip path.

Parameters

path
[Path or Path or TransformedPath or None] The clip path. If
given a Path, transform must be provided as well. If None, a
previously set clip path is removed.

transform
[Transform, optional] Only used if path is a Path, in which case
the given Path is converted to a TransformedPath using trans-
form.
Notes

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap

[Colormap or str or None]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor
For setting the edge or face color individually.

set_contains(self, picker)
[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

• a bool indicating if the event is within the artist

• a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.
Notes

Deprecated since version 3.3.

set_dashes(self, ls)
   Alias for set_linestyle.

set_ec(self, c)
   Alias for set_edgecolor.

set_edgecolor(self, c)
   Set the edgecolor(s) of the collection.

   Parameters

   c
      [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)
   Alias for set_edgecolor.

set_facecolor(self, c)
   Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

   If c is 'none', the patch will not be filled.

   Parameters

   c
      [color or list of colors]

set_facecolors(self, c)
   Alias for set_facecolor.

set_fc(self, c)
   Alias for set_facecolor.

set_figure(self, fig)
   Set the Figure instance the artist belongs to.

   Parameters

   fig
      [Figure]

set_gid(self, gid)
   Set the (group) id for the artist.
Parameters

gid
  [str]

set_hatch(self, hatch)
  Set the hatching pattern

hatch can be one of:

/  - diagonal hatching
\ - back diagonal
|  - vertical
-  - horizontal
+  - crossed
x  - crossed diagonal
o  - small circle
O  - large circle
.  - dots
*  - stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

Parameters

hatch
  [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*', '*'}]

set_in_layout(self, in_layout)
  Set if artist is to be included in layout calculations, E.g. Constrained Layout
  Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').

Parameters

in_layout
  [bool]

set_joinstyle(self, js)
  Set the joinstyle for the collection (for all its elements).

Parameters

js
  [{'miter', 'round', 'bevel'}] The joinstyle.
`set_label(self, s)`
Set a label that will be displayed in the legend.

**Parameters**

- `s`  
  [object] s will be converted to a string by calling `str`.

`set_linestyle(self, ls)`
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

- `ls`  
  [str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See `Line2D.set_linestyle` for a complete description.

`set_linestyles(self, ls)`
Alias for `set_linestyle`.

`set_linewidth(self, lw)`
Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**

- `lw`  
  [float or list of floats]

`set_linewidths(self, lw)`
Alias for `set_linewidth`.

`set_ls(self, ls)`
Alias for `set_linestyle`. 

---

18.16. matplotlib.collections 1905
set_lw(self, lw)
   Alias for set_linewidth.

set_norm(self, norm)
   Set the normalization instance.

   Parameters

      norm

      [Normalize or None]

   Notes

   If there are any colorbars using the mappable for this norm, setting the norm
   of the mappable will reset the norm, locator, and formatters on the colorbar
to default.

set_offset_position(self, offset_position)
   [Deprecated] Set how offsets are applied. If offset_position is 'screen' (de-
   fault) the offset is applied after the master transform has been applied, that
   is, the offsets are in screen coordinates. If offset_position is 'data', the offset
   is applied before the master transform, i.e., the offsets are in data coordi-

   Parameters

      offset_position

      [{'screen', 'data'}]

   Notes

   Deprecated since version 3.3.

set_offsets(self, offsets)
   Set the offsets for the collection.

   Parameters

      offsets

      [array-like (N, 2) or (2,)]

set_path_effects(self, path_effects)
   Set the path effects.

   Parameters
**path_effects**

```python
[AbstractPathEffect]
```

`set_paths(self)`

`set_picker(self, picker)`

Define the picking behavior of the artist.

**Parameters**

**picker**

[None or bool or callable] This can be one of the following:

- *None*: Picking is disabled for this artist (default).
- A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```python
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. if the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.

- *deprecated*: For `Line2D` only, picker can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use `Line2D.set_pickradius` instead.

`set_pickradius(self, pr)`

Set the pick radius used for containment tests.

**Parameters**

**d**

[float] Pick radius, in points.

`set_rasterized(self, rasterized)`

Force rasterized (bitmap) drawing in vector backend output.

Defaults to `None`, which implies the backend's default behavior.

**Parameters**

**rasterized**

[bool or None]
set_sketch_params(
    self, scale=None, length=None, randomness=None
)
Sets the sketch parameters.

Parameters

scale
[float, optional] The amplitude of the wiggle perpendicular to
the source line, in pixels. If scale is None, or not provided, no
sketch filter will be provided.

length
[float, optional] The length of the wiggle along the line, in pixels
(default 128.0)

randomness
[float, optional] The scale factor by which the length is
shrunken or expanded (default 16.0)

set_snap(
    self, snap
)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer im-
ages. For example, if a black line of 1px width was defined at a position
in between two pixels, the resulting image would contain the interpolated
value of that line in the pixel grid, which would be a grey value on both adja-
cent pixel positions. In contrast, snapping will move the line to the nearest
integer pixel value, so that the resulting image will really contain a 1px wide
black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap
[bool or None] Possible values:

- True: Snap vertices to the nearest pixel center.
- False: Do not modify vertex positions.
- None: (auto) If the path contains only rectilinear line seg-
ments, round to the nearest pixel center.

set_transform(
    self, t
)
Set the artist transform.

Parameters

t
[Transform]
set_url(self, url)
    Set the url for the artist.

    **Parameters**

    url
        [str]

set_urls(self, urls)

    **Parameters**

    urls
        [list of str or None]

    **Notes**

    URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(self, b)
    Set the artist's visibility.

    **Parameters**

    b
        [bool]

set_zorder(self, level)
    Set the zorder for the artist. Artists with lower zorder values are drawn first.

    **Parameters**

    level
        [float]

    **property stale**

    Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

    **property sticky_edges**

    x and y sticky edge lists for autoscaling.

    When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.
This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

**Examples**

```python
>>> artist.sticky_edges.x[:,] = (xmin, xmax)
>>> artist.sticky_edges.y[:,] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)

Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)

Update this artist's properties from the dict props.

**Parameters**

- **props**
  [dict]

property update_dict

update_from(self, other)

Copy properties from other to self.

update_scalarmappable(self)

Update colors from the scalar mappable array, if it is not None.

zorder = 0
class matplotlib.collections.RegularPolyCollection(numsides, rotation=0, sizes=1, **kwargs)

Bases: matplotlib.collections._CollectionWithSizes

A collection of n-sided regular polygons.

Parameters

- **numsides**
  - [int] The number of sides of the polygon.

- **rotation**
  - [float] The rotation of the polygon in radians.

- **sizes**
  - [tuple of float] The area of the circle circumscribing the polygon
    in points^2.

- **kwargs**
  Forwarded to Collection.

Examples

See /gallery/event_handling/lasso_demo for a complete example:

```python
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5, # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors="black",
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)
```

```python
add_callback(self, func)

Add a callback function that will be called whenever one of the Artist's properties changes.

Parameters

- **func**
  - [callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```
where artist is the calling Artist. Return values may exist but are ignored.

**Returns**

int

The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

**See also:**

remove_callback

add_checker(self, checker)

[Deprecated]

**Notes**

Deprecated since version 3.3:

autoscale(self)

Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)

Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes

The Axes instance the artist resides in, or None.

changed(self)

Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)

[Deprecated]

**Notes**

Deprecated since version 3.3:

contains(self, mouseevent)

Test whether the mouse event occurred in the collection.

Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.
convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

calculate_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

        renderer
            [RendererBase subclass.]

    Notes

    This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)
    Find artist objects.
    Recursively find all Artist instances contained in the artist.

    Parameters

        match
            A filter criterion for the matches. This can be
            • None: Return all objects contained in artist.
            • A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
            • A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

        include_self
            [bool] Include self in the list to be checked for a match.

    Returns

        list of Artist
format_cursor_data(self, data)
Return a string representation of data.

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

get_cursor_data

get_agg_filter(self)
Return filter function to be used for agg filter.

get_alpha(self)
Return the alpha value used for blending - not supported on all backends.

get_animated(self)
Return whether the artist is animated.

get_array(self)
Return the data array.

get_capstyle(self)

get_children(self)
Return a list of the child *Artists* of this *Artist*.

get_clim(self)
Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
Return the clipbox.

get_clip_on(self)
Return whether the artist uses clipping.

get_clip_path(self)
Return the clip path.

get_cmap(self)
Return the *Colormap* instance.

get_contains(self)
[Deprecated] Return the custom contains function of the artist if set, or None.

**See also:**

set_contains
Notes

Deprecated since version 3.3.

```python
def get_cursor_data(self, event):
    Return the cursor data for a given event.
```

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns *None*.

Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- `event`  
  [matplotlib.backend_bases.MouseEvent]

**See also:**

- `format_cursor_data`

```python
def get_dashes(self):
    Alias for `get_linestyle`.
```

```python
def get_datalim(self, transData):
```

```python
def get_ec(self):
    Alias for `get_edgecolor`.
```

```python
def get_edgecolor(self):
```

```python
def get_edgecolors(self):
    Alias for `get_edgecolor`.
```

```python
def get_facecolor(self):
    Alias for `get_facecolor`.
```

```python
def get_facecolors(self):
    Alias for `get_facecolor`.
```

```python
def get_fc(self):
    Alias for `get_facecolor`.
```

```python
def get_figure(self):
    Return the `Figure` instance the artist belongs to.
```
get_fill(self)
    Return whether fill is set.

get_gid(self)
    Return the group id.

get_hatch(self)
    Return the current hatching pattern.

get_in_layout(self)
    Return boolean flag, True if artist is included in layout calculations.
    E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.
    savefig(fname, bbox_inches='tight').

get_joinstyle(self)

get_label(self)
    Return the label used for this artist in the legend.

get_linestyle(self)

get_linestyles(self)
    Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
    Alias for get_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_numsides(self)

get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position
    is 'screen', the offset is applied after the master transform has been applied, that is, the offsets
    are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets
    are in data coordinates.

    Notes

    Deprecated since version 3.3.

get_offset_transform(self)

get_offsets(self)
    Return the offsets for the collection.

get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.
    See also:
    set_picker, pickable, pick

get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_rotation(self)
get_sizes(self)
    Return the sizes ('areas') of the elements in the collection.
    Returns
    array
    The 'area' of each element.

get_sketch_params(self)
    Return the sketch parameters for the artist.
    Returns
    tuple or None
    A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or expanded.
    Returns None if no sketch parameters were set.

get_snap(self)
    Return the snap setting.
    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.
    Parameters
renderer

[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox

The enclosing bounding box (in figure pixel coordinates).

get_transform(self)

Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)

Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)

Return the url.

get_urls(self)

Return a list of URLs, one for each element of the collection.

The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)

Return the visibility.

get_window_extent(self, renderer)

Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)

Return the artist's zorder.

have_units(self)

Return True if units are set on any axis.

is_transform_set(self)

Return whether the Artist has an explicitly set transform.
This is True after `set_transform` has been called.

**property mouseover**

If this property is set to `True`, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

**pchanged(self)**

Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

- `add_callback`
- `remove_callback`

**pick(self, mouseevent)**

Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

See also:

- `set_picker`, `get_picker`, `pickable`

**pickable(self)**

Return whether the artist is pickable.

See also:

- `set_picker`, `get_picker`, `pick`

**properties(self)**

Return a dictionary of all the properties of the artist.

**remove(self)**

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with `FigureCanvasBase.draw_idle`. Call `relim` to update the axes limits if desired.

Note: `relim` will not see collections even if the collection was added to the axes with `autolim` = True.

Note: there is no support for removing the artist's legend entry.

**remove_callback(self, oid)**

Remove a callback based on its observer id.

See also:
add_callback

set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
Alias for set_antialiased.

set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func
[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha
[float or None]

set_animated(self, b)
Set the artist's animation state.

Parameters

b
[bool]

set_antialiased(self, aa)
Set the antialiasing state for rendering.

Parameters

aa
[bool or list of bools]

set_antialiaseds(self, aa)
Alias for set_antialiased.

set_array(self, A)
Set the image array from numpy array A.

Parameters
A

[ndarray]

set_capstyle(self, cs)
Set the capstyle for the collection (for all its elements).

**Parameters**

- **cs**
  - [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
Set the norm limits for image scaling.

**Parameters**

- **vmin, vmax**
  - [float] The limits.
  - The limits may also be passed as a tuple \((vmin, vmax)\) as a single positional argument.

set_clip_box(self, clipbox)
Set the artist's clip \(Bbox\).

**Parameters**

- **clipbox**
  - [\(Bbox\)]

set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

- **b**
  - [bool]

set_clip_path(self, path, transform=None)
Set the artist's clip path.

**Parameters**

- **path**
[Patch or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.

transform

[Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

Notes
For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap

[Colormap or str or None]

set_color(self, c)
Set both the edgecolor and the facecolor.

Parameters

c

[color or list of rgba tuples]

See also:

Collection.set_facecolor, Collection.set_edgecolor

For setting the edge or face color individually.

set_contains(self, picker)
[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

Parameters

picker

[callable] A custom picker function to evaluate if an event is within the artist. The function must have the signature:
def contains(artist: Artist, event: MouseEvent) -> bool, dict

that returns:
• a bool indicating if the event is within the artist
• a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.

Notes

Deprecated since version 3.3.

set_dashes(self, ls)
    Alias for set_linestyle.

set_ec(self, c)
    Alias for set_edgecolor.

set_edgecolor(self, c)
    Set the edgecolor(s) of the collection.

    Parameters

    c
        [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)
    Alias for set_edgecolor.

set_facecolor(self, c)
    Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

    If c is 'none', the patch will not be filled.

    Parameters

    c
        [color or list of colors]

set_facecolors(self, c)
    Alias for set_facecolor.
set_fc(self, c)
    Alias for set_facecolor.

set_figure(self, fig)
    Set the Figure instance the artist belongs to.

    Parameters

    fig
        [Figure]

set_gid(self, gid)
    Set the (group) id for the artist.

    Parameters

    gid
        [str]

set_hatch(self, hatch)
    Set the hatching pattern

    hatch can be one of:

    / - diagonal hatching
    \ - back diagonal
    | - vertical
    - - horizontal
    + - crossed
    x - crossed diagonal
    o - small circle
    O - large circle
    . - dots
    * - stars

    Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

    Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

    Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

    Parameters

    hatch
        [{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]

set_in_layout(self, in_layout)
    Set if artist is to be included in layout calculations, E.g. Constrained Layout Guide, Figure.tight_layout(), and fig.savefig(fname, bbox_inches='tight').
Parameters

in_layout
[bool]

set_joinstyle(self, js)
Set the joinstyle for the collection (for all its elements).

Parameters

js

[{'miter', 'round', 'bevel'}] The joinstyle.

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s

[object] s will be converted to a string by calling str.

set_linestyle(self, ls)
Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink in points.

Parameters

ls

[str or tuple or list thereof] Valid values for individual linestyles include {',', '->', '->', ':', '"', (offset, on-off-seq)}. See Line2D.set_linestyle for a complete description.

set_linestyles(self, ls)
Alias for set_linestyle.
set_linewidth(self, lw)
Set the linewidth(s) for the collection. lw can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence

**Parameters**

lw
[float or list of floats]

set_linewidths(self, lw)
Alias for set_linewidth.

set_ls(self, ls)
Alias for set_linestyle.

set_lw(self, lw)
Alias for set_linewidth.

set_norm(self, norm)
Set the normalization instance.

**Parameters**

norm
[Normalize or None]

**Notes**

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

set_offset_position(self, offset_position)
[Deprecated] Set how offsets are applied. If offset_position is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

offset_position
[{'screen', 'data'}]
Notes

Deprecated since version 3.3.

`set_offsets(self, offsets)`
Set the offsets for the collection.

**Parameters**

offsets
[array-like (N, 2) or (2,)]

`set_path_effects(self, path_effects)`
Set the path effects.

**Parameters**

path_effects
[AbstractPathEffect]

`set_paths(self)`

`set_picker(self, picker)`
Define the picking behavior of the artist.

**Parameters**

picker
[None or bool or callable] This can be one of the following:

- **None**: Picking is disabled for this artist (default).
- A boolean: If `True` then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.
- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```python
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. If the mouse event is over the artist, return `hit=True` and props is a dictionary of properties you want added to the PickEvent attributes.
- **deprecated**: For `Line2D` only, `picker` can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use `Line2D.set_pickradius` instead.
**set_pickradius**(*self, pr*)
Set the pick radius used for containment tests.

**Parameters**

*d*

[**float**] Pick radius, in points.

**set_rasterized**(*self, rasterized*)
Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend's default behavior.

**Parameters**

*rasterized*

[**bool or None**]

**set_sizes**(*self, sizes, dpi=72.0*)
Set the sizes of each member of the collection.

**Parameters**

*sizes*

[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

*dpi*

**set_sketch_params**(*self, scale=None, length=None, randomness=None*)
Sets the sketch parameters.

**Parameters**

*scale*

[**float**, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

*length*

[**float**, optional] The length of the wiggle along the line, in pixels (default 128.0)

*randomness*

[**float**, optional] The scale factor by which the length is shrunken or expanded (default 16.0)
```python
set_snap(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap
[bool or None] Possible values:
• True: Snap vertices to the nearest pixel center.
• False: Do not modify vertex positions.
• None: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.
```

```python
set_transform(self, t)
Set the artist transform.

Parameters

t
[Transform]
```

```python
set_url(self, url)
Set the url for the artist.

Parameters

url
[str]
```

```python
set_urls(self, urls)

Parameters

urls
[list of str or None]
```
Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(self, b)
Set the artist’s visibility.

Parameters

b
[bool]

set_zorder(self, level)
Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level
[float]

property stale
Whether the artist is ‘stale’ and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.
There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If \( x \) is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the \( \text{alpha} \) kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the \( \text{alpha} \) kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if \text{bytes} \ is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If \text{norm} \ is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

\[
\text{update}\quad (\text{self, props})
\]

Update this artist’s properties from the dict \( \text{props} \).

\section*{Parameters}

\textbf{props}

[dict]

\section*{property update_dict}

\textbf{update_from}\quad (\text{self, other})

Copy properties from other to self.

\textbf{update_scalarmappable}\quad (\text{self})

Update colors from the scalar mappable array, if it is not None.

\textbf{zorder} = 0

class matplotlib.collections.StarPolygonCollection\quad (\text{numsides, \quad rotation=0, sizes=1, **kwargs})

Bases: \texttt{matplotlib.collections.RegularPolyCollection}

Draw a collection of regular stars with \text{numsides} points.

\section*{Parameters}

\textbf{numsides}

[int] The number of sides of the polygon.

\textbf{rotation}

[float] The rotation of the polygon in radians.

\textbf{sizes}
[tuple of float] The area of the circle circumscribing the polygon in points^2.

**kwargs

Forwarded to Collection.

Examples

See /gallery/event_handling/lasso_demo for a complete example:

```python
offsets = np.random.rand(20, 2)
facecolors = [cm.jet(x) for x in np.random.rand(20)]

collection = RegularPolyCollection(
    numsides=5,  # a pentagon
    rotation=0, sizes=(50,),
    facecolors=facecolors,
    edgecolors="black",
    linewidths=(1,),
    offsets=offsets,
    transOffset=ax.transData,
)

add_callback(self, func)

Add a callback function that will be called whenever one of the Artist’s properties changes.

Parameters

func

[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where artist is the calling Artist. Return values may exist but are ignored.

Returns

int

The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.

See also:

remove_callback
add_checker(self, checker)
[Deprecated]

Notes

Deprecated since version 3.3:

autoscale(self)
    Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
    Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
    The Axes instance the artist resides in, or None.

changed(self)
    Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)
[Deprecated]

Notes

Deprecated since version 3.3:

contains(self, mouseevent)
    Test whether the mouse event occurred in the collection.
    Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

convert_xunits(self, x)
    Convert x using the unit type of the xaxis.
    If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
    Convert y using the unit type of the yaxis.
    If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters
renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

`findobj(self, match=None, include_self=True)`
Find artist objects.
Recursively find all Artist instances contained in the artist.

Parameters

match
A filter criterion for the matches. This can be
- None: Return all objects contained in artist.
- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns True.
- A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self
[bool] Include self in the list to be checked for a match.

Returns

list of Artist

`format_cursor_data(self, data)`
Return a string representation of data.

---

**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

`get_cursor_data`

`get_agg_filter(self)`
Return filter function to be used for agg filter.
get_alpha(self)
    Return the alpha value used for blending - not supported on all backends.

get_animated(self)
    Return whether the artist is animated.

get_array(self)
    Return the data array.

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

Notes

Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.
Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- **event**
  
  [matplotlib.backend_bases.MouseEvent]

**See also:**

- `format_cursor_data`

get_dashes(self)
  
  Alias for `get_linestyle`.

get_datalim(self, transData)

get_ec(self)
  
  Alias for `get_edgecolor`.

get_edgecolor(self)

get_edgecolors(self)
  
  Alias for `get_edgecolor`.

get_facecolor(self)

get_facecolors(self)
  
  Alias for `get_facecolor`.

get_fc(self)
  
  Alias for `get_facecolor`.

get_figure(self)
  
  Return the `Figure` instance the artist belongs to.

get_fill(self)
  
  Return whether fill is set.

get_gid(self)
  
  Return the group id.

get_hatch(self)
  
  Return the current hatching pattern.

get_in_layout(self)
  
  Return boolean flag, True if artist is included in layout calculations.

E.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.
get_joinstyle(self)

Return the label used for this artist in the legend.

get_label(self)

get_linestyle(self)

get_linestyles(self)
  Alias for get_linestyle.

get_linewidth(self)

get_linewidths(self)
  Alias for get_linewidth.

get_ls(self)
  Alias for get_linestyle.

get_lw(self)
  Alias for get_linewidth.

get_numsides(self)

get_offset_position(self)
  [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.

get_offset_transform(self)

get_offsets(self)
  Return the offsets for the collection.

get_path_effects(self)

get_paths(self)

get_picker(self)
  Return the picking behavior of the artist.

  The possible values are described in set_picker.

See also:

  set_picker, pickable, pick

get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.

get_rotation(self)

get_sizes(self)
    Return the sizes ('areas') of the elements in the collection.

Returns

array
    The 'area' of each element.

get_sketch_params(self)
    Return the sketch parameters for the artist.

Returns

tuple or None
    A 3-tuple with the following elements:
    • scale: The amplitude of the wiggle perpendicular to the source line.
    • length: The length of the wiggle along the line.
    • randomness: The scale factor by which the length is shrunken or expanded.
    Returns None if no sketch parameters were set.

get_snap(self)
    Return the snap setting.
    See set_snap for details.

get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

Parameters

renderer

[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

Returns

Bbox
    The enclosing bounding box (in figure pixel coordinates).
get_transform(self)
    Return the Transform instance used by this artist.

get_transformed_clip_path_and_affine(self)
    Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

get_transforms(self)

get_url(self)
    Return the url.

get_urls(self)
    Return a list of URLs, one for each element of the collection.
    The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

get_visible(self)
    Return the visibility.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_zorder(self)
    Return the artist's zorder.

have_units(self)
    Return True if units are set on any axis.

is_transform_set(self)
    Return whether the Artist has an explicitly set transform.
    This is True after set_transform has been called.

property mouseover
    If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.
    See also get_cursor_data(), ToolCursorPosition and NavigationToolbar2.

pchanged(self)
    Call all of the registered callbacks.
    This function is triggered internally when a property is changed.
See also:

add_callback
remove_callback

pick(self, mouseevent)
    Process a pick event.
    Each child artist will fire a pick event if mouseevent is over the artist and
    the artist has picker set.

    See also:

set_picker, get_picker, pickable

pickable(self)
    Return whether the artist is pickable.

    See also:

set_picker, get_picker, pick

properties(self)
    Return a dictionary of all the properties of the artist.

remove(self)
    Remove the artist from the figure if possible.
    The effect will not be visible until the figure is redrawn, e.g., with
    FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.
    Note: relim will not see collections even if the collection was added to the
    axes with autolim = True.
    Note: there is no support for removing the artist's legend entry.

remove_callback(self, oid)
    Remove a callback based on its observer id.

    See also:

add_callback

set(self, **kwargs)
    A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
    Alias for set_antialiased.

set_agg_filter(self, filter_func)
    Set the agg filter.

Parameters
**filter_func**

[callable] A filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array.

```python
set_alpha(self, alpha)
```

Set the alpha value used for blending - not supported on all backends.

**Parameters**

*alpha*  
[float or None]

```python
set_animated(self, b)
```

Set the artist's animation state.

**Parameters**

*b*  
[bool]

```python
set_antialiased(self, aa)
```

Set the antialiasing state for rendering.

**Parameters**

*aa*  
[bool or list of bools]

```python
set_antialiaseds(self, aa)
```

Alias for *set_antialiased*.

```python
set_array(self, A)
```

Set the image array from numpy array A.

**Parameters**

*A*  
[ndarray]

```python
set_capstyle(self, cs)
```

Set the capstyle for the collection (for all its elements).

**Parameters**

*cs*  
[{‘butt’, ‘round’, ‘projecting’}] The capstyle.
set_clim(self, vmin=None, vmax=None)
Set the norm limits for image scaling.

Parameters

vmin, vmax
[float] The limits.
The limits may also be passed as a tuple (vmin, vmax) as a single
positional argument.

set_clip_box(self, clipbox)
Set the artist’s clip Bbox.

Parameters

clipbox
[Bbox]

set_clip_on(self, b)
Set whether the artist uses clipping.
When False artists will be visible outside of the axes which can lead to un-
expected results.

Parameters

b
[bool]

set_clip_path(self, path, transform=None)
Set the artist’s clip path.

Parameters

path
[Patch or Path or TransformedPath or None] The clip path. If
given a Path, transform must be provided as well. If None, a
previously set clip path is removed.

transform
[Transform, optional] Only used if path is a Path, in which case
the given Path is converted to a TransformedPath using trans-
form.
Notes

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

`set_cmap(self, cmap)`
Set the colormap for luminance data.

**Parameters**

`cmap`

[Colormap or str or None]

`set_color(self, c)`
Set both the edgecolor and the facecolor.

**Parameters**

`c`

[color or list of rgba tuples]

See also:

`Collection.set_facecolor`, `Collection.set_edgecolor`

For setting the edge or face color individually.

`set_contains(self, picker)`

[Deprecated] Define a custom contains test for the artist.

The provided callable replaces the default contains method of the artist.

**Parameters**

`picker`

[callback] A custom picker function to evaluate if an event is within the artist. The function must have the signature:

```python
def contains(artist: Artist, event: MouseEvent) -> bool, dict
```

that returns:

- a bool indicating if the event is within the artist

- a dict of additional information. The dict should at least return the same information as the default contains() implementation of the respective artist, but may provide additional information.
Notes

Deprecated since version 3.3.

set_dashes(self, ls)
Alias for set_linestyle.

set_ec(self, c)
Alias for set_edgecolor.

set_edgecolor(self, c)
Set the edgecolor(s) of the collection.

Parameters

c
[color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_edgecolors(self, c)
Alias for set_edgecolor.

set_facecolor(self, c)
Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If c is 'none', the patch will not be filled.

Parameters

c
[color or list of colors]

set_facecolors(self, c)
Alias for set_facecolor.

set_fc(self, c)
Alias for set_facecolor.

set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig
[Figure]

set_gid(self, gid)
Set the (group) id for the artist.
Parameters

**gid**

[**str**]

`set_hatch(self, hatch)`

Set the hatching pattern

*hatch* can be one of:

```
/ - diagonal hatching
\ - back diagonal
| - vertical
- - horizontal
+ - crossed
x - crossed diagonal
o - small circle
O - large circle
. - dots
* - stars
```

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only. Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

**hatch**

```
[{'/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*'}]
```

`set_in_layout(self, in_layout)`

Set if artist is to be included in layout calculations, E.g. *Constrained Layout Guide, Figure.tight_layout()*, and *fig.savefig(fname, bbox_inches='tight')*.

**Parameters**

**in_layout**

[**bool**]

`set_joinstyle(self, js)`

Set the joinstyle for the collection (for all its elements).

**Parameters**

**js**

```
[{'miter', 'round', 'bevel'}] The joinstyle.
**set_label**(*self, s*)

Set a label that will be displayed in the legend.

**Parameters**

**s**

[object] *s* will be converted to a string by calling *str*.

**set_linestyle**(*self, ls*)

Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where *onoffseq* is an even length tuple of on and off ink in points.

**Parameters**

**ls**

[str or tuple or list thereof] Valid values for individual linestyles include {'-', '--', '-.', ':', '', (offset, on-off-seq)}. See *Line2D.set_linestyle* for a complete description.

**set_linestyles**(*self, ls*)

Alias for *set_linestyle*.

**set_linewidth**(*self, lw*)

Set the linewidth(s) for the collection. *lw* can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

**lw**

[float or list of floats]

**set_linewidths**(*self, lw*)

Alias for *set_linewidth*.

**set_ls**(*self, ls*)

Alias for *set_linestyle*. 
set_lw(self, lw)
    Alias for set_linewidth.

set_norm(self, norm)
    Set the normalization instance.

    Parameters

    norm
        [Normalize or None]

    Notes

    If there are any colorbars using the mappable for this norm, setting the norm
    of the mappable will reset the norm, locator, and formatters on the colorbar
to default.

set_offset_position(self, offset_position)
    [Deprecated] Set how offsets are applied. If offset_position is 'screen' (de-
    fault) the offset is applied after the master transform has been applied, that
    is, the offsets are in screen coordinates. If offset_position is 'data', the offset
    is applied before the master transform, i.e., the offsets are in data coordi-
    nates.

    Parameters

    offset_position
        [{'screen', 'data'}]

    Notes

    Deprecated since version 3.3.

set_offsets(self, offsets)
    Set the offsets for the collection.

    Parameters

    offsets
        [array-like (N, 2) or (2,)]

set_path_effects(self, path_effects)
    Set the path effects.

    Parameters
path_effects

    [AbstractPathEffect]

set_paths(self)

set_picker(self, picker)
    Define the picking behavior of the artist.

    Parameters

    picker
        [None or bool or callable] This can be one of the following:
        • None: Picking is disabled for this artist (default).
        • A boolean: If True then picking will be enabled and the artist
          will fire a pick event if the mouse event is over the artist.
        • A function: If picker is callable, it is a user supplied func-
          tion which determines whether the artist is hit by the mouse
          event:

            hit, props = picker(artist, mouseevent)

          to determine the hit test. if the mouse event is over the artist,
          return hit=True and props is a dictionary of properties you
          want added to the PickEvent attributes.
        • deprecated: For Line2D only, picker can also be a float that
          sets the tolerance for checking whether an event occurred
          "on" the line; this is deprecated. Use Line2D.set_pickradius
          instead.

set_pickradius(self, pr)
    Set the pick radius used for containment tests.

    Parameters

    d
        [float] Pick radius, in points.

set_rasterized(self, rasterized)
    Force rasterized (bitmap) drawing in vector backend output.
    Defaults to None, which implies the backend's default behavior.

    Parameters

    rasterized
        [bool or None]
set_sizes(self, sizes, dpi=72.0)
Set the sizes of each member of the collection.

Parameters

sizes
[ndarray or None] The size to set for each element of the collection. The value is the 'area' of the element.

dpi
[float, default: 72] The dpi of the canvas.

set_sketch_params(self, scale=None, length=None, randomness=None)
Sets the sketch parameters.

Parameters

scale
[float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is None, or not provided, no sketch filter will be provided.

length
[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

randomness
[float, optional] The scale factor by which the length is shrunken or expanded (default 16.0)

set_snap(self, snap)
Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

Parameters

snap
[bool or None] Possible values:
• True: Snap vertices to the nearest pixel center.
- `False`: Do not modify vertex positions.
- `None`: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```python
set_transform(self, t)
```
Set the artist transform.

**Parameters**

- `t`  
  `[Transform]`

```python
set_url(self, url)
```
Set the url for the artist.

**Parameters**

- `url`  
  `[str]`

```python
set_urls(self, urls)
```

**Parameters**

- `urls`  
  `[list of str or None]`

**Notes**

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

```python
set_visible(self, b)
```
Set the artist's visibility.

**Parameters**

- `b`  
  `[bool]`

```python
set_zorder(self, level)
```
Set the zorder for the artist. Artists with lower zorder values are drawn first.

**Parameters**
level

[float]

property stale
Whether the artist is 'stale' and needs to be re-drawn for the output to match
the internal state of the artist.

property sticky_edges
x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the
corresponding sticky_edges list, then no margin will be added--the view limit
"sticks" to the edge. A typical use case is histograms, where one usually
expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be mod-
ified in place as needed.

Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corre-
sponding ndarray of rgba values will be returned, based on the norm and
colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba,
such as might have been read from an image file. If x is an ndarray with 3
dimensions, and the last dimension is either 3 or 4, then it will be treated
as an rgb or rgba array, and no mapping will be done. The array can be
uint8, or it can be floating point with values in the 0-1 range; otherwise a
ValueError will be raised. If it is a masked array, the mask will be ignored. If
the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill
in the transparency. If the last dimension is 4, the alpha kwarg is ignored;
it does not replace the pre-existing alpha. A ValueError will be raised if the
third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the
0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255
range.

If norm is False, no normalization of the input data is performed, and it is
assumed to be in the range (0-1).

update(self, props)
Update this artist's properties from the dict props.
Parameters

props

[dict]

property update_dict

update_from(self, other)
    Copy properties from other to self.

update_scalarmappable(self)
    Update colors from the scalar mappable array, if it is not None.

zorder = 0

class matplotlib.collections.TriMesh(triangulation, **kwargs)
    Bases: matplotlib.collections.Collection

Class for the efficient drawing of a triangular mesh using Gouraud shading.
A triangular mesh is a Triangulation object.

Parameters

edgecolors

[color or list of colors, default: rcParams["patch.edgecolor"] (default: 'black')] Edge color for each patch making up the collection. The special value 'face' can be passed to make the edgecolor match the facecolor.

facecolors

[color or list of colors, default: rcParams["patch.facecolor"] (default: 'C0')] Face color for each patch making up the collection.

linewidths

[float or list of floats, default: rcParams["patch.linewidth"] (default: 1.0)] Line width for each patch making up the collection.

linestyles

[str or tuple or list thereof, default: 'solid'] Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

(offset, onoffseq),

where onoffseq is an even length tuple of on and off ink lengths in points. For examples, see /gallery/lines_bars_and_markers/linestyles.

capstyle
[str, default: rcParams["patch.capstyle"]] Style to use for capping lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

**joinstyle**

[‘str, default: rcParams["patch.joinstyle"]’] Style to use for joining lines for all paths in the collection. See /gallery/lines_bars_and_markers/joinstyle for a demonstration of each of the allowed values.

**antialiaseds**

[bool or list of bool, default: rcParams["patch.antialiased"] (default: True)] Whether each patch in the collection should be drawn with antialiasing.

**offsets**

[(float, float) or list thereof, default: (0, 0)] A vector by which to translate each patch after rendering (default is no translation). The translation is performed in screen (pixel) coordinates (i.e. after the Artist’s transform is applied).

**transOffset**

[Transform, default: IdentityTransform] A single transform which will be applied to each offsets vector before it is used.

**offset_position**

[‘screen’ (default), ‘data’ (deprecated)] If set to ‘data’ (deprecated), offsets will be treated as if it is in data coordinates instead of in screen coordinates.

**norm**

[Normalize, optional] Forwarded to ScalarMappable. The default of None means that the first draw call will set vmin and vmax using the minimum and maximum values of the data.

**cmap**

[Colormap, optional] Forwarded to ScalarMappable. The default of None will result in rcParams["image.cmap"] (default: ‘viridis’) being used.

**hatch**

[‘str, optional’] Hatching pattern to use in filled paths, if any. Valid strings are [‘/', ',', '|', '+', 'x', 'o', 'O', '.', '*’]. See /gallery/shapes_and_collections/hatch_demo for the meaning of each hatch type.

**pickradius**
[float, default: 5.0] If `pickradius <= 0`, then `Collection.contains` will return True whenever the test point is inside of one of the polygons formed by the control points of a Path in the Collection. On the other hand, if it is greater than 0, then we instead check if the test point is contained in a stroke of width `2*pickradius` following any of the Paths in the Collection.

**urls**

[list of str, default: None] A URL for each patch to link to once drawn. Currently only works for the SVG backend. See /gallery/misc/hyperlinks_sgskip for examples.

**zorder**

[float, default: 1] The drawing order, shared by all Patches in the Collection. See /gallery/misc/zorder_demo for all defaults and examples.

```python
def add_callback(self, func):
    Add a callback function that will be called whenever one of the Artist's properties changes.
```

**Parameters**

**func**

[callable] The callback function. It must have the signature:

```python
def func(artist: Artist) -> Any
```

where `artist` is the calling Artist. Return values may exist but are ignored.

**Returns**

**int**

The observer id associated with the callback. This id can be used for removing the callback with `remove_callback` later.

**See also:**

`remove_callback`

```python
def add_checker(self, checker):
    [Deprecated]
```
Notes

Deprecated since version 3.3:

autoscale(self)
   Autoscale the scalar limits on the norm instance using the current array

autoscale_None(self)
   Autoscale the scalar limits on the norm instance using the current array, changing only limits that are None

property axes
   The Axes instance the artist resides in, or None.

changed(self)
   Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

check_update(self, checker)
   [Deprecated]

Notes

Deprecated since version 3.3:

contains(self, mouseevent)
   Test whether the mouse event occurred in the collection.
   Returns bool, dict(ind=itemlist), where every item in itemlist contains the event.

static convert_mesh_to_paths(tri)
   Convert a given mesh into a sequence of Path objects.
   This function is primarily of use to implementers of backends that do not directly support meshes.

convert_xunits(self, x)
   Convert x using the unit type of the xaxis.
   If the artist is not in contained in an Axes or if the xaxis does not have units, x itself is returned.

convert_yunits(self, y)
   Convert y using the unit type of the yaxis.
   If the artist is not in contained in an Axes or if the yaxis does not have units, y itself is returned.

draw(self, renderer)
   Draw the Artist (and its children) using the given renderer.
   This has no effect if the artist is not visible (Artist.get_visible returns False).
Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

findobj(self, match=None, include_self=True)

Find artist objects.

Recursively find all Artist instances contained in the artist.

Parameters

match

A filter criterion for the matches. This can be

- None: Return all objects contained in artist.
- A function with signature def match(artist: Artist) -> bool. The result will only contain artists for which the function returns True.
- A class instance: e.g., Line2D. The result will only contain artists of this class or its subclasses (isinstance check).

include_self

[bool] Include self in the list to be checked for a match.

Returns

list of Artist

format_cursor_data(self, data)

Return a string representation of data.

Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

See also:

g et_cursor_data
get_agg_filter(self)
    Return filter function to be used for agg filter.

get_alpha(self)
    Return the alpha value used for blending - not supported on all backends.

get_animated(self)
    Return whether the artist is animated.

get_array(self)
    Return the data array.

get_capstyle(self)

get_children(self)
    Return a list of the child Artists of this Artist.

get_clim(self)
    Return the values (min, max) that are mapped to the colormap limits.

get_clip_box(self)
    Return the clipbox.

get_clip_on(self)
    Return whether the artist uses clipping.

get_clip_path(self)
    Return the clip path.

get_cmap(self)
    Return the Colormap instance.

get_contains(self)
    [Deprecated] Return the custom contains function of the artist if set, or None.

    See also:

    set_contains

    Notes

    Deprecated since version 3.3.

get_cursor_data(self, event)
    Return the cursor data for a given event.

    Note: This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

    Cursor data can be used by Artists to provide additional context information for a given event. The default implementation just returns None.
Subclasses can override the method and return arbitrary data. However, when doing so, they must ensure that `format_cursor_data` can convert the data to a string representation.

The only current use case is displaying the z-value of an `AxesImage` in the status bar of a plot window, while moving the mouse.

**Parameters**

- **event**
  
  [matplotlib.backend_bases.MouseEvent]

**See also:**

- `format_cursor_data`

- `get_dashes(self)`
  
  Alias for `get linestyle`.

- `get_datalim(self, transData)`

- `get_ec(self)`
  
  Alias for `get edgecolor`.

- `get_edgecolor(self)`

- `get_edgecolors(self)`
  
  Alias for `get edgecolor`.

- `get_facecolor(self)`

- `get_facecolors(self)`
  
  Alias for `get facecolor`.

- `get_fc(self)`
  
  Alias for `get facecolor`.

- `get_figure(self)`
  
  Return the `Figure` instance the artist belongs to.

- `get_fill(self)`
  
  Return whether fill is set.

- `get_gid(self)`
  
  Return the group id.

- `get_hatch(self)`
  
  Return the current hatching pattern.

- `get_in_layout(self)`
  
  Return boolean flag, `True` if artist is included in layout calculations.

  E.g.  
  
  Constrained Layout Guide, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.  

get_joinstyle(self)
get_label(self)
    Return the label used for this artist in the legend.
get_linestyle(self)
get_linestyles(self)
    Alias for get_linestyle.
get_linewidth(self)
get_linewidths(self)
    Alias for get_linewidth.
get_ls(self)
    Alias for get_linestyle.
get_lw(self)
    Alias for get_linewidth.
get_offset_position(self)
    [Deprecated] Return how offsets are applied for the collection. If offset_position is 'screen', the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

Notes

Deprecated since version 3.3.
get_offset_transform(self)
get_offsets(self)
    Return the offsets for the collection.
get_path_effects(self)
get_paths(self)
get_picker(self)
    Return the picking behavior of the artist.
    The possible values are described in set_picker.

See also:

set_picker, pickable, pick
get_pickradius(self)
get_rasterized(self)
    Return whether the artist is to be rasterized.
get_sketch_params(self)
    Return the sketch parameters for the artist.

    **Returns**

    **tuple or None**
    A 3-tuple with the following elements:
    - *scale*: The amplitude of the wiggle perpendicular to the source line.
    - *length*: The length of the wiggle along the line.
    - *randomness*: The scale factor by which the length is shrunk or expanded.

    Returns *None* if no sketch parameters were set.

get_snap(self)
    Return the snap setting.

    See *set_snap* for details.

get_tightbbox(self, renderer)
    Like *Artist.get_window_extent*, but includes any clipping.

    **Parameters**

    renderer
        [RendererBase subclass] renderer that will be used to draw the figures (i.e. *fig.canvas.get_renderer()*).

    **Returns**

    *Bbox*
        The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
    Return the *Transform* instance used by this artist.

generateclipped_path(self)
    Return the clip path with the non-affine part of its transformation applied, and the remaining affine part of its transformation.

generatetransforms(self)

generate_url(self)
    Return the url.

generate_urls(self)
    Return a list of URLs, one for each element of the collection.
The list contains None for elements without a URL. See /gallery/misc/hyperlinks_sgskip for an example.

`get_visible(self)`
Return the visibility.

`get_window_extent(self, renderer)`
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`get_zorder(self)`
Return the artist's zorder.

`have_units(self)`
Return True if units are set on any axis.

`is_transform_set(self)`
Return whether the Artist has an explicitly set transform.

This is True after `set_transform` has been called.

`property mouseover`
If this property is set to True, the artist will be queried for custom context information when the mouse cursor moves over it.

See also `get_cursor_data()`, `ToolCursorPosition` and `NavigationToolbar2`.

`pchanged(self)`
Call all of the registered callbacks.

This function is triggered internally when a property is changed.

See also:

`add_callback`

`remove_callback`

`pick(self, mouseevent)`
Process a pick event.

Each child artist will fire a pick event if `mouseevent` is over the artist and the artist has picker set.

See also:
set_picker, get_picker, pickable

pickable(self)
Return whether the artist is pickable.

See also:

set_picker, get_picker, pick

properties(self)
Return a dictionary of all the properties of the artist.

remove(self)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with
FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the
axes with autolim = True.

Note: there is no support for removing the artist's legend entry.

remove_callback(self, oid)
Remove a callback based on its observer id.

See also:

add_callback

set(self, **kwargs)
A property batch setter. Pass kwargs to set properties.

set_aa(self, aa)
Alias for set_antialiased.

set_agg_filter(self, filter_func)
Set the agg filter.

Parameters

filter_func
[callable] A filter function, which takes a (m, n, 3) float array
and a dpi value, and returns a (m, n, 3) array.

set_alpha(self, alpha)
Set the alpha value used for blending - not supported on all backends.

Parameters

alpha
[float or None]
set_animated(self, b)
    Set the artist's animation state.

    Parameters

    b
        [bool]

set_antialiased(self, aa)
    Set the antialiasing state for rendering.

    Parameters

    aa
        [bool or list of bools]

set_antialiaseds(self, aa)
    Alias for set_antialiased.

set_array(self, A)
    Set the image array from numpy array A.

    Parameters

    A
        [ndarray]

set_capstyle(self, cs)
    Set the capstyle for the collection (for all its elements).

    Parameters

    cs
        [{'butt', 'round', 'projecting'}] The capstyle.

set_clim(self, vmin=None, vmax=None)
    Set the norm limits for image scaling.

    Parameters

    vmin, vmax
        [float] The limits.

        The limits may also be passed as a tuple (vmin, vmax) as a single
        positional argument.

set_clip_box(self, clipbox)
    Set the artist's clip Bbox.
**Parameters**

**clipbox**

[Bbox]

**set_clip_on**(self, b)

Set whether the artist uses clipping.

When False artists will be visible outside of the axes which can lead to unexpected results.

**Parameters**

**b**

[bool]

**set_clip_path**(self, path, transform=None)

Set the artist's clip path.

**Parameters**

**path**

[Path or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.

**transform**

[Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

**Notes**

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

**set_cmap**(self, cmap)

Set the colormap for luminance data.

**Parameters**

**cmap**

[Colormap or str or None]
set_color(self, c)
    Set both the edgecolor and the facecolor.

    **Parameters**

    c
        [color or list of rgba tuples]

    **See also:**

    Collection.set_facecolor, Collection.set_edgecolor

    For setting the edge or face color individually.

set_contains(self, picker)
    [Deprecated] Define a custom contains test for the artist.

    The provided callable replaces the default contains method of the artist.

    **Parameters**

    picker
        [callable] A custom picker function to evaluate if an event is
        within the artist. The function must have the signature:

        ```python
        def contains(artist: Artist, event: MouseEvent) -> bool, dict
        ```

        that returns:
        • a bool indicating if the event is within the artist
        • a dict of additional information. The dict should at least return
          the same information as the default contains() implementation
          of the respective artist, but may provide additional information.

    **Notes**

    Deprecated since version 3.3.

set_dashes(self, ls)
    Alias for set_linestyle.

set_ec(self, c)
    Alias for set_edgecolor.

set_edgecolor(self, c)
    Set the edgecolor(s) of the collection.

    **Parameters**
The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

```python
set_edgecolors(self, c)
```
Alias for `set_edgecolor`.

```python
set_facecolor(self, c)
```
Set the facecolor(s) of the collection. `c` can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

If `c` is 'none', the patch will not be filled.

**Parameters**

```python
c
```
[ color or list of colors ]

```python
set_facecolors(self, c)
```
Alias for `set_facecolor`.

```python
set_fc(self, c)
```
Alias for `set_facecolor`.

```python
set_figure(self, fig)
```
Set the `Figure` instance the artist belongs to.

**Parameters**

```python
fig
```
[ `Figure` ]

```python
set_gid(self, gid)
```
Set the (group) id for the artist.

**Parameters**

```python
gid
```
[ `str` ]

```python
set_hatch(self, hatch)
```
Set the hatching pattern

`hatch` can be one of:
Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only. Unlike other properties such as linewidth and colors, hatching can only be specified for the collection as a whole, not separately for each member.

**Parameters**

**hatch**

```python
['/', '\', '|', '-', '+', 'x', 'o', 'O', '.', '*']
```

**set_in_layout**(self, in_layout)

Set if artist is to be included in layout calculations, e.g. `Constrained Layout Guide`, `Figure.tight_layout()`, and `fig.savefig(fname, bbox_inches='tight')`.

**Parameters**

**in_layout**

[bool]

**set_joinstyle**(self, js)

Set the joinstyle for the collection (for all its elements).

**Parameters**

**js**

[{'miter', 'round', 'bevel'}] The joinstyle.

**set_label**(self, s)

Set a label that will be displayed in the legend.

**Parameters**

**s**

[object] s will be converted to a string by calling `str`. 
**set_linestyle**(self, ls)

Set the linestyle(s) for the collection.

<table>
<thead>
<tr>
<th>linestyle</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-' or 'solid'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--' or 'dashed'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-' or 'dashdot'</td>
<td>dash-dotted line</td>
</tr>
<tr>
<td>':' or 'dotted'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Alternatively a dash tuple of the following form can be provided:

```
(offset, onoffseq),
```

where `onoffseq` is an even length tuple of on and off ink in points.

**Parameters**

**ls**

[str or tuple or list thereof] Valid values for individual linestyles include `{'-', '--', '.', ':', '', (offset, on-off-seq)}`. See `Line2D.set_linestyle` for a complete description.

**set_linestyles**(self, ls)

Alias for `set_linestyle`.

**set_linewidth**(self, lw)

Set the linewidth(s) for the collection. `lw` can be a scalar or a sequence; if it is a sequence the patches will cycle through the sequence.

**Parameters**

**lw**

[float or list of floats]

**set_linewidths**(self, lw)

Alias for `set_linewidth`.

**set_ls**(self, ls)

Alias for `set_linestyle`.

**set_lw**(self, lw)

Alias for `set_linewidth`.

**set_norm**(self, norm)

Set the normalization instance.

**Parameters**

**norm**
[Normalize or None]

Notes

If there are any colorbars using the mappable for this norm, setting the norm of the mappable will reset the norm, locator, and formatters on the colorbar to default.

```
set_offset_position(self, offset_position)
```

[Deprecated] Set how offsets are applied. If offset_position is 'screen' (default) the offset is applied after the master transform has been applied, that is, the offsets are in screen coordinates. If offset_position is 'data', the offset is applied before the master transform, i.e., the offsets are in data coordinates.

**Parameters**

- **offset_position**
  ```
  [{'screen', 'data'}]
  ```

Notes

Deprecated since version 3.3.

```
set_offsets(self, offsets)
```

Set the offsets for the collection.

**Parameters**

- **offsets**
  ```
  [array-like (N, 2) or (2,)]
  ```

```
set_path_effects(self, path_effects)
```

Set the path effects.

**Parameters**

- **path_effects**
  ```
  [AbstractPathEffect]
  ```

```
set_paths(self)
```

```
set_picker(self, picker)
```

Define the picking behavior of the artist.

**Parameters**
picker

[None or bool or callable] This can be one of the following:

• *None*: Picking is disabled for this artist (default).

• A boolean: If *True* then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

• A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

\[
\text{hit, props} = \text{picker}(\text{artist, mouseevent})
\]

to determine the hit test. If the mouse event is over the artist, return *hit=True* and props is a dictionary of properties you want added to the PickEvent attributes.

• *deprecated*: For *Line2D* only, *picker* can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use *Line2D.set_pickradius* instead.

```
set_pickradius(self, pr)
```

Set the pick radius used for containment tests.

**Parameters**

- **d**
  
  [float] Pick radius, in points.

```
set_rasterized(self, rasterized)
```

Force rasterized (bitmap) drawing in vector backend output.

Defaults to None, which implies the backend’s default behavior.

**Parameters**

- **rasterized**
  
  [bool or None]

```
set_sketch_params(self, scale=None, length=None, randomness=None)
```

Sets the sketch parameters.

**Parameters**

- **scale**
  
  [float, optional] The amplitude of the wiggle perpendicular to the source line, in pixels. If scale is *None*, or not provided, no sketch filter will be provided.
**length**

[float, optional] The length of the wiggle along the line, in pixels (default 128.0)

**randomness**

[float, optional] The scale factor by which the length is shrunk or expanded (default 16.0)

```python
set_snap(self, snap)
```

Set the snapping behavior.

Snapping aligns positions with the pixel grid, which results in clearer images. For example, if a black line of 1px width was defined at a position in between two pixels, the resulting image would contain the interpolated value of that line in the pixel grid, which would be a grey value on both adjacent pixel positions. In contrast, snapping will move the line to the nearest integer pixel value, so that the resulting image will really contain a 1px wide black line.

Snapping is currently only supported by the Agg and MacOSX backends.

**Parameters**

```python
snap
```

[bool or None] Possible values:

- **True**: Snap vertices to the nearest pixel center.
- **False**: Do not modify vertex positions.
- **None**: (auto) If the path contains only rectilinear line segments, round to the nearest pixel center.

```python
set_transform(self, t)
```

Set the artist transform.

**Parameters**

```python
t
```

[Transform]

```python
set_url(self, url)
```

Set the url for the artist.

**Parameters**

```python
url
```

[str]

```python
set_urls(self, urls)
```
Parameters

urls

[list of str or None]

Notes

URLs are currently only implemented by the SVG backend. They are ignored by all other backends.

set_visible(self, b)

Set the artist's visibility.

Parameters

b

[bool]

set_zorder(self, level)

Set the zorder for the artist. Artists with lower zorder values are drawn first.

Parameters

level

[float]

property stale

Whether the artist is 'stale' and needs to be re-drawn for the output to match the internal state of the artist.

property sticky_edges

x and y sticky edge lists for autoscaling.

When performing autoscaling, if a data limit coincides with a value in the corresponding sticky_edges list, then no margin will be added--the view limit "sticks" to the edge. A typical use case is histograms, where one usually expects no margin on the bottom edge (0) of the histogram.

This attribute cannot be assigned to; however, the x and y lists can be modified in place as needed.
Examples

```python
>>> artist.sticky_edges.x[:] = (xmin, xmax)
>>> artist.sticky_edges.y[:] = (ymin, ymax)
```

to_rgba(self, x, alpha=None, bytes=False, norm=True)
Return a normalized rgba array corresponding to x.

In the normal case, x is a 1-D or 2-D sequence of scalars, and the corresponding ndarray of rgba values will be returned, based on the norm and colormap set for this ScalarMappable.

There is one special case, for handling images that are already rgb or rgba, such as might have been read from an image file. If x is an ndarray with 3 dimensions, and the last dimension is either 3 or 4, then it will be treated as an rgb or rgba array, and no mapping will be done. The array can be uint8, or it can be floating point with values in the 0-1 range; otherwise a ValueError will be raised. If it is a masked array, the mask will be ignored. If the last dimension is 3, the alpha kwarg (defaulting to 1) will be used to fill in the transparency. If the last dimension is 4, the alpha kwarg is ignored; it does not replace the pre-existing alpha. A ValueError will be raised if the third dimension is other than 3 or 4.

In either case, if bytes is False (default), the rgba array will be floats in the 0-1 range; if it is True, the returned rgba array will be uint8 in the 0 to 255 range.

If norm is False, no normalization of the input data is performed, and it is assumed to be in the range (0-1).

update(self, props)
Update this artist's properties from the dict props.

Parameters

props
    [dict]

property update_dict
update_from(self, other)
    Copy properties from other to self.

update_scalarmappable(self)
    Update colors from the scalar mappable array, if it is not None.

zorder = 0
18.17 matplotlib.colorbar

Colorbars are a visualization of the mapping from scalar values to colors. In Matplotlib they are drawn into a dedicated `Axes`.

**Note:** Colorbars are typically created through `Figure.colorbar` or its pyplot wrapper `pyplot.colorbar`, which use `make_axes` and `Colorbar` internally.

As an end-user, you most likely won't have to call the methods or instantiate the classes in this module explicitly.

`ColorbarBase`

The base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

`Colorbar`

On top of `ColorbarBase` this connects the colorbar with a `ScalarMappable` such as an image or contour plot.

`ColorbarPatch`

A specialized `Colorbar` to support hatched contour plots.

`make_axes()`

Create an `Axes` suitable for a colorbar. This functions can be used with figures containing a single axes or with freely placed axes.

`make_axes_gridspec()`

Create a `SubplotBase` suitable for a colorbar. This function should be used for adding a colorbar to a `GridSpec`.

```python
class matplotlib.colorbar.Colorbar(ax, mappable, **kwargs)
```

Bases: `matplotlib.colorbar.ColorbarBase`

This class connects a `ColorbarBase` to a `ScalarMappable` such as an `AxesImage` generated via `imshow`.

**Note:** This class is not intended to be instantiated directly; instead, use `Figure.colorbar` or `pyplot.colorbar` to create a colorbar.

`add_lines(self, CS, erase=True)`

Add the lines from a non-filled `ContourSet` to the colorbar.

**Parameters**

- **CS**
The line positions are taken from the ContourSet levels. The ContourSet must not be filled.

**erase**

[bool, default: True] Whether to remove any previously added lines.

**on_mappable_changed**(*self, mappable*)

[Deprecated] Update this colorbar to match the mappable's properties.

Typically this is automatically registered as an event handler by `colorbar_factory()` and should not be called manually.

**Notes**

Deprecated since version 3.3.

**remove**(*self*)

Remove this colorbar from the figure.

If the colorbar was created with `use_gridspec=True` the previous gridspec is restored.

**update_bruteforce**(*self, mappable*)

[Deprecated] Destroy and rebuild the colorbar. This is intended to become obsolete, and will probably be deprecated and then removed. It is not called when the `pyplot.colorbar` function or the `Figure.colorbar` method are used to create the colorbar.

**Notes**

Deprecated since version 3.3.

**update_normal**(*self, mappable*)

Update solid patches, lines, etc.

This is meant to be called when the norm of the image or contour plot to which this colorbar belongs changes.

If the norm on the mappable is different than before, this resets the locator and formatter for the axis, so if these have been customized, they will need to be customized again. However, if the norm only changes values of `vmin`, `vmax` or `cmap` then the old formatter and locator will be preserved.
class matplotlib.colorbar.ColorbarBase(ax, *, cmap=None, norm=None,  
alpha=None, values=None, boundaries=None, orientation='vertical',  
ticklocation='auto', extend=None, spacing='uniform', ticks=None,  
format=None, drawedges=False, filled=True, extendfrac=None, extendrect=False, label='')

Bases: object

Draw a colorbar in an existing axes.

There are only some rare cases in which you would work directly with a ColorbarBase as an end-user. Typically, colorbars are used with ScalarMappables such as an AxesImage generated via imshow. For these cases you will use Colorbar and likely create it via pyplot.colorbar or Figure.colorbar.

The main application of using a ColorbarBase explicitly is drawing colorbars that are not associated with other elements in the figure, e.g. when showing a colormap by itself.

If the cmap kwarg is given but boundaries and values are left as None, then the colormap will be displayed on a 0-1 scale. To show the under- and over-value colors, specify the norm as:

```python
norm=colors.Normalize(clip=False)
```

To show the colors versus index instead of on the 0-1 scale, use:

```python
norm=colors.NoNorm()
```

Useful public methods are set_label() and add_lines().

**Parameters**

- **ax**
  
  [Axes] The Axes instance in which the colorbar is drawn.

- **cmap**
  
  [Colormap, default: rcParams["image.cmap"] (default: ‘viridis’)]
  The colormap to use.

- **norm**
  
  [Normalize]

- **alpha**
  
  [float] The colorbar transparency between 0 (transparent) and 1 (opaque).

- **values**

- **boundaries**
orientation

[{'vertical', 'horizontal'}]

ticklocation

[{'auto', 'left', 'right', 'top', 'bottom'}]

extend

[{'neither', 'both', 'min', 'max'}]

spacing

[{'uniform', 'proportional'}]

ticks

[Locator or array-like of float]

format

[str or Formatter]

drawedges

[bool]

filled

[bool]

extendfrac

extendrect

label

[str]

Attributes

ax

[Axes] The Axes instance in which the colorbar is drawn.

lines

[list] A list of LineCollection if lines were drawn, otherwise an empty list.

dividers

[LineCollection] A LineCollection if drawedges is True, otherwise None.

add_lines(self, levels, colors, linewights, erase=True)

Draw lines on the colorbar.

The lines are appended to the list lines.
Parameters

levels
[array-like] The positions of the lines.

colors
[color or list of colors] Either a single color applying to all lines or one color value for each line.

linewidths
[float or array-like] Either a single linewidth applying to all lines or one linewidth for each line.

erase
[bool, default: True] Whether to remove any previously added lines.

config_axis(self)
[Deprecated]

Notes

Deprecated since version 3.3:

draw_all(self)
Calculate any free parameters based on the current cmap and norm, and do all the drawing.

get_ticks(self, minor=False)
Return the x ticks as a list of locations.

minorticks_off(self)
Turn the minor ticks of the colorbar off.

minorticks_on(self)
Turn the minor ticks of the colorbar on without extruding into the "extend regions".

n_rasterize = 50

remove(self)
Remove this colorbar from the figure.

set_alpha(self, alpha)
Set the transparency between 0 (transparent) and 1 (opaque).

set_label(self, label, *, loc=None, **kwargs)
Add a label to the long axis of the colorbar.
set_ticklabels(self, ticklabels, update_ticks=True)
Set tick labels.

Tick labels are updated immediately unless update_ticks is False, in which case one should call update_ticks explicitly.

set_ticks(self, ticks, update_ticks=True)
Set tick locations.

Parameters

ticks
[array-like or Locator or None] The tick positions can be hard-coded by an array of values; or they can be defined by a Locator. Setting to None reverts to using a default locator.

update_ticks
[bool, default: True] If True, tick locations are updated immediately. If False, the user has to call update_ticks later to update the ticks.

update_ticks(self)
Force the update of the ticks and ticklabels. This must be called whenever the tick locator and/or tick formatter changes.

class matplotlib.colorbar.ColorbarPatch(ax, mappable, **kw)
Bases: matplotlib.colorbar.Colorbar

A Colorbar that uses a list of Patch instances rather than the default PatchCollection created by pcolor, because the latter does not allow the hatch pattern to vary among the members of the collection.

matplotlib.colorbar.colorbar_factory(cax, mappable, **kwargs)
Create a colorbar on the given axes for the given mappable.

Note: This is a low-level function to turn an existing axes into a colorbar axes. Typically, you'll want to use colorbar instead, which automatically handles creation and placement of a suitable axes as well.

Parameters

cax
[Axes] The Axes to turn into a colorbar.

mappable
[ScalarMappable] The mappable to be described by the colorbar.

**kwargs
Keyword arguments are passed to the respective colorbar class.

**Returns**

*Colorbar or ColorbarPatch*

The created colorbar instance. *ColorbarPatch* is only used if *map\-pable* is a *ContourSet* with hatches.

```
matplotlib.colorbar.make_axes(parents, location=None, orientation=None, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Create an *Axes* suitable for a colorbar.

The axes is placed in the figure of the *parents* axes, by resizing and repositioning *parents*.

**Parameters**

*parents*

[*Axes* or list of *Axes*] The Axes to use as parents for placing the colorbar.

*location*

[None or {'left', 'right', 'top', 'bottom'}] The position, relative to *parents*, where the colorbar axes should be created. If None, the value will either come from the given *orientation*, else it will default to 'right'.

*orientation*

[None or {'vertical', 'horizontal'}] The orientation of the colorbar. Typically, this keyword shouldn't be used, as it can be derived from the *location* keyword.

*fraction*

[float, default: 0.15] Fraction of original axes to use for colorbar.

*shrink*

[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

*aspect*

[float, default: 20] Ratio of long to short dimensions.

**Returns**

*cax*

[*Axes*] The child axes.
**kw**

[dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

**Other Parameters**

**pad**

[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

**anchor**

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

**panchor**

[(float, float), or False, optional] The anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

```python
matplotlib.colorbar.make_axes_gridspec(parent, *, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Create a `SubplotBase` suitable for a colorbar.

The axes is placed in the figure of the parent axes, by resizing and repositioning parent.

This function is similar to `make_axes`. Primary differences are

- `make_axes_gridspec` only handles the orientation keyword and cannot handle the location keyword.
- `make_axes_gridspec` should only be used with a `SubplotBase` parent.
- `make_axes` creates an `Axes`; `make_axes_gridspec` creates a `SubplotBase`.
- `make_axes` updates the position of the parent. `make_axes_gridspec` replaces the grid_spec attribute of the parent with a new one.

While this function is meant to be compatible with `make_axes`, there could be some minor differences.

**Parameters**

**parent**

[`Axes`] The Axes to use as parent for placing the colorbar.

**fraction**

[float, default: 0.15] Fraction of original axes to use for colorbar.
shrink
   [float, default: 1.0] Fraction by which to multiply the size of the colorbar.

aspect
   [float, default: 20] Ratio of long to short dimensions.

Returns

cax
   [SubplotBase] The child axes.

kw
   [dict] The reduced keyword dictionary to be passed when creating the colorbar instance.

Other Parameters

orientation
   [{'vertical', 'horizontal'}, default: 'vertical'] The orientation of the colorbar.

pad
   [float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

anchor
   [(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor
   [(float, float), or False, optional] The anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

18.18 matplotlib.colors

The Color tutorials and examples demonstrate how to set colors and colormaps. A module for converting numbers or color arguments to RGB or RGBA.

RGB and RGBA are sequences of, respectively, 3 or 4 floats in the range 0-1.

This module includes functions and classes for color specification conversions, and for mapping numbers to colors in a 1-D array of colors called a colormap.
Mapping data onto colors using a colormap typically involves two steps: a data array is first mapped onto the range 0-1 using a subclass of `Normalize`, then this number is mapped to a color using a subclass of `Colormap`. Two subclasses of `Colormap` provided here: `LinearSegmentedColormap`, which uses piecewise-linear interpolation to define colormaps, and `ListedColormap`, which makes a colormap from a list of colors.

**See also:**

*Creating Colormaps in Matplotlib* for examples of how to make colormaps and *Choosing Colormaps in Matplotlib* for a list of built-in colormaps.

*Colormap Normalization* for more details about data normalization.

More colormaps are available at [palettable](https://python-palettable.readthedocs.io/).

The module also provides functions for checking whether an object can be interpreted as a color (`is_color_like`), for converting such an object to an RGBA tuple (`to_rgba`) or to an HTML-like hex string in the "#rrggbb" format (`to_hex`), and a sequence of colors to an (n, 4) RGBA array (`to_rgba_array`). Caching is used for efficiency.

Matplotlib recognizes the following formats to specify a color:

- an RGB or RGBA (red, green, blue, alpha) tuple of float values in closed interval [0, 1] (e.g., (0.1, 0.2, 0.5) or (0.1, 0.2, 0.5, 0.3));
- a hex RGB or RGBA string (e.g., '#0f0f0f' or '#0f0f0f80'; case-insensitive);
- a shorthand hex RGB or RGBA string, equivalent to the hex RGB or RGBA string obtained by duplicating each character, (e.g., '#abc', equivalent to '#aabbcc', or '#abcd', equivalent to '#aabbccdd'; case-insensitive);
- a string representation of a float value in [0, 1] inclusive for gray level (e.g., '0.5');
- one of the characters {'b', 'g', 'r', 'c', 'm', 'y', 'k', 'w'}, which are shorthand notations for shades of blue, green, red, cyan, magenta, yellow, black, and white. Note that the colors 'g', 'c', 'm', 'y' do not coincide with the X11/CSS4 colors. Their particular shades were chosen for better visibility of colored lines against typical backgrounds.
- a X11/CSS4 color name (case-insensitive);
- a name from the xkcd color survey, prefixed with 'xkcd:' (e.g., 'xkcd:sky blue'; case insensitive);
- one of the Tableau Colors from the 'T10' categorical palette (the default color cycle): {'tab:blue', 'tab:orange', 'tab:green', 'tab:red', 'tab:purple', 'tab:brown', 'tab:pink', 'tab:gray', 'tab:olive', 'tab: cyan'} (case-insensitive);
- a "CN" color spec, i.e. 'C' followed by a number, which is an index into the default property cycle (`rcParams['axes.prop_cycle']`) (default: cycler('color', ['#ff77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '####f1b611', '#a66cfc', '#ffca28', '#9e525e', '#cb2020'])).
Matplotlib, Release 3.3.3

'\#8c564b', '\#e377c2', '\#7f7f7f', '\#bcdd22', '\#17becf']); the indexing is intended to occur at rendering time, and defaults to black if the cycle does not include color.

.matplotlib.colors.BoundaryNorm

class matplotlib.colors.BoundaryNorm(boundaries, ncolors, clip=False, *, extend='neither')

Bases: matplotlib.colors.Normalize

Generate a colormap index based on discrete intervals.

Unlike Normalize or LogNorm, BoundaryNorm maps values to integers instead of to the interval 0-1.

Mapping to the 0-1 interval could have been done via piece-wise linear interpolation, but using integers seems simpler, and reduces the number of conversions back and forth between integer and floating point.
Parameters

boundaries
[array-like] Monotonically increasing sequence of boundaries

ncolors
[int] Number of colors in the colormap to be used

clip
[bool, optional] If clip is True, out of range values are mapped to 0 if they are below boundaries[0] or mapped to ncolors - 1 if they are above boundaries[-1].

If clip is False, out of range values are mapped to -1 if they are below boundaries[0] or mapped to ncolors if they are above boundaries[-1]. These are then converted to valid indices by Colormap.__call__.

extend
[{'neither', 'both', 'min', 'max'}, default: 'neither'] Extend the number of bins to include one or both of the regions beyond the boundaries. For example, if extend is 'min', then the color to which the region between the first pair of boundaries is mapped will be distinct from the first color in the colormap, and by default a Colorbar will be drawn with the triangle extension on the left or lower end.

Returns

int16 scalar or array

Notes

boundaries defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins, including any extensions, is less than ncolors, the color index is chosen by linear interpolation, mapping the [0, nbins - 1] range onto the [0, ncolors - 1] range.

__call__(self, value, clip=None)
Normalize value data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.

Parameters

value
Data to normalize.
clip

[bool] If None, defaults to self.clip (which defaults to False).

Notes

If not already initialized, self.vmin and self.vmax are initialized using self.
autoscale_None(value).

__init__(self, boundaries, ncolors, clip=False, *, extend='neither')

Parameters

boundaries

[array-like] Monotonically increasing sequence of boundaries

ncolors

[int] Number of colors in the colormap to be used

clip

[bool, optional] If clip is True, out of range values are mapped
to 0 if they are below boundaries[0] or mapped to ncolors - 1 if
they are above boundaries[-1].

If clip is False, out of range values are mapped to -1 if they
are below boundaries[0] or mapped to ncolors if they are above
boundaries[-1]. These are then converted to valid indices by
Colormap.__call__.

defaults: 'neither']

Extend the
number of bins to include one or both of the regions beyond
the boundaries. For example, if extend is 'min', then the color to
which the region between the first pair of boundaries is mapped
will be distinct from the first color in the colormap, and by de-
def the Colorbar will be drawn with the triangle extension on the
left or lower end.

Returns

int16 scalar or array
Notes

*boundaries* defines the edges of bins, and data falling within a bin is mapped to the color with the same index.

If the number of bins, including any extensions, is less than *ncolors*, the color index is chosen by linear interpolation, mapping the \([0, n\text{bins} - 1]\) range onto the \([0, n\text{colors} - 1]\) range.

```python
__module__ = 'matplotlib.colors'
__slotnames__ = []
inverse(self, value)
```

Raises

*ValueError*

BoundaryNorm is not invertible, so calling this method will always raise an error.

**matplotlib.colors.Colormap**

class matplotlib.colors.Colormap(name, N=256)

Bases: object

Baseclass for all scalar to RGBA mappings.

Typically, Colormap instances are used to convert data values (floats) from the interval \([0, 1]\) to the RGBA color that the respective Colormap represents. For scaling of data into the \([0, 1]\) interval see *matplotlib.colors.Normalize*. Subclasses of *matplotlib.cm.ScalarMappable* make heavy use of this data -> normalize -> map-to-color processing chain.
Parameters

name
[str] The name of the colormap.

N
[int] The number of rgb quantization levels.

__call__(self, X, alpha=None, bytes=False)

Parameters

X
[float or int, ndarray or scalar] The data value(s) to convert to RGBA. For floats, X should be in the interval [0.0, 1.0] to return the RGBA values $x \times 100$ percent along the Colormap line. For integers, X should be in the interval [0, Colormap.N) to return RGBA values indexed from the Colormap with index $x$.

alpha
[float, None] Alpha must be a scalar between 0 and 1, or None.

bytes
[bool] If False (default), the returned RGBA values will be floats in the interval [0, 1] otherwise they will be uint8s in the interval [0, 255].

Returns

Tuple of RGBA values if X is scalar, otherwise an array of RGBA values with a shape of X.shape + (4, ).

__copy__(self)

__dict__ = mappingproxy({'__module__': 'matplotlib.colors', '__doc__': '
Baseclass for all scalar to RGBA mappings.

... <attribute '__dict__' of 'Colormap' objects>, '__weakref__': <attribute '__weakref__' of 'Colormap' objects>})
__weakref__
    list of weak references to the object (if defined)

colorbar_extend
    When this colormap exists on a scalar mappable and colorbar_extend is not
    False, colorbar creation will pick up colorbar_extend as the default value for
    the extend keyword in the matplotlib.colorbar.Colorbar constructor.

is_gray(self)

reversed(self, name=None)
    Return a reversed instance of the Colormap.

    **Note:** This function is not implemented for base class.

    **Parameters**

    name
        [str, optional] The name for the reversed colormap. If it's None
        the name will be the name of the parent colormap + "_r".

    **See also:**

    LinearSegmentedColormap.reversed
    ListedColormap.reversed

set_bad(self, color='k', alpha=None)
    Set the color for masked values.

set_over(self, color='k', alpha=None)
    Set the color for high out-of-range values when norm.clip = False.

set_under(self, color='k', alpha=None)
    Set the color for low out-of-range values when norm.clip = False.

Examples using matplotlib.colors.Colormap

- sphx_glr_gallery_lines_bars_and_markers_multicolored_line.py
- sphx_glr_gallery_images_contours_and_fields_contourf_demo.py

- Creating Colormaps in Matplotlib
matplotlib.colors.DivergingNorm

class matplotlib.colors.DivergingNorm(**kwargs)
    Bases: matplotlib.colors.TwoSlopeNorm

    [Deprecated]

Notes

Deprecated since version 3.2:
Normalize data with a set center.
Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

Parameters

vcenter
    [float] The data value that defines 0.5 in the normalization.

vmin
    [float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.

vmax
    [float, optional] The data value that defines 1.0 in the normalization. Defaults to the the max value of the dataset.

Examples

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```python
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000., vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

__init__(self, vcenter, vmin=None, vmax=None)
    Normalize data with a set center.
    Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

Parameters
**vc**

[float] The data value that defines 0.5 in the normalization.

**vmin**

[float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.

**vmax**

[float, optional] The data value that defines 1.0 in the normalization. Defaults to the max value of the dataset.

### Examples

This maps data value -4000 to 0.0, 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```python
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                               vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

```
__module__ = 'matplotlib.colors'
```

### Examples using matplotlib.colors.DivergingNorm

**matplotlib.colors.LightSource**

```python
class matplotlib.colors.LightSource(azdeg=315, altdeg=45, hsv_min_val=0,
                                   hsv_max_val=1, hsv_min_sat=1,
                                   hsv_max_sat=0)
```

Bases: `object`

Create a light source coming from the specified azimuth and elevation. Angles are in degrees, with the azimuth measured clockwise from north and elevation up from the zero plane of the surface.

*shade* is used to produce "shaded" rgb values for a data array. *shade_rgb* can be used to combine an rgb image with an elevation map. *hillshade* produces an illumination map of a surface.

Specify the azimuth (measured clockwise from south) and altitude (measured up from the plane of the surface) of the light source in degrees.

### Parameters
azdeg

[float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

altdeg

[float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

Notes

For backwards compatibility, the parameters hsv_min_val, hsv_max_val, hsv_min_sat, and hsv_max_sat may be supplied at initialization as well. However, these parameters will only be used if "blend_mode='hsv'" is passed into shade or shade_rgb. See the documentation for blend_hsv for more details.

Parameters

azdeg

[float, default: 315 degrees (from the northwest)] The azimuth (0-360, degrees clockwise from North) of the light source.

altdeg

[float, default: 45 degrees] The altitude (0-90, degrees up from horizontal) of the light source.

Notes

For backwards compatibility, the parameters hsv_min_val, hsv_max_val, hsv_min_sat, and hsv_max_sat may be supplied at initialization as well. However, these parameters will only be used if "blend_mode='hsv'" is passed into shade or shade_rgb. See the documentation for blend_hsv for more details.
a specified light source. RGBA values are returned, which can then be used to plot the shaded image with imshow.

The color of the resulting image will be darkened by moving the \((s, v)\) values (in hsv colorspace) toward \((hsv\_min\_sat, hsv\_min\_val)\) in the shaded regions, or lightened by sliding \((s, v)\) toward \((hsv\_max\_sat, hsv\_max\_val)\) in regions that are illuminated. The default extremes are chose so that completely shaded points are nearly black \((s = 1, v = 0)\) and completely illuminated points are nearly white \((s = 0, v = 1)\).

**Parameters**

**rgb**

[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity**

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

**hsv\_max\_sat**

[number, default: 1] The maximum saturation value that the intensity map can shift the output image to.

**hsv\_min\_sat**

[number, optional] The minimum saturation value that the intensity map can shift the output image to. Defaults to 0.

**hsv\_max\_val**

[number, optional] The maximum value ("v" in "hsv") that the intensity map can shift the output image to. Defaults to 1.

**hsv\_min\_val**

[number, optional] The minimum value ("v" in "hsv") that the intensity map can shift the output image to. Defaults to 0.

**Returns**

**ndarray**

An MxNx3 RGB array representing the combined images.

**blend\_overlay**(*)

Combines an rgb image with an intensity map using "overlay" blending.

**Parameters**

**rgb**
[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity**

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

**Returns**

**ndarray**

An MxNx3 RGB array representing the combined images.

```python
blend_soft_light(self, rgb, intensity)
```

Combine an rgb image with an intensity map using "soft light" blending, using the "pegtop" formula.

**Parameters**

rgb

[ndarray] An MxNx3 RGB array of floats ranging from 0 to 1 (color image).

**intensity**

[ndarray] An MxNx1 array of floats ranging from 0 to 1 (grayscale image).

**Returns**

**ndarray**

An MxNx3 RGB array representing the combined images.

**property direction**

The unit vector direction towards the light source.

```python
hillshade(self, elevation, vert_exag=1, dx=1, dy=1, fraction=1.0)
```

Calculate the illumination intensity for a surface using the defined azimuth and elevation for the light source.

This computes the normal vectors for the surface, and then passes them on to `shade_normals`

**Parameters**

**elevation**

[array-like] A 2d array (or equivalent) of the height values used to generate an illumination map
vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topographic effects.

dx

[number, optional] The x-spacing (columns) of the input elevation grid.

dy

[number, optional] The y-spacing (rows) of the input elevation grid.

fraction

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

ndarray

A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

shade

(self, data, cmap, norm=None, blend_mode='overlay', vmin=None, vmax=None, vert_exag=1, dx=1, dy=1, fraction=1, **kwargs)

Combine colormapped data values with an illumination intensity map (a.k.a. "hillshade") of the values.

Parameters

data

[array-like] A 2d array (or equivalent) of the height values used to generate a shaded map.

cmap

[Colormap] The colormap used to color the data array. Note that this must be a Colormap instance. For example, rather than passing in cmap='gist_earth', use cmap=plt.get_cmap('gist_earth') instead.
norm

Normalize instance, optional] The normalization used to scale values before colormapping. If None, the input will be linearly scaled between its min and max.

blend_mode

{{'hsv', 'overlay', 'soft'} or callable, optional} The type of blending used to combine the colormapped data values with the illumination intensity. Default is "overlay". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature func(rgb, illum, **kwargs)) Additional kwargs supplied to this function will be passed on to the blend_mode function.

vmin

[float or None, optional] The minimum value used in colormapping data. If None the minimum value in data is used. If norm is specified, then this argument will be ignored.

vmax

[float or None, optional] The maximum value used in colormapping data. If None the maximum value in data is used. If norm is specified, then this argument will be ignored.

vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

dx

[number, optional] The x-spacing (columns) of the input elevation grid.

dy

[number, optional] The y-spacing (rows) of the input elevation grid.

fraction

[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.
Additional kwargs are passed on to the *blend_mode* function.

Returns

ndarray
An MxNx4 array of floats ranging between 0-1.

shade_normals(self, normals, fraction=1.0)
Calculate the illumination intensity for the normal vectors of a surface using the defined azimuth and elevation for the light source.

Imagine an artificial sun placed at infinity in some azimuth and elevation position illuminating our surface. The parts of the surface that slope toward the sun should brighten while those sides facing away should become darker.

Parameters

fraction
[number, optional] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

Returns

ndarray
A 2d array of illumination values between 0-1, where 0 is completely in shadow and 1 is completely illuminated.

shade_rgb(self, rgb, elevation, fraction=1.0, blend_mode='hsv', vert_exag=1, dx=1, dy=1, **kwargs)
Use this light source to adjust the colors of the rgb input array to give the impression of a shaded relief map with the given elevation.

Parameters

rgb
[array-like] An (M, N, 3) RGB array, assumed to be in the range of 0 to 1.

elevation
[array-like] An (M, N) array of the height values used to generate a shaded map.
fraction

[number] Increases or decreases the contrast of the hillshade. Values greater than one will cause intermediate values to move closer to full illumination or shadow (and clipping any values that move beyond 0 or 1). Note that this is not visually or mathematically the same as vertical exaggeration.

blend_mode

[{'hsv', 'overlay', 'soft'} or callable, optional] The type of blending used to combine the colormapped data values with the illumination intensity. For backwards compatibility, this defaults to "hsv". Note that for most topographic surfaces, "overlay" or "soft" appear more visually realistic. If a user-defined function is supplied, it is expected to combine an MxNx3 RGB array of floats (ranging 0 to 1) with an MxNx1 hillshade array (also 0 to 1). (Call signature `func(rgb, illum, **kwargs)`) Additional kwargs supplied to this function will be passed on to the `blend_mode` function.

vert_exag

[number, optional] The amount to exaggerate the elevation values by when calculating illumination. This can be used either to correct for differences in units between the x-y coordinate system and the elevation coordinate system (e.g. decimal degrees vs. meters) or to exaggerate or de-emphasize topography.

dx

[number, optional] The x-spacing (columns) of the input elevation grid.

dy

[number, optional] The y-spacing (rows) of the input elevation grid.

Additional kwargs are passed on to the *blend_mode* function.

Returns

ndarray

An (m, n, 3) array of floats ranging between 0-1.
Examples using `matplotlib.colors.LightSource`

`matplotlib.colors.LinearSegmentedColormap`

class `matplotlib.colors.LinearSegmentedColormap(name, segmentdata, N=256, gamma=1.0)`

Bases: `matplotlib.colors.Colormap`

Colormap objects based on lookup tables using linear segments.

The lookup table is generated using linear interpolation for each primary color, with the 0-1 domain divided into any number of segments.

Create color map from linear mapping segments

segmentdata argument is a dictionary with a red, green and blue entries. Each entry should be a list of $x$, $y0$, $y1$ tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```python
cdict = {'red': [(0.0, 0.0, 0.0),
                 (0.5, 1.0, 1.0),
                 (1.0, 1.0, 1.0)],

            'green': [(0.0, 0.0, 0.0),
                      (0.25, 0.0, 0.0),
                      (0.75, 1.0, 1.0),
                      (1.0, 1.0, 1.0)],

            'blue': [(0.0, 0.0, 0.0),
                      (0.5, 0.0, 0.0),
                      (1.0, 1.0, 1.0)]}
```

Each row in the table for a given color is a sequence of $x$, $y0$, $y1$ tuples. In each sequence, $x$ must increase monotonically from 0 to 1. For any input value $z$ falling between $x[i]$ and $x[i+1]$, the output value of a given color will be linearly interpolated between $y1[i]$ and $y0[i+1]$. 

18.18. `matplotlib.colors`
Hence y0 in the first row and y1 in the last row are never used.

See also:

`LinearSegmentedColormap.from_list`

Static method; factory function for generating a smoothly-varying LinearSegmentedColormap.

`makeMappingArray`

For information about making a mapping array.

```python
__init__(self, name, segmentdata, N=256, gamma=1.0)
```

Create color map from linear mapping segments

segmentdata argument is a dictionary with a red, green and blue entries. Each entry should be a list of x, y0, y1 tuples, forming rows in a table. Entries for alpha are optional.

Example: suppose you want red to increase from 0 to 1 over the bottom half, green to do the same over the middle half, and blue over the top half. Then you would use:

```python
cdict = {'red': [(0.0, 0.0, 0.0),
                (0.5, 1.0, 1.0),
                (1.0, 1.0, 1.0)],

            'green': [(0.0, 0.0, 0.0),
                      (0.25, 0.0, 0.0),
                      (0.75, 1.0, 1.0),
                      (1.0, 1.0, 1.0)],

            'blue': [(0.0, 0.0, 0.0),
                      (0.5, 0.0, 0.0),
                      (1.0, 1.0, 1.0)]}
```

Each row in the table for a given color is a sequence of x, y0, y1 tuples. In each sequence, x must increase monotonically from 0 to 1. For any input value z falling between x[i] and x[i+1], the output value of a given color will be linearly interpolated between y1[i] and y0[i+1]:

```python
row i: x y0 y1
        / 
        / 
row i+1: x y0 y1
```

Hence y0 in the first row and y1 in the last row are never used.
See also:

`LinearSegmentedColormap.from_list`
Static method; factory function for generating a smoothly-varying LinearSegmentedColormap.

`makeMappingArray`
For information about making a mapping array.

```py
__module__ = 'matplotlib.colors'
static from_list(name, colors, N=256, gamma=1.0)
Create a LinearSegmentedColormap from a list of colors.

Parameters

name
[str] The name of the colormap.

colors
[array-like of colors or array-like of (value, color)] If only colors are given, they are equidistantly mapped from the range [0, 1]; i.e. 0 maps to colors[0] and 1 maps to colors[-1]. If (value, color) pairs are given, the mapping is from value to color. This can be used to divide the range unevenly.

N
[int] The number of rgb quantization levels.

gamma
[float]

reversed(self, name=None)
Return a reversed instance of the Colormap.

Parameters

name
[str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "_r".

Returns

LinearSegmentedColormap
The reversed colormap.

```python
set_gamma(self, gamma)
    Set a new gamma value and regenerate color map.
```

matplotlib.colors.ListedColormap

class matplotlib.colors.ListedColormap(colors, name='from_list', N=None)
Bases: matplotlib.colors.Colormap

Colormap object generated from a list of colors.
This may be most useful when indexing directly into a colormap, but it can also
be used to generate special colormaps for ordinary mapping.

Parameters

colors
[list, array] List of Matplotlib color specifications, or an equivalent Nx3 or Nx4 floating point array (N rgb or rgba values).

**name**

[str, optional] String to identify the colormap.

**N**

[int, optional] Number of entries in the map. The default is *None*, in which case there is one colormap entry for each element in the list of colors. If

\[ N < \text{len}(\text{colors}) \]

the list will be truncated at N. If

\[ N > \text{len}(\text{colors}) \]

the list will be extended by repetition.

**Parameters**

**name**

[ str ] The name of the colormap.

**N**

[int] The number of rgb quantization levels.

`__init__(self, colors, name='from_list', N=None)`

**Parameters**

**name**

[ str ] The name of the colormap.

**N**

[int] The number of rgb quantization levels.

`__module__ = 'matplotlib.colors'

reversed(self, name=None)

Return a reversed instance of the Colormap.

**Parameters**

**name**

[ str, optional] The name for the reversed colormap. If it's None the name will be the name of the parent colormap + "_r".
Returns

ListedColormap

A reversed instance of the colormap.

matplotlib.colors.LogNorm

class matplotlib.colors.LogNorm(vmin=None, vmax=None, clip=False)

Bases: matplotlib.colors.Normalize

Normalize a given value to the 0-1 range on a log scale.

Parameters

vmin, vmax

[Float or None] If vmin and/or vmax is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., __call__(A) calls autoscale_None(A).

clip

[bool, default: False] If True values falling outside the range [vmin, vmax], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.
Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is clip=False.

Notes

Returns 0 if vmin == vmax.

```
__call__(self, value, clip=None)
```

Normalize value data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.

**Parameters**

- **value**
  - Data to normalize.

- **clip**
  - [bool] If None, defaults to self.clip (which defaults to False).

Notes

If not already initialized, self.vmin and self.vmax are initialized using self.autoscale_None(value).

```
__module__ = 'matplotlib.colors'
__slotnames__ = []
```

```
autoscale(self, A)
Set vmin, vmax to min, max of A.
```

```
autoscale_None(self, A)
If vmin or vmax are not set, use the min/max of A to set them.
```

```
inverse(self, value)
```

**Examples using matplotlib.colors.LogNorm**

- sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py
- sphx_glr_gallery_statistics_hist.py
- sphx_glr_gallery_userdemo_colormap_normalizations.py
- Colormap Normalization
matplotlib.colors.NoNorm

class matplotlib.colors.NoNorm(vmin=None, vmax=None, clip=False)
  Bases: matplotlib.colors.Normalize

  Dummy replacement for Normalize, for the case where we want to use indices directly in a ScalarMappable.

  Parameters

  vmin, vmax
  [float or None] If vmin and/or vmax is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., __call__(A) calls autoscale_None(A).

  clip
  [bool, default: False] If True values falling outside the range [vmin, vmax], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

  Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is clip=False.

  Notes

  Returns 0 if vmin == vmax.

  __call__(self, value, clip=None)
  Normalize value data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.

  Parameters

  value
  Data to normalize.

  clip
  [bool] If None, defaults to self.clip (which defaults to False).
Notes

If not already initialized, self.vmin and self.vmax are initialized using self.autoscale_None(value).

```python
__module__ = 'matplotlib.colors'
__slotnames__ = []
inverse(self, value)
```

Examples using matplotlib.colors.NoNorm

```python
matplotlib.colors.Normalize

class matplotlib.colors.Normalize(vmin=\text{None}, vmax=\text{None}, clip=\text{False})

Bases: object

A class which, when called, linearly normalizes data into the $[0.0, 1.0]$ interval.

Parameters

\text{vmin, vmax}

[float or None] If \text{vmin} and/or \text{vmax} is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., \text{__call__}(A) calls autoscale_None(A).

\text{clip}

[bool, default: False] If True values falling outside the range $[\text{vmin}, \text{vmax}]$, are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is clip=False.

Notes

Returns 0 if \text{vmin} == \text{vmax}.

```python
__call__(self, value, clip=\text{None})

Normalize value data in the $[\text{vmin, vmax}]$ interval into the $[0.0, 1.0]$ interval and return it.

Parameters
```
value

Data to normalize.

clip

[bool] If None, defaults to self.clip (which defaults to False).

Notes

If not already initialized, self.vmin and self.vmax are initialized using self.
autoscale_None(value).

__dict__ = mappingproxy({'__module__': 'matplotlib.colors', '__doc__': '
 A class which, when called, linearly ... of 'Normalize' objects>, '__weakref__': <attribute '__weakref__' of 'Normalize' objects>, '__slotnames__': []})

__init__(self, vmin=None, vmax=None, clip=False)

Parameters

vmin, vmax

[float or None] If vmin and/or vmax is not given, they are
initialized from the minimum and maximum value, respec-
_\textit{tively}, of the first input processed; i.e., __call__(A) calls
autoscale_None(A).

clip

[bool, default: False] If True values falling outside the range
[vmin, vmax], are mapped to 0 or 1, whichever is closer, and
masked values are set to 1. If False masked values remain
masked.

Clipping silently defeats the purpose of setting the over, un-
der, and masked colors in a colormap, so it is likely to lead to
surprises; therefore the default is clip=False.

Notes

Returns 0 if vmin == vmax.

__module__ = 'matplotlib.colors'

__slotnames__ = []

__weakref__

list of weak references to the object (if defined)

autoscale(self, A)
Set vmin, vmax to min, max of A.

autoscale_None(self, A)
If vmin or vmax are not set, use the min/max of A to set them.
inverse(self, value)

static process_value(value)

Homogenize the input value for easy and efficient normalization.

value can be a scalar or sequence.

Returns

result

[masked array] Masked array with the same shape as value.

is_scalar

[bool] Whether value is a scalar.

Notes

Float dtypes are preserved; integer types with two bytes or smaller are con-
verted to np.float32, and larger types are converted to np.float64. Preserv-
ing float32 when possible, and using in-place operations, greatly improves
speed for large arrays.

scaled(self)

Return whether vmin and vmax are set.

matplotlib.colors.PowerNorm

class matplotlib.colors.PowerNorm(gamma, vmin=None, vmax=None, clip=False)

Bases: matplotlib.colors.Normalize

Linearly map a given value to the 0-1 range and then apply a power-law normalization over that range.

Parameters

vmin, vmax

[Float or None] If vmin and/or vmax is not given, they are initialized from the minimum and maximum value, respectively, of the first input processed; i.e., __call__(A) calls autoscale_None(A).

clip

[bool, default: False] If True values falling outside the range [vmin, vmax], are mapped to 0 or 1, whichever is closer, and masked values are set to 1. If False masked values remain masked.

Clipping silently defeats the purpose of setting the over, under, and masked colors in a colormap, so it is likely to lead to surprises; therefore the default is clip=False.

Notes

Returns 0 if vmin == vmax.

__call__(self, value, clip=None)

Normalize value data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.

Parameters
value
Data to normalize.

clip
[bool] If None, defaults to self.clip (which defaults to False).

Notes
If not already initialized, self.vmin and self.vmax are initialized using self.
autoscale_None(value).

__init__(self, gamma, vmin=None, vmax=None, clip=False)

Parameters

vmin, vmax
[float or None] If vmin and/or vmax is not given, they are
initialized from the minimum and maximum value, respec-
tively, of the first input processed; i.e., __call__(A) calls
autoscale_None(A).

clip
[bool, default: False] If True values falling outside the range
[vmin, vmax], are mapped to 0 or 1, whichever is closer, and
masked values are set to 1. If False masked values remain
masked.

Clipping silently defeats the purpose of setting the over, un-
der, and masked colors in a colormap, so it is likely to lead to
surprises; therefore the default is clip=False.

Notes
Returns 0 if vmin == vmax.

__module__ = 'matplotlib.colors'
__slotnames__ = []

inverse(self, value)
Examples using `matplotlib.colors.PowerNorm`

- sphx_glr_gallery_showcase_mandelbrot.py
- sphx_glr_gallery_scales_power_norm.py
- sphx_glr_gallery_userdemo_colormap_normalizations.py
- `Colormap Normalization`

`matplotlib.colors.SymLogNorm`

class `matplotlib.colors.SymLogNorm(linthresh, linscale=1.0, vmin=None, vmax=None, clip=False, *, base=None)`

Bases: `matplotlib.colors.Normalize`

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter `linthresh` allows the user to specify the size of this range (`-linthresh`, `linthresh`).

**Parameters**

- **linthresh**
  
  [float] The range within which the plot is linear (to avoid having the plot go to infinity around zero).

- **linscale**
  
  [float, default: 1] This allows the linear range (`-linthresh` to `linthresh`) to be stretched relative to the logarithmic range. Its value is the number of powers of `base` to use for each half of the linear range.

  For example, when `linscale` == 1.0 (the default) and `base=10`, then space used for the positive and negative halves of the linear range will be equal to a decade in the logarithmic.

- **base**
  
  [float, default: None] If not given, defaults to `np.e` (consistent with prior behavior) and warns.

  In v3.3 the default value will change to 10 to be consistent with `SymLogNorm`.

  To suppress the warning pass `base` as a keyword argument.
__call__(self, value, clip=None)

Normalize value data in the [vmin, vmax] interval into the [0.0, 1.0] interval and return it.

Parameters

- **value**: Data to normalize.
- **clip**: [bool] If None, defaults to self.clip (which defaults to False).

Notes

If not already initialized, self.vmin and self.vmax are initialized using self.autoscale_None(value).

__init__(self, linthresh, linscale=1.0, vmin=None, vmax=None, clip=False, *
* , base=None)

Parameters

- **linthresh**: [float] The range within which the plot is linear (to avoid having the plot go to infinity around zero).
- **linscale**: [float, default: 1] This allows the linear range (-linthresh to linthresh) to be stretched relative to the logarithmic range. Its value is the number of powers of base to use for each half of the linear range.

  For example, when linscale == 1.0 (the default) and base=10, then space used for the positive and negative halves of the linear range will be equal to a decade in the logarithmic.

- **base**: [float, default: None] If not given, defaults to np.e (consistent with prior behavior) and warns.

  In v3.3 the default value will change to 10 to be consistent with SymLogNorm.

  To suppress the warning pass base as a keyword argument.
autoscale(self, A)
    Set vmin, vmax to min, max of A.

autoscale_None(self, A)
    If vmin or vmax are not set, use the min/max of A to set them.

inverse(self, value)

Examples using matplotlib.colors.SymLogNorm

- sphx_glr_gallery_userdemo_colormap_normalizations.py
- sphx_glr_gallery_userdemo_colormap_normalizations_symlognorm.py
- Colormap Normalization

matplotlib.colors.TwoSlopeNorm

class matplotlib.colors.TwoSlopeNorm(vcenter, vmin=None, vmax=None)
    Bases: matplotlib.colors.Normalize

    Normalize data with a set center.

    Useful when mapping data with an unequal rates of change around a conceptual
    center, e.g., data that range from -2 to 4, with 0 as the midpoint.

    Parameters

    vcenter
        [float] The data value that defines 0.5 in the normalization.

    vmin
        [float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.

    vmax
        [float, optional] The data value that defines 1.0 in the normalization. Defaults to the the max value of the dataset.

    Examples

    This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:
```python
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                 vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

__call__(self, value, clip=None)
Map value to the interval [0, 1]. The clip argument is unused.

__init__(self, vcenter, vmin=None, vmax=None)
Normalize data with a set center.
Useful when mapping data with an unequal rates of change around a conceptual center, e.g., data that range from -2 to 4, with 0 as the midpoint.

**Parameters**

vcenter

[float] The data value that defines 0.5 in the normalization.

vmin

[float, optional] The data value that defines 0.0 in the normalization. Defaults to the min value of the dataset.

vmax

[float, optional] The data value that defines 1.0 in the normalization. Defaults to the max value of the dataset.

**Examples**

This maps data value -4000 to 0., 0 to 0.5, and +10000 to 1.0; data between is linearly interpolated:

```python
>>> import matplotlib.colors as mcolors
>>> offset = mcolors.TwoSlopeNorm(vmin=-4000.,
                                 vcenter=0., vmax=10000)
>>> data = [-4000., -2000., 0., 2500., 5000., 7500., 10000.]
>>> offset(data)
array([0., 0.25, 0.5, 0.625, 0.75, 0.875, 1.0])
```

__module__ = 'matplotlib.colors'
__slotnames__ = []
autoscale_None(self, A)
Get vmin and vmax, and then clip at vcenter
Examples using `matplotlib.colors.TwoSlopeNorm`

- **Colormap Normalization**

## 18.18.2 Functions

```python
from levels_and_colors(levels, colors[, extend])
```

A helper routine to generate a cmap and a norm instance which behave similar to `contourf`'s levels and colors arguments.

```python
hsv_to_rgb(hsv)
```

Convert hsv values to rgb.

```python
rgb_to_hsv(arr)
```

Convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.

```python
to_hex(c[, keep_alpha])
```

Convert c to a hex color.

```python
to_rgb(c)
```

Convert c to an RGB color, silently dropping the alpha channel.

```python
to_rgba(c[, alpha])
```

Convert c to an RGBA color.

```python
to_rgba_array(c[, alpha])
```

Convert c to a (n, 4) array of RGBA colors.

```python
is_color_like(c)
```

Return whether c can be interpreted as an RGB(A) color.

```python
same_color(c1, c2)
```

Return whether the colors c1 and c2 are the same.

```python
makeMappingArray(N, data[, gamma])
```

[Deprecated] Create an N-element 1-d lookup table.

```python
get_named_colors_mapping()
```

Return the global mapping of names to named colors.

## `matplotlib.colors.from_levels_and_colors`

`matplotlib.colors.from_levels_and_colors(levels, colors, extend='neither')`

A helper routine to generate a cmap and a norm instance which behave similar to `contourf`'s levels and colors arguments.

### Parameters

#### levels

[sequence of numbers] The quantization levels used to construct the `BoundaryNorm`. Value v is quantized to level i if `lev[i] <= v < lev[i+1]`.

#### colors

[sequence of colors] The fill color to use for each level. If `extend` is "neither" there must be `n_level - 1` colors. For an `extend` of
"min" or "max" add one extra color, and for an extend of "both" add two colors.

**extend**

[{'neither', 'min', 'max', 'both'}, optional] The behaviour when a value falls out of range of the given levels. See `contourf` for details.

**Returns**

cmap

[Normalize]

norm

[Colormap]

**Examples using** matplotlib.colors.from_levels_and_colors

matplotlib.colors.hsv_to_rgb

```
matplotlib.colors.hsv_to_rgb(hsv)
```

Convert hsv values to rgb.

**Parameters**

**hsv**

[(..., 3) array-like] All values assumed to be in range [0, 1]

**Returns**

(..., 3) ndarray

Colors converted to RGB values in range [0, 1]

**Examples using** matplotlib.colors.hsv_to_rgb

- sphx_glr_gallery_mplot3d_voxels_torus.py
matplotlib.colors.rgb_to_hsv

matplotlib.colors.rgb_to_hsv(arr)
Convert float rgb values (in the range [0, 1]), in a numpy array to hsv values.

**Parameters**

- **arr**
  
  [(..., 3) array-like] All values must be in the range [0, 1]

**Returns**

- (..., 3) ndarray
  
  Colors converted to hsv values in range [0, 1]

**Examples using** matplotlib.colors.rgb_to_hsv

- sphx_glr_gallery_color_named_colors.py

matplotlib.colors.to_hex

matplotlib.colors.to_hex(c, keep_alpha=False)
Convert c to a hex color.

Uses the #rrggbb format if keep_alpha is False (the default), #rrggbbaa otherwise.

**Examples using** matplotlib.colors.to_hex

matplotlib.colors.to_rgb

matplotlib.colors.to_rgb(c)
Convert c to an RGB color, silently dropping the alpha channel.

**Examples using** matplotlib.colors.to_rgb

- sphx_glr_gallery_color_named_colors.py
matplotlib.colors.to_rgba

matplotlib.colors.to_rgba(c, alpha=None)
Convert c to an RGBA color.

Parameters

c
[Matplotlib color or np.ma.masked]

alpha
[float, optional] If alpha is not None, it forces the alpha value, except if c is "none" (case-insensitive), which always maps to (0, 0, 0, 0).

Returns
tuple
TUPLE OF (R, G, B, A) SCALARS.

Examples using matplotlib.colors.to_rgba

• sphx_glr_gallery_color_named_colors.py
• sphx_glr_gallery_shapes_and_collections_collections.py
• sphx_glr_gallery_shapes_and_collections_line_collection.py
• sphx_glr_gallery_event_handling_lasso_demo.py
• sphx_glr_gallery_misc_demo_ribbon_box.py
• sphx_glr_gallery_widgets_menu.py

matplotlib.colors.to_rgba_array

matplotlib.colors.to_rgba_array(c, alpha=None)
Convert c to a (n, 4) array of RGBA colors.

If alpha is not None, it forces the alpha value. If c is "none" (case-insensitive) or an empty list, an empty array is returned. If c is a masked array, an ndarray is returned with a (0, 0, 0, 0) row for each masked value or row in c.
Examples using matplotlib.colors.to_rgba_array

matplotlib.colors.is_color_like

matplotlib.colors.is_color_like(c)
    Return whether c can be interpreted as an RGB(A) color.

Examples using matplotlib.colors.is_color_like

matplotlib.colors.same_color

matplotlib.colors.same_color(c1, c2)
    Return whether the colors c1 and c2 are the same.
    c1, c2 can be single colors or lists/arrays of colors.

Examples using matplotlib.colors.same_color

matplotlib.colors.makeMappingArray

matplotlib.colors.makeMappingArray(N, data, gamma=1.0)
    [Deprecated] Create an N-element 1-d lookup table.
    This assumes a mapping $f : [0,1] \rightarrow [0,1]$. The returned data is an array of N values $y = f(x)$ where x is sampled from [0, 1].
    By default ($gamma = 1$) x is equidistantly sampled from [0, 1]. The gamma correction factor $\gamma$ distorts this equidistant sampling by $x \rightarrow x^\gamma$.

Parameters

- **N**
  [int] The number of elements of the created lookup table; at least 1.

- **data**
  [Mx3 array-like or callable] Defines the mapping $f$.
  If a Mx3 array-like, the rows define values (x, y0, y1). The x values must start with x=0, end with x=1, and all x values be in increasing order.
  A value between $x_i$ and $x_{i+1}$ is mapped to the range $y_{i-1}^1 \ldots y_i^0$ by linear interpolation.
  For the simple case of a y-continuous mapping, y0 and y1 are identical.
The two values of \( y \) are to allow for discontinuous mapping functions. E.g. a sawtooth with a period of 0.2 and an amplitude of 1 would be:

\[
[(0, 1, 0), (0.2, 1, 0), (0.4, 1, 0), \ldots, (1, 1, 0)]
\]

In the special case of \( N == 1 \), by convention the returned value is \( y0 \) for \( x == 1 \).

If \( data \) is a callable, it must accept and return numpy arrays:

\[
data(x : \text{ndarray}) \rightarrow \text{ndarray}
\]

and map values between 0 - 1 to 0 - 1.

**gamma**

[float] Gamma correction factor for input distribution \( x \) of the mapping.

See also https://en.wikipedia.org/wiki/Gamma_correction.

**Returns**

array

The lookup table where \( \text{lut}[x * (N-1)] \) gives the closest value for values of \( x \) between 0 and 1.

**Notes**

This function is internally used for \textit{LinearSegmentedColormap}.

Deprecated since version 3.2.

**Examples using** matplotlib.colors.makeMappingArray

**matplotlib.colors.get_named_colors_mapping**

**matplotlib.colors.get_named_colors_mapping()**

Return the global mapping of names to named colors.
Examples using matplotlib.colors.get_named_colors_mapping

18.19 matplotlib.container

class matplotlib.container.BarContainer(*args, **kwargs)
    Bases: matplotlib.container.Container

    Container for the artists of bar plots (e.g. created by Axes.bar).
    The container can be treated as a tuple of the patches themselves. Additionally, you can access these and further parameters by the attributes.

    Attributes

    patches
        [list of Rectangle] The artists of the bars.

    errorbar
        [None or ErrorbarContainer] A container for the error bar artists if error bars are present. None otherwise.

class matplotlib.container.Container(*args, **kwargs)
    Bases: tuple

    Base class for containers.

    Containers are classes that collect semantically related Artists such as the bars of a bar plot.

    add_callback(self, func)
        Add a callback function that will be called whenever one of the Artist's properties changes.

        Parameters

        func
            [callable] The callback function. It must have the signature:

            ```python
            def func(artist: Artist) -> Any
            ```

            where artist is the calling Artist. Return values may exist but are ignored.

        Returns

        int
            The observer id associated with the callback. This id can be used for removing the callback with remove_callback later.
See also:

delete_callback

get_children(self)
get_label(self)
Return the label used for this artist in the legend.

data_changed(self)
Call all of the registered callbacks.
This function is triggered internally when a property is changed.

See also:

add_callback
delete_callback

remove(self)
remove_callback(self, oid)
Remove a callback based on its observer id.

See also:

add_callback

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s

[object] s will be converted to a string by calling str.

class matplotlib.container.ErrorbarContainer(*args, **kwargs)
Bases: matplotlib.container.Container

Container for the artists of error bars (e.g. created by Axes.errorbar).

The container can be treated as the lines tuple itself. Additionally, you can access these and further parameters by the attributes.

Attributes

lines

[tuple] Tuple of (data_line, caplines, barlinecols).

- data_line : Line2D instance of x, y plot markers and/or line.
- caplines : tuple of Line2D instances of the error bar caps.
• barlinecols : list of LineCollection with the horizontal and vertical error ranges.

**has_xerr, has_yerr**

[bool] True if the errorbar has x/y errors.

class matplotlib.container.StemContainer(*args, **kwargs)
Bases: matplotlib.container.Container

Container for the artists created in a Axes.stem() plot.

The container can be treated like a namedtuple (markerline, stemlines, baseline).

**Attributes**

**markerline**

[Line2D] The artist of the markers at the stem heads.

**stemlines**

[list of Line2D] The artists of the vertical lines for all stems.

**baseline**

[Line2D] The artist of the horizontal baseline.

**Parameters**

**markerline_stemlines_baseline**

[tuple] Tuple of (markerline, stemlines, baseline). markerline contains the LineCollection of the markers, stemlines is a LineCollection of the main lines, baseline is the Line2D of the baseline.

**18.20 matplotlib.contour**

Classes to support contour plotting and labelling for the Axes class.

class matplotlib.contour.ClabelText(x=0, y=0, text='', color=None, verticalalignment='baseline', horizontalalignment='left', multialignment=None, fontproperties=None, rotation=None, linespacing=None, rotation_mode=None, usetex=None, wrap=False, **kwargs)

Bases: matplotlib.text.Text
Unlike the ordinary text, the get_rotation returns an updated angle in the pixel coordinate assuming that the input rotation is an angle in data coordinate (or whatever transform set).

Create a `Text` instance at x, y with string `text`.

Valid keyword arguments are:

get_rotation(self)
    Return the text angle in degrees between 0 and 360.

class matplotlib.contour.ContourLabeler
    Mixin to provide labelling capability to ContourSet.
    
    add_label(self, x, y, rotation, lev, cvalue)
        Add contour label using Text class.
    
    add_label_clabeltext(self, x, y, rotation, lev, cvalue)
        Add contour label using ClabelText class.
    
    add_label_near(self, x, y, inline=True, inline_spacing=5, transform=None)
        Add a label near the point (x, y). If transform is None (default), (x, y) is in data coordinates; if transform is False, (x, y) is in display coordinates; otherwise, the specified transform will be used to translate (x, y) into display coordinates.

    Parameters

    x, y
        [float] The approximate location of the label.

    inline
        [bool, default: True] If True remove the segment of the contour beneath the label.

    inline_spacing
        [int, default: 5] Space in pixels to leave on each side of label when placing inline. This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.

    calc_label_rot_and_inline(self, slc, ind, lw, lc=None, spacing=5)
        Calculate the appropriate label rotation given the linecontour coordinates in screen units, the index of the label location and the label width.
        If lc is not None or empty, also break contours and compute inlining.
spacing is the empty space to leave around the label, in pixels.

Both tasks are done together to avoid calculating path lengths multiple times, which is relatively costly.

The method used here involves computing the path length along the contour in pixel coordinates and then looking approximately (label width / 2) away from central point to determine rotation and then to break contour if desired.

clabel(self, levels=None, *, fontsize=None, inline=True, inline_spacing=5, fmt='%.3f', colors=None, use_clabeltext=False, manual=False, rightside_up=True, zorder=None)
Label a contour plot.

Adds labels to line contours in this ContourSet (which inherits from this mixin class).

Parameters

levels
[array-like, optional] A list of level values, that should be labeled. The list must be a subset of cs.levels. If not given, all levels are labeled.

fontsize
[str or float, default: rcParams["font.size"] (default: 10.0)] Size in points or relative size e.g., 'smaller', 'x-large'. See Text. set_size for accepted string values.

colors
[color or colors or None, default: None] The label colors:
- If None, the color of each label matches the color of the corresponding contour.
- If one string color, e.g., colors = 'r' or colors = 'red', all labels will be plotted in this color.
- If a tuple of colors (string, float, rgb, etc), different labels will be plotted in different colors in the order specified.

inline
[bool, default: True] If True the underlying contour is removed where the label is placed.

inline_spacing
[float, default: 5] Space in pixels to leave on each side of label when placing inline.

This spacing will be exact for labels at locations where the contour is straight, less so for labels on curved contours.
fmt

[str or dict, default: '%1.3f'] A format string for the label. Alternatively, this can be a dictionary matching contour levels with arbitrary strings to use for each contour level (i.e., fmt[level]=string), or it can be any callable, such as a *Formatter* instance, that returns a string when called with a numeric contour level.

manual

[bool or iterable, default: False] If True, contour labels will be placed manually using mouse clicks. Click the first button near a contour to add a label, click the second button (or potentially both mouse buttons at once) to finish adding labels. The third button can be used to remove the last label added, but only if labels are not inline. Alternatively, the keyboard can be used to select label locations (enter to end label placement, delete or backspace act like the third mouse button, and any other key will select a label location).

manual can also be an iterable object of (x, y) tuples. Contour labels will be created as if mouse is clicked at each (x, y) position.

rightside_up

[bool, default: True] If True, label rotations will always be plus or minus 90 degrees from level.

use_clabeltext

[bool, default: False] If True, *ClabelText* class (instead of *Text*) is used to create labels. *ClabelText* recalculates rotation angles of texts during the drawing time, therefore this can be used if aspect of the axes changes.

zorder

[float or None, default: (2 + contour.get_zorder())] zorder of the contour labels.

Returns

labels

A list of *Text* instances for the labels.

get_label_coords(*self, distances, XX, YY, ysize, lw*)

Return x, y, and the index of a label location.

Labels are plotted at a location with the smallest deviation of the contour from a straight line unless there is another label nearby, in which case the
next best place on the contour is picked up. If all such candidates are
rejected, the beginning of the contour is chosen.

get_label_width(self, lev, fmt, fsize)
    Return the width of the label in points.

get_text(self, lev, fmt)
    Get the text of the label.

labels(self, inline, inline_spacing)

locate_label(self, linecontour, labelwidth)
    Find good place to draw a label (relatively flat part of the contour).

pop_label(self, index=-1)
    Defaults to removing last label, but any index can be supplied

print_label(self, linecontour, labelwidth)
    Return whether a contour is long enough to hold a label.

set_label_props(self, label, text, color)
    Set the label properties - color, fontsize, text.

too_close(self, x, y, lw)
    Return True if a label is already near this location.

class matplotlib.contour.ContourSet(ax, *args, levels=None, filled=False, linewidths=None, linestyles=None, hatches=None, alpha=None, origin=None, extent=None, cmap=None, colors=None, norm=None, vmin=None, vmax=None, extend='neither', antialiased=None, nchunk=0, locator=None, transform=None, **kwargs)

Bases: matplotlib.cm.ScalarMappable, matplotlib.contour.ContourLabeler

Store a set of contour lines or filled regions.

User-callable method: clabel

Parameters

ax
    [Axes]

levels
    [[level0, level1, ..., levelN]] A list of floating point numbers indi-
cating the contour levels.

allsegs
    [[level0segs, level1segs, ...]] List of all the polygon segments for
all the levels. For contour lines len(allsegs) == len(levels), and
for filled contour regions \(\text{len(allsegs)} = \text{len(levels)} - 1\). The lists should look like

```python
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

**allkinds**

\([\text{None} \text{ or } [\text{level0kinds}, \text{level1kinds}, ...]]\) Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply-connected paths such as holes within filled polygons. If not None, \(\text{len(allkinds)} == \text{len(allsegs)}\). The lists should look like

```python
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If \(\text{allkinds}\) is not \(\text{None}\), usually all polygons for a particular contour level are grouped together so that \(\text{level0segs} = [\text{polygon0}]\) and \(\text{level0kinds} = [\text{polygon0kinds}]\).

**kwargs**

Keyword arguments are as described in the docstring of \texttt{contour}.

**Attributes**

\texttt{ax}

The axes object in which the contours are drawn.

\texttt{collections}

A silent list of LineCollections or PolyCollections.

\texttt{levels}

Contour levels.

\texttt{layers}

Same as levels for line contours; half-way between levels for filled contours. See \texttt{_process_colors()}.

**Parameters**

Draw contour lines or filled regions, depending on whether keyword arg \texttt{filled} is False (default) or True.

Call signature:

```python
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```
ax

[Axes] The Axes object to draw on.

levels

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs

[[level0segs, level1segs, ...]] List of all the polygon segments for all the levels. For contour lines len(allsegs) == len(levels), and for filled contour regions len(allsegs) = len(levels)-1. The lists should look like

```python
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

allkinds

[[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply-connected paths such as holes within filled polygons. If not None, len(allkinds) == len(allsegs). The lists should look like

```python
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If allkinds is not None, usually all polygons for a particular contour level are grouped together so that level0segs = [polygon0] and level0kinds = [polygon0kinds].

**kwargs

Keyword arguments are as described in the docstring of contour.

property ax

changed(self)

Call this whenever the mappable is changed to notify all the callback listeners to the 'changed' signal.

find_nearest_contour(self, x, y, indices=None, pixel=True)

Find the point in the contour plot that is closest to \((x, y)\).

**Parameters**

x, y: float

The reference point.

indices
Indices of contour levels to consider. If None (the default), all levels are considered.

**pixel**

If True, measure distance in pixel (screen) space, which is useful for manual contour labeling; else, measure distance in axes space.

**Returns**

**contour**

The contour that is closest to \((x, y)\).

**segment**

The index of the \textit{Path} in \textit{contour} that is closest to \((x, y)\).

**index**

The index of the path segment in \textit{segment} that is closest to \((x, y)\).

**xmin, ymin**

The point in the contour plot that is closest to \((x, y)\).

**d**

The distance from \((xmin, ymin)\) to \((x, y)\).

**get_alpha**

Return alpha to be applied to all ContourSet artists.

**get_transform**

Return the \textit{Transform} instance used by this ContourSet.

**legend_elements**

Return a list of artists and labels suitable for passing through to \textit{legend} which represent this ContourSet.

The labels have the form "0 < x <= 1" stating the data ranges which the artists represent.

**Parameters**

**variable_name**

The string used inside the inequality used on the labels.

**str_format**

Function used to format the numbers in the labels.

**Returns**
**artists**

[List[Artist]] A list of the artists.

**labels**

[List[str]] A list of the labels.

```python
def set_alpha(self, alpha)
    Set the alpha blending value for all ContourSet artists. *alpha* must be between 0 (transparent) and 1 (opaque).
```

```python
class matplotlib.contour.QuadContourSet(ax, *args, levels=None, filled=False, linewidths=None, linestyles=None, hatches=None, alpha=None, origin=None, extent='auto', cmap=None, colors=None, norm=None, vmin=None, vmax=None, antialiased=None, nchunk=0, locator=None, transform=None, **kwargs)

Bases: matplotlib.contour.ContourSet
```

Create and store a set of contour lines or filled regions.

User-callable method: `clabel`

**Attributes**

**ax**

The axes object in which the contours are drawn.

**collections**

A silent list of LineCollections or PolyCollections.

**levels**

Contour levels.

**layers**

Same as levels for line contours; half-way between levels for filled contours. See `_process_colors()` method.

Draw contour lines or filled regions, depending on whether keyword arg `filled` is `False` (default) or `True`.

Call signature:

```python
ContourSet(ax, levels, allsegs, [allkinds], **kwargs)
```

**Parameters**
ax

[Axes] The Axes object to draw on.

levels

[[level0, level1, ..., leveln]] A list of floating point numbers indicating the contour levels.

allsegs

[[level0segs, level1segs, ...]] List of all the polygon segments for all the levels. For contour lines len(allsegs) == len(levels), and for filled contour regions len(allsegs) = len(levels)-1. The lists should look like

```python
level0segs = [polygon0, polygon1, ...]
polygon0 = [[x0, y0], [x1, y1], ...]
```

allkinds

[[level0kinds, level1kinds, ...], optional] Optional list of all the polygon vertex kinds (code types), as described and used in Path. This is used to allow multiply-connected paths such as holes within filled polygons. If not None, len(allkinds) == len(allsegs). The lists should look like

```python
level0kinds = [polygon0kinds, ...]
polygon0kinds = [vertexcode0, vertexcode1, ...]
```

If allkinds is not None, usually all polygons for a particular contour level are grouped together so that level0segs = [polygon0] and level0kinds = [polygon0kinds].

**kwargs

Keyword arguments are as described in the docstring of `contour`. 
18.21 matplotlib.dates

Matplotlib provides sophisticated date plotting capabilities, standing on the shoulders of python `datetime` and the add-on module `dateutil`.

18.21.1 Matplotlib date format

Matplotlib represents dates using floating point numbers specifying the number of days since a default epoch of 1970-01-01 UTC; for example, 1970-01-01, 06:00 is the floating point number 0.25. The formatters and locators require the use of `datetime.datetime` objects, so only dates between year 0001 and 9999 can be represented. Microsecond precision is achievable for (approximately) 70 years on either side of the epoch, and 20 microseconds for the rest of the allowable range of dates (year 0001 to 9999). The epoch can be changed at import time via `dates.set_epoch` or `rcParams["dates.epoch"]` to other dates if necessary; see /gallery/ticks_and_spines/date_precision_and_epochs for a discussion.

Note: Before Matplotlib 3.3, the epoch was 0000-12-31 which lost modern microsecond precision and also made the default axis limit of 0 an invalid datetime. In 3.3 the epoch was changed as above. To convert old ordinal floats to the new epoch, users can do:

```python
new_ordinal = old_ordinal + mdates.date2num(np.datetime64('0000-12-31'))
```

There are a number of helper functions to convert between `datetime` objects and Matplotlib dates:
<table>
<thead>
<tr>
<th>Function</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>datestr2num</td>
<td>Convert a date string to a datenum using dateutil.parser.parse.</td>
</tr>
<tr>
<td>date2num</td>
<td>Convert datetime objects to Matplotlib dates.</td>
</tr>
<tr>
<td>num2date</td>
<td>Convert Matplotlib dates to datetime objects.</td>
</tr>
<tr>
<td>num2timedelta</td>
<td>Convert number of days to a timedelta object.</td>
</tr>
<tr>
<td>drange</td>
<td>Return a sequence of equally spaced Matplotlib dates.</td>
</tr>
<tr>
<td>set_epoch</td>
<td>Set the epoch (origin for dates) for datetime calculations.</td>
</tr>
<tr>
<td>get_epoch</td>
<td>Get the epoch used by dates.</td>
</tr>
</tbody>
</table>

**Note:** Like Python’s `datetime.datetime`, Matplotlib uses the Gregorian calendar for all conversions between dates and floating point numbers. This practice is not universal, and calendar differences can cause confusing differences between what Python and Matplotlib give as the number of days since 0001-01-01 and what other software and databases yield. For example, the US Naval Observatory uses a calendar that switches from Julian to Gregorian in October, 1582. Hence, using their calculator, the number of days between 0001-01-01 and 2006-04-01 is 732403, whereas using the Gregorian calendar via the datetime module we find:

```python
In [1]: date(2006, 4, 1).toordinal() - date(1, 1, 1).toordinal()
Out[1]: 732401
```

All the Matplotlib date converters, tickers and formatters are timezone aware. If no explicit timezone is provided, `rcParams["timezone"]` (default: 'UTC') is assumed. If you want to use a custom time zone, pass a `datetime.tzinfo` instance with the tz keyword argument to `num2date`, `plot_date`, and any custom date tickers or locators you create.

A wide range of specific and general purpose date tick locators and formatters are provided in this module. See `matplotlib.ticker` for general information on tick locators and formatters. These are described below.

The `dateutil` module provides additional code to handle date ticking, making it easy to place ticks on any kinds of dates. See examples below.
18.21.2 Date tickers

Most of the date tickers can locate single or multiple values. For example:

```python
# import constants for the days of the week
from matplotlib.dates import MO, TU, WE, TH, FR, SA, SU

# tick on mondays every week
loc = WeekdayLocator(byweekday=MO, tz=tz)

# tick on mondays and saturdays
loc = WeekdayLocator(byweekday=(MO, SA))
```

In addition, most of the constructors take an interval argument:

```python
# tick on mondays every second week
loc = WeekdayLocator(byweekday=MO, interval=2)
```

The rrule locator allows completely general date ticking:

```python
# tick every 5th easter
rule = rrulewrapper(YEARLY, byeaster=1, interval=5)
loc = RRuleLocator(rule)
```

The available date tickers are:

- **MicrosecondLocator**: Locate microseconds.
- **SecondLocator**: Locate seconds.
- **MinuteLocator**: Locate minutes.
- **HourLocator**: Locate hours.
- **DayLocator**: Locate specified days of the month.
- **WeekdayLocator**: Locate days of the week, e.g., MO, TU.
- **MonthLocator**: Locate months, e.g., 7 for July.
- **YearLocator**: Locate years that are multiples of base.
- **RRuleLocator**: Locate using a `matplotlib.dates.rrulewrapper`. `rrulewrapper` is a simple wrapper around `dateutil's dateutil.rrule` which allow almost arbitrary date tick specifications. See rrule example.

- **AutoDateLocator**: On autoscale, this class picks the best `DateLocator` (e.g., `RRuleLocator`) to set the view limits and the tick locations. If called with `interval_multiples=True` it will make ticks line up with sensible multiples of the tick intervals. E.g. if the interval is 4 hours, it will pick hours 0, 4, 8, etc as ticks. This behaviour is not guaranteed by default.
18.21.3 Date formatters

The available date formatters are:

- **AutoDateFormatter**: attempts to figure out the best format to use. This is most useful when used with the `AutoDateLocator`.

- **ConciseDateFormatter**: also attempts to figure out the best format to use, and to make the format as compact as possible while still having complete date information. This is most useful when used with the `AutoDateLocator`.

- **DateFormatter**: use `strftime` format strings.

- **IndexDateFormatter**: date plots with implicit x indexing.

```python
class matplotlib.dates.AutoDateFormatter(locator, tz=None, defaultfmt='%Y-%m-%d')
Bases: matplotlib.ticker.Formatter

A Formatter which attempts to figure out the best format to use. This is most useful when used with the AutoDateLocator.

The AutoDateFormatter has a scale dictionary that maps the scale of the tick (the distance in days between one major tick) and a format string. The default looks like this:

```python
self.scaled = {
    DAYS_PER_YEAR: rcParams['date.autoformat.year'],
    DAYS_PER_MONTH: rcParams['date.autoformat.month'],
    1.0: rcParams['date.autoformat.day'],
    1. / HOURS_PER_DAY: rcParams['date.autoformat.hour'],
    1. / MINUTES_PER_DAY: rcParams['date.autoformat.minute'],
    1. / SEC_PER_DAY: rcParams['date.autoformat.second'],
    1. / MILLISECONDS_PER_DAY: rcParams['date.autoformat.microsecond'],
}
```

The algorithm picks the key in the dictionary that is >= the current scale and uses that format string. You can customize this dictionary by doing:

```python
>>> locator = AutoDateLocator()
>>> formatter = AutoDateFormatter(locator)
>>> formatter.scaled[1/(24.*60.)] = '%M:%S' # only show min and sec
```

A custom `FuncFormatter` can also be used. The following example shows how to use a custom format function to strip trailing zeros from decimal seconds and adds the date to the first ticklabel:

```python
>>> def my_format_function(x, pos=None):
...     x = matplotlib.dates.num2date(x)
...     if pos == 0:
...         fmt = '%D %H:%M:%S.%f'
...     else:
...         fmt = '%H:%M:%S.%f'
```
Autoformat the date labels. The default format is the one to use if none of the values in `self.scaled` are greater than the unit returned by `locator._get_unit()`.

```python
from matplotlib.ticker import FuncFormatter

formatter = locator.scaled[1/(24.*60.)] = FuncFormatter(my_format_function)
```

### class matplotlib.dates.AutoDateLocator

Bases: `matplotlib.dates.DateLocator`

On autoscale, this class picks the best `DateLocator` to set the view limits and the tick locations.

**Attributes**

#### intervalvald

*dict* Mapping of tick frequencies to multiples allowed for that ticking. The default is

```python
self.intervalvald = {
    YEARLY : [1, 2, 4, 5, 10, 20, 40, 50, 100, 200, 400, 500, 1000, 2000, 4000, 5000, 10000],
    MONTHLY : [1, 2, 3, 4, 6],
    DAILY : [1, 2, 3, 7, 14, 21],
    HOURLY : [1, 2, 3, 4, 6, 12],
    MINUTELY : [1, 5, 10, 15, 30],
    SECONDLY : [1, 5, 10, 15, 30],
    MICROSECONDLY : [1, 2, 5, 10, 20, 50, 100, 200, 500, 1000, 2000, 5000, 10000, 20000, 50000, 100000],
}
```

where the keys are defined in `dateutil.rrule`.

The interval is used to specify multiples that are appropriate for the frequency of ticking. For instance, every 7 days is sensible for daily ticks, but for minutes/seconds, 15 or 30 make sense.

When customizing, you should only modify the values for the existing keys. You should not add or delete entries.

Example for forcing ticks every 3 hours:

```python
locator = AutoDateLocator()
locator.intervalvald[HOURLY] = [3]  # only show every 3 hours
```

**Parameters**
tz

[datetime.tzinfo] Ticks timezone.

minticks

[int] The minimum number of ticks desired; controls whether ticks occur yearly, monthly, etc.

maxticks

[int] The maximum number of ticks desired; controls the interval between ticks (ticking every other, every 3, etc.). For fine-grained control, this can be a dictionary mapping individual rrule frequency constants (YEARLY, MONTHLY, etc.) to their own maximum number of ticks. This can be used to keep the number of ticks appropriate to the format chosen in AutoDateFormatter. Any frequency not specified in this dictionary is given a default value.

interval_multiples

[bool, default: True] Whether ticks should be chosen to be multiple of the interval, locking them to 'nicer' locations. For example, this will force the ticks to be at hours 0, 6, 12, 18 when hourly ticking is done at 6 hour intervals.

autoscale(self)

[Deprecated] Try to choose the view limits intelligently.

Notes

Deprecated since version 3.2.

get_locator(self, dmin, dmax)
Pick the best locator based on a distance.

nonsingular(self, vmin, vmax)
Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

tick_values(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```
class matplotlib.dates.ConciseDateConverter(formats=None, 
    zero_formats=None, 
    offset_formats=None, 
    show_offset=True)

Bases: matplotlib.dates.DateConverter

axisinfo(self, unit, axis)

Return the AxisInfo for unit.

unit is a tzinfo instance or None. The axis argument is required but not used.

class matplotlib.dates.ConciseDateFormatter(locator, tz=None, 
    formats=None, 
    offset_formats=None, 
    zero_formats=None, 
    show_offset=True)

Bases: matplotlib.ticker.Formatter

A Formatter which attempts to figure out the best format to use for the date, and to make it as compact as possible, but still be complete. This is most useful when used with the AutoDateLocator:

```python
>>> locator = AutoDateLocator()
>>> formatter = ConciseDateFormatter(locator)
```

Parameters

**locator**

[ticker.Locator] Locator that this axis is using.

**tz**

[optional] Passed to dates.date2num.

**formats**

[list of 6 strings, optional] Format strings for 6 levels of tick labelling: mostly years, months, days, hours, minutes, and seconds. Strings use the same format codes as strftime. Default is ['%Y', '%b', '%d', '%H:%M', '%H:%M', '%S.%f']

**zero_formats**

[list of 6 strings, optional] Format strings for tick labels that are "zeros" for a given tick level. For instance, if most ticks are months, ticks around 1 Jan 2005 will be labeled "Dec", "2005", "Feb". The default is [' ', '%Y', '%b', '%b-%d', '%H:%M', '%H:%M']

**offset_formats**
[list of 6 strings, optional] Format strings for the 6 levels that is applied to the "offset" string found on the right side of an x-axis, or top of a y-axis. Combined with the tick labels this should completely specify the date. The default is:
\[
[', '
%Y', '
%Y-%b', '
%Y-%b-%d', '
%Y-%b-%d', '
%Y-%b-%d
%H:%M]
\]

**show_offset**

[bool, default: True] Whether to show the offset or not.

**Examples**

See /gallery/ticks_and_spines/date_concise_formatter

Autoformat the date labels. The default format is used to form an initial string, and then redundant elements are removed.

**format_data_short**(self, value)

Return a short string version of the tick value.

Defaults to the position-independent long value.

**format_ticks**(self, values)

Return the tick labels for all the ticks at once.
get_offset(self)

class matplotlib.dates.DateConverter
    Bases: matplotlib.units.ConversionInterface

    Converter for datetime.date and datetime.datetime data, or for date/time data represented as it would be converted by date2num.

    The 'unit' tag for such data is None or a tzinfo instance.

    static axisinfo(unit, axis)
        Return the AxisInfo for unit.

        unit is a tzinfo instance or None. The axis argument is required but not used.

    static convert(value, unit, axis)
        If value is not already a number or sequence of numbers, convert it with date2num.

        The unit and axis arguments are not used.

    static default_units(x, axis)
        Return the tzinfo instance of x or of its first element, or None

class matplotlib.dates.DateFormatter(fmt, tz=None)
    Bases: matplotlib.ticker.Formatter

    Format a tick (in days since the epoch) with a strftime format string.

    Parameters

        fmt
            [str] strftime format string

        tz
            [datetime.tzinfo, default: rcParams['timezone'] (default: 'UTC')]
            Ticks timezone.

    property illegal_s

    set_tzinfo(self, tz)

class matplotlib.dates.DateLocator(tz=None)
    Bases: matplotlib.ticker.Locator

    Determines the tick locations when plotting dates.

    This class is subclassed by other Locators and is not meant to be used on its own.

    Parameters

        tz

            [datetime.tzinfo]
`datalim_to_dt(self)`
Convert axis data interval to datetime objects.

`hms0d = {‘byhour’: 0, ‘byminute’: 0, ‘bysecond’: 0}`

`nonsingular(self, vmin, vmax)`
Given the proposed upper and lower extent, adjust the range if it is too close to being singular (i.e. a range of ~0).

`set_tzinfo(self, tz)`
Set time zone info.

`viewlim_to_dt(self)`
Convert the view interval to datetime objects.

class matplotlib.dates.DayLocator(bymonthday=None, interval=1, tz=None)
Bases: `matplotlib.dates.RRuleLocator`
Make ticks on occurrences of each day of the month. For example, 1, 15, 30.
Mark every day in `bymonthday`; `bymonthday` can be an int or sequence.
Default is to tick every day of the month: `bymonthday=range(1, 32)`.

class matplotlib.dates.HourLocator(byhour=None, interval=1, tz=None)
Bases: `matplotlib.dates.RRuleLocator`
Make ticks on occurrences of each hour.
Mark every hour in `byhour`; `byhour` can be an int or sequence. Default is to tick every hour: `byhour=range(24)`

`interval` is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

class matplotlib.dates.IndexDateFormatter(**kwargs)
Bases: `matplotlib.ticker.Formatter`

[Deprecated] Use with `IndexLocator` to cycle format strings by index.

**Notes**

Deprecated since version 3.3.

**Parameters**

`t`
[list of float] A sequence of dates (floating point days).

`fmt`
[str] A `strftime` format string.
class matplotlib.dates.MicrosecondLocator

Bases: matplotlib.dates.DateLocator

Make ticks on regular intervals of one or more microsecond(s).

**Note:** By default, Matplotlib uses a floating point representation of time in days since the epoch, so plotting data with microsecond time resolution does not work well for dates that are far (about 70 years) from the epoch (check with `get_epoch`).

If you want sub-microsecond resolution time plots, it is strongly recommended to use floating point seconds, not datetime-like time representation.

If you really must use `datetime.datetime()` or similar and still need microsecond precision, change the time origin via `dates.set_epoch` to something closer to the dates being plotted. See /gallery/ticks_and_spines/date_precision_and_epochs.

`interval` is the interval between each iteration. For example, if `interval=2`, mark every second microsecond.

```python
set_axis(self, axis)
set_data_interval(self, vmin, vmax)
set_view_interval(self, vmin, vmax)
tick_values(self, vmin, vmax)
```

Return the values of the located ticks given `vmin` and `vmax`.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated `axis` simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

class matplotlib.dates.MinuteLocator

Bases: matplotlib.dates.RRuleLocator

Make ticks on occurrences of each minute.

Mark every minute in `byminute`; `byminute` can be an int or sequence. Default is to tick every minute: `byminute=range(60)`

`interval` is the interval between each iteration. For example, if `interval=2`, mark every second occurrence.

class matplotlib.dates.MonthLocator

Bases: matplotlib.dates.RRuleLocator

Make ticks on occurrences of each month.

Mark every month in `bymonth`; `bymonth` can be an int or sequence. Default is to tick every month: `bymonth=range(12)`
Make ticks on occurrences of each month, e.g., 1, 3, 12.
Mark every month in \texttt{bymonth}; \texttt{bymonth} can be an int or sequence. Default is range(1, 13), i.e. every month.

\textit{interval} is the interval between each iteration. For example, if \texttt{interval=2}, mark every second occurrence.

class matplotlib.dates.RRuleLocator\( (o, \texttt{tz=\textit{None}}) \)
Bases: matplotlib.dates.DateLocator

\section*{Parameters}

\texttt{tz}

\texttt{[datetime.tzinfo]}

\texttt{autoscale(self)}

\texttt{[\textit{Deprecated}] Set the view limits to include the data range.}

\section*{Notes}

\textit{Deprecated} since version 3.2.

static \texttt{get_unit_generic(freq)}

tick\_values\( (self, \texttt{vmin, vmax}) \)

Return the values of the located ticks given \texttt{vmin} and \texttt{vmax}.

\textbf{Note:} To get tick locations with the \texttt{vmin} and \texttt{vmax} values defined automatically for the associated \texttt{axis} simply call the Locator instance:

\begin{verbatim}
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
\end{verbatim}

class matplotlib.dates.SecondLocator\( (\texttt{bysecond=\textit{None}, interval=1, tz=\textit{None}}) \)
Bases: matplotlib.dates.RRuleLocator

Make ticks on occurrences of each second.
Mark every second in \texttt{bysecond}; \texttt{bysecond} can be an int or sequence. Default is to tick every second: \texttt{bysecond = range(60)}

\textit{interval} is the interval between each iteration. For example, if \texttt{interval=2}, mark every second occurrence.

class matplotlib.dates.WeekdayLocator\( (\texttt{byweekday=1, interval=1, tz=\textit{None}}) \)
Bases: matplotlib.dates.RRuleLocator

Make ticks on occurrences of each weekday.
Mark every weekday in `byweekday`; `byweekday` can be a number or sequence. Elements of `byweekday` must be one of MO, TU, WE, TH, FR, SA, SU, the constants from `dateutil.rrule`, which have been imported into the `matplotlib.dates` namespace.

`interval` specifies the number of weeks to skip. For example, `interval=2` plots every second week.

class `matplotlib.dates.YearLocator(base=1, month=1, day=1, tz=None)`

Bases: `matplotlib.dates.DateLocator`

Make ticks on a given day of each year that is a multiple of base.

Examples:

```python
# Tick every year on Jan 1st
locator = YearLocator()

# Tick every 5 years on July 4th
locator = YearLocator(5, month=7, day=4)
```

Mark years that are multiple of base on a given month and day (default jan 1).

autoscale(self)

[Deprecated] Set the view limits to include the data range.

Notes

Deprecated since version 3.2.

tick_values(self, vmin, vmax)

Return the values of the located ticks given `vmin` and `vmax`.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`matplotlib.dates.date2num(d)`

Convert datetime objects to Matplotlib dates.

Parameters

d

[datetime.datetime or numpy.datetime64 or sequences of these]
Returns

**float or sequence of floats**

Number of days since the epoch. See `get_epoch` for the epoch, which can be changed by `rcParams["date.epoch"]` (default: '1970-01-01T00:00:00') or `set_epoch`. If the epoch is "1970-01-01T00:00:00" (default) then noon Jan 1 1970 ("1970-01-01T12:00:00") returns 0.5.

Notes

The Gregorian calendar is assumed; this is not universal practice. For details see the module docstring.

`matplotlib.dates.datestr2num(d, default=None)`

Convert a date string to a datenum using `dateutil.parser.parse`.

**Parameters**

- `d` [str or sequence of str] The dates to convert.
- `default` [datetime.datetime, optional] The default date to use when fields are missing in `d`.

`matplotlib.dates.drange(dstart, dend, delta)`

Return a sequence of equally spaced Matplotlib dates.

The dates start at `dstart` and reach up to, but not including `dend`. They are spaced by `delta`.

**Parameters**

- `dstart, dend` [datetime] The date limits.
- `delta` [datetime.timedelta] Spacing of the dates.

**Returns**

`numpy.array`

A list floats representing Matplotlib dates.

`matplotlib.dates.epoch2num(e)`

Convert UNIX time to days since Matplotlib epoch.
**Parameters**

e

**Returns**

numpy.array

Time in days since Matplotlib epoch (see `get_epoch()`).

`matplotlib.dates.get_epoch()`  
Get the epoch used by `dates`.

**Returns**

epoch: str

String for the epoch (parsable by `numpy.datetime64`).

`matplotlib.dates.mx2num(mxdates)`  
[Deprecated] Convert mx datetime instance (or sequence of mx instances) to the new date format.

**Notes**

Deprecated since version 3.2.

`matplotlib.dates.num2date(x, tz=None)`  
Convert Matplotlib dates to `datetime` objects.

**Parameters**

x

[float or sequence of floats] Number of days (fraction part represents hours, minutes, seconds) since the epoch. See `get_epoch` for the epoch, which can be changed by `rcParams["date.epoch"]` (default: '1970-01-01T00:00:00') or `set_epoch`.

tz

[str, optional] Timezone of x (defaults to `rcParams["timezone"]` (default: 'UTC')).

**Returns**

datetime or sequence of datetime

Dates are returned in timezone `tz`. 
If x is a sequence, a sequence of datetime objects will be returned.

Notes

The addition of one here is a historical artifact. Also, note that the Gregorian calendar is assumed; this is not universal practice. For details, see the module docstring.

matplotlib.dates.num2epoch(d)
Convert days since Matplotlib epoch to UNIX time.

Parameters

d
[list of floats] Time in days since Matplotlib epoch (see get_epoch()).

Returns

numpy.array
Time in seconds since 1970-01-01.

matplotlib.dates.num2timedelta(x)
Convert number of days to a timedelta object.

If x is a sequence, a sequence of timedelta objects will be returned.

Parameters

x
[float, sequence of floats] Number of days. The fraction part represents hours, minutes, seconds.

Returns

datetime.timedelta or list[datetime.timedelta]

class matplotlib.dates.relativedelta(dt1=None, dt2=None, years=0, months=0, days=0, leapdays=0, weeks=0, hours=0, minutes=0, seconds=0, microseconds=0, year=None, month=None, day=None, weekday=None, yearday=None, nlyearday=None, hour=None, minute=None, second=None, microsecond=None)

Bases: object
The relativedelta type is designed to be applied to an existing datetime and can replace specific components of that datetime, or represents an interval of time.

It is based on the specification of the excellent work done by M.-A. Lemburg in his mx.DateTime extension. However, notice that this type does NOT implement the same algorithm as his work. Do NOT expect it to behave like mx.DateTime's counterpart.

There are two different ways to build a relativedelta instance. The first one is passing it two date/datetime classes:

```python
relativedelta(datetime1, datetime2)
```

The second one is passing it any number of the following keyword arguments:

```python
relativedelta(arg1=x, arg2=y, arg3=z...)
```

- `year, month, day, hour, minute, second, microsecond:`
  - Absolute information (argument is singular); adding or subtracting a relativedelta with absolute information does not perform an arithmetic operation, but rather REPLACES the corresponding value in the original datetime with the value(s) in relativedelta.

- `years, months, weeks, days, hours, minutes, seconds, microseconds:`
  - Relative information, may be negative (argument is plural); adding or subtracting a relativedelta with relative information performs the corresponding arithmetic operation on the original datetime value with the information in the relativedelta.

- `weekday:`
  - One of the weekday instances (MO, TU, etc) available in the relativedelta module. These instances may receive a parameter N, specifying the Nth weekday, which could be positive or negative (like MO(+1) or MO(-2)). Not specifying it is the same as specifying +1. You can also use an integer, where 0=MO. This argument is always relative e.g. if the calculated date is already Monday, using MO(1) or MO(-1) won't change the day. To effectively make it absolute, use it in combination with the day argument (e.g. day=1, MO(1) for first Monday of the month).

- `leapdays:`
  - Will add given days to the date found, if year is a leap year, and the date found is post 28 of February.

- `yearday, nlyearday:`
  - Set the yearday or the non-leap year day (jump leap days).
  - These are converted to day/month/leapdays information.

There are relative and absolute forms of the keyword arguments. The plural is relative, and the singular is absolute. For each argument in the order below, the absolute form is applied first (by setting each attribute to that value) and then the relative form (by adding the value to the attribute).
The order of attributes considered when this relativedelta is added to a datetime is:

1. Year
2. Month
3. Day
4. Hours
5. Minutes
6. Seconds
7. Microseconds

Finally, weekday is applied, using the rule described above.

For example

```python
>>> from datetime import datetime
>>> from dateutil.relativedelta import relativedelta, MO
>>> dt = datetime(2018, 4, 9, 13, 37, 0)
>>> delta = relativedelta(hours=25, day=1, weekday=MO(1))
>>> dt + delta
datetime.datetime(2018, 4, 2, 14, 37)
```

First, the day is set to 1 (the first of the month), then 25 hours are added, to get to the 2nd day and 14th hour, finally the weekday is applied, but since the 2nd is already a Monday there is no effect.

```python
normalized(self)
```

Return a version of this object represented entirely using integer values for the relative attributes.

```python
>>> relativedelta(days=1.5, hours=2).normalized()
relativedelta(days=+1, hours=+14)
```

**Returns**

Returns a `dateutil.relativedelta.relativedelta` object.

```
property weeks
```

class matplotlib.dates.rrule(freq, dtstart=None, interval=1, wkst=None, count=None, until=None, bysetpos=None, bymonth=None, bymonthday=None, byyearday=None, byeaster=None, byweekno=None, byweekday=None, byhour=None, byminute=None, bysecond=None, cache=False)

Bases: dateutil.rrule.rrulebase

That's the base of the rrule operation. It accepts all the keywords defined in the RFC as its constructor parameters (except byday, which was renamed to
byweekday) and more. The constructor prototype is:

```
rrule(freq)
```

Where `freq` must be one of YEARLY, MONTHLY, WEEKLY, DAILY, HOURLY, MINUTELY, or SECONDLY.

**Note:** Per RFC section 3.3.10, recurrence instances falling on invalid dates and times are ignored rather than coerced:

Recurrence rules may generate recurrence instances with an invalid date (e.g., February 30) or nonexistent local time (e.g., 1:30 AM on a day where the local time is moved forward by an hour at 1:00 AM). Such recurrence instances MUST be ignored and MUST NOT be counted as part of the recurrence set.

This can lead to possibly surprising behavior when, for example, the start date occurs at the end of the month:

```python
>>> from dateutil.rrule import rrule, MONTHLY
>>> from datetime import datetime
>>> start_date = datetime(2014, 12, 31)
>>> list(rrule(freq=MONTHLY, count=4, dtstart=start_date))
...   [datetime.datetime(2014, 12, 31, 0, 0),
     datetime.datetime(2015, 1, 31, 0, 0),
     datetime.datetime(2015, 3, 31, 0, 0),
     datetime.datetime(2015, 5, 31, 0, 0)]
```

Additionally, it supports the following keyword arguments:

**Parameters**

- `dtstart` -- The recurrence start. Besides being the base for the recurrence, missing parameters in the final recurrence instances will also be extracted from this date. If not given, `datetime.now()` will be used instead.

- `interval` -- The interval between each `freq` iteration. For example, when using YEARLY, an interval of 2 means once every two years, but with HOURLY, it means once every two hours. The default interval is 1.

- `wkst` -- The week start day. Must be one of the MO, TU, WE constants, or an integer, specifying the first day of the week. This will affect recurrences based on weekly periods. The default week start is got from `calendar.firstweekday()`, and may be modified by `calendar.setfirstweekday()`.

- `count` -- If given, this determines how many occurrences will be generated.
**Note:** As of version 2.5.0, the use of the keyword `until` in conjunction with `count` is deprecated, to make sure `dateutil` is fully compliant with RFC-5545 Sec. 3.3.10. Therefore, `until` and `count` must not occur in the same call to `rrule`.

- **until** -- If given, this must be a datetime instance specifying the upper-bound limit of the recurrence. The last recurrence in the rule is the greatest datetime that is less than or equal to the value specified in the `until` parameter.

**Note:** As of version 2.5.0, the use of the keyword `until` in conjunction with `count` is deprecated, to make sure `dateutil` is fully compliant with RFC-5545 Sec. 3.3.10. Therefore, `until` and `count` must not occur in the same call to `rrule`.

- **bysetpos** -- If given, it must be either an integer, or a sequence of integers, positive or negative. Each given integer will specify an occurrence number, corresponding to the nth occurrence of the rule inside the frequency period. For example, a bysetpos of -1 if combined with a MONTHLY frequency, and a byweekday of (MO, TU, WE, TH, FR), will result in the last work day of every month.

- **bymonth** -- If given, it must be either an integer, or a sequence of integers, meaning the months to apply the recurrence to.

- **bymonthday** -- If given, it must be either an integer, or a sequence of integers, meaning the month days to apply the recurrence to.

- **byyearday** -- If given, it must be either an integer, or a sequence of integers, meaning the year days to apply the recurrence to.

- **byeaster** -- If given, it must be either an integer, or a sequence of integers, positive or negative. Each integer will define an offset from the Easter Sunday. Passing the offset 0 to byeaster will yield the Easter Sunday itself. This is an extension to the RFC specification.

- **byweekno** -- If given, it must be either an integer, or a sequence of integers, meaning the week numbers to apply the recurrence to. Week numbers have the meaning described in ISO8601, that is, the first week of the year is that containing at least four days of the new year.

- **byweekday** -- If given, it must be either an integer (0 == MO), a sequence of integers, one of the weekday constants (MO, TU, etc), or a sequence of these constants. When given, these variables will define the weekdays where the recurrence will be ap-
plied. It's also possible to use an argument n for the weekday instances, which will mean the nth occurrence of this weekday in the period. For example, with MONTHLY, or with YEARLY and BYMONTH, using FR(+1) in byweekday will specify the first friday of the month where the recurrence happens. Notice that in the RFC documentation, this is specified as BYDAY, but was renamed to avoid the ambiguity of that keyword.

- **byhour** -- If given, it must be either an integer, or a sequence of integers, meaning the hours to apply the recurrence to.
- **bymminute** -- If given, it must be either an integer, or a sequence of integers, meaning the minutes to apply the recurrence to.
- **bysecond** -- If given, it must be either an integer, or a sequence of integers, meaning the seconds to apply the recurrence to.
- **cache** -- If given, it must be a boolean value specifying to enable or disable caching of results. If you will use the same rrule instance multiple times, enabling caching will improve the performance considerably.

```
replace(self, **kwargs)
```

Return new rrule with same attributes except for those attributes given new values by whichever keyword arguments are specified.

```
matplotlib.dates.set_epoch(epoch)
```

Set the epoch (origin for dates) for datetime calculations.

The default epoch is `rcParams["dates.epoch"]` (by default 1970-01-01T00:00).

If microsecond accuracy is desired, the date being plotted needs to be within approximately 70 years of the epoch. Matplotlib internally represents dates as days since the epoch, so floating point dynamic range needs to be within a factor of $2^{52}$.

`set_epoch` must be called before any dates are converted (i.e. near the import section) or a RuntimeError will be raised.

See also /gallery/ticks_and_spines/date_precision_and_epochs.

**Parameters**

- **epoch**

  [str] valid UTC date parsable by `numpy.datetime64` (do not include timezone).
18.22 matplotlib.dviread

A module for reading dvi files output by TeX. Several limitations make this not (currently) useful as a general-purpose dvi preprocessor, but it is currently used by the pdf backend for processing usetex text.

Interface:

```python
with Dvi(filename, 72) as dvi:
    # iterate over pages:
    for page in dvi:
        w, h, d = page.width, page.height, page.descent
        for x, y, font, glyph, width in page.text:
            fontname = font.texname
            pointsize = font.size
        ...
        for x, y, height, width in page.boxes:
            ...
```

```python
class matplotlib.dviread.Dvi(filename, dpi)
    Bases: object

    A reader for a dvi ("device-independent") file, as produced by TeX. The current implementation can only iterate through pages in order, and does not even attempt to verify the postamble.

    This class can be used as a context manager to close the underlying file upon exit. Pages can be read via iteration. Here is an overly simple way to extract text without trying to detect whitespace:

```python
>>> with matplotlib.dviread.Dvi('input.dvi', 72) as dvi:
...     for page in dvi:
...         print(''.join(chr(t.glyph) for t in page.text))
```

Read the data from the file named `filename` and convert TeX's internal units to units of `dpi` per inch. `dpi` only sets the units and does not limit the resolution. Use None to return TeX's internal units.

```python
close(self)

    Close the underlying file if it is open.
```

```python
class matplotlib.dviread.DviFont(scale, tfm, texname, vf)
    Bases: object

    Encapsulation of a font that a DVI file can refer to.

    This class holds a font's texname and size, supports comparison, and knows the widths of glyphs in the same units as the AFM file. There are also internal attributes (for use by dviread.py) that are not used for comparison.

    The size is in Adobe points (converted from TeX points).

    Parameters
```
scale
    [float] Factor by which the font is scaled from its natural size.

tfm
    [Tfm] TeX font metrics for this font

texname
    [bytes] Name of the font as used internally by TeX and friends, as an ASCII bytestring. This is usually very different from any external font names, and dviread.PsfontsMap can be used to find the external name of the font.

vf
    [Vf] A TeX "virtual font" file, or None if this font is not virtual.

Attributes

texname
    [bytes]

size
    [float] Size of the font in Adobe points, converted from the slightly smaller TeX points.

widths
    [list] Widths of glyphs in glyph-space units, typically 1/1000ths of the point size.

Parameters

```python
for name in Encoding(filename):
    whatever(name)
```
**filename**

[estr or path-like]

**Notes**

Deprecated since version 3.3.

**Attributes**

**encoding**

[list] List of character names

encoding
class matplotlib.dviread.PsFont(texname, psname, effects, encoding, filename)
Bases: tuple
Create new instance of PsFont(texname, psname, effects, encoding, filename)
effects
   Alias for field number 2
ing
   Alias for field number 3
filename
   Alias for field number 4
psname
   Alias for field number 1
texname
   Alias for field number 0
class matplotlib.dviread.PsfontsMap(filename)
Bases: object
A psfonts.map formatted file, mapping TeX fonts to PS fonts.

**Parameters**

**filename**

[estr or path-like]
Notes

For historical reasons, TeX knows many Type-1 fonts by different names than the outside world. (For one thing, the names have to fit in eight characters.) Also, TeX's native fonts are not Type-1 but Metafont, which is nontrivial to convert to PostScript except as a bitmap. While high-quality conversions to Type-1 format exist and are shipped with modern TeX distributions, we need to know which Type-1 fonts are the counterparts of which native fonts. For these reasons a mapping is needed from internal font names to font file names.

A texmf tree typically includes mapping files called e.g. psfonts.map, pdftex.map, or dvipdfm.map. The file psfonts.map is used by dvips, pdftex.map by pdfTeX, and dvipdfm.map by dvipdfm. psfonts.map might avoid embedding the 35 PostScript fonts (i.e., have no filename for them, as in the Times-Bold example above), while the pdf-related files perhaps only avoid the "Base 14" pdf fonts. But the user may have configured these files differently.

Examples

```python
>>> map = PsFontsMap(find_tex_file('pdftex.map'))
>>> entry = map[b'ptmbo8r']
>>> entry.texname
b'ptmbo8r'
>>> entry.psname
b'Times-Bold'
>>> entry.encoding
'/usr/local/texlive/2008/texmf-dist/fonts/enc/dvips/base/8r.enc'
>>> entry.effects
{'slant': 0.16700000000000001}
>>> entry.filename
```

class matplotlib.dviread.Tfm(filename)
Bases: object

A TeX Font Metric file.

This implementation covers only the bare minimum needed by the Dvi class.

Parameters

filename

[str or path-like]

Attributes

checksum

[int] Used for verifying against the dvi file.
design_size

[int] Design size of the font (unknown units)

width, height, depth

[dict] Dimensions of each character, need to be scaled by the
t factor specified in the dvi file. These are dicts because indexing
may not start from 0.

calculate_checksum
depth
design_size
declare_height
declare_width
class matplotlib.dviread.Vf(filename)
    Bases: matplotlib.dviread.Dvi

A virtual font (*.vf file) containing subroutines for dvi files.

Parameters

filename

[str or path-like]

Notes

The virtual font format is a derivative of dvi: http://mirrors.ctan.org/info/knuth/virtual-fonts This class reuses some of the machinery of Dvi but replaces the
_read loop and dispatch mechanism.

Examples

vf = Vf(filename)
glyph = vf[code]
glyph.text, glyph.boxes, glyph.width

Read the data from the file named filename and convert TeX's internal units to
units of dpi per inch. dpi only sets the units and does not limit the resolution.
Use None to return TeX's internal units.

matplotlib.dviread.find_tex_file(filename, format=None)
    Find a file in the texmf tree.
Calls `kpsewhich` which is an interface to the kpathsea library [1]. Most existing TeX distributions on Unix-like systems use kpathsea. It is also available as part of MikTeX, a popular distribution on Windows.

*If the file is not found, an empty string is returned.*

**Parameters**

- **filename**
  - [str or path-like]

- **format**
  - [str or bytes] Used as the value of the `--format` option to `kpsewhich`. Could be e.g. 'tfm' or 'vf' to limit the search to that type of files.

### 18.23 matplotlib.figure

`matplotlib.figure` implements the following classes:

- **Figure**
  - Top level *Artist*, which holds all plot elements.

- **SubplotParams**
  - Control the default spacing between subplots.

#### 18.23.1 Classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>AxesStack</code></td>
<td>[Deprecated]</td>
</tr>
<tr>
<td><code>Figure</code></td>
<td>The top level container for all the plot elements.</td>
</tr>
<tr>
<td><code>SubplotParams</code></td>
<td>A class to hold the parameters for a subplot.</td>
</tr>
</tbody>
</table>
**matplotlib.figure.AxesStack**

```python
class matplotlib.figure.AxesStack(**kwargs)
   Bases: matplotlib.figure._AxesStack

[Deprecated]
```

**Notes**

Deprecated since version 3.2:

```python
__init__(self)
   Initialize self. See help(type(self)) for accurate signature.
__module__ = 'matplotlib.figure'
```

**Examples using** `matplotlib.figure.AxesStack`

**matplotlib.figure.Figure**

```python
class matplotlib.figure.Figure(figsize=None, dpi=None, facecolor=None,
   edgecolor=None, linewidth=0.0, frameon=None, subplotpars=None,
   tight_layout=None, constrained_layout=None)
   Bases: matplotlib.artist.Artist

The top level container for all the plot elements.

The Figure instance supports callbacks through a **callbacks** attribute which is a **CallbackRegistry** instance. The events you can connect to are 'dpi_changed', and the callback will be called with **func(fig)** where fig is the **Figure** instance.

**Attributes**

`patch`

   The **Rectangle** instance representing the figure background patch.

`suppressComposite`

   For multiple figure images, the figure will make composite images depending on the renderer option **image_nocomposite** function. If **suppressComposite** is a boolean, this will override the renderer.

**Parameters**

`figsize`
Figure dimension (width, height) in inches.

**dpi**

[float, default: $\text{rcParams["figure.dpi"]}$ (default: 100.0)] Dots per inch.

**facecolor**

[default: $\text{rcParams["figure.facecolor"]}$ (default: 'white')] The figure patch facecolor.

**edgcolor**

[default: $\text{rcParams["figure.edgcolor"]}$ (default: 'white')] The figure patch edge color.

**linewidth**

[float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

**frameon**

[bool, default: $\text{rcParams["figure.frameon"]}$ (default: True)] If False, suppress drawing the figure background patch.

**subplotpars**

[SubplotParams] Subplot parameters. If not given, the default subplot parameters $\text{rcParams["figure.subplot.*"]}$ are used.

**tight_layout**

[bool or dict, default: $\text{rcParams["figure.autolayout"]}$ (default: False)] If False use subplotpars. If True adjust subplot parameters using tight_layout with default padding. When providing a dict containing the keys pad, w_pad, h_pad, and rect, the default tight_layout paddings will be overridden.

**constrained_layout**

[bool, default: $\text{rcParams["figure.constrained_layout.use"]}$ (default: False)] If True use constrained layout to adjust positioning of plot elements. Like tight_layout, but designed to be more flexible. See Constrained Layout Guide for examples. (Note: does not work with add_subplot or subplot2grid.)

__getstate__(self)

__init__(self, figsize=None, dpi=None, facecolor=None, edgcolor=None, linewidth=0.0, frameon=None, subplotpars=None, tight_layout=None, constrained_layout=None)

**Parameters**
figsize

[2-tuple of floats, default: rcParams["figure.figsize"] (default: [6.4, 4.8])] Figure dimension (width, height) in inches.

dpi

[float, default: rcParams["figure.dpi"] (default: 100.0)] Dots per inch.

facecolor

[default: rcParams["figure.facecolor"] (default: 'white'')] The figure patch facecolor.

edgecolor

[default: rcParams["figure.edgecolor"] (default: 'white'')] The figure patch edge color.

linewidth

[float] The linewidth of the frame (i.e. the edge linewidth of the figure patch).

frameon

[bool, default: rcParams["figure.frameon"] (default: True)] If False, suppress drawing the figure background patch.

subplotpars

[SubplotParams] Subplot parameters. If not given, the default subplot parameters rcParams["figure.subplot.*"] are used.

tight_layout

[bool or dict, default: rcParams["figure.autolayout"] (default: False)] If False use subplotpars. If True adjust subplot parameters using tight_layout with default padding. When providing a dict containing the keys pad, w_pad, h_pad, and rect, the default tight_layout paddings will be overridden.

constrained_layout

[bool, default: rcParams["figure.constrained_layout.use"] (default: False)] If True use constrained layout to adjust positioning of plot elements. Like tight_layout, but designed to be more flexible. See Constrained Layout Guide for examples. (Note: does not work with add_subplot or subplot2grid.)

__module__ = 'matplotlib.figure'

__repr__(self)
    Return repr(self).

__setstate__(self, state)
__str__(self)
    Return str(self).

add_artist(self, artist, clip=False)
    Add an Artist to the figure.

    Usually artists are added to axes objects using Axes.add_artist; this method
    can be used in the rare cases where one needs to add artists directly to the
    figure instead.

    Parameters

    artist
        [Artist] The artist to add to the figure. If the added artist has
        no transform previously set, its transform will be set to figure.
        transFigure.

    clip
        [bool, default: False] Whether the added artist should be
        clipped by the figure patch.

    Returns

    Artist
        The added artist.

add_axes(self, *args, **kwargs)
    Add an axes to the figure.

    Call signatures:

    add_axes(rect, projection=None, polar=False, **kwargs)
    add_axes(ax)

    Parameters

    rect
        [sequence of float] The dimensions [left, bottom, width, height]
        of the new axes. All quantities are in fractions of figure width
        and height.

    projection
        [{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rect-
        tilinear', str}, optional] The projection type of the Axes. str is
        the name of a custom projection, see projections. The default
        None results in a 'rectilinear' projection.
polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[Axes, optional] Share the x or y axis with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[str] A label for the returned axes.

Returns

Axes, or a subclass of Axes

The returned axes class depends on the projection used. It is Axes if rectilinear projection is used and projections.polar.PolarAxes if polar projection is used.

Other Parameters

**kwargs

This method also takes the keyword arguments for the returned axes class. The keyword arguments for the rectilinear axes class Axes can be found in the following table but there might also be other keyword arguments if another projection is used, see the actual axes class.

**See also:**

- `Figure.add_subplot`
- `pyplot.subplot`
- `pyplot.axes`
- `Figure.subplots`
`pyplot.subplots`

**Notes**

If the figure already has an axes with key (*args, **kwargs*) then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes label attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, `add_axes` may be called with a single argument, a axes instance already created in the present figure but not in the figure's list of axes.

**Examples**

Some simple examples:

```python
rect = l, b, w, h
fig = plt.figure()
fig.add_axes(rect, label=label1)
fig.add_axes(rect, label=label2)
fig.add_axes(rect, frameon=False, facecolor='g')
fig.add_axes(rect, polar=True)
ax = fig.add_axes(rect, projection='polar')
fig.delaxes(ax)
fig.add_axes(ax)
```

`add_axobserver(self, func)`

Whenever the axes state change, `func(self)` will be called.

`add_gridspec(self, nrows=1, ncols=1, **kwargs)`

Return a `GridSpec` that has this figure as a parent. This allows complex layout of axes in the figure.

**Parameters**

- `nrows`
  - [int, default: 1] Number of rows in grid.

- `ncols`
  - [int, default: 1] Number of columns in grid.

**Returns**

`GridSpec`
Other Parameters

**kwargs

Keyword arguments are passed to GridSpec.

See also:

matplotlib.pyplot.subplots

Examples

Adding a subplot that spans two rows:

```python
fig = plt.figure()
gs = fig.add_gridspec(2, 2)
ax1 = fig.add_subplot(gs[0, 0])
ax2 = fig.add_subplot(gs[1, 0])
# spans two rows:
ax3 = fig.add_subplot(gs[:, 1])
```

`add_subplot(self, *args, **kwargs)`

Add an Axes to the figure as part of a subplot arrangement.

Call signatures:

```python
add_subplot(nrows, ncols, index, **kwargs)
add_subplot(pos, **kwargs)
add_subplot(ax)
add_subplot()
```

Parameters

*args

[int, (int, int, index), or SubplotSpec, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (nrows, ncols, index). The subplot will take the index position on a grid with nrows rows and ncols columns. index starts at 1 in the upper left corner and increases to the right. index can also be a two-tuple specifying the (first, last) indices (1-based, and including last) of the subplot, e.g., fig.add_subplot(3, 1, (1, 2)) makes a subplot that spans the upper 2/3 of the figure.
- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. fig.add_subplot(235) is the same as fig.add_subplot(2, 3, 5). Note that this can only be used if there are no more than 9 subplots.
• A `SubplotSpec`

In rare circumstances, `add_subplot` may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure's list of axes.

**projection**

`str` is the name of a custom projection, see `projections`. The default None results in a 'rectilinear' projection.

**polar**

`[bool, default: False]` If True, equivalent to `projection='polar'`.

**sharex, sharey**

`[Axes, optional]` Share the x or y axis with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

**label**

`[str]` A label for the returned axes.

**Returns**

`axes.SubplotBase, or another subclass of Axes`

The axes of the subplot. The returned axes base class depends on the projection used. It is `Axes` if rectilinear projection is used and `projections.polar.PolarAxes` if polar projection is used. The returned axes is then a subplot subclass of the base class.

**Other Parameters**

****kwargs**

This method also takes the keyword arguments for the returned axes base class; except for the `figure` argument. The keyword arguments for the rectilinear base class `Axes` can be found in the following table but there might also be other keyword arguments if another projection is used.

<table>
<thead>
<tr>

**See also:**

*Figure.add_axes*

*pyplot.subplot*

*pyplot.axes*

*Figure.subplots*

*pyplot.subplots*

**Notes**

If the figure already has a subplot with key (*args, **kwargs*) then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of *args and **kwargs*. The axes *label* attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

**Examples**

```python
fig = plt.figure()
fig.add_subplot(231)
ax1 = fig.add_subplot(2, 3, 1)  # equivalent but more general

fig.add_subplot(232, frameon=False)  # subplot with no frame
fig.add_subplot(233, projection='polar')  # polar subplot
fig.add_subplot(234, sharex=ax1)  # subplot sharing x-axis with ax1
fig.add_subplot(235, facecolor='red')  # red subplot

ax1.remove()  # delete ax1 from the figure
fig.add_subplot(ax1)  # add ax1 back to the figure
```

**align_labels(self, axs=None)**

Align the xlabels and ylabels of subplots with the same subplots row or column (respectively) if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.
Parameters

**axs**

[list of `Axes`]
Optional list (or ndarray) of `Axes` to align the labels.
Default is to align all axes on the figure.

See also:

- `matplotlib.figure.Figure.align_xlabels`
- `matplotlib.figure.Figure.align_ylabels`

`align_xlabels` *(self, axs=None)*

Align the xlabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the bottom, it is aligned with labels on axes that also have their label on the bottom and that have the same bottom-most subplot row. If the label is on the top, it is aligned with labels on axes with the same top-most row.

Parameters

**axs**

[list of `Axes`]
Optional list of (or ndarray) `Axes` to align the xlabels. Default is to align all axes on the figure.

See also:

- `matplotlib.figure.Figure.align_ylabels`
- `matplotlib.figure.Figure.align_labels`

Notes

This assumes that `axs` are from the same `GridSpec`, so that their `SubplotSpec` positions correspond to figure positions.
Examples

Example with rotated xtick labels:

```python
fig, axs = plt.subplots(1, 2)
for tick in axs[0].get_xticklabels():
    tick.set_rotation(55)
axs[0].set_xlabel('XLabel 0')
axs[1].set_xlabel('XLabel 1')
fig.align_xlabels()
```

`align_ylabels(self, axs=None)`
Align the ylabels of subplots in the same subplot column if label alignment is being done automatically (i.e. the label position is not manually set).

Alignment persists for draw events after this is called.

If a label is on the left, it is aligned with labels on axes that also have their label on the left and that have the same left-most subplot column. If the label is on the right, it is aligned with labels on axes with the same right-most column.

**Parameters**

- **axs**
  [list of *Axes*] Optional list (or ndarray) of *Axes* to align the ylabels. Default is to align all axes on the figure.

**See also:**

`matplotlib.figure.Figure.align_xlabels`
`matplotlib.figure.Figure.align_labels`

**Notes**

This assumes that axs are from the same *GridSpec*, so that their *SubplotSpec* positions correspond to figure positions.

**Examples**

Example with large yticks labels:

```python
fig, axs = plt.subplots(2, 1)
axs[0].plot(np.arange(0, 1000, 50))
axs[0].set_ylabel('YLabel 0')
axs[1].set_ylabel('YLabel 1')
fig.align_ylabels()
```
autofmt_xdate(self, bottom=0.2, rotation=30, ha='right', which='major')

Date ticklabels often overlap, so it is useful to rotate them and right align them. Also, a common use case is a number of subplots with shared xaxes where the x-axis is date data. The ticklabels are often long, and it helps to rotate them on the bottom subplot and turn them off on other subplots, as well as turn off xlabels.

**Parameters**

**bottom**
- [float, default: 0.2] The bottom of the subplots for `subplots_adjust`.

**rotation**
- [float, default: 30 degrees] The rotation angle of the xtick labels in degrees.

**ha**
- [{‘left’, ‘center’, ‘right’}, default: ‘right’] The horizontal alignment of the xticklabels.

**which**
- [{‘major’, ‘minor’, ‘both’}, default: ‘major’] Selects which ticklabels to rotate.

**property axes**
- List of axes in the Figure. You can access and modify the axes in the Figure through this list.

Do not modify the list itself. Instead, use "add_axes, add_subplot or delaxes to add or remove an axes.

**clear(self, keep_observers=False)**
- Clear the figure -- synonym for `clf`.

**clf(self, keep_observers=False)**
- Clear the figure.

Set keep_observers to True if, for example, a gui widget is tracking the axes in the figure.

**colorbar(self, mappable, cax=None, ax=None, use_gridspec=True, **kw)**
- Create a colorbar for a ScalarMappable instance, `mappable`.

Documentation for the `pyplot` thin wrapper:

Add a colorbar to a plot.

Function signatures for the `pyplot` interface; all but the first are also method signatures for the `colorbar` method:
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)

Parameters

mappable

The `matplotlib.cm.ScalarMappable` (i.e., `AxesImage`, `ContourSet`, etc.) described by this colorbar. This argument is mandatory for the `Figure.colorbar` method but optional for the `pyplot.colorbar` function, which sets the default to the current image.

Note that one can create a `ScalarMappable "on-the-fly"` to generate colorbars not attached to a previously drawn artist, e.g.

```python
fig.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap), ax=ax)
```

cax

[`Axes`, optional] Axes into which the colorbar will be drawn.

ax

[`Axes`, list of `Axes`, optional] Parent axes from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

use_gridspec

[bool, optional] If `cax` is `None`, a new `cax` is created as an instance of `Axes`. If `ax` is an instance of `Subplot` and `use_gridspec` is `True`, `cax` is created as an instance of `Subplot` using the `gridspec` module.

Returns

colorbar

[`Colorbar`] See also its base class, `ColorbarBase`.  

18.23. `matplotlib.figure` 2077
Notes

Additional keyword arguments are of two kinds:

axes properties:

- **fraction**
  - [float, default: 0.15] Fraction of original axes to use for colorbar.

- **shrink**
  - [float, default: 1.0] Fraction by which to multiply the size of the colorbar.

- **aspect**
  - [float, default: 20] Ratio of long to short dimensions.

- **pad**
  - [float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.

- **anchor**
  - [(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

- **panchor**
  - [(float, float), or False, optional] The anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extend</td>
<td>{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap set_under and set_over methods.</td>
</tr>
<tr>
<td>extendfrac</td>
<td>{None, 'auto', length, lengths} If set to None, both the minimum and maximum triangular colorbar extensions with have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when spacing is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when spacing is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the internal colorbar length.</td>
</tr>
<tr>
<td>extendrect</td>
<td>bool If False the minimum and maximum colorbar extensions will be triangular (the default). If True the extensions will be rectangular.</td>
</tr>
<tr>
<td>spacing</td>
<td>{'uniform', 'proportional'} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.</td>
</tr>
<tr>
<td>ticks</td>
<td>None or list of ticks or Locator If None, ticks are determined automatically from the input.</td>
</tr>
<tr>
<td>format</td>
<td>None or str or Formatter If None, ScalarFormatter is used. If a format string is given, e.g., '%.3f', that is used. An alternative Formatter may be given instead.</td>
</tr>
<tr>
<td>drawedges</td>
<td>Whether to draw lines at color boundaries.</td>
</tr>
<tr>
<td>label</td>
<td>str The label on the colorbar's long axis.</td>
</tr>
</tbody>
</table>

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boundaries</td>
<td>None or a sequence</td>
</tr>
<tr>
<td>values</td>
<td>None or a sequence which must be of length 1 less than the sequence of <code>boundaries</code>. For each region delimited by adjacent entries in <code>boundaries</code>, the color mapped to the corresponding value in <code>values</code> will be used.</td>
</tr>
</tbody>
</table>

If `mappable` is a `ContourSet`, its `extend` kwarg is included automatically.

The `shrink` kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if `cax` is specified, it determines the size of the colorbar and `shrink` and `aspect` kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```python
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

`contains(self, mouseevent)`
Test whether the mouse event occurred on the figure.

**Returns**

`bool, {}`

`delaxes(self, ax)`
Remove the Axes `ax` from the figure; update the current axes.

`property dpi`
The resolution in dots per inch.

`draw(self, renderer)`
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).
Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

draw_artist(self, a)
Draw Artist instance a only.
This can only be called after the figure has been drawn.

execute_constrained_layout(self, renderer=None)
Use layoutbox to determine pos positions within axes.
See also set_constrained_layout_pads.

figimage(self, X, xo=0, yo=0, alpha=None, norm=None, cmap=None, 
vmin=None, vmax=None, origin=None, resize=False, **kwargs)
Add a non-resampled image to the figure.
The image is attached to the lower or upper left corner depending on origin.

Parameters

X
The image data. This is an array of one of the following shapes:
• MxN: luminance (grayscale) values
• MxNx3: RGB values
• MxNx4: RGBA values

xo, yo
[int] The x/y image offset in pixels.

alpha
[None or float] The alpha blending value.

norm

[matplotlib.colors.Normalize] A Normalize instance to map the luminance to the interval [0, 1].

cmap
[str or matplotlib.colors.Colormap, default: rcParams["image.cmap"] (default: 'viridis')] The colormap to use.
**vmin, vmax**

[float] If `norm` is not given, these values set the data limits for the colormap.

**origin**

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: 'upper')] Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.

**resize**

[bool] If `True`, resize the figure to match the given image size.

**Returns**

`matplotlib.image.FigureImage`

**Other Parameters**

****kwargs

Additional kwargs are `Artist` kwargs passed on to `FigureImage`.

**Notes**

`figimage` complements the axes image (`imshow`) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an `Axes` with extent [0, 0, 1, 1].

**Examples**

```python
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

**property frameon**

Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to `Figure.patch.get_visible()`.

**gca**(self, **kwargs)**

Get the current axes, creating one if necessary.

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:
<table>

</table>

**get_axes(self)**

Return a list of axes in the Figure. You can access and modify the axes in the Figure through this list.

Do not modify the list itself. Instead, use `add_axes`, `add_subplot` or `delaxes` to add or remove an axes.

Note: This is equivalent to the property `axes`.

**get_children(self)**

Get a list of artists contained in the figure.

**get_constrained_layout(self)**

Return whether constrained layout is being used.

See [Constrained Layout Guide](#).

**get_constrained_layout_pads(self, relative=False)**

Get padding for `constrained_layout`.

Returns a list of `w_pad`, `h_pad` in inches and `wspace` and `hspace` as fractions of the subplot.

See [Constrained Layout Guide](#).

**Parameters**

**relative**

[bool] If True, then convert from inches to figure relative.

**get_default_bbox_extra_artists(self)**

**get_dpi(self)**

Return the resolution in dots per inch as a float.

**get_edgecolor(self)**

Get the edge color of the Figure rectangle.

**get_facecolor(self)**

Get the face color of the Figure rectangle.
get_figheight(self)
Return the figure height in inches.

get_figwidth(self)
Return the figure width in inches.

get_frameon(self)
Return the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to Figure.patch.get_visible().

get_size_inches(self)
Return the current size of the figure in inches.

Returns

darray
The size (width, height) of the figure in inches.

See also:

matplotlib.figure.Figure.set_size_inches
matplotlib.figure.Figure.get_figwidth
matplotlib.figure.Figure.get_fighheight

Notes

The size in pixels can be obtained by multiplying with Figure.dpi.

get_tight_layout(self)
Return whether tight_layout is called when drawing.

get_tightbbox(self, renderer, bbox_extra_artists=None)
Return a (tight) bounding box of the figure in inches.

Artists that have artist.set_in_layout(False) are not included in the bbox.

Parameters

renderer
[RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

bbox_extra_artists
[list of Artist or None] List of artists to include in the tight bounding box. If None (default), then all artist children of each axes are included in the tight bounding box.

Returns
containing the bounding box (in figure inches).

```python
get_window_extent(self, *args, **kwargs)
```

Return the figure bounding box in display space. Arguments are ignored.

```python
ginput(self, n=1, timeout=30, show_clicks=True, mouse_add=<MouseButton.LEFT:1>, mouse_pop=<MouseButton.RIGHT:3>, mouse_stop=<MouseButton.MIDDLE:2>)
```

Blocking call to interact with a figure.

Wait until the user clicks \( n \) times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments `mouse_add`, `mouse_pop` and `mouse_stop`.

**Parameters**

- \( n \)  
  [int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

- \( \text{timeout} \)  
  [float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never timeout.

- \( \text{show_clicks} \)  
  [bool, default: True] If True, show a red cross at the location of each click.

- `mouse_add`  
  [MouseButton or None, default: MouseButton.LEFT] Mouse button used to add points.

- `mouse_pop`  
  [MouseButton or None, default: MouseButton.RIGHT] Mouse button used to remove the most recently added point.

- `mouse_stop`  
  [MouseButton or None, default: MouseButton.MIDDLE] Mouse button used to stop input.
Returns

list of tuples

A list of the clicked (x, y) coordinates.

Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

init_layoutbox(self)

Initialize the layoutbox for use in constrained_layout.

legend(self, *args, **kwargs)

Place a legend on the figure.

To make a legend from existing artists on every axes:

```python
legend()
```

To make a legend for a list of lines and labels:

```python
legend((line1, line2, line3),
       ('label1', 'label2', 'label3'),
       loc='upper right')
```

These can also be specified by keyword:

```python
legend(
       handles=(line1, line2, line3),
       labels=('label1', 'label2', 'label3'),
       loc='upper right')
```

Parameters

handles

[list of Artist, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with labels, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

labels
[list of str, optional] A list of labels to show next to the artists. Use this together with handles, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

**Returns**

*Legend*

**Other Parameters**

**loc**

[str or pair of floats, default: rcParams["legend.loc"] (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case bbox_to_anchor will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:
**bbox_to_anchor**

*[BboxBase, 2-tuple, or 4-tuple of floats]* Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or `BboxBase` is given, then it specifies the bbox \((x, y, width, height)\) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple \((x, y)\) places the corner of the legend specified by `loc` at \(x, y\). For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol**

[int, default: 1] The number of columns that the legend has.

**prop**

[None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

**fontsize**
The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if prop is not specified.

**labelcolor**

[str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints**

[int, default: rcParams["legend.numpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a Line2D (line).

**scatterpoints**

[int, default: rcParams["legend.scatterpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a PathCollection (scatter plot).

**scatteryoffsets**

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale**

[float, default: rcParams["legend.markerscale"] (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.

**markerfirst**

[bool, default: True] If True, legend marker is placed to the left of the legend label. If False, legend marker is placed to the right of the legend label.

**frameon**

[bool, default: rcParams["legend.frameon"] (default: True)] Whether the legend should be drawn on a patch (frame).

**fancybox**

[bool, default: rcParams["legend.fancybox"] (default: True)] Whether round edges should be enabled around the FancyBboxPatch which makes up the legend's background.
shadow
[bool, default: rcParams["legend.shadow"] (default: False)]
Whether to draw a shadow behind the legend.

framealpha
[float, default: rcParams["legend.framealpha"] (default: 0.8)]
The alpha transparency of the legend's background. If shadow is activated and framealpha is None, the default value is ignored.

facecolor
["inherit" or color, default: rcParams["legend.facecolor"] (default: 'inherit')] The legend's background color. If "inherit", use rcParams["axes.facecolor"] (default: 'white').

dbgcolor
["inherit" or color, default: rcParams["legend.edgecolor"] (default: '0.8')] The legend's background patch edge color. If "inherit", use take rcParams["axes.edgecolor"] (default: 'black').

mode
["expand", None] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or bbox_to_anchor if defines the legend's size).

bbox_transform
[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor). For a value of None (default) the Axes' transAxes transform will be used.

title
[str or None] The legend's title. Default is no title (None).

title_fontsize
[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: rcParams["legend.title_fontsize"] (default: None)] The font size of the legend's title.

borderpad
[float, default: rcParams["legend.borderpad"] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspsacing
[float, default: rcParams["legend.labelspsacing"] (default: 0.5)] The vertical space between the legend entries, in font-size units.
**handlelength**

[float, default: `rcParams["legend.handlelength"]` (default: 2.0)]

The length of the legend handles, in font-size units.

**handletextpad**

[float, default: `rcParams["legend.handletextpad"]` (default: 0.8)]

The pad between the legend handle and text, in font-size units.

**borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)]

The pad between the axes and legend border, in font-size units.

**columnspacing**

[float, default: `rcParams["legend.columnspacing"]` (default: 2.0)]

The spacing between columns, in font-size units.

**handler_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

**Notes**

Some artists are not supported by this function. See Legend guide for details.

**savefig(self, fname, *, transparent=None, **kwargs)**

Save the current figure.

Call signature:

```python
savefig(fname, dpi=None, facecolor='w', edgecolor='w', orientation='portrait', papertype=None, format=None, transparent=False, bbox_inches=None, pad_inches=0.1, frameon=None, metadata=None)
```

The available output formats depend on the backend being used.

**Parameters**

**fname**

[str or path-like or file-like] A path, or a Python file-like object, or possibly some backend-dependent object such as `matplotlib.backends.backend_pdf.PdfPages`.

If `format` is set, it determines the output format, and the file is saved as `fname`. Note that `fname` is used verbatim, and there
is no attempt to make the extension, if any, of \texttt{fname} match \texttt{format}, and no extension is appended.

If \texttt{format} is not set, then the format is inferred from the extension of \texttt{fname}, if there is one. If \texttt{format} is not set and \texttt{fname} has no extension, then the file is saved with \texttt{rcParams["savefig.format"]} (default: \texttt{"png"}) and the appropriate extension is appended to \texttt{fname}.

\subsection*{Other Parameters}

\textbf{dpi}

[float or \texttt{"figure"}, default: \texttt{rcParams["savefig.dpi"]} (default: \texttt{"figure"})] The resolution in dots per inch. If \texttt{"figure"}, use the figure's dpi value.

\textbf{quality}

[int, default: \texttt{rcParams["savefig.jpeg_quality"]} (default: 95)] Applicable only if \texttt{format} is \texttt{"jpg"} or \texttt{"jpeg"}, ignored otherwise.

The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality.

This parameter is deprecated.

\textbf{optimize}

[bool, default: False] Applicable only if \texttt{format} is \texttt{"jpg"} or \texttt{"jpeg"}, ignored otherwise.

Whether the encoder should make an extra pass over the image in order to select optimal encoder settings.

This parameter is deprecated.

\textbf{progressive}

[bool, default: False] Applicable only if \texttt{format} is \texttt{"jpg"} or \texttt{"jpeg"}, ignored otherwise.

Whether the image should be stored as a progressive JPEG file.

This parameter is deprecated.

\textbf{facecolor}

[color or \texttt{"auto"}, default: \texttt{rcParams["savefig.facecolor"]} (default: \texttt{"auto"})] The facecolor of the figure. If \texttt{"auto"}, use the current figure facecolor.

\textbf{edgecolor}
The edgecolor of the figure. If 'auto', use the current figure edgecolor.

**orientation**

('landscape', 'portrait') Currently only supported by the postscript backend.

**papertype**

str One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

**format**

str The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under `fname`.

**transparent**

If True, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

**bbox_inches**

str or Bbox Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

**pad_inches**

float Amount of padding around the figure when bbox_inches is 'tight'.

**bbox_extra_artists**

list of Artist A list of extra artists that will be considered when the tight bbox is calculated.

**backend**

str Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See The builtin backends for a list of valid backends for each file format. Custom backends can be referenced as "module://....".

**metadata**
[dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:

- 'png' with Agg backend: See the parameter metadata of print_png.
- 'pdf' with pdf backend: See the parameter metadata of PdfPages.
- 'svg' with svg backend: See the parameter metadata of print_svg.
- 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

pil_kwargs

[dict, optional] Additional keyword arguments that are passed to PIL.Image.Image.save when saving the figure.

sca(self, a)
Set the current axes to be a and return a.

set_canvas(self, canvas)
Set the canvas that contains the figure

Parameters

canvas

[FigureCanvas]

set_constrained_layout(self, constrained)
Set whether constrained_layout is used upon drawing. If None, 
rcParams["figure.constrained_layout.use"] (default: False) value will be 
used.

When providing a dict containing the keys w_pad, h_pad the default 
constrained_layout paddings will be overridden. These pads are in inches 
and default to 3.0/72.0. w_pad is the width padding and h_pad is the height 
padding.

See Constrained Layout Guide.

Parameters

constrained

[bool or dict or None]

set_constrained_layout_pads(self, **kwargs)
Set padding for constrained_layout. Note the kwargs can be passed as a 
dictionary fig.set_constrained_layout(**paddict).

See Constrained Layout Guide.
Parameters

**w_pad**

[float] Width padding in inches. This is the pad around axes and is meant to make sure there is enough room for fonts to look good. Defaults to 3 pts = 0.04167 inches

**h_pad**

[float] Height padding in inches. Defaults to 3 pts.

**wspace**

[float] Width padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being w_pad + wspace.

**hspace**

[float] Height padding between subplots, expressed as a fraction of the subplot width. The total padding ends up being h_pad + hspace.

```python
set_dpi(self, val)
```

Set the resolution of the figure in dots-per-inch.

Parameters

**val**

[float]

```python
set_edgecolor(self, color)
```

Set the edge color of the Figure rectangle.

Parameters

**color**

[color]

```python
set_facecolor(self, color)
```

Set the face color of the Figure rectangle.

Parameters

**color**

[color]

```python
set_figheight(self, val, forward=True)
```

Set the height of the figure in inches.

Parameters
val
[float]
forward
[bool] See set_size_inches.

See also:

matplotlib.figure.Figure.set_figwidth
matplotlib.figure.Figure.set_size_inches

set_figwidth(self, val, forward=True)
Set the width of the figure in inches.

Parameters

val
[float]
forward
[bool] See set_size_inches.

See also:

matplotlib.figure.Figure.set_figheight
matplotlib.figure.Figure.set_size_inches

set_frameon(self, b)
Set the figure's background patch visibility, i.e. whether the figure background will be drawn. Equivalent to Figure.patch.set_visible().

Parameters

b
[bool]

set_size_inches(self, w, h=None, forward=True)
Set the figure size in inches.

Call signatures:

fig.set_size_inches(w, h)  # OR
fig.set_size_inches((w, h))

Parameters
w

[(float, float) or float] Width and height in inches (if height not specified as a separate argument) or width.

h

[float] Height in inches.

forward

[bool, default: True] If True, the canvas size is automatically updated, e.g., you can resize the figure window from the shell.

See also:

matplotlib.figure.Figure.get_size_inches
matplotlib.figure.Figure.set_figwidth
matplotlib.figure.Figure.set_figheight

Notes

To transform from pixels to inches divide by Figure.dpi.

set_tight_layout(self, tight)

Set whether and how tight_layout is called when drawing.

Parameters

tight

[bool or dict with keys "pad", "w_pad", "h_pad", "rect" or None] If a bool, sets whether to call tight_layout upon drawing. If None, use the figure.autolayout rcparam instead. If a dict, pass it as kwargs to tight_layout, overriding the default paddings.

show(self, warn=True)

If using a GUI backend with pyplot, display the figure window.

If the figure was not created using figure, it will lack a FigureManagerBase, and this method will raise an AttributeError.

Warning: This does not manage an GUI event loop. Consequently, the figure may only be shown briefly or not shown at all if you or your environment are not managing an event loop.

Proper use cases for Figure.show include running this from a GUI application or an IPython shell.
If you're running a pure python shell or executing a non-GUI python script, you should use `matplotlib.pyplot.show` instead, which takes care of managing the event loop for you.

**Parameters**

**warn**

`[bool, default: True]` If True and we are not running headless (i.e. on Linux with an unset DISPLAY), issue warning when called on a non-GUI backend.

```python
subplot_mosaic(self, layout, *, subplot_kw=None, gridspec_kw=None, empty_sentinel='.')
```

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

**Note:** This API is provisional and may be revised in the future based on early user feedback.

**Parameters**

**layout**

`[list of list of {hashable or nested} or str]` A visual layout of how you want your Axes to be arranged labeled as strings. For example

```python
x = [['A panel', 'A panel', 'edge'],
     ['C panel', '.', 'edge']]
```

Produces 4 axes:

- 'A panel' which is 1 row high and spans the first two columns
- 'edge' which is 2 rows high and is on the right edge
- 'C panel' which in 1 row and 1 column wide in the bottom left
- a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str; then it must be of the form
where each character is a column and each line is a row. This only allows only single character Axes labels and does not allow nesting but is very terse.

**subplot_kw**

[dict, optional] Dictionary with keywords passed to the `Figure.add_subplot` call used to create each subplot.

**gridspec_kw**

[dict, optional] Dictionary with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**empty_sentinel**

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to `. `. Note, if `layout` is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

Returns

**dict[label, Axes]**

A dictionary mapping the labels to the Axes objects.

```python
subplots(self, nrows=1, ncols=1, *, sharex=False, sharey=False, squeeze=True, subplot_kw=None, gridspec_kw=None)
```

Add a set of subplots to this figure.

This utility wrapper makes it convenient to create common layouts of subplots in a single call.

**Parameters**

**nrows, ncols**

[int, default: 1] Number of rows/columns of the subplot grid.

**sharex, sharey**

[bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (sharex) or y (sharey) axes:

- True or 'all': x- or y-axis will be shared among all subplots.
- False or 'none': each subplot x- or y-axis will be independent.
• 'row': each subplot row will share an x- or y-axis.
• 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use `tick_params`.

**squeeze**

[bool, default: True]

- If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
- If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

**subplot_kw**

[dict, optional] Dict with keywords passed to the `Figure.add_subplot` call used to create each subplot.

**gridspec_kw**

[dict, optional] Dict with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**Returns**

*Axes or array of Axes*

Either a single Axes object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the `squeeze` keyword, see above.

**See also:**

- `pyplot.subplots`
- `Figure.add_subplot`
- `pyplot subplot`
Examples

```python
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create a figure
plt.figure()

# Create a subplot
ax = fig.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
ax1, ax2 = fig.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar axes and access them through the returned array
axes = fig.subplots(2, 2, subplot_kw=dict(polar=True))
axes[0, 0].plot(x, y)
axes[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
fig.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
fig.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
fig.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
fig.subplots(2, 2, sharex=True, sharey=True)
```

subplots_adjust(self, left=None, bottom=None, right=None, top=None, 
wspace=None, hspace=None)

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by
rcParams["figure.subplot.[name]"].

Parameters

left

[float, optional] The position of the left edge of the subplots, as 
a fraction of the figure width.

right

[float, optional] The position of the right edge of the subplots,
as a fraction of the figure width.

**bottom**

[float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

**top**

[float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

**wspace**

[float, optional] The width of the padding between subplots, as a fraction of the average axes width.

**hspace**

[float, optional] The height of the padding between subplots, as a fraction of the average axes height.

```
suptitle(self, t, **kwargs)
```

Add a centered title to the figure.

**Parameters**

- **t**
  - [str] The title text.

- **x**
  - [float, default 0.5] The x location of the text in figure coordinates.

- **y**
  - [float, default 0.98] The y location of the text in figure coordinates.

- **horizontalalignment, ha**
  - [{'center', 'left', 'right'}, default: 'center'] The horizontal alignment of the text relative to (x, y).

- **verticalalignment, va**
  - [{'top', 'center', 'bottom', 'baseline'}, default: 'top'] The vertical alignment of the text relative to (x, y).

- **fontsize, size**
  - [default: rcParams["figure.titlesize"] (default: ‘large’)]] The font size of the text. See Text.set_size for possible values.

- **fontweight, weight**
The font weight of the text. See `Text.set_weight` for possible values.

**Returns**

- **text**
  The `Text` instance of the title.

**Other Parameters**

- **fontproperties**
  [None or dict, optional] A dict of font properties. If `fontproperties` is given the default values for font size and weight are taken from the `FontProperties` defaults. `rcParams["figure.titlesize"]` (default: 'large') and `rcParams["figure.titleweight"]` (default: 'normal') are ignored in this case.

- **kwargs**
  Additional kwargs are `matplotlib.text.Text` properties.

**Examples**

```python
>>> fig.suptitle('This is the figure title', fontsize=12)
```

**text**

- **Parameters**

  - **x, y**
    [float] The position to place the text. By default, this is in figure coordinates, floats in [0, 1]. The coordinate system can be changed using the `transform` keyword.

  - **s**
    [str] The text string.

  - **fontdict**
    [dict, optional] A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as `kwargs` override the corresponding ones given in `fontdict`.

**Returns**
Text

Other Parameters

**kwargs

[Text properties] Other miscellaneous text parameters.

**See also:**

*Axes.text*

*pyplot.text*

```python
tight_layout(self, renderer=<deprecated parameter>, pad=1.08, h_pad=None, w_pad=None, rect=None)
```

Adjust the padding between and around subplots.

To exclude an artist on the axes from the bounding box calculation that determines the subplot parameters (i.e. legend, or annotation), set a `set_in_layout(False)` for that artist.

**Parameters**

**renderer**

[subclass of `RendererBase`, optional] Defaults to the renderer for the figure. Deprecated.

**pad**

[float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h_pad, w_pad**

[float, default: pad] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.

**rect**

[tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.

**See also:**

*Figure.set_tight_layout*

*pyplot.tight_layout*
`waitforbuttonpress(self, timeout=-1)`

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within `timeout` seconds. Negative values deactivate `timeout`.

### `matplotlib.figure.SubplotParams`

```python
class matplotlib.figure.SubplotParams(left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)
```

**Bases:** `object`

A class to hold the parameters for a subplot.

Defaults are given by `rcParams["figure.subplot.[name]"]`.

**Parameters**

- **left**

  [float] The position of the left edge of the subplots, as a fraction of the figure width.
right
[float] The position of the right edge of the subplots, as a fraction of the figure width.

bottom
[float] The position of the bottom edge of the subplots, as a fraction of the figure height.

top
[float] The position of the top edge of the subplots, as a fraction of the figure height.

wspace
[float] The width of the padding between subplots, as a fraction of the average axes width.

hspace
[float] The height of the padding between subplots, as a fraction of the average axes height.

__dict__ = mappingproxy({'__module__': 'matplotlib.figure', '__doc__': '
 A class to hold the parameters for a ... of 'SubplotParams' objects>, '__weakref__': <attribute '__weakref__' of 'SubplotParams' objects>, '__slotnames__': []})

__init__(self, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)

Defaults are given by rcParams["figure.subplot.[name]"].

Parameters

left
[float] The position of the left edge of the subplots, as a fraction of the figure width.

right
[float] The position of the right edge of the subplots, as a fraction of the figure width.

bottom
[float] The position of the bottom edge of the subplots, as a fraction of the figure height.

top
[float] The position of the top edge of the subplots, as a fraction of the figure height.

wspace
[float] The width of the padding between subplots, as a fraction of the average axes width.
hspace
[float] The height of the padding between subplots, as a fraction of the average axes height.

__module__ = 'matplotlib.figure'
__slotnames__ = []
__weakref__
    list of weak references to the object (if defined)
update(self, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)
    Update the dimensions of the passed parameters. None means unchanged.

Examples using matplotlib.figure.SubplotParams

- sphx_glr_gallery_pyplots_auto_subplots_adjust.py

18.23.2 Functions

figaspect

Calculate the width and height for a figure with a specified aspect ratio.

matplotlib.figure.figaspect

matplotlib.figure.figaspect(arg)
    Calculate the width and height for a figure with a specified aspect ratio.
    
    While the height is taken from rcParams['figure.figsize'] (default: [6.4, 4.8]), the width is adjusted to match the desired aspect ratio. Additionally, it is ensured that the width is in the range [4., 16.] and the height is in the range [2., 16.]. If necessary, the default height is adjusted to ensure this.

Parameters

arg
    [float or 2d array] If a float, this defines the aspect ratio (i.e. the ratio height / width). In case of an array the aspect ratio is number of rows / number of columns, so that the array could be fitted in the figure undistorted.

Returns

width, height
The figure size in inches.

Notes

If you want to create an axes within the figure, that still preserves the aspect ratio, be sure to create it with equal width and height. See examples below.

Thanks to Fernando Perez for this function.

Examples

Make a figure twice as tall as it is wide:

```python
w, h = figaspect(2.)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Make a figure with the proper aspect for an array:

```python
A = rand(5, 3)
w, h = figaspect(A)
fig = Figure(figsize=(w, h))
ax = fig.add_axes([0.1, 0.1, 0.8, 0.8])
ax.imshow(A, **kwargs)
```

Examples using matplotlib.figure.figaspect

18.24 matplotlib.font_manager

A module for finding, managing, and using fonts across platforms.

This module provides a single `FontManager` instance that can be shared across back-ends and platforms. The `findfont` function returns the best TrueType (TTF) font file in the local or system font path that matches the specified `FontProperties` instance. The `FontManager` also handles Adobe Font Metrics (AFM) font files for use by the PostScript backend.

The design is based on the W3C Cascading Style Sheet, Level 1 (CSS1) font specification. Future versions may implement the Level 2 or 2.1 specifications.

```python
class matplotlib.font_manager.FontEntry(fname='', name='', style='normal',
                           variant='normal', weight='normal',
                           stretch='normal', size='medium')

Bases: object
```

A class for storing Font properties. It is used when populating the font lookup dictionary.
class matplotlib.font_manager.FontManager(
    size=None, weight='normal')

Bases: object

On import, the FontManager singleton instance creates a list of ttf and afm fonts and caches their FontProperties. The FontManager.findfont method does a nearest neighbor search to find the font that most closely matches the specification. If no good enough match is found, the default font is returned.

addfont(self, path)
    Cache the properties of the font at path to make it available to the FontManager. The type of font is inferred from the path suffix.

Parameters

path
    [str or path-like]

property defaultFont

findfont(self, prop, fontext='ttf', directory=None, fallback_to_default=True, rebuild_if_missing=True)
    Find a font that most closely matches the given font properties.

Parameters

prop
    [str or FontProperties] The font properties to search for. This can be either a FontProperties object or a string defining a font-config patterns.

fontext
    [{‘ttf’, ‘afm’}, default: ‘ttf’] The extension of the font file:
    • ‘ttf’: TrueType and OpenType fonts (.ttf, .ttc, .otf)
    • ‘afm’: Adobe Font Metrics (.afm)

directory
    [str, optional] If given, only search this directory and its subdirectories.

fallback_to_default
    [bool] If True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

rebuild_if_missing
    [bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).
Returns

str

The filename of the best matching font.

Notes

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the W3C Cascading Style Sheet, Level 1 documentation for a description of the font finding algorithm.

static get_default_size()

Return the default font size.

get_default_weight(self)

Return the default font weight.

score_family(self, families, family2)

Return a match score between the list of font families in families and the font family name family2.

An exact match at the head of the list returns 0.0.

A match further down the list will return between 0 and 1.

No match will return 1.0.

score_size(self, size1, size2)

Return a match score between size1 and size2.

If size2 (the size specified in the font file) is 'scalable', this function always returns 0.0, since any font size can be generated.

Otherwise, the result is the absolute distance between size1 and size2, normalized so that the usual range of font sizes (6pt - 72pt) will lie between 0.0 and 1.0.

score_stretch(self, stretch1, stretch2)

Return a match score between stretch1 and stretch2.

The result is the absolute value of the difference between the CSS numeric values of stretch1 and stretch2, normalized between 0.0 and 1.0.

score_style(self, style1, style2)

Return a match score between style1 and style2.

An exact match returns 0.0.
A match between 'italic' and 'oblique' returns 0.1.
No match returns 1.0.

```python
score_variant(self, variant1, variant2)
```
Return a match score between `variant1` and `variant2`.
An exact match returns 0.0, otherwise 1.0.

```python
score_weight(self, weight1, weight2)
```
Return a match score between `weight1` and `weight2`.
The result is 0.0 if both `weight1` and `weight2` are given as strings and have the same value.
Otherwise, the result is the absolute value of the difference between the CSS numeric values of `weight1` and `weight2`, normalized between 0.05 and 1.0.

```python
set_default_weight(self, weight)
```
Set the default font weight. The initial value is 'normal'.

```python
class matplotlib.font_manager.FontProperties(family=None, style=None, variant=None, weight=None, stretch=None, size=None, fname=None)
```
A class for storing and manipulating font properties.

The font properties are those described in the W3C Cascading Style Sheet, Level 1 font specification. The six properties are:

- **family**: A list of font names in decreasing order of priority. The items may include a generic font family name, either ‘serif’, ‘sans-serif’, ‘cursive’, ‘fantasy’, or ‘monospace’. In that case, the actual font to be used will be looked up from the associated rcParam.

- **style**: Either 'normal', 'italic' or 'oblique'.

- **variant**: Either 'normal' or 'small-caps'.

- **stretch**: A numeric value in the range 0-1000 or one of 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded' or 'ultra-expanded'.

- **weight**: A numeric value in the range 0-1000 or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'.

- **size**: Either an relative value of 'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

The default font property for TrueType fonts (as specified in the default rcParams) is
Alternatively, a font may be specified using the absolute path to a font file, by using the `fname` kwarg. However, in this case, it is typically simpler to just pass the path (as a `pathlib.Path`, not a `str`) to the `font` kwarg of the `Text` object.

The preferred usage of font sizes is to use the relative values, e.g., 'large', instead of absolute font sizes, e.g., 12. This approach allows all text sizes to be made larger or smaller based on the font manager’s default font size.

This class will also accept a `fontconfig pattern`, if it is the only argument provided. This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

Note that Matplotlib’s internal font manager and fontconfig use a different algorithm to lookup fonts, so the results of the same pattern may be different in Matplotlib than in other applications that use fontconfig.

`copy(self)`
   Return a copy of self.

`get_family(self)`
   Return a list of font names that comprise the font family.

`get_file(self)`
   Return the filename of the associated font.

`get_fontconfig_pattern(self)`
   Get a `fontconfig pattern` suitable for looking up the font as specified with fontconfig’s `fc-match` utility.
   This support does not depend on fontconfig; we are merely borrowing its pattern syntax for use here.

`get_name(self)`
   Return the name of the font that best matches the font properties.

`get_size(self)`
   Return the font size.

`get_size_in_points(self)`

`get_slant(self)`
   Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_stretch(self)`
   Return the font stretch or width. Options are: 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'.

`get_style(self)`
   Return the font style. Values are: 'normal', 'italic' or 'oblique'.

`get_variant(self)`
   Return the font variant. Values are: 'normal' or 'small-caps'.

sans-serif, normal, normal, normal, normal, scalable.
```python
def get_weight(self)
    Set the font weight. Options are: A numeric value in the range 0-1000 or
    one of 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold',
    'demi', 'bold', 'heavy', 'extra bold', 'black'

set_family(self, family)
    Change the font family. May be either an alias (generic name is CSS par-
    lance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real
    font name or a list of real font names. Real font names are not supported
    when rcParams['text.usetex'] (default: False) is True.

set_file(self, file)
    Set the filename of the fontfile to use. In this case, all other properties will
    be ignored.

set_fontconfig_pattern(self, pattern)
    Set the properties by parsing a fontconfig pattern.
    This support does not depend on fontconfig; we are merely borrowing its
    pattern syntax for use here.

set_name(self, family)
    Change the font family. May be either an alias (generic name is CSS par-
    lance), such as: 'serif', 'sans-serif', 'cursive', 'fantasy', or 'monospace', a real
    font name or a list of real font names. Real font names are not supported
    when rcParams['text.usetex'] (default: False) is True.

set_size(self, size)
    Set the font size. Either an relative value of 'xx-small', 'x-small', 'small',
    'medium', 'large', 'x-large', 'xx-large' or an absolute font size, e.g., 12.

set_slant(self, style)
    Set the font style. Values are: 'normal', 'italic' or 'oblique'.

set_stretch(self, stretch)
    Set the font stretch or width. Options are: 'ultra-condensed', 'extra-
    condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'ex-
    panded', 'extra-expanded' or 'ultra-expanded', or a numeric value in the
    range 0-1000.

set_style(self, style)
    Set the font style. Values are: 'normal', 'italic' or 'oblique'.

set_variant(self, variant)
    Set the font variant. Values are: 'normal' or 'small-caps'.

set_weight(self, weight)
    Set the font weight. May be either a numeric value in the range 0-1000
    or one of 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman',
    'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'
```

```python
class matplotlib.font_manager.JSONEncoder(**kwargs)
    Bases: matplotlib.font_manager._JSONEncoder
```

18.24. `matplotlib.font_manager` 2115
[Deprecated]

**Notes**

Deprecated since version 3.2:

Constructor for JSONEncoder, with sensible defaults.

If skipkeys is false, then it is a TypeError to attempt encoding of keys that are not str, int, float or None. If skipkeys is True, such items are simply skipped.

If ensure_ascii is true, the output is guaranteed to be str objects with all incoming non-ASCII characters escaped. If ensure_ascii is false, the output can contain non-ASCII characters.

If check_circular is true, then lists, dicts, and custom encoded objects will be checked for circular references during encoding to prevent an infinite recursion (which would cause an OverflowError). Otherwise, no such check takes place.

If allow_nan is true, then NaN, Infinity, and -Infinity will be encoded as such. This behavior is not JSON specification compliant, but is consistent with most JavaScript based encoders and decoders. Otherwise, it will be a ValueError to encode such floats.

If sort_keys is true, then the output of dictionaries will be sorted by key; this is useful for regression tests to ensure that JSON serializations can be compared on a day-to-day basis.

If indent is a non-negative integer, then JSON array elements and object members will be pretty-printed with that indent level. An indent level of 0 will only insert newlines. None is the most compact representation.

If specified, separators should be an (item_separator, key_separator) tuple. The default is (',', ': ') if indent is `None` and (',', ': ') otherwise. To get the most compact JSON representation, you should specify (',', ': ') to eliminate whitespace.

If specified, default is a function that gets called for objects that can't otherwise be serialized. It should return a JSON encodable version of the object or raise a TypeError.

```python
matplotlib.font_manager.afmFontProperty(fontpath, font)
```

Extract information from an AFM font file.

**Parameters**

- **font**

  [AFM] The AFM font file from which information will be extracted.

**Returns**

- **FontEntry**
The extracted font properties.

```
matplotlib.font_manager.createFontList(fontfiles, fontext='ttf')
[Deprecated] Create a font lookup list. The default is to create a list of TrueType fonts. An AFM font list can optionally be created.
```

**Notes**

Deprecated since version 3.2.

```
matplotlib.font_manager.findSystemFonts(fontpaths=None, fontext='ttf')
Search for fonts in the specified font paths. If no paths are given, will use a standard set of system paths, as well as the list of fonts tracked by fontconfig if fontconfig is installed and available. A list of TrueType fonts are returned by default with AFM fonts as an option.
```

```
matplotlib.font_manager.findfont(prop, fontext='ttf', directory=None, fallback_to_default=True, rebuild_if_missing=True)
Find a font that most closely matches the given font properties.
```

**Parameters**

- **prop**
  - [str or FontProperties] The font properties to search for. This can be either a FontProperties object or a string defining a fontconfig pattern.

- **fontext**
  - [{'ttf', 'afm'}, default: 'ttf'] The extension of the font file:
    - 'ttf': TrueType and OpenType fonts (.ttf, .ttc, .otf)
    - 'afm': Adobe Font Metrics (.afm)

- **directory**
  - [str, optional] If given, only search this directory and its subdirectories.

- **fallback_to_default**
  - [bool] If True, will fallback to the default font family (usually "DejaVu Sans" or "Helvetica") if the first lookup hard-fails.

- **rebuild_if_missing**
  - [bool] Whether to rebuild the font cache and search again if the first match appears to point to a nonexisting font (i.e., the font cache contains outdated entries).

**Returns**

18.24. matplotlib.font_manager
**str**

The filename of the best matching font.

**Notes**

This performs a nearest neighbor search. Each font is given a similarity score to the target font properties. The first font with the highest score is returned. If no matches below a certain threshold are found, the default font (usually DejaVu Sans) is returned.

The result is cached, so subsequent lookups don't have to perform the O(n) nearest neighbor search.

See the W3C Cascading Style Sheet, Level 1 documentation for a description of the font finding algorithm.

```python
matplotlib.font_manager.get_font(filename, hinting_factor=None)
```

List font filenames known to `fc-list` having the given extension.

```python
matplotlib.font_manager.get_fontconfig_fonts(fontext='ttf')
```

Return a list of file extensions extensions that are synonyms for the given file extension `fileext`.

```python
matplotlib.font_manager.is_opentype_cff_font(filename)
```

Return whether the given font is a Postscript Compact Font Format Font embedded in an OpenType wrapper. Used by the PostScript and PDF backends that can not subset these fonts.

```python
matplotlib.font_manager.json_dump(data, filename)
```

Dump `FontManager data` as JSON to the file named `filename`.

**See also:**

`json_load`

**Notes**

File paths that are children of the Matplotlib data path (typically, fonts shipped with Matplotlib) are stored relative to that data path (to remain valid across virtualenvs).

This function temporarily locks the output file to prevent multiple processes from overwriting one another's output.

```python
matplotlib.font_manager.json_load(filename)
```

Load a `FontManager` from the JSON file named `filename`.

**See also:**
matplotlib.font_manager.list_fonts(directory, extensions)
Return a list of all fonts matching any of the extensions, found recursively under the directory.

matplotlib.font_manager.ttfFontProperty(font)
Extract information from a TrueType font file.

Parameters

font
[FT2Font] The TrueType font file from which information will be extracted.

Returns

FontEntry
The extracted font properties.

matplotlib.font_manager.win32FontDirectory()
Return the user-specified font directory for Win32. This is looked up from the registry key

```
\HKEY_CURRENT_USER\Software\Microsoft\Windows\CurrentVersion\Explorer\Shell\...
   Folders\Fonts
```
If the key is not found, %WINDIR%\Fonts will be returned.

matplotlib.font_manager.win32InstalledFonts(directory=None, fontext='ttf')
Search for fonts in the specified font directory, or use the system directories if none given. Additionally, it is searched for user fonts installed. A list of TrueType font filenames are returned by default, or AFM fonts if fontext == 'afm'.

18.25 matplotlib.fontconfig_pattern

A module for parsing and generating fontconfig patterns.

class matplotlib.fontconfig_pattern.FontconfigPatternParser
Bases: object
A simple pyparsing-based parser for fontconfig patterns.

def parse(self, pattern)
    Parse the given fontconfig pattern and return a dictionary of key/value pairs useful for initializing a font_manager.FontProperties object.
matplotlib.fontconfig_pattern.family_escape(repl, string, count=0)
    Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.family_unescape(repl, string, count=0)
    Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.generate_fontconfig_pattern(d)
    Given a dictionary of key/value pairs, generates a fontconfig pattern string.

matplotlib.fontconfig_pattern.parse_fontconfig_pattern(pattern)
    Parse the given fontconfig pattern and return a dictionary of key/value pairs useful for initializing a font_manager.FontProperties object.

matplotlib.fontconfig_pattern.value_escape(repl, string, count=0)
    Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

matplotlib.fontconfig_pattern.value_unescape(repl, string, count=0)
    Return the string obtained by replacing the leftmost non-overlapping occurrences of pattern in string by the replacement repl.

18.26 matplotlib.gridspec

gridspec contains classes that help to layout multiple Axes in a grid-like pattern within a figure.

The GridSpec specifies the overall grid structure. Individual cells within the grid are referenced by SubplotSpecs.

See the tutorial Customizing Figure Layouts Using GridSpec and Other Functions for a comprehensive usage guide.

18.26.1 Classes

<table>
<thead>
<tr>
<th>Class</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GridSpec(nrows, ncols[, figure, left, ...])</td>
<td>A grid layout to place subplots within a figure.</td>
</tr>
<tr>
<td>SubplotSpec(gridspec, num1[, num2])</td>
<td>Specifies the location of a subplot in a GridSpec.</td>
</tr>
<tr>
<td>GridSpecBase(nrows, height_ratios, ...)]</td>
<td>ncols[, A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.</td>
</tr>
<tr>
<td>GridSpecFromSubplotSpec(nrows, ncols, ...[, ...])</td>
<td>GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.</td>
</tr>
</tbody>
</table>
matplotlib.gridspec.GridSpec

class matplotlib.gridspec.GridSpec(nrows, ncols, figure=None, left=None, bottom=None, right=None, top=None, wspace=None, hspace=None, width_ratios=None, height_ratios=None)

Bases: matplotlib.gridspec.GridSpecBase

A grid layout to place subplots within a figure.

The location of the grid cells is determined in a similar way to SubplotParams using left, right, top, bottom, wspace and hspace.

Parameters

nrows, ncols

[int] The number of rows and columns of the grid.

figure

[Figure, optional] Only used for constrained layout to create a proper layoutbox.

left, right, top, bottom

[float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or rcParams at draw time. See also GridSpec.get_subplot_params.

wspace

[float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or rcParams when necessary. See also GridSpec.get_subplot_params.

hspace

[float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or rcParams when necessary. See also GridSpec.get_subplot_params.

width_ratios

[array-like of length ncols, optional] Defines the relative widths of the columns. Each column gets a relative width of width_ratios[i] / sum(width_ratios). If not given, all columns will have the same width.
height_ratios

[array-like of length nrows, optional] Defines the relative heights of the rows. Each column gets a relative height of height_ratios[i] / sum(height_ratios). If not given, all rows will have the same height.

```
__getstate__ (self)
```

```
__init__ (self, nrows, ncols, figure=None, left=None, right=None, top=None, bottom=None, width_ratios=None, height_ratios=None)
```

**Parameters**

nrows, ncols

[int] The number of rows and columns of the grid.

figure

[Figure, optional] Only used for constrained layout to create a proper layoutbox.

left, right, top, bottom

[float, optional] Extent of the subplots as a fraction of figure width or height. Left cannot be larger than right, and bottom cannot be larger than top. If not given, the values will be inferred from a figure or rcParams at draw time. See also GridSpec.get_subplot_params.

wspace

[float, optional] The amount of width reserved for space between subplots, expressed as a fraction of the average axis width. If not given, the values will be inferred from a figure or rcParams when necessary. See also GridSpec.get_subplot_params.

hspace

[float, optional] The amount of height reserved for space between subplots, expressed as a fraction of the average axis height. If not given, the values will be inferred from a figure or rcParams when necessary. See also GridSpec.get_subplot_params.

width_ratios

[array-like of length ncols, optional] Defines the relative widths of the columns. Each column gets a relative width of width_ratios[i] / sum(width_ratios). If not given, all columns will have the same width.
**height_ratios**

[array-like of length nrows, optional] Defines the relative heights of the rows. Each column gets a relative height of height_ratios[i] / sum(height_ratios). If not given, all rows will have the same height.

```
__module__ = 'matplotlib.gridspec'

get_subplot_params(self, figure=None)
    Return the SubplotParams for the GridSpec.

    In order of precedence the values are taken from
    • non-None attributes of the GridSpec
    • the provided figure
    • rcParams["figure.subplot.*"]

locally_modified_subplot_params(self)
    Return a list of the names of the subplot parameters explicitly set in the GridSpec.

    This is a subset of the attributes of SubplotParams.

tight_layout(self, figure, renderer=None, pad=1.08, h_pad=None, w_pad=None, rect=None)
    Adjust subplot parameters to give specified padding.

    **Parameters**

    **pad**
    [float] Padding between the figure edge and the edges of subplots, as a fraction of the font-size.

    **h_pad, w_pad**
    [float, optional] Padding (height/width) between edges of adjacent subplots. Defaults to pad.

    **rect**
    [tuple of 4 floats, default: (0, 0, 1, 1), i.e. the whole figure] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into.

update(self, **kwargs)
    Update the subplot parameters of the grid.

    Parameters that are not explicitly given are not changed. Setting a parameter to None resets it to rcParams["figure.subplot.*"].

    **Parameters**
left, right, top, bottom

[float or None, optional] Extent of the subplots as a fraction of figure width or height.

wspace, hspace

[float, optional] Spacing between the subplots as a fraction of the average subplot width / height.

matplotlib.gridspec.SubplotSpec

class matplotlib.gridspec.SubplotSpec(gridspec, num1, num2=None)

Bases: object

Specifies the location of a subplot in a GridSpec.

Note: Likely, you'll never instantiate a SubplotSpec yourself. Instead you will typically obtain one from a GridSpec using item-access.
Parameters

gridspec

[GridSpec] The GridSpec, which the subplot is referencing.

num1, num2

[int] The subplot will occupy the num1-th cell of the given gridspec. If num2 is provided, the subplot will span between num1-th cell and num2-th cell inclusive.

The index starts from 0.

__dict__ = mappingproxy({'__module__': 'matplotlib.gridspec', '__doc__': "\nSpecifies the location of a subplot in a GridSpec.

Two SubplotSpecs are considered equal if they refer to the same position(s) in the same GridSpec.
"})

__eq__(self, other)

Two SubplotSpecs are considered equal if they refer to the same position(s) in the same GridSpec.

__getstate__(self)

__hash__(self)

Return hash(self).

__init__(self, gridspec, num1, num2=None)

Initialize self. See help(type(self)) for accurate signature.

__module__ = 'matplotlib.gridspec'

__repr__(self)

Return repr(self).

__weakref__

list of weak references to the object (if defined)

property colspan

The columns spanned by this subplot, as a range object.

get_geometry(self)

Return the subplot geometry as tuple (n_rows, n_cols, start, stop).

The indices start and stop define the range of the subplot within the GridSpec.
stop is inclusive (i.e. for a single cell start == stop).

get_gridspec(self)

get_position(self, figure, return_all=False)

Update the subplot position from figure.subplotpars.

get_rows_columns(self)

[Deprecated] Return the subplot row and column numbers as a tuple (n_rows, n_cols, row_start, row_stop, col_start, col_stop).
Notes

Deprecated since version 3.3.

get_topmost_subplotspec(self)
   Return the topmost SubplotSpec instance associated with the subplot.

property num2

property rowspan
   The rows spanned by this subplot, as a range object.

subgridspec(self, nrows, ncols, **kwargs)
   Create a GridSpec within this subplot.

   The created GridSpecFromSubplotSpec will have this SubplotSpec as a parent.

Parameters

    nrows
       [int] Number of rows in grid.

    ncols
       [int] Number or columns in grid.

Returns

    GridSpecFromSubplotSpec

Other Parameters

    **kwargs

       All other parameters are passed to GridSpecFromSubplotSpec.

See also:

   matplotlib.pyplot.subplots

Examples

   Adding three subplots in the space occupied by a single subplot:

```python
fig = plt.figure()
gs0 = fig.add_gridspec(3, 1)
ax1 = fig.add_subplot(gs0[0])
ax2 = fig.add_subplot(gs0[1])
gssub = gs0[2].subgridspec(1, 3)
for i in range(3):
    fig.add_subplot(gssub[0, i])
```

`matplotlib.gridspec.GridSpecBase`

class `matplotlib.gridspec.GridSpecBase`(nrows, ncols, height_ratios=None, width_ratios=None)

Bases: `object`

A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.

**Parameters**

nrows, ncols

[int] The number of rows and columns of the grid.

width_ratios

[array-like of length ncols, optional] Defines the relative widths of the columns. Each column gets a relative width of width_ratios[i] / sum(width_ratios). If not given, all columns will have the same width.

height_ratios

[array-like of length nrows, optional] Defines the relative heights of the rows. Each column gets a relative height of height_ratios[i] / sum(height_ratios). If not given, all rows will have the same height.

__dict__ = `mappingproxy`({'__module__': 'matplotlib.gridspec', '__doc__': '
A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.

**Parameters**

nrows, ncols

[int] The number of rows and columns of the grid.

width_ratios

[array-like of length ncols, optional] Defines the relative widths of the columns. Each column gets a relative width of width_ratios[i] / sum(width_ratios). If not given, all columns will have the same width.

height_ratios

[array-like of length nrows, optional] Defines the relative heights of the rows. Each column gets a relative height of height_ratios[i] / sum(height_ratios). If not given, all rows will have the same height.

__dict__ = `mappingproxy`({'__module__': 'matplotlib.gridspec', '__doc__': '
A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.

**Parameters**

nrows, ncols

[int] The number of rows and columns of the grid.

width_ratios

[array-like of length ncols, optional] Defines the relative widths of the columns. Each column gets a relative width of

```python
__dict__ = mappingproxy({'__module__': 'matplotlib.gridspec', '__doc__': '
A base class of GridSpec that specifies the geometry of the grid that a subplot will be placed.

**Parameters**

nrows, ncols

[int] The number of rows and columns of the grid.

width_ratios

[array-like of length ncols, optional] Defines the relative widths of the columns. Each column gets a relative width of

```
width_ratios[i] / sum(width_ratios). If not given, all columns will have the same width.

**height_ratios**

[array-like of length nrows, optional] Defines the relative heights of the rows. Each column gets a relative height of height_ratios[i] / sum(height_ratios). If not given, all rows will have the same height.

```
__module__ = 'matplotlib.gridspec'
__repr__(self)
    Return repr(self).
__weakref__
    list of weak references to the object (if defined)
get_geometry(self)
    Return a tuple containing the number of rows and columns in the grid.
get_grid_positions(self, fig, raw=False)
    Return the positions of the grid cells in figure coordinates.

Parameters

**fig**

[Figure] The figure the grid should be applied to. The subplot parameters (margins and spacing between subplots) are taken from fig.

**raw**

[bool, default: False] If True, the subplot parameters of the figure are not taken into account. The grid spans the range [0, 1] in both directions without margins and there is no space between grid cells. This is used for constrained_layout.

Returns

**bottoms, tops, lefts, rights**

[array] The bottom, top, left, right positions of the grid cells in figure coordinates.

get_height_ratios(self)
    Return the height ratios.

This is None if no height ratios have been set explicitly.

gs.get_subplot_params(self, figure=None)
get_width_ratios(self)
    Return the width ratios.
    This is None if no width ratios have been set explicitly.

property ncols
    The number of columns in the grid.

new_subplotspec(self, loc, rowspan=1, colspan=1)
    Create and return a SubplotSpec instance.

    Parameters
    
    loc
        [(int, int)] The position of the subplot in the grid as (row_index, column_index).

    rowspan, colspan
        [int, default: 1] The number of rows and columns the subplot should span in the grid.

property nrows
    The number of rows in the grid.

set_height_ratios(self, height_ratios)
    Set the relative heights of the rows.
    height_ratios must be of length nrows. Each row gets a relative height of
    height_ratios[i] / sum(height_ratios).

set_width_ratios(self, width_ratios)
    Set the relative widths of the columns.
    width_ratios must be of length ncols. Each column gets a relative width of
    width_ratios[i] / sum(width_ratios).

subplots(self, *, sharex=False, sharey=False, squeeze=True, subplot_kw=None)
    Add all subplots specified by this GridSpec to its parent figure.
    This utility wrapper makes it convenient to create common layouts of subplots in a single call.

    Parameters

    sharex, sharey
        [bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (sharex) or y (sharey) axes:
        • True or 'all': x- or y-axis will be shared among all subplots.
        • False or 'none': each subplot x- or y-axis will be independent.
        • 'row': each subplot row will share an x- or y-axis.
• 'col': each subplot column will share an x- or y-axis.

When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use `tick_params`.

**squeeze**

[bool, optional, default: True]

• If True, extra dimensions are squeezed out from the returned array of Axes:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single Axes object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of Axes objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.

• If False, no squeezing at all is done: the returned Axes object is always a 2D array containing Axes instances, even if it ends up being 1x1.

**subplot_kw**

[dict, optional] Dict with keywords passed to the `add_subplot` call used to create each subplot.

**Returns**

**ax**

[Axes object or array of Axes objects.] ax can be either a single Axes object or an array of Axes objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the squeeze keyword, see above.

### `matplotlib.gridspec.GridSpecFromSubplotSpec`

```python
class matplotlib.gridspec.GridSpecFromSubplotSpec(nrows, ncols, subplot_spec, wspace=None, hspace=None, height_ratios=None, width_ratios=None)
```

Bases: `matplotlib.gridspec.GridSpecBase`

GridSpec whose subplot layout parameters are inherited from the location specified by a given SubplotSpec.

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

```python
__init__(self, nrows, ncols, subplot_spec, wspace=None, hspace=None, height_ratios=None, width_ratios=None)
```

The number of rows and number of columns of the grid need to be set. An instance of SubplotSpec is also needed to be set from which the layout parameters will be inherited. The wspace and hspace of the layout can be optionally specified or the default values (from the figure or rcParams) will be used.

```python
__module__ = 'matplotlib.gridspec'
```

```python
get_subplot_params(self, figure=None)
```

Return a dictionary of subplot layout parameters.
get_topmost_subplotspec(self)
    Return the topmost SubplotSpec instance associated with the subplot.

Examples using matplotlib.gridspec.GridSpecFromSubplotSpec

- sphx_glr_gallery_subplots_axes_and_figures_demo_constrained_layout.py
- sphx_glr_gallery_subplots_axes_and_figures_gridspec_nested.py

18.27 matplotlib.image

The image module supports basic image loading, rescaling and display operations.

class matplotlib.image.AxesImage(ax, cmap=None, norm=None, interpolation=None, origin=None, extent=None, filternorm=True, filterrad=4.0, resample=False, **kwargs)

Bases: matplotlib.image._ImageBase

An image attached to an Axes.

Parameters

ax
    [Axes] The axes the image will belong to.

cmap
    [str or Colormap, default: rcParams["image.cmap"] (default: 'viridis')] The Colormap instance or registered colormap name used to map scalar data to colors.

norm

interpolation
origin

[{'upper', 'lower'}, default: $rcParams["image.origin"]$ (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention 'upper' is typically used for matrices and images.

extent

[tuple, optional] The data axes (left, right, bottom, top) for making image plots registered with data plots. Default is to label the pixel centers with the zero-based row and column indices.

filternorm

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If filternorm is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

filterrad

[float > 0, default: 4] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

resample

[bool, default: False] When True, use a full resampling method. When False, only resample when the output image is larger than the input image.

**kwargs

[Artist properties]

Parameters

norm

[$matplotlib.colors.Normalize$ (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If None, norm defaults to a $colors.Normalize$ object which initializes its scaling based on the first data processed.

cmap

[str or $Colormap$] The colormap used to map normalized data values to RGBA colors.

format_cursor_data($self$, data)

Return a string representation of data.
**Note:** This method is intended to be overridden by artist subclasses. As an end-user of Matplotlib you will most likely not call this method yourself.

The default implementation converts ints and floats and arrays of ints and floats into a comma-separated string enclosed in square brackets.

**See also:**

`get_cursor_data`

`get_cursor_data(self, event)`
Return the image value at the event position or `None` if the event is outside the image.

**See also:**

`matplotlib.artist.Artist.get_cursor_data`

`get_extent(self)`
Return the image extent as tuple (left, right, bottom, top).

`get_window_extent(self, renderer=None)`
Get the axes bounding box in display space.

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

`make_image(self, renderer, magnification=1.0, unsampled=False)`
Normalize, rescale, and colormap this image's data for rendering using `renderer`, with the given `magnification`.

If `unsampled` is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

**Returns**

`image`

`[(M, N, 4) uint8 array]` The RGBA image, resampled unless `unsampled` is True.

`x, y`
[float] The upper left corner where the image should be drawn, in pixel space.

**trans**

[Affine2D] The affine transformation from image to pixel space.

```python
def set_extent(self, extent)
    Set the image extent.
```

**Parameters**

**extent**

[4-tuple of float] The position and size of the image as tuple (left, right, bottom, top) in data coordinates.

**Notes**

This updates `ax.dataLim`, and, if autoscaling, sets `ax.viewLim` to tightly fit the image, regardless of `dataLim`. Autoscaling state is not changed, so following this with `ax.autoscale_view()` will redo the autoscaling in accord with `dataLim`.

```python
class matplotlib.image.BboxImage(bbox, cmap=None, norm=None, interpolation=None, origin=None, filternorm=True, filterrad=4.0, resample=False, **kwargs)
```

**Bases:** `matplotlib.image._ImageBase`

The Image class whose size is determined by the given bbox.

cmap is a `colors.Colormap` instance norm is a `colors.Normalize` instance to map luminance to 0-1

kwargs are an optional list of Artist keyword args

```python
def contains(self, mouseevent)
    Test whether the mouse event occurred within the image.
```

```python
def get_transform(self)
    Return the Transform instance used by this artist.
```

```python
def get_window_extent(self, renderer=None)
    Get the axes bounding box in display space.
```

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to
unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

```python
make_image(self, renderer, magnification=1.0, unsampled=False)
    Normalize, rescale, and colormap this image's data for rendering using renderer, with the given magnification.
    If unsampled is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

    Returns

    image
        [(M, N, 4) uint8 array] The RGBA image, resampled unless unsampled is True.

    x, y
        [float] The upper left corner where the image should be drawn, in pixel space.

    trans
        [Affine2D] The affine transformation from image to pixel space.
```

```python
class matplotlib.image.FigureImage(fig, cmap=None, norm=None, offsetx=0, offsety=0, origin=None, **kwargs)
    Bases: matplotlib.image._ImageBase
    An image attached to a figure.
    cmap is a colors.Colormap instance norm is a colors.Normalize instance to map luminance to 0-1
    kwargs are an optional list of Artist keyword args

    get_extent(self)
        Return the image extent as tuple (left, right, bottom, top).

    make_image(self, renderer, magnification=1.0, unsampled=False)
        Normalize, rescale, and colormap this image's data for rendering using renderer, with the given magnification.
        If unsampled is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

    Returns

    image
        [(M, N, 4) uint8 array] The RGBA image, resampled unless unsampled is True.

    x, y
```
[float] The upper left corner where the image should be drawn, in pixel space.

**trans**

[Affine2D] The affine transformation from image to pixel space.

def set_data(self, A):
    """Set the image array."
    
zorder = 0

class NonUniformImage(ax, *, interpolation='nearest', **kwargs):
    """Bases: AxesImage"

    Parameters

    interpolation

    [{‘nearest’, ‘bilinear’}, default: ‘nearest’]

    **kwargs

    All other keyword arguments are identical to those of AxesImage.

    def get_extent(self):
        """Return the image extent as tuple (left, right, bottom, top)."

    @property
    def is_grayscale(self):
        """""

    def make_image(self, renderer, magnification=1.0, unsampled=False):
        """Normalize, rescale, and colormap this image's data for rendering using renderer, with the given magnification.

        If unsampled is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

        Returns

        image

        [(M, N, 4) uint8 array] The RGBA image, resampled unless unsampled is True.

        x, y

        [float] The upper left corner where the image should be drawn, in pixel space.

        trans

        [Affine2D] The affine transformation from image to pixel space.

    def set_array(self, *args):
        """Retained for backwards compatibility - use set_data instead."""
Parameters

A
[array-like]

set_cmap(self, cmap)
Set the colormap for luminance data.

Parameters

cmap
[Colormap or str or None]

set_data(self, x, y, A)
Set the grid for the pixel centers, and the pixel values.

Parameters

x, y
[1D array-like] Monotonic arrays of shapes (N,) and (M,), respectively, specifying pixel centers.

A
[array-like] (M, N) ndarray or masked array of values to be colormapped, or (M, N, 3) RGB array, or (M, N, 4) RGBA array.

set_filternorm(self, s)
Set whether the resize filter normalizes the weights.

See help for imshow.

Parameters

filternorm
[bool]

set_filterrad(self, s)
Set the resize filter radius only applicable to some interpolation schemes -- see help for imshow

Parameters

filterrad
[positive float]

set_interpolation(self, s)

Parameters
s
    [{#'nearest', 'bilinear'} or None] If None, use rcParams["image.
    interpolation"] (default: 'antialiased').

set_norm(self, norm)
    Set the normalization instance.

Parameters

    norm
        [Normalize or None]

Notes

    If there are any colorbars using the mappable for this norm, setting the norm
    of the mappable will reset the norm, locator, and formatters on the colorbar
to default.

class matplotlib.image.PcolorImage(ax,  x=None,  y=None,  A=None,
    cmap=None,  norm=None,  **kwargs)
Bases: matplotlib.image.AxesImage

Make a pcolor-style plot with an irregular rectangular grid.
This uses a variation of the original irregular image code, and it is used by pcol-
orfast for the corresponding grid type.

Parameters

    ax
        [Axes] The axes the image will belong to.

    x, y
        [1D array-like, optional] Monotonic arrays of length N+1 and
        M+1, respectively, specifying rectangle boundaries. If not given,
        will default to range(N + 1) and range(M + 1), respectively.

    A
        [array-like] The data to be color-coded. The interpretation de-
        pends on the shape:
        • (M, N) ndarray or masked array: values to be colormapped
        • (M, N, 3): RGB array
        • (M, N, 4): RGBA array

    cmap
[str or `Colormap`, default: `rcParams['image.cmap']` (default: 'viridis')] The Colormap instance or registered colormap name used to map scalar data to colors.

**norm**

**kwargs**

[Artist properties]

get_cursor_data(self, event)

Return the image value at the event position or None if the event is outside the image.

See also:

`matplotlib.artist.Artist.get_cursor_data`

property `is_grayscale`

make_image(self, renderer, magnification=1.0, unsampled=False)

Normalize, rescale, and colormap this image's data for rendering using renderer, with the given magnification.

If `unsampled` is True, the image will not be scaled, but an appropriate affine transformation will be returned instead.

Returns

image

[(M, N, 4) uint8 array] The RGBA image, resampled unless unsampled is True.

x, y

[float] The upper left corner where the image should be drawn, in pixel space.

trans

[Affine2D] The affine transformation from image to pixel space.

set_array(self, *args)

Retained for backwards compatibility - use set_data instead.

Parameters

A

[array-like]
set_data(self, x, y, A)
Set the grid for the rectangle boundaries, and the data values.

Parameters

x, y

[1D array-like, optional] Monotonic arrays of length N+1 and M+1, respectively, specifying rectangle boundaries. If not given, will default to range(N + 1) and range(M + 1), respectively.

A

[array-like] The data to be color-coded. The interpretation depends on the shape:
• (M, N) ndarray or masked array: values to be colormapped
• (M, N, 3): RGB array
• (M, N, 4): RGBA array

matplotlib.image.composite_images(images, renderer, magnification=1.0)
Composite a number of RGBA images into one. The images are composited in the order in which they appear in the images list.

Parameters

images

[list of Images] Each must have a make_image method. For each image, can_composite should return True, though this is not enforced by this function. Each image must have a purely affine transformation with no shear.

renderer

[RendererBase]

magnification

[float, default: 1] The additional magnification to apply for the renderer in use.

Returns

image

[uint8 3d array] The composited RGBA image.

offset_x, offset_y

[float] The (left, bottom) offset where the composited image should be placed in the output figure.
matplotlib.image.imread(fname, format=None)
Read an image from a file into an array.

Parameters

fname
[str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.

format
[str, optional] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

Returns

numpy.array
The image data. The returned array has shape
- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

matplotlib.image.imsave(fname, arr, vmin=None, vmax=None, cmap=None, format=None, origin=None, dpi=100, *, metadata=None, pil_kwargs=None)
Save an array as an image file.

Parameters

fname
[str or path-like or file-like] A path or a file-like object to store the image in. If format is not set, then the output format is inferred from the extension of filename, if any, and from rcParams["savefig.format"] (default: 'png') otherwise. If format is set, it determines the output format.

arr
[array-like] The image data. The shape can be one of MxN (luminance), MxNx3 (RGB) or MxNx4 (RGBA).

vmin, vmax
[float, optional] vmin and vmax set the color scaling for the image by fixing the values that map to the colormap color limits. If either vmin or vmax is None, that limit is determined from the arr min/max value.
cmap

[\text{str or \texttt{Colormap}}, \text{default: } \texttt{rcParams['image.cmap']}] (default: 'viridis') A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

format

[\text{str, optional}] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under \texttt{fname}.

origin

[\{\text{'upper', \text{'lower'}}, \text{default: } \texttt{rcParams['image.origin']}] (default: 'upper')] Indicates whether the \((0, 0)\) index of the array is in the upper left or lower left corner of the axes.

dpi

[\text{float}] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

metadata

[\text{dict, optional}] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information.

pil_kwargs

[\text{dict, optional}] Keyword arguments passed to \texttt{PIL.Image.Image.save}. If the 'pnginfo' key is present, it completely overrides \texttt{metadata}, including the default 'Software' key.

\texttt{matplotlib.image.pil_to_array(pilImage)}

Load a PIL image and return it as a numpy int array.

Returns

\texttt{numpy.array}

The array shape depends on the image type:

- (M, N) for grayscale images.
- (M, N, 3) for RGB images.
- (M, N, 4) for RGBA images.

\texttt{matplotlib.image.thumbnail(infile, thumbfile, scale=0.1, interpolation='bilinear', preview=False)}

Make a thumbnail of image in \texttt{infile} with output filename \texttt{thumbfile}.

See /gallery/misc/image_thumbnail_sgskip.
**Parameters**

**in**

[&str or file-like] The image file. Matplotlib relies on Pillow for image reading, and thus supports a wide range of file formats, including PNG, JPG, TIFF and others.

**thumbfile**

[&str or file-like] The thumbnail filename.

**scale**

[float, default: 0.1] The scale factor for the thumbnail.

**interpolation**

[&str, default: 'bilinear'] The interpolation scheme used in the resampling. See the `interpolation` parameter of `imshow` for possible values.

**preview**

[&bool, default: False] If True, the default backend (presumably a user interface backend) will be used which will cause a figure to be raised if `show` is called. If it is False, the figure is created using `FigureCanvasBase` and the drawing backend is selected as `Figure.savefig` would normally do.

**Returns**

*Figure*

The figure instance containing the thumbnail.

---

**18.28 matplotlib.legend**

The legend module defines the Legend class, which is responsible for drawing legends associated with axes and/or figures.

**Important:** It is unlikely that you would ever create a Legend instance manually. Most users would normally create a legend via the `legend` function. For more details on legends there is also a *legend guide*.

The `Legend` class is a container of legend handles and legend texts.

The legend handler map specifies how to create legend handles from artists (lines, patches, etc.) in the axes or figures. Default legend handlers are defined in the
legend_handler module. While not all artist types are covered by the default legend handlers, custom legend handlers can be defined to support arbitrary objects.

See the legend guide for more information.

class matplotlib.legend.DraggableLegend(legend, use_blit=False, update='loc')

    Bases: matplotlib.offsetbox.DraggableOffsetBox

    Wrapper around a Legend to support mouse dragging.

    Parameters

    legend

        [Legend] The Legend instance to wrap.

    use_blit

        [bool, optional] Use blitting for faster image composition. For details see FuncAnimation.

    update

        [{'loc', 'bbox'}, optional] If "loc", update the loc parameter of the legend upon finalizing. If "bbox", update the bbox_to_anchor parameter.

    finalize_offset(self)

class matplotlib.legend.Legend(parent, handles, labels, loc=None, numpoints=None, markerscale=None, markerfirst=True, scatterpoints=None, scatteryoffsets=None, prop=None, fontsize=None, labelcolor=None, borderpad=None, labelspacing=None, handlelength=None, handleheight=None, handletextpad=None, borderaxespad=None, columnspacing=None, ncol=1, mode=None, fancybox=None, shadow=None, title=None, title_fontsize=None, framealpha=None, edgecolor=None, facecolor=None, bbox_to_anchor=None, bbox_transform=None, frameon=None, handler_map=None)

    Bases: matplotlib.artist.Artist

    Place a legend on the axes at location loc.

    Parameters

    parent

        [Axes or Figure] The artist that contains the legend.

    handles
[list of Artist] A list of Artists (lines, patches) to be added to the legend.

labels

[list of str] A list of labels to show next to the artists. The length of handles and labels should be the same. If they are not, they are truncated to the smaller of both lengths.

Other Parameters

loc

[str or pair of floats, default: rcParams["legend.loc"] (default: 'best') ('best' for axes, 'upper right' for figures)] The location of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.

The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case bbox_to_anchor will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:
<table>
<thead>
<tr>
<th>Location String</th>
<th>Location Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>'best'</td>
<td>0</td>
</tr>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

bbox_to_anchor

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc. Defaults to axes.bbox (if called as a method to Axes.legend) or figure.bbox (if Figure.legend). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by bbox transform, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or BboxBase is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```python
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by loc at x, y. For example, to put the legend’s upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```python
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

ncol

[int, default: 1] The number of columns that the legend has.

prop

[None or matplotlib.font_manager.FontProperties or dict] The font properties of the legend. If None (default), the current matplotlib.rcParams will be used.

fontsize
The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if prop is not specified.

labelcolor

Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

numpoints

The number of marker points in the legend when creating a legend entry for a Line2D (line).

scatterpoints

The number of marker points in the legend when creating a legend entry for a PathCollection (scatter plot).

scatteryoffsets

The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

markerscale

The relative size of legend markers compared with the originally drawn ones.

markerfirst

If True, legend marker is placed to the left of the legend label. If False, legend marker is placed to the right of the legend label.

frameon

Whether the legend should be drawn on a patch (frame).

fancybox

Whether round edges should be enabled around the FancyBboxPatch which makes up the legend's background.
shadow
[bool, default: rcParams["legend.shadow"] (default: False)]
Whether to draw a shadow behind the legend.

framealpha
[float, default: rcParams["legend.framealpha"] (default: 0.8)] The alpha transparency of the legend's background. If shadow is activated and framealpha is None, the default value is ignored.

facecolor
["inherit" or color, default: rcParams["legend.facecolor"] (default: 'inherit')] The legend's background color. If "inherit", use rcParams["axes.facecolor"] (default: 'white').

eedgecolor
["inherit" or color, default: rcParams["legend.edgecolor"] (default: '0.8')] The legend's background patch edge color. If "inherit", use take rcParams["axes.edgecolor"] (default: 'black').

mode
[{"expand", None}] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or bbox_to_anchor if defines the legend's size).

bbox_transform
[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor). For a value of None (default) the Axes' transAxes transform will be used.

title
[str or None] The legend's title. Default is no title (None).

title_fontsize
[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: rcParams["legend.title_fontsize"] (default: None)] The font size of the legend's title.

borderpad
[float, default: rcParams["legend.borderpad"] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing
[float, default: rcParams["legend.labelspacing"] (default: 0.5)] The vertical space between the legend entries, in font-size units.
**handletextpad**

[float, default: `rcParams["legend.handlelength"]` (default: 2.0)]
The length of the legend handles, in font-size units.

**borderaxespad**

[float, default: `rcParams["legend.borderaxespad"]` (default: 0.5)]
The pad between the axes and legend border, in font-size units.

**columnspacing**

[float, default: `rcParams["legend.columnspacing"]` (default: 2.0)]
The spacing between columns, in font-size units.

**handler_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This `handler_map` updates the default handler map found at `matplotlib.legend.Legend.get_legend_handler_map`.

**Notes**

Users can specify any arbitrary location for the legend using the `bbox_to_anchor` keyword argument. `bbox_to_anchor` can be a `BboxBase` (or derived therefrom) or a tuple of 2 or 4 floats. See `set_bbox_to_anchor` for more detail.

The legend location can be specified by setting `loc` with a tuple of 2 floats, which is interpreted as the lower-left corner of the legend in the normalized axes coordinate.

```python
codes = {'best': 0, 'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower left': 3, 'lower right': 4, 'right': 5, 'upper center': 9, 'upper left': 2, 'upper right': 1}
```

**contains**(self, event)
Test whether the artist contains the mouse event.

**Parameters**

**mouseevent**

`matplotlib.backend_bases.MouseEvent`

**Returns**

**contains**

[bool] Whether any values are within the radius.
details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

draw_frame(self, b)

Set whether the legend box patch is drawn.

Parameters

b

[bool]

get_bbox_to_anchor(self)

Return the bbox that the legend will be anchored to.

get_children(self)

Return a list of the child Artists of this Artist.

classmethod get_default_handler_map()

A class method that returns the default handler map.

get_draggable(self)

Return True if the legend is draggable, False otherwise.

get_frame(self)

Return the Rectangle used to frame the legend.

get_frame_on(self)

Get whether the legend box patch is drawn.

static get_legend_handler(legend_handler_map, orig_handler)

Return a legend handler from legend_handler_map that corresponds to orig_handler.
Legend handler map should be a dictionary object (that is returned by the
get_legend_handler_map method).

It first checks if the orig_handle itself is a key in the legend_handler_map
and return the associated value. Otherwise, it checks for each of the classes
in its method-resolution-order. If no matching key is found, it returns None.

```
def get_legend_handler_map(self):
    Return the handler map.
```

```
def get_lines(self):
    Return the list of Line2Ds in the legend.
```

```
def get_patches(self):
    Return the list of Patches in the legend.
```

```
def get_texts(self):
    Return the list of Texts in the legend.
```

```
def get_tightbbox(self, renderer):
    Like Legend.get_window_extent, but uses the box for the legend.
```

Parameters

renderer

[RendererBase subclass] renderer that will be used to draw the
figures (i.e. fig.canvas.get_renderer())

Returns

BboxBase

The bounding box in figure pixel coordinates.

```
def get_title(self):
    Return the Text instance for the legend title.
```

```
def get_window_extent(self, renderer=None):
    Get the axes bounding box in display space.
```

The bounding box' width and height are nonnegative.

Subclasses should override for inclusion in the bounding box "tight" calcu-
lation. Default is to return an empty bounding box at 0, 0.

Be careful when using this function, the results will not update if the artist
window extent of the artist changes. The extent can change due to any
changes in the transform stack, such as changing the axes limits, the figure
size, or the canvas used (as is done when saving a figure). This can lead to
unexpected behavior where interactive figures will look fine on the screen,
but will save incorrectly.

```
def set_bbox_to_anchor(self, bbox, transform=None):
    Set the bbox that the legend will be anchored to.
```
Parameters

bbox

[BboxBase or tuple] The bounding box can be specified in the following ways:
• A BboxBase instance
• A tuple of (left, bottom, width, height) in the given transform (normalized axes coordinate if None)
• A tuple of (left, bottom) where the width and height will be assumed to be zero.
• None, to remove the bbox anchoring, and use the parent bbox.

transform

[Transform, optional] A transform to apply to the bounding box. If not specified, this will use a transform to the bounding box of the parent.

classmethod set_default_handler_map(handler_map)
A class method to set the default handler map.

set_draggable(self, state, use_blit=False, update='loc')
Enable or disable mouse dragging support of the legend.

Parameters

state

[bool] Whether mouse dragging is enabled.

use_blit

[bool, optional] Use blitting for faster image composition. For details see FuncAnimation.

update

[{'loc', 'bbox'}, optional] The legend parameter to be changed when dragged:
• 'loc': update the loc parameter of the legend
• 'bbox': update the bbox_to_anchor parameter of the legend

Returns

DraggableLegend or None

If state is True this returns the DraggableLegend helper instance. Otherwise this returns None.
set_frame_on(self, b)
    Set whether the legend box patch is drawn.

Parameters

    b
        [bool]

set_title(self, title, prop=None)
    Set the legend title. Fontproperties can be optionally set with prop parameter.

classmethod update_default_handler_map(handler_map)
    A class method to update the default handler map.

zorder = 5

18.29 matplotlib.legend_handler

Default legend handlers.

It is strongly encouraged to have read the legend guide before this documentation.
Legend handlers are expected to be a callable object with a following signature.

```python
legend_handler(legend, orig_handle, fontsize, handlebox)
```

Where legend is the legend itself, orig_handle is the original plot, fontsize is the font-size in pixels, and handlebox is a OffsetBox instance. Within the call, you should create relevant artists (using relevant properties from the legend and/or orig_handle) and add them into the handlebox. The artists needs to be scaled according to the fontsize (note that the size is in pixel, i.e., this is dpi-scaled value).

This module includes definition of several legend handler classes derived from the base class (HandlerBase) with the following method:

```python
def legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

class matplotlib.legend_handler.HandlerBase(xpad=0.0, ypad=0.0, update_func=None)
    A Base class for default legend handlers.

    The derived classes are meant to override create_artists method, which has a following signature:

```python
def create_artists(self, legend, orig_handle,
            xdescent, ydescent, width, height, fontsize,
            trans):
```
The overridden method needs to create artists of the given transform that fits in the given dimension (xdescent, ydescent, width, height) that are scaled by fontsize if necessary.

```python
adjust_drawing_area(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize)
```

```python
create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)
```

```python
legend_artist(self, legend, orig_handle, fontsize, handlebox)
```

Return the artist that this HandlerBase generates for the given original artist/handle.

**Parameters**

- **legend**
  - [Legend] The legend for which these legend artists are being created.

- **orig_handle**
  - [matplotlib.artist.Artist or similar] The object for which these legend artists are being created.

- **fontsize**
  - [int] The fontsize in pixels. The artists being created should be scaled according to the given fontsize.

- **handlebox**
  - [matplotlib.offsetbox.OffsetBox] The box which has been created to hold this legend entry's artists. Artists created in the `legend_artist` method must be added to this handlebox inside this method.

```python
update_prop(self, legend_handle, orig_handle, legend)
```

**class** `matplotlib.legend_handler.HandlerCircleCollection(yoffsets=None, sizes=None, **kw)`

Handler for `CircleCollections`.

**Parameters**

- **numpoints**
  - [int] Number of points to show in legend entry.

- **yoffsets**
  - [array of floats] Length numpoints list of y offsets for each point in legend entry.
Notes

Any other keyword arguments are given to `HandlerNpoints`.

```python
class matplotlib.legend_handler.HandlerErrorbar(xerr_size=0.5,
                                           yerr_size=None,
                                           marker_pad=0.3,
                                           numpoints=None, **kw)
```

Handler for Errorbars.

**Parameters**

- `marker_pad`  
  [float] Padding between points in legend entry.

- `numpoints`  
  [int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to `HandlerNpoints`.

```python
class matplotlib.legend_handler.HandlerLine2D(marker_pad=0.3,
                                           numpoints=None, **kw)
```

Handler for `Line2D` instances.

**Parameters**

- `marker_pad`  
  [float] Padding between points in legend entry.

- `numpoints`  
  [int] Number of points to show in legend entry.
Notes

Any other keyword arguments are given to HandlerNpoints.

create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)

class matplotlib.legend_handler.HandlerLineCollection(marker_pad=0.3, num_points=None, **kw)

Handler for LineCollection instances.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to HandlerNpoints.

create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)

global matplotlib.legend_handler.HandlerNpoints(marker_pad=0.3, num_points=None, **kw)

A legend handler that shows numpoints points in the legend entry.

Parameters

marker_pad

[float] Padding between points in legend entry.

numpoints

[int] Number of points to show in legend entry.

Notes

Any other keyword arguments are given to HandlerBase.

global matplotlib.legend_handler.HandlerNpoints(self, legend)

global matplotlib.legend_handler.HandlerNpoints(self, legend, xdescent, ydescent, width, height, fontsize)
class matplotlib.legend_handler.HandlerNpointsYoffsets(numpoints=None, yoffsets=None, **kw)

A legend handler that shows numpoints in the legend, and allows them to be individually offset in the y-direction.

Parameters

numpoints

[int] Number of points to show in legend entry.

yoffsets

[array of floats] Length numpoints list of y offsets for each point in legend entry.

Notes

Any other keyword arguments are given to HandlerNpoints.

get_ydata(self, legend, xdescent, ydescent, width, height, fontsize)

class matplotlib.legend_handler.HandlerPatch(patch_func=None, **kw)

Handler for Patch instances.

Parameters

patch_func

[callable, optional] The function that creates the legend key artist. patch_func should have the signature:

```python
def patch_func(legend=legend, orig_handle=orig_handle, xdescent=xdescent, ydescent=ydescent, width=width, height=height, fontsize=fontsize)
```

Subsequently the created artist will have its update_prop method called and the appropriate transform will be applied.

Notes

Any other keyword arguments are given to HandlerBase.

create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)

class matplotlib.legend_handler.HandlerPathCollection(yoffsets=None, sizes=None, **kw)

Handler for PathCollections, which are used by scatter.

Parameters
**numpoints**

[int] Number of points to show in legend entry.

**yoffsets**

[array of floats] Length numpoints list of y offsets for each point in legend entry.

**Notes**

Any other keyword arguments are given to HandlerNpoints.

class matplotlib.legend_handler.HandlerPolyCollection(xpad=0.0, ypad=0.0, update_func=None)

Handler for PolyCollection used in fill_between and stackplot.

class matplotlib.legend_handler.HandlerRegularPolyCollection(yoffsets=None, sizes=None, **kw)

Handler for RegularPolyCollections.

**Parameters**

**numpoints**

[int] Number of points to show in legend entry.

**yoffsets**

[array of floats] Length numpoints list of y offsets for each point in legend entry.

**Notes**

Any other keyword arguments are given to HandlerNpoints.

class matplotlib.legend_handler.HandlerPolyCollection(xpad=0.0, ypad=0.0, update_func=None)

Handler for PolyCollection used in fill_between and stackplot.

class matplotlib.legend_handler.HandlerRegularPolyCollection(yoffsets=None, sizes=None, **kw)
class `matplotlib.legend_handler.HandlerStem`:

Handler for plots produced by `stem`.

**Parameters**

- **marker_pad**
  - [float, default: 0.3] Padding between points in legend entry.

- **numpoints**
  - [int, optional] Number of points to show in legend entry.

- **bottom**
  - [float, optional]

- **yoffsets**
  - [array of floats, optional] Length `numpoints` list of y offsets for each point in legend entry.

**Notes**

Any other keyword arguments are given to `HandlerNpointsYoffsets`.

- `create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)`
- `get_ydata(self, legend, xdescent, ydescent, width, height, fontsize)`

class `matplotlib.legend_handler.HandlerTuple`:

Handler for Tuple.

Additional kwargs are passed through to `HandlerBase`.

**Parameters**

- **ndivide**
  - [int, default: 1] The number of sections to divide the legend area into. If None, use the length of the input tuple.

- **pad**
  - [float, default: `rcParams["legend.borderpad"]` (default: 0.4)] Padding in units of fraction of font size.

- `create_artists(self, legend, orig_handle, xdescent, ydescent, width, height, fontsize, trans)`
- `matplotlib.legend_handler.update_from_first_child(tgt, src)`
18.30 matplotlib.lines

The 2D line class which can draw with a variety of line styles, markers and colors.

18.30.1 Classes

```
Line2D(xdata, ydata[, linewidth, linestyle, ...])
```

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex.

```
VertexSelector(line)
```

Manage the callbacks to maintain a list of selected vertices for Line2D.

```
matplotlib.lines.Line2D
```

class matplotlib.lines.Line2D(xdata, ydata, linewidth=None, linestyle=None, color=None, marker=None, markersize=None, markeredgewidth=None, markeredgewidthcolor=None, markerfacecoloralt='none', fillstyle=None, antialiased=None, dash_capstyle=None, solid_capstyle=None, dash_joinstyle=None, solid_joinstyle=None, pickradius=5, drawstyle=None, markevery=None, **kwargs)

Bases: matplotlib.artist.Artist

A line - the line can have both a solid linestyle connecting all the vertices, and a marker at each vertex. Additionally, the drawing of the solid line is influenced by the drawstyle, e.g., one can create "stepped" lines in various styles.

Create a Line2D instance with x and y data in sequences of xdata, ydata.

Additional keyword arguments are Line2D properties:

See \texttt{set_linestyle()} for a description of the line styles, \texttt{set_marker()} for a description of the markers, and \texttt{set_drawstyle()} for a description of the draw styles.

```python
__module__ = 'matplotlib.lines'
__str__(self)
   Return str(self).
```

property axes
   The \textit{Axes} instance the artist resides in, or \texttt{None}.

contains(self, mouseevent)
   Test whether \textit{mouseevent} occurred on the line.

   An event is deemed to have occurred "on" the line if it is less than self.pickradius (default: 5 points) away from it. Use \texttt{get_pickradius} or \texttt{set_pickradius} to get or set the pick radius.

   Parameters

   \textbf{mouseevent}
      \[[\texttt{matplotlib.backend_bases.MouseEvent}]\]

   Returns

   contains
      [bool] Whether any values are within the radius.

   details
      [dict] A dictionary \{'ind': pointlist\}, where \textit{pointlist} is a list of points of the line that are within the pickradius around the event position.

      TODO: sort returned indices by distance

draw(self, renderer)
   Draw the Artist (and its children) using the given renderer.

   This has no effect if the artist is not visible (\texttt{Artist.get_visible} returns False).

   Parameters

   \textbf{renderer}
      [RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

drawStyleKeys = ['default', 'steps-mid', 'steps-pre', 'steps-post', 'steps']
drawStyles = {'default': '_draw_lines', 'steps': '_draw_steps_pre', 'steps-mid': '_draw_steps_mid', 'steps-pre': '_draw_steps_pre', 'steps-post': '_draw_steps_post'}
fillStyles = ('full', 'left', 'right', 'bottom', 'top', 'none')
filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')

get_aa(self)
    Alias for get_antialiased.

get_antialiased(self)
    Return whether antialiased rendering is used.

get_c(self)
    Alias for get_color.

get_color(self)
    Return the line color.
    See also set_color.

get_dash_capstyle(self)
    Return the cap style for dashed lines.
    See also set_dash_capstyle.

get_dash_joinstyle(self)
    Return the join style for dashed lines.
    See also set_dash_joinstyle.

get_data(self, orig=True)
    Return the xdata, ydata.
    If orig is True, return the original data.

get_drawstyle(self)
    Return the drawstyle.
    See also set_drawstyle.

get_ds(self)
    Alias for get_drawstyle.

get_fillstyle(self)
    Return the marker fill style.
    See also set_fillstyle.

get_linestyle(self)
    Return the linestyle.
    See also set_linestyle.
get_linewidth(self)
    Return the linewidth in points.
    See also set_linewidth.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_marker(self)
    Return the line marker.
    See also set_marker.

get_markeredgecolor(self)
    Return the marker edge color.
    See also set_markeredgecolor.

get_markeredgewidth(self)
    Return the marker edge width in points.
    See also set_markeredgewidth.

get_markerfacecolor(self)
    Return the marker face color.
    See also set_markerfacecolor.

get_markerfacecoloralt(self)
    Return the alternate marker face color.
    See also set_markerfacecoloralt.

get_markersize(self)
    Return the marker size in points.
    See also set_markersize.

get_markevery(self)
    Return the markevery setting for marker subsampling.
    See also set_markevery.

get_mec(self)
    Alias for get_markeredgecolor.

get_mew(self)
    Alias for get_markeredgewidth.

get_mfc(self)
    Alias for get_markerfacecolor.

get_mfcalt(self)
    Alias for get_markerfacecoloralt.
get_ms(self)
    Alias for get_markersize.

get_path(self)
    Return the Path object associated with this line.

get_pickradius(self)
    Return the pick radius used for containment tests.
    See contains for more details.

get_solid_capstyle(self)
    Return the cap style for solid lines.
    See also set_solid_capstyle.

get_solid_joinstyle(self)
    Return the join style for solid lines.
    See also set_solid_joinstyle.

get_window_extent(self, renderer)
    Get the axes bounding box in display space.
    The bounding box' width and height are nonnegative.
    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.
    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

get_xdata(self, orig=True)
    Return the xdata.
    If orig is True, return the original data, else the processed data.

get_xydata(self)
    Return the xy data as a Nx2 numpy array.

get_ydata(self, orig=True)
    Return the ydata.
    If orig is True, return the original data, else the processed data.

is_dashed(self)
    Return whether line has a dashed linestyle.
    See also set_linestyle.

markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triangle_up', '<': 'triangle_left', ... 10: 'caretupbase', 11: 'caretdownbase', 'None': 'nothing', None: 'nothing', ' ': 'nothing', '': 'nothing'}
property pickradius
    Return the pick radius used for containment tests.
    
    See contains for more details.

recache(self, always=False)
recache_always(self)

set_aa(self, b)
    Alias for set_antialiased.

set_antialiased(self, b)
    Set whether to use antialiased rendering.

    Parameters

    b
        [bool]

set_c(self, color)
    Alias for set_color.

set_color(self, color)
    Set the color of the line.

    Parameters

    color
        [color]

set_dash_capstyle(self, s)
    Set the cap style for dashed lines.

    Parameters

    s
        [{'butt', 'round', 'projecting'}] For examples see /gallery/lines_bars_and_markers/joinstyle.

set_dash_joinstyle(self, s)
    Set the join style for dashed lines.

    Parameters

    s
        [{'miter', 'round', 'bevel'}] For examples see /gallery/lines_bars_and_markers/joinstyle.
set_dashes(self, seq)
    Set the dash sequence.
    
    The dash sequence is a sequence of floats of even length describing the
    length of dashes and spaces in points.
    
    For example, (5, 2, 1, 2) describes a sequence of 5 point and 1 point dashes
    separated by 2 point spaces.

    Parameters

    seq
        [sequence of floats (on/off ink in points) or (None, None)] If seq
        is empty or (None, None), the linestyle will be set to solid.

set_data(self, *args)
    Set the x and y data.

    Parameters

    *args
        [(2, N) array or two 1D arrays]

set_drawstyle(self, drawstyle)
    Set the drawstyle of the plot.
    
    The drawstyle determines how the points are connected.

    Parameters

    drawstyle
        [{'default', 'steps', 'steps-pre', 'steps-mid', 'steps-post'}, default: 'default'] For 'default', the points are connected with
        straight lines.
        
        The steps variants connect the points with step-like lines, i.e.
        horizontal lines with vertical steps. They differ in the location
        of the step:
        • 'steps-pre': The step is at the beginning of the line segment,
        i.e. the line will be at the y-value of point to the right.
        • 'steps-mid': The step is halfway between the points.
        • 'steps-post: The step is at the end of the line segment, i.e. the
        line will be at the y-value of the point to the left.
        • 'steps' is equal to 'steps-pre' and is maintained for backward-
        compatibility.
        
        For examples see /gallery/lines_bars_and_markers/step_demo.
set_ds(self, drawstyle)
    Alias for set_drawstyle.

set_fillstyle(self, fs)
    Set the marker fill style.

    **Parameters**

    fs

    [{‘full’, ‘left’, ‘right’, ‘bottom’, ‘top’, ‘none’}] Possible values:
    • ‘full’: Fill the whole marker with the markerfacecolor.
    • ‘left’, ‘right’, ‘bottom’, ‘top’: Fill the marker half at the given side with the markerfacecolor. The other half of the marker is filled with markerfacecoloralt.
    • ‘none’: No filling.
    For examples see marker_fill_styles.

set_linestyle(self, ls)
    Set the linestyle of the line.

    **Parameters**

    ls

    [{‘-‘, ‘-.-‘, ‘-‘, ‘ ‘, ‘ ‘, (offset, on-off-seq), …}] Possible values:
    • A string:

    | Linestyle    | Description |
    |--------------|-------------|
    | ‘-‘ or ‘solid’ | solid line |
    | ‘-.-‘ or ‘dashed’ | dashed line |
    | ‘-‘, ‘dashdot’ | dash-dotted line |
    | ‘ ‘, ‘dotted’ | dotted line |
    | ‘None‘ or ‘ ‘ | draw nothing |

    • Alternatively a dash tuple of the following form can be provided:

    (offset, onoffseq)

    where onoffseq is an even length tuple of on and off ink in points. See also set_dashes().
    For examples see /gallery/lines_bars_and_markers/linestyles.

set_linewidth(self, w)
    Set the line width in points.
Parameters

\(w\)

[float] Line width, in points.

\texttt{set\_ls}(\texttt{self}, \texttt{ls})

Alias for \texttt{set\_linestyle}.

\texttt{set\_lw}(\texttt{self}, \texttt{w})

Alias for \texttt{set\_linewidth}.

\texttt{set\_marker}(\texttt{self}, \texttt{marker})

Set the line marker.

Parameters

\textbf{marker}

[marker style string, \textit{Path} or \textit{MarkerStyle}] See markers for full description of possible arguments.

\texttt{set\_markeredgecolor}(\texttt{self}, \texttt{ec})

Set the marker edge color.

Parameters

\textbf{ec}

[color]

\texttt{set\_markeredgewidth}(\texttt{self}, \texttt{ew})

Set the marker edge width in points.

Parameters

\textbf{ew}

[float] Marker edge width, in points.

\texttt{set\_markerfacecolor}(\texttt{self}, \texttt{fc})

Set the marker face color.

Parameters

\textbf{fc}

[color]

\texttt{set\_markerfacecoloralt}(\texttt{self}, \texttt{fc})

Set the alternate marker face color.

Parameters
**fc**

[color]

**set_markersize**(self, sz)

Set the marker size in points.

**Parameters**

**sz**

[float] Marker size, in points.

**set_markevery**(self, every)

Set the markevery property to subsample the plot when using markers.

e.g., if every=5, every 5-th marker will be plotted.

**Parameters**

**every**

[None or int or (int, int) or slice or List[int] or float or (float, float) or List[bool]] Which markers to plot.

• every=None, every point will be plotted.

• every=N, every N-th marker will be plotted starting with marker 0.

• every=(start, N), every N-th marker, starting at point start, will be plotted.

• every=slice(start, end, N), every N-th marker, starting at point start, up to but not including point end, will be plotted.

• every=[i, j, m, n], only markers at points i, j, m, and n will be plotted.

• every=[True, False, True], positions that are True will be plotted.

• every=0.1, (i.e. a float) then markers will be spaced at approximately equal distances along the line; the distance along the line between markers is determined by multiplying the display-coordinate distance of the axes bounding-box diagonal by the value of every.

• every=(0.5, 0.1) (i.e. a length-2 tuple of float), the same functionality as every=0.1 is exhibited but the first marker will be 0.5 multiplied by the display-coordinate-diagonal-distance along the line.

For examples see /gallery/lines_bars_and_markers/markevery_demo.
Notes

Setting the markevery property will only show markers at actual data points. When using float arguments to set the markevery property on irregularly spaced data, the markers will likely not appear evenly spaced because the actual data points do not coincide with the theoretical spacing between markers.

When using a start offset to specify the first marker, the offset will be from the first data point which may be different from the first visible data point if the plot is zoomed in.

If zooming in on a plot when using float arguments then the actual data points that have markers will change because the distance between markers is always determined from the display-coordinates axes-bounding-box-diagonal regardless of the actual axes data limits.

```
set_mec(self, ec)
  Alias for set_markeredgecolor.

set_mew(self, ew)
  Alias for set_markeredgewidth.

set_mfc(self, fc)
  Alias for set_markerfacecolor.

set_mfcalt(self, fc)
  Alias for set_markerfacecoloralt.

set_ms(self, sz)
  Alias for set_markersize.

set_picker(self, p)
  Define the picking behavior of the artist.
```

Parameters

**picker**

[None or bool or callable] This can be one of the following:

- **None**: Picking is disabled for this artist (default).

- A boolean: If True then picking will be enabled and the artist will fire a pick event if the mouse event is over the artist.

- A function: If picker is callable, it is a user supplied function which determines whether the artist is hit by the mouse event:

  ```
  hit, props = picker(artist, mouseevent)
  ```

  to determine the hit test. If the mouse event is over the artist, return hit=True and props is a dictionary of properties you
want added to the PickEvent attributes.

• deprecated: For Line2D only, picker can also be a float that sets the tolerance for checking whether an event occurred "on" the line; this is deprecated. Use Line2D.set_pickradius instead.

```
set_pickradius(self, d)
    Set the pick radius used for containment tests.
    See contains for more details.

    Parameters

    d
        [float] Pick radius, in points.
```

```
set_solid_capstyle(self, s)
    Set the cap style for solid lines.

    Parameters

    s
        [{'butt', 'round', 'projecting'}] For examples see /gallery/lines_bars_and_markers/joinstyle.
```

```
set_solid_joinstyle(self, s)
    Set the join style for solid lines.

    Parameters

    s
        [{'miter', 'round', 'bevel'}] For examples see /gallery/lines_bars_and_markers/joinstyle.
```

```
set_transform(self, t)
    Set the Transformation instance used by this artist.

    Parameters

    t
        [matplotlib.transforms.Transform]
```

```
set_xdata(self, x)
    Set the data array for x.

    Parameters
```
x

[1D array]

set_ydata(self, y)
    Set the data array for y.

Parameters

y

[1D array]

data

update_from(self, other)
    Copy properties from other to self.

validCap = ('butt', 'round', 'projecting')
validJoin = ('miter', 'round', 'bevel')
zorder = 2

matplotlib.lines.VertexSelector

class matplotlib.lines.VertexSelector(line)
    Bases: object

    Manage the callbacks to maintain a list of selected vertices for Line2D. Derived classes should override process_selected() to do something with the picks.

    Here is an example which highlights the selected verts with red circles:

    ```python
    import numpy as np
    import matplotlib.pyplot as plt
    import matplotlib.lines as lines

    class HighlightSelected(lines.VertexSelector):
        def __init__(self, line, fmt='ro', **kwargs):
            lines.VertexSelector.__init__(self, line)
            self.markers, = self.axes.plot([], [], fmt, **kwargs)

        def process_selected(self, ind, xs, ys):
            self.markers.set_data(xs, ys)
            self.canvas.draw()

    fig, ax = plt.subplots()
    x, y = np.random.rand(2, 30)
    line, = ax.plot(x, y, 'bs-', picker=5)

    selector = HighlightSelected(line)
    plt.show()
    ```

    Initialize the class with a Line2D instance. The line should already be added to some matplotlib.axes.Axes instance and should have the picker property set.

    __dict__ = mappingproxy({'__module__': 'matplotlib.lines', '__doc__': '
    Manage the callbacks to maintain a list of selected vertices for Line2D. Derived classes should override process_selected() to do something with the picks.

    Here is an example which highlights the selected verts with red circles:

    ```python
    import numpy as np
    import matplotlib.pyplot as plt
    import matplotlib.lines as lines

    class HighlightSelected(lines.VertexSelector):
        def __init__(self, line, fmt='ro', **kwargs):
            lines.VertexSelector.__init__(self, line)
            self.markers, = self.axes.plot([], [], fmt, **kwargs)

        def process_selected(self, ind, xs, ys):
            self.markers.set_data(xs, ys)
            self.canvas.draw()

    fig, ax = plt.subplots()
    x, y = np.random.rand(2, 30)
    line, = ax.plot(x, y, 'bs-', picker=5)

    selector = HighlightSelected(line)
    plt.show()
    ```

    Initialize the class with a Line2D instance. The line should already be added to some matplotlib.axes.Axes instance and should have the picker property set.

    __dict__ = mappingproxy({'__module__': 'matplotlib.lines', '__doc__': '
    Manage the callbacks to maintain a list of selected vertices for Line2D. Derived classes should override process_selected() to do something with the picks.

    Here is an example which highlights the selected verts with red circles:

    ```python
    import numpy as np
    import matplotlib.pyplot as plt
    import matplotlib.lines as lines

    class HighlightSelected(lines.VertexSelector):
        def __init__(self, line, fmt='ro', **kwargs):
            lines.VertexSelector.__init__(self, line)
            self.markers, = self.axes.plot([], [], fmt, **kwargs)

        def process_selected(self, ind, xs, ys):
            self.markers.set_data(xs, ys)
            self.canvas.draw()

    fig, ax = plt.subplots()
    x, y = np.random.rand(2, 30)
    line, = ax.plot(x, y, 'bs-', picker=5)

    selector = HighlightSelected(line)
    plt.show()
```
process_selected(self, ind, xs, ys)

Default "do nothing" implementation of the `process_selected()` method.

**Parameters**

ind

[list of int] The indices of the selected vertices.

xs, ys

[array-like] The coordinates of the selected vertices.

**Examples using matplotlib.lines.VertexSelector**

**18.30.2 Functions**

segment_hits(cx, cy, x, y, radius)

Return the indices of the segments in the polyline with coordinates (cx, cy) that are within a distance `radius` of the point (x, y).

**matplotlib.lines.segment_hits**

**18.31 matplotlib.markers**

Functions to handle markers; used by the marker functionality of `plot` and `scatter`.

All possible markers are defined here:

<table>
<thead>
<tr>
<th>marker</th>
<th>symbol</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;.&quot;</td>

</tr>
<tr>
<td>(numsides, 1, angle)</td>
<td></td>
<td>A star-like symbol with numsides sides, rotated by angle.</td>
</tr>
<tr>
<td>(numsides, 2, angle)</td>
<td></td>
<td>An asterisk with numsides sides, rotated by angle.</td>
</tr>
</tbody>
</table>

None is the default which means 'nothing', however this table is referred to from other docs for the valid inputs from marker inputs and in those cases `None` still means 'default'.

Note that special symbols can be defined via the **STIX math font**, e.g. "$\u266B". For an overview over the STIX font symbols refer to the **STIX font table**. Also see the /gallery/text_labels_and_annotations/stix_fonts_demo.

Integer numbers from 0 to 11 create lines and triangles. Those are equally accessible via capitalized variables, like `CARETDOWNBASE`. Hence the following are equivalent:

```python
plt.plot([1, 2, 3], marker=11)
plt.plot([1, 2, 3], marker=matplotlib.markers.CARETDOWNBASE)
```

Examples showing the use of markers:

- /gallery/lines_bars_and_markers/marker_reference
- /gallery/shapes_and_collections/marker_path
- /gallery/lines_bars_and_markers/scatter_star_poly

18.31.1 Classes

```
MarkerStyle([marker, fillstyle])            A class representing marker types.
```

```python
matplotlib.markers.MarkerStyle
```

class matplotlib.markers.MarkerStyle(marker=None, fillstyle=None)
Bases: object

A class representing marker types.

**Attributes**

```
markers

[ ] All known markers.
```

```
filled_markers
```

[list] All known filled markers. This is a subset of markers.

**fillstyles**

[list] The supported fillstyles.

**Parameters**

**marker**

[str or array-like or None, default: None] *None* means no marker. For other possible marker values see the module doc-string `matplotlib.markers`.

**fillstyle**

```
__bool__(self)
__dict__ = mappingproxy({'__module__': 'matplotlib.markers', '__doc__': '
 A class representing marker types.

 ... <attribute '__dict__' of 'MarkerStyle' objects>, '__weakref__': <attribute '__weakref__' of 'MarkerStyle' objects>})
__init__(self, marker=None, fillstyle=None)
```

**Parameters**

**marker**

[str or array-like or None, default: None] *None* means no marker. For other possible marker values see the module doc-string `matplotlib.markers`.

**fillstyle**

```
__module__ = 'matplotlib.markers'
__weakref__
    list of weak references to the object (if defined)
filled_markers = ('o', 'v', '^', '<', '>', '8', 's', 'p', '*', 'h', 'H', 'D', 'd', 'P', 'X')
fillstyles = ('full', 'left', 'right', 'bottom', 'top', 'none')
get_alt_path(self)
    Return a Path for the alternate part of the marker.
    For unfilled markers, this is None; for filled markers, this is the area to be drawn with markerfacecoloralt.
get_alt_transform(self)
    Return the transform to be applied to the Path from MarkerStyle.
    get_alt_path().
```
get_capstyle(self)
get_fillstyle(self)
get_joinstyle(self)
get_marker(self)
get_path(self)
    Return a Path for the primary part of the marker.
    For unfilled markers this is the whole marker, for filled markers, this is the
    area to be drawn with markerfacecolor.
get_snap_threshold(self)
get_transform(self)
    Return the transform to be applied to the Path from MarkerStyle.get_path().
is_filled(self)
markers = {'.': 'point', ',': 'pixel', 'o': 'circle', 'v': 'triangle_down', '^': 'triangle_up', '<': 'triangle_left', ... 10: 'caretupbase', 11: 'caretdownbase', 'None': 'nothing', None: 'nothing', ' ': 'nothing'}
set_fillstyle(self, fillstyle)
    Set the fillstyle.

Parameters

fillstyle
    [{'full', 'left', 'right', 'bottom', 'top', 'none}] The part of the
    marker surface that is colored with markerfacecolor.

set Marker(self, marker)
    Set the marker.

Parameters

marker
    [str or array-like or None, default: None] None means no
    marker. For other possible marker values see the module doc-
    string matplotlib.markers.
A module for parsing a subset of the TeX math syntax and rendering it to a Matplotlib backend.

For a tutorial of its usage, see *Writing mathematical expressions*. This document is primarily concerned with implementation details.

The module uses `pyparsing` to parse the TeX expression.
The Bakoma distribution of the TeX Computer Modern fonts, and STIX fonts are supported. There is experimental support for using arbitrary fonts, but results may vary without proper tweaking and metrics for those fonts.

class matplotlib.mathtext.Accent(c, state, math=True)
   Bases: matplotlib.mathtext.Char

   The font metrics need to be dealt with differently for accents, since they are
   already offset correctly from the baseline in TrueType fonts.

grow(self)
   Grows one level larger. There is no limit to how big something can get.

render(self, x, y)
   Render the character to the canvas.

shrink(self)
   Shrinks one level smaller. There are only three levels of sizes, after which
   things will no longer get smaller.

class matplotlib.mathtext.AutoHeightChar(c, height, depth, state, always=False, factor=None)
   Bases: matplotlib.mathtext.Hlist

   A character as close to the given height and depth as possible.

   When using a font with multiple height versions of some characters (such as the
   BaKoMa fonts), the correct glyph will be selected, otherwise this will always just
   return a scaled version of the glyph.

class matplotlib.mathtext.AutoWidthChar(c, width, state, always=False, char_class=<class 'matplotlib.mathtext.Char'>)
   Bases: matplotlib.mathtext.Hlist

   A character as close to the given width as possible.

   When using a font with multiple width versions of some characters (such as the
   BaKoMa fonts), the correct glyph will be selected, otherwise this will always just
   return a scaled version of the glyph.

class matplotlib.mathtext.BakomaFonts(*args, **kwargs)
   Bases: matplotlib.mathtext.TruetypeFonts

   Use the Bakoma TrueType fonts for rendering.

   Symbols are strewn about a number of font files, each of which has its own
   proprietary 8-bit encoding.

   Parameters

   default_font_prop: `~.font_manager.FontProperties`
       The default non-math font, or the base font for Unicode (generic) font rendering.
**mathtext_backend: `MathtextBackend` subclass**

Backend to which rendering is actually delegated.

```
alias = '\\\'

get_sized_alternatives_for_symbol(self, fontname, sym)
  Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching sym in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

target = ']'
```

class matplotlib.mathtext.Box(width, height, depth)
  Bases: matplotlib.mathtext.Node

A node with a physical location.

grow(self)
  Grows one level larger. There is no limit to how big something can get.

render(self, x1, y1, x2, y2)

shrink(self)
  Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.Char(c, state, math=True)
  Bases: matplotlib.mathtext.Node

A single character.

Unlike TeX, the font information and metrics are stored with each `Char` to make it easier to lookup the font metrics when needed. Note that TeX boxes have a width, height, and depth, unlike Type1 and TrueType which use a full bounding box and an advance in the x-direction. The metrics must be converted to the TeX model, and the advance (if different from width) must be converted into a `Kern` node when the `Char` is added to its parent `Hlist`.

```
get_kerning(self, next)
  Return the amount of kerning between this and the given character.
  This method is called when characters are strung together into `Hlist` to create `Kern` nodes.

grow(self)
  Grows one level larger. There is no limit to how big something can get.

is_slanted(self)

render(self, x, y)
  Render the character to the canvas
```
shrink(self)
Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.ComputerModernFontConstants
Bases: matplotlib.mathtext.FontConstantsBase
delta = 0.075
delta_integral = 0.3
delta_slanted = 0.3
script_space = 0.075
sub1 = 0.2
sub2 = 0.3
subdrop = 0.2
sup1 = 0.45

class matplotlib.mathtext.DejaVuFonts(*args, **kwargs)
Bases: matplotlib.mathtext.UnicodeFonts

Parameters

default_font_prop: `~.font_manager.FontProperties`
The default non-math font, or the base font for Unicode (generic)
font rendering.

mathtext_backend: `MathtextBackend` subclass
Backend to which rendering is actually delegated.

use_cmex = False

class matplotlib.mathtext.DejaVuSansFontConstants
Bases: matplotlib.mathtext.FontConstantsBase

class matplotlib.mathtext.DejaVuSansFonts(*args, **kwargs)
Bases: matplotlib.mathtext.DejaVuFonts
A font handling class for the DejaVu Sans fonts
If a glyph is not found it will fallback to Stix Sans

Parameters

default_font_prop: `~.font_manager.FontProperties`
The default non-math font, or the base font for Unicode (generic)
font rendering.

mathtext_backend: `MathtextBackend` subclass
Backend to which rendering is actually delegated.
class matplotlib.mathtext.DejaVuSerifFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase

class matplotlib.mathtext.DejaVuSerifFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.DejaVuFonts

    A font handling class for the DejaVu Serif fonts
    If a glyph is not found it will fallback to Stix Serif

    Parameters

    default_font_prop: `~.font_manager.FontProperties`
        The default non-math font, or the base font for Unicode (generic)
        font rendering.

    mathtext_backend: `MathtextBackend` subclass
        Backend to which rendering is actually delegated.

matplotlib.mathtext.Error(msg)
    Helper class to raise parser errors.

class matplotlib.mathtext.Fill(**kwargs)
    Bases: matplotlib.mathtext.Glue

    [Deprecated]

    Notes

    Deprecated since version 3.3:

class matplotlib.mathtext.Fill1(**kwargs)
    Bases: matplotlib.mathtext.Glue

    [Deprecated]

    Notes

    Deprecated since version 3.3:
Notes

Deprecated since version 3.3:

class matplotlib.mathtext.FontConstantsBase
Bases: object

A set of constants that controls how certain things, such as sub- and superscripts are laid out. These are all metrics that can't be reliably retrieved from the font metrics in the font itself.

delta = 0.025

delta_integral = 0.1

delta_slanted = 0.2

script_space = 0.05

sub1 = 0.3

sub2 = 0.5

subdrop = 0.4

sup1 = 0.7

class matplotlib.mathtext.Fonts(default_font_prop, mathtext_backend)
Bases: object

An abstract base class for a system of fonts to use for mathtext.

The class must be able to take symbol keys and font file names and return the character metrics. It also delegates to a backend class to do the actual drawing.

Parameters

**default_font_prop:** `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext_backend:** `MathtextBackend` subclass

Backend to which rendering is actually delegated.

destroy(self)

Fix any cyclical references before the object is about to be destroyed.

get_kern(self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)

Get the kerning distance for font between sym1 and sym2.

**fontX:** one of the TeX font names:

- tt, it, rm, cal, sf, bf or default/regular (non-math)
fontclassX: TODO
symX: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'
fontsizeX: the fontsize in points
dpi: the current dots-per-inch

get_metrics(self, font, font_class, sym, fontsize, dpi, math=True)
font: one of the TeX font names:

\begin{itemize}
  \item tt, it, rm, cal, sf, bf or default/regular (non-math)
\end{itemize}

font_class: TODO
sym: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'
fontsize: font size in points
dpi: current dots-per-inch
math: whether sym is a math character

Returns an object with the following attributes:

\begin{itemize}
  \item advance: The advance distance (in points) of the glyph.
  \item height: The height of the glyph in points.
  \item width: The width of the glyph in points.
  \item xmin, xmax, ymin, ymax - the ink rectangle of the glyph
  \item iceberg - the distance from the baseline to the top of the glyph. This corresponds to TeX's definition of "height".
\end{itemize}

get_results(self, box)
Get the data needed by the backend to render the math expression. The return value is backend-specific.

get_sized_alternatives_for_symbol(self, fontname, sym)
Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching sym in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

get_underline_thickness(self, font, fontsize, dpi)
Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

get_used_characters(self)
Get the set of characters that were used in the math expression. Used by backends that need to subset fonts so they know which glyphs to include.

get_xheight(self, font, fontsize, dpi)
Get the xheight for the given font and fontsize.
render_glyph(self, ox, oy, facename, font_class, sym, fontsize, dpi)

Draw a glyph at

- ox, oy: position
- facename: One of the TeX face names
- font_class:
- sym: TeX symbol name or single character
- fontsize: font size in points
- dpi: The dpi to draw at.

render_rect_filled(self, x1, y1, x2, y2)

Draw a filled rectangle from (x1, y1) to (x2, y2).

set_canvas_size(self, w, h, d)

Set the size of the buffer used to render the math expression. Only really
necessary for the bitmap backends.

class matplotlib.mathtext.Glue(glue_type, copy=<deprecated parameter>)

Bases: matplotlib.mathtext.Node

Most of the information in this object is stored in the underlying _GlueSpec class,
which is shared between multiple glue objects. (This is a memory optimization
which probably doesn't matter anymore, but it's easier to stick to what TeX does.)

property glue_subtype

grow(self)

Grows one level larger. There is no limit to how big something can get.

shrink(self)

Shrinks one level smaller. There are only three levels of sizes, after which
things will no longer get smaller.

class matplotlib.mathtext.GlueSpec(**kwargs)

Bases: object

[Deprecated] See Glue.

Notes

Deprecated since version 3.3.

copy(self)

classmethod factory(glue_type)

class matplotlib.mathtext.HCentered(elements)

Bases: matplotlib.mathtext.Hlist
A convenience class to create an `Hlist` whose contents are centered within its enclosing box.

class matplotlib.mathtext.Hbox(width)
Bases: matplotlib.mathtext.Box

A box with only width (zero height and depth).

class matplotlib.mathtext.Hlist(elements, w=0.0, m='additional', do_kern=True)
Bases: matplotlib.mathtext.List

A horizontal list of boxes.

hpack(self, w=0.0, m='additional')

Compute the dimensions of the resulting boxes, and adjust the glue if one of those dimensions is pre-specified. The computed sizes normally enclose all of the material inside the new box; but some items may stick out if negative glue is used, if the box is overfull, or if a `\vbox` includes other boxes that have been shifted left.

**Parameters**

- **w**
  - [float, default: 0] A width.

- **m**
  - [{'exactly', 'additional'}, default: 'additional'] Whether to produce a box whose width is 'exactly' w; or a box with the natural width of the contents, plus w ('additional').

**Notes**

The defaults produce a box with the natural width of the contents.

kern(self)

Insert `Kern` nodes between `Char` nodes to set kerning.

The `Char` nodes themselves determine the amount of kerning they need (in `get_kerning`), and this function just creates the correct linked list.

class matplotlib.mathtext.Hrule(state, thickness=None)
Bases: matplotlib.mathtext.Rule

Convenience class to create a horizontal rule.

class matplotlib.mathtext.Kern(width)
Bases: matplotlib.mathtext.Node

A `Kern` node has a width field to specify a (normally negative) amount of spacing. This spacing correction appears in horizontal lists between letters like A and V when the font designer said that it looks better to move them closer together.
or further apart. A kern node can also appear in a vertical list, when its width

denotes additional spacing in the vertical direction.

def depth = 0
grow(self)
    Grows one level larger. There is no limit to how big something can get.

def height = 0
shrink(self)
    Shrinks one level smaller. There are only three levels of sizes, after which
    things will no longer get smaller.

class matplotlib.mathtext.List(elements)
    Bases: matplotlib.mathtext.Box
    A list of nodes (either horizontal or vertical).

grow(self)
    Grows one level larger. There is no limit to how big something can get.

shrink(self)
    Shrinks one level smaller. There are only three levels of sizes, after which
    things will no longer get smaller.

class matplotlib.mathtext.MathTextParser(output)
    Bases: object
    Create a MathTextParser for the given backend output.

def get_depth(self, texstr, dpi=120, fontsize=14)
    Parameters

        texstr
            [str] A valid mathtext string, e.g., r'IQ: $\sigma_i=15$'.

        dpi
            [float] The dots-per-inch setting used to render the text.

    Returns

        int
            Offset of the baseline from the bottom of the image, in pixels.

parse(self, s, dpi=72, prop=None)
    Parse the given math expression s at the given dpi. If prop is provided, it
    is a FontProperties object specifying the "default" font to use in the math
    expression, used for all non-math text.

    The results are cached, so multiple calls to parse with the same expression
    should be fast.
**to_mask**

```python
self, texstr, dpi=120, fontsize=14)
```

**Parameters**

- **texstr**
  - [str] A valid mathtext string, e.g., r'IQ: $\sigma_i=15$'.

- **dpi**
  - [float] The dots-per-inch setting used to render the text.

- **fontsize**
  - [int] The font size in points

**Returns**

- **array**

- **depth**
  - [int] Offset of the baseline from the bottom of the image, in pixels.

**to_png**

```python
self, filename, texstr, color='black', dpi=120, fontsize=14)
```

Render a tex expression to a PNG file.

**Parameters**

- **filename**
  - A writable filename or fileobject.

- **texstr**
  - [str] A valid mathtext string, e.g., r'IQ: $\sigma_i=15$'.

- **color**
  - [color] The text color.

- **dpi**
  - [float] The dots-per-inch setting used to render the text.

- **fontsize**
  - [int] The font size in points.

**Returns**

- **int**
  - Offset of the baseline from the bottom of the image, in pixels.
to_rgba(self, texstr, color='black', dpi=120, fontsize=14)

Parameters

texstr
  [str] A valid mathtext string, e.g., r'IQ: $\sigma_i=15$'.

color
  [color] The text color.

dpi
  [float] The dots-per-inch setting used to render the text.

fontsize
  [int] The font size in points.

Returns

array
  [(M, N, 4) array] RGBA color values of rasterized tex, colorized with color.

depth
  [int] Offset of the baseline from the bottom of the image, in pixels.

exception matplotlib.mathtext.MathTextWarning
  Bases: Warning

class matplotlib.mathtext.MathtextBackend
  Bases: object

The base class for the mathtext backend-specific code. MattextBackend subclasses interface between mathtext and specific Matplotlib graphics backends. Subclasses need to override the following:

• render_glyph()
• render_rect_filled()
• get_results()

And optionally, if you need to use a FreeType hinting style:

• get_hinting_type()

get_hinting_type(self)
  Get the FreeType hinting type to use with this particular backend.
get_results(*self, box*)
   Return a backend-specific tuple to return to the backend after all processing
   is done.

render_glyph(*self, ox, oy, info*)
   Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self, x1, y1, x2, y2*)
   Draw a filled black rectangle from (*x1, y1*) to (*x2, y2*).

set_canvas_size(*self, w, h, d*)
   Set the dimension of the drawing canvas.

class matplotlib.mathtext.MathtextBackendAgg
   Bases: matplotlib.mathtext.MathtextBackend

   Render glyphs and rectangles to an FTImage buffer, which is later transferred
   to the Agg image by the Agg backend.

get_hinting_type(*self*)
   Get the FreeType hinting type to use with this particular backend.

get_results(*self, box, used_characters*)
   Return a backend-specific tuple to return to the backend after all processing
   is done.

render_glyph(*self, ox, oy, info*)
   Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self, x1, y1, x2, y2*)
   Draw a filled black rectangle from (*x1, y1*) to (*x2, y2*).

set_canvas_size(*self, w, h, d*)
   Set the dimension of the drawing canvas.

class matplotlib.mathtext.MathtextBackendBitmap
   Bases: matplotlib.mathtext.MathtextBackendAgg

get_results(*self, box, used_characters*)
   Return a backend-specific tuple to return to the backend after all processing
   is done.

class matplotlib.mathtext.MathtextBackendCairo
   Bases: matplotlib.mathtext.MathtextBackend

   Store information to write a mathtext rendering to the Cairo backend.

get_results(*self, box, used_characters*)
   Return a backend-specific tuple to return to the backend after all processing
   is done.

render_glyph(*self, ox, oy, info*)
   Draw a glyph described by *info* to the reference point (*ox*, *oy*).

render_rect_filled(*self, x1, y1, x2, y2*)
   Draw a filled black rectangle from (*x1, y1*) to (*x2, y2*).
class matplotlib.mathtext.MathtextBackendPath
    Bases: matplotlib.mathtext.MathtextBackend

    Store information to write a mathtext rendering to the text path machinery.

get_results(self, box, used_characters)
    Return a backend-specific tuple to return to the backend after all processing
    is done.

draw_glyph(self, ox, oy, info)
    Draw a glyph described by info to the reference point (ox, oy).

draw_rect_filled(self, x1, y1, x2, y2)
    Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.MathtextBackendPdf
    Bases: matplotlib.mathtext.MathtextBackend

    Store information to write a mathtext rendering to the PDF backend.

get_results(self, box, used_characters)
    Return a backend-specific tuple to return to the backend after all processing
    is done.

draw_glyph(self, ox, oy, info)
    Draw a glyph described by info to the reference point (ox, oy).

draw_rect_filled(self, x1, y1, x2, y2)
    Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.MathtextBackendPs
    Bases: matplotlib.mathtext.MathtextBackend

    Store information to write a mathtext rendering to the PostScript backend.

get_results(self, box, used_characters)
    Return a backend-specific tuple to return to the backend after all processing
    is done.

draw_glyph(self, ox, oy, info)
    Draw a glyph described by info to the reference point (ox, oy).

draw_rect_filled(self, x1, y1, x2, y2)
    Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.MathtextBackendSvg
    Bases: matplotlib.mathtext.MathtextBackend

    Store information to write a mathtext rendering to the SVG backend.

get_results(self, box, used_characters)
    Return a backend-specific tuple to return to the backend after all processing
    is done.

draw_glyph(self, ox, oy, info)
    Draw a glyph described by info to the reference point (ox, oy).
render_rect_filled(self, x1, y1, x2, y2)

Draw a filled black rectangle from (x1, y1) to (x2, y2).

class matplotlib.mathtext.NegFil(**kwargs)

Bases: matplotlib.mathtext.Glue

[Deprecated]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.NegFill(**kwargs)

Bases: matplotlib.mathtext.Glue

[Deprecated]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.NegFill1(**kwargs)

Bases: matplotlib.mathtext.Glue

[Deprecated]

Notes

Deprecated since version 3.3:

class matplotlib.mathtext.Node

Bases: object

A node in the TeX box model.

get_kerning(self, next)

grow(self)

Grows one level larger. There is no limit to how big something can get.

render(self, x, y)

shrink(self)

Shrinks one level smaller. There are only three levels of sizes, after which things will no longer get smaller.

class matplotlib.mathtext.Parser

Bases: object

A pyparsing-based parser for strings containing math expressions.

Raw text may also appear outside of pairs of $.
The grammar is based directly on that in TeX, though it cuts a few corners.

class State(font_output, font, font_class, fontsize, dpi)
    Bases: object
    Stores the state of the parser.
    States are pushed and popped from a stack as necessary, and the "current" state is always at the top of the stack.
    copy(self)
    property font
accent(self, s, loc, toks)
accentprefixed(self, s, loc, toks)
auto_delim(self, s, loc, toks)
binom(self, s, loc, toks)
c_over_c(self, s, loc, toks)
customspace(self, s, loc, toks)
dfrac(self, s, loc, toks)
end_group(self, s, loc, toks)
font(self, s, loc, toks)
frac(self, s, loc, toks)
function(self, s, loc, toks)
genfrac(self, s, loc, toks)
get_state(self)
    Get the current State of the parser.
group(self, s, loc, toks)
is_between_brackets(self, s, loc)
is_dropsub(self, nucleus)
is_overunder(self, nucleus)
is_slanted(self, nucleus)
main(self, s, loc, toks)
math(self, s, loc, toks)
math_string(self, s, loc, toks)
on_math(self, s, loc, toks)
operatorname(self, s, loc, toks)
overline(self, s, loc, toks)
parse(self, s, fonts_object, fontsize, dpi)
    Parse expression s using the given fonts_object for output, at the given fontsize and dpi.
    Returns the parse tree of Node instances.

pop_state(self)
    Pop a State off of the stack.

push_state(self)
    Push a new State onto the stack, copying the current state.

required_group(self, s, loc, toks)

simple_group(self, s, loc, toks)

space(self, s, loc, toks)

sqrt(self, s, loc, toks)

start_group(self, s, loc, toks)

subsuper(self, s, loc, toks)

symbol(self, s, loc, toks)

unknown_symbol(self, s, loc, toks)

class matplotlib.mathtext.Rule(width, height, depth, state)
    Bases: matplotlib.mathtext.Box
    A solid black rectangle.
    It has width, depth, and height fields just as in an Hlist. However, if any of these dimensions is inf, the actual value will be determined by running the rule up to the boundary of the innermost enclosing box. This is called a "running dimension". The width is never running in an Hlist; the height and depth are never running in a Vlist.

render(self, x, y, w, h)

class matplotlib.mathtext.STIXFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase
    delta = 0.05
    delta_integral = 0.3
    delta_slanted = 0.3
    script_space = 0.1
    sub2 = 0.6
    sup1 = 0.8

class matplotlib.mathtext.STIXSansFontConstants
    Bases: matplotlib.mathtext.FontConstantsBase
    delta_integral = 0.3
delta_slanted = 0.6
script_space = 0.05
sup1 = 0.8

class matplotlib.mathtext.Ship
    Bases: object

    Ship boxes to output once they have been set up, this sends them to output.

    Since boxes can be inside of boxes inside of boxes, the main work of Ship is
done by two mutually recursive routines, hlist_out and vlist_out, which traverse
the Hlist nodes and Vlist nodes inside of horizontal and vertical boxes. The
global variables used in TeX to store state as it processes have become member
variables here.

    static clamp(value)
    hlist_out(self, box)
    vlist_out(self, box)

class matplotlib.mathtext.SsGlue(**kwargs)
    Bases: matplotlib.mathtext.Glue

    [Deprecated]

    Notes

    Deprecated since version 3.3:

class matplotlib.mathtext.StandardPsFonts(default_font_prop)
    Bases: matplotlib.mathtext.Fonts

    Use the standard postscript fonts for rendering to backend_ps

    Unlike the other font classes, BakomaFont and UnicodeFont, this one requires
the Ps backend.

    Parameters

    **default_font_prop: `~.font_manager.FontProperties`**

        The default non-math font, or the base font for Unicode (generic)
        font rendering.

    **mathtext_backend: `MathtextBackend` subclass**

        Backend to which rendering is actually delegated.

    basepath = '/usr/local/lib64/python3.8/site-packages/matplotlib/mpl-data/fonts/afm'
    fontmap = {'cal': 'pzcmi8a', 'rm': 'pncr8a', 'tt': 'pcrr8a', 'it': 'pncri8a', 'sf': 'phv
get_kern(self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)
Get the kerning distance for font between sym1 and sym2.

fontX: one of the TeX font names:

tt, it, rm, cal, sf, bf or default/regular (non-math)

fontclassX: TODO
symX: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'

fontsizeX: the fontsize in points
dpi: the current dots-per-inch

get_underline_thickness(self, font, fontsize, dpi)
Get the line thickness that matches the given font. Used as a base unit for
drawing lines such as in a fraction or radical.

get_xheight(self, font, fontsize, dpi)
Get the xheight for the given font and fontsize.

class matplotlib.mathtext.StixFonts(*args, **kwargs)
Bases: matplotlib.mathtext.UnicodeFonts

A font handling class for the STIX fonts.

In addition to what UnicodeFonts provides, this class:
• supports "virtual fonts" which are complete alpha numeric character sets
  with different font styles at special Unicode code points, such as "Black-
  board".
• handles sized alternative characters for the STIXSizeX fonts.

Parameters

default_font_prop: `~.font_manager.FontProperties`
The default non-math font, or the base font for Unicode (generic)
font rendering.

mathtext_backend: `MathtextBackend` subclass
Backend to which rendering is actually delegated.

cm_fallback = False

get_sized_alternatives_for_symbol(self, fontname, sym)
Override if your font provides multiple sizes of the same symbol. Should
return a list of symbols matching sym in various sizes. The expression ren-
derer will select the most appropriate size for a given situation from this
list.

use_cmex = False
class matplotlib.mathtext.StixSansFonts(*args, **kwargs)

Bases: matplotlib.mathtext.StixFonts

A font handling class for the STIX fonts (that uses sans-serif characters by default).

**Parameters**

**default_font_prop:** `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext_backend:** `MathtextBackend` subclass

Backend to which rendering is actually delegated.

class matplotlib.mathtext.SubSuperCluster

Bases: matplotlib.mathtext.Hlist

A hack to get around that fact that this code does a two-pass parse like TeX. This lets us store enough information in the hlist itself, namely the nucleus, sub- and super-script, such that if another script follows that needs to be attached, it can be reconfigured on the fly.

class matplotlib.mathtext.TruetypeFonts(default_font_prop, mathtext_backend)

Bases: matplotlib.mathtext.Fonts

A generic base class for all font setups that use Truetype fonts (through FT2Font).

**Parameters**

**default_font_prop:** `~.font_manager.FontProperties`

The default non-math font, or the base font for Unicode (generic) font rendering.

**mathtext_backend:** `MathtextBackend` subclass

Backend to which rendering is actually delegated.

def destroy(self)

Fix any cyclical references before the object is about to be destroyed.

def get_kern(self, font1, fontclass1, sym1, fontsize1, font2, fontclass2, sym2, fontsize2, dpi)

Get the kerning distance for font between `sym1` and `sym2`.

`fontX`: one of the TeX font names:

- tt, it, rm, cal, sf, bf or default/regular (non-math)

`fontclassX`: TODO

`symX`: a symbol in raw TeX form. e.g., '1', 'x' or 'sigma'
**fontsizeX**: the fontsize in points

**dpi**: the current dots-per-inch

`get_underline_thickness(self, font, fontsize, dpi)`
Get the line thickness that matches the given font. Used as a base unit for drawing lines such as in a fraction or radical.

`get_xheight(self, fontname, fontsize, dpi)`
Get the xheight for the given font and fontsize.

```python
class matplotlib.mathtext.UnicodeFonts(*args, **kwargs)
    Bases: matplotlib.mathtext.TrueTypeFonts

    An abstract base class for handling Unicode fonts.

    While some reasonably complete Unicode fonts (such as DejaVu) may work in some situations, the only Unicode font I’m aware of with a complete set of math symbols is STIX.

    This class will "fallback" on the Bakoma fonts when a required symbol can not be found in the font.
```

**Parameters**

- **default_font_prop**: `~.font_manager.FontProperties`
  The default non-math font, or the base font for Unicode (generic) font rendering.

- **mathtext_backend**: `MathtextBackend` subclass
  Backend to which rendering is actually delegated.

- **get_sized_alternatives_for_symbol(self, fontname, sym)**
  Override if your font provides multiple sizes of the same symbol. Should return a list of symbols matching sym in various sizes. The expression renderer will select the most appropriate size for a given situation from this list.

- **use_cmex = True**

```python
class matplotlib.mathtext.VCentered(elements)
    Bases: matplotlib.mathtext.Vlist

    A convenience class to create a Vlist whose contents are centered within its enclosing box.
```

```python
class matplotlib.mathtext.Vbox(height, depth)
    Bases: matplotlib.mathtext.Box

    A box with only height (zero width).
```

```python
class matplotlib.mathtext.Vlist(elements, h=0.0, m='additional')
    Bases: matplotlib.mathtext.List

    A vertical list of boxes.
```
vpack(self, h=0.0, m='additional', l=inf)
Compute the dimensions of the resulting boxes, and to adjust the glue if one
of those dimensions is pre-specified.

**Parameters**

**h**

[float, default: 0] A height.

**m**

[{‘exactly’, ‘additional’}, default: ‘additional’] Whether to pro-
duce a box whose height is ‘exactly’ w; or a box with the natural
height of the contents, plus w (‘additional’).

**l**

**Notes**

The defaults produce a box with the natural height of the contents.

class matplotlib.mathtext.Vrule(state)
Bases: matplotlib.mathtext.Rule
Convenience class to create a vertical rule.

matplotlib.mathtext.get_unicode_index(symbol, math=True)
Return the integer index (from the Unicode table) of symbol.

**Parameters**

**symbol**

[str] A single unicode character, a TeX command (e.g. r'pi') or a
Type1 symbol name (e.g. 'phi').

**math**

[bool, default: True] If False, always treat as a single unicode
character.

matplotlib.mathtext.math_to_image(s, filename_or_obj, prop=None, dpi=None, format=None)
Given a math expression, renders it in a closely-clipped bounding box to an image
file.

**Parameters**

**s**
[str] A math expression. The math portion must be enclosed in dollar signs.

filename_or_obj
[|str or path-like or file-like|] Where to write the image data.

prop
[|FontProperties, optional|] The size and style of the text.

dpi
[|float, optional|] The output dpi. If not set, the dpi is determined as for Figure.savefig.

format
[|str, optional|] The output format, e.g., 'svg', 'pdf', 'ps' or 'png'. If not set, the format is determined as for Figure.savefig.

18.33 matplotlib.mlab

Numerical python functions written for compatibility with MATLAB commands with the same names. Most numerical python functions can be found in the numpy and scipy libraries. What remains here is code for performing spectral computations.

18.33.1 Spectral functions

cohere
Coherence (normalized cross spectral density)

csd
Cross spectral density using Welch's average periodogram

detrend
Remove the mean or best fit line from an array

psd
Power spectral density using Welch's average periodogram

specgram
Spectrogram (spectrum over segments of time)

complex_spectrum
Return the complex-valued frequency spectrum of a signal
magnitude_spectrum

Return the magnitude of the frequency spectrum of a signal

angle_spectrum

Return the angle (wrapped phase) of the frequency spectrum of a signal

phase_spectrum

Return the phase (unwrapped angle) of the frequency spectrum of a signal

detrend_mean

Remove the mean from a line.

detrend_linear

Remove the best fit line from a line.

detrend_none

Return the original line.

stride_windows

Get all windows in an array in a memory-efficient manner

stride_repeat

Repeat an array in a memory-efficient manner

apply_window

Apply a window along a given axis

class matplotlib.mlab.GaussianKDE(dataset, bw_method=None)

Bases: object

Representation of a kernel-density estimate using Gaussian kernels.

Parameters

dataset

[array-like] Datapoints to estimate from. In case of univariate
data this is a 1-D array, otherwise a 2-D array with shape (# of
dims, # of data).

bw_method

[str, scalar or callable, optional] The method used to calculate the
estimator bandwidth. This can be 'scott', 'silverman', a scalar
constant or a callable. If a scalar, this will be used directly as
kde.factor. If a callable, it should take a GaussianKDE instance as
only parameter and return a scalar. If None (default), 'scott' is
used.

Attributes
**dataset**

[/ndarray] The dataset with which gaussian_kde was initialized.

**dim**

/int/ Number of dimensions.

**num_dp**

/int/ Number of datapoints.

**factor**

[float] The bandwidth factor, obtained from kde.covariance_factor, with which the covariance matrix is multiplied.

**covariance**

[/ndarray] The covariance matrix of dataset, scaled by the calculated bandwidth (kde.factor).

**inv_cov**

[/ndarray] The inverse of covariance.

**Methods**

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>kde.evaluate(points)</strong></td>
<td>(ndarray) Evaluate the estimated pdf on a provided set of points.</td>
</tr>
<tr>
<td><strong>kde(points)</strong></td>
<td>(ndarray) Same as kde.evaluate(points)</td>
</tr>
</tbody>
</table>

**covariance_factor(self)**

**evaluate(self, points)**

Evaluate the estimated pdf on a set of points.

**Parameters**

**points**

([# of dimensions, # of points]-array) Alternatively, a (# of dimensions, ) vector can be passed in and treated as a single point.

**Returns**

(# of points,)-array

The values at each point.

**Raises**
**ValueError**

[if the dimensionality of the input points is different] than the dimensionality of the KDE.

```python
scotts_factor(self)
silverman_factor(self)
```

```python
matplotlib.mlab.angle_spectrum(x, Fs=None, window=None, pad_to=None,
sides=None)
```

Compute the angle of the frequency spectrum (wrapped phase spectrum) of \( x \). Data is padded to a length of \( \text{pad\_to} \) and the windowing function \( \text{window} \) is applied to the signal.

**Parameters**

- **x**
  - [1-D array or sequence] Array or sequence containing the data

- **Fs**
  - [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, \( \text{freqs} \), in cycles per time unit.

- **window**
  - [callable or ndarray, default: \( \text{window\_hanning} \)] A function or a vector of length \( \text{NFFT} \). To create window vectors see \( \text{window\_hanning} \), \( \text{window\_none} \), \( \text{numpy.blackman} \), \( \text{numpy.hamming} \), \( \text{numpy.bartlett} \), \( \text{scipy.signal} \), \( \text{scipy.signal.get\_window} \), etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

- **sides**
  - [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

- **pad_to**
  - [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the \( n \) parameter in the call to \( \text{fft()} \). The default is None, which sets \( \text{pad\_to} \) equal to the length of the input signal (i.e. no padding).

**Returns**
spectrum

[1-D array] The angle of the frequency spectrum (wrapped phase spectrum).

freqs

[1-D array] The frequencies corresponding to the elements in spectrum.

See also:

psd

Returns the power spectral density.

complex_spectrum

Returns the complex-valued frequency spectrum.

magnitude_spectrum

Returns the absolute value of the complex_spectrum.

angle_spectrum

Returns the angle of the complex_spectrum.

phase_spectrum

Returns the phase (unwrapped angle) of the complex_spectrum.

specgram

Can return the complex spectrum of segments within the signal.

matplotlib.mlab.apply_window(x, window, axis=0, return_window=None)

[Deprecated] Apply the given window to the given 1D or 2D array along the given axis.

Parameters

x

[1D or 2D array or sequence] Array or sequence containing the data.

window

[function or array.] Either a function to generate a window or an array with length x.shape[axis]

axis

[int] The axis over which to do the repetition. Must be 0 or 1. The default is 0
**return_window**

[bool] If true, also return the 1D values of the window that was applied

**Notes**

Deprecated since version 3.2.

**matplotlib.mlab.cohere**(x, y, NFFT=256, Fs=2, detrend=<function detrend_none at 0x7f5434697820>, window=<function window_hanning at 0x7f5434697160>, noverlap=0, pad_to=None, sides='default', scale_by_freq=None)

The coherence between x and y. Coherence is the normalized cross spectral density:

\[
C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}
\]

**Parameters**

x, y

Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

window

[callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum
distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.

detrend

[\{'none', 'mean', 'linear'\} or callable, default 'none]\} The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls detrend_none. 'mean' calls detrend_mean. 'linear' calls detrend_linear.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int] The number of points of overlap between blocks. The default value is 0 (no overlap).

Returns

The return value is the tuple \((Cxy, f)\), where \(f\) are the frequencies of the coherence vector. For cohere, scaling the individual densities by the sampling frequency has no effect, since the factors cancel out.

See also:

psd(), csd()

For information about the methods used to compute \(P_{xy}, P_{xx}\) and \(P_{yy}\).
matplotlib.mlab.complex_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)

Compute the complex-valued frequency spectrum of x. Data is padded to a length of pad_to and the windowing function window is applied to the signal.

**Parameters**

x

[1-D array or sequence] Array or sequence containing the data

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

window

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*(). The default is None, which sets pad_to equal to the length of the input signal (i.e. no padding).

**Returns**

spectrum

freqs

[1-D array] The frequencies corresponding to the elements in spectrum.
See also:

`psd`

Returns the power spectral density.

`complex_spectrum`

Returns the complex-valued frequency spectrum.

`magnitude_spectrum`

Returns the absolute value of the `complex_spectrum`.

`angle_spectrum`

Returns the angle of the `complex_spectrum`.

`phase_spectrum`

Returns the phase (unwrapped angle) of the `complex_spectrum`.

`specgram`

Can return the complex spectrum of segments within the signal.

```python
matplotlib.mlab.csd(x, y, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None)
```

Compute the cross-spectral density.

The cross spectral density $P_{xy}$ by Welch’s average periodogram method. The vectors $x$ and $y$ are divided into $NFFT$ length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The product of the direct FFTs of $x$ and $y$ are averaged over each segment to compute $P_{xy}$, with a scaling to correct for power loss due to windowing.

If $\text{len}(x) < NFFT$ or $\text{len}(y) < NFFT$, they will be zero padded to $NFFT$.

Parameters

- $x$, $y$
  
  [1-D arrays or sequences] Arrays or sequences containing the data

- $Fs$
  
  [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, $freqs$, in cycles per time unit.

- `window`
  
  [callable or ndarray, default: `window_hanning`] A function or a vector of length $NFFT$. To create window vectors
see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls detrend_none. 'mean' calls detrend_mean. 'linear' calls detrend_linear.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int] The number of points of overlap between segments. The default value is 0 (no overlap).

Returns
**Pxy**

[1-D array] The values for the cross spectrum $P_{xy}$ before scaling (real valued)

**freqs**

[1-D array] The frequencies corresponding to the elements in $P_{xy}$

**See also:**

*psd*

equivalent to setting $y = x$.

**References**

```python
matplotlib.mlab.detrend(x, key=None, axis=None)
```

Return x with its trend removed.

**Parameters**

**x**

[array or sequence] Array or sequence containing the data.

**key**

[{'default', 'constant', 'mean', 'linear', 'none'} or function] The detrending algorithm to use. 'default', 'mean', and 'constant' are the same as `detrend_mean`. 'linear' is the same as `detrend_linear`. 'none' is the same as `detrend_none`. The default is 'mean'. See the corresponding functions for more details regarding the algorithms. Can also be a function that carries out the detrend operation.

**axis**

[int] The axis along which to do the detrending.

**See also:**

*detrend_mean*

Implementation of the 'mean' algorithm.

*detrend_linear*

Implementation of the 'linear' algorithm.
detrend_none

Implementation of the 'none' algorithm.

matplotlib.mlab.detrend_linear(y)
Return x minus best fit line; 'linear' detrending.

**Parameters**

y

[0-D or 1-D array or sequence] Array or sequence containing the data

axis

[int] The axis along which to take the mean. See numpy.mean for a description of this argument.

**See also:**

detrend_mean

Another detrend algorithm.

detrend_none

Another detrend algorithm.

detrend

A wrapper around all the detrend algorithms.

matplotlib.mlab.detrend_mean(x, axis=None)
Return x minus the mean(x).

**Parameters**

x

[array or sequence] Array or sequence containing the data Can have any dimensionality

axis

[int] The axis along which to take the mean. See numpy.mean for a description of this argument.

**See also:**

detrend_linear

Another detrend algorithm.
detrend_none
   Another detrend algorithm.

detrend
   A wrapper around all the detrend algorithms.

matplotlib.mlab.detrend_none(x, axis=None)
   Return x: no detrending.

   Parameters

   x
      [any object] An object containing the data

   axis
      [int] This parameter is ignored. It is included for compatibility
           with detrend_mean

   See also:

   detrend_mean
      Another detrend algorithm.

   detrend_linear
      Another detrend algorithm.

   detrend
      A wrapper around all the detrend algorithms.

matplotlib.mlab.magnitude_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)
   Compute the magnitude (absolute value) of the frequency spectrum of x. Data
   is padded to a length of pad_to and the windowing function window is applied to
   the signal.

   Parameters

   x
      [1-D array or sequence] Array or sequence containing the data

   Fs
      [float, default: 2] The sampling frequency (samples per time
           unit). It is used to calculate the Fourier frequencies, freqs, in
           cycles per time unit.
window
[callable or ndarray, default: \textit{window\_hanning}] A function or a vector of length \textit{NFFT}. To create window vectors see \textit{window\_hanning}, \textit{window\_none}, \textit{numpy\_blackman}, \textit{numpy\_hamming}, \textit{numpy\_bartlett}, \textit{scipy\_signal}, \textit{scipy\_signal\_get\_window}, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides
[\{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad\_to
[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the \textit{n} parameter in the call to \textit{fft()}. The default is None, which sets pad\_to equal to the length of the input signal (i.e. no padding).

Returns

\textbf{spectrum}
[1-D array] The magnitude (absolute value) of the frequency spectrum.

\textbf{freqs}
[1-D array] The frequencies corresponding to the elements in \textit{spectrum}.

\textbf{See also:}

\textbf{psd}
Returns the power spectral density.

\textbf{complex\_spectrum}
Returns the complex-valued frequency spectrum.

\textbf{magnitude\_spectrum}
Returns the absolute value of the \textit{complex\_spectrum}.

\textbf{angle\_spectrum}
Returns the angle of the \textit{complex\_spectrum}. 
**phase_spectrum**

Returns the phase (unwrapped angle) of the complex_spectrum.

**specgram**

Can return the complex spectrum of segments within the signal.

```python
matplotlib.mlab.phase_spectrum(x, Fs=None, window=None, pad_to=None, sides=None)
```

Compute the phase of the frequency spectrum (unwrapped phase spectrum) of x. Data is padded to a length of pad_to and the windowing function window is applied to the signal.

**Parameters**

- **x**
  
  [1-D array or sequence] Array or sequence containing the data

- **Fs**
  
  [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

- **window**
  
  [callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

- **sides**
  
  [{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. ‘default’ is one-sided for real data and two-sided for complex data. ‘onesided’ forces the return of a one-sided spectrum, while ‘twosided’ forces two-sided.

- **pad_to**
  
  [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to the length of the input signal (i.e. no padding).

**Returns**
**spectrum**

[1-D array] The phase of the frequency spectrum (unwrapped phase spectrum).

**freqs**

[1-D array] The frequencies corresponding to the elements in `spectrum`.

See also:

**psd**

Returns the power spectral density.

**complex_spectrum**

Returns the complex-valued frequency spectrum.

**magnitude_spectrum**

Returns the absolute value of the `complex_spectrum`.

**angle_spectrum**

Returns the angle of the `complex_spectrum`.

**phase_spectrum**

Returns the phase (unwrapped angle) of the `complex_spectrum`.

**specgram**

Can return the complex spectrum of segments within the signal.

```
matplotlib.mlab.psd(x, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None)
```

Compute the power spectral density.

The power spectral density $P_{xx}$ by Welch's average periodogram method. The vector $x$ is divided into $NFFT$ length segments. Each segment is detrended by function `detrend` and windowed by function `window`. `noverlap` gives the length of the overlap between segments. The $|\text{ft}(i)|^2$ of each segment $i$ are averaged to compute $P_{xx}$.

If len($x$) < $NFFT$, it will be zero padded to $NFFT$.

**Parameters**

**x**

[1-D array or sequence] Array or sequence containing the data
Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

**window**

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window*, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad_to**

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from *NFFT*, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the *n* parameter in the call to *fft()*.

**NFFT**

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use *pad_to* for this instead.

**detrend**

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the *detrend* parameter is a vector, in Matplotlib it is a function. The *mlab* module defines *detrend_none, detrend_mean, and detrend_linear*, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls *detrend_none*. 'mean' calls *detrend_mean*. 'linear' calls *detrend_linear*.

**scale_by_freq**
[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

[int] The number of points of overlap between segments. The default value is 0 (no overlap).

**Returns**

**Pxx**

[1-D array] The values for the power spectrum $P_{xx}$ (real valued)

**freqs**

[1-D array] The frequencies corresponding to the elements in $P_{xx}$

**See also:**

specgram

specgram differs in the default overlap; in not returning the mean of the segment periodograms; and in returning the times of the segments.

magnitude_spectrum

returns the magnitude spectrum.

csd

returns the spectral density between two signals.

**References**

```python
matplotlib.mlab.specgram(x, NFFT=None, Fs=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, mode=None)
```

Compute a spectrogram.

Compute and plot a spectrogram of data in x. Data are split into NFFT length segments and the spectrum of each section is computed. The windowing function window is applied to each segment, and the amount of overlap of each segment is specified with noverlap.

**Parameters**
x

[array-like] 1-D array or sequence.

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

window

[callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls detrend_none. 'mean' calls detrend_mean. 'linear' calls detrend_linear.
scale_by_freq
[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap
[int, optional] The number of points of overlap between blocks. The default value is 128.

mode
[str, default: 'psd']

What sort of spectrum to use:

'psd'
Returns the power spectral density.

'complex'
Returns the complex-valued frequency spectrum.

'magnitude'
Returns the magnitude spectrum.

'angle'
Returns the phase spectrum without unwrapping.

'phase'
Returns the phase spectrum with unwrapping.

Returns

spectrum
[array-like] 2-D array, columns are the periodograms of successive segments.

df
[array-like] 1-D array, frequencies corresponding to the rows in spectrum.

t
[array-like] 1-D array, the times corresponding to midpoints of segments (i.e the columns in spectrum).

See also:
The `psd` function differs in the overlap and in the return values. The `complex_spectrum` function is similar, but with complex valued frequencies. The `magnitude_spectrum` function is similar single segment when mode is 'magnitude'. The `angle_spectrum` function is similar to single segment when mode is 'angle'. The `phase_spectrum` function is similar to single segment when mode is 'phase'.

**Notes**

Detrend and `scale_by_freq` only apply when `mode` is set to 'psd'.

```python
matplotlib.mlab.stride_repeat(x, n, axis=0)
```

[Deprecated] Repeat the values in an array in a memory-efficient manner. Array `x` is stacked vertically `n` times.

**Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

**Parameters**

- `x`  
  [1D array or sequence] Array or sequence containing the data.
- `n`  
  [int] The number of time to repeat the array.
- `axis`  
  [int] The axis along which the data will run.
Notes

Deprecated since version 3.2.

References

stackoverflow: Repeat NumPy array without replicating data?

matplotlib.mlab.stride_windows(x, n, noverlap=None, axis=0)
Get all windows of x with length n as a single array, using strides to avoid data duplication.

**Warning:** It is not safe to write to the output array. Multiple elements may point to the same piece of memory, so modifying one value may change others.

Parameters

- **x**
  [1D array or sequence] Array or sequence containing the data.

- **n**
  [int] The number of data points in each window.

- **noverlap**
  [int] The overlap between adjacent windows. Default is 0 (no overlap)

- **axis**
  [int] The axis along which the windows will run.

References

stackoverflow: Rolling window for 1D arrays in Numpy? stackoverflow: Using strides for an efficient moving average filter

matplotlib.mlab.window_hanning(x)
Return x times the hanning window of len(x).

**See also:**

window_none

Another window algorithm.
matplotlib.mlab.window_none(x)
No window function; simply return x.

See also:

window_hanning
Another window algorithm.

18.34 matplotlib.offsetbox

Container classes for Artists.

OffsetBox
The base of all container artists defined in this module.

AnchoredOffsetbox, AnchoredText
Anchor and align an arbitrary Artist or a text relative to the parent axes or a specific anchor point.

DrawingArea
A container with fixed width and height. Children have a fixed position inside the container and may be clipped.

HPacker, VPacker
Containers for layouting their children vertically or horizontally.

PaddedBox
A container to add a padding around an Artist.
TextArea

Contains a single Text instance.

class matplotlib.offsetbox.AnchoredOffsetbox(loc, pad=0.4, borderpad=0.5, child=None, prop=None, frameon=True, bbox_to_anchor=None, bbox_transform=None, **kwargs)

Bases: matplotlib.offsetbox.OffsetBox

An offset box placed according to location loc.

AnchoredOffsetbox has a single child. When multiple children are needed, use an extra OffsetBox to enclose them. By default, the offset box is anchored against its parent axes. You may explicitly specify the bbox_to_anchor.

Parameters

loc

[str] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter loc of Legend for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the bbox_to_anchor.

child

[OffsetBox] The box that will be anchored.
prop

[FontProperties] This is only used as a reference for paddings. If not given, rcParams['legend.fontsize'] (default: 'medium') is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs

All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

codes = {'center': 10, 'center left': 6, 'center right': 7, 'lower center': 8, 'lower left': 3, 'lower right': 4, 'right': 5, 'upper center': 9, 'upper left': 2, 'upper right': 1}

draw(self, renderer)

Update the location of children if necessary and draw them to the given renderer.

get_bbox_to_anchor(self)

Return the bbox that the box is anchored to.

get_child(self)

Return the child.

get_children(self)

Return the list of children.

get_extent(self, renderer)

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

get_window_extent(self, renderer)

Return the bounding box in display space.

set_bbox_to_anchor(self, bbox, transform=None)

Set the bbox that the box is anchored to.
bbox can be a Bbox instance, a list of [left, bottom, width, height], or a list
of [left, bottom] where the width and height will be assumed to be zero. The
bbox will be transformed to display coordinate by the given transform.

```
set_child(self, child)
    Set the child to be anchored.
```

```
update_frame(self, bbox, fontsize=None)
zorder = 5
```

class matplotlib.offsetbox.AnchoredText(s, loc, pad=0.4, borderpad=0.5,
    prop=None, **kwargs)
Bases: matplotlib.offsetbox.AnchoredOffsetbox

AnchoredOffsetbox with Text.

**Parameters**

**s**
   [str] Text.

**loc**
   [str] Location code. See AnchoredOffsetbox.

**pad**
   [float, default: 0.4] Padding around the text as fraction of the
   fontsize.

**borderpad**
   [float, default: 0.5] Spacing between the offsetbox frame and the
   bbox_to_anchor.

**prop**
   [dict, optional] Dictionary of keyword parameters to be passed
   to the Text instance contained inside AnchoredText.

**kwags**
   All other parameters are passed to AnchoredOffsetbox.

class matplotlib.offsetbox.AnnotationBbox(offsetbox, xy, xybox=None,
    xycoords='data', boxcoords=boxcoords=boxcoords=None, frameon=True,
    pad=0.4, annotation_clip=None, box_alignment=0.5, 0.5, bboxprops=None,
    arrowprops=arrowprops=None, fontsize=None, **kwargs)
Bases: matplotlib.artist.Artist, matplotlib.text._AnnotationBase

Container for an OffsetBox referring to a specific position xy.
Optionally an arrow pointing from the offsetbox to xy can be drawn.
This is like Annotation, but with OffsetBox instead of Text.

**Parameters**

- **offsetbox**
  
  [OffsetBox]

- **xy**
  
  [(float, float)] The point \((x, y)\) to annotate. The coordinate system is determined by xycoords.

- **xybox**
  
  [(float, float), default: xy] The position \((x, y)\) to place the text at. The coordinate system is determined by boxcoords.

- **xycoords**
  
  [str or Artist or Transform or callable or (float, float), default: 'data'] The coordinate system that xy is given in. See the parameter xycoords in Annotation for a detailed description.

- **boxcoords**
  
  [str or Artist or Transform or callable or (float, float), default: value of xycoords] The coordinate system that xybox is given in. See the parameter textcoords in Annotation for a detailed description.

- **frameon**
  
  [bool, default: True] Whether to draw a frame around the box.

- **pad**
  
  [float, default: 0.4] Padding around the offsetbox.

- **box_alignment**
  
  [(float, float)] A tuple of two floats for a vertical and horizontal alignment of the offset box w.r.t. the boxcoords. The lower-left corner is \((0, 0)\) and upper-right corner is \((1, 1)\).

- ****kwargs
  
  Other parameters are identical to Annotation.

**property anncoords**

contains(self, mouseevent)

Test whether the artist contains the mouse event.

**Parameters**
mouseevent

matplotlib.backend_bases.MouseEvent

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_children(self)

Return a list of the child Artists of this Artist.

get_fontsize(self, s=<deprecated parameter>)

Return the fontsize in points.

get_tightbbox(self, renderer)

get tight bounding box in display space.

get_window_extent(self, renderer)

get the bounding box in display space.

set_figure(self, fig)

Set the Figure instance the artist belongs to.

Parameters

fig

[Figure]
set_fontsize(self, s=None)
    Set the fontsize in points.

    If s is not given, reset to rcParams["legend.fontsize"] (default: 'medium').

update_positions(self, renderer)
    Update the pixel positions of the annotated point and the text.

property xyann
    zorder = 3

class matplotlib.offsetbox.AuxTransformBox(aux_transform)
    Bases: matplotlib.offsetbox.OffsetBox
    
    Offset Box with the aux_transform. Its children will be transformed with the
aux_transform first then will be offsetted. The absolute coordinate of the
aux_transform is meaning as it will be automatically adjust so that the left-lower
corner of the bounding box of children will be set to (0, 0) before the offset
transform.

    It is similar to drawing area, except that the extent of the box is not predeter-
mined but calculated from the window extent of its children. Furthermore, the
extent of the children will be calculated in the transformed coordinate.

    add_artist(self, a)
        Add an Artist to the container box.

    draw(self, renderer)
        Update the location of children if necessary and draw them to the given
        renderer.

    get_extent(self, renderer)
        Return a tuple width, height, xdescent, ydescent of the box.

    get_offset(self)
        Return offset of the container.

    get_transform(self)
        Return the Transform applied to the children

    get_window_extent(self, renderer)
        Return the bounding box in display space.

    set_offset(self, xy)
        Set the offset of the container.

    Parameters

    xy
        [(float, float)] The (x, y) coordinates of the offset in display units.

    set_transform(self, t)
        set_transform is ignored.
class matplotlib.offsetbox.DraggableAnnotation(annotation, use_blit=False)
Bases: matplotlib.offsetbox.DraggableBase

save_offset(self)
update_offset(self, dx, dy)

class matplotlib.offsetbox.DraggableBase(ref_artist, use_blit=False)
Bases: object

Helper base class for a draggable artist (legend, offsetbox).
Derived classes must override the following methods:

```
def save_offset(self):
    '''
    Called when the object is picked for dragging; should save the
    reference position of the artist.
    '''

def update_offset(self, dx, dy):
    '''
    Called during the dragging; (*dx*, *dy*) is the pixel offset from
    the point where the mouse drag started.
    '''
```

Optionally, you may override the following method:

```
def finalize_offset(self):
    '''Called when the mouse is released.'''
```

In the current implementation of DraggableLegend and DraggableAnnotation,
update_offset places the artists in display coordinates, and finalize_offset re-
calculates their position in axes coordinate and set a relevant attribute.

artist_picker(self, artist, evt)
    [Deprecated]

Notes

Deprecated since version 3.3:

disconnect(self)
    Disconnect the callbacks.
finalize_offset(self)
on_motion(self, evt)
on_motion_blit(self, evt)
    [Deprecated]
Notes

Deprecated since version 3.3:

```python
on_pick(self, evt)
on_release(self, event)
save_offset(self)
update_offset(self, dx, dy)
```

class matplotlib.offsetbox.DraggableOffsetBox(ref_artist, offsetbox, use_blit=False)

Bases: matplotlib.offsetbox.DraggableBase

```python
get_loc_in_canvas(self)
save_offset(self)
update_offset(self, dx, dy)
```

class matplotlib.offsetbox.DrawingArea(width, height, xdescent=0.0, ydescent=0.0, clip=False)

Bases: matplotlib.offsetbox.OffsetBox

The DrawingArea can contain any Artist as a child. The DrawingArea has a fixed width and height. The position of children relative to the parent is fixed. The children can be clipped at the boundaries of the parent.

Parameters

**width, height**

[Float] Width and height of the container box.

**xdescent, ydescent**

[Float] Descent of the box in x- and y-direction.

**clip**

[Bool] Whether to clip the children to the box.

```python
add_artist(self, a)
```

Add an Artist to the container box.

```python
property clip_children
```

If the children of this DrawingArea should be clipped by DrawingArea bounding box.

```python
draw(self, renderer)
```

Update the location of children if necessary and draw them to the given renderer.

```python
get_extent(self, renderer)
```

Return width, height, xdescent, ydescent of box.
get_offset(self)
    Return offset of the container.

get_transform(self)
    Return the Transform applied to the children.

get_window_extent(self, renderer)
    Return the bounding box in display space.

set_offset(self, xy)
    Set the offset of the container.

    Parameters

    xy
        [(float, float)] The (x, y) coordinates of the offset in display units.

set_transform(self, t)
    set_transform is ignored.

class matplotlib.offsetbox.HPacker(pad=None, sep=None, width=None, height=None, align='baseline', mode='fixed', children=None)

Bases: matplotlib.offsetbox.PackerBase

The HPacker has its children packed horizontally. It automatically adjusts the relative positions of children at draw time.

    Parameters

    pad
        [float, optional] The boundary padding in points.

    sep
        [float, optional] The spacing between items in points.

    width, height
        [float, optional] Width and height of the container box in pixels, calculated if None.

    align
        [{'top', 'bottom', 'left', 'right', 'center', 'baseline'}] Alignment of boxes.

    mode
        [{'fixed', 'expand', 'equal'}] The packing mode.
        • 'fixed' packs the given Artists tight with sep spacing.
        • 'expand' uses the maximal available space to distribute the artists with equal spacing in between.
• ‘equal’: Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

children

[list of Artist] The artists to pack.

Notes

pad and sep are in points and will be scaled with the renderer dpi, while width and height are in in pixels.

get_extent_offsets(self, renderer)

Update offset of the children and return the extent of the box.

Parameters

renderer

[RendererBase subclass]

Returns

width
height
xdescent
ydescent
list of (xoffset, yoffset) pairs

class matplotlib.offsetbox.OffsetBox(*args, **kwargs)

Bases: matplotlib.artist.Artist

The OffsetBox is a simple container artist.

The child artists are meant to be drawn at a relative position to its parent.

Being an artist itself, all parameters are passed on to Artist.

property axes

The Axes instance the artist resides in, or None.

contains(self, mouseevent)

Delegate the mouse event contains-check to the children.

As a container, the OffsetBox does not respond itself to mouseevents.

Parameters

mouseevent

[matplotlib.backend_bases.MouseEvent]
Returns

contains
[bool] Whether any values are within the radius.

details
[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

See also:

Artist.contains
draw(self, renderer)
Update the location of children if necessary and draw them to the given renderer.

get_children(self)
Return a list of the child Artists.

get_extent(self, renderer)
Return a tuple width, height, xdescent, ydescent of the box.

get_extent_offsets(self, renderer)
Update offset of the children and return the extent of the box.

Parameters

renderer
[RendererBase subclass]

Returns

width
height
xdescent
ydescent

list of (xoffset, yoffset) pairs

get_offset(self, width, height, xdescent, ydescent, renderer)
Return the offset as a tuple (x, y).

The extent parameters have to be provided to handle the case where the offset is dynamically determined by a callable (see set_offset).

Parameters
width, height, xdescent, ydescent
Extent parameters.

renderer

[RendererBase subclass]

get_visible_children(self)
Return a list of the visible child Artists.

get_window_extent(self, renderer)
Return the bounding box (Bbox) in display space.

set_figure(self, fig)
Set the Figure for the OffsetBox and all its children.

Parameters

fig

[Figure]

set_height(self, height)
Set the height of the box.

Parameters

height

[float]

set_offset(self, xy)
Set the offset.

Parameters

xy

[(float, float) or callable] The (x, y) coordinates of the offset in display units. These can either be given explicitly as a tuple (x, y), or by providing a function that converts the extent into the offset. This function must have the signature:

def offset(width, height, xdescent, ydescent, renderer) -> (float, float)

set_width(self, width)
Set the width of the box.

Parameters
class matplotlib.offsetbox.OffsetImage(arr, zoom=1, cmap=None, norm=None, interpolation=None, origin=None, filternorm=True, filterrad=4.0, resample=False, dpi_cor=True, **kwargs)

Bases: matplotlib.offsetbox.OffsetBox
draw(self, renderer)
    Update the location of children if necessary and draw them to the given renderer.

get_children(self)
    Return a list of the child Artists.

get_data(self)

get_extent(self, renderer)
    Return a tuple width, height, xdescent, ydescent of the box.

get_offset(self)
    Return offset of the container.

get_window_extent(self, renderer)
    Return the bounding box in display space.

get_zoom(self)

set_data(self, arr)

set_zoom(self, zoom)

class matplotlib.offsetbox.PackerBase(pad=None, sep=None, width=None, height=None, align=None, mode=None, children=None)

Bases: matplotlib.offsetbox.OffsetBox

Parameters

    pad
        [float, optional] The boundary padding in points.

    sep
        [float, optional] The spacing between items in points.

    width, height
        [float, optional] Width and height of the container box in pixels, calculated if None.

    align
Alignment of boxes.

**mode**

[{‘fixed’, ‘expand’, ‘equal’}] The packing mode.
- ‘fixed’ packs the given Artists tight with sep spacing.
- ‘expand’ uses the maximal available space to distribute the artists with equal spacing in between.
- ‘equal’: Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

**children**

[list of *Artist*] The artists to pack.

**Notes**

*pad* and *sep* are in points and will be scaled with the renderer dpi, while *width* and *height* are in in pixels.

### class matplotlib.offsetbox.PaddedBox(child, pad=None, draw_frame=False, patch_attrs=None)

Bases: matplotlib.offsetbox.OffsetBox

A container to add a padding around an *Artist*.

The `PaddedBox` contains a `FancyBboxPatch` that is used to visualize it when rendering.

**Parameters**

**child**

[*Artist*] The contained *Artist*.

**pad**

[float] The padding in points. This will be scaled with the renderer dpi. In contrast *width* and *height* are in *pixels* and thus not scaled.

**draw_frame**

[bool] Whether to draw the contained `FancyBboxPatch`.

**patch_attrs**

[dict or None] Additional parameters passed to the contained `FancyBboxPatch`. 
draw(self, renderer)
    Update the location of children if necessary and draw them to the given
    renderer.

draw_frame(self, renderer)

get_extent_offsets(self, renderer)
    Update offset of the children and return the extent of the box.

Parameters

renderer
    [RendererBase subclass]

Returns

width
height
xdescent
ydescent
list of (xoffset, yoffset) pairs

update_frame(self, bbox, fontsize=None)

class matplotlib.offsetbox.TextArea(s, textprops=None, multilinebaseline=None, minimumdescent=True)
Bases: matplotlib.offsetbox.OffsetBox

The TextArea is contains a single Text instance. The text is placed at (0, 0) with
baseline+left alignment. The width and height of the TextArea instance is the
width and height of the its child text.

Parameters

s
    [str] The text to be displayed.

textprops
    [dict, optional] Dictionary of keyword parameters to be passed
to the Text instance contained inside TextArea.

multilinebaseline
    [bool, optional] If True, baseline for multiline text is adjusted so
that it is (approximately) center-aligned with singleline text.

minimumdescent
    [bool, optional] If True, the box has a minimum descent of "p".
draw(self, renderer)
    Update the location of children if necessary and draw them to the given
    renderer.

get_extent(self, renderer)
    Return a tuple width, height, xdescent, ydescent of the box.

get_minimumdescent(self)
    Get minimumdescent.

get_multilinebaseline(self)
    Get multilinebaseline.

get_offset(self)
    Return offset of the container.

get_text(self)
    Return the string representation of this area's text.

get_window_extent(self, renderer)
    Return the bounding box in display space.

set_minimumdescent(self, t)
    Set minimumdescent.
    If True, extent of the single line text is adjusted so that it has minimum
descent of "p"

set_multilinebaseline(self, t)
    Set multilinebaseline.
    If True, baseline for multiline text is adjusted so that it is (approximately)
center-aligned with single-line text.

set_offset(self, xy)
    Set the offset of the container.

    Parameters

    xy
        [(float, float)] The (x, y) coordinates of the offset in display units.

set_text(self, s)
    Set the text of this area as a string.

set_transform(self, t)
    set_transform is ignored.

class matplotlib.offsetbox.VPacker(pad=None, sep=None, width=None,
    height=None, align='baseline',
    mode='fixed', children=None)

Bases: matplotlib.offsetbox.PackerBase

    The VPacker has its children packed vertically. It automatically adjusts the re-
    lative positions of children at drawing time.
Parameters

pad

[float, optional] The boundary padding in points.

sep

[float, optional] The spacing between items in points.

width, height

[float, optional] Width and height of the container box in pixels, calculated if None.

align

mode

[{‘fixed’, ‘expand’, ‘equal’}] The packing mode.

• ‘fixed’ packs the given Artists tight with sep spacing.
• ‘expand’ uses the maximal available space to distribute the artists with equal spacing in between.
• ‘equal’: Each artist an equal fraction of the available space and is left-aligned (or top-aligned) therein.

children

[list of Artist] The artists to pack.

Notes

pad and sep are in points and will be scaled with the renderer dpi, while width and height are in in pixels.

get_extent_offsets(self, renderer)

Update offset of the children and return the extent of the box.

Parameters

renderer

[RendererBase subclass]

Returns

width

height
**xdescent**

**ydescent**

**list of (xoffset, yoffset) pairs**

```
matplotlib.offsetbox.bbox_artist(*args, **kwargs)
```

---

### 18.35 matplotlib.patches

#### 18.35.1 Classes

- **Arc***(xy, width, height[, angle, theta1, theta2])***
  An elliptical arc, i.e.

- **Arrow***(x, y, dx, dy[, width])**
  An arrow patch.

- **ArrowStyle***(stylename, **kw)**
  *ArrowStyle* is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path.

- **BoxStyle***(stylename, **kw)**
  *BoxStyle* is a container class which defines several boxstyle classes, which are used for *FancyBboxPatch*.

- **Circle***(xy[, radius])**
  A circle patch.

- **CirclePolygon***(xy[, radius, resolution])**
  A polygon-approximation of a circle patch.

- **ConnectionPatch***(xA, yB, coordsA[, ...])**
  A patch that connects two points (possibly in different axes).

- **ConnectionStyle***(stylename, **kw)**
  *ConnectionStyle* is a container class which defines several connectionstyle classes, which is used to create a path between two points.

- **Ellipse***(xy, width, height[, angle])**
  A scale-free ellipse.

- **FancyArrow***(x, y, dx, dy[, width, ...])**
  Like *Arrow*, but lets you set head width and head height independently.

- **FancyArrowPatch***((posA, posB, path, ...))**
  A fancy arrow patch.

- **FancyBboxPatch***(xy, width, height[, ...])**
  A fancy box around a rectangle with lower left at *xy* = (x, y) with specified width and height.

- **Patch***(edgecolor, facecolor, color, ...)**
  A patch is a 2D artist with a face color and an edge color.

- **PathPatch***(path, **kwargs)**
  A general polycurve path patch.

- **Polygon***(xy[, closed])**
  A general polygon patch.

- **Rectangle***(xy, width, height[, angle])**
  A rectangle defined via an anchor point *xy* and its *width* and *height*.

**matplotlib.patches.Arc**

```python
class matplotlib.patches.Arc(xy, width, height, angle=0.0, theta1=0.0, theta2=360.0, **kwargs)

Bases: matplotlib.patches.Ellipse
```

An elliptical arc, i.e. a segment of an ellipse.

Due to internal optimizations, there are certain restrictions on using Arc:

- The arc cannot be filled.
- The arc must be used in an `Axes` instance. It can not be added directly to a `Figure` because it is optimized to only render the segments that are inside the axes bounding box with high resolution.

**Parameters**

- **xy**
  - [(float, float)] The center of the ellipse.

- **width**
  - [float] The length of the horizontal axis.

- **height**
  - [float] The length of the vertical axis.

- **angle**
  - [float] Rotation of the ellipse in degrees (counterclockwise).

- **theta1, theta2**
  - [float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to `angle`, e.g. if `angle = 45` and `theta1 = 90` the absolute starting angle is 135. Default `theta1 = 0`, `theta2 = 360`, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

**Other Parameters**
**kwargs

[Patch properties] Most Patch properties are supported as keyword arguments, with the exception of fill and facecolor because filling is not supported.

**Parameters**

xy

[[float, float]] The center of the ellipse.

width
[float] The length of the horizontal axis.

**height**

[float] The length of the vertical axis.

**angle**

[float] Rotation of the ellipse in degrees (counterclockwise).

**theta1, theta2**

[float, default: 0, 360] Starting and ending angles of the arc in degrees. These values are relative to *angle*, e.g. if *angle* = 45 and *theta1* = 90 the absolute starting angle is 135. Default *theta1* = 0, *theta2* = 360, i.e. a complete ellipse. The arc is drawn in the counterclockwise direction. Angles greater than or equal to 360, or smaller than 0, are represented by an equivalent angle in the range [0, 360), by taking the input value mod 360.

```python
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

draw(self, renderer)
    Draw the arc to the given renderer.
```

Notes

Ellipses are normally drawn using an approximation that uses eight cubic Bezier splines. The error of this approximation is 1.89818e-6, according to this unverified source:

Lancaster, Don. *Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.*

There is a use case where very large ellipses must be drawn with very high accuracy, and it is too expensive to render the entire ellipse with enough segments (either splines or line segments). Therefore, in the case where either radius of the ellipse is large enough that the error of the spline approximation will be visible (greater than one pixel offset from the ideal), a different technique is used.

In that case, only the visible parts of the ellipse are drawn, with each visible arc using a fixed number of spline segments (8). The algorithm proceeds as follows:

1. The points where the ellipse intersects the axes bounding box are located. (This is done by performing an inverse transformation on the axes bbox such that it is relative to the unit circle -- this makes the intersection calculation much easier than doing rotated ellipse intersection directly).
This uses the "line intersecting a circle" algorithm from:

2. The angles of each of the intersection points are calculated.

3. Proceeding counterclockwise starting in the positive x-direction, each of the visible arc-segments between the pairs of vertices are drawn using the Bezier arc approximation technique implemented in `Path.arc`.

**Examples using `matplotlib.patches.Arc`**

- sphx_glr_gallery_units_ellipse_with_units.py
- *Sample plots in Matplotlib*

**`matplotlib.patches.Arrow`**

```python
class matplotlib.patches.Arrow(x, y, dx, dy, width=1.0, **kwargs)
    Bases: matplotlib.patches.Patch

An arrow patch.

Draws an arrow from (x, y) to (x + dx, y + dy). The width of the arrow is scaled by `width`.

**Parameters**

- **x**
  - [float] x coordinate of the arrow tail.
- **y**
  - [float] y coordinate of the arrow tail.
- **dx**
  - [float] Arrow length in the x direction.
- **dy**
  - [float] Arrow length in the y direction.
- **width**
  - [float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.
- **kwargs**
  - Keyword arguments control the `Patch` properties:

FancyArrow

Patch that allows independent control of the head and tail properties.

```
__init__(self, x, y, dx, dy, width=1.0, **kwargs)
```

Draws an arrow from (x, y) to (x + dx, y + dy). The width of the arrow is scaled by width.

**Parameters**

x

[float] x coordinate of the arrow tail.
y
  [float] y coordinate of the arrow tail.

dx
  [float] Arrow length in the x direction.

dy
  [float] Arrow length in the y direction.

width
  [float, default: 1] Scale factor for the width of the arrow. With a default value of 1, the tail width is 0.2 and head width is 0.6.

**kwargs

Keyword arguments control the Patch properties:

FancyArrow

Patch that allows independent control of the head and tail properties.

```python
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

get_patch_transform(self)
    Return the `Transform` instance mapping patch coordinates to data coordinates.

    For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path(self)
    Return the path of this patch.
```

Examples using `matplotlib.patches.Arrow`

- sphx_glr_gallery_shapes_and_collections_arrow_guide.py
- sphx_glr_gallery_shapes_and_collections_artist_reference.py

`matplotlib.patches.ArrowStyle`

class `matplotlib.patches.ArrowStyle(stylename, **kw)`

    Bases: `matplotlib.patches._Style`

    `ArrowStyle` is a container class which defines several arrowstyle classes, which is used to create an arrow path along a given path. These are mainly used with `FancyArrowPatch`.

    A arrowstyle object can be either created as:

    ```python
    ArrowStyle.Fancy(head_length=.4, head_width=.4, tail_width=.4)
    ```

    or:

    ```python
    ArrowStyle("Fancy", head_length=.4, head_width=.4, tail_width=.4)
    ```
or:

```python
ArrowStyle("Fancy, head_length=.4, head_width=.4, tail_width=.4")
```

The following classes are defined

<table>
<thead>
<tr>
<th>Class</th>

</tbody>
</table>

An instance of any arrow style class is a callable object, whose call signature is:

```python
__call__(self, path, mutation_size, linewidth, aspect_ratio=1.)
```

and it returns a tuple of a `Path` instance and a boolean value. `path` is a `Path` instance along which the arrow will be drawn. `mutation_size` and `aspect_ratio` have the same meaning as in `BoxStyle`. `linewidth` is a line width to be stroked. This is meant to be used to correct the location of the head so that it does not overshoot the destination point, but not all classes support it.

Return the instance of the subclass with the given style name.

```python
class BarAB(widthA=1.0, angleA=None, widthB=1.0, angleB=None)
    Bases: matplotlib.patches.ArrowStyle._Bracket

    An arrow with vertical bars | at both ends.

    Parameters

    widthA
```

2254 Chapter 18. Modules
[float, default: 1.0] Width of the bracket.

**angleA**

[float, default: None] Angle between the bracket and the line.

**widthB**

[float, default: 1.0] Width of the bracket.

**angleB**

[float, default: None] Angle between the bracket and the line.

```python
__init__(self, widthA=1.0, angleA=None, widthB=1.0, angleB=None)
```

**Parameters**

**widthA**

[float, default: 1.0] Width of the bracket.

**angleA**

[float, default: None] Angle between the bracket and the line.

**widthB**

[float, default: 1.0] Width of the bracket.

**angleB**

[float, default: None] Angle between the bracket and the line.

```python
__module__ = 'matplotlib.patches'
```

class BracketA(widthA=1.0, lengthA=0.2, angleA=None)

**Bases:** matplotlib.patches.ArrowStyle._Bracket

An arrow with an outward square bracket at its start.

**Parameters**

**widthA**

[float, default: 1.0] Width of the bracket.

**lengthA**

[float, default: 0.2] Length of the bracket.

**angleA**

[float, default: None] Angle between the bracket and the line.

```python
__init__(self, widthA=1.0, lengthA=0.2, angleA=None)
```

**Parameters**

**widthA**

[float, default: 1.0] Width of the bracket.
lengthA
   [float, default: 0.2] Length of the bracket.

angleA
   [float, default: None] Angle between the bracket and the line.

__module__ = 'matplotlib.patches'

class BracketAB(widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None)
Bases: matplotlib.patches.ArrowStyle._Bracket

An arrow with outward square brackets at both ends.

Parameters

widthA  
   [float, default: 1.0] Width of the bracket.

lengthA
   [float, default: 0.2] Length of the bracket.

angleA
   [float, default: None] Angle between the bracket and the line.

widthB
   [float, default: 1.0] Width of the bracket.

lengthB
   [float, default: 0.2] Length of the bracket.

angleB
   [float, default: None] Angle between the bracket and the line.

__init__  
   (self, widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None)

Parameters

widthA
   [float, default: 1.0] Width of the bracket.

lengthA
   [float, default: 0.2] Length of the bracket.

angleA
   [float, default: None] Angle between the bracket and the line.

widthB
   [float, default: 1.0] Width of the bracket.
lengthB
    [float, default: 0.2] Length of the bracket.

angleB
    [float, default: None] Angle between the bracket and the line.

__module__ = 'matplotlib.patches'
class BracketB(widthB=1.0, lengthB=0.2, angleB=None)
    Bases: matplotlib.patches.ArrowStyle._Bracket
    An arrow with an outward square bracket at its end.

Parameters

widthB
    [float, default: 1.0] Width of the bracket.

lengthB
    [float, default: 0.2] Length of the bracket.

angleB
    [float, default: None] Angle between the bracket and the line.

__init__(self, widthB=1.0, lengthB=0.2, angleB=None)

Parameters

widthB
    [float, default: 1.0] Width of the bracket.

lengthB
    [float, default: 0.2] Length of the bracket.

angleB
    [float, default: None] Angle between the bracket and the line.

__module__ = 'matplotlib.patches'
class Curve
    Bases: matplotlib.patches.ArrowStyle._Curve
    A simple curve without any arrow head.

    The arrows are drawn if beginarrow and/or endarrow are true. head_length
    and head_width determines the size of the arrow relative to the mutation
    scale. The arrowhead at the begin (or end) is closed if fillbegin (or fillend)
    is True.

__init__(self)
    The arrows are drawn if beginarrow and/or endarrow are true. head_length
    and head_width determines the size of the arrow relative to the mutation scale. The arrowhead at the begin (or end) is closed if fillbegin (or fillend) is True.
class CurveA:

    head_length = 0.4
    head_width = 0.2

    Bases: matplotlib.patches.ArrowStyle._Curve

    An arrow with a head at its begin point.

    Parameters

    head_length
    [float, default: 0.4] Length of the arrow head.

    head_width
    [float, default: 0.2] Width of the arrow head.

class CurveAB:

    head_length = 0.4
    head_width = 0.2

    Bases: matplotlib.patches.ArrowStyle._Curve

    An arrow with heads both at the begin and the end point.

    Parameters

    head_length
    [float, default: 0.4] Length of the arrow head.

    head_width
    [float, default: 0.2] Width of the arrow head.
class CurveB(head_length=0.4, head_width=0.2)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with a head at its end point.

Parameters

head_length
[float, default: 0.4] Length of the arrow head.

head_width
[float, default: 0.2] Width of the arrow head.

__init__(self, head_length=0.4, head_width=0.2)
Parameters

head_length
[float, default: 0.4] Length of the arrow head.

head_width
[float, default: 0.2] Width of the arrow head.

__module__ = 'matplotlib.patches'

class CurveFilledA(head_length=0.4, head_width=0.2)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with filled triangle head at the begin.

Parameters

head_length
[float, default: 0.4] Length of the arrow head.

head_width
[float, default: 0.2] Width of the arrow head.

__init__(self, head_length=0.4, head_width=0.2)
Parameters

head_length
[float, default: 0.4] Length of the arrow head.

head_width
[float, default: 0.2] Width of the arrow head.

__module__ = 'matplotlib.patches'

class CurveFilledAB(head_length=0.4, head_width=0.2)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with filled triangle heads at both ends.
**Parameters**

**head_length**

[float, default: 0.4] Length of the arrow head.

**head_width**

[float, default: 0.2] Width of the arrow head.

```python
__init__(self, head_length=0.4, head_width=0.2)
```

**Parameters**

**head_length**

[float, default: 0.4] Length of the arrow head.

**head_width**

[float, default: 0.2] Width of the arrow head.

```
__module__ = 'matplotlib.patches'
```

class CurveFilledB(head_length=0.4, head_width=0.2)
Bases: matplotlib.patches.ArrowStyle._Curve

An arrow with filled triangle head at the end.

**Parameters**

**head_length**

[float, default: 0.4] Length of the arrow head.

**head_width**

[float, default: 0.2] Width of the arrow head.

```python
__init__(self, head_length=0.4, head_width=0.2)
```

**Parameters**

**head_length**

[float, default: 0.4] Length of the arrow head.

**head_width**

[float, default: 0.2] Width of the arrow head.

```
__module__ = 'matplotlib.patches'
```

class Fancy(head_length=0.4, head_width=0.4, tail_width=0.4)
Bases: matplotlib.patches.ArrowStyle._Base

A fancy arrow. Only works with a quadratic Bezier curve.

**Parameters**
head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.4] Width of the arrow head.

tail_width

[float, default: 0.4] Width of the arrow tail.

__init__(self, head_length=0.4, head_width=0.4, tail_width=0.4)

Parameters

head_length

[float, default: 0.4] Length of the arrow head.

head_width

[float, default: 0.4] Width of the arrow head.

tail_width

[float, default: 0.4] Width of the arrow tail.

__module__ = 'matplotlib.patches'

transmute(self, path, mutation_size, linewidth)

The transmute method is the very core of the ArrowStyle class and must
be overridden in the subclasses. It receives the path object along which
the arrow will be drawn, and the mutation_size, with which the arrow
head etc. will be scaled. The linewidth may be used to adjust the path
so that it does not pass beyond the given points. It returns a tuple of
a Path instance and a boolean. The boolean value indicate whether the
path can be filled or not. The return value can also be a list of paths and
list of booleans of a same length.

class Simple(head_length=0.5, head_width=0.5, tail_width=0.2)

Bases: matplotlib.patches.ArrowStyle._Base

A simple arrow. Only works with a quadratic Bezier curve.

Parameters

head_length

[float, default: 0.5] Length of the arrow head.

head_width

[float, default: 0.5] Width of the arrow head.

tail_width

[float, default: 0.2] Width of the arrow tail.

__init__(self, head_length=0.5, head_width=0.5, tail_width=0.2)
Parameters

head_length
   [float, default: 0.5] Length of the arrow head.

head_width
   [float, default: 0.5] Width of the arrow head.

tail_width
   [float, default: 0.2] Width of the arrow tail.

__module__ = 'matplotlib.patches'

transmute(self, path, mutation_size, linewidth)
The transmute method is the very core of the ArrowStyle class and must
be overridden in the subclasses. It receives the path object along which
the arrow will be drawn, and the mutation_size, with which the arrow
head etc. will be scaled. The linewidth may be used to adjust the path
so that it does not pass beyond the given points. It returns a tuple of
a Path instance and a boolean. The boolean value indicate whether the
path can be filled or not. The return value can also be a list of paths and
list of booleans of a same length.

class Wedge(tail_width=0.3, shrink_factor=0.5)
Bases: matplotlib.patches.ArrowStyle._Base

Wedge(?) shape. Only works with a quadratic Bezier curve. The begin
point has a width of the tail_width and the end point has a width of 0. At the
middle, the width is shrink_factor*tail_width.

Parameters

tail_width
   [float, default: 0.3] Width of the tail.

shrink_factor
   [float, default: 0.5] Fraction of the arrow width at the middle
   point.

__init__(self, tail_width=0.3, shrink_factor=0.5)

Parameters

tail_width
   [float, default: 0.3] Width of the tail.

shrink_factor
   [float, default: 0.5] Fraction of the arrow width at the middle
   point.

__module__ = 'matplotlib.patches'
transmute(self, path, mutation_size, linewidth)

The transmute method is the very core of the ArrowStyle class and must be overridden in the subclasses. It receives the path object along which the arrow will be drawn, and the mutation_size, with which the arrow head etc. will be scaled. The linewidth may be used to adjust the path so that it does not pass beyond the given points. It returns a tuple of a Path instance and a boolean. The boolean value indicate whether the path can be filled or not. The return value can also be a list of paths and list of booleans of a same length.

__module__ = 'matplotlib.patches'

Examples using matplotlib.patches.ArrowStyle

• sphx_glr_gallery_text_labels_and_annotations_fancyarrow_demo.py

matplotlib.patches.BoxStyle

class matplotlib.patches.BoxStyle(stylename, **kw)
    Bases: matplotlib.patches._Style

BoxStyle is a container class which defines several boxstyle classes, which are used for FancyBboxPatch.

A style object can be created as:

BoxStyle.Round(pad=0.2)

or:

BoxStyle("Round", pad=0.2)

or:

BoxStyle("Round, pad=0.2")

The following boxstyle classes are defined.

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circle</td>
<td>circle</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>DArrow</td>
<td>darrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>LArrow</td>
<td>larrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>RArrow</td>
<td>rarrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>Round</td>
<td>round</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Round4</td>
<td>round4</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Roundtooth</td>
<td>roundtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Sawtooth</td>
<td>sawtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Square</td>
<td>square</td>
<td>pad=0.3</td>
</tr>
</tbody>
</table>
An instance of any boxstyle class is an callable object, whose call signature is:

```python
__call__(self, x0, y0, width, height, mutation_size, aspect_ratio=1.)
```

and returns a `Path` instance. \(x0, y0, width\) and \(height\) specify the location and size of the box to be drawn. \(mutation\_scale\) determines the overall size of the mutation (by which I mean the transformation of the rectangle to the fancy box). \(mutation\_aspect\) determines the aspect-ratio of the mutation.

Return the instance of the subclass with the given style name.

```python
class Circle(pad=0.3):
    Bases: matplotlib.patches.BoxStyle._Base

    A circular box.

    Parameters

    pad

    [float, default: 0.3] The amount of padding around the original box.

    __init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'matplotlib.patches'

    transmute(self, x0, y0, width, height, mutation_size)
    Return the `Path` outlining the given rectangle.

class DArrow(pad=0.3):
    Bases: matplotlib.patches.BoxStyle._Base

    A box in the shape of a two-way arrow.

    Parameters

    pad

    [float, default: 0.3] The amount of padding around the original box.

    __init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'matplotlib.patches'

    transmute(self, x0, y0, width, height, mutation_size)
    Return the `Path` outlining the given rectangle.

class LArrow(pad=0.3):
    Bases: matplotlib.patches.BoxStyle._Base

    A box in the shape of a left-pointing arrow.
```
**Parameters**

**pad**

[float, default: 0.3] The amount of padding around the original box.

```
__init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.
__module__ = 'matplotlib.patches'
transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.
```

**class RArrow(pad=0.3)**

Bases: `matplotlib.patches.BoxStyle.LArrow`

A box in the shape of a right-pointing arrow.

**Parameters**

**pad**

[float, default: 0.3] The amount of padding around the original box.

```
__init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.
__module__ = 'matplotlib.patches'
transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.
```

**class Round(pad=0.3, rounding_size=None)**

Bases: `matplotlib.patches.BoxStyle._Base`

A box with round corners.

**Parameters**

**pad**

[float, default: 0.3] The amount of padding around the original box.

**rounding_size**

[float, default: pad] Radius of the corners.

```
__init__(self, pad=0.3, rounding_size=None)
    Initialize self. See help(type(self)) for accurate signature.
__module__ = 'matplotlib.patches'
```
transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.

class Round4(pad=0.3, rounding_size=None)
    Bases: matplotlib.patches.BoxStyle._Base

    A box with rounded edges.

    Parameters

    pad
        [float, default: 0.3] The amount of padding around the original box.

    rounding_size

    __init__(self, pad=0.3, rounding_size=None)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'matplotlib.patches'

    transmute(self, x0, y0, width, height, mutation_size)
        Return the Path outlining the given rectangle.

class Roundtooth(pad=0.3, tooth_size=None)
    Bases: matplotlib.patches.BoxStyle.Sawtooth

    A box with a rounded sawtooth outline.

    Parameters

    pad
        [float, default: 0.3] The amount of padding around the original box.

    tooth_size
        [float, default: pad/2] Size of the sawtooth.

    __init__(self, pad=0.3, tooth_size=None)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'matplotlib.patches'

    transmute(self, x0, y0, width, height, mutation_size)
        Return the Path outlining the given rectangle.

class Sawtooth(pad=0.3, tooth_size=None)
    Bases: matplotlib.patches.BoxStyle._Base

    A box with a sawtooth outline.

    Parameters
**pad**

[float, default: 0.3] The amount of padding around the original box.

**tooth_size**

[float, default: \(pad/2\)] Size of the sawtooth.

```python
__init__(self, pad=0.3, tooth_size=None)
    Initialize self. See help(type(self)) for accurate signature.
__module__ = 'matplotlib.patches'
transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.
```

class Square(pad=0.3)
    Bases: matplotlib.patches.BoxStyle._Base
    A square box.

**Parameters**

**pad**

[float, default: 0.3] The amount of padding around the original box.

```python
__init__(self, pad=0.3)
    Initialize self. See help(type(self)) for accurate signature.
__module__ = 'matplotlib.patches'
transmute(self, x0, y0, width, height, mutation_size)
    Return the Path outlining the given rectangle.
__module__ = 'matplotlib.patches'
```

**Examples using** matplotlib.patches.BoxStyle

- sphx_glr_gallery_shapes_and_collections_artist_reference.py
- sphx_glr_gallery_shapes_and_collections_fancybox_demo.py
class matplotlib.patches.Circle(xy, radius=5, **kwargs)
Bases: matplotlib.patches.Ellipse

A circle patch.

Create a true circle at center \( xy = (x, y) \) with given \( radius \).

Unlike CirclePolygon which is a polygonal approximation, this uses Bezier splines and is much closer to a scale-free circle.

Valid keyword arguments are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a ((m, n, 3)) float array and a dpi value, and returns a ((m, n, 3)) array</td>

__module__ = 'matplotlib.patches'

__str__(self)

Return \texttt{str(self)}.

get_radius(self)

Return the radius of the circle.
property radius
    Return the radius of the circle.

set_radius(self, radius)
    Set the radius of the circle.

Parameters

    radius
        [float]

**matplotlib.patches.CirclePolygon**

**class** matplotlib.patches.CirclePolygon(xy, radius=5, resolution=20, **kwargs)

**Bases:** matplotlib.patches.RegularPolygon

A polygon-approximation of a circle patch.

Create a circle at \( xy = (x, y) \) with given \( radius \).

This circle is approximated by a regular polygon with \( resolution \) sides. For a smoother circle drawn with splines, see Circle.

Valid keyword arguments are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).
Examples using `matplotlib.patches.CirclePolygon` 

`matplotlib.patches.ConnectionPatch`

class `matplotlib.patches.ConnectionPatch(xyA, xyB, coordsA, coordsB=None, 
axesA=None, axesB=None, 
arrowsAstyle='-', 
connectionstyle='arc3', 
patchA=None, 
patchB=None, 
shrinkA=0.0, 
shrinkB=0.0, 
motion_scale=10.0, 
motion_aspect=None, 
clip_on=False, 
dpi_cor=1.0, 
**kwargs)

Bases: `matplotlib.patches.FancyArrowPatch`

A patch that connects two points (possibly in different axes).

Connect point `xyA` in `coordsA` with point `xyB` in `coordsB`.

Valid keys are

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowsAstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>motion_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>motion_aspect</td>
<td>default is 1.</td>
</tr>
</tbody>
</table>

| ?            | any key for `matplotlib.patches.PathPatch` |

`coordsA` and `coordsB` are strings that indicate the coordinates of `xyA` and `xyB`. 
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>points from the lower left corner of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>pixels from the lower left corner of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>0, 0 is lower left of figure and 1, 1 is upper right</td>
</tr>
<tr>
<td>'axes points'</td>
<td>points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>0, 0 is lower left of axes and 1, 1 is upper right</td>
</tr>
<tr>
<td>'data'</td>
<td>use the coordinate system of the object being annotated (default)</td>
</tr>
<tr>
<td>'offset points'</td>
<td>offset (in points) from the xy value</td>
</tr>
<tr>
<td>'polar'</td>
<td>you can specify theta, r for the annotation, even in cartesian plots. Note that if you are using a polar axes, you do not need to specify polar for the coordinate system since that is the native &quot;data&quot; coordinate system.</td>
</tr>
</tbody>
</table>

Alternatively they can be set to any valid `Transform`.

**Note:** Using `ConnectionPatch` across two `Axes` instances is not directly compatible with `constrained layout`. Add the artist directly to the `Figure` instead of adding it to a specific Axes.

```python
fig, ax = plt.subplots(1, 2, constrained_layout=True)
con = ConnectionPatch(..., axesA=ax[0], axesB=ax[1])
fig.add_artist(con)
```

```
__init__(self, xyA, xyB, coordsA, coordsB=None, axesA=None, axesB=None, arrowstyle='-', connectionstyle='arc3', patchA=None, patchB=None, shrinkA=0.0, shrinkB=0.0, mutation_scale=10.0, mutation_aspect=None, clip_on=False, dpi_cor=1.0, **kwargs)
```

Connect point `xyA` in `coordsA` with point `xyB` in `coordsB`. 
Valid keys are

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
Alternatively they can be set to any valid `Transform`.

**Note:** Using `ConnectionPatch` across two `Axes` instances is not directly compatible with `constrained layout`. Add the artist directly to the `Figure` instead of adding it to a specific Axes.

```python
fig, ax = plt.subplots(1, 2, constrained_layout=True)
con = ConnectionPatch(..., axesA=ax[0], axesB=ax[1])
fig.add_artist(con)
```

```py
__module__ = 'matplotlib.patches'
__str__(self)
    Return str(self).

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (`Artist.get_visible` returns False).

    **Parameters**

    renderer
        `[RendererBase subclass.]`

    **Notes**

    This method is overridden in the Artist subclasses.

get_annotation_clip(self)
    Return the clipping behavior.

    See `set_annotation_clip` for the meaning of the return value.

get_path_in_displaycoord(self)
    Return the mutated path of the arrow in display coordinates.

set_annotation_clip(self, b)
    Set the clipping behavior.

    **Parameters**

    b
        [bool or None]

        * False: The annotation will always be drawn regardless of its position.*
• **True**: The annotation will only be drawn if `self.xy` is inside the axes.

• **None**: The annotation will only be drawn if `self.xy` is inside the axes and `self.xycoords == "data"`.

**Examples using `matplotlib.patches.ConnectionPatch`**

- `sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py`
- `sphx_glr_gallery_userdemo_connect_simple01.py`
- *Constrained Layout Guide*

**`matplotlib.patches.ConnectionStyle`**

```python
class matplotlib.patches.ConnectionStyle(style, **kw)
Bases: matplotlib.patches._Style
```

`ConnectionStyle` is a container class which defines several connectionstyle classes, which is used to create a path between two points. These are mainly used with `FancyArrowPatch`.

A connectionstyle object can be either created as:

```python
ConnectionStyle.Arc3(rad=0.2)
```

or:

```python
ConnectionStyle("Arc3", rad=0.2)
```

or:

```python
ConnectionStyle("Arc3, rad=0.2")
```

The following classes are defined

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Angle</td>
<td>angle</td>
<td>angleA=90, angleB=0, rad=0.0</td>
</tr>
<tr>
<td>Angle3</td>
<td>angle3</td>
<td>angleA=90, angleB=0</td>
</tr>
<tr>
<td>Arc</td>
<td>arc</td>
<td>angleA=0, angleB=0, armA=None, armB=None, rad=0.0</td>
</tr>
<tr>
<td>Arc3</td>
<td>arc3</td>
<td>rad=0.0</td>
</tr>
<tr>
<td>Bar</td>
<td>bar</td>
<td>armA=0.0, armB=0.0, fraction=0.3, angle=None</td>
</tr>
</tbody>
</table>

An instance of any connection style class is an callable object, whose call signature is:

**18.35. `matplotlib.patches` 2277**
and it returns a `Path` instance. `posA` and `posB` are tuples of (x, y) coordinates of the two points to be connected. `patchA` (or `patchB`) is given, the returned path is clipped so that it start (or end) from the boundary of the patch. The path is further shrunk by `shrinkA` (or `shrinkB`) which is given in points.

Return the instance of the subclass with the given style name.

class Angle(angleA=90, angleB=0, rad=0.0)
    Bases: matplotlib.patches.ConnectionStyle._Base

    Creates a piecewise continuous quadratic Bezier path between two points. The path has a one passing-through point placed at the intersecting point of two lines which cross the start and end point, and have a slope of angleA and angleB, respectively. The connecting edges are rounded with `rad`.

    **angleA**
    starting angle of the path

    **angleB**
    ending angle of the path

    **rad**
    rounding radius of the edge

    __init__(self, angleA=90, angleB=0, rad=0.0)
        angleA
        starting angle of the path

        angleB
        ending angle of the path

        rad
        rounding radius of the edge

    __module__ = 'matplotlib.patches'

    connect(self, posA, posB)

class Angle3(angleA=90, angleB=0)
    Bases: matplotlib.patches.ConnectionStyle._Base

    Creates a simple quadratic Bezier curve between two points. The middle control points is placed at the intersecting point of two lines which cross the start and end point, and have a slope of angleA and angleB, respectively.

    **angleA**
    starting angle of the path
angleB
    ending angle of the path
__init__(self, angleA=90, angleB=0)

angleA
    starting angle of the path
angleB
    ending angle of the path
__module__ = 'matplotlib.patches'
connect(self, posA, posB)

class Arc(angleA=0, angleB=0, armA=None, armB=None, rad=0.0)
Bases: matplotlib.patches.ConnectionStyle._Base

Creates a piecewise continuous quadratic Bezier path between two points. The path can have two passing-through points, a point placed at the distance of armA and angle of angleA from point A, another point with respect to point B. The edges are rounded with rad.

angleA :
    starting angle of the path
angleB :
    ending angle of the path
armA :
    length of the starting arm
armB :
    length of the ending arm
rad :
    rounding radius of the edges
__init__(self, angleA=0, angleB=0, armA=None, armB=None, rad=0.0)
angleA :
    starting angle of the path
angleB :
    ending angle of the path
armA :
    length of the starting arm
armB :
    length of the ending arm
rad :
    rounding radius of the edges
__module__ = 'matplotlib.patches'
connect(self, posA, posB)
class Arc3(rad=0.0)
    Bases: matplotlib.patches.ConnectionStyle._Base
    Creates a simple quadratic Bezier curve between two points. The curve is
    created so that the middle control point (C1) is located at the same distance
    from the start (C0) and end points(C2) and the distance of the C1 to the line
    connecting C0-C2 is rad times the distance of C0-C2.
    
    rad
    curvature of the curve.
__init__(self, rad=0.0)
    rad
    curvature of the curve.
__module__ = 'matplotlib.patches'
connect(self, posA, posB)
class Bar(armA=0.0, armB=0.0, fraction=0.3, angle=None)
    Bases: matplotlib.patches.ConnectionStyle._Base
    A line with angle between A and B with armA and armB. One of the arms is
    extended so that they are connected in a right angle. The length of armA is
    determined by (armA + fraction x AB distance). Same for armB.

    Parameters

    armA
        [float] minimum length of armA
    armB
        [float] minimum length of armB
    fraction
        [float] a fraction of the distance between two points that will be
        added to armA and armB.
    angle
        [float or None] angle of the connecting line (if None, parallel to
        A and B)
__init__(self, armA=0.0, armB=0.0, fraction=0.3, angle=None)

Parameters
armA
  [float] minimum length of armA
armB
  [float] minimum length of armB
fraction
  [float] a fraction of the distance between two points that will be added to armA and armB.
angle
  [float or None] angle of the connecting line (if None, parallel to A and B)

Examples using `matplotlib.patches.ConnectionStyle`

`matplotlib.patches.Ellipse`

class `matplotlib.patches.Ellipse(xy, width, height, angle=0, **kwargs)`
  Bases: `matplotlib.patches.Patch`
  A scale-free ellipse.

Parameters

xy
  [(float, float)] xy coordinates of ellipse centre.

width
  [float] Total length (diameter) of horizontal axis.

height
  [float] Total length (diameter) of vertical axis.

angle
  [float, default: 0] Rotation in degrees anti-clockwise.
Notes

Valid keyword arguments are:

__init__(self, xy, width, height, angle=0, **kwargs)

Parameters

xy

[(float, float)] xy coordinates of ellipse centre.

width
[float] Total length (diameter) of horizontal axis.

**height**

[float] Total length (diameter) of vertical axis.

**angle**

[float, default: 0] Rotation in degrees anti-clockwise.

**Notes**

Valid keyword arguments are:

</tbody>
</table>
 property angle
    Return the angle of the ellipse.

 property center
    Return the center of the ellipse.

 get_angle(self)
    Return the angle of the ellipse.

 get_center(self)
    Return the center of the ellipse.

 get_height(self)
    Return the height of the ellipse.

 get_patch_transform(self)
    Return the `Transform` instance mapping patch coordinates to data coordinates.
    For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

 get_path(self)
    Return the path of the ellipse.

 get_width(self)
    Return the width of the ellipse.

 property height
    Return the height of the ellipse.

 set_angle(self, angle)
    Set the angle of the ellipse.

    Parameters
    
    angle
       [float]

 set_center(self, xy)
    Set the center of the ellipse.

    Parameters
    
    xy
       [(float, float)]
set_height(self, height)
    Set the height of the ellipse.

    Parameters
    
    height
        [float]

set_width(self, width)
    Set the width of the ellipse.

    Parameters
    
    width
        [float]

property width
    Return the width of the ellipse.

matplotlib.patches.FancyArrow

class matplotlib.patches.FancyArrow(x, y, dx, dy, width=0.001, length_includes_head=False, head_width=None, head_length=None, shape='full', overhang=0, head_starts_at_zero=False, **kwargs)

Bases: matplotlib.patches.Polygon

Like Arrow, but lets you set head width and head height independently.

Parameters

width: float, default: 0.001
  Width of full arrow tail.

length_includes_head: bool, default: False
  True if head is to be counted in calculating the length.

head_width: float or None, default: 3*width
  Total width of the full arrow head.

head_length: float or None, default: 1.5*head_width
  Length of arrow head.

shape: ['full', 'left', 'right'], default: 'full'
  Draw the left-half, right-half, or full arrow.
**overhang:** float, default: 0

Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

**head_starts_at_zero:** bool, default: False

If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

**kwargs**

```
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).
```

Examples using matplotlib.patches.FancyArrow

matplotlib.patches.FancyArrowPatch

```
class matplotlib.patches.FancyArrowPatch(posA=None, posB=None, path=None, arrowstyle='simple', connectionstyle='arc3', patchA=None, patchB=None, shrinkA=2, shrinkB=2, mutation_scale=1, mutation_aspect=None, dpi_cor=1, **kwargs)
```

Bases: matplotlib.patches.Patch

A fancy arrow patch. It draws an arrow using the ArrowStyle.

The head and tail positions are fixed at the specified start and end points of the arrow, but the size and shape (in display coordinates) of the arrow does not change when the axis is moved or zoomed.

There are two ways for defining an arrow:
• If posA and posB are given, a path connecting two points is created according to connectionstyle. The path will be clipped with patchA and patchB and further shrunken by shrinkA and shrinkB. An arrow is drawn along this resulting path using the arrowstyle parameter.

• Alternatively if path is provided, an arrow is drawn along this path and patchA, patchB, shrinkA, and shrinkB are ignored.

Parameters

posA, posB

[(float, float), default: None] (x, y) coordinates of arrow tail and arrow head respectively.

path

[Path, default: None] If provided, an arrow is drawn along this path and patchA, patchB, shrinkA, and shrinkB are ignored.

arrowstyle

[str or ArrowStyle, default: 'simple']

The ArrowStyle with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional attributes are meant to be scaled with the mutation_scale. The following arrow styles are available:
<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Curve</td>
<td>-</td>
<td>None</td>
</tr>
<tr>
<td>CurveB</td>
<td>-&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>BracketB</td>
<td>[</td>
<td>widthB=1.0, lengthB=0.2, angleB=None</td>
</tr>
<tr>
<td>CurveFilledB</td>
<td>-&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>CurveA</td>
<td>&lt;-</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>CurveAB</td>
<td>&lt;-&gt;</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>CurveFilledA</td>
<td>&lt;-</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>CurveFilledAB</td>
<td>&lt;=</td>
<td>head_length=0.4, head_width=0.2</td>
</tr>
<tr>
<td>BracketA</td>
<td>]-</td>
<td>widthA=1.0, lengthA=0.2, angleA=None</td>
</tr>
<tr>
<td>BracketAB</td>
<td>]-[</td>
<td>widthA=1.0, lengthA=0.2, angleA=None, widthB=1.0, lengthB=0.2, angleB=None</td>
</tr>
<tr>
<td>Fancy</td>
<td>fancy</td>
<td>head_length=0.4, head_width=0.4, tail_width=0.4</td>
</tr>
<tr>
<td>Simple</td>
<td>simple</td>
<td>head_length=0.5, head_width=0.5, tail_width=0.2</td>
</tr>
<tr>
<td>Wedge</td>
<td>wedge</td>
<td>tail width=0.3, shrink factor=0.5</td>
</tr>
<tr>
<td>BarAB</td>
<td></td>
<td>-</td>
</tr>
</tbody>
</table>

**connectionstyle**

[str or ConnectionStyle or None, optional, default: 'arc3']

The ConnectionStyle with which posA and posB are connected. If a string, it should be one of the available connectionstyle names, with optional comma-separated attributes. The following connection styles are available:

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Angle</td>
<td>angle</td>
<td>angleA=90, angleB=0, rad=0.0</td>
</tr>
<tr>
<td>Angle3</td>
<td>angle3</td>
<td>angleA=90, angleB=0</td>
</tr>
<tr>
<td>Arc</td>
<td>arc</td>
<td>angleA=0, angleB=0, armA=None, armB=None, rad=0.0</td>
</tr>
<tr>
<td>Arc3</td>
<td>arc3</td>
<td>rad=0.0</td>
</tr>
<tr>
<td>Bar</td>
<td>bar</td>
<td>armA=0.0, armB=0.0, fraction=0.3, angle=0.0</td>
</tr>
</tbody>
</table>
Head and tail patches, respectively.

**shrinkA, shrinkB**

[default: 2] Shrinking factor of the tail and head of the arrow respectively.

**mutation_scale**

[default: 1] Value with which attributes of *arrowstyle* (e.g., *head_length*) will be scaled.

**mutation_aspect**

[default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

**dpi_cor**

[default: 1] *dpi_cor* is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

### Other Parameters

**kwargs**

[Patch properties, optional] Here is a list of available Patch properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) float array</td>

<tr>
<td>joinstyle</td>
<td>{'miter', 'round', 'bevel'}</td>
</tr>
<tr>
<td>label</td>
<td>object</td>
</tr>
</tbody>
</table>
Table 159 – continued from previous page

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>linestyle or ls</td>
<td>{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}</td>
</tr>
<tr>
<td>linewidth or lw</td>
<td>float or None</td>
</tr>
<tr>
<td>path_effects</td>
<td>AbstractPathEffect</td>
</tr>
<tr>
<td>picker</td>
<td>None or bool or callable</td>
</tr>
<tr>
<td>rasterized</td>
<td>bool or None</td>
</tr>
<tr>

<td>(scale: float, length: float, randomness: float)</td>
</tr>
<tr>
<td>snap</td>
<td>bool or None</td>
</tr>
<tr>
<td>transform</td>
<td>Transform</td>
</tr>
<tr>
<td>url</td>
<td>str</td>
</tr>
<tr>
<td>visible</td>
<td>bool</td>
</tr>
<tr>
<td>zorder</td>
<td>float</td>
</tr>
</tbody>
</table>

In contrast to other patches, the default capstyle and joinstyle for FancyArrowPatch are set to "round".

```
def __init__(self, posA=None, posB=None, path=None, arrowstyle='simple',
             connectionstyle='arc3', patchA=None, patchB=None, shrinkA=2,
             shrinkB=2, mutation_scale=1, mutation_aspect=None,
             dpi_cor=1, **kwargs)
```

There are two ways for defining an arrow:

- If posA and posB are given, a path connecting two points is created according to connectionstyle. The path will be clipped with patchA and patchB and further shrunken by shrinkA and shrinkB. An arrow is drawn along this resulting path using the arrowstyle parameter.
- Alternatively if path is provided, an arrow is drawn along this path and patchA, patchB, shrinkA, and shrinkB are ignored.

**Parameters**

**posA, posB**

[((float, float), default: None) (x, y) coordinates of arrow tail and arrow head respectively.

**path**

[Path, default: None] If provided, an arrow is drawn along this path and patchA, patchB, shrinkA, and shrinkB are ignored.

**arrowstyle**

[str or ArrowStyle, default: 'simple']

The ArrowStyle with which the fancy arrow is drawn. If a string, it should be one of the available arrowstyle names, with optional comma-separated attributes. The optional at-
tributes are meant to be scaled with the mutation_scale. The following arrow styles are available:

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Curve</td>
<td>-</td>
<td>None</td>
</tr>
<tr>
<td>CurveB</td>

</tr>
<tr>
<td>Bar</td>
<td>bar</td>
<td>armA=0.0, armB=0.0, fraction=0.3, angle=None</td>
</tr>
</tbody>
</table>
**patchA, patchB**

[Patch, default: None] Head and tail patches, respectively.

**shrinkA, shrinkB**

[float, default: 2] Shrinking factor of the tail and head of the arrow respectively.

**mutation_scale**

[float, default: 1] Value with which attributes of arrowstyle (e.g., head_length) will be scaled.

**mutation_aspect**

[None or float, default: None] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it.

**dpi_cor**

[float, default: 1] dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

In contrast to other patches, the default capstyle and joinstyle for FancyArrowPatch are set to "round".

```python
__module__ = 'matplotlib.patches'
__str__(self)
    Return str(self).
draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer
    [RendererBase subclass.]
```

Notes

This method is overridden in the Artist subclasses.

```python
get_arrowstyle(self)
    Return the arrowstyle object.
get_connectionstyle(self)
    Return the ConnectionStyle used.
get_dpi_cor(self)
    dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.
```

Returns
**scalar**

`get_mutation_aspect(self)`
Return the aspect ratio of the bbox mutation.

`get_mutation_scale(self)`
Return the mutation scale.

**Returns**

**scalar**

`get_path(self)`
Return the path of the arrow in the data coordinates. Use `get_path_in_displaycoord()` method to retrieve the arrow path in display coordinates.

`get_path_in_displaycoord(self)`
Return the mutated path of the arrow in display coordinates.

`set_arrowstyle(self, arrowstyle=None, **kw)`
Set the arrow style. Old attributes are forgotten. Without arguments (or with `arrowstyle=None`) returns available box styles as a list of strings.

**Parameters**

**arrowstyle**
[None or ArrowStyle or str, default: None] Can be a string with arrowstyle name with optional comma-separated attributes, e.g.:

```python
set_arrowstyle("Fancy,head_length=0.2")
```

Alternatively attributes can be provided as keywords, e.g.:

```python
set_arrowstyle("fancy", head_length=0.2)
```

`set_connectionstyle(self, connectionstyle, **kw)`
Set the connection style. Old attributes are forgotten.

**Parameters**

**connectionstyle**
[str or ConnectionStyle or None, optional] Can be a string with connectionstyle name with optional comma-separated attributes, e.g.:

```python
set_connectionstyle("arc,angleA=0,armA=30,rad=10")
```

Alternatively, the attributes can be provided as keywords, e.g.:
set_connectionstyle("arc", angleA=0, armA=30, rad=10)

Without any arguments (or with connectionstyle=None), return available styles as a list of strings.

**set_dpi_cor**(*self, dpi_cor*)

dpi_cor is currently used for linewidth-related things and shrink factor. Mutation scale is affected by this.

**Parameters**

- **dpi_cor**
  - [float]

**set_mutation_aspect**(*self, aspect*)

Set the aspect ratio of the bbox mutation.

**Parameters**

- **aspect**
  - [float]

**set_mutation_scale**(*self, scale*)

Set the mutation scale.

**Parameters**

- **scale**
  - [float]

**set_patchA**(*self, patchA*)

Set the tail patch.

**Parameters**

- **patchA**
  - [patches.Patch]

**set_patchB**(*self, patchB*)

Set the head patch.

**Parameters**

- **patchB**
  - [patches.Patch]
set_positions(self, posA, posB)
    Set the begin and end positions of the connecting path.

    Parameters

    posA, posB
        [None, tuple] (x, y) coordinates of arrow tail and arrow head respectively. If None use current value.

Examples using matplotlib.patches.FancyArrowPatch

- sphx_glr_gallery_pie_and_polar_charts_bar_of_pie.py
- sphx_glr_gallery_shapes_and_collections_arrow_guide.py
- sphx_glr_gallery_userdemo_connect_simple01.py
- sphx_glr_gallery_userdemo_connectionstyle_demo.py

matplotlib.patches.FancyBboxPatch

class matplotlib.patches.FancyBboxPatch(xy, width, height, boxstyle='round',
    bbox_transmuter=None,
    mutation_scale=1.0,
    mutation_aspect=None,
    **kwargs)

Bases: matplotlib.patches.Patch

A fancy box around a rectangle with lower left at xy = (x, y) with specified width and height.

FancyBboxPatch is similar to Rectangle, but it draws a fancy box around the rectangle. The transformation of the rectangle box to the fancy box is delegated to the style classes defined in BoxStyle.

    Parameters

    xy
        [float, float] The lower left corner of the box.

    width
        [float] The width of the box.

    height
        [float] The height of the box.

    boxstyle
        [str or matplotlib.patches.BoxStyle]
The style of the fancy box. This can either be a `BoxStyle` instance or a string of the style name and optionally comma separated attributes (e.g. "Round, pad=0.2"). This string is passed to `BoxStyle` to construct a `BoxStyle` object. See there for a full documentation.

The following box styles are available:

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circle</td>
<td>circle</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>DArrow</td>
<td>darrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>LArrow</td>
<td>larrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>RArrow</td>
<td>rarrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>Round</td>
<td>round</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Round4</td>
<td>round4</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Roundtooth</td>
<td>roundtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Sawtooth</td>
<td>sawtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Square</td>
<td>square</td>
<td>pad=0.3</td>
</tr>
</tbody>
</table>

**mutation_scale**

[float, default: 1] Scaling factor applied to the attributes of the box style (e.g. pad or rounding_size).

**mutation_aspect**

[float, optional] The height of the rectangle will be squeezed by this value before the mutation and the mutated box will be stretched by the inverse of it. For example, this allows different horizontal and vertical padding.

**Other Parameters**

**kwargs**

```python
__init__(self, xy, width, height, boxstyle='round', bbox_transmuter=None, mutation_scale=1.0, mutation_aspect=None, **kwargs)
```

**Parameters**

- **xy**
  - `[float, float]` The lower left corner of the box.

- **width**
  - `[float]` The width of the box.

- **height**
  - `[float]` The height of the box.

- **boxstyle**
  - `[str or `matplotlib.patches.BoxStyle`]` The style of the fancy box. This can either be a `BoxStyle` instance or a string of the style name and optionally comma separated attributes (e.g. "Round, pad=0.2"). This string is passed to `BoxStyle` to construct a `BoxStyle` object. See there for a full documentation.

</tbody>
</table>

```
__module__ = 'matplotlib.patches'
__str__(self)
    Return str(self).
get_bbox(self)
    Return the Bbox.
get_boxstyle(self)
    Return the boxstyle object.
get_height(self)
    Return the height of the rectangle.
get_mutation_aspect(self)
    Return the aspect ratio of the bbox mutation.
get_mutation_scale(self)
    Return the mutation scale.
get_path(self)
    Return the mutated path of the rectangle.
get_width(self)
    Return the width of the rectangle.
get_x(self)
    Return the left coord of the rectangle.
get_y(self)
    Return the bottom coord of the rectangle.
set_bounds(self, *args)
    Set the bounds of the rectangle.
```

Call signatures:
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))

Parameters

left, bottom
[float] The coordinates of the bottom left corner of the rectangle.

width, height
[float] The width/height of the rectangle.

set_boxstyle(self, boxstyle=None, **kwargs)
Set the box style.

Most box styles can be further configured using attributes. Attributes from the previous box style are not reused.

Without argument (or with boxstyle=None), the available box styles are returned as a human-readable string.

Parameters

boxstyle
[str]
The name of the box style. Optionally, followed by a comma and a comma-separated list of attributes. The attributes may alternatively be passed separately as keyword arguments.

The following box styles are available:

<table>
<thead>
<tr>
<th>Class</th>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Circle</td>
<td>circle</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>DA Arrow</td>
<td>darrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>LA Arrow</td>
<td>larrow</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>RA Arrow</td>
<td>razor</td>
<td>pad=0.3</td>
</tr>
<tr>
<td>Round</td>
<td>round</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Round4</td>
<td>round4</td>
<td>pad=0.3, rounding_size=None</td>
</tr>
<tr>
<td>Roundtooth</td>
<td>roundtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Sawtooth</td>
<td>sawtooth</td>
<td>pad=0.3, tooth_size=None</td>
</tr>
<tr>
<td>Square</td>
<td>square</td>
<td>pad=0.3</td>
</tr>
</tbody>
</table>

**kwargs
Additional attributes for the box style. See the table above for supported parameters.

**Examples**

```python
set_boxstyle("round, pad=0.2")
set_boxstyle("round", pad=0.2)
```

```
set_height(self, h)
   Set the rectangle height.

   **Parameters**
   
   h
      [float]
```

```
set_mutation_aspect(self, aspect)
   Set the aspect ratio of the bbox mutation.

   **Parameters**
   
   aspect
      [float]
```

```
set_mutation_scale(self, scale)
   Set the mutation scale.

   **Parameters**
   
   scale
      [float]
```

```
set_width(self, w)
   Set the rectangle width.

   **Parameters**
   
   w
      [float]
```

```
set_x(self, x)
   Set the left coord of the rectangle.

   **Parameters**
   
   x
      [float]
```
```python
def set_y(self, y):
    Set the bottom coord of the rectangle.

    Parameters

    y
        [float]
```

Examples using `matplotlib.patches.FancyBboxPatch`

- sphx_glr_gallery_shapes_and_collections_artist_reference.py
- sphx_glr_gallery_shapes_and_collections_fancybox_demo.py
- sphx_glr_gallery_userdemo_annotate_text_arrow.py

`matplotlib.patches.Patch`

```python
class matplotlib.patches.Patch(
    edgecolor=None, facecolor=None,
    color=None, linewidth=None, linestyle=None,
    antialiased=None, hatch=None, fill=True,
    capstyle=None, joinstyle=None, **kwargs)
```

Bases: `matplotlib.artist.Artist`

A patch is a 2D artist with a face color and an edge color.

If any of `edgecolor`, `facecolor`, `linewidth`, or `antialiased` are `None`, they default to their rc params setting.

The following kwarg properties are supported

<table>

</tbody>
</table>

```python
__module__ = 'matplotlib.patches'
```

contains(self, mouseevent, radius=None)

Test whether the mouse event occurred in the patch.

**Returns**

(boolempty dict)

contains_point(self, point, radius=None)

Return whether the given point is inside the patch.

**Parameters**

point

[(float, float)] The point (x, y) to check, in target coordinates of self.get_transform(). These are display coordinates for patches that are added to a figure or axes.

radius

[float, optional] Add an additional margin on the patch in target coordinates of self.get_transform(). See Path.contains_point for further details.

**Returns**

bool
Notes

The proper use of this method depends on the transform of the patch. Isolated patches do not have a transform. In this case, the patch creation coordinates and the point coordinates match. The following example checks that the center of a circle is within the circle

```python
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> c.contains_point(center)
True
```

The convention of checking against the transformed patch stems from the fact that this method is predominantly used to check if display coordinates (e.g. from mouse events) are within the patch. If you want to do the above check with data coordinates, you have to properly transform them first:

```python
>>> center = 0, 0
>>> c = Circle(center, radius=1)
>>> plt.gca().add_patch(c)
>>> transformed_center = c.get_transform().transform(center)
>>> c.contains_point(transformed_center)
True
```

`contains_points(self, points, radius=None)`
Return whether the given points are inside the patch.

**Parameters**

- `points`
  
  [(N, 2) array] The points to check, in target coordinates of `self`. `get_transform()`. These are display coordinates for patches that are added to a figure or axes. Columns contain x and y values.

- `radius`
  
  [float, optional] Add an additional margin on the patch in target coordinates of `self.get_transform()`. See `Path.contains_point` for further details.

**Returns**

- `length-N bool array`
Notes

The proper use of this method depends on the transform of the patch. See the notes on `Patch.contains_point`.

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters**

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

**property fill**

Return whether the patch is filled.

**get_aa(self)**

Alias for `get_antialiased`.

**get_antialiased(self)**

Return whether antialiasing is used for drawing.

**get_capstyle(self)**

Return the capstyle.

**get_data_transform(self)**

Return the `Transform` mapping data coordinates to physical coordinates.

**get_ec(self)**

Alias for `get_edgecolor`.

**get_edgecolor(self)**

Return the edge color.

**get_extents(self)**

Return the `Patch`'s axis-aligned extents as a `Bbox`.

**get_facecolor(self)**

Return the face color.

**get_fc(self)**

Alias for `get_facecolor`.

**get_fill(self)**

Return whether the patch is filled.
get_hatch(self)
    Return the hatching pattern.

get_joinstyle(self)
    Return the joinstyle.

get_linestyle(self)
    Return the linestyle.

get_linewidth(self)
    Return the line width in points.

get_ls(self)
    Alias for get_linestyle.

get_lw(self)
    Alias for get_linewidth.

get_patch_transform(self)
    Return the Transform instance mapping patch coordinates to data coordinates.

    For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path(self)
    Return the path of this patch.

get_transform(self)
    Return the Transform applied to the Patch.

get_verts(self)
    Return a copy of the vertices used in this patch.

    If the patch contains Bezier curves, the curves will be interpolated by line segments. To access the curves as curves, use get_path.

get_window_extent(self, renderer=None)
    Get the axes bounding box in display space.

    The bounding box' width and height are nonnegative.

    Subclasses should override for inclusion in the bounding box "tight" calculation. Default is to return an empty bounding box at 0, 0.

    Be careful when using this function, the results will not update if the artist window extent of the artist changes. The extent can change due to any changes in the transform stack, such as changing the axes limits, the figure size, or the canvas used (as is done when saving a figure). This can lead to unexpected behavior where interactive figures will look fine on the screen, but will save incorrectly.

set_aa(self, aa)
    Alias for set_antialiased.
set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.

    Parameters

    alpha
        [float or None]

set_antialiased(self, aa)
    Set whether to use antialiased rendering.

    Parameters

    b
        [bool or None]

set_capstyle(self, s)
    Set the capstyle.

    Parameters

    s
        [{'butt', 'round', 'projecting'}]

set_color(self, c)
    Set both the edgecolor and the facecolor.

    Parameters

    c
        [color]

    See also:

    Patch.set_facecolor, Patch.set_edgecolor

        For setting the edge or face color individually.

set_ec(self, color)
    Alias for set_edgecolor.

set_edgecolor(self, color)
    Set the patch edge color.

    Parameters

    color
        [color or None or 'auto']
set_facecolor(self, color)
Set the patch face color.

Parameters

color
[color or None]

set_fc(self, color)
Alias for set_facecolor.

set_fill(self, b)
Set whether to fill the patch.

Parameters

b
[bool]

set_hatch(self, hatch)
Set the hatching pattern.

hatch can be one of:

- / - diagonal hatching
- \ - back diagonal
- | - vertical
- - - horizontal
- + - crossed
- x - crossed diagonal
- o - small circle
- O - large circle
- . - dots
- * - stars

Letters can be combined, in which case all the specified hatchings are done. If same letter repeats, it increases the density of hatching of that pattern.

Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

Parameters

hatch
[\[/, \\/, \|, \-, \+, \x, \o, \O, \., \*\]]

set_joinstyle(self, s)
Set the joinstyle.

Parameters
set_linestyle(self, ls)
Set the patch linestyle.

Parameters

ls
[{',-', '--', '-.', ':', '', (offset, on-off-seq), ...}] The line style.

set_linewidth(self, w)
Set the patch linewidth in points.

Parameters

w
[Float or None]

set_ls(self, ls)
Alias for set_linestyle.

set_lw(self, w)
Alias for set_linewidth.

update_from(self, other)
Copy properties from other to self.

validCap = ('butt', 'round', 'projecting')
validJoin = ('miter', 'round', 'bevel')
zorder = 1

matplotlib.patches.Polygon

class matplotlib.patches.Polygon(xy, closed=True, **kwargs)
   Bases: matplotlib.patches.Patch

A general polygon patch.

xy is a numpy array with shape N×2.

If closed is True, the polygon will be closed so the starting and ending points are the same.

Valid keyword arguments are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

</table>

__module__ = 'matplotlib.patches'

__str__(self)

Return str(self).

get_closed(self)

Return whether the polygon is closed.
get_path(self)
    Get the Path of the polygon.

get_xy(self)
    Get the vertices of the path.

Returns

(N, 2) numpy array
    The coordinates of the vertices.

set_closed(self, closed)
    Set whether the polygon is closed.

Parameters

closed
    [bool] True if the polygon is closed

set_xy(self, xy)
    Set the vertices of the polygon.

Parameters

xy
    [(N, 2) array-like] The coordinates of the vertices.

Notes

Unlike Path, we do not ignore the last input vertex. If the polygon is meant
to be closed, and the last point of the polygon is not equal to the first, we
assume that the user has not explicitly passed a CLOSEPOLY vertex, and add
it ourselves.

property xy
    The vertices of the path as (N, 2) numpy array.

Examples using matplotlib.patches.Polygon

- sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py
- sphx_glr_gallery_statistics_boxplot_demo.py
- sphx_glr_gallery_shapes_and_collections_hatch_demo.py
- sphx_glr_gallery_shapes_and_collections_patch_collection.py
- sphx_glr_gallery_axisartist_demo_floating_axes.py
class `matplotlib.patches.Rectangle(xy, width, height, angle=0.0, **kwargs)`

A rectangle defined via an anchor point `xy` and its `width` and `height`.

One may picture `xy` as the bottom left corner, but which corner `xy` is actually depends on the the direction of the axis and the sign of `width` and `height`; e.g. `xy` would be the bottom right corner if the x-axis was inverted or if `width` was negative.

**Parameters**

- **xy**
  
  [(float, float)] The anchor point.

- **width**
  
  [float] Rectangle width.

- **height**
  
  [float] Rectangle height.

- **angle**
  
  [float, default: 0] Rotation in degrees anti-clockwise about `xy`.

**Other Parameters**

- **kwargs**

__module__ = 'matplotlib.patches'

__str__(self)

    Return str(self).

get_bbox(self)

    Return the Bbox.
get_height(self)
Return the height of the rectangle.

get_patch_transform(self)
Return the Transform instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path(self)
Return the vertices of the rectangle.

get_width(self)
Return the width of the rectangle.

get_x(self)
Return the left coordinate of the rectangle.

get_xy(self)
Return the left and bottom coords of the rectangle as a tuple.

get_y(self)
Return the bottom coordinate of the rectangle.

set_bounds(self, *args)
Set the bounds of the rectangle as left, bottom, width, height.

The values may be passed as separate parameters or as a tuple:

```python
set_bounds(left, bottom, width, height)
set_bounds((left, bottom, width, height))
```

set_height(self, h)
Set the height of the rectangle.

set_width(self, w)
Set the width of the rectangle.

set_x(self, x)
Set the left coordinate of the rectangle.

set_xy(self, xy)
Set the left and bottom coordinates of the rectangle.

Parameters

- **xy**
  
  [(float, float)]

set_y(self, y)
Set the bottom coordinate of the rectangle.
property xy
    Return the left and bottom coords of the rectangle as a tuple.

matplotlib.patches.RegularPolygon

class matplotlib.patches.RegularPolygon(xy, numVertices, radius=5, orientation=0, **kwargs)

Bases: matplotlib.patches.Patch

A regular polygon patch.

Parameters

xy

[(float, float)] The center position.

numVertices

[int] The number of vertices.

radius

[float] The distance from the center to each of the vertices.

orientation

[float] The polygon rotation angle (in radians).

**kwargs

Patch properties:

<table>

```python
__module__ = 'matplotlib.patches'

__str__(self)
    Return str(self).

get_patch_transform(self)
    Return the Transform instance mapping patch coordinates to data coordinates.

    For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path(self)
    Return the path of this patch.

property numvertices

property orientation

property radius

property xy
```
Examples using `matplotlib.patches.RegularPolygon`

- sphx_glr_gallery_specialty_plots_radar_chart.py

`matplotlib.patches.Shadow`

```python
class matplotlib.patches.Shadow(patch, ox, oy, props=<deprecated parameter>, **kwargs)
```

Bases: `matplotlib.patches.Patch`

Create a shadow of the given `patch`.

By default, the shadow will have the same face color as the `patch`, but darkened.

**Parameters**

- **patch**
  
  [Patch] The patch to create the shadow for.

- **ox, oy**
  
  [float] The shift of the shadow in data coordinates, scaled by a factor of dpi/72.

- **props**
  
  [dict] *deprecated (use kwargs instead)* Properties of the shadow patch.

- **kwargs**
  
  Properties of the shadow patch. Supported keys are:

<table>

</tbody>
</table>

__module__ = 'matplotlib.patches'

__str__(self)
Return str(self).

draw(self, renderer)
Draw the Artist (and its children) using the given renderer.
This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

```python
get_patch_transform(self)
```

Return the `Transform` instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

```python
get_path(self)
```

Return the path of this patch.

```python
property props
```

Examples using `matplotlib.patches.Shadow`

- sphx_glr_gallery_text_labels_and_annotations_demo_text_path.py
- sphx_glr_gallery_misc_svg_filter_pie.py

`matplotlib.patches.Wedge`

```python
class matplotlib.patches.Wedge(center, r, theta1, theta2, width=None, **kwargs)
```

Bases: `matplotlib.patches.Patch`

Wedge shaped patch.

A wedge centered at x, y center with radius r that sweeps theta1 to theta2 (in degrees). If width is given, then a partial wedge is drawn from inner radius r - width to outer radius r.

Valid keyword arguments are:

<table>
<thead>
<tr>

- sphx_glr_gallery_shapes_and_collections_patch_collection.py
- sphx_glr_gallery_misc_svg_filter_pie.py
18.35.2 Functions

(bbox_artist(artist, renderer[, props, fill])) A debug function to draw a rectangle around the bounding box returned by an artist's Artist.get_window_extent to test whether the artist is returning the correct bbox.

draw_bbox(bbox, renderer[, color, trans]) A debug function to draw a rectangle around the bounding box returned by an artist's Artist.get_window_extent to test whether the artist is returning the correct bbox.

matplotlib.patches.bbox_artist

matplotlib.patches.bbox_artist(artist, renderer, props=None, fill=True)
A debug function to draw a rectangle around the bounding box returned by an artist's Artist.get_window_extent to test whether the artist is returning the correct bbox. props is a dict of rectangle props with the additional property 'pad' that sets the padding around the bbox in points.

Examples using matplotlib.patches.bbox_artist

matplotlib.patches.draw_bbox

matplotlib.patches.draw_bbox(bbox, renderer, color='k', trans=None)
A debug function to draw a rectangle around the bounding box returned by an artist's Artist.get_window_extent to test whether the artist is returning the correct bbox.

Examples using matplotlib.patches.draw_bbox

18.36 matplotlib.path

A module for dealing with the polylines used throughout Matplotlib.
The primary class for polyline handling in Matplotlib is Path. Almost all vector drawing makes use of Paths somewhere in the drawing pipeline.

Whilst a Path instance itself cannot be drawn, some Artist subclasses, such as PathPatch and PathCollection, can be used for convenient Path visualisation.

18.36. matplotlib.path
A series of possibly disconnected, possibly closed, line and curve segments. The underlying storage is made up of two parallel numpy arrays:

- `vertices`: an Nx2 float array of vertices
- `codes`: an N-length uint8 array of vertex types, or None

These two arrays always have the same length in the first dimension. For example, to represent a cubic curve, you must provide three vertices as well as three codes CURVE3.

The code types are:

- **STOP**
  
  [1 vertex (ignored)] A marker for the end of the entire path (currently not required and ignored)

- **MOVETO**
  
  [1 vertex] Pick up the pen and move to the given vertex.

- **LINETO**
  
  [1 vertex] Draw a line from the current position to the given vertex.

- **CURVE3**
  
  [1 control point, 1 endpoint] Draw a quadratic Bezier curve from the current position, with the given control point, to the given end point.

- **CURVE4**
  
  [2 control points, 1 endpoint] Draw a cubic Bezier curve from the current position, with the given control points, to the given end point.

- **CLOSEPOLY**
  
  [1 vertex (ignored)] Draw a line segment to the start point of the current polyline.

If `codes` is None, it is interpreted as a MOVETO followed by a series of LINETO.

Users of Path objects should not access the vertices and codes arrays directly. Instead, they should use `iter_segments` or `cleaned` to get the vertex/code pairs. This helps, in particular, to consistently handle the case of `codes` being None.

Some behavior of Path objects can be controlled by rcParams. See the rcParams whose keys start with 'path.'.

**Note:** The vertices and codes arrays should be treated as immutable -- there are a number of optimizations and assumptions made up front in the constructor.
that will not change when the data changes.

Create a new path with the given vertices and codes.

**Parameters**

- **vertices**
  - [array-like] The \((N, 2)\) float array, masked array or sequence of pairs representing the vertices of the path.

  If `vertices` contains masked values, they will be converted to NaNs which are then handled correctly by the Agg PathIterator and other consumers of path data, such as `iter_segments()`.

- **codes**
  - [array-like or None, optional] n-length array integers representing the codes of the path. If not None, codes must be the same length as vertices. If None, `vertices` will be treated as a series of line segments.

- **_interpolation_steps**
  - [int, optional] Used as a hint to certain projections, such as Polar, that this path should be linearly interpolated immediately before drawing. This attribute is primarily an implementation detail and is not intended for public use.

- **closed**
  - [bool, optional] If `codes` is None and closed is True, vertices will be treated as line segments of a closed polygon. Note that the last vertex will then be ignored (as the corresponding code will be set to CLOSEPOLY).

- **readonly**
  - [bool, optional] Makes the path behave in an immutable way and sets the vertices and codes as read-only arrays.

```
CLOSEPOLY = 79
CURVE3 = 3
CURVE4 = 4
LINETO = 2
MOVETO = 1

NUM_VERTICES_FOR_CODE = {0: 1, 1: 1, 2: 1, 3: 2, 4: 3, 79: 1}
```

A dictionary mapping Path codes to the number of vertices that the code expects.
classmethod arc(theta1, theta2, n=None, is_wedge=False)
Return the unit circle arc from angles theta1 to theta2 (in degrees).

theta2 is unwrapped to produce the shortest arc within 360 degrees. That is, if theta2 > theta1 + 360, the arc will be from theta1 to theta2 - 360 and not a full circle plus some extra overlap.

If n is provided, it is the number of spline segments to make. If n is not provided, the number of spline segments is determined based on the delta between theta1 and theta2.

Masionobe, L. 2003. Drawing an elliptical arc using polylines, quadratic or cubic Bezier curves.

classmethod circle(center=0.0, 0.0, radius=1.0, readonly=False)
Return a Path representing a circle of a given radius and center.

Parameters

center
[(float, float), default: (0, 0)] The center of the circle.

radius
[float, default: 1] The radius of the circle.

readonly
[bool] Whether the created path should have the "readonly" argument set when creating the Path instance.

Notes

The circle is approximated using 8 cubic Bezier curves, as described in

Lancaster, Don. Approximating a Circle or an Ellipse Using Four Bezier Cubic Splines.

cleaned(self, transform=None, remove_nans=False, clip=None, quantize=<deprecated parameter>, simplify=False, curves=False, stroke_width=1.0, snap=False, sketch=None)
Return a new Path with vertices and codes cleaned according to the parameters.

See also:

Path.iter_segments
for details of the keyword arguments.

clip_to_bbox(self, bbox, inside=True)
Clip the path to the given bounding box.
The path must be made up of one or more closed polygons. This algorithm
will not behave correctly for unclosed paths.

If inside is True, clip to the inside of the box, otherwise to the outside of the
box.

code_type
alias of numpy.uint8

property codes
The list of codes in the Path as a 1-D numpy array. Each code is one of
STOP, MOVETO, LINETO, CURVE3, CURVE4 or CLOSEPOLY. For codes that correspond
to more than one vertex (CURVE3 and CURVE4), that code will be repeated so
that the length of self.vertices and self.codes is always the same.

contains_path(self, path, transform=None)
Return whether this (closed) path completely contains the given path.
If transform is not None, the path will be transformed before checking for
containment.

contains_point(self, point, transform=None, radius=0.0)
Return whether the (closed) path contains the given point.

Parameters

point
[(float, float)] The point (x, y) to check.

transform
[matplotlib.transforms.Transform, optional] If not None, point
will be compared to self transformed by transform; i.e. for
a correct check, transform should transform the path into the
coordinate system of point.

radius
[float, default: 0] Add an additional margin on the path in coor-
dinates of point. The path is extended tangentially by radius/2;
i.e. if you would draw the path with a linewidth of radius, all
points on the line would still be considered to be contained in
the area. Conversely, negative values shrink the area: Points
on the imaginary line will be considered outside the area.

Returns

bool

contains_points(self, points, transform=None, radius=0.0)
Return whether the (closed) path contains the given point.

Parameters
points
[(N, 2) array] The points to check. Columns contain x and y values.

transform

[matplotlib.transforms.Transform, optional] If not None, points will be compared to self transformed by transform; i.e. for a correct check, transform should transform the path into the coordinate system of points.

radius
[double, default: 0.] Add an additional margin on the path in coordinates of points. The path is extended tangentially by radius/2; i.e. if you would draw the path with a linewidth of radius, all points on the line would still be considered to be contained in the area. Conversely, negative values shrink the area: Points on the imaginary line will be considered outside the area.

Returns
length-N bool array

copy(self)
Return a shallow copy of the Path, which will share the vertices and codes with the source Path.

deprecated(self, memo=None)
Return a deep copy of the Path. The Path will not be readonly, even if the source Path is.

get_extents(self, transform=None, **kwargs)
Get Bbox of the path.

Parameters
transform
[matplotlib.transforms.Transform, optional] Transform to apply to path before computing extents, if any.

**kwargs
Forwarded to iter_bezier.

Returns
matplotlib.transforms.Bbox
The extents of the path Bbox([[xmin, ymin], [xmax, ymax]])
static hatch(hatchpattern, density=6)
Given a hatch specifier, hatchpattern, generates a Path that can be used in
a repeated hatching pattern. density is the number of lines per unit square.

interpolated(self, steps)
Return a new path resampled to length N x steps.
Codes other than LINETO are not handled correctly.

intersects_bbox(self, bbox, filled=True)
Return whether this path intersects a given Bbox.
If filled is True, then this also returns True if the path completely encloses
the bbox (i.e., the path is treated as filled).
The bounding box is always considered filled.

intersects_path(self, other, filled=True)
Return whether if this path intersects another given path.
If filled is True, then this also returns True if one path completely encloses
the other (i.e., the paths are treated as filled).

iter_bezier(self, **kwargs)
Iterate over each bezier curve (lines included) in a Path.

Parameters

**kwargs
Forwarded to iter_segments.

Yields

B
[matplotlib.bezier.BezierSegment] The bezier curves that make
up the current path. Note in particular that freestanding points
are bezier curves of order 0, and lines are bezier curves of order
1 (with two control points).

code
[Path.code_type] The code describing what kind of curve is
being returned. Path.MOVETO, Path.LINETO, Path.CURVE3,
Path.CURVE4 correspond to bezier curves with 1, 2, 3,
and 4 control points (respectively). Path.CLOSEPOLY is a
Path.LINETO with the control points correctly chosen based on
the start/end points of the current stroke.

iter_segments(self, transform=None, remove_nans=True, clip=None,
    snap=False, stroke_width=1.0, simplify=None,
curves=True, sketch=None)
Iterate over all curve segments in the path.
Each iteration returns a pair \((\text{vertices}, \text{code})\), where \text{vertices} is a sequence of 1-3 coordinate pairs, and \text{code} is a \textit{Path} code.

Additionally, this method can provide a number of standard cleanups and conversions to the path.

**Parameters**

\textbf{transform}

- \[\text{None or } \text{Transform}\] If not None, the given affine transformation will be applied to the path.

\textbf{remove_nans}

- \[\text{bool, optional}\] Whether to remove all NaNs from the path and skip over them using MOVETO commands.

\textbf{clip}

- \[\text{None or } (\text{float, float, float, float}), \text{optional}\] If not None, must be a four-tuple \((x1, y1, x2, y2)\) defining a rectangle in which to clip the path.

\textbf{snap}

- \[\text{None or bool, optional}\] If True, snap all nodes to pixels; if False, don't snap them. If None, snap if the path contains only segments parallel to the x or y axes, and no more than 1024 of them.

\textbf{stroke_width}

- \[\text{float, optional}\] The width of the stroke being drawn (used for path snapping).

\textbf{simplify}

- \[\text{None or bool, optional}\] Whether to simplify the path by removing vertices that do not affect its appearance. If None, use the \texttt{should_simplify} attribute. See also \texttt{rcParams["path.simplify"]} (default: True) and \texttt{rcParams["path.simplify_threshold"]} (default: 0.111111111111).

\textbf{curves}

- \[\text{bool, optional}\] If True, curve segments will be returned as curve segments. If False, all curves will be converted to line segments.

\textbf{sketch}

- \[\text{None or sequence, optional}\] If not None, must be a 3-tuple of the form (scale, length, randomness), representing the sketch parameters.
classmethod make_compound_path(*args)
    Make a compound path from a list of Path objects. Blindly removes all
    Path.STOP control points.

classmethod make_compound_path_from_polys(XY)
    Make a compound path object to draw a number of polygons with equal
    numbers of sides XY is a (numpolys x numsides x 2) numpy array of vertices.
    Return object is a Path

property readonly
    True if the Path is read-only.

property should_simplify
    True if the vertices array should be simplified.

property simplify_threshold
    The fraction of a pixel difference below which vertices will be simplified out.

to_polygons(self, transform=None, width=0, height=0, closed_only=True)
    Convert this path to a list of polygons or polylines. Each polygon/polyline
    is an Nx2 array of vertices. In other words, each polygon has no MOVE_TO
    instructions or curves. This is useful for displaying in backends that do not
    support compound paths or Bezier curves.

    If width and height are both non-zero then the lines will be simplified so that
    vertices outside of (0, 0), (width, height) will be clipped.
If `closed_only` is `True` (default), only closed polygons, with the last point being the same as the first point, will be returned. Any unclosed polylines in the path will be explicitly closed. If `closed_only` is `False`, any unclosed polygons in the path will be returned as unclosed polygons, and the closed polygons will be returned explicitly closed by setting the last point to the same as the first point.

`transformed(self, transform)`
Return a transformed copy of the path.

**See also:**

`matplotlib.transforms.TransformedPath`
A specialized path class that will cache the transformed result and automatically update when the transform changes.

classmethod `unit_circle()`
Return the readonly `Path` of the unit circle.

For most cases, `Path.circle()` will be what you want.

classmethod `unit_circle_righthalf()`
Return a `Path` of the right half of a unit circle.

See `Path.circle` for the reference on the approximation used.

classmethod `unit_rectangle()`
Return a `Path` instance of the unit rectangle from (0, 0) to (1, 1).

classmethod `unit_regular_asterisk(numVertices)`
Return a `Path` for a unit regular asterisk with the given numVertices and radius of 1.0, centered at (0, 0).

classmethod `unit_regular_polygon(numVertices)`
Return a `Path` instance for a unit regular polygon with the given `numVertices` such that the circumscribing circle has radius 1.0, centered at (0, 0).

classmethod `unit_regular_star(numVertices, innerCircle=0.5)`
Return a `Path` for a unit regular star with the given numVertices and radius of 1.0, centered at (0, 0).

`property vertices`
The list of vertices in the `Path` as an Nx2 numpy array.

classmethod `wedge(theta1, theta2, n=None)`
Return the unit circle wedge from angles `theta1` to `theta2` (in degrees).

`theta2` is unwrapped to produce the shortest wedge within 360 degrees. That is, if `theta2 > theta1 + 360`, the wedge will be from `theta1` to `theta2 - 360` and not a full circle plus some extra overlap.

If `n` is provided, it is the number of spline segments to make. If `n` is not provided, the number of spline segments is determined based on the delta between `theta1` and `theta2`.
See `Path.arc` for the reference on the approximation used.

```python
matplotlib.path.get_path_collection_extents(master_transform, paths, transforms, offsets, offset_transform)
```

Given a sequence of `Paths`, `Transforms` objects, and offsets, as found in a `PathCollection`, returns the bounding box that encapsulates all of them.

**Parameters**

- **master_transform**
  
    `[Transform] Global transformation applied to all paths.

- **paths**
  
    `[list of Path]`

- **transforms**
  
    `[list of Affine2D]`

- **offsets**
  
    `[(N, 2) array-like]`

- **offset_transform**
  
    `[Affine2D] Transform applied to the offsets before offsetting the path.

**Notes**

The way that `paths`, `transforms` and `offsets` are combined follows the same method as for collections: Each is iterated over independently, so if you have 3 paths, 2 transforms and 1 offset, their combinations are as follows:

- (A, A, A)
- (B, B, A)
- (C, A, A)

### 18.37 `matplotlib.path_effects`

Defines classes for path effects. The path effects are supported in `Text`, `Line2D` and `Patch`.

**See also:**

- `Path effects guide`

```python
class matplotlib.path_effects.AbstractPathEffect(offset=0.0, 0.0)
Bases: object
```

A base class for path effects.

Subclasses should override the `draw_path` method to add effect functionality.
**Parameters**

**offset**

[pair of floats] The offset to apply to the path, measured in points.

draw_path(self, renderer, gc, tpath, affine, rgbFace=None)

Derived should override this method. The arguments are the same as 
`matplotlib.backend_bases.RendererBase.draw_path()` except the first argu-
ment is a renderer.

class matplotlib.patheffects.Normal(offset=0.0, 0.0)

Bases: matplotlib.patheffects.AbstractPathEffect

The "identity" PathEffect.
The Normal PathEffect's sole purpose is to draw the original artist with no special 
path effect.

**Parameters**

**offset**

[pair of floats] The offset to apply to the path, measured in points.

class matplotlib.patheffects.PathEffectRenderer(path_effects, renderer)

Bases: matplotlib.backend_bases.RendererBase

Implements a Renderer which contains another renderer.
This proxy then intercepts draw calls, calling the appropriate `AbstractPathEffect 
draw` method.

**Note:** Not all methods have been overridden on this RendererBase subclass. It 
may be necessary to add further methods to extend the PathEffects capabilities 
further.

**Parameters**

**path_effects**

[iterable of `AbstractPathEffect`] The path effects which this ren-
derer represents.

**renderer**

[`matplotlib.backend_bases.RendererBase` subclass]

copy_with_path_effect(self, path_effects)
draw_markers(self, gc, marker_path, marker_trans, path, *args, **kwargs)
Draw a marker at each of the vertices in path.

This includes all vertices, including control points on curves. To avoid that behavior, those vertices should be removed before calling this function.

This provides a fallback implementation of draw_markers that makes multiple calls to draw_path(). Some backends may want to override this method in order to draw the marker only once and reuse it multiple times.

Parameters

gc

marker_trans

trans
[matplotlib.transforms.Transform] An affine transform applied to the path.

draw_path(self, gc, tpath, affine, rgbFace=None)
Draw a Path instance using the given affine transform.

draw_path_collection(self, gc, master_transform, paths, *args, **kwargs)
Draw a collection of paths selecting drawing properties from the lists face-colors, edgecolors, linewidths, linestyles and antialiaseds. offsets is a list of offsets to apply to each of the paths. The offsets in offsets are first transformed by offsetTrans before being applied.

offset_position may be either "screen" or "data" depending on the space that the offsets are in; "data" is deprecated.

This provides a fallback implementation of draw_path_collection() that makes multiple calls to draw_path(). Some backends may want to override this in order to render each set of path data only once, and then reference that path multiple times with the different offsets, colors, styles etc. The generator methods _iter_collection_raw_paths() and _iter_collection() are provided to help with (and standardize) the implementation across backends. It is highly recommended to use those generators, so that changes to the behavior of draw_path_collection() can be made globally.

class matplotlib.pathpatterns.PathPatchEffect(offset=0, 0, **kwargs)
Bases: matplotlib.pathpatterns.AbstractPathEffect

Draws a PathPatch instance whose Path comes from the original PathEffect artist.

Parameters
offset
[pair of floats] The offset to apply to the path, in points.

**kwargs
All keyword arguments are passed through to the `PathPatch` constructor. The properties which cannot be overridden are "path", "clip_box" "transform" and "clip_path".

draw_path(self, renderer, gc, tpath, affine, rgbFace)
Derived should override this method. The arguments are the same as `matplotlib.backend_bases.RendererBase.draw_path()` except the first argument is a renderer.

class matplotlib.path_effects.SimpleLineShadow(offset=2, -2, shadow_color='k', alpha=0.3, rho=0.3, **kwargs)

Bases: `matplotlib.path_effects.AbstractPathEffect`

A simple shadow via a line.

**Parameters**

offset
[pair of floats] The offset to apply to the path, in points.

shadow_color
[color, default: 'black'] The shadow color. A value of None takes the original artist's color with a scale factor of rho.

alpha
[float, default: 0.3] The alpha transparency of the created shadow patch.

rho
[float, default: 0.3] A scale factor to apply to the rgbFace color if shadow_rgbFace is None.

**kwargs
Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

draw_path(self, renderer, gc, tpath, affine, rgbFace)
Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.path_effects.SimplePatchShadow(offset=2, -2, shadow_rgbFace=None, alpha=None, rho=0.3, **kwargs)

Bases: `matplotlib.path_effects.AbstractPathEffect`
A simple shadow via a filled patch.

**Parameters**

- **offset**
  [pair of floats] The offset of the shadow in points.

- **shadow_rgbFace**
  [color] The shadow color.

- **alpha**
  [float, default: 0.3] The alpha transparency of the created shadow patch. [link](http://matplotlib.1069221.n5.nabble.com/path-effects-question-td27630.html)

- **rho**
  [float, default: 0.3] A scale factor to apply to the rgbFace color if `shadow_rgbFace` is not specified.

- ****kwargs
  Extra keywords are stored and passed through to `AbstractPathEffect._update_gc()`.

```python
draw_path(self, renderer, gc, tpath, affine, rgbFace)
```
Overides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

```python
class matplotlib.patheffects.Stroke(offset=0,0,**kwargs)
```
A line based PathEffect which re-draws a stroke.

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

```python
draw_path(self, renderer, gc, tpath, affine, rgbFace)
```
Draw the path with updated gc.

```python
class matplotlib.patheffects.withSimplePatchShadow(offset=2,2,shadow_rgbFace=None,alpha=None,rho=0.3,**kwargs)
```
A shortcut PathEffect for applying `SimplePatchShadow` and then drawing the original Artist.

With this class you can use

```python
artist.set_path_effects([path_effects.withSimplePatchShadow()])
```
as a shortcut for
Parameters

offset
[pair of floats] The offset of the shadow in points.

shadow_rgbFace
[color] The shadow color.

alpha

rho
[float, default: 0.3] A scale factor to apply to the rgbFace color if shadow_rgbFace is not specified.

**kwargs
Extra keywords are stored and passed through to AbstractPathEffect._update_gc().

draw_path(self, renderer, gc, tpath, affine, rgbFace)
Overrides the standard draw_path to add the shadow offset and necessary color changes for the shadow.

class matplotlib.patheffects.withStroke(offset=0, 0, **kwargs)
Bases: matplotlib.patheffects.Stroke
A shortcut PathEffect for applying Stroke and then drawing the original Artist. With this class you can use

artist.set_path_effects([path_effects.withStroke()])

as a shortcut for

artist.set_path_effects([path_effects.Stroke(), path_effects.Normal()])

The path will be stroked with its gc updated with the given keyword arguments, i.e., the keyword arguments should be valid gc parameter values.

draw_path(self, renderer, gc, tpath, affine, rgbFace)
Draw the path with updated gc.
18.38 matplotlib.pyplot

18.38.1 Pyplot function overview

```
import numpy as np
import matplotlib.pyplot as plt

x = np.arange(0, 5, 0.1)
y = np.sin(x)
plt.plot(x, y)
```

The object-oriented API is recommended for more complex plots.

**Functions**

<table>

</tr>
</tbody>
</table>
Plot the autocorrelation of \( x \).

**Parameters**

- \( x \) [array-like]
- **detrend**
  - [callable, default: `mlab.detrend_none` (no detrending)] A detrending function applied to \( x \). It must have the signature

\[
detrend(x: np.ndarray) -> np.ndarray
\]

- **normed**
  - [bool, default: True] If True, input vectors are normalised to unit length.

- **usevlines**
  - [bool, default: True] Determines the plot style.

  If True, vertical lines are plotted from 0 to the acorr value using `Axes.vlines`. Additionally, a horizontal line is plotted at y=0 using `Axes.axhline`.

  If False, markers are plotted at the acorr values using `Axes.plot`.

- **maxlags**
  - [int, default: 10] Number of lags to show. If None, will return all \( 2 \times \text{len}(x) - 1 \) lags.

**Returns**

- **lags**
  - [array (length \( 2 \times \text{maxlags} + 1 \))] The lag vector.

- **c**
  - [array (length \( 2 \times \text{maxlags} + 1 \))] The auto correlation vector.

- **line**
  - `[LineCollection or Line2D] Artist` added to the axes of the correlation:

  - `LineCollection` if `usevlines` is True.
  - `Line2D` if `usevlines` is False.
b

[Line2D or None] Horizontal line at 0 if usevlines is True None
usevlines is False.

Other Parameters

linestyle

[Line2D property, optional] The linestyle for plotting the data
points. Only used if usevlines is False.

marker

[str, default: 'o'] The marker for plotting the data points. Only
used if usevlines is False.

**kwargs

Additional parameters are passed to Axes.vlines and Axes.
axhline if usevlines is True; otherwise they are passed to Axes.
plot.

Notes

The cross correlation is performed with numpy.correlate with mode = "full".

Note: In addition to the above described arguments, this function can take a
data keyword argument. If such a data argument is given, the following argu-
ments can also be string s, which is interpreted as data[s] (unless this raises an
exception): x.

Objects passed as data must support item access (data[s]) and membership test
(s in data).

Examples using matplotlib.pyplot.acorr

• sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py
**Matplotlib.pyplot.angle_spectrum**

```python
matplotlib.pyplot.angle_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, *, data=None, **kwargs)
```

Plot the angle spectrum.

Compute the angle spectrum (wrapped phase spectrum) of x. Data is padded to a length of `pad_to` and the windowing function `window` is applied to the signal.

**Parameters**

- **x**
  - [1-D array or sequence] Array or sequence containing the data.

- **Fs**
  - [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, `freqs`, in cycles per time unit.

- **window**
  - [callable or ndarray, default: `window_hanning`] A function or a vector of length `NFFT`. To create window vectors see `window_hanning`, `window_none`, `numpy.blackman`, `numpy.hamming`, `numpy.bartlett`, `scipy.signal`, `scipy.signal.get_window`, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

- **sides**
  - [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

- **pad_to**
  - [int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the `n` parameter in the call to `fft()`. The default is None, which sets `pad_to` equal to the length of the input signal (i.e. no padding).

- **Fc**
  - [int, default: 0] The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.
Returns

**spectrum**

[1-D array] The values for the angle spectrum in radians (real valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in *spectrum*.

**line**

[List2D] The line created by this function.

Other Parameters

**kwargs

Keyword arguments control the List2D properties:

**See also:**

- **magnitude_spectrum**
  
  Plots the magnitudes of the corresponding frequencies.

- **phase_spectrum**
  
  Plots the unwrapped version of this function.

- **specgram**
  
  Can plot the angle spectrum of segments within the signal in a colormap.

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).
Examples using `matplotlib.pyplot.angle_spectrum`

`matplotlib.pyplot.annotate`

`matplotlib.pyplot.annotate(text, xy, *args, **kwargs)`

Annotate the point `xy` with text `text`.

In the simplest form, the text is placed at `xy`.

Optionally, the text can be displayed in another position `xytext`. An arrow pointing from the text to the annotated point `xy` can then be added by defining `arrowprops`.

**Parameters**

- **text**
  
  `[str]` The text of the annotation. `s` is a deprecated synonym for this parameter.

- **xy**
  
  `[(float, float)]` The point `(x, y)` to annotate. The coordinate system is determined by `xycoords`.

- **xytext**
  
  `[(float, float), default: xy]` The position `(x, y)` to place the text at. The coordinate system is determined by `textcoords`.

- **xycoords**
  
  `[str or Artist or Transform or callable or (float, float), default: 'data']` The coordinate system that `xy` is given in. The following types of values are supported:
  
  - One of the following strings:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>Points from the lower left of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>Pixels from the lower left of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>Fraction of figure from lower left</td>
</tr>
<tr>
<td>'axes points'</td>
<td>Points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>Pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>Fraction of axes from lower left</td>
</tr>
<tr>
<td>'data'</td>
<td>Use the coordinate system of the object being annotated (default)</td>
</tr>
<tr>
<td>'polar'</td>
<td>(theta, r) if not native 'data' coordinates</td>
</tr>
</tbody>
</table>

- An **Artist**: xy is interpreted as a fraction of the artist's **Bbox**. E.g. (0, 0) would be the lower left corner of the bounding box and (0.5, 1) would be the center top of the bounding box.

- A **Transform** to transform xy to screen coordinates.

- A function with one of the following signatures:

  ```python
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
  ```

  where `renderer` is a **RendererBase** subclass.

  The result of the function is interpreted like the **Artist** and **Transform** cases above.

- A tuple `(xcoords, ycoords)` specifying separate coordinate systems for x and y. `xcoords` and `ycoords` must each be of one of the above described types.

See **Advanced Annotations** for more details.

**textcoords**

[**str** or **Artist** or **Transform** or callable or (float, float), default: value of `xycoords`] The coordinate system that `xytext` is given in.

All `xycoords` values are valid as well as the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'offset points'</td>
<td>Offset (in points) from the xy value</td>
</tr>
<tr>
<td>'offset pixels'</td>
<td>Offset (in pixels) from the xy value</td>
</tr>
</tbody>
</table>
**arrowprops**

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>The width of the arrow in points</td>
</tr>
<tr>
<td>headwidth</td>
<td>The width of the base of the arrow head in points</td>
</tr>
<tr>
<td>headlength</td>
<td>The length of the arrow head in points</td>
</tr>
<tr>
<td>shrink</td>
<td>Fraction of total length to shrink from both ends</td>
</tr>
<tr>
<td>?</td>
<td>Any key to <em>matplotlib.patches.FancyArrowPatch</em></td>
</tr>
</tbody>
</table>

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>None</td>
</tr>
<tr>
<td>'--&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'-[]'</td>
<td>widthB=1.0,lengthB=0.2,angleB=None</td>
</tr>
<tr>
<td>'[-'</td>
<td>widthA=1.0,widthB=1.0</td>
</tr>
<tr>
<td>'-</td>
<td>&gt;'</td>
</tr>
<tr>
<td>'&lt;-'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;</td>
<td>-'</td>
</tr>
<tr>
<td>'&lt;</td>
<td>-&gt;'</td>
</tr>
<tr>
<td>'fancy'</td>
<td>head_length=0.4,head_width=0.4,tail_width=0.4</td>
</tr>
<tr>
<td>'simple'</td>
<td>head_length=0.5,head_width=0.5,tail_width=0.4</td>
</tr>
<tr>
<td>'wedge'</td>
<td>tail_width=0.3,shrink_factor=0.5</td>
</tr>
</tbody>
</table>

Valid keys for *FancyArrowPatch* are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>mutation_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>mutation_aspect</td>
<td>default is 1.</td>
</tr>
<tr>
<td>?</td>
<td>any key for <em>matplotlib.patches.PathPatch</em></td>
</tr>
</tbody>
</table>

Defaults to None, i.e. no arrow is drawn.
annotation_clip

[bool or None, default: None] Whether to draw the annotation when the annotation point xy is outside the axes area.

- If True, the annotation will only be drawn when xy is within the axes.
- If False, the annotation will always be drawn.
- If None, the annotation will only be drawn when xy is within the axes and xycoords is 'data'.

**kwargs

Additional kwargs are passed to Text.

Returns

Annotation

matplotlib.pyplot.arrow

matplotlib.pyplot.arrow(x, y, dx, dy, **kwargs)

Add an arrow to the axes.

This draws an arrow from (x, y) to (x+dx, y+dy).

Parameters
**Arrow properties:**

- **x, y**
  - [float] The x and y coordinates of the arrow base.

- **dx, dy**
  - [float] The length of the arrow along x and y direction.

- **width**: float, default: 0.001
  - Width of full arrow tail.

- **length_includes_head**: bool, default: False
  - True if head is to be counted in calculating the length.

- **head_width**: float or None, default: 3*width
  - Total width of the full arrow head.

- **head_length**: float or None, default: 1.5*head_width
  - Length of arrow head.

- **shape**: ['full', 'left', 'right'], default: 'full'
  - Draw the left-half, right-half, or full arrow.

- **overhang**: float, default: 0
  - Fraction that the arrow is swept back (0 overhang means triangular shape). Can be negative or greater than one.

- **head_starts_at_zero**: bool, default: False
  - If True, the head starts being drawn at coordinate 0 instead of ending at coordinate 0.

- ****kwargs
  - Patch properties:

</table>

Returns

FancyArrow

The created FancyArrow object.

Notes

The resulting arrow is affected by the axes aspect ratio and limits. This may produce an arrow whose head is not square with its stem. To create an arrow whose head is square with its stem, use annotate() for example:

```python
>>> ax.annotate('', xy=(0.5, 0.5), xytext=(0, 0),
...       arrowprops=dict(arrowstyle='->'))
```

Examples using matplotlib.pyplot.arrow

- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
matplotlib.pyplot.autoscale

matplotlib.pyplot.autoscale(enable=True, axis='both', tight=None)

Autoscale the axis view to the data (toggle).

Convenience method for simple axis view autoscaling. It turns autoscaling on or off, and then, if autoscaling for either axis is on, it performs the autoscaling on the specified axis or axes.

Parameters

enable

[bool or None, default: True] True turns autoscaling on, False turns it off. None leaves the autoscaling state unchanged.

axis

[{'both', 'x', 'y'}, default: 'both'] Which axis to operate on.

tight

[bool or None, default: None] If True, first set the margins to zero. Then, this argument is forwarded to autoscale_view (regardless of its value); see the description of its behavior there.

Examples using matplotlib.pyplot.autoscale

matplotlib.pyplot.autumn

matplotlib.pyplot.autumn()

Set the colormap to "autumn".

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

Examples using matplotlib.pyplot.autumn

matplotlib.pyplot.axes

matplotlib.pyplot.axes(arg=None, **kwargs)

Add an axes to the current figure and make it the current axes.

Call signatures:

-plt.axes()
-plt.axes(rect, projection=None, polar=False, **kwargs)
-plt.axes(ax)
Parameters

arg
[None or 4-tuple] The exact behavior of this function depends on
the type:

• None: A new full window axes is added using subplot(111,
**kwargs).

• 4-tuple of floats rect = [left, bottom, width, height]. A new
axes is added with dimensions rect in normalized (0, 1) units
using add_axes on the current figure.

projection
[{None, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'recti-
linear', str}, optional] The projection type of the Axes. str is the
name of a custom projection, see projections. The default None
results in a 'rectilinear' projection.

polar
[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey
[Axes, optional] Share the x or y axis with sharex and/or sharey.
The axis will have the same limits, ticks, and scale as the axis of
the shared axes.

label
[str] A label for the returned axes.

Returns

Axes, or a subclass of Axes

The returned axes class depends on the projection used. It is Axes
if rectilinear projection is used and projections.polar.PolarAxes
if polar projection is used.

Other Parameters

**kwargs

This method also takes the keyword arguments for the returned
axes class. The keyword arguments for the rectilinear axes class
Axes can be found in the following table but there might also be
other keyword arguments if another projection is used, see the
actual axes class.

**See also:**

- `Figure.add_axes`
- `pyplot.subplot`
- `Figure.add_subplot`
- `Figure.subplots`
- `pyplot.subplots`

**Notes**

If the figure already has an axes with key `(args, kwargs)` then it will simply make that axes current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new axes), you must use a unique set of args and kwargs. The axes `label` attribute has been exposed for this purpose: if you want two axes that are otherwise identical to be added to the figure, make sure you give them unique labels.

**Examples**

```python
# Creating a new full window axes
plt.axes()

# Creating a new axes with specified dimensions and some kwargs
plt.axes((left, bottom, width, height), facecolor='w')```
Examples using `matplotlib.pyplot.axes`

- `sphx_glr_gallery_widgets_slider_demo.py`

`matplotlib.pyplot.axhline`

`matplotlib.pyplot.axhline(y=0, xmin=0, xmax=1, **kwargs)`

Add a horizontal line across the axis.

**Parameters**

- `y`
  
  [float, default: 0] y position in data coordinates of the horizontal line.

- `xmin`
  
  [float, default: 0] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

- `xmax`
  
  [float, default: 1] Should be between 0 and 1, 0 being the far left of the plot, 1 the far right of the plot.

**Returns**

`Line2D`

**Other Parameters**

- `**kwargs`
  
  Valid keyword arguments are `Line2D` properties, with the exception of 'transform':

See also:
**hlines**

Add horizontal lines in data coordinates.

**axhspan**

Add a horizontal span (rectangle) across the axis.

**axline**

Add a line with an arbitrary slope.

**Examples**

- draw a thick red hline at 'y' = 0 that spans the xrange:

  ```
  >>> axhline(linewidth=4, color='r')
  ```

- draw a default hline at 'y' = 1 that spans the xrange:

  ```
  >>> axhline(y=1)
  ```

- draw a default hline at 'y' = .5 that spans the middle half of the xrange:

  ```
  >>> axhline(y=.5, xmin=0.25, xmax=0.75)
  ```

**Examples using matplotlib.pyplot.axhline**

- sphx_glr_gallery_text_labels_and_annotations_multiline.py
- sphx_glr_gallery_pyplots_axline.py
- sphx_glr_gallery_color_cycle_default.py
- sphx_glr_gallery_misc_zorder_demo.py

**matplotlib.pyplot.axhspan**

```
matplotlib.pyplot.axhspan(ymin, ymax, xmin=0, xmax=1, **kwargs)
```

Add a horizontal span (rectangle) across the axis.

The rectangle spans from \( ymin \) to \( ymax \) vertically, and, by default, the whole x-axis horizontally. The x-span can be set using \( xmin \) (default: 0) and \( xmax \) (default: 1) which are in axis units; e.g. \( xmin = 0.5 \) always refers to the middle of the x-axis regardless of the limits set by \( set_xlim \).

**Parameters**

**ymin**

[float] Lower y-coordinate of the span, in data units.
**ymax**

[float] Upper y-coordinate of the span, in data units.

**xmin**

[float, default: 0] Lower x-coordinate of the span, in x-axis (0-1) units.

**xmax**

[float, default: 1] Upper x-coordinate of the span, in x-axis (0-1) units.

**Returns**

*Polygon*

Horizontal span (rectangle) from (xmin, ymin) to (xmax, ymax).

**Other Parameters**

**kwargs

[Polygon properties]

See also:

axvspan

Add a vertical span across the axes.

Examples using matplotlib.pyplot.axhspan

- sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py

matplotlib.pyplot.axis

matplotlib.pyplot.axis(*args, emit=True, **kwargs)

Convenience method to get or set some axis properties.

Call signatures:

```
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

Parameters

**xmin, xmax, ymin, ymax**

[float, optional] The axis limits to be set. This can also be achieved using

```
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

**option**

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:
### Value | Description
--- | ---
'on' | Turn on axis lines and labels. Same as True.
'off' | Turn off axis lines and labels. Same as False.
'equal' | Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as `ax.set_aspect('equal', adjustable='datalim')`. Explicit data limits may not be respected in this case.
'scaled' | Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as `ax.set_aspect('equal', adjustable='box', anchor='C')`. Additionally, further autoscaling will be disabled.
'tight' | Set limits just large enough to show all data, then disable further autoscaling.
'auto' | Automatic scaling (fill plot box with data).
'image' | 'scaled' with axis limits equal to data limits.
'square' | Square plot; similar to 'scaled', but initially forcing `xmax-xmin == ymax-ymin`.

**emit**

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

```
xmin, xmax, ymin, ymax
```

[float] The axis limits.

**See also:**

- `matplotlib.axes.Axes.set_xlim`
- `matplotlib.axes.Axes.set_ylim`

**Examples using matplotlib.pyplot.axis**

- sphx_glr_gallery_lines_bars_and_markers_fill.py
- sphx_glr_gallery_text_labels_and_annotations_autowrap.py

- Pyplot tutorial
matplotlib.pyplot.axline

```python
matplotlib.pyplot.axline(xy1, xy2=None, *, slope=None, **kwargs)
```

Add an infinitely long straight line.

The line can be defined either by two points `xy1` and `xy2`, or by one point `xy1` and a `slope`.

This draws a straight line "on the screen", regardless of the x and y scales, and is thus also suitable for drawing exponential decays in semilog plots, power laws in loglog plots, etc. However, `slope` should only be used with linear scales; It has no clear meaning for all other scales, and thus the behavior is undefined. Please specify the line using the points `xy1`, `xy2` for non-linear scales.

**Parameters**

`xy1`, `xy2`

[(float, float)] Points for the line to pass through. Either `xy2` or `slope` has to be given.

`slope`

[float, optional] The slope of the line. Either `xy2` or `slope` has to be given.

**Returns**

`Line2D`

**Other Parameters**

`**kwargs`

Valid kwags are `Line2D` properties, with the exception of 'transform':

  for vertical lines
Examples

Draw a thick red line passing through (0, 0) and (1, 1):

```python
>>> axline((0, 0), (1, 1), linewidth=4, color='r')
```

Examples using `matplotlib.pyplot.axline`

- `sphx_glr_gallery_pyplots_axline.py`

`matplotlib.pyplot.axvline`

```python
matplotlib.pyplot.axvline(x=0, ymin=0, ymax=1, **kwargs)
```

Add a vertical line across the axes.

**Parameters**

- `x`
  
  [float, default: 0] x position in data coordinates of the vertical line.

- `ymin`
  
  [float, default: 0] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

- `ymax`
  
  [float, default: 1] Should be between 0 and 1, 0 being the bottom of the plot, 1 the top of the plot.

**Returns**

- `Line2D`

**Other Parameters**

- `**kwargs`

  Valid keyword arguments are `Line2D` properties, with the exception of 'transform':

**See also:**

vlines

Add vertical lines in data coordinates.
axvspan

Add a vertical span (rectangle) across the axis.

Examples

• draw a thick red vline at x = 0 that spans the yrange:

```python
>>> axvline(linewidth=4, color='r')
```

• draw a default vline at x = 1 that spans the yrange:

```python
>>> axvline(x=1)
```

• draw a default vline at x = .5 that spans the middle half of the yrange:

```python
>>> axvline(x=.5, ymin=0.25, ymax=0.75)
```

Examples using matplotlib.pyplot.axline

• sphx_glr_gallery_pyplots_axline.py
• sphx_glr_gallery_color_color_cycle_default.py

matplotlib.pyplot.axvspan

matplotlib.pyplot.axvspan(xmin, xmax, ymin=0, ymax=1, **kwargs)

Add a vertical span (rectangle) across the axes.

The rectangle spans from xmin to xmax horizontally, and, by default, the whole y-axis vertically. The y-span can be set using ymin (default: 0) and ymax (default: 1) which are in axis units; e.g. ymin = 0.5 always refers to the middle of the y-axis regardless of the limits set by set_ylim.

Parameters

xmin

[float] Lower x-coordinate of the span, in data units.

xmax

[float] Upper x-coordinate of the span, in data units.
ymin

(float, default: 0) Lower y-coordinate of the span, in y-axis units (0-1).

ymax

(float, default: 1) Upper y-coordinate of the span, in y-axis units (0-1).

Returns

Polygon

Vertical span (rectangle) from (xmin, ymin) to (xmax, ymax).

Other Parameters

**kwargs

[Polygon properties]

%(Polygon)s

See also:

axhspan

Add a horizontal span across the axes.

Examples

Draw a vertical, green, translucent rectangle from x = 1.25 to x = 1.55 that spans the yrange of the axes.

```python
>>> axvspan(1.25, 1.55, facecolor='g', alpha=0.5)
```

Examples using matplotlib.pyplot.axvspan

* sphx_glr_gallery_subplots_axes_and_figures_axhspan_demo.py
matplotlib.pyplot.bar

matplotlib.pyplot.bar(x, height, width=0.8, bottom=None, *, align='center', data=None, **kwargs)

Make a bar plot.

The bars are positioned at x with the given alignment. Their dimensions are given by height and width. The vertical baseline is bottom (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

**Parameters**

**x**

[float or array-like] The x coordinates of the bars. See also align for the alignment of the bars to the coordinates.

**height**

[float or array-like] The height(s) of the bars.

**width**

[float or array-like, default: 0.8] The width(s) of the bars.

**bottom**

[float or array-like, default: 0] The y coordinate(s) of the bars bases.

**align**

[{'center', 'edge'}, default: 'center'] Alignment of the bars to the x coordinates:
- 'center': Center the base on the x positions.
- 'edge': Align the left edges of the bars with the x positions.

To align the bars on the right edge pass a negative width and align='edge'.

**Returns**

*BarContainer*

Container with all the bars and optionally errorbars.

**Other Parameters**

**color**

[ color or list of color, optional] The colors of the bar faces.
**edgecolor**

[color or list of color, optional] The colors of the bar edges.

**linewidth**

[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

**tick_label**

[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

**xerr, yerr**

[float or array-like of shape(N,) or shape(2, N), optional] If not None, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- None: No errorbar. (Default)

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

**ecolor**

[color or list of color, default: 'black'] The line color of the errorbars.

**capsize**

[float, default: rcParams["errorbar.capsize"] (default: 0.0)] The length of the error bar caps in points.

**error_kw**

[dict, optional] Dictionary of kwargs to be passed to the errorbar method. Values of ecolor or capsize defined here take precedence over the independent kwargs.

**log**

[bool, default: False] If True, set the y-axis to be log scale.

**kwargs**

**See also:**

barh

Plot a horizontal bar plot.
Notes

Stacked bars can be achieved by passing individual *bottom* values per bar. See /gallery/lines_bars_and_markers/bar_stacked.

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, every other argument can also be string *s*, which is interpreted as *data*[s] (unless this raises an exception).

Objects passed as *data* must support item access (*data*[s]) and membership test (*s in data*).

- sphx_glr_gallery_misc_table_demo.py
- *Pyplot tutorial*
- *Sample plots in Matplotlib*

**matplotlib.pyplot.barbs**

`matplotlib.pyplot.barbs(*args, data=None, **kw)`

Plot a 2D field of barbs.

Call signature:

```python
barbs([X, Y], U, V, [C], **kw)
```

Where *X, Y* define the barb locations, *U, V* define the barb directions, and *C* optionally sets the color.

All arguments may be 1D or 2D. *U, V, C* may be masked arrays, but masked *X, Y* are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by
the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
/ \
/ \
/ \ \\
/ \ \\
/ \ \\
\---------------------------------```

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

**Parameters**

**X, Y**

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See **pivot** for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of **U** and **V**.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of **U** and **V**.

**U, V**

[1D or 2D array-like] The x and y components of the barb shaft.

**C**

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via **norm** and **cmap**.

This does not support explicit colors. If you want to set colors directly, use **barbcolor** instead.

**length**

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

**pivot**
[{'tip', 'middle'} or float, default: ‘tip’] The part of the arrow that
is anchored to the X, Y grid. The barb rotates about this point.
This can also be a number, which shifts the start of the barb that
many points away from grid point.

**barbcolor**

[color or color sequence] The color of all parts of the barb except
for the flags. This parameter is analogous to the *edgecolor* pa-
rameter for polygons, which can be used instead. However this
parameter will override facecolor.

**flagcolor**

[color or color sequence] The color of any flags on the barb. This
parameter is analogous to the *facecolor* parameter for polygons,
which can be used instead. However, this parameter will over-
ride facecolor. If this is not set (and $C$ has not either) then *flag-
color* will be set to match *barbcolor* so that the barb has a uni-
form color. If $C$ has been set, *flagcolor* has no effect.

**sizes**

[dict, optional] A dictionary of coefficients specifying the ratio of
a given feature to the length of the barb. Only those values one
wishes to override need to be included. These features include:

- ‘spacing’ - space between features (flags, full/half barbs)
- ‘height’ - height (distance from shaft to top) of a flag or full
  barb
- ‘width’ - width of a flag, twice the width of a full barb
- ‘emptybarb’ - radius of the circle used for low magnitudes

**fill_empty**

[bool, default: False] Whether the empty barbs (circles) that are
drawn should be filled with the flag color. If they are not filled,
the center is transparent.

**rounding**

[bool, default: True] Whether the vector magnitude should be
rounded when allocating barb components. If True, the mag-
nitude is rounded to the nearest multiple of the half-barb incre-
ment. If False, the magnitude is simply truncated to the next
lowest multiple.

**barb_increments**

[dict, optional] A dictionary of increments specifying values to
associate with different parts of the barb. Only those values one
wishes to override need to be included.
• 'half' - half barbs (Default is 5)
• 'full' - full barbs (Default is 10)
• 'flag' - flags (default is 50)

**flip_barb**

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as U and V.

**Returns**

**barbs**

[Barbs]

**Other Parameters**

****kwargs

The barbs can further be customized using `PolyCollection` keyword arguments:

### Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).
Examples using matplotlib.pyplot.barbs

- sphx_glr_gallery_images_contours_and_fields_barb_demo.py

matplotlib.pyplot.barh

matplotlib.pyplot.barh(y, width, height=0.8, left=None, *, align='center', **kwargs)

Make a horizontal bar plot.

The bars are positioned at y with the given alignment. Their dimensions are given by width and height. The horizontal baseline is left (default 0).

Many parameters can take either a single value applying to all bars or a sequence of values, one for each bar.

Parameters

y

[float or array-like] The y coordinates of the bars. See also align for the alignment of the bars to the coordinates.

width

[float or array-like] The width(s) of the bars.

height

[float or array-like, default: 0.8] The heights of the bars.

left

[float or array-like, default: 0] The x coordinates of the left sides of the bars.

align

[{‘center’, ‘edge’}, default: ‘center’] Alignment of the base to the y coordinates*:
- ‘center’: Center the bars on the y positions.
- ‘edge’: Align the bottom edges of the bars with the y positions.

To align the bars on the top edge pass a negative height and align=’edge’.

Returns

BarContainer

Container with all the bars and optionally errorbars.
Other Parameters

color
[color or list of color, optional] The colors of the bar faces.

defedgecolor
[color or list of color, optional] The colors of the bar edges.

linewidth
[float or array-like, optional] Width of the bar edge(s). If 0, don't draw edges.

tick_label
[str or list of str, optional] The tick labels of the bars. Default: None (Use default numeric labels.)

xerr, yerr
[float or array-like of shape(N,) or shape(2, N), optional] If not None, add horizontal / vertical errorbars to the bar tips. The values are +/- sizes relative to the data:

- scalar: symmetric +/- values for all bars
- shape(N,): symmetric +/- values for each bar
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- None: No errorbar. (default)

See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

ecolor
[color or list of color, default: 'black'] The line color of the errorbars.

capsize
[float, default: rcParams["errorbar.capsize"] (default: 0.0)] The length of the error bar caps in points.

error_kw
[dict, optional] Dictionary of kwargs to be passed to the errorbar method. Values of ecolor or capsize defined here take precedence over the independent kwargs.

log
[bool, default: False] If True, set the x-axis to be log scale.
**kwargs

**See also:**

bar

Plot a vertical bar plot.
Notes

Stacked bars can be achieved by passing individual left values per bar. See /gallery/lines_bars_and_markers/horizontal_barchart_distribution.

Examples using matplotlib.pyplot.barh

- sphx_glr_gallery_lines_bars_and_markers_horizontal_barchart_distribution.py

matplotlib.pyplot.bone

matplotlib.pyplot.bone()
Set the colormap to "bone".
This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

Examples using matplotlib.pyplot.bone

matplotlib.pyplot.box

matplotlib.pyplot.box(on=None)
Turn the axes box on or off on the current axes.

Parameters

on
[bool or None] The new Axes box state. If None, toggle the state.

See also:

matplotlib.axes.Axes.set_frame_on()
matplotlib.axes.Axes.get_frame_on()

Examples using matplotlib.pyplot.box
matplotlib.pyplot.boxplot

matplotlib.pyplot.boxplot(x, notch=None, sym=None, vert=None, whis=None, positions=None, widths=None, patch_artist=None, bootstrap=None, usermedians=None, conf_intervals=None, meanline=None, showmeans=None, showcaps=None, showcaps=None, showbox=None, showfliers=None, boxprops=None, labels=None, flierprops=None, medianprops=None, meanprops=None, capprops=None, whiskerprops=None, manage_ticks=True, autorange=False, zorder=None, *, data=None)

Make a box and whisker plot.

Make a box and whisker plot for each column of x or each vector in sequence x. The box extends from the lower to upper quartile values of the data, with a line at the median. The whiskers extend from the box to show the range of the data. Flier points are those past the end of the whiskers.

**Parameters**

**x**

[Array or a sequence of vectors.] The input data.

**notch**

[bool, default: False] Whether to draw a notched box plot (True), or a rectangular box plot (False). The notches represent the confidence interval (CI) around the median. The documentation for bootstrap describes how the locations of the notches are computed.

**Note:** In cases where the values of the CI are less than the lower quartile or greater than the upper quartile, the notches will extend beyond the box, giving it a distinctive "flipped" appearance. This is expected behavior and consistent with other statistical visualization packages.

**sym**

[str, optional] The default symbol for flier points. An empty string ("") hides the fliers. If None, then the fliers default to 'b+'. More control is provided by the flierprops parameter.

**vert**

[bool, default: True] If True, draws vertical boxes. If False, draw horizontal boxes.

**whis**
[float or (float, float), default: 1.5] The position of the whiskers.

If a float, the lower whisker is at the lowest datum above \(Q1 - \text{whis} \times (Q3 - Q1)\), and the upper whisker at the highest datum below \(Q3 + \text{whis} \times (Q3 - Q1)\), where \(Q1\) and \(Q3\) are the first and third quartiles. The default value of \(\text{whis} = 1.5\) corresponds to Tukey’s original definition of boxplots.

If a pair of floats, they indicate the percentiles at which to draw the whiskers (e.g., (5, 95)). In particular, setting this to (0, 100) results in whiskers covering the whole range of the data. "range" is a deprecated synonym for (0, 100).

In the edge case where \(Q1 == Q3\), \(\text{whis}\) is automatically set to (0, 100) (cover the whole range of the data) if \(\text{autorange}\) is True.

Beyond the whiskers, data are considered outliers and are plotted as individual points.

**bootstrap**

[int, optional] Specifies whether to bootstrap the confidence intervals around the median for notched boxplots. If \(\text{bootstrap}\) is None, no bootstrapping is performed, and notches are calculated using a Gaussian-based asymptotic approximation (see McGill, R., Tukey, J.W., and Larsen, W.A., 1978, and Kendall and Stuart, 1967). Otherwise, bootstrap specifies the number of times to bootstrap the median to determine its 95% confidence intervals. Values between 1000 and 10000 are recommended.

**usermedians**

[array-like, optional] A 1D array-like of length \(\text{len}(x)\). Each entry that is not None forces the value of the median for the corresponding dataset. For entries that are None, the medians are computed by Matplotlib as normal.

**conf_intervals**

[array-like, optional] A 2D array-like of shape \((\text{len}(x), 2)\). Each entry that is not None forces the location of the corresponding notch (which is only drawn if \(\text{notch}\) is True). For entries that are None, the notches are computed by the method specified by the other parameters (e.g., \(\text{bootstrap}\)).

**positions**

[array-like, optional] Sets the positions of the boxes. The ticks and limits are automatically set to match the positions. Defaults to range(1, \(N+1\)) where \(N\) is the number of boxes to be drawn.

**widths**

[float or array-like] Sets the width of each box either with a scalar or a sequence. The default is 0.5, or \(0.15 \times \text{distance between...}\)
extreme positions), if that is smaller.

**patch_artist**

[bool, default: False] If False produces boxes with the Line2D artist. Otherwise, boxes and drawn with Patch artists.

**labels**

[sequence, optional] Labels for each dataset (one per dataset).

**manage_ticks**

[bool, default: True] If True, the tick locations and labels will be adjusted to match the boxplot positions.

**autorange**

[bool, default: False] When True and the data are distributed such that the 25th and 75th percentiles are equal, whis is set to (0, 100) such that the whisker ends are at the minimum and maximum of the data.

**meanline**

[bool, default: False] If True (and showmeans is True), will try to render the mean as a line spanning the full width of the box according to meanprops (see below). Not recommended if shownotches is also True. Otherwise, means will be shown as points.

**zorder**

[float, default: Line2D.zorder = 2] Sets the zorder of the boxplot.

**Returns**

**dict**

A dictionary mapping each component of the boxplot to a list of the Line2D instances created. That dictionary has the following keys (assuming vertical boxplots):

- **boxes**: the main body of the boxplot showing the quartiles and the median's confidence intervals if enabled.
- **medians**: horizontal lines at the median of each box.
- **whiskers**: the vertical lines extending to the most extreme, non-outlier data points.
- **caps**: the horizontal lines at the ends of the whiskers.
- **fliers**: points representing data that extend beyond the whiskers (fliers).
- **means**: points or lines representing the means.
Other Parameters

**showcaps**
[bool, default: True] Show the caps on the ends of whiskers.

**showbox**
[bool, default: True] Show the central box.

**showfliers**
[bool, default: True] Show the outliers beyond the caps.

**showmeans**
[bool, default: False] Show the arithmetic means.

**capprops**
[dict, default: None] The style of the caps.

**boxprops**
[dict, default: None] The style of the box.

**whiskerprops**
[dict, default: None] The style of the whiskers.

**flierprops**
[dict, default: None] The style of the fliers.

**medianprops**
[dict, default: None] The style of the median.

**meanprops**
[dict, default: None] The style of the mean.

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).
Examples using matplotlib.pyplot.boxplot

- sphx_glr_gallery_pyplots_boxplot_demo_pyplot.py

matplotlib.pyplot.broken_barh

matplotlib.pyplot.broken_barh(xranges, yrange, *, data=None, **kwargs)

Plot a horizontal sequence of rectangles.

A rectangle is drawn for each element of xranges. All rectangles have the same vertical position and size defined by yrange.

This is a convenience function for instantiating a BrokenBarHCollection, adding it to the axes and autoscaling the view.

Parameters

xranges
[sequence of tuples (xmin, xwidth)] The x-positions and extends of the rectangles. For each tuple (xmin, xwidth) a rectangle is drawn from xmin to xmin + xwidth.

yrange
[(ymin, yheight)] The y-position and extend for all the rectangles.

Returns

BrokenBarHCollection

Other Parameters

**kwargs

[BrokenBarHCollection properties] Each kwarg can be either a single argument applying to all rectangles, e.g.:

- facecolors='black'

or a sequence of arguments over which is cycled, e.g.:

- facecolors=('black', 'blue')

would create interleaving black and blue rectangles.

Supported keywords:

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.broken_barh`

`matplotlib.pyplot cla`

`matplotlib.pyplot.cla()`

Clear the current axes.

Examples using `matplotlib.pyplot.cla`

- *Pyplot tutorial*

`matplotlib.pyplot.clabel`

`matplotlib.pyplot.clabel(CS, levels=None, **kwargs)`

Label a contour plot.

Adds labels to line contours in given `ContourSet`.

**Parameters**

**CS**

[`ContourSet` instance] Line contours to label.

**levels**

[array-like, optional] A list of level values, that should be labeled. The list must be a subset of `CS.levels`. If not given, all levels are labeled.

**kwargs**

All other parameters are documented in `clabel`. 
Examples using `matplotlib.pyplot.clabel`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

`matplotlib.pyplot.clf`

`matplotlib.pyplot.clf()`

Clear the current figure.

Examples using `matplotlib.pyplot.clf`

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

`matplotlib.pyplot.clim`

`matplotlib.pyplot.clim(vmin=None, vmax=None)`

Set the color limits of the current image.

If either `vmin` or `vmax` is None, the image min/max respectively will be used for color scaling.

If you want to set the clim of multiple images, use `set_clim` on every image, for example:

```python
for im in gca().get_images():
    im.set_clim(0, 0.5)
```

Examples using `matplotlib.pyplot.clim`

`matplotlib.pyplot.close`

`matplotlib.pyplot.close(fig=None)`

Close a figure window.

**Parameters**

`fig`

[None or int or str or `Figure`] The figure to close. There are a number of ways to specify this:

- `None`: the current figure
- `Figure`: the given `Figure` instance
- int: a figure number
Examples using matplotlib.pyplot.close

- sphx_glr_gallery_misc_multiprocess_sgskip.py

matplotlib.pyplot.cohere

matplotlib.pyplot.cohere(x, y, NFFT=256, Fs=2, Fc=0, detrend=<function detrend_none at 0x7f5434697820>, window=<function window_hanning at 0x7f5434697160>, noverlap=0, pad_to=None, sides='default', scale_by_freq=None, *, data=None, **kwargs)

Plot the coherence between x and y.

Plot the coherence between x and y. Coherence is the normalized cross spectral density:

$$C_{xy} = \frac{|P_{xy}|^2}{P_{xx}P_{yy}}$$

Parameters

Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

window

[callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{‘default’, ‘onesided’, ‘twosided’}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from
$NFFT$, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the $n$ parameter in the call to fft(). The default is None, which sets pad_to equal to $NFFT$

$NFFT$

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.

detrend

[{‘none’, ‘mean’, ‘linear’} or callable, default ‘none’] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib is it a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls detrend_none. 'mean' calls detrend_mean. 'linear' calls detrend_linear.

scale_by_freq

[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

noverlap

[int, default: 0 (no overlap)] The number of points of overlap between blocks.

Fc

[int, default: 0] The center frequency of $x$, which offsets the $x$ extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

$Cxy$

[1-D array] The coherence vector.

freqs

[1-D array] The frequencies for the elements in $Cxy$. 

### Other Parameters

**kwargs

Keyword arguments control the *Line2D* properties:

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

References

Examples using `matplotlib.pyplot.cohere`

`matplotlib.pyplot.colorbar`

```python
matplotlib.pyplot.colorbar(mappable=None, cax=None, ax=None, **kw)
```

Add a colorbar to a plot.

Function signatures for the `pyplot` interface; all but the first are also method signatures for the `colorbar` method:

```python
colorbar(**kwars)
colorbar(mappable, **kwars)
colorbar(mappable, cax=cax, **kwars)
colorbar(mappable, ax=ax, **kwars)
```

Parameters

**mappable**

The `matplotlib.cm.ScalarMappable` (i.e., `AxesImage`, `ContourSet`, etc.) described by this colorbar. This argument is mandatory for the `Figure.colorbar` method but optional for the `pyplot.colorbar` function, which sets the default to the current image.
Note that one can create a `ScalarMappable"on-the-fly" to generate colorbars not attached to a previously drawn artist, e.g.

```python
def.colorbar(cm.ScalarMappable(norm=norm, cmap=cmap), ax=ax)
```

### cax

- `[Axes, optional] Axes into which the colorbar will be drawn.

### ax

- `[Axes, list of Axes, optional] Parent axes from which space for a new colorbar axes will be stolen. If a list of axes is given they will all be resized to make room for the colorbar axes.

### use_gridspec

- `[bool, optional] If `cax` is `none`, a new `cax` is created as an instance of Axes. If `ax` is an instance of Subplot and `use_gridspec` is `True`, `cax` is created as an instance of Subplot using the `gridspec` module.

### Returns

- `colorbar`

  - `[Colorbar] See also its base class, ColorbarBase.

### Notes

Additional keyword arguments are of two kinds:

#### axes properties:

- **fraction**
  - `[float, default: 0.15] Fraction of original axes to use for colorbar.

- **shrink**
  - `[float, default: 1.0] Fraction by which to multiply the size of the colorbar.

- **aspect**
  - `[float, default: 20] Ratio of long to short dimensions.

- **pad**
  - `[float, default: 0.05 if vertical, 0.15 if horizontal] Fraction of original axes between colorbar and new image axes.`
anchor

[(float, float), optional] The anchor point of the colorbar axes. Defaults to (0.0, 0.5) if vertical; (0.5, 1.0) if horizontal.

panchor

[(float, float), or False, optional] The anchor point of the colorbar parent axes. If False, the parent axes' anchor will be unchanged. Defaults to (1.0, 0.5) if vertical; (0.5, 0.0) if horizontal.

colorbar properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>extend</td>
<td>{'neither', 'both', 'min', 'max'} If not 'neither', make pointed end(s) for out-of-range values. These are set for a given colormap using the colormap set_under and set_over methods.</td>
</tr>
<tr>
<td>extendfrac</td>
<td>{None, 'auto', length, lengths} If set to None, both the minimum and maximum triangular colorbar extensions with have a length of 5% of the interior colorbar length (this is the default setting). If set to 'auto', makes the triangular colorbar extensions the same lengths as the interior boxes (when spacing is set to 'uniform') or the same lengths as the respective adjacent interior boxes (when spacing is set to 'proportional'). If a scalar, indicates the length of both the minimum and maximum triangular colorbar extensions as a fraction of the interior colorbar length. A two-element sequence of fractions may also be given, indicating the lengths of the minimum and maximum colorbar extensions respectively as a fraction of the interior colorbar length.</td>
</tr>
<tr>
<td>extended</td>
<td>bool If False the minimum and maximum colorbar extensions will be triangular (the default). If True the extensions will be rectangular.</td>
</tr>
<tr>
<td>spacing</td>
<td>{'uniform', 'proportional'} Uniform spacing gives each discrete color the same space; proportional makes the space proportional to the data interval.</td>
</tr>
<tr>
<td>ticks</td>
<td>None or list of ticks or Locator If None, ticks are determined automatically from the input.</td>
</tr>
<tr>
<td>format</td>
<td>None or str or Formatter If None, ScalarFormatter is used. If a format string is given, e.g., '%.3f', that is used. An alternative Formatter may be given instead.</td>
</tr>
<tr>
<td>drawedges</td>
<td>str Whether to draw lines at color boundaries.</td>
</tr>
<tr>
<td>label</td>
<td>str The label on the colorbar's long axis.</td>
</tr>
</tbody>
</table>
The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boundaries</td>
<td>None or a sequence</td>
</tr>
<tr>
<td>values</td>
<td>None or a sequence which must be of length 1 less than the sequence of boundaries. For each region delimited by adjacent entries in boundaries, the color mapped to the corresponding value in values will be used.</td>
</tr>
</tbody>
</table>

If `mappable` is a `ContourSet`, its `extend` kwarg is included automatically.

The `shrink` kwarg provides a simple way to scale the colorbar with respect to the axes. Note that if `cax` is specified, it determines the size of the colorbar and `shrink` and `aspect` kwargs are ignored.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwargs.

It is known that some vector graphics viewers (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers, not Matplotlib. As a workaround, the colorbar can be rendered with overlapping segments:

```python
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances, e.g. with semi-transparent images (alpha < 1) and colorbar extensions; therefore, this workaround is not used by default (see issue #1188).

*Image tutorial*

*Tight Layout guide*

**matplotlib.pyplot.connect**

`matplotlib.pyplot.connect(s, func)`

Bind function `func` to event `s`.

**Parameters**

**s**

[[str]] One of the following events ids:

• 'button_press_event'
• 'button_release_event'
• 'draw_event'
• 'key_press_event'
• 'key_release_event'
• 'motion_notify_event'
• 'pick_event'
• 'resize_event'
• 'scroll_event'
• 'figure_enter_event',
• 'figure_leave_event',
• 'axes_enter_event',
• 'axes_leave_event'
• 'close_event'.

**func**

[callable] The callback function to be executed, which must have the signature:

```python
def func(event: Event) -> Any
```

For the location events (button and key press/release), if the mouse is over the axes, the `inaxes` attribute of the event will be set to the `Axes` the event occurs is over, and additionally, the variables `xdata` and `ydata` attributes will be set to the mouse location in data coordinates. See `KeyEvent` and `MouseEvent` for more info.

**Returns**

**cid**

A connection id that can be used with `FigureCanvasBase.mpl_disconnect`.

**Examples**

```python
def on_press(event):
    print('you pressed', event.button, event.xdata, event.ydata)

cid = canvas.mpl_connect('button_press_event', on_press)
```

**Examples using matplotlib.pyplot.connect**

• `sphx_glr_gallery_event_handling_coords_demo.py`

**matplotlib.pyplot.contour**

```python
matplotlib.pyplot.contour(*args, data=None, **kwargs)
```

Plot contours.

Call signature:

```python
contour([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

**Parameters**
X, Y
[array-like, optional] The coordinates of the values in Z.
X and Y must both be 2-D with the same shape as Z (e.g. created via numpy.meshgrid), or they must both be 1-D such that len(X) == M is the number of columns in Z and len(Y) == N is the number of rows in Z.
If not given, they are assumed to be integer indices, i.e. X = range(M), Y = range(N).

Z
[array-like(N, M)] The height values over which the contour is drawn.

levels
[int or array-like, optional] Determines the number and positions of the contour lines / regions.
If an int n, use MaxNLocator, which tries to automatically choose no more than n+1 "nice" contour levels between vmin and vmax.
If array-like, draw contour lines at the specified levels. The values must be in increasing order.

Returns
QuadContourSet

Other Parameters

corner_mask
[bool, default: rcParams["contour.corner_mask"] (default: True)]
Enable/disable corner masking, which only has an effect if Z is a masked array. If False, any quad touching a masked point is masked out. If True, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

colors
[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for contour and the areas for contourf.
The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.
As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.
By default (value *None*), the colormap specified by *cmap* will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or *Colormap*, default: *rcParams*['image.cmap'] (default: 'viridis')] A *Colormap* instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

**norm**

[ *Normalize*, optional] If a colormap is used, the *Normalize* instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**vmin, vmax**

[float, optional] If not *None*, either or both of these values will be supplied to the *Normalize* instance, overriding the default color scaling based on *levels*.

**origin**

[{*None*, 'upper', 'lower', 'image'}, default: *None*] Determines the orientation and exact position of *Z* by specifying the position of *Z*[0, 0]. This is only relevant, if *X*, *Y* are not given.

- *None*: *Z*[0, 0] is at X=0, Y=0 in the lower left corner.
- 'lower': *Z*[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': *Z*[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams*['image.origin'] (default: 'upper').

**extent**

[(x0, x1, y0, y1), optional] If *origin* is not *None*, then *extent* is interpreted as in *imshow*: it gives the outer pixel boundaries. In this case, the position of *Z*[0, 0] is the center of the pixel, not a corner. If *origin* is *None*, then (x0, y0) is the position of *Z*[0, 0], and (x1, y1) is the position of *Z*[-1, -1].

This argument is ignored if *X* and *Y* are specified in the call to *contour*.

**locator**
[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via `levels`. Defaults to `MaxNLocator`.

**extend**

`{'neither', 'both', 'min', 'max'}, default: 'neither'` Determines the `contourf`-coloring of values that are outside the `levels` range.

If 'neither', values outside the `levels` range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the `levels` range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the `Colormap`. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

**Note:** An existing `QuadContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `QuadContourSet` because it internally calls `QuadContourSet.changed()`.

**Example:**

```python
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                  colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')

cs.cmap.set_over('red')

cs.cmap.set_under('blue')

cs.changed()
```

**xunits, yunits**

[registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

**antialiased**

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is `True`. For line contours, it is taken from `rcParams['lines.antialiased']` (default: `True`).

**nchunk**
[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of \textit{nchunk} by \textit{nchunk} quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the \textit{antialiased} flag and value of \textit{alpha}.

**linewights**

[float or array-like, default: rcParams["contour.linewidth"] (default: None)] Only applies to \textit{contour}.

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to rcParams["lines.linewidth"] (default: 1.5).

**linestyles**

[{\text{None}, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] Only applies to \textit{contour}.

If \textit{linestyles} is \text{None}, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from rcParams["contour.negative_linestyle"] (default: 'dashed') setting.

\textit{linestyles} can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**hatches**

[List[str], optional] Only applies to \textit{contourf}.

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.
Notes

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.

2. `contourf` fills intervals that are closed at the top; that is, for boundaries $z_1$ and $z_2$, the filled region is:

   $z_1 < Z <= z_2$

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

Examples using `matplotlib.pyplot.contour`

- `sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`

`matplotlib.pyplot.contourf`

`matplotlib.pyplot.contourf(*args, data=None, **kwargs)`

Plot contours.

Call signature:

```
contour([X, Y,] Z, [levels], **kwargs)
```

`contour` and `contourf` draw contour lines and filled contours, respectively. Except as noted, function signatures and return values are the same for both versions.

Parameters

- **X, Y**
  
  [array-like, optional] The coordinates of the values in $Z$.

  $X$ and $Y$ must both be 2-D with the same shape as $Z$ (e.g. created via `numpy.meshgrid`), or they must both be 1-D such that `len(X) == M` is the number of columns in $Z$ and `len(Y) == N` is the number of rows in $Z$.

  If not given, they are assumed to be integer indices, i.e. $X = \text{range}(M), Y = \text{range}(N)$.

- **Z**
  
  [array-like(N, M)] The height values over which the contour is drawn.

- **levels**
[int or array-like, optional] Determines the number and positions of the contour lines / regions.

If an int \( n \), use \texttt{MaxNLocator}, which tries to automatically choose no more than \( n+1 \) "nice" contour levels between \( \text{vmin} \) and \( \text{vmax} \).

If array-like, draw contour lines at the specified levels. The values must be in increasing order.

**Returns**

\texttt{QuadContourSet}

**Other Parameters**

**corner_mask**

[bool, default: \texttt{rcParams["contour.corner_mask"]} (default: True)]

Enable/disable corner masking, which only has an effect if \( Z \) is a masked array. If False, any quad touching a masked point is masked out. If True, only the triangular corners of quads nearest those points are always masked out, other triangular corners comprising three unmasked points are contoured as usual.

**colors**

[color string or sequence of colors, optional] The colors of the levels, i.e. the lines for \texttt{contour} and the areas for \texttt{contourf}.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. \texttt{'red'} instead of \texttt[['red']] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value \texttt{None}), the colormap specified by \texttt{cmap} will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or \texttt{Colormap}, default: \texttt{rcParams["image.cmap"]} (default: 'viridis')] A \texttt{Colormap} instance or registered colormap name. The colormap maps the level values to colors.

If both \texttt{colors} and \texttt{cmap} are given, an error is raised.

**norm**
[Normalize, optional] If a colormap is used, the Normalize instance scales the level values to the canonical colormap range $[0, 1]$ for mapping to colors. If not given, the default linear scaling is used.

vmin, vmax

[float, optional] If not None, either or both of these values will be supplied to the Normalize instance, overriding the default color scaling based on levels.

origin

[{None, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of Z by specifying the position of $Z[0, 0]$. This is only relevant, if X, Y are not given.

- None: $Z[0, 0]$ is at $X=0$, $Y=0$ in the lower left corner.
- 'lower': $Z[0, 0]$ is at $X=0.5$, $Y=0.5$ in the lower left corner.
- 'upper': $Z[0, 0]$ is at $X=N+0.5$, $Y=0.5$ in the upper left corner.
- 'image': Use the value from rcParams["image.origin"] (default: 'upper').

extent

[(x0, x1, y0, y1), optional] If origin is not None, then extent is interpreted as in imshow: it gives the outer pixel boundaries. In this case, the position of $Z[0, 0]$ is the center of the pixel, not a corner. If origin is None, then $(x0, y0)$ is the position of $Z[0, 0]$, and $(x1, y1)$ is the position of $Z[-1, -1]$.

This argument is ignored if X and Y are specified in the call to contour.

locator

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via levels. Defaults to MaxNLocator.

extend

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the contourf-coloring of values that are outside the levels range.

If 'neither', values outside the levels range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the levels range.

Values below min(levels) and above max(levels) are mapped to the under/over values of the Colormap. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may
want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

**Note:** An existing `QuadContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call `QuadContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `QuadContourSet` because it internally calls `QuadContourSet.changed()`.

Example:

```python
x = np.arange(1, 10)
y = x.reshape(-1, 1)
h = x * y

cs = plt.contourf(h, levels=[10, 30, 50],
                 colors=['#808080', '#A0A0A0', '#C0C0C0'], extend='both')
cs.cmap.set_over('red')
cs.cmap.set_under('blue')
cs.changed()
```

**xunits, yunits**

[registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

**antialiased**

[bool, optional] Enable antialiasing, overriding the defaults. For filled contours, the default is `True`. For line contours, it is taken from `rcParams['lines.antialiased']` (default: `True`).

**nchunk**

[int >= 0, optional] If 0, no subdivision of the domain. Specify a positive integer to divide the domain into subdomains of `nchunk` by `nchunk` quads. Chunking reduces the maximum length of polygons generated by the contouring algorithm which reduces the rendering workload passed on to the backend and also requires slightly less RAM. It can however introduce rendering artifacts at chunk boundaries depending on the backend, the `antialiased` flag and value of `alpha`.

**linewidths**

[float or array-like, default: `rcParams['contour.linewidth']`] (default: `None`) *Only applies to contour.*

The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.
If a sequence, the levels in ascending order will be plotted with the linelengths in the order specified.

If None, this falls back to `rcParams["lines.linewidth"]` (default: 1.5).

**linestyles**

`[{None, 'solid', 'dashed', 'dashdot', 'dotted'}, optional] Only applies to contour.`

If `linestyles` is None, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their linestyle from `rcParams["contour.negative_linestyle"]` (default: 'dashed') setting.

`linestyles` can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

**hatches**

`[List[str], optional] Only applies to contourf.`

A list of cross hatch patterns to use on the filled areas. If None, no hatching will be added to the contour. Hatching is supported in the PostScript, PDF, SVG and Agg backends only.

**Notes**

1. `contourf` differs from the MATLAB version in that it does not draw the polygon edges. To draw edges, add line contours with calls to `contour`.
2. `contourf` fills intervals that are closed at the top; that is, for boundaries $z1$ and $z2$, the filled region is:

   $z1 < Z <= z2$

   except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).

- sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
matplotlib.pyplot.cool

matplotlib.pyplot.cool()

Set the colormap to "cool".

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

Examples using matplotlib.pyplot.cool

matplotlib.pyplot.copper

matplotlib.pyplot.copper()

Set the colormap to "copper".

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

Examples using matplotlib.pyplot.copper

matplotlib.pyplot.csd

matplotlib.pyplot.csd(x, y, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)

Plot the cross-spectral density.

The cross spectral density $P_{xy}$ by Welch's average periodogram method. The vectors $x$ and $y$ are divided into $NFFT$ length segments. Each segment is detrended by function detrend and windowed by function window. noverlap gives the length of the overlap between segments. The product of the direct FFTs of $x$ and $y$ are averaged over each segment to compute $P_{xy}$, with a scaling to correct for power loss due to windowing.

If len(x) < NFFT or len(y) < NFFT, they will be zero padded to NFFT.

Parameters

x, y

[1-D arrays or sequences] Arrays or sequences containing the data.
Fs

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

window

[callee or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls detrend_none. 'mean' calls detrend_mean. 'linear' calls detrend_linear.

scale_by_freq
Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

**noverlap**

The number of points of overlap between segments.

**Fc**

The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsamped to baseband.

**return_line**

Whether to include the line object plotted in the returned values.

**Returns**

**Pxy**

The values for the cross spectrum $P_{xy}$ before scaling (complex valued).

**freqs**

The frequencies corresponding to the elements in Pxy.

**line**

The line created by this function. Only returned if return_line is True.

**Other Parameters**

**kwargs**

Keyword arguments control the Line2D properties:

**See also:**

*psd*

is equivalent to setting $y = x$.  

18.38. matplotlib.pyplot  2427
Notes

For plotting, the power is plotted as \(10 \log_{10}(P_{xy})\) for decibels, though \(P_{xy}\) itself is returned.

References

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, y.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.pyplot.csd

matplotlib.pyplot.delaxes

matplotlib.pyplot.delaxes(ax=None)

Remove an Axes (defaulting to the current axes) from its figure.

Examples using matplotlib.pyplot.delaxes

matplotlib.pyplot.disconnect

matplotlib.pyplot.disconnect(cid)

Disconnect the callback with id cid.

Examples

```
cid = canvas.mpl_connect('button_press_event', on_press)
    # ... later
canvas.mpl_disconnect(cid)
```
Examples using `matplotlib.pyplot.disconnect`

- `sphx_glr_gallery_event_handling_coords_demo.py`

`matplotlib.pyplot.draw`

`matplotlib.pyplot.draw()`  
Redraw the current figure.

This is used to update a figure that has been altered, but not automatically redrawn. If interactive mode is on (via `ion()`), this should be only rarely needed, but there may be ways to modify the state of a figure without marking it as "stale". Please report these cases as bugs.

This is equivalent to calling `fig.canvas.draw_idle()`, where `fig` is the current figure.

Examples using `matplotlib.pyplot.draw`

- `sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`
- `sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py`

`matplotlib.pyplot.draw_if_interactive`

`matplotlib.pyplot.draw_if_interactive()`

Examples using `matplotlib.pyplot.draw_if_interactive`

`matplotlib.pyplot.errorbar`

`matplotlib.pyplot.errorbar(x, y, yerr=None, xerr=None, fmt='', ecolor=None,elinewidth=None, capsize=None, barsabove=False, lolims=False, uplims=False, xlolims=False, xuplims=False, errorevery=1, capthick=None, *, data=None, **kwargs)`  
Plot y versus x as lines and/or markers with attached errorbars.

x, y define the data locations, xerr, yerr define the errorbar sizes. By default, this draws the data markers/lines as well the errorbars. Use fmt='none' to draw errorbars without any data markers.

**Parameters**
x, y
[loat or array-like] The data positions.

xerr, yerr
[float or array-like, shape(N), or shape(2, N), optional] The errorbar sizes:

- scalar: Symmetric +/- values for all data points.
- shape(N,): Symmetric +/-values for each data point.
- shape(2, N): Separate - and + values for each bar. First row contains the lower errors, the second row contains the upper errors.
- None: No errorbar.

Note that all error arrays should have positive values.
See /gallery/statistics/errorbar_features for an example on the usage of xerr and yerr.

fmt
[short, default: ''] The format for the data points / data lines. See plot for details.
Use 'none' (case insensitive) to plot errorbars without any data markers.

ecolor
[color, default: None] The color of the errorbar lines. If None, use the color of the line connecting the markers.

elinewidth
[float, default: None] The linewidth of the errorbar lines. If None, the linewidth of the current style is used.

capsize
[float, default: rcParams["errorbar.capsize"] (default: 0.0)] The length of the error bar caps in points.

capthick
[float, default: None] An alias to the keyword argument markeredgewidth (a.k.a. mew). This setting is a more sensible name for the property that controls the thickness of the error bar cap in points. For backwards compatibility, if mew or markeredgewidth are given, then they will over-ride capthick. This may change in future releases.

barsabove
If True, will plot the error bars above the plot symbols. Default is below.

lolims, uplims, xlolims, xuplims

These arguments can be used to indicate that a value gives only upper/lower limits. In that case a caret symbol is used to indicate this. lims-arguments may be scalars, or array-likes of the same length as xerr and yerr. To use limits with inverted axes, set_xlim or set_ylim must be called before errorbar(). Note the tricky parameter names: setting e.g. lolims to True means that the y-value is a lower limit of the True value, so, only an upward-pointing arrow will be drawn!

errorevery

[1 or (1, 1), default: 1] draws error bars on a subset of the data. errorevery=N draws error bars on the points (x[::N], y[::N]). errorevery=(start, N) draws error bars on the points (x[start::N], y[start::N]). e.g. errorevery=(6, 3) adds error bars to the data at (x[6], x[9], x[12], x[15], ...). Used to avoid overlapping error bars when two series share x-axis values.

Returns

ErrorbarContainer

The container contains:

- plotline: Line2D instance of x, y plot markers and/or line.
- caplines: A tuple of Line2D instances of the error bar caps.
- barlinecols: A tuple of LineCollection with the horizontal and vertical error ranges.

Other Parameters

**kwargs

All other keyword arguments are passed on to the plot call drawing the markers. For example, this code makes big red squares with thick green edges:

```python
x, y, yerr = rand(3, 10)
errorbar(x, y, yerr, marker='s', mfc='red', mec='green', ms=20, mew=4)
```

where mfc, mec, ms and mew are aliases for the longer property names, markerfacecolor, markeredgecolor, markersize and markeredgewidth.

Valid kwargs for the marker properties are Line2D properties:

</tbody>
</table>
Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `xerr`, `yerr`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.errorbar`

- sphx_glr_gallery_lines_bars_and_markers_errorbar_limits_simple.py

`matplotlib.pyplot.eventplot`

```python
matplotlib.pyplot.eventplot(positions, orientation='horizontal', lineoffsets=1,
                           linelengths=1, linewidths=None, colors=None,
                           linestyles='solid', *, data=None, **kwargs)
```

Plot identical parallel lines at the given positions.

This type of plot is commonly used in neuroscience for representing neural events, where it is usually called a spike raster, dot raster, or raster plot.

However, it is useful in any situation where you wish to show the timing or position of multiple sets of discrete events, such as the arrival times of people to a business on each day of the month or the date of hurricanes each year of the last century.

**Parameters**

**positions**

[array-like or list of array-like] A 1D array-like defines the positions of one sequence of events.

Multiple groups of events may be passed as a list of array-likes. Each group can be styled independently by passing lists of values to `lineoffsets`, `linelengths`, `linewidths`, `colors` and `linestyles`.

Note that `positions` can be a 2D array, but in practice different event groups usually have different counts so that one will use a list of different-length arrays rather than a 2D array.

**orientation**

[{`'horizontal'`, `'vertical'`}, default: `'horizontal'`] The direction of the event sequence:
• 'horizontal': the events are arranged horizontally. The indicator lines are vertical.
• 'vertical': the events are arranged vertically. The indicator lines are horizontal.

**lineoffsets**

[float or array-like, default: 1] The offset of the center of the lines from the origin, in the direction orthogonal to **orientation**.

If **positions** is 2D, this can be a sequence with length matching the length of **positions**.

**linelengths**

[float or array-like, default: 1] The total height of the lines (i.e. the lines stretches from lineoffset - linelength/2 to lineoffset + linelength/2).

If **positions** is 2D, this can be a sequence with length matching the length of **positions**.

**linewidths**

[float or array-like, default: rcParams["lines.linewidth"] (default: 1.5)] The line width(s) of the event lines, in points.

If **positions** is 2D, this can be a sequence with length matching the length of **positions**.

**colors**

[color or list of colors, default: rcParams["lines.color"] (default: 'C0')] The color(s) of the event lines.

If **positions** is 2D, this can be a sequence with length matching the length of **positions**.

**linestyles**

[str or tuple or list of such values, default: 'solid'] Default is 'solid'. Valid strings are ['solid', 'dashed', 'dashdot', 'dotted', '-', '--', '-.', ':']. Dash tuples should be of the form:

```
(offset, onoffseq),
```

where **onoffseq** is an even length tuple of on and off ink in points.

If **positions** is 2D, this can be a sequence with length matching the length of **positions**.

**kwargs**

Other keyword arguments are line collection properties. See **LineCollection** for a list of the valid properties.
Returns

list of EventCollection

The EventCollection that were added.

Notes

For linelengths, linewidths, colors, and linestyles, if only a single value is given, that value is applied to all lines. If an array-like is given, it must have the same length as positions, and each value will be applied to the corresponding row of the array.

Examples

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): positions, lineoffsets, linelengths, linewidths, colors, linestyles.
Objects passed as **data** must support item access (**data[s]**) and membership test (**s in data**).

**Examples using** `matplotlib.pyplot.eventplot`  

`matplotlib.pyplot.figimage`  

`matplotlib.pyplot.figimage(X, xo=0, yo=0, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, origin=None, resize=False, **kwargs)`  

Add a non-resampled image to the figure.

The image is attached to the lower or upper left corner depending on **origin**.

**Parameters**

**X**

The image data. This is an array of one of the following shapes:

- MxN: luminance (grayscale) values
- MxNx3: RGB values
- MxNx4: RGBA values

**xo, yo**

[int] The x/y image offset in pixels.

**alpha**

[None or float] The alpha blending value.

**norm**

[``matplotlib.colors.Normalize``] A Normalize instance to map the luminance to the interval [0, 1].

**cmap**

**vmin, vmax**

[float] If **norm** is not given, these values set the data limits for the colormap.

**origin**

[{"upper", "lower"}, default: `rcParams["image.origin"]` (default: "upper")} Indicates where the [0, 0] index of the array is in the upper left or lower left corner of the axes.
resize

[bool] If True, resize the figure to match the given image size.

Returns

matplotlib.image.FigureImage

Other Parameters

**kwargs

Additional kwargs are Artist kwargs passed on to FigureImage.

Notes

figimage complements the axes image (imshow) which will be resampled to fit the current axes. If you want a resampled image to fill the entire figure, you can define an Axes with extent [0, 0, 1, 1].

Examples

```python
f = plt.figure()
nx = int(f.get_figwidth() * f.dpi)
ny = int(f.get_figheight() * f.dpi)
data = np.random.random((ny, nx))
f.figimage(data)
plt.show()
```

Examples using matplotlib.pyplot.figimage

- sphx_glr_gallery_images_contours_and_fields_figimage_demo.py

matplotlib.pyplot.figlegend

**kwargs

Place a legend on the figure.

To make a legend from existing artists on every axes:

```python
figlegend()
```

To make a legend for a list of lines and labels:
These can also be specified by keyword:

```python
figlegend(
    handles=(line1, line2, line3),
    labels=('label1', 'label2', 'label3'),
    loc='upper right')
```

### Parameters

- **handles**
  
  [list of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

  The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

- **labels**
  
  [list of str, optional] A list of labels to show next to the artists. Use this together with `handles`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

### Returns

- **Legend**

### Other Parameters

- **loc**
  

  The strings 'upper left', 'upper right', 'lower left', 'lower right' place the legend at the corresponding corner of the axes/figure.

  The strings 'upper center', 'lower center', 'center left', 'center right' place the legend at the center of the corresponding edge of the axes/figure.
The string 'center' places the legend at the center of the axes/figure.

The string 'best' places the legend at the location, among the nine locations defined so far, with the minimum overlap with other drawn artists. This option can be quite slow for plots with large amounts of data; your plotting speed may benefit from providing a specific location.

The location can also be a 2-tuple giving the coordinates of the lower-left corner of the legend in axes coordinates (in which case bbox_to_anchor will be ignored).

For back-compatibility, 'center right' (but no other location) can also be spelled 'right', and each "string" locations can also be given as a numeric value:

<table>
<thead>
<tr>
<th>Location String</th>
<th>Location Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>'best'</td>
<td>0</td>
</tr>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

bbox_to_anchor

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc. Defaults to axes.bbox (if called as a method to Axes.legend) or figure.bbox (if Figure.legend). This argument allows arbitrary placement of the legend.

Bbox coordinates are interpreted in the coordinate system given by bbox transform, with the default transform Axes or Figure coordinates, depending on which legend is called.

If a 4-tuple or BboxBase is given, then it specifies the bbox (x, y, width, height) that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0., 0.5, 0.5)
```

A 2-tuple (x, y) places the corner of the legend specified by loc at x, y. For example, to put the legend's upper right-hand corner...
in the center of the axes (or figure) the following keywords can be used:

```python
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

**ncol**

[int, default: 1] The number of columns that the legend has.

**prop**

[None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

**fontsize**

[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

**labelcolor**

[str or list] Sets the color of the text in the legend. Can be a valid color string (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linecolor', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints**

[int, default: `rcParams`["legend.numpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a `Line2D` (line).

**scatterpoints**

[int, default: `rcParams`["legend.scatterpoints"] (default: 1)] The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot).

**scatteryoffsets**

[iterable of floats, default: [0.375, 0.5, 0.3125]] The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale**

[float, default: `rcParams`["legend.markerscale"] (default: 1.0)] The relative size of legend markers compared with the originally drawn ones.
**markerfirst**

[bool, default: True] If True, legend marker is placed to the left of the legend label. If False, legend marker is placed to the right of the legend label.

**frameon**

[bool, default: rcParams["legend.frameon"] (default: True)] Whether the legend should be drawn on a patch (frame).

**fancybox**

[bool, default: rcParams["legend.fancybox"] (default: True)] Whether round edges should be enabled around the FancyBboxPatch which makes up the legend's background.

**shadow**

[bool, default: rcParams["legend.shadow"] (default: False)] Whether to draw a shadow behind the legend.

**framealpha**

[float, default: rcParams["legend.framealpha"] (default: 0.8)] The alpha transparency of the legend's background. If shadow is activated and framealpha is None, the default value is ignored.

**facecolor**

["inherit" or color, default: rcParams["legend.facecolor"] (default: 'inherit')] The legend's background color. If "inherit", use rcParams["axes.facecolor"] (default: 'white').

**edgecolor**

["inherit" or color, default: rcParams["legend.edgecolor"] (default: '0.8')] The legend's background patch edge color. If "inherit", use take rcParams["axes.edgecolor"] (default: 'black').

**mode**

["expand", None] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or bbox_to_anchor if defines the legend's size).

**bbox_transform**

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor). For a value of None (default) the Axes' transAxes transform will be used.

**title**

[str or None] The legend's title. Default is no title (None).
title_fontsize

[float, default: rcParams["legend.borderpad"] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing

[float, default: rcParams["legend.labelspacing"] (default: 0.5)] The vertical space between the legend entries, in font-size units.

handlelength

[float, default: rcParams["legend.handlelength"] (default: 2.0)] The length of the legend handles, in font-size units.

handletextpad

[float, default: rcParams["legend.handletextpad"] (default: 0.8)] The pad between the legend handle and text, in font-size units.

borderaxespad

[float, default: rcParams["legend.borderaxespad"] (default: 0.5)] The pad between the axes and legend border, in font-size units.

columnspacing

[float, default: rcParams["legend.columnspacing"]] (default: 2.0)] The spacing between columns, in font-size units.

handler_map

[dict or None] The custom dictionary mapping instances or types to a legend handler. This handler_map updates the default handler map found at matplotlib.legend.Legend.get_legend_handler_map.

Notes

Some artists are not supported by this function. See Legend guide for details.
Examples using `matplotlib.pyplot.figlegend`

`matplotlib.pyplot.fignum_exists`

`matplotlib.pyplot.fignum_exists(num)`

Return whether the figure with the given id exists.

Examples using `matplotlib.pyplot.fignum_exists`

`matplotlib.pyplot.figtext`

`matplotlib.pyplot.figtext(x, y, s, fontdict=None, **kwargs)`

Add text to figure.

**Parameters**

\[ x, y \]

*float* The position to place the text. By default, this is in figure coordinates, floats in \([0, 1]\). The coordinate system can be changed using the `transform` keyword.

\[ s \]

*str* The text string.

\[ fontdict \]

*dict, optional* A dictionary to override the default text properties. If not given, the defaults are determined by `rcParams["font.*"]`. Properties passed as `kwargs` override the corresponding ones given in `fontdict`.

**Returns**

`Text`

Other Parameters

\[ **kwargs \]

*Text properties* Other miscellaneous text parameters.

Examples using matplotlib.pyplot.figtext

- sphx_glr_gallery_text_labels_and_annotations_fonts_demo.py
- sphx_glr_gallery_text_labels_and_annotations_fonts_demo_kw.py

matplotlib.pyplot.figure

```python
matplotlib.pyplot.figure(num=None, figsize=None, dpi=None, facecolor=None, edgecolor=None, frameon=True, FigureClass=<class 'matplotlib.figure.Figure'>, clear=False, **kwargs)
```

Create a new figure, or activate an existing figure.

**Parameters**

**num**

[int or str, optional] A unique identifier for the figure.

If a figure with that identifier already exists, this figure is made active and returned. An integer refers to the Figure.number attribute, a string refers to the figure label.

If there is no figure with the identifier or num is not given, a new figure is created, made active and returned. If num is an int, it will be used for the Figure.number attribute, otherwise, an auto-generated integer value is used (starting at 1 and incremented for each new figure). If num is a string, the figure label and the window title is set to this value.

**figsize**

[(float, float), default: rcParams["figure.figsize"] (default: [6.4, 4.8])] Width, height in inches.

**dpi**

[float, default: rcParams["figure.dpi"] (default: 100.0)] The resolution of the figure in dots-per-inch.

**facecolor**

[color, default: rcParams["figure.facecolor"] (default: 'white')] The background color.

**edgecolor**

[color, default: rcParams["figure.edgecolor"] (default: 'white')] The border color.

**frameon**

[bool, default: True] If False, suppress drawing the figure frame.
**FigureClass**

[subclass of *Figure*] Optionally use a custom *Figure* instance.

**clear**

[bool, default: False] If True and the figure already exists, then it is cleared.

**tight_layout**

[bool or dict, default: `rcParams["figure.autolayout"]` (default: False)] If False use `subplotpars`. If True adjust subplot parameters using `tight_layout` with default padding. When providing a dict containing the keys pad, w_pad, h_pad, and rect, the default `tight_layout` paddings will be overridden.

**constrained_layout**

[bool, default: `rcParams["figure.constrained_layout.use"]` (default: False)] If True use constrained layout to adjust positioning of plot elements. Like `tight_layout`, but designed to be more flexible. See *Constrained Layout Guide* for examples. (Note: does not work with `add_subplot` or `subplot2grid`.)

**kwargs : optional**

See *Figure* for other possible arguments.

**Returns**

*Figure*

The *Figure* instance returned will also be passed to `new_figure_manager` in the backends, which allows to hook custom *Figure* classes into the pyplot interface. Additional kwargs will be passed to the *Figure* init function.

**Notes**

If you are creating many figures, make sure you explicitly call `pyplot.close` on the figures you are not using, because this will enable pyplot to properly clean up the memory.

*rcParams* defines the default values, which can be modified in the `matplotlibrc` file.
Examples using `matplotlib.pyplot.figure`

- *Frame grabbing*
- `sphx_glr_gallery_misc_hyperlinks_sgskip.py`
- `sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py`
- `sphx_glr_gallery_mplot3d_wire3d_animation_sgskip.py`
- `sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py`
- `sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py`
- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

`matplotlib.pyplot.fill`

`matplotlib.pyplot.fill(*args, data=None, **kwargs)`

Plot filled polygons.

**Parameters**

*args

[sequence of x, y, [color]] Each polygon is defined by the lists of x and y positions of its nodes, optionally followed by a color specifier. See `matplotlib.colors` for supported color specifiers. The standard color cycle is used for polygons without a color specifier.

You can plot multiple polygons by providing multiple x, y, [color] groups.

For example, each of the following is legal:

```python
ax.fill(x, y)  # a polygon with default color
ax.fill(x, y, "b")  # a blue polygon
ax.fill(x, y, x2, y2)  # two polygons
ax.fill(x, y, "b", x2, y2, "r")  # a blue and a red polygon
```

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y, e.g.:

```python
ax.fill("time", "signal",
       data={"time": [0, 1, 2], "signal": [0, 1, 0]})
```

**Returns**

list of `Polygon`
Other Parameters

**kwargs

[Polygon properties]

Notes

Use \texttt{fill\_between()} if you would like to fill the region between two curves.

Examples using \texttt{matplotlib.pyplot.fill}

• sphx\_glr\_gallery\_event\_handling\_ginput\_manual\_clabel\_sgskip.py

\texttt{matplotlib.pyplot.fill\_between}

\begin{verbatim}
matplotlib.pyplot.fill_between(x, y1, y2=0, where=None, interpolate=False,
                               step=None, *, data=None, **kwargs)
\end{verbatim}

Fill the area between two horizontal curves.

The curves are defined by the points \((x, y1)\) and \((x, y2)\). This creates one or multiple polygons describing the filled area.

You may exclude some horizontal sections from filling using \texttt{where}.

By default, the edges connect the given points directly. Use \texttt{step} if the filling should be a step function, i.e. constant in between \(x\).

Parameters

\texttt{x}

[array (length N)] The x coordinates of the nodes defining the curves.

\texttt{y1}

[array (length N) or scalar] The y coordinates of the nodes defining the first curve.

\texttt{y2}

[array (length N) or scalar, default: 0] The y coordinates of the nodes defining the second curve.

\texttt{where}

[array of bool (length N), optional] Define \texttt{where} to exclude some horizontal regions from being filled. The filled regions are defined by the coordinates \(x[\texttt{where}]\). More precisely, fill between
x[i] and x[i+1] if where[i] and where[i+1]. Note that this definition implies that an isolated True value between two False values in where will not result in filling. Both sides of the True position remain unfilled due to the adjacent False values.

**interpolate**

[bool, default: False] This option is only relevant if where is used and the two curves are crossing each other.

Semantically, where is often used for y1 > y2 or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the x array. Such a polygon cannot describe the above semantics close to the intersection. The x-sections containing the intersection are simply clipped.

Setting interpolate to True will calculate the actual intersection point and extend the filled region up to this point.

**step**

[{‘pre’, ‘post’, ‘mid’}, optional] Define step if the filling should be a step function, i.e. constant in between x. The value determines where the step will occur:

- ‘pre’: The y value is continued constantly to the left from every x position, i.e. the interval (x[i-1], x[i]) has the value y[i].
- ‘post’: The y value is continued constantly to the right from every x position, i.e. the interval [x[i], x[i+1]) has the value y[i].
- ‘mid’: Steps occur half-way between the x positions.

**Returns**

*PolyCollection*

A *PolyCollection* containing the plotted polygons.

**Other Parameters**

**kwargs**

All other keyword arguments are passed on to *PolyCollection*. They control the *Polygon* properties:

See also:

**fill_between**

Fill between two sets of y-values.

**fill_betweenx**

Fill between two sets of x-values.
Notes

Note: In addition to the above described arguments, this function can take a
\texttt{data} keyword argument. If such a \texttt{data} argument is given, the following argu-
ments can also be string \texttt{s}, which is interpreted as \texttt{data[s]} (unless this raises an
exception): \(x, y1, y2, \text{where}\).

Objects passed as \texttt{data} must support item access (\texttt{data[s]}) and membership test
(s in data).

Examples using \texttt{matplotlib.pyplot.fill_between}

- \texttt{sphx\_glr\_gallery\_lines\_bars\_and\_markers\_fill\_between\_demo.py}
- \texttt{sphx\_glr\_gallery\_text\_labels\_and\_annotations\_mathtext\_examples.py}

\texttt{matplotlib.pyplot.fill\_betweenx}

\texttt{matplotlib.pyplot.fill\_betweenx(y, x1, x2=0, where=\texttt{None}, step=\texttt{None}, \texttt{inter-
polate}=False, *, data=\texttt{None}, **kwargs)}

Fill the area between two vertical curves.

The curves are defined by the points \((y, x1)\) and \((y, x2)\). This creates one or
multiple polygons describing the filled area.

You may exclude some vertical sections from filling using \texttt{where}.

By default, the edges connect the given points directly. Use \texttt{step} if the filling
should be a step function, i.e. constant in between \(y\).

Parameters

\texttt{y}

[array (length N)] The y coordinates of the nodes defining the
curves.

\texttt{x1}

[array (length N) or scalar] The x coordinates of the nodes defin-
ing the first curve.

\texttt{x2}

[array (length N) or scalar, default: 0] The x coordinates of the
nodes defining the second curve.

\texttt{where}
[array of bool (length N), optional] Define where to exclude some vertical regions from being filled. The filled regions are defined by the coordinates y[where]. More precisely, fill between y[i] and y[i+1] if where[i] and where[i+1]. Note that this definition implies that an isolated True value between two False values in where will not result in filling. Both sides of the True position remain unfilled due to the adjacent False values.

**interpolate**

[bool, default: False] This option is only relevant if where is used and the two curves are crossing each other.

Semantically, where is often used for x1 > x2 or similar. By default, the nodes of the polygon defining the filled region will only be placed at the positions in the y array. Such a polygon cannot describe the above semantics close to the intersection. The y-sections containing the intersection are simply clipped.

Setting interpolate to True will calculate the actual intersection point and extend the filled region up to this point.

**step**

[{'pre', 'post', 'mid'}, optional] Define step if the filling should be a step function, i.e. constant in between y. The value determines where the step will occur:

- 'pre': The y value is continued constantly to the left from every x position, i.e. the interval (x[i-1], x[i]) has the value y[i].
- 'post': The y value is continued constantly to the right from every x position, i.e. the interval [x[i], x[i+1]) has the value y[i].
- 'mid': Steps occur half-way between the x positions.

**Returns**

*PolyCollection*

A PolyCollection containing the plotted polygons.

**Other Parameters**

**kwarg**s

All other keyword arguments are passed on to PolyCollection. They control the Polygon properties:

**See also:**

- `fill_between`
  Fill between two sets of y-values.
- `fill_betweenx`
  Fill between two sets of x-values.
Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `y`, `x1`, `x2`, `where`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using matplotlib.pyplot.fill_betweenx**

`matplotlib.pyplot.findobj`

`matplotlib.pyplot.findobj(o=None, match=None, include_self=True)`

Find artist objects. Recursively find all `Artist` instances contained in the artist.

**Parameters**

**match**

A filter criterion for the matches. This can be

- `None`: Return all objects contained in artist.

- A function with signature `def match(artist: Artist) -> bool`. The result will only contain artists for which the function returns `True`.

- A class instance: e.g., `Line2D`. The result will only contain artists of this class or its subclasses (`isinstance` check).

**include_self**

[bool] Include `self` in the list to be checked for a match.

**Returns**

list of `Artist`
Examples using `matplotlib.pyplot.findobj`  

`matplotlib.pyplot.flag`  

`matplotlib.pyplot.flag()`  
Set the colormap to "flag".  
This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.flag`  

`matplotlib.pyplot.gca`  

`matplotlib.pyplot.gca(**kwargs)`  
Get the current axes, creating one if necessary.

The following kwargs are supported for ensuring the returned axes adheres to the given projection etc., and for axes creation if the active axes does not exist:

<table>

</tbody>
</table>

**Examples using matplotlib.pyplot.gca**

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py
**matplotlib.pyplot.gcf**

```python
cmatplot.pyplot.gcf()
```

Get the current figure.

If no current figure exists, a new one is created using `figure()`.

**Examples using matplotlib.pyplot.gcf**

- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
- sphx_glr_gallery_event_handling_trifinder_event_demo.py
- sphx_glr_gallery_misc_agg_buffer.py
- *Tight Layout guide*

**matplotlib.pyplot.gci**

```python
cmatplot.pyplot.gci()
```

Get the current colorable artist.

Specifically, returns the current `ScalarMappable` instance (Image created by `imshow` or `figimage`, Collection created by `pcolor` or `scatter`, etc.), or `None` if no such instance has been defined.

The current image is an attribute of the current axes, or the nearest earlier axes in the current figure that contains an image.

**Notes**

Historically, the only colorable artists were images; hence the name `gci` (get current image).

**Examples using matplotlib.pyplot.gci**

**matplotlib.pyplot.get**

```python
cmatplot.pyplot.get(obj, *args, **kwargs)
```

Return the value of an object's `property`, or print all of them.

**Parameters**

- **obj**
  - *Artist* The queried artist; e.g., a `Line2D`, a `Text`, or an `Axes`.  

---

**18.38. matplotlib.pyplot**

2457
**property**

[Dic or None, default: None] If *property* is 'somename', this function returns `obj.get_somename()`. If is is None (or unset), it prints all gettable properties from `obj`. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

property or alias = value

e.g.:

linewidth or lw = 2

**Examples using matplotlib.pyplot.get**

**matplotlib.pyplot.get_current_fig_manager**

`matplotlib.pyplot.get_current_fig_manager()`

Return the figure manager of the current figure.

The figure manager is a container for the actual backend-dependent window that displays the figure on screen.

If if no current figure exists, a new one is created an its figure manager is returned.

**Returns**

*FigureManagerBase* or backend-dependent subclass thereof

**Examples using matplotlib.pyplot.get_current_fig_manager**

**matplotlib.pyplot.get_figlabels**

`matplotlib.pyplot.get_figlabels()`

Return a list of existing figure labels.
Examples using `matplotlib.pyplot.get_figlabels`

`matplotlib.pyplot.get_fignums`

`matplotlib.pyplot.get_fignums()`  
Return a list of existing figure numbers.

Examples using `matplotlib.pyplot.get_fignums`

`matplotlib.pyplot.get_plot_commands`

`matplotlib.pyplot.get_plot_commands()`  
Get a sorted list of all of the plotting commands.

Examples using `matplotlib.pyplot.get_plot_commands`

`matplotlib.pyplot.getp`

`matplotlib.pyplot.getp(obj, *args, **kwargs)`  
Return the value of an object's `property`, or print all of them.

**Parameters**

- **obj**  
  [Artist] The queried artist; e.g., a `Line2D`, a `Text`, or an `Axes`.

- **property**  
  [str or None, default: None] If `property` is 'somename', this function returns `obj.get_somename()`.

  If is is None (or unset), it prints all gettable properties from `obj`. Many properties have aliases for shorter typing, e.g. 'lw' is an alias for 'linewidth'. In the output, aliases and full property names will be listed as:

  property or alias = value

  e.g.:

  linewidth or lw = 2
Examples using `matplotlib.pyplot.getp`

- `sphx_glr_gallery_misc_set_and_get.py`
- *Artist tutorial*

`matplotlib.pyplot.ginput`

```python
matplotlib.pyplot.ginput(n=1, timeout=30, show_clicks=True,
                          mouse_add=<MouseButton.LEFT: 1>,
                          mouse_pop=<MouseButton.RIGHT: 3>,
                          mouse_stop=<MouseButton.MIDDLE: 2>)
```

Blocking call to interact with a figure.

Wait until the user clicks $n$ times on the figure, and return the coordinates of each click in a list.

There are three possible interactions:

- Add a point.
- Remove the most recently added point.
- Stop the interaction and return the points added so far.

The actions are assigned to mouse buttons via the arguments `mouse_add`, `mouse_pop` and `mouse_stop`.

**Parameters**

- **n**
  
  [int, default: 1] Number of mouse clicks to accumulate. If negative, accumulate clicks until the input is terminated manually.

- **timeout**
  
  [float, default: 30 seconds] Number of seconds to wait before timing out. If zero or negative will never timeout.

- **show_clicks**
  
  [bool, default: True] If True, show a red cross at the location of each click.

- **mouse_add**
  
  [MouseButton or None, default: MouseButton.LEFT] Mouse button used to add points.

- **mouse_pop**
  
  [MouseButton or None, default: MouseButton.RIGHT] Mouse button used to remove the most recently added point.
mouse_stop

MouseButton or None, default: MouseButton.MIDDLE] Mouse button used to stop input.

Returns

list of tuples

A list of the clicked (x, y) coordinates.

Notes

The keyboard can also be used to select points in case your mouse does not have one or more of the buttons. The delete and backspace keys act like right clicking (i.e., remove last point), the enter key terminates input and any other key (not already used by the window manager) selects a point.

Examples using matplotlib.pyplot.ginput

• sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.gray

matplotlib.pyplot.gray()

Set the colormap to "gray".

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

Examples using matplotlib.pyplot.gray

matplotlib.pyplot.grid

matplotlib.pyplot.grid(b=None, which='major', axis='both', **kwargs)

Configure the grid lines.

Parameters

b

[bool or None, optional] Whether to show the grid lines. If any kwargs are supplied, it is assumed you want the grid on and b will be set to True.
If \( b \) is \textit{None} and there are no \textit{kwargs}, this toggles the visibility of the lines.

**which**

\[
\{\text{'major', 'minor', 'both'}\} \text{, optional} \]

The grid lines to apply the changes on.

**axis**

\[
\{\text{'both', 'x', 'y'}\} \text{, optional} \]

The axis to apply the changes on.

**kwargs**

\[
\text{[Line2D properties]} \]

Define the line properties of the grid, e.g.:

```python
grid(color='r', linestyle='-', linewidth=2)
```

Valid keyword arguments are:

### Notes

The axis is drawn as a unit, so the effective zorder for drawing the grid is determined by the zorder of each axis, not by the zorder of the `Line2D` objects comprising the grid. Therefore, to set grid zorder, use `set_axisbelow` or, for more control, call the `set_zorder` method of each axis.

- Pyplot tutorial
matplotlib.pyplot.hexbin

```python
matplotlib.pyplot.hexbin(x, y, C=None, gridsize=100, bins=None, xscale='linear',yscale='linear', extent=None, cmap=None, norm=None, vmin=None, vmax=None, alpha=None, linewidths=None, edgecolors='face', reduce_C_function=<function mean at 0x7f5439899310>, mincnt=None, marginals=False, *, data=None, **kwargs)
```

Make a 2D hexagonal binning plot of points `x`, `y`.

If `C` is `None`, the value of the hexagon is determined by the number of points in the hexagon. Otherwise, `C` specifies values at the coordinate `(x[i], y[i])`. For each hexagon, these values are reduced using `reduce_C_function`.

**Parameters**

- `x, y`
  - `[array-like]` The data positions. `x` and `y` must be of the same length.

- `C`
  - `[array-like, optional]` If given, these values are accumulated in the bins. Otherwise, every point has a value of 1. Must be of the same length as `x` and `y`.

- `gridsize`
  - `[int or (int, int), default: 100]` If a single int, the number of hexagons in the `x`-direction. The number of hexagons in the `y`-direction is chosen such that the hexagons are approximately regular.

  Alternatively, if a tuple `(nx, ny)`, the number of hexagons in the `x`-direction and the `y`-direction.

- `bins`
  - `['log' or int or sequence, default: None]` Discretization of the hexagon values.

    - If `None`, no binning is applied; the color of each hexagon directly corresponds to its count value.

    - If `log`, use a logarithmic scale for the color map. Internally, \( \log_{10}(i+1) \) is used to determine the hexagon color. This is equivalent to `norm=LogNorm()`.

    - If an integer, divide the counts in the specified number of bins, and color the hexagons accordingly.
• If a sequence of values, the values of the lower bound of the bins to be used.

**xscale**

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the horizontal axis.

**yscale**

[{'linear', 'log'}, default: 'linear'] Use a linear or log10 scale on the vertical axis.

**mincnt**

[int > 0, default: None] If not None, only display cells with more than mincnt number of points in the cell.

**marginals**

[bool, default: False] If marginals is True, plot the marginal density as colormapped rectangles along the bottom of the x-axis and left of the y-axis.

**extent**

[float, default: None] The limits of the bins. The default assigns the limits based on gridsize, x, y, xscale andyscale.

If xscale or yscale is set to 'log', the limits are expected to be the exponent for a power of 10. E.g. for x-limits of 1 and 50 in 'linear' scale and y-limits of 10 and 1000 in 'log' scale, enter (1, 50, 1, 3).

Order of scalars is (left, right, bottom, top).

**Returns**

*PolyCollection*

A *PolyCollection* defining the hexagonal bins.

• *PolyCollection.get_offsets* contains a Mx2 array containing the x, y positions of the M hexagon centers.

• *PolyCollection.get_array* contains the values of the M hexagons.

If marginals is True, horizontal bar and vertical bar (both PolyCollections) will be attached to the return collection as attributes hbar and vbar.

**Other Parameters**

**cmap**
[str or \texttt{Colormap}, default: \texttt{rcParams['image.cmap']}] (default: 'viridis')] The Colormap instance or registered colormap name used to map the bin values to colors.

**norm**

\texttt{[Normalize, optional]} The Normalize instance scales the bin values to the canonical colormap range \([0, 1]\) for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax**

[float, default: None] The colorbar range. If \texttt{None}, suitable min/max values are automatically chosen by the \texttt{Normalize} instance (defaults to the respective min/max values of the bins in case of the default linear scaling). It is deprecated to use \texttt{vmin/vmax} when \texttt{norm} is given.

**alpha**

[float between 0 and 1, optional] The alpha blending value, between 0 (transparent) and 1 (opaque).

**linewidths**

[float, default: \texttt{None}] If \texttt{None}, defaults to 1.0.

**edgecolors**

[\{'face', 'none', \texttt{None}\} or color, default: 'face\} The color of the hexagon edges. Possible values are:

- 'face': Draw the edges in the same color as the fill color.
- 'none': No edges are drawn. This can sometimes lead to unsightly unpainted pixels between the hexagons.
- \texttt{None}: Draw outlines in the default color.
- An explicit color.

**reduce\_C\_function**

[callable, default: \texttt{numpy.mean}] The function to aggregate \(C\) within the bins. It is ignored if \(C\) is not given. This must have the signature:

\begin{verbatim}
def reduce\_C\_function(C: array) -> float
\end{verbatim}

Commonly used functions are:

- \texttt{numpy.mean}: average of the points
- \texttt{numpy.sum}: integral of the point values
- \texttt{numpy.max}: value taken from the largest point
**kwargs

*PolyCollection properties* All other keyword arguments are passed on to *PolyCollection*:

Mayplotlib, Release 3.3.3

Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.hexbin`

`matplotlib.pyplot.hist`

```python
matplotlib.pyplot.hist(x, bins=None, range=None, density=False,
weights=None, cumulative=False, bottom=None,
histtype='bar', align='mid', orientation='vertical',
rwidth=None, log=False, color=None, label=None,
stacked=False, *, data=None, **kwargs)
```

Plot a histogram.

Compute and draw the histogram of `x`. The return value is a tuple `(n, bins, patches)` or `([n0, n1, ...], bins, [patches0, patches1, ...])` if the input contains multiple data. See the documentation of the `weights` parameter to draw a histogram of already-binned data.

Multiple data can be provided via `x` as a list of datasets of potentially different length `([x0, x1, ...])`, or as a 2-D ndarray in which each column is a dataset. Note that the ndarray form is transposed relative to the list form.

Masked arrays are not supported.

The `bins`, `range`, `weights`, and `density` parameters behave as in `numpy.histogram`.

**Parameters**

`x`

[(n,) array or sequence of (n,) arrays] Input values, this takes either a single array or a sequence of arrays which are not required to be of the same length.

`bins`

[int or sequence or str, default: `rcParams["hist.bins"]` (default: 10)] If `bins` is an integer, it defines the number of equal-width bins in the range.
If `bins` is a sequence, it defines the bin edges, including the left edge of the first bin and the right edge of the last bin; in this case, bins may be unequally spaced. All but the last (righthand-most) bin is half-open. In other words, if `bins` is:

```
[1, 2, 3, 4]
```

then the first bin is [1, 2) (including 1, but excluding 2) and the second [2, 3). The last bin, however, is [3, 4], which includes 4.

If `bins` is a string, it is one of the binning strategies supported by `numpy.histogram_bin_edges`: 'auto', 'fd', 'doane', 'scott', 'stone', 'rice', 'sturges', or 'sqrt'.

**range**

[tuple or None, default: None] The lower and upper range of the bins. Lower and upper outliers are ignored. If not provided, `range` is (x.min(), x.max()). Range has no effect if `bins` is a sequence.

If `bins` is a sequence or `range` is specified, autoscaling is based on the specified bin range instead of the range of x.

**density**

[bool, default: False] If True, draw and return a probability density: each bin will display the bin's raw count divided by the total number of counts and the bin width (density = counts / (sum(counts) * np.diff(bins))), so that the area under the histogram integrates to 1 (np.sum(density * np.diff(bins)) == 1).

If `stacked` is also True, the sum of the histograms is normalized to 1.

**weights**

[(n,) array-like or None, default: None] An array of weights, of the same shape as x. Each value in x only contributes its associated weight towards the bin count (instead of 1). If `density` is True, the weights are normalized, so that the integral of the density over the range remains 1.

This parameter can be used to draw a histogram of data that has already been binned, e.g. using `numpy.histogram` (by treating each bin as a single point with a weight equal to its count)

```
counts, bins = np.histogram(data)
plt.hist(bins[:-1], bins, weights=counts)
```

(or you may alternatively use `bar()`).

**cumulative**
[bool or -1, default: False] If True, then a histogram is computed where each bin gives the counts in that bin plus all bins for smaller values. The last bin gives the total number of datapoints.

If density is also True then the histogram is normalized such that the last bin equals 1.

If cumulative is a number less than 0 (e.g., -1), the direction of accumulation is reversed. In this case, if density is also True, then the histogram is normalized such that the first bin equals 1.

**bottom**

[array-like, scalar, or None, default: None] Location of the bottom of each bin, i.e., bins are drawn from bottom to bottom + hist(x, bins) If a scalar, the bottom of each bin is shifted by the same amount. If an array, each bin is shifted independently and the length of bottom must match the number of bins. If None, defaults to 0.

**histtype**

[{'bar', 'barstacked', 'step', 'stepfilled'}, default: 'bar'] The type of histogram to draw.

- 'bar' is a traditional bar-type histogram. If multiple data are given the bars are arranged side by side.
- 'barstacked' is a bar-type histogram where multiple data are stacked on top of each other.
- 'step' generates a lineplot that is by default unfilled.
- 'stepfilled' generates a lineplot that is by default filled.

**align**

[{'left', 'mid', 'right'}, default: 'mid'] The horizontal alignment of the histogram bars.

- 'left': bars are centered on the left bin edges.
- 'mid': bars are centered between the bin edges.
- 'right': bars are centered on the right bin edges.

**orientation**

[{'vertical', 'horizontal'}, default: 'vertical'] If 'horizontal', barh will be used for bar-type histograms and the bottom kwarg will be the left edges.

**rwidth**
The relative width of the bars as a fraction of the bin width. If `None`, automatically compute the width. Ignored if `histtype` is 'step' or 'stepfilled'.

**log**

[bool, default: False] If `True`, the histogram axis will be set to a log scale. If `log` is `True` and `x` is a 1D array, empty bins will be filtered out and only the non-empty `(n, bins, patches)` will be returned.

**color**

[color or array-like of colors or None, default: None] Color or sequence of colors, one per dataset. Default (`None`) uses the standard line color sequence.

**label**

[str or None, default: None] String, or sequence of strings to match multiple datasets. Bar charts yield multiple patches per dataset, but only the first gets the label, so that `legend` will work as expected.

**stacked**

[bool, default: False] If `True`, multiple data are stacked on top of each other If `False` multiple data are arranged side by side if `histtype` is 'bar' or on top of each other if `histtype` is 'step'

**Returns**

**n**

[array or list of arrays] The values of the histogram bins. See `density` and `weights` for a description of the possible semantics. If input `x` is an array, then this is an array of length `nbins`. If input is a sequence of arrays `[data1, data2, ...]`, then this is a list of arrays with the values of the histograms for each of the arrays in the same order. The dtype of the array `n` (or of its element arrays) will always be float even if no weighting or normalization is used.

**bins**

[array] The edges of the bins. Length `nbins + 1` (nbins left edges and right edge of last bin). Always a single array even when multiple data sets are passed in.

**patches**

[BarContainer or list of a single Polygon or list of such objects] Container of individual artists used to create the histogram or list of such containers if there are multiple input datasets.
Other Parameters

**kwargs

Patch properties

See also:

hist2d

2D histograms

Notes

For large numbers of bins (>1000), 'step' and 'stepfilled' can be significantly faster than 'bar' and 'barstacked'.

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, weights.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.pyplot.hist

• sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py

matplotlib.pyplot.hist2d

matplotlib.pyplot.hist2d(x, y, bins=10, range=None, density=False, weights=None, cmin=None, cmax=None, *, data=None, **kwargs)

Make a 2D histogram plot.

Parameters

x, y

[array-like, shape (n, )] Input values

bins

[None or int or [int, int] or array-like or [array, array]] The bin specification:
• If int, the number of bins for the two dimensions (nx=ny=bins).
• If [int, int], the number of bins in each dimension (nx, ny = bins).
• If array-like, the bin edges for the two dimensions (x_edges=y_edges=bins).
• If [array, array], the bin edges in each dimension (x_edges, y_edges = bins).

The default value is 10.

range

[array-like shape(2, 2), optional] The leftmost and rightmost edges of the bins along each dimension (if not specified explicitly in the bins parameters): [[xmin, xmax], [ymin, ymax]]. All values outside of this range will be considered outliers and not tallied in the histogram.

density

[bool, default: False] Normalize histogram. See the documentation for the density parameter of hist for more details.

weights

[array-like, shape (n, ), optional] An array of values w_i weighing each sample (x_i, y_i).

cmin, cmax

[float, default: None] All bins that has count less than cmin or more than cmax will not be displayed (set to NaN before passing to imshow) and these count values in the return value count histogram will also be set to nan upon return.

Returns

h

[2D array] The bi-dimensional histogram of samples x and y. Values in x are histogrammed along the first dimension and values in y are histogrammed along the second dimension.

xedges

[1D array] The bin edges along the x axis.

yedges

[1D array] The bin edges along the y axis.

image

[QuadMesh]
Other Parameters

**cmap**

**norm**

[Normalize, optional] A `colors.Normalize` instance is used to scale luminance data to [0, 1]. If not set, defaults to `colors.Normalize()`.

**vmin/vmax**

[None or scalar, optional] Arguments passed to the `Normalize` instance.

**alpha**

[0 <= scalar <= 1 or None, optional] The alpha blending value.

**kwargs**

Additional parameters are passed along to the `pcolormesh` method and `QuadMesh` constructor.

See also:

**hist**

1D histogram plotting

Notes

- Currently `hist2d` calculates its own axis limits, and any limits previously set are ignored.
- Rendering the histogram with a logarithmic color scale is accomplished by passing a `colors.LogNorm` instance to the `norm` keyword argument. Likewise, power-law normalization (similar in effect to gamma correction) can be accomplished with `colors.PowerNorm`.

Note: In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x, y, weights`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).
Examples using matplotlib.pyplot.hist2d

- sphx_glr_gallery_scales_power_norm.py

matplotlib.pyplot.hlines

matplotlib.pyplot.hlines(y, xmin, xmax, colors=None, linestyles='solid', label='', *, data=None, **kwargs)
Plot horizontal lines at each y from xmin to xmax.

Parameters

y
[float or array-like] y-indexes where to plot the lines.

xmin, xmax
[float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

colors
[list of colors, default: rcParams["lines.color"] (default: 'C0')]  

linestyles
[{'solid', 'dashed', 'dashdot', 'dotted'}, optional]

label
[str, default: '']

Returns

LineCollection

Other Parameters

**kwargs
[LineCollection properties.]

See also:

vlines
vertical lines

axhline
horizontal line across the axes
Notes

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `y`, `xmin`, `xmax`, `colors`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.hlines`

`matplotlib.pyplot.hlines`

`matplotlib.pyplot.hot`

`matplotlib.pyplot.hot()`

Set the colormap to "hot".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.hsv`

`matplotlib.pyplot.hsv`

`matplotlib.pyplot.hsv()`

Set the colormap to "hsv".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.imread`

`matplotlib.pyplot.imread`

`matplotlib.pyplot.imread(fname, format=None)`

Read an image from a file into an array.

**Parameters**

- `fname`
  
  [str or file-like] The image file to read: a filename, a URL or a file-like object opened in read-binary mode.
format

[\text{str, optional}] The image file format assumed for reading the data. If not given, the format is deduced from the filename. If nothing can be deduced, PNG is tried.

Returns

\text{\texttt{numpy.array}}

The image data. The returned array has shape

- \text{(M, N)} for grayscale images.
- \text{(M, N, 3)} for RGB images.
- \text{(M, N, 4)} for RGBA images.

\text{Examples using \texttt{matplotlib.pyplot.imread}}

- \text{sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_clip\_path.py}
- \text{sphx\_glr\_gallery\_images\_contours\_and\_fields\_image\_demo.py}
- \text{sphx\_glr\_gallery\_images\_contours\_and\_fields\_watermark\_image.py}
- \text{sphx\_glr\_gallery\_text\_labels\_and\_annotations\_demo\_annotation\_box.py}
- \text{sphx\_glr\_gallery\_text\_labels\_and\_annotations\_demo\_text\_path.py}
- \text{sphx\_glr\_gallery\_misc\_demo\_ribbon\_box.py}

\text{matplotlib.pyplot.imsave}

\text{matplotlib.pyplot.imsave}(\text{\texttt{fname, arr, **kwargs}})

Save an array as an image file.

Parameters

\text{\texttt{fname}}

[\text{str or path-like or file-like}] A path or a file-like object to store the image in. If \text{format} is not set, then the output format is inferred from the extension of \text{fname}, if any, and from \text{rcParams["savefig.format"]} (default: \text{'png'}) otherwise. If \text{format} is set, it determines the output format.

\text{\texttt{arr}}

[array-like] The image data. The shape can be one of \text{MxN} (luminance), \text{MxNx3} (RGB) or \text{MxNx4} (RGBA).
vmin, vmax

[float, optional] vmin and vmax set the color scaling for the image by fixing the values that map to the colormap color limits. If either vmin or vmax is None, that limit is determined from the arr min/max value.

cmap

[str or Colormap, default: rcParams['image.cmap'] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps scalar data to colors. It is ignored for RGB(A) data.

format

[str, optional] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under fname.

origin

[{'upper', 'lower'}, default: rcParams['image.origin'] (default: 'upper')] Indicates whether the (0, 0) index of the array is in the upper left or lower left corner of the axes.

dpi

[float] The DPI to store in the metadata of the file. This does not affect the resolution of the output image. Depending on file format, this may be rounded to the nearest integer.

metadata

[dict, optional] Metadata in the image file. The supported keys depend on the output format, see the documentation of the respective backends for more information.

pil_kwargs

[dict, optional] Keyword arguments passed to PIL.Image.Image.save. If the 'pnginfo' key is present, it completely overrides metadata, including the default 'Software' key.

Examples using matplotlib.pyplot.imsave

matplotlib.pyplot.imshow

matplotlib.pyplot.imshow(X, cmap=None, norm=None, aspect=None, interpolation=None, alpha=None, vmin=None, vmax=None, origin=None, extent=None, *, filternorm=True, filterrad=4.0, resample=None, url=None, data=None, **kwargs)

Display data as an image, i.e., on a 2D regular raster.
The input may either be actual RGB(A) data, or 2D scalar data, which will be rendered as a pseudocolor image. For displaying a grayscale image set up the color mapping using the parameters `cmap='gray'`, `vmin=0`, `vmax=255`.

The number of pixels used to render an image is set by the axes size and the dpi of the figure. This can lead to aliasing artifacts when the image is resampled because the displayed image size will usually not match the size of X (see /gallery/images_contours_and_fields/image_antialiasing). The resampling can be controlled via the `interpolation` parameter and/or `rcParams['image.interpolation']` (default: 'antialiased').

**Parameters**

**X**

[array-like or PIL image] The image data. Supported array shapes are:

- (M, N): an image with scalar data. The values are mapped to colors using normalization and a colormap. See parameters `norm`, `cmap`, `vmin`, `vmax`.
- (M, N, 3): an image with RGB values (0-1 float or 0-255 int).
- (M, N, 4): an image with RGBA values (0-1 float or 0-255 int), i.e. including transparency.

The first two dimensions (M, N) define the rows and columns of the image.

Out-of-range RGB(A) values are clipped.

**cmap**

[str or Colormap, default: rcParams['image.cmap']] (default: 'viridis')] The Colormap instance or registered colormap name used to map scalar data to colors. This parameter is ignored for RGB(A) data.

**norm**

[Normalize, optional] The Normalize instance used to scale scalar data to the [0, 1] range before mapping to colors using `cmap`. By default, a linear scaling mapping the lowest value to 0 and the highest to 1 is used. This parameter is ignored for RGB(A) data.

**aspect**

[{'equal', 'auto'} or float, default: rcParams['image.aspect']] (default: 'equal']) The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling `Axes.set_aspect`. See there for further details.
- 'equal': Ensures an aspect ratio of 1. Pixels will be square (unless pixel sizes are explicitly made non-square in data coordinates using extent).

- 'auto': The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.

**interpolation**

[**str**, default: **rcParams["image.interpolation"]**] (default: 'antialiased')] The interpolation method used.

Supported values are 'none', 'antialiased', 'nearest', 'bilinear', 'bicubic', 'spline16', 'spline36', 'hanning', 'hamming', 'hermite', 'kaiser', 'quadric', 'catrom', 'gaussian', 'bessel', 'mitchell', 'sinc', 'lanczos'.

If *interpolation* is 'none', then no interpolation is performed on the Agg, ps, pdf and svg backends. Other backends will fall back to 'nearest'. Note that most SVG renderers perform interpolation at rendering and that the default interpolation method they implement may differ.

If *interpolation* is the default 'antialiased', then 'nearest' interpolation is used if the image is upsampled by more than a factor of three (i.e. the number of display pixels is at least three times the size of the data array). If the upsampling rate is smaller than 3, or the image is downsampled, then 'hanning' interpolation is used to act as an anti-aliasing filter, unless the image happens to be upsampled by exactly a factor of two or one.

See /gallery/images_contours_and_fields/interpolation_methods for an overview of the supported interpolation methods, and /gallery/images_contours_and_fields/image_antialiasing for a discussion of image antialiasing.

Some interpolation methods require an additional radius parameter, which can be set by *filterrad*. Additionally, the antigrain image resize filter is controlled by the parameter *filternorm*.

**alpha**

[**float or array-like**, optional] The alpha blending value, between 0 (transparent) and 1 (opaque). If *alpha* is an array, the alpha blending values are applied pixel by pixel, and *alpha* must have the same shape as *X*.

**vmin, vmax**

[**float**, optional] When using scalar data and no explicit *norm*, *vmin* and *vmax* define the data range that the colormap covers. By default, the colormap covers the complete value range of the
supplied data. It is deprecated to use vmin/vmax when norm is
given.

**origin**

[{'upper', 'lower'}, default: rcParams["image.origin"] (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention (the default) 'upper' is typically used for matrices and images.

Note that the vertical axes points upward for 'lower' but downward for 'upper'.

See the origin and extent in imshow tutorial for examples and a more detailed description.

**extent**

[floats (left, right, bottom, top), optional] The bounding box in data coordinates that the image will fill. The image is stretched individually along x and y to fill the box.

The default extent is determined by the following conditions. Pixels have unit size in data coordinates. Their centers are on integer coordinates, and their center coordinates range from 0 to columns-1 horizontally and from 0 to rows-1 vertically.

Note that the direction of the vertical axis and thus the default values for top and bottom depend on origin:

- For origin == 'upper' the default is (-0.5, numcols-0.5, numrows-0.5, -0.5).
- For origin == 'lower' the default is (-0.5, numcols-0.5, -0.5, numrows-0.5).

See the origin and extent in imshow tutorial for examples and a more detailed description.

**filternorm**

[bool, default: True] A parameter for the antigrain image resize filter (see the antigrain documentation). If filternorm is set, the filter normalizes integer values and corrects the rounding errors. It doesn't do anything with the source floating point values, it corrects only integers according to the rule of 1.0 which means that any sum of pixel weights must be equal to 1.0. So, the filter function must produce a graph of the proper shape.

**filterrad**

[float > 0, default: 4.0] The filter radius for filters that have a radius parameter, i.e. when interpolation is one of: 'sinc', 'lanczos' or 'blackman'.

18.38. matplotlib.pyplot

2481
resample

[bool, default: rcParams["image.resample"] (default: True)] When True, use a full resampling method. When False, only resample when the output image is larger than the input image.

url

[str, optional] Set the url of the created AxesImage. See Artist. set_url.

Returns

AxesImage

Other Parameters

**kwargs

[Artist properties] These parameters are passed on to the constructor of the AxesImage artist.

See also:

matshow

Plot a matrix or an array as an image.

Notes

Unless extent is used, pixel centers will be located at integer coordinates. In other words: the origin will coincide with the center of pixel (0, 0).

There are two common representations for RGB images with an alpha channel:

- Straight (unassociated) alpha: R, G, and B channels represent the color of the pixel, disregarding its opacity.
- Premultiplied (associated) alpha: R, G, and B channels represent the color of the pixel, adjusted for its opacity by multiplication.

imshow expects RGB images adopting the straight (unassociated) alpha representation.

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, every other argument can also be string s, which is interpreted as data[s] (unless this raises an exception).
Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using `matplotlib.pyplot.imshow`**

- `sphx_glr_gallery_misc_hyperlinks_sgskip.py`

**`matplotlib.pyplot.inferno`**

`matplotlib.pyplot.inferno()`  
Set the colormap to "inferno".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.inferno`**

**`matplotlib.pyplot.install_repl_displayhook`**

`matplotlib.pyplot.install_repl_displayhook()`  
Install a repl display hook so that any stale figure are automatically redrawn when control is returned to the repl.

This works both with IPython and with vanilla python shells.

**Examples using `matplotlib.pyplot.install_repl_displayhook`**

**`matplotlib.pyplot.ioff`**

`matplotlib.pyplot.ioff()`  
Turn the interactive mode off.

**See also:**

- `ion`  
  enable interactive mode
- `isinteractive`  
  query current state
- `show`  
  show windows (and maybe block)
pause

show windows, run GUI event loop, and block for a time

Examples using `matplotlib.pyplot.ioff`

- *Usage Guide*

`matplotlib.pyplot.ion`

`matplotlib.pyplot.ion()`

Turn the interactive mode on.

*See also:*

- `ioff`
  disable interactive mode

- `isinteractive`
  query current state

- `show`
  show windows (and maybe block)

- `pause`
  show windows, run GUI event loop, and block for a time

Examples using `matplotlib.pyplot.ion`

- *Usage Guide*

`matplotlib.pyplot.isinteractive`

`matplotlib.pyplot.isinteractive()`

Return if pyplot is in "interactive mode" or not.

If in interactive mode then:

- newly created figures will be shown immediately
- figures will automatically redraw on change
- `pyplot.show` will not block by default

If not in interactive mode then:
- newly created figures and changes to figures will not be reflected until explicitly asked to be
- `pyplot.show` will block by default

**See also:**

- `ion`
  - enable interactive mode
- `ioff`
  - disable interactive mode
- `show`
  - show windows (and maybe block)
- `pause`
  - show windows, run GUI event loop, and block for a time

**Examples using matplotlib.pyplot.isinteractive**

```python
matplotlib.pyplot.jet
```

```python
matplotlib.pyplot.jet()
```

Set the colormap to "jet".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using matplotlib.pyplot.jet**

```python
matplotlib.pyplot.legend
```

```python
matplotlib.pyplot.legend(*args, **kwargs)
```

Place a legend on the axes.

Call signatures:

```python
legend()
legend(labels)
legend(handles, labels)
```

The call signatures correspond to three different ways how to use this method.

**1. Automatic detection of elements to be shown in the legend**

The elements to be added to the legend are automatically determined, when you do not pass in any extra arguments.
In this case, the labels are taken from the artist. You can specify them either at artist creation or by calling the `set_label()` method on the artist:

```python
line, = ax.plot([1, 2, 3], label='Inline label')
ax.legend()
```

or:

```python
line, = ax.plot([1, 2, 3])
line.set_label('Label via method')
ax.legend()
```

Specific lines can be excluded from the automatic legend element selection by defining a label starting with an underscore. This is default for all artists, so calling `Axes.legend` without any arguments and without setting the labels manually will result in no legend being drawn.

2. Labeling existing plot elements

To make a legend for lines which already exist on the axes (via `plot` for instance), simply call this function with an iterable of strings, one for each legend item. For example:

```python
ax.plot([1, 2, 3])
ax.legend(['A simple line'])
```

Note: This way of using is discouraged, because the relation between plot elements and labels is only implicit by their order and can easily be mixed up.

3. Explicitly defining the elements in the legend

For full control of which artists have a legend entry, it is possible to pass an iterable of legend artists followed by an iterable of legend labels respectively:

```python
legend((line1, line2, line3), ('label1', 'label2', 'label3'))
```

**Parameters**

- **handles**

  [sequence of `Artist`, optional] A list of Artists (lines, patches) to be added to the legend. Use this together with `labels`, if you need full control on what is shown in the legend and the automatic mechanism described above is not sufficient.

  The length of handles and labels should be the same in this case. If they are not, they are truncated to the smaller length.

- **labels**

  [list of str, optional] A list of labels to show next to the artists. Use this together with `handles`, if you need full control on what
is shown in the legend and the automatic mechanism described
above is not sufficient.

Returns

Legend

Other Parameters

loc

[str or pair of floats, default: rcParams["legend.loc"] (default:
'best') ('best' for axes, 'upper right' for figures)] The location
of the legend.

The strings 'upper left', 'upper right', 'lower left', 'lower
right' place the legend at the corresponding corner of the
axes/figure.

The strings 'upper center', 'lower center', 'center left',
'center right' place the legend at the center of the correspond-
ing edge of the axes/figure.

The string 'center' places the legend at the center of the
axes/figure.

The string 'best' places the legend at the location, among the
nine locations defined so far, with the minimum overlap with
other drawn artists. This option can be quite slow for plots with
large amounts of data; your plotting speed may benefit from pro-
viding a specific location.

The location can also be a 2-tuple giving the coordinates of the
lower-left corner of the legend in axes coordinates (in which case
bbox_to_anchor will be ignored).

For back-compatibility, 'center right' (but no other location) can
also be spelled 'right', and each "string" locations can also be
given as a numeric value:
### bbox_to_anchor

`bbox_to_anchor` 

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with `loc`. Defaults to `axes.bbox` (if called as a method to `Axes.legend`) or `figure.bbox` (if `Figure.legend`). This argument allows arbitrary placement of the legend. Bbox coordinates are interpreted in the coordinate system given by `bbox_transform`, with the default transform Axes or Figure coordinates, depending on which `legend` is called.

If a 4-tuple or `BboxBase` is given, then it specifies the bbox `(x, y, width, height)` that the legend is placed in. To put the legend in the best location in the bottom right quadrant of the axes (or figure):

```
loc='best', bbox_to_anchor=(0.5, 0, 0.5, 0.5)
```

A 2-tuple `(x, y)` places the corner of the legend specified by `loc` at `x, y`. For example, to put the legend's upper right-hand corner in the center of the axes (or figure) the following keywords can be used:

```
loc='upper right', bbox_to_anchor=(0.5, 0.5)
```

### ncol

[int, default: 1] The number of columns that the legend has.

### prop

[None or `matplotlib.font_manager.FontProperties` or dict] The font properties of the legend. If None (default), the current `matplotlib.rcParams` will be used.

### fontsize
The font size of the legend. If the value is numeric the size will be the absolute font size in points. String values are relative to the current default font size. This argument is only used if `prop` is not specified.

**labelcolor**

A string or list of color strings (for example, 'red'), or a list of color strings. The labelcolor can also be made to match the color of the line or marker using 'linestyle', 'markerfacecolor' (or 'mfc'), or 'markeredgecolor' (or 'mec').

**numpoints**

The number of marker points in the legend when creating a legend entry for a `Line2D` (line).

**scatterpoints**

The number of marker points in the legend when creating a legend entry for a `PathCollection` (scatter plot).

**scatteryoffsets**

The vertical offset (relative to the font size) for the markers created for a scatter plot legend entry. 0.0 is at the base the legend text, and 1.0 is at the top. To draw all markers at the same height, set to [0.5].

**markerscale**

The relative size of legend markers compared with the originally drawn ones.

**markerfirst**

If `True`, legend marker is placed to the left of the legend label. If `False`, legend marker is placed to the right of the legend label.

**frameon**

Whether the legend should be drawn on a patch (frame).

**fancybox**

Whether round edges should be enabled around the `FancyBboxPatch` which makes up the legend's background.
shadow
[bool, default: rcParams["legend.shadow"] (default: False)]
Whether to draw a shadow behind the legend.

framealpha
[float, default: rcParams["legend.framealpha"] (default: 0.8)] The alpha transparency of the legend's background. If shadow is activated and framealpha is None, the default value is ignored.

facecolor
["inherit" or color, default: rcParams["legend.facecolor"] (default: 'inherit')] The legend's background color. If "inherit", use rcParams["axes.facecolor"] (default: 'white').

edgecolor
["inherit" or color, default: rcParams["legend.edgecolor"] (default: '0.8')] The legend's background patch edge color. If "inherit", use take rcParams["axes.edgecolor"] (default: 'black').

mode
[{"expand", None}] If mode is set to "expand" the legend will be horizontally expanded to fill the axes area (or bbox_to_anchor if defines the legend's size).

bbox_transform
[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor). For a value of None (default) the Axes' transAxes transform will be used.

title
[str or None] The legend's title. Default is no title (None).

title_fontsize
[int or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}, default: rcParams["legend.title_fontsize"] (default: None)] The font size of the legend's title.

borderpad
[float, default: rcParams["legend.borderpad"] (default: 0.4)] The fractional whitespace inside the legend border, in font-size units.

labelspacing
[float, default: rcParams["legend.labelspacing"] (default: 0.5)] The vertical space between the legend entries, in font-size units.

[float, default: \( \text{rcParams["legend.handlelength"]} \) (default: 2.0)]
The length of the legend handles, in font-size units.

**handletextpad**

[float, default: \( \text{rcParams["legend.handletextpad"]} \) (default: 0.8)]
The pad between the legend handle and text, in font-size units.

**borderaxespad**

[float, default: \( \text{rcParams["legend.borderaxespad"]} \) (default: 0.5)]
The pad between the axes and legend border, in font-size units.

**columnspacing**

[float, default: \( \text{rcParams["legend.columnspacing"]} \) (default: 2.0)]
The spacing between columns, in font-size units.

**handler_map**

[dict or None] The custom dictionary mapping instances or types to a legend handler. This *handler_map* updates the default handler map found at *matplotlib.legend.Legend.get_legend_handler_map*.

**Notes**

Some artists are not supported by this function. See *Legend guide* for details.

**Examples**

Examples using *matplotlib.pyplot.legend*

- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

**matplotlib.pyplot.locator_params**

*matplotlib.pyplot.locator_params(axis='both', tight=None, **kwargs)*

Control behavior of major tick locators.

Because the locator is involved in autoscaling, *autoscale_view* is called automatically after the parameters are changed.

**Parameters**

**axis**

[{'both', 'x', 'y'}, default: 'both'] The axis on which to operate.
**tight**

[bool or None, optional] Parameter passed to `autoscale_view`. Default is None, for no change.

**Other Parameters**

**kwargs

Remaining keyword arguments are passed to directly to the `set_params()` method of the locator. Supported keywords depend on the type of the locator. See for example `set_params` for the `ticker.MaxNLocator` used by default for linear axes.
Examples

When plotting small subplots, one might want to reduce the maximum number of ticks and use tight bounds, for example:

```python
ax.locator_params(tight=True, nbins=4)
```

Examples using `matplotlib.pyplot.locator_params`

`matplotlib.pyplot.loglog`

`matplotlib.pyplot.loglog(*args, **kwargs)`

Make a plot with log scaling on both the x and y axis.

Call signatures:

```python
loglog([x], y, [fmt], data=None, **kwargs)
loglog([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes both the x-axis and the y-axis to log scaling. All of the concepts and parameters of `plot` can be used here as well.

The additional parameters `base`, `subs` and `nonpositive` control the x/y-axis properties. They are just forwarded to `Axes.set_xscale` and `Axes.set_yscale`. To use different properties on the x-axis and the y-axis, use e.g. `ax.set_xscale("log", base=10); ax.set_yscale("log", base=2).

Parameters

**base**

[Float, default: 10] Base of the logarithm.

**subs**

[Sequence, optional] The location of the minor ticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale/Axes.set_yscale` for details.

**nonpositive**

[{'mask', 'clip'}, default: 'mask'] Non-positive values can be masked as invalid, or clipped to a very small positive number.

Returns

**lines**

A list of `Line2D` objects representing the plotted data.
Other Parameters

**kwargs

All parameters supported by *plot*.

Examples using *matplotlib.pyplot.loglog*

- *Sample plots in Matplotlib*

*matplotlib.pyplot.magma*

*matplotlib.pyplot.magma()*

Set the colormap to "magma".

This changes the default colormap as well as the colormap of the current image if there is one. See *help(colormaps)* for more information.

Examples using *matplotlib.pyplot.magma*

*matplotlib.pyplot.magnitude_spectrum*

*matplotlib.pyplot.magnitude_spectrum(x, Fs=None, Fc=None, window=None, pad_to=None, sides=None, scale=None, *, data=None, **kwargs)*

Plot the magnitude spectrum.

Compute the magnitude spectrum of *x*. Data is padded to a length of *pad_to* and the windowing function *window* is applied to the signal.

**Parameters**

*x*

[1-D array or sequence] Array or sequence containing the data.

*Fs*

[float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, *freqs*, in cycles per time unit.

*window*

[callable or ndarray, default: *window_hanning*] A function or a vector of length *NFFT*. To create window vectors see *window_hanning*, *window_none*, *numpy.blackman*, *numpy.hamming*, *numpy.bartlett*, *scipy.signal*, *scipy.signal.get_window*, etc. If a
function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to the length of the input signal (i.e. no padding).

scale

[{'default', 'linear', 'dB'}] The scaling of the values in the spec. 'linear' is no scaling. 'dB' returns the values in dB scale, i.e., the dB amplitude (20 * log10). 'default' is 'linear'.

Fc

[int, default: 0] The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to base-band.

Returns

spectrum

[1-D array] The values for the magnitude spectrum before scaling (real valued).

freqs

[1-D array] The frequencies corresponding to the elements in spectrum.

line

[Line2D] The line created by this function.

Other Parameters

**kwargs

Keyword arguments control the Line2D properties:

**See also:**
**psd**

Plots the power spectral density.

**angle_spectrum**

Plots the angles of the corresponding frequencies.

**phase_spectrum**

Plots the phase (unwrapped angle) of the corresponding frequencies.

**specgram**

Can plot the magnitude spectrum of segments within the signal in a colormap.

**Notes**

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using matplotlib.pyplot.magnitude_spectrum**

**matplotlib.pyplot.margins**

```python
matplotlib.pyplot.margins(*margins, x=None, y=None, tight=True)
```

Set or retrieve autoscaling margins.

The padding added to each limit of the axes is the `margin` times the data interval. All input parameters must be floats within the range [0, 1]. Passing both positional and keyword arguments is invalid and will raise a TypeError. If no arguments (positional or otherwise) are provided, the current margins will remain in place and simply be returned.

Specifying any margin changes only the autoscaling; for example, if `xmargin` is not `None`, then `xmargin` times the X data interval will be added to each end of that interval before it is used in autoscaling.

**Parameters**

`*margins`
[float, optional] If a single positional argument is provided, it
specifies both margins of the x-axis and y-axis limits. If two posi-
tional arguments are provided, they will be interpreted as xmar-
gin, ymargin. If setting the margin on a single axis is desired,
use the keyword arguments described below.

\textbf{x, y} 

[float, optional] Specific margin values for the x-axis and y-axis,
respectively. These cannot be used with positional arguments,
but can be used individually to alter on e.g., only the y-axis.

\textbf{tight} 

[bool or None, default: True] The tight parameter is passed to
autoscale_view(), which is executed after a margin is changed;
the default here is True, on the assumption that when margins
are specified, no additional padding to match tick marks is usu-
ally desired. Set tight to None will preserve the previous setting.

\textbf{Returns} 

\textbf{xmargin, ymargin} 

[float]

\textbf{Notes} 

If a previously used Axes method such as \texttt{pcolor()} has set use_sticky_edges to
True, only the limits not set by the "sticky artists" will be modified. To force all
of the margins to be set, set use_sticky_edges to False before calling margins().

\textbf{Examples using matplotlib.pyplot.margins} 

\begin{itemize}
  \item sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py
  \item sphx_glr_gallery_ticks_and_spines_ticklabels_rotation.py
\end{itemize}

\texttt{matplotlib.pyplot.matshow} 

\texttt{matplotlib.pyplot.matshow(A, fignum=None, **kwargs)} 

Display an array as a matrix in a new figure window.

The origin is set at the upper left hand corner and rows (first dimension of the
array) are displayed horizontally. The aspect ratio of the figure window is that
of the array, unless this would make an excessively short or narrow figure.

Tick labels for the xaxis are placed on top.
Parameters

**A**

[array-like(M, N)] The matrix to be displayed.

**fignum**

[None or int or False] If `None`, create a new figure window with automatic numbering.
If a nonzero integer, draw into the figure with the given number (create it if it does not exist).
If 0, use the current axes (or create one if it does not exist).

**Note:** Because of how `Axes.matshow` tries to set the figure aspect ratio to be the one of the array, strange things may happen if you reuse an existing figure.

Returns

`AxesImage`

Other Parameters

****kwargs

[`imshow` arguments]

Examples using `matplotlib.pyplot.matshow`

- sphx_glr_gallery_images_contours_and_fields_matshow.py

`matplotlib.pyplot.minorticks_off`

`matplotlib.pyplot.minorticks_off()` Remove minor ticks from the axes.
Examples using `matplotlib.pyplot.minorticks_off`

`matplotlib.pyplot.minorticks_on`

`matplotlib.pyplot.minorticks_on()`  
Display minor ticks on the axes.  
Displaying minor ticks may reduce performance; you may turn them off using `minorticks_off()` if drawing speed is a problem.

Examples using `matplotlib.pyplot.minorticks_on`

`matplotlib.pyplot.new_figure_manager`

`matplotlib.pyplot.new_figure_manager(num, *args, **kwargs)`  
Create a new figure manager instance.

Examples using `matplotlib.pyplot.new_figure_manager`

`matplotlib.pyplot.nipy_spectral`

`matplotlib.pyplot.nipy_spectral()`  
Set the colormap to "nipy_spectral".  
This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.nipy_spectral`

`matplotlib.pyplot.pause`

`matplotlib.pyplot.pause(interval)`  
Run the GUI event loop for `interval` seconds.  
If there is an active figure, it will be updated and displayed before the pause, and the GUI event loop (if any) will run during the pause.  
This can be used for crude animation. For more complex animation use `matplotlib.animation`.  
If there is no active figure, sleep for `interval` seconds instead.

See also:
matplotlib.animation

Complex animation

show

show figures and optional block forever

Examples using matplotlib.pyplot.pause

- sphx_glr_gallery_mplot3d_rotate_axes3d_sgskip.py
- sphx_glr_gallery_mplot3d_wire3d_animation_sgskip.py

matplotlib.pyplot.pcolor

matplotlib.pyplot.pcolor(*args, shading=None, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, data=None, **kwargs)

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```
pcolor([X, Y], C, **kwargs)
```

X and Y can be used to specify the corners of the quadrilaterals.

**Hint:** pcolor() can be very slow for large arrays. In most cases you should use the similar but much faster pcolormesh instead. See Differences between pcolor() and pcolormesh() for a discussion of the differences.

**Parameters**

**C**

[array-like] A scalar 2-D array. The values will be color-mapped.

**X, Y**

[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

```
(X[i+1, j], Y[i+1, j]) ------ (X[i+1, j+1], Y[i+1, j+1])
|                     |         
|                     |         
(X[i, j], Y[i, j]) ------ (X[i, j+1], Y[i, j+1])
```
Note that the column index corresponds to the x-coordinate, and the row index corresponds to y. For details, see the Notes section below.

If shading='flat' the dimensions of X and Y should be one greater than those of C, and the quadrilateral is colored due to the value at C[i, j]. If X, Y and C have equal dimensions, a warning will be raised and the last row and column of C will be ignored.

If shading='nearest', the dimensions of X and Y should be the same as those of C (if not, a ValueError will be raised). The color C[i, j] will be centered on (X[i, j], Y[i, j]).

If X and/or Y are 1-D arrays or column vectors they will be expanded as needed into the appropriate 2-D arrays, making a rectangular grid.

**shading**

>{{flat, 'nearest', 'auto'}, optional} The fill style for the quadrilateral; defaults to 'flat' or rcParams["pcolor.shading"] (default: 'flat'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by C[i, j]. The dimensions of X and Y should be one greater than those of C; if they are the same as C, then a deprecation warning is raised, and the last row and column of C are dropped.

- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of X and Y must be the same as C.

- 'auto': Choose 'flat' if dimensions of X and Y are one larger than C. Choose 'nearest' if dimensions are the same.

See /gallery/images_contours_and_fields/pcolormesh_grids for more description.

**cmap**

[{str or Colormap, default: rcParams["image.cmap"] (default: 'viridis')}] A Colormap instance or registered colormap name. The colormap maps the C values to colors.

**norm**

[Normalize, optional] The Normalize instance scales the data values to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax**
The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of $C$ in case of the default linear scaling). It is deprecated to use vmin/vmax when norm is given.

**edgecolors**

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.
- None: rcParams["patch.edgecolor"] (default: 'black') will be used. Note that currently rcParams["patch.force_edgecolor"] (default: False) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form edgecolor works as an alias.

**alpha**

[0.0, default: None] The alpha blending value of the face color, between 0 (transparent) and 1 (opaque). Note: The edgecolor is currently not affected by this.

**snap**

[bool, default: False] Whether to snap the mesh to pixel boundaries.

**Returns**

matplotlib.collections.Collection

**Other Parameters**

**antialiaseds**

[bool, default: False] The default antialiaseds is False if the default edgecolors="none" is used. This eliminates artificial lines at patch boundaries, and works regardless of the value of alpha. If edgecolors is not "none", then the default antialiaseds is taken from rcParams["patch.antialiased"] (default: True). Stroking the edges may be preferred if alpha is 1, but will cause artifacts otherwise.

**kwargs**

Additionally, the following arguments are allowed. They are passed along to the PolyCollection constructor:
<table>
<thead>
<tr>

**See also:**

`pcolormesh`

for an explanation of the differences between pcolor and pcolormesh.

`imshow`
If $X$ and $Y$ are each equidistant, `imshow` can be a faster alternative.

**Notes**

**Masked arrays**

$X$, $Y$ and $C$ may be masked arrays. If either $C[i, j]$, or one of the vertices surrounding $C[i, j]$ ($X$ or $Y$ at $[i, j]$, $[i+1, j]$, $[i, j+1]$, $[i+1, j+1]$) is masked, nothing is plotted.

**Grid orientation**

The grid orientation follows the standard matrix convention: An array $C$ with shape (nrows, ncolumns) is plotted with the column number as $X$ and the row number as $Y$.

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string $s$, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test ($s$ in `data`).

**Examples using matplotlib.pyplot.pcolor**

- `sphx_glr_gallery_images_contours_and_fields_pcolor_demo.py`
- `sphx_glr_gallery_subplots_axes_and_figures_axes_margins.py`

**matplotlib.pyplot.pcolormesh**

`matplotlib.pyplot.pcolormesh(*args, alpha=None, norm=None, cmap=None, vmin=None, vmax=None, shading=None, antialiased=False, data=None, **kwargs)`

Create a pseudocolor plot with a non-regular rectangular grid.

Call signature:

```python
pcolormesh([X, Y], C, **kwargs)
```

$X$ and $Y$ can be used to specify the corners of the quadrilaterals.

**Hint:** `pcolormesh` is similar to `pcolor`. It is much faster and preferred in most cases. For a detailed discussion on the differences see `Differences between`
**pcolor() and pcolormesh()**

**Parameters**

**C**
[array-like] A scalar 2-D array. The values will be color-mapped.

**X, Y**
[array-like, optional] The coordinates of the corners of quadrilaterals of a pcolormesh:

\[
(X[i+1, j], Y[i+1, j]) \quad (X[i+1, j+1], Y[i+1, j+1])
\]

\[
(X[i, j], Y[i, j]) \quad (X[i, j+1], Y[i, j+1])
\]

Note that the column index corresponds to the x-coordinate, and
the row index corresponds to y. For details, see the **Notes** section
below.

If shading='flat' the dimensions of X and Y should be one greater
than those of C, and the quadrilateral is colored due to the value
at C[i, j]. If X, Y and C have equal dimensions, a warning will
be raised and the last row and column of C will be ignored.

If shading='nearest' or 'gouraud', the dimensions of X and Y
should be the same as those of C (if not, a ValueError will be
raised). For 'nearest' the color C[i, j] is centered on (X[i, j],
Y[i, j]). For 'gouraud', a smooth interpolation is carried out be-
tween the quadrilateral corners.

If X and/or Y are 1-D arrays or column vectors they will be ex-
panded as needed into the appropriate 2-D arrays, making a rect-
angular grid.

**cmap**

[**str** or **Colormap**, default: *rcParams*["image.cmap"] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps the C values to colors.

**norm**

[**Normalize**, optional] The Normalize instance scales the data val-
ues to the canonical colormap range [0, 1] for mapping to colors. By default, the data range is mapped to the colorbar range using linear scaling.

**vmin, vmax**
The colorbar range. If None, suitable min/max values are automatically chosen by the Normalize instance (defaults to the respective min/max values of C in case of the default linear scaling). It is deprecated to use vmin/vmax when norm is given.

**edgecolors**

[{'none', None, 'face', color, color sequence}, optional] The color of the edges. Defaults to 'none'. Possible values:

- 'none' or '': No edge.
- None: rcParams["patch.edgecolor"] (default: 'black') will be used. Note that currently rcParams["patch.force_edgecolor"] (default: False) has to be True for this to work.
- 'face': Use the adjacent face color.
- A color or sequence of colors will set the edge color.

The singular form edgecolor works as an alias.

**alpha**

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

**shading**

[{'flat', 'nearest', 'gouraud', 'auto'}, optional] The fill style for the quadrilateral; defaults to 'flat' or rcParams["pcolor.shading"] (default: 'flat'). Possible values:

- 'flat': A solid color is used for each quad. The color of the quad (i, j), (i+1, j), (i, j+1), (i+1, j+1) is given by C[i, j]. The dimensions of X and Y should be one greater than those of C; if they are the same as C, then a deprecation warning is raised, and the last row and column of C are dropped.
- 'nearest': Each grid point will have a color centered on it, extending halfway between the adjacent grid centers. The dimensions of X and Y must be the same as C.
- 'gouraud': Each quad will be Gouraud shaded: The color of the corners (i', j') are given by C[i', j']. The color values of the area in between is interpolated from the corner values. The dimensions of X and Y must be the same as C. When Gouraud shading is used, edgecolors is ignored.
- 'auto': Choose 'flat' if dimensions of X and Y are one larger than C. Choose 'nearest' if dimensions are the same.

See /gallery/images_contours_and_fields/pcolormesh_grids for more description.
**snap**

[bool, default: False] Whether to snap the mesh to pixel boundaries.

**Returns**

`matplotlib.collections.QuadMesh`

**Other Parameters**

**kwargs

Additionally, the following arguments are allowed. They are passed along to the `QuadMesh` constructor:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>

#### See also:

- **pcolor**
  
  An alternative implementation with slightly different features. For a detailed discussion on the differences see *Differences between pcolor() and pcolormesh()*.

- **imshow**
  
  If X and Y are each equidistant, *imshow* can be a faster alternative.

#### Notes

**Masked arrays**

C may be a masked array. If C[i, j] is masked, the corresponding quadrilateral will be transparent. Masking of X and Y is not supported. Use *pcolor* if you need this functionality.

**Grid orientation**

The grid orientation follows the standard matrix convention: An array C with shape (nrows, ncolumns) is plotted with the column number as X and the row number as Y.

**Differences between pcolor() and pcolormesh()**

Both methods are used to create a pseudocolor plot of a 2-D array using quadrilaterals.

The main difference lies in the created object and internal data handling: While *pcolor* returns a *PolyCollection*, *pcolormesh* returns a *QuadMesh*. The latter is more specialized for the given purpose and thus is faster. It should almost always be preferred.

There is also a slight difference in the handling of masked arrays. Both *pcolor* and *pcolormesh* support masked arrays for C. However, only *pcolor* supports masked arrays for X and Y. The reason lies in the internal handling of the...
masked values. \texttt{pcolor} leaves out the respective polygons from the PolyCollection. \texttt{pcolormesh} sets the facecolor of the masked elements to transparent. You can see the difference when using edgecolors. While all edges are drawn irrespective of masking in a QuadMesh, the edge between two adjacent masked quadrilaterals in \texttt{pcolor} is not drawn as the corresponding polygons do not exist in the PolyCollection.

Another difference is the support of Gouraud shading in \texttt{pcolormesh}, which is not available with \texttt{pcolor}.

**Note:** In addition to the above described arguments, this function can take a \texttt{data} keyword argument. If such a \texttt{data} argument is given, every other argument can also be string \texttt{s}, which is interpreted as \texttt{data[s]} (unless this raises an exception).

Objects passed as \texttt{data} must support item access (\texttt{data[s]}) and membership test (\texttt{s in data}).

---

**Examples using** \texttt{matplotlib.pyplot.pcolormesh}

- \texttt{sphx\_glr\_gallery\_images\_contours\_and\_fields\_pcolor\_demo.py}
- \texttt{sphx\_glr\_gallery\_images\_contours\_and\_fields\_pcolormesh\_grids.py}
- \texttt{sphx\_glr\_gallery\_images\_contours\_and\_fields\_pcolormesh\_levels.py}
- \texttt{sphx\_glr\_gallery\_images\_contours\_and\_fields\_quadmesh\_demo.py}
- \texttt{Sample plots in Matplotlib}

---

**matplotlib.pyplot.phase\_spectrum**

\texttt{matplotlib.pyplot.phase\_spectrum(x, Fs=None, Fc=None, window=None, pad\_to=None, sides=None, *, data=None, **kwargs)}

Plot the phase spectrum.

Compute the phase spectrum (unwrapped angle spectrum) of \texttt{x}. Data is padded to a length of \texttt{pad\_to} and the windowing function \texttt{window} is applied to the signal.

**Parameters**

- \texttt{x}
  - [1-D array or sequence] Array or sequence containing the data
- \texttt{Fs}
The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, \( \textit{freqs} \), in cycles per time unit.

**window**

A function or a vector of length \( \textit{NFFT} \). To create window vectors see \textit{window\_hanning}, \textit{window\_none}, \textit{numpy\_blackman}, \textit{numpy\_hamming}, \textit{numpy\_bartlett}, \textit{scipy\_signal}, \textit{scipy\_signal\_get\_window}, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

**sides**

Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

**pad\_to**

The number of points to which the data segment is padded when performing the FFT. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the \( n \) parameter in the call to \texttt{fft()}. The default is None, which sets \texttt{pad\_to} equal to the length of the input signal (i.e. no padding).

**Fc**

The center frequency of \( x \), which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsampled to baseband.

Returns

- **spectrum**
  
  The values for the phase spectrum in radians (real valued).

- **freqs**
  
  The frequencies corresponding to the elements in \textit{spectrum}.

- **line**
  
  The line created by this function.

Other Parameters
**kwargs

Keyword arguments control the `Line2D` properties:

**See also:**

- **magnitude_spectrum**
  Plots the magnitudes of the corresponding frequencies.

- **angle_spectrum**
  Plots the wrapped version of this function.

- **specgram**
  Can plot the phase spectrum of segments within the signal in a colormap.

**Notes**

*Note:* In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using matplotlib.pyplot.phase_spectrum**

```python
matplotlib.pyplot.pie(x, explode=None, labels=None, colors=None, autopct=None, pctdistance=0.6, shadow=False, labeldistance=1.1, startangle=0, radius=1, counterclock=True, wedgeprops=None, textprops=None, center=0, 0, frame=False, rotatelabels=False, *, normalize=None, data=None)
```

Plot a pie chart.

Make a pie chart of array `x`. The fractional area of each wedge is given by `x/sum(x)`. If `sum(x) < 1`, then the values of `x` give the fractional area directly and the array will not be normalized. The resulting pie will have an empty wedge of size `1 - sum(x)`.

The wedges are plotted counterclockwise, by default starting from the x-axis.

**Parameters**
x
    [1D array-like] The wedge sizes.

explode
    [array-like, default: None] If not None, is a len(x) array which
    specifies the fraction of the radius with which to offset each
    wedge.

labels
    [list, default: None] A sequence of strings providing the labels
    for each wedge

colors
    [array-like, default: None] A sequence of colors through which
    the pie chart will cycle. If None, will use the colors in the cur-
    rently active cycle.

autopct
    [None or str or callable, default: None] If not None, is a string or
    function used to label the wedges with their numeric value. The
    label will be placed inside the wedge. If it is a format string, the
    label will be fmt % pct. If it is a function, it will be called.

pctdistance
    [float, default: 0.6] The ratio between the center of each pie slice
    and the start of the text generated by autopct. Ignored if autopct
    is None.

shadow
    [bool, default: False] Draw a shadow beneath the pie.

normalize: None or bool, default: None
    When True, always make a full pie by normalizing x so that
    sum(x) == 1. False makes a partial pie if sum(x) <= 1 and raises
    a ValueError for sum(x) > 1.

    When None, defaults to True if sum(x) >= 1 and False if sum(x) <
    1.

    Please note that the previous default value of None is now dep-
    recated, and the default will change to True in the next release.
    Please pass normalize=False explicitly if you want to draw a par-
    tial pie.

labeldistance
    [float or None, default: 1.1] The radial distance at which the pie
    labels are drawn. If set to None, label are not drawn, but are
    stored for use in legend()
**startangle**

[float, default: 0 degrees] The angle by which the start of the pie is rotated, counterclockwise from the x-axis.

**radius**

[float, default: 1] The radius of the pie.

**counterclock**

[bool, default: True] Specify fractions direction, clockwise or counterclockwise.

**wedgeprops**

[dict, default: None] Dict of arguments passed to the wedge objects making the pie. For example, you can pass in `wedgeprops = {'linewidth': 3}` to set the width of the wedge border lines equal to 3. For more details, look at the doc/arguments of the wedge object. By default `clip_on=False`.

**textprops**

[dict, default: None] Dict of arguments to pass to the text objects.

**center**

[(float, float), default: (0, 0)] The coordinates of the center of the chart.

**frame**

[bool, default: False] Plot axes frame with the chart if true.

**rotatelabels**

[bool, default: False] Rotate each label to the angle of the corresponding slice if true.

**Returns**

**patches**

[list] A sequence of `matplotlib.patches.Wedge` instances

**texts**

[list] A list of the label `Text` instances.

**autotexts**

[list] A list of `Text` instances for the numeric labels. This will only be returned if the parameter `autopct` is not `None`. 
Notes

The pie chart will probably look best if the figure and axes are square, or the Axes aspect is equal. This method sets the aspect ratio of the axis to "equal". The axes aspect ratio can be controlled with \texttt{Axes.set_aspect}.

\textbf{Note:} In addition to the above described arguments, this function can take a \texttt{data} keyword argument. If such a \texttt{data} argument is given, the following arguments can also be string \texttt{s}, which is interpreted as \texttt{data[s]} (unless this raises an exception): \texttt{x}, \texttt{explode}, \texttt{labels}, \texttt{colors}.

Objects passed as \texttt{data} must support item access (\texttt{data[s]}) and membership test (\texttt{s in data}).

Examples using \texttt{matplotlib.pyplot.pie}

- sphx_glr_gallery_pie_and_polar_charts_pie_features.py
- sphx_glr_gallery_pie_and_polar_charts_pie_demo2.py
- sphx_glr_gallery_pie_and_polar_charts_nested_pie.py
- sphx_glr_gallery_pie_and_polar_charts_pie_and_donut_labels.py
- \textit{Sample plots in Matplotlib}

\texttt{matplotlib.pyplot.pink}

\texttt{matplotlib.pyplot.pink()}  
Set the colormap to "pink".

This changes the default colormap as well as the colormap of the current image if there is one. See \texttt{help(colormaps)} for more information.

Examples using \texttt{matplotlib.pyplot.pink}

\texttt{matplotlib.pyplot.plasma}

\texttt{matplotlib.pyplot.plasma()}  
Set the colormap to "plasma".

This changes the default colormap as well as the colormap of the current image if there is one. See \texttt{help(colormaps)} for more information.
Examples using `matplotlib.pyplot.plasma`

`matplotlib.pyplot.plot`

`matplotlib.pyplot.plot(*args, scalex=True, scaley=True, data=None, **kwargs)`

Plot y versus x as lines and/or markers.

Call signatures:

```
plot([x], y, [fmt], *, data=None, **kwargs)
plot([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

The coordinates of the points or line nodes are given by x, y.

The optional parameter `fmt` is a convenient way for defining basic formatting like color, marker and linestyle. It's a shortcut string notation described in the `Notes` section below.

```
>>> plot(x, y)  # plot x and y using default line style and color
>>> plot(x, y, 'bo')  # plot x and y using blue circle markers
>>> plot(y)  # plot y using x as index array 0..N-1
>>> plot(y, 'r+')  # ditto, but with red plusses
```

You can use `Line2D` properties as keyword arguments for more control on the appearance. Line properties and `fmt` can be mixed. The following two calls yield identical results:

```
>>> plot(x, y, 'go--', linewidth=2, markersize=12)
>>> plot(x, y, color='green', marker='o', linestyle='dashed',
...       linewidth=2, markersize=12)
```

When conflicting with `fmt`, keyword arguments take precedence.

**Plotting labelled data**

There's a convenient way for plotting objects with labelled data (i.e. data that can be accessed by index `obj['y']`). Instead of giving the data in x and y, you can provide the object in the `data` parameter and just give the labels for x and y:

```
>>> plot('xlabel', 'ylabel', data=obj)
```

All indexable objects are supported. This could e.g. be a dict, a pandas.DataFrame or a structured numpy array.

**Plotting multiple sets of data**

There are various ways to plot multiple sets of data.

- The most straight forward way is just to call `plot` multiple times. Example:

```
>>> plot(x1, y1, 'bo')
>>> plot(x2, y2, 'go')
```
• Alternatively, if your data is already a 2d array, you can pass it directly to x, y. A separate data set will be drawn for every column.

Example: an array a where the first column represents the x values and the other columns are the y columns:

```python
>>> plot(a[0], a[1:1])
```

• The third way is to specify multiple sets of [x], y, [fmt] groups:

```python
>>> plot(x1, y1, 'g^', x2, y2, 'g-')
```

In this case, any additional keyword argument applies to all datasets. Also this syntax cannot be combined with the data parameter.

By default, each line is assigned a different style specified by a 'style cycle'. The fmt and line property parameters are only necessary if you want explicit deviations from these defaults. Alternatively, you can also change the style cycle using `rcParams["axes.prop_cycle"]` (default: cycler('color', ['#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd', '#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf'])).

**Parameters**

x, y

[array-like or scalar] The horizontal / vertical coordinates of the data points. x values are optional and default to range(len(y)).

Commonly, these parameters are 1D arrays.

They can also be scalars, or two-dimensional (in that case, the columns represent separate data sets).

These arguments cannot be passed as keywords.

fmt

[std, optional] A format string, e.g. 'ro' for red circles. See the Notes section for a full description of the format strings.

Format strings are just an abbreviation for quickly setting basic line properties. All of these and more can also be controlled by keyword arguments.

This argument cannot be passed as keyword.

data

[indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.

**Note:** Technically there's a slight ambiguity in calls where the second label is a valid fmt. `plot('n', 'o', data=obj)` could be
plt(x, y) or plt(y, fmt). In such cases, the former interpretation is chosen, but a warning is issued. You may suppress the warning by adding an empty format string plot('n', 'o', '', data=obj).

Returns

* list of Line2D
  A list of lines representing the plotted data.

Other Parameters

scalex, scaley
[bool, default: True] These parameters determine if the view limits are adapted to the data limits. The values are passed on to autoscale_view.

**kwargs
[Line2D properties, optional] kwargs are used to specify properties like a line label (for auto legends), linewidth, antialiased, marker face color. Example:

```python
>>> plot([1, 2, 3], [1, 2, 3], 'go-', label='line 1', linewidth=2)
>>> plot([1, 2, 3], [1, 4, 9], 'rs', label='line 2')
```

If you make multiple lines with one plot call, the kwargs apply to all those lines.

Here is a list of available Line2D properties:

<table>
<thead>

**See also:**

scatter

XY scatter plot with markers of varying size and/or color (sometimes also called bubble chart).
Notes

Format Strings

A format string consists of a part for color, marker and line:

\[
\text{fmt} = '[\text{marker}][\text{line}][\text{color}]'
\]

Each of them is optional. If not provided, the value from the style cycle is used. Exception: If line is given, but no marker, the data will be a line without markers. Other combinations such as [color][marker][line] are also supported, but note that their parsing may be ambiguous.

Markers

<table>
<thead>
<tr>
<th>character</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'.'</td>
<td>point marker</td>
</tr>
<tr>
<td>','</td>
<td>pixel marker</td>
</tr>
<tr>
<td>'o'</td>
<td>circle marker</td>
</tr>
<tr>
<td>'v'</td>
<td>triangle_down marker</td>
</tr>
<tr>
<td>'&lt;'</td>
<td>triangle_up marker</td>
</tr>
<tr>
<td>'&gt;'</td>
<td>triangle_left marker</td>
</tr>
<tr>
<td>'1'</td>
<td>tri_down marker</td>
</tr>
<tr>
<td>'2'</td>
<td>tri_up marker</td>
</tr>
<tr>
<td>'3'</td>
<td>tri_left marker</td>
</tr>
<tr>
<td>'4'</td>
<td>tri_right marker</td>
</tr>
<tr>
<td>'s'</td>
<td>square marker</td>
</tr>
<tr>
<td>'p'</td>
<td>pentagon marker</td>
</tr>
<tr>
<td>'*'</td>
<td>star marker</td>
</tr>
<tr>
<td>'h'</td>
<td>hexagon1 marker</td>
</tr>
<tr>
<td>'H'</td>
<td>hexagon2 marker</td>
</tr>
<tr>
<td>'+'</td>
<td>plus marker</td>
</tr>
<tr>
<td>'x'</td>
<td>x marker</td>
</tr>
<tr>
<td>'D'</td>
<td>diamond marker</td>
</tr>
<tr>
<td>'d'</td>
<td>thin_diamond marker</td>
</tr>
<tr>
<td>'</td>
<td>'</td>
</tr>
<tr>
<td>'_'</td>
<td>hline marker</td>
</tr>
</tbody>
</table>

Line Styles

<table>
<thead>
<tr>
<th>character</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>solid line style</td>
</tr>
<tr>
<td>'--'</td>
<td>dashed line style</td>
</tr>
<tr>
<td>'-.'</td>
<td>dash-dot line style</td>
</tr>
<tr>
<td>':'</td>
<td>dotted line style</td>
</tr>
</tbody>
</table>
Example format strings:

```
'b'   # blue markers with default shape
'or'  # red circles
'-g'  # green solid line
'--'  # dashed line with default color
'^k:' # black triangle_up markers connected by a dotted line
```

**Colors**

The supported color abbreviations are the single letter codes

<table>
<thead>
<tr>
<th>character</th>
<th>color</th>
</tr>
</thead>
<tbody>
<tr>
<td>'b'</td>
<td>blue</td>
</tr>
<tr>
<td>'g'</td>
<td>green</td>
</tr>
<tr>
<td>'r'</td>
<td>red</td>
</tr>
<tr>
<td>'c'</td>
<td>cyan</td>
</tr>
<tr>
<td>'m'</td>
<td>magenta</td>
</tr>
<tr>
<td>'y'</td>
<td>yellow</td>
</tr>
<tr>
<td>'k'</td>
<td>black</td>
</tr>
<tr>
<td>'w'</td>
<td>white</td>
</tr>
</tbody>
</table>

...and the 'CN' colors that index into the default property cycle.

If the color is the only part of the format string, you can additionally use any *matplotlib.colors* spec, e.g. full names ('green') or hex strings ('#008000').

**Examples using matplotlib.pyplot.plot**

- *Frame grabbing*
- sphx_glr_gallery_misc_print_stdout_sgskip.py
- sphx_glr_gallery_user_interfaces_toolmanager_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

**matplotlib.pyplot.plot_date**

```python
matplotlib.pyplot.plot_date(x, y, fmt='o', tz=None, xdate=True, ydate=False, *
* data=None, **kwargs)
```

Plot data that contains dates.

Similar to *plot*, this plots *y* vs. *x* as lines or markers. However, the axis labels are formatted as dates depending on *xdate* and *ydate*.

**Parameters**
x, y
[array-like] The coordinates of the data points. If xdate or ydate is True, the respective values x or y are interpreted as Matplotlib dates.

fmt
[str, optional] The plot format string. For details, see the corresponding parameter in plot.

tz
[timezone string or datetime.tzinfo, default: rcParams["timezone"] (default: ‘UTC’)] The time zone to use in labeling dates.

xdate
[bool, default: True] If True, the x-axis will be interpreted as Matplotlib dates.

ydate
[bool, default: False] If True, the y-axis will be interpreted as Matplotlib dates.

Returns

lines
A list of Line2D objects representing the plotted data.

Other Parameters

**kwargs
Keyword arguments control the Line2D properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value</td>

**See also:**

- `matplotlib.dates`
  Helper functions on dates.
- `matplotlib.dates.date2num`
  Convert dates to num.
- `matplotlib.dates.num2date`
  Convert num to dates.
Create an equally spaced sequence of dates.

Notes

If you are using custom date tickers and formatters, it may be necessary to set the formatters/locators after the call to `plot_date`. `plot_date` will set the default tick locator to `AutoDateLocator` (if the tick locator is not already set to a `DateLocator` instance) and the default tick formatter to `AutoDateFormatter` (if the tick formatter is not already set to a `DateFormatter` instance).

Note: In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.plot_date`

- sphx_glr_gallery_ticks_and_spines_date_demo_rrule.py

`matplotlib.pyplot.polar`

`matplotlib.pyplot.polar(*args, **kwargs)`

Make a polar plot.

call signature:

```
polar(theta, r, **kwargs)
```

Multiple `theta, r` arguments are supported, with format strings, as in `plot`.

Examples using `matplotlib.pyplot.polar`

- sphx_glr_gallery_misc_transoffset.py
- Sample plots in Matplotlib
matplotlib.pyplot.prism

matplotlib.pyplot.prism()

Set the colormap to "prism".

This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.

Examples using matplotlib.pyplot.prism

matplotlib.pyplot.psd

matplotlib.pyplot.psd(x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, pad_to=None, sides=None, scale_by_freq=None, return_line=None, *, data=None, **kwargs)

Plot the power spectral density.

The power spectral density $P_{xx}$ by Welch's average periodogram method. The vector x is divided into NFFT length segments. Each segment is detrended by function detrend and windowed by function window. noverlap gives the length of the overlap between segments. The $|\text{fft}(i)|^2$ of each segment $i$ are averaged to compute $P_{xx}$, with a scaling to correct for power loss due to windowing.

If len(x) < NFFT, it will be zero padded to NFFT.

**Parameters**

- **x**
  
  [1-D array or sequence] Array or sequence containing the data

- **Fs**
  
  [float, default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

- **window**
  
  [callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

- **sides**
  
  [{'default', 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-
sided for complex data. 'onesided' forces the return of a one-
side spectrum, while 'twosided' forces two-sided.

**pad_to**

[int, optional] The number of points to which the data segment
is padded when performing the FFT. This can be different from
**NFFT**, which specifies the number of data points used. While not
increasing the actual resolution of the spectrum (the minimum
distance between resolvable peaks), this can give more points
in the plot, allowing for more detail. This corresponds to the \( n \)
parameter in the call to \texttt{fft}(). The default is None, which sets
\texttt{pad\_to} equal to \texttt{NFFT}

**NFFT**

[int, default: 256] The number of data points used in each block
for the FFT. A power 2 is most efficient. This should NOT be used
to get zero padding, or the scaling of the result will be incorrect;
use \texttt{pad\_to} for this instead.

**detrend**

[\{'none', 'mean', 'linear'} or callable, default 'none'] The function
applied to each segment before \texttt{fft}-ing, designed to remove the
mean or linear trend. Unlike in MATLAB, where the \texttt{detrend}
parameter is a vector, in Matplotlib it is a function. The \texttt{mlab}
module defines \texttt{detrend\_none}, \texttt{detrend\_mean}, and \texttt{detrend\_linear},
but you can use a custom function as well. You can also use a
string to choose one of the functions: 'none' calls \texttt{detrend\_none}.
'mean' calls \texttt{detrend\_mean}. 'linear' calls \texttt{detrend\_linear}.

**scale\_by\_freq**

[bool, default: True] Whether the resulting density values should
be scaled by the scaling frequency, which gives density in units of
\texttt{Hz}^-1. This allows for integration over the returned frequency
values. The default is True for MATLAB compatibility.

**noverlap**

[int, default: 0 (no overlap)] The number of points of overlap
between segments.

**Fc**

[int, default: 0] The center frequency of \( x \), which offsets the \( x \)
 extents of the plot to reflect the frequency range used when a
signal is acquired and then filtered and downsampled to base-
band.

**return\_line**

[bool, default: False] Whether to include the line object plotted
in the returned values.
Returns

**Pxx**

[1-D array] The values for the power spectrum $P_{xx}$ before scaling (real valued).

**freqs**

[1-D array] The frequencies corresponding to the elements in $P_{xx}$.

**line**

[Line2D] The line created by this function. Only returned if `return_line` is True.

Other Parameters

**kwargs

Keyword arguments control the Line2D properties:

**See also:**

- specgram
  
  Differs in the default overlap; in not returning the mean of the segment periodograms; in returning the times of the segments; and in plotting a colormap instead of a line.

- magnitude_spectrum

  Plots the magnitude spectrum.

- csd

  Plots the spectral density between two signals.

**Notes**

For plotting, the power is plotted as $10 \log_{10}(P_{xx})$ for decibels, though $P_{xx}$ itself is returned.
References

**Note:** In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x.

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.pyplot.psd

- sphx_glr_gallery_lines_bars_and_markers_psd_demo.py

`matplotlib.pyplot.quiver`

`matplotlib.pyplot.quiver(*args, data=None, **kw)`

Plot a 2D field of arrows.

Call signature:

```
quiver([X, Y], U, V, [C], **kw)
```

X, Y define the arrow locations, U, V define the arrow directions, and C optionally sets the color.

**Arrow size**

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the `scale` and `scale_units` parameters.

**Arrow shape**

The defaults give a slightly swept-back arrow; to make the head a triangle, make `headaxislength` the same as `headlength`. To make the arrow more pointed, reduce `headwidth` or increase `headlength` and `headaxislength`. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

**Arrow outline**

`linewidths` and `edgecolors` can be used to customize the arrow outlines.

**Parameters**
X, Y

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using \( \text{X, Y} = \text{np.meshgrid}(X, Y) \). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

U, V

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. U and V may be masked. Only locations unmasked in U, V, and C will be drawn.

C

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via norm and cmap.

This does not support explicit colors. If you want to set colors directly, use color instead. The size of C must match the number of arrow locations.

units

[\{
'width', 'height', 'dots', 'inches', 'x', 'y', 'xy'
\}, default: 'width']

The arrow dimensions (except for length) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': \( X, Y \) or \( \sqrt{X^2 + Y^2} \) in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

angles

[\{
'uv', 'xy'
\} or array-like, default: 'uv'] Method for determining the angle of the arrows.
• ‘uv’: The arrow axis aspect ratio is 1 so that if $U == V$ the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on $X, Y$ data coordinates.

• ’xy’: Arrows point from $(x, y)$ to $(x+u, y+v)$. Use this for plotting a gradient field, for example.

• Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

   In this case $U, V$ is only used to determine the length of the arrows.

   Note: inverting a data axis will correspondingly invert the arrows only with angles='xy'.

scale

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is None.

If None, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the scale_units parameter.

scale_units

[{‘width’, ‘height’, ‘dots’, ‘inches’, ‘x’, ‘y’, ‘xy’}, optional] If the scale kwarg is None, the arrow length unit. Default is None.

e.g. scale_units is ‘inches’, scale is 2.0, and $(u, v) = (1, 0)$, then the vector will be 0.5 inches long.

If scale_units is ‘width’ or ‘height’, then the vector will be half the width/height of the axes.

If scale_units is ‘x’ then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with $u$ and $v$ having the same units as $x$ and $y$, use angles='xy', scale_units='xy', scale=1.

width

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

headwidth

[float, default: 3] Head width as multiple of shaft width.

headlength
[float, default: 5] Head length as multiple of shaft width.

**headaxislength**

[float, default: 4.5] Head length at shaft intersection.

**minshaft**

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength**

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot**

[{'tail', 'mid', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is anchored to the $X$, $Y$ grid. The arrow rotates about this point.

'mid' is a synonym for 'middle'.

**color**

[color or color sequence, optional] Explicit color(s) for the arrows. If $C$ has been set, color has no effect.

This is a synonym for the $PolyCollection$ facecolor parameter.

**Other Parameters**

**kwargs**

[PolyCollection properties, optional] All other keyword arguments are passed on to PolyCollection:

**See also:**

*Axes.quiverkey*

Add a key to a quiver plot.

**Examples using matplotlib.pyplot.quiver**

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py
- sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py
- Sample plots in Matplotlib
matplotlib.pyplot.quiverkey

matplotlib.pyplot.quiverkey(Q, X, Y, U, label, **kw)

Add a key to a quiver plot.

The positioning of the key depends on X, Y, coordinates, and labelpos. If labelpos is 'N' or 'S', X, Y give the position of the middle of the key arrow. If labelpos is 'E', X, Y positions the head, and if labelpos is 'W', X, Y positions the tail; in either of these two cases, X, Y is somewhere in the middle of the arrow+label key object.

Parameters

Q

[matplotlib.quiver.Quiver] A Quiver object as returned by a call to quiver().

X, Y

[float] The location of the key.

U

[float] The length of the key.

label

[str] The key label (e.g., length and units of the key).

angle

[float, default: 0] The angle of the key arrow, in degrees anti-clockwise from the x-axis.

coordinates

[{‘axes’, ‘figure’, ‘data’, ‘inches’}, default: ‘axes’] Coordinate system and units for X, Y: ‘axes’ and ‘figure’ are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; ‘data’ are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); ‘inches’ is position in the figure in inches, with (0, 0) at the lower left corner.

color

[color] Overrides face and edge colors from Q.

labelpos

[{‘N’, ‘S’, ‘E’, ‘W’}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[float, default: 0.1] Distance in inches between the arrow and the label.
**labelcolor**

[color, default: rcParams["text.color"] (default: 'black')] Label color.

**fontproperties**

[dict, optional] A dictionary with keyword arguments accepted by the FontProperties initializer: family, style, variant, size, weight.

**kwargs**

Any additional keyword arguments are used to override vector properties taken from Q.

Examples using matplotlib.pyplot.quiverkey

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py
- sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py

**matplotlib.pyplot.rc**

matplotlib.pyplot.rc(group, **kwargs)

Set the current rcParams. group is the grouping for the rc, e.g., for lines. linewidth the group is lines, for axes.facecolor, the group is axes, and so on. Group may also be a list or tuple of group names, e.g., (xtick, ytick). kwargs is a dictionary attribute name/value pairs, e.g.,:

```
rc('lines', linewidth=2, color='r')
```

sets the current rcParams and is equivalent to:

```
rcParams["lines.linewidth"] = 2
rcParams["lines.color"] = 'r'
```

The following aliases are available to save typing for interactive users:

<table>
<thead>
<tr>
<th>Alias</th>
<th>Property</th>
</tr>
</thead>
<tbody>
<tr>
<td>'lw'</td>
<td>'linewidth'</td>
</tr>
<tr>
<td>'ls'</td>
<td>'linestyle'</td>
</tr>
<tr>
<td>'c'</td>
<td>'color'</td>
</tr>
<tr>
<td>'fc'</td>
<td>'facecolor'</td>
</tr>
<tr>
<td>'ec'</td>
<td>'edgecolor'</td>
</tr>
<tr>
<td>'mew'</td>
<td>'markeredgewidth'</td>
</tr>
<tr>
<td>'aa'</td>
<td>'antialiased'</td>
</tr>
</tbody>
</table>

Thus you could abbreviate the above call as:
Note you can use python's kwargs dictionary facility to store dictionaries of default parameters. e.g., you can customize the font rc as follows:

```python
font = {'family': 'monospace', 'weight': 'bold', 'size': 'larger'}
rc('font', **font)  # pass in the font dict as kwargs
```

This enables you to easily switch between several configurations. Use `matplotlib.style.use('default')` or `rcdefaults()` to restore the default `rcParams` after changes.

**Notes**

Similar functionality is available by using the normal dict interface, i.e. `rcParams.update({'lines.linewidth': 2, ...})` (but `rcParams.update` does not support abbreviations or grouping).

**Examples using matplotlib.pyplot.rc**

- **Styling with cycler**

```
matplotlib.pyplot.rc_context
```

`matplotlib.pyplot.rc_context(rc=rc, fname=None)`  
Return a context manager for temporarily changing rcParams.

**Parameters**

- `rc`  
  [dict] The rcParams to temporarily set.

- `fname`  
  [str or path-like] A file with Matplotlib rc settings. If both `fname` and `rc` are given, settings from `rc` take precedence.

**See also:**

**The matplotlibrc file**
Examples

Passing explicit values via a dict:

```python
with mpl.rc_context({'interactive': False}):
    fig, ax = plt.subplots()
    ax.plot(range(3), range(3))
    fig.savefig('example.png')
    plt.close(fig)
```

Loading settings from a file:

```python
with mpl.rc_context(fname='print.rc'):
    plt.plot(x, y)  # uses 'print.rc'
```

Examples using matplotlib.pyplot.rc_context

- sphx_glr_gallery_text_labels_and_annotations_usetex_baseline_test.py
- sphx_glr_gallery_misc_logos2.py
- sphx_glr_gallery_ticks_and_spines_auto_ticks.py

matplotlib.pyplot.rcdefaults

```python
matplotlib.pyplot.rcdefaults()
```

Restore the `rcParams` from Matplotlib's internal default style.

Style-blacklisted `rcParams` (defined in matplotlib.style.core.STYLE_BLACKLIST) are not updated.

See also:

- matplotlib.rc_file_defaults
  
  Restore the `rcParams` from the rc file originally loaded by Matplotlib.

- matplotlib.style.use
  
  Use a specific style file. Call `style.use('default')` to restore the default style.
Examples using `matplotlib.pyplot.rcdefaults`

- sphx_glr_gallery_lines_bars_and_markers_barh.py
- sphx_glr_gallery_misc_customize_rc.py

`matplotlib.pyplot.rgrids`

```python
matplotlib.pyplot.rgrids(radii=None, labels=None, angle=None, fmt=None, **kwargs)
```

Get or set the radial gridlines on the current polar plot.

Call signatures:

```python
lines, labels = rgrids()
lines, labels = rgrids(radii, labels=None, angle=22.5, fmt=None, **kwargs)
```

When called with no arguments, `rgrids` simply returns the tuple `(lines, labels)`. When called with arguments, the labels will appear at the specified radial distances and angle.

**Parameters**

- **radii**
  - [tuple with floats] The radii for the radial gridlines

- **labels**
  - [tuple with strings or None] The labels to use at each radial gridline. The `matplotlib.ticker.ScalarFormatter` will be used if None.

- **angle**
  - [float] The angular position of the radius labels in degrees.

- **fmt**
  - [str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example '%f'.

**Returns**

- **lines**
  - [list of `lines.Line2D`] The radial gridlines.

- **labels**
  - [list of `text.Text`] The tick labels.

**Other Parameters**
**kwargs

`kwargs` are optional `Text` properties for the labels.

See also:

`pyplot.thetagrids`

`projections.polar.PolarAxes.set_rgrids`

`Axis.get_gridlines`

`Axis.get_ticklabels`

Examples

```python
# set the locations of the radial gridlines
lines, labels = rgrids((0.25, 0.5, 1.0))

# set the locations and labels of the radial gridlines
lines, labels = rgrids((0.25, 0.5, 1.0), ('Tom', 'Dick', 'Harry'))
```

Examples using `matplotlib.pyplot.rgrids`

`matplotlib.pyplot.savefig`

`matplotlib.pyplot.savefig(*args, **kwargs)`

Save the current figure.

Call signature:

```python
savefig(fname, dpi=None, facecolor='w', edgecolor='w', orientation='portrait', papertype=None, format=None, transparent=False, bbox_inches=None, pad_inches=0.1, frameon=None, metadata=None)
```

The available output formats depend on the backend being used.

Parameters

**fname**

A path, or a Python file-like object, or possibly some backend-dependent object such as `matplotlib.backends.backend_pdf.PdfPages`.

If `format` is set, it determines the output format, and the file is saved as `fname`. Note that `fname` is used verbatim, and there is no attempt to make the extension, if any, of `fname` match `format`, and no extension is appended.
If `format` is not set, then the format is inferred from the extension of `fname`, if there is one. If `format` is not set and `fname` has no extension, then the file is saved with `rcParams["savefig.format"]` (default: 'png') and the appropriate extension is appended to `fname`.

**Other Parameters**

**dpi**

[float or 'figure', default: `rcParams["savefig.dpi"]` (default: 'figure')] The resolution in dots per inch. If 'figure', use the figure's dpi value.

**quality**

[int, default: `rcParams["savefig.jpeg_quality"]` (default: 95)] Applicable only if `format` is 'jpg' or 'jpeg', ignored otherwise.

The image quality, on a scale from 1 (worst) to 95 (best). Values above 95 should be avoided; 100 disables portions of the JPEG compression algorithm, and results in large files with hardly any gain in image quality.

This parameter is deprecated.

**optimize**

[bool, default: False] Applicable only if `format` is 'jpg' or 'jpeg', ignored otherwise.

Whether the encoder should make an extra pass over the image in order to select optimal encoder settings.

This parameter is deprecated.

**progressive**

[bool, default: False] Applicable only if `format` is 'jpg' or 'jpeg', ignored otherwise.

Whether the image should be stored as a progressive JPEG file.

This parameter is deprecated.

**facecolor**

[color or 'auto', default: `rcParams["savefig.facecolor"]` (default: 'auto')] The facecolor of the figure. If 'auto', use the current figure facecolor.

**edgecolor**

[color or 'auto', default: `rcParams["savefig.edgetcolor"]` (default: 'auto')] The edgecolor of the figure. If 'auto', use the current figure edgecolor.
orientation

[{'landscape', 'portrait'}] Currently only supported by the postscript backend.

papertype

[str] One of 'letter', 'legal', 'executive', 'ledger', 'a0' through 'a10', 'b0' through 'b10'. Only supported for postscript output.

format

[str] The file format, e.g. 'png', 'pdf', 'svg', ... The behavior when this is unset is documented under fname.

transparent

[bool] If True, the axes patches will all be transparent; the figure patch will also be transparent unless facecolor and/or edgecolor are specified via kwargs. This is useful, for example, for displaying a plot on top of a colored background on a web page. The transparency of these patches will be restored to their original values upon exit of this function.

bbox_inches

[str or Bbox, default: rcParams["savefig.bbox"] (default: None)] Bounding box in inches: only the given portion of the figure is saved. If 'tight', try to figure out the tight bbox of the figure.

pad_inches

[float, default: rcParams["savefig.pad_inches"] (default: 0.1)] Amount of padding around the figure when bbox_inches is 'tight'.

bbox_extra_artists

[list of Artist, optional] A list of extra artists that will be considered when the tight bbox is calculated.

backend

[str, optional] Use a non-default backend to render the file, e.g. to render a png file with the "cairo" backend rather than the default "agg", or a pdf file with the "pgf" backend rather than the default "pdf". Note that the default backend is normally sufficient. See The builtin backends for a list of valid backends for each file format. Custom backends can be referenced as "module://...".

metadata

[dict, optional] Key/value pairs to store in the image metadata. The supported keys and defaults depend on the image format and backend:
• 'png' with Agg backend: See the parameter metadata of 
  `print_png`.
• 'pdf' with pdf backend: See the parameter metadata of `PdfPages`.
• 'svg' with svg backend: See the parameter metadata of `print_svg`.
• 'eps' and 'ps' with PS backend: Only 'Creator' is supported.

**pil_kwargs**

[dict, optional] Additional keyword arguments that are passed to 
`PIL.Image.Image.save` when saving the figure.

**Examples using** `matplotlib.pyplot.savefig`

- sphx_glr_gallery_misc_print_stdout_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_tooltip_sgskip.py
- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

**Examples using** `matplotlib.pyplot.sca`

`matplotlib.pyplot.sca(ax)`

Set the current Axes to `ax` and the current Figure to the parent of `ax`.

**Examples using** `matplotlib.pyplot.scatter`

`matplotlib.pyplot.scatter(x, y, s=None, c=None, marker=None, cmap=None, norm=None, vmin=None, vmax=None, alpha=None, linewidths=None, verts=<deprecated parameter>, edgecolors=None, *, plotnonfinite=False, data=None, **kwargs)`

A scatter plot of `y` vs. `x` with varying marker size and/or color.

**Parameters**

- `x`, `y`
  
  [float or array-like, shape (n, )] The data positions.
s

[float or array-like, shape (n, ), optional] The marker size in points**2. Default is rcParams['lines.markersize'] ** 2.

c

[array-like or list of colors or color, optional] The marker colors. Possible values:

• A scalar or sequence of n numbers to be mapped to colors using cmap and norm.

• A 2-D array in which the rows are RGB or RGBA.

• A sequence of colors of length n.

• A single color format string.

Note that c should not be a single numeric RGB or RGBA sequence because that is indistinguishable from an array of values to be colormapped. If you want to specify the same RGB or RGBA value for all points, use a 2-D array with a single row. Otherwise, value-matching will have precedence in case of a size matching with x and y.

If you wish to specify a single color for all points prefer the color keyword argument.

Defaults to None. In that case the marker color is determined by the value of color, facecolor or facecolors. In case those are not specified or None, the marker color is determined by the next color of the Axes' current "shape and fill" color cycle. This cycle defaults to rcParams['axes.prop_cycle'] (default: cycler('color', [
'#1f77b4', '#ff7f0e', '#2ca02c', '#d62728', '#9467bd',
'#8c564b', '#e377c2', '#7f7f7f', '#bcbd22', '#17becf']].)

marker

[MarkerStyle, default: rcParams['scatter.marker'] (default: 'o')] The marker style. marker can be either an instance of the class or the text shorthand for a particular marker. See matplotlib.markers for more information about marker styles.

cmap

[str or Colormap, default: rcParams['image.cmap'] (default: 'viridis')] A Colormap instance or registered colormap name. cmap is only used if c is an array of floats.

norm

[Normalize, default: None] If c is an array of floats, norm is used to scale the color data, c, in the range 0 to 1, in order to map into the colormap cmap. If None, use the default colors.Normalize.
vmin, vmax

[float, default: None] vmin and vmax are used in conjunction with the default norm to map the color array c to the colormap cmap. If None, the respective min and max of the color array is used. It is deprecated to use vmin/vmax when norm is given.

alpha

[float, default: None] The alpha blending value, between 0 (transparent) and 1 (opaque).

linewidths

[float or array-like, default: rcParams["lines.linewidth"] (default: 1.5)] The linewidth of the marker edges. Note: The default edgecolors is 'face'. You may want to change this as well.

decolors

[{"face", 'none', None} or color or sequence of color, default: rcParams["scatter.edgecolors"] (default: 'face')] The edge color of the marker. Possible values:
• 'face': The edge color will always be the same as the face color.
• 'none': No patch boundary will be drawn.
• A color or sequence of colors.
For non-filled markers, the edgecolors kwarg is ignored and forced to 'face' internally.

plotnonfinite

[bool, default: False] Set to plot points with nonfinite c, in conjunction with set_bad.

Returns

PathCollection

Other Parameters

**kwargs

[Collection properties]

See also:

plot

To plot scatter plots when markers are identical in size and color.
Notes

• The `plot` function will be faster for scatterplots where markers don't vary in size or color.

• Any or all of `x`, `y`, `s`, and `c` may be masked arrays, in which case all masks will be combined and only unmasked points will be plotted.

• Fundamentally, scatter works with 1-D arrays; `x`, `y`, `s`, and `c` may be input as N-D arrays, but within scatter they will be flattened. The exception is `c`, which will be flattened only if its size matches the size of `x` and `y`.

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x`, `y`, `s`, `linewidths`, `edgecolors`, `c`, `facecolor`, `facecolors`, `color`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.scatter`

• `sphx_glr_gallery_misc_hyperlinks_sgskip.py`

`matplotlib.pyplot.sci`

`matplotlib.pyplot.sci(im)`

Set the current image.

This image will be the target of colormap functions like `viridis`, and other functions such as `clim`. The current image is an attribute of the current axes.

Examples using `matplotlib.pyplot.sci`

• `sphx_glr_gallery_shapes_and_collections_line_collection.py`
matplotlib.pyplot.semilogx

matplotlib.pyplot.semilogx(*args, **kwargs)

Make a plot with log scaling on the x axis.

Call signatures:

```python
semilogx([x], y, [fmt], data=None, **kwargs)
semilogx([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the x-axis to log scaling. All of the concepts and parameters of plot can be used here as well. The additional parameters `base`, `subs`, and `nonpositive` control the x-axis properties. They are just forwarded to `Axes.set_xscale`.

**Parameters**

- **base**
  
  [float, default: 10] Base of the x logarithm.

- **subs**
  
  [array-like, optional] The location of the minor xticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_xscale` for details.

- **nonpositive**
  
  [{‘mask’, ‘clip’}, default: ‘mask’] Non-positive values in x can be masked as invalid, or clipped to a very small positive number.

**Returns**

- **lines**
  
  A list of `Line2D` objects representing the plotted data.

**Other Parameters**

- ****kwargs**
  
  All parameters supported by `plot`. 
Examples using `matplotlib.pyplot.semilogx`

- Sample plots in `Matplotlib`

`matplotlib.pyplot.semilogy`  

`matplotlib.pyplot.semilogy(*args, **kwargs)`  
Make a plot with log scaling on the y axis.

Call signatures:

```python
semilogy([x], y, [fmt], data=None, **kwargs)
semilogy([x], y, [fmt], [x2], y2, [fmt2], ..., **kwargs)
```

This is just a thin wrapper around `plot` which additionally changes the y-axis to log scaling. All of the concepts and parameters of plot can be used here as well.

The additional parameters `base`, `subs`, and `nonpositive` control the y-axis properties. They are just forwarded to `Axes.set_yscale`.

**Parameters**

- `base`
  
  [float, default: 10] Base of the y logarithm.

- `subs`
  
  [array-like, optional] The location of the minor yticks. If `None`, reasonable locations are automatically chosen depending on the number of decades in the plot. See `Axes.set_yscale` for details.

- `nonpositive`
  
  [{'mask', 'clip'}, default: 'mask'] Non-positive values in y can be masked as invalid, or clipped to a very small positive number.

**Returns**

- `lines`
  
  A list of `Line2D` objects representing the plotted data.

**Other Parameters**

- `**kwargs`
  
  All parameters supported by `plot`.
**Examples using** matplotlib.pyplot.semilogy

- *Sample plots in Matplotlib*

**matplotlib.pyplot.set_cmap**

**matplotlib.pyplot.set_cmap(cmap)**

Set the default colormap, and applies it to the current image if any.

**Parameters**

- **cmap**

  *Colormap* or *str* A colormap instance or the name of a registered colormap.

**See also:**

colormaps

**matplotlib.cm.register_cmap**

**matplotlib.cm.get_cmap**

**Examples using** matplotlib.pyplot.set_cmap

**matplotlib.pyplot.setp**

**matplotlib.pyplot.setp(obj, *args, **kwargs)**

Set a property on an artist object.

matplotlib supports the use of *setp()* (*set property*) and *getp()* to set and get object properties, as well as to do introspection on the object. For example, to set the linestyle of a line to be dashed, you can do:

```python
>>> line, = plot([1, 2, 3])
>>> setp(line, linestyle='--')
```

If you want to know the valid types of arguments, you can provide the name of the property you want to set without a value:

```python
>>> setp(line, 'linestyle')
linestyle: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

If you want to see all the properties that can be set, and their possible values, you can do:
>>> setp(line)
... long output listing omitted

By default `setp` prints to `sys.stdout`, but this can be modified using the `file` keyword-only argument:

```python
>>> with fopen('output.log') as f:
...     setp(line, file=f)
```

`setp()` operates on a single instance or a iterable of instances. If you are in query mode introspecting the possible values, only the first instance in the sequence is used. When actually setting values, all the instances will be set. e.g., suppose you have a list of two lines, the following will make both lines thicker and red:

```python
>>> x = arange(0, 1, 0.01)
>>> y1 = sin(2*pi*x)
>>> y2 = sin(4*pi*x)
>>> lines = plot(x, y1, x, y2)
>>> setp(lines, linewidth=2, color='r')
```

`setp()` works with the MATLAB style string/value pairs or with python kwargs. For example, the following are equivalent:

```python
>>> setp(lines, 'linewidth', 2, 'color', 'r')  # MATLAB style
>>> setp(lines, linewidth=2, color='r')        # python style
```

**Examples using matplotlib.pyplot.setp**

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

**matplotlib.pyplot.show**

```python
def matplotlib.pyplot.show(*, block=None)
    Display all open figures.
    In non-interactive mode, block defaults to True. All figures will display and show will not return until all windows are closed. If there are no figures, return immediately.
    In interactive mode block defaults to False. This will ensure that all of the figures are shown and this function immediately returns.
    Parameters
    block
        [bool, optional] If True block and run the GUI main loop until all windows are closed.
```
If `False` ensure that all windows are displayed and return immediately. In this case, you are responsible for ensuring that the event loop is running to have responsive figures.

**See also:**

- `ion`
  - enable interactive mode
- `ioff`
  - disable interactive mode

**`matplotlib.pyplot.specgram`**

```python
matplotlib.pyplot.specgram(x, NFFT=None, Fs=None, Fc=None, detrend=None, window=None, noverlap=None, cmap=None, xextent=None, pad_to=None, sides=None, scale_by_freq=None, mode=None, scale=None, vmin=None, vmax=None, *, data=None, **kwargs)
```

Plot a spectrogram.

Compute and plot a spectrogram of data in `x`. Data are split into `NFFT` length segments and the spectrum of each section is computed. The windowing function `window` is applied to each segment, and the amount of overlap of each segment is specified with `noverlap`. The spectrogram is plotted as a colormap (using `imshow`).

**Parameters**

- `x`
  - [1-D array or sequence] Array or sequence containing the data.
Fs

[default: 2] The sampling frequency (samples per time unit). It is used to calculate the Fourier frequencies, freqs, in cycles per time unit.

window

[callable or ndarray, default: window_hanning] A function or a vector of length NFFT. To create window vectors see window_hanning, window_none, numpy.blackman, numpy.hamming, numpy.bartlett, scipy.signal, scipy.signal.get_window, etc. If a function is passed as the argument, it must take a data segment as an argument and return the windowed version of the segment.

sides

[{"default", 'onesided', 'twosided'}, optional] Which sides of the spectrum to return. 'default' is one-sided for real data and two-sided for complex data. 'onesided' forces the return of a one-sided spectrum, while 'twosided' forces two-sided.

pad_to

[int, optional] The number of points to which the data segment is padded when performing the FFT. This can be different from NFFT, which specifies the number of data points used. While not increasing the actual resolution of the spectrum (the minimum distance between resolvable peaks), this can give more points in the plot, allowing for more detail. This corresponds to the n parameter in the call to fft(). The default is None, which sets pad_to equal to NFFT

NFFT

[int, default: 256] The number of data points used in each block for the FFT. A power 2 is most efficient. This should NOT be used to get zero padding, or the scaling of the result will be incorrect; use pad_to for this instead.

detrend

[{'none', 'mean', 'linear'} or callable, default 'none'] The function applied to each segment before fft-ing, designed to remove the mean or linear trend. Unlike in MATLAB, where the detrend parameter is a vector, in Matplotlib it is a function. The mlab module defines detrend_none, detrend_mean, and detrend_linear, but you can use a custom function as well. You can also use a string to choose one of the functions: 'none' calls detrend_none. 'mean' calls detrend_mean. 'linear' calls detrend_linear.

scale_by_freq
[bool, default: True] Whether the resulting density values should be scaled by the scaling frequency, which gives density in units of Hz^-1. This allows for integration over the returned frequency values. The default is True for MATLAB compatibility.

mode

[{{'default', 'psd', 'magnitude', 'angle', 'phase'}}] What sort of spectrum to use. Default is 'psd', which takes the power spectral density. 'magnitude' returns the magnitude spectrum. 'angle' returns the phase spectrum without unwrapping. 'phase' returns the phase spectrum with unwrapping.

noverlap

[int] The number of points of overlap between blocks. The default value is 128.

scale

[{{'default', 'linear', 'dB'}}] The scaling of the values in the spec. 'linear' is no scaling. 'dB' returns the values in dB scale. When mode is 'psd', this is dB power (10 * log10). Otherwise this is dB amplitude (20 * log10). 'default' is 'dB' if mode is 'psd' or 'magnitude' and 'linear' otherwise. This must be 'linear' if mode is 'angle' or 'phase'.

Fc

[int, default: 0] The center frequency of x, which offsets the x extents of the plot to reflect the frequency range used when a signal is acquired and then filtered and downsamples to baseband.

cmap

[Colormap, default: rcParams["image.cmap"] (default: 'viridis')]

xextent

[None or (xmin, xmax)] The image extent along the x-axis. The default sets xmin to the left border of the first bin (spectrum column) and xmax to the right border of the last bin. Note that for noverlap>0 the width of the bins is smaller than those of the segments.

**kwargs

Additional keyword arguments are passed on to imshow which makes the specgram image.

Returns

spectrum
[2-D array] Columns are the periodograms of successive segments.

freqs

[1-D array] The frequencies corresponding to the rows in spectrum.

t

[1-D array] The times corresponding to midpoints of segments (i.e., the columns in spectrum).

im

[AxesImage] The image created by imshow containing the spectrogram.

See also:

psd

Differs in the default overlap; in returning the mean of the segment periodograms; in not returning times; and in generating a line plot instead of colormap.

magnitude_spectrum

A single spectrum, similar to having a single segment when mode is 'magnitude'. Plots a line instead of a colormap.

angle_spectrum

A single spectrum, similar to having a single segment when mode is 'angle'. Plots a line instead of a colormap.

phase_spectrum

A single spectrum, similar to having a single segment when mode is 'phase'. Plots a line instead of a colormap.

Notes

The parameters detrend and scale_by_freq do only apply when mode is set to 'psd'.

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x.
Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

**Examples using `matplotlib.pyplot.specgram`**

- `sphx_glr_gallery_images_contours_and_fields_specgram_demo.py`
- `Sample plots in Matplotlib`

**matplotlib.pyplot.spring**

`matplotlib.pyplot.spring()`

Set the colormap to "spring".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

**Examples using `matplotlib.pyplot.spring`**

**matplotlib.pyplot.spy**

`matplotlib.pyplot.spy(Z, precision=0, marker=None, markersize=None, aspect='equal', origin='upper', **kwargs)`

Plot the sparsity pattern of a 2D array.

This visualizes the non-zero values of the array.

Two plotting styles are available: image and marker. Both are available for full arrays, but only the marker style works for `scipy.sparse.spmatrix` instances.

**Image style**

If `marker` and `markersize` are `None`, `imshow` is used. Any extra remaining keyword arguments are passed to this method.

**Marker style**

If `Z` is a `scipy.sparse.spmatrix` or `marker` or `markersize` are `None`, a `Line2D` object will be returned with the value of marker determining the marker type, and any remaining keyword arguments passed to `plot`.

**Parameters**

- `Z` ([array-like (M, N)]) The array to be plotted.
**precision**

[float or 'present', default: 0] If `precision` is 0, any non-zero value will be plotted. Otherwise, values of $|Z| > precision$ will be plotted.

For `scipy.sparse.spmatrix` instances, you can also pass 'present'. In this case any value present in the array will be plotted, even if it is identically zero.

**aspect**

[{'equal', 'auto', None} or float, default: 'equal'] The aspect ratio of the axes. This parameter is particularly relevant for images since it determines whether data pixels are square.

This parameter is a shortcut for explicitly calling `Axes.set_aspect`. See there for further details.

- 'equal': Ensures an aspect ratio of 1. Pixels will be square.
- 'auto': The axes is kept fixed and the aspect is adjusted so that the data fit in the axes. In general, this will result in non-square pixels.
- `None`: Use `rcParams["image.aspect"]` (default: 'equal').

**origin**

[{'upper', 'lower'}, default: `rcParams["image.origin"]` (default: 'upper')] Place the [0, 0] index of the array in the upper left or lower left corner of the axes. The convention 'upper' is typically used for matrices and images.

**Returns**

`AxesImage` or `Line2D`

The return type depends on the plotting style (see above).

**Other Parameters**

**kwargs**

The supported additional parameters depend on the plotting style.

For the image style, you can pass the following additional parameters of `imshow`:

- `cmap`
- `alpha`
- `url`
For the marker style, you can pass any Line2D property except for linestyle:

Examples using matplotlib.pyplot.spy

- sphx_glr_gallery_images_contours_and_fields_spy_demos.py

matplotlib.pyplot.stackplot

```python
matplotlib.pyplot.stackplot(x, *args, labels=(), colors= None, baseline='zero', data= None, **kwargs)
```

Draw a stacked area plot.

**Parameters**

**x**

[1d array of dimension N]

**y**

[2d array (dimension MxN), or sequence of 1d arrays (each dimension 1xN)] The data is assumed to be unstacked. Each of the following calls is legal:

```
stackplot(x, y)          # where y is MxN
stackplot(x, y1, y2, y3, y4)  # where y1, y2, y3, y4, are all 1xNm
```

**baseline**

[{`zero`, `sym`, `wiggle`, `weighted_wiggle`}] Method used to calculate the baseline:

- 'zero': Constant zero baseline, i.e. a simple stacked plot.
- 'sym': Symmetric around zero and is sometimes called 'ThemRiver'.
- 'wiggle': Minimizes the sum of the squared slopes.
- 'weighted_wiggle': Does the same but weights to account for size of each layer. It is also called 'Streamgraph'-layout. More details can be found at http://leebyron.com/streamgraph/.

**labels**

[Length N sequence of strings] Labels to assign to each data series.
colors

[Length N sequence of colors] A list or tuple of colors. These will be cycled through and used to colour the stacked areas.

**kwargs

All other keyword arguments are passed to Axes.fill_between.

Returns

list of PolyCollection

A list of PolyCollection instances, one for each element in the stacked area plot.

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, every other argument can also be string s, which is interpreted as data[s] (unless this raises an exception).

Objects passed as data must support item access (data[s]) and membership test (s in data).

Examples using matplotlib.pyplot.stackplot

matplotlib.pyplot.stem

matplotlib.pyplot.stem(*args, linefmt=None, markerfmt=None, basefmt=None, bottom=0, label=None, use_line_collection=True, data=None)

Create a stem plot.

A stem plot plots vertical lines at each x location from the baseline to y, and places a marker there.

Call signature:

stem([x,] y, linefmt=None, markerfmt=None, basefmt=None)

The x-positions are optional. The formats may be provided either as positional or as keyword-arguments.

Parameters
x
[array-like, optional] The x-positions of the stems. Default: (0, 1, ..., len(y) - 1).

y
[array-like] The y-values of the stem heads.

linefmt
[str, optional] A string defining the properties of the vertical lines. Usually, this will be a color or a color and a linestyle:

<table>
<thead>
<tr>
<th>Character</th>
<th>Line Style</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>solid line</td>
</tr>
<tr>
<td>'--'</td>
<td>dashed line</td>
</tr>
<tr>
<td>'-.'</td>
<td>dash-dot line</td>
</tr>
<tr>
<td>'.'</td>
<td>dotted line</td>
</tr>
</tbody>
</table>

Default: 'C0-', i.e. solid line with the first color of the color cycle.

Note: While it is technically possible to specify valid formats other than color or color and linestyle (e.g. 'rx' or '-.'), this is beyond the intention of the method and will most likely not result in a reasonable plot.

markerfmt
[str, optional] A string defining the properties of the markers at the stem heads. Default: 'C0o', i.e. filled circles with the first color of the color cycle.

basefmt
[str, default: 'C3- ('C2-' in classic mode)] A format string defining the properties of the baseline.

bottom
[float, default: 0] The y-position of the baseline.

label
[str, default: None] The label to use for the stems in legends.

use_line_collection
[bool, default: True] If True, store and plot the stem lines as a LineCollection instead of individual lines, which significantly increases performance. If False, defaults to the old behavior of using a list of Line2D objects. This parameter may be deprecated in the future.

Returns
**StemContainer**

The container may be treated like a tuple \((markerline, stemlines, baseline)\)

**Notes**

**See also:**

The MATLAB function `stem` which inspired this method.

---

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, every other argument can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception).

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

---

**Examples using `matplotlib.pyplot.stem`**

- sphx_glr_gallery_lines_bars_and_markers_stem_plot.py

**`matplotlib.pyplot.step`**

```python
matplotlib.pyplot.step(x, y, *args, where='pre', data=None, **kwargs)
```

Make a step plot.

Call signatures:

```python
step(x, y, [fmt], *, data=None, where='pre', **kwargs)
step(x, y, [fmt], x2, y2, [fmt2], ..., *, where='pre', **kwargs)
```

This is just a thin wrapper around `plot` which changes some formatting options. Most of the concepts and parameters of `plot` can be used here as well.

**Parameters**

- `x`
  
  [array-like] 1-D sequence of x positions. It is assumed, but not checked, that it is uniformly increasing.

- `y`
  
  [array-like] 1-D sequence of y levels.
fmt
[\text{str, optional}] A format string, e.g. 'g' for a green line. See plot for a more detailed description.

Note: While full format strings are accepted, it is recommended to only specify the color. Line styles are currently ignored (use the keyword argument linestyle instead). Markers are accepted and plotted on the given positions, however, this is a rarely needed feature for step plots.

data
[indexable object, optional] An object with labelled data. If given, provide the label names to plot in x and y.

where
[\{\text{'pre', 'post', 'mid'}, default: 'pre'}\} Define where the steps should be placed:
• 'pre': The y value is continued constantly to the left from every x position, i.e. the interval $(x[i-1], x[i])$ has the value $y[i]$.
• 'post': The y value is continued constantly to the right from every x position, i.e. the interval $[x[i], x[i+1])$ has the value $y[i]$.
• 'mid': Steps occur half-way between the x positions.

Returns
lines
A list of Line2D objects representing the plotted data.

Other Parameters
**kwargs
Additional parameters are the same as those for plot.

Notes

Examples using matplotlib.pyplot.step

• sphx_glr_gallery_lines_bars_and_markers_step_demo.py
Draw streamlines of a vector flow.

**Parameters**

- **x, y**

- **u, v**
  [2D arrays] x and y-velocities. The number of rows and columns must match the length of y and x, respectively.

- **density**
  [float or (float, float)] Controls the closeness of streamlines. When density = 1, the domain is divided into a 30x30 grid. density linearly scales this grid. Each cell in the grid can have, at most, one traversing streamline. For different densities in each direction, use a tuple (density_x, density_y).

- **linewidth**
  [float or 2D array] The width of the stream lines. With a 2D array the line width can be varied across the grid. The array must have the same shape as u and v.

- **color**
  [color or 2D array] The streamline color. If given an array, its values are converted to colors using cmap and norm. The array must have the same shape as u and v.

- **cmap**
  [Colormap] Colormap used to plot streamlines and arrows. This is only used if color is an array.

- **norm**
  [Normalize] Normalize object used to scale luminance data to 0, 1. If None, stretch (min, max) to (0, 1). This is only used if color is an array.

- **arrowsize**
  [float] Scaling factor for the arrow size.
arrowstyle

minlength

start_points

[Nx2 array] Coordinates of starting points for the streamlines in data coordinates (the same coordinates as the x and y arrays).

zorder

[int] The zorder of the stream lines and arrows. Artists with lower zorder values are drawn first.

maxlength

[float] Maximum length of streamline in axes coordinates.

integration_direction

[{'forward', 'backward', 'both'}, default: 'both'] Integrate the streamline in forward, backward or both directions.

Returns

StreamplotSet

Container object with attributes

• lines: LineCollection of streamlines

• arrows: PatchCollection containing FancyArrowPatch objects representing the arrows half-way along stream lines.

This container will probably change in the future to allow changes to the colormap, alpha, etc. for both lines and arrows, but these changes should be backward compatible.

Notes

Note: In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): x, y, u, v, start_points.

Objects passed as data must support item access (data[s]) and membership test (s in data).
Examples using `matplotlib.pyplot.streamplot`

- `sphx_glr_gallery_images_contours_and_fields_plot_streamplot.py`
- *Sample plots in Matplotlib*

`matplotlib.pyplot.subplot`

```python
matplotlib.pyplot.subplot(*args, **kwargs)
```

Add a subplot to the current figure.

Wrapper of `Figure.add_subplot` with a difference in behavior explained in the notes section.

Call signatures:

```
subplot(nrows, ncols, index, **kwargs)
subplot(pos, **kwargs)
subplot(**kwargs)
subplot(ax)
```

### Parameters

**`*args`**

[int, (int, int, `index`), or `SubplotSpec`, default: (1, 1, 1)] The position of the subplot described by one of

- Three integers (`nrows`, `ncols`, `index`). The subplot will take the `index` position on a grid with `nrows` rows and `ncols` columns. `index` starts at 1 in the upper left corner and increases to the right. `index` can also be a two-tuple specifying the (first, last) indices (1-based, and including last) of the subplot, e.g., fig. `add_subplot(3, 1, (1, 2))` makes a subplot that spans the upper 2/3 of the figure.

- A 3-digit integer. The digits are interpreted as if given separately as three single-digit integers, i.e. `fig.add_subplot(235)` is the same as `fig.add_subplot(2, 3, 5)`. Note that this can only be used if there are no more than 9 subplots.

- A `SubplotSpec`.

**projection**

[{`None`, 'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', 'rectilinear', `str`}, optional] The projection type of the subplot (`Axes`). `str` is the name of a custom projection, see `projections`. The default `None` results in a 'rectilinear' projection.
polar

[bool, default: False] If True, equivalent to projection='polar'.

sharex, sharey

[Axes, optional] Share the x or y axis with sharex and/or sharey. The axis will have the same limits, ticks, and scale as the axis of the shared axes.

label

[st] A label for the returned axes.

Returns

axes.SubplotBase, or another subclass of Axes

The axes of the subplot. The returned axes base class depends on the projection used. It is Axes if rectilinear projection is used and projections.polar.PolarAxes if polar projection is used. The returned axes is then a subplot subclass of the base class.

Other Parameters

**kwargs

This method also takes the keyword arguments for the returned axes base class; except for the figure argument. The keyword arguments for the rectilinear base class Axes can be found in the following table but there might also be other keyword arguments if another projection is used.

<table>

- `Figure.add_subplot`
- `pyplot.subplots`
- `pyplot.axes`
- `Figure.subplots`
Notes

Creating a subplot will delete any pre-existing subplot that overlaps with it beyond sharing a boundary:

```python
import matplotlib.pyplot as plt

# plot a line, implicitly creating a subplot(111)
plt.plot([1, 2, 3])

# now create a subplot which represents the top plot of a grid
# with 2 rows and 1 column. Since this subplot will overlap the
# first, the plot (and its axes) previously created, will be removed
plt.subplot(211)
```

If you do not want this behavior, use the `Figure.add_subplot` method or the `pyplot.axes` function instead.

If the figure already has a subplot with key `(args, kwargs)` then it will simply make that subplot current and return it. This behavior is deprecated. Meanwhile, if you do not want this behavior (i.e., you want to force the creation of a new subplot), you must use a unique set of args and kwargs. The axes `label` attribute has been exposed for this purpose: if you want two subplots that are otherwise identical to be added to the figure, make sure you give them unique labels.

In rare circumstances, `add_subplot` may be called with a single argument, a subplot axes instance already created in the present figure but not in the figure’s list of axes.

Examples

```python
plt.subplot(221)

# equivalent but more general
ax1=plt.subplot(2, 2, 1)

# add a subplot with no frame
ax2=plt.subplot(222, frameon=False)

# add a polar subplot
plt.subplot(223, projection='polar')

# add a red subplot that shares the x-axis with ax1
plt.subplot(224, sharex=ax1, facecolor='red')

# delete ax2 from the figure
plt.delaxes(ax2)

# add ax2 to the figure again
plt.subplot(ax2)
```

**matplotlib.pyplot.subplot2grid**

```python
matplotlib.pyplot.subplot2grid(shape, loc, rowspan=1, colspan=1, fig=None, **kwargs)
```

Create a subplot at a specific location inside a regular grid.

**Parameters**

- **shape**
  - [(int, int)] Number of rows and of columns of the grid in which to place axis.

- **loc**
  - [(int, int)] Row number and column number of the axis location within the grid.

- **rowspan**
  - [int, default: 1] Number of rows for the axis to span to the right.

- **colspan**
  - [int, default: 1] Number of columns for the axis to span downwards.

- **fig**
  - [Figure, optional] Figure to place the subplot in. Defaults to the current figure.

- ****kwargs
  - Additional keyword arguments are handed to `add_subplot`.

**Returns**

- *axes.SubplotBase, or another subclass of Axes*

  The axes of the subplot. The returned axes base class depends on the projection used. It is `Axes` if rectilinear projection is used and `projections.polar.PolarAxes` if polar projection is used. The returned axes is then a subplot subclass of the base class.
Notes

The following call

\[
ax = subplot2grid((nrows, ncols), (row, col), rowspan, colspan)
\]

is identical to

\[
fig = gcf()
gs = fig.add_gridspec(nrows, ncols)
ax = fig.add_subplot(gs[row:row+rowspan, col:col+colspan])
\]

Examples using matplotlib.pyplot.subplot2grid

- sphx_glr_gallery_userdemo_demo_gridspec01.py
- Customizing Figure Layouts Using GridSpec and Other Functions
- Constrained Layout Guide
- Tight Layout guide

matplotlib.pyplot.subplot_mosaic

\[
matplotlib.pyplot.subplot_mosaic(layout, *, subplot_kw=None, gridspec_kw=None, empty_sentinel='.', **fig_kw)
\]

Build a layout of Axes based on ASCII art or nested lists.

This is a helper function to build complex GridSpec layouts visually.

**Note:** This API is provisional and may be revised in the future based on early user feedback.

**Parameters**

**layout**

[list of list of {hashable or nested} or str] A visual layout of how you want your Axes to be arranged labeled as strings. For example

\[
x = [['A panel', 'A panel', 'edge'],
     ['C panel', '.', 'edge']]
\]

Produces 4 axes:
• 'A panel' which is 1 row high and spans the first two columns
• 'edge' which is 2 rows high and is on the right edge
• 'C panel' which in 1 row and 1 column wide in the bottom left
• a blank space 1 row and 1 column wide in the bottom center

Any of the entries in the layout can be a list of lists of the same form to create nested layouts.

If input is a str, then it must be of the form

```
... 
AAE
C.E
... 
```

where each character is a column and each line is a row. This only allows only single character Axes labels and does not allow nesting but is very terse.

**subplot_kw**

[dict, optional] Dictionary with keywords passed to the `Figure.add_subplot` call used to create each subplot.

**gridspec_kw**

[dict, optional] Dictionary with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**empty_sentinel**

[object, optional] Entry in the layout to mean "leave this space empty". Defaults to `. `. Note, if `layout` is a string, it is processed via `inspect.cleandoc` to remove leading white space, which may interfere with using white-space as the empty sentinel.

**fig_kw**

All additional keyword arguments are passed to the `pyplot.figure` call.

**Returns**

**fig**

[Figure] The new figure

**dict[label, Axes]**

A dictionary mapping the labels to the Axes objects.
Examples using `matplotlib.pyplot.subplot_mosaic`

`matplotlib.pyplot.subplot_tool`

`matplotlib.pyplot.subplot_tool(targetfig=None)`
Launch a subplot tool window for a figure.
A `matplotlib.widgets.SubplotTool` instance is returned.

Examples using `matplotlib.pyplot.subplot_tool`

- sphx_glr_gallery_subplots_axes_and_figures_subplot_toolbar.py

`matplotlib.pyplot.subplots`

`matplotlib.pyplot.subplots(nrows=1, ncols=1, *, sharex=False, sharey=False,
squeeze=True, subplot_kw=None, gridspec_kw=None, **fig_kw)`
Create a figure and a set of subplots.
This utility wrapper makes it convenient to create common layouts of subplots, including the enclosing figure object, in a single call.

**Parameters**

- **nrows, ncols**
  [int, default: 1] Number of rows/columns of the subplot grid.

- **sharex, sharey**
  [bool or {'none', 'all', 'row', 'col'}, default: False] Controls sharing of properties among x (`sharex`) or y (`sharey`) axes:
  - True or 'all': x- or y-axis will be shared among all subplots.
  - False or 'none': each subplot x- or y-axis will be independent.
  - 'row': each subplot row will share an x- or y-axis.
  - 'col': each subplot column will share an x- or y-axis.
  When subplots have a shared x-axis along a column, only the x tick labels of the bottom subplot are created. Similarly, when subplots have a shared y-axis along a row, only the y tick labels of the first column subplot are created. To later turn other subplots' ticklabels on, use `tick_params`.

- **squeeze**
  [bool, default: True]
• If True, extra dimensions are squeezed out from the returned array of `Axes`:
  - if only one subplot is constructed (nrows=ncols=1), the resulting single `Axes` object is returned as a scalar.
  - for Nx1 or 1xM subplots, the returned object is a 1D numpy object array of `Axes` objects.
  - for NxM, subplots with N>1 and M>1 are returned as a 2D array.
• If False, no squeezing at all is done: the returned `Axes` object is always a 2D array containing `Axes` instances, even if it ends up being 1x1.

`subplot_kw`

[dict, optional] Dict with keywords passed to the `add_subplot` call used to create each subplot.

`gridspec_kw`

[dict, optional] Dict with keywords passed to the `GridSpec` constructor used to create the grid the subplots are placed on.

**`fig_kw`**

All additional keyword arguments are passed to the `pyplot.figure` call.

Returns

`fig`

[`Figure`]

`ax`

[`axes.Axes` or array of `Axes`] `ax` can be either a single `Axes` object or an array of `Axes` objects if more than one subplot was created. The dimensions of the resulting array can be controlled with the squeeze keyword, see above.

Typical idioms for handling the return value are:

```python
# using the variable ax for single a Axes
fig, ax = plt.subplots()

# using the variable axs for multiple Axes
fig, axs = plt.subplots(2, 2)

# using tuple unpacking for multiple Axes
fig, (ax1, ax2) = plt.subplot(1, 2)
fig, ((ax1, ax2), (ax3, ax4)) = plt.subplot(2, 2)
```
The names ax and pluralized axs are preferred over axes because for the latter it's not clear if it refers to a single Axes instance or a collection of these.

See also:

- `pyplot.figure`
- `pyplot.subplot`
- `pyplot.axes`
- `Figure.subplots`
- `Figure.add_subplot`

Examples

```python
# First create some toy data:
x = np.linspace(0, 2*np.pi, 400)
y = np.sin(x**2)

# Create just a figure and only one subplot
fig, ax = plt.subplots()
ax.plot(x, y)
ax.set_title('Simple plot')

# Create two subplots and unpack the output array immediately
f, (ax1, ax2) = plt.subplots(1, 2, sharey=True)
ax1.plot(x, y)
ax1.set_title('Sharing Y axis')
ax2.scatter(x, y)

# Create four polar axes and access them through the returned array
fig, axs = plt.subplots(2, 2, subplot_kw=dict(polar=True))
axs[0, 0].plot(x, y)
axs[1, 1].scatter(x, y)

# Share a X axis with each column of subplots
plt.subplots(2, 2, sharex='col')

# Share a Y axis with each row of subplots
plt.subplots(2, 2, sharey='row')

# Share both X and Y axes with all subplots
plt.subplots(2, 2, sharex='all', sharey='all')

# Note that this is the same as
plt.subplots(2, 2, sharex=True, sharey=True)

# Create figure number 10 with a single subplot
```

(continues on next page)
fig, ax = plt.subplots(num=10, clear=True)

- sphx_glr_gallery_user_interfaces_svg_tooltip_sgskip.py
- sphx_glr_gallery_widgets_lasso_selector_demo_sgskip.py

`matplotlib.pyplot.subplots_adjust`:

```python
matplotlib.pyplot.subplots_adjust(left=None, bottom=None, right=None, top=None, wspace=None, hspace=None)
```

Adjust the subplot layout parameters.

Unset parameters are left unmodified; initial values are given by `rcParams["figure.subplot.[name]"].`

**Parameters**

- **left**
  
  [float, optional] The position of the left edge of the subplots, as a fraction of the figure width.

- **right**
  
  [float, optional] The position of the right edge of the subplots, as a fraction of the figure width.

- **bottom**
  
  [float, optional] The position of the bottom edge of the subplots, as a fraction of the figure height.

- **top**
  
  [float, optional] The position of the top edge of the subplots, as a fraction of the figure height.

- **wspace**
  
  [float, optional] The width of the padding between subplots, as a fraction of the average axes width.
**hspace**

[float, optional] The height of the padding between subplots, as a fraction of the average axes height.

`matplotlib.pyplot.summer`

`matplotlib.pyplot.summer()`

Set the colormap to "summer".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

Examples using `matplotlib.pyplot.summer`

`matplotlib.pyplot.suptitle`

`matplotlib.pyplot.suptitle(t, **kwargs)`

Add a centered title to the figure.

**Parameters**
t
[tr] The title text.
x
[float, default 0.5] The x location of the text in figure coordinates.
y
[float, default 0.98] The y location of the text in figure coordinates.
horizontalalignment, ha
[\{'center', 'left', 'right'\}, default: 'center'] The horizontal alignment of the text relative to (x, y).
verticalalignment, va
[\{'top', 'center', 'bottom', 'baseline'\}, default: 'top'] The vertical alignment of the text relative to (x, y).
fontsize, size
[default: rcParams['figure.titlesize'] (default: 'large')] The font size of the text. See Text.set_size for possible values.
fontweight, weight
[default: rcParams['figure.titleweight'] (default: 'normal')] The font weight of the text. See Text.set_weight for possible values.

Returns

text
The Text instance of the title.

Other Parameters

fontproperties
[None or dict, optional] A dict of font properties. If fontproperties is given the default values for font size and weight are taken from the FontProperties defaults. rcParams['figure.titlesize'] (default: 'large') and rcParams['figure.titleweight'] (default: 'normal') are ignored in this case.

**kwargs
Additional kwargs are matplotlib.text.Text properties.
Examples

```python
>>> fig.suptitle('This is the figure title', fontsize=12)
```

Examples using `matplotlib.pyplot.suptitle`

- `sphx_glr_gallery_subplots_axes_and_figures_gridspec_nested.py`
- *Pyplot tutorial*

`matplotlib.pyplot.switch_backend`

`matplotlib.pyplot.switch_backend(newbackend)`

Close all open figures and set the Matplotlib backend.

The argument is case-insensitive. Switching to an interactive backend is possible only if no event loop for another interactive backend has started. Switching to and from non-interactive backends is always possible.

**Parameters**

- `newbackend`
  
  [str] The name of the backend to use.

Examples using `matplotlib.pyplot.switch_backend`

`matplotlib.pyplot.table`

`matplotlib.pyplot.table(cellText=None, cellColours=None, cellLoc='right', colWidths=None, rowLabels=None, rowColours=None, rowLoc='left', colLabels=None, colColours=None, colLoc='center', loc='bottom', bbox=None, edges='closed', **kwargs)`

Add a table to an `Axes`.

At least one of `cellText` or `cellColours` must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using `rowLabels`, `rowColours`, `rowLoc` and `colLabels`, `colColours`, `colLoc` respectively.

For finer grained control over tables, use the `Table` class and add it to the axes with `Axes.add_table`. 
Parameters

**cellText**

[2D list of str, optional] The texts to place into the table cells.

*Note:* Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

**cellColours**

[2D list of colors, optional] The background colors of the cells.

**cellLoc**

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.

**colWidths**

[list of float, optional] The column widths in units of the axes. If not given, all columns will have a width of $1 / ncols$.

**rowLabels**

[list of str, optional] The text of the row header cells.

**rowColours**

[list of colors, optional] The colors of the row header cells.

**rowLoc**

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the row header cells.

**colLabels**

[list of str, optional] The text of the column header cells.

**colColours**

[list of colors, optional] The colors of the column header cells.

**colLoc**

[{'left', 'center', 'right'}, default: 'left'] The text alignment of the column header cells.

**loc**

[str, optional] The position of the cell with respect to ax. This must be one of the *codes*.

**bbox**

[Bbox, optional] A bounding box to draw the table into. If this is not None, this overrides loc.
edges

[substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}]
The cell edges to be drawn with a line. See also `visible_edges`.

Returns

Table

The created table.

Other Parameters

**kwargs

Table properties.

`matplotlib.pyplot.text`

`matplotlib.pyplot.text(x, y, s, fontdict=None, **kwargs)`

Add text to the axes.

Add the text `s` to the axes at location `x`, `y` in data coordinates.

**Parameters**

- **x, y**
  - [float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the `transform` parameter.

- **s**
  - [str] The text.

- **fontdict**
  - [dict, default: None] A dictionary to override the default text properties. If `fontdict` is None, the defaults are determined by `rcParams`.

**Returns**

`Text`

The created `Text` instance.

**Other Parameters**

- ****kwargs**
  - [Text properties.] Other miscellaneous text parameters.

</table>
Examples

Individual keyword arguments can be used to override any given parameter:

```python
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```python
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center', ...
       verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword `bbox`. `bbox` is a dictionary of `Rectangle` properties. For example:

```python
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

matplotlib.pyplot.thetagrids

matplotlib.pyplot.thetagrids(angles=None, labels=None, fmt=None, **kwargs)

Get or set the theta gridlines on the current polar plot.

Call signatures:

```
lines, labels = thetagrids()
lines, labels = thetagrids(angles, labels=None, fmt=None, **kwargs)
```

When called with no arguments, `thetagrids` simply returns the tuple `(lines, labels)`. When called with arguments, the labels will appear at the specified angles.

**Parameters**

`angles`
- [tuple with floats, degrees] The angles of the theta gridlines.

`labels`
- [tuple with strings or None] The labels to use at each radial gridline. The `projections.polar.ThetaFormatter` will be used if None.

`fmt`
- [str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example '%f'. Note that the angle in radians will be used.

**Returns**

`lines`
- [list of `lines.Line2D`] The theta gridlines.

`labels`
- [list of `text.Text`] The tick labels.

**Other Parameters**

`**kwargs`
- `kwargs` are optional `Text` properties for the labels.

**See also:**

`pyplot.rgrids`

`projections.polar.PolarAxes.set_thetagrids`

`Axis.get_gridlines`
Axis.get_ticklabels

Examples

```python
# set the locations of the angular gridlines
lines, labels = theagrids(range(45, 360, 90))

# set the locations and labels of the angular gridlines
lines, labels = theagrids(range(45, 360, 90), ('NE', 'NW', 'SW', 'SE'))
```

Examples using matplotlib.pyplot.thetagrids

matplotlib.pyplot.tick_params

```python
matplotlib.pyplot.tick_params(axis='both', **kwargs)
```

Change the appearance of ticks, tick labels, and gridlines.

Tick properties that are not explicitly set using the keyword arguments remain unchanged unless reset is True.

Parameters

axis

[{'x', 'y', 'both'}, default: 'both'] The axis to which the parameters are applied.

which

[{'major', 'minor', 'both'}, default: 'major'] The group of ticks to which the parameters are applied.

reset

[bool, default: False] Whether to reset the ticks to defaults before updating them.

Other Parameters

direction

[{'in', 'out', 'inout'}] Puts ticks inside the axes, outside the axes, or both.

length

[optional float] Tick length in points.

width

[optional float] Tick width in points.
**color**

[color] Tick color.

**pad**

[float] Distance in points between tick and label.

**labelsiz**

[float or str] Tick label font size in points or as a string (e.g., 'large').

**labelcolor**

[color] Tick label color.

**colors**

[color] Tick color and label color.

**zorder**

[float] Tick and label zorder.

**bottom, top, left, right**

[bool] Whether to draw the respective ticks.

**labelbottom, labeltop, labelleft, labelright**

[bool] Whether to draw the respective tick labels.

**labelrotation**

[float] Tick label rotation

**grid_color**

[color] Gridline color.

**grid_alpha**

[float] Transparency of gridlines: 0 (transparent) to 1 (opaque).

**grid_linewidth**

[float] Width of gridlines in points.

**grid_linestyle**

[str] Any valid Line2D line style spec.
Examples

```python
ax.tick_params(direction='out', length=6, width=2, colors='r', grid_color='r', grid_alpha=0.5)
```

This will make all major ticks be red, pointing out of the box, and with dimensions 6 points by 2 points. Tick labels will also be red. Gridlines will be red and translucent.

Examples using `matplotlib.pyplot.tick_params`

```python
matplotlib.pyplot.ticklabel_format
```

Configure the `ScalarFormatter` used by default for linear axes.

If a parameter is not set, the corresponding property of the formatter is left unchanged.

**Parameters**

- **axis**
  - `{'x', 'y', 'both'}`, default: 'both' The axes to configure. Only major ticks are affected.

- **style**
  - `{'sci', 'scientific', 'plain'}` Whether to use scientific notation. The formatter default is to use scientific notation.

- **scilimits**
  - `[pair of ints (m, n)]` Scientific notation is used only for numbers outside the range \(10^m\) to \(10^n\) (and only if the formatter is configured to use scientific notation at all). Use \((0, 0)\) to include all numbers. Use \((m, m)\) where \(m \neq 0\) to fix the order of magnitude to \(10^m\). The formatter default is `rcParams["axes.formatter.limits"]` (default: \([-5, 6]\)).

- **useOffset**
  - `[bool or float]` If True, the offset is calculated as needed. If False, no offset is used. If a numeric value, it sets the offset. The formatter default is `rcParams["axes.formatter.useoffset"]` (default: True).

- **useLocale**
[bool] Whether to format the number using the current locale or using the C (English) locale. This affects e.g. the decimal separator. The formatter default is `rcParams["axes.formatter.use_locale"]` (default: False).

**useMathText**

[bool] Render the offset and scientific notation in mathtext. The formatter default is `rcParams["axes.formatter.use_mathtext"]` (default: False).

**Raises**

**AttributeError**

If the current formatter is not a `ScalarFormatter`.

**Examples using matplotlib.pyplot.ticklabel_format**

```python
matplotlib.pyplot.ticklabel_format
```

```python
matplotlib.pyplot.tight_layout
```

```python
matplotlib.pyplot.tight_layout(*, pad=1.08, h_pad=None, w_pad=None, rect=None)
```

Adjust the padding between and around subplots.

**Parameters**

**pad**

[float, default: 1.08] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

**h_pad, w_pad**

[float, default: pad] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size.

**rect**

[tuple (left, bottom, right, top), default: (0, 0, 1, 1)] A rectangle in normalized figure coordinates into which the whole subplots area (including labels) will fit.
Examples using `matplotlib.pyplot.tight_layout`

- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

`matplotlib.pyplot.title`

`matplotlib.pyplot.title(label, fontdict=None, loc=None, pad=None, *, y=None, **kwargs)`

Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned above the axes in the center, flush with the left edge, and flush with the right edge.

**Parameters**

**label**

[`str`] Text to use for the title

**fontdict**

[`dict`] A dictionary controlling the appearance of the title text, the default `fontdict` is:

```python
{'fontsize': rcParams['axes.titlesize'],
 'fontweight': rcParams['axes.titleweight'],
 'color': rcParams['axes.titlecolor'],
 'verticalalignment': 'baseline',
 'horizontalalignment': loc}
```

**loc**

[\{'center', 'left', 'right'\}, default: `rcParams["axes.titlelocation"]` (default: 'center')] Which title to set.

**y**

[float, default: `rcParams["axes.titley"]` (default: `None`)] Vertical axes location for the title (1.0 is the top). If None (the default), `y` is determined automatically to avoid decorators on the axes.

**pad**

[float, default: `rcParams["axes.titlepad"]` (default: `6.0`)] The offset of the title from the top of the axes, in points.

**Returns**

`Text`

The matplotlib text instance representing the title
Other Parameters

**kwargs

[Text properties] Other keyword arguments are text properties, see Text for a list of valid text properties.

Examples using matplotlib.pyplot.title

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py
- sphx_glr_gallery_user_interfaces_svg_histogram_sgskip.py

matplotlib.pyplot.tricontour

matplotlib.pyplot.tricontour(*args, **kwargs)
Draw contour lines on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

tricontour(triangulation, ...)

where triangulation is a Triangulation object, or

tricontour(x, y, ...)
tricontour(x, y, triangles, ...)
tricontour(x, y, triangles=triangles, ...)
tricontour(x, y, mask=mask, ...)
tricontour(x, y, triangles, mask=mask, ...)

in which case a Triangulation object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

tricontour(..., Z)

where Z is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

tricontour(..., Z, levels)

contour up to levels+1 automatically chosen contour levels (levels intervals).

tricontour(..., Z, levels)

draw contour lines at the values specified in sequence levels, which must be in increasing order.
`tricontour(Z, **kwargs)`

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

**Parameters**

**triangulation**

[Triangulation, optional] The unstructured triangular grid.
If specified, then `x`, `y`, `triangles`, and `mask` are not accepted.

**x, y**

[array-like, optional] The coordinates of the values in `Z`.

**triangles**

[int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.

**mask**

[bool array-like of shape (ntri), optional] Which triangles are masked out.

**Z**

[array-like(N, M)] The height values over which the contour is drawn.

**levels**

[int or array-like, optional] Determines the number and positions of the contour lines / regions.
If an int `n`, use `MaxNLocator`, which tries to automatically choose no more than `n+1` "nice" contour levels between `vmin` and `vmax`.
If array-like, draw contour lines at the specified levels. The values must be in increasing order.

**Returns**

`TriContourSet`

**Other Parameters**

**colors**

[color string or sequence of colors, optional] The colors of the levels, i.e., the contour lines.
The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value None), the colormap specified by cmap will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or Colormap, default: rcParams['image.cmap'] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

**norm**

[Normalize, optional] If a colormap is used, the Normalize instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**origin**

[{None, 'upper', 'lower', 'image'}, default: None] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.

- None: Z[0, 0] is at X=0, Y=0 in the lower left corner.
- 'lower': Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from rcParams['image.origin'] (default: 'upper').

**extent**

[(x0, x1, y0, y1), optional] If *origin* is not None, then *extent* is interpreted as in imshow: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is None, then (x0, y0) is the position of Z[0, 0], and (x1, y1) is the position of Z[-1, -1].

This argument is ignored if X and Y are specified in the call to contour.
locator
[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via *levels*. Defaults to *MaxNLocator*.

extend
[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the tricontour-coloring of values that are outside the *levels* range.

If 'neither', values outside the *levels* range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the *levels* range.

Values below min(*levels*) and above max(*levels*) are mapped to the under/over values of the *Colormap*. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using *Colormap.set_under* and *Colormap.set_over*.

**Note:** An existing *TriContourSet* does not get notified if properties of its colormap are changed. Therefore, an explicit call to *ContourSet.changed()* is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the *TriContourSet* because it internally calls *ContourSet.changed()*.

xunits, yunits
[registered units, optional] Override axis units by specifying an instance of a *matplotlib.units.ConversionInterface*.

linewidths
[float or array-like, default: *rcParams*['contour.linewidth'] (default: None)] The line width of the contour lines.

If a number, all levels will be plotted with this linewidth.

If a sequence, the levels in ascending order will be plotted with the linewidths in the order specified.

If None, this falls back to *rcParams*['lines.linewidth'] (default: 1.5).

linestyles
[{'solid', 'dashed', 'dashdot', 'dotted'}, optional] If *linestyles* is None, the default is 'solid' unless the lines are monochrome. In that case, negative contours will take their
linestyle from rcParams["contour.negative_linestyle"] (default: 'dashed') setting.

linestyles can also be an iterable of the above strings specifying a set of linestyles to be used. If this iterable is shorter than the number of contour levels it will be repeated as necessary.

Examples using matplotlib.pyplot.tricontour

• sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py
• sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py
• sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py
• sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py

matplotlib.pyplot.tricontourf

matplotlib.pyplot.tricontourf(*args, **kwargs)

Draw contour regions on an unstructured triangular grid.

The triangulation can be specified in one of two ways; either

```
tricontourf(triangulation, ...)
```

where triangulation is a Triangulation object, or

```
tricontourf(x, y, ...)
tricontourf(x, y, triangles, ...)
tricontourf(x, y, triangles=triangles, ...)
tricontourf(x, y, mask=mask, ...)
tricontourf(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See that class' docstring for an explanation of these cases.

The remaining arguments may be:

```
tricontourf(..., Z)
```

where Z is the array of values to contour, one per point in the triangulation. The level values are chosen automatically.

```
tricontourf(..., Z, levels)
```

contour up to levels+1 automatically chosen contour levels (levels intervals).

```
tricontourf(..., Z, levels)
```
draw contour regions at the values specified in sequence `levels`, which must be in increasing order.

```python
tricontourf(Z, **kwargs)
```

Use keyword arguments to control colors, linewidth, origin, cmap ... see below for more details.

**Parameters**

- **triangulation**
  
  `[Triangulation, optional] The unstructured triangular grid.
  
  If specified, then x, y, triangles, and mask are not accepted.`

- **x, y**
  
  `[array-like, optional] The coordinates of the values in Z.`

- **triangles**
  
  `[int array-like of shape (ntri, 3), optional] For each triangle, the indices of the three points that make up the triangle, ordered in an anticlockwise manner. If not specified, the Delaunay triangulation is calculated.`

- **mask**
  
  `[bool array-like of shape (ntri), optional] Which triangles are masked out.`

- **Z**
  
  `[array-like(N, M)] The height values over which the contour is drawn.`

- **levels**
  
  `[int or array-like, optional] Determines the number and positions of the contour lines / regions.
  
  If an int n, use `MaxNLocator`, which tries to automatically choose no more than n+1 "nice" contour levels between vmin and vmax.
  
  If array-like, draw contour lines at the specified levels. The values must be in increasing order.`

**Returns**

- `TriContourSet`

**Other Parameters**
**colors**

[Omit string or sequence of colors, optional] The colors of the levels, i.e., the contour regions.

The sequence is cycled for the levels in ascending order. If the sequence is shorter than the number of levels, it's repeated.

As a shortcut, single color strings may be used in place of one-element lists, i.e. 'red' instead of ['red'] to color all levels with the same color. This shortcut does only work for color strings, not for other ways of specifying colors.

By default (value *None*), the colormap specified by *cmap* will be used.

**alpha**

[float, default: 1] The alpha blending value, between 0 (transparent) and 1 (opaque).

**cmap**

[str or Colormap, default: *rcParams*["image.cmap"] (default: 'viridis')] A Colormap instance or registered colormap name. The colormap maps the level values to colors.

If both *colors* and *cmap* are given, an error is raised.

**norm**

[Normalize, optional] If a colormap is used, the Normalize instance scales the level values to the canonical colormap range [0, 1] for mapping to colors. If not given, the default linear scaling is used.

**origin**

[None, 'upper', 'lower', 'image'], default: None] Determines the orientation and exact position of Z by specifying the position of Z[0, 0]. This is only relevant, if X, Y are not given.

- None: Z[0, 0] is at X=0, Y=0 in the lower left corner.
- 'lower': Z[0, 0] is at X=0.5, Y=0.5 in the lower left corner.
- 'upper': Z[0, 0] is at X=N+0.5, Y=0.5 in the upper left corner.
- 'image': Use the value from *rcParams*["image.origin"] (default: 'upper').

**extent**

[x0, x1, y0, y1], optional] If *origin* is not None, then *extent* is interpreted as in imshow: it gives the outer pixel boundaries. In this case, the position of Z[0, 0] is the center of the pixel, not a corner. If *origin* is None, then (x0, y0) is the position of Z[0, 0], and (x1, y1) is the position of Z[-1, -1].
This argument is ignored if X and Y are specified in the call to contour.

**locator**

[ticker.Locator subclass, optional] The locator is used to determine the contour levels if they are not given explicitly via `levels`. Defaults to `MaxNLocator`.

**extend**

[{'neither', 'both', 'min', 'max'}, default: 'neither'] Determines the `tricontourf`-coloring of values that are outside the `levels` range.

If 'neither', values outside the `levels` range are not colored. If 'min', 'max' or 'both', color the values below, above or below and above the `levels` range.

Values below `min(levels)` and above `max(levels)` are mapped to the under/over values of the `Colormap`. Note that most colormaps do not have dedicated colors for these by default, so that the over and under values are the edge values of the colormap. You may want to set these values explicitly using `Colormap.set_under` and `Colormap.set_over`.

**Notes**

An existing `TriContourSet` does not get notified if properties of its colormap are changed. Therefore, an explicit call to `ContourSet.changed()` is needed after modifying the colormap. The explicit call can be left out, if a colorbar is assigned to the `TriContourSet` because it internally calls `ContourSet.changed()`.

**xunits, yunits**

[registered units, optional] Override axis units by specifying an instance of a `matplotlib.units.ConversionInterface`.

**antialiased**

[bool, default: True] Whether to use antialiasing.

**Notes**

`tricontourf` fills intervals that are closed at the top; that is, for boundaries `z1` and `z2`, the filled region is:

\[
 z1 < Z \leq z2
\]

except for the lowest interval, which is closed on both sides (i.e. it includes the lowest value).
Examples using `matplotlib.pyplot.tricontourf`

- `sphx_glr_gallery_images_contours_and_fields_irregulardatagrid.py`
- `sphx_glr_gallery_images_contours_and_fields_tricontour_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py`
- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_user.py`
- `sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py`

`matplotlib.pyplot.tripcolor`

```
matplotlib.pyplot.tripcolor(*args, alpha=1.0, norm=None, cmap=None, vmin=None, vmax=None, shading='flat', facecolors=None, **kwargs)
```

Create a pseudocolor plot of an unstructured triangular grid.

The triangulation can be specified in one of two ways; either:

```
tripcolor(triangulation, ...)
```

where `triangulation` is a `Triangulation` object, or

```
tripcolor(x, y, ...)
```
```
tripcolor(x, y, triangles, ...)
```
```
tripcolor(x, y, triangles=triangles, ...)
```
```
tripcolor(x, y, mask=mask, ...)
```
```
tripcolor(x, y, triangles, mask=mask, ...)
```

in which case a `Triangulation` object will be created. See `Triangulation` for an explanation of these possibilities.

The next argument must be `C`, the array of color values, either one per point in the triangulation if color values are defined at points, or one per triangle in the triangulation if color values are defined at triangles. If there are the same number of points and triangles in the triangulation it is assumed that color values are defined at points; to force the use of color values at triangles use the kwarg `facecolors=C` instead of just `C`.

`shading` may be 'flat' (the default) or 'gouraud'. If `shading` is 'flat' and `C` values are defined at points, the color values used for each triangle are from the mean `C` of the triangle's three points. If `shading` is 'gouraud' then color values must be defined at points.

The remaining kwargs are the same as for `pcolor`. 
Examples using `matplotlib.pyplot.tripcolor`

- `sphx_glr_gallery_images_contours_and_fields_tripcolor_demo.py`

`matplotlib.pyplot.triplot`

```python
matplotlib.pyplot.triplot(*args, **kwargs)
```

Draw a unstructured triangular grid as lines and/or markers.

The triangulation to plot can be specified in one of two ways; either:

```python
triplot(triangulation, ...)
```

where triangulation is a `Triangulation` object, or

```python
triplot(x, y, ...)
triplot(x, y, triangles, ...)
triplot(x, y, triangles=triangles, ...)
triplot(x, y, mask=mask, ...)
triplot(x, y, triangles, mask=mask, ...)
```

in which case a Triangulation object will be created. See `Triangulation` for an explanation of these possibilities.

The remaining args and kwargs are the same as for `plot`.

**Returns**

- **lines**
  
  `[Line2D]` The drawn triangles edges.

- **markers**
  
  `[Line2D]` The drawn marker nodes.

Examples using `matplotlib.pyplot.triplot`

- `sphx_glr_gallery_images_contours_and_fields_tricontour_smooth_delaunay.py`
- `sphx_glr_gallery_images_contours_and_fields_trigradient_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_triinterp_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_triplot_demo.py`
- `sphx_glr_gallery_event_handling_trifinder_event_demo.py`
matplotlib.pyplot.twinx

matplotlib.pyplot.twinx(ax=None)
Make and return a second axes that shares the x-axis. The new axes will overlay
ax (or the current axes if ax is None), and its ticks will be on the right.

Examples

/gallery/subplots_axes_and_figures/two_scales

Examples using matplotlib.pyplot.twinx

matplotlib.pyplot.twiny

matplotlib.pyplot.twiny(ax=None)
Make and return a second axes that shares the y-axis. The new axes will overlay
ax (or the current axes if ax is None), and its ticks will be on the top.

Examples

/gallery/subplots_axes_and_figures/two_scales

Examples using matplotlib.pyplot.twiny

matplotlib.pyplot.uninstall_repl_displayhook

matplotlib.pyplot.uninstall_repl_displayhook()
Uninstall the matplotlib display hook.

Warning: Need IPython >= 2 for this to work. For IPython < 2 will raise a
NotImplementedError

Warning: If you are using vanilla python and have installed another display
hook this will reset sys.displayhook to what ever function was there when
matplotlib installed it's displayhook, possibly discarding your changes.
Examples using `matplotlib.pyplot.uninstall_repl_displayhook`

`matplotlib.pyplot.violinplot`

```
matplotlib.pyplot.violinplot(dataset, positions=None, vert=True, widths=0.5, showmeans=False, showextrema=True, showmedians=False, quantiles=None, points=100, bw_method=None, *, data=None)
```

Make a violin plot.

Make a violin plot for each column of `dataset` or each vector in sequence `dataset`. Each filled area extends to represent the entire data range, with optional lines at the mean, the median, the minimum, the maximum, and user-specified quantiles.

**Parameters**

`dataset`

[Array or a sequence of vectors.] The input data.

`positions`

[array-like, default: [1, 2, ..., n]] Sets the positions of the violins. The ticks and limits are automatically set to match the positions.

`vert`

[bool, default: True] If true, creates a vertical violin plot. Otherwise, creates a horizontal violin plot.

`widths`

[array-like, default: 0.5] Either a scalar or a vector that sets the maximal width of each violin. The default is 0.5, which uses about half of the available horizontal space.

`showmeans`

[bool, default: False] If True, will toggle rendering of the means.

`showextrema`

[bool, default: True] If True, will toggle rendering of the extrema.

`showmedians`

[bool, default: False] If True, will toggle rendering of the medians.

`quantiles`

[array-like, default: None] If not None, set a list of floats in interval [0, 1] for each violin, which stands for the quantiles that will be rendered for that violin.
points
[\text{int, default: 100}] Defines the number of points to evaluate each of the gaussian kernel density estimations at.

bw_method
[\text{str, scalar or callable, optional}] The method used to calculate the estimator bandwidth. This can be 'scott', 'silverman', a scalar constant or a callable. If a scalar, this will be used directly as kde.factor. If a callable, it should take a GaussianKDE instance as its only parameter and return a scalar. If None (default), 'scott' is used.

Returns

dict
A dictionary mapping each component of the violinplot to a list of the corresponding collection instances created. The dictionary has the following keys:

- bodies: A list of the \textit{PolyCollection} instances containing the filled area of each violin.
- cmeans: A \textit{LineCollection} instance that marks the mean values of each of the violin's distribution.
- cmins: A \textit{LineCollection} instance that marks the bottom of each violin's distribution.
- cmaxes: A \textit{LineCollection} instance that marks the top of each violin's distribution.
- cbars: A \textit{LineCollection} instance that marks the centers of each violin's distribution.
- cmedians: A \textit{LineCollection} instance that marks the median values of each of the violin's distribution.
- cquantiles: A \textit{LineCollection} instance created to identify the quantile values of each of the violin's distribution.

Notes

\textbf{Note:} In addition to the above described arguments, this function can take a data keyword argument. If such a data argument is given, the following arguments can also be string s, which is interpreted as data[s] (unless this raises an exception): \textit{dataset}. 

\[18.38. \texttt{matplotlib.pyplot} \]
Objects passed as **data** must support item access (**data[s]**) and membership test (**s in data**).

### Examples using `matplotlib.pyplot.violinplot`

### `matplotlib.pyplot.viridis`

`matplotlib.pyplot.viridis()`

Set the colormap to "viridis".

This changes the default colormap as well as the colormap of the current image if there is one. See `help(colormaps)` for more information.

### Examples using `matplotlib.pyplot.viridis`

### `matplotlib.pyplot.vlines`

`matplotlib.pyplot.vlines(x, ymin, ymax, colors=None, linestyles='solid', label='', *, data=None, **kwargs)`

Plot vertical lines.

Plot vertical lines at each `x` from `ymin` to `ymax`.

**Parameters**

- **x**
  
  [float or array-like] x-indexes where to plot the lines.

- **ymin, ymax**
  
  [float or array-like] Respective beginning and end of each line. If scalars are provided, all lines will have same length.

- **colors**
  
  [list of colors, default: `rcParams["lines.color"]` (default: 'C0')]  

- **linestyles**
  
  [{'solid', 'dashed', 'dashdot', 'dotted'}, optional]

- **label**
  
  [str, default: '']

**Returns**

`LineCollection`
Other Parameters

**kwargs

[LineCollection properties.]

See also:

*hlines*

horizontal lines

*axvline*

vertical line across the axes

Notes

**Note:** In addition to the above described arguments, this function can take a *data* keyword argument. If such a *data* argument is given, the following arguments can also be string *s*, which is interpreted as *data*[s] (unless this raises an exception): *x*, *ymin*, *ymax*, *colors*.

Objects passed as *data* must support item access (*data*[s]) and membership test (*s in data*).

Examples using *matplotlib.pyplot.vlines*

*matplotlib.pyplot.waitforbuttonpress*

*matplotlib.pyplot.waitforbuttonpress*(timeout=-1)

Blocking call to interact with the figure.

Wait for user input and return True if a key was pressed, False if a mouse button was pressed and None if no input was given within *timeout* seconds. Negative values deactivate *timeout*.
Examples using matplotlib.pyplot.waitforbuttonpress

- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.winter

```python
matplotlib.pyplot.winter()
Set the colormap to "winter".
This changes the default colormap as well as the colormap of the current image if there is one. See help(colormaps) for more information.
```

Examples using matplotlib.pyplot.winter

matplotlib.pyplot.xcorr

```python
matplotlib.pyplot.xcorr(x, y, normed=True, detrend=<function detrend_none at 0x7f5434697820>, usevlines=True, maxlags=10, *,
data=None, **kwargs)
Plot the cross correlation between x and y.
The correlation with lag k is defined as \( \sum_n x[n+k] \cdot y^*[n] \), where \( y^* \) is the complex conjugate of \( y \).
```

**Parameters**

- `x, y`
  [array-like of length n]

- **detrend**
  [callable, default: `mlab.detrend_none` (no detrending)] A detrending function applied to \( x \) and \( y \). It must have the signature

  ```python
detrend(x: np.ndarray) -> np.ndarray
  ```

- **normed**
  [bool, default: True] If True, input vectors are normalised to unit length.

- **usevlines**
  [bool, default: True] Determines the plot style.
  If True, vertical lines are plotted from 0 to the xcorr value using `Axes.vlines`. Additionally, a horizontal line is plotted at \( y=0 \) using `Axes.axhline`.
  If False, markers are plotted at the xcorr values using `Axes.plot`.  

2606 Chapter 18. Modules
**maxlags**

[int, default: 10] Number of lags to show. If None, will return all
$2 \times \text{len}(x) - 1$ lags.

**Returns**

**lags**

[array (length $2 \times \text{maxlags}+1$)] The lag vector.

**c**

[array (length $2 \times \text{maxlags}+1$)] The auto correlation vector.

**line**

[ListCollection or Line2D] Artist added to the axes of the corre-
lation:

- ListCollection if usevlines is True.
- Line2D if usevlines is False.

**b**

[Line2D or None] Horizontal line at 0 if usevlines is True None
usevlines is False.

**Other Parameters**

**linestyle**

[List2D property, optional] The linestyle for plotting the data
points. Only used if usevlines is False.

**marker**

[str, default: 'o'] The marker for plotting the data points. Only
used if usevlines is False.

****kwargs**

Additional parameters are passed to Axes.vlines and Axes.
axhline if usevlines is True; otherwise they are passed to Axes.
plot.
Notes

The cross correlation is performed with `numpy.correlate` with `mode = "full"`.

**Note:** In addition to the above described arguments, this function can take a `data` keyword argument. If such a `data` argument is given, the following arguments can also be string `s`, which is interpreted as `data[s]` (unless this raises an exception): `x, y`.

Objects passed as `data` must support item access (`data[s]`) and membership test (`s in data`).

Examples using `matplotlib.pyplot.xcorr`

- `sphx_glr_gallery_lines_bars_and_markers_xcorr_acorr_demo.py`

`matplotlib.pyplot.xkcd`

`matplotlib.pyplot.xkcd(scale=1, length=100, randomness=2)`

Turn on `xkcd` sketch-style drawing mode. This will only have effect on things drawn after this function is called.

For best results, the "Humor Sans" font should be installed: it is not included with Matplotlib.

**Parameters**

- `scale`
  - [float, optional] The amplitude of the wiggle perpendicular to the source line.

- `length`
  - [float, optional] The length of the wiggle along the line.

- `randomness`
  - [float, optional] The scale factor by which the length is shrunk or expanded.
Notes

This function works by a number of rcParams, so it will probably override others you have set before.

If you want the effects of this function to be temporary, it can be used as a context manager, for example:

```python
with plt.xkcd():
    # This figure will be in XKCD-style
    fig1 = plt.figure()
    # ...

# This figure will be in regular style
fig2 = plt.figure()
```

Examples using `matplotlib.pyplot.xkcd`

- sphx_glr_gallery_showcase_xkcd.py

`matplotlib.pyplot.xlabel`

Set the label for the x-axis.

**Parameters**

- `xlabel` [str] The label text.
- `labelpad` [float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.
- `loc` [{'left', 'center', 'right'}, default: `rcParams["xaxis.labellocation"]` (default: 'center')] The label position. This is a high-level alternative for passing parameters x and `horizontalalignment`.

**Other Parameters**

- `**kwargs` [Text properties] `Text` properties control the appearance of the label.
See also:

text

Documents the properties supported by `Text`.

Examples using `matplotlib.pyplot.xlabel`

- `sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py`

`matplotlib.pyplot.xlim`

`matplotlib.pyplot.xlim(*args, **kwargs)`

Get or set the x limits of the current axes.

Call signatures:

```python
left, right = xlim()  # return the current xlim
xlim((left, right))  # set the xlim to left, right
xlim(left, right)    # set the xlim to left, right
```

If you do not specify args, you can pass `left` or `right` as kwargs, i.e.:

```python
xlim(right=3)  # adjust the right leaving left unchanged
xlim(left=1)   # adjust the left leaving right unchanged
```

Setting limits turns autoscaling off for the x-axis.

**Returns**

`left, right`

A tuple of the new x-axis limits.

**Notes**

Calling this function with no arguments (e.g. `xlim()`) is the pyplot equivalent of calling `get_xlim` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_xlim` on the current axes. All arguments are passed though.
Examples using matplotlib.pyplot.xlim

- Frame grabbing
- sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py

matplotlib.pyplot.xscale

matplotlib.pyplot.xscale(value, **kwargs)
Set the x-axis scale.

**Parameters**

value

[{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**kwargs

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- matplotlib.scale.LinearScale
- matplotlib.scale.LogScale
- matplotlib.scale.SymmetricalLogScale
- matplotlib.scale.LogitScale

**Notes**

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using matplotlib.scale.register_scale. These scales can then also be used here.

Examples using matplotlib.pyplot.xscale

- sphx_glr_gallery_scales_symlog_demo.py
matplotlib.pyplot.xticks

**matplotlib.pyplot.xticks(ticks=\texttt{None}, labels=\texttt{None}, **kw\texttt{args})**

Get or set the current tick locations and labels of the x-axis.

Pass no arguments to return the current values without modifying them.

**Parameters**

- **ticks**
  
  [array-like, optional] The list of xtick locations. Passing an empty list removes all xticks.

- **labels**
  
  [array-like, optional] The labels to place at the given ticks locations. This argument can only be passed if ticks is passed as well.

- **\texttt{kw\texttt{args}}**

  *Text* properties can be used to control the appearance of the labels.

**Returns**

- **locs**

  The list of xtick locations.

- **labels**

  The list of xlabel *Text* objects.

**Notes**

Calling this function with no arguments (e.g. \texttt{xticks()}) is the pyplot equivalent of calling \texttt{get_xticks} and \texttt{get_ticklabels} on the current axes. Calling this function with arguments is the pyplot equivalent of calling \texttt{set_xticks} and \texttt{set_ticklabels} on the current axes.
Examples

```python
>>> locs, labels = xticks()  # Get the current locations and labels.
>>> xticks(np.arange(0, 1, step=0.2))  # Set label locations.
>>> xticks(np.arange(3), ['Tom', 'Dick', 'Sue'])  # Set text labels.
>>> xticks([0, 1, 2], ['January', 'February', 'March'],
          rotation=20)  # Set text labels and properties.
>>> xticks([])  # Disable xticks.
```

Examples using `matplotlib.pyplot.xticks`

- `sphx_glr_gallery_subplots_axes_and_figures_secondary_axis.py`
- `sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py`
- `sphx_glr_gallery_text_labels_and_annotations_multiline.py`
- `sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py`
- `sphx_glr_gallery_misc_table_demo.py`
- `sphx_glr_gallery_ticks_and_spines_ticklabels_rotation.py`

`matplotlib.pyplot.ylabel`

```
matplotlib.pyplot.ylabel(ylabel, fontdict=None, labelpad=None, *, loc=None, **kwargs)
```

Set the label for the y-axis.

**Parameters**

- `ylabel`
  - `[str] The label text.

- `labelpad`
  - `[float, default: None] Spacing in points from the axes bounding box including ticks and tick labels.

- `loc`
  - `[{'bottom', 'center', 'top'}, default: rcParams["yaxis.labellocation"] (default: 'center')] The label position. This is a high-level alternative for passing parameters `y` and `horizontalalignment`.

**Other Parameters**

- `**kwargs`
[Text properties] Text properties control the appearance of the label.

See also:

`text`

Documents the properties supported by `Text`.

Examples using `matplotlib.pyplot.ylabel`

- sphx_glr_gallery_userdemo_pgf_preamble_sgskip.py

`matplotlib.pyplot.ylim`

`matplotlib.pyplot.ylim(*args, **kwargs)`

Get or set the y-limits of the current axes.

Call signatures:

```python
bottom, top = ylim()  # return the current ylim
ylim((bottom, top))  # set the ylim to bottom, top
ylim(bottom, top)    # set the ylim to bottom, top
```

If you do not specify args, you can alternatively pass `bottom` or `top` as kwargs, i.e.:

```python
ylim(top=3)  # adjust the top leaving bottom unchanged
ylim(bottom=1)  # adjust the bottom leaving top unchanged
```

Setting limits turns autoscaling off for the y-axis.

Returns

`bottom, top`

A tuple of the new y-axis limits.

Notes

Calling this function with no arguments (e.g. `ylim()`) is the pyplot equivalent of calling `get_ylim` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_ylim` on the current axes. All arguments are passed though.
Examples using `matplotlib.pyplot.ylim`

- *Frame grabbing*
- `sphx_glr_gallery_event_handling_ginput_manual_clabel_sgskip.py`

`matplotlib.pyplot.yscale`

`matplotlib.pyplot.yscale(value, **kwargs)`

Set the y-axis scale.

**Parameters**

`value`

["linear", "log", "symlog", "logit", ...] The axis scale type to apply.

`**kwargs` Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

**Notes**

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

Examples using `matplotlib.pyplot.yscale`

- `sphx_glr_gallery_scales_symlog_demo.py`
- `Pyplot tutorial`
**matplotlib.pyplot.yticks**

**matplotlib.pyplot.yticks(ticks=None, labels=None, \*\*kwargs)**

Get or set the current tick locations and labels of the y-axis.

Pass no arguments to return the current values without modifying them.

**Parameters**

- **ticks**
  [array-like, optional] The list of ytick locations. Passing an empty list removes all yticks.

- **labels**
  [array-like, optional] The labels to place at the given ticks locations. This argument can only be passed if ticks is passed as well.

- **\*\*kwargs**
  *Text* properties can be used to control the appearance of the labels.

**Returns**

- **locs**
  The list of ytick locations.

- **labels**
  The list of ylabel *Text* objects.

**Notes**

Calling this function with no arguments (e.g. `yticks()`) is the pyplot equivalent of calling `get_yticks` and `get_yticklabels` on the current axes. Calling this function with arguments is the pyplot equivalent of calling `set_yticks` and `set_yticklabels` on the current axes.
Examples

```python
>>> locs, labels = yticks()  # Get the current locations and labels.
>>> yticks(np.arange(0, 1, step=0.2))  # Set label locations.
>>> yticks(np.arange(3), ['Tom', 'Dick', 'Sue'])  # Set text labels.
>>> yticks([0, 1, 2], ['January', 'February', 'March'],
          rotation=45)  # Set text labels and properties.
>>> yticks([])  # Disable yticks.
```

Examples using matplotlib.pyplot.yticks

- sphx_glr_gallery_text_labels_and_annotations_arrow_demo.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_misc_table_demo.py

### 18.38.2 Colors in Matplotlib

There are many colormaps you can use to map data onto color values. Below we list several ways in which color can be utilized in Matplotlib.

For a more in-depth look at colormaps, see the *Choosing Colormaps in Matplotlib* tutorial.

```python
import matplotlib.pyplot as plt

matplotlib.pyplot.colormaps()
```

Matplotlib provides a number of colormaps, and others can be added using `register_cmap()`. This function documents the built-in colormaps, and will also return a list of all registered colormaps if called.

You can set the colormap for an image, `pcolor`, `scatter`, etc, using a keyword argument:

```python
plt.imshow(X, cmap='hot')
```

or using the `set_cmap()` function:
In interactive mode, `set_cmap()` will update the colormap post-hoc, allowing you to see which one works best for your data.

All built-in colormaps can be reversed by appending `_r`: For instance, `gray_r` is the reverse of `gray`.

There are several common color schemes used in visualization:

**Sequential schemes**
- for unipolar data that progresses from low to high

**Diverging schemes**
- for bipolar data that emphasizes positive or negative deviations from a central value

**Cyclic schemes**
- for plotting values that wrap around at the endpoints, such as phase angle, wind direction, or time of day

**Qualitative schemes**
- for nominal data that has no inherent ordering, where color is used only to distinguish categories

Matplotlib ships with 4 perceptually uniform color maps which are the recommended color maps for sequential data:

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>inferno</td>
<td>perceptually uniform shades of black-red-yellow</td>
</tr>
<tr>
<td>magma</td>
<td>perceptually uniform shades of black-red-white</td>
</tr>
<tr>
<td>plasma</td>
<td>perceptually uniform shades of blue-red-yellow</td>
</tr>
<tr>
<td>viridis</td>
<td>perceptually uniform shades of blue-green-yellow</td>
</tr>
</tbody>
</table>

The following colormaps are based on the ColorBrewer color specifications and designs developed by Cynthia Brewer:

ColorBrewer Diverging (luminance is highest at the midpoint, and decreases towards differently-colored endpoints):
<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BrBG</td>
<td>brown, white, blue-green</td>
</tr>
<tr>
<td>PiYG</td>
<td>pink, white, yellow-green</td>
</tr>
<tr>
<td>PRGn</td>
<td>purple, white, green</td>
</tr>
<tr>
<td>PuOr</td>
<td>orange, white, purple</td>
</tr>
<tr>
<td>RdBu</td>
<td>red, white, blue</td>
</tr>
<tr>
<td>RdGy</td>
<td>red, white, gray</td>
</tr>
<tr>
<td>RdYlBu</td>
<td>red, yellow, blue</td>
</tr>
<tr>
<td>RdYlGn</td>
<td>red, yellow, green</td>
</tr>
<tr>
<td>Spectral</td>
<td>red, orange, yellow, green, blue</td>
</tr>
</tbody>
</table>

ColorBrewer Sequential (luminance decreases monotonically):

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blues</td>
<td>white to dark blue</td>
</tr>
<tr>
<td>BuGn</td>
<td>white, light blue, dark green</td>
</tr>
<tr>
<td>BuPu</td>
<td>white, light blue, dark purple</td>
</tr>
<tr>
<td>GnBu</td>
<td>white, light green, dark blue</td>
</tr>
<tr>
<td>Greens</td>
<td>white to dark green</td>
</tr>
<tr>
<td>Greys</td>
<td>white to black (not linear)</td>
</tr>
<tr>
<td>Oranges</td>
<td>white, orange, dark brown</td>
</tr>
<tr>
<td>OrRd</td>
<td>white, orange, dark red</td>
</tr>
<tr>
<td>PuBu</td>
<td>white, light purple, dark blue</td>
</tr>
<tr>
<td>PuBuGn</td>
<td>white, light purple, dark green</td>
</tr>
<tr>
<td>PuRd</td>
<td>white, light purple, dark red</td>
</tr>
<tr>
<td>Purples</td>
<td>white to dark purple</td>
</tr>
<tr>
<td>RdPu</td>
<td>white, pink, dark purple</td>
</tr>
<tr>
<td>Reds</td>
<td>white to dark red</td>
</tr>
<tr>
<td>YlGn</td>
<td>light yellow, dark green</td>
</tr>
<tr>
<td>YlGnBu</td>
<td>light yellow, light green, dark blue</td>
</tr>
<tr>
<td>YlOrBr</td>
<td>light yellow, orange, dark brown</td>
</tr>
<tr>
<td>YlOrRd</td>
<td>light yellow, orange, dark red</td>
</tr>
</tbody>
</table>

ColorBrewer Qualitative:
(For plotting nominal data, ListedColormap is used, not LinearSegmentedColormap. Different sets of colors are recommended for different numbers of categories.)

- Accent
- Dark2
- Paired
- Pastel1
- Pastel2
- Set1
• Set2
• Set3

A set of colormaps derived from those of the same name provided with Matlab are also included:

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>autumn</td>
<td>sequential linearly-increasing shades of red-orange-yellow</td>
</tr>
<tr>
<td>bone</td>
<td>sequential increasing black-white color map with a tinge of blue, to emulate X-ray film</td>
</tr>
<tr>
<td>cool</td>
<td>linearly-decreasing shades of cyan-magenta</td>
</tr>
<tr>
<td>copper</td>
<td>sequential increasing shades of black-copper</td>
</tr>
<tr>
<td>flag</td>
<td>repetitive red-white-blue-black pattern (not cyclic at endpoints)</td>
</tr>
<tr>
<td>gray</td>
<td>sequential linearly-increasing black-to-white grayscale</td>
</tr>
<tr>
<td>hot</td>
<td>sequential black-red-yellow-white, to emulate blackbody radiation from an object at increasing temperatures</td>
</tr>
<tr>
<td>jet</td>
<td>a spectral map with dark endpoints, blue-cyan-yellow-red; based on a fluid-jet simulation by NCSA¹</td>
</tr>
<tr>
<td>pink</td>
<td>sequential increasing pastel black-pink-white, meant for sepia tone colorization of photographs</td>
</tr>
<tr>
<td>prism</td>
<td>repetitive red-yellow-green-blue-purple-...-green pattern (not cyclic at endpoints)</td>
</tr>
<tr>
<td>spring</td>
<td>linearly-increasing shades of magenta-yellow</td>
</tr>
<tr>
<td>summer</td>
<td>sequential linearly-increasing shades of green-yellow</td>
</tr>
<tr>
<td>winter</td>
<td>linearly-increasing shades of blue-green</td>
</tr>
</tbody>
</table>

A set of palettes from the Yorick scientific visualisation package, an evolution of the GIST package, both by David H. Munro are included:

¹ Rainbow colormaps, jet in particular, are considered a poor choice for scientific visualization by many researchers: Rainbow Color Map (Still) Considered Harmful
<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>gist_earth</td>
<td>mapmaker's colors from dark blue deep ocean to green lowlands to brown highlands to white mountains</td>
</tr>
<tr>
<td>gist_heat</td>
<td>sequential increasing black-red-orange-white, to emulate blackbody radiation from an iron bar as it grows hotter</td>
</tr>
<tr>
<td>gist_ncar</td>
<td>pseudo-spectral black-blue-green-yellow-red-purple-white colormap from National Center for Atmospheric Research</td>
</tr>
<tr>
<td>gist_rainbow</td>
<td>through the colors in spectral order from red to violet at full saturation (like hsv but not cyclic)</td>
</tr>
<tr>
<td>gist_stern</td>
<td>“Stern special” color table from Interactive Data Language software</td>
</tr>
</tbody>
</table>

A set of cyclic color maps:

<table>
<thead>
<tr>
<th>Colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>hsv</td>
<td>red-yellow-green-cyan-blue-magenta-red, formed by changing the hue component in the HSV color space</td>
</tr>
<tr>
<td>twilight</td>
<td>perceptually uniform shades of white-blue-black-red-white</td>
</tr>
<tr>
<td>twilight_shifted</td>
<td>perceptually uniform shades of black-blue-white-red-black</td>
</tr>
</tbody>
</table>

Other miscellaneous schemes:

2 Resembles "BkBlAqGrYeOrReViWh200" from NCAR Command Language. See [Color Table Gallery](#)
<table>
<thead>
<tr>
<th>colormap</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>afmhot</td>
<td>sequential black-orange-yellow-white blackbody spectrum, commonly used in atomic force microscopy</td>
</tr>
<tr>
<td>brg</td>
<td>blue-red-green</td>
</tr>
<tr>
<td>bwr</td>
<td>diverging blue-white-red</td>
</tr>
</tbody>
</table>
| cool-warm  | diverging blue-gray-red, meant to avoid issues with 3D shading, color blindness, and ordering of colors | 3
| CM-Rmap    | "Default colormaps on color images often reproduce to confusing grayscale images. The proposed colormap maintains an aesthetically pleasing color image that automatically reproduces to a monotonic grayscale with discrete, quantifiable saturation levels." | 4
| cube-helix | Unlike most other color schemes cubehelix was designed by D.A. Green to be monotonically increasing in terms of perceived brightness. Also, when printed on a black and white postscript printer, the scheme results in a greyscale with monotonically increasing brightness. This color scheme is named cubehelix because the (r, g, b) values produced can be visualised as a squashed helix around the diagonal in the (r, g, b) color cube. |
| gnu-plot   | gnuplot’s traditional pm3d scheme (black-blue-red-yellow)                   |
| gnu-plot2  | sequential color printable as gray (black-blue-violet-yellow-white)          |
| ocean      | green-blue-white                                                             |
| rainbow    | spectral purple-blue-green-yellow-orange-red colormap with diverging luminance |
| seismic    | diverging blue-white-red                                                     |
| nipy       | spectral purple-blue-green-yellow-red-white spectrum, originally from the Neuroimaging in Python project |
| terrain    | mapmaker’s colors, blue-green-yellow-brown-white, originally from IGOR Pro |
| turbo      | Spectral map (purple-blue-green-yellow-orange-red) with a bright center and darker endpoints. A smoother alternative to jet. |

The following colormaps are redundant and may be removed in future versions. It's recommended to use the names in the descriptions instead, which produce identical output:

### 18.39 matplotlib.projections

class matplotlib.projections.ProjectionRegistry
  Bases: object
  A mapping of registered projection names to projection classes.

  get_projection_class(self, name)
  Get a projection class from its name.

  get_projection_names(self)
  Return the names of all projections currently registered.

  register(self, *projections)
  Register a new set of projections.

matplotlib.projections.get_projection_class(projection=None)
  Get a projection class from its name.
  If projection is None, a standard rectilinear projection is returned.

matplotlib.projections.get_projection_names()
  Return the names of all projections currently registered.

matplotlib.projections.register_projection(cls)

### 18.40 matplotlib.projections.polar

class matplotlib.projections.polar.InvertedPolarTransform(axis=None,
    use_rmin=True,
    _ap-
ply_theta_transforms=True)
  Bases: matplotlib.transforms.Transform
  The inverse of the polar transform, mapping Cartesian coordinate space x and y back to theta and r.

  **Parameters**

  **shorthand_name**

  [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.
has_inverse = True
input_dims = 2

inverted(self)

Return the corresponding inverse transformation.

It holds x == self.inverted().transform(self.transform(x)).

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

output_dims = 2

transform_non_affine(self, xy)

Apply only the non-affine part of this transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array

The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

class matplotlib.projections.polar.PolarAffine(scale_transform, limits)

Bases: matplotlib.transforms.Affine2DBase

The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

limits is the view limit of the data. The only part of its bounds that is used is the y limits (for the radius limits). The theta range is handled by the non-affine transform.

get_matrix(self)

Get the matrix for the affine part of this transform.

class matplotlib.projections.polar.PolarAxes(*args, theta_offset=0,
theta_direction=1, rla-
bel_position=22.5, **kwargs)

Bases: matplotlib.axes._axes.Axes

A polar graph projection, where the input dimensions are theta, r.
Theta starts pointing east and goes anti-clockwise.

Build an axes in a figure.

**Parameters**

**fig**

[Figure] The axes is build in the Figure `fig`.

**rect**

[[left, bottom, width, height]] The axes is build in the rectangle `rect`. `rect` is in Figure coordinates.

**sharex, sharey**

[Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.

**frameon**

[bool, default: True] Whether the axes frame is visible.

**box_aspect**

[None, or a number, optional] Sets the aspect of the axes box. See `set_box_aspect` for details.

**kwargs**

Other optional keyword arguments:

<table>

</tbody>
</table>

**Returns**

**Axes**

The new `Axes` object.

```python
class InvertedPolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True):
    Bases: matplotlib.transforms.Transform
```

The inverse of the polar transform, mapping Cartesian coordinate space x
and y back to theta and r.

**Parameters**

**shorthand_name**

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

```
has_inverse = True
input_dims = 2

inverted(self)
    Return the corresponding inverse transformation.
    It holds x == self.inverted().transform(self.transform(x)).
    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.
```

```
output_dims = 2

transform_non_affine(self, xy)
    Apply only the non-affine part of this transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.
```

**Parameters**

**values**

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

**Returns**

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

```
class PolarAffine(scale_transform, limits)
    Bases: matplotlib.transforms.Affine2DBase

    The affine part of the polar projection. Scales the output so that maximum radius rests on the edge of the axes circle.

    `limits` is the view limit of the data. The only part of its bounds that is used is the y limits (for the radius limits). The theta range is handled by the non-affine transform.
```
get_matrix(self)

Get the matrix for the affine part of this transform.

class PolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)

Bases: matplotlib.transforms.Transform

The base polar transform. This handles projection $\theta$ and $r$ into Cartesian coordinate space $x$ and $y$, but does not perform the ultimate affine transformation into the correct position.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

has_inverse = True

input_dims = 2

inverted(self)

Return the corresponding inverse transformation.

It holds $x == self.inverted().transform(self.transform(x))$.

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

output_dims = 2

transform_non_affine(self, tr)

Apply only the non-affine part of this transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array

The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.
transform_path_non_affine(self, path)

Apply the non-affine part of this transform to Path path, returning a new Path.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values)).

class RadialLocator(base, axes=None)

Bases: matplotlib.ticker.Locator

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base Locator (which may be different depending on the scale of the r-axis).

autoscale(self)

[Deprecated]

Notes

Deprecated since version 3.2:

nonsingular(self, vmin, vmax)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with (v0, v1) set to the data limits on the axes if the axes contains any data, or (-inf, +inf) if not.

• If v0 == v1 (possibly up to some floating point slop), this method returns an expanded interval around this value.
• If (v0, v1) == (-inf, +inf), this method returns appropriate default view limits.
• Otherwise, (v0, v1) is returned without modification.

pan(self, numsteps)

[Deprecated]

Notes

Deprecated since version 3.3:

refresh(self)

[Deprecated]
Notes

Deprecated since version 3.3:

`view_limits(self, vmin, vmax)`
Select a scale for the range from vmin to vmax.
Subclasses should override this method to change locator behaviour.

`zoom(self, direction)`
[Deprecated]

Notes

Deprecated since version 3.3:

```python
class ThetaFormatter
    Bases: matplotlib.ticker.Formatter

    Used to format the theta tick labels. Converts the native unit of radians into
degrees and adds a degree symbol.
```

```python
class ThetaLocator(base)
    Bases: matplotlib.ticker.Locator

    Used to locate theta ticks.
    This will work the same as the base locator except in the case that the view
spans the entire circle. In such cases, the previously used default locations
of every 45 degrees are returned.

    autoscale(self)
        [Deprecated]
```

Notes

Deprecated since version 3.2:

```python
pan(self, numsteps)
    [Deprecated]
```

Notes

Deprecated since version 3.3:

```python
refresh(self)
    [Deprecated] Refresh internal information based on current limits.
```
Notes

Deprecated since version 3.3.

set_axis(self, axis)

view_limits(self, vmin, vmax)
    Select a scale for the range from vmin to vmax.
    Subclasses should override this method to change locator behaviour.

zoom(self, direction)
    [Deprecated]

Notes

Deprecated since version 3.3:

can_pan(self)
    Return True if this axes supports the pan/zoom button functionality.
    For polar axes, this is slightly misleading. Both panning and zooming are performed by the same button. Panning is performed in azimuth while zooming is done along the radial.

can_zoom(self)
    Return True if this axes supports the zoom box button functionality.
    Polar axes do not support zoom boxes.

cla(self)
    Clear the current axes.

drag_pan(self, button, key, x, y)
    Called when the mouse moves during a pan operation.

Parameters

button
    [MouseButton] The pressed mouse button.

key
    [str or None] The pressed key, if any.

x, y
    [float] The mouse coordinates in display coords.
Notes

This is intended to be overridden by new projection types.

def draw(self, renderer, *args, **kwargs)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

        renderer
            [RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

def end_pan(self)
    Called when a pan operation completes (when the mouse button is up.)

Notes

This is intended to be overridden by new projection types.

def format_coord(self, theta, r)
    Return a format string formatting the x, y coordinates.

def get_data_ratio(self)
    Return the aspect ratio of the data itself. For a polar plot, this should always be 1.0

def get_rlabel_position(self)
    Returns float
    The theta position of the radius labels in degrees.

def get_rmax(self)
    Returns float
    Outer radial limit.

def get_rmin(self)
Returns

float
The inner radial limit.

get_rorigin(self)

Returns

float

get_rsign(self)

get_theta_direction(self)
Get the direction in which theta increases.

-1:
Theta increases in the clockwise direction

1:
Theta increases in the counterclockwise direction

get_theta_offset(self)
Get the offset for the location of 0 in radians.

get_thetamax(self)
Return the maximum theta limit in degrees.

get_thetamin(self)
Get the minimum theta limit in degrees.

get_xaxis_text1_transform(self, pad)

Returns

transform
[Transform] The transform used for drawing x-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates.

valign
[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign
[{'center', 'left', 'right'}] The text horizontal alignment.
Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_xaxis_text2_transform(self, pad)

Returns

transform

[Transform] The transform used for drawing secondary x-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in data coordinates and the y-direction is in axis coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_xaxis_transform(self, which='grid')

Get the transformation used for drawing x-axis labels, ticks and gridlines. The x-direction is in data coordinates and the y-direction is in axis coordinates.

Note: This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_yaxis_text1_transform(self, pad)

Returns

transform

[Transform] The transform used for drawing y-axis labels, which will add pad_points of padding (in points) between the
axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the Axis class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_yaxis_text2_transform(self, pad)

Returns

transform

[Transform] The transform used for drawing secondart y-axis labels, which will add pad_points of padding (in points) between the axes and the label. The x-direction is in axis coordinates and the y-direction is in data coordinates

valign

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}] The text vertical alignment.

halign

[{'center', 'left', 'right'}] The text horizontal alignment.

Notes

This transformation is primarily used by the Axis class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

get_yaxis_transform(self, which='grid')

Get the transformation used for drawing y-axis labels, ticks and gridlines. The x-direction is in axis coordinates and the y-direction is in data coordinates.
**Note:** This transformation is primarily used by the `Axis` class, and is meant to be overridden by new kinds of projections that may need to place axis elements in different locations.

```python
ame = 'polar'

set_rgrids(self, radii, labels=None, angle=None, fmt=None, **kwargs)
```

Set the radial gridlines on a polar plot.

**Parameters**

- **radii**
  - [tuple with floats] The radii for the radial gridlines

- **labels**
  - [tuple with strings or None] The labels to use at each radial gridline. The `matplotlib.ticker.ScalarFormatter` will be used if None.

- **angle**
  - [float] The angular position of the radius labels in degrees.

- **fmt**
  - [str or None] Format string used in `matplotlib.ticker.FormatStrFormatter`. For example '%f'.

**Returns**

- **lines**
  - [list of `lines.Line2D`] The radial gridlines.

- **labels**
  - [list of `text.Text`] The tick labels.

**Other Parameters**

- **kwargs**
  - *kwargs are optional `Text` properties for the labels.

**See also:**

- `PolarAxes.set_thetagrids`
- `Axis.get_gridlines`
- `Axis.get_ticklabels`
set_rlabel_position(self, value)
    Update the theta position of the radius labels.

    Parameters

    value
        [number] The angular position of the radius labels in degrees.

set_rlim(self, bottom=None, top=None, emit=True, auto=False, **kwargs)
    See set_ylim.

set_rmax(self, rmax)
    Set the outer radial limit.

    Parameters

    rmax
        [float]

set_rmin(self, rmin)
    Set the inner radial limit.

    Parameters

    rmin
        [float]

set_rorigin(self, rorigin)
    Update the radial origin.

    Parameters

    rorigin
        [float]

set_rscale(self, *args, **kwargs)

set_rticks(self, *args, **kwargs)

set_theta_direction(self, direction)
    Set the direction in which theta increases.

    clockwise, -1:
        Theta increases in the clockwise direction

    counterclockwise, anticlockwise, 1:
        Theta increases in the counterclockwise direction

set_theta_offset(self, offset)
    Set the offset for the location of 0 in radians.
**set_theta_zero_location**(*self*, *loc*, *offset=0.0*)

Set the location of theta's zero.

This simply calls *set_theta_offset* with the correct value in radians.

**Parameters**

**loc**

[str] May be one of "N", "NW", "W", "SW", "S", "SE", "E", or "NE".

**offset**

[float, default: 0] An offset in degrees to apply from the specified loc. **Note:** this offset is always applied counter-clockwise regardless of the direction setting.

**set_thetagrids**(*self*, *angles*, *labels=None*, *fmt=None*, **kwargs*)

Set the theta gridlines in a polar plot.

**Parameters**

**angles**

[tuple with floats, degrees] The angles of the theta gridlines.

**labels**

[tuple with strings or None] The labels to use at each theta gridline. The *projections.polar.ThetaFormatter* will be used if None.

**fmt**

[str or None] Format string used in *matplotlib.ticker.FormatStrFormatter*. For example '%f'. Note that the angle that is used is in radians.

**Returns**

**lines**

[list of *lines.Line2D*] The theta gridlines.

**labels**

[list of *text.Text*] The tick labels.

**Other Parameters**

**kwargs**

*kwargs are optional *Text* properties for the labels.
See also:

- `PolarAxes.set_rgrids`
- `Axis.get_gridlines`
- `Axis.get_ticklabels`

`set_thetalim(self, *args, **kwargs)`
Set the minimum and maximum theta values.

Can take the following signatures:

- `set_thetalim(minval, maxval)`: Set the limits in radians.
- `set_thetalim(thetamin=minval, thetamax=maxval)`: Set the limits in degrees.

where minval and maxval are the minimum and maximum limits. Values are wrapped in the range $[0, 2\pi]$ (in radians), so for example it is possible to do `set_thetalim(-np.pi / 2, np.pi / 2)` to have an axes symmetric around 0. A ValueError is raised if the absolute angle difference is larger than $2\pi$.

`set_thetamax(self, thetamax)`
Set the maximum theta limit in degrees.

`set_thetamin(self, thetamin)`
Set the minimum theta limit in degrees.

`set_xscale(self, scale, *args, **kwargs)`
Set the x-axis scale.

**Parameters**

- `value`
  
  ["linear", "log", "symlog", "logit", ...] The axis scale type to apply.

- `**kwargs`
  
  Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

  - `matplotlib.scale.LinearScale`
  - `matplotlib.scale.LogScale`
  - `matplotlib.scale.SymmetricalLogScale`
  - `matplotlib.scale.LogitScale`
Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

```python
set_ylim(self, bottom=None, top=None, emit=True, auto=False, *
         ymin=None, ymax=None)
```
Set the data limits for the radial axis.

**Parameters**

**bottom**

[<class 'float'>, optional] The bottom limit (default: None, which leaves the bottom limit unchanged). The bottom and top ylims may be passed as the tuple `(bottom, top)` as the first positional argument (or as the `bottom` keyword argument).

**top**

[<class 'float'>, optional] The top limit (default: None, which leaves the top limit unchanged).

**emit**

[bool, default: True] Whether to notify observers of limit change.

**auto**

[bool or None, default: False] Whether to turn on autoscaling of the y-axis. True turns on, False turns off, None leaves unchanged.

**ymin, ymax**

[float, optional] These arguments are deprecated and will be removed in a future version. They are equivalent to `bottom` and `top` respectively, and it is an error to pass both `ymin` and `bottom` or `ymax` and `top`.

**Returns**

**bottom, top**

[<class 'float'>, <class 'float'>] The new y-axis limits in data coordinates.

```python
set_yscale(self, *args, **kwargs)
```
Set the y-axis scale.

**Parameters**
value

    [{"linear", "log", "symlog", "logit", ...}] The axis scale type to apply.

**kwargs

Different keyword arguments are accepted, depending on the scale. See the respective class keyword arguments:

- `matplotlib.scale.LinearScale`
- `matplotlib.scale.LogScale`
- `matplotlib.scale.SymmetricalLogScale`
- `matplotlib.scale.LogitScale`

Notes

By default, Matplotlib supports the above mentioned scales. Additionally, custom scales may be registered using `matplotlib.scale.register_scale`. These scales can then also be used here.

`start_pan(self, x, y, button)`

Called when a pan operation has started.

Parameters

- `x, y`
  - [float] The mouse coordinates in display coords.
- `button`
  - `[MouseButton]` The pressed mouse button.

Notes

This is intended to be overridden by new projection types.

class `matplotlib.projections.polar.PolarTransform(axis=None, use_rmin=True, _apply_theta_transforms=True)`

Bases: `matplotlib.transforms.Transform`

The base polar transform. This handles projection `theta` and `r` into Cartesian coordinate space `x` and `y`, but does not perform the ultimate affine transformation into the correct position.

Parameters
**shorthand_name**

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

```python
has_inverse = True
input_dims = 2

inverted(self)
    Return the corresponding inverse transformation.
    It holds `x == self.inverted().transform(self.transform(x))`.
    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

output_dims = 2

transform_non_affine(self, tr)
    Apply only the non-affine part of this transformation.
    `transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.
    In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values
    [array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

Returns

array
    The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

transform_path_non_affine(self, path)
    Apply the non-affine part of this transform to Path `path`, returning a new Path.
    `transform_path(path)` is equivalent to `transform_path_affine(transform_path_non_affine(values))`.
```

class matplotlib.projections.polar.RadialAxis(*args, **kwargs)
    Bases: matplotlib.axis.YAxis

A radial Axis.
This overrides certain properties of a YAxis to provide special-casing for a radial axis.
Parameters

**axes**

**pickradius**

[float] The acceptance radius for containment tests. See also Axis.contains.

axis_name = 'radius'

Read-only name identifying the axis.

cla(self)

Clear this axis.

class matplotlib.projections.polar.RadialLocator(base, axes=None)

Bases: matplotlib.ticker.Locator

Used to locate radius ticks.

Ensures that all ticks are strictly positive. For all other tasks, it delegates to the base Locator (which may be different depending on the scale of the r-axis.

autoscale(self)

[Deprecated]

Notes

Deprecated since version 3.2:

nonsingular(self, vmin, vmax)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with \((v0, v1)\) set to the data limits on the axes if the axes contains any data, or \((-\infty, +\infty)\) if not.

- If \(v0 == v1\) (possibly up to some floating point slop), this method returns an expanded interval around this value.

- If \((v0, v1) == (-\infty, +\infty)\), this method returns appropriate default view limits.

- Otherwise, \((v0, v1)\) is returned without modification.

pan(self, numsteps)

[Deprecated]
Notes

Deprecated since version 3.3:

```
refresh(self)
[Deprecated]
```

Notes

Deprecated since version 3.3:

```
view_limits(self, vmin, vmax)
Select a scale for the range from vmin to vmax.
Subclasses should override this method to change locator behaviour.
```

```
zoom(self, direction)
[Deprecated]
```

Notes

Deprecated since version 3.3:

```
class matplotlib.projections.polar.RadialTick(*args, **kwargs)
Bases: matplotlib.axis.YTick
A radial-axis tick.
This subclass of YTick provides radial ticks with some small modification to their re-positioning such that ticks are rotated based on axes limits. This results in ticks that are correctly perpendicular to the spine. Labels are also rotated to be perpendicular to the spine, when 'auto' rotation is enabled.
bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points
update_position(self, loc)
Set the location of tick in data coords with scalar loc.
```

```
class matplotlib.projections.polar.ThetaAxis(*args, **kwargs)
Bases: matplotlib.axis.XAxis
A theta Axis.
This overrides certain properties of an XAxis to provide special-casing for an angular axis.
```

Parameters

```
axes
```
**pickradius**

[float] The acceptance radius for containment tests. See also `Axis.contains`.

```python
taxis_name = 'theta'
    Read-only name identifying the axis.
```

```python
cla(self)
    Clear this axis.
```

class matplotlib.projections.polar.ThetaFormatter
    Bases: matplotlib.ticker.Formatter
    Used to format the theta tick labels. Converts the native unit of radians into degrees and adds a degree symbol.

class matplotlib.projections.polar.ThetaLocator(base)
    Bases: matplotlib.ticker.Locator
    Used to locate theta ticks.
    This will work the same as the base locator except in the case that the view spans the entire circle. In such cases, the previously used default locations of every 45 degrees are returned.

```python
autoscale(self)
    [Deprecated]
```

**Notes**

Deprecation since version 3.2:

```python
pan(self, numsteps)
    [Deprecated]
```

**Notes**

Deprecation since version 3.3:

```python
refresh(self)
    [Deprecated] Refresh internal information based on current limits.
```
Notes

Deprecated since version 3.3.

set_axis(self, axis)

view_limits(self, vmin, vmax)

Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.

zoom(self, direction)

[Deprecated]

Notes

Deprecated since version 3.3:

class matplotlib.projections.polar.ThetaTick(axes, *args, **kwargs)

Bases: matplotlib.axis.XTick

A theta-axis tick.

This subclass of XTick provides angular ticks with some small modification to their re-positioning such that ticks are rotated based on tick location. This results in ticks that are correctly perpendicular to the arc spine.

When 'auto' rotation is enabled, labels are also rotated to be parallel to the spine. The label padding is also applied here since it’s not possible to use a generic axes transform to produce tick-specific padding.

bbox is the Bound2D bounding box in display coords of the Axes loc is the tick location in data coords size is the tick size in points

update_position(self, loc)

Set the location of tick in data coords with scalar loc.

18.41 matplotlib.quiver

Support for plotting vector fields.

Presently this contains Quiver and Barb. Quiver plots an arrow in the direction of the vector, with the size of the arrow related to the magnitude of the vector.

Barbs are like quiver in that they point along a vector, but the magnitude of the vector is given schematically by the presence of barbs or flags on the barb.

This will also become a home for things such as standard deviation ellipses, which can and will be derived very easily from the Quiver code.
18.41.1 Classes

**Quiver** *(ax, *args[, scale, headwidth, ...])*  
Specialized PolyCollection for arrows.

**QuiverKey** *(Q, X, Y, U, label, *[angle, ...]*)*  
Labelled arrow for use as a quiver plot scale key.

**Barbs** *(ax, *args[, pivot, length, barb-color, ...]*)  
Specialized PolyCollection for barbs.

**matplotlib.quiver.Quiver**

class matplotlib.quiver.Quiver(ax, *args, scale=None, headwidth=3, headlength=5, headaxislength=4.5, minshaft=1, minlength=1, units='width', scale_units=None, angles='uv', width=None, color='k', pivot='tail', **kw)

Bases: matplotlib.collections.PolyCollection

Specialized PolyCollection for arrows.

The only API method is set_UVC(), which can be used to change the size, orientation, and color of the arrows; their locations are fixed when the class is instantiated. Possibly this method will be useful in animations.

Much of the work in this class is done in the draw() method so that as much information as possible is available about the plot. In subsequent draw() calls, recalculation is limited to things that might have changed, so there should be no performance penalty from putting the calculations in the draw() method.

Plot a 2D field of arrows.

Call signature:

```python
quiver([X, Y], U, V, [C], **kw)
```

X, Y define the arrow locations, U, V define the arrow directions, and C optionally sets the color.

**Arrow size**

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the *scale* and *scale_units* parameters.

**Arrow shape**

The defaults give a slightly swept-back arrow; to make the head a triangle, make *headaxislength* the same as *headlength*. To make the arrow more pointed, reduce *headwidth* or increase *headlength* and *headaxislength*. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

**Arrow outline**
linewidths and edgecolors can be used to customize the arrow outlines.

Parameters

X, Y
[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.
If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.
If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

U, V
[1D or 2D array-like] The x and y direction components of the arrow vectors.
They must have the same number of elements, matching the number of arrow locations. U and V may be masked. Only locations unmasked in U, V, and C will be drawn.

C
[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via norm and cmap.
This does not support explicit colors. If you want to set colors directly, use color instead. The size of C must match the number of arrow locations.

units
[{'width', 'height', 'dots', 'inches', 'x', 'y' 'xy'}, default: 'width']
The arrow dimensions (except for length) are measured in multiples of this unit.
The following values are supported:
• 'width', 'height': The width or height of the axis.
• 'dots', 'inches': Pixels or inches based on the figure dpi.
• 'x', 'y', 'xy': X, Y or √X² + Y² in data units.
The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width' or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

angles
[{‘uv’, ‘xy’} or array-like, default: ‘uv’] Method for determining the angle of the arrows.

- ‘uv’: The arrow axis aspect ratio is 1 so that if \(U == V\) the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).
  
  Use this if the arrows symbolize a quantity that is not based on \(X, Y\) data coordinates.

- ‘xy’: Arrows point from \((x, y)\) to \((x+u, y+v)\). Use this for plotting a gradient field, for example.

- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.
  
  In this case \(U, V\) is only used to determine the length of the arrows.

  Note: inverting a data axis will correspondingly invert the arrows only with \(\text{angles} = ‘xy’\).

**scale**

[float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is \(\text{None}\).

If \(\text{None}\), a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the \(\text{scale_units}\) parameter.

**scale_units**

[{‘width’, ‘height’, ‘dots’, ‘inches’, ‘x’, ‘y’, ‘xy’}, optional] If the \(\text{scale}\) kwarg is \(\text{None}\), the arrow length unit. Default is \(\text{None}\).

e.g. \(\text{scale_units}\) is ‘inches’, \(\text{scale}\) is 2.0, and \((u, v) = (1, 0)\), then the vector will be 0.5 inches long.

If \(\text{scale_units}\) is ‘width’ or ‘height’, then the vector will be half the width/height of the axes.

If \(\text{scale_units}\) is ‘x’ then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with \(u\) and \(v\) having the same units as \(x\) and \(y\), use \(\text{angles} = ‘xy’\), \(\text{scale_units} = ‘xy’\), \(\text{scale}=1\).

**width**

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth**

[float, default: 3] Head width as multiple of shaft width.
**headlength**

[float, default: 5] Head length as multiple of shaft width.

**headaxislength**

[float, default: 4.5] Head length at shaft intersection.

**minshaft**

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength**

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot**

[{‘tail’, ‘mid’, ‘middle’, ‘tip’}, default: ‘tail’] The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

‘mid’ is a synonym for ‘middle’.

**color**

[color or color sequence, optional] Explicit color(s) for the arrows. If C has been set, color has no effect.

This is a synonym for the PolyCollection facecolor parameter.

**Other Parameters**

**kwargs**

[PolyCollection properties, optional] All other keyword arguments are passed on to PolyCollection:

See also:

**Axes.quiverkey**

Add a key to a quiver plot.

```python
__init__(self, ax, *args, scale=None, headwidth=3, headlength=5, headaxislength=4.5, minshaft=1, minlength=1, units='width', scale_units=None, angles='uv', width=None, color='k', pivot='tail', **kw)
```

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of arrows.

Call signature:
**Matplotlib, Release 3.3.3**

```
quiver([X, Y], U, V, [C], **kw)
```

**X, Y** define the arrow locations, **U, V** define the arrow directions, and **C** optionally sets the color.

**Arrow size**

The default settings auto-scales the length of the arrows to a reasonable size. To change this behavior see the `scale` and `scale_units` parameters.

**Arrow shape**

The defaults give a slightly swept-back arrow; to make the head a triangle, make `headaxislength` the same as `headlength`. To make the arrow more pointed, reduce `headwidth` or increase `headlength` and `headaxislength`. To make the head smaller relative to the shaft, scale down all the head parameters. You will probably do best to leave minshaft alone.

**Arrow outline**

`linewidths` and `edgecolors` can be used to customize the arrow outlines.

**Parameters**

**X, Y**

[1D or 2D array-like, optional] The x and y coordinates of the arrow locations.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of **U** and **V**.

If **X** and **Y** are 1D but **U, V** are 2D, **X, Y** are expanded to 2D using `X, Y = np.meshgrid(X, Y)`. In this case `len(X)` and `len(Y)` must match the column and row dimensions of **U** and **V**.

**U, V**

[1D or 2D array-like] The x and y direction components of the arrow vectors.

They must have the same number of elements, matching the number of arrow locations. **U** and **V** may be masked. Only locations unmasked in **U, V**, and **C** will be drawn.

**C**

[1D or 2D array-like, optional] Numeric data that defines the arrow colors by colormapping via `norm` and `cmap`.

This does not support explicit colors. If you want to set colors directly, use `color` instead. The size of **C** must match the number of arrow locations.

**units**
The arrow dimensions (except for length) are measured in multiples of this unit.

The following values are supported:

- 'width', 'height': The width or height of the axis.
- 'dots', 'inches': Pixels or inches based on the figure dpi.
- 'x', 'y', 'xy': \( X, Y \) or \( \sqrt{X^2 + Y^2} \) in data units.

The arrows scale differently depending on the units. For 'x' or 'y', the arrows get larger as one zooms in; for other units, the arrow size is independent of the zoom state. For 'width or 'height', the arrow size increases with the width and height of the axes, respectively, when the window is resized; for 'dots' or 'inches', resizing does not change the arrows.

### angles

\n
- 'uv': The arrow axis aspect ratio is 1 so that if \( U == V \) the orientation of the arrow on the plot is 45 degrees counter-clockwise from the horizontal axis (positive to the right).

Use this if the arrows symbolize a quantity that is not based on \( X, Y \) data coordinates.

- 'xy': Arrows point from \( (x, y) \) to \( (x+u, y+v) \). Use this for plotting a gradient field, for example.

- Alternatively, arbitrary angles may be specified explicitly as an array of values in degrees, counter-clockwise from the horizontal axis.

In this case \( U, V \) is only used to determine the length of the arrows.

Note: inverting a data axis will correspondingly invert the arrows only with angles='xy'.

### scale

[Float, optional] Number of data units per arrow length unit, e.g., m/s per plot width; a smaller scale parameter makes the arrow longer. Default is None.

If None, a simple autoscaling algorithm is used, based on the average vector length and the number of vectors. The arrow length unit is given by the scale_units parameter.

### scale_units
If the `scale` kwarg is `None`, the arrow length unit. Default is `None`.

e.g. `scale_units` is 'inches', `scale` is 2.0, and $(u, v) = (1, 0)$, then the vector will be 0.5 inches long.

If `scale_units` is 'width' or 'height', then the vector will be half the width/height of the axes.

If `scale_units` is 'x' then the vector will be 0.5 x-axis units. To plot vectors in the x-y plane, with u and v having the same units as x and y, use `angles='xy', scale_units='xy', scale=1`.

**width**

[float, optional] Shaft width in arrow units; default depends on choice of units, above, and number of vectors; a typical starting value is about 0.005 times the width of the plot.

**headwidth**

[float, default: 3] Head width as multiple of shaft width.

**headlength**

[float, default: 5] Head length as multiple of shaft width.

**headaxislength**

[float, default: 4.5] Head length at shaft intersection.

**minshaft**

[float, default: 1] Length below which arrow scales, in units of head length. Do not set this to less than 1, or small arrows will look terrible!

**minlength**

[float, default: 1] Minimum length as a multiple of shaft width; if an arrow length is less than this, plot a dot (hexagon) of this diameter instead.

**pivot**

[{‘tail’, ‘mid’, ‘middle’, ‘tip’}, default: ‘tail’) The part of the arrow that is anchored to the X, Y grid. The arrow rotates about this point.

‘mid’ is a synonym for ‘middle’.

**color**

[color or color sequence, optional] Explicit color(s) for the arrows. If $C$ has been set, `color` has no effect.

This is a synonym for the `PolyCollection` `facecolor` parameter.
**Other Parameters**

**kwargs

[PolyCollection properties, optional] All other keyword arguments are passed on to PolyCollection:

Axes.quiverkey

Add a key to a quiver plot.

__module__ = 'matplotlib.quiver'

ax(self)

[Deprecated]

Notes

Deprecated since version 3.3:

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_datalim(self, transData)

quiver_doc = "\nPlot a 2D field of arrows.\nCall signature: quiver([X, Y], U, V, [C])\n"

remove(self)

Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the axes with autolim = True.

Note: there is no support for removing the artist's legend entry.

set_UVC(self, U, V, C=None)
Examples using `matplotlib.quiver.Quiver`

- `sphx_glr_gallery_images_contours_and_fields_quiver_demo.py`
- `sphx_glr_gallery_images_contours_and_fields_quiver_simple_demo.py`

`matplotlib.quiver.QuiverKey`

class `matplotlib.quiver.QuiverKey`

    `(Q, X, Y, U, label, *, angle=0, coordinates='axes', color=None, labelsep=0.1, labelpos='N', labelcolor=None, fontproperties=None, **kw)`

    Bases: `matplotlib.artist.Artist`

    Labelled arrow for use as a quiver plot scale key.

    Add a key to a quiver plot.

    The positioning of the key depends on `X`, `Y`, `coordinates`, and `labelpos`. If `labelpos` is 'N' or 'S', `X`, `Y` give the position of the middle of the key arrow. If `labelpos` is 'E', `X`, `Y` positions the head, and if `labelpos` is 'W', `X`, `Y` positions the tail; in either of these two cases, `X`, `Y` is somewhere in the middle of the arrow+label key object.

    **Parameters**

    - `Q`:
      - `[matplotlib.quiver.Quiver]` A `Quiver` object as returned by a call to `quiver()`.

    - `X, Y`:
      - `[float]` The location of the key.

    - `U`:
      - `[float]` The length of the key.

    - `label`:
      - `[str]` The key label (e.g., length and units of the key).

    - `angle`:
      - `[float, default: 0]` The angle of the key arrow, in degrees anti-clockwise from the x-axis.

    - `coordinates`:
      - `[{'axes', 'figure', 'data', 'inches'}, default: 'axes']` Coordinate system and units for `X, Y`: 'axes' and 'figure' are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; 'data' are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); 'inches' is position in the figure in inches, with (0, 0) at the lower left corner.
color
[color] Overrides face and edge colors from Q.

labelpos
[{‘N’, ‘S’, ‘E’, ‘W’}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep
[float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor
[color, default: rcParams["text.color"] (default: ‘black’)] Label color.

fontproperties
[dict, optional] A dictionary with keyword arguments accepted by the FontProperties initializer: family, style, variant, size, weight.

**kwargs
Any additional keyword arguments are used to override vector properties taken from Q.

```
__init__(self, Q, X, Y, U, label, *, angle=0, coordinates='axes', color=None, labelsep=0.1, labelpos='N', labelcolor=None, fontproperties=None, **kw)
```
Add a key to a quiver plot.

The positioning of the key depends on X, Y, coordinates, and labelpos. If labelpos is ‘N’ or ‘S’, X, Y give the position of the middle of the key arrow. If labelpos is ‘E’, X, Y positions the head, and if labelpos is ‘W’, X, Y positions the tail; in either of these two cases, X, Y is somewhere in the middle of the arrow+label key object.

**Parameters**

Q
[matplotlib.quiver.Quiver] A Quiver object as returned by a call to quiver().

X, Y
[float] The location of the key.

U
[float] The length of the key.
label

[|str] The key label (e.g., length and units of the key).

angle

[|float, default: 0] The angle of the key arrow, in degrees anticlockwise from the x-axis.

coordinates

[|{|’axes’, ’figure’, ’data’, ’inches’}, default: ’axes’}] Coordinate system and units for X, Y: ’axes’ and ’figure’ are normalized coordinate systems with (0, 0) in the lower left and (1, 1) in the upper right; ’data’ are the axes data coordinates (used for the locations of the vectors in the quiver plot itself); ’inches’ is position in the figure in inches, with (0, 0) at the lower left corner.

color

[|color] Overrides face and edge colors from Q.

labellpos

[|{|’N’, ’S’, ’E’, ’W’}] Position the label above, below, to the right, to the left of the arrow, respectively.

labelsep

[|float, default: 0.1] Distance in inches between the arrow and the label.

labelcolor

[|color, default: rcParams["text.color"] (default: ‘black’)] Label color.

fontproperties

[|dict, optional] A dictionary with keyword arguments accepted by the FontProperties initializer: family, style, variant, size, weight.

**kwargs

Any additional keyword arguments are used to override vector properties taken from Q.

__module__ = ’matplotlib.quiver’

contains(self, mouseevent)

Test whether the artist contains the mouse event.

Parameters

mouseevent
Returns

contains
[bool] Whether any values are within the radius.

details
[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.

draw(self, renderer)
Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer
[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

halign = {'E': 'left', 'N': 'center', 'S': 'center', 'W': 'right'}

pivot = {'E': 'tip', 'N': 'middle', 'S': 'middle', 'W': 'tail'}

property quiverkey_doc

remove(self)
Remove the artist from the figure if possible.

The effect will not be visible until the figure is redrawn, e.g., with FigureCanvasBase.draw_idle. Call relim to update the axes limits if desired.

Note: relim will not see collections even if the collection was added to the axes with autoscale = True.

Note: there is no support for removing the artist's legend entry.

set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig
[Figure]
valign = {'E': 'center', 'N': 'bottom', 'S': 'top', 'W': 'center'}

Examples using matplotlib.quiver.QuiverKey

- sphx_glr_gallery_images_contours_and_fields_quiver_demo.py

matplotlib.quiver.Barbs
class matplotlib.quiver.Barbs(ax, *args, pivot='tip', length=7, barb_color=None, flagcolor=None, sizes=None, fill_empty=False, barb_increments=None, rounding=True, flip_barb=False, **kw)

Bases: matplotlib.collections.PolyCollection

Specialized PolyCollection for barbs.

The only API method is set_UVC(), which can be used to change the size, orientation, and color of the arrows. Locations are changed using the set_offsets() collection method. Possibly this method will be useful in animations.

There is one internal function _find_tails() which finds exactly what should be put on the barb given the vector magnitude. From there _make_barbs() is used to find the vertices of the polygon to represent the barb based on this information.

Plot a 2D field of barbs.

Call signature:

```
barbs([X, Y], U, V, [C], **kw)
```

Where X, Y define the barb locations, U, V define the barb directions, and C optionally sets the color.

All arguments may be 1D or 2D. U, V, C may be masked arrays, but masked X, Y are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
:          /\   \  
:          / \  \ 
:          /  \  \ 
:          /   \  \ 
:          /     \ 
```

---

2664  Chapter 18.  Modules
The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.

See also https://en.wikipedia.org/wiki/Wind_barb.

Parameters

X, Y
[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See pivot for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of U and V.

If X and Y are 1D but U, V are 2D, X, Y are expanded to 2D using X, Y = np.meshgrid(X, Y). In this case len(X) and len(Y) must match the column and row dimensions of U and V.

U, V
[1D or 2D array-like] The x and y components of the barb shaft.

C
[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via norm and cmap.

This does not support explicit colors. If you want to set colors directly, use barbcolor instead.

length
[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

pivot
[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the X, Y grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

barbcolor
[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the edgecolor parameter for polygons, which can be used instead. However this parameter will override facecolor.
**flagcolor**

[COLOR or COLOR SEQUENCE] The color of any flags on the barb. This parameter is analogous to the `facecolor` parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and `C` has not either) then `flagcolor` will be set to match `barbcolor` so that the barb has a uniform color. If `C` has been set, `flagcolor` has no effect.

**sizes**

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

**fill_empty**

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

**rounding**

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

**barb_increments**

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

**flip_barb**

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).
A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as U and V.

**Returns**

**barbs**

[Barbs]

**Other Parameters**

****kwargs

The barbs can further be customized using `PolyCollection` keyword arguments:

<table>

__init__(self, ax, *args, pivot='tip', length=7, barbcolor=None, flagcolor=None, sizes=None, fill_empty=False, barb_increments=None, rounding=True, flip_barb=False, **kw)

The constructor takes one required argument, an Axes instance, followed by the args and kwargs described by the following pyplot interface documentation:

Plot a 2D field of barbs.

Call signature:

barbs([X, Y], U, V, [C], **kw)

Where X, Y define the barb locations, U, V define the barb directions, and C optionally sets the color.

All arguments may be 1D or 2D. U, V, C may be masked arrays, but masked X, Y are not supported at present.

Barbs are traditionally used in meteorology as a way to plot the speed and direction of wind observations, but can technically be used to plot any two dimensional vector quantity. As opposed to arrows, which give vector magnitude by the length of the arrow, the barbs give more quantitative information about the vector magnitude by putting slanted lines or a triangle for various increments in magnitude, as show schematically below:

```
\/: /  \\
:: /   \\
:: /   \\
:: /   \\
:: /   \\
:: /   \\
```

The largest increment is given by a triangle (or "flag"). After those come full lines (barbs). The smallest increment is a half line. There is only, of course, ever at most 1 half line. If the magnitude is small and only needs a single half-line and no full lines or triangles, the half-line is offset from the end of the barb so that it can be easily distinguished from barbs with a single full line. The magnitude for the barb shown above would nominally be 65, using the standard increments of 50, 10, and 5.
See also https://en.wikipedia.org/wiki/Wind_barb.

**Parameters**

**X, Y**

[1D or 2D array-like, optional] The x and y coordinates of the barb locations. See *pivot* for how the barbs are drawn to the x, y positions.

If not given, they will be generated as a uniform integer meshgrid based on the dimensions of *U* and *V*.

If *X* and *Y* are 1D but *U*, *V* are 2D, *X*, *Y* are expanded to 2D using *X*, *Y* = np.meshgrid(*X*, *Y*). In this case len(*X*) and len(*Y*) must match the column and row dimensions of *U* and *V*.

**U, V**

[1D or 2D array-like] The x and y components of the barb shaft.

**C**

[1D or 2D array-like, optional] Numeric data that defines the barb colors by colormapping via *norm* and *cmap*.

This does not support explicit colors. If you want to set colors directly, use *barbcolor* instead.

**length**

[float, default: 7] Length of the barb in points; the other parts of the barb are scaled against this.

**pivot**

[{'tip', 'middle'} or float, default: 'tip'] The part of the arrow that is anchored to the *X*, *Y* grid. The barb rotates about this point. This can also be a number, which shifts the start of the barb that many points away from grid point.

**barbcolor**

[color or color sequence] The color of all parts of the barb except for the flags. This parameter is analogous to the *edgecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor.

**flagcolor**

[color or color sequence] The color of any flags on the barb. This parameter is analogous to the *facecolor* parameter for polygons, which can be used instead. However, this parameter will override facecolor. If this is not set (and *C* has not either) then *flagcolor* will be set to match *barbcolor* so that the barb has a uniform color. If *C* has been set, *flagcolor* has no effect.
sizes

[dict, optional] A dictionary of coefficients specifying the ratio of a given feature to the length of the barb. Only those values one wishes to override need to be included. These features include:

- 'spacing' - space between features (flags, full/half barbs)
- 'height' - height (distance from shaft to top) of a flag or full barb
- 'width' - width of a flag, twice the width of a full barb
- 'emptybarb' - radius of the circle used for low magnitudes

fill_empty

[bool, default: False] Whether the empty barbs (circles) that are drawn should be filled with the flag color. If they are not filled, the center is transparent.

rounding

[bool, default: True] Whether the vector magnitude should be rounded when allocating barb components. If True, the magnitude is rounded to the nearest multiple of the half-barb increment. If False, the magnitude is simply truncated to the next lowest multiple.

barb_increments

[dict, optional] A dictionary of increments specifying values to associate with different parts of the barb. Only those values one wishes to override need to be included.

- 'half' - half barbs (Default is 5)
- 'full' - full barbs (Default is 10)
- 'flag' - flags (default is 50)

flip_barb

[bool or array-like of bool, default: False] Whether the lines and flags should point opposite to normal. Normal behavior is for the barbs and lines to point right (comes from wind barbs having these features point towards low pressure in the Northern Hemisphere).

A single value is applied to all barbs. Individual barbs can be flipped by passing a bool array of the same size as U and V.

Returns

barbs
Other Parameters

**kwargs

The barbs can further be customized using `PolyCollection` keyword arguments:

```
__module__ = 'matplotlib.quiver'

barbs_doc = '\nPlot a 2D field of barbs.\n\nCall signature:\n\nbarbs([X, Y], U, V, [C], **kw)

Where *X*, *Y* ... |
```

```
set_UVC(self, U, V, C=\n
set_offsets(self, xy)

    Set the offsets for the barb polygons. This saves the offsets passed in and
    masks them as appropriate for the existing U/V data.

    **Parameters**

    xy
        [sequence of pairs of floats]
```

**Examples using matplotlib.quiver.Barbs**

### 18.42 matplotlib.rcsetup

The rcsetup module contains the validation code for customization using Matplotlib's rc settings.

Each rc setting is assigned a function used to validate any attempted changes to that setting. The validation functions are defined in the rcsetup module, and are used to construct the rcParams global object which stores the settings and is referenced throughout Matplotlib.

The default values of the rc settings are set in the default matplotlibrc file. Any additions or deletions to the parameter set listed here should also be propagated to the matplotlibrc.template in Matplotlib's root source directory.

```
class matplotlib.rcsetup.ValidateInStrings(key, valid, ignorecase=False, *,
    _deprecated_since=None)

    Bases: object

    valid is a list of legal strings.
```

```
matplotlib.rcsetup.cycler(*args, **kwargs)

    Create a Cycler object much like cycler.cycler(), but includes input validation.
    
    Call signatures:
        cycler(cycler)
        cycler(label=values[, label2=values2[, ...]])
        cycler(label, values)
```

2672 Chapter 18. Modules
Form 1 copies a given `Cycler` object.
Form 2 creates a `Cycler` which cycles over one or more properties simultaneously. If multiple properties are given, their value lists must have the same length.
Form 3 creates a `Cycler` for a single property. This form exists for compatibility with the original cycler. Its use is discouraged in favor of the kwarg form, i.e. `cycler(label=values)`.

**Parameters**

- **cycler**
  - [Cycler] Copy constructor for Cycler.
- **label**
  - [str] The property key. Must be a valid `Artist` property. For example, 'color' or 'linestyle'. Aliases are allowed, such as 'c' for 'color' and 'lw' for 'linewidth'.
- **values**
  - [iterable] Finite-length iterable of the property values. These values are validated and will raise a ValueError if invalid.

**Returns**

`Cycler`

A new `Cycler` for the given properties.

**Examples**

Creating a cycler for a single property:

```python
>>> c = cycler(color=['red', 'green', 'blue'])
```

Creating a cycler for simultaneously cycling over multiple properties (e.g. red circle, green plus, blue cross):

```python
>>> c = cycler(color=['red', 'green', 'blue'],
              marker=['o', '+', 'x'])
```

This function is deprecated as of version 18.4.2.
Notes

Deprecated since version 3.2:

matplotlib.rcsetup.validate_animation_writer_path(p)

[Deprecated]

Notes

Deprecated since version 3.2:

matplotlib.rcsetup.validate_any(s)

matplotlib.rcsetup.validate_aspect(s)
matplotlib.rcsetup.validate_axisbelow(s)
matplotlib.rcsetup.validate_backend(s)
matplotlib.rcsetup.validate_bbox(s)
matplotlib.rcsetup.validate_bool(b)
    Convert b to bool or raise.
matplotlib.rcsetup.validate_bool_maybe_none(b)
    [Deprecated] Convert b to bool or raise, passing through None.

Notes

Deprecated since version 3.3.

matplotlib.rcsetup.validate_capstyle(s)
matplotlib.rcsetup.validate_capstylelist(s)
matplotlib.rcsetup.validate_color(s)
    Return a valid color arg.
matplotlib.rcsetup.validate_color_for_prop_cycle(s)
matplotlib.rcsetup.validate_color_or_auto(s)
matplotlib.rcsetup.validate_color_or_inherit(s)
    Return a valid color arg.
matplotlib.rcsetup.validate_colorlist(s)
    return a list of colorspecs
matplotlib.rcsetup.validate_cycler(s)
    Return a Cycler object from a string repr or the object itself.
matplotlib.rcsetup.validate_dashlist(s)
    return a list of floats
matplotlib.rcsetup.validate_dpi(s)
    Confirm s is string 'figure' or convert s to float or raise.

matplotlib.rcsetup.validate_fillstylelist(s)

matplotlib.rcsetup.validate_float(s)

matplotlib.rcsetup.validate_float_or_None(s)

matplotlib.rcsetup.validate_floatlist(s)
    return a list of floats

matplotlib.rcsetup.validate_font_properties(s)

matplotlib.rcsetup.validate_fontsize(s)

matplotlib.rcsetup.validate_fontsize_None(s)

matplotlib.rcsetup.validate_fontszelist(s)

matplotlib.rcsetup.validate_fonttype(s)
    Confirm that this is a Postscript or PDF font type that we know how to convert
to.

matplotlib.rcsetup.validate_fontweight(s)

matplotlib.rcsetup.validate_hatch(s)
    Validate a hatch pattern. A hatch pattern string can have any sequence of the
    following characters: \ / | - + * . x o O.

matplotlib.rcsetup.validate_hatchlist(s)
    Validate a hatch pattern. A hatch pattern string can have any sequence of the
    following characters: \ / | - + * . x o O.

matplotlib.rcsetup.validate_hinting(s)
    [Deprecated]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_hist_bins(s)

matplotlib.rcsetup.validate_int(s)

matplotlib.rcsetup.validate_int_or_None(s)

matplotlib.rcsetup.validate_joinstyle(s)

matplotlib.rcsetup.validate_joinstylelist(s)

matplotlib.rcsetup.validate_markevery(s)
    Validate the markevery property of a Line2D object.

Parameters
s
[None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats, list of ints

Returns

None, int, float, slice, length-2 tuple of ints,
length-2 tuple of floats, list of ints

matplotlib.rcsetup.validate_markeverylist(s)
Validate the markevery property of a Line2D object.

Parameters

s
[None, int, float, slice, length-2 tuple of ints,] length-2 tuple of floats, list of ints

Returns

None, int, float, slice, length-2 tuple of ints,
length-2 tuple of floats, list of ints

matplotlib.rcsetup.validate_movie_writer(s)
[Deprecated]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_nseq_float(n)
[Deprecated]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_nseq_int(n)
[Deprecated]
Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_path_exists(s)

[Deprecated] If s is a path, return s, else False

Notes

Deprecated since version 3.2.

[Deprecated]

Notes

Deprecated since version 3.3:

matplotlib.rcsetup.validate_whiskers(s)

18.43 matplotlib.sankey

Module for creating Sankey diagrams using Matplotlib.

class matplotlib.sankey.Sankey(ax=None, scale=1.0, unit='', format='%G',
    gap=0.25, radius=0.1, shoulder=0.03, offset=0.15, head_angle=100, margin=0.4,
    tolerance=1e-06, **kwargs)

Bases: object

Sankey diagram.

Sankey diagrams are a specific type of flow diagram, in which the width of the arrows is shown proportionally to the flow quantity. They are typically used to visualize energy or material or cost transfers between processes. Wikipedia (6/1/2011)
Create a new Sankey instance.

The optional arguments listed below are applied to all subdiagrams so that there is consistent alignment and formatting.

In order to draw a complex Sankey diagram, create an instance of `Sankey` by calling it without any kwargs:

```python
sankey = Sankey()
```

Then add simple Sankey sub-diagrams:

```python
sankey.add()  # 1
sankey.add()  # 2
#...
sankey.add()  # n
```

Finally, create the full diagram:

```python
sankey.finish()
```

Or, instead, simply daisy-chain those calls:

```python
Sankey().add().add... .add().finish()
```

### Other Parameters

- **ax**
  - [Axes] Axes onto which the data should be plotted. If `ax` isn't provided, new Axes will be created.

- **scale**
  - [float] Scaling factor for the flows. `scale` sizes the width of the paths in order to maintain proper layout. The same scale is applied to all subdiagrams. The value should be chosen such that the product of the scale and the sum of the inputs is approximately 1.0 (and the product of the scale and the sum of the outputs is approximately -1.0).

- **unit**
  - [str] The physical unit associated with the flow quantities. If `unit` is None, then none of the quantities are labeled.

- **format**
  - [str] A Python number formatting string to be used in labeling the flow as a quantity (i.e., a number times a unit, where the unit is given).

- **gap**
Space between paths that break in/break away to/from the top or bottom.

**radius**

Inner radius of the vertical paths.

**shoulder**

Size of the shoulders of output arrows.

**offset**

Text offset (from the dip or tip of the arrow).

**head_angle**

Angle, in degrees, of the arrow heads (and negative of the angle of the tails).

**margin**

Minimum space between Sankey outlines and the edge of the plot area.

**tolerance**

Acceptable maximum of the magnitude of the sum of flows. The magnitude of the sum of connected flows cannot be greater than *tolerance*.

**kwargs**

Any additional keyword arguments will be passed to *add()* , which will create the first subdiagram.

**See also:**

Sankey.add

Sankey.finish

**Examples**

```python
add(self, patchlabel='', flows=None, orientations=None, labels='', trunk_length=1.0, pathlengths=0.25, prior=None, connect=0, 0, rotation=0, **kwargs)
```

Add a simple Sankey diagram with flows at the same hierarchical level.

**Parameters**

**patchlabel**
The default settings produce a diagram like this.

![Diagram](image)

[str] Label to be placed at the center of the diagram. Note that label (not patchlabel) can be passed as keyword argument to create an entry in the legend.

**flows**

[list of float] Array of flow values. By convention, inputs are positive and outputs are negative.

Flows are placed along the top of the diagram from the inside out in order of their index within flows. They are placed along the sides of the diagram from the top down and along the bottom from the outside in.

If the sum of the inputs and outputs is nonzero, the discrepancy will appear as a cubic Bezier curve along the top and bottom edges of the trunk.

**orientations**

[list of {-1, 0, 1}] List of orientations of the flows (or a single orientation to be used for all flows). Valid values are 0 (inputs from the left, outputs to the right), 1 (from and to the top) or -1 (from and to the bottom).

**labels**
Flow Diagram of a Widget

Widget

A

0% 10% 20% 5% 15% 10% 40%

First
Second
Third
Fourth
Fifth

Hurray!

[18.43. matplotlib.sankey 2681]

[function] List of labels for the flows (or a single label to be used for all flows). Each label may be None (no label), or a labeling string. If an entry is a (possibly empty) string, then the quantity for the corresponding flow will be shown below the string. However, if the unit of the main diagram is None, then quantities are never shown, regardless of the value of this argument.

**trunklength**

[float] Length between the bases of the input and output groups (in data-space units).

**pathlengths**

[List of float] List of lengths of the vertical arrows before break-in or after break-away. If a single value is given, then it will be applied to the first (inside) paths on the top and bottom, and the length of all other arrows will be justified accordingly. The pathlengths are not applied to the horizontal inputs and outputs.

**prior**

[int] Index of the prior diagram to which this diagram should
be connected.

**connect**

[(int, int)] A (prior, this) tuple indexing the flow of the prior diagram and the flow of this diagram which should be connected. If this is the first diagram or prior is None, connect will be ignored.

**rotation**

[float] Angle of rotation of the diagram in degrees. The interpretation of the orientations argument will be rotated accordingly (e.g., if rotation == 90, an orientations entry of 1 means to/from the left). rotation is ignored if this diagram is connected to an existing one (using prior and connect).

**Returns**

**Sankey**

The current Sankey instance.

**Other Parameters**
**kwargs

Additional keyword arguments set `matplotlib.patches.PathPatch` properties, listed below. For example, one may want to use `fill=False` or `label="A legend entry"`.

<table>
<thead>
<tr>

*Sankey.add*

### 18.44 matplotlib.scale

Scales define the distribution of data values on an axis, e.g. a log scaling. They are attached to an `Axis` and hold a `Transform`, which is responsible for the actual data transformation.

See also `axes.Axes.set_xscale` and the scales examples in the documentation.

```python
class matplotlib.scale.FuncScale(axis, functions)
    Bases: matplotlib.scale.ScaleBase

    Provide an arbitrary scale with user-supplied function for the axis.
```

**Parameters**

- `axis`
  
  `[Axis]` The axis for the scale.

- `functions`
  
  `[(callable, callable)]` two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

  Both functions must have the signature:
```python
def forward(values: array-like) -> array-like
```

```python
def forward(values: array-like) -> array-like
```

def get_transform(self)
    Return the FuncTransform associated with this scale.

def set_default_locators_and_formatters(self, axis)
    Set the locators and formatters of axis to instances suitable for this scale.

```
class matplotlib.scale.FuncScaleLog(axis, functions, base=10)
    Bases: matplotlib.scale.LogScale

    Provide an arbitrary scale with user-supplied function for the axis and then put on a logarithmic axes.

    Parameters

    axis

    functions
        [(callable, callable)] two-tuple of the forward and inverse functions for the scale. The forward function must be monotonic.

        Both functions must have the signature:

        ```python
def forward(values: array-like) -> array-like
```

    base
        [float, default: 10] Logarithmic base of the scale.

```
class matplotlib.scale.FuncTransform(forward, inverse)
    Bases: matplotlib.transforms.Transform

    A simple transform that takes and arbitrary function for the forward and inverse transform.

    Parameters

    forward
        [callable] The forward function for the transform. This function must have an inverse and, for best behavior, be monotonic. It must have the signature:
def forward(values: array-like) -> array-like

inverse
[callable] The inverse of the forward function. Signature as forward.

has_inverse = True
input_dims = 1
inverted(self)
    Return the corresponding inverse transformation.
    It holds x == self.inverted().transform(self.transform(x)).
    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

is_separable = True
output_dims = 1
transform_non_affine(self, values)
    Apply only the non-affine part of this transformation.
    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
    In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Parameters
values
    [array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns
array
    The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

class matplotlib.scale.InvertedLogTransform(base)
    Bases: matplotlib.transforms.Transform

Parameters
shorthand_name
    [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.
has_inverse = True
input_dims = 1

inverted(self)
    Return the corresponding inverse transformation.
    It holds $x == self.inverted().transform(self.transform(x))$.
    The return value of this method should be treated as temporary. An update
to self does not cause a corresponding update to its inverted copy.

is_separable = True
output_dims = 1

transform_non_affine(self, a)
    Apply only the non-affine part of this transformation.
    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

    In non-affine transformations, this is generally equivalent to
    transform(values). In affine transformations, this is always a no-op.

Parameters

values
    [array] The input values as NumPy array of length input_dims
    or shape (N x input_dims).

Returns

array
    The output values as NumPy array of length output_dims
    or shape (N x output_dims), depending on the input.

class matplotlib.scale.InvertedSymmetricalLogTransform(base, linthresh, linscale)
Bases: matplotlib.transforms.Transform

Parameters

shorthand_name
    [str] A string representing the "name" of the transform. The
    name carries no significance other than to improve the readabil-
    ity of str(transform) when DEBUG=True.

has_inverse = True
input_dims = 1
inverted(self)
    Return the corresponding inverse transformation.

    It holds x == self.inverted().transform(self.transform(x)).

    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

    is_separable = True
    output_dims = 1

transform_non_affine(self, a)
    Apply only the non-affine part of this transformation.

    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

    In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

    Parameters

    values
        [array] The input values as NumPy array of length input_dims or shape (N x input_dims).

    Returns

    array
        The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

class matplotlib.scale.LinearScale(axis, **kwargs)
    Bases: matplotlib.scale.ScaleBase

    The default linear scale.

    get_transform(self)
        Return the transform for linear scaling, which is just the IdentityTransform.

    name = 'linear'

    set_default_locators_and_formatters(self, axis)
        Set the locators and formatters of axis to instances suitable for this scale.

class matplotlib.scale.LogScale(axis, **kwargs)
    Bases: matplotlib.scale.ScaleBase

    A standard logarithmic scale. Care is taken to only plot positive values.

    Parameters

    axis
        [Axis] The axis for the scale.
base

[float, default: 10] The base of the logarithm.

nonpositive

[{'clip', 'mask'}, default: 'clip'] Determines the behavior for non-positive values. They can either be masked as invalid, or clipped to a very small positive number.

subs

[sequence of int, default: None] Where to place the subticks between each major tick. For example, in a log10 scale, [2, 3, 4, 5, 6, 7, 8, 9] will place 8 logarithmically spaced minor ticks between each major tick.

property InvertedLogTransform

property LogTransform

property base

get_transform(self)

Return the LogTransform associated with this scale.

limit_range_for_scale(self, vmin, vmax, minpos)

Limit the domain to positive values.

name = 'log'

set_default_locators_and_formatters(self, axis)

Set the locators and formatters of axis to instances suitable for this scale.

class matplotlib.scale.LogTransform(**kwargs)

Bases: matplotlib.transforms.Transform

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

has_inverse = True

input_dims = 1

inverted(self)

Return the corresponding inverse transformation.

It holds x == self.inverted().transform(self.transform(x)).

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.
is_separable = True
output_dims = 1

transform_non_affine(self, a)
    Apply only the non-affine part of this transformation.
    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).
    In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Parameters

values
    [array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array
    The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

class matplotlib.scale.LogisticTransform(**kwargs)
    Bases: matplotlib.transforms.Transform

Parameters

shorthand_name
    [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

has_inverse = True
input_dims = 1

inverted(self)
    Return the corresponding inverse transformation.
    It holds x == self.inverted().transform(self.transform(x)).
    The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

is_separable = True
output_dims = 1

transform_non_affine(self, a)
    logistic transform (base 10)
class matplotlib.scale.LogitScale(**kwargs)
    Bases: matplotlib.scale.ScaleBase

    Logit scale for data between zero and one, both excluded.
    This scale is similar to a log scale close to zero and to one, and almost linear
    around 0.5. It maps the interval ]0, 1[ onto ]-infty, +infty[.

    Parameters

    axis

    nonpositive
        [{'mask', 'clip'}] Determines the behavior for values beyond the
        open interval ]0, 1[. They can either be masked as invalid, or
        clipped to a number very close to 0 or 1.

    use_overline
        [bool, default: False] Indicate the usage of survival notation
        (overline{x}) in place of standard notation (1-x) for probability
        close to one.

    one_half
        [str, default: r"frac{1}{2}"] The string used for ticks formatter
        to represent 1/2.

    get_transform(self)
        Return the LogitTransform associated with this scale.

    limit_range_for_scale(self, vmin, vmax, minpos)
        Limit the domain to values between 0 and 1 (excluded).

    name = 'logit'

    set_default_locators_and_formatters(self, axis)
        Set the locators and formatters of axis to instances suitable for this scale.

class matplotlib.scale.LogitTransform(**kwargs)
    Bases: matplotlib.transforms.Transform

    Parameters

    shorthand_name
        [str] A string representing the "name" of the transform. The
        name carries no significance other than to improve the readabil-
        ity of str(transform) when DEBUG=True.

    has_inverse = True

    input_dims = 1
inverted(self)
    Return the corresponding inverse transformation.

    It holds \( x == \text{self.inverted().transform(self.transform(x))} \).

    The return value of this method should be treated as temporary. An update to \textit{self} does not cause a corresponding update to its inverted copy.

    \texttt{is\_separable} = True

    \texttt{output\_dims} = 1

    transform\_non\_affine(self, a)
        logit transform (base 10), masked or clipped

class matplotlib.scale.ScaleBase(axis, **kwargs)
    Bases: object

    The base class for all scales.

    Scales are separable transformations, working on a single dimension.

    Any subclasses will want to override:

    • \texttt{name}

    • \texttt{get\_transform()}

    • \texttt{set\_default\_locators\_and\_formatters()}

    And optionally:

    • \texttt{limit\_range\_for\_scale()}

    Construct a new scale.

    \textbf{Notes}

    The following note is for scale implementors.

    For back-compatibility reasons, scales take an \textit{Axis} object as first argument. However, this argument should not be used: a single scale object should be usable by multiple \textit{Axes} at the same time.

    \texttt{get\_transform(self)}
        Return the \texttt{Transform} object associated with this scale.

    \texttt{limit\_range\_for\_scale(self, vmin, vmax, minpos)}
        Return the range \( vmin, vmax \), restricted to the domain supported by this scale (if any).

        \texttt{minpos} should be the minimum positive value in the data. This is used by log scales to determine a minimum value.

    \texttt{set\_default\_locators\_and\_formatters(self, axis)}
        Set the locators and formatters of \textit{axis} to instances suitable for this scale.
class matplotlib.scale.SymmetricalLogScale(axis, **kwargs)
    Bases: matplotlib.scale.ScaleBase

The symmetrical logarithmic scale is logarithmic in both the positive and negative directions from the origin.

Since the values close to zero tend toward infinity, there is a need to have a range around zero that is linear. The parameter `linthresh` allows the user to specify the size of this range (`-linthresh, linthresh`).

**Parameters**

- **base**
  
  [float, default: 10] The base of the logarithm.

- **linthresh**
  
  [float, default: 2] Defines the range (`-x, x`), within which the plot is linear. This avoids having the plot go to infinity around zero.

- **subs**
  
  [sequence of int] Where to place the subticks between each major tick. For example, in a log10 scale: `[2, 3, 4, 5, 6, 7, 8, 9]` will place 8 logarithmically spaced minor ticks between each major tick.

- **linscale**
  
  [float, optional] This allows the linear range (`-linthresh, linthresh`) to be stretched relative to the logarithmic range. Its value is the number of decades to use for each half of the linear range. For example, when `linscale == 1.0` (the default), the space used for the positive and negative halves of the linear range will be equal to one decade in the logarithmic range.

Construct a new scale.

**Notes**

The following note is for scale implementors.

For back-compatibility reasons, scales take an `Axis` object as first argument. However, this argument should not be used: a single scale object should be usable by multiple `Axes`es at the same time.

- property `InvertedSymmetricalLogTransform`
- property `SymmetricalLogTransform`
- property `base`
get_transform(self)
    Return the `SymmetricalLogTransform` associated with this scale.

property linscale

property linthresh

name = 'symlog'

set_default_locators_and_formatters(self, axis)
    Set the locators and formatters of `axis` to instances suitable for this scale.

class matplotlib.scale.SymmetricalLogTransform(base, linthresh, linscale)
    Bases: `matplotlib.transforms.Transform`

    Parameters

    shorthand_name
        [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of `str(transform)` when DEBUG=True.

    has_inverse = True

    input_dims = 1

    inverted(self)
        Return the corresponding inverse transformation.
        It holds x == self.inverted().transform(self.transform(x)).
        The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

    is_separable = True

    output_dims = 1

    transform_non_affine(self, a)
        Apply only the non-affine part of this transformation.
        `transform(values)` is always equivalent to `transform_affine(transform_non_affine(values))`.
        In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

        Parameters

        values
            [array] The input values as NumPy array of length `input_dims` array or shape (N x `input_dims`).

        Returns
array

The output values as NumPy array of length \texttt{input\_dims} or shape (N x \texttt{output\_dims}), depending on the input.

\begin{verbatim}
matplotlib.scale.get_scale_names()
    Return the names of the available scales.

matplotlib.scale.register_scale(scale_class)
    Register a new kind of scale.

\textbf{Parameters}

\textbf{scale_class}

[subclass of \texttt{ScaleBase}] The scale to register.

matplotlib.scale.scale_factory(scale, axis, **kwargs)
    Return a scale class by name.

\textbf{Parameters}

\textbf{scale}

\textbf{axis}

[\texttt{matplotlib.axis.Axis}]
\end{verbatim}

\section{18.45 \texttt{matplotlib.sphinxext.plot\_directive}}

\subsection{18.45.1 A directive for including a Matplotlib plot in a Sphinx document}

By default, in HTML output, \texttt{plot} will include a .png file with a link to a high-res .png and .pdf. In LaTeX output, it will include a .pdf.

The source code for the plot may be included in one of three ways:

1. \textbf{A path to a source file} as the argument to the directive:

\begin{verbatim}
.. plot:: path/to/plot.py
\end{verbatim}

When a path to a source file is given, the content of the directive may optionally contain a caption for the plot:

\begin{verbatim}
.. plot:: path/to/plot.py
    The plot's caption.
\end{verbatim}

Additionally, one may specify the name of a function to call (with no arguments) immediately after importing the module:
2. Included as **inline content** to the directive:

```python
.. plot::

    import matplotlib.pyplot as plt
    import matplotlib.image as mpimg
    import numpy as np
    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
```

3. Using **doctest** syntax:

```python
.. plot::

    A plotting example:
    >>> import matplotlib.pyplot as plt
    >>> plt.plot([1, 2, 3], [4, 5, 6])
```

**Options**

The `plot` directive supports the following options:

- **format**
  
  `[{python}, {doctest}]` The format of the input.

- **include-source**
  
  `[bool]` Whether to display the source code. The default can be changed using the `plot_include_source` variable in `conf.py`.

- **encoding**
  
  `[str]` If this source file is in a non-UTF8 or non-ASCII encoding, the encoding must be specified using the `:encoding:` option. The encoding will not be inferred using the ` -*- coding -*- ` metacomment.

- **context**
  
  `[bool or str]` If provided, the code will be run in the context of all previous plot directives for which the `:context:` option was specified. This only applies to inline code plot directives, not those run from files. If the `:context: reset` option is specified, the context is reset for this and future plots, and previous figures are closed prior to running the code. `:context: close-figs` keeps the context but closes previous figures before running the code.

- **nofigs**
  
  `[bool]` If specified, the code block will be run, but no figures will be inserted. This is usually useful with the `:context:` option.
Additionally, this directive supports all of the options of the `image` directive, except for `target` (since `plot` will add its own target). These include `alt`, `height`, `width`, `scale`, `align` and `class`.

**Configuration options**

The `plot` directive has the following configuration options:

**plot_include_source**

Default value for the include-source option

**plot_html_show_source_link**

Whether to show a link to the source in HTML.

**plot_pre_code**

Code that should be executed before each plot. If not specified or None it will default to a string containing:

```python
import numpy as np
from matplotlib import pyplot as plt
```

**plot_basedir**

Base directory, to which `plot::` file names are relative to. (If None or empty, file names are relative to the directory where the file containing the directive is.)

**plot_formats**

File formats to generate. List of tuples or strings:

```
[(suffix, dpi), suffix, ...]
```

that determine the file format and the DPI. For entries whose DPI was omitted, sensible defaults are chosen. When passing from the command line through `sphinx_build` the list should be passed as suffix:dpi,suffix:dpi, ...

**plot_html_show_formats**

Whether to show links to the files in HTML.

**plot_rcparams**

A dictionary containing any non-standard `rcParams` that should be applied before each plot.

**plot_apply_rcparams**

By default, `rcParams` are applied when `:context:` option is not used in a plot directive. This configuration option overrides this behavior and applies `rcParams` before each plot.
**plot_working_directory**

By default, the working directory will be changed to the directory of the example, so the code can get at its data files, if any. Also its path will be added to `sys.path` so it can import any helper modules sitting beside it. This configuration option can be used to specify a central directory (also added to `sys.path`) where data files and helper modules for all code are located.

**plot_template**

Provide a customized template for preparing restructured text.

```python
class matplotlib.sphinxext.plot_directive.PlotDirective
    (name, arguments, options, content, lineno,
     content_offset, block_text, state, state_machine)
```

The `.. plot::` directive, as documented in the module's docstring.

```python
run(self)
    Run the plot directive.
```

**exception** matplotlib.sphinxext.plot_directive.PlotError

```python
matplotlib.sphinxext.plot_directive.mark_plot_labels(app, document)
    To make plots referenceable, we need to move the reference from the "htmlonly" (or "latexonly") node to the actual figure node itself.
```

```python
matplotlib.sphinxext.plot_directive.out_of_date(original, derived)
    Return whether `derived` is out-of-date relative to `original`, both of which are full file paths.
```

```python
matplotlib.sphinxext.plot_directive.render_figures(code, code_path, output_dir, output_base, context, function_name, config, context_reset=False, close_figs=False)
    Run a pyplot script and save the images in `output_dir`.
    Save the images under `output_dir` with file names derived from `output_base`
```

```python
matplotlib.sphinxext.plot_directive.run_code(code, code_path, ns=None, function_name=None)
    Import a Python module from a path, and run the function given by name, if function_name is not None.
```

```python
matplotlib.sphinxext.plot_directive.split_code_at_show(text)
    Split code at plt.show().
```

```python
matplotlib.sphinxext.plot_directive.unescape_doctest(text)
    Extract code from a piece of text, which contains either Python code or doctests.
```
18.46 matplotlib.spines

class matplotlib.spines.Spine(axes, spine_type, path, **kwargs)
    Bases: matplotlib.patches.Patch

An axis spine -- the line noting the data area boundaries.

Spines are the lines connecting the axis tick marks and noting the boundaries of the data area. They can be placed at arbitrary positions. See set_position for more information.

The default position is ('outward', 0).

Spines are subclasses of Patch, and inherit much of their behavior.

Spines draw a line, a circle, or an arc depending if set_patch_line, set_patch_circle, or set_patch_arc has been called. Line-like is the default.

Parameters

axes
    [Axes] The Axes instance containing the spine.

spine_type
    [str] The spine type.

path
    [Path] The Path instance used to draw the spine.

Other Parameters

**kwargs

Valid keyword arguments are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

</tr>
</tbody>
</table>

```python

classmethod arc_spine(axes, spine_type, center, radius, theta1, theta2, **kwargs)
    Create and return an arc Spine.

classmethod circular_spine(axes, center, radius, **kwargs)
    Create and return a circular Spine.

c1a(self)
    Clear the current spine.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

    renderer
        [RendererBase subclass.]
```
Notes

This method is overridden in the Artist subclasses.

get_bounds(self)
Get the bounds of the spine.

get_patch_transform(self)
Return the Transform instance mapping patch coordinates to data coordinates.

For example, one may define a patch of a circle which represents a radius of 5 by providing coordinates for a unit circle, and a transform which scales the coordinates (the patch coordinate) by 5.

get_path(self)
Return the path of this patch.

get_position(self)
Return the spine position.

get_smart_bounds(self)
[Deprecated] Return whether the spine has smart bounds.

Notes

Deprecated since version 3.2.

get_spine_transform(self)
Return the spine transform.

get_window_extent(self, renderer=None)
Return the window extent of the spines in display space, including padding for ticks (but not their labels)

See also:

matplotlib.axes.Axes.get_tightbbox
matplotlib.axes.Axes.get_window_extent

classmethod linear_spine(axes, spine_type, **kwargs)
Create and return a linear Spine.

register_axis(self, axis)
Register an axis.

An axis should be registered with its corresponding spine from the Axes instance. This allows the spine to clear any axis properties when needed.

set_bounds(self, low=None, high=None)
Set the spine bounds.
Parameters

low
[float or None, optional] The lower spine bound. Passing None leaves the limit unchanged.
The bounds may also be passed as the tuple (low, high) as the first positional argument.

high
[float or None, optional] The higher spine bound. Passing None leaves the limit unchanged.

set_color(self, c)
Set the edgecolor.

Parameters

c
[|color|

Notes
This method does not modify the facecolor (which defaults to "none"), unlike the Patch.set_color method defined in the parent class. Use Patch.set_facecolor to set the facecolor.

set_patch_arc(self, center, radius, theta1, theta2)
Set the spine to be arc-like.

set_patch_circle(self, center, radius)
Set the spine to be circular.

set_patch_line(self)
Set the spine to be linear.

set_position(self, position)
Set the position of the spine.
Spine position is specified by a 2 tuple of (position type, amount). The position types are:

- 'outward': place the spine out from the data area by the specified number of points. (Negative values place the spine inwards.)
- 'axes': place the spine at the specified Axes coordinate (0 to 1).
- 'data': place the spine at the specified data coordinate.

Additionally, shorthand notations define a special positions:

- 'center' -> ('axes', 0.5)
• 'zero' -> ('data', 0.0)

```
set_smart_bounds(self, value)
```

[Deprecated] Set the spine and associated axis to have smart bounds.

**Notes**

Deprecated since version 3.2.

### 18.47 matplotlib.style

Styles are predefined sets of `rcParams` that define the visual appearance of a plot. *Customizing Matplotlib with style sheets and rcParams* describes the mechanism and usage of styles.

The `/gallery/style_sheets/style_sheets_reference` gives an overview of the builtin styles.

```
matplotlib.style.context(style, after_reset=False)
```

Context manager for using style settings temporarily.

**Parameters**

- `style`
  
  [str, dict, Path or list] A style specification. Valid options are:

<table>
<thead>
<tr>
<th>type</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>str</td>
<td>The name of a style or a path/URL to a style file. For a list of available style names, see <code>style.available</code>.</td>
</tr>
<tr>
<td>dict</td>
<td>Dictionary with valid key/value pairs for <code>matplotlib.rcParams</code>.</td>
</tr>
<tr>
<td>Path</td>
<td>A path-like object which is a path to a style file.</td>
</tr>
<tr>
<td>list</td>
<td>A list of style specifiers (str, Path or dict) applied from first to last in the list.</td>
</tr>
</tbody>
</table>

- `after_reset`
  
  [bool] If True, apply style after resetting settings to their defaults; otherwise, apply style on top of the current settings.

```
matplotlib.style.reload_library()
```

Reload the style library.

```
matplotlib.style.use(style)
```

Use Matplotlib style settings from a style specification.

The style name of 'default' is reserved for reverting back to the default style settings.
**Note:** This updates the `rcParams` with the settings from the style. `rcParams` not defined in the style are kept.

**Parameters**

**style**

A style specification. Valid options are:

<table>
<thead>
<tr>
<th>str</th>
<th>The name of a style or a path/URL to a style file. For a list of available style names, see <code>style.available</code>.</th>
</tr>
</thead>
<tbody>
<tr>
<td>dict</td>
<td>Dictionary with valid key/value pairs for <code>matplotlib.rcParams</code>.</td>
</tr>
<tr>
<td>Path</td>
<td>A path-like object which is a path to a style file.</td>
</tr>
<tr>
<td>list</td>
<td>A list of style specifiers (str, Path or dict) applied from first to last in the list.</td>
</tr>
</tbody>
</table>

*matplotlib.style.library*

A dict mapping from style name to `RcParams` defining that style.

This is meant to be read-only. Use `reload_library` to update.

*matplotlib.style.available*

List of the names of the available styles.

This is meant to be read-only. Use `reload_library` to update.

18.48 *matplotlib.table*

Tables drawing.

Use the factory function `table` to create a ready-made table from texts. If you need more control, use the `Table` class and its methods.

The table consists of a grid of cells, which are indexed by (row, column). The cell (0, 0) is positioned at the top left.

Thanks to John Gill for providing the class and table.

*class matplotlib.table.Cell(xy, width, height, edgecolor='k', facecolor='w', fill=True, text='', loc=None, fontproperties=None, *, visible_edges='closed')*

Bases: `matplotlib.patches.Rectangle`

A cell is a `Rectangle` with some associated `Text`.

As a user, you'll most likely not creates cells yourself. Instead, you should use either the `table` factory function or `Table.add_cell`.

2704 Chapter 18. Modules
Parameters

xy
    [2-tuple] The position of the bottom left corner of the cell.

width
    [float] The cell width.

height
    [float] The cell height.

degecolor
    [color] The color of the cell border.

gfacecolor
    [color] The cell facecolor.

fill
    [bool] Whether the cell background is filled.

text
    [str] The cell text.

loc
    [{‘left’, ‘center’, ‘right’}, default: ‘right’] The alignment of the
text within the cell.

fontproperties
    [dict] A dict defining the font properties of the text. Supported
keys and values are the keyword arguments accepted by
FontProperties.

visible_edges
    [str, default: ‘closed’] The cell edges to be drawn with a line:
a substring of ‘BRTL’ (bottom, right, top, left), or one of ‘open’
(no edges drawn), ‘closed’ (all edges drawn), ‘horizontal’ (bottom
and top), ‘vertical’ (right and left).

PAD = 0.1
    Padding between text and rectangle.

auto_set_font_size(self, renderer)
    Shrink font size until the text fits into the cell width.

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.

    This has no effect if the artist is not visible (Artist.get_visible returns
    False).
Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_fontsize(self)
Return the cell fontsize.

get_path(self)
Return a Path for the visible_edges.

get_required_width(self, renderer)
Return the minimal required width for the cell.

get_text(self)
Return the cell Text instance.

get_text_bounds(self, renderer)
Return the text bounds as (x, y, width, height) in table coordinates.

set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig

[Figure]

set_fontsize(self, size)
Set the text fontsize.

set_text_props(self, **kwargs)
Update the text properties.

Valid keyword arguments are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>
</tr>
<tr>
<td>alpha</td>
<td>float or None</td>
</tr>
<tr>
<td>animated</td>
<td>bool</td>
</tr>
<tr>
<td>backgroundcolor</td>
<td>color</td>
</tr>
<tr>
<td>bbox</td>

</tbody>
</table>

**set_transform(self, trans)**

Set the artist transform.

**Parameters**

- **t**
  - Transform

18.48. **matplotlib.table** 2707
property visible_edges
    The cell edges to be drawn with a line.

    Reading this property returns a substring of 'BRTL' (bottom, right, top, left).

    When setting this property, you can use a substring of 'BRTL' or one of
    {'open', 'closed', 'horizontal', 'vertical'}.

matplotlib.table.CustomCell
    alias of matplotlib.table.Cell
class matplotlib.table.Table(ax, loc=None, bbox=None, **kwargs)
    Bases: matplotlib.artist.Artist

    A table of cells.

    The table consists of a grid of cells, which are indexed by (row, column).

    For a simple table, you'll have a full grid of cells with indices from (0, 0) to
    (num_rows-1, num_cols-1), in which the cell (0, 0) is positioned at the top left.
    However, you can also add cells with negative indices. You don't have to add a
    cell to every grid position, so you can create tables that have holes.

    Note: You'll usually not create an empty table from scratch. Instead use table
    to create a table from data.

    Parameters

    ax

    loc
        [str] The position of the cell with respect to ax. This must be one
        of the codes.

    bbox
        [Bbox or None] A bounding box to draw the table into. If this is
        not None, this overrides loc.

    Other Parameters

    **kwargs
        Artist properties.

AXESPAD = 0.02
    The border between the Axes and the table edge in Axes units.

FONTSIZE = 10

    add_cell(self, row, col, *args, **kwargs)
    Create a cell and add it to the table.

    Parameters
row

[int] Row index.

col

[int] Column index.

*args, **kwargs

All other parameters are passed on to Cell.

Returns

Cell

The created cell.

auto_set_column_width(self, col)

Automatically set the widths of given columns to optimal sizes.

Parameters

col

[int or sequence of ints] The indices of the columns to auto-scale.

auto_set_font_size(self, value=True)

Automatically set font size.

codes = {'best': 0, 'bottom': 17, 'bottom left': 12, 'bottom right': 13, 'center': 9, 'center left': 5, 'center right': 14, 'left': 1, 'right': 14, 'top': 16, 'top left': 11, 'top right': 10, 'upper center': 8, 'upper left': 2, 'upper right': 1}

Possible values where to place the table relative to the Axes.

contains(self, mouseevent)

Test whether the artist contains the mouse event.

Parameters

mouseevent

[matplotlib.backend_bases.MouseEvent]

Returns

contains

[bool] Whether any values are within the radius.

details

[dict] An artist-specific dictionary of details of the event context, such as which points are contained in the pick radius. See the individual Artist subclasses for details.
**draw**(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (**Artist.get_visible** returns False).

**Parameters**

**renderer**

[**RendererBase** subclass.]

**Notes**

This method is overridden in the Artist subclasses.

**property edges**

The default value of **visible_edges** for newly added cells using **add_cell**.

**Notes**

This setting does currently only affect newly created cells using **add_cell**. To change existing cells, you have to set their edges explicitly:

```python
for c in tab.get_cellld().values():
    c.visible_edges = 'horizontal'
```

**get_cellld**(self)

Return a dict of cells in the table mapping (row, column) to **Cells**.

**Notes**

You can also directly index into the Table object to access individual cells:

```python
cell = table[row, col]
```

**get_children**(self)

Return the Artists contained by the table.

**get_window_extent**(self, renderer)

Return the bounding box of the table in window coords.

**scale**(self, xscale, yscale)

Scale column widths by **xscale** and row heights by **yscale**.

**set_fontsize**(self, size)

Set the font size, in points, of the cell text.

**Parameters**
**size**

[float]

**Notes**

As long as auto font size has not been disabled, the value will be clipped such that the text fits horizontally into the cell.

You can disable this behavior using `auto_set_font_size`.

```
>>> the_table.auto_set_font_size(False)
>>> the_table.set_fontsize(20)
```

However, there is no automatic scaling of the row height so that the text may exceed the cell boundary.

```
matplotlib.table.table(ax, cellText=None, cellColours=None, cellLoc='right', colWidths=None, rowLabels=None, rowColours=None, rowLoc='left', colLabels=None, colColours=None, colLoc='center', loc='bottom', bbox=None, edges='closed', **kwargs)
```

Add a table to an `Axes`.

At least one of `cellText` or `cellColours` must be specified. These parameters must be 2D lists, in which the outer lists define the rows and the inner list define the column values per row. Each row must have the same number of elements.

The table can optionally have row and column headers, which are configured using `rowLabels`, `rowColours`, `rowLoc` and `colLabels`, `colColours`, `colLoc` respectively.

For finer grained control over tables, use the `Table` class and add it to the axes with `Axes.add_table`.

**Parameters**

**cellText**

[2D list of str, optional] The texts to place into the table cells.

*Note*: Line breaks in the strings are currently not accounted for and will result in the text exceeding the cell boundaries.

**cellColours**

[2D list of colors, optional] The background colors of the cells.

**cellLoc**

[{'left', 'center', 'right'}, default: 'right'] The alignment of the text within the cells.
colWidths
  [list of float, optional] The column widths in units of the axes. If
  not given, all columns will have a width of $1 / ncols$.

rowLabels
  [list of str, optional] The text of the row header cells.

rowColours
  [list of colors, optional] The colors of the row header cells.

rowLoc
  [{'left', 'center', 'right'}, default: 'left'] The text alignment of the
  row header cells.

colLabels
  [list of str, optional] The text of the column header cells.

colColours
  [list of colors, optional] The colors of the column header cells.

colLoc
  [{'left', 'center', 'right'}, default: 'left'] The text alignment of the
  column header cells.

loc
  [str, optional] The position of the cell with respect to ax. This
  must be one of the codes.

bbox
  [Bbox, optional] A bounding box to draw the table into. If this is
  not None, this overrides loc.

dges
  [substring of 'BRTL' or {'open', 'closed', 'horizontal', 'vertical'}]
  The cell edges to be drawn with a line. See also visible_edges.

Returns

Table
  The created table.

Other Parameters

**kwargs
  Table properties.

### 18.49 matplotlib.testing

#### 18.49.1 matplotlib.testing

Helper functions for testing.

```python
called_from_pytest()
```

[Deprecated] Whether we are in a pytest run.

**Notes**

Deprecated since version 3.2.

```python
set_font_settings_for_testing()
set_reproducibility_for_testing()
setup()
```
18.49.2 matplotlib.testing.compare

Utilities for comparing image results.

matplotlib.testing.compare.comparable_formats()

Return the list of file formats that `compare_images` can compare on this system.

**Returns**

- **list of str**
  - E.g. ['png', 'pdf', 'svg', 'eps'].

matplotlib.testing.compare.compare_images(expected, actual, tol, in_decorator=False)

Compare two "image" files checking differences within a tolerance.

The two given filenames may point to files which are convertible to PNG via the converter dictionary. The underlying RMS is calculated with the `calculate_rms` function.

**Parameters**

- **expected**
  - [str] The filename of the expected image.

- **actual**
  - [str] The filename of the actual image.

- **tol**
  - [float] The tolerance (a color value difference, where 255 is the maximal difference). The test fails if the average pixel difference is greater than this value.

- **in_decorator**
  - [bool] Determines the output format. If called from image_comparison decorator, this should be True. (default=False)

**Returns**

- **None or dict or str**
  - Return None if the images are equal within the given tolerance.
  - If the images differ, the return value depends on `in_decorator`. If `in_decorator` is true, a dict with the following entries is returned:
    - `rms`: The RMS of the image difference.
    - `expected`: The filename of the expected image.
    - `actual`: The filename of the actual image.
• **diff_image**: The filename of the difference image.
• **tol**: The comparison tolerance.

Otherwise, a human-readable multi-line string representation of this information is returned.

### Examples

```python
img1 = "./baseline/plot.png"
img2 = "./output/plot.png"
compare_images(img1, img2, 0.001)
```

18.49.3 *matplotlib.testing.decorators*

**class** matplotlib.testing.decorators.CleanupTestCase(methodName='runTest')

**Bases**: unittest.case.TestCase

A wrapper for unittest.TestCase that includes cleanup operations.

Create an instance of the class that will use the named test method when executed. Raises a ValueError if the instance does not have a method with the specified name.

**classmethod setUpClass()**

Hook method for setting up class fixture before running tests in the class.

**classmethod tearDownClass()**

Hook method for deconstructing the class fixture after running all tests in the class.

matplotlib.testing.decorators.check_figures_equal(*, extensions='png', 'pdf', 'svg', tol=0)

Decorator for test cases that generate and compare two figures.

The decorated function must take two keyword arguments, *fig_test* and *fig_ref*, and draw the test and reference images on them. After the function returns, the figures are saved and compared.

This decorator should be preferred over *image_comparison* when possible in order to keep the size of the test suite from ballooning.

**Parameters**

- **extensions**
  
  [list, default: ["png", "pdf", "svg"]] The extensions to test.

- **tol**
  
  [float] The RMS threshold above which the test is considered failed.
Examples

Check that calling `Axes.plot` with a single argument plots it against `[0, 1, 2, ...]:`

```python
@check_figures_equal()
def test_plot(fig_test, fig_ref):
    fig_test.subplots().plot([1, 3, 5])
    fig_ref.subplots().plot([0, 1, 2], [1, 3, 5])
```

```
matplotlib.testing.decorators.check_freetype_version(ver)
```

```
matplotlib.testing.decorators.cleanup(style=None)
```

A decorator to ensure that any global state is reset before running a test.

**Parameters**

**style**

[ str, dict, or list, optional ] The style(s) to apply. Defaults to ["classic", "_classic_test_patch"].

```
matplotlib.testing.decorators.image_comparison(baseline_images, extensions=None, tol=0, freetype_version=None, remove_text=False, savefig_kwarg=None, style='classic', '_classic_test_patch')
```

Compare images generated by the test with those specified in `baseline_images`, which must correspond, else an `ImageComparisonFailure` exception will be raised.

**Parameters**

**baseline_images**

[ list or None ] A list of strings specifying the names of the images generated by calls to `Figure.savefig`.

If `None`, the test function must use the `baseline_images` fixture, either as a parameter or with `pytest.mark.usefixtures`. This value is only allowed when using pytest.

**extensions**

[ None or list of str ] The list of extensions to test, e.g. ['png', 'pdf'].

If `None`, defaults to all supported extensions: png, pdf, and svg.

When testing a single extension, it can be directly included in the names passed to `baseline_images`. In that case, `extensions` must not be set.
In order to keep the size of the test suite from ballooning, we only include the svg or pdf outputs if the test is explicitly exercising a feature dependent on that backend (see also the
check_figures_equal decorator for that purpose).

tol

[float, default: 0] The RMS threshold above which the test is considered failed.

Due to expected small differences in floating-point calculations, on 32-bit systems an additional 0.06 is added to this threshold.

freetype_version

[str or tuple] The expected freetype version or range of versions for this test to pass.

remove_text

[bool] Remove the title and tick text from the figure before comparison. This is useful to make the baseline images independent of variations in text rendering between different versions of FreeType.

This does not remove other, more deliberate, text, such as legends and annotations.

savefig_kwarg

[dict] Optional arguments that are passed to the savefig method.

style

[str, dict, or list] The optional style(s) to apply to the image test. The test itself can also apply additional styles if desired. Defaults to ["classic", "_classic_test_patch"].

matplotlib.testing.decorators.remove_ticks_and_titles(figure)

18.49.4 matplotlib.testing.exceptions

exception matplotlib.testing.exceptions.ImageComparisonFailure

Bases: AssertionError

Raise this exception to mark a test as a comparison between two images.
18.50 matplotlib.text

Classes for including text in a figure.

class matplotlib.text.Annotation(text,  xy,  xytext=None,  xycoords='data',  textcoords=None,  arrowprops=None,  annotation_clip=None,  **kwargs)

Bases: matplotlib.text.Text, matplotlib.text._AnnotationBase

An Annotation is a Text that can refer to a specific position xy. Optionally an arrow pointing from the text to xy can be drawn.

Attributes

xy
The annotated position.

xycoords
The coordinate system for xy.

arrow_patch
A FancyArrowPatch to point from xytext to xy.

Annotate the point xy with text text.
In the simplest form, the text is placed at xy.
Optionally, the text can be displayed in another position xytext. An arrow pointing from the text to the annotated point xy can then be added by defining arrowprops.

Parameters

text
[const] The text of the annotation. s is a deprecated synonym for this parameter.

xy
[(float, float)] The point (x, y) to annotate. The coordinate system is determined by xycoords.

xytext
[(float, float), default: xy] The position (x, y) to place the text at. The coordinate system is determined by textcoords.

xycoords
[str or Artist or Transform or callable or (float, float), default: 'data'] The coordinate system that xy is given in. The following types of values are supported:
• One of the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'figure points'</td>
<td>Points from the lower left of the figure</td>
</tr>
<tr>
<td>'figure pixels'</td>
<td>Pixels from the lower left of the figure</td>
</tr>
<tr>
<td>'figure fraction'</td>
<td>Fraction of figure from lower left</td>
</tr>
<tr>
<td>'axes points'</td>
<td>Points from lower left corner of axes</td>
</tr>
<tr>
<td>'axes pixels'</td>
<td>Pixels from lower left corner of axes</td>
</tr>
<tr>
<td>'axes fraction'</td>
<td>Fraction of axes from lower left</td>
</tr>
<tr>
<td>'data'</td>
<td>Use the coordinate system of the object being annotated (default)</td>
</tr>
<tr>
<td>'polar'</td>
<td>$(\theta, r)$ if not native 'data' coordinates</td>
</tr>
</tbody>
</table>

• An *Artist*: $xy$ is interpreted as a fraction of the artist's $Bbox$. E.g. $(0, 0)$ would be the lower left corner of the bounding box and $(0.5, 1)$ would be the center top of the bounding box.

• A *Transform* to transform $xy$ to screen coordinates.

• A function with one of the following signatures:

```python
def transform(renderer) -> Bbox
def transform(renderer) -> Transform
```

where $renderer$ is a *RendererBase* subclass.

The result of the function is interpreted like the *Artist* and *Transform* cases above.

• A tuple ($xcoords$, $ycoords$) specifying separate coordinate systems for $x$ and $y$. $xcoords$ and $ycoords$ must each be of one of the above described types.

See *Advanced Annotations* for more details.

**textcoords**

[str or *Artist* or *Transform* or callable or (float, float), default: value of $xycoords$] The coordinate system that $xytext$ is given in.

All $xycoords$ values are valid as well as the following strings:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'offset points'</td>
<td>Offset (in points) from the $xy$ value</td>
</tr>
<tr>
<td>'offset pixels'</td>
<td>Offset (in pixels) from the $xy$ value</td>
</tr>
</tbody>
</table>
**arrowprops**

[dict, optional] The properties used to draw a *FancyArrowPatch* arrow between the positions *xy* and *xytext*.

If *arrowprops* does not contain the key 'arrowstyle' the allowed keys are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>width</td>
<td>The width of the arrow in points</td>
</tr>
<tr>
<td>headwidth</td>
<td>The width of the base of the arrow head in points</td>
</tr>
<tr>
<td>headlength</td>
<td>The length of the arrow head in points</td>
</tr>
<tr>
<td>shrink</td>
<td>Fraction of total length to shrink from both ends</td>
</tr>
<tr>
<td>?</td>
<td>Any key to <em>matplotlib.patches.FancyArrowPatch</em></td>
</tr>
</tbody>
</table>

If *arrowprops* contains the key 'arrowstyle' the above keys are forbidden. The allowed values of 'arrowstyle' are:

<table>
<thead>
<tr>
<th>Name</th>
<th>Attrs</th>
</tr>
</thead>
<tbody>
<tr>
<td>'-'</td>
<td>None</td>
</tr>
<tr>
<td>'-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'-['</td>
<td>widthB=1.0,lengthB=0.2,angleB=None</td>
</tr>
<tr>
<td>'</td>
<td>-]'</td>
</tr>
<tr>
<td>'-</td>
<td>&gt;'</td>
</tr>
<tr>
<td>'&lt;-'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;-&gt;'</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;-['</td>
<td>head_length=0.4,head_width=0.2</td>
</tr>
<tr>
<td>'&lt;</td>
<td>-]'</td>
</tr>
<tr>
<td>'fancy'</td>
<td>head_length=0.4,head_width=0.4,tail_width=0.4</td>
</tr>
<tr>
<td>'simple'</td>
<td>head_length=0.5,head_width=0.5,tail_width=0.4</td>
</tr>
<tr>
<td>'wedge'</td>
<td>tail_width=0.3,shrink_factor=0.5</td>
</tr>
</tbody>
</table>

Valid keys for *FancyArrowPatch* are:

<table>
<thead>
<tr>
<th>Key</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>arrowstyle</td>
<td>the arrow style</td>
</tr>
<tr>
<td>connectionstyle</td>
<td>the connection style</td>
</tr>
<tr>
<td>relpos</td>
<td>default is (0.5, 0.5)</td>
</tr>
<tr>
<td>patchA</td>
<td>default is bounding box of the text</td>
</tr>
<tr>
<td>patchB</td>
<td>default is None</td>
</tr>
<tr>
<td>shrinkA</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>shrinkB</td>
<td>default is 2 points</td>
</tr>
<tr>
<td>mutation_scale</td>
<td>default is text size (in points)</td>
</tr>
<tr>
<td>mutation_aspect</td>
<td>default is 1.</td>
</tr>
<tr>
<td>?</td>
<td>any key for <em>matplotlib.patches.PathPatch</em></td>
</tr>
</tbody>
</table>

Defaults to None, i.e. no arrow is drawn.
**annotation_clip**

[bool or None, default: None] Whether to draw the annotation when the annotation point xy is outside the axes area.

- If *True*, the annotation will only be drawn when xy is within the axes.
- If *False*, the annotation will always be drawn.
- If *None*, the annotation will only be drawn when xy is within the axes and xycoords is 'data'.

**kwargs

Additional kwargs are passed to *Text*.

**Returns**

*Annotation*

**See also:**

*Advanced Annotations*

**property anncoords**

The coordinate system to use for *Annotation.xyann*.

**contains(self, event)**

Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

**draw(self, renderer)**

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (*Artist.get_visible* returns False).

**Parameters**

**renderer**

[RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

get_anncoords(self)
Return the coordinate system to use for Annotation.xyann.
See also xycoords in Annotation.

get_window_extent(self, renderer=None)
Return the Bbox bounding the text and arrow, in display units.

Parameters

renderer
[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

set_anncoords(self, coords)
Set the coordinate system to use for Annotation.xyann.
See also xycoords in Annotation.

set_figure(self, fig)
Set the Figure instance the artist belongs to.

Parameters

fig
[Figure]

update_positions(self, renderer)
Update the pixel positions of the annotation text and the arrow patch.

property xyann
The text position.
See also xytext in Annotation.

property xycoords

class matplotlib.text.OffsetFrom(artist, ref_coord, unit='points')
Bases: object
Callable helper class for working with Annotation.

Parameters
artist

[Artist or BboxBase or Transform] The object to compute the offset from.

ref_coord

[(float, float)] If artist is an Artist or BboxBase, this values is the location to of the offset origin in fractions of the artist bounding box.

If artist is a transform, the offset origin is the transform applied to this value.

unit

[{‘points’, ‘pixels’}, default: ‘points’] The screen units to use (pixels or points) for the offset input.

get_unit(self)

Return the unit for input to the transform used by __call__.

set_unit(self, unit)

Set the unit for input to the transform used by __call__.

Parameters

unit

[{‘points’, ‘pixels’}]

class matplotlib.text.Text(x=0, y=0, text='', color=None, verticalalignment='baseline', horizontalalignment='left', multialignment=None, fontproperties=None, rotation=None, linespacing=None, rotation_mode=None, usetex=None, wrap=False, **kwargs)

Bases: matplotlib.artist.Artist

Handle storing and drawing of text in window or data coordinates.

Create a Text instance at x, y with string text.

Valid keyword arguments are:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>

</table>

`contains(self, mouseevent)`
Return whether the mouse event occurred inside the axis-aligned bounding-box of the text.

`draw(self, renderer)`
Draw the Artist (and its children) using the given renderer.
This has no effect if the artist is not visible (Artist.get_visible returns False).

**Parameters**

renderer

[RendererBase subclass.]

**Notes**

This method is overridden in the Artist subclasses.

get_bbox_patch(self)

Return the bbox Patch, or None if the patches.FancyBboxPatch is not made.

get_c(self)

Alias for get_color.

get_color(self)

Return the color of the text.

get_family(self)

Alias for get_fontfamily.

get_font(self)

Alias for get_fontproperties.

get_font_properties(self)

Alias for get_fontproperties.

get_fontfamily(self)

Return the list of font families used for font lookup.

See also:

font_manager.FontProperties.get_family

get_fontname(self)

Return the font name as a string.

See also:

font_manager.FontProperties.get_name

get_fontproperties(self)

Return the font_manager.FontProperties.

get_fontsize(self)

Return the font size as an integer.

See also:
get_fontstyle(self)
Return the font style as a string.

See also:

get_fontvariant(self)
Return the font variant as a string.

See also:

get_fontweight(self)
Return the font weight as a string or a number.

See also:

get_ha(self)
Alias for get_horizontalalignment.

g_get_horizontalalignment(self)
Return the horizontal alignment as a string. Will be one of 'left', 'center' or 'right'.

g_get_name(self)
Alias for get_fontname.

g_get_position(self)
Return the (x, y) position of the text.

g_get_prop_tup(self, renderer=None)
Return a hashable tuple of properties.
Not intended to be human readable, but useful for backends who want to cache derived information about text (e.g., layouts) and need to know if the text has changed.

g_get_rotation(self)
Return the text angle in degrees between 0 and 360.

g_get_rotation_mode(self)
Return the text rotation mode.

g_get_size(self)
Alias for get_fontsize.
get_stretch(self)
Return the font stretch as a string or a number.

See also:

font_manager.FontProperties.get_stretch

get_style(self)
Alias for get_fontstyle.

get_text(self)
Return the text string.

get_unitless_position(self)
Return the (x, y) unitless position of the text.

gusetex(self)
Return whether this Text object uses TeX for rendering.

g_get_va(self)
Alias for get_verticalalignment.

get_variant(self)
Alias for get_fontvariant.

g_get_verticalalignment(self)
Return the vertical alignment as a string. Will be one of 'top', 'center', 'bottom' or 'baseline'.

get_weight(self)
Alias for get_fontweight.

get_window_extent(self, renderer=None, dpi=None)
Return the Bbox bounding the text, in display units.
In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer
[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi
[float, optional] The dpi value for computing the bbox, defaults to self.figure.dpi (not the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.
get_wrap(self)
    Return whether the text can be wrapped.

set_backgroundcolor(self, color)
    Set the background color of the text by updating the bbox.

    Parameters

    color
        [color]

    See also:

    set_bbox

        To change the position of the bounding box

    set_bbox(self, rectprops)
        Draw a bounding box around self.

        Parameters

        rectprops
            [dict with properties for patches.FancyBboxPatch] The default boxstyle is 'square'. The mutation scale of the patches.FancyBboxPatch is set to the fontsize.

    Examples

    t.set_bbox(dict(facecolor='red', alpha=0.5))

set_c(self, color)
    Alias for set_color.

set_clip_box(self, clipbox)
    Set the artist's clip Bbox.

    Parameters

    clipbox
        [Bbox]

set_clip_on(self, b)
    Set whether the artist uses clipping.

    When False artists will be visible outside of the axes which can lead to unexpected results.

    Parameters
**set_clip_path**

Set the artist's clip path.

**Parameters**

**path**

[Patch or Path or TransformedPath or None] The clip path. If given a Path, transform must be provided as well. If None, a previously set clip path is removed.

**transform**

[Transform, optional] Only used if path is a Path, in which case the given Path is converted to a TransformedPath using transform.

**Notes**

For efficiency, if path is a Rectangle this method will set the clipping box to the corresponding rectangle and set the clipping path to None.

For technical reasons (support of set), a tuple (path, transform) is also accepted as a single positional parameter.

**set_color**

Set the foreground color of the text

**Parameters**

**color**

[color]

**set_family**

Alias for set_fontfamily.

**set_font**

Alias for set_fontproperties.

**set_font_properties**

Alias for set_fontproperties.

**set_fontfamily**

Set the font family. May be either a single string, or a list of strings in decreasing priority. Each string may be either a real font name or a generic font class name. If the latter, the specific font names will be looked up in the corresponding rcParams.
If a `Text` instance is constructed with `fontfamily=None`, then the font is set to `rcParams["font.family"]` (default: ['sans-serif']), and the same is done when `set_fontfamily()` is called on an existing `Text` instance.

**Parameters**

- **fontname**
  
  [{`FONTNAME`, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

See also:

- `font_manager.FontProperties.set_family`

`set_fontname(self, fontname)`

Alias for `set_family`.

One-way alias only: the getter differs.

**Parameters**

- **fontname**
  
  [{`FONTNAME`, 'serif', 'sans-serif', 'cursive', 'fantasy', 'monospace'}]

See also:

- `font_manager.FontProperties.set_family`

`set_fontproperties(self, fp)`

Set the font properties that control the text.

**Parameters**

- **fp**
  
  [`font_manager.FontProperties` or `str` or `pathlib.Path`]

  If a `str`, it is interpreted as a fontconfig pattern parsed by `FontProperties`. If a `pathlib.Path`, it is interpreted as the absolute path to a font file.

`set_fontsize(self, fontsize)`

Set the font size.

**Parameters**

- **fontsize**
[float or {'xx-small', 'x-small', 'small', 'medium', 'large', 'x-large', 'xx-large'}] If float, the fontsize in points. The string values denote sizes relative to the default font size.

**See also:**

`font_manager.FontProperties.set_size`

`set_fontstretch(self, stretch)`
Set the font stretch (horizontal condensation or expansion).

**Parameters**

`stretch`

[{a numeric value in range 0-1000, 'ultra-condensed', 'extra-condensed', 'condensed', 'semi-condensed', 'normal', 'semi-expanded', 'expanded', 'extra-expanded', 'ultra-expanded'}]

**See also:**

`font_manager.FontProperties.set_stretch`

`set_fontstyle(self, fontstyle)`
Set the font style.

**Parameters**

`fontstyle`

[{`normal`, 'italic', 'oblique'}]

**See also:**

`font_manager.FontProperties.set_style`

`set_fontvariant(self, variant)`
Set the font variant.

**Parameters**

`variant`

[{`normal`, 'small-caps'}]

**See also:**

`font_manager.FontProperties.set_variant`

`set_fontweight(self, weight)`
Set the font weight.
Parameters

**weight**

{{a numeric value in range 0-1000, 'ultralight', 'light', 'normal', 'regular', 'book', 'medium', 'roman', 'semibold', 'demibold', 'demi', 'bold', 'heavy', 'extra bold', 'black'}}

See also:

`font_manager.FontProperties.set_weight`

`set_ha(self, align)`

Alias for `set_horizontalalignment`.

`set_horizontalalignment(self, align)`

Set the horizontal alignment to one of

**Parameters**

**align**

{{'center', 'right', 'left'}}

`set_linespacing(self, spacing)`

Set the line spacing as a multiple of the font size.

The default line spacing is 1.2.

**Parameters**

**spacing**

[Float (multiple of font size)]

`set_ma(self, align)`

Alias for `set_multialignment`.

`set_multialignment(self, align)`

Set the text alignment for multiline texts.

The layout of the bounding box of all the lines is determined by the horizontalalignment and verticalalignment properties. This property controls the alignment of the text lines within that box.

**Parameters**

**align**

{{'left', 'right', 'center'}}

`set_name(self, fontname)`

Alias for `set_fontname`.
set_position(self, xy)
    Set the (x, y) position of the text.

    Parameters

    xy
        [(float, float)]

set_rotation(self, s)
    Set the rotation of the text.

    Parameters

    s
        [float or {'vertical', 'horizontal'}] The rotation angle in degrees in mathematically positive direction (counterclockwise). 'horizontal' equals 0, 'vertical' equals 90.

set_rotation_mode(self, m)
    Set text rotation mode.

    Parameters

    m
        [{None, 'default', 'anchor'}] If None or "default", the text will be first rotated, then aligned according to their horizontal and vertical alignments. If "anchor", then alignment occurs before rotation.

set_size(self, fontsize)
    Alias for set_fontsize.

set_stretch(self, stretch)
    Alias for set_fontstretch.

set_style(self, fontstyle)
    Alias for set_fontstyle.

set_text(self, s)
    Set the text string s.
    It may contain newlines (\n) or math in LaTeX syntax.

    Parameters

    s
        [object] Any object gets converted to its str representation, except for None which is converted to an empty string.

set_usetex(self, usetex)
Parameters

usetex

[bool or None] Whether to render using TeX, None means to use
rcParams["text.usetex"] (default: False).

set_va(self, align)
Alias for set_verticalalignment.

set_variant(self, variant)
Alias for set_fontvariant.

set_verticalalignment(self, align)
Set the vertical alignment.

Parameters

align

[{'center', 'top', 'bottom', 'baseline', 'center_baseline'}]

set_weight(self, weight)
Alias for set_fontweight.

set_wrap(self, wrap)
Set whether the text can be wrapped.

Parameters

wrap

[bool]

set_x(self, x)
Set the x position of the text.

Parameters

x

[float]

set_y(self, y)
Set the y position of the text.

Parameters

y

[float]

update(self, kwargs)
Update this artist's properties from the dict props.
**Parameters**

```python
def update_bbox_position_size(self, renderer):
    Update the location and the size of the bbox.
    This method should be used when the position and size of the bbox needs to
    be updated before actually drawing the bbox.
```

```python
def update_from(self, other):
    Copy properties from other to self.
```

```python
zorder = 3
```

```python
matplotlib.text.get_rotation(rotation)
Return rotation normalized to an angle between 0 and 360 degrees.
```

**Parameters**

```python
rotation
    [float or {None, 'horizontal', 'vertical'}] Rotation angle in de-
    grees. None and 'horizontal' equal 0, 'vertical' equals 90.
```

**Returns**

```python
float
```

### 18.51 matplotlib.texmanager

Support for embedded TeX expressions in Matplotlib via dvipng and dvips for the
raster and PostScript backends. The tex and dvipng/dvips information is cached in
~/.matplotlib/tex.cache for reuse between sessions.

**Requirements:**

- latex
- *Agg backends: dvipng>=1.6
- PS backend: psfrag, dvips, and Ghostscript>=8.60

**Backends:**

- *Agg
- PS
- PDF

For raster output, you can get RGBA numpy arrays from TeX expressions as follows:
To enable tex rendering of all text in your matplotlib figure, set `rcParams["text.usetex"]` (default: False) to True.

```python
texmanager = TexManager()
s = ('\TeX\ is Number ' '\sum_{n=1}^{\infty}\frac{-e^{i\pi}}{2^n}\')
Z = texmanager.get_rgba(s, fontsize=12, dpi=80, rgb=(1, 0, 0))
```

## class matplotlib.texmanager.TexManager

**Bases:** object

Convert strings to dvi files using TeX, caching the results to a directory.

Repeated calls to this constructor always return the same instance.

**property cachedir**

**property cursive**

```python
font_families = ('serif', 'sans-serif', 'cursive', 'monospace')
font_family = 'serif'
font_info = {'avant garde': ('pag', '\usepackage{avant}'), 'bookman': ('pbk', '\renewcommand{\rmdefault}{pbk}'), ...
```

**get_basefile(self, tex, fontsize=None, dpi=None)**

Return a filename based on a hash of the string, fontsize, and dpi.

**get_custom_preamble(self)**

Return a string containing user additions to the tex preamble.

**get_font_config(self)**

Return a string containing font configuration for the tex preamble.

**get_grey(self, tex, fontsize=None, dpi=None)**

Return the alpha channel.

**get_rgba(self, tex, fontsize=None, dpi=None, rgb=0, 0, 0)**

Return latex's rendering of the tex string as an rgba array.

**get_text_width_height_descent(self, tex, fontsize, renderer=None)**

Return width, height and descent of the text.

```python
grey_arrayd = {('$+1$', 'sans-serifcmrcmssspzccmttd41d8cd98f00b204e9800998ecf8427e', 20.0, 100.0): array([0., 0., 0., ..., 0., 0., 0., ..., 0., 0., 0., 0.], dtype=float32)}
```

**make_dvi(self, tex, fontsize)**

Generate a dvi file containing latex's layout of tex string.

Return the file name.

**make_dvi_preview(self, tex, fontsize)**

[Deprecated] Generate a dvi file containing latex's layout of tex string.

It calls make_tex_preview() method and store the size information (width, height, descent) in a separate file.
Return the file name.

Notes

Deprecated since version 3.3.

make_png(self, tex, fontsize, dpi)
Generate a png file containing latex's rendering of tex string.
Return the file name.

make_tex(self, tex, fontsize)
Generate a tex file to render the tex string at a specific font size.
Return the file name.

make_tex_preview(self, tex, fontsize)
[Deprecated] Generate a tex file to render the tex string at a specific font size.
It uses the preview.sty to determine the dimension (width, height, descent) of the output.
Return the file name.

Notes

Deprecated since version 3.3.

property monospace
property rgba_array
property sans_serif
property serif

texcache = '/root/.cache/matplotlib/tex.cache'

18.52 matplotlib.textpath

class matplotlib.textpath.TextPath(xy, s, size=None, prop=None, _interpolation_steps=1, usetex=False)
Bases: matplotlib.path.Path

Create a path from the text.

Create a path from the text. Note that it simply is a path, not an artist. You need to use the PathPatch (or other artists) to draw this path onto the canvas.

Parameters
xy
[tuple or array of two float values] Position of the text. For no offset, use xy=(0, 0).

s
[str] The text to convert to a path.

size
[float, optional] Font size in points. Defaults to the size specified via the font properties prop.

prop
[matplotlib.font_manager.FontProperties, optional] Font property. If not provided, will use a default FontProperties with parameters from the rcParams.

_interpolation_steps
[int, optional] (Currently ignored)

usetex
[bool, default: False] Whether to use tex rendering.

Examples

The following creates a path from the string "ABC" with Helvetica font face; and another path from the latex fraction 1/2:

```python
from matplotlib.textpath import TextPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Helvetica", style="italic")
path1 = TextPath((12, 12), "ABC", size=12, prop=fp)
path2 = TextPath((0, 0), r"\frac{1}{2}", size=12, usetex=True)
```

Also see /gallery/text_labels_and_annotations/demo_text_path.

property codes
Return the codes

get_size(self)
Get the text size.

set_size(self, size)
Set the text size.

property vertices
Return the cached path after updating it if necessary.
class matplotlib.textpath.TextToPath
    Bases: object

A class that converts strings to paths.

DPI = 72

FONT_SCALE = 100.0

get_glyphs_mathtext(self, prop, s, glyph_map=None, return_new_glyphs_only=False)
    Parse mathtext string s and convert it to a (vertices, codes) pair.

glyphs_tex(self, prop, s, glyph_map=None, return_new_glyphs_only=False)
    Convert the string s to vertices and codes using usetex mode.

glyphs_with_font(self, font, s, glyph_map=None, return_new_glyphs_only=False)
    Convert string s to vertices and codes using the provided ttf font.

glyphs_tex(self)
    Return the cached TexManager instance.

glyphs_path(self, prop, s, ismath=False)
    Convert text s to path (a tuple of vertices and codes for matplotlib.path.Path).

    Parameters

    prop
        [FontProperties] The font properties for the text.
    s
        [str] The text to be converted.
    ismath
        [{False, True, "TeX"}] If True, use mathtext parser. If "TeX", use tex for rendering.

    Returns

    verts
        [list] A list of numpy arrays containing the x and y coordinates of the vertices.
    codes
        [list] A list of path codes.
Examples

Create a list of vertices and codes from a text, and create a Path from those:

```
from matplotlib.path import Path
from matplotlib.textpath import TextToPath
from matplotlib.font_manager import FontProperties

fp = FontProperties(family="Humor Sans", style="italic")
verts, codes = TextToPath().get_text_path(fp, "ABC")
path = Path(verts, codes, closed=False)
```

Also see TextPath for a more direct way to create a path from a text.

```
get_text_width_height_descent(self, s, prop, ismath)
```

18.53 matplotlib.ticker

18.53.1 Tick locating and formatting

This module contains classes for configuring tick locating and formatting. Generic tick locators and formatters are provided, as well as domain specific custom ones.

Although the locators know nothing about major or minor ticks, they are used by the Axis class to support major and minor tick locating and formatting.

Tick locating

The Locator class is the base class for all tick locators. The locators handle autoscaling of the view limits based on the data limits, and the choosing of tick locations. A useful semi-automatic tick locator is MultipleLocator. It is initialized with a base, e.g., 10, and it picks axis limits and ticks that are multiples of that base.

The Locator subclasses defined here are

AutoLocator

MaxNLocator with simple defaults. This is the default tick locator for most plotting.

MaxNLocator

Finds up to a max number of intervals with ticks at nice locations.

LinearLocator

Space ticks evenly from min to max.

LogLocator

Space ticks logarithmically from min to max.
MultipleLocator

Ticks and range are a multiple of base; either integer or float.

FixedLocator

Tick locations are fixed.

IndexLocator

Locator for index plots (e.g., where \( x = \text{range}(\text{len}(y)) \)).

NullLocator

No ticks.

SymmetricalLogLocator

Locator for use with with the symlog norm; works like LogLocator for the part outside of the threshold and adds 0 if inside the limits.

LogitLocator

Locator for logit scaling.

OldAutoLocator

Choose a MultipleLocator and dynamically reassign it for intelligent ticking during navigation.

AutoMinorLocator

Locator for minor ticks when the axis is linear and the major ticks are uniformly spaced. Subdivides the major tick interval into a specified number of minor intervals, defaulting to 4 or 5 depending on the major interval.

There are a number of locators specialized for date locations - see the dates module.

You can define your own locator by deriving from Locator. You must override the __call__ method, which returns a sequence of locations, and you will probably want to override the autoscale method to set the view limits from the data limits.

If you want to override the default locator, use one of the above or a custom locator and pass it to the x or y axis instance. The relevant methods are:

```python
ax.xaxis.set_major_locator(xmajor_locator)
ax.xaxis.set_minor_locator(xminor_locator)
ax.yaxis.set_major_locator(ymajor_locator)
ax.yaxis.set_minor_locator(ymminor_locator)
```

The default minor locator is NullLocator, i.e., no minor ticks on by default.
Tick formatting

Tick formatting is controlled by classes derived from Formatter. The formatter operates on a single tick value and returns a string to the axis.

NullFormatter

No labels on the ticks.

IndexFormatter

Set the strings from a list of labels.

FixedFormatter

Set the strings manually for the labels.

FuncFormatter

User defined function sets the labels.

StrMethodFormatter

Use string format method.

FormatStrFormatter

Use an old-style sprintf format string.

ScalarFormatter

Default formatter for scalars: autopick the format string.

LogFormatter

Formatter for log axes.

LogFormatterExponent

Format values for log axis using exponent = log_base(value).

LogFormatterMathText

Format values for log axis using exponent = log_base(value) using Math text.

LogFormatterSciNotation

Format values for log axis using scientific notation.

LogitFormatter

Probability formatter.

EngFormatter

Format labels in engineering notation.

PercentFormatter

Format labels as a percentage.
You can derive your own formatter from the Formatter base class by simply overriding the \_\_call\_\_ method. The formatter class has access to the axis view and data limits.

To control the major and minor tick label formats, use one of the following methods:

```python
ax.xaxis.set_major_formatter(xmajor_formatter)
ax.xaxis.set_minor_formatter(xminor_formatter)
ax.yaxis.set_major_formatter(ymajor_formatter)
ax.yaxis.set_minor_formatter(yminor_formatter)
```

In addition to a Formatter instance, set_major_formatter and set_minor_formatter also accept a str or function. str input will be internally replaced with an autogenerated StrMethodFormatter with the input str. For function input, a FuncFormatter with the input function will be generated and used.

See /gallery/ticks_and_spines/major_minor_demo for an example of setting major and minor ticks. See the matplotlib.dates module for more information and examples of using date locators and formatters.

class matplotlib.ticker.AutoLocator
    Bases: matplotlib.ticker.MaxNLocator

    Dynamically find major tick positions. This is actually a subclass of MaxNLocator, with parameters nbins = 'auto' and steps = [1, 2, 2.5, 5, 10].

    To know the values of the non-public parameters, please have a look to the defaults of MaxNLocator.

class matplotlib.ticker.AutoMinorLocator(n=None)
    Bases: matplotlib.ticker.Locator

    Dynamically find minor tick positions based on the positions of major ticks. The scale must be linear with major ticks evenly spaced.

    n is the number of subdivisions of the interval between major ticks; e.g., n=2 will place a single minor tick midway between major ticks.

    If n is omitted or None, it will be set to 5 or 4.

    tick_values(self, vmin, vmax)

        Return the values of the located ticks given vmin and vmax.

        **Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

        ```python
        >>> print(type(loc))
        <type 'Locator'>
        >>> print(loc())
        [1, 2, 3, 4]
        ```

```python
class matplotlib.ticker.EngFormatter(unit='', places=None, sep=' ', *, use\_tex=None, useMathText=None)
    Bases: matplotlib.ticker.Formatter
```

18.53. matplotlib.ticker
Format axis values using engineering prefixes to represent powers of 1000, plus a specified unit, e.g., 10 MHz instead of 1e7.

**Parameters**

- **unit**
  
  [str, default: ""] Unit symbol to use, suitable for use with single-letter representations of powers of 1000. For example, 'Hz' or 'm'.

- **places**
  
  [int, default: None] Precision with which to display the number, specified in digits after the decimal point (there will be between one and three digits before the decimal point). If it is None, the formatting falls back to the floating point format '%g', which displays up to 6 significant digits, i.e. the equivalent value for places varies between 0 and 5 (inclusive).

- **sep**
  
  [str, default: ""] Separator used between the value and the prefix/unit. For example, one get '3.14 mV' if sep is " " (default) and '3.14mV' if sep is "". Besides the default behavior, some other useful options may be:
  - sep="" to append directly the prefix/unit to the value;
  - sep="\N{THIN SPACE}" (U+2009);
  - sep="\N{NARROW NO-BREAK SPACE}" (U+202F);
  - sep="\N{NO-BREAK SPACE}" (U+00A0).

- **usetex**
  
  [bool, default: rcParams['text.usetex'] (default: False)] To enable/disable the use of TeX's math mode for rendering the numbers in the formatter.

- **useMathText**
  
  [bool, default: rcParams['axes.formatter.use_mathtext'] (default: False)] To enable/disable the use mathtext for rendering the numbers in the formatter.

**format_eng** (self, num)

Format a number in engineering notation, appending a letter representing the power of 1000 of the original number. Some examples:

```python
>>> format_eng(0) # for self.places = 0
'0'
```
Matplotlib, Release 3.3.3

```python
>>> format_eng(1000000) # for self.places = 1
'1.0 M'

>>> format_eng("-1e-6") # for self.places = 2
'-1.00 µ'
```

def get_useMathText(self):

def get_usetex(self):

def set_useMathText(self, val):

def set_usetex(self, val):

class matplotlib.ticker.FixedFormatter(seq):
    Bases: matplotlib.ticker.Formatter

    Return fixed strings for tick labels based only on position, not value.

    **Note:** *FixedFormatter* should only be used together with *FixedLocator*. Otherwise, the labels may end up in unexpected positions.

    Set the sequence *seq* of strings that will be used for labels.

    def get_offset(self):

    def set_offset_string(self, ofs):

class matplotlib.ticker.FixedLocator(locs, nbins=None):
    Bases: matplotlib.ticker.Locator

    Tick locations are fixed. If nbins is not None, the array of possible positions will be subsampled to keep the number of ticks <= nbins +1. The subsampling will be done so as to include the smallest absolute value; for example, if zero is included in the array of possibilities, then it is guaranteed to be one of the chosen ticks.

    def set_params(self, nbins=None)
        Set parameters within this locator.

    def tick_values(self, vmin, vmax)
        Return the locations of the ticks.

    **Note:** Because the values are fixed, vmin and vmax are not used in this method.

class matplotlib.ticker.FormatStrFormatter(fmt):
    Bases: matplotlib.ticker.Formatter
Use an old-style ('%' operator) format string to format the tick.

The format string should have a single variable format (%) in it. It will be applied to the value (not the position) of the tick.

class matplotlib.ticker.Formatter
    Bases: matplotlib.ticker.TickHelper

Create a string based on a tick value and location.

    static fix_minus(s)
        Some classes may want to replace a hyphen for minus with the proper unicode symbol (U+2212) for typographical correctness. This is a helper method to perform such a replacement when it is enabled via rcParams["axes.unicode_minus"] (default: True).

    format_data(self, value)
        Return the full string representation of the value with the position unspecified.

    format_data_short(self, value)
        Return a short string version of the tick value.
        Defaults to the position-independent long value.

    format_ticks(self, values)
        Return the tick labels for all the ticks at once.

    get_offset(self)

    locs = []

    set_locs(self, locs)
        Set the locations of the ticks.
        This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

class matplotlib.ticker.FuncFormatter(func)
    Bases: matplotlib.ticker.Formatter

    Use a user-defined function for formatting.

    The function should take in two inputs (a tick value x and a position pos), and return a string containing the corresponding tick label.

    get_offset(self)

    set_offset_string(self, ofs)

class matplotlib.ticker.IndexFormatter(**kwargs)
    Bases: matplotlib.ticker.Formatter

    [Deprecated] Format the position x to the nearest i-th label where i = int(x + 0.5). Positions where i < 0 or i > len(list) have no tick labels.

    Parameters
**labels**

[list] List of labels.

**Notes**

Deprecated since version 3.3.

class matplotlib.ticker.IndexLocator(base, offset)
Bases: matplotlib.ticker.Locator

Place a tick on every multiple of some base number of points plotted, e.g., on every 5th point. It is assumed that you are doing index plotting; i.e., the axis is 0, len(data). This is mainly useful for x ticks.

Place ticks every base data point, starting at offset.

set_params(self, base=None, offset=None)
Set parameters within this locator

tick_values(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.

Note: To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

class matplotlib.ticker.LinearLocator(numticks=None, presets=None)
Bases: matplotlib.ticker.Locator

Determine the tick locations

The first time this function is called it will try to set the number of ticks to make a nice tick partitioning. Thereafter the number of ticks will be fixed so that interactive navigation will be nice

Use presets to set locs based on lom. A dict mapping vmin, vmax->locs

property numticks

set_params(self, numticks=None, presets=None)
Set parameters within this locator.

tick_values(self, vmin, vmax)
Return the values of the located ticks given vmin and vmax.
**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```python
def view_limits(self, vmin, vmax):
    """Try to choose the view limits intelligently."""
```

class matplotlib.ticker.Locator
    Bases: matplotlib.ticker.TickHelper

Determine the tick locations;

Note that the same locator should not be used across multiple Axis because the locator stores references to the Axis data and view limits.

MAXTICKS = 1000

```python
def autoscale(self):
    """[Deprecated] Autoscale the view limits."""
```

Notes

Deprecated since version 3.2.

```python

def nonsingular(self, v0, v1):
    """Adjust a range as needed to avoid singularities."""

    This method gets called during autoscaling, with (v0, v1) set to the data limits on the axes if the axes contains any data, or (-inf, +inf) if not.
    
    • If v0 == v1 (possibly up to some floating point slop), this method returns an expanded interval around this value.
    
    • If (v0, v1) == (-inf, +inf), this method returns appropriate default view limits.
    
    • Otherwise, (v0, v1) is returned without modification.
```

```python
def pan(self, numsteps):
    """[Deprecated] Pan numticks (can be positive or negative)"""
```
Notes

Deprecated since version 3.3.

`raise_if_exceeds(self, locs)`
Log at WARNING level if `locs` is longer than `Locator.MAXTICKS`.

This is intended to be called immediately before returning `locs` from `__call__` to inform users in case their Locator returns a huge number of ticks, causing Matplotlib to run out of memory.

The "strange" name of this method dates back to when it would raise an exception instead of emitting a log.

`refresh(self)`
[Deprecated] Refresh internal information based on current limits.

Notes

Deprecated since version 3.3.

`set_params(self, **kwargs)`
Do nothing, and raise a warning. Any locator class not supporting the `set_params()` function will call this.

`tick_values(self, vmin, vmax)`
Return the values of the located ticks given `vmin` and `vmax`.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated `axis` simply call the `Locator` instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

`view_limits(self, vmin, vmax)`
Select a scale for the range from `vmin` to `vmax`.

Subclasses should override this method to change locator behaviour.

`zoom(self, direction)`
[Deprecated] Zoom in/out on axis; if direction is >0 zoom in, else zoom out.
class matplotlib.ticker.LogFormatter(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: matplotlib.ticker.Formatter

Base class for formatting ticks on a log or symlog scale.
It may be instantiated directly, or subclassed.

Parameters

base

[float, default: 10.] Base of the logarithm used in all calculations.

labelOnlyBase

[bool, default: False] If True, label ticks only at integer powers of base. This is normally True for major ticks and False for minor ticks.

minor_thresholds

[(subset, all), default: (1, 0.4)] If labelOnlyBase is False, these two numbers control the labeling of ticks that are not at integer powers of base; normally these are the minor ticks. The controlling parameter is the log of the axis data range. In the typical case where base is 10 it is the number of decades spanned by the axis, so we can call it 'numdec'. If \( \text{numdec} \leq \text{all} \), all minor ticks will be labeled. If \( \text{all} < \text{numdec} \leq \text{subset} \), then only a subset of minor ticks will be labeled, so as to avoid crowding. If \( \text{numdec} > \text{subset} \) then no minor ticks will be labeled.

linthresh

[None or float, default: None] If a symmetric log scale is in use, its linthresh parameter must be supplied here.

Notes

The set_locs method must be called to enable the subsetting logic controlled by the minor_thresholds parameter.

In some cases such as the colorbar, there is no distinction between major and minor ticks; the tick locations might be set manually, or by a locator that puts ticks at integer powers of base and at intermediate locations. For this situation, disable the minor_thresholds logic by using minor_thresholds=(np.inf, np.inf), so that all ticks will be labeled.
To disable labeling of minor ticks when 'labelOnlyBase' is False, use minor_thresholds=(0, 0). This is the default for the "classic" style.

Examples

To label a subset of minor ticks when the view limits span up to 2 decades, and all of the ticks when zoomed in to 0.5 decades or less, use minor_thresholds=(2, 0.5).

To label all minor ticks when the view limits span up to 1.5 decades, use minor_thresholds=(1.5, 1.5).

base(self, base)
  Change the base for labeling.

Warning: Should always match the base used for LogLocator

format_data(self, value)
  Return the full string representation of the value with the position unspecified.

format_data_short(self, value)
  Return a short string version of the tick value.
  Defaults to the position-independent long value.

label_minor(self, labelOnlyBase)
  Switch minor tick labeling on or off.

Parameters

labelOnlyBase
  [bool] If True, label ticks only at integer powers of base.

set_locs(self, locs=None)
  Use axis view limits to control which ticks are labeled.
  The locs parameter is ignored in the present algorithm.

class matplotlib.ticker.LogFormatterExponent(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: matplotlib.ticker.LogFormatter

Format values for log axis using exponent = log_base(value).

18.53. matplotlib.ticker
class matplotlib.ticker.LogFormatterMathtext(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: matplotlib.ticker.LogFormatter

Format values for log axis using exponent = log_base(value).

class matplotlib.ticker.LogFormatterSciNotation(base=10.0, labelOnlyBase=False, minor_thresholds=None, linthresh=None)

Bases: matplotlib.ticker.LogFormatterMathtext

Format values following scientific notation in a logarithmic axis.

class matplotlib.ticker.LogLocator(base=10.0, subs=1.0, numdec=4, numticks=None)

Bases: matplotlib.ticker.Locator

Determine the tick locations for log axes

Place ticks on the locations: subs[j] * base**i

Parameters

subs

[None or str or sequence of float, default: (1.0,)] Gives the multiples of integer powers of the base at which to place ticks. The default places ticks only at integer powers of the base. The permitted string values are 'auto' and 'all', both of which use an algorithm based on the axis view limits to determine whether and how to put ticks between integer powers of the base. With 'auto', ticks are placed only between integer powers; with 'all', the integer powers are included. A value of None is equivalent to 'auto'.

base(self, base)

Set the log base (major tick every base**i, i integer).

nonsingular(self, vmin, vmax)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with (v0, v1) set to the data limits on the axes if the axes contains any data, or (-inf, +inf) if not.

- If v0 == v1 (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If (v0, v1) == (-inf, +inf), this method returns appropriate default view limits.
- Otherwise, (v0, v1) is returned without modification.
set_params(self, base=None, subs=None, numdec=None, numticks=None)
    Set parameters within this locator.

subs(self, subs)
    Set the minor ticks for the log scaling every base**i*subs[j].

tick_values(self, vmin, vmax)
    Return the values of the located ticks given vmin and vmax.

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

view_limits(self, vmin, vmax)
    Try to choose the view limits intelligently.

class matplotlib.ticker.LogitFormatter(*, use_overline=False,
    one_half='\frac{1}{2}', minor=False, minor_threshold=25,
    minor_number=6)
Bases: matplotlib.ticker.Formatter

Probability formatter (using Math text).

**Parameters**

**use_overline**
[bool, default: False] If $x > 1/2$, with $x = 1-v$, indicate if $x$ should be displayed as $\overline{v}$. The default is to display $1-v$.

**one_half**
[str, default: r"\frac{1}{2}"] The string used to represent $1/2$.

**minor**
[bool, default: False] Indicate if the formatter is formatting minor ticks or not. Basically minor ticks are not labelled, except when only few ticks are provided, ticks with most space with neighbor ticks are labelled. See other parameters to change the default behavior.

**minor_threshold**
[int, default: 25] Maximum number of locs for labelling some minor ticks. This parameter have no effect if minor is False.
**minor_number**

  [int, default: 6] Number of ticks which are labelled when the number of ticks is below the threshold.

`format_data_short(self, value)`

Return a short string version of the tick value.

Defaults to the position-independent long value.

`set_locs(self, locs)`

Set the locations of the ticks.

This method is called before computing the tick labels because some formatters need to know all tick locations to do so.

`set_minor_number(self, minor_number)`

Set the number of minor ticks to label when some minor ticks are labelled.

**Parameters**

**minor_number**

  [int] Number of ticks which are labelled when the number of ticks is below the threshold.

`set_minor_threshold(self, minor_threshold)`

Set the threshold for labelling minors ticks.

**Parameters**

**minor_threshold**

  [int] Maximum number of locations for labelling some minor ticks. This parameter have no effect if minor is False.

`set_one_half(self, one_half)`

Set the way one half is displayed.

**one_half**

  [str, default: r"frac{1}{2}"] The string used to represent 1/2.

`use_overline(self, use_overline)`

Switch display mode with overline for labelling p>1/2.

**Parameters**

**use_overline**

  [bool, default: False] If x > 1/2, with x = 1-v, indicate if x should be displayed as $overline{v}$. The default is to display $1-v$. 
class matplotlib.ticker.LogitLocator(minor=False, *, nbins='auto')

Bases: matplotlib.ticker.MaxNLocator

Determine the tick locations for logit axes
Place ticks on the logit locations

**Parameters**

- **nbins**
  - [int or 'auto', optional] Number of ticks. Only used if minor is False.
- **minor**
  - [bool, default: False] Indicate if this locator is for minor ticks or not.

**property minor**

**nonsingular**(self, vmin, vmax)

Adjust a range as needed to avoid singularities.

This method gets called during autoscaling, with \((v_0, v_1)\) set to the data limits on the axes if the axes contains any data, or \((-\infty, +\infty)\) if not.

- If \(v_0 == v_1\) (possibly up to some floating point slop), this method returns an expanded interval around this value.
- If \((v_0, v_1) == (-\infty, +\infty)\), this method returns appropriate default view limits.
- Otherwise, \((v_0, v_1)\) is returned without modification.

**set_params**(self, minor=None, **kwargs)

Set parameters within this locator.

**tick_values**(self, vmin, vmax)

Return the values of the located ticks given \(vmin\) and \(vmax\).

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

class matplotlib.ticker.MaxNLocator(*args, **kwargs)

Bases: matplotlib.ticker.Locator

Find nice tick locations with no more than \(N\) being within the view limits. Locations beyond the limits are added to support autoscaling.
Parameters

nbins

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

steps

[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

integer

[bool, default: False] If True, ticks will take only integer values, provided at least min_n_ticks integers are found within the view limits.

symmetric

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

prune

[{'lower', 'upper', 'both', None}, default: None] Remove edge ticks -- useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when rcParams["axes.autolimit_mode"] (default: 'data') is 'round_numbers'. If prune=='lower', the smallest tick will be removed. If prune == 'upper', the largest tick will be removed. If prune == 'both', the largest and smallest ticks will be removed. If prune is None, no ticks will be removed.

min_n_ticks

[int, default: 2] Relax nbins and integer constraints if necessary to obtain this minimum number of ticks.

default_params = {'integer': False, 'min_n_ticks': 2, 'nbins': 10, 'prune': None, 'steps': None}

set_params(self, **kwargs)
Set parameters for this locator.

Parameters

nbins

[int or 'auto', optional] see MaxNLocator
**steps**
[array-like, optional] see *MaxNLocator*

**integer**
[bool, optional] see *MaxNLocator*

**symmetric**
[bool, optional] see *MaxNLocator*

**prune**
[{'lower', 'upper', 'both', None}, optional] see *MaxNLocator*

**min_n_ticks**
[int, optional] see *MaxNLocator*

**tick_values**(*self, vmin, vmax*)
Return the values of the located ticks given *vmin* and *vmax*.

**view_limits**(*self, dmin, dmax*)
Select a scale for the range from vmin to vmax.
Subclasses should override this method to change locator behaviour.

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

**class** **matplotlib.ticker.MultipleLocator**(base=1.0)
**Bases:** **matplotlib.ticker.Locator**
Set a tick on each integer multiple of a base within the view interval.

**set_params**(*self, base*)
Set parameters within this locator.

**tick_values**(*self, vmin, vmax*)
Return the values of the located ticks given *vmin* and *vmax*.

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```
View limits

Set the view limits to the nearest multiples of base that contain the data.

```python
def view_limits(self, dmin, dmax):
    pass
```

Class: matplotlib.ticker.NullFormatter

```
Bases: matplotlib.ticker.Formatter

Always return the empty string.
```

Class: matplotlib.ticker.NullLocator

```
Bases: matplotlib.ticker.Locator

No ticks
```

```python
def tick_values(self, vmin, vmax):
    return []
```

**Note:** Because the values are Null, vmin and vmax are not used in this method.

Class: matplotlib.ticker.OldAutoLocator

```
Bases: matplotlib.ticker.Locator

[Deprecated] On autoscale this class picks the best MultipleLocator to set the view limits and the tick locs.
```

Notes

Deprecated since version 3.3.

```python
def get_locator(self, d):
    return None
```

```python
def tick_values(self, vmin, vmax):
    return [1, 2, 3, 4]
```

**Note:** To get tick locations with the vmin and vmax values defined automatically for the associated axis simply call the Locator instance:

```
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

View limits

Select a scale for the range from vmin to vmax.

Subclasses should override this method to change locator behaviour.
class matplotlib.ticker.OldScalarFormatter(*args, **kwargs)
   Bases: matplotlib.ticker.Formatter
   
   [Deprecated] Tick location is a plain old number.

Notes

Deprecated since version 3.3.

class matplotlib.ticker.PercentFormatter(xmax=100, decimals=None, symbol='%', is_latex=False)
   Bases: matplotlib.ticker.Formatter
   
   Format numbers as a percentage.

Parameters

xmax
   [float] Determines how the number is converted into a percentage. \( xmax \) is the data value that corresponds to 100%. Percentages are computed as \( x / xmax \times 100 \). So if the data is already scaled to be percentages, \( xmax \) will be 100. Another common situation is where \( xmax \) is 1.0.

decimals
   [None or int] The number of decimal places to place after the point. If None (the default), the number will be computed automatically.

symbol
   [str or None] A string that will be appended to the label. It may be None or empty to indicate that no symbol should be used. LaTeX special characters are escaped in symbol whenever latex mode is enabled, unless is_latex is True.

is_latex
   [bool] If False, reserved LaTeX characters in symbol will be escaped.

convert_to_pct(self, x)

format_pct(self, x, display_range)
   Format the number as a percentage number with the correct number of decimals and adds the percent symbol, if any.

If self.decimals is None, the number of digits after the decimal point is set based on the display_range of the axis as follows:
<table>
<thead>
<tr>
<th>display_range</th>
<th>decimals</th>
<th>sample</th>
</tr>
</thead>
<tbody>
<tr>
<td>&gt;50</td>
<td>0</td>
<td>x = 34.5 =&gt; 35%</td>
</tr>
<tr>
<td>&gt;5</td>
<td>1</td>
<td>x = 34.5 =&gt; 34.5%</td>
</tr>
<tr>
<td>&gt;0.5</td>
<td>2</td>
<td>x = 34.5 =&gt; 34.50%</td>
</tr>
<tr>
<td>...</td>
<td>...</td>
<td>...</td>
</tr>
</tbody>
</table>

This method will not be very good for tiny axis ranges or extremely large ones. It assumes that the values on the chart are percentages displayed on a reasonable scale.

**property symbol**

The configured percent symbol as a string.

If LaTeX is enabled via `rcParams["text.usetex"]` (default: `False`), the special characters {'#', '$', '%', '&', '~', '_', '^', '\', '{', '}'} are automatically escaped in the string.

```python
class matplotlib.ticker.ScalarFormatter(useOffset=None, useMathText=None, useLocale=None)
```

Bases: `matplotlib.ticker.Formatter`

Format tick values as a number.

**Parameters**

**useOffset**

[bool or float, default: `rcParams["axes.formatter.useoffset"]` (default: `True`)] Whether to use offset notation. See `set_useOffset`.

**useMathText**

[bool, default: `rcParams["axes.formatter.use_mathtext"]` (default: `False`)] Whether to use fancy math formatting. See `set_useMathText`.

**useLocale**

[bool, default: `rcParams["axes.formatter.use_locale"]` (default: `False`)] Whether to use locale settings for decimal sign and positive sign. See `set_useLocale`.

**Notes**

In addition to the parameters above, the formatting of scientific vs. floating point representation can be configured via `set_scientific` and `set_powerlimits`.

**Offset notation and scientific notation**

Offset notation and scientific notation look quite similar at first sight. Both split some information from the formatted tick values and display it at the end of the axis.
• The scientific notation splits up the order of magnitude, i.e. a multiplicative scaling factor, e.g. 1e6.

• The offset notation separates an additive constant, e.g. +1e6. The offset notation label is always prefixed with a + or - sign and is thus distinguishable from the order of magnitude label.

The following plot with x limits 1,000,000 to 1,000,010 illustrates the different formatting. Note the labels at the right edge of the x axis.

format_data(self, value)
    Return the full string representation of the value with the position unspecified.

format_data_short(self, value)
    Return a short string version of the tick value.
    Defaults to the position-independent long value.

get_offset(self)
    Return scientific notation, plus offset.

get_useLocale(self)
    Return whether locale settings are used for formatting.

See also:
ScalarFormatter.set_useLocale

def get_useMathText(self):
    Return whether to use fancy math formatting.

See also:

ScalarFormatter.set_useMathText

def get_useOffset(self):
    Return whether automatic mode for offset notation is active.
    This returns True if set_useOffset(True); it returns False if an explicit offset
    was set, e.g. set_useOffset(1000).

See also:

ScalarFormatter.set_useOffset

def set_locs(self, locs):
    Set the locations of the ticks.
    This method is called before computing the tick labels because some for-
matters need to know all tick locations to do so.

def set_powerlimits(self, lims):
    Set size thresholds for scientific notation.

Parameters

limits

[(int, int)] A tuple (min_exp, max_exp) containing the powers
of 10 that determine the switchover threshold. For a number
representable as \( a \times 10^{\text{exp}} \) with \( 1 \leq |a| < 10 \), scientific notation
will be used if \( \text{exp} \leq \text{min}\_\text{exp} \) or \( \text{exp} \geq \text{max}\_\text{exp} \).

The default limits are controlled by rcParams["axes.formatter.
limits"] (default: [-5, 6]).

In particular numbers with exp equal to the thresholds are writ-
ten in scientific notation.

Typically, min_exp will be negative and max_exp will be posi-
tive.

For example, formatter.set_powerlimits((-3, 4)) will provide
the following formatting: \( 1 \times 10^{-3}, 9.9 \times 10^{-3}, 0.01, 9999, 1 \times 10^4 \).

See also:

ScalarFormatter.set_scientific
set_scientific(self, b)
    Turn scientific notation on or off.

    See also:

    ScalarFormatter.set_powerlimits

set_useLocale(self, val)
    Set whether to use locale settings for decimal sign and positive sign.

    Parameters

    val
        [bool or None]  None resets to rcParams["axes.formatter.
                        use_locale"] (default: False).

set_useMathText(self, val)
    Set whether to use fancy math formatting.

    If active, scientific notation is formatted as $1.2 \times 10^3$.

    Parameters

    val
        [bool or None]  None resets to rcParams["axes.formatter.
                        use_mathtext"] (default: False).

set_useOffset(self, val)
    Set whether to use offset notation.

    When formatting a set numbers whose value is large compared to their
    range, the formatter can separate an additive constant. This can shorten
    the formatted numbers so that they are less likely to overlap when drawn
    on an axis.

    Parameters

    val
        [bool or float]

        • If False, do not use offset notation.

        • If True (=automatic mode), use offset notation if it can
          make the residual numbers significantly shorter. The
          exact behavior is controlled by rcParams["axes.formatter.
          offset_threshold"] (default: 4).

        • If a number, force an offset of the given value.
Examples

With active offset notation, the values
100_000, 100_002, 100_004, 100_006, 100_008
will be formatted as 0, 2, 4, 6, 8 plus an offset +1e5, which is written to the edge of the axis.

property useLocale
Return whether locale settings are used for formatting.

See also:

ScalarFormatter.set_useLocale

property useMathText
Return whether to use fancy math formatting.

See also:

ScalarFormatter.set_useMathText

property useOffset
Return whether automatic mode for offset notation is active.

This returns True if set_useOffset(True); it returns False if an explicit offset was set, e.g. set_useOffset(1000).

See also:

ScalarFormatter.set_useOffset

class matplotlib.ticker.StrMethodFormatter(fmt)
Bases: matplotlib.ticker.Formatter

Use a new-style format string (as used by str.format) to format the tick.

The field used for the tick value must be labeled x and the field used for the tick position must be labeled pos.

class matplotlib.ticker.SymmetricalLogLocator(transform=None, subs=None, linthresh=None, base=None)
Bases: matplotlib.ticker.Locator

Determine the tick locations for symmetric log axes.

Parameters

transform

[SymmetricalLogTransform, optional] If set, defines the base and linthresh of the symlog transform.
**base, linthresh**

[float, optional] The `base` and `linthresh` of the symlog transform, as documented for `SymmetricalLogScale`. These parameters are only used if `transform` is not set.

**subs**

[sequence of float, default: [1]] The multiples of integer powers of the base where ticks are placed, i.e., ticks are placed at `[sub * base**i for i in ... for sub in subs]`.

**Notes**

Either `transform`, or both `base` and `linthresh`, must be given.

```python
set_params(self, subs=None, numticks=None)
```

Set parameters within this locator.

```python
tick_values(self, vmin, vmax)
```

Return the values of the located ticks given `vmin` and `vmax`.

**Note:** To get tick locations with the `vmin` and `vmax` values defined automatically for the associated `axis` simply call the Locator instance:

```python
>>> print(type(loc))
<type 'Locator'>
>>> print(loc())
[1, 2, 3, 4]
```

```python
view_limits(self, vmin, vmax)
```

Try to choose the view limits intelligently.

**class matplotlib.ticker.TickHelper**

Bases: `object`

```python
axis = None
create_dummy_axis(self, **kwargs)
set_axis(self, axis)
set_bounds(self, vmin, vmax)
set_data_interval(self, vmin, vmax)
set_view_interval(self, vmin, vmax)
```
\section*{18.54 matplotlib.tight_layout}

Routines to adjust subplot params so that subplots are nicely fit in the figure. In doing so, only axis labels, tick labels, axes titles and offsetboxes that are anchored to axes are currently considered.

Internally, this module assumes that the margins (left\_margin, etc.) which are differences between ax.get\_tightbbox and ax.bbox are independent of axes position. This may fail if Axes.adjustable is datalim. Also, This will fail for some cases (for example, left or right margin is affected by xlabel).
Return a dict of subplot parameters to adjust spacing between subplots or None if resulting axes would have zero height or width.

Note that this function ignores geometry information of subplot itself, but uses what is given by the *nrows ncols* and *num1num2_list* parameters. Also, the results could be incorrect if some subplots have *adjustable=datalim*.

**Parameters**

- **nrows ncols**
  
  [Tuple[int, int]] Number of rows and number of columns of the grid.

- **num1num2_list**
  
  [List[int]] List of numbers specifying the area occupied by the subplot

- **subplot_list**
  
  [list of subplots] List of subplots that will be used to calculate optimal subplot_params.

- **pad**
  
  [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.

- **h_pad, w_pad**
  
  [float] Padding (height/width) between edges of adjacent subplots, as a fraction of the font size. Defaults to pad.

- **rect**
  
  [Tuple[float, float, float, float]] [left, bottom, right, top] in normalized (0, 1) figure coordinates.

- **get_renderer(fig)**

- **get_subplotspec_list(axes_list, grid_spec=None)**
  
  Return a list of subplotspec from the given list of axes.

  For an instance of axes that does not support subplotspec, None is inserted in the list.

  If grid_spec is given, None is inserted for those not from the given grid_spec.
Return subplot parameters for tight-layouted-figure with specified padding.

**Parameters**

- **fig**
  - [Figure]
- **axes_list**
  - [list of Axes]
- **subplotspec_list**
  - [list of SubplotSpec] The subplotspecs of each axes.
- **renderer**
  - [renderer]
- **pad**
  - [float] Padding between the figure edge and the edges of subplots, as a fraction of the font size.
- **h_pad, w_pad**
  - [float] Padding (height/width) between edges of adjacent subplots. Defaults to `pad`.
- **rect**
  - [Tuple[Float, Float, Float, Float], optional] (left, bottom, right, top) rectangle in normalized figure coordinates that the whole subplots area (including labels) will fit into. Defaults to using the entire figure.

**Returns**

- **subplotspec or None**
  subplotspec kwargs to be passed to `Figure.subplots_adjust` or None if tight_layout could not be accomplished.
Matplotlib includes a framework for arbitrary geometric transformations that is used to determine the final position of all elements drawn on the canvas.

Transforms are composed into trees of `TransformNode` objects whose actual value depends on their children. When the contents of children change, their parents are automatically invalidated. The next time an invalidated transform is accessed, it is recomputed to reflect those changes. This invalidation/caching approach prevents unnecessary recomputations of transforms, and contributes to better interactive performance.

For example, here is a graph of the transform tree used to plot data to the graph:
The framework can be used for both affine and non-affine transformations. However, for speed, we want use the backend renderers to perform affine transformations whenever possible. Therefore, it is possible to perform just the affine or non-affine part of a transformation on a set of data. The affine is always assumed to occur after the non-affine. For any transform:
full transform == non-affine part + affine part

The backends are not expected to handle non-affine transformations themselves.

class matplotlib.transforms.Affine2D(matrix=None, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

    A mutable 2D affine transformation.

    Initialize an Affine transform from a 3x3 numpy float array:

    \[
    \begin{pmatrix}
    a & c & e \\
    b & d & f \\
    0 & 0 & 1
    \end{pmatrix}
    \]

    If matrix is None, initialize with the identity transform.

    .. _init_: (self, matrix=None, **kwargs)
    Initialize an Affine transform from a 3x3 numpy float array:

    \[
    \begin{pmatrix}
    a & c & e \\
    b & d & f \\
    0 & 0 & 1
    \end{pmatrix}
    \]

    If matrix is None, initialize with the identity transform.

    __module__ = 'matplotlib.transforms'

    __str__(self)
    Return str(self).

clear(self)
    Reset the underlying matrix to the identity transform.

static from_values(a, b, c, d, e, f)
    Create a new Affine2D instance from the given values:

    \[
    \begin{pmatrix}
    a & c & e \\
    b & d & f \\
    0 & 0 & 1
    \end{pmatrix}
    \]

    get_matrix(self)
    Get the underlying transformation matrix as a 3x3 numpy array:

    \[
    \begin{pmatrix}
    a & c & e \\
    b & d & f \\
    0 & 0 & 1
    \end{pmatrix}
    \]

    static identity()
    Return a new Affine2D object that is the identity transform.
Unless this transform will be mutated later on, consider using the faster `IdentityTransform` class instead.

**rotate** *(self, theta)*
Add a rotation (in radians) to this transform in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**rotate_around** *(self, x, y, theta)*
Add a rotation (in radians) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**rotate_deg** *(self, degrees)*
Add a rotation (in degrees) to this transform in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**rotate_deg_around** *(self, x, y, degrees)*
Add a rotation (in degrees) around the point (x, y) in place.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**scale** *(self, sx, sy=None)*
Add a scale in place.

If *sy* is None, the same scale is applied in both the x- and y-directions.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.

**set** *(self, other)*
Set this transformation from the frozen copy of another `Affine2DBase` object.

**set_matrix** *(self, mtx)*
Set the underlying transformation matrix from a 3x3 numpy array:

```
  a c e
  b d f
  0 0 1
```

**skew** *(self, xShear, yShear)*
Add a skew in place.

*xShear* and *yShear* are the shear angles along the x- and y-axes, respectively, in radians.

Returns *self*, so this method can easily be chained with more calls to `rotate()`, `rotate_deg()`, `translate()` and `scale()`.
skew_deg(self, xShear, yShear)
    Add a skew in place.
    xShear and yShear are the shear angles along the x- and y-axes, respectively,
    in degrees.
    Returns self, so this method can easily be chained with more calls to
    rotate(), rotate_deg(), translate() and scale().

translate(self, tx, ty)
    Add a translation in place.
    Returns self, so this method can easily be chained with more calls to
    rotate(), rotate_deg(), translate() and scale().

class matplotlib.transforms.Affine2DBase(*args, **kwargs)
    Bases: matplotlib.transforms.AffineBase
    The base class of all 2D affine transformations.
    2D affine transformations are performed using a 3x3 numpy array:

    a c e
    b d f
    0 0 1

    This class provides the read-only interface. For a mutable 2D affine transforma-
    tion, use Affine2D.

    Subclasses of this class will generally only need to override a constructor and
    get_matrix() that generates a custom 3x3 matrix.

    Parameters

    shorthand_name
        [str] A string representing the "name" of the transform. The
        name carries no significance other than to improve the readabil-
        ity of str(transform) when DEBUG=True.

    __module__ = 'matplotlib.transforms'

    frozen(self)
        Return a frozen copy of this transform node. The frozen copy will not be
        updated when its children change. Useful for storing a previously known
        state of a transform where copy.deepcopy() might normally be used.

    has_inverse = True

    input_dims = 2

    inverted(self)
        Return the corresponding inverse transformation.
        It holds x == self.inverted().transform(self.transform(x)).
The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

**property is_separable**

```python
bool(x) -> bool
```

Returns True when the argument `x` is true, False otherwise. The builtins `True` and `False` are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

**static matrix_from_values**

```python
(a, b, c, d, e, f)
```

```markdown
[Deprecated] Create a new transformation matrix as a 3x3 numpy array of the form:

```
<table>
<thead>
<tr>
<th>a</th>
<th>c</th>
<th>e</th>
</tr>
</thead>
<tbody>
<tr>
<td>b</td>
<td>d</td>
<td>f</td>
</tr>
<tr>
<td>0</td>
<td>0</td>
<td>1</td>
</tr>
</tbody>
</table>
```

**Notes**

Deprecated since version 3.2.

```python
output_dims = 2
```

**to_values**

```python
(self)
```

Return the values of the matrix as an `(a, b, c, d, e, f)` tuple.

**transform_affine**

```python
(self, points)
```

Apply only the affine part of this transformation on the given array of values.

**transform**

```python
(values)
```

is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

**Parameters**

- **values**
  ```python
  [array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`. 
  ```

**Returns**

- **array**
  ```python
  The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input. 
  ```

**class` matplotlib.transforms.AffineBase(**args, **kwargs)**

Bases: `matplotlib.transforms.Transform`

The base class of all affine transformations of any number of dimensions.
Parameters

shorthand_name
[|str|] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__array__(self, *args, **kwargs)
Array interface to get at this Transform's affine matrix.

__eq__(self, other)
Return self==value.

__hash__ = None

__init__(self, *args, **kwargs)
Parameters

shorthand_name
[|str|] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__module__ = 'matplotlib.transforms'

get_affine(self)
Get the affine part of this transform.

is_affine = True

transform(self, values)
Apply this transformation on the given array of values.

Parameters

values
[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array
The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

transform_affine(self, values)
Apply only the affine part of this transformation on the given array of values.

transform(values) is always equivalent to transform_affine(transform_non_affine(values))
In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to \texttt{transform(values)}.

**Parameters**

\texttt{values}  
[array] The input values as NumPy array of length \texttt{input_dims} or shape (N x \texttt{input_dims}).

**Returns**

\texttt{array}  
The output values as NumPy array of length \texttt{input_dims} or shape (N x \texttt{output_dims}), depending on the input.

\texttt{transform_non_affine(self, points)}  
Apply only the non-affine part of this transformation.  
\texttt{transform(values)} is always equivalent to \texttt{transform_affine(transform_non_affine(values))}.

In non-affine transformations, this is generally equivalent to \texttt{transform(values)}. In affine transformations, this is always a no-op.

**Parameters**

\texttt{values}  
[array] The input values as NumPy array of length \texttt{input_dims} or shape (N x \texttt{input_dims}).

**Returns**

\texttt{array}  
The output values as NumPy array of length \texttt{input_dims} or shape (N x \texttt{output_dims}), depending on the input.

\texttt{transform_path(self, path)}  
Apply the transform to \texttt{Path path}, returning a new \texttt{Path}.

In some cases, this transform may insert curves into the path that began as line segments.

\texttt{transform_path_affine(self, path)}  
Apply the affine part of this transform to \texttt{Path path}, returning a new \texttt{Path}.

\texttt{transform_path_non_affine(self, path)}  
Apply the non-affine part of this transform to \texttt{Path path}, returning a new \texttt{Path}.
transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values))

class matplotlib.transforms.AffineDeltaTransform(transform, **kwargs)
Bases: matplotlib.transforms.Affine2DBase

A transform wrapper for transforming displacements between pairs of points.
This class is intended to be used to transform displacements ("position deltas") between pairs of points (e.g., as the offset_transform of Collections): given a transform t such that t = AffineDeltaTransform(t) + offset, AffineDeltaTransform satisfies AffineDeltaTransform(a - b) == AffineDeltaTransform(a) - AffineDeltaTransform(b).
This is implemented by forcing the offset components of the transform matrix to zero.
This class is experimental as of 3.3, and the API may change.

Parameters

shorthand_name
[ str ] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__init__(self, transform, **kwargs)

Parameters

shorthand_name
[ str ] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__module__ = 'matplotlib.transforms'
__str__(self)
    Return str(self).
get_matrix(self)
    Get the matrix for the affine part of this transform.

class matplotlib.transforms.Bbox(points, **kwargs)
Bases: matplotlib.transforms.BboxBase

A mutable bounding box.
Examples

Create from known bounds

The default constructor takes the boundary "points" \([\text{xmin}, \text{ymin}], [\text{xmax}, \text{ymax}]\).

```python
>>> Bbox([[1, 1], [3, 7]])
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

Alternatively, a Bbox can be created from the flattened points array, the so-called "extents" (xmin, ymin, xmax, ymax)

```python
>>> Bbox.from_extents(1, 1, 3, 7)
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

or from the "bounds" (xmin, ymin, width, height).

```python
>>> Bbox.from_bounds(1, 1, 2, 6)
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

Create from collections of points

The "empty" object for accumulating Bboxs is the null bbox, which is a stand-in for the empty set.

```python
>>> Bbox.null()
Bbox([[inf, inf], [-inf, -inf]])
```

Adding points to the null bbox will give you the bbox of those points.

```python
>>> box = Bbox.null()
>>> box.update_from_data_xy([[1, 1]])
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
>>> box.update_from_data_xy([[2, 3], [3, 2]], ignore=False)
>>> box
Bbox([[1.0, 1.0], [3.0, 3.0]])
```

Setting ignore=True is equivalent to starting over from a null bbox.

```python
>>> box.update_from_data_xy([[1, 1]], ignore=True)
>>> box
Bbox([[1.0, 1.0], [1.0, 1.0]])
```

**Warning:** It is recommended to always specify ignore explicitly. If not, the default value of ignore can be changed at any time by code with access to your Bbox, for example using the method `ignore`.

Properties of the `null` bbox
Note: The current behavior of `Bbox.null()` may be surprising as it does not have all of the properties of the "empty set", and as such does not behave like a "zero" object in the mathematical sense. We may change that in the future (with a deprecation period).

The null bbox is the identity for intersections

```python
>>> Bbox.intersection(Bbox([[1, 1], [3, 7]]), Bbox.null())
Bbox([[1.0, 1.0], [3.0, 7.0]])
```

except with itself, where it returns the full space.

```python
>>> Bbox.intersection(Bbox.null(), Bbox.null())
Bbox([-inf, -inf], [inf, inf])
```

A union containing null will always return the full space (not the other set!)

```python
>>> Bbox.union([Bbox([[0, 0], [0, 0]]), Bbox.null()])
Bbox([-inf, -inf], [inf, inf])
```

**Parameters**

points

[ndarray] A 2x2 numpy array of the form \([x0, y0], [x1, y1]\).

__format__(self, fmt)

Default object formatter.

__init__(self, points, **kwargs)

**Parameters**

points

[ndarray] A 2x2 numpy array of the form \([x0, y0], [x1, y1]\).

__module__ = 'matplotlib.transforms'

__repr__(self)

Return repr(self).

__str__(self)

Return str(self).

property bounds

Return \((x0, y0, width, height)\).

static from_bounds(x0, y0, width, height)

Create a new Bbox from \(x0, y0, width\) and \(height\).

width and height may be negative.
static from_extents(*args)
Create a new Bbox from left, bottom, right and top.

The y-axis increases upwards.

get_points(self)
Get the points of the bounding box directly as a numpy array of the form:
[[x0, y0], [x1, y1]].

ignore(self, value)
Set whether the existing bounds of the box should be ignored by subsequent
calls to update_from_data_xy().

value
[bool]
  • When True, subsequent calls to update_from_data_xy() will ignore the
    existing bounds of the Bbox.
  • When False, subsequent calls to update_from_data_xy() will include
    the existing bounds of the Bbox.

property intervalx
The pair of x coordinates that define the bounding box.

This is not guaranteed to be sorted from left to right.

property intervaly
The pair of y coordinates that define the bounding box.

This is not guaranteed to be sorted from bottom to top.

property minpos
property minposx
property minposy

mutated(self)
Return whether the bbox has changed since init.

mutatedx(self)
Return whether the x-limits have changed since init.

mutatedy(self)
Return whether the y-limits have changed since init.

static null()
Create a new null Bbox from (inf, inf) to (-inf, -inf).

property p0
The first pair of (x, y) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use min).

property p1
The second pair of (x, y) coordinates that define the bounding box.
This is not guaranteed to be the top-right corner (for that, use \texttt{max}).

\texttt{set(self, other)}

Set this bounding box from the "frozen" bounds of another \texttt{Bbox}.

\texttt{set_points(self, points)}

Set the points of the bounding box directly from a numpy array of the form: \([x0, y0], [x1, y1]\). No error checking is performed, as this method is mainly for internal use.

\texttt{static unit()}

Create a new unit \texttt{Bbox} from \((0, 0)\) to \((1, 1)\).

\texttt{update_from_data_xy(self, xy, ignore=None, updatex=True, updatey=True)}

Update the bounds of the \texttt{Bbox} based on the passed in data. After updating, the bounds will have positive \texttt{width} and \texttt{height}; \(x0\) and \(y0\) will be the minimal values.

\textbf{Parameters}

\texttt{xy}

[ndarray] A numpy array of 2D points.

\texttt{ignore}

[bool, optional]

\begin{itemize}
  \item When \texttt{True}, ignore the existing bounds of the \texttt{Bbox}.
  \item When \texttt{False}, include the existing bounds of the \texttt{Bbox}.
  \item When \texttt{None}, use the last value passed to \texttt{ignore()}.
\end{itemize}

\texttt{updatex, updatey}

[bool, default: \texttt{True}] When \texttt{True}, update the \(x/y\) values.

\texttt{update_from_path(self, path, ignore=None, updatex=True, updatey=True)}

Update the bounds of the \texttt{Bbox} to contain the vertices of the provided path. After updating, the bounds will have positive \texttt{width} and \texttt{height}; \(x0\) and \(y0\) will be the minimal values.

\textbf{Parameters}

\texttt{path}

[\texttt{Path}]

\texttt{ignore}

[bool, optional]

\begin{itemize}
  \item when \texttt{True}, ignore the existing bounds of the \texttt{Bbox}.
  \item when \texttt{False}, include the existing bounds of the \texttt{Bbox}.
  \item when \texttt{None}, use the last value passed to \texttt{ignore()}.
**updateX, updateY**

[bool, default: True] When True, update the x/y values.

*property x0*

The first of the pair of x coordinates that define the bounding box.
This is not guaranteed to be less than x1 (for that, use xmin).

*property x1*

The second of the pair of x coordinates that define the bounding box.
This is not guaranteed to be greater than x0 (for that, use xmax).

*property y0*

The first of the pair of y coordinates that define the bounding box.
This is not guaranteed to be less than y1 (for that, use ymin).

*property y1*

The second of the pair of y coordinates that define the bounding box.
This is not guaranteed to be greater than y0 (for that, use ymax).

class matplotlib.transforms.BboxBase(shorthand_name=None)

Bases: matplotlib.transforms.TransformNode

The base class of all bounding boxes.

This class is immutable; Bbox is a mutable subclass.

The canonical representation is as two points, with no restrictions on their or-dering. Convenience properties are provided to get the left, bottom, right and top edges and width and height, but these are not stored explicitly.

**Parameters**

*shorthand_name*

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

```
__array__(self, *args, **kwargs)
__module__ = 'matplotlib.transforms'
anchored(self, c, container=None)
```

Return a copy of the Bbox shifted to position c within container.

**Parameters**

*c*

([float, float] or str) May be either:
• A sequence \((cx, cy)\) where \(cx\) and \(cy\) range from 0 to 1, where 0 is left or bottom and 1 is right or top

• a string: - 'C' for centered - 'S' for bottom-center - 'SE' for bottom-left - 'E' for left - etc.

**container**

[Bbox, optional] The box within which the Bbox is positioned; it defaults to the initial Bbox.

**property bounds**

Return \((x_0, y_0, width, height)\).

coefs = {'C': (0.5, 0.5), 'E': (1.0, 0.5), 'N': (0.5, 1.0), 'NE': (1.0, 1.0), 'NW': (0, 1.0), 'S': (0.5, 0), 'SE': (1.0, 0), 'SW': (0, 0), 'W': (0, 0.5)}

contains(self, x, y)

Return whether \((x, y)\) is in the bounding box or on its edge.

containsx(self, x)

Return whether \(x\) is in the closed \((x_0, x_1)\) interval.

containsy(self, y)

Return whether \(y\) is in the closed \((y_0, y_1)\) interval.

corners(self)

Return the corners of this rectangle as an array of points.

Specifically, this returns the array \([[x_0, y_0], [x_0, y_1], [x_1, y_0], [x_1, y_1]]\).

count_contains(self, vertices)

Count the number of vertices contained in the Bbox. Any vertices with a non-finite \(x\) or \(y\) value are ignored.

**Parameters**

vertices

[Nx2 Numpy array.]

count_overlaps(self, bboxes)

Count the number of bounding boxes that overlap this one.

**Parameters**

bboxes

[sequence of BboxBase]

expanded(self, sw, sh)

Construct a Bbox by expanding this one around its center by the factors \(sw\) and \(sh\).
property extents
    Return \((x_0, y_0, x_1, y_1)\).

frozen(self)
The base class for anything that participates in the transform tree and needs
to invalidate its parents or be invalidated. This includes classes that are not
really transforms, such as bounding boxes, since some transforms depend
on bounding boxes to compute their values.

fully_contains(self, x, y)
    Return whether \(x, y\) is in the bounding box, but not on its edge.

fully_containsx(self, x)
    Return whether \(x\) is in the open \((x_0, x_1)\) interval.

fully_containsy(self, y)
    Return whether \(y\) is in the open \((y_0, y_1)\) interval.

fully_overlaps(self, other)
    Return whether this bounding box overlaps with the other bounding box,
    not including the edges.

Parameters

other
    [BboxBase]

get_points(self)

property height
    The (signed) height of the bounding box.

static intersection(bbox1, bbox2)
    Return the intersection of \(bbox1\) and \(bbox2\) if they intersect, or None if they
don't.

property intervalx
    The pair of \(x\) coordinates that define the bounding box.
    This is not guaranteed to be sorted from left to right.

property intervaly
    The pair of \(y\) coordinates that define the bounding box.
    This is not guaranteed to be sorted from bottom to top.

inverse_transformed(self, transform)
    [Deprecated] Construct a Bbox by statically transforming this one by the in-
    verse of transform.
Notes

Deprecated since version 3.3.

```python
is_affine = True
is_bbox = True
is_unit(self)
    [Deprecated] Return whether this is the unit box (from (0, 0) to (1, 1)).
```

Notes

Deprecated since version 3.2.

**property max**

The top-right corner of the bounding box.

**property min**

The bottom-left corner of the bounding box.

```python
overlaps(self, other)
    Return whether this bounding box overlaps with the other bounding box.
```

**Parameters**

- **other**

  [BboxBase]

**property p0**

The first pair of \((x, y)\) coordinates that define the bounding box.

This is not guaranteed to be the bottom-left corner (for that, use \(\text{min}\)).

**property p1**

The second pair of \((x, y)\) coordinates that define the bounding box.

This is not guaranteed to be the top-right corner (for that, use \(\text{max}\)).

**padded(self, p)**

Construct a \(\text{bbox}\) by padding this one on all four sides by \(p\).

**rotated(self, radians)**

Return the axes-aligned bounding box that bounds the result of rotating this \(\text{bbox}\) by an angle of \(\text{radians}\).

**shrunk(self, mx, my)**

Return a copy of the \(\text{bbox}\), shrunk by the factor \(mx\) in the \(x\) direction and the factor \(my\) in the \(y\) direction. The lower left corner of the box remains unchanged. Normally \(mx\) and \(my\) will be less than 1, but this is not enforced.
shrunk_to_aspect(self, box_aspect, container=None, fig_aspect=1.0)

Return a copy of the Bbox, shrunk so that it is as large as it can be while having the desired aspect ratio, box_aspect. If the box coordinates are relative (i.e. fractions of a larger box such as a figure) then the physical aspect ratio of that figure is specified with fig_aspect, so that box_aspect can also be given as a ratio of the absolute dimensions, not the relative dimensions.

property size
The (signed) width and height of the bounding box.

splitx(self, *args)
Return a list of new Bbox objects formed by splitting the original one with vertical lines at fractional positions given by args.

splity(self, *args)
Return a list of new Bbox objects formed by splitting the original one with horizontal lines at fractional positions given by args.

transformed(self, transform)
Construct a Bbox by statically transforming this one by transform.

translated(self, tx, ty)
Construct a Bbox by translating this one by tx and ty.

static union(bboxes)
Return a Bbox that contains all of the given bboxes.

property width
The (signed) width of the bounding box.

property x0
The first of the pair of x coordinates that define the bounding box.
This is not guaranteed to be less than x1 (for that, use xmin).

property x1
The second of the pair of x coordinates that define the bounding box.
This is not guaranteed to be greater than x0 (for that, use xmax).

property xmax
The right edge of the bounding box.

property xmin
The left edge of the bounding box.

property y0
The first of the pair of y coordinates that define the bounding box.
This is not guaranteed to be less than y1 (for that, use ymin).

property y1
The second of the pair of y coordinates that define the bounding box.
This is not guaranteed to be greater than y0 (for that, use ymax).
property ymax
   The top edge of the bounding box.

property ymin
   The bottom edge of the bounding box.

class matplotlib.transforms.BboxTransform(boxin, boxout, **kwargs)
   BboxTransform linearly transforms points from one Bbox to another.

Create a new BboxTransform that linearly transforms points from boxin to boxout.

__init__(self, boxin, boxout, **kwargs)
   Create a new BboxTransform that linearly transforms points from boxin to boxout.

__module__ = 'matplotlib.transforms'

__str__(self)
   Return str(self).

get_matrix(self)
   Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BboxTransformFrom(boxin, **kwargs)
   BboxTransformFrom linearly transforms points from a given Bbox to the unit bounding box.

Parameters

shorthand_name
   [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__init__(self, boxin, **kwargs)

Parameters

shorthand_name
   [str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__module__ = 'matplotlib.transforms'

__str__(self)
   Return str(self).
get_matrix(self)
    Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BboxTransformTo(boxout, **kwargs)
    Bases: matplotlib.transforms.Affine2DBase

BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given Bbox.

Create a new BboxTransformTo that linearly transforms points from the unit bounding box to boxout.

__init__(self, boxout, **kwargs)
    Create a new BboxTransformTo that linearly transforms points from the unit bounding box to boxout.

__module__ = 'matplotlib.transforms'

__str__(self)
    Return str(self).

get_matrix(self)
    Get the matrix for the affine part of this transform.

is_separable = True

class matplotlib.transforms.BboxTransformToMaxOnly(boxout, **kwargs)
    Bases: matplotlib.transforms.BboxTransformTo

BboxTransformTo is a transformation that linearly transforms points from the unit bounding box to a given Bbox with a fixed upper left of (0, 0).

Create a new BboxTransformTo that linearly transforms points from the unit bounding box to boxout.

__module__ = 'matplotlib.transforms'

get_matrix(self)
    Get the matrix for the affine part of this transform.

class matplotlib.transforms.BlendedAffine2D(x_transform, y_transform, **kwargs)
    Bases: matplotlib.transforms._BlendedMixin, matplotlib.transforms.Affine2DBase

A "blended" transform uses one transform for the x-direction, and another transform for the y-direction.

This version is an optimization for the case where both child transforms are of type Affine2DBase.

Create a new "blended" transform using x_transform to transform the x-axis and y_transform to transform the y-axis.

Both x_transform and y_transform must be 2D affine transforms.
You will generally not call this constructor directly but use the `blended_transform_factory` function instead, which can determine automatically which kind of blended transform to create.

```python
__init__(self, x_transform, y_transform, **kwargs)
```
Create a new "blended" transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

Both `x_transform` and `y_transform` must be 2D affine transforms.

You will generally not call this constructor directly but use the `blended_transform_factory` function instead, which can determine automatically which kind of blended transform to create.

```python
__module__ = 'matplotlib.transforms'
```

```python
get_matrix(self)
```
Get the matrix for the affine part of this transform.

```python
is_separable = True
```

```python
class matplotlib.transforms.BlendedGenericTransform(x_transform, y_transform, **kwargs)
```
Bases: `matplotlib.transforms._BlendedMixin`, `matplotlib.transforms.Transform`

A "blended" transform uses one transform for the x-direction, and another transform for the y-direction.

This "generic" version can handle any given child transform in the x- and y-directions.

Create a new "blended" transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

You will generally not call this constructor directly but use the `blended_transform_factory` function instead, which can determine automatically which kind of blended transform to create.

```python
__init__(self, x_transform, y_transform, **kwargs)
```
Create a new "blended" transform using `x_transform` to transform the x-axis and `y_transform` to transform the y-axis.

You will generally not call this constructor directly but use the `blended_transform_factory` function instead, which can determine automatically which kind of blended transform to create.

```python
__module__ = 'matplotlib.transforms'
```

```python
contains_branch(self, other)
```
Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.

For the case where the given transform represents the whole of this transform, returns True.
property depth
    Return the number of transforms which have been chained together to form
    this Transform instance.

    **Note:** For the special case of a Composite transform, the maximum depth
    of the two is returned.

frozen(self)
    Return a frozen copy of this transform node. The frozen copy will not be
    updated when its children change. Useful for storing a previously known
    state of a transform where `copy.deepcopy()` might normally be used.

get_affine(self)
    Get the affine part of this transform.

property has_inverse
    bool(x) -> bool

    Returns True when the argument x is true, False otherwise. The builtins
    True and False are the only two instances of the class bool. The class bool
    is a subclass of the class int, and cannot be subclassed.

input_dims = 2

inverted(self)
    Return the corresponding inverse transformation.

    It holds x == self.inverted().transform(self.transform(x)).

    The return value of this method should be treated as temporary. An update
    to self does not cause a corresponding update to its inverted copy.

property is_affine
    bool(x) -> bool

    Returns True when the argument x is true, False otherwise. The builtins
    True and False are the only two instances of the class bool. The class bool
    is a subclass of the class int, and cannot be subclassed.

is_separable = True

output_dims = 2

pass_through = True

transform_non_affine(self, points)
    Apply only the non-affine part of this transformation.

    transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

    In non-affine transformations, this is generally equivalent to
    transform(values). In affine transformations, this is always a no-op.

Parameters
values

[array] The input values as NumPy array of length \textit{input\_dims}

or shape (N x \textit{input\_dims}).

Returns

array

The output values as NumPy array of length \textit{input\_dims} or shape

(N x \textit{output\_dims}), depending on the input.

class matplotlib.transforms.CompositeAffine2D(a, b, **kwargs)
Bases: matplotlib.transforms.Affine2DBase

A composite transform formed by applying transform \textit{a} then transform \textit{b}.

This version is an optimization that handles the case where both \textit{a} and \textit{b} are 2D

affines.

Create a new composite transform that is the result of applying \textit{Affine2DBase a}

then \textit{Affine2DBase b}.

You will generally not call this constructor directly but write \textit{a + b} instead, which

will automatically choose the best kind of composite transform instance to cre-

ate.

__init__ (self, a, b, **kwargs)

Create a new composite transform that is the result of applying \textit{Affine2DBase a}

then \textit{Affine2DBase b}.

You will generally not call this constructor directly but write \textit{a + b} instead, which

will automatically choose the best kind of composite transform instance to create.

__module__ = 'matplotlib.transforms'

__str__ (self)

Return str(self).

property depth

Return the number of transforms which have been chained together to form

this Transform instance.

Note: For the special case of a Composite transform, the maximum depth

of the two is returned.

generate_matrix(self)

Get the matrix for the affine part of this transform.

class matplotlib.transforms.CompositeGenericTransform(a, b, **kwargs)
Bases: matplotlib.transforms.Transform
A composite transform formed by applying transform $a$ then transform $b$.
This "generic" version can handle any two arbitrary transformations.
Create a new composite transform that is the result of applying transform $a$ then transform $b$.
You will generally not call this constructor directly but write $a + b$ instead, which will automatically choose the best kind of composite transform instance to create.

```python
__eq__(self, other)
    Return self==value.
__hash__ = None
__init__(self, a, b, **kwargs)
    Create a new composite transform that is the result of applying transform $a$ then transform $b$.
    You will generally not call this constructor directly but write $a + b$ instead, which will automatically choose the best kind of composite transform instance to create.
__module__ = 'matplotlib.transforms'
__str__(self)
    Return str(self).
```

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

```python
frozen(self)
    Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where copy.deepcopy() might normally be used.
get_affine(self)
    Get the affine part of this transform.
```

**property has_inverse**

```python
bool(x) -> bool
    Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.
```

```python
inverted(self)
    Return the corresponding inverse transformation.
```
It holds $x == \text{self.inverted().transform(self.transform(x))}$.

The return value of this method should be treated as temporary. An update to \textit{self} does not cause a corresponding update to its inverted copy.

**property is_affine**

bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

**property is_separable**

bool(x) -> bool

Returns True when the argument x is true, False otherwise. The builtins True and False are the only two instances of the class bool. The class bool is a subclass of the class int, and cannot be subclassed.

**pass_through = True**

**transform_affine(self, points)**

Apply only the affine part of this transformation on the given array of values.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to transform(values).

**Parameters**

**values**

[array] The input values as NumPy array of length \textit{input_dims} or shape (N x \textit{input_dims}).

**Returns**

array

The output values as NumPy array of length \textit{input_dims} or shape (N x \textit{output_dims}), depending on the input.

**transform_non_affine(self, points)**

Apply only the non-affine part of this transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

**Parameters**

**values**
[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array

The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

transform_path_non_affine(self, path)

Apply the non-affine part of this transform to Path path, returning a new Path.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values))

class matplotlib.transforms.IdentityTransform(*args, **kwargs)

Bases: matplotlib.transforms.Affine2DBase

A special class that does one thing, the identity transform, in a fast way.

Parameters

shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of str(transform) when DEBUG=True.

__module__ = 'matplotlib.transforms'

__str__(self)

Return str(self).

frozen(self)

Return a frozen copy of this transform node. The frozen copy will not be updated when its children change. Useful for storing a previously known state of a transform where copy.deepcopy() might normally be used.

get_affine(self)

Get the affine part of this transform.

get_matrix(self)

Get the matrix for the affine part of this transform.

inverted(self)

Return the corresponding inverse transformation.

It holds x == self.inverted().transform(self.transform(x)).

The return value of this method should be treated as temporary. An update to self does not cause a corresponding update to its inverted copy.

transform(self, points)

Apply this transformation on the given array of values.
Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_affine(self, points)`

Apply only the affine part of this transformation on the given array of values.

transform(values) is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to `transform(values)`.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns

array

The output values as NumPy array of length `input_dims` or shape (N x `output_dims`), depending on the input.

`transform_non_affine(self, points)`

Apply only the non-affine part of this transformation.

transform(values) is always equivalent to `transform_affine(transform_non_affine(values))`.

In non-affine transformations, this is generally equivalent to `transform(values)`. In affine transformations, this is always a no-op.

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape (N x `input_dims`).

Returns
array

The output values as NumPy array of length `input_dims` or shape
(N x `output_dims`), depending on the input.

transform_path(self, path)

Apply the transform to `Path path`, returning a new `Path`.

In some cases, this transform may insert curves into the path that began as
line segments.

transform_path_affine(self, path)

Apply the affine part of this transform to `Path path`, returning a new `Path`.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(path))

transform_path_non_affine(self, path)

Apply the non-affine part of this transform to `Path path`, returning a new `Path`.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(path))

class matplotlib.transforms.LockableBbox(bbox, x0=None, y0=None, x1=None, y1=None, **kwargs)

Bases: matplotlib.transforms.BboxBase

A `Bbox` where some elements may be locked at certain values.

When the child bounding box changes, the bounds of this bbox will update ac-
cordingly with the exception of the locked elements.

**Parameters**

bbox

[`Bbox`] The child bounding box to wrap.

x0

[float or None] The locked value for x0, or None to leave un-
locked.

y0

[float or None] The locked value for y0, or None to leave un-
locked.

x1

[float or None] The locked value for x1, or None to leave un-
locked.

y1

[float or None] The locked value for y1, or None to leave un-
locked.
```
__init__(self, bbox, x0=None, y0=None, x1=None, y1=None, **kwargs)

Parameters

bbox
    [Bbox] The child bounding box to wrap.

x0
    [float or None] The locked value for x0, or None to leave unlocked.

y0
    [float or None] The locked value for y0, or None to leave unlocked.

x1
    [float or None] The locked value for x1, or None to leave unlocked.

y1
    [float or None] The locked value for y1, or None to leave unlocked.

__module__ = 'matplotlib.transforms'

__str__(self)
    Return str(self).

get_points(self)

property locked_x0
    float or None: The value used for the locked x0.

property locked_x1
    float or None: The value used for the locked x1.

property locked_y0
    float or None: The value used for the locked y0.

property locked_y1
    float or None: The value used for the locked y1.

class matplotlib.transforms.ScaledTranslation(xt, yt, scale_trans, **kwargs)
Bases: matplotlib.transforms.Affine2DBase

A transformation that translates by xt and yt, after xt and yt have been transformed by scale_trans.

Parameters

shorthand_name
```
[str] A string representing the "name" of the transform. The
name carries no significance other than to improve the readabil-
ity of \texttt{str(transform)} when DEBUG=True.

```python
__init__(self, xt, yt, scale_trans, **kwargs)
```

**Parameters**

**shorthand_name**

[\texttt{str}] A string representing the "name" of the transform. The
name carries no significance other than to improve the readabil-
ity of \texttt{str(transform)} when DEBUG=True.

```python
__module__ = 'matplotlib.transforms'
```

```python
__str__(self)
    Return str(self).
```

```python
get_matrix(self)
    Get the matrix for the affine part of this transform.
```

class matplotlib.transforms.Transform(shorthand_name=None)
    Bases: matplotlib.transforms.TransformNode

The base class of all \texttt{TransformNode} instances that actually perform a transforma-
tion.

All non-affine transformations should be subclasses of this class. New affine
transformations should be subclasses of \texttt{Affine2D}.

Subclasses of this class should override the following members (at minimum):

- \texttt{input_dims}
- \texttt{output_dims}
- \texttt{transform()}
- \texttt{inverted()} (if an inverse exists)

The following attributes may be overridden if the default is unsuitable:

- \texttt{is_separable} (defaults to True for 1d -> 1d transforms, False otherwise)
- \texttt{has_inverse} (defaults to True if \texttt{inverted()} is overridden, False otherwise)

If the transform needs to do something non-standard with \texttt{matplotlib.path.Path}
objects, such as adding curves where there were once line segments, it should
override:

- \texttt{transform_path()}

**Parameters**
shorthand_name

[str] A string representing the "name" of the transform. The name carries no significance other than to improve the readability of \texttt{str(transform)} when \texttt{DEBUG=True}.

\_\_add\_\_(\texttt{self}, \texttt{other})

Compose two transforms together so that \texttt{self} is followed by \texttt{other}.

\texttt{A + B} returns a transform \texttt{C} so that \texttt{C.transform(x) == B.transform(A.transform(x))}.

\_\_array\_\_(\texttt{self}, *\texttt{args}, **\texttt{kwargs})

Array interface to get at this Transform's affine matrix.

classmethod \_\_init\_subclass\_(\)

This method is called when a class is subclassed.

The default implementation does nothing. It may be overridden to extend subclasses.

\_\_module\_\_ = 'matplotlib.transforms'

\_\_sub\_\_(\texttt{self}, \texttt{other})

Compose \texttt{self} with the inverse of \texttt{other}, cancelling identical terms if any:

\begin{verbatim}
# In general:
A - B == A + B.inverted()
# (but see note regarding frozen transforms below).

# If \texttt{A} "ends with" \texttt{B} (i.e. \texttt{A == A' + B} for some \texttt{A'}) we can cancel
# out \texttt{B}:
(A' + B) - B == A'

# Likewise, if \texttt{B} "starts with" \texttt{A} (\texttt{B = A + B'}), we can cancel out \texttt{A}:
A - (A + B') == B'.inverted() == B'^-1
\end{verbatim}

Cancellation (rather than naively returning \texttt{A + B.inverted()}) is important for multiple reasons:

- It avoids floating-point inaccuracies when computing the inverse of \texttt{B}: \texttt{B - B} is guaranteed to cancel out exactly (resulting in the identity transform), whereas \texttt{B + B.inverted()} may differ by a small epsilon.

- \texttt{B.inverted()} always returns a frozen transform: if one computes \texttt{A + B + B.inverted()} and later mutates \texttt{B}, then \texttt{B.inverted()} won't be updated and the last two terms won't cancel out anymore; on the other hand, \texttt{A + B - B} will always be equal to \texttt{A} even if \texttt{B} is mutated.

contains_branch(\texttt{self}, \texttt{other})

Return whether the given transform is a sub-tree of this transform.

This routine uses transform equality to identify sub-trees, therefore in many situations it is object id which will be used.
For the case where the given transform represents the whole of this transform, returns True.

`contains_branch_separately(self, other_transform)`
Return whether the given branch is a sub-tree of this transform on each separate dimension.

A common use for this method is to identify if a transform is a blended transform containing an axes' data transform. e.g.:

```python
x_isdata, y_isdata = trans.contains_branch_separately(ax.transData)
```

**property depth**
Return the number of transforms which have been chained together to form this Transform instance.

**Note:** For the special case of a Composite transform, the maximum depth of the two is returned.

`get_affine(self)`
Get the affine part of this transform.

`get_matrix(self)`
Get the matrix for the affine part of this transform.

`has_inverse = False`
True if this transform has a corresponding inverse transform.

`input_dims = None`
The number of input dimensions of this transform. Must be overridden (with integers) in the subclass.

`inverted(self)`
Return the corresponding inverse transformation.

It holds \( x = \text{self}.\text{inverted()}.\text{transform}(\text{self}.\text{transform}(x)) \).

The return value of this method should be treated as temporary. An update to `self` does not cause a corresponding update to its inverted copy.

`is_separable = False`
True if this transform is separable in the x- and y- dimensions.

`output_dims = None`
The number of output dimensions of this transform. Must be overridden (with integers) in the subclass.

`transform(self, values)`
Apply this transformation on the given array of `values`.

**Parameters**

values
The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

Returns

array

The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

transform_affine(self, values)

Apply only the affine part of this transformation on the given array of values.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally a no-op. In affine transformations, this is equivalent to transform(values).

Parameters

values

[array] The input values as NumPy array of length `input_dims` or shape `(N x input_dims)`.

Returns

array

The output values as NumPy array of length `input_dims` or shape `(N x output_dims)`, depending on the input.

transform_angles(self, angles, pts, radians=False, pushoff=1e-05)

Transform a set of angles anchored at specific locations.

Parameters

angles

[(N,) array-like] The angles to transform.

pts

[(N, 2) array-like] The points where the angles are anchored.

radians

[bool, default: False] Whether `angles` are radians or degrees.

pushoff

[float] For each point in `pts` and angle in `angles`, the transformed angle is computed by transforming a segment of length `pushoff` starting at that point and making that angle relative
to the horizontal axis, and measuring the angle between the horizontal axis and the transformed segment.

Returns

(N,) array

transform_bbox(self, bbox)
Transform the given bounding box.

For smarter transforms including caching (a common requirement in Matplotlib), see TransformedBbox.

transform_non_affine(self, values)
Apply only the non-affine part of this transformation.

transform(values) is always equivalent to transform_affine(transform_non_affine(values)).

In non-affine transformations, this is generally equivalent to transform(values). In affine transformations, this is always a no-op.

Parameters

values
[array] The input values as NumPy array of length input_dims or shape (N x input_dims).

Returns

array
The output values as NumPy array of length input_dims or shape (N x output_dims), depending on the input.

transform_path(self, path)
Apply the transform to Path path, returning a new Path.

In some cases, this transform may insert curves into the path that began as line segments.

transform_path_affine(self, path)
Apply the affine part of this transform to Path path, returning a new Path.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values)).

transform_path_non_affine(self, path)
Apply the non-affine part of this transform to Path path, returning a new Path.

transform_path(path) is equivalent to transform_path_affine(transform_path_non_affine(values)).
transform_point(self, point)
    Return a transformed point.

    This function is only kept for backcompatibility; the more general transform
    method is capable of transforming both a list of points and a single point.

    The point is given as a sequence of length input_dims. The transformed point
    is returned as a sequence of length output_dims.

class matplotlib.transforms.TransformNode(shorthand_name=None)
    Bases: object

    The base class for anything that participates in the transform tree and needs to
    invalidate its parents or be invalidated. This includes classes that are not really
    transforms, such as bounding boxes, since some transforms depend on bounding
    boxes to compute their values.

    Parameters

    shorthand_name
        [str] A string representing the "name" of the transform. The
        name carries no significance other than to improve the readabil-
        ity of str(transform) when DEBUG=True.

    INVALID = 3
    INVALID_AFFINE = 2
    INVALID_NON_AFFINE = 1

    __copy__(self, *args)
    __deepcopy__(self, *args)
    __dict__ = mappingproxy({'__module__': 'matplotlib.transforms', '__doc__': '
    The base class for anything that participates in the transform tree and needs to
    invalidate its parents or be invalidated. This includes classes that are not really
    transforms, such as bounding boxes, since some transforms depend on bounding
    boxes to compute their values.

    Parameters

    shorthand_name
        [str] A string representing the "name" of the transform. The
        name carries no significance other than to improve the readabil-
        ity of str(transform) when DEBUG=True.

    __module__ = 'matplotlib.transforms'
    __setstate__(self, data_dict)
    __weakref__
        list of weak references to the object (if defined)
frozen(self)

   Return a frozen copy of this transform node. The frozen copy will not be
   updated when its children change. Useful for storing a previously known
   state of a transform where copy.deepcopy() might normally be used.

invalidate(self)

   Invalidate this TransformNode and triggers an invalidation of its ancestors.
   Should be called any time the transform changes.

is_ affine = False

is_bbox = False

pass_through = False

   If pass_through is True, all ancestors will always be invalidated, even if 'self'
   is already invalid.

set_children(self, *children)

   Set the children of the transform, to let the invalidation system know which
   transforms can invalidate this transform. Should be called from the con-
   structor of any transforms that depend on other transforms.

class matplotlib.transforms.TransformWrapper(child)

   Bases: matplotlib.transforms.Transform

   A helper class that holds a single child transform and acts equivalently to it.

   This is useful if a node of the transform tree must be replaced at run time with
   a transform of a different type. This class allows that replacement to correctly
   trigger invalidation.

   TransformWrapper instances must have the same input and output dimensions dur-
   ing their entire lifetime, so the child transform may only be replaced with another
   child transform of the same dimensions.

   child: A Transform instance. This child may later be replaced with set().

   __eq__(self, other)

      Return self==value.

   __hash__ = None

   __init__(self, child)

      child: A Transform instance. This child may later be replaced with set().

   __module__ = 'matplotlib.transforms'

   __str__(self)

      Return str(self).

frozen(self)

   Return a frozen copy of this transform node. The frozen copy will not be
   updated when its children change. Useful for storing a previously known
   state of a transform where copy.deepcopy() might normally be used.
property has_inverse
    bool(x) -> bool

    Returns True when the argument x is true, False otherwise. The builtins
    True and False are the only two instances of the class bool. The class bool
    is a subclass of the class int, and cannot be subclassed.

property is_affine
    bool(x) -> bool

    Returns True when the argument x is true, False otherwise. The builtins
    True and False are the only two instances of the class bool. The class bool
    is a subclass of the class int, and cannot be subclassed.

property is_separable
    bool(x) -> bool

    Returns True when the argument x is true, False otherwise. The builtins
    True and False are the only two instances of the class bool. The class bool
    is a subclass of the class int, and cannot be subclassed.

pass_through = True

set(self, child)
    Replace the current child of this transform with another one.
    The new child must have the same number of input and output dimensions
    as the current child.

class matplotlib.transforms.TransformedBbox(bbox, transform, **kwargs)
    Bases: matplotlib.transforms.BboxBase

    A Bbox that is automatically transformed by a given transform. When either the
    child bounding box or transform changes, the bounds of this bbox will update
    accordingly.

    Parameters

    bbox
        [Bbox]

    transform
        [Transform]

    __init__(self, bbox, transform, **kwargs)

    Parameters

    bbox
        [Bbox]

    transform
        [Transform]
__module__ = 'matplotlib.transforms'
__str__(self)
    Return str(self).
get_points(self)

class matplotlib.transforms.TransformedPatchPath(patch)
    Bases: matplotlib.transforms.TransformedPath

A TransformedPatchPath caches a non-affine transformed copy of the Patch. This cached copy is automatically updated when the non-affine part of the transform or the patch changes.

Parameters

    patch
        [Patch]

    __init__(self, patch)

Parameters

    patch
        [Patch]

__module__ = 'matplotlib.transforms'

class matplotlib.transforms.TransformedPath(path, transform)
    Bases: matplotlib.transforms.TransformNode

A TransformedPath caches a non-affine transformed copy of the Path. This cached copy is automatically updated when the non-affine part of the transform changes.

Note: Paths are considered immutable by this class. Any update to the path's vertices/codes will not trigger a transform recomputation.

Parameters

    path
        [Path]

    transform
        [Transform]

    __init__(self, path, transform)

Parameters
path

[Path]

transform

[Transform]

__module__ = 'matplotlib.transforms'

get_affine(self)

get_fully_transformed_path(self)
Return a fully-transformed copy of the child path.

get_transformed_path_and_affine(self)
Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation.

get_transformed_points_and_affine(self)
Return a copy of the child path, with the non-affine part of the transform already applied, along with the affine part of the path necessary to complete the transformation. Unlike get_transformed_path_and_affine(), no interpolation will be performed.

matplotlib.transforms.blended_transform_factory(x_transform, y_transform)
Create a new "blended" transform using x_transform to transform the x-axis and y_transform to transform the y-axis.

A faster version of the blended transform is returned for the case where both child transforms are affine.

matplotlib.transforms.composite_transform_factory(a, b)
Create a new composite transform that is the result of applying transform a then transform b.

Shortcut versions of the blended transform are provided for the case where both child transforms are affine, or one or the other is the identity transform.

Composite transforms may also be created using the '+' operator, e.g.:

```
c = a + b
```

matplotlib.transforms.interval_contains(interval, val)
Check, inclusively, whether an interval includes a given value.

Parameters

interval

[(float, float)] The endpoints of the interval.

val

[float] Value to check is within interval.
Returns

bool

Whether \( val \) is within the \( interval \).

matplotlib.transforms.interval_contains_open(interval, val)
Check, excluding endpoints, whether an interval includes a given value.

Parameters

interval

[(float, float)] The endpoints of the interval.

val

[float] Value to check is within interval.

Returns

bool

Whether \( val \) is within the \( interval \).

matplotlib.transforms.nonsingular(vmin, vmax, expander=0.001, tiny=1e-15, increasing=True)
Modify the endpoints of a range as needed to avoid singularities.

Parameters

vmin, vmax

[float] The initial endpoints.

expander

[float, default: 0.001] Fractional amount by which \( vmin \) and \( vmax \) are expanded if the original interval is too small, based on \( tiny \).

tiny

[float, default: 1e-15] Threshold for the ratio of the interval to the maximum absolute value of its endpoints. If the interval is smaller than this, it will be expanded. This value should be around 1e-15 or larger; otherwise the interval will be approaching the double precision resolution limit.

increasing

[bool, default: True] If True, swap \( vmin \), \( vmax \) if \( vmin > vmax \).

Returns
vmin, vmax

[float] Endpoints, expanded and/or swapped if necessary. If either input is inf or NaN, or if both inputs are 0 or very close to zero, it returns -expander, expander.

matplotlib.transforms.offset_copy(trans, fig=None, x=0.0, y=0.0, units='inches')

Return a new transform with an added offset.

Parameters

trans

[Transform subclass] Any transform, to which offset will be applied.

fig

[Figure, default: None] Current figure. It can be None if units are 'dots'.

x, y

[float, default: 0.0] The offset to apply.

units

[{'inches', 'points', 'dots'}, default: 'inches'] Units of the offset.

Returns

Transform subclass

Transform with applied offset.

18.56 matplotlib.tri

Unstructured triangular grid functions.

class matplotlib.tri.Triangulation(x, y, triangles=None, mask=None)

An unstructured triangular grid consisting of npoints points and ntri triangles. The triangles can either be specified by the user or automatically generated using a Delaunay triangulation.

Parameters

x, y

[array-like of shape (npoints)] Coordinates of grid points.
triangles

[int array-like of shape (ntri, 3), optional] For each triangle, the
indices of the three points that make up the triangle, ordered in
an anticlockwise manner. If not specified, the Delaunay triangula-
tion is calculated.

mask

[bool array-like of shape (ntri), optional] Which triangles are
masked out.

Notes

For a Triangulation to be valid it must not have duplicate points, triangles formed
from colinear points, or overlapping triangles.

Attributes

edges

[int array of shape (nedges, 2)] Return integer array of shape
(nedges, 2) containing all edges of non-masked triangles.

neighbors

[int array of shape (ntri, 3)] Return integer array of shape (ntri,
3) containing neighbor triangles.

mask

[bool array of shape (ntri, 3)] Masked out triangles.

is_delaunay

[bool] Whether the Triangulation is a calculated Delaunay trian-
gulation (where triangles was not specified) or not.

calculate_plane_coefficients(self, z)

Calculate plane equation coefficients for all unmasked triangles from the
point (x, y) coordinates and specified z-array of shape (npoints). The re-
turned array has shape (npoints, 3) and allows z-value at (x, y) position in
triangle tri to be calculated using \( z = \text{array}[\text{tri}, 0] \times x + \text{array}[\text{tri}, 1] \times y + \text{array}[\text{tri}, 2] \).

property edges

Return integer array of shape (nedges, 2) containing all edges of non-
masked triangles.

Each row defines an edge by it's start point index and end point index. Each
edge appears only once, i.e. for an edge between points \( i \) and \( j \), there will
only be either \( (i, j) \) or \( (j, i) \).
get_cpp_triangulation(self)
   Return the underlying C++ Triangulation object, creating it if necessary.

static get_from_args_and_kwargs(*args, **kwargs)
   Return a Triangulation object from the args and kwargs, and the remaining
   args and kwargs with the consumed values removed.

   There are two alternatives: either the first argument is a Triangulation ob-
   ject, in which case it is returned, or the args and kwargs are sufficient
   to create a new Triangulation to return. In the latter case, see Triangu-
   lation.__init__ for the possible args and kwargs.

get_masked_triangles(self)
   Return an array of triangles that are not masked.

get_trifinder(self)
   Return the default matplotlib.tri.TriFinder of this triangulation, creating
   it if necessary. This allows the same TriFinder object to be easily shared.

property neighbors
   Return integer array of shape (ntri, 3) containing neighbor triangles.

   For each triangle, the indices of the three triangles that share the same
   edges, or -1 if there is no such neighboring triangle. neighbors[i, j] is the
   triangle that is the neighbor to the edge from point index triangles[i, j] to
   point index triangles[i, (j+1)%3].

set_mask(self, mask)
   Set or clear the mask array.

   Parameters

   mask
      [None or bool array of length ntri]

class matplotlib.tri.TriContourSet(ax, *args, **kwargs)
   Bases: matplotlib.contour.ContourSet

   Create and store a set of contour lines or filled regions for a triangular grid.

   User-callable method: clabel

   Attributes

   ax
      The axes object in which the contours are drawn.

   collections
      A silent list of LineCollections or PolyCollections.

   levels
      Contour levels.
layers

Same as levels for line contours; half-way between levels for filled contours. See \_process\_colors().

Draw triangular grid contour lines or filled regions, depending on whether keyword arg 'filled' is False (default) or True.

The first argument of the initializer must be an axes object. The remaining arguments and keyword arguments are described in the docstring of \texttt{tricontour}.

class matplotlib.tri.TriFinder(triangulation)
Abstract base class for classes used to find the triangles of a Triangulation in which (x, y) points lie.

Rather than instantiate an object of a class derived from TriFinder, it is usually better to use the function \texttt{Triangulation.get\_trifinder}.

Derived classes implement \_\_call\_\_(x, y) where x and y are array-like point coordinates of the same shape.

class matplotlib.tri.TrapezoidMapTriFinder(triangulation)
Bases: matplotlib.tri.trifinder.TriFinder

The triangulation must be valid, i.e. it must not have duplicate points, triangles formed from colinear points, or overlapping triangles. The algorithm has some tolerance to triangles formed from colinear points, but this should not be relied upon.

class matplotlib.tri.TriInterpolator(triangulation, z, trifinder=None)
Abstract base class for classes used to interpolate on a triangular grid.

Derived classes implement the following methods:

• \_\_call\_\_(x, y), where x, y are array-like point coordinates of the same shape, and that returns a masked array of the same shape containing the interpolated z-values.

• \texttt{gradient(x, y)}, where x, y are array-like point coordinates of the same shape, and that returns a list of 2 masked arrays of the same shape containing the 2 derivatives of the interpolator (derivatives of interpolated z values with respect to x and y).

class matplotlib.tri.LinearTriInterpolator(triangulation, z, trifinder=None)
Bases: matplotlib.tri.triinterpolate.TriInterpolator

Linear interpolator on a triangular grid.

Each triangle is represented by a plane so that an interpolated value at point (x, y) lies on the plane of the triangle containing (x, y). Interpolated values
are therefore continuous across the triangulation, but their first derivatives are
discontinuous at edges between triangles.

**Parameters**

**triangulation**

[Triangulation] The triangulation to interpolate over.

**z**

[array-like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.

**trifinder**

[TriFinder, optional] If this is not specified, the Triangulation's default TriFinder will be used by calling Triangulation.get_trifinder.

**Methods**

```
__call__(x, y)  # (Returns interpolated values at (x, y) points.)
gradient(x, y)  # (Returns interpolated derivatives at (x, y) points.)
```

**gradient(self, x, y)**

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

**Parameters**

**x, y**

[array-like] x and y coordinates of the same shape and any number of dimensions.

**Returns**

**dzdx, dzdy**

[np.ma.array] 2 masked arrays of the same shape as x and y; values corresponding to (x, y) points outside of the triangulation are masked out. The first returned array contains the values of $\frac{\partial z}{\partial x}$ and the second those of $\frac{\partial z}{\partial y}$.

class matplotlib.tri.CubicTriInterpolator(triangulation, z, kind='min_E', trifinder=None, dz=None)

Bases: matplotlib.tri.triinterpolate.TriInterpolator

Cubic interpolator on a triangular grid.
In one-dimension - on a segment - a cubic interpolating function is defined by the values of the function and its derivative at both ends. This is almost the same in 2-d inside a triangle, except that the values of the function and its 2 derivatives have to be defined at each triangle node.

The CubicTriInterpolator takes the value of the function at each node - provided by the user - and internally computes the value of the derivatives, resulting in a smooth interpolation. (As a special feature, the user can also impose the value of the derivatives at each node, but this is not supposed to be the common usage.)

**Parameters**

- **triangulation**
  
  [Triangulation] The triangulation to interpolate over.

- **z**
  
  [array-like of shape (npoints,)] Array of values, defined at grid points, to interpolate between.

- **kind**
  
  [{'min_E', 'geom', 'user'}, optional] Choice of the smoothing algorithm, in order to compute the interpolant derivatives (defaults to 'min_E'):

  - if 'min_E': (default) The derivatives at each node is computed to minimize a bending energy.
  - if 'geom': The derivatives at each node is computed as a weighted average of relevant triangle normals. To be used for speed optimization (large grids).
  - if 'user': The user provides the argument dz, no computation is hence needed.

- **trifinder**
  
  [TriFinder, optional] If not specified, the Triangulation’s default TriFinder will be used by calling Triangulation.get_trifinder.

- **dz**
  
  [tuple of array-likes (dzdx, dzdy), optional] Used only if kind = 'user'. In this case dz must be provided as (dzdx, dzdy) where dzdx, dzdy are arrays of the same shape as z and are the interpolant first derivatives at the triangulation points.
Notes

This note is a bit technical and details how the cubic interpolation is computed. The interpolation is based on a Clough-Tocher subdivision scheme of the triangulation mesh (to make it clearer, each triangle of the grid will be divided in 3 child-triangles, and on each child triangle the interpolated function is a cubic polynomial of the 2 coordinates). This technique originates from FEM (Finite Element Method) analysis; the element used is a reduced Hsieh-Clough-Tocher (HCT) element. Its shape functions are described in [1]. The assembled function is guaranteed to be C1-smooth, i.e. it is continuous and its first derivatives are also continuous (this is easy to show inside the triangles but is also true when crossing the edges).

In the default case (kind = 'min_E'), the interpolant minimizes a curvature energy on the functional space generated by the HCT element shape functions - with imposed values but arbitrary derivatives at each node. The minimized functional is the integral of the so-called total curvature (implementation based on an algorithm from [2] - PCG sparse solver):

\[
E(z) = \frac{1}{2} \int_{\Omega} \left( \left( \frac{\partial^2 z}{\partial x^2} \right)^2 + \left( \frac{\partial^2 z}{\partial y^2} \right)^2 + 2 \left( \frac{\partial^2 z}{\partial y \partial x} \right)^2 \right) \, dx \, dy
\]

If the case kind = 'geom' is chosen by the user, a simple geometric approximation is used (weighted average of the triangle normal vectors), which could improve speed on very large grids.

References

[1], [2]

Methods

```python
__call__(x, y)
(Returns interpolated values at (x, y) points.)
```

`gradient(x, y)`

(Returns interpolated derivatives at the specified (x, y) points.)

`gradient(self, x, y)`

Returns a list of 2 masked arrays containing interpolated derivatives at the specified (x, y) points.

Parameters

x, y

[array-like] x and y coordinates of the same shape and any number of dimensions.

18.56. matplotlib.tri
Returns

\[ \text{dzdx, dzdy} \]

[np.ma.array] 2 masked arrays of the same shape as \( x \) and \( y \); values corresponding to \((x, y)\) points outside of the triangulation are masked out. The first returned array contains the values of \( \frac{\partial z}{\partial x} \) and the second those of \( \frac{\partial z}{\partial y} \).

class matplotlib.tri.TriRefiner(triangulation)

Abstract base class for classes implementing mesh refinement.

A TriRefiner encapsulates a Triangulation object and provides tools for mesh refinement and interpolation.

Derived classes must implement:

• refine_triangulation(return_tri_index=False, **kwargs) , where the optional keyword arguments kvargs are defined in each TriRefiner concrete implementation, and which returns:
  - a refined triangulation,
  - optionally (depending on return_tri_index), for each point of the refined triangulation: the index of the initial triangulation triangle to which it belongs.

• refine_field(z, triinterpolator=None, **kwargs), where:
  - \( z \) array of field values (to refine) defined at the base triangulation nodes,
  - \( triinterpolator \) is an optional TriInterpolator,
  - the other optional keyword arguments kvargs are defined in each TriRefiner concrete implementation;

and which returns (as a tuple) a refined triangular mesh and the interpolated values of the field at the refined triangulation nodes.

class matplotlib.tri.UniformTriRefiner(triangulation)

Bases: matplotlib.tri.trirefine.TriRefiner

Uniform mesh refinement by recursive subdivisions.

Parameters

\[ \text{triangulation} \]

[Triangulation] The encapsulated triangulation (to be refined)

refine_field(self, z, triinterpolator=None, subdiv=3)

Refine a field defined on the encapsulated triangulation.

Parameters
z

[1d-array-like of length n_points] Values of the field to refine, defined at the nodes of the encapsulated triangulation. (n_points is the number of points in the initial triangulation)

**triinterpolator**

[TriInterpolator, optional] Interpolator used for field interpolation. If not specified, a CubicTriInterpolator will be used.

**subdiv**

[int, default: 3] Recursion level for the subdivision. Each triangle is divided into $4^{\text{subdiv}}$ child triangles.

**Returns**

refi_tri

[Triangulation] The returned refined triangulation.

refi_z

[1d array of length: refi_tri node count.] The returned interpolated field (at refi_tri nodes).

refine_triangulation(self, return_tri_index=False, subdiv=3)

Compute an uniformly refined triangulation refi_triangulation of the encapsulated triangulation.

This function refines the encapsulated triangulation by splitting each father triangle into 4 child sub-triangles built on the edges midside nodes, recursing subdiv times. In the end, each triangle is hence divided into $4^{\text{subdiv}}$ child triangles.

**Parameters**

**return_tri_index**

[bool, default: False] Whether an index table indicating the father triangle index of each point is returned.

**subdiv**

[int, default: 3] Recursion level for the subdivision. Each triangle is divided into $4^{\text{subdiv}}$ child triangles; hence, the default results in 64 refined subtriangles for each triangle of the initial triangulation.

**Returns**

refi_triangulation

[Triangulation] The refined triangulation.
found_index

[int array] Index of the initial triangulation containing triangle, for each point of refi_triangulation. Returned only if return_tri_index is set to True.

class matplotlib.tri.TriAnalyzer(triangulation)
Define basic tools for triangular mesh analysis and improvement.

A TriAnalyzer encapsulates a Triangulation object and provides basic tools for mesh analysis and mesh improvement.

Parameters

triangulation

[Triangulation] The encapsulated triangulation to analyze.

Attributes

scale_factors

Factors to rescale the triangulation into a unit square.

circle_ratios(self, rescale=True)
Return a measure of the triangulation triangles flatness.

The ratio of the incircle radius over the circumcircle radius is a widely used indicator of a triangle flatness. It is always <= 0.5 and == 0.5 only for equilateral triangles. Circle ratios below 0.01 denote very flat triangles.

To avoid unduly low values due to a difference of scale between the 2 axis, the triangular mesh can first be rescaled to fit inside a unit square with scale_factors (Only if rescale is True, which is its default value).

Parameters

rescale

[bool, default: True] If True, internally rescale (based on scale_factors), so that the (unmasked) triangles fit exactly inside a unit square mesh.

Returns

masked array

Ratio of the incircle radius over the circumcircle radius, for each 'rescaled' triangle of the encapsulated triangulation. Values corresponding to masked triangles are masked out.
get_flat_tri_mask(self, min_circle_ratio=0.01, rescale=True)

Eliminate excessively flat border triangles from the triangulation.

Returns a mask new_mask which allows to clean the encapsulated triangulation from its border-located flat triangles (according to their circle_ratios()). This mask is meant to be subsequently applied to the triangulation using Triangulation.set_mask. new_mask is an extension of the initial triangulation mask in the sense that an initially masked triangle will remain masked.

The new_mask array is computed recursively; at each step flat triangles are removed only if they share a side with the current mesh border. Thus no new holes in the triangulated domain will be created.

Parameters

min_circle_ratio

[float, default: 0.01] Border triangles with incircle/circumcircle radii ratio r/R will be removed if r/R < min_circle_ratio.

rescale

[bool, default: True] If True, first, internally rescale (based on scale_factors) so that the (unmasked) triangles fit exactly inside a unit square mesh. This rescaling accounts for the difference of scale which might exist between the 2 axis.

Returns

bool array-like

Mask to apply to encapsulated triangulation. All the initially masked triangles remain masked in the new_mask.

Notes

The rationale behind this function is that a Delaunay triangulation - of an unstructured set of points - sometimes contains almost flat triangles at its border, leading to artifacts in plots (especially for high-resolution contouring). Masked with computed new_mask, the encapsulated triangulation would contain no more unmasked border triangles with a circle ratio below min_circle_ratio, thus improving the mesh quality for subsequent plots or interpolation.

property scale_factors

Factors to rescale the triangulation into a unit square.

Returns

(float, float)
Scaling factors \((k_x, k_y)\) so that the triangulation \([\text{triangulation}.x \times k_x, \text{triangulation}.y \times k_y]\) fits exactly inside a unit square.

### 18.57 matplotlib.type1font

A class representing a Type 1 font.

This version reads pfa and pfb files and splits them for embedding in pdf files. It also supports SlantFont and ExtendFont transformations, similarly to pdfTeX and friends. There is no support yet for subsetting.

Usage:

```python
>>> font = Type1Font(filename)
>>> clear_part, encrypted_part, finale = font.parts
>>> slanted_font = font.transform({"slant": 0.167})
>>> extended_font = font.transform({"extend": 1.2})
```

Sources:

- Adobe Technical Note #5040, Supporting Downloadable PostScript Language Fonts.

```python
class matplotlib.type1font.Type1Font(input)
Bases: object

A class representing a Type-1 font, for use by backends.

**Attributes**

- **parts**
  
  [tuple] A 3-tuple of the cleartext part, the encrypted part, and the finale of zeros.

- **prop**
  
  [Dict[str, Any]] A dictionary of font properties.

Initialize a Type-1 font.

**Parameters**

- **input**
  
  [str or 3-tuple] Either a pfb file name, or a 3-tuple of already-decoded Type-1 font parts.
```

parts
prop

transform(self, effects)

Return a new font that is slanted and/or extended.

Parameters

effects

[dict] A dict with optional entries:

• 'slant'

[float, default: 0] Tangent of the angle that the font is to be
slanted to the right. Negative values slant to the left.

• 'extend'

[float, default: 1] Scaling factor for the font width. Values
less than 1 condense the glyphs.

Returns

Type1Font

18.58 matplotlib.units

The classes here provide support for using custom classes with Matplotlib, e.g., those
that do not expose the array interface but know how to convert themselves to arrays.
It also supports classes with units and units conversion. Use cases include convert-
ers for custom objects, e.g., a list of datetime objects, as well as for objects that are
unit aware. We don’t assume any particular units implementation; rather a units im-
plementation must provide the register with the Registry converter dictionary and a
ConversionInterface. For example, here is a complete implementation which supports
plotting with native datetime objects:

```python
import matplotlib.units as units
import matplotlib.dates as dates
import matplotlib.ticker as ticker
import datetime

class DateConverter(units.ConversionInterface):

    @staticmethod
    def convert(value, unit, axis):
        'Convert a datetime value to a scalar or array'
        return dates.date2num(value)

    @staticmethod
    def axisinfo(unit, axis):
```

(continues on next page)
'Return major and minor tick locators and formatters'
if unit!='date': return None
majloc = dates.AutoDateLocator()
majfmt = dates.AutoDateFormatter(majloc)
return AxisInfo(majloc=majloc,
        majfmt=majfmt,
        label='date')

@staticmethod
def default_units(x, axis):
    'Return the default unit for x or None'
    return 'date'

# Finally we register our object type with the Matplotlib units registry.
units.registry[datetime.date] = DateConverter()

class matplotlib.units.AxisInfo(majloc=None, minloc=None,
        majfmt=None, minfmt=None, label=None,
        default_limits=None):
    Bases: object

    Information to support default axis labeling, tick labeling, and limits.
    An instance of this class must be returned by ConversionInterface.axisinfo.

    Parameters

    majloc, minloc
        [Locator, optional] Tick locators for the major and minor ticks.

    majfmt, minfmt
        [Formatter, optional] Tick formatters for the major and minor
        ticks.

    label
        [str, optional] The default axis label.

    default_limits
        [optional] The default min and max limits of the axis if no data
        has been plotted.
**Notes**

If any of the above are `None`, the axis will simply use the default value.

```python
exception matplotlib.units.ConversionError
    Bases: TypeError

class matplotlib.units.ConversionInterface
    Bases: object
    The minimal interface for a converter to take custom data types (or sequences) and convert them to values Matplotlib can use.

    static axisinfo(unit, axis)
        Return an `AxisInfo` for the axis with the specified units.

    static convert(obj, unit, axis)
        Convert `obj` using `unit` for the specified `axis`.
        If `obj` is a sequence, return the converted sequence. The output must be a sequence of scalars that can be used by the numpy array layer.

    static default_units(x, axis)
        Return the default unit for `x` or `None` for the given axis.

    static is_numlike(x)
        The Matplotlib datalim, autoscaling, locators etc work with scalars which are the units converted to floats given the current unit. The converter may be passed these floats, or arrays of them, even when units are set.

class matplotlib.units.DecimalConverter
    Bases: matplotlib.units.ConversionInterface
    Converter for decimal.Decimal data to float.

    static axisinfo(unit, axis)
        Return an `AxisInfo` for the axis with the specified units.

    static convert(value, unit, axis)
        Convert Decimals to floats.
        The `unit` and `axis` arguments are not used.

    Parameters

    value
        [decimal.Decimal or iterable] Decimal or list of Decimal need to be converted

    static default_units(x, axis)
        Return the default unit for `x` or `None` for the given axis.

class matplotlib.units.Registry
    Bases: dict
Register types with conversion interface.

```
get_converter(self, x)
```

Get the converter interface instance for `x`, or None.

18.59 `matplotlib.widgets`
18.59.1 GUI neutral widgets

Widgets that are designed to work for any of the GUI backends. All of these widgets require you to predefine a `matplotlib.axes.Axes` instance and pass that as the first parameter. Matplotlib doesn't try to be too smart with respect to layout -- you will have to figure out how wide and tall you want your Axes to be to accommodate your widget.

class matplotlib.widgets.AxesWidget(ax)
    Bases: matplotlib.widgets.Widget

    Widget connected to a single `Axes`.

    To guarantee that the widget remains responsive and not garbage-collected, a reference to the object should be maintained by the user.

    This is necessary because the callback registry maintains only weak-refs to the functions, which are member functions of the widget. If there are no references to the widget object it may be garbage collected which will disconnect the callbacks.

    Attributes

    ax
        [Axes] The parent axes for the widget.

    canvas
        [FigureCanvasBase] The parent figure canvas for the widget.

    active
        [bool] Is the widget active?

    connect_event(self, event, callback)
        Connect callback with an event.

        This should be used in lieu of figure.canvas.mpl_connect since this function stores callback ids for later clean up.

    disconnect_events(self)
        Disconnect all events created by this widget.

class matplotlib.widgets.Button(ax, label, image=None, color='0.85', hover-color='0.95')
    Bases: matplotlib.widgets.AxesWidget

    A GUI neutral button.

    For the button to remain responsive you must keep a reference to it. Call `on_clicked` to connect to the button.

    Attributes
ax
   The matplotlib.axes.Axes the button renders into.

label
   A matplotlib.text.Text instance.

color
   The color of the button when not hovering.

hovercolor
   The color of the button when hovering.

Parameters

ax
   [Axes] The Axes instance the button will be placed into.

label
   [str] The button text.

image
   [array-like or PIL Image] The image to place in the button, if not None. The parameter is directly forwarded to imshow.

color
   [color] The color of the button when not activated.

hovercolor
   [color] The color of the button when the mouse is over it.

disconnect(self, cid)
   Remove the callback function with connection id cid.

on_clicked(self, func)
   Connect the callback function func to button click events.
   Returns a connection id, which can be used to disconnect the callback.

class matplotlib.widgets.CheckButtons(ax, labels, actives=None)
   Bases: matplotlib.widgets.AxesWidget

   A GUI neutral set of check buttons.

   For the check buttons to remain responsive you must keep a reference to this object.

   Connect to the CheckButtons with the on_clicked method.

   Attributes
ax

[Axes] The parent axes for the widget.

labels

[list of Text]

rectangles

[list of Rectangle]

lines

[list of (Line2D, Line2D) pairs] List of lines for the x’s in the check boxes. These lines exist for each box, but have set_visible(False) when its box is not checked.

Add check buttons to matplotlib.axes.Axes instance ax

Parameters

ax

[Axes] The parent axes for the widget.

labels

[list of str] The labels of the check buttons.

actives

[list of bool, optional] The initial check states of the buttons. The list must have the same length as labels. If not given, all buttons are unchecked.

disconnect(self, cid)

Remove the observer with connection id cid.

get_status(self)

Return a tuple of the status (True/False) of all of the check buttons.

on_clicked(self, func)

Connect the callback function func to button click events.

Returns a connection id, which can be used to disconnect the callback.

set_active(self, index)

Toggle (activate or deactivate) a check button by index.

Callbacks will be triggered if eventson is True.

Parameters

index

[int] Index of the check button to toggle.
Raises

ValueError

If index is invalid.

class matplotlib.widgets.Cursor(ax, horizOn=True, vertOn=True, useblit=False, **lineprops)
Bases: matplotlib.widgets.AxesWidget

A crosshair cursor that spans the axes and moves with mouse cursor.
For the cursor to remain responsive you must keep a reference to it.

Parameters

ax

[matplotlib.axes.Axes] The Axes to attach the cursor to.

horizOn

[bool, default: True] Whether to draw the horizontal line.

vertOn

[bool, default: True] Whether to draw the vertical line.

useblit

[bool, default: False] Use blitting for faster drawing if supported by the backend.

Other Parameters

**lineprops

Line2D properties that control the appearance of the lines. See also axhline.

Examples

See /gallery/widgets/cursor.

clear(self, event)

Internal event handler to clear the cursor.

onmove(self, event)

Internal event handler to draw the cursor when the mouse moves.
class matplotlib.widgets.EllipseSelector(ax, onselect, drawtype='box', minspanx=0, minspany=0, useblit=False, lineprops=None, rectprops=None, spancoords='data', button=None, maxdist=10, marker_props=None, interactive=False, state_modifier_keys=None)

Bases: matplotlib.widgets.RectangleSelector

Select an elliptical region of an axes.

For the cursor to remain responsive you must keep a reference to it.

Example usage:

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib.widgets import EllipseSelector

def onselect(eclick, erelease):
    "eclick and erelease are matplotlib events at press and release."
    print('startposition: (%f, %f)' % (eclick.xdata, eclick.ydata))
    print('endposition : (%f, %f)' % (erelease.xdata, erelease.ydata))
    print('used button : %d', eclick.button)

def toggle_selector(event):
    print('Key pressed.
    if event.key in ['Q', 'q'] and toggle_selector.ES.active:
       print('EllipseSelector deactivated.')
       toggle_selector.RS.set_active(False)
    if event.key in ['A', 'a'] and not toggle_selector.ES.active:
       print('EllipseSelector activated.')
       toggle_selector.ES.set_active(True)

x = np.arange(100.) / 99
y = np.sin(x)
fig, ax = plt.subplots()
ax.plot(x, y)
toggle_selector.ES = EllipseSelector(ax, onselect, drawtype='line')
fig.canvas.mpl_connect('key_press_event', toggle_selector)
plt.show()
```

Parameters

- **ax**
  
  [Axes] The parent axes for the widget.

- **onselect**
  
  [function] A callback function that is called after a selection is completed. It must have the signature:
def onselect(eclick: MouseEvent, erelease: MouseEvent)

where *eclick* and *erelease* are the mouse click and release *MouseEvent* that start and complete the selection.

drawtype

[{"box", "line", "none"}, default: "box"] Whether to draw the full rectangle box, the diagonal line of the rectangle, or nothing at all.

minspanx

[float, default: 0] Selections with an x-span less than *minspanx* are ignored.

minspany

[float, default: 0] Selections with an y-span less than *minspany* are ignored.

useblit

[bool, default: False] Whether to use blitting for faster drawing (if supported by the backend).

lineprops

[dict, optional] Properties with which the line is drawn, if *drawtype == "line"*. Default:

```python
dict(color="black", linestyle="-", linewidth=2, alpha=0.5)
```

rectprops

[dict, optional] Properties with which the rectangle is drawn, if *drawtype == "box"*. Default:

```python
dict(facecolor="red", edgecolor="black", alpha=0.2, fill=True)
```

spancoords

[{"data", "pixels"}, default: "data"] Whether to interpret *minspanx* and *minspany* in data or in pixel coordinates.

button

[MouseButton, list of MouseButton, default: all buttons] Button(s) that trigger rectangle selection.

maxdist

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.
**marker_props**

[dict] Properties with which the interactive handles are drawn. Currently not implemented and ignored.

**interactive**

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

**state_modifier_keys**

[dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults.

- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".
- "square": Makes the shape square, default: "shift".
- "center": Make the initial point the center of the shape, default: "ctrl".

"square" and "center" can be combined.

draw_shape(self, extents)

class matplotlib.widgets.Lasso(ax, xy, callback=None, useblit=True)
    Bases: matplotlib.widgets.AxesWidget

Selection curve of an arbitrary shape.

The selected path can be used in conjunction with `contains_point` to select data points from an image.

Unlike `LassoSelector`, this must be initialized with a starting point `xy`, and the `Lasso` events are destroyed upon release.

**Parameters**

**ax**

[Axes] The parent axes for the widget.

**xy**

[(float, float)] Coordinates of the start of the lasso.

**callback**

[callable] Whenever the lasso is released, the `callback` function is called and passed the vertices of the selected path.

onmove(self, event)

onrelease(self, event)
class matplotlib.widgets.LassoSelector(ax, onselect=None, useblit=True, lineprops=None, button=None)

Bases: matplotlib.widgets._SelectorWidget

Selection curve of an arbitrary shape.

For the selector to remain responsive you must keep a reference to it.

The selected path can be used in conjunction with contains_point to select data points from an image.

In contrast to Lasso, LassoSelector is written with an interface similar to RectangleSelector and SpanSelector, and will continue to interact with the axes until disconnected.

Example usage:

```python
ax = subplot(111)
ax.plot(x, y)

def onselect(verts):
    print(verts)
lasso = LassoSelector(ax, onselect)
```

**Parameters**

- **ax**
  
  [Axes] The parent axes for the widget.

- **onselect**
  
  [function] Whenever the lasso is released, the onselect function is called and passed the vertices of the selected path.

- **button**
  
  [MouseButton or list of MouseButton, optional] The mouse buttons used for rectangle selection. Default is None, which corresponds to all buttons.

```python
onpress(self, event)
onrelease(self, event)
```

class matplotlib.widgets.LockDraw

Bases: object

Some widgets, like the cursor, draw onto the canvas, and this is not desirable under all circumstances, like when the toolbar is in zoom-to-rect mode and drawing a rectangle. To avoid this, a widget can acquire a canvas' lock with canvas.widgetlock(widget) before drawing on the canvas; this will prevent other widgets from doing so at the same time (if they also try to acquire the lock first).
available(self, o)
    Return whether drawing is available to o.

isowner(self, o)
    Return whether o owns this lock.

locked(self)
    Return whether the lock is currently held by an owner.

release(self, o)
    Release the lock from o.

class matplotlib.widgets.MultiCursor(canvas, axes, useblit=True, horizontOn=False, vertOn=True, **lineprops)
    Bases: matplotlib.widgets.Widget

    Provide a vertical (default) and/or horizontal line cursor shared between multiple axes.

    For the cursor to remain responsive you must keep a reference to it.

    Example usage:

    from matplotlib.widgets import MultiCursor
    import matplotlib.pyplot as plt
    import numpy as np

    fig, (ax1, ax2) = plt.subplots(nrows=2, sharex=True)
    t = np.arange(0.0, 2.0, 0.01)
    ax1.plot(t, np.sin(2*np.pi*t))
    ax2.plot(t, np.sin(4*np.pi*t))

    multi = MultiCursor(fig.canvas, (ax1, ax2), color='r', lw=1,
                        horizOn=False, vertOn=True)

    plt.show()

    clear(self, event)
        Clear the cursor.

    connect(self)
        Connect events.

    disconnect(self)
        Disconnect events.

    onmove(self, event)

    class matplotlib.widgets.PolygonSelector(ax, onselect, useblit=False, lineprops=None, markerprops=None, vertex_select_radius=15)
        Bases: matplotlib.widgets._SelectorWidget

        Select a polygon region of an axes.

        Place vertices with each mouse click, and make the selection by completing the polygon (clicking on the first vertex). Hold the ctrl key and click and drag a
vertex to reposition it (the `ctrl` key is not necessary if the polygon has already been completed). Hold the `shift` key and click and drag anywhere in the axes to move all vertices. Press the `esc` key to start a new polygon.

For the selector to remain responsive you must keep a reference to it.

**Parameters**

- `ax`  
  `[Axes]` The parent axes for the widget.

- `onselect`  
  [function] When a polygon is completed or modified after completion, the `onselect` function is called and passed a list of the vertices as `(xdata, ydata)` tuples.

- `useblit`  
  [bool, default: False]

- `lineprops`  
  [dict, default: `dict(color='k', linestyle='-', linewidth=2, alpha=0.5)`] Artist properties for the line representing the edges of the polygon.

- `markerprops`  
  [dict, default: `dict(marker='o', markersize=7, mec='k', mfc='k', alpha=0.5)`] Artist properties for the markers drawn at the vertices of the polygon.

- `vertex_select_radius`  
  [float, default: 15px] A vertex is selected (to complete the polygon or to move a vertex) if the mouse click is within `vertex_select_radius` pixels of the vertex.

**Examples**

```python
/gallery/widgets/polygon_selector_demo
```

```python
onmove(self, event)
    Cursor move event handler and validator

property verts
    The polygon vertices, as a list of `(x, y)` pairs.
```

```python
class matplotlib.widgets.RadioButtons(ax, labels, active=0, activecolor='blue')
```

**Bases:** `matplotlib.widgets.AxesWidget`

A GUI neutral radio button.

For the buttons to remain responsive you must keep a reference to this object.
Connect to the RadioButtons with the `on_clicked` method.

**Attributes**

- **ax**
  - `[Axes]` The parent axes for the widget.

- **activecolor**
  - [color] The color of the selected button.

- **labels**
  - [list of `Text`] The button labels.

- **circles**
  - [list of `Circle`] The buttons.

- **value_selected**
  - [str] The label text of the currently selected button.

Add radio buttons to an `Axes`.

**Parameters**

- **ax**
  - `[Axes]` The axes to add the buttons to.

- **labels**
  - [list of str] The button labels.

- **active**
  - [int] The index of the initially selected button.

- **activecolor**
  - [color] The color of the selected button.

- **disconnect**(*self*, *cid*)
  - Remove the observer with connection id `cid`.

- **on_clicked**(*self*, *func*)
  - Connect the callback function `func` to button click events.
    - Returns a connection id, which can be used to disconnect the callback.

- **set_active**(*self*, *index*)
  - Select button with number `index`.
    - Callbacks will be triggered if `eventson` is True.
Matplotlib, Release 3.3.3

class matplotlib.widgets.RectangleSelector(ax,
onselect,
drawtype='box',
minspanx=0, minspany=0, useblit=False,
lineprops=None,
rectprops=None,
spancoords='data',
button=None,
maxdist=10, marker_props=None,
interactive=False,
state_modiﬁer_keys=None)
Bases: matplotlib.widgets._SelectorWidget
Select a rectangular region of an axes.
For the cursor to remain responsive you must keep a reference to it.

Examples
/gallery/widgets/rectangle_selector
Parameters
ax
[Axes] The parent axes for the widget.
onselect
[function] A callback function that is called after a selection is
completed. It must have the signature:
def onselect(eclick: MouseEvent, erelease: MouseEvent)

where eclick and erelease are the mouse click and release
MouseEvents that start and complete the selection.
drawtype
[{"box", "line", "none"}, default: "box"] Whether to draw the full
rectangle box, the diagonal line of the rectangle, or nothing at
all.
minspanx
[ﬂoat, default: 0] Selections with an x-span less than minspanx
are ignored.
minspany
[ﬂoat, default: 0] Selections with an y-span less than minspany
are ignored.
useblit
[bool, default: False] Whether to use blitting for faster drawing
(if supported by the backend).
2836

Chapter 18. Modules


**lineprops**

[dict, optional] Properties with which the line is drawn, if drawtype == "line". Default:

```
dict(color="black", linestyle="-", linewidth=2, alpha=0.5)
```

**rectprops**

[dict, optional] Properties with which the rectangle is drawn, if drawtype == "box". Default:

```
dict(facecolor="red", edgecolor="black", alpha=0.2, fill=True)
```

**spancoords**

["data", "pixels"], default: "data"] Whether to interpret minsapanx and minspany in data or in pixel coordinates.

**button**

[MouseButton, list of MouseButton, default: all buttons] Button(s) that trigger rectangle selection.

**maxdist**

[float, default: 10] Distance in pixels within which the interactive tool handles can be activated.

**marker_props**

[dict] Properties with which the interactive handles are drawn. Currently not implemented and ignored.

**interactive**

[bool, default: False] Whether to draw a set of handles that allow interaction with the widget after it is drawn.

**state_modifier_keys**

[dict, optional] Keyboard modifiers which affect the widget's behavior. Values amend the defaults.

- "move": Move the existing shape, default: no modifier.
- "clear": Clear the current shape, default: "escape".
- "square": Makes the shape square, default: "shift".
- "center": Make the initial point the center of the shape, default: "ctrl".

"square" and "center" can be combined.

**property center**

Center of rectangle
property corners
Corners of rectangle from lower left, moving clockwise.

draw_shape(self, extents)

property edge_centers
Midpoint of rectangle edges from left, moving clockwise.

property extents
Return (xmin, xmax, ymin, ymax).

property geometry
Return an array of shape (2, 5) containing the x (RectangleSelector.geometry[1, :]) and y (RectangleSelector.geometry[0, :]) coordinates of the four corners of the rectangle starting and ending in the top left corner.

class matplotlib.widgets.Slider(ax, label, valmin, valmax, valinit=0.5, valfmt=None, closedmin=True, closedmax=True, slidermin=None, slidermax=None, dragging=True, valstep=None, orientation='horizontal', **kwargs)

Bases: matplotlib.widgets.AxesWidget

A slider representing a floating point range.

Create a slider from valmin to valmax in axes ax. For the slider to remain responsive you must maintain a reference to it. Call on_changed() to connect to the slider event.

Attributes

val
[float] Slider value.

Parameters

ax
[Axes] The Axes to put the slider in.

label
[str] Slider label.

valmin
[float] The minimum value of the slider.

valmax
[float] The maximum value of the slider.

valinit
[float, default: 0.5] The slider initial position.
valfmt

[|str, default: None] %-format string used to format the slider value. If None, a ScalarFormatter is used instead.

closedmin

[|bool, default: True] Whether the slider interval is closed on the bottom.

closedmax

[|bool, default: True] Whether the slider interval is closed on the top.

slidermin

[|Slider, default: None] Do not allow the current slider to have a value less than the value of the Slider slidermin.

slidermax

[|Slider, default: None] Do not allow the current slider to have a value greater than the value of the Slider slidermax.

dragging

[|bool, default: True] If True the slider can be dragged by the mouse.

valstep

[|float, default: None] If given, the slider will snap to multiples of valstep.

orientation

[|{'horizontal', 'vertical'}, default: 'horizontal'] The orientation of the slider.

Notes

Additional kwargs are passed on to self.poly which is the Rectangle that draws the slider knob. See the Rectangle documentation for valid property names (facecolor, edgecolor, alpha, etc.).

disconnect(self, cid)

Remove the observer with connection id cid

Parameters

cid

[|int] Connection id of the observer to be removed
on_changed(self, func)
    When the slider value is changed call func with the new slider value

    Parameters

        func
            [callable] Function to call when slider is changed. The function
            must accept a single float as its arguments.

    Returns

        int
            Connection id (which can be used to disconnect func)

reset(self)
    Reset the slider to the initial value

set_val(self, val)
    Set slider value to val

    Parameters

        val
            [float]

class matplotlib.widgets.SpanSelector(ax, onselect, direction, minspan=None, useblit=False, rectprops=None, onmove_callback=None, span_stays=False, button=None)

    Bases: matplotlib.widgets._SelectorWidget

    Visually select a min/max range on a single axis and call a function with those
    values.

    To guarantee that the selector remains responsive, keep a reference to it.

    In order to turn off the SpanSelector, set span_selector.active to False. To turn
    it back on, set it to True.

    Parameters

        ax
            [matplotlib.axes.Axes]

        onselect
            [func(min, max), min/max are floats]

        direction
The direction along which to draw the span selector.

**minspan**

[float, default: None] If selection is less than minspan, do not call onselect.

**useblit**

[bool, default: False] If True, use the backend-dependent blitting features for faster canvas updates.

**rectprops**

**onmove_callback**

[func(min, max), min/max are floats, default: None] Called on mouse move while the span is being selected.

**span_stays**

[bool, default: False] If True, the span stays visible after the mouse is released.

**button**

[MouseButton or list of MouseButton] The mouse buttons which activate the span selector.

---

**Examples**

```python
code
>>> import matplotlib.pyplot as plt
>>> import matplotlib.widgets as mwidgets
>>> fig, ax = plt.subplots()
>>> ax.plot([1, 2, 3], [10, 50, 100])
>>> def onselect(vmin, vmax):
...     print(vmin, vmax)
>>> rectprops = dict(facecolor='blue', alpha=0.5)
>>> span = mwidgets.SpanSelector(ax, onselect, 'horizontal',
...                               **rectprops=rectprops)
>>> fig.show()
```

See also: /gallery/widgets/span_selector

**ignore**(self, event)

Return whether event should be ignored.

This method should be called at the beginning of any event callback.

**new_axes**(self, ax)

Set SpanSelector to operate on a new Axes.
class matplotlib.widgets.SubplotTool(targetfig, toolfig)

Bases: matplotlib.widgets.Widget

A tool to adjust the subplot params of a matplotlib.figure.Figure.

**Parameters**

- **targetfig**
  
  [Figure] The figure instance to adjust.

- **toolfig**
  
  [Figure] The figure instance to embed the subplot tool into.

**property axbottom**

**property axhspace**

**property axleft**

**property axright**

**property axtop**

**property axwspace**

**funcbottom(self, val)**

Notes

Deprecated since version 3.3:

```python
class matplotlib.widgets.TextBox(ax, label='', initial='', color='.95', hovercolor='1', label_pad=0.01)
Bases: matplotlib.widgets.AxesWidget
```

A GUI neutral text input box.

For the text box to remain responsive you must keep a reference to it.

Call `on_text_change` to be updated whenever the text changes.

Call `on_submit` to be updated whenever the user hits enter or leaves the text entry field.

**Attributes**

- `ax`
  - **Axes** The parent axes for the widget.

- `label`
  - **Text**

- `color`
  - [color] The color of the text box when not hovering.
**hovercolor**

[color] The color of the text box when hovering.

**Parameters**

**ax**

[Axes] The Axes instance the button will be placed into.

**label**

[str] Label for this text box.

**initial**

[str] Initial value in the text box.

**color**

[color] The color of the box.

**hovercolor**

[color] The color of the box when the mouse is over it.

**label_pad**

[float] The distance between the label and the right side of the textbox.

**begin_typing**(self, x)

**disconnect**(self, cid)

Remove the observer with connection id cid.

**on_submit**(self, func)

When the user hits enter or leaves the submission box, call this func with event.

A connection id is returned which can be used to disconnect.

**on_text_change**(self, func)

When the text changes, call this func with event.

A connection id is returned which can be used to disconnect.

**property params_to_disable**

**position_cursor**(self, x)

**set_val**(self, val)

**stop_typing**(self)

**property text**
class matplotlib.widgets.ToolHandles(ax, x, y, marker='o', marker_props=None, useblit=True)
Bases: object
Control handles for canvas tools.

Parameters

ax

x, y
[1D arrays] Coordinates of control handles.

marker
[str] Shape of marker used to display handle. See matplotlib.

marker_props
[dict] Additional marker properties. See matplotlib.lines.Line2D.

closest(self, x, y)
Return index and pixel distance to closest index.

set_animated(self, val)

set_data(self, pts, y=None)
Set x and y positions of handles

set_visible(self, val)

property x

property y

class matplotlib.widgets.Widget
Bases: object
Abstract base class for GUI neutral widgets

property active
Is the widget active?

drawon = True
eventson = True

get_active(self)
Get whether the widget is active.

ignore(self, event)
Return whether event should be ignored.
This method should be called at the beginning of any event callback.

```python
set_active(self, active)
```
Set whether the widget is active.
Toolkits are collections of application-specific functions that extend Matplotlib. The following toolkits are included:

19.1 Toolkits

Toolkits are collections of application-specific functions that extend Matplotlib.

19.1.1 mplot3d

mpl_toolkits.mplot3d provides some basic 3D plotting (scatter, surf, line, mesh) tools. Not the fastest or most feature complete 3D library out there, but it ships with Matplotlib and thus may be a lighter weight solution for some use cases. Check out the mplot3d tutorial for more information.
mplot3d

Matplotlib mplot3d toolkit

The mplot3d toolkit adds simple 3D plotting capabilities to matplotlib by supplying an axes object that can create a 2D projection of a 3D scene. The resulting graph will have the same look and feel as regular 2D plots.

See the mplot3d tutorial for more information on how to use this toolkit.

The interactive backends also provide the ability to rotate and zoom the 3D scene. One can rotate the 3D scene by simply clicking-and-dragging the scene. Zooming is done by right-clicking the scene and dragging the mouse up and down. Note that one does not use the zoom button like one would use for regular 2D plots.
mplot3d FAQ

How is mplot3d different from Mayavi?

Mayavi is a very powerful and featureful 3D graphing library. For advanced 3D scenes and excellent rendering capabilities, it is highly recommended to use Mayavi.

mplot3d was intended to allow users to create simple 3D graphs with the same "look-and-feel" as matplotlib's 2D plots. Furthermore, users can use the same toolkit that they are already familiar with to generate both their 2D and 3D plots.

My 3D plot doesn't look right at certain viewing angles

This is probably the most commonly reported issue with mplot3d. The problem is that -- from some viewing angles -- a 3D object would appear in front of another object, even though it is physically behind it. This can result in plots that do not look "physically correct."

Unfortunately, while some work is being done to reduce the occurrence of this artifact, it is currently an intractable problem, and can not be fully solved until matplotlib supports 3D graphics rendering at its core.

The problem occurs due to the reduction of 3D data down to 2D + z-order scalar. A single value represents the 3rd dimension for all parts of 3D objects in a collection. Therefore, when the bounding boxes of two collections intersect, it becomes possible for this artifact to occur. Furthermore, the intersection of two 3D objects (such as polygons or patches) can not be rendered properly in matplotlib's 2D rendering engine.

This problem will likely not be solved until OpenGL support is added to all of the backends (patches are greatly welcomed). Until then, if you need complex 3D scenes, we recommend using MayaVi.

I don't like how the 3D plot is laid out, how do I change that?

Historically, mplot3d has suffered from a hard-coding of parameters used to control visuals such as label spacing, tick length, and grid line width. Work is being done to eliminate this issue. For matplotlib v1.1.0, there is a semi-official manner to modify these parameters. See the note in the mplot3d.axis3d section of the mplot3d API documentation for more information.
19.1.2 Matplotlib axes_grid1 Toolkit

The matplotlib mpl_toolkits.axes_grid1 toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjust the position of the single axes, axes_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See What is axes_grid1 toolkit? for a guide on the usage of axes_grid1.

The submodules of the axes_grid1 API are:

<table>
<thead>
<tr>
<th>Submodule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>axes_grid1.anchored_artists</td>
<td>Helper classes to adjust the positions of multiple axes at drawing time.</td>
</tr>
<tr>
<td>axes_grid1.axes_divider</td>
<td>Provides classes of simple units that will be used with AxesDivider class (or others) to determine the size of each axes.</td>
</tr>
<tr>
<td>axes_grid1.axes_grid</td>
<td>Colorbar toolkit with two classes and a function:</td>
</tr>
<tr>
<td>axes_grid1.axes_rgb</td>
<td>A collection of functions and objects for creating or placing inset axes.</td>

</tbody>
</table>

mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox(transform, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

An anchored container with transformed coordinates.

Artists added to the drawing area are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

Parameters

**transform**

**loc**

[int] Location of this artist. Valid location codes are:

```python
{'upper right' : 1, 'upper left' : 2,
```
Matplotlib, Release 3.3.3

(continued from previous page)

'lower left' : 3,
'lower right' : 4,
'right' : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center' : 10

pad

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad

[float, default: 0.5] Border padding, in fraction of the font size.

prop

frameon

[bool, default: True] If True, draw a box around this artists.

**kwargs

Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```python
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

Attributes

drawing_area

[matplotlib.offsetbox.AuxTransformBox] A container for artists to display.

__init__(self, transform, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs)

An anchored container with transformed coordinates.
Artists added to the *drawing area* are scaled according to the coordinates of the transformation used. The dimensions of this artist will scale to contain the artists added.

**Parameters**

**transform**

**loc**

[int] Location of this artist. Valid location codes are:

```python
{'upper right': 1,
 'upper left': 2,
 'lower left': 3,
 'lower right': 4,
 'right': 5,
 'center left': 6,
 'center right': 7,
 'lower center': 8,
 'upper center': 9,
 'center': 10}
```

**pad**

[float, default: 0.4] Padding around the child objects, in fraction of the font size.

**borderpad**

[float, default: 0.5] Border padding, in fraction of the font size.

**prop**

**frameon**

[bool, default: True] If True, draw a box around this artists.

****kwargs**

Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.
Examples

To display an ellipse in the upper left, with a width of 0.1 and height of 0.4 in data coordinates:

```python
>>> box = AnchoredAuxTransformBox(ax.transData, loc='upper left')
>>> el = Ellipse((0, 0), width=0.1, height=0.4, angle=30)
>>> box.drawing_area.add_artist(el)
>>> ax.add_artist(box)
```

Attributes

- **drawing_area**
  
  `[matplotlib.offsetbox.AuxTransformBox] A container for artists to display.`

  __module__ = 'mpl_toolkits.axes_grid1.anchored_artists'

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredAuxTransformBox

- sphx_glr_gallery_userdemo_anchored_box03.py
mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows:

Draw two perpendicular arrows to indicate directions.

**Parameters**

- **transform**
  

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`
label_x, label_y
[ str ] Label text for the x and y arrows

length
[ float, default: 0.15 ] Length of the arrow, given in coordinates of transform.

fontsize
[ float, default: 0.08 ] Size of label strings, given in coordinates of transform.

loc
[ int, default: 2 ] Location of the direction arrows. Valid location codes are:

<table>
<thead>
<tr>
<th>Location Code</th>
<th>Location Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>upper right</td>
</tr>
<tr>
<td>2</td>
<td>upper left</td>
</tr>
<tr>
<td>3</td>
<td>lower left</td>
</tr>
<tr>
<td>4</td>
<td>lower right</td>
</tr>
<tr>
<td>5</td>
<td>right</td>
</tr>
<tr>
<td>6</td>
<td>center left</td>
</tr>
<tr>
<td>7</td>
<td>center right</td>
</tr>
<tr>
<td>8</td>
<td>lower center</td>
</tr>
<tr>
<td>9</td>
<td>upper center</td>
</tr>
<tr>
<td>10</td>
<td>center</td>
</tr>
</tbody>
</table>

angle
[ float, default: 0 ] The angle of the arrows in degrees.

aspect_ratio
[ float, default: 1 ] The ratio of the length of arrow_x and arrow_y. Negative numbers can be used to change the direction.

pad
[ float, default: 0.4 ] Padding around the labels and arrows, in fraction of the font size.

borderpad
[ float, default: 0.4 ] Border padding, in fraction of the font size.

frameon
[ bool, default: False ] If True, draw a box around the arrows and labels.

color
[ str, default: 'white' ] Color for the arrows and labels.

alpha
Alpha values of the arrows and labels

**sep_x, sep_y**

Separation between the arrows and labels in coordinates of `transform`.

**fontproperties**

Font properties for the label text.

**back_length**

Fraction of the arrow behind the arrow crossing.

**head_width**

Width of arrow head, sent to `ArrowStyle`.

**head_length**

Length of arrow head, sent to `ArrowStyle`.

**tail_width**

Width of arrow tail, sent to `ArrowStyle`.

**text_props, arrow_props**

Properties of the text and arrows, passed to `textpath`, `TextPath` and `patches.FancyArrowPatch`.

**kwargs**

Keyworded arguments to pass to `matplotlib.offsetbox.AnchoredOffsetbox`.

**Notes**

If `prop` is passed as a keyword argument, but `fontproperties` is not, then `prop` is assumed to be the intended `fontproperties`. Using both `prop` and `fontproperties` is not supported.

**Examples**

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (...
... AnchoredDirectionArrows)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
```
Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
...                                   loc='lower left', color='k',
...                                   aspect_ratio=-1, sep_x=0.02,
...                                   sep_y=-0.01,
...                                   text_props={'ec':'w', 'fc':'k'},
...                                   fontproperties=fontprops)
```

Attributes

arrow_x, arrow_y

[matplotlib.patches.FancyArrowPatch] Arrow x and y
text_path_x, text_path_y

[matplotlib.textpath.TextPath] Path for arrow labels
p_x, p_y

[matplotlib.patches.PathPatch] Patch for arrow labels
box

[matplotlib.offsetbox.AuxTransformBox] Container for the arrows and labels.

```
__init__(self, transform, label_x, label_y, length=0.15, fontsize=0.08,
          loc=2, angle=0, aspect_ratio=1, pad=0.4, borderpad=0.4,
          frameon=False, color='w', alpha=1, sep_x=0.01, sep_y=0,
          fontproperties=None, back_length=0.15, head_width=10,
          head_length=15, tail_width=2, text_props=None, arrow_props=None, **kwargs)
```

Draw two perpendicular arrows to indicate directions.

Parameters

transform

label_x, label_y
[str] Label text for the x and y arrows

**length**

[float, default: 0.15] Length of the arrow, given in coordinates of `transform`.

**fontsize**

[float, default: 0.08] Size of label strings, given in coordinates of `transform`.

**loc**

[int, default: 2] Location of the direction arrows. Valid location codes are:

<table>
<thead>
<tr>
<th>Location Code</th>
<th>Location</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>'upper right'</td>
</tr>
<tr>
<td>2</td>
<td>'upper left'</td>
</tr>
<tr>
<td>3</td>
<td>'lower left'</td>
</tr>
<tr>
<td>4</td>
<td>'lower right'</td>
</tr>
<tr>
<td>5</td>
<td>'right'</td>
</tr>
<tr>
<td>6</td>
<td>'center left'</td>
</tr>
<tr>
<td>7</td>
<td>'center right'</td>
</tr>
<tr>
<td>8</td>
<td>'lower center'</td>
</tr>
<tr>
<td>9</td>
<td>'upper center'</td>
</tr>
<tr>
<td>10</td>
<td>'center'</td>
</tr>
</tbody>
</table>

**angle**

[float, default: 0] The angle of the arrows in degrees.

**aspect_ratio**

[float, default: 1] The ratio of the length of arrow_x and arrow_y. Negative numbers can be used to change the direction.

**pad**

[float, default: 0.4] Padding around the labels and arrows, in fraction of the font size.

**borderpad**

[float, default: 0.4] Border padding, in fraction of the font size.

**frameon**

[bool, default: False] If True, draw a box around the arrows and labels.

**color**

[str, default: 'white'] Color for the arrows and labels.

**alpha**

[float, default: 1] Alpha values of the arrows and labels.
**sep_x, sep_y**  
[float, default: 0.01 and 0 respectively] Separation between the arrows and labels in coordinates of *transform*.

**fontproperties**  

**back_length**  
[float, default: 0.15] Fraction of the arrow behind the arrow crossing.

**head_width**  
[float, default: 10] Width of arrow head, sent to ArrowStyle.

**head_length**  
[float, default: 15] Length of arrow head, sent to ArrowStyle.

**tail_width**  
[float, default: 2] Width of arrow tail, sent to ArrowStyle.

**text_props, arrow_props**  
[dict] Properties of the text and arrows, passed to *textpath*.  
*TextPath* and *patches.FancyArrowPatch*.

**kwargs**  
Keyworded arguments to pass to *matplotlib.offsetbox*.  
*AnchoredOffsetbox*.

**Notes**

If *prop* is passed as a keyword argument, but *fontproperties* is not, then *prop* is be assumed to be the intended *fontproperties*. Using both *prop* and *fontproperties* is not supported.

**Examples**

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import 
... AnchoredDirectionArrows
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> arrows = AnchoredDirectionArrows(ax.transAxes, '111', '110')
>>> ax.add_artist(arrows)
>>> fig.show()
```
Using several of the optional parameters, creating downward pointing arrow and high contrast text labels.

```python
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(family='monospace')
>>> arrows = AnchoredDirectionArrows(ax.transAxes, 'East', 'South',
... loc='lower left', color='k',
... aspect_ratio=-1, sep_x=0.02,
... sep_y=-0.01,
... text_props={'ec': 'w', 'fc': 'k'},
... fontproperties=fontprops)
```

Attributes

**arrow_x, arrow_y**

```python
[matplotlib.patches.FancyArrowPatch] Arrow x and y
```

**text_path_x, text_path_y**

```python
[matplotlib.textpath.TextPath] Path for arrow labels
```

**p_x, p_y**

```python
[matplotlib.patches.PathPatch] Patch for arrow labels
```

**box**

```python
[matplotlib.offsetbox.AuxTransformBox] Container for the arrows and labels.
```

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredDirectionArrows

- sphx_glr_gallery_axes_grid1_demo_anchored_direction_arrows.py
mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea(width, height, xdescent, ydescent, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

An anchored container with a fixed size and fillable DrawingArea.

Artists added to the drawing_area will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

Parameters

width, height
[float] width and height of the container, in pixels.

xdescent, ydescent
[float] descent of the container in the x- and y-direction, in pixels.

loc
[int] Location of this artist. Valid location codes are:

<table>
<thead>
<tr>
<th>Location Code</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

pad
[float, default: 0.4] Padding around the child objects, in fraction of the font size.

borderpad
[float, default: 0.5] Border padding, in fraction of the font size.
prop

frameon

[bool, default: True] If True, draw a box around this artists.

**kwargs

Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Examples

To display blue and red circles of different sizes in the upper right of an axes ax:

```python
>>> ada = AnchoredDrawingArea(20, 20, 0, 0,
...                             loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

Attributes

drawing_area

[matplotlib.offsetbox.DrawingArea] A container for artists to display.

__init__(self, width, height, xdescent, ydescent, loc, pad=0.4, borderpad=0.5, prop=None, frameon=True, **kwargs)

An anchored container with a fixed size and fillable DrawingArea. Artists added to the drawing_area will have their coordinates interpreted as pixels. Any transformations set on the artists will be overridden.

Parameters

width, height

[float] width and height of the container, in pixels.

xdescent, ydescent

[float] descent of the container in the x- and y- direction, in pixels.

loc

[int] Location of this artist. Valid location codes are:
The `AnchoredDrawingArea` class is used to create an anchored area for displaying artists. It has several key attributes and parameters:

- **loc**
  - Values: 'upper right', 'upper left', 'lower left', 'lower right', 'right', 'center left', 'center right', 'lower center', 'upper center', 'center'
  - Default: 'upper right'
  - 0-indexed:
    - 1: upper right
    - 2: upper left
    - 3: lower left
    - 4: lower right
    - 5: right
    - 6: center left
    - 7: center right
    - 8: lower center
    - 9: upper center
    - 10: center

- **pad**
  - [float, default: 0.4] Padding around the child objects, in fraction of the font size.

- **borderpad**
  - [float, default: 0.5] Border padding, in fraction of the font size.

- **prop**

- **frameon**
  - [bool, default: True] If True, draw a box around this artists.

- ****kwargs
  - Keyworded arguments to pass to `matplotlib.offsetbox.AnchoredOffsetbox`.

### Examples

To display blue and red circles of different sizes in the upper right of an axes `ax`:

```python
>>> ada = AnchoredDrawingArea(20, 20, 0, 0, loc='upper right', frameon=False)
>>> ada.drawing_area.add_artist(Circle((10, 10), 10, fc="b"))
>>> ada.drawing_area.add_artist(Circle((30, 10), 5, fc="r"))
>>> ax.add_artist(ada)
```

### Attributes

- **drawing_area**
  - [matplotlib.offsetbox.DrawingArea] A container for artists to display.

  ```python
  __module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
  ```
Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredDrawingArea`

- `sphx_glr_gallery_axes_grid1_simple_anchored_artists.py`
- `sphx_glr_gallery_userdemo_anchored_box02.py`

`mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse`

class `mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse`(`transform`, `width`, `height`, `angle`, `loc`, `pad=0.1`, `borderpad=0.1`, `prop=None`, `frameon=True`, **kwargs)

Bases: `matplotlib.offsetbox.AnchoredOffsetbox`

Draw an anchored ellipse of a given size.

**Parameters**

- `transform`:
  - [`matplotlib.transforms.Transform`]: The transformation object for the coordinate system in use, i.e., `matplotlib.axes.Axes.transData`.

- `width`, `height`:
  - [float]: Width and height of the ellipse, given in coordinates of `transform`.

- `angle`:
  - [float]: Rotation of the ellipse, in degrees, anti-clockwise.

- `loc`:
  - [int]: Location of this size bar. Valid location codes are:

```
'upper right' : 1,
'upper left' : 2,
'lower left' : 3,
'lower right' : 4,
'right' : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center' : 10
```
pad
[Float, optional] Padding around the ellipse, in fraction of the font size. Defaults to 0.1.

borderpad
[Float, default: 0.1] Border padding, in fraction of the font size.

frameon
[bool, default: True] If True, draw a box around the ellipse.

prop

**kwargs
Keyworded arguments to pass to matplotlib.offsetbox.AnchoredOffsetbox.

Attributes

ellipse

__init__(self, transform, width, height, angle, loc, pad=0.1, borderpad=0.1, prop=None, frameon=True, **kwargs)
Draw an anchored ellipse of a given size.

Parameters

transform

width, height
[Float] Width and height of the ellipse, given in coordinates of transform.

angle
[Float] Rotation of the ellipse, in degrees, anti-clockwise.

loc
[int] Location of this size bar. Valid location codes are:
'upper right' : 1,
'upper left' : 2,
'lower left' : 3,
'lower right' : 4,
'right' : 5,
'center left' : 6,
'center right' : 7,
'lower center' : 8,
'upper center' : 9,
'center' : 10

pad
[float, optional] Padding around the ellipse, in fraction of the
font size. Defaults to 0.1.

borderpad
[float, default: 0.1] Border padding, in fraction of the font size.

frameon
[bool, default: True] If True, draw a box around the ellipse.

prop
[matplotlib.font_manager.FontProperties, optional] Font prop-
erty used as a reference for paddings.

**kwargs
Keyworded arguments to pass to matplotlib.offsetbox.
AnchoredOffsetbox.

Attributes

ellipse

__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'

Examples using mpl_toolkits.axes_grid1.anchored_artists.AnchoredEllipse

• sphx_glr_gallery_axes_grid1_simple_anchored_artists.py
mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar

class mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar(transform, size, label, loc, pad=0.1, borderpad=0.1, sep=2, frameon=True, size_vertical=0, color='black', label_top=False, fontproperties=None, fill_bar=None, **kwargs)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

Draw a horizontal scale bar with a center-aligned label underneath.

**Parameters**

**transform**

**size**

[float] Horizontal length of the size bar, given in coordinates of transform.

**label**

[str] Label to display.

**loc**

[int] Location of this size bar. Valid location codes are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

**pad**
[float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

**borderpad**

[float, default: 0.1] Border padding, in fraction of the font size.

**sep**

[float, default: 2] Separation between the label and the size bar, in points.

**frameon**

[bool, default: True] If True, draw a box around the horizontal bar and label.

**size_vertical**

[float, default: 0] Vertical length of the size bar, given in coordinates of `transform`.

**color**

[str, default: 'black'] Color for the size bar and label.

**label_top**

[bool, default: False] If True, the label will be over the size bar.

**fontproperties**

**fill_bar**

[bool, optional] If True and if size_vertical is nonzero, the size bar will be filled in with the color specified by the size bar. Defaults to True if size_vertical is greater than zero and False otherwise.

**kwargs**

Keyworded arguments to pass to `matplotlib.offsetbox.AnchoredOffsetbox`.

**Notes**

If `prop` is passed as a keyworded argument, but `fontproperties` is not, then `prop` is be assumed to be the intended `fontproperties`. Using both `prop` and `fontproperties` is not supported.
Examples

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import ( AnchoredSizeBar
    ...)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```python
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
    ...  sep=5, borderpad=0.5, frameon=False,
    ...  size_vertical=0.5, color='white',
    ...  fontproperties=fontprops)
```

Attributes

- **size_bar**
  
  `[matplotlib.offsetbox.AuxTransformBox]` Container for the size bar.

- **txt_label**
  
  `[matplotlib.offsetbox.TextArea]` Container for the label of the size bar.

```python
__init__(self, transform, size, label, loc, pad=0.1, borderpad=0.1, sep=2,
    frameon=True, size_vertical=0, color='black', label_top=False,
    fontproperties=None, fill_bar=None, **kwargs)
```

Draw a horizontal scale bar with a center-aligned label underneath.

Parameters

- **transform**
  

- **size**
  
  [float] Horizontal length of the size bar, given in coordinates of `transform`.

- **label**
  
  [str] The label of the size bar.
[str] Label to display.

**loc**

[int] Location of this size bar. Valid location codes are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Code</th>
</tr>
</thead>
<tbody>
<tr>
<td>upper right</td>
<td>1</td>
</tr>
<tr>
<td>upper left</td>
<td>2</td>
</tr>
<tr>
<td>lower left</td>
<td>3</td>
</tr>
<tr>
<td>lower right</td>
<td>4</td>
</tr>
<tr>
<td>right</td>
<td>5</td>
</tr>
<tr>
<td>center left</td>
<td>6</td>
</tr>
<tr>
<td>center right</td>
<td>7</td>
</tr>
<tr>
<td>lower center</td>
<td>8</td>
</tr>
<tr>
<td>upper center</td>
<td>9</td>
</tr>
<tr>
<td>center</td>
<td>10</td>
</tr>
</tbody>
</table>

**pad**

[float, default: 0.1] Padding around the label and size bar, in fraction of the font size.

**borderpad**

[float, default: 0.1] Border padding, in fraction of the font size.

**sep**

[float, default: 2] Separation between the label and the size bar, in points.

**frameon**

[bool, default: True] If True, draw a box around the horizontal bar and label.

**size_vertical**

[float, default: 0] Vertical length of the size bar, given in coordinates of `transform`.

**color**

[str, default: 'black'] Color for the size bar and label.

**label_top**

[bool, default: False] If True, the label will be over the size bar.

**fontproperties**

**fill_bar**

[bool, optional] If True and if size_vertical is nonzero, the size bar will be filled in with the color specified by the size bar. De-
faults to True if `size_vertical` is greater than zero and False otherwise.

**kwargs

Keyworded arguments to pass to `matplotlib.offsetbox.AnchoredOffsetBox`.

Notes

If `prop` is passed as a keyworded argument, but `fontproperties` is not, then `prop` is be assumed to be the intended `fontproperties`. Using both `prop` and `fontproperties` is not supported.

Examples

```python
>>> import matplotlib.pyplot as plt
>>> import numpy as np
>>> from mpl_toolkits.axes_grid1.anchored_artists import (...
... AnchoredSizeBar)
>>> fig, ax = plt.subplots()
>>> ax.imshow(np.random.random((10, 10)))
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 data units', 4)
>>> ax.add_artist(bar)
>>> fig.show()
```

Using all the optional parameters

```python
>>> import matplotlib.font_manager as fm
>>> fontprops = fm.FontProperties(size=14, family='monospace')
>>> bar = AnchoredSizeBar(ax.transData, 3, '3 units', 4, pad=0.5,
... sep=5, borderpad=0.5, frameon=False,
... size_vertical=0.5, color='white',
... fontproperties=fontprops)
```

Attributes

`size_bar`

`[matplotlib.offsetbox.AuxTransformBox]` Container for the size bar.

`txt_label`

`[matplotlib.offsetbox.TextArea]` Container for the label of the size bar.

```
__module__ = 'mpl_toolkits.axes_grid1.anchored_artists'
```
Examples using `mpl_toolkits.axes_grid1.anchored_artists.AnchoredSizeBar`

- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`
- `sphx_glr_gallery_axes_grid1_simple_anchored_artists.py`

`mpl_toolkits.axes_grid1.axes_divider`

Helper classes to adjust the positions of multiple axes at drawing time.

</tbody>
</table>

`mpl_toolkits.axes_grid1.axes_divider.AxesDivider`  

```python
class mpl_toolkits.axes_grid1.axes_divider.AxesDivider(axes, xref=None, yref=None)
```

Bases: `mpl_toolkits.axes_grid1.axes_divider.Divider`

Divider based on the pre-existing axes.

**Parameters**

- `axes`  
  - [Axes]
- `xref`
- `yref`

```python
__init__(self, axes, xref=None, yref=None)
```
Parameters

axes

[Axes]
xref
yref

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'

append_axes(self, position, size, pad=None, add_to_figure=True, **kwargs)

Create an axes at the given position with the same height (or width) of the main axes.

position

["left"|"right"|"bottom"|"top"]

size and pad should be axes_grid.axes_size compatible.

get_anchor(self)

Return the anchor.

get_aspect(self)

Return aspect.

get_position(self)

Return the position of the rectangle.

get_subplotspec(self)

new_horizontal(self, size, pad=None, pack_start=False, **kwargs)

Add a new axes on the right (or left) side of the main axes.

Parameters

size

[axes_size or float or str] A width of the axes. If float or string is given, from any function is used to create the size, with ref_size set to AxesX instance of the current axes.

pad

[axes_size or float or str] Pad between the axes. It takes same argument as size.

pack_start

[bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

**kwargs
All extra keywords arguments are passed to the created axes. If axes_class is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

```python
new_vertical(self, size, pad=None, pack_start=False, **kwargs)
```

Add a new axes on the top (or bottom) side of the main axes.

**Parameters**

- **size**
  
  [axes_size or float or str] A height of the axes. If float or string is given, from_any function is used to create the size, with ref_size set to AxesX instance of the current axes.

- **pad**
  
  [axes_size or float or str] Pad between the axes. It takes same argument as size.

- **pack_start**
  
  [bool] If False, the new axes is appended at the end of the list, i.e., it became the right-most axes. If True, it is inserted at the start of the list, and becomes the left-most axes.

- **kwargs**
  
  All extra keywords arguments are passed to the created axes. If axes_class is given, the new axes will be created as an instance of the given class. Otherwise, the same class of the main axes will be used.

**Examples using** mpl_toolkits.axes_grid1.axes_divider.AxesDivider

- sphx_glr_gallery_axes_grid1_demo_colorbar_with_axes_divider.py
- sphx_glr_gallery_axes_grid1_make_room_for_ylabel_using_axesgrid.py

- sphx_glr_gallery_axes_grid1_simple_colorbar.py
- Tight Layout guide
mpl_toolkits.axes_grid1.axes_divider.AxesLocator

class mpl_toolkits.axes_grid1.axes_divider.AxesLocator(axes_divider, nx, ny, nx1=None, ny1=None)

Bases: object

A simple callable object, initialized with AxesDivider class, returns the position and size of the given cell.

Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

__call__(self, axes, renderer)

Call self as a function.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_divider', '__doc__': '
 A simple callable object, initialized with AxesDivider class, returns the position and size of the given cell.

Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'

__weakref__

list of weak references to the object (if defined)
get_subplotspec(self)

Examples using mpl_toolkits.axes_grid1.axes_divider.AxesLocator

class mpl_toolkits.axes_grid1.axes_divider.Divider(fig, pos, horizontal, vertical, aspect=None, anchor='C')

Bases: object

An Axes positioning class.

The divider is initialized with lists of horizontal and vertical sizes (mpl_toolkits. axes_grid1.axes_size) based on which a given rectangular area will be divided.

The new_locator method then creates a callable object that can be used as the axes_locator of the axes.

Parameters

fig

[Figure]
pos

[tuple of 4 floats] Position of the rectangle that will be divided.

horizontal

[list of axes_size] Sizes for horizontal division.

vertical

[list of axes_size] Sizes for vertical division.

aspect

[bool] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

anchor

[{'C', 'SW', 'S', 'SE', 'E', 'NE', 'N', 'NW', 'W'}] Placement of the reduced rectangle, when aspect is True.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.axes_divider', '__doc__': '__init__(self, fig, pos, horizontal, vertical, aspect=None, anchor='C')

Parameters

19.1. Toolkits
fig
[Figure]

pos
[tuple of 4 floats] Position of the rectangle that will be divided.

horizontal
[list of axes_size] Sizes for horizontal division.

vertical
[list of axes_size] Sizes for vertical division.

aspect
[bool] Whether overall rectangular area is reduced so that the relative part of the horizontal and vertical scales have the same scale.

anchor

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'

__weakref__

   list of weak references to the object (if defined)

add_auto_adjustable_area(self, use_axes, pad=0.1, adjust_dirs=None)

append_size(self, position, size)

get_anchor(self)
   Return the anchor.

get_aspect(self)
   Return aspect.

get_horizontal(self)
   Return horizontal sizes.

get_horizontal_sizes(self, renderer)

get_locator(self)

get_position(self)
   Return the position of the rectangle.

get_position_runtime(self, ax, renderer)

get_vertical(self)
   Return vertical sizes.

get_vertical_sizes(self, renderer)

get_vsize_hsize(self)
locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)

**Parameters**

nx, nx1

[int] Integers specifying the column-position of the cell. When
nx1 is None, a single nx-th column is specified. Otherwise lo-
cation of columns spanning between nx to nx1 (but excluding
nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

axes

renderer

new_locator(self, nx, ny, nx1=None, ny1=None)

Return a new AxesLocator for the specified cell.

**Parameters**

nx, nx1

[int] Integers specifying the column-position of the cell. When
nx1 is None, a single nx-th column is specified. Otherwise lo-
cation of columns spanning between nx to nx1 (but excluding
nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

set_anchor(self, anchor)

**Parameters**

anchor

anchor position
<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>

</tbody>
</table>

```python
set_aspect(self, aspect=False)

Parameters

aspect

[bool]
```

```python
set_horizontal(self, h)

Parameters

h

[list of axes_size] sizes for horizontal division
```

```python
set_locator(self, _locator)
```

```python
set_position(self, pos)

Set the position of the rectangle.

Parameters

pos

[tuple of 4 floats] position of the rectangle that will be divided
```

```python
set_vertical(self, v)

Parameters

v

[list of axes_size] sizes for vertical division
```
Examples using `mpl_toolkits.axes_grid1.axes_divider.Divider`

`mpl_toolkits.axes_grid1.axes_divider.HBoxDivider`

class `mpl_toolkits.axes_grid1.axes_divider.HBoxDivider(fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')`

Bases: `mpl_toolkits.axes_grid1.axes_divider.SubplotDivider`

Parameters

**fig**

`[mpl_toolkits.figure.Figure]`

**args**

[tuple (nrows, ncols, index) or int] The array of subplots in the figure has dimensions (nrows, ncols), and index is the index of the subplot being created. index starts at 1 in the upper left corner and increases to the right.

If nrows, ncols, and index are all single digit numbers, then args can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

`__module__ = 'mpl_toolkits.axes_grid1.axes_divider'`

```python
locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)
```

Parameters

**axes_divider**

[AxesDivider]

**nx, nx1**

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

**ny, ny1**

[int] Same as nx and nx1, but for row positions.

**axes**

**renderer**

```python
new_locator(self, nx, nx1=None)
```

Create a new AxesLocator for the specified cell.
Parameters

nx, nx1

[int] Integers specifying the column-position of the cell. When nx1 is None, a single nx-th column is specified. Otherwise location of columns spanning between nx to nx1 (but excluding nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

Examples using mpl_toolkits.axes_grid1.axes_divider.HBoxDivider

• sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py

mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

class mpl_toolkits.axes_grid1.axes_divider.SubplotDivider(fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')

Bases: mpl_toolkits.axes_grid1.axes_divider.Divider

The Divider class whose rectangle area is specified as a subplot geometry.

Parameters

fig

[matplotlib.figure.Figure]

*args

[tuple (nrows, ncols, index) or int] The array of subplots in the figure has dimensions (nrows, ncols), and index is the index of the subplot being created. index starts at 1 in the upper left corner and increases to the right.

If nrows, ncols, and index are all single digit numbers, then args can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).
*args

[tuple (nrows, ncols, index) or int] The array of subplots in the figure has dimensions (nrows, ncols), and index is the index of the subplot being created. index starts at 1 in the upper left corner and increases to the right.

If nrows, ncols, and index are all single digit numbers, then args can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

Examples using mpl_toolkits.axes_grid1.axes_divider.SubplotDivider

mpl_toolkits.axes_grid1.axes_divider.VBoxDivider

class mpl_toolkits.axes_grid1.axes_divider.VBoxDivider(fig, *args, horizontal=None, vertical=None, aspect=None, anchor='C')

Bases: mpl_toolkits.axes_grid1.axes_divider.HBoxDivider

The Divider class whose rectangle area is specified as a subplot geometry.

Parameters

fig

[matplotlib.figure.Figure]
*args

tuple (nrows, ncols, index) or int] The array of subplots in the
figure has dimensions (nrows, ncols), and index is the index of
the subplot being created. index starts at 1 in the upper left
corner and increases to the right.

If nrows, ncols, and index are all single digit numbers, then args
can be passed as a single 3-digit number (e.g. 234 for (2, 3, 4)).

__module__ = 'mpl_toolkits.axes_grid1.axes_divider'
locate(self, nx, ny, nx1=None, ny1=None, axes=None, renderer=None)

Parameters

axes_divider

[AxesDivider]

nx, nx1

[int] Integers specifying the column-position of the cell. When
nx1 is None, a single nx-th column is specified. Otherwise lo-
cation of columns spanning between nx to nx1 (but excluding
nx1-th column) is specified.

ny, ny1

[int] Same as nx and nx1, but for row positions.

axes

renderer

new_locator(self, ny, ny1=None)

Create a new AxesLocator for the specified cell.

Parameters

ny, ny1

[int] Integers specifying the row-position of the cell. When ny1
is None, a single ny-th row is specified. Otherwise location of
rows spanning between ny to ny1 (but excluding ny1-th row) is
specified.
Examples using `mpl_toolkits.axes_grid1.axes_divider.VBoxDivider`

Functions

```py
make_axes_area_auto_adjustable(ax[, ...])
make_axes_locatable(axes)
```

```py

Examples using mpl_toolkits.axes_grid1.axes_grid.CbarAxesBase

mpl_toolkits.axes_grid1.axes_grid.Grid

class mpl_toolkits.axes_grid1.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=<deprecated parameter>, share_all=False, share_x=True, share_y=True, label_mode='L', axes_class=None, *, aspect=False)

Bases: object

A grid of Axes.

In Matplotlib, the axes location (and size) is specified in normalized figure coordinates. This may not be ideal for images that needs to be displayed with a given aspect ratio; for example, it is difficult to display multiple images of a same size with some fixed padding between them. AxesGrid can be used in such case.

**Parameters**

- **fig**
  
  [Figure] The parent figure.

- **rect**
  
  [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

- **nrows_ncols**
  
  [(int, int)] Number of rows and columns in the grid.

- **ngrids**
  
  [int or None, default: None] If not None, only the first ngrids axes in the grid are created.

- **direction**
  
  [{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column").

- **axes_pad**
  
  [float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

- **add_all**
Matplotlib, Release 3.3.3

[bool, default: True] Whether to add the axes to the figure using
`Figure.add_axes`. This parameter is deprecated.

**share_all**

[bool, default: False] Whether all axes share their x- and y-axis. 
Overrides `share_x` and `share_y`.

**share_x**

[bool, default: True] Whether all axes of a column share their x-axis.

**share_y**

[bool, default: True] Whether all axes of a row share their y-axis.

**label_mode**

[{"L", "1", "all"}, default: "L"] Determines which axes will get
 tick labels:

- "L": All axes on the left column get vertical tick labels; all axes
  on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**axes_class**

[subclass of `matplotlib.axes.Axes`, default: None]

**aspect**

[bool, default: False] Whether the axes aspect ratio follows the
aspect ratio of the data limits.

```
__dict__ = mappingproxy({"__module__": 'mpl_toolkits.axes_grid1.axes_grid', '__doc__': "
__getitem__(self, i)
__init__(self, fig, rect, nrows_ncols, ngrids=None, direction='row',
axes_pad=0.02, add_all=<deprecated parameter>,
share_all=False, share_x=True, share_y=True, label_mode='L',
axes_class=None, *, aspect=False)

Parameters

**fig**

[Figure] The parent figure.

**rect**

[(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

2888 Chapter 19. Toolkits
**nrows_ncols**

[(int, int)] Number of rows and columns in the grid.

**ngrids**

[int or None, default: None] If not None, only the first ngrids axes in the grid are created.

**direction**

[{"row", "column"}, default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column").

**axes_pad**

[float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add_all**

[bool, default: True] Whether to add the axes to the figure using Figure.add_axes. This parameter is deprecated.

**share_all**

[bool, default: False] Whether all axes share their x- and y-axis. Overrides share_x and share_y.

**share_x**

[bool, default: True] Whether all axes of a column share their x-axis.

**share_y**

[bool, default: True] Whether all axes of a row share their y-axis.

**label_mode**

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**axes_class**

[subclass of matplotlib.axes.Axes, default: None]

**aspect**

[bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.
__len__(self)

__module__ = 'mpl_toolkits.axes_grid1.axes_grid'

__weakref__
    list of weak references to the object (if defined)

get_aspect(self)
    Return the aspect of the SubplotDivider.

get_axes_locator(self)

get_axes_pad(self)
    Return the axes padding.

Returns

hpad, vpad
    Padding (horizontal pad, vertical pad) in inches.

get_divider(self)

get_geometry(self)
    Return the number of rows and columns of the grid as (nrows, ncols).

get_vsize_hsize(self)

set_aspect(self, aspect)
    Set the aspect of the SubplotDivider.

set_axes_locator(self, locator)

set_axes_pad(self, axes_pad)
    Set the padding between the axes.

Parameters

axes_pad
    [(float, float)] The padding (horizontal pad, vertical pad) in inches.

set_label_mode(self, mode)
    Define which axes have tick labels.

Parameters

mode
    ["L", "1", "all"] The label mode:
    • "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
    • "1": Only the bottom left axes is labelled.
• "all": all axes are labelled.

Examples using `mpl_toolkits.axes_grid1.axes_grid.Grid`

`mpl_toolkits.axes_grid1.axes_grid.ImageGrid`

class `mpl_toolkits.axes_grid1.axes_grid.ImageGrid(fig, rect, nrows_ncols, 
n nrows_ncols[, ngrids=None, direction='row', axes_pad=0.02, 
add_all=<deprecated parameter>, share_all=False, 
aspect=True, label_mode='L', 
cbar_mode=None, cbar_location='right', 
cbar_pad=None, cbar_size='5%', 
cbar_set_cax=True, 
axes_class=None)

Bases: `mpl_toolkits.axes_grid1.axes_grid.Grid`

Parameters

`fig`

[[Figure]] The parent figure.

`rect`

[(float, float, float, float) or int] The axes position, as a (left, 
bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

`nrows_ncols`

[(int, int)] Number of rows and columns in the grid.

`ngrids`

[int or None, default: None] If not None, only the first `ngrids` 
axes in the grid are created.

`direction`

[{"row", "column"}, default: "row"] Whether axes are created 
in row-major ("row by row") or column-major order ("column by 
column"). This also affects the order in which axes are accessed 
using indexing (grid[index]).

`axes_pad`
[float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add_all**

[bool, default: True] Whether to add the axes to the figure using `Figure.add_axes`. This parameter is deprecated.

**share_all**

[bool, default: False] Whether all axes share their x- and y-axis.

**aspect**

[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

**label_mode**

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**cbar_mode**

[{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by `cbar_location`, or no colorbars. The colorbars are stored in the `cbar_axes` attribute.

**cbar_location**

[{"left", "right", "bottom", "top"}, default: "right"]

**cbar_pad**

[float, default: None] Padding between the image axes and the colorbar axes.

**cbar_size**

[size specification (see `Size.from_any`), default: "5%"] Colorbar size.

**cbar_set_cax**

[bool, default: True] If True, each axes in the grid has a `cax` attribute that is bound to associated `cbar_axes`.

**axes_class**

[subclass of `matplotlib.axes.Axes`, default: None]
**Parameters**

- **fig**
  - `[Figure]` The parent figure.

- **rect**
  - `[(float, float, float, float) or int]` The axes position, as a `(left, bottom, width, height)` tuple or as a three-digit subplot position code (e.g., "121").

- **nrows_ncols**
  - `[(int, int)]` Number of rows and columns in the grid.

- **ngrids**
  - `[int or None, default: None]` If not None, only the first `ngrids` axes in the grid are created.

- **direction**
  - `["row", "column"], default: "row"]` Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (grid[index]).

- **axes_pad**
  - `[float or (float, float), default: 0.02in]` Padding or (horizontal padding, vertical padding) between axes, in inches.

- **add_all**
  - `[bool, default: True]` Whether to add the axes to the figure using `Figure.add_axes`. This parameter is deprecated.

- **share_all**
  - `[bool, default: False]` Whether all axes share their x- and y-axis.

- **aspect**
  - `[bool, default: True]` Whether the axes aspect ratio follows the aspect ratio of the data limits.

- **label_mode**
  - `["L", "1", "all"], default: "L"]` Determines which axes will get tick labels:
• "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
• "1": Only the bottom left axes is labelled.
• "all": all axes are labelled.

cbar_mode

[{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by cbar_location, or no colorbars. The colorbars are stored in the cbar_axes attribute.

cbar_location

[{"left", "right", "bottom", "top"}, default: "right"]

cbar_pad

[float, default: None] Padding between the image axes and the colorbar axes.

cbar_size

[size specification (see Size.from_any), default: "5%"] Colorbar size.

cbar_set_cax

[bool, default: True] If True, each axes in the grid has a cax attribute that is bound to associated cbar_axes.

axes_class

[subclass of matplotlib.axes.Axes, default: None]

__module__ = 'mpl_toolkits.axes_grid1.axes_grid'

Examples using mpl_toolkits.axes_grid1.axes_grid.ImageGrid

mpl_toolkits.axes_grid1.axes_grid1.axes_rgb

2894  Chapter 19. Toolkits
mpl_toolkits.axes_grid1.axes_rgb.RGBAxes

class mpl_toolkits.axes_grid1.axes_rgb.RGBAxes(*args,             
       pad=0,                                                   
       add_all=<deprecated parameter>, **kwargs)

Bases: object

4-panel imshow (RGB, R, G, B).

Layout: +---------------+-----+ | | R | + +-----+ | RGB | G | + +-----+ | | B | +------------+-----+

Subclasses can override the _defaultAxesClass attribute.

Attributes

RGB

[._defaultAxesClass] The axes object for the three-channel imshow.

R

[._defaultAxesClass] The axes object for the red channel imshow.

G

[._defaultAxesClass] The axes object for the green channel imshow.

B

[._defaultAxesClass] The axes object for the blue channel imshow.

Parameters

pad

[float, default: 0] fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]

*args

Unpacked into axes_class() init for RGB

**kwargs

Unpacked into axes_class() init for RGB, R, G, B axes
Parameters

pad

[float, default: 0] Fraction of the axes height to put as padding.

add_all

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

axes_class

[matplotlib.axes.Axes]

*args

Unpacked into axes_class() init for RGB

**kwargs

Unpacked into axes_class() init for RGB, R, G, B axes

Notes

Deprecated since version 3.3.

imshow_rgb(self, r, g, b, **kwargs)

Create the four images {rgb, r, g, b}.

Parameters

r

[array-like] The red array

g

[array-like] The green array

b

[array-like] The blue array
**kwargs

[imshow kwargs] kwargs get unpacked into the imshow calls for the four images

**Returns**

**rgb**

[matplotlib.image.AxesImage]

**r**

[matplotlib.image.AxesImage]

**g**

[matplotlib.image.AxesImage]

**b**

[matplotlib.image.AxesImage]

**Examples using** mpl_toolkits.axes_grid1.axes_rgb.RGBAxes

- sphx_glr_gallery_pyplots_whats_new_99_axes_grid.py
- sphx_glr_gallery_axes_grid1_demo_axes_rgb.py

**mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase**

class mpl_toolkits.axes_grid1.axes_rgb.RGBAxesBase(*args, pad=0, add_all=<deprecated parameter>, **kwargs)

Bases: mpl_toolkits.axes_grid1.axes_rgb.RGBAxes

[Deprecated]

**Notes**

Deprecated since version 3.3:

**Parameters**

**pad**

[float, default: 0] fraction of the axes height to put as padding.

**add_all**

[bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

Examples using `mpl_toolkits.axes_grid1.axes_size.MaxExtent`

`mpl_toolkits.axes_grid1.axes_size.MaxHeight`

class `mpl_toolkits.axes_grid1.axes_size.MaxHeight(artist_list)`

Bases: `mpl_toolkits.axes_grid1.axes_size.MaxExtent`

Size whose absolute part is the largest height of the given `artist_list`.

```python
__init__(self, artist_list)
```

Initialize self. See help(type(self)) for accurate signature.

```python
__module__ = 'mpl_toolkits.axes_grid1.axes_size'
```

Examples using `mpl_toolkits.axes_grid1.axes_size.MaxHeight`

`mpl_toolkits.axes_grid1.axes_size.MaxWidth`

class `mpl_toolkits.axes_grid1.axes_size.MaxWidth(artist_list)`

Bases: `mpl_toolkits.axes_grid1.axes_size.MaxExtent`

Size whose absolute part is the largest width of the given `artist_list`.

```python
__init__(self, artist_list)
```

Initialize self. See help(type(self)) for accurate signature.

```python
__module__ = 'mpl_toolkits.axes_grid1.axes_size'
```
Examples using `mpl_toolkits.axes_grid1.axes_size.MaxWidth`

`mpl_toolkits.axes_grid1.axes_size.Padded`

class `mpl_toolkits.axes_grid1.axes_size.Padded(size, pad)`

Bases: `mpl_toolkits.axes_grid1.axes_size._Base`

Return a instance where the absolute part of `size` is increase by the amount of `pad`.

```python
__init__(self, size, pad)
    Initialize self. See help(type(self)) for accurate signature.
```

Examples using `mpl_toolkits.axes_grid1.axes_size.Padded`

`mpl_toolkits.axes_grid1.axes_size.Scalable`

mpl_toolkits.axes_grid1.axes_size.Scalable

alias of `mpl_toolkits.axes_grid1.axes_size.Scaled`

`mpl_toolkits.axes_grid1.axes_size.Scaled`

class `mpl_toolkits.axes_grid1.axes_size.Scaled(scalable_size)`

Bases: `mpl_toolkits.axes_grid1.axes_size._Base`

Simple scaled(?) size with absolute part = 0 and relative part = `scalable_size`.

```python
__init__(self, scalable_size)
    Initialize self. See help(type(self)) for accurate signature.
```

Examples using `mpl_toolkits.axes_grid1.axes_size.Scaled`

- sphx_glr_gallery_axes_grid1_demo_axes_hbox_divider.py
- sphx_glr_gallery_axes_grid1_demo_fixed_size_axes.py
- sphx_glr_gallery_axes_grid1_simple_axes_divider1.py
mpl_toolkits.axes_grid1.axes_size.SizeFromFunc

class mpl_toolkits.axes_grid1.axes_size.SizeFromFunc(func)
    Bases: mpl_toolkits.axes_grid1.axes_size._Base
    __init__ (self, func)
        Initialize self. See help(type(self)) for accurate signature.
        __module__ = 'mpl_toolkits.axes_grid1.axes_size'
    get_size(self, renderer)

Examples using mpl_toolkits.axes_grid1.axes_size.SizeFromFunc

Functions

from_any(size[, fraction_ref])  Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %.

mpl_toolkits.axes_grid1.axes_size.from_any

mpl_toolkits.axes_grid1.axes_size.from_any(size, fraction_ref=\nNone)  Create a Fixed unit when the first argument is a float, or a Fraction unit if that is a string that ends with %. The second argument is only meaningful when Fraction unit is created.

>>> a = Size.from_any(1.2)  # => Size.Fixed(1.2)
>>> Size.from_any("50\%", a)  # => Size.Fraction(0.5, a)

Examples using mpl_toolkits.axes_grid1.axes_size.from_any

mpl_toolkits.axes_grid1.colorbar

Colorbar toolkit with two classes and a function:

ColorbarBase
    the base class with full colorbar drawing functionality. It can be used as-is to make a colorbar for a given colormap; a mappable object (e.g., image) is not needed.

Colorbar
    the derived class for use with images or contour plots.
make_axes()

a function for resizing an axes and adding a second axes suitable for a colorbar

The colorbar() method uses make_axes() and Colorbar; the colorbar() function is a thin wrapper over colorbar().

class mpl_toolkits.axes_grid1.colorbar.CbarAxesLocator(locator=None, extend='neither', orientation='vertical')

CbarAxesLocator is a axes locator for colorbar axes. It adjust the position of the axes to make a room for extended ends, i.e., the extended ends are located outside the axes area.

locator

[the bbox returned from the locator is used as a] initial axes location. If None, axes.bbox is used.

extend : same as in ColorbarBase orientation : same as in ColorbarBase

get_end_vertices(self)
Return a tuple of two vertices for the colorbar extended ends.

The first vertices is for the minimum end, and the second is for the maximum end.

get_original_position(self, axes, renderer)
Return the original position of the axes.

get_path_ends(self)
Return the paths for extended ends.

get_path_patch(self)
Return the path for axes patch.

class mpl_toolkits.axes_grid1.colorbar.Colorbar(ax, mappable, **kw)

Parameters

norm

[matplotlib.colors.Normalize (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If None, norm defaults to a colors.Normalize object which initializes its scaling based on the first data processed.

cmap

[str or Colormap] The colormap used to map normalized data values to RGBA colors.

add_lines(self, CS)
Add the lines from a non-filled ContourSet to the colorbar.
update_bruteforce(self, mappable)
    Update the colorbar artists to reflect the change of the associated mappable.

update_normal(self, mappable)
    Update solid patches, lines, etc.

    This is meant to be called when the norm of the image or contour plot to which
    this colorbar belongs changes.

    If the norm on the mappable is different than before, this resets the locator
    and formatter for the axis, so if these have been customized, they will need
    to be customized again. However, if the norm only changes values of vmin, vmax
    or cmap then the old formatter and locator will be preserved.

class mpl_toolkits.axes_grid1.colorbar.ColorbarBase(ax, cmap=None,
    norm=None, alpha=1.0, values=None, boundaries=None, orientation='vertical',
    extend='neither', spacing='uniform', ticks=None, format=None,
    drawedges=False, filled=True)

    Draw a colorbar in an existing axes.

    This is a base class for the Colorbar class, which is the basis for the
colorbar() method and pyplot function.

    It is also useful by itself for showing a colormap. If the cmap kwarg is given but
boundaries and values are left as None, then the colormap will be displayed on
a 0-1 scale. To show the under- and over-value colors, specify the norm as:

    colors.Normalize(clip=False)

    To show the colors versus index instead of on the 0-1 scale, use:

    norm=colors.NoNorm.

    Useful attributes:

        ax
            the Axes instance in which the colorbar is drawn

        lines
            a LineCollection if lines were drawn, otherwise None

        dividers
            a LineCollection if drawedges is True, otherwise None

    Useful public methods are set_label() and add_lines().
Parameters

**norm**

```
[matplotlib.colors.Normalize (or subclass thereof)] The normalizing object which scales data, typically into the interval [0, 1]. If None, norm defaults to a colors.Normalize object which initializes its scaling based on the first data processed.
```

**cmap**

```
[str or Colormap] The colormap used to map normalized data values to RGBA colors.
```

`add_lines(self, levels, colors, linewdths)`

Draw lines on the colorbar. It deletes preexisting lines.

`set_alpha(self, alpha)`

Set the alpha value for transparency.

`set_label_text(self, label, **kw)`

Label the long axis of the colorbar.

`update_artists(self)`

Update the colorbar associated artists, filled and ends. Note that lines are not updated. This needs to be called whenever clim of associated image changes.

```
mpl_toolkits.axes_grid1.colorbar.colorbar(mappable, cax=None, ax=None, **kw)
```

Create a colorbar for a ScalarMappable instance.

Documentation for the pyplot thin wrapper:

Add a colorbar to a plot.

Function signatures for the *pyplot* interface; all but the first are also method signatures for the `colorbar()` method:

```
colorbar(**kwargs)
colorbar(mappable, **kwargs)
colorbar(mappable, cax=cax, **kwargs)
colorbar(mappable, ax=ax, **kwargs)
```

arguments:

**mappable**

the Image, ContourSet, etc. to which the colorbar applies; this argument is mandatory for the `colorbar()` method but optional for the `colorbar()` function, which sets the default to the current image.

keyword arguments:
**cax**
None | axes object into which the colorbar will be drawn

**ax**
None | parent axes object from which space for a new colorbar axes will be stolen

Additional keyword arguments are of two kinds:

axes properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>orientation</strong></td>
<td>vertical or horizontal</td>
</tr>
<tr>
<td><strong>fraction</strong></td>
<td>0.15; fraction of original axes to use for colorbar</td>
</tr>
<tr>
<td><strong>pad</strong></td>
<td>0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes</td>
</tr>
<tr>
<td><strong>shrink</strong></td>
<td>1.0; fraction by which to shrink the colorbar</td>
</tr>
<tr>
<td><strong>aspect</strong></td>
<td>20; ratio of long to short dimensions</td>
</tr>
</tbody>
</table>

colorbar properties:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>extend</strong></td>
<td>[ 'neither'</td>
</tr>
<tr>
<td><strong>spacing</strong></td>
<td>[ 'uniform'</td>
</tr>
<tr>
<td><strong>ticks</strong></td>
<td>[ None</td>
</tr>
<tr>
<td><strong>format</strong></td>
<td>[ None</td>
</tr>
<tr>
<td><strong>drawedges</strong></td>
<td>Whether to draw lines at color boundaries.</td>
</tr>
</tbody>
</table>

The following will probably be useful only in the context of indexed colors (that is, when the mappable has norm=NoNorm()), or other unusual circumstances.
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>boundaries</td>
<td>None or a sequence values</td>
</tr>
</tbody>
</table>

If `mappable` is a `ContourSet`, its `extend` kwarg is included automatically.

Note that the `shrink` kwarg provides a simple way to keep a vertical colorbar, for example, from being taller than the axes of the mappable to which the colorbar is attached; but it is a manual method requiring some trial and error. If the colorbar is too tall (or a horizontal colorbar is too wide) use a smaller value of `shrink`.

For more precise control, you can manually specify the positions of the axes objects in which the mappable and the colorbar are drawn. In this case, do not use any of the axes properties kwarg.

It is known that some vector graphics viewer (svg and pdf) renders white gaps between segments of the colorbar. This is due to bugs in the viewers not matplotlib. As a workaround the colorbar can be rendered with overlapping segments:

```python
cbar = colorbar()
cbar.solids.set_edgecolor("face")
draw()
```

However this has negative consequences in other circumstances. Particularly with semi transparent images (alpha < 1) and colorbar extensions and is not enabled by default see (issue #1188).

returns:

```
Colorbar instance; see also its base class, ColorbarBase. Call the set_label() method to label the colorbar.
```

The transData of the `cax` is adjusted so that the limits in the longest axis actually corresponds to the limits in colorbar range. On the other hand, the shortest axis has a data limits of [1,2], whose unconventional value is to prevent underflow when log scale is used.

```python
mpl_toolkits.axes_grid1.colorbar.make_axes(parent, *, fraction=0.15, shrink=1.0, aspect=20, **kw)
```

Resize and reposition a parent axes, and return a child axes suitable for a colorbar

```python
cax, kw = make_axes(parent, **kw)
```

Keyword arguments may include the following (with defaults):

19.1. Toolkits
**orientation**

'vertical' or 'horizontal'

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>orientation</td>
<td>vertical or horizontal</td>
</tr>
<tr>
<td>fraction</td>
<td>0.15; fraction of original axes to use for colorbar</td>
</tr>
<tr>
<td>pad</td>
<td>0.05 if vertical, 0.15 if horizontal; fraction of original axes between colorbar and new image axes</td>
</tr>
<tr>
<td>shrink</td>
<td>1.0; fraction by which to shrink the colorbar</td>
</tr>
<tr>
<td>aspect</td>
<td>20; ratio of long to short dimensions</td>
</tr>
</tbody>
</table>

All but the first of these are stripped from the input kw set.

Returns (cax, kw), the child axes and the reduced kw dictionary.

**mpl_toolkits.axes_grid1.inset_locator**

A collection of functions and objects for creating or placing inset axes.

**Classes**

- **AnchoredLocatorBase**(bbox_to_anchor, ...
  
  Parameters

- **AnchoredSizeLocator**(bbox_to_anchor, x_size, ...)
  Parameters

- **AnchoredZoomLocator**(parent_axes, zoom, loc)
  Parameters

- **BboxConnector**(bbox1, bbox2, loc1[, loc2])
  Connect two bboxes with a straight line.

- **BboxConnectorPatch**(bbox1, bbox2, loc1a, ...)
  Connect two bboxes with a quadrilateral.

- **BboxPatch**(bbox, **kwargs)
  Patch showing the shape bounded by a Bbox.

- **InsetPosition**(parent, lbwh)
  An object for positioning an inset axes.
class mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase(bbox_to_anchor, offsetbox, loc, borderpad=0.5, bbox_transform=None)

Bases: matplotlib.offsetbox.AnchoredOffsetbox

Parameters

loc

[str] The box location. Supported values:
  • 'upper right'
  • 'upper left'
  • 'lower left'
  • 'lower right'
  • 'center left'
  • 'center right'
  • 'lower center'
  • 'upper center'
  • 'center'

For backward compatibility, numeric values are accepted as well. See the parameter loc of Legend for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.

borderpad

[float, default: 0.5] Padding between the offsetbox frame and the bbox_to_anchor.

cchild

[OffsetBox] The box that will be anchored.

prop

[FontProperties] This is only used as a reference for paddings. If not given, rcParams["legend.fontsize"] (default: 'medium') is used.
[bool] Whether to draw a frame around the box.

**bbox_to_anchor**

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with *loc*.

**bbox_transform**

[None or matplotlib.transforms.Transform] The transform for the bounding box (*bbox_to_anchor*).

**kwargs**

All other parameters are passed on to *OffsetBox*.

**Notes**

See *Legend* for a detailed description of the anchoring mechanism.

```python
__call__(self, ax, renderer)
Call self as a function.
```

```python
__init__(self, bbox_to_anchor, offsetbox, loc, borderpad=0.5, bbox_transform=None)
```

**Parameters**

**loc**

[std] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter *loc* of *Legend* for details.

**pad**

[float, default: 0.4] Padding around the child as fraction of the fontsize.
borderpad
[0.5] Padding between the offsetbox frame and the bbox_to_anchor.

child
[OffsetBox] The box that will be anchored.

prop
[FontProperties] This is only used as a reference for paddings. If not given, rcParams['legend.fontsize'] (default: medium) is used.

frameon
[bool] Whether to draw a frame around the box.

bbox_to_anchor
[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform
[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs
All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

draw(self, renderer)
Update the location of children if necessary and draw them to the given renderer.

Examples using mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase
mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator

class mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator(bbox_to_anchor,
        x_size,
        y_size,
        loc, borderpad=0.5,
        bbox_transform=None)

Bases: mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase

Parameters

loc
        [str] The box location. Supported values:
        • 'upper right'
        • 'upper left'
        • 'lower left'
        • 'lower right'
        • 'center left'
        • 'center right'
        • 'lower center'
        • 'upper center'
        • 'center'
        For backward compatibility, numeric values are accepted as well. See the parameter
        loc of Legend for details.

pad
        [float, default: 0.4] Padding around the child as fraction of the
        fontsize.

borderpad
        [float, default: 0.5] Padding between the offsetbox frame and the
        bbox_to_anchor.

child
        [OffsetBox] The box that will be anchored.

prop
        [FontProperties] This is only used as a reference for paddings. If not
        given, rcParams["legend.fontsize"] (default: 'medium') is
        used.
frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[BoxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs

All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

__init__(self, bbox_to_anchor, x_size, y_size, loc, borderpad=0.5, bbox_transform=None)

Parameters

loc

[str] The box location. Supported values:

• 'upper right'
• 'upper left'
• 'lower left'
• 'lower right'
• 'center left'
• 'center right'
• 'lower center'
• 'upper center'
• 'center'

For backward compatibility, numeric values are accepted as well. See the parameter loc of Legend for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.
borderpad

[float, default: 0.5] Padding between the offsetbox frame and the bbox_to_anchor.

child

[OffsetBox] The box that will be anchored.

prop

[FontProperties] This is only used as a reference for paddings. If not given, rcParams["legend.fontsize"] (default: 'medium') is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs

All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

get_extent(self, renderer)

Return the extent of the box as (width, height, x, y).

This is the extent of the child plus the padding.

Examples using mpl_toolkits.axes_grid1.inset_locator.AnchoredSizeLocator
mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator

class mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator(
    parent_axes, 
    zoom, 
    loc, 
    border-pad=0.5, 
    bbox_to_anchor=None, 
    bbox_transform=None)

Bases: mpl_toolkits.axes_grid1.inset_locator.AnchoredLocatorBase

Parameters

loc

[ str ] The box location. Supported values:

- 'upper right'
- 'upper left'
- 'lower left'
- 'lower right'
- 'center left'
- 'center right'
- 'lower center'
- 'upper center'
- 'center'

For backward compatibility, numeric values are accepted as well. See the parameter loc of Legend for details.

pad

[ float, default: 0.4 ] Padding around the child as fraction of the fontsize.

borderpad

[ float, default: 0.5 ] Padding between the offsetbox frame and the bbox_to_anchor.

child

[ OffsetBox ] The box that will be anchored.

prop

[ FontProperties ] This is only used as a reference for paddings. If not given, rcParams["legend.fontsize"] (default: 'medium') is used.
frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs

All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

__init__ (self, parent_axes, zoom, loc, borderpad=0.5, bbox_to_anchor=None, bbox_transform=None)

Parameters

loc

[str] The box location. Supported values:
• 'upper right'
• 'upper left'
• 'lower left'
• 'lower right'
• 'center left'
• 'center right'
• 'lower center'
• 'upper center'
• 'center'

For backward compatibility, numeric values are accepted as well. See the parameter loc of Legend for details.

pad

[float, default: 0.4] Padding around the child as fraction of the fontsize.
borderpad

[float, default: 0.5] Padding between the offsetbox frame and the bbox_to_anchor.

child

[OffsetBox] The box that will be anchored.

prop

[FontProperties] This is only used as a reference for paddings. If not given, rcParams["legend.fontsize"] (default: 'medium') is used.

frameon

[bool] Whether to draw a frame around the box.

bbox_to_anchor

[BboxBase, 2-tuple, or 4-tuple of floats] Box that is used to position the legend in conjunction with loc.

bbox_transform

[None or matplotlib.transforms.Transform] The transform for the bounding box (bbox_to_anchor).

**kwargs

All other parameters are passed on to OffsetBox.

Notes

See Legend for a detailed description of the anchoring mechanism.

Examples using mpl_toolkits.axes_grid1.inset_locator.AnchoredZoomLocator

mpl_toolkits.axes_grid1.inset_locator.BboxConnector

class mpl_toolkits.axes_grid1.inset_locator.BboxConnector(bbox1, bbox2, loc1, loc2=None, **kwargs)

Bases: matplotlib.patches.Patch

Connect two bboxes with a straight line.
Parameters

bbox1, bbox2

loc1

{{1, 2, 3, 4}} Corner of bbox1 to draw the line. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

loc2

{{1, 2, 3, 4}, optional} Corner of bbox2 to draw the line. If None, defaults to loc1. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

**kwargs

Patch properties for the line drawn. Valid arguments include:

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>agg_filter</td>
<td>a filter function, which takes a (m, n, 3) float array and a dpi value, and returns a (m, n, 3) array</td>
</tr>
<tr>
<td>alpha</td>
<td>float or None</td>
</tr>
<tr>
<td>animated</td>
<td>bool</td>
</tr>
<tr>
<td>antialiased</td>
<td>unknown</td>
</tr>
<tr>
<td>capstyle</td>
<td>{'butt', 'round', 'projecting'}</td>
</tr>
<tr>
<td>clip_box</td>
<td>Bbox</td>
</tr>
<tr>
<td>clip_on</td>
<td>bool</td>
</tr>
<tr>
<td>clip_path</td>
<td>Patch or (Path, Transform) or None</td>
</tr>
<tr>
<td>color</td>
<td>color</td>
</tr>
<tr>
<td>contains</td>
<td>unknown</td>
</tr>
<tr>
<td>edgecolor</td>
<td>color or None or 'auto'</td>
</tr>
<tr>
<td>facecolor</td>
<td>color or None</td>
</tr>
<tr>
<td>figure</td>
<td>Figure</td>
</tr>
<tr>
<td>fill</td>
<td>bool</td>
</tr>
<tr>
<td>gid</td>
<td>str</td>
</tr>
<tr>
<td>hatch</td>
<td>{'/', '', '</td>
</tr>
<tr>
<td>in_layout</td>
<td>bool</td>
</tr>
<tr>
<td>joinstyle</td>
<td>{'miter', 'round', 'bevel'}</td>
</tr>
<tr>
<td>label</td>
<td>object</td>
</tr>
<tr>
<td>linestyle</td>
<td>{'-', '--', '-.', ':', '', (offset, on-off-seq), ...}</td>
</tr>
</tbody>
</table>

```
__init__(self, bbox1, bbox2, loc1, loc2=None, **kwargs)
    Connect two bboxes with a straight line.

Parameters
bbox1, bbox2

loc1
    [{1, 2, 3, 4}] Corner of bbox1 to draw the line. Valid values are:
    ```
    {'upper right' : 1,
    'upper left'  : 2,
    'lower left'  : 3,
    'lower right' : 4
    ```

loc2
    [{1, 2, 3, 4}, optional] Corner of bbox2 to draw the line. If None, defaults to loc1. Valid values are:
    ```
    {'upper right' : 1,
    'upper left'  : 2,
    'lower left'  : 3,
    'lower right' : 4
    ```

**kwargs
    Patch properties for the line drawn. Valid arguments include:

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

static connect_bbox(bbox1, bbox2, loc1, loc2=None)

    Helper function to obtain a Path from one bbox to another.

Parameters

bbox1, bbox2

loc1

    [{1, 2, 3, 4}] Corner of bbox1 to use. Valid values are:

    | Corner      | Value |
    |-------------|-------|
    | 'upper right'| 1     |
    | 'upper left' | 2     |
    | 'lower left' | 3     |
    | 'lower right'| 4     |

loc2
[{1, 2, 3, 4}, optional] Corner of bbox2 to use. If None, defaults to loc1. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

**Returns**

**path**

[matplotlib.path.Path] A line segment from the loc1 corner of bbox1 to the loc2 corner of bbox2.

```python
static get_bbox_edge_pos(bbox, loc)
```

Helper function to obtain the location of a corner of a bbox

**Parameters**

bbox

[matplotlib.transforms.Bbox]

loc

[{1, 2, 3, 4}] Corner of bbox. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

**Returns**

x, y

[float] Coordinates of the corner specified by loc.

```python
get_path(self)
```

Return the path of this patch.
Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

- `sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py`

`mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch`

class `mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch(bbox1, bbox2, loc1a, loc2a, loc1b, loc2b, **kwargs)`

Bases: `mpl_toolkits.axes_grid1.inset_locator.BboxConnector`

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in `bbox1` and the line between the two corners specified in `bbox2`.

Parameters

- **bbox1, bbox2**
  

- **loc1a, loc2a**
  
  `{1, 2, 3, 4}` Corners of `bbox1` and `bbox2` to draw the first line. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

- **loc1b, loc2b**

  `{1, 2, 3, 4}` Corners of `bbox1` and `bbox2` to draw the second line. Valid values are:

<table>
<thead>
<tr>
<th>Corner</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
</tbody>
</table>

- **kwargs**

  Patch properties for the line drawn:
<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>

<td>float</td>
</tr>
</tbody>
</table>

```python
__init__(self, bbox1, bbox2, loc1a, loc2a, loc1b, loc2b, **kwargs)
```

Connect two bboxes with a quadrilateral.

The quadrilateral is specified by two lines that start and end at corners of the bboxes. The four sides of the quadrilateral are defined by the two lines given, the line between the two corners specified in `bbox1` and the line between the two corners specified in `bbox2`.

**Parameters**

**bbox1, bbox2**

**loc1a, loc2a**

[{1, 2, 3, 4}] Corners of `bbox1` and `bbox2` to draw the first line.
Valid values are:

```python
'upper right' : 1,
'upper left' : 2,
'lower left' : 3,
'lower right' : 4
```

**loc1b, loc2b**

`[1, 2, 3, 4]` Corners of `bbox1` and `bbox2` to draw the second line. Valid values are:

```python
'upper right' : 1,
'upper left' : 2,
'lower left' : 3,
'lower right' : 4
```

**kwargs

Patch properties for the line drawn:

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxConnectorPatch`

- sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py

`mpl_toolkits.axes_grid1.inset_locator.BboxPatch`

```python
class mpl_toolkits.axes_grid1.inset_locator.BboxPatch(bbox, **kwargs)
```

Bases: `matplotlib.patches.Patch`

Patch showing the shape bounded by a Bbox.

**Parameters**

- `bbox`
  - `[matplotlib.transforms.Bbox]` Bbox to use for the extents of this patch.

- `**kwargs`
  - Patch properties. Valid arguments include:

```
__module__ = 'mpl_toolkits.axes_grid1.inset_locator'

get_path(self)
  Return the path of this patch.
```

Examples using `mpl_toolkits.axes_grid1.inset_locator.BboxPatch`

- `sphx_glr_gallery_subplots_axes_and_figures_axes_zoom_effect.py`

`mpl_toolkits.axes_grid1.inset_locator.InsetPosition`

```
class mpl_toolkits.axes_grid1.inset_locator.InsetPosition(parent, lbwh)
  Bases: object

  An object for positioning an inset axes.

  This is created by specifying the normalized coordinates in the axes, instead of the figure.

  Parameters

    parent

```
lbwh

[iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the parent axes.

See also:

matplotlib.axes.Axes.set_axes_locator()

Examples

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ([0, 0, 1, 1]) ensures that the axes completely fills the bounding box:

```python
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

__call__(self, ax, renderer)

Call self as a function.

__dict__

mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.inset_locator', '__init__': <function ... of 'InsetPosition' objects>, '__weakref__': <attribute '__weakref__' of 'InsetPosition' objects>, '__doc__': None})

__init__(self, parent, lbwh)

An object for positioning an inset axes.

This is created by specifying the normalized coordinates in the axes, instead of the figure.

Parameters

parent

lbwh

[iterable of four floats] The left edge, bottom edge, width, and height of the inset axes, in units of the normalized coordinate of the parent axes.

See also:

matplotlib.axes.Axes.set_axes_locator()
Examples

The following bounds the inset axes to a box with 20% of the parent axes's height and 40% of the width. The size of the axes specified ([0, 0, 1, 1]) ensures that the axes completely fills the bounding box:

```python
>>> parent_axes = plt.gca()
>>> ax_ins = plt.axes([0, 0, 1, 1])
>>> ip = InsetPosition(ax, [0.5, 0.1, 0.4, 0.2])
>>> ax_ins.set_axes_locator(ip)
```

__module__ = 'mpl_toolkits.axes_grid1.inset_locator'
__weakref__
   list of weak references to the object (if defined)

Examples using mpl_toolkits.axes_grid1.inset_locator.InsetPosition

Functions

inset_axes(parent_axes, width, height[, ...]) Create an inset axes with a given width and height.
mark_inset(parent_axes, inset_axes, loc1, ...) Draw a box to mark the location of an area represented by an inset axes.
zoomed_inset_axes(parent_axes, zoom[, loc, ...]) Create an anchored inset axes by scaling a parent axes.

mpl_toolkits.axes_grid1.inset_locator.inset_axes

mpl_toolkits.axes_grid1.inset_locator.inset_axes(parent_axes, width, height, loc='upper right', bbox_to_anchor=None, bbox_transform=None, axes_class=None, axes_kwargs=None, borderpad=0.5)

Create an inset axes with a given width and height.
Both sizes used can be specified either in inches or percentage. For example,

```python
inset_axes(parent_axes, width='40%', height='30%', loc=3)
```
creates in inset axes in the lower left corner of parent_axes which spans over 30% in height and 40% in width of the parent_axes. Since the usage of inset_axes may become slightly tricky when exceeding such standard cases, it is recommended to read the examples.
Parameters

**parent_axes**

[parentlib.axes.Axes] Axes to place the inset axes.

**width, height**

[float or str] Size of the inset axes to create. If a float is provided, it is the size in inches, e.g. *width*=1.3. If a string is provided, it is the size in relative units, e.g. *width*=‘40%’. By default, i.e. if neither *bbox_to_anchor* nor *bbox_transform* are specified, those are relative to the parent_axes. Otherwise they are to be understood relative to the bounding box provided via *bbox_to_anchor*.

**loc**

[int or str, default: 1] Location to place the inset axes. The valid locations are:

<table>
<thead>
<tr>
<th>Location</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>'upper right'</td>
<td>1</td>
</tr>
<tr>
<td>'upper left'</td>
<td>2</td>
</tr>
<tr>
<td>'lower left'</td>
<td>3</td>
</tr>
<tr>
<td>'lower right'</td>
<td>4</td>
</tr>
<tr>
<td>'right'</td>
<td>5</td>
</tr>
<tr>
<td>'center left'</td>
<td>6</td>
</tr>
<tr>
<td>'center right'</td>
<td>7</td>
</tr>
<tr>
<td>'lower center'</td>
<td>8</td>
</tr>
<tr>
<td>'upper center'</td>
<td>9</td>
</tr>
<tr>
<td>'center'</td>
<td>10</td>
</tr>
</tbody>
</table>

**bbox_to_anchor**

[tuple or matplotlib.transforms.BboxBase, optional] Bbox that the inset axes will be anchored to. If None, a tuple of (0, 0, 1, 1) is used if *bbox_transform* is set to *parent_axes*.*transAxes* or *parent_axes*.*figure*.*transFigure*. Otherwise, *parent_axes*.*bbox* is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs *width* and/or *height* are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that, unless *bbox_transform* is set, the units of the bounding box are interpreted in the pixel coordinate. When using *bbox_to_anchor* with tuple, it almost always makes sense to also specify a *bbox_transform*. This might often be the axes transform *parent_axes*.*transAxes*.

**bbox_transform**

[matplotlib.transforms.Transform, optional] Transformation for the bbox that contains the inset axes. If None, a transforms.IdentityTransform is used. The value of *bbox_to_anchor* (or the return value of its get_points method) is transformed by the *bbox_transform* and then interpreted as points in the

---

Chapter 19. Toolkits
pixel coordinate (which is dpi dependent). You may provide
bbox_to_anchor in some normalized coordinate, and give an ap-
propriate transform (e.g., parent_axes.transAxes).

axes_class

[matplotlib.axes.Axes type, optional] If specified, the inset axes
created will be created with this class's constructor.

axes_kwargs

[dict, optional] Keyworded arguments to pass to the constructor
of the inset axes. Valid arguments include:

<table>

**borderpad**

[float, default: 0.5] Padding between inset axes and the bbox to anchor. The units are axes font size, i.e. for a default font size of 10 points borderpad = 0.5 is equivalent to a padding of 5 points.

**Returns**

**inset_axes**

[axes_class] Inset axes object created.

**Notes**

The meaning of bbox to anchor and bbox to transform is interpreted differently from that of legend. The value of bbox to anchor (or the return value of its get_points method; the default is parent_axes.bbox) is transformed by the bbox_transform (the default is Identity transform) and then interpreted as points in the pixel coordinate (which is dpi dependent).

Thus, following three calls are identical and creates an inset axes with respect to the parent_axes:
Examples using mpl_toolkits.axes_grid1.inset_locator.inset_axes

- sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py
- sphx_glr_gallery_axes_grid1_demo_colorbar_with_inset_locator.py
- sphx_glr_gallery_axes_grid1_inset_locator_demo.py
- Overview of axes_grid1 toolkit

mpl_toolkits.axes_grid1.inset_locator.mark_inset

Draw a box to mark the location of an area represented by an inset axes. This function draws a box in parent_axes at the bounding box of inset_axes, and shows a connection with the inset axes by drawing lines at the corners, giving a "zoomed in" effect.

**Parameters**

parent_axes

[matplotlib.axes.Axes] Axes which contains the area of the inset axes.

inset_axes

loc1, loc2

[{1, 2, 3, 4}] Corners to use for connecting the inset axes and the area in the parent axes.

**kwargs

Patch properties for the lines and box drawn:

</table>

**Returns**

**pp**

[matplotlib.patches.Patch] The patch drawn to represent the area of the inset axes.

**p1, p2**

Examples using `mpl_toolkits.axes_grid1.inset_locator.mark_inset`

- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`

`mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

```
mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes(parent_axes, zoom, loc='upper right', bbox_to_anchor=None, bbox_transform=None, axes_class=None, axes_kwargs=None, borderpad=0.5)
```

Create an anchored inset axes by scaling a parent axes. For usage, also see the examples.

**Parameters**

**parent_axes**

`[matplotlib.axes.Axes]` Axes to place the inset axes.

**zoom**

[float] Scaling factor of the data axes. `zoom > 1` will enlarge the coordinates (i.e., "zoomed in"), while `zoom < 1` will shrink the coordinates (i.e., "zoomed out").

**loc**

[int or str, default: 'upper right'] Location to place the inset axes. The valid locations are:

```
'upper right' : 1,
'upper left'  : 2,
'lower left'  : 3,
'lower right' : 4,
'right'       : 5,
'center left' : 6,
'center right': 7,
'lower center': 8,
'upper center': 9,
'center'      : 10
```

**bbox_to_anchor**

[tuple or `matplotlib.transforms.BboxBase`, optional] Bbox that the inset axes will be anchored to. If None, `parent_axes.bbox` is used. If a tuple, can be either [left, bottom, width, height], or [left, bottom]. If the kwargs `width` and/or `height` are specified in relative units, the 2-tuple [left, bottom] cannot be used. Note that
the units of the bounding box are determined through the transform in use. When using `bbox_to_anchor` it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`.

**bbox_transform**

`[matplotlib.transforms.Transform, optional]` Transformation for the bbox that contains the inset axes. If None, a `transforms.IdentityTransform` is used (i.e. pixel coordinates). This is useful when not providing any argument to `bbox_to_anchor`. When using `bbox_to_anchor` it almost always makes sense to also specify a `bbox_transform`. This might often be the axes transform `parent_axes.transAxes`. Inversely, when specifying the axes- or figure-transform here, be aware that not specifying `bbox_to_anchor` will use `parent_axes.bbox`, the units of which are in display (pixel) coordinates.

**axes_class**

`[matplotlib.axes.Axes type, optional]` If specified, the inset axes created will be created with this class's constructor.

**axes_kwargs**

`[dict, optional]` Keyworded arguments to pass to the constructor of the inset axes. Valid arguments include:

**borderpad**

[float, default: 0.5] Padding between inset axes and the bbox_to_anchor. The units are axes font size, i.e. for a default font size of 10 points `borderpad = 0.5` is equivalent to a padding of 5 points.

**Returns**

**inset_axes**

[axes_class] Inset axes object created.
Examples using `mpl_toolkits.axes_grid1.inset_locator.zoomed_inset_axes`

- `sphx_glr_gallery_axes_grid1_demo_colorbar_of_inset_axes.py`
- `sphx_glr_gallery_axes_grid1_inset_locator_demo2.py`

`mpl_toolkits.axes_grid1.mpl_axes`

**Classes**

```python
Axes(fig, rect[, facecolor, frameon, ...]) Build an axes in a figure.
```

```python
SimpleAxisArtist(axis, axisnum, spine)
```

```python
SimpleChainedObjects(objects)
```

`mpl_toolkits.axes_grid1.mpl_axes.Axes`

class `mpl_toolkits.axes_grid1.mpl_axes.Axes(fig, rect, facecolor=None, frameon=True, sharex=None, sharey=None, label='', xscale=None, yscale=None, box_aspect=None, **kwargs)`

Build an axes in a figure.

**Parameters**

`fig`

[Figure] The axes is build in the Figure `fig`.

`rect`

[[left, bottom, width, height]] The axes is build in the rectangle `rect`. `rect` is in Figure coordinates.

`sharex, sharey`

[Axes, optional] The x or y axis is shared with the x or y axis in the input `Axes`.

`frameon`

[bool, default: True] Whether the axes frame is visible.

`box_aspect`

[None, or a number, optional] Sets the aspect of the axes box. See `set_box_aspect` for details.
**kwargs

Other optional keyword arguments:

Returns

Axes

The new Axes object.

class AxisDict() -> new empty dictionary dict(mapping) -> new dictionary initialized from a mapping object's (key, value) pairs
dict( iterable ) -> new dictionary initialized as if via: d = {}
for k, v in iterable: d[k] = v
dict(**kwargs) -> new dictionary initialized with the name=value pairs in the keyword argument list. For example: dict(one=1, two=2)

Bases: dict

__call__ (self, *v, **kwargs)
Call self as a function.

__dict__ = mappingproxy({'_module__': 'mpl_toolkits.axes_grid1.mpl_axes', '__init__':<function AxisDict.__init__>, ... '__dict__' of 'AxisDict' objects>, '__weakref__': <attribute '__weakref__' of 'AxisDict' objects>, '__doc__': None})

__getitem__ (self, k)
x.__getitem__(y) <==> x[y]

__init__ (self, axes)
Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'

__weakref__
list of weak references to the object (if defined)

__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'

property axis
Convenience method to get or set some axis properties.

Call signatures:

xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])

(continues on next page)
\( \text{xmin, xmax, ymin, ymax} = \text{axis}(\text{option}) \)
\( \text{xmin, xmax, ymin, ymax} = \text{axis}(**\text{kwargs}) \)

**Parameters**

\textbf{xmin, xmax, ymin, ymax}

[float, optional] The axis limits to be set. This can also be achieved using

\[ \text{ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))} \]

**option**

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'on'</td>
<td>Turn on axis lines and labels. Same as True.</td>
</tr>
<tr>
<td>'off'</td>
<td>Turn off axis lines and labels. Same as False.</td>
</tr>
<tr>
<td>'equal'</td>
<td>Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as \text{ax.set_aspect('equal', adjustable='datalim')} . Explicit data limits may not be respected in this case.</td>
</tr>
<tr>
<td>'scaled'</td>
<td>Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as \text{ax.set_aspect('equal', adjustable='box', anchor='C')} . Additionally, further autoscaling will be disabled.</td>
</tr>
<tr>
<td>'tight'</td>
<td>Set limits just large enough to show all data, then disable further autoscaling.</td>
</tr>
<tr>
<td>'auto'</td>
<td>Automatic scaling (fill plot box with data).</td>
</tr>
<tr>
<td>'image'</td>
<td>'scaled' with axis limits equal to data limits.</td>
</tr>
<tr>
<td>'square'</td>
<td>Square plot; similar to 'scaled', but initially forcing ( xmax-xmin == ymax-ymin ).</td>
</tr>
</tbody>
</table>

**emit**

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to \text{set_xlim} and \text{set_ylim}.

**Returns**

\textbf{xmin, xmax, ymin, ymax}

[float] The axis limits.
See also:

matplotlib.axes.Axes.set_xlim
matplotlib.axes.Axes.set_ylim

cla(self)
Clear the current axes.

mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist

class mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist(axis, axisnum, spine)
Bases: matplotlib.artist.Artist

__init__(self, axis, axisnum, spine)
Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'

property label

property major_ticklabels

property major_ticks

set_label(self, txt)
Set a label that will be displayed in the legend.

Parameters

s
[object] s will be converted to a string by calling str.

set_visible(self, b)
Set the artist’s visibility.

Parameters
toggle(self, all=None, ticks=None, ticklabels=None, label=None)

Examples using mpl_toolkits.axes_grid1.mpl_axes.SimpleAxisArtist

mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects

class mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects(objects)
Bases: object
__call__(self, *args, **kwargs)
    Call self as a function.
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axes_grid1.mpl_axes', '__init__': <function ... objects>, '__weakref__': <attribute '__weakref__' of 'SimpleChainedObjects' objects>, '__doc__': None})
__getattr__(self, k)
__init__(self, objects)
    Initialize self. See help(type(self)) for accurate signature.
__module__ = 'mpl_toolkits.axes_grid1.mpl_axes'
__weakref__
    list of weak references to the object (if defined)

Examples using mpl_toolkits.axes_grid1.mpl_axes.SimpleChainedObjects

mpl_toolkits.axes_grid1.parasite_axes.host_axes

call(*args, axes_class=<class 'mpl_toolkits.axes_grid1.mpl_axes.Axes'>, figure=None, **kwargs)

Create axes that can act as a hosts to parasitic axes.

**Parameters**

*figure*

[matplotlib.figure.Figure] Figure to which the axes will be added. Defaults to the current figure pyplot.gcf().

*args, **kwargs*

Will be passed on to the underlying Axes object creation.

Examples using mpl_toolkits.axes_grid1.parasite_axes.host_axes

mpl_toolkits.axes_grid1.parasite_axes.host_axes_class_factory

mpl_toolkits.axes_grid1.parasite_axes.host_axes_class_factory(axes_class=None)

Examples using mpl_toolkits.axes_grid1.parasite_axes.host_axes_class_factory

mpl_toolkits.axes_grid1.parasite_axes.host_subplot

mpl_toolkits.axes_grid1.parasite_axes.host_subplot(*args, axes_class=<class 'mpl_toolkits.axes_grid1.mpl_axes.Axes'>, figure=None, **kwargs)

Create a subplot that can act as a host to parasitic axes.

**Parameters**

*figure*

[matplotlib.figure.Figure] Figure to which the subplot will be added. Defaults to the current figure pyplot.gcf().

*args, **kwargs*

Will be passed on to the underlying Axes object creation.

19.1.3 Matplotlib axisartist Toolkit

The axisartist namespace includes a derived Axes implementation (mpl_toolkits.axisartist.Axes). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's Axis class. This change was strongly motivated to support curvilinear grid. You can find a tutorial describing usage of axisartist at the axisartist user guide.

The submodules of the axisartist API are:
<table>
<thead>
<tr>

**mpl_toolkits.axisartist.angle_helper**

**Classes**

```python
ExtremeFinderCycle(nx, ny[, lon_cycle, ...])
```

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

```python
FormatterDMS()
FormatterHMS()
LocatorBase(**kwargs)
LocatorD(**kwargs)
LocatorDM(**kwargs)
LocatorDMS(**kwargs)
LocatorH(**kwargs)
LocatorHM(**kwargs)
LocatorHMS(**kwargs)
```
mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle

class mpl_toolkits.axisartist.angle_helper.ExtremeFinderCycle(nx, ny, lon_cycle=360.0, lat_cycle=None, lon_minmax=None, lat_minmax=(-90, 90))

Bases: mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

Parameters

nx, ny

[int] The number of samples in each direction.

lon_cycle, lat_cycle

[360 or None] If not None, values in the corresponding direction are taken modulo lon_cycle or lat_cycle; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results.

This is done by "unwrapping" the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].

lon_minmax, lat_minmax

[(float, float) or None] If not None, the computed bounding box is clipped to the given range in the corresponding direction.

__call__(self, transform_xy, x1, y1, x2, y2)

Compute an approximation of the bounding box obtained by applying transform_xy to the box delimited by (x1, y1, x2, y2).

The intended use is to have (x1, y1, x2, y2) in axes coordinates, and have transform_xy be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

The computation is done by sampling nx * ny equispaced points in the (x1, y1, x2, y2) box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.
As each sampling step covers a relative range of $1/nx$ or $1/ny$, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

```python
__init__(self, nx, ny, lon_cycle=360.0, lat_cycle=None, lon_minmax=None, lat_minmax=-90, 90)
```

This subclass handles the case where one or both coordinates should be taken modulo 360, or be restricted to not exceed a specific range.

**Parameters**

nx, ny

[int] The number of samples in each direction.

lon_cycle, lat_cycle

[360 or None] If not None, values in the corresponding direction are taken modulo `lon_cycle` or `lat_cycle`; in theory this can be any number but the implementation actually assumes that it is 360 (if not None); other values give nonsensical results. This is done by "unwrapping" the transformed grid coordinates so that jumps are less than a half-cycle; then normalizing the span to no more than a full cycle.

For example, if values are in the union of the [0, 2] and [358, 360] intervals (typically, angles measured modulo 360), the values in the second interval are normalized to [-2, 0] instead so that the values now cover [-2, 2]. If values are in a range of [5, 1000], this gets normalized to [5, 365].

lon_minmax, lat_minmax

[(float, float) or None] If not None, the computed bounding box is clipped to the given range in the corresponding direction.

mpl_toolkits.axisartist.axes_grid.CbarAxes

class mpl_toolkits.axisartist.axes_grid.CbarAxes(*args, orientation, **kwargs)

    __module__ = 'mpl_toolkits.axisartist.axes_grid'

Examples using mpl_toolkits.axisartist.axes_grid.CbarAxes

mpl_toolkits.axisartist.axes_grid.Grid

class mpl_toolkits.axisartist.axes_grid.Grid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=<deprecated parameter>, share_all=False, share_x=True, share_y=True, label_mode='L', axes_class=None, *, aspect=False)

    Bases: mpl_toolkits.axes_grid1.axes_grid1.Grid

Parameters

    fig
        [Figure] The parent figure.

    rect
        [(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").

    nrows_ncols
        [(int, int)] Number of rows and columns in the grid.

    ngrids
        [int or None, default: None] If not None, only the first ngrids axes in the grid are created.

    direction
Axes are created in row-major ("row by row") or column-major order ("column by column").

**axes_pad**

[float or (float, float), default: 0.02] Padding or (horizontal padding, vertical padding) between axes, in inches.

**add_all**

[bool, default: True] Whether to add the axes to the figure using `Figure.add_axes`. This parameter is deprecated.

**share_all**

[bool, default: False] Whether all axes share their x- and y-axis. Overrides `share_x` and `share_y`.

**share_x**

[bool, default: True] Whether all axes of a column share their x-axis.

**share_y**

[bool, default: True] Whether all axes of a row share their y-axis.

**label_mode**

["L", "1", "all"], default: "L"] Determines which axes will get tick labels:

- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**axes_class**

[subclass of `matplotlib.axes.Axes`, default: None]

**aspect**

[bool, default: False] Whether the axes aspect ratio follows the aspect ratio of the data limits.

```
__module__ = 'mpl_toolkits.axisartist.axes_grid'
```
Examples using `mpl_toolkits.axisartist.axes_grid.Grid`

`mpl_toolkits.axisartist.axes_grid.ImageGrid`

class `mpl_toolkits.axisartist.axes_grid.ImageGrid(fig, rect, nrows_ncols, ngrids=None, direction='row', axes_pad=0.02, add_all=<deprecated parameter>, share_all=False, aspect=True, label_mode='L', cbar_mode=None, cbar_location='right', cbar_pad=None, cbar_size='5%', cbar_set_cax=True, axes_class=None)`

Bases: `mpl_toolkits.axisgrid1.axisgrid1.ImageGrid`

**Parameters**

- **fig**
  
  `[Figure] The parent figure.`

- **rect**
  
  `[(float, float, float, float) or int] The axes position, as a (left, bottom, width, height) tuple or as a three-digit subplot position code (e.g., "121").`

- **nrows_ncols**
  
  `[int, int] Number of rows and columns in the grid.`

- **ngrids**
  
  `[int or None, default: None] If not None, only the first ngrids axes in the grid are created.`

- **direction**
  
  `["row", "column"], default: "row"] Whether axes are created in row-major ("row by row") or column-major order ("column by column"). This also affects the order in which axes are accessed using indexing (grid[index]).`

- **axes_pad**
  
  `[float or (float, float), default: 0.02in] Padding or (horizontal padding, vertical padding) between axes, in inches.`

- **add_all**
[bool, default: True] Whether to add the axes to the figure using `Figure.add_axes`. This parameter is deprecated.

**share_all**

[bool, default: False] Whether all axes share their x- and y-axis.

**aspect**

[bool, default: True] Whether the axes aspect ratio follows the aspect ratio of the data limits.

**label_mode**

[{"L", "1", "all"}, default: "L"] Determines which axes will get tick labels:
- "L": All axes on the left column get vertical tick labels; all axes on the bottom row get horizontal tick labels.
- "1": Only the bottom left axes is labelled.
- "all": all axes are labelled.

**cbar_mode**

[{"each", "single", "edge", None}, default: None] Whether to create a colorbar for "each" axes, a "single" colorbar for the entire grid, colorbars only for axes on the "edge" determined by `cbar_location`, or no colorbars. The colorbars are stored in the `cbar_axes` attribute.

**cbar_location**

[{"left", "right", "bottom", "top"}, default: "right"]

**cbar_pad**

[float, default: None] Padding between the image axes and the colorbar axes.

**cbar_size**

[size specification (see `Size.from_any`), default: "5%"] Colorbar size.

**cbar_set_cax**

[bool, default: True] If True, each axes in the grid has a `cax` attribute that is bound to associated `cbar_axes`.

**axes_class**

[subclass of `matplotlib.axes.Axes`, default: None]

```
__module__ = 'mpl_toolkits.axisartist.axes_grid'
```
Examples using `mpl_toolkits.axisartist.axes_grid.ImageGrid`

`mpl_toolkits.axisartist.axes_rgb`

Classes

```python
RGBAxes(*args[, pad, add_all])
```

**Parameters**

- **pad**
  - [float, default: 0] fraction of the axes height to put as padding.

- **add_all**
  - [bool, default: True] Whether to add the {rgb, r, g, b} axes to the figure. This parameter is deprecated.

- **axes_class**
  - [matplotlib.axes.Axes]

- **args**
  - Unpacked into axes_class() init for RGB

- **kwargs**
  - Unpacked into axes_class() init for RGB, R, G, B axes

- `__module__ = 'mpl_toolkits.axisartist.axes_rgb'`
Examples using mpl_toolkits.axisartist.axes_rgb.RGBAxes

mpl_toolkits.axisartist.axis_artist

axis_artist.py module provides axis-related artists. They are

- axis line
- tick lines
- tick labels
- axis label
- grid lines

The main artist classes are AxisArtist and GridlinesCollection. While GridlinesCollection is responsible for drawing grid lines, AxisArtist is responsible for all other artists. AxisArtist has attributes that are associated with each type of artists:

- line: axis line
- major_ticks: major tick lines
- major_ticklabels: major tick labels
- minor_ticks: minor tick lines
- minor_ticklabels: minor tick labels
- label: axis label

Typically, the AxisArtist associated with an axes will be accessed with the axis dictionary of the axes, i.e., the AxisArtist for the bottom axis is

\[
\text{ax.axis["bottom"]}
\]

where ax is an instance of mpl_toolkits.axislines.Axes. Thus, ax.axis["bottom"].line is an artist associated with the axis line, and ax.axis["bottom"].major_ticks is an artist associated with the major tick lines.

You can change the colors, fonts, line widths, etc. of these artists by calling suitable set method. For example, to change the color of the major ticks of the bottom axis to red, use

\[
\text{ax.axis["bottom"].major_ticks.set_color("r")}
\]

However, things like the locations of ticks, and their ticklabels need to be changed from the side of the grid_helper.
axis_direction

AxisArtist, AxisLabel, TickLabels have an axis direction attribute, which adjusts the location, angle, etc. The axis direction must be one of "left", "right", "bottom", "top", and follows the Matplotlib convention for rectangular axis.

For example, for the bottom axis (the left and right is relative to the direction of the increasing coordinate),

- ticklabels and axislabel are on the right
- ticklabels and axislabel have text angle of 0
- ticklabels are baseline, center-aligned
- axislabel is top, center-aligned

The text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>ticklabels location</td>
<td>left</td>
<td>right</td>
<td>right</td>
<td>left</td>
</tr>
<tr>
<td>axislabel location</td>
<td>left</td>
<td>right</td>
<td>right</td>
<td>left</td>
</tr>
<tr>
<td>ticklabels angle</td>
<td>90</td>
<td>0</td>
<td>-90</td>
<td>180</td>
</tr>
<tr>
<td>axislabel angle</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
</tr>
<tr>
<td>ticklabel va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
</tr>
<tr>
<td>axislabel va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
</tr>
<tr>
<td>ticklabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
<tr>
<td>axislabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Ticks are by default direct opposite side of the ticklabels. To make ticks to the same side of the ticklabels,

```python
ax.axis["bottom"].major_ticks.set_ticks_out(True)
```

The following attributes can be customized (use the set_xxx methods):

- **Ticks**: ticksize, tick_out
- **TickLabels**: pad
- **AxisLabel**: pad
Classes

**AttributeCopier(**kwargs)** [Deprecated]

**AxisArtist**(axes, helper[, offset, ...]) An artist which draws axis (a line along which the n-th axes coord is constant) line, ticks, ticklabels, and axis label.

**AxisLabel(**args[, axis_direction, axis])** Axis Label.

**BezierPath(**kwargs)** [Deprecated]

**GridlinesCollection(**args[, which, axis])** Parameters

**LabelBase(**args, **kwargs)** A base class for AxisLabel and TickLabels.

**TickLabels(**[, axis_direction])** Tick Labels.

**Ticks**(ticksize[, tick_out, axis]) Ticks are derived from Line2D, and note that ticks themselves are markers.

`mpl_toolkits.axisartist.axis_artist.AttributeCopier`

class `mpl_toolkits.axisartist.axis_artist.AttributeCopier(**kwargs)`

Bases: object

[Deprecated]

Notes

Deprecated since version 3.2:

```python
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.axis_artist', '__init__': <function ... of 'AttributeCopier' objects>, '__weakref__': <attribute '__weakref__' of 'AttributeCopier' objects>, '__doc__': None})

__init__(self, ref_artist, klass=<class 'matplotlib.artist.Artist'>)

[Deprecated]
```

Notes

Deprecated since version 3.2:

```python
__module__ = 'mpl_toolkits.axisartist.axis_artist'

__weakref__

list of weak references to the object (if defined)

get_attribute_from_ref_artist(self, attr_name, default_value=<deprecated parameter>)
```
get_ref_artist(self)
    Return the underlying artist that actually defines some properties (e.g.,
    color) of this artist.

set_ref_artist(self, artist)
    [Deprecated]

Notes

Deprecated since version 3.2:

Examples using mpl_toolkits.axisartist.axis_artist.AttributeCopier

class mpl_toolkits.axisartist.axis_artist.AxisArtist
    axes
    [mpl_toolkits.axisartist.axislines.Axes]

    helper
    [AxisArtistHelper]

Bases: matplotlib.artist.Artist

An artist which draws axis (a line along which the n-th axes coord is constant)
line, ticks, ticklabels, and axis label.

Parameters

axes

helper

property LABELPAD

ZORDER = 2.5

__init__(self, axes, helper, offset=None, axis_direction='bottom',
        **kwargs)

Parameters

axes

helper
property dpi_transform

draw(self, renderer)
   Draw the Artist (and its children) using the given renderer.
   This has no effect if the artist is not visible (Artist.get_visible returns False).

   Parameters

       renderer

           [RendererBase subclass.]

   Notes

   This method is overridden in the Artist subclasses.

get_axisline_style(self)
   Return the current axisline style.

get_helper(self)
   Return axis artist helper instance.

get_tightbbox(self, renderer)
   Like Artist.get_window_extent, but includes any clipping.

   Parameters

       renderer

           [RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

   Returns

       Bbox

           The enclosing bounding box (in figure pixel coordinates).

get_transform(self)
   Return the Transform instance used by this artist.

invert_ticklabel_direction(self)

set_axis_direction(self, axis_direction)
   Adjust the direction, text angle, text alignment of ticklabels, labels following the matplotlib convention for the rectangle axes.
   The axis_direction must be one of [left, right, bottom, top].
Note that the direction "+" and "-" are relative to the direction of the increasing coordinate. Also, the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

```python
def set_axislabel_direction(self, label_direction)
    Adjust the direction of the axislabel.
    Note that the label_directions '+' and '-' are relative to the direction of the increasing coordinate.

    Parameters

    tick_direction
        ["+", "]")
```

```python
def set_axisline_style(self, axisline_style=None, **kwargs)
    Set the axisline style.
    The new style is completely defined by the passed attributes. Existing style attributes are forgotten.

    Parameters

    axisline_style
        [str or None] The line style, e.g. '->', optionally followed by a comma-separated list of attributes. Alternatively, the attributes can be provided as keywords.

        If None this returns a string containing the available styles.
Examples

The following two commands are equal: >>> set_axisline_style("->", size=1.5) >>> set_axisline_style("->", size=1.5)

set_label(self, s)
Set a label that will be displayed in the legend.

Parameters

s
[object] s will be converted to a string by calling str.

set_ticklabel_direction(self, tick_direction)
Adjust the direction of the ticklabel.

Note that the label directions '+' and '-' are relative to the direction of the increasing coordinate.

Parameters

 tick_direction
  ["+", "]

toggle(self, all=None, ticks=None, ticklabels=None, label=None)
Toggle visibility of ticks, ticklabels, and (axis) label. To turn all off,

  axis.toggle(all=False)

To turn all off but ticks on

  axis.toggle(all=False, ticks=True)

To turn all on but (axis) label off

  axis.toggle(all=True, label=False))

zorder = 2.5

Examples using mpl_toolkits.axisartist.axis_artist.AxisArtist

mpl_toolkits.axisartist.axis_artist.AxisLabel

class mpl_toolkits.axisartist.axis_artist.AxisLabel(*args, axis_direction='bottom', axis=None, **kwargs)

Bases: mpl_toolkits.axisartist.axis_artist.AttributeCopier, mpl_toolkits.axisartist.axis_artist.LabelBase
Axis Label. Derived from Text. The position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text.

To change the pad between ticklabels and axis label, use set_pad.

[Deprecated]

Notes

Deprecated since version 3.2:

```python
__init__(self, *args, axis_direction='bottom', axis=None, **kwargs)
```

[Deprecated]

Notes

Deprecated since version 3.2:

```python
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_color(self)

Return the color of the text.

get_pad(self)

Return the internal pad in points.

See `set_pad` for more details.

get_ref_artist(self)

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

get_text(self)

Return the text string.
get_window_extent(self, renderer)

Return the Bbox bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

Parameters

renderer

[Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling get_window_extent before the first draw. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

dpi

[float, optional] The dpi value for computing the bbox, defaults to self.figure.dpi (not the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

set_axis_direction(self, d)

Adjust the text angle and text alignment of axis label according to the matplotlib convention.

<table>
<thead>
<tr>
<th>property</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>axislabel angle</td>
<td>180</td>
<td>0</td>
<td>0</td>
<td>180</td>
</tr>
<tr>
<td>axislabel va</td>
<td>center</td>
<td>top</td>
<td>center</td>
<td>bottom</td>
</tr>
<tr>
<td>axislabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>

Note that the text angles are actually relative to (90 + angle of the direction to the ticklabel), which gives 0 for bottom axis.

set_default_alignment(self, d)

set_default_angle(self, d)

set_pad(self, pad)

Set the internal pad in points.

The actual pad will be the sum of the internal pad and the external pad (the latter is set automatically by the AxisArtist).
Examples using `mpl_toolkits.axisartist.axis_artist.AxisLabel`

`mpl_toolkits.axisartist.axis_artist.BezierPath`

class `mpl_toolkits.axisartist.axis_artist.BezierPath(**kwargs)`
   Bases: `matplotlib.lines.Line2D`
   [Deprecated]

   Notes

   Deprecated since version 3.2:

   **Parameters**

   path
      [Path] The path to draw.
   **kwargs
      All remaining keyword arguments are passed to `Line2D`.

   __init__(self, path, *args, **kwargs)

   **Parameters**

   path
      [Path] The path to draw.
   **kwargs
      All remaining keyword arguments are passed to `Line2D`.

   __module__ = 'mpl_toolkits.axisartist.axis_artist'

draw(self, renderer)
   Draw the Artist (and its children) using the given renderer.
   This has no effect if the artist is not visible (`Artist.get_visible` returns False).

   **Parameters**

   renderer
      [RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

```python
def recache(self):
    self.set_path(self, path)
```

Examples using `mpl_toolkits.axisartist.axis_artist.BezierPath`

```python
class mpl_toolkits.axisartist.axis_artist.GridlinesCollection:
    Bases: `matplotlib.collections.LineCollection`

    def __init__(self, *args, which='major', axis='both', **kwargs):
        Parameters

        which
        ["major", "minor"]

        axis
        ["both", "x", "y"]

def draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (`Artist.get_visible` returns False).

    Parameters

    renderer
        [RendererBase subclass.]
```

19.1. Toolkits
Notes

This method is overridden in the Artist subclasses.

```python
set_axis(self, axis)
set_grid_helper(self, grid_helper)
set_which(self, which)
```

Examples using `mpl_toolkits.axisartist.axis_artist.GridlinesCollection`

```python
class mpl_toolkits.axisartist.axis_artist.LabelBase(*args, **kwargs)
    Bases: matplotlib.text.Text
```

A base class for AxisLabel and TickLabels. The position and angle of the text are calculated by to offset_ref_angle, text_ref_angle, and offset_radius attributes.

Create a `Text` instance at x, y with string `text`.

Valid keyword arguments are:

<table>

</tbody>
</table>

```
__module__ = 'mpl_toolkits.axisartist.axis_artist'

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

    renderer
        [RendererBase subclass.]
```
Notes

This method is overridden in the Artist subclasses.

```
get_window_extent(self, renderer)
```

Return the `Bbox` bounding the text, in display units.

In addition to being used internally, this is useful for specifying clickable regions in a png file on a web page.

**Parameters**

- `renderer`  
  [Renderer, optional] A renderer is needed to compute the bounding box. If the artist has already been drawn, the renderer is cached; thus, it is only necessary to pass this argument when calling `get_window_extent` before the first `draw`. In practice, it is usually easier to trigger a draw first (e.g. by saving the figure).

- `dpi`  
  [float, optional] The dpi value for computing the bbox, defaults to `self.figure.dpi` (not the renderer dpi); should be set e.g. if to match regions with a figure saved with a custom dpi value.

**Examples using mpl_toolkits.axisartist.axis_artist.LabelBase**

```
mpl_toolkits.axisartist.axis_artist.TickLabels
```

```
class mpl_toolkits.axisartist.axis_artist.TickLabels(*,
  axis_direction='bottom',
  **kwargs)
```

**Bases:** `mpl_toolkits.axisartist.axis_artist.AxisLabel`

Tick Labels. While derived from Text, this single artist draws all ticklabels. As in AxisLabel, the position of the text is updated in the fly, so changing text position has no effect. Otherwise, the properties can be changed as a normal Text. Unlike the ticklabels of the mainline matplotlib, properties of single ticklabel alone cannot modified.

To change the pad between ticks and ticklabels, use `set_pad`.

[Deprecated]
Notes

Deprecated since version 3.2:

```python
__init__(self, *, axis_direction='bottom', **kwargs)
[Deprecated]
```

Notes

Deprecated since version 3.2:

```python
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters**

**renderer**

[`RendererBase` subclass.]

Notes

This method is overridden in the Artist subclasses.

get_ref_artist(self)

Return the underlying artist that actually defines some properties (e.g., color) of this artist.

get_texts_widths_heights_descents(self, renderer)

Return a list of `(width, height, descent)` tuples for ticklabels.

Empty labels are left out.

get_window_extents(self, renderer)

invert_axis_direction(self)

set_axis_direction(self, label_direction)

Adjust the text angle and text alignment of ticklabels according to the matplotlib convention.

The `label_direction` must be one of [left, right, bottom, top].

<table>
<thead>
<tr>
<th>property</th>
<th>left</th>
<th>bottom</th>
<th>right</th>
<th>top</th>
</tr>
</thead>
<tbody>
<tr>
<td>ticklabels_angle</td>
<td>90</td>
<td>0</td>
<td>-90</td>
<td>180</td>
</tr>
<tr>
<td>ticklabel va</td>
<td>center</td>
<td>baseline</td>
<td>center</td>
<td>baseline</td>
</tr>
<tr>
<td>ticklabel ha</td>
<td>right</td>
<td>center</td>
<td>right</td>
<td>center</td>
</tr>
</tbody>
</table>
Note that the text angles are actually relative to \((90 + \text{angle of the direction to the ticklabel})\), which gives 0 for bottom axis.

```python
def set_locs_angles_labels(self, locs_angles_labels)
```

**Examples using** `mpl_toolkits.axisartist.axis_artist.TickLabels`

`mpl_toolkits.axisartist.axis_artist.Ticks`

```python
class mpl_toolkits.axisartist.axis_artist.Ticks(ticksize, tick_out=False, *, axis=None, **kwargs)
```

**Bases:** `mpl_toolkits.axisartist.axis_artist.AttributeCopier`, `matplotlib.lines.Line2D`

Ticks are derived from Line2D, and note that ticks themselves are markers. Thus, you should use `set_mec`, `set_mew`, etc.

To change the tick size (length), you need to use `set_ticksize`. To change the direction of the ticks (ticks are in opposite direction of ticklabels by default), use `set_tick_out(False)`.

[Deprecated]

**Notes**

Deprecated since version 3.2:

```python
__init__(self, ticksize, tick_out=False, *, axis=None, **kwargs)
```

[Deprecated]

**Notes**

Deprecated since version 3.2:

```python
__module__ = 'mpl_toolkits.axisartist.axis_artist'
```

```python
def draw(self, renderer)
```

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

**Parameters**

- `renderer`  
  [RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

get_color(self)
Return the line color.
See also set_color.

get_markeredgecolor(self)
Return the marker edge color.
See also set_markeredgecolor.

get_markeredgewidth(self)
Return the marker edge width in points.
See also set_markeredgewidth.

get_ref_artist(self)
Return the underlying artist that actually defines some properties (e.g., color) of this artist.

get_tick_out(self)
Return whether ticks are drawn inside or outside the axes.

get_ticksize(self)
Return length of the ticks in points.

set_locs_angles(self, locs_angles)

set_tick_out(self, b)
Set whether ticks are drawn inside or outside the axes.

set_ticksize(self, ticksize)
Set length of the ticks in points.

Examples using mpl_toolkits.axisartist.axis_artist.Ticks

mpl_toolkits.axisartist.axisline_style

Classes

| AxislineStyle(stylename, **kw) | A container class which defines style classes for AxisArtists. |
mpl_toolkits.axisartist.axisline_style.AxislineStyle

class mpl_toolkits.axisartist.axisline_style.AxislineStyle(stylename, **kw)
Bases: matplotlib.patches._Style
A container class which defines style classes for AxisArtists.
An instance of any axisline style class is an callable object, whose call signature is

```python
__call__(self, axis_artist, path, transform)
```

When called, this should return an Artist with the following methods:

```python
def set_path(self, path):
    # set the path for axisline.
def set_line_mutation_scale(self, scale):
    # set the scale
def draw(self, renderer):
    # draw
```

Return the instance of the subclass with the given style name.

class FilledArrow(size=1)
Bases: mpl_toolkits.axisartist.axisline_style.AxislineStyle.SimpleArrow

**Parameters**

- **size**
  - [float] Size of the arrow as a fraction of the ticklabel size.

```
ArrowAxisClass
alias of _FancyAxislineStyle.FilledArrow
__module__ = 'mpl_toolkits.axisartist.axisline_style'
```

class SimpleArrow(size=1)
Bases: mpl_toolkits.axisartist.axisline_style.AxislineStyle._Base

A simple arrow.

**Parameters**

- **size**
  - [float] Size of the arrow as a fraction of the ticklabel size.

```
ArrowAxisClass
alias of _FancyAxislineStyle.SimpleArrow
__init__(self, size=1)
```
Parameters

size
[Float] Size of the arrow as a fraction of the ticklabel size.

```
__module__ = 'mpl_toolkits.axisartist.axisline_style'
new_line(self, axis_artist, transform)
__module__ = 'mpl_toolkits.axisartist.axisline_style'
```

Examples using `mpl_toolkits.axisartist.axisline_style.AxislineStyle`

`mpl_toolkits.axisartist.axislines`

Axislines includes modified implementation of the Axes class. The biggest difference is that the artists responsible for drawing the axis spine, ticks, ticklabels and axis labels are separated out from Matplotlib's Axis class. Originally, this change was motivated to support curvilinear grid. Here are a few reasons that I came up with a new axes class:

- "top" and "bottom" x-axis (or "left" and "right" y-axis) can have different ticks (tick locations and labels). This is not possible with the current Matplotlib, although some twin axes trick can help.
- Curvilinear grid.
- angled ticks.

In the new axes class, xaxis and yaxis is set to not visible by default, and new set of artist (AxisArtist) are defined to draw axis line, ticks, ticklabels and axis label. Axes.axis attribute serves as a dictionary of these artists, i.e., ax.axis["left"] is a AxisArtist instance responsible to draw left y-axis. The default Axes.axis contains "bottom", "left", "top" and "right".

AxisArtist can be considered as a container artist and has following children artists which will draw ticks, labels, etc.

- line
- major_ticks, major_ticklabels
- minor_ticks, minor_ticklabels
- offsetText
- label

Note that these are separate artists from `matplotlib.axis.Axis`, thus most tick-related functions in Matplotlib won't work. For example, color and markerwidth of the ax.axis["bottom"].major_ticks will follow those of Axes.xaxis unless explicitly specified.
In addition to AxisArtist, the Axes will have `gridlines` attribute, which obviously draws grid lines. The gridlines needs to be separated from the axis as some gridlines can never pass any axis.

**Classes**

```python
Axes(*args[, grid_helper])  # Build an axes in a figure.
AxesZero(*args[, grid_helper])  # Build an axes in a figure.
AxisArtistHelper()  # AxisArtistHelper should define following method with given APIs.
AxisArtistHelperRectlinear()  #
GridHelperBase()  #
GridHelperRectlinear(axes)
```

**mpl_toolkits.axisartist.axislines.Axes**

```python
class mpl_toolkits.axisartist.axislines.Axes(*args, grid_helper=None, **kwargs)

Bases: matplotlib.axes._axes.Axes

Build an axes in a figure.
```

**Parameters**

- **fig**
  
  `[Figure] The axes is build in the Figure fig.`

- **rect**
  
  `[[left, bottom, width, height]] The axes is build in the rectangle rect. rect is in Figure coordinates.`

- **sharex, sharey**
  
  `[Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.`

- **frameon**
  
  `[bool, default: True] Whether the axes frame is visible.`

- **box_aspect**
  
  `[None, or a number, optional] Sets the aspect of the axes box. See set_box_aspect for details.`

- ****kwargs**

**Returns**

Axes

The new Axes object.

`__call__`(self, *args, **kwargs)

Call self as a function.

`__init__`(self, *args, grid_helper=None, **kwargs)

Build an axes in a figure.

**Parameters**

fig

[Figure] The axes is build in the Figure fig.

rect

[[left, bottom, width, height]] The axes is build in the rectangle rect. rect is in Figure coordinates.

sharex, sharey

[Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[None, or a number, optional] Sets the aspect of the axes box. See set_box_aspect for details.

**kwargs

Other optional keyword arguments:

**Returns**

Axes

The new Axes object.

__module__ = 'mpl_toolkits.axisartist.axislines'

**property axis**

Convenience method to get or set some axis properties.

Call signatures:

```python
xmin, xmax, ymin, ymax = axis()
xmin, xmax, ymin, ymax = axis([xmin, xmax, ymin, ymax])
xmin, xmax, ymin, ymax = axis(option)
xmin, xmax, ymin, ymax = axis(**kwargs)
```

**Parameters**

**xmin, xmax, ymin, ymax**

[float, optional] The axis limits to be set. This can also be achieved using

```python
ax.set(xlim=(xmin, xmax), ylim=(ymin, ymax))
```

**option**

[bool or str] If a bool, turns axis lines and labels on or off. If a string, possible values are:
<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'on'</td>
<td>Turn on axis lines and labels. Same as True.</td>
</tr>
<tr>
<td>'off'</td>
<td>Turn off axis lines and labels. Same as False.</td>
</tr>
<tr>
<td>'equal'</td>
<td>Set equal scaling (i.e., make circles circular) by changing axis limits. This is the same as <code>ax.set_aspect('equal', adjustable='datalim')</code>. Explicit data limits may not be respected in this case.</td>
</tr>
<tr>
<td>'scaled'</td>
<td>Set equal scaling (i.e., make circles circular) by changing dimensions of the plot box. This is the same as <code>ax.set_aspect('equal', adjustable='box', anchor='C')</code>. Additionally, further autoscaling will be disabled.</td>
</tr>
<tr>
<td>'tight'</td>
<td>Set limits just large enough to show all data, then disable further autoscaling.</td>
</tr>
<tr>
<td>'auto'</td>
<td>Automatic scaling (fill plot box with data).</td>
</tr>
<tr>
<td>'image'</td>
<td>'scaled' with axis limits equal to data limits.</td>
</tr>
<tr>
<td>'square'</td>
<td>Square plot; similar to 'scaled', but initially forcing <code>xmax-xmin == ymax-ymin</code>.</td>
</tr>
</tbody>
</table>

**emit**

[bool, default: True] Whether observers are notified of the axis limit change. This option is passed on to `set_xlim` and `set_ylim`.

**Returns**

**xmin, xmax, ymin, ymax**

[float] The axis limits.

**See also:**

`matplotlib.axes.Axes.set_xlim`

`matplotlib.axes.Axes.set_ylim`

**cla**(self)

Clear the current axes.

**get_children**(self)

Return a list of the child `Artists` of this `Artist`.

**get_grid_helper**(self)

**grid**(self, b=None, which='major', axis='both', **kwargs)

Toggle the gridlines, and optionally set the properties of the lines.

**invalidate_grid_helper**(self)
new_fixed_axis(self, loc, offset=None)
new_floating_axis(self, nth_coord, value, axis_direction='bottom')
new_gridlines(self, grid_helper=None)

Create and return a new GridlineCollection instance.

which : "major" or "minor" axis : "both", "x" or "y"
toggle_axisline(self, b=None)

Examples using mpl_toolkits.axisartist.axislines.Axes

mpl_toolkits.axisartist.axislines.AxesZero

class mpl_toolkits.axisartist.axislines.AxesZero(*args, grid_helper=None, **kwargs)

Bases: mpl_toolkits.axisartist.axislines.Axes

Build an axes in a figure.

Parameters

fig

[Figure] The axes is build in the Figure fig.

rect

[[left, bottom, width, height]] The axes is build in the rectangle rect. rect is in Figure coordinates.

sharex, sharey

[Axes, optional] The x or y axis is shared with the x or y axis in the input Axes.

frameon

[bool, default: True] Whether the axes frame is visible.

box_aspect

[None, or a number, optional] Sets the aspect of the axes box. See set_box_aspect for details.

**kwargs

Other optional keyword arguments:

**Returns**

**Axes**

The new `Axes` object.

```
__module__ = 'mpl_toolkits.axisartist.axislines'
```

**Examples using** `mpl_toolkits.axisartist.axislines.AxesZero`

`mpl_toolkits.axisartist.axislines.AxisArtistHelper`

```python
class mpl_toolkits.axisartist.axislines.AxisArtistHelper
Bases: object

AxisArtistHelper should define following method with given APIs. Note that the first axes argument will be axes attribute of the caller artist.:
```

```python
# LINE (spinal line?)

def get_line(self, axes):
    # path : Path
    return path

def get_line_transform(self, axes):
    # ...  
    # trans : transform
    return trans

# LABEL

def get_label_pos(self, axes):
    # x, y : position
    return (x, y), trans

def get_label_offset_transform(self, axes, pad_points, fontprops, renderer, bboxes):
    ):  
```

(continues on next page)
# va : vertical alignment
# ha : horizontal alignment
# a : angle
    return trans, va, ha, a

# TICK

def get_tick_transform(self, axes):
    return trans

def get_tick_iterators(self, axes):
    # iter : iterable object that yields (c, angle, l) where
    # c, angle, l is position, tick angle, and label
    return iter_major, iter_minor

class Fixed(loc, nth_coord=None):
    Bases: mpl_toolkits.axisartist.axislines.AxisArtistHelper._Base

    Helper class for a fixed (in the axes coordinate) axis.
    nth_coord = along which coordinate value varies in 2d, nth_coord = 0 -> x
    axis, nth_coord = 1 -> y axis

    __init__(self; loc, nth_coord=None)
        nth_coord = along which coordinate value varies in 2d, nth_coord = 0
        -> x axis, nth_coord = 1 -> y axis

    __module__ = 'mpl_toolkits.axisartist.axislines'

get_axislabel_pos_angle(self, axes)
    Return the label reference position in transAxes.

get_label_transform() returns a transform of (transAxes+offset)

get_axislabel_transform(self, axes)

get_line(self, axes)

get_line_transform(self, axes)

get_nth_coord(self)

get_tick_transform(self, axes)

class Floating(nth_coord, value):
    Bases: mpl_toolkits.axisartist.axislines.AxisArtistHelper._Base

    __init__(self; nth_coord, value)
        Initialize self. See help(type(self)) for accurate signature.

    __module__ = 'mpl_toolkits.axisartist.axislines'

get_line(self, axes)

get_nth_coord(self)
Examples using `mpl_toolkits.axisartist.axislines.AxisArtistHelper`

`mpl_toolkits.axisartist.axislines.AxisArtistHelperRectlinear`

class `mpl_toolkits.axisartist.axislines.AxisArtistHelperRectlinear`
  Bases: `object`

    Bases: `mpl_toolkits.axisartist.axislines.AxisArtistHelper.Fixed`
    nth_coord = along which coordinate value varies in 2d, nth_coord = 0 -> x axis, nth_coord = 1 -> y axis

  __init__(self, axes, loc, nth_coord=None)
    nth_coord = along which coordinate value varies in 2d, nth_coord = 0 -> x axis, nth_coord = 1 -> y axis

  __module__ = 'mpl_toolkits.axisartist.axislines'

  get_tick_iterators(self, axes)
    tick_loc, tick_angle, tick_label

class `Floating(axes, nth_coord, passingthrough_point, axis_direction='bottom')`
  Bases: `mpl_toolkits.axisartist.axislines.AxisArtistHelper.Floating`

  __init__(self, axes, nth_coord, passingthrough_point, axis_direction='bottom')
    Initialize self. See help(type(self)) for accurate signature.

  __module__ = 'mpl_toolkits.axisartist.axislines'

  get_axislabel_pos_angle(self, axes)
    Return the label reference position in transAxes.
    get_label_transform() returns a transform of (transAxes+offset)

  get_axislabel_transform(self, axes)

  get_line(self, axes)

  get_line_transform(self, axes)

  get_tick_iterators(self, axes)
    tick_loc, tick_angle, tick_label

  get_tick_transform(self, axes)
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.axislines', 'Fixed': <class ... objects>, '__weakref__': <attribute '__weakref__' of 'AxisArtistHelperRectlinear' objects>, '__doc__': None})
__module__ = 'mpl_toolkits.axisartist.axislines'
__weakref__
    list of weak references to the object (if defined)

Examples using mpl_toolkits.axisartist.axislines.AxisArtistHelperRectlinear

mpl_toolkits.axisartist.axislines.GridHelperBase

class mpl_toolkits.axisartist.axislines.GridHelperBase
    Bases: object
    __dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.axislines', '__init__': <function __init__ of 'GridHelperBase' objects>, '__weakref__': <attribute '__weakref__' of 'GridHelperBase' objects>, '__doc__': None})
    __init__(self)
        Initialize self. See help(type(self)) for accurate signature.
    __module__ = 'mpl_toolkits.axisartist.axislines'
    __weakref__
        list of weak references to the object (if defined)
    get_gridlines(self, which, axis)
        Return list of grid lines as a list of paths (list of points).
        which : "major" or "minor" axis : "both", "x" or "y"
    invalidate(self)
    new_gridlines(self, ax)
        Create and return a new GridlineCollection instance.
        which : "major" or "minor" axis : "both", "x" or "y"
    update_lim(self, axes)
    valid(self)

Examples using mpl_toolkits.axisartist.axislines.GridHelperBase

mpl_toolkits.axisartist.axislines.GridHelperRectlinear

class mpl_toolkits.axisartist.axislines.GridHelperRectlinear(axes)
    Bases: mpl_toolkits.axisartist.axislines.GridHelperBase
    __init__(self, axes)
        Initialize self. See help(type(self)) for accurate signature.
    __module__ = 'mpl_toolkits.axisartist.axislines'
get_gridlines(self, which='major', axis='both')
Return list of gridline coordinates in data coordinates.

which : "major" or "minor" axis : "both", "x" or "y"

new_fixed_axis(self, loc, nth_coord=None, axis_direction=None, offset=None, axes=None)
new_floating_axis(self, nth_coord, value, axis_direction='bottom', axes=None)

Examples using mpl_toolkits.axisartist.axislines.GridHelperRectlinear

mpl_toolkits.axisartist.clip_path

Functions

atan2(dy, dx)
clip(xlines, ylines, x0[, clip, xdir, ydir])
clip_line_to_rect(xline, yline, bbox)

mpl_toolkits.axisartist.clip_path.atan2

`mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed`

class `mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed(extremes)`
Bases: `mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple`

This subclass always returns the same bounding box.

**Parameters**

- **extremes**
  
  `[(float, float, float, float)]` The bounding box that this helper always returns.

- **__call__(self, transform_xy, x1, y1, x2, y2)**
  
  Compute an approximation of the bounding box obtained by applying `transform_xy` to the box delimited by `(x1, y1, x2, y2)`. The intended use is to have `(x1, y1, x2, y2)` in axes coordinates, and have `transform_xy` be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.

  The computation is done by sampling `nx * ny` equispaced points in the `(x1, y1, x2, y2)` box and finding the resulting points with extremal coordinates;
then adding some padding to take into account the finite sampling.
As each sampling step covers a relative range of $1/nx$ or $1/ny$, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

__init__(self, extremes)
This subclass always returns the same bounding box.

Parameters

extremes
[(float, float, float, float)] The bounding box that this helper always returns.

__module__ = 'mpl_toolkits.axisartist.floating_axes'

Examples using mpl_toolkits.axisartist.floating_axes.ExtremeFinderFixed

mpl_toolkits.axisartist.floating_axes.FixedAxisArtistHelper

class mpl_toolkits.axisartist.floating_axes.FixedAxisArtistHelper(grid_helper, side, nth_coord_ticks=None)
Bases: mpl_toolkits.axisartist.grid_helper_curvelinear.FloatingAxisArtistHelper

nth_coord = along which coordinate value varies.

nth_coord = 0 -> x axis, nth_coord = 1 -> y axis

__init__(self, grid_helper, side, nth_coord_ticks=None)

nth_coord = along which coordinate value varies.

nth_coord = 0 -> x axis, nth_coord = 1 -> y axis

`mpl_toolkits.axisartist.floating_axes.FloatingAxisArtistHelper`

class `mpl_toolkits.axisartist.floating_axes.FloatingAxisArtistHelper(grid_helper, nth_coord, value, axis_direction=None)`

Bases: `mpl_toolkits.axisartist.grid_helper_curvelinear.FloatingAxisArtistHelper`

```
nth_coord = along which coordinate value varies.
nth_coord = 0 -> x axis, nth_coord = 1 -> y axis
__module__ = 'mpl_toolkits.axisartist.floating_axes'
```
Examples using `mpl_toolkits.axisartist.floating_axes.FloatingAxisArtistHelper`

`mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear`

class `mpl_toolkits.axisartist.floating_axes.GridHelperCurveLinear`

```python
aux_trans : a transform from the source (curved) coordinate to target (rectilinear) coordinate. An instance of MPL's Transform (inverse transform should be defined) or a tuple of two callable objects which defines the transform and its inverse. The callables need take two arguments of array of source coordinates and should return two target coordinates.
```

e.g., `x2, y2 = trans(x1, y1)`

```python
__init__(self, aux_trans, extremes, grid_locator1=None, grid_locator2=None, tick_formatter1=None, tick_formatter2=None)

aux_trans : a transform from the source (curved) coordinate to target (rectilinear) coordinate. An instance of MPL's Transform (inverse transform should be defined) or a tuple of two callable objects which defines the transform and its inverse. The callables need take two arguments of array of source coordinates and should return two target coordinates.
```

e.g., `x2, y2 = trans(x1, y1)`

```python
__module__ = 'mpl_toolkits.axisartist.floating_axes'
```

get_boundary(self)
Return (N, 2) array of (x, y) coordinate of the boundary.

get_data_boundary(self, side)
Return v=0, nth=1.

get_gridlines(self, which='major', axis='both')
Return list of grid lines as a list of paths (list of points).

which : "major" or "minor" axis : "both", "x" or "y"

new_fixed_axis(self, loc, nth_coord=None, axis_direction=None, offset=None, axes=None)

Examples using mpl_toolkits.axisartist.grid_finder.DictFormatter

• sphx_glr_gallery_axisartist_demo_floating_axes.py

mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple

class mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple(nx, ny)

Bases: object

A helper class to figure out the range of grid lines that need to be drawn.

Parameters

nx, ny
[int] The number of samples in each direction.

__call__(self, transform_xy, x1, y1, x2, y2)
Compute an approximation of the bounding box obtained by applying transform_xy to the box delimited by (x1, y1, x2, y2).

The intended use is to have (x1, y1, x2, y2) in axes coordinates, and have transform_xy be the transform from axes coordinates to data coordinates; this method then returns the range of data coordinates that span the actual axes.
The computation is done by sampling $nx \times ny$ equispaced points in the $(x_1, y_1, x_2, y_2)$ box and finding the resulting points with extremal coordinates; then adding some padding to take into account the finite sampling.

As each sampling step covers a relative range of $1/nx$ or $1/ny$, the padding is computed by expanding the span covered by the extremal coordinates by these fractions.

```
__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__doc__': 'A helper class to figure out ... of 'ExtremeFinderSimple' objects>, '__weakref__': <attribute '__weakref__' of 'ExtremeFinderSimple' objects>})

__init__(self, nx, ny)

Parameters

nx, ny

[int] The number of samples in each direction.

__module__ = 'mpl_toolkits.axisartist.grid_finder'

__weakref__

list of weak references to the object (if defined)

Examples using mpl_toolkits.axisartist.grid_finder.ExtremeFinderSimple

- sphx_glr_gallery_axisartist_demo_axis_direction.py
- sphx_glr_gallery_axisartist_demo_curvelinear_grid.py
- sphx_glr_gallery_axisartist_demo_curvelinear_grid2.py
- sphx_glr_gallery_axisartist_demo_floating_axis.py
- sphx_glr_gallery_axisartist_simple_axis_pad.py

mpl_toolkits.axisartist.grid_finder.FixedLocator

class mpl_toolkits.axisartist.grid_finder.FixedLocator(locs)

Bases: object

__call__(self, v1, v2)

Call self as a function.

__dict__ = mappingproxy({'__module__': 'mpl_toolkits.axisartist.grid_finder', '__doc__': '__call__ of 'FixedLocator' objects>, '__weakref__': <attribute '__weakref__' of 'FixedLocator' objects>, '__init__': <function __init__ of 'FixedLocator' objects>, '__module__': 'mpl_toolkits.axisartist.grid_finder', '__weakref__': <attribute '__weakref__' of 'FixedLocator' objects>})

__init__(self, locs)

Initialize self. See help(type(self)) for accurate signature.

__module__ = 'mpl_toolkits.axisartist.grid_finder'

__weakref__

list of weak references to the object (if defined)
set_factor(self, f)
    [Deprecated]

[Deprecated]

Notes

Deprecated since version 3.2:

transform : transform from the image coordinate (which will be the transData of the axes to the world coordinate.

or transform = (transform_xy, inv_transform_xy)

locator1, locator2 : grid locator for 1st and 2nd axis.

__init__(self, extreme_finder, grid_locator1=None, grid_locator2=None, tick_formatter1=None, tick_formatter2=None)

transform : transform from the image coordinate (which will be the transData of the axes to the world coordinate.
or transform = (transform_xy, inv_transform_xy)
locator1, locator2 : grid locator for 1st and 2nd axis.

```
__module__ = 'mpl_toolkits.axisartist.grid_finder'
```

Examples using `mpl_toolkits.axisartist.grid_finder.GridFinderBase`

`mpl_toolkits.axisartist.grid_finder.MaxNLocator`

```
class mpl_toolkits.axisartist.grid_finder.MaxNLocator(nbins=10, steps=None, trim=True, integer=False, symmetric=False, prune=None)
```

Bases: `matplotlib.ticker.MaxNLocator`

**Parameters**

**nbins**

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

**steps**

[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

**integer**

[bool, default: False] If True, ticks will take only integer values, provided at least min_n_ticks integers are found within the view limits.

**symmetric**

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

**prune**

[{'lower', 'upper', 'both', None}, default: None] Remove edge ticks -- useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when rcParams["axes.autolimit_mode"] (default: 'data') is
'round_numbers'. If prune=='lower', the smallest tick will be removed. If prune == 'upper', the largest tick will be removed. If prune == 'both', the largest and smallest ticks will be removed. If prune is None, no ticks will be removed.

**min_n_ticks**

[int, default: 2] Relax nbins and integer constraints if necessary to obtain this minimum number of ticks.

```python
__call__(self, v1, v2)
Return the locations of the ticks.
```

```python
__init__(self, nbins=10, steps=None, trim=True, integer=False, symmetric=False, prune=None)
```

**Parameters**

**nbins**

[int or 'auto', default: 10] Maximum number of intervals; one less than max number of ticks. If the string 'auto', the number of bins will be automatically determined based on the length of the axis.

**steps**

[array-like, optional] Sequence of nice numbers starting with 1 and ending with 10; e.g., [1, 2, 4, 5, 10], where the values are acceptable tick multiples. i.e. for the example, 20, 40, 60 would be an acceptable set of ticks, as would 0.4, 0.6, 0.8, because they are multiples of 2. However, 30, 60, 90 would not be allowed because 3 does not appear in the list of steps.

**integer**

[bool, default: False] If True, ticks will take only integer values, provided at least min_n_ticks integers are found within the view limits.

**symmetric**

[bool, default: False] If True, autoscaling will result in a range symmetric about zero.

**prune**

[{‘lower’, ‘upper’, ‘both’, None}, default: None] Remove edge ticks -- useful for stacked or ganged plots where the upper tick of one axes overlaps with the lower tick of the axes above it, primarily when rcParams["axes.autolimit_mode"] (default: 'data') is 'round_numbers'. If prune='lower', the smallest tick will be removed. If prune == 'upper', the largest tick will be removed.
If `prune == 'both'`, the largest and smallest ticks will be removed. If `prune` is `None`, no ticks will be removed.

**min_n_ticks**

[int, default: 2] Relax `nbins` and `integer` constraints if necessary to obtain this minimum number of ticks.

```python
__module__ = 'mpl_toolkits.axisartist.grid_finder'

set_factor(self, f)
[Deprecated]
```

GridHelperCurveLinear

mpl_toolkits.axisartist.parasite_axes

19.1.4 Matplotlib axes_grid Toolkit

Note: AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of axes_grid. In more recent version, the toolkit has divided into two separate namespace (axes_grid1 and axisartist). While axes_grid namespace is maintained for the backward compatibility, use of axes_grid1 and axisartist is recommended. For the documentation on axes_grid, see the previous version of the docs.

Matplotlib axes_grid1 Toolkit

The matplotlib mpl_toolkits.axes_grid1 toolkit is a collection of helper classes to ease displaying multiple images in matplotlib. While the aspect parameter in matplotlib adjust the position of the single axes, axes_grid1 toolkit provides a framework to adjust the position of multiple axes according to their aspects.

See What is axes_grid1 toolkit? for a guide on the usage of axes_grid1.

The submodules of the axes_grid1 API are:

axes_grid1.anchored_artists
Matplotlib, Release 3.3.3

Table 43 – continued from previous page

</tbody>
</table>

Matplotlib axisartist Toolkit

The axisartist namespace includes a derived Axes implementation (mpl_toolkits.axisartist.Axes). The biggest difference is that the artists that are responsible for drawing axis lines, ticks, ticklabels, and axis labels are separated out from the mpl's Axis class. This change was strongly motivated to support curvilinear grid.

You can find a tutorial describing usage of axisartist at the axisartist user guide.

The submodules of the axisartist API are:

<table>
<thead>
<tr>

  - proj3d

#### 19.2.1 axes3d

**Note:** Significant effort went into bringing axes3d to feature-parity with regular axes objects for version 1.1.0. However, more work remains. Please report any functions that do not behave as expected as a bug. In addition, help and patches would be greatly appreciated!

```python
axes3d.Axes3D(fig[, rect, azim, elev, ...]) 3D axes object.
```
mpl_toolkits.mplot3d.axes3d.Axes3D

class mpl_toolkits.mplot3d.axes3d.Axes3D(fig, rect=None, *args, azim=-60, elev=30, sharez=None, proj_type='persp', box_aspect=None, **kwargs)

Bases: matplotlib.axes._axes.Axes

3D axes object.

Parameters

**fig**

[Figure] The parent figure.

**rect**

[(float, float, float, float)] The (left, bottom, width, height) axes position.

**azim**

**elev**

[float, default: 30] Elevation viewing angle.

**sharez**

[Axes3D, optional] Other axes to share z-limits with.

**proj_type**

[{'persp', 'ortho'}] The projection type, default 'persp'.

**kwargs**

Other optional keyword arguments:

Notes

New in version 1.2.1: The sharez parameter.

```python
__init__(self, fig, rect=None, *args, azim=-60, elev=30, sharez=None, proj_type='persp', box_aspect=None, **kwargs)
```

Parameters

- **fig**
  [Figure] The parent figure.

- **rect**
  [(float, float, float, float)] The (left, bottom, width, height) axes position.

- **azim**

- **elev**
  [float, default: 30] Elevation viewing angle.

- **sharez**
  [Axes3D, optional] Other axes to share z-limits with.

- **proj_type**
  [{'persp', 'ortho'}] The projection type, default 'persp'.

- ****kwargs
  Other optional keyword arguments:

Notes

New in version 1.2.1: The sharez parameter.

__module__ = 'mpl_toolkits.mplot3d.axes3d'

add_collection3d(self, col, zs=0, zdir='z')
Add a 3D collection object to the plot.

2D collection types are converted to a 3D version by modifying the object and adding z coordinate information.

Supported are:

- PolyCollection
- LineCollection
- PatchCollection

add_contour_set(self, cset, extend3d=False, stride=5, zdir='z', offset=None)

add_contourf_set(self, cset, zdir='z', offset=None)

apply_aspect(self, position=None)
Adjust the Axes for a specified data aspect ratio.

Depending on get_adjustable this will modify either the Axes box (position) or the view limits. In the former case, get_anchor will affect the position.

See also:

matplotlib.axes.Axes.set_aspect

For a description of aspect ratio handling.
**matplotlib.axes.Axes.set_adjustable**

Set how the Axes adjusts to achieve the required aspect ratio.

**matplotlib.axes.Axes.set_anchor**

Set the position in case of extra space.

**Notes**

This is called automatically when each Axes is drawn. You may need to call it yourself if you need to update the Axes position and/or view limits before the Figure is drawn.

**auto_scale_xyz**

```python
auto_scale_xyz(self, X, Y, Z=None, had_data=None)
```

Convenience method for simple axis view autoscaling. See `matplotlib.axes.Axes.autoscale()` for full explanation. Note that this function behaves the same, but for all three axes. Therefore, 'z' can be passed for `axis`, and 'both' applies to all three axes.

New in version 1.1.0.

**autoscale_view**

```python
autoscale_view(self, tight=None, scalex=True, scaley=True, scalez=True)
```

Autoscale the view limits using the data limits. See `matplotlib.axes.Axes.autoscale_view()` for documentation. Note that this function applies to the 3D axes, and as such adds the `scalez` to the function arguments.

Changed in version 1.1.0: Function signature was changed to better match the 2D version. `tight` is now explicitly a kwarg and placed first.

Changed in version 1.2.1: This is now fully functional.

**bar**

```python
bar(self, left, height, zs=0, zdir='z', *args, **kwargs)
```

Add 2D bar(s).

**Parameters**

- **left**
  
  [1D array-like] The x coordinates of the left sides of the bars.

- **height**
  
  [1D array-like] The height of the bars.

- **zs**
  
  [float or 1D array-like] Z coordinate of bars; if a single value is specified, it will be used for all bars.

- **zdir**
  
  [{'x', 'y', 'z'}, default: 'z'] When plotting 2D data, the direction to use as z ('x', 'y' or 'z').
**kwargs

Other arguments are forwarded to `matplotlib.axes.Axes.bar`.

**Returns**

`mpl_toolkits.mplot3d.art3d.Patch3DCollection

```
bar3d(self, x, y, z, dx, dy, dz, color=None, zsort='average', shade=True, 
lightsource=None, *args, **kwargs)
```

Generate a 3D barplot.

This method creates three dimensional barplot where the width, depth, height, and color of the bars can all be uniquely set.

**Parameters**

\[ x, y, z \]

[array-like] The coordinates of the anchor point of the bars.

\[ dx, dy, dz \]

[float or array-like] The width, depth, and height of the bars, respectively.

**color**

[sequence of colors, optional] The color of the bars can be specified globally or individually. This parameter can be:

- A single color, to color all bars the same color.
- An array of colors of length N bars, to color each bar independently.
- An array of colors of length 6, to color the faces of the bars similarly.
- An array of colors of length 6 * N bars, to color each face independently.

When coloring the faces of the boxes specifically, this is the order of the coloring:

1. -Z (bottom of box)
2. +Z (top of box)
3. -Y
4. +Y
5. -X
6. +X
zsort
  [str, optional] The z-axis sorting scheme passed onto 
  Poly3DCollection

shade
  [bool, default: True] When true, this shades the dark sides of 
  the bars (relative to the plot's source of light).

lightsource
  [LightSource] The lightsource to use when shade is True.

**kwargs
  Any additional keyword arguments are passed onto 
  Poly3DCollection.

Returns

collection
  [Poly3DCollection] A collection of three dimensional polygons 
  representing the bars.

can_pan(self)
  Return True if this axes supports the pan/zoom button functionality. 
  3D axes objects do not use the pan/zoom button.

can_zoom(self)
  Return True if this axes supports the zoom box button functionality. 
  3D axes objects do not use the zoom box button.

cla(self)
  Clear the current axes.

clabel(self, *args, **kwargs)
  Currently not implemented for 3D axes, and returns None.

contour(self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)
  Create a 3D contour plot.

Parameters

X, Y, Z
  [array-like] Input data.

extend3d
  [bool, default: False] Whether to extend contour in 3D.
**stride**

[int] Step size for extending contour.

**zdir**

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

**offset**

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**args, **kwargs**

Other arguments are forwarded to `matplotlib.axes.Axes.contour`.

**Returns**

`matplotlib.contour.QuadContourSet`

`contour3D(self, X, Y, Z, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)`

Create a 3D contour plot.

**Parameters**

**X, Y, Z**

[array-like] Input data.

**extend3d**

[bool, default: False] Whether to extend contour in 3D.

**stride**

[int] Step size for extending contour.

**zdir**

[{'x', 'y', 'z'}, default: 'z'] The direction to use.

**offset**

[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

**args, **kwargs**

Other arguments are forwarded to `matplotlib.axes.Axes.contour`.

**Returns**

`matplotlib.contour.QuadContourSet`
contourf(self, X, Y, Z, *args, zdir='z', offset=None, **kwargs)

Create a 3D filled contour plot.

Parameters

X, Y, Z
[array-like] Input data.

zdir
[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset
[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

*args, **kwargs
Other arguments are forwarded to *matplotlib.axes.Axes.contourf.*

Returns

*matplotlib.contour.QuadContourSet*

Notes

New in version 1.1.0: The zdir and offset parameters.

contourf3D(self, X, Y, Z, *args, zdir='z', offset=None, **kwargs)

Create a 3D filled contour plot.

Parameters

X, Y, Z
[array-like] Input data.

zdir
[{'x', 'y', 'z'}, default: 'z'] The direction to use.

offset
[float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

*args, **kwargs
Other arguments are forwarded to *matplotlib.axes.Axes.contourf.*

Returns
matplotlib.contour.QuadContourSet

Notes

New in version 1.1.0: The `zdir` and `offset` parameters.

convert_units(self, z)

For artists in an axes, if the zaxis has units support, convert z using zaxis unit type

New in version 1.2.1.

disable_mouse_rotation(self)

Disable mouse buttons for 3D rotation and zooming.

draw(self, renderer)

Draw the Artist (and its children) using the given renderer.

This has no effect if the artist is not visible (`Artist.get_visible` returns False).

Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

format_coord(self, xd, yd)

Given the 2D view coordinates attempt to guess a 3D coordinate. Looks for the nearest edge to the point and then assumes that the point is at the same z location as the nearest point on the edge.

format_zdata(self, z)

Return z string formatted. This function will use the `fmt_zdata` attribute if it is callable, else will fall back on the zaxis major formatter

get_autoscale_on(self)

Get whether autoscaling is applied for all axes on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

get_autoscalez_on(self)

Get whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

get_axis_position(self)
get_frame_on(self)
Get whether the 3D axes panels are drawn.

get_proj(self)
Create the projection matrix from the current viewing position.

get_tightbbox(self, renderer, call_axes_locator=True,
bbox_extra_artists=None, *, for_layout_only=False)
Return the tight bounding box of the axes, including axis and their decora-
tors (xlabel, title, etc).

Artists that have artist.set_in_layout(False) are not included in the bbox.

Parameters

renderer
[RendererBase subclass] renderer that will be used to draw the
figures (i.e. fig.canvas.get_renderer())

bbox_extra_artists
[list of Artist or None] List of artists to include in the tight bound-
ing box. If None (default), then all artist children of the axes are
included in the tight bounding box.

call_axes_locator
[bool, default: True] If call_axes_locator is False, it does not
call the _axes_locator attribute, which is necessary to get the
correct bounding box. call_axes_locator=False can be used if
the caller is only interested in the relative size of the tightbbox
compared to the axes bbox.

for_layout_only
[default: False] The bounding box will not include the x-extent
of the title and the xlabel, or the y-extent of the ylabel.

Returns

BboxBase
Bounding box in figure pixel coordinates.

See also:

matplotlib.axes.Axes.get_window_extent
matplotlib.axis.Axis.get_tightbbox
matplotlib.spines.Spine.get_window_extent

get_w_lims(self)
Get 3D world limits.
get_xlim(self)
   Alias for get_xlim3d.

get_xlim3d(self)
   Return the x-axis view limits.

   **Returns**

   left, right
      [(float, float)] The current x-axis limits in data coordinates.

See also:

   set_xlim
   set_xbound, get_xbound
   invert_xaxis, xaxis_inverted

Notes

The x-axis may be inverted, in which case the *left* value will be greater than
the *right* value.

Changed in version 1.1.0: This function now correctly refers to the 3D x-limits

get_ylim(self)
   Alias for get_ylim3d.

get_ylim3d(self)
   Return the y-axis view limits.

   **Returns**

   bottom, top
      [(float, float)] The current y-axis limits in data coordinates.

See also:

   set_ylim
   set_ybound, get_ybound
   invert_yaxis, yaxis_inverted
Notes

The y-axis may be inverted, in which case the bottom value will be greater than the top value.

Changed in version 1.1.0: This function now correctly refers to the 3D y-limits.

def get_zaxis(self)
    Return the ZAxis (Axis) instance.

def get_zbound(self)
    Return the lower and upper z-axis bounds, in increasing order.
    New in version 1.1.0.

def get_zgridlines(self)
    Return the zaxis' grid lines as a list of Line2Ds.

def get_zlabel(self)
    Get the z-label text string.
    New in version 1.1.0: This function was added, but not tested. Please report any bugs.

def get_zlim(self)
    Alias for get_zlim3d.

def get_zlim3d(self)
    Get 3D z limits.

def get_zmajorticklabels(self)
    Return the zaxis' major tick labels, as a list of Text.

def get_zminorticklabels(self)
    Return the zaxis' minor tick labels, as a list of Text.

def get_zscale(self)

def get_zticklabels(self, minor=False, which=None)
    Get the zaxis' tick labels.

Parameters

- minor
  [bool] Whether to return the minor or the major ticklabels.
- which
  [None, ('minor', 'major', 'both')] Overrides minor.

Returns
Notes

The tick label strings are not populated until a `draw` method has been called. See also: `draw` and `draw`.

`get_zticklines(self, minor=False)`
Return the zaxis' tick lines as a list of `Line2D`

`get_zticks(self, *, minor=False)`
Return the zaxis' tick locations in data coordinates.

`grid(self, b=True, **kwargs)`
Set / unset 3D grid.

**Note:** Currently, this function does not behave the same as `matplotlib.axes.Axes.grid()`, but it is intended to eventually support that behavior.

New in version 1.1.0.

`invert_zaxis(self)`
Invert the z-axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`locator_params(self, axis='both', tight=None, **kwargs)`
Convenience method for controlling tick locators. See `matplotlib.axes.Axes.locator_params()` for full documentation. Note that this is for Axes3D objects, therefore, setting `axis` to 'both' will result in the parameters being set for all three axes. Also, `axis` can also take a value of 'z' to apply parameters to the z axis.

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

`margins(self, *margins, x=None, y=None, z=None, tight=True)`
Convenience method to set or retrieve autoscaling margins.

Call signatures:

```
margins()
```

returns xmargin, ymargin, zmargin

```
margins(margin)
margins(xmargin, ymargin, zmargin)
```

(continues on next page)
(continued from previous page)

```
margins(x=xmargin, y=ymargin, z=zmargin)
margins(..., tight=False)
```

All forms above set the xmargin, ymargin and zmargin parameters. All keyword parameters are optional. A single positional argument specifies xmargin, ymargin and zmargin. Passing both positional and keyword arguments for xmargin, ymargin, and/or zmargin is invalid.

The tight parameter is passed to autoscale_view(), which is executed after a margin is changed; the default here is True, on the assumption that when margins are specified, no additional padding to match tick marks is usually desired. Setting tight to None will preserve the previous setting.

Specifying any margin changes only the autoscaling; for example, if xmargin is not None, then xmargin times the X data interval will be added to each end of that interval before it is used in autoscaling.

New in version 1.1.0.

```
mouse_init(self, rotate_btn=1, zoom_btn=3)
```

Set the mouse buttons for 3D rotation and zooming.

**Parameters**

- **rotate_btn**
  - [int or list of int, default: 1] The mouse button or buttons to use for 3D rotation of the axes.

- **zoom_btn**
  - [int or list of int, default: 3] The mouse button or buttons to use to zoom the 3D axes.

```
names = '3d'
```

```
plot(self, xs, ys, *args, zdir='z', **kwargs)
```

Plot 2D or 3D data.

**Parameters**

- **xs**
  - [1D array-like] x coordinates of vertices.

- **ys**
  - [1D array-like] y coordinates of vertices.

- **zs**
[float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

**zdir**

[{`x`, `y`, `z`}, default: `z`] When plotting 2D data, the direction to use as z (`x`, `y` or `z`).

**kwargs

Other arguments are forwarded to `matplotlib.axes.Axes.plot`.

```
plot3D(self, xs, ys, *args, zdir='z', **kwargs)
```

Plot 2D or 3D data.

**Parameters**

**xs**

[1D array-like] x coordinates of vertices.

**ys**

[1D array-like] y coordinates of vertices.

**zs**

[float or 1D array-like] z coordinates of vertices; either one for all points or one for each point.

**zdir**

[{`x`, `y`, `z`}, default: `z`] When plotting 2D data, the direction to use as z (`x`, `y` or `z`).

**kwargs

Other arguments are forwarded to `matplotlib.axes.Axes.plot`.

```
plot_surface(self, X, Y, Z, *args, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)
```

Create a surface plot.

By default it will be colored in shades of a solid color, but it also supports color mapping by supplying the `cmap` argument.

**Note:** The `rcount` and `ccount` kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

**Note:** To maximize rendering speed consider setting `rstride` and `cstride` to divisors of the number of rows minus 1 and columns minus 1 respectively. For example, given 51 rows rstride can be any of the divisors of 50.
Similarly, a setting of \texttt{rstride} and \texttt{cstride} equal to 1 (or \texttt{rcount} and \texttt{ccount} equal the number of rows and columns) can use the optimized path.

**Parameters**

\texttt{X, Y, Z}

[2d arrays] Data values.

\texttt{rcount, ccount}

[int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Defaults to 50.

New in version 2.0.

\texttt{rstride, cstride}

[int] Downsampling stride in each direction. These arguments are mutually exclusive with \texttt{rcount} and \texttt{ccount}. If only one of \texttt{rstride} or \texttt{cstride} is set, the other defaults to 10.

'classic' mode uses a default of \texttt{rstride = cstride = 10} instead of the new default of \texttt{rcount = ccount = 50}.

\texttt{color}

[color-like] Color of the surface patches.

\texttt{cmap}

[Colormap] Colormap of the surface patches.

\texttt{facecolors}

[array-like of colors.] Colors of each individual patch.

\texttt{norm}

[Normalize] Normalization for the colormap.

\texttt{vmin, vmax}

[float] Bounds for the normalization.

\texttt{shade}

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when \texttt{cmap} is specified.

\texttt{lightsource}

[LightSource] The lightsource to use when \texttt{shade} is True.

**\texttt{**kwargs**}

Other arguments are forwarded to \texttt{Poly3DCollection}.  

3034 Chapter 19. Toolkits
plot_trisurf(self, *args, color=None, norm=None, vmin=None, vmax=None, lightsource=None, **kwargs)

Plot a triangulated surface.

The (optional) triangulation can be specified in one of two ways; either:

```
plot_trisurf(triangulation, ...)
```

where triangulation is a `Triangulation` object, or:

```
plot_trisurf(X, Y, ...)
pplot_trisurf(X, Y, triangles, ...)
plot_trisurf(X, Y, triangles=triangles, ...)
```

in which case a Triangulation object will be created. See `Triangulation` for an explanation of these possibilities.

The remaining arguments are:

```
plot_trisurf(..., Z)
```

where Z is the array of values to contour, one per point in the triangulation.

**Parameters**

- **X, Y, Z**
  - [array-like] Data values as 1D arrays.
- **color**
  - Color of the surface patches.
- **cmap**
  - A colormap for the surface patches.
- **norm**
  - [Normalize] An instance of Normalize to map values to colors.
- **vmin, vmax**
  - [float, default: None] Minimum and maximum value to map.
- **shade**
  - [bool, default: True] Whether to shade the facecolors. Shading is always disabled when `cmap` is specified.
- **lightsource**
  - [LightSource] The lightsource to use when `shade` is True.
- ****kwargs
  - All other arguments are passed on to `Poly3DCollection`
New in version 1.2.0.

```
plot_wireframe(self, X, Y, Z, *args, **kwargs)
```

Plot a 3D wireframe.

**Note:** The *rcount* and *ccount* kwargs, which both default to 50, determine the maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points.

**Parameters**

- **X, Y, Z**
  - [2d arrays] Data values.

- **rcount, ccount**
  - [int] Maximum number of samples used in each direction. If the input data is larger, it will be downsampled (by slicing) to these numbers of points. Setting a count to zero causes the data to
be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot. Defaults to 50.

New in version 2.0.

**rstride, cstride**

[int] Downsampling stride in each direction. These arguments are mutually exclusive with rcount and ccount. If only one of rstride or cstride is set, the other defaults to 1. Setting a stride to zero causes the data to be not sampled in the corresponding direction, producing a 3D line plot rather than a wireframe plot.

'classic' mode uses a default of rstride = cstride = 1 instead of the new default of rcount = ccount = 50.

**kwargs

Other arguments are forwarded to Line3DCollection.

**kwargs**

Other arguments are forwarded to `Line3DCollection`.

quiver(X, Y, Z, U, V, W, /, length=1, arrow_length_ratio=0.3, pivot='tail', normalize=False, **kwargs)

Plot a 3D field of arrows.

The arguments could be array-like or scalars, so long as they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

**Parameters**

X, Y, Z
The arguments could be array-like or scalars, so long as they can be broadcast together. The arguments can also be masked arrays. If an element in any of argument is masked, then that corresponding quiver element will not be plotted.

Parameters

**X, Y, Z**

[array-like] The x, y and z coordinates of the arrow locations (default is tail of arrow; see pivot kwarg).

**U, V, W**

[array-like] The x, y and z components of the arrow vectors.

**length**

[float, default: 1] The length of each quiver.

**arrow_length_ratio**

[float, default: 0.3] The ratio of the arrow head with respect to the quiver.

**pivot**

[{'tail', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name pivot.

**normalize**

[bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by u, v, and w.

**kwargs**

Any additional keyword arguments are delegated to LineCollection.
**arrow_length_ratio**

[Float, default: 0.3] The ratio of the arrow head with respect to the quiver.

**pivot**

[{'tail', 'middle', 'tip'}, default: 'tail'] The part of the arrow that is at the grid point; the arrow rotates about this point, hence the name *pivot*.

**normalize**

[bool, default: False] Whether all arrows are normalized to have the same length, or keep the lengths defined by \( u, v, \) and \( w \).

**kwargs**

Any additional keyword arguments are delegated to `LineCollection`.

```python
scatter(self, xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args, **kwargs)
```

Create a scatter plot.

**Parameters**

**xs, ys**

[array-like] The data positions.

**zs**

[float or array-like, default: 0] The z-positions. Either an array of the same length as \( xs \) and \( ys \) or a single value to place all points in the same plane.

**zdir**

[{'x', 'y', 'z', '-x', '-y', '-z'}, default: 'z'] The axis direction for the zs. This is useful when plotting 2D data on a 3D Axes. The data must be passed as \( xs, ys \). Setting \( zdir \) to 'y' then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.

**s**

[float or array-like, default: 20] The marker size in points. Either an array of the same length as \( xs \) and \( ys \) or a single value to make all markers the same size.

**c**

[color, sequence, or sequence of colors, optional] The marker color. Possible values:
• A single color format string.
• A sequence of colors of length n.
• A sequence of n numbers to be mapped to colors using `cmap` and `norm`.
• A 2-D array in which the rows are RGB or RGBA.

For more details see the c argument of `scatter`.

depthshade
[bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to `scatter()` will perform its depthshading independently.

**kwargs
All other arguments are passed on to `scatter`.

Returns

paths

[PathCollection]

```python
scatter3D(self, xs, ys, zs=0, zdir='z', s=20, c=None, depthshade=True, *args, **kwargs)
```
Create a scatter plot.

Parameters

xs, ys

[array-like] The data positions.

zs

[float or array-like, default: 0] The z-positions. Either an array of the same length as xs and ys or a single value to place all points in the same plane.

zdir

[{`x`, `y`, `z`, `-x`, `-y`, `-z`}, default: `z`] The axis direction for the zs. This is useful when plotting 2D data on a 3D Axes. The data must be passed as xs, ys. Setting `zdir` to `y` then plots the data to the x-z-plane.

See also /gallery/mplot3d/2dcollections3d.

s

[float or array-like, default: 20] The marker size in points**2. Either an array of the same length as xs and ys or a single value to make all markers the same size.
c
[color, sequence, or sequence of colors, optional] The marker color. Possible values:

• A single color format string.
• A sequence of colors of length n.
• A sequence of n numbers to be mapped to colors using cmap and norm.
• A 2-D array in which the rows are RGB or RGBA.
For more details see the c argument of scatter.

depthshade
[bool, default: True] Whether to shade the scatter markers to give the appearance of depth. Each call to scatter() will perform its depthshading independently.

**kwargs
All other arguments are passed on to scatter.

Returns
paths
[PathCollection]

set_anchor(self, anchor, share=False)
Define the anchor location.

The actual drawing area (active position) of the Axes may be smaller than the Bbox (original position) when a fixed aspect is required. The anchor defines where the drawing area will be located within the available space.

Parameters
anchor
[2-tuple of floats or {'C', 'SW', 'S', 'SE', ...}] The anchor position may be either:

• a sequence (cx, cy). cx and cy may range from 0 to 1, where 0 is left or bottom and 1 is right or top.
• a string using cardinal directions as abbreviation:
  - 'C' for centered
  - 'S' (south) for bottom-center
  - 'SW' (south west) for bottom-left
  - etc.
Here is an overview of the possible positions:

<table>
<thead>
<tr>
<th>'NW'</th>
<th>'N'</th>
<th>'NE'</th>
</tr>
</thead>
<tbody>
<tr>
<td>'W'</td>
<td>'C'</td>
<td>'E'</td>
</tr>
<tr>
<td>'SW'</td>
<td>'S'</td>
<td>'SE'</td>
</tr>
</tbody>
</table>

**share**

[bool, default: False] If True, apply the settings to all shared Axes.

**See also:**

*matplotlib.axes.Axes.set_aspect*

for a description of aspect handling.

```python
def set_aspect(self, aspect, adjustable=None, anchor=None, share=False):
    Set the aspect ratios.

    Axes 3D does not currently support any aspect but 'auto' which fills the axes
    with the data limits.

    To simulate having equal aspect in data space, set the ratio of your data
    limits to match the value of get_box_aspect. To control box aspect ratios use
    set_box_aspect.
```

**Parameters**

**aspect**

[{'auto'}] Possible values:

<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'auto'</td>
<td>automatic; fill the position rectangle with data.</td>
</tr>
</tbody>
</table>

**adjustable**

[None] Currently ignored by Axes3D

If not None, this defines which parameter will be adjusted to meet the required aspect. See set_adjustable for further details.

**anchor**

[None or str or 2-tuple of float, optional] If not None, this defines where the Axes will be drawn if there is extra space due to aspect constraints. The most common way to to specify the anchor are abbreviations of cardinal directions:
<table>
<thead>
<tr>
<th>value</th>
<th>description</th>
</tr>
</thead>
<tbody>
<tr>
<td>'C'</td>
<td>centered</td>
</tr>
<tr>
<td>'SW'</td>
<td>lower left corner</td>
</tr>
<tr>
<td>'S'</td>
<td>middle of bottom edge</td>
</tr>
<tr>
<td>'SE'</td>
<td>lower right corner</td>
</tr>
<tr>
<td>etc.</td>
<td></td>
</tr>
</tbody>
</table>

See `set_anchor` for further details.

**share**

[bool, default: False] If `True`, apply the settings to all shared Axes.

**See also:**

`mpl_toolkits.mplot3d.axes3d.Axes3D.set_box_aspect`

`set_autoscale_on(self, b)`
Set whether autoscaling is applied on plot commands

New in version 1.1.0: This function was added, but not tested. Please report any bugs.

**Parameters**

b

[bool]

`set_autoscalez_on(self, b)`
Set whether autoscaling for the z-axis is applied on plot commands

New in version 1.1.0.

**Parameters**

b

[bool]

`set_axis_off(self)`
Turn the x- and y-axis off.

This affects the axis lines, ticks, ticklabels, grid and axis labels.

`set_axis_on(self)`
Turn the x- and y-axis on.

This affects the axis lines, ticks, ticklabels, grid and axis labels.
set_box_aspect(self, aspect, *, zoom=1)
Set the axes box aspect.

The box aspect is the ratio of height to width in display units for each face of
the box when viewed perpendicular to that face. This is not to be confused
with the data aspect (which for Axes3D is always 'auto'). The default ratios
are 4:4:3 (x:y:z).

To simulate having equal aspect in data space, set the box aspect to match
your data range in each dimension.

zoom controls the overall size of the Axes3D in the figure.

Parameters

aspect
3-tuple of floats or None] Changes the physical dimensions of
the Axes3D, such that the ratio of the axis lengths in display
units is x:y:z.
If None, defaults to 4:4:3

zoom
[float] Control overall size of the Axes3D in the figure.

set_frame_on(self, b)
Set whether the 3D axes panels are drawn.

Parameters

b
[bool]

set_proj_type(self, proj_type)
Set the projection type.

Parameters

proj_type
[{'persp', 'ortho'}]

set_title(self, label, fontdict=None, loc='center', **kwargs)
Set a title for the axes.

Set one of the three available axes titles. The available titles are positioned
above the axes in the center, flush with the left edge, and flush with the right
edge.

Parameters
label

[st] Text to use for the title

fontdict

[dict] A dictionary controlling the appearance of the title text, the default fontdict is:

```
{
    'fontsize': rcParams['axes.titlesize'],
    'fontweight': rcParams['axes.titleweight'],
    'color': rcParams['axes.titlecolor'],
    'verticalalignment': 'baseline',
    'horizontalalignment': 'loc'
}
```

loc

[{'center', 'left', 'right'}, default: rcParams["axes.
titlelocation"] (default: 'center')] Which title to set.

y

[float, default: rcParams["axes.titley"] (default: None)] Vertical axes loaction for the title (1.0 is the top). If None (the default), y is determined automatically to avoid decorators on the axes.

pad

[float, default: rcParams["axes.titlepad"] (default: 6.0)] The offset of the title from the top of the axes, in points.

Returns

Text

The matplotlib text instance representing the title

Other Parameters

**kwargs

[Text properties] Other keyword arguments are text properties, see Text for a list of valid text properties.

set_top_view(self)

set_xlim(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)

Alias for set_xlim3d.

set_xlim3d(self, left=None, right=None, emit=True, auto=False, *, xmin=None, xmax=None)

Set 3D x limits.

See matplotlib.axes.Axes.set_xlim() for full documentation.
set_xscale(self, value, **kwargs)
Set the x-axis scale.

Parameters

value

["linear"] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**kwargs
Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

set_ylim(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
Alias for set_ylim3d.

set_ylim3d(self, bottom=None, top=None, emit=True, auto=False, *, ymin=None, ymax=None)
Set 3D y limits.
See matplotlib.axes.Axes.set_ylim() for full documentation.

set_yscale(self, value, **kwargs)
Set the y-axis scale.

Parameters

value

["linear"] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**kwargs
Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

set_zbound(self, lower=None, upper=None)
Set the lower and upper numerical bounds of the z-axis.
This method will honor axes inversion regardless of parameter order. It will not change the autoscaling setting (get_autoscalez_on()).
New in version 1.1.0.

set_zlabel(self, zlabel, fontdict=None, labelpad=None, **kwargs)
Set zlabel. See doc for set_ylabel for description.

set_zlim(self, bottom=None, top=None, emit=True, auto=False, *, zmin=None, zmax=None)
Alias for set_zlim3d.
set_zlim3d(self, bottom=None, top=None, emit=True, auto=False, *, zmin=None, zmax=None)
Set 3D z limits.

See `matplotlib.axes.Axes.set_ylim()` for full documentation.

set_zmargin(self, m)
Set padding of Z data limits prior to autoscaling.

m times the data interval will be added to each end of that interval before it is used in autoscaling.

accepts: float in range 0 to 1

New in version 1.1.0.

set_zscale(self, value, **kwargs)
Set the z-axis scale.

**Parameters**

value

["linear"] The axis scale type to apply. 3D axes currently only support linear scales; other scales yield nonsensical results.

**kwargs

Keyword arguments are nominally forwarded to the scale class, but none of them is applicable for linear scales.

set_zticklabels(self, labels, *, fontdict=None, minor=False, **kwargs)
Set the zaxis' labels with list of string labels.

**Warning:** This method should only be used after fixing the tick positions using `Axes3D.set_sticks`. Otherwise, the labels may end up in unexpected positions.

**Parameters**

labels

[list of str] The label texts.

fontdict

[dict, optional] A dictionary controlling the appearance of the ticklabels. The default fontdict is:

```python
{"fontsize": rcParams["axes.titlesize"],
 "fontweight": rcParams["axes.titleweight"],
 "verticalalignment": "baseline",
 "horizontalalignment": "loc"}
```
minor

[bool, default: False] Whether to set the minor ticklabels rather than the major ones.

Returns

list of Text
The labels.

Other Parameters

**kwargs
[Text properties.]

set_zticks(self, ticks, *, minor=False)
Set the zaxis' tick locations.

Parameters

ticks

[list of floats] List of tick locations.

minor

[bool, default: False] If False, set the major ticks; if True, the minor ticks.

text(self, x, y, z, s, zdir=None, **kwargs)
Add text to the plot. kwargs will be passed on to Axes.text, except for the zdir keyword, which sets the direction to be used as the z direction.

text2D(self, x, y, s, fontdict=None, **kwargs)
Add text to the axes.

Add the text s to the axes at location x, y in data coordinates.

Parameters

x, y
[float] The position to place the text. By default, this is in data coordinates. The coordinate system can be changed using the transform parameter.

s
[str] The text.
**fontdict**

[dict, default: None] A dictionary to override the default text properties. If fontdict is None, the defaults are determined by `rcParams`.

**Returns**

*Text*

The created `Text` instance.

**Other Parameters**

****kwargs

[ `Text` properties.] Other miscellaneous text parameters.

**Examples**

Individual keyword arguments can be used to override any given parameter:

```python
>>> text(x, y, s, fontsize=12)
```

The default transform specifies that text is in data coords, alternatively, you can specify text in axis coords ((0, 0) is lower-left and (1, 1) is upper-right). The example below places text in the center of the axes:

```python
>>> text(0.5, 0.5, 'matplotlib', horizontalalignment='center',
        ...       verticalalignment='center', transform=ax.transAxes)
```

You can put a rectangular box around the text instance (e.g., to set a background color) by using the keyword bbox. bbox is a dictionary of Rectangle properties. For example:

```python
>>> text(x, y, s, bbox=dict(facecolor='red', alpha=0.5))
```

`text3D(self, x, y, z, s, zdir=None, **kwargs)`

Add text to the plot. kwargs will be passed on to Axes.text, except for the zdir keyword, which sets the direction to be used as the z direction.

`tick_params(self, axis='both', **kwargs)`

Convenience method for changing the appearance of ticks and tick labels.

See `matplotlib.axes.Axes.tick_params()` for more complete documentation.

The only difference is that setting axis to 'both' will mean that the settings are applied to all three axes. Also, the axis parameter also accepts a value of 'z', which would mean to apply to only the z-axis.
Also, because of how Axes3D objects are drawn very differently from regular 2D axes, some of these settings may have ambiguous meaning. For simplicity, the 'z' axis will accept settings as if it was like the 'y' axis.

**Note:** Axes3D currently ignores some of these settings.

New in version 1.1.0.

```python
tricontour(self, *args, extend3d=False, stride=5, zdir='z', offset=None, **kwargs)
```

Create a 3D contour plot.

Changed in version 1.3.0: Added support for custom triangulations

**Note:** This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

**Parameters**

- **X, Y, Z**
  - [array-like] Input data.
- **extend3d**
  - [bool, default: False] Whether to extend contour in 3D.
- **stride**
  - [int] Step size for extending contour.
- **zdir**
  - [{'x', 'y', 'z'}, default: 'z'] The direction to use.
- **offset**
  - [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.
- ***args, **kwargs**
  - Other arguments are forwarded to `matplotlib.axes.Axes.tricontour`.

**Returns**

- `matplotlib.tri.tricontour.TriContourSet`

```python
tricontourf(self, *args, zdir='z', offset=None, **kwargs)
```

Create a 3D filled contour plot.
**Note:** This method currently produces incorrect output due to a longstanding bug in 3D PolyCollection rendering.

### Parameters

- **X, Y, Z**
  [array-like] Input data.

- **zdir**
  [{'x', 'y', 'z'}, default: 'z'] The direction to use.

- **offset**
  [float, optional] If specified, plot a projection of the contour lines at this position in a plane normal to zdir.

- ***args, **kwargs**
  Other arguments are forwarded to matplotlib.axes.Axes.tricontourf.

### Returns

**matplotlib.tri.tricontour.TriContourSet**

### Notes

New in version 1.1.0: The `zdir` and `offset` parameters.

Changed in version 1.3.0: Added support for custom triangulations

- **tunit_cube**(self, vals=None, M=None)
- **tunit_edges**(self, vals=None, M=None)
- **unit_cube**(self, vals=None)
- **update_datalim**(self, xys, **kwargs)
  Extend the dataLim Bbox to include the given points.

  If no data is set currently, the Bbox will ignore its limits and set the bound to be the bounds of the xdata (xys). Otherwise, it will compute the bounds of the union of its current data and the data in xys.

### Parameters

- **xys**
  [2D array-like] The points to include in the data limits Bbox. This can be either a list of (x, y) tuples or a Nx2 array.
**updatex, updatey**

[bool, default: True] Whether to update the x/y limits.

```python
view_init(self, elev=None, azim=None)
Set the elevation and azimuth of the axes in degrees (not radians).
This can be used to rotate the axes programmatically.
'ellev' stores the elevation angle in the z plane (in degrees). 'azim' stores the
azimuth angle in the (x, y) plane (in degrees).
if 'ellev' or 'azim' are None (default), then the initial value is used which was
specified in the Axes3D constructor.
```

```python
voxels([x, y, z], /, filled, facecolors=None, edgecolors=None, **kwargs)
Plot a set of filled voxels
All voxels are plotted as 1x1x1 cubes on the axis, with filled[0, 0, 0] placed
with its lower corner at the origin. Occluded faces are not plotted.
New in version 2.1.
```

**Parameters**

**filled**

[3D np.array of bool] A 3d array of values, with truthy values indicating which voxels to fill

**x, y, z**

[3D np.array, optional] The coordinates of the corners of the voxels. This should broadcast to a shape one larger in every dimension than the shape of filled. These can be used to plot non-cubic voxels.

If not specified, defaults to increasing integers along each axis, like those returned by indices(). As indicated by the / in the function signature, these arguments can only be passed positionally.

**facecolors, edgecolors**

[array-like, optional] The color to draw the faces and edges of the voxels. Can only be passed as keyword arguments. This parameter can be:

- A single color value, to color all voxels the same color. This can be either a string, or a 1D rgb/rgba array
- None, the default, to use a single color for the faces, and the style default for the edges.
- A 3D ndarray of color names, with each item the color for the corresponding voxel. The size must match the voxels.
• A 4D ndarray of rgb/rgba data, with the components along the last axis.

**shade**

[bool, default: True] Whether to shade the facecolors. Shading is always disabled when *cmap* is specified.

New in version 3.1.

**lightsource**

[LightSource] The lightsource to use when *shade* is True.

New in version 3.1.

**kwargs**

Additional keyword arguments to pass onto *Poly3DCollection*.

Returns

**faces**

[dict] A dictionary indexed by coordinate, where faces[i, j, k] is a *Poly3DCollection* of the faces drawn for the voxel filled[i, j, k]. If no faces were drawn for a given voxel, either because it was not asked to be drawn, or it is fully occluded, then (i, j, k) not in faces.

Examples

property w_xaxis

property w_yaxis

property w_zaxis

zaxis_date(self, tz=None)

Sets up axis ticks and labels to treat data along the zaxis as dates.

**Parameters**

**tz**

[str or datetime.tzinfo, default: rcParams["timezone"] (default: 'UTC')] The timezone used to create date labels.

zaxis_inverted(self)

Returns True if the z-axis is inverted.

New in version 1.1.0.
Examples using `mpl_toolkits.mplot3d.axes3d.Axes3D`

19.2.2 `axis3d`

**Note:** See `mpl_toolkits.mplot3d.axis3d._axinfo` for a dictionary containing constants that may be modified for controlling the look and feel of mplot3d axes (e.g., label spacing, font colors and panel colors). Historically, `axis3d` has suffered from having hard-coded constants that precluded user adjustments, and this dictionary was implemented in version 1.1 as a stop-gap measure.

```python
axis3d.Axis(adir, v_intervalx, d_intervalx, ...)  
```

An Axis class for the 3D plots.

```python
mpl_toolkits.mplot3d.axis3d.Axis
```

class `mpl_toolkits.mplot3d.axis3d.Axis`

```
mpl_toolkits.mplot3d.axis3d.Axis(adir, v_intervalx, d_intervalx, axes, *args, rotate_label=\( None \), **kwargs)
```

An Axis class for the 3D plots.

**Parameters**

- `axes`

- `adir`

  The axis direction.

- `v_intervalx`

  The vertical interval.

- `d_intervalx`

  The depth interval.
__module__ = 'mpl_toolkits.mplot3d.axis3d'

property d_interval
draw(self, renderer)
        Draw the Artist (and its children) using the given renderer.
        This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer
        [RendererBase subclass.]
Notes

This method is overridden in the Artist subclasses.

```
draw_pane(self, renderer)
```

```
get_major_ticks(self, numticks=None)
    Return the list of major Ticks.
```

```
get_minor_ticks(self, numticks=None)
    Return the list of minor Ticks.
```

```
get_rotate_label(self, text)
```

```
get_tightbbox(self, renderer, *, for_layout_only=False)
    Return a bounding box that encloses the axis. It only accounts tick labels, axis label, and offsetText.

    If for_layout_only is True, then the width of the label (if this is an x-axis) or the height of the label (if this is a y-axis) is collapsed to near zero. This allows tight/constrained_layout to ignore too-long labels when doing their layout.
```

```
init3d(self)
```
set_pane_color(self, color)
    Set pane color to a RGBA tuple.

set_pane_pos(self, xys)

set_rotate_label(self, val)
    Whether to rotate the axis label: True, False or None. If set to None the
    label will be rotated if longer than 4 chars.

property v_interval

Examples using mpl_toolkits.mplot3d.axis3d.Axes

<td>Convert a Text to a Text3D object.</td>
</tr>
</tbody>
</table>

`mpl_toolkits.mplot3d.art3d.Line3D`

```python
class mpl_toolkits.mplot3d.art3d.Line3D(xs, ys, zs, *args, **kwargs)

    Bases: matplotlib.lines.Line2D

    3D line object.

    Keyword arguments are passed onto Line2D().

    __init__(self, xs, ys, zs, *args, **kwargs)

        Keyword arguments are passed onto Line2D().

    __module__ = 'mpl_toolkits.mplot3d.art3d'

    draw(self, renderer)

        Draw the Artist (and its children) using the given renderer.

        This has no effect if the artist is not visible (Artist.get_visible returns False).
```

19.2. mplot3d API
Parameters

renderer

[RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

get_data_3d(self)
Get the current data

Returns

verts3d

[length-3 tuple or array-like] The current data as a tuple or array-like.

set_3d_properties(self, zs=0, zdir='z')

set_data_3d(self, *args)
Set the x, y and z data

Parameters

x

[array-like] The x-data to be plotted.

y

[array-like] The y-data to be plotted.

z

[array-like] The z-data to be plotted.

Notes

Accepts x, y, z arguments or a single array-like (x, y, z)
Examples using mpl_toolkits.mplot3d.art3d.Line3D

mpl_toolkits.mplot3d.art3d.Line3DCollection

class mpl_toolkits.mplot3d.art3d.Line3DCollection:

    segments: list of array-like
        A sequence of (line0, line1, line2), where:
        linen = (x0, y0), (x1, y1), ... (xm, ym)

        or the equivalent numpy array with two columns. Each line can
        have a different number of segments.

    linewidths
        [float or list of float, default: rcParams["lines.linewidth"] (de-
        fault: 1.5)] The width of each line in points.

    colors
        [color or list of color, default: rcParams["lines.color"] (default:
        'C0')] A sequence of RGBA tuples (e.g., arbitrary color strings,
        etc, not allowed).

    antialiaseds
        [bool or list of bool, default: rcParams["lines.antialiased"] (de-
        fault: True)] Whether to use antialiasing for each line.

    zorder
        [int, default: 2] zorder of the lines once drawn.

    facecolors
        [color or list of color, default: 'none'] The facecolors of the
        LineCollection. Setting to a value other than 'none' will lead to
        each line being "filled in" as if there was an implicit line segment
joining the last and first points of that line back around to each
other. In order to manually specify what should count as the "in-
terior" of each line, please use PathCollection instead, where the
"interior" can be specified by appropriate usage of CLOSEPOLY.

**kwargs
Forwareded to Collection.

__module__ = 'mpl_toolkits.mplot3d.art3d'
do_3d_projection(self, renderer)
    Project the points according to renderer matrix.
draw(self, renderer, project=False)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

Parameters

renderer
    [RendererBase subclass.]

Notes

This method is overridden in the Artist subclasses.

set_segments(self, segments)
    Set 3D segments.

set_sort_zpos(self, val)
    Set the position to use for z-sorting.

Examples using mpl_toolkits.mplot3d.art3d.Line3DCollection

mpl_toolkits.mplot3d.art3d.Patch3D

class mpl_toolkits.mplot3d.art3d.Patch3D(*args, zs=(), zdir='z', **kwargs)
    Bases: matplotlib.patches.Patch
    3D patch object.
    The following kwarg properties are supported

<table>

__module__ = 'mpl_toolkits.mplot3d.art3d'

do_3d_projection(self, renderer)

get_facecolor(self)
    Return the face color.

gid(self)
    Return the path of this patch.

set_3d_properties(self, verts, zs=0, zdir='z')

Examples using mpl_toolkits.mplot3d.art3d.Patch3D

mpl_toolkits.mplot3d.art3d.Patch3DCollection

class mpl_toolkits.mplot3d.art3d.Patch3DCollection(*args, zs=0, zdir='z',
    depthshade=True, **kwargs)

    Bases: matplotlib.collections.PatchCollection

    A collection of 3D patches.

    Create a collection of flat 3D patches with its normal vector pointed in zdir direction, and located at zs on the zdir axis. 'zs' can be a scalar or an array-like of
the same length as the number of patches in the collection.

Constructor arguments are the same as for PatchCollection. In addition, keywords zs=0 and zdir='z' are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is True). This is typically desired in scatter plots.

```
__init__(self, *args, zs=0, zdir='z', depthshade=True, **kwargs)
```

Create a collection of flat 3D patches with its normal vector pointed in zdir direction, and located at zs on the zdir axis. 'zs' can be a scalar or an array-like of the same length as the number of patches in the collection.

Constructor arguments are the same as for PatchCollection. In addition, keywords zs=0 and zdir='z' are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is True). This is typically desired in scatter plots.

```
_do_3d_projection(self, renderer)
_set_3d_properties(self, zs, zdir)
_set_sort_zpos(self, val)
```

Set the position to use for z-sorting.

Examples using mpl_toolkits.mplot3d.art3d.Patch3DCollection

mpl_toolkits.mplot3d.art3d.Path3DCollection

```
class mpl_toolkits.mplot3d.art3d.Path3DCollection(*args, zs=0, zdir='z',
         depthshade=True, **kwargs)
```

Bases: matplotlib.collections.PathCollection

A collection of 3D paths.

Create a collection of flat 3D paths with its normal vector pointed in zdir direction, and located at zs on the zdir axis. 'zs' can be a scalar or an array-like of the same length as the number of paths in the collection.

Constructor arguments are the same as for PathCollection. In addition, keywords zs=0 and zdir='z' are available.

Also, the keyword argument "depthshade" is available to indicate whether or not to shade the patches in order to give the appearance of depth (default is True). This is typically desired in scatter plots.
__init__(self, *args, zs=0, zdir='z', depthshade=True, **kwargs)
Create a collection of flat 3D paths with its normal vector pointed in zdir
direction, and located at zs on the zdir axis. 'zs' can be a scalar or an array-
like of the same length as the number of paths in the collection.

Constructor arguments are the same as for PathCollection. In addition, key-
words zs=0 and zdir='z' are available.

Also, the keyword argument "depthshade" is available to indicate whether
or not to shade the patches in order to give the appearance of depth (default
is True). This is typically desired in scatter plots.

__module__ = 'mpl_toolkits.mplot3d.art3d'
do_3d_projection(self, renderer)
set_3d_properties(self, zs, zdir)
set_sort_zpos(self, val)
Set the position to use for z-sorting.

Examples using mpl_toolkits.mplot3d.art3d.Path3DCollection

mpl_toolkits.mplot3d.art3d.PathPatch3D

class mpl_toolkits.mplot3d.art3d.PathPatch3D(path, *, zs=(), zdir='z', **kwargs)
        Bases: mpl_toolkits.mplot3d.art3d.Path3D

3D PathPatch object.

The following kwarg properties are supported

```
__module__ = 'mpl_toolkits.mplot3d.art3d'

do_3d_projection(self, renderer)

set_3d_properties(self, path, zs=0, zdir='z')
```

Examples using `mpl_toolkits.mplot3d.art3d.PathPatch3D`

- sphx_glr_gallery_mplot3d_pathpatch3d.py

`mpl_toolkits.mplot3d.art3d.Poly3DCollection`

```python
class mpl_toolkits.mplot3d.art3d.Poly3DCollection(verts, *args, zsort='average', **kwargs)

Bases: matplotlib.collections.PolyCollection

A collection of 3D polygons.
```

**Note:** Filling of 3D polygons

There is no simple definition of the enclosed surface of a 3D polygon unless the polygon is planar.

In practice, Matplotlib fills the 2D projection of the polygon. This gives a correct filling appearance only for planar polygons. For all other polygons, you’ll find orientations in which the edges of the polygon intersect in the projection. This will lead to an incorrect visualization of the 3D area.

If you need filled areas, it is recommended to create them via `plot_trisurf`, which creates a triangulation and thus generates consistent surfaces.

**Parameters**

**verts**

[list of array-like Nx3] Each element describes a polygon as a sequence of N_i points (x, y, z).

zsort

[{'average', 'min', 'max'}, default: 'average'] The calculation method for the z-order. See `set_zsort` for details.

*args, **kwargs

All other parameters are forwarded to `PolyCollection`.

Notes

Note that this class does a bit of magic with the `_facecolors` and `_edgecolors` properties.

```
__init__(self, verts, *args, zsort='average', **kwargs)
```

Parameters

verts

[list of array-like Nx3] Each element describes a polygon as a sequence of $N_i$ points $(x, y, z)$.

zsort

[{'average', 'min', 'max'}, default: 'average'] The calculation method for the z-order. See `set_zsort` for details.

*args, **kwargs

All other parameters are forwarded to `PolyCollection`.

Notes

Note that this class does a bit of magic with the `_facecolors` and `_edgecolors` properties.

```
__module__ = 'mpl_toolkits.mplot3d.art3d'
do_3d_projection(self, renderer)
    Perform the 3D projection for this object.
get_edgecolor(self)
get_facecolor(self)
get_vector(self, segments3d)
    Optimize points for projection.
set_3d_properties(self)
set_alpha(self, alpha)
    Set the alpha value used for blending - not supported on all backends.
```

Parameters
alpha
    [float or None]

set_edgecolor(self, colors)
    Set the edgecolor(s) of the collection.

Parameters

    c
    [color or list of colors or 'face'] The collection edgecolor(s). If a sequence, the patches cycle through it. If 'face', match the facecolor.

set_facecolor(self, colors)
    Set the facecolor(s) of the collection. c can be a color (all patches have same color), or a sequence of colors; if it is a sequence the patches will cycle through the sequence.

    If c is 'none', the patch will not be filled.

Parameters

    c
    [color or list of colors]

set_sort_zpos(self, val)
    Set the position to use for z-sorting.

set_verts(self, verts, closed=True)
    Set 3D vertices.

set_verts_and_codes(self, verts, codes)
    Set 3D vertices with path codes.

set_zsort(self, zsort)
    Set the calculation method for the z-order.

Parameters

    zsort
    [{‘average’, ‘min’, ‘max’}] The function applied on the z-coordinates of the vertices in the viewer's coordinate system, to determine the z-order.
Examples using `mpl_toolkits.mplot3d.art3d.Poly3DCollection`

- sphx_glr_gallery_mplot3d_surface3d.py
- sphx_glr_gallery_mplot3d_surface3d_3.py

`mpl_toolkits.mplot3d.art3d.Text3D`

class mpl_toolkits.mplot3d.art3d.Text3D(x=0, y=0, z=0, text='', zdir='z', **kwargs)

Bases: matplotlib.text.Text

Text object with 3D position and direction.

**Parameters**

- x, y, z
  - The position of the text.
- text
  - [str] The text string to display.
- zdir
  - [{'x', 'y', 'z', None, 3-tuple}] The direction of the text. See `get_dir_vector` for a description of the values.

**Other Parameters**

- **kwargs
  - All other parameters are passed on to `Text`.

Create a `Text` instance at x, y with string text.

Valid keyword arguments are:

```python
__module__ = 'mpl_toolkits.mplot3d.art3d'

draw(self, renderer)
    Draw the Artist (and its children) using the given renderer.
    This has no effect if the artist is not visible (Artist.get_visible returns False).

    Parameters

    renderer
        [RendererBase subclass.]

    Notes

    This method is overridden in the Artist subclasses.
```

```python
get_tightbbox(self, renderer)
    Like Artist.get_window_extent, but includes any clipping.

    Parameters

    renderer
        [RendererBase subclass] renderer that will be used to draw the figures (i.e. fig.canvas.get_renderer())

    Returns

    Bbox
        The enclosing bounding box (in figure pixel coordinates).
```

```python
set_3d_properties(self, z=0, zdir='z')
```
Examples using `mpl_toolkits.mplot3d.art3d.Text3D`

`mpl_toolkits.mplot3d.art3d.get_dir_vector`

`mpl_toolkits.mplot3d.art3d.get_dir_vector(zdir)`
Return a direction vector.

**Parameters**

`zdir`

`{['x', 'y', 'z', None, 3-tuple]}` The direction. Possible values are:
- 'x': equivalent to (1, 0, 0)
- 'y': equivalent to (0, 1, 0)
- 'z': equivalent to (0, 0, 1)
- `None`: equivalent to (0, 0, 0)
- an iterable (x, y, z) is returned unchanged.

**Returns**

`x`, `y`, `z`

[array-like] The direction vector. This is either a `numpy.array` or `zdir` itself if `zdir` is already a length-3 iterable.

Examples using `mpl_toolkits.mplot3d.art3d.get_dir_vector`

`mpl_toolkits.mplot3d.art3d.juggle_axes`

`mpl_toolkits.mplot3d.art3d.juggle_axes(xs, ys, zs, zdir)`
Reorder coordinates so that 2D `xs`, `ys` can be plotted in the plane orthogonal to `zdir`. `zdir` is normally `x`, `y` or `z`. However, if `zdir` starts with a '-' it is interpreted as a compensation for `rotate_axes`.

Examples using `mpl_toolkits.mplot3d.art3d.juggle_axes`

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.line_2d_to_3d(line, zs=0, zdir='z')`
Convert a 2D line to 3D.
Examples using `mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`  

`mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d(col, zs=0, zdir='z')`  
Convert a LineCollection to a Line3DCollection object.

Examples using `mpl_toolkits.mplot3d.art3d.line_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_2d_to_3d`  

`mpl_toolkits.mplot3d.art3d.patch_2d_to_3d(patch, z=0, zdir='z')`  
Convert a Patch to a Patch3D object.

Examples using `mpl_toolkits.mplot3d.art3d.patch_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`  

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d(col, zs=0, zdir='z', depthshade=True)`  
Convert a `PatchCollection` into a `Patch3DCollection` object (or a `PathCollection` into a `Path3DCollection` object).

**Parameters**

`za`  
The location or locations to place the patches in the collection along the `zdir` axis. Default: 0.

`zdir`  
The axis in which to place the patches. Default: "z".

`depthshade`  
Whether to shade the patches to give a sense of depth. Default: `True`. 
Examples using `mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d(pathpatch, z=0, zdir='z')`

Convert a PathPatch to a PathPatch3D object.

Examples using `mpl_toolkits.mplot3d.art3d.patch_collection_2d_to_3d`

- `sphx_glr_gallery_mplot3d_pathpatch3d.py`

`mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d(col, zs=0, zdir='z')`

Convert a PolyCollection to a Poly3DCollection object.

Examples using `mpl_toolkits.mplot3d.art3d.poly_collection_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.rotate_axes`

`mpl_toolkits.mplot3d.art3d.rotate_axes(xs, ys, zs, zdir)`

Reorder coordinates so that the axes are rotated with zdir along the original z axis. Prepending the axis with a '-' does the inverse transform, so zdir can be x, -x, y, -y, z or -z.

Examples using `mpl_toolkits.mplot3d.art3d.rotate_axes`

`mpl_toolkits.mplot3d.art3d.text_2d_to_3d`

`mpl_toolkits.mplot3d.art3d.text_2d_to_3d(obj, z=0, zdir='z')`

Convert a Text to a Text3D object.

Examples using `mpl_toolkits.mplot3d.art3d.text_2d_to_3d`

19.2.4 proj3d

`proj3d.inv_transform(xs, ys, zs, M)`

`proj3d.persp_transformation(zfront, zback)`

mpl_toolkits.mplot3d.pro3d.world_transformation

mpl_toolkits.mplot3d.pro3d.world_transformation(xmin, xmax, ymin, ymax, zmin, zmax, pb_aspect=None)
```

Produce a matrix that scales homogeneous coords in the specified ranges to [0, 1], or [0, pb_aspect[i]] if the plotbox aspect ratio is specified.

Examples using `mpl_toolkits.mplot3d.pro3d.world_transformation`

19.3 Matplotlib axes_grid Toolkit

**Note:** AxesGrid toolkit has been a part of matplotlib since v 0.99. Originally, the toolkit had a single namespace of `axes_grid`. In more recent version, the toolkit has divided into two separate namespace (`axes_grid1` and `axisartist`). While `axes_grid` namespace is maintained for the backward compatibility, use of `axes_grid1` and `axisartist` is recommended. For the documentation on `axes_grid`, see the previous version of the docs.

Part V

Third party packages
Several external packages that extend or build on Matplotlib functionality are listed below. They are maintained and distributed separately from Matplotlib and thus need to be installed individually.

Please submit an issue or pull request on GitHub if you have created a package that you would like to have included. We are also happy to host third party packages within the Matplotlib GitHub Organization.
23.1 Basemap

Basemap plots data on map projections, with continental and political boundaries.
23.2 Cartopy

Cartopy builds on top of Matplotlib to provide object oriented map projection definitions and close integration with Shapely for powerful yet easy-to-use vector data processing tools. An example plot from the Cartopy gallery:

US States which intersect the track of Hurricane Katrina (2005)

23.3 Geoplot

Geoplot builds on top of Matplotlib and Cartopy to provide a "standard library" of simple, powerful, and customizable plot types. An example plot from the Geoplot gallery:
23.4 Ridge Map

ridge_map uses Matplotlib, SRTM.py, NumPy, and scikit-image to make ridge plots of your favorite ridges.
THE WHITE MOUNTAINS
24.1 ggplot

*ggplot* is a port of the R ggplot2 package to python based on Matplotlib.

![ggplot examples](image)

24.2 holoviews

*holoviews* makes it easier to visualize data interactively, especially in a Jupyter notebook, by providing a set of declarative plotting objects that store your data and associated metadata. Your data is then immediately visualizable alongside or overlaid with other data, either statically or with automatically provided widgets for parameter exploration.
24.3 plotnine

plotnine implements a grammar of graphics, similar to R's ggplot2. The grammar allows users to compose plots by explicitly mapping data to the visual objects that make up the plot.
25.1 Broken Axes

brokenaxes supplies an axes class that can have a visual break to indicate a discontinuous range.

25.2 DeCiDa

DeCiDa is a library of functions and classes for electron device characterization, electronic circuit design and general data visualization and analysis.
25.3 matplotlib-scalebar

matplotlib-scalebar provides a new artist to display a scale bar, aka micron bar. It is particularly useful when displaying calibrated images plotted using plt.imshow(…).

![Scale bar image](image)

25.4 Matplotlib-Venn

Matplotlib-Venn provides a set of functions for plotting 2- and 3-set area-weighted (or unweighted) Venn diagrams.

25.5 mpl-probscale

mpl-probscale is a small extension that allows Matplotlib users to specify probability scales. Simply importing the probscale module registers the scale with Matplotlib, making it accessible via e.g., ax.set_xscale('prob') or plt.yscale('prob').
25.6 mpl-scatter-density

mpl-scatter-density is a small package that makes it easy to make scatter plots of large numbers of points using a density map. The following example contains around 13 million points and the plotting (excluding reading in the data) took less than a second on an average laptop:
When used in interactive mode, the density map is downsampled on-the-fly while panning/zooming in order to provide a smooth interactive experience.

25.7 mplstereonet

mplstereonet provides stereonets for plotting and analyzing orientation data in Matplotlib.
25.8 Natgrid

`mpl_toolkits.natgrid` is an interface to the natgrid C library for gridding irregularly spaced data.

25.9 pyUpSet

`pyUpSet` is a static Python implementation of the UpSet suite by Lex et al. to explore complex intersections of sets and data frames.

25.10 seaborn

`seaborn` is a high level interface for drawing statistical graphics with Matplotlib. It aims to make visualization a central part of exploring and understanding complex datasets.

![seaborn examples](image)

25.11 WCSAxes

The Astropy core package includes a submodule called WCSAxes (available at `astropy.visualization.wcsaxes`) which adds Matplotlib projections for Astronomical image data. The following is an example of a plot made with WCSAxes which includes the original coordinate system of the image and an overlay of a different coordinate system:
25.12 Windrose

Windrose is a Python Matplotlib, Numpy library to manage wind data, draw windroses (also known as polar rose plots), draw probability density functions and fit Weibull distributions.

25.13 Yellowbrick

Yellowbrick is a suite of visual diagnostic tools for machine learning that enables human steering of the model selection process. Yellowbrick combines scikit-learn with matplotlib using an estimator-based API called the Visualizer, which wraps both sklearn models and matplotlib Axes. Visualizer objects fit neatly into the machine learning workflow allowing data scientists to integrate visual diagnostic and model interpretation tools into experimentation without extra steps.
25.13. Yellowbrick
26.1 animatplot

`animatplot` is a library for producing interactive animated plots with the goal of making production of animated plots almost as easy as static ones.

For an animated version of the above picture and more examples, see the `animatplot` gallery.
26.2 gif

gif is an ultra lightweight animated gif API.

26.3 numpngw

numpngw provides functions for writing NumPy arrays to PNG and animated PNG files. It also includes the class AnimatedPNGWriter that can be used to save a Matplotlib animation as an animated PNG file. See the example on the PyPI page or at the numpngw github repository.
27.1 mplcursors

mplcursors provides interactive data cursors for Matplotlib.

27.2 MplDataCursor

MplDataCursor is a toolkit written by Joe Kington to provide interactive "data cursors" (clickable annotation boxes) for Matplotlib.

27.3 mpl_interactions

mpl_interactions makes it easy to create interactive plots controlled by sliders and other widgets. It also provides several handy capabilities such as manual image segmentation, comparing cross-sections of arrays, and using the scroll wheel to zoom.
28.1 mplcairo

mplcairo is a cairo backend for Matplotlib, with faster and more accurate marker drawing, support for a wider selection of font formats and complex text layout, and various other features.

28.2 gr

gr is a framework for cross-platform visualisation applications, which can be used as a high-performance Matplotlib backend.
29.1 adjustText

adjustText is a small library for automatically adjusting text position in Matplotlib plots to minimize overlaps between them, specified points and other objects.
29.2 iTerm2 terminal backend

`matplotlib_iterm2` is an external Matplotlib backend using the iTerm2 nightly build inline image display feature.
29.3 mpl-template

mpl-template provides a customizable way to add engineering figure elements such as a title block, border, and logo.
29.4 figpager

figpager provides customizable figure elements such as text, lines and images and subplot layout control for single or multi page output.
29.5 blume

blume provides a replacement for the Matplotlib table module. It fixes a number of issues with the existing table. See the blume github repository for more details.
29.6 DNA Features Viewer

DNA Features Viewer provides methods to plot annotated DNA sequence maps (possibly along other Matplotlib plots) for Bioinformatics and Synthetic Biology applications.
GUI APPLICATIONS

30.1 sviewgui

sviewgui is a PyQt-based GUI for visualisation of data from csv files or pandas. DataFrames. Main features:

- Scatter, line, density, histogram, and box plot types
- Settings for the marker size, line width, number of bins of histogram, color map (from cmocean)
- Save figure as editable PDF
- Code of the plotted graph is available so that it can be reused and modified outside of sviewgui
Part VI

The Matplotlib Developers' Guide
This project is a community effort, and everyone is welcome to contribute. We follow the Python Software Foundation Code of Conduct in everything we do.

The project is hosted on https://github.com/matplotlib/matplotlib

### 31.1 Submitting a bug report

If you find a bug in the code or documentation, do not hesitate to submit a ticket to the Bug Tracker. You are also welcome to post feature requests or pull requests.

If you are reporting a bug, please do your best to include the following:

1. A short, top-level summary of the bug. In most cases, this should be 1-2 sentences.
2. A short, self-contained code snippet to reproduce the bug, ideally allowing a simple copy and paste to reproduce. Please do your best to reduce the code snippet to the minimum required.
3. The actual outcome of the code snippet.
4. The expected outcome of the code snippet.
5. The Matplotlib version, Python version and platform that you are using. You can grab the version with the following commands:

```python
>>> import matplotlib
>>> matplotlib.__version__
'1.5.3'
>>> import platform
>>> platform.python_version()
'2.7.12'
```

We have preloaded the issue creation page with a Markdown template that you can use to organize this information.

Thank you for your help in keeping bug reports complete, targeted and descriptive.
31.2 Retrieving and installing the latest version of the code

When developing Matplotlib, sources must be downloaded, built, and installed into a local environment on your machine.

We use Git for version control and GitHub for hosting our main repository.

You can check out the latest sources with the command (see Set up your fork for more details):

```
git clone https://github.com/matplotlib/matplotlib.git
```

and navigate to the matplotlib directory. If you have the proper privileges, you can use git@ instead of https://, which works through the ssh protocol and might be easier to use if you are using 2-factor authentication.

31.2.1 Installing Matplotlib in developer mode

It is strongly recommended to set up a clean virtual environment. Do not use on a preexisting environment!

A new environment can be set up with

```
python3 -mvenv /path/to/devel/env
```

and activated with one of the following:

```
source /path/to/devel/env/bin/activate    # Linux/macOS
/path/to/devel/env/Scripts/activate.bat  # Windows cmd.exe
/path/to/devel/env/Scripts/Activate.ps1   # Windows PowerShell
```

Whenever you plan to work on Matplotlib, remember to activate the development environment in your shell!

To install Matplotlib (and compile the C-extensions) run the following command from the top-level directory

```
python -mpip install -ve .
```

This installs Matplotlib in 'editable/develop mode', i.e., builds everything and places the correct link entries in the install directory so that python will be able to import Matplotlib from the source directory. Thus, any changes to the *.py files will be reflected the next time you import the library. If you change the C-extension source (which might happen if you change branches) you will need to run

```
python setup.py build_ext --inplace
```

or re-run python -mpip install -ve ..

You can then run the tests to check your work environment is set up properly:
Note: Additional dependencies for testing: pytest (version 3.6 or later), Ghostscript, Inkscape

See also:
- Developer's tips for testing

31.3 Contributing code

31.3.1 How to contribute

The preferred way to contribute to Matplotlib is to fork the main repository on GitHub, then submit a "pull request" (PR).

The best practices for using GitHub to make PRs to Matplotlib are documented in the Development workflow section.

A brief overview is:

1. Create an account on GitHub if you do not already have one.
2. Fork the project repository: click on the 'Fork' button near the top of the page. This creates a copy of the code under your account on the GitHub server.
3. Clone this copy to your local disk:

   ```bash
   $ git clone https://github.com/YourLogin/matplotlib.git
   ```

4. Create a branch to hold your changes:

   ```bash
   $ git checkout -b my-feature origin/master
   ```

   and start making changes. Never work in the master branch!

5. Work on this copy, on your computer, using Git to do the version control. When you're done editing e.g., lib/matplotlib/collections.py, do:

   ```bash
   $ git add lib/matplotlib/collections.py
   $ git commit
   ```

   to record your changes in Git, then push them to GitHub with:

   ```bash
   $ git push -u origin my-feature
   ```

Finally, go to the web page of your fork of the Matplotlib repo, and click 'Pull request' to send your changes to the maintainers for review. You may want to consider sending an email to the mailing list for more visibility.
31.3.2 Contributing pull requests

It is recommended to check that your contribution complies with the following rules before submitting a pull request:

- If your pull request addresses an issue, please use the title to describe the issue and mention the issue number in the pull request description to ensure that a link is created to the original issue.
- All public methods should have informative docstrings with sample usage when appropriate. Use the numpy docstring standard.
- Formatting should follow the recommendations of PEP8. You should consider installing/enabling automatic PEP8 checking in your editor. Part of the test suite is checking PEP8 compliance, things go smoother if the code is mostly PEP8 compliant to begin with.
- Each high-level plotting function should have a simple example in the Example section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go in the examples tree.
- Changes (both new features and bugfixes) should be tested. See Developer's tips for testing for more details.
- Import the following modules using the standard scipy conventions:

```python
import numpy as np
import numpy.ma as ma
import matplotlib as mpl
import matplotlib.pyplot as plt
import matplotlib.cbook as cbook
import matplotlib.patches as mpatches
```

In general, Matplotlib modules should not import rcParams using from matplotlib import rcParams, but rather access it as mpl.rcParams. This is because some modules are imported very early, before the rcParams singleton is constructed.

- If your change is a major new feature, add an entry to the What's new section by adding a new file in doc/users/next_whats_new (see doc/users/next_whats_new/README.rst for more information).
• If you change the API in a backward-incompatible way, please document it in doc/api/api_changes, by adding to the relevant file (see doc/api/api_changes.rst for more information)

• See below for additional points about Keyword argument processing, if applicable for your pull request.

In addition, you can check for common programming errors with the following tools:

• Code with a good unittest coverage (at least 70%, better 100%), check with:

```bash
python -mpip install coverage
python -mpytest --cov=matplotlib --showlocals -v
```

• No pyflakes warnings, check with:

```bash
python -mpip install pyflakes
pyflakes path/to/module.py
```

**Note:** The current state of the Matplotlib code base is not compliant with all of those guidelines, but we expect that enforcing those constraints on all new contributions will move the overall code base quality in the right direction.

**See also:**

- Coding guidelines
- Developer's tips for testing
- Writing documentation

### 31.3.3 Issues for New Contributors

New contributors should look for the following tags when looking for issues. We strongly recommend that new contributors tackle issues labeled good first issue as they are easy, well documented issues, that do not require an understanding of the different submodules of Matplotlib. This helps the contributor become familiar with the contribution workflow, and for the core devs to become acquainted with the contributor; besides which, we frequently underestimate how easy an issue is to solve!
31.4 Contributing documentation

Code is not the only way to contribute to Matplotlib. For instance, documentation is also a very important part of the project and often doesn't get as much attention as it deserves. If you find a typo in the documentation, or have made improvements, do not hesitate to send an email to the mailing list or submit a GitHub pull request. To make a pull request, refer to the guidelines outlined in How to contribute.

Full documentation can be found under the doc/, tutorials/, and examples/ directories.

See also:

- Writing documentation

31.5 Other ways to contribute

It also helps us if you spread the word: reference the project from your blog and articles or link to it from your website! If Matplotlib contributes to a project that leads to a scientific publication, please follow the Citing Matplotlib guidelines.

31.6 Coding guidelines

31.6.1 API changes

Changes to the public API must follow a standard deprecation procedure to prevent unexpected breaking of code that uses Matplotlib.

- Deprecations must be announced via an entry in the most recent doc/api/api_changes_X.Y
- Deprecations are targeted at the next point-release (i.e. 3.x.0).
- The deprecated API should, to the maximum extent possible, remain fully functional during the deprecation period. In cases where this is not possible, the deprecation must never make a given piece of code do something different than it was before; at least an exception should be raised.
- If possible, usage of an deprecated API should emit a MatplotlibDeprecationWarning. There are a number of helper tools for this:
  - Use cbook.warn_deprecated() for general deprecation warnings.
  - Use the decorator @cbook.deprecated to deprecate classes, functions, methods, or properties.
  - To warn on changes of the function signature, use the decorators @cbook._delete_parameter, @cbook._rename_parameter, and @cbook._make_keyword_only.
• Deprecated API may be removed two point-releases after they were deprecated.

31.6.2 Adding new API

Every new function, parameter and attribute that is not explicitly marked as private (i.e., starts with an underscore) becomes part of Matplotlib's public API. As discussed above, changing the existing API is cumbersome. Therefore, take particular care when adding new API:

• Mark helper functions and internal attributes as private by prefixing them with an underscore.
• Carefully think about good names for your functions and variables.
• Try to adopt patterns and naming conventions from existing parts of the Matplotlib API.
• Consider making as many arguments keyword-only as possible. See also API Evolution the Right Way -- Add Parameters Compatibly.

31.6.3 New modules and files: installation

• If you have added new files or directories, or reorganized existing ones, make sure the new files are included in the match patterns in MANIFEST.in, and/or in package_data in setup.py.

31.6.4 C/C++ extensions

• Extensions may be written in C or C++.
• Code style should conform to PEP7 (understanding that PEP7 doesn't address C++, but most of its admonitions still apply).
• Python/C interface code should be kept separate from the core C/C++ code. The interface code should be named FOO_wrap.cpp or FOO_wrapper.cpp.
• Header file documentation (aka docstrings) should be in Numpydoc format. We don't plan on using automated tools for these docstrings, and the Numpydoc format is well understood in the scientific Python community.
31.6.5 Keyword argument processing

Matplotlib makes extensive use of **kwargs for pass-through customizations from one function to another. A typical example is in `matplotlib.pyplot.text()`. The definition of the `pylab.text` function is a simple pass-through to `matplotlib.axes.Axes.text()`:

```python
# in pylab.py
def text(*args, **kwargs):
    ret = gca().text(*args, **kwargs)
    draw_if_interactive()
    return ret

text() in simplified form looks like this, i.e., it just passes all args and kwargs on to `matplotlib.text.Text.__init__()`:

```python
# in axes/_axes.py
def text(self, x, y, s, fontdict=None, withdash=False, **kwargs):
    t = Text(x=x, y=y, text=s, **kwargs)
```

and `__init__()` (again with liberties for illustration) just passes them on to the `matplotlib.artist.Artist.update()` method:

```python
# in text.py
def __init__(self, x=0, y=0, text=' ', **kwargs):
    Artist.__init__(self)
    self.update(kwargs)
```

update does the work looking for methods named like `set_property` if property is a keyword argument. i.e., no one looks at the keywords, they just get passed through the API to the artist constructor which looks for suitably named methods and calls them with the value.

As a general rule, the use of **kwargs should be reserved for pass-through keyword arguments, as in the example above. If all the keyword args are to be used in the function, and not passed on, use the key/value keyword args in the function definition rather than the **kwargs idiom.

In some cases, you may want to consume some keys in the local function, and let others pass through. Instead of popping arguments to use off **kwargs, specify them as keyword-only arguments to the local function. This makes it obvious at a glance which arguments will be consumed in the function. For example, in `plot()`, scalex and scaley are local arguments and the rest are passed on as `Line2D()` keyword arguments:

```python
# in axes/_axes.py
def plot(self, *args, scalex=True, scaley=True, **kwargs):
    lines = []
    for line in self._get_lines(*args, **kwargs):
        self.add_line(line)
        lines.append(line)
```
### 31.6.6 Using logging for debug messages

Matplotlib uses the standard python `logging` library to write verbose warnings, information, and debug messages. Please use it! In all those places you write `print()` statements to do your debugging, try using `log.debug()` instead!

To include `logging` in your module, at the top of the module, you need to import `logging`. Then calls in your code like:

```python
_log = logging.getLogger(__name__)  # right after the imports

# code
# more code
_log.info('Here is some information')
_log.debug('Here is some more detailed information')
```

will log to a logger named `matplotlib.yourmodulename`.

If an end-user of Matplotlib sets up `logging` to display at levels more verbose than `logging.WARNING` in their code with the Matplotlib-provided helper:

```python
plt.set_loglevel("debug")
```

or manually with

```python
import logging
logging.basicConfig(level=logging.DEBUG)
import matplotlib.pyplot as plt
```

Then they will receive messages like:

```
DEBUG:matplotlib.backends:backend MacOSX version unknown
DEBUG:matplotlib.yourmodulename:Here is some information
DEBUG:matplotlib.yourmodulename:Here is some more detailed information
```

#### Which logging level to use?

There are five levels at which you can emit messages.

- `logging.critical` and `logging.error` are really only there for errors that will end the use of the library but not kill the interpreter.
- `logging.warning` and `cbook._warn_external` are used to warn the user, see below.
- `logging.info` is for information that the user may want to know if the program behaves oddly. They are not displayed by default. For instance, if an object isn’t drawn because its position is NaN, that can usually be ignored, but a mystified user could call `logging.basicConfig(level=logging.INFO)` and get an error message that says why.
• `logging.debug` is the least likely to be displayed, and hence can be the most verbose. "Expected" code paths (e.g., reporting normal intermediate steps of laying-out or rendering) should only log at this level.

By default, `logging` displays all log messages at levels higher than `logging.WARNING` to `sys.stderr`.

The `logging tutorial` suggests that the difference between `logging.warning` and `cbook._warn_external` (which uses `warnings.warn`) is that `cbook._warn_external` should be used for things the user must change to stop the warning (typically in the source), whereas `logging.warning` can be more persistent. Moreover, note that `cbook._warn_external` will by default only emit a given warning once for each line of user code, whereas `logging.warning` will display the message every time it is called.

By default, `warnings.warn` displays the line of code that has the warn call. This usually isn't more informative than the warning message itself. Therefore, Matplotlib uses `cbook._warn_external` which uses `warnings.warn`, but goes up the stack and displays the first line of code outside of Matplotlib. For example, for the module:

```
# in my_matplotlib_module.py
import warnings

def set_range(bottom, top):
    if bottom == top:
        warnings.warn('Attempting to set identical bottom==top')
```

running the script:

```
from matplotlib import my_matplotlib_module
my_matplotlib_module.set_range(0, 0)  #set range
```

will display:

```
UserWarning: Attempting to set identical bottom==top
warnings.warn('Attempting to set identical bottom==top')
```

Modifying the module to use `cbook._warn_external`:

```
from matplotlib import cbook

def set_range(bottom, top):
    if bottom == top:
        cbook._warn_external('Attempting to set identical bottom==top')
```

and running the same script will display:

```
UserWarning: Attempting to set identical bottom==top
my_matplotlib_module.set_range(0, 0)  #set range
```
31.6.7 Writing examples

We have hundreds of examples in subdirectories of `matplotlib/examples`, and these are automatically generated when the website is built to show up in the examples section of the website.

Any sample data that the example uses should be kept small and distributed with Matplotlib in the `lib/matplotlib/mpl-data/sample_data/` directory. Then in your example code you can load it into a file handle with:

```python
import matplotlib.cbook as cbook
fh = cbook.get_sample_data('mydata.dat')
```
Matplotlib’s testing infrastructure depends on pytest. The tests are in lib/matplotlib/tests, and customizations to the pytest testing infrastructure are in matplotlib.testing.

32.1 Requirements

Install the latest version of Matplotlib as documented in Retrieving and installing the latest version of the code.

The following software is required to run the tests:

• pytest (>=3.6)
• Ghostscript (>= 9.0, to render PDF files)
• Inkscape (to render SVG files)

Optionally you can install:

• pytest-cov (>=2.3.1) to collect coverage information
• pytest-flake8 to test coding standards using flake8
• pytest-timeout to limit runtime in case of stuck tests
• pytest-xdist to run tests in parallel

32.2 Running the tests

Running the tests is simple. Make sure you have pytest installed and run:

```
pytest
```

in the root directory of the repository.

pytest can be configured via a lot of command-line parameters. Some particularly useful ones are:
To run a single test from the command line, you can provide a file path, optionally followed by the function separated by two colons, e.g., (tests do not need to be installed, but Matplotlib should be):

`pytest lib/matplotlib/tests/test_simplification.py::test_clipping`

or, if tests are installed, a dot-separated path to the module, optionally followed by the function separated by two colons, such as:

`pytest --pyargs matplotlib.tests.test_simplification::test_clipping`

If you want to run the full test suite, but want to save wall time try running the tests in parallel:

`pytest --verbose -n 5`

An alternative implementation that does not look at command line arguments and works from within Python is to run the tests from the Matplotlib library function `matplotlib.test()`:

```python
import matplotlib
matplotlib.test()
```

### 32.3 Writing a simple test

Many elements of Matplotlib can be tested using standard tests. For example, here is a test from `matplotlib.tests.test_basic`:

```python
def test_simple():
    
    very simple example test
    
    assert 1 + 1 == 2
```

Pytest determines which functions are tests by searching for files whose names begin with "test_" and then within those files for functions beginning with "test" or classes beginning with "Test".
Some tests have internal side effects that need to be cleaned up after their execution (such as created figures or modified `rcParams`). The pytest fixture `mpl_test_settings()` will automatically clean these up; there is no need to do anything further.

### 32.4 Random data in tests

Random data is a very convenient way to generate data for examples, however the randomness is problematic for testing (as the tests must be deterministic!). To work around this set the seed in each test. For numpy use:

```python
import numpy as np
np.random.seed(19680801)
```

and Python's random number generator:

```python
import random
random.seed(19680801)
```

The seed is John Hunter's birthday.

### 32.5 Writing an image comparison test

Writing an image-based test is only slightly more difficult than a simple test. The main consideration is that you must specify the "baseline", or expected, images in the `image_comparison` decorator. For example, this test generates a single image and automatically tests it:

```python
from matplotlib.testing.decorators import image_comparison
import matplotlib.pyplot as plt

@image_comparison(baseline_images=['line_dashes'], remove_text=True,
                  extensions=['.png'])
def test_line_dashes():
    fig, ax = plt.subplots()
    ax.plot(range(10), linestyle=(0, (3, 3)), lw=5)
```

The first time this test is run, there will be no baseline image to compare against, so the test will fail. Copy the output images (in this case `result_images/test_lines/test_line_dashes.png`) to the correct subdirectory of `baseline_images` tree in the source directory (in this case `lib/matplotlib/tests/baseline_images/test_lines`). Put this new file under source code revision control (with `git add`). When rerunning the tests, they should now pass.

Baseline images take a lot of space in the Matplotlib repository. An alternative approach for image comparison tests is to use the `check_figures_equal` decorator, which should be used to decorate a function taking two `Figure` parameters and draws the same images on the figures using two different methods (the tested method and the
baseline method). The decorator will arrange for setting up the figures and then collect the drawn results and compare them.

See the documentation of `image_comparison` and `check_figures_equal` for additional information about their use.

### 32.6 Known failing tests

If you're writing a test, you may mark it as a known failing test with the `pytest.mark.xfail` decorator. This allows the test to be added to the test suite and run on the buildbots without causing undue alarm. For example, although the following test will fail, it is an expected failure:

```python
import pytest

@pytest.mark.xfail  # very simple example test that should fail
def test_simpleFail():
    assert 1 + 1 == 3
```

Note that the first argument to the `xfail()` decorator is a fail condition, which can be a value such as True, False, or may be a dynamically evaluated expression. If a condition is supplied, then a reason must also be supplied with the `reason='message'` keyword argument.

### 32.7 Creating a new module in matplotlib.tests

We try to keep the tests categorized by the primary module they are testing. For example, the tests related to the `mathtext.py` module are in `test_mathtext.py`.

### 32.8 Using Travis CI

Travis CI is a hosted CI system "in the cloud".

Travis is configured to receive notifications of new commits to GitHub repos (via GitHub "service hooks") and to run builds or tests when it sees these new commits. It looks for a YAML file called `.travis.yml` in the root of the repository to see how to test the project.

Travis CI is already enabled for the main Matplotlib GitHub repository -- for example, see its Travis page.

If you want to enable Travis CI for your personal Matplotlib GitHub repo, simply enable the repo to use Travis CI in either the Travis CI UI or the GitHub UI (Admin | Service Hooks). For details, see the Travis CI Getting Started page. This generally
isn't necessary, since any pull request submitted against the main Matplotlib repository will be tested.

Once this is configured, you can see the Travis CI results at https://travis-ci.org/your_GitHub_user_name/matplotlib -- here's an example.

32.9 Using tox

Tox is a tool for running tests against multiple Python environments, including multiple versions of Python (e.g., 3.6, 3.7) and even different Python implementations altogether (e.g., CPython, PyPy, Jython, etc.), as long as all these versions are available on your system's $PATH (consider using your system package manager, e.g. apt-get, yum, or Homebrew, to install them).

tox makes it easy to determine if your working copy introduced any regressions before submitting a pull request. Here's how to use it:

```bash
$ pip install tox
$ tox
```

You can also run tox on a subset of environments:

```
$ tox -e py36,py37
```

Tox processes everything serially so it can take a long time to test several environments. To speed it up, you might try using a new, parallelized version of tox called detox. Give this a try:

```
$ pip install -U -i http://pypi.testrun.org detox
$ detox
```

Tox is configured using a file called tox.ini. You may need to edit this file if you want to add new environments to test (e.g., py33) or if you want to tweak the dependencies or the way the tests are run. For more info on the tox.ini file, see the Tox Configuration Specification.

32.10 Building old versions of Matplotlib

When running a git bisect to see which commit introduced a certain bug, you may (rarely) need to build very old versions of Matplotlib. The following constraints need to be taken into account:

- Matplotlib 1.3 (or earlier) requires numpy 1.8 (or earlier).

    * Wrapping parameter lists
33.1 Getting started

33.1.1 General file structure

All documentation is built from the doc/, tutorials/, and examples/ directories. The doc/ directory contains configuration files for Sphinx and reStructuredText (ReST; .rst) files that are rendered to documentation pages.

The main entry point is doc/index.rst, which pulls in the index.rst file for the users guide (doc/users), developers guide (doc/devel), api reference (doc/api), and FAQs (doc/faq). The documentation suite is built as a single document in order to make the most effective use of cross referencing.

Sphinx also creates .rst files that are staged in doc/api from the docstrings of the classes in the Matplotlib library. Except for doc/api/api_changes/, these .rst files are created when the documentation is built.

Similarly, the contents of doc/gallery and doc/tutorials are generated by the Sphinx Gallery from the sources in examples/ and tutorials/. These sources consist of python scripts that have ReST documentation built into their comments.

Note: Don't directly edit the .rst files in doc/gallery, doc/tutorials, and doc/api (excepting doc/api/api_changes/). Sphinx regenerates files in these directories when building documentation.
33.1.2 Installing dependencies

The documentation for Matplotlib is generated from reStructuredText (ReST) using the Sphinx documentation generation tool. To build the documentation you will need to (1) set up an appropriate Python environment and (2) separately install LaTeX and Graphviz.

To (1) set up an appropriate Python environment for building the documentation, you should:

- create a clean virtual environment with no existing Matplotlib installation
- install the Python packages required for Matplotlib
- install the additional Python packages required to build the documentation

There are several extra python packages that are needed to build the documentation. They are listed in doc-requirements.txt, which is shown below:

```plaintext
# Requirements for building docs
#
# You will first need a matching Matplotlib installation
# e.g (from the Matplotlib root directory)
#   pip install -e .
#
# Install the documentation requirements with:
#   pip install -r requirements/doc/doc-requirements.txt
#
sphinx>=1.8.1,!=2.0.0
colorspacious
ipython
ipywidgets
numpydoc>=0.8
sphinxcontrib-svg2pdfconverter>=1.1.0
sphinx-gallery>=0.7
sphinx-copybutton
scipy
```

To (2) set up LaTeX and Graphviz dependencies you should:

- install a minimal working LaTeX distribution
- install the LaTeX packages cm-super and dvipng
- install Graphviz

**Note:** The documentation will not build without LaTeX and Graphviz. These are not Python packages and must be installed separately.
33.1.3 Building the docs

The documentation sources are found in the doc/ directory in the trunk. The configuration file for Sphinx is doc/conf.py. It controls which directories Sphinx parses, how the docs are built, and how the extensions are used. To build the documentation in html format, cd into doc/ and run:

```
make html
```

Other useful invocations include

```
# Delete built files. May help if you get errors about missing paths or
# broken links.
make clean

# Build pdf docs.
make latexpdf
```

The SPHINXOPTS variable is set to -W --keep-going by default to build the complete docs but exit with exit status 1 if there are warnings. To unset it, use

```
make SPHINXOPTS= html
```

On Windows the arguments must be at the end of the statement:

```
make html SPHINXOPTS= 
```

You can use the O variable to set additional options:

- make O=-j4 html runs a parallel build with 4 processes.
- make O=-Dplot_formats=png:100 html saves figures in low resolution.
- make O=-Dplot_gallery=0 html skips the gallery build.

Multiple options can be combined using e.g. make O='--j4 -Dplot_gallery=0' html.

On Windows, either use the format shown above or set options as environment variables, e.g.:

```
set O=-W --keep-going -j4
make html
```
33.2 Writing ReST pages

Most documentation is either in the docstring of individual classes and methods, in explicit .rst files, or in examples and tutorials. All of these use the ReST syntax. Users should look at the ReST documentation for a full description. But some specific hints and conventions Matplotlib uses are useful for creating documentation.

33.2.1 Formatting and style conventions

It is useful to strive for consistency in the Matplotlib documentation. Here are some formatting and style conventions that are used.

Section name formatting

For everything but top-level chapters, use Upper lower for section titles, e.g., Possible hangups rather than Possible Hangups

Function arguments

Function arguments and keywords within docstrings should be referred to using the *emphasis* role. This will keep Matplotlib's documentation consistent with Python's documentation:

Here is a description of *argument*

Do not use the `default role`:

Do not describe `argument` like this. As per the next section, this syntax will (unsuccessfully) attempt to resolve the argument as a link to a class or method in the library.

nor the ```literal``` role:

Do not describe ``argument`` like this.

33.2.2 Referring to other documents and sections

Sphinx allows internal references between documents.

Documents can be linked with the :doc: directive:
will render as:

See the *Installation*

See the tutorial *Sample plots in Matplotlib*

See the example /gallery/lines_bars_and_markers/simple_plot

Sections can also be given reference names. For instance from the *Installation* link:

```bash
.. _clean-install:

How to completely remove Matplotlib
-----------------------------------

Occasionally, problems with Matplotlib can be solved with a clean...
```

and refer to it using the standard reference syntax:

```bash
See :ref:`clean-install`
```

will give the following link: *How to completely remove Matplotlib*

To maximize internal consistency in section labeling and references, use hyphen separated, descriptive labels for section references. Keep in mind that contents may be reorganized later, so avoid top level names in references like *user* or *devel* or *faq* unless necessary, because for example the FAQ "what is a backend?" could later become part of the users guide, so the label:

```bash
.. _what-is-a-backend:
```

is better than:

```bash
.. _faq-backend:
```

In addition, since underscores are widely used by Sphinx itself, use hyphens to separate words.
33.2.3 Referring to other code

To link to other methods, classes, or modules in Matplotlib you can use back ticks, for example:

`matplotlib.collections.LineCollection`

generates a link like this: `matplotlib.collections.LineCollection`.  

Note: We use the sphinx setting `default_role = 'obj'` so that you don't have to use qualifiers like `:class:`, `:func:`, `:meth:` and the likes.

Often, you don't want to show the full package and module name. As long as the target is unambiguous you can simply leave them out:

`.LineCollection`

and the link still works: `LineCollection`.

If there are multiple code elements with the same name (e.g. `plot()` is a method in multiple classes), you'll have to extend the definition:

`.pyplot.plot` or `.Axes.plot`

These will show up as `pyplot.plot` or `Axes.plot`. To still show only the last segment you can add a tilde as prefix:

`~.pyplot.plot` or `~.Axes.plot`

will render as `plot` or `plot`.

Other packages can also be linked via `intersphinx`:

`numpy.mean`

will return this link: `numpy.mean`. This works for Python, Numpy, Scipy, and Pandas (full list is in `doc/conf.py`). If external linking fails, you can check the full list of referenceable objects with the following commands:

```bash
python -m sphinx.ext.intersphinx 'https://docs.python.org/3/objects.inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/numpy/objects.inv'
python -m sphinx.ext.intersphinx 'https://docs.scipy.org/doc/scipy/reference/objects.inv'
python -m sphinx.ext.intersphinx 'https://pandas.pydata.org/pandas-docs/stable(objects.inv)'
```
33.2.4 Including figures and files

Image files can directly included in pages with the image:: directive. e.g., thirdpartypackages/index.rst displays the images for the third-party packages as static images:

```
.. image:: /_static/toolbar.png
```

as rendered on the page: Third party packages.

Files can be included verbatim. For instance the matplotlibrc file is important for customizing Matplotlib, and is included verbatim in the tutorial in Customizing Matplotlib with style sheets and rcParams:

```
.. literalinclude:: ../../_static/matplotlibrc
```

This is rendered at the bottom of Customizing Matplotlib with style sheets and rcParams. Note that this is in a tutorial; see Writing examples and tutorials below.

The examples directory is also copied to doc/gallery by sphinx-gallery, so plots from the examples directory can be included using

```
.. plot:: gallery/lines_bars_and_markers/simple_plot.py
```

Note that the python script that generates the plot is referred to, rather than any plot that is created. Sphinx-gallery will provide the correct reference when the documentation is built.

33.3 Writing docstrings

Most of the API documentation is written in docstrings. These are comment blocks in source code that explain how the code works.

**Note:** Some parts of the documentation do not yet conform to the current documentation style. If in doubt, follow the rules given here and not what you may see in the source code. Pull requests updating docstrings to the current style are very welcome.

All new or edited docstrings should conform to the numpydoc docstring guide. Much of the ReST syntax discussed above (Writing ReST pages) can be used for links and references. These docstrings eventually populate the doc/api directory and form the reference documentation for the library.
33.3.1 Example docstring

An example docstring looks like:

```python
def hlines(self, y, xmin, xmax, colors='k', linestyles='solid',
           label=' ', **kwargs):
    
    Plot horizontal lines at each *y* from *xmin* to *xmax*.

    Parameters
    ----------
    y : float or array-like
        y-indexes where to plot the lines.

    xmin, xmax : float or array-like
        Respective beginning and end of each line. If scalars are
        provided, all lines will have the same length.

    colors : array-like of colors, default: 'k'

    linestyles : {'solid', 'dashed', 'dashdot', 'dotted'}, default: 'solid'

    label : str, default: ''

    Returns
    -------
    lines : `~matplotlib.collections.LineCollection`

    Other Parameters
    ----------------
    **kwargs : `~matplotlib.collections.LineCollection` properties

    See also
    --------
    vlines : vertical lines
    axhline: horizontal line across the axes
```

See the `hlines` documentation for how this renders.

The Sphinx website also contains plenty of documentation concerning ReST markup and working with Sphinx in general.
### 33.3.2 Formatting conventions

The basic docstring conventions are covered in the [numpydoc docstring guide](https://numpydoc.readthedocs.io/en/latest/) and the [Sphinx documentation](https://sphinx-doc.org). Some Matplotlib-specific formatting conventions to keep in mind:

#### Quote positions

The quotes for single line docstrings are on the same line (pydocstyle D200):

```python
def get_linewidth(self):
    """Return the line width in points."""
```

The quotes for multi-line docstrings are on separate lines (pydocstyle D213):

```python
def set_linestyle(self, ls):
    """Set the linestyle of the line.

    [...]"""
```

#### Function arguments

Function arguments and keywords within docstrings should be referred to using the *emphasis* role. This will keep Matplotlib's documentation consistent with Python's documentation:

If *linestyles* is *None*, the default is 'solid'.

Do not use the `default role` or the `literal` role:

Neither `argument` nor `argument` should be used.

#### Quotes for strings

Matplotlib does not have a convention whether to use single-quotes or double-quotes. There is a mixture of both in the current code.

Use simple single or double quotes when giving string values, e.g.

If 'tight', try to figure out the tight bbox of the figure.

No ```'extra'``` literal quotes.
The use of extra literal quotes around the text is discouraged. While they slightly improve the rendered docs, they are cumbersome to type and difficult to read in plain-text docs.

**Parameter type descriptions**

The main goal for parameter type descriptions is to be readable and understandable by humans. If the possible types are too complex use a simplification for the type description and explain the type more precisely in the text.

Generally, the numpydoc docstring guide conventions apply. The following rules expand on them where the numpydoc conventions are not specific.

Use `float` for a type that can be any number.

Use `(float, float)` to describe a 2D position. The parentheses should be included to make the tuple-ness more obvious.

Use `array-like` for homogeneous numeric sequences, which could typically be a `numpy.array`. Dimensionality may be specified using `2D`, `3D`, `n-dimensional`. If you need to have variables denoting the sizes of the dimensions, use capital letters in brackets `(array-like (M, N))`. When referring to them in the text they are easier read and no special formatting is needed.

`float` is the implicit default dtype for `array-like`. For other dtypes use `array-like of int`.

Some possible uses:

```plaintext
2D array-like
array-like (N)
array-like (M, N)
array-like (M, N, 3)
array-like of int
```

Non-numeric homogeneous sequences are described as lists, e.g.:

```plaintext
list of str
list of `.Artist`
```

**Referencing types**

Generally, the rules from referring-to-other-code apply. More specifically:

Use full references `~matplotlib.colors.Normalize` with an abbreviation tilde in parameter types. While the full name helps the reader of plain text docstrings, the HTML does not need to show the full name as it links to it. Hence, the ~-shortening keeps it more readable.

Use abbreviated links `.Normalize` in the text.
Default values

As opposed to the numpydoc guide, parameters need not be marked as *optional* if they have a simple default:

- use `{name} : {type}, default: {val}` when possible.
- use `{name} : {type}, optional` and describe the default in the text if it cannot be explained sufficiently in the recommended manner.

The default value should provide semantic information targeted at a human reader. In simple cases, it restates the value in the function signature. If applicable, units should be added.

Prefer:

```
    interval : int, default: 1000ms
```

over:

```
    interval : int, default: 1000
```

If *None* is only used as a sentinel value for "parameter not specified", do not document it as the default. Depending on the context, give the actual default, or mark the parameter as optional if not specifying has no particular effect.

Prefer:

```
    dpi : float, default: :rc:`figure.dpi`
```

over:

```
    dpi : float, default: None
```

Prefer:

```
    textprops : dict, optional
    Dictionary of keyword parameters to be passed to the ``~matplotlib.text.Text`` instance contained inside TextArea.
```

over:

```
    textprops : dict, default: None
    Dictionary of keyword parameters to be passed to the ``~matplotlib.text.Text`` instance contained inside TextArea.
```

See also sections

Sphinx automatically links code elements in the definition blocks of *See also sections*. No need to use backticks there:
Wrapping parameter lists

Long parameter lists should be wrapped using a \ for continuation and starting on the new line without any indent (no indent because pydoc will parse the docstring and strip the line continuation so that indent would result in a lot of whitespace within the line):

```python
def add_axes(self, *args, **kwargs):
    ""
    ...

    Parameters
    ----------
    projection : {'aitoff', 'hammer', 'lambert', 'mollweide', 'polar', \'
    'rectilinear'}, optional
        The projection type of the axes.
    ...
    ""
```

Alternatively, you can describe the valid parameter values in a dedicated section of the docstring.

rcParams

rcParams can be referenced with the custom :rc: role: :rc:`foo` yields rcParams["foo"] = 'default', which is a link to the matplotlibrc file description.

33.3.3 Setters and getters

Artist properties are implemented using setter and getter methods (because Matplotlib predates the introductions of the property decorator in Python). By convention, these setters and getters are named set_PROPERTYNAME and get_PROPERTYNAME; the list of properties thusly defined on an artist and their values can be listed by the setp and getp functions.

The Parameters block of property setter methods is parsed to document the accepted values, e.g. the docstring of Line2D.set_linestyle starts with

```python
def set_linestyle(self, ls):
    ""
    Set the linestyle of the line.

    Parameters
    ----------
    ls : {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
    etc.
    ""
```
which results in the following line in the output of `plt.setp(line)` or `plt.setp(line, "linestyle")`:

```
linestyle or ls: {'-', '--', '-.', ':', '', (offset, on-off-seq), ...}
```

In some rare cases (mostly, setters which accept both a single tuple and an unpacked tuple), the accepted values cannot be documented in such a fashion; in that case, they can be documented as an .. ACCEPTS: block, e.g. for `axes.Axes.set_xlim`:

```python
def set_xlim(self, ...):
    ""
    Set the x-axis view limits.

    Parameters
    ----------
    left : float, optional
        The left xlim in data coordinates. Passing *None* leaves the
        limit unchanged.

        The left and right xlims may also be passed as the tuple
        (*left*, *right*) as the first positional argument (or as
        the *left* keyword argument).

        .. ACCEPTS: (bottom: float, top: float)

    right : float, optional
        etc.
    ""
```

Note that the leading .. makes the .. ACCEPTS: block a reST comment, hiding it from the rendered docs.

### 33.3.4 Keyword arguments

**Note:** The information in this section is being actively discussed by the development team, so use the docstring interpolation only if necessary. This section has been left in place for now because this interpolation is part of the existing documentation.

Since Matplotlib uses a lot of pass-through `**kwargs`, e.g., in every function that creates a line (`plot`, `semilogx`, `semilogy`, etc...), it can be difficult for the new user to know which `kwargs` are supported. Matplotlib uses a docstring interpolation scheme to support documentation of every function that takes a `**kwargs`. The requirements are:

1. single point of configuration so changes to the properties don't require multiple docstring edits.
2. as automated as possible so that as properties change, the docs are updated automatically.
The function `matplotlib.artist.kwdoc` and the decorator `matplotlib.docstring.dedent_interpd` facilitate this. They combine Python string interpolation in the docstring with the Matplotlib artist introspection facility that underlies `setp` and `getp`. The `kwdoc` function gives the list of properties as a docstring. In order to use this in another docstring, first update the `matplotlib.docstring.interpd` object, as seen in this example from `matplotlib.lines`:

```python
# in lines.py
docstring.interpd.update(Line2D=artist.kwdoc(Line2D))
```

Then in any function accepting `Line2D` pass-through `kwargs`, e.g., `matplotlib.axes.Axes.plot`:

```python
# in axes.py
@docstring.dedent_interpd
def plot(self, *args, **kwargs):
    """
    Some stuff omitted
    The kwargs are Line2D properties:
    %(Line2D_docstr)s
    kwars scalex and scaley, if defined, are passed on
to autoscale_view to determine whether the x and y axes are
autoscaled; default True. See Axes.autoscale_view for more
information
    """
```

Note there is a problem for `Artist __init__` methods, e.g., `matplotlib.patches.Patch.__init__`, which supports Patch `kwargs`, since the artist inspector cannot work until the class is fully defined and we can't modify the `Patch.__init__.__doc__` docstring outside the class definition. There are some some manual hacks in this case, violating the "single entry point" requirement above -- see the `docstring.interpd.update` calls in `matplotlib.patches`.

### 33.3.5 Inheriting docstrings

If a subclass overrides a method but does not change the semantics, we can reuse the parent docstring for the method of the child class. Python does this automatically, if the subclass method does not have a docstring.

Use a plain comment `# docstring inherited` to denote the intention to reuse the parent docstring. That way we do not accidentally create a docstring in the future:

```python
class A:
    def foo():
        """The parent docstring.""
        pass
```

(continues on next page)
class B(A):
    def foo():
        # docstring inherited
        pass

33.3.6 Adding figures

As above (see Including figures and files), figures in the examples gallery can be referenced with a :plot: directive pointing to the python script that created the figure. For instance the legend docstring references the file examples/text_labels_and_annotations/legend.py:

```python
###
...

Examples
-------

.. plot:: gallery/text_labels_and_annotations/legend.py
###
```

Note that examples/text_labels_and_annotations/legend.py has been mapped to gallery/text_labels_and_annotations/legend.py, a redirection that may be fixed in future re-organization of the docs.

Plots can also be directly placed inside docstrings. Details are in matplotlib.sphinxext.plot_directive. A short example is:

```python
###
...

Examples
-------

.. plot::
    :import: matplotlib.image as mpimg
    :import: matplotlib.pyplot as plt

    img = mpimg.imread('_static/stinkbug.png')
    imgplot = plt.imshow(img)
###
```

An advantage of this style over referencing an example script is that the code will also appear in interactive docstrings.
33.4 Writing examples and tutorials

Examples and tutorials are python scripts that are run by Sphinx Gallery to create a gallery of images in the /doc/gallery and /doc/tutorials directories respectively. To exclude an example from having an plot generated insert "sgskip" somewhere in the filename.

The format of these files is relatively straightforward. Properly formatted comment blocks are treated as ReST text, the code is displayed, and figures are put into the built page.

For instance the example /gallery/lines_bars_and_markers/simple_plot example is generated from /examples/lines_bars_and_markers/simple_plot.py, which looks like:

```python
"""
===========
Simple Plot
===========

Create a simple plot.
"""
import matplotlib.pyplot as plt
import numpy as np

# Data for plotting
 t = np.arange(0.0, 2.0, 0.01)
 s = 1 + np.sin(2 * np.pi * t)

# Note that using plt.subplots below is equivalent to using
# fig = plt.figure and then ax = fig.add_subplot(111)
 fig, ax = plt.subplots()
 ax.plot(t, s)

 ax.set(xlabel='time (s)', ylabel='voltage (mV)',
       title='About as simple as it gets, folks')
 ax.grid()
 plt.show()
```

The first comment block is treated as ReST text. The other comment blocks render as comments in /gallery/lines_bars_and_markers/simple_plot.

Tutorials are made with the exact same mechanism, except they are longer, and typically have more than one comment block (i.e. Usage Guide). The first comment block can be the same as the example above. Subsequent blocks of ReST text are delimited by a line of ### characters:

```python
"""
===========
Simple Plot
===========

(continues on next page)"""

(continues on next page)
In this way text, code, and figures are output in a "notebook" style.

33.4.1 Order of examples in the gallery

The order of the sections of the *Tutorials* and the gallery, as well as the order of the examples within each section are determined in a two step process from within the `/doc/sphinxext/gallery_order.py`:

- **Explicit order**: This file contains a list of folders for the section order and a list of examples for the subsection order. The order of the items shown in the doc pages is the order those items appear in those lists.

- **Implicit order**: If a folder or example is not in those lists, it will be appended after the explicitly ordered items and all of those additional items will be ordered by pathname (for the sections) or by filename (for the subsections).

As a consequence, if you want to let your example appear in a certain position in the gallery, extend those lists with your example. In case no explicit order is desired or necessary, still make sure to name your example consistently, i.e. use the main function or subject of the example as first word in the filename; e.g. an image example should ideally be named similar to `imshow_mynewexample.py`.

33.5 Miscellaneous

33.5.1 Adding animations

Animations are scraped automatically by Sphinx-gallery. If this is not desired, there is also a Matplotlib Google/Gmail account with username `mplgithub` which was used to setup the github account but can be used for other purposes, like hosting Google docs or Youtube videos. You can embed a Matplotlib animation in the docs by first saving the animation as a movie using `matplotlib.animation.Animation.save()`, and
then uploading to Matplotlib's Youtube channel and inserting the embedding string youtube provides like:

```html
.. raw:: html

    <iframe width="420" height="315"
    src="http://www.youtube.com/embed/32cjc6V0OZY"
    frameborder="0" allowfullscreen>
</iframe>
```

An example save command to generate a movie looks like this

```python
ani = animation.FuncAnimation(fig, animate, np.arange(1, len(y)),
                           interval=25, blit=True, init_func=init)

ani.save('double_pendulum.mp4', fps=15)
```

Contact Michael Droettboom for the login password to upload youtube videos of google docs to the mplgithub account.

### 33.5.2 Generating inheritance diagrams

Class inheritance diagrams can be generated with the `inheritance-diagram` directive. To use it, provide the directive with a number of class or module names (separated by whitespace). If a module name is provided, all classes in that module will be used. All of the ancestors of these classes will be included in the inheritance diagram.

A single option is available: `parts` controls how many of parts in the path to the class are shown. For example, if `parts == 1`, the class `matplotlib.patches.Patch` is shown as `Patch`. If `parts == 2`, it is shown as `patches.Patch`. If `parts == 0`, the full path is shown.

Example:

```ini
.. inheritance-diagram:: matplotlib.patches matplotlib.lines matplotlib.text
   :parts: 2
```
33.5.3 Emacs helpers

There is an emacs mode `rst.el` which automates many important ReST tasks like building and updating table-of-contents, and promoting or demoting section headings. Here is the basic `.emacs` configuration:

```
(requires 'rst)
(setq auto-mode-alist
      (append '(("\.txt$" . rst-mode)
                ("\.rst$" . rst-mode)
                ("\.rest$" . rst-mode)) auto-mode-alist))
```

Some helpful functions:

```
C-c TAB - rst-toc-insert

    Insert table of contents at point

C-c C-u - rst-toc-update

    Update the table of contents at point

C-c C-l rst-shift-region-left

    Shift region to the left
```

(continues on next page)
Shift region to the right
Matplotlib supports the addition of custom procedures that transform the data before it is displayed.

There is an important distinction between two kinds of transformations. Separable transformations, working on a single dimension, are called "scales", and non-separable transformations, that handle data in two or more dimensions at a time, are called "projections".

From the user's perspective, the scale of a plot can be set with `Axes.set_xscale` and `Axes.set_yscale`. Projections can be chosen using the `projection` keyword argument of functions that create Axes, such as `pyplot.subplot` or `pyplot.axes`, e.g.

```python
plt.subplot(projection="custom")
```

This document is intended for developers and advanced users who need to create new scales and projections for Matplotlib. The necessary code for scales and projections can be included anywhere: directly within a plot script, in third-party code, or in the Matplotlib source tree itself.

### 34.1 Creating a new scale

Adding a new scale consists of defining a subclass of `matplotlib.scale.ScaleBase`, that includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- A function to limit the range of the axis to acceptable values (`limit_range_for_scale()`). A log scale, for instance, would prevent the range from including values less than or equal to zero.
- Locators (major and minor) that determine where to place ticks in the plot, and optionally, how to adjust the limits of the plot to some "good" values. Unlike
limit_range_for_scale(), which is always enforced, the range setting here is only used when automatically setting the range of the plot.

- Formatters (major and minor) that specify how the tick labels should be drawn.

Once the class is defined, it must be registered with Matplotlib so that the user can select it.

A full-fledged and heavily annotated example is in /gallery/scales/custom_scale. There are also some classes in matplotlib.scale that may be used as starting points.

### 34.2 Creating a new projection

Adding a new projection consists of defining a projection axes which subclasses matplotlib.axes.Axes and includes the following elements:

- A transformation from data coordinates into display coordinates.
- An inverse of that transformation. This is used, for example, to convert mouse positions from screen space back into data space.
- Transformations for the gridlines, ticks and ticklabels. Custom projections will often need to place these elements in special locations, and Matplotlib has a facility to help with doing so.
- Setting up default values (overriding cla()), since the defaults for a rectilinear axes may not be appropriate.
- Defining the shape of the axes, for example, an elliptical axes, that will be used to draw the background of the plot and for clipping any data elements.
- Defining custom locators and formatters for the projection. For example, in a geographic projection, it may be more convenient to display the grid in degrees, even if the data is in radians.
- Set up interactive panning and zooming. This is left as an "advanced" feature left to the reader, but there is an example of this for polar plots in matplotlib.projections.polar.
- Any additional methods for additional convenience or features.

Once the projection axes is defined, it can be used in one of two ways:

- By defining the class attribute name, the projection axes can be registered with matplotlib.projections.register_projection() and subsequently simply invoked by name:

```python
plt.axes(projection='my_proj_name')
```

- For more complex, parameterisable projections, a generic "projection" object may be defined which includes the method _as_mpl_axes. _as_mpl_axes should take no arguments and return the projection's axes subclass and a dictionary of
additional arguments to pass to the subclass' `__init__` method. Subsequently a parameterised projection can be initialised with:

```python
plt.axes(projection=MyProjection(param1=param1_value))
```

where MyProjection is an object which implements a `_as_mpl_axes` method.

A full-fledged and heavily annotated example is in `/gallery/misc/custom_projection`. The polar plot functionality in `matplotlib.projections.polar` may also be of interest.

### 34.3 API documentation

- `matplotlib.scale`
- `matplotlib.projections`
- `matplotlib.projections.polar`
WORKING WITH *MATPLOTLIB* SOURCE CODE

Contents:

35.1 Introduction

These pages describe a *git* and *github* workflow for the *Matplotlib* project.

There are several different workflows here, for different ways of working with *Matplotlib*.

This is not a comprehensive *git* reference, it's just a workflow for our own project. It's tailored to the *github* hosting service. You may well find better or quicker ways of getting stuff done with *git*, but these should get you started.

For general resources for learning *git*, see *git resources*.

35.2 Install *git*

35.2.1 Overview

<table>
<thead>
<tr>
<th>Operating System</th>
<th>Command</th>
</tr>
</thead>
<tbody>
<tr>
<td>Debian / Ubuntu</td>
<td><code>sudo apt-get install git</code></td>
</tr>
<tr>
<td>Fedora</td>
<td><code>sudo yum install git</code></td>
</tr>
<tr>
<td>Windows</td>
<td>Download and install <em>msysGit</em></td>
</tr>
<tr>
<td>OS X</td>
<td>Use the <em>git-osx-installer</em></td>
</tr>
</tbody>
</table>
35.2.2 In detail

See the git page for the most recent information.

Have a look at the github install help pages available from github help

There are good instructions here: https://git-scm.com/book/en/v2/Getting-Started-Installing-Git

35.3 Following the latest source

These are the instructions if you just want to follow the latest Matplotlib source, but you don't need to do any development for now.

The steps are:

• Install git
  • get local copy of the Matplotlib github git repository
  • update local copy from time to time

35.3.1 Get the local copy of the code

From the command line:

```
git clone git://github.com/matplotlib/matplotlib.git
```

You now have a copy of the code tree in the new matplotlib directory.

35.3.2 Updating the code

From time to time you may want to pull down the latest code. Do this with:

```
cd matplotlib
git pull
```

The tree in matplotlib will now have the latest changes from the initial repository.
35.4 Making a patch

You've discovered a bug or something else you want to change in Matplotlib — excellent!
You've worked out a way to fix it — even better!
You want to tell us about it — best of all!
The easiest way is to make a patch or set of patches. Here we explain how. Making a patch is the simplest and quickest, but if you're going to be doing anything more than simple quick things, please consider following the Git for development model instead.

35.4.1 Making patches

Overview

```
# tell git who you are
git config --global user.email you@yourdomain.example.com
git config --global user.name "Your Name Comes Here"
# get the repository if you don't have it
git clone git://github.com/matplotlib/matplotlib.git
# make a branch for your patching
cd matplotlib
git branch the-fix-im-thinking-of
git checkout the-fix-im-thinking-of
# hack, hack, hack
# Tell git about any new files you've made
git add somewhere/tests/test_my_bug.py
# commit work in progress as you go
git commit -am 'BF - added tests for Funny bug'
# hack hack, hack

git commit -am 'BF - added fix for Funny bug'
# make the patch files
git format-patch -M -C master
```

Then, send the generated patch files to the Matplotlib mailing list — where we will thank you warmly.
In detail

1. Tell git who you are so it can label the commits you've made:

   ```bash
   git config --global user.email you@yourdomain.example.com
   git config --global user.name "Your Name Comes Here"
   ```

2. If you don't already have one, clone a copy of the Matplotlib repository:

   ```bash
   git clone git://github.com/matplotlib/matplotlib.git
   cd matplotlib
   ```

3. Make a 'feature branch'. This will be where you work on your bug fix. It's nice and safe and leaves you with access to an unmodified copy of the code in the main branch:

   ```bash
   git branch the-fix-im-thinking-of
   git checkout the-fix-im-thinking-of
   ```

4. Do some edits, and commit them as you go:

   ```bash
   # hack, hack, hack
   # Tell git about any new files you've made
   git add somewhere/tests/test_my_bug.py
   # commit work in progress as you go
   git commit -am 'BF - added tests for Funny bug'
   # hack hack, hack
   git commit -am 'BF - added fix for Funny bug'
   ```

   Note the -am options to commit. The m flag just signals that you're going to type a message on the command line. The a flag — you can just take on faith — or see why the -a flag?

5. When you have finished, check you have committed all your changes:

   ```bash
   git status
   ```

6. Finally, make your commits into patches. You want all the commits since you branched from the master branch:

   ```bash
   git format-patch -M -C master
   ```

   You will now have several files named for the commits:

   ```bash
   0001-BF-added-tests-for-Funny-bug.patch
   0002-BF-added-fix-for-Funny-bug.patch
   ```

   Send these files to the Matplotlib mailing list.

   When you are done, to switch back to the main copy of the code, just return to the master branch:
35.4.2 Moving from patching to development

If you find you have done some patches, and you have one or more feature branches, you will probably want to switch to development mode. You can do this with the repository you have.

Fork the Matplotlib repository on github — Making your own copy (fork) of Matplotlib. Then:

```bash
# checkout and refresh master branch from main repo
git checkout master
git pull origin master
# rename pointer to main repository to 'upstream'
git remote rename origin upstream
# point your repo to default read / write to your fork on github
git remote add origin git@github.com:your-user-name/matplotlib.git
# push up any branches you've made and want to keep
git push origin the-fix-im-thinking-of
```

Then you can, if you want, follow the Development workflow.

35.5 Git for development

Contents:

35.5.1 Making your own copy (fork) of Matplotlib

You need to do this only once. The instructions here are very similar to the instructions at https://help.github.com/forking/ — please see that page for more detail. We're repeating some of it here just to give the specifics for the Matplotlib project, and to suggest some default names.

Set up and configure a github account

If you don't have a github account, go to the github page, and make one.

You then need to configure your account to allow write access — see the Generating SSH keys help on github help.
Create your own forked copy of Matplotlib

1. Log into your github account.
2. Go to the Matplotlib github home at Matplotlib github.
3. Click on the fork button:

   ![Fork Button]

   Now, after a short pause, you should find yourself at the home page for your own forked copy of Matplotlib.

35.5.2 Set up your fork

First you follow the instructions for Making your own copy (fork) of Matplotlib.

Overview

```bash
git clone https://github.com/your-user-name/matplotlib.git
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

In detail

Clone your fork

1. Clone your fork to the local computer with `git clone https://github.com/your-user-name/matplotlib.git`
2. Investigate. Change directory to your new repo: `cd matplotlib`. Then `git branch -a` to show you all branches. You'll get something like:

   ```
   * master
   remotes/origin/master
   ```

   This tells you that you are currently on the master branch, and that you also have a remote connection to origin/master. What remote repository is remote/origin? Try `git remote -v` to see the URLs for the remote. They will point to your github fork.
Now you want to connect to the upstream Matplotlib github repository, so you can merge in changes from trunk.

**Linking your repository to the upstream repo**

```
cd matplotlib
git remote add upstream git://github.com/matplotlib/matplotlib.git
```

**upstream** here is just the arbitrary name we're using to refer to the main Matplotlib repository at Matplotlib github.

Note that we've used `git://` for the URL rather than `https://` or `git@`. The `git://` URL is read only. This means that we can't accidentally (or deliberately) write to the upstream repo, and we are only going to use it to merge into our own code.

Just for your own satisfaction, show yourself that you now have a new 'remote', with `git remote -v show`, giving you something like:

```
upstream git://github.com/matplotlib/matplotlib.git (fetch)
upstream git://github.com/matplotlib/matplotlib.git (push)
origin https://github.com/your-user-name/matplotlib.git (fetch)
origin https://github.com/your-user-name/matplotlib.git (push)
```

### 35.5.3 Configure git

**Overview**

Your personal git configurations are saved in the `.gitconfig` file in your home directory.

Here is an example `.gitconfig` file:

```
[user]
    name = Your Name
    email = you@yourdomain.example.com

[alias]
    ci = commit -a
    co = checkout
    st = status
    stat = status
    br = branch
    wdiff = diff --color-words

[core]
    editor = vim

[merge]
    summary = true
```
You can check what is already in your config file using the `git config --list` command. You can edit the `.gitconfig` file directly or you can use the `git config --global` command:

```
$ git config --global user.name "Your Name"
$ git config --global user.email you@yourdomain.example.com
$ git config --global alias.ci "commit -a"
$ git config --global alias.co checkout
$ git config --global alias.st "status -a"
$ git config --global alias.stat "status -a"
$ git config --global alias.br branch
$ git config --global alias.wdiff "diff --color-words"
$ git config --global core.editor vim
$ git config --global merge.summary true
```

To set up on another computer, you can copy your `~/.gitconfig` file, or run the commands above.

In detail

**user.name and user.email**

It is good practice to tell `git` who you are, for labeling any changes you make to the code. The simplest way to do this is from the command line:

```
$ git config --global user.name "Your Name"
$ git config --global user.email you@yourdomain.example.com
```

This will write the settings into your git configuration file, which should now contain a user section with your name and email:

```
[user]
    name = Your Name
    email = you@yourdomain.example.com
```

You'll need to replace `Your Name` and `you@yourdomain.example.com` with your actual name and email address.

**Aliases**

You might well benefit from some aliases to common commands.

For example, you might well want to be able to shorten `git checkout` to `git co`. Or you may want to alias `git diff --color-words` (which gives a nicely formatted output of the diff) to `git wdiff`

The following `git config --global` commands:

```
$ git config --global user.name "Your Name"
$ git config --global user.email you@yourdomain.example.com
```
git config --global alias.ci "commit -a"
git config --global alias.co checkout
git config --global alias.st "status -a"
git config --global alias.stat "status -a"
git config --global alias.br branch
git config --global alias.wdiff "diff --color-words"

will create an alias section in your .gitconfig file with contents like this:

```
[alias]
  ci = commit -a
  co = checkout
  st = status -a
  stat = status -a
  br = branch
  wdiff = diff --color-words
```

Editor

You may also want to make sure that your editor of choice is used

```
git config --global core.editor vim
```

Merging

To enforce summaries when doing merges (~/.gitconfig file again):

```
[merge]
  log = true
```

Or from the command line:

```
git config --global merge.log true
```

Fancy log output

This is a very nice alias to get a fancy log output; it should go in the alias section of your .gitconfig file:

```
lg = log --graph --pretty=format:'%Cred%h%Creset %C(yellow)%d%Creset %s %Cgreen(%cr) --%C(bold blue)(%an)%Creset' --abbrev-commit --date=relative
```

You use the alias with:

```
git lg
```
and it gives graph / text output something like this (but with color!):

```plaintext
* 6d8e1ee - (HEAD, origin/my-fancy-feature, my-fancy-feature) NF - a fancy file (45 minutes ago) [Matthew Brett]
* d304a73 - (origin/placement, placeholder) Merge pull request #46 from hhuuggoo/master (2 weeks ago) [Jonathan Terhorst]
| * 4aff2a8 - fixed bug 35, and added a test in test_bugfixes (2 weeks ago) [Hugo]
|/
* a7ff2e5 - Added notes on discussion/proposal made during Data Array Summit. (2 weeks ago) [Corran Webster]
* 68f6752 - Initial implementation of AxisIndexer - uses 'index_by' which needs to be changed to a call on an Axes object - this is all very sketchy right now. (2 weeks ago) [Corr]
* 376adbd - Merge pull request #46 from terhorst/master (2 weeks ago) [Jonathan Terhorst]
|\ |
* b605216 - updated joshu example to current api (3 weeks ago) [Jonathan Terhorst]
* 2e991e8 - add testing for outer ufunc (3 weeks ago) [Jonathan Terhorst]
* 7beda5a - prevent axis from throwing an exception if testing equality with non-axis object (3 weeks ago) [Jonathan Terhorst]
* 65af65e - convert unit testing code to assertions (3 weeks ago) [Jonathan Terhorst]
* 956fbb - Merge remote-tracking branch 'upstream/master' (3 weeks ago) [Jonathan Terhorst]
| |
```

Thanks to Yury V. Zaytsev for posting it.

### 35.5.4 Development workflow

You already have your own forked copy of the Matplotlib repository, by following *Making your own copy (fork) of Matplotlib*. You have Set up your fork. You have configured git by following *Configure git*. Now you are ready for some real work.

**Workflow summary**

In what follows we'll refer to the upstream Matplotlib master branch, as "trunk".

- Don't use your master branch for anything. Consider deleting it.
- When you are starting a new set of changes, fetch any changes from trunk, and start a new feature branch from that.
- Make a new branch for each separable set of changes — "one task, one branch" (ipython git workflow).
- Name your branch for the purpose of the changes - e.g. bugfix-for-issue-14 or refactor-database-code.
• If you can possibly avoid it, avoid merging trunk or any other branches into your feature branch while you are working.

• If you do find yourself merging from trunk, consider *Rebasing on trunk*.

• Ask on the Matplotlib mailing list if you get stuck.

• Ask for code review!

This way of working helps to keep work well organized, with readable history. This in turn makes it easier for project maintainers (that might be you) to see what you've done, and why you did it.

**Consider deleting your master branch**

It may sound strange, but deleting your own `master` branch can help reduce confusion about which branch you are on. See [deleting master on github](https://help.github.com/articles/what-happens-when-you-delete-a-branch/) for details.

**Update the mirror of trunk**

First make sure you have done *Linking your repository to the upstream repo*. From time to time you should fetch the upstream (trunk) changes from github:

```
$ git fetch upstream
```

This will pull down any commits you don't have, and set the remote branches to point to the right commit. For example, 'trunk' is the branch referred to by (remote/branchname) `upstream/master` - and if there have been commits since you last checked, `upstream/master` will change after you do the fetch.

**Make a new feature branch**

When you are ready to make some changes to the code, you should start a new branch. Branches that are for a collection of related edits are often called 'feature branches'. Making an new branch for each set of related changes will make it easier for someone reviewing your branch to see what you are doing.

Choose an informative name for the branch to remind yourself and the rest of us what the changes in the branch are for. For example add-ability-to-fly, or buxfix-for-issue-42.

```
# Update the mirror of trunk
$ git fetch upstream
# Make new feature branch starting at current trunk
$ git branch my-new-feature upstream/master
$ git checkout my-new-feature
```
Generally, you will want to keep your feature branches on your public github fork of Matplotlib. To do this, you git push this new branch up to your github repo. Generally (if you followed the instructions in these pages, and by default), git will have a link to your github repo, called origin. You push up to your own repo on github with:

```
git push origin my-new-feature
```

In git >= 1.7 you can ensure that the link is correctly set by using the `--set-upstream` option:

```
git push --set-upstream origin my-new-feature
```

From now on git will know that `my-new-feature` is related to the `my-new-feature` branch in the github repo.

**The editing workflow**

**Overview**

```
# hack hack
git add my_new_file
git commit -am 'NF - some message'
git push
```

**In more detail**

1. Make some changes
2. See which files have changed with `git status` (see `git status`). You'll see a listing like this one:

```
# On branch ny-new-feature
# Changed but not updated:
#   (use "git add <file>..." to update what will be committed)
#   (use "git checkout -- <file>..." to discard changes in working directory)
#   modified:   README
#
# Untracked files:
#   (use "git add <file>..." to include in what will be committed)
#   INSTALL
no changes added to commit (use "git add" and/or "git commit -a")
```

3. Check what the actual changes are with `git diff` (`git diff`).
4. Add any new files to version control `git add new_file_name` (see `git add`).
5. To commit all modified files into the local copy of your repo, do `git commit -am 'A commit message'`. Note the -am options to commit. The m flag just signals that you're going to type a message on the command line. The a flag — you can just take on faith — or see why the -a flag? — and the helpful use-case description in the tangled working copy problem. The `git commit` manual page might also be useful.

6. To push the changes up to your forked repo on github, do `git push` (see `git push`).

**Ask for your changes to be reviewed or merged**

When you are ready to ask for someone to review your code and consider a merge:

1. Go to the URL of your forked repo, say `https://github.com/your-user-name/matplotlib`.

2. Use the 'Switch Branches' dropdown menu near the top left of the page to select the branch with your changes:

3. Click on the 'Pull request' button:

Enter a title for the set of changes, and some explanation of what you've done. Say if there is anything you'd like particular attention for - like a complicated change or some code you are not happy with.

If you don't think your request is ready to be merged, just say so in your pull request message. This is still a good way of getting some preliminary code review.
Some other things you might want to do

Delete a branch on github

```
git checkout master
# delete branch locally
git branch -D my-unwanted-branch
# delete branch on github
git push origin :my-unwanted-branch
```

Note the colon : before my-unwanted-branch. See also: https://help.github.com/articles/pushing-to-a-remote/#deleting-a-remote-branch-or-tag

Several people sharing a single repository

If you want to work on some stuff with other people, where you are all committing into the same repository, or even the same branch, then just share it via github.

First fork Matplotlib into your account, as from Making your own copy (fork) of Matplotlib.

Then, go to your forked repository github page, say https://github.com/your-user-name/matplotlib

Click on the 'Admin' button, and add anyone else to the repo as a collaborator:

Now all those people can do:

```
git clone https://github.com/your-user-name/matplotlib.git
```

Remember that links starting with https or git@ are read-write, and that git@ uses the ssh protocol; links starting with git:// are read-only.

Your collaborators can then commit directly into that repo with the usual:

```
git commit -am 'ENH - much better code'
git push origin master # pushes directly into your repo
```
Explore your repository

To see a graphical representation of the repository branches and commits:

```
gitk --all
```

To see a linear list of commits for this branch:

```
git log
```

You can also look at the network graph visualizer for your github repo.

Finally the `Fancy log output 1g` alias will give you a reasonable text-based graph of the repository.

Rebasing on trunk

Let's say you thought of some work you'd like to do. You Update the mirror of trunk and Make a new feature branch called cool-feature. At this stage trunk is at some commit, let's call it E. Now you make some new commits on your cool-feature branch, let's call them A, B, C. Maybe your changes take a while, or you come back to them after a while. In the meantime, trunk has progressed from commit E to commit (say) G:

```
A---B---C cool-feature
  /
D---E---F---G trunk
```

At this stage you consider merging trunk into your feature branch, and you remember that this here page sternly advises you not to do that, because the history will get messy. Most of the time you can just ask for a review, and not worry that trunk has got a little ahead. But sometimes, the changes in trunk might affect your changes, and you need to harmonize them. In this situation you may prefer to do a rebase.

rebase takes your changes (A, B, C) and replays them as if they had been made to the current state of trunk. In other words, in this case, it takes the changes represented by A, B, C and replays them on top of G. After the rebase, your history will look like this:

```
A'--B'--C' cool-feature
  /
D---E---F---G trunk
```

See rebase without tears for more detail.

To do a rebase on trunk:

```
# Update the mirror of trunk
git fetch upstream
```

(continues on next page)
In this situation, where you are already on branch `cool-feature`, the last command can be written more succinctly as:

```
git rebase upstream/master
```

When all looks good you can delete your backup branch:

```
git branch -D tmp
```

If it doesn't look good you may need to have a look at *Recovering from mess-ups*. If you have made changes to files that have also changed in trunk, this may generate merge conflicts that you need to resolve - see the `git rebase` man page for some instructions at the end of the "Description" section. There is some related help on merging in the git user manual - see *resolving a merge*. 

**Recovering from mess-ups**

Sometimes, you mess up merges or rebases. Luckily, in git it is relatively straightforward to recover from such mistakes.

If you mess up during a rebase:

```
git rebase --abort
```

If you notice you messed up after the rebase:

```
# reset branch back to the saved point
git reset --hard tmp
```

If you forgot to make a backup branch:

```
# look at the reflog of the branch
git reflog show cool-feature

8630830 cool-feature@{0}: commit: BUG: io: close file handles immediately
278dd2a cool-feature@{1}: rebase finished: refs/heads/my-feature-branch onto
   11ee694744f2552d
26aa21a cool-feature@{2}: commit: BUG: lib: make seek_gzip_factory not leak gzip
...

# reset the branch to where it was before the botched rebase

git reset --hard cool-feature@{2}
```
Rewriting commit history

**Note:** Do this only for your own feature branches.

There's an embarrassing typo in a commit you made? Or perhaps the you made several false starts you would like the posterity not to see.

This can be done via *interactive rebasing*.

Suppose that the commit history looks like this:

```
git log --oneline
eadc391 Fix some remaining bugs
a815645 Modify it so that it works
2dec1ac Fix a few bugs + disable
13d7934 First implementation
6ad92e5 * masked is now an instance of a new object, MaskedConstant
29001ed Add pre-nep for a copule of structured_array_extensions.
...```

and 6ad92e5 is the last commit in the `cool-feature` branch. Suppose we want to make the following changes:

- Rewrite the commit message for 13d7934 to something more sensible.
- Combine the commits 2dec1ac, a815645, eadc391 into a single one.

We do as follows:

```
# make a backup of the current state
git branch tmp HEAD
# interactive rebase
git rebase -i 6ad92e5
```

This will open an editor with the following text in it:

```
pick 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
pick a815645 Modify it so that it works
pick eadc391 Fix some remaining bugs

# Rebase 6ad92e5..eadc391 onto 6ad92e5
#
# Commands:
# p, pick = use commit
# r, reword = use commit, but edit the commit message
# e, edit = use commit, but stop for amending
# s, squash = use commit, but meld into previous commit
# f, fixup = like "squash", but discard this commit's log message
#
# If you remove a line here THAT COMMIT WILL BE LOST.
```

(continues on next page)
To achieve what we want, we will make the following changes to it:

```
r 13d7934 First implementation
pick 2dec1ac Fix a few bugs + disable
f a815645 Modify it so that it works
f eadc391 Fix some remaining bugs
```

This means that (i) we want to edit the commit message for 13d7934, and (ii) collapse the last three commits into one. Now we save and quit the editor.

Git will then immediately bring up an editor for editing the commit message. After revising it, we get the output:

```
[detached HEAD 721fc64] FOO: First implementation
    2 files changed, 199 insertions(+), 66 deletions(-)
[detached HEAD 0f22701] Fix a few bugs + disable
    1 files changed, 79 insertions(+), 61 deletions(-)
Successfully rebased and updated refs/heads/my-feature-branch.
```

and the history looks now like this:

```
0f22701 Fix a few bugs + disable
721fc64 ENH: Sophisticated feature
6ad92e5 * masked is now an instance of a new object, MaskedConstant
```

If it went wrong, recovery is again possible as explained above.

### 35.5.5 Maintainer workflow

This page is for maintainers — those of us who merge our own or other peoples' changes into the upstream repository.

Being as how you're a maintainer, you are completely on top of the basic stuff in Development workflow.

The instructions in Linking your repository to the upstream repo add a remote that has read-only access to the upstream repo. Being a maintainer, you've got read-write access.

It's good to have your upstream remote have a scary name, to remind you that it's a read-write remote:

```
git remote add upstream-rw git@github.com:matplotlib/matplotlib.git
git fetch upstream-rw
```
Integrating changes

Let's say you have some changes that need to go into trunk (upstream-rw/master).

The changes are in some branch that you are currently on. For example, you are looking at someone's changes like this:

```
git remote add someone git://github.com/someone/matplotlib.git
git fetch someone
git branch cool-feature --track someone/cool-feature
git checkout cool-feature
```

So now you are on the branch with the changes to be incorporated upstream. The rest of this section assumes you are on this branch.

A few commits

If there are only a few commits, consider rebasing to upstream:

```
# Fetch upstream changes
git fetch upstream-rw
# rebase
git rebase upstream-rw/master
```

Remember that, if you do a rebase, and push that, you'll have to close any github pull requests manually, because github will not be able to detect the changes have already been merged.

A long series of commits

If there are a longer series of related commits, consider a merge instead:

```
git fetch upstream-rw
git merge --no-ff upstream-rw/master
```

The merge will be detected by github, and should close any related pull requests automatically.

Note the `--no-ff` above. This forces git to make a merge commit, rather than doing a fast-forward, so that these set of commits branch off trunk then rejoin the main history with a merge, rather than appearing to have been made directly on top of trunk.
Check the history

Now, in either case, you should check that the history is sensible and you have the right commits:

```bash
git log --oneline --graph
git log -p upstream-rw/master..
```

The first line above just shows the history in a compact way, with a text representation of the history graph. The second line shows the log of commits excluding those that can be reached from trunk (upstream-rw/master), and including those that can be reached from current HEAD (implied with the .. at the end). So, it shows the commits unique to this branch compared to trunk. The -p option shows the diff for these commits in patch form.

Push to trunk

```bash
git push upstream-rw my-new-feature:master
```

This pushes the my-new-feature branch in this repository to the master branch in the upstream-rw repository.

35.6 git resources

35.6.1 Tutorials and summaries

- [github help](#) has an excellent series of how-to guides.
- [The pro git book](#) is a good in-depth book on git.
- [A git cheat sheet](#) is a page giving summaries of common commands.
- [The git user manual](#)
- [The git tutorial](#)
- [The git community book](#)
- [git ready](#) — a nice series of tutorials
- [git magic](#) — extended introduction with intermediate detail
- [The git parable](#) is an easy read explaining the concepts behind git.
- [git foundation](#) expands on the git parable.
- Fernando Perez' git page — [Fernando's git page](#) — many links and tips
- [A good but technical page on git concepts](#)
• *git svn crash course*: git for those of us used to subversion

### 35.6.2 Advanced git workflow

There are many ways of working with git; here are some posts on the rules of thumb that other projects have come up with:

• Linus Torvalds on [*git management*](#)

• Linus Torvalds on [*linux git workflow*](#). Summary; use the git tools to make the history of your edits as clean as possible; merge from upstream edits as little as possible in branches where you are doing active development.

### 35.6.3 Manual pages online

You can get these on your own machine with (e.g) `git help push` or (same thing) `git push --help`, but, for convenience, here are the online manual pages for some common commands:

• *git add*

• *git branch*

• *git checkout*

• *git clone*

• *git commit*

• *git config*

• *git diff*

• *git log*

• *git pull*

• *git push*

• *git remote*

• *git status*

### 35.7 Two and three dots in difference specs

Thanks to Yarik Halchenko for this explanation.

Imagine a series of commits A, B, C, D... Imagine that there are two branches, *topic* and *master*. You branched *topic* off *master* when *master* was at commit 'E'. The graph of the commits looks like this:
Then:

```
$ git diff master..topic
```

will output the difference from G to C (i.e. with effects of F and G), while:

```
$ git diff master...topic
```

would output just differences in the topic branch (i.e. only A, B, and C).
PULL REQUEST GUIDELINES

Pull requests (PRs) are the mechanism for contributing to Matplotlib's code and documentation.

36.1 Summary for PR authors

Note:

- We value contributions from people with all levels of experience. In particular if this is your first PR not everything has to be perfect. We'll guide you through the PR process.

- Nevertheless, try to follow the guidelines below as well as you can to help make the PR process quick and smooth.

- Be patient with reviewers. We try our best to respond quickly, but we have limited bandwidth. If there is no feedback within a couple of days, please ping us by posting a comment to your PR.

When making a PR, pay attention to:

- Target the master branch.

- Adhere to the Coding guidelines.

- Update the documentation if necessary.

- Aim at making the PR as "ready-to-go" as you can. This helps to speed up the review process.

- It is ok to open incomplete or work-in-progress PRs if you need help or feedback from the developers. You may mark these as draft pull requests on GitHub.

- When updating your PR, instead of adding new commits to fix something, please consider amending your initial commit(s) to keep the history clean. You can achieve this using:
36.2 Summary for PR reviewers

**Note:**

- If you have commit rights, then you are trusted to use them. **Please help review and merge PRs!**
- Be patient and **kind** with contributors.

Content topics:

- Is the feature / bugfix reasonable?
- Does the PR conform with the Coding guidelines?
- Is the documentation (docstrings, examples, what's new, API changes) updated?

Organizational topics:

- Make sure all **automated tests** pass.
- The PR should target the master branch.
- Tag with descriptive **labels**.
- Set the **milestone**.
- Keep an eye on the **number of commits**.
- Approve if all of the above topics handled.
- **Merge** if a sufficient number of approvals is reached.

36.3 Detailed Guidelines

36.3.1 Documentation

- Every new feature should be documented. If it's a new module, don't forget to add a new rst file to the API docs.
- Each high-level plotting function should have a small example in the Examples section of the docstring. This should be as simple as possible to demonstrate the method. More complex examples should go into a dedicated example file.
in the examples directory, which will be rendered to the examples gallery in the documentation.

- Build the docs and make sure all formatting warnings are addressed.
- See Writing documentation for our documentation style guide.
- If your change is a major new feature, add an entry to doc/users/whats_new.rst.
- If you change the API in a backward-incompatible way, please document it in the relevant file in most recent doc/api/api_changes_X.Y.

### 36.3.2 Labels

- If you have the rights to set labels, tag the PR with descriptive labels. See the list of labels.

### 36.3.3 Milestones

- Set the milestone according to these rules:
  - *New features and API changes* are milestone for the next minor release v3.X.0.
  - *Bugfixes and docstring changes* are milestone for the next patch release v3.X.Y
  - *Documentation changes* (all .rst files and examples) are milestone v3.X-doc

If multiple rules apply, choose the first matching from the above list.

Setting a milestone does not imply or guarantee that a PR will be merged for that release, but if it were to be merged what release it would be in.

All of these PRs should target the master branch. The milestone tag triggers an automatic backport for milestones which have a corresponding branch.

### 36.3.4 Merging

- Documentation and examples may be merged by the first reviewer. Use the threshold "is this better than it was?" as the review criteria.

- For code changes (anything in src or lib) at least two core developers (those with commit rights) should review all pull requests. If you are the first to review a PR and approve of the changes use the GitHub approve review tool to mark it as such. If you are a subsequent reviewer please approve the review and if you think no more review is needed, merge the PR.

Ensure that all API changes are documented in the relevant file in the most recent doc/api/api_changes_X.Y and significant new features have an entry in doc/user/whats_new.
- If a PR already has a positive review, a core developer (e.g. the first reviewer, but not necessarily) may champion that PR for merging. In order to do so, they should ping all core devs both on GitHub and on the dev mailing list, and label the PR with the "Merge with single review?" label. Other core devs can then either review the PR and merge or reject it, or simply request that it gets a second review before being merged. If no one asks for such a second review within a week, the PR can then be merged on the basis of that single review.

A core dev should only champion one PR at a time and we should try to keep the flow of championed PRs reasonable.

• Do not self merge, except for 'small' patches to un-break the CI or when another reviewer explicitly allows it (ex, "Approve modulo CI passing, may self merge when green").

36.3.5 Automated tests

Whenever a pull request is created or updated, various automated test tools will run on all supported platforms and versions of Python.

• Make sure the Linting, Travis, AppVeyor, CircleCI, and Azure pipelines are passing before merging (All checks are listed at the bottom of the GitHub page of your pull request). Here are some tips for finding the cause of the test failure:
  
  - If Linting fails, you have a code style issue, which will be listed as annotations on the pull request's diff.
  
  - If a Travis or AppVeyor run fails, search the log for FAILURES. The subsequent section will contain information on the failed tests.
  
  - If CircleCI fails, likely you have some reStructuredText style issue in the docs. Search the CircleCI log for WARNING.
  
  - If Azure pipelines fail with an image comparison error, you can find the images as artifacts of the Azure job:

  * Click Details on the check on the GitHub PR page.

  * Click View more details on Azure Pipelines to go to Azure.

  * On the overview page artifacts are listed in the section Related.

• Codecov and LGTM are currently for information only. Their failure is not necessarily a blocker.

• tox is not used in the automated testing. It is supported for testing locally.
36.3.6 Number of commits and squashing

- Squashing is case-by-case. The balance is between burden on the contributor, keeping a relatively clean history, and keeping a history usable for bisecting. The only time we are really strict about it is to eliminate binary files (ex multiple test image re-generations) and to remove upstream merges.

- Do not let perfect be the enemy of the good, particularly for documentation or example PRs. If you find yourself making many small suggestions, either open a PR against the original branch, push changes to the contributor branch, or merge the PR and then open a new PR against upstream.

- If you push to a contributor branch leave a comment explaining what you did, ex "I took the liberty of pushing a small clean-up PR to your branch, thanks for your work.". If you are going to make substantial changes to the code or intent of the PR please check with the contributor first.

36.4 Branches and Backports

36.4.1 Current branches

The current active branches are

**master**

The current development version. Future minor releases (v3.N.0) will be branched from this. Supports Python 3.6+.

**v3.N.x**

Maintenance branch for Matplotlib 3.N. Future patch releases will be branched from this. Supports Python 3.6+.

**v3.N.M-doc**

Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.

**v2.2.x**

Maintenance branch for Matplotlib 2.2 LTS. Supports Python 2.7, 3.4+.

**v2.2.N-doc**

Documentation for the current release. On a patch release, this will be replaced by a properly named branch for the new release.
36.4.2 Branch selection for pull requests

Generally, all pull requests should target the master branch. Other branches are fed through automatic or manual. Directly targeting other branches is only rarely necessary for special maintenance work.

36.4.3 Backport strategy

We will always backport to the patch release branch (v3.N.x):

- critical bug fixes (segfault, failure to import, things that the user can not work around)
- fixes for regressions against the last two releases.

Everything else (regressions against older releases, bugs/api inconsistencies the user can work around in their code) are on a case-by-case basis, should be low-risk, and need someone to advocate for and shepherd through the backport.

The only changes to be backported to the documentation branch (v3.N.M-doc) are changes to doc, examples, or tutorials. Any changes to lib or src including docstring-only changes should not be backported to this branch.

36.4.4 Automated backports

We use meeseeksdev bot to automatically backport merges to the correct maintenance branch base on the milestone. To work properly the milestone must be set before merging. If you have commit rights, the bot can also be manually triggered after a merge by leaving a message `@meeseeksdev backport to BRANCH` on the PR. If there are conflicts meeseekdevs will inform you that the backport needs to be done manually.

The target branch is configured by putting `on-merge: backport to TARGETBRANCH` in the milestone description on it's own line.

If the bot is not working as expected, please report issues to Meeseeksdev.

36.4.5 Manual backports

When doing backports please copy the form used by meeseekdev, `Backport PR #XXXX: TITLE OF PR`. If you need to manually resolve conflicts make note of them and how you resolved them in the commit message.

We do a backport from master to v2.2.x assuming:

- matplotlib is a read-only remote branch of the matplotlib/matplotlib repo
The TARGET_SHA is the hash of the merge commit you would like to backport. This can be read off of the GitHub PR page (in the UI with the merge notification) or through the git CLI tools.

Assuming that you already have a local branch v2.2.x (if not, then `git checkout -b v2.2.x`), and that your remote pointing to https://github.com/matplotlib/matplotlib is called `upstream`:

```bash
git fetch upstream
git checkout v2.2.x  # or include -b if you don't already have this.
git reset --hard upstream/v2.2.x
git cherry-pick -m TARGET_SHA
# resolve conflicts and commit if required
```

Files with conflicts can be listed by `git status`, and will have to be fixed by hand (search on `>>>>>>`). Once the conflict is resolved, you will have to re-add the file(s) to the branch and then continue the cherry pick:

```bash
git add lib/matplotlib/conflicted_file.py
git add lib/matplotlib/conflicted_file2.py
git cherry-pick --continue
```

Use your discretion to push directly to upstream or to open a PR; be sure to push or PR against the v2.2.x upstream branch, not master!
This document is only relevant for Matplotlib release managers.
A guide for developers who are doing a Matplotlib release.

Note: This assumes that a read-only remote for the canonical repository is remote
and a read/write remote is DANGER

37.1 All Releases

37.1.1 Testing

We use Travis CI for continuous integration. When preparing for a release, the final
tagged commit should be tested locally before it is uploaded:

```
pytest -n 8 .
```

In addition the following test should be run and manually inspected:

```
python tools/memleak.py agg 1000 agg.pdf
```

In addition the following should be run and manually inspected, but is currently bro-
ken:

```
pushd examples/tests/
python backend_driver_sgskip.py
popd
```
37.1.2 GitHub Stats

We automatically extract GitHub issue, PRs, and authors from GitHub via the API. Copy the current doc/users/github_stats.rst to doc/users/prev_whats_new/github_stats_X.Y.Z.rst, changing the link target at the top of the file, and removing the "Previous GitHub Stats" section at the end.

For example, when updating from v3.2.0 to v3.2.1:

```bash
cp doc/users/github_stats.rst doc/users/prev_whats_new/github_stats_3.2.0.rst
$EDITOR doc/users/prev_whats_new/github_stats_3.2.0.rst
# Change contents as noted above.
git add doc/users/prev_whats_new/github_stats_3.2.0.rst
```

Then re-generate the updated stats:

```bash
python tools/github_stats.py --since-tag v3.2.0 --milestone=v3.2.1 --project 'matplotlib/matplotlib' --links > doc/users/github_stats.rst
```

Review and commit changes. Some issue/PR titles may not be valid reST (the most common issue is * which is interpreted as unclosed markup).

**Note:** Make sure you authenticate against the GitHub API. If you do not you will get blocked by GitHub for going over the API rate limits. You can authenticate in one of two ways:

- using the keyring package; pip install keyring and then when running the stats script, you will be prompted for user name and password, that will be stored in your system keyring, or,
- using a personal access token; generate a new token on this GitHub page with the repo:public_repo scope and place the token in ~/.ghoauth.

37.1.3 Update and Validate the Docs

**Merge *-doc branch**

Merge the most recent 'doc' branch (e.g., v3.2.0-doc) into the branch you are going to tag on and delete the doc branch on GitHub.
Update "What’s New" and "API changes"

Before tagging major and minor releases, the "what’s new" and "API changes" listings should be updated. This is not needed for micro releases.

For the "what's new",

1. copy the current content to a file in doc/users/prev_whats_new
2. merge all of the files in doc/users/next_whats_new/ into doc/users/whats_new.rst and delete the individual files
3. comment out the next what's new glob at the top

Similarly for the "API changes",

1. copy the current api changes to a file is doc/api/prev_api_changes
2. merge all of the files in the most recent doc/api/api_changes_X.Y into doc/api/ api_changes.rst
3. comment out the most recent API changes at the top.

In both cases step 3 will have to be un-done right after the release.

Verify that docs build

Finally, make sure that the docs build cleanly

```
make -Cdoc 0=-j$(nproc) html latexpdf
```

After the docs are built, check that all of the links, internal and external, are still valid. We use linkchecker for this, which has not been ported to Python3 yet. You will need to create a Python2 environment with requests==2.9.0 and linkchecker

```
conda create -p /tmp/lnkchk python=2 requests==2.9.0
source activate /tmp/lnkchk
pip install linkchecker
pushd doc/build/html
linkchecker index.html --check-extern
popd
```

Address any issues which may arise. The internal links are checked on Circle CI, this should only flag failed external links.
37.1.4 Create release commit and tag

To create the tag, first create an empty commit with a very terse set of the release notes in the commit message

```
git commit --allow-empty
```

and then create a signed, annotated tag with the same text in the body message

```
git tag -a -s v2.0.0
```

which will prompt you for your GPG key password and an annotation. For pre releases it is important to follow PEP 440 so that the build artifacts will sort correctly in PyPI.

To prevent issues with any down-stream builders which download the tarball from GitHub it is important to move all branches away from the commit with the tag\(^1\):

```
git commit --allow-empty
```

Finally, push the tag to GitHub:

```
git push DANGER master v2.0.0
```

Congratulations, the scariest part is done!

If this is a final release, also create a 'doc' branch (this is not done for pre-releases):

```
git branch v2.0.0-doc
```

```
git push DANGER v2.0.0-doc
```

and if this is a major or minor release, also create a bug-fix branch (a micro release will be cut from this branch):

```
git branch v2.0.x
```

On this branch un-comment the globs from Update and Validate the Docs. And then

```
git push DANGER v2.0.x
```

\(^1\) The tarball that is provided by GitHub is produced using `git archive`. We use versioneer which uses a format string in `lib/matplotlib/_version.py` to have git insert a list of references to exported commit (see `.gitattributes` for the configuration). This string is then used by versioneer to produce the correct version, based on the git tag, when users install from the tarball. However, if there is a branch pointed at the tagged commit, then the branch name will also be included in the tarball. When the branch eventually moves, anyone how checked the hash of the tarball before the branch moved will have an incorrect hash.

To generate the file that GitHub does use

```
git archive v2.0.0 -o matplotlib-2.0.0.tar.gz --prefix=matplotlib-2.0.0/
```
37.1.5 Release Management / DOI

Via the GitHub UI, turn the newly pushed tag into a release. If this is a pre-release remember to mark it as such.

For final releases, also get the DOI from zenodo (which will automatically produce one once the tag is pushed). Add the doi post-fix and version to the dictionary in tools/cache_zenodo_svg.py and run the script.

This will download the new svg to the _static directory in the docs and edit doc/citing.rst. Commit the new svg, the change to tools/cache_zenodo_svg.py, and the changes to doc/citing.rst to the VER-doc branch and push to GitHub.

```
git checkout v2.0.0-doc
$EDITOR tools/cache_zenodo_svg.py
python tools/cache_zenodo_svg.py
$EDITOR doc/citing.html
git commit -a
git push DANGER v2.0.0-doc:v2.0.0-doc
```

37.1.6 Building binaries

We distribute macOS, Windows, and many Linux wheels as well as a source tarball via PyPI. Most builders should trigger automatically once the tag is pushed to GitHub:

- Mac and manylinux wheels are built on Travis CI. Builds are triggered by the GitHub Action defined in .github/workflows/wheels.yml, and wheels will be available at the site defined in the matplotlib-wheels repo.
- Windows wheels are built by Christoph Gohlke automatically and will be available at his site once built.
- The auto-tick bot should open a pull request into the conda-forge feedstock. Review and merge (if you have the power to).

**Warning:** Because this is automated, it is extremely important to bump all branches away from the tag as discussed in *Create release commit and tag*.

If this is a final release the following downstream packagers should be contacted:

- Debian
- Fedora
- Arch
- Gentoo
- Macports
- Homebrew
• Continuum
• Enthought

This can be done ahead of collecting all of the binaries and uploading to pypi.

37.1.7 Make distribution and upload to PyPI

Once you have collected all of the wheels (expect this to take about a day), generate the tarball

```
git checkout v2.0.0
git clean -xfd
python setup.py sdist
```

and copy all of the wheels into dist directory. First, check that the dist files are OK

```
twine check dist/*
```

and then use twine to upload all of the files to pypi

```
twine upload -s dist/matplotlib*tar.gz
twine upload dist/*whl
```

Congratulations, you have now done the second scariest part!

37.1.8 Build and Deploy Documentation

To build the documentation you must have the tagged version installed, but build the docs from the ver-doc branch. An easy way to arrange this is:

```
pip install matplotlib
pip install -r requirements/doc/doc-requirements.txt
git checkout v2.0.0-doc
git clean -xfd
make -Cdoc O=-j${nproc} html latexpdf LATEXMKOPTS="-silent -f"
```

which will build both the html and pdf version of the documentation.

The built documentation exists in the matplotlib.github.com repository. Pushing changes to master automatically updates the website.

The documentation is organized by version. At the root of the tree is always the documentation for the latest stable release. Under that, there are directories containing the documentation for older versions. The documentation for current master is built on Circle CI and pushed to the devdocs repository. These are available at matplotlib.org/devdocs.

Assuming you have this repository checked out in the same directory as matplotlib
which will copy the built docs over. If this is a final release, also replace the top-level docs

```
rsync -a 2.0.0/* ./
```

You will need to manually edit `versions.html` to show the last 3 tagged versions. Now commit and push everything to GitHub

```
git add *
git commit -a -m 'Updating docs for v2.0.0'
git push DANGER master
```

Congratulations you have now done the third scariest part!

If you have access, clear the Cloudflare caches.

It typically takes about 5-10 minutes for GitHub to process the push and update the live web page (remember to clear your browser cache).

### 37.1.9 Announcing

The final step is to announce the release to the world. A short version of the release notes along with acknowledgments should be sent to

- matplotlib-users@python.org
- matplotlib-devel@python.org
- matplotlib-announce@python.org

For final releases announcements should also be sent to the numpy/scipy/scikit-image mailing lists.

In addition, announcements should be made on social networks (twitter via the @matplotlib account, any other via personal accounts). NumFOCUS should be contacted for inclusion in their newsletter.
MINIMUM VERSION OF DEPENDENCIES POLICY

For the purpose of this document, 'minor version' is in the sense of SemVer (major, minor, patch) and includes both major and minor releases. For projects that use date-based versioning, every release is a 'minor version'.

Matplotlib follows NEP 29.

38.1 Python and NumPy

Matplotlib supports:

- All minor versions of Python released 42 months prior to the project, and at minimum the two latest minor versions.
- All minor versions of numpy released in the 24 months prior to the project, and at minimum the last three minor versions.

In setup.py, the python_requires variable should be set to the minimum supported version of Python. All supported minor versions of Python should be in the test matrix and have binary artifacts built for the release.

Minimum Python and NumPy version support should be adjusted upward on every major and minor release, but never on a patch release.

See also the List of dependency versions.

38.2 Python Dependencies

For Python dependencies we should support at least:

with compiled extensions

    minor versions initially released in the 24 months prior to our planned release date or the oldest that support our minimum Python + NumPy

without complied extensions
minor versions initially released in the 12 months prior to our planned release
date or the oldest that supports our minimum Python.

We will only bump these dependencies as we need new features or the old versions
no longer support our minimum NumPy or Python.

### 38.3 Test and Documentation Dependencies

As these packages are only needed for testing or building the docs and not needed
by end-users, we can be more aggressive about dropping support for old versions.
However, we need to be careful to not over-run what down-stream packagers support
(as most of the run the tests and build the documentation as part of the packaging
process).

We will support at least minor versions of the development dependencies released in
the 12 months prior to our planned release.

We will only bump these as needed or versions no longer support our minimum Python
and numpy.

### 38.4 System and C-dependencies

For system or C-dependencies (FreeType, GUI frameworks, LaTeX, Ghostscript, FFm-
peg) support as old as practical. These can be difficult to install for end-users and we
want to be usable on as many systems as possible. We will bump these on a case-by-

### 38.5 List of dependency versions

The following list shows the minimal versions of Python and NumPy dependencies
for different versions of Matplotlib. Follow the links for the full specification of the
dependencies.

MATPLOTLIB ENHANCEMENT PROPOSALS

Matplotlib Enhancement Proposals (MEP), inspired by cpython’s PEP’s but less formal, are design documents for large or controversial changes to Matplotlib. These documents should provide a discussion of both why and how the changes should be made.

To create a new MEP open a pull request (PR) adding a file based on the template to this the MEP directory. For the initial PR only a rough description is required and it should be merged quickly. Further detailed discussion can happen in follow on PRs.

39.1 MEP Template

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Alternatives

This MEP template is a guideline of the sections that a MEP should contain. Extra sections may be added if appropriate, and unnecessary sections may be noted as such.
39.1.1 Status

MEPs go through a number of phases in their lifetime:

- **Discussion**: The MEP is being actively discussed on the mailing list and it is being improved by its author. The mailing list discussion of the MEP should include the MEP number (MEPxxx) in the subject line so they can be easily related to the MEP.
- **Progress**: Consensus was reached and implementation work has begun.
- **Completed**: The implementation has been merged into master.
- **Superseded**: This MEP has been abandoned in favor of another approach.
- **Rejected**: There are currently no plans to implement the proposal.

39.1.2 Branches and Pull requests

All development branches containing work on this MEP should be linked to from here. All pull requests submitted relating to this MEP should be linked to from here. (A MEP does not need to be implemented in a single pull request if it makes sense to implement it in discrete phases).

39.1.3 Abstract

The abstract should be a short description of what the MEP will achieve.

39.1.4 Detailed description

This section describes the need for the MEP. It should describe the existing problem that it is trying to solve and why this MEP makes the situation better. It should include examples of how the new functionality would be used and perhaps some use cases.

39.1.5 Implementation

This section lists the major steps required to implement the MEP. Where possible, it should be noted where one step is dependent on another, and which steps may be optionally omitted. Where it makes sense, each step should include a link related pull requests as the implementation progresses.
39.1.6 Backward compatibility

This section describes the ways in which the MEP breaks backward incompatibility.

39.1.7 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

39.2 MEP8: PEP8

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
- **Implementation**
- **Backward compatibility**
- **Alternatives**

39.2.1 Status

**Completed**

We are currently enforcing a sub-set of pep8 on new code contributions.

39.2.2 Branches and Pull requests

None so far.
39.2.3 Abstract

The matplotlib codebase predates PEP8, and therefore is less than consistent style-wise in some areas. Bringing the codebase into compliance with PEP8 would go a long way to improving its legibility.

39.2.4 Detailed description

Some files use four space indentation, some use three. Some use different levels in the same file.

For the most part, class/function/variable naming follows PEP8, but it wouldn't hurt to fix where necessary.

39.2.5 Implementation

The implementation should be fairly mechanical: running the pep8 tool over the code and fixing where appropriate.

This should be merged in after the 2.0 release, since the changes will likely make merging any pending pull requests more difficult.

Additionally, and optionally, PEP8 compliance could be tracked by an automated build system.

39.2.6 Backward compatibility

Public names of classes and functions that require change (there shouldn't be many of these) should first be deprecated and then removed in the next release cycle.

39.2.7 Alternatives

PEP8 is a popular standard for Python code style, blessed by the Python core developers, making any alternatives less desirable.

39.3 MEP9: Global interaction manager

- Status
- Branches and Pull requests
- Abstract
Add a global manager for all user interactivity with artists; make any artist resizeable, moveable, highlightable, and selectable as desired by the user.

39.3.1 Status

Discussion

39.3.2 Branches and Pull requests

https://github.com/dhyams/matplotlib/tree/MEP9

39.3.3 Abstract

The goal is to be able to interact with matplotlib artists in a very similar way as drawing programs do. When appropriate, the user should be able to move, resize, or select an artist that is already on the canvas. Of course, the script writer is ultimately in control of whether an artist is able to be interacted with, or whether it is static.

This code to do this has already been privately implemented and tested, and would need to be migrated from its current "mixin" implementation, to a bona-fide part of matplotlib.

The end result would be to have four new keywords available to matplotlib.artist.Artist: _moveable_, _resizeable_, _selectable_, and _highlightable_. Setting any one of these keywords to True would activate interactivity for that artist.

In effect, this MEP is a logical extension of event handling in matplotlib; matplotlib already supports "low level" interactions like left mouse presses, a key press, or similar. The MEP extends the support to the logical level, where callbacks are performed on the artists when certain interactive gestures from the user are detected.
39.3.4 Detailed description

This new functionality would be used to allow the end-user to better interact with the graph. Many times, a graph is almost what the user wants, but a small repositioning and/or resizing of components is necessary. Rather than force the user to go back to the script to trial-and-error the location, and simple drag and drop would be appropriate.

Also, this would better support applications that use matplotlib; here, the end-user has no reasonable access or desire to edit the underlying source in order to fine-tune a plot. Here, if matplotlib offered the capability, one could move or resize artists on the canvas to suit their needs. Also, the user should be able to highlight (with a mouse over) an artist, and select it with a double-click, if the application supports that sort of thing. In this MEP, we also want to support the highlighting and selection natively; it is up to application to handle what happens when the artist is selected. A typical handling would be to display a dialog to edit the properties of the artist.

In the future, as well (this is not part of this MEP), matplotlib could offer backend-specific property dialogs for each artist, which are raised on artist selection. This MEP would be a necessary stepping stone for that sort of capability.

There are currently a few interactive capabilities in matplotlib (e.g. legend.draggable()), but they tend to be scattered and are not available for all artists. This MEP seeks to unify the interactive interface and make it work for all artists.

The current MEP also includes grab handles for resizing artists, and appropriate boxes drawn when artists are moved or resized.

39.3.5 Implementation

- Add appropriate methods to the "tree" of artists so that the interactivity manager has a consistent interface for the interactivity manager to deal with. The proposed methods to add to the artists, if they are to support interactivity, are:
  - get_pixel_position_ll(self): get the pixel position of the lower left corner of the artist's bounding box
  - get_pixel_size(self): get the size of the artist's bounding box, in pixels
  - set_pixel_position_and_size(self,x,y,dx,dy): set the new size of the artist, such that it fits within the specified bounding box.

- add capability to the backends to 1) provide cursors, since these are needed for visual indication of moving/resizing, and 2) provide a function that gets the current mouse position

- Implement the manager. This has already been done privately (by dhyams) as a mixin, and has been tested quite a bit. The goal would be to move the functionality of the manager into the artists so that it is in matplotlib properly, and not as a "monkey patch" as I currently have it coded.
39.3.6 Current summary of the mixin

(Note that this mixin is for now just private code, but can be added to a branch obviously)

InteractiveArtistMixin:

Mixin class to make any generic object that is drawn on a matplotlib canvas moveable and possibly resizeable. The Powerpoint model is followed as closely as possible; not because I’m enamoured with Powerpoint, but because that’s what most people understand. An artist can also be selectable, which means that the artist will receive the on_activated() callback when double clicked. Finally, an artist can be highlightable, which means that a highlight is drawn on the artist whenever the mouse passes over. Typically, highlightable artists will also be selectable, but that is left up to the user.

So, basically there are four attributes that can be set by the user on a per-artist basis:

- highlightable
- selectable
- moveable
- resizeable

To be moveable (draggable) or resizeable, the object that is the target of the mixin must support the following protocols:

- get_pixel_position_ll(self)
- get_pixel_size(self)
- set_pixel_position_and_size(self,x,y,sx,sy)

Note that nonresizeable objects are free to ignore the sx and sy parameters. To be highlightable, the object that is the target of the mixin must also support the following protocol:

- get_highlight(self)

Which returns a list of artists that will be used to draw the highlight.

If the object that is the target of the mixin is not an matplotlib artist, the following protocols must also be implemented. Doing so is usually fairly trivial, as there has to be an artist somewhere that is being drawn. Typically your object would just route these calls to that artist.

- get_figure(self)
- get_axes(self)
- contains(self,event)
- set_animated(self,flag)
- draw(self,renderer)
- get_visible(self)
The following notifications are called on the artist, and the artist can optionally implement these:

- `on_select_begin(self)`
- `on_select_end(self)`
- `on_drag_begin(self)`
- `on_drag_end(self)`
- `on_activated(self)`
- `on_highlight(self)`
- `on_right_click(self, event)`
- `on_left_click(self, event)`
- `on_middle_click(self, event)`
- `on_context_click(self, event)`
- `on_key_up(self, event)`
- `on_key_down(self, event)`

The following notifications are called on the canvas, if no interactive artist handles the event:

- `on_press(self, event)`
- `on_left_click(self, event)`
- `on_middle_click(self, event)`
- `on_right_click(self, event)`
- `on_context_click(self, event)`
- `on_key_up(self, event)`
- `on_key_down(self, event)`

The following functions, if present, can be used to modify the behavior of the interactive object:

- `press_filter(self, event)`  # determines if the object wants to have the press event routed to it
- `handle_unpicked_cursor()`  # can be used by the object to set a cursor as the cursor passes over the object when it is unpicked.

Supports multiple canvases, maintaining a drag lock, motion notifier, and a global "enabled" flag per canvas. Supports fixed aspect ratio resizings by holding the shift key during the resize.

Known problems:
• Zorder is not obeyed during the selection/drag operations. Because of the blit technique used, I do not believe this can be fixed. The only way I can think of is to search for all artists that have a zorder greater than me, set them all to animated, and then redraw them all on top during each drag refresh. This might be very slow; need to try.

• the mixin only works for wx backends because of two things: 1) the cursors are hardcoded, and 2) there is a call to wx.GetMousePosition() Both of these shortcomings are reasonably fixed by having each backend supply these things.

39.3.7 Backward compatibility

No problems with backward compatibility, although once this is in place, it would be appropriate to obsolete some of the existing interactive functions (like legend.draggable())

39.3.8 Alternatives

None that I know of.

39.4 MEP10: Docstring consistency

- Status
- Branches and Pull requests
- Abstract
- Detailed description
  - Numpy docstring format
  - Cross references
  - Overriding signatures
  - Linking rather than duplicating
  - autosummary extension
  - Examples linking to relevant documentation
  - Documentation using help() vs. a browser
- Implementation
- Backward compatibility
- Alternatives
39.4.1 Status

Progress

This is still an on-going effort

39.4.2 Branches and Pull requests

39.4.3 Abstract

matplotlib has a great deal of inconsistency between docstrings. This not only makes the docs harder to read, but it is harder on contributors, because they don't know which specifications to follow. There should be a clear docstring convention that is followed consistently.

The organization of the API documentation is difficult to follow. Some pages, such as pyplot and axes, are enormous and hard to browse. There should instead be short summary tables that link to detailed documentation. In addition, some of the docstrings themselves are quite long and contain redundant information.

Building the documentation takes a long time and uses a `make.py` script rather than a Makefile.

39.4.4 Detailed description

There are number of new tools and conventions available since matplotlib started using Sphinx that make life easier. The following is a list of proposed changes to docstrings, most of which involve these new features.

Numpy docstring format

Numpy docstring format: This format divides the docstring into clear sections, each having different parsing rules that make the docstring easy to read both as raw text and as HTML. We could consider alternatives, or invent our own, but this is a strong choice, as it's well used and understood in the Numpy/Scipy community.

Cross references

Most of the docstrings in matplotlib use explicit "roles" when linking to other items, for example: `:func:`myfunction`. As of Sphinx 0.4, there is a "default role" that can be set to "obj", which will polymorphically link to a Python object of any type. This allows one to write `myfunction` instead. This makes docstrings much easier to read and edit as raw text. Additionally, Sphinx allows for setting a current module, so links like `~matplotlib.axes.Axes.set_xlim` could be written as `~axes.Axes.set_xlim`. 
Overriding signatures

Many methods in matplotlib use the *args and **kwargs syntax to dynamically handle the keyword arguments that are accepted by the function, or to delegate on to another function. This, however, is often not useful as a signature in the documentation. For this reason, many matplotlib methods include something like:

```
def annotate(self, *args, **kwargs):
    """
    Create an annotation: a piece of text referring to a data point.
    
    Call signature:
    
    annotate(s, xy, xytext=None, xycoords='data',
              textcoords='data', arrowprops=None, **kwargs)
    """
```

This can't be parsed by Sphinx, and is rather verbose in raw text. As of Sphinx 1.1, if the autodoc_docstring_signature config value is set to True, Sphinx will extract a replacement signature from the first line of the docstring, allowing this:

```
def annotate(self, *args, **kwargs):
    """
    annotate(s, xy, xytext=None, xycoords='data',
              textcoords='data', arrowprops=None, **kwargs)
    """
    Create an annotation: a piece of text referring to a data point.
    """
```

The explicit signature will replace the actual Python one in the generated documentation.

Linking rather than duplicating

Many of the docstrings include long lists of accepted keywords by interpolating things into the docstring at load time. This makes the docstrings very long. Also, since these tables are the same across many docstrings, it inserts a lot of redundant information in the docs -- particularly a problem in the printed version.

These tables should be moved to docstrings on functions whose only purpose is for help. The docstrings that refer to these tables should link to them, rather than including them verbatim.
The Sphinx autosummary extension should be used to generate summary tables, that link to separate pages of documentation. Some classes that have many methods (e.g. Axes) should be documented with one method per page, whereas smaller classes should have all of their methods together.

**Examples linking to relevant documentation**

The examples, while helpful at illustrating how to use a feature, do not link back to the relevant docstrings. This could be addressed by adding module-level docstrings to the examples, and then including that docstring in the parsed content on the example page. These docstrings could easily include references to any other part of the documentation.

**Documentation using help() vs. a browser**

Using Sphinx markup in the source allows for good-looking docs in your browser, but the markup also makes the raw text returned using help() look terrible. One of the aims of improving the docstrings should be to make both methods of accessing the docs look good.

**39.4.5 Implementation**

1. The numpydoc extensions should be turned on for matplotlib. There is an important question as to whether these should be included in the matplotlib source tree, or used as a dependency. Installing Numpy is not sufficient to get the numpydoc extensions -- it's a separate install procedure. In any case, to the extent that they require customization for our needs, we should endeavor to submit those changes upstream and not fork them.

2. Manually go through all of the docstrings and update them to the new format and conventions. Updating the cross references (from `:func:`myfunc` to `func`) may be able to be semi-automated. This is a lot of busy work, and perhaps this labor should be divided on a per-module basis so no single developer is over-burdened by it.

3. Reorganize the API docs using autosummary and sphinx-autogen. This should hopefully have minimal impact on the narrative documentation.

4. Modify the example page generator (`gen_rst.py`) so that it extracts the module docstring from the example and includes it in a non-literal part of the example page.

5. Use `sphinx-quickstart` to generate a new-style Sphinx Makefile. The following features in the current `make.py` will have to be addressed in some other way:
• Copying of some static content
• Specifying a "small" build (only low-resolution PNG files for examples)

Steps 1, 2, and 3 are interdependent. 4 and 5 may be done independently, though 5 has some dependency on 3.

### 39.4.6 Backward compatibility

As this mainly involves docstrings, there should be minimal impact on backward compatibility.

### 39.4.7 Alternatives

None yet discussed.

### 39.5 MEP11: Third-party dependencies

- **Status**
- **Branches and Pull requests**
- **Abstract**
- **Detailed description**
  - **Current behavior**
  - **Desired behavior**
- **Implementation**
- **Backward compatibility**
- **Alternatives**

This MEP attempts to improve the way in which third-party dependencies in matplotlib are handled.
39.5.1 Status

Completed -- needs to be merged

39.5.2 Branches and Pull requests

#1157: Use automatic dependency resolution
#1290: Debundle pyparsing
#1261: Update six to 1.2

39.5.3 Abstract

One of the goals of matplotlib has been to keep it as easy to install as possible. To that end, some third-party dependencies are included in the source tree and, under certain circumstances, installed alongside matplotlib. This MEP aims to resolve some problems with that approach, bring some consistency, while continuing to make installation convenient.

At the time that was initially done, setuptools, easy_install and PyPI were not mature enough to be relied on. However, at present, we should be able to safely leverage the "modern" versions of those tools, distribute and pip.

While matplotlib has dependencies on both Python libraries and C/C++ libraries, this MEP addresses only the Python libraries so as to not confuse the issue. C libraries represent a larger and mostly orthogonal set of problems.

39.5.4 Detailed description

matplotlib depends on the following third-party Python libraries:

- Numpy
- dateutil (pure Python)
- pytz (pure Python)
- six -- required by dateutil (pure Python)
- pyparsing (pure Python)
- PIL (optional)
- GUI frameworks: pygtk, gobject, tkinter, PySide, PyQt4, wx (all optional, but one is required for an interactive GUI)
Current behavior

When installing from source, a git checkout or pip:

- setup.py attempts to import numpy. If this fails, the installation fails.
- For each of dateutil, pytz and six, setup.py attempts to import them (from the top-level namespace). If that fails, matplotlib installs its local copy of the library into the top-level namespace.
- pyparsing is always installed inside of the matplotlib namespace.

This behavior is most surprising when used with pip, because no pip dependency resolution is performed, even though it is likely to work for all of these packages.

The fact that pyparsing is installed in the matplotlib namespace has reportedly (#1290) confused some users into thinking it is a matplotlib-related module and import it from there rather than the top-level.

When installing using the Windows installer, dateutil, pytz and six are installed at the top-level always, potentially overwriting already installed copies of those libraries.

TODO: Describe behavior with the OS-X installer.

When installing using a package manager (Debian, RedHat, MacPorts etc.), this behavior actually does the right thing, and there are no special patches in the matplotlib packages to deal with the fact that we handle dateutil, pytz and six in this way. However, care should be taken that whatever approach we move to continues to work in that context.

Maintaining these packages in the matplotlib tree and making sure they are up-to-date is a maintenance burden. Advanced new features that may require a third-party pure Python library have a higher barrier to inclusion because of this burden.

Desired behavior

Third-party dependencies are downloaded and installed from their canonical locations by leveraging pip, distribute and PyPI.

dateutil, pytz, and pyparsing should be made into optional dependencies -- though obviously some features would fail if they aren't installed. This will allow the user to decide whether they want to bother installing a particular feature.
39.5.5 Implementation

For installing from source, and assuming the user has all of the C-level compilers and dependencies, this can be accomplished fairly easily using distribute and following the instructions here. The only anticipated change to the matplotlib library code will be to import pyparsing from the top-level namespace rather than from within matplotlib. Note that distribute will also allow us to remove the direct dependency on six, since it is, strictly speaking, only a direct dependency of dateutil.

For binary installations, there are a number of alternatives (here ordered from best/hardest to worst/easiest):

1. The distutils wininst installer allows a post-install script to run. It might be possible to get this script to run pip to install the other dependencies. (See this thread for someone who has trod that ground before).

2. Continue to ship dateutil, pytz, six and pyparsing in our installer, but use the post-install-script to install them only if they can not already be found.

3. Move all of these packages inside a (new) matplotlib.extern namespace so it is clear for outside users that these are external packages. Add some conditional imports in the core matplotlib codebase so dateutil (at the top-level) is tried first, and failing that matplotlib.extern.dateutil is used.

2 and 3 are undesirable as they still require maintaining copies of these packages in our tree -- and this is exacerbated by the fact that they are used less -- only in the binary installers. None of these 3 approaches address Numpy, which will still have to be manually installed using an installer.

TODO: How does this relate to the Mac OS-X installer?

39.5.6 Backward compatibility

At present, matplotlib can be installed from source on a machine without the third party dependencies and without an internet connection. After this change, an internet connection (and a working PyPI) will be required to install matplotlib for the first time. (Subsequent matplotlib updates or development work will run without accessing the network).

39.5.7 Alternatives

Distributing binary eggs doesn't feel like a usable solution. That requires getting easy_install installed first, and Windows users generally prefer the well known .exe or .msi installer that works out of the box.
39.6 MEP12: Improve Gallery and Examples

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
  - Gallery sections
  - Clean up guidelines
  * Additional suggestions
- Backward compatibility
- Alternatives
  - Tags

39.6.1 Status

Progress
Initial changes added in 1.3. Conversion of the gallery is on-going. 29 September 2015 - The last `pylab_examples` where `pylab` is imported has been converted over to use `matplotlib.pyplot` and `numpy`.

39.6.2 Branches and Pull requests

#1623, #1924, #2181
PR #2474 demonstrates a single example being cleaned up and moved to the appropriate section.

39.6.3 Abstract

Reorganizing the matplotlib plot gallery would greatly simplify navigation of the gallery. In addition, examples should be cleaned-up and simplified for clarity.
39.6.4 Detailed description

The matplotlib gallery was recently set up to split examples up into sections. As discussed in that PR\(^1\), the current example sections (\texttt{api}, \texttt{pylab_examples}) aren't terribly useful to users: New sections in the gallery would help users find relevant examples.

These sections would also guide a cleanup of the examples: Initially, all the current examples would remain and be listed under their current directories. Over time, these examples could be cleaned up and moved into one of the new sections.

This process allows users to easily identify examples that need to be cleaned up; i.e. anything in the \texttt{api} and \texttt{pylab_examples} directories.

39.6.5 Implementation

1. Create new gallery sections. [Done]
2. Clean up examples and move them to the new gallery sections (over the course of many PRs and with the help of many users/developers). [In progress]

Gallery sections

The naming of sections is critical and will guide the clean-up effort. The current sections are:

- Lines, bars, and markers (more-or-less 1D data)
- Shapes and collections
- Statistical plots
- Images, contours, and fields
- Pie and polar charts: Round things
- Color
- Text, labels, and annotations
- Ticks and spines
- Subplots, axes, and figures
- Specialty plots (e.g., sankey, radar, tornado)
- Showcase (plots with tweaks to make them publication-quality)
- separate sections for toolboxes (already exists: 'mplot3d', 'axes_grid', 'units', 'widgets')

These names are certainly up for debate. As these sections grow, we should reevaluate them and split them up as necessary.

\(^1\) https://github.com/matplotlib/matplotlib/pull/714
Clean up guidelines

The current examples in the api and pylab_examples sections of the gallery would remain in those directories until they are cleaned up. After clean-up, they would be moved to one of the new gallery sections described above. "Clean-up" should involve:

- **sphinx-gallery docstrings**: a title and a description of the example formatted as follows, at the top of the example:

  ```
  ================================
  Colormaps alter your perception
  ================================

  Here I plot the function
  .. math:: f(x, y) = \sin(x) + \cos(y)

  with different colormaps. Look at how colormaps alter your perception!
  ```

- **PEP8 clean-ups** (running flake8, or a similar checker, is highly recommended)
- Commented-out code should be removed.
- Replace uses of *pylab* interface with *pyplot* (+ numpy, etc.). See c25ef1e
- Remove shebang line, e.g.:
  ```
  #!/usr/bin/env python
  ```
- Use consistent imports. In particular:
  ```
  import numpy as np
  import matplotlib.pyplot as plt
  ```
  Avoid importing specific functions from these modules (e.g. from numpy import sin)
- Each example should focus on a specific feature (excluding showcase examples, which will show more "polished" plots). Tweaking unrelated to that feature should be removed. See f7b2217, e57b5fc, and 1458aa8

Use of *pylab* should be demonstrated/discussed on a dedicated help page instead of the gallery examples.

**Note**: When moving an existing example, you should search for references to that example. For example, the API documentation for axes.py and pyplot.py may use these examples to generate plots. Use your favorite search tool (e.g., grep, ack, grin, pss) to search the matplotlib package. See 2dc9a46 and aa6b410
Additional suggestions

- Provide links (both ways) between examples and API docs for the methods/objects used. (issue #2222)
- Use `plt.subplots` (note trailing "s") in preference over `plt.subplot`.
- Rename the example to clarify it's purpose. For example, the most basic demo of `imshow` might be `imshow_demo.py`, and one demonstrating different interpolation settings would be `imshow_demo_interpolation.py` (not `imshow_demo2.py`).
- Split up examples that try to do too much. See 5099675 and fc2ab07
- Delete examples that don't show anything new.
- Some examples exercise esoteric features for unit testing. These tweaks should be moved out of the gallery to an example in the `unit` directory located in the root directory of the package.
- Add plot titles to clarify intent of the example. See bd2b13c

39.6.6 Backward compatibility

The website for each Matplotlib version is readily accessible, so users who want to refer to old examples can still do so.

39.6.7 Alternatives

Tags

Tagging examples will also help users search the example gallery. Although tags would be a big win for users with specific goals, the plot gallery will remain the entry point to these examples, and sections could really help users navigate the gallery. Thus, tags are complementary to this reorganization.

39.7 MEP13: Use properties for Artists

• *Alternatives*

39.7.1 Status

• *Discussion*

39.7.2 Branches and Pull requests

None

39.7.3 Abstract

Wrap all of the matplotlib getter and setter methods with python properties, allowing them to be read and written like class attributes.

39.7.4 Detailed description

Currently matplotlib uses getter and setter functions (usually prefixed with `get_` and `set_`, respectively) for reading and writing data related to classes. However, since 2.6 python supports properties, which allow such setter and getter functions to be accessed as though they were attributes. This proposal would implement all existing setter and getter methods as properties.

39.7.5 Implementation

1. All existing getter and setter methods will need to have two aliases, one with the `get_` or `set_` prefix and one without. Getter methods that currently lack prefixes should be recording in a text file.

2. Classes should be reorganized so setter and getter methods are sequential in the code, with getter methods first.
3. Getter and setter methods the provide additional optional optional arguments should have those arguments accessible in another manner, either as additional getter or setter methods or attributes of other classes. If those classes are not accessible, getters for them should be added.

4. Property decorators will be added to the setter and getter methods without the prefix. Those with the prefix will be marked as deprecated.

5. Docstrings will need to be rewritten so the getter with the prefix has the current docstring and the getter without the prefix has a generic docstring appropriate for an attribute.

6. Automatic alias generation will need to be modified so it will also create aliases for the properties.

7. All instances of getter and setter method calls will need to be changed to attribute access.

8. All setter and getter aliases with prefixes will be removed

The following steps can be done simultaneously: 1, 2, and 3; 4 and 5; 6 and 7. Only the following steps must be done in the same release: 4, 5, and 6. All other changes can be done in separate releases. 8 should be done several major releases after everything else.

39.7.6 Backward compatibility

All existing getter methods that do not have a prefix (such as get_) will need to be changed from function calls to attribute access. In most cases this will only require removing the parenthesis.

setter and getter methods that have additional optional arguments will need to have those arguments implemented in another way, either as a separate property in the same class or as attributes or properties of another class.

Cases where the setter returns a value will need to be changed to using the setter followed by the getter.

Cases where there are set_ATTR_on() and set_ATTR_off() methods will be changed to ATTR_on properties.

39.7.7 Examples

axes.Axes.set_axis_off/set_axis_on

Current implementation:

```
axes.Axes.set_axis_off()
axes.Axes.set_axis_on()
```
New implementation:

```
True = axes.Axes.axis_on
False = axes.Axes.axis_on
axes.Axes.axis_on = True
axes.Axes.axis_on = False
```

```
axes.Axes.get_xlim/set_xlim and get_autoscalex_on/set_autoscalex_on
```

Current implementation:

```
[left, right] = axes.Axes.get_xlim()
auto = axes.Axes.get_autoscalex_on()

[left, right] = axes.Axes.set_xlim(left=left, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, right=None, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=None, right=right, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(left=left, emit=emit, auto=auto)
[left, right] = axes.Axes.set_xlim(right=right, emit=emit, auto=auto)

axes.Axes.set_autoscalex_on(auto)
```

New implementation:

```
[left, right] = axes.Axes.axes_xlim
auto = axes.Axes.autoscalex_on

axes.Axes.axes_xlim = [left, right]
axes.Axes.axes_xlim = [left, None]
axes.Axes.axes_xlim = [None, right]
axes.Axes.axes_xlim[0] = left
axes.Axes.axes_xlim[1] = right

axes.Axes.autoscalex_on = auto
axes.Axes.emit_xlim = emit
```

```
axes.Axes.get_title/set_title
```

Current implementation:

```
string = axes.Axes.get_title()
axes.Axes.set_title(string, fontdict=fontdict, **kwargs)
```

New implementation:

```
string = axes.Axes.title
string = axes.Axes.title_text.text
```

(continues on next page)
axes.Axes.get_xticklabels/set_xticklabels

Current implementation:

[text.Text] = axes.Axes.get_xticklabels()
[text.Text] = axes.Axes.get_xticklabels(minor=False)
[text.Text] = axes.Axes.get_xticklabels(minor=True)
[text.Text] = axes.Axes.([string], fontdict=None, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=False, **kwargs)
[text.Text] = axes.Axes.([string], fontdict=None, minor=True, **kwargs)

New implementation:

[text.Text] = axes.Axes.ticklabels
[text.Text] = axes.Axes.xminorlabels
axes.Axes.ticklabels = [string]
axes.Axes.xminorlabels = [string]
axes.Axes.ticklabels = [text.Text]
axes.Axes.xminorlabels = [text.Text]

39.7.8 Alternatives

Instead of using decorators, it is also possible to use the property function. This would change the procedure so that all getter methods that lack a prefix will need to be renamed or removed. This makes handling docstrings more difficult and harder to read.

It is not necessary to deprecate the setter and getter methods, but leaving them in will complicate the code.

This could also serve as an opportunity to rewrite or even remove automatic alias generation.

Another alternate proposal:

Convert set_xlim, set_xlabel, set_title, etc. to xlim, xlabel, title,... to make the transition from plt functions to axes methods significantly simpler. These would still be methods, not properties, but it's still a great usability enhancement while retaining the interface.
39.8 MEP14: Text handling

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Alternatives

39.8.1 Status

- Discussion

39.8.2 Branches and Pull requests

Issue #253 demonstrates a bug where using the bounding box rather than the advance width of text results in misaligned text. This is a minor point in the grand scheme of things, but it should be addressed as part of this MEP.

39.8.3 Abstract

By reorganizing how text is handled, this MEP aims to:

- improve support for Unicode and non-ltr languages
- improve text layout (especially multi-line text)
- allow support for more fonts, especially non-Apple-format TrueType fonts and OpenType fonts.
- make the font configuration easier and more transparent
39.8.4 Detailed description

Text layout
At present, matplotlib has two different ways to render text: "built-in" (based on FreeType and our own Python code), and "usetex" (based on calling out to a TeX installation). Adjunct to the "built-in" renderer there is also the Python-based "math-text" system for rendering mathematical equations using a subset of the TeX language without having a TeX installation available. Support for these two engines in strewn about many source files, including every backend, where one finds clauses like

```python
if rcParams['text.usetex']:
    # do one thing else: # do another
```

Adding a third text rendering approach (more on that later) would require editing all of these places as well, and therefore doesn't scale.

Instead, this MEP proposes adding a concept of "text engines", where the user could select one of many different approaches for rendering text. The implementations of each of these would be localized to their own set of modules, and not have little pieces around the whole source tree.

Why add more text rendering engines? The "built-in" text rendering has a number of shortcomings.

- It only handles right-to-left languages, and doesn't handle many special features of Unicode, such as combining diacriticals.
- The multiline support is imperfect and only supports manual line-breaking -- it can not break up a paragraph into lines of a certain length.
- It also does not handle inline formatting changes in order to support something like Markdown, reStructuredText or HTML. (Though rich-text formatting is contemplated in this MEP, since we want to make sure this design allows it, the specifics of a rich-text formatting implementation is outside of the scope of this MEP.)

Supporting these things is difficult, and is the "full-time job" of a number of other projects:

- pango/harfbuzz
- QtTextLayout
- Microsoft DirectWrite
- Apple Core Text

Of the above options, it should be noted that harfbuzz is designed from the start as a cross platform option with minimal dependencies, so therefore is a good candidate for a single option to support.

Additionally, for supporting rich text, we could consider using WebKit, and possibly whether than represents a good single cross-platform option. Again, however, rich text formatting is outside of the scope of this project.
Rather than trying to reinvent the wheel and add these features to matplotlib's "built-in" text renderer, we should provide a way to leverage these projects to get more powerful text layout. The "built-in" renderer will still need to exist for reasons of ease of installation, but its feature set will be more limited compared to the others. [TODO: This MEP should clearly decide what those limited features are, and fix any bugs to bring the implementation into a state of working correctly in all cases that we want it to work. I know @leejjoon has some thoughts on this.]

Font selection

Going from an abstract description of a font to a file on disk is the task of the font selection algorithm -- it turns out to be much more complicated than it seems at first.

The "built-in" and "usetex" renderers have very different ways of handling font selection, given their different technologies. TeX requires the installation of TeX-specific font packages, for example, and can not use TrueType fonts directly. Unfortunately, despite the different semantics for font selection, the same set of font properties are used for each. This is true of both the `FontProperties` class and the font-related `rcParams` (which basically share the same code underneath). Instead, we should define a core set of font selection parameters that will work across all text engines, and have engine-specific configuration to allow the user to do engine-specific things when required. For example, it is possible to directly select a font by name in the "built-in" using `rcParams["font.family"]` (default: ['sans-serif']), but the same is not possible with "usetex". It may be possible to make it easier to use TrueType fonts by using XeTeX, but users will still want to use the traditional metafonts through TeX font packages. So the issue still stands that different text engines will need engine-specific configuration, and it should be more obvious to the user which configuration will work across text engines and which are engine-specific.

Note that even excluding "usetex", there are different ways to find fonts. The default is to use the font list cache in `font_manager` which matches fonts using our own algorithm based on the CSS font matching algorithm. It doesn't always do the same thing as the native font selection algorithms on Linux (fontconfig), Mac and Windows, and it doesn't always find all of the fonts on the system that the OS would normally pick up. However, it is cross-platform, and always finds the fonts that ship with matplotlib. The Cairo and MacOSX backends (and presumably a future HTML5-based backend) currently bypass this mechanism and use the OS-native ones. The same is true when not embedding fonts in SVG, PS or PDF files and opening them in a third-party viewer. A downside there is that (at least with Cairo, need to confirm with MacOSX) they don't always find the fonts we ship with matplotlib. (It may be possible to add the fonts to their search path, though, or we may need to find a way to install our fonts to a location the OS expects to find them).

There are also special modes in the PS and PDF to only use the core fonts that are always available to those formats. There, the font lookup mechanism must only match against those fonts. It is unclear whether the OS-native font lookup systems can handle this case.

There is also experimental support for using fontconfig for font selection in matplotlib, turned off by default. fontconfig is the native font selection algorithm on Linux, but is also cross platform and works well on the other platforms (though obviously is an
additional dependency there).

Many of the text layout libraries proposed above (pango, QtTextLayout, DirectWrite and CoreText etc.) insist on using the font selection library from their own ecosystem. All of the above seems to suggest that we should move away from our self-written font selection algorithm and use the native APIs where possible. That's what Cairo and MacOSX backends already want to use, and it will be a requirement of any complex text layout library. On Linux, we already have the bones of a fontconfig implementation (which could also be accessed through pango). On Windows and Mac we may need to write custom wrappers. The nice thing is that the API for font lookup is relatively small, and essentially consist of "given a dictionary of font properties, give me a matching font file".

**Font subsetting**

Font subsetting is currently handled using ttconv. ttconv was a standalone command-line utility for converting TrueType fonts to subsetted Type 3 fonts (among other features) written in 1995, which matplotlib (well, I) forked in order to make it work as a library. It only handles Apple-style TrueType fonts, not ones with the Microsoft (or other vendor) encodings. It doesn't handle OpenType fonts at all. This means that even though the STIX fonts come as .otf files, we have to convert them to .ttf files to ship them with matplotlib. The Linux packagers hate this -- they'd rather just depend on the upstream STIX fonts. ttconv has also been shown to have a few bugs that have been difficult to fix over time.

Instead, we should be able to use FreeType to get the font outlines and write our own code (probably in Python) to output subsetted fonts (Type 3 on PS and PDF and paths on SVG). Freetype, as a popular and well-maintained project, handles a wide variety of fonts in the wild. This would remove a lot of custom C code, and remove some code duplication between backends.

Note that subsetting fonts this way, while the easiest route, does lose the hinting in the font, so we will need to continue, as we do now, provide a way to embed the entire font in the file where possible.

Alternative font subsetting options include using the subsetting built-in to Cairo (not clear if it can be used without the rest of Cairo), or using fontforge (which is a heavy and not terribly cross-platform dependency).

**Freetype wrappers**

Our FreeType wrapper could really use a reworking. It defines its own image buffer class (when a Numpy array would be easier). While FreeType can handle a huge diversity of font files, there are limitations to our wrapper that make it much harder to support non-Apple-vendor TrueType files, and certain features of OpenType files. (See #2088 for a terrible result of this, just to support the fonts that ship with Windows 7 and 8). I think a fresh rewrite of this wrapper would go a long way.

**Text anchoring and alignment and rotation**

The handling of baselines was changed in 1.3.0 such that the backends are now given the location of the baseline of the text, not the bottom of the text. This is probably
the correct behavior, and the MEP refactoring should also follow this convention.

In order to support alignment on multi-line text, it should be the responsibility of
the (proposed) text engine to handle text alignment. For a given chunk of text, each
engine calculates a bounding box for that text and the offset of the anchor point within
that box. Therefore, if the va of a block was "top", the anchor point would be at the
top of the box.

Rotating of text should always be around the anchor point. I'm not sure that lines
up with current behavior in matplotlib, but it seems like the sanest/least surprising
choice. [This could be revisited once we have something working]. Rotation of text
should not be handled by the text engine -- that should be handled by a layer between
the text engine and the rendering backend so it can be handled in a uniform way. [I
don't see any advantage to rotation being handled by the text engines individually...]

There are other problems with text alignment and anchoring that should be resolved
as part of this work. [TODO: enumerate these].

Other minor problems to fix

The mathtext code has backend-specific code -- it should instead provide its output as
just another text engine. However, it's still desirable to have mathtext layout inserted
as part of a larger layout performed by another text engine, so it should be possible
to do this. It's an open question whether embedding the text layout of an arbitrary
text engine in another should be possible.

The text mode is currently set by a global rcParam ("text.usetex") so it's either all
on or all off. We should continue to have a global rcParam to choose the text engine
("text.layout_engine"), but it should under the hood be an overridable property on the
Text object, so the same figure can combine the results of multiple text layout engines
if necessary.

39.8.5 Implementation

A concept of a "text engine" will be introduced. Each text engine will implement a
number of abstract classes. The TextFont interface will represent text for a given set
of font properties. It isn't necessarily limited to a single font file -- if the layout engine
supports rich text, it may handle a number of font files in a family. Given a TextFont
instance, the user can get a TextLayout instance, which represents the layout for a
given string of text in a given font. From a TextLayout, an iterator over TextSpans is
returned so the engine can output raw editable text using as few spans as possible.
If the engine would rather get individual characters, they can be obtained from the
TextSpan instance:

```python
class TextFont(TextFontBase):
    def __init__(self, font_properties):
        ""
        Create a new object for rendering text using the given font properties.
        ""
        pass
```

(continues on next page)
def get_layout(self, s, ha, va):
    """
    Get the TextLayout for the given string in the given font and
    the horizontal (left, center, right) and vertical alignment (top,
    center, baseline, bottom)
    """
    pass

class TextLayout(TextLayoutBase):
    def get_metrics(self):
        """
        Return the bounding box of the layout, anchored at (0, 0).
        """
        pass

    def get_spans(self):
        """
        Returns an iterator over the spans of different in the layout.
        This is useful for backends that want to editable raw text as
        individual lines. For rich text where the font may change,
        each span of different font type will have its own span.
        """
        pass

    def get_image(self):
        """
        Returns a rasterized image of the text. Useful for raster backends,
        like Agg.

        In all likelihood, this will be overridden in the backend, as it can
        be created from get_layout(), but certain backends may want to
        override it if their library provides it (as freetype does).
        """
        pass

    def get_rectangles(self):
        """
        Returns an iterator over the filled black rectangles in the layout.
        Used by TeX and mathtext for drawing, for example, fraction lines.
        """
        pass

    def get_path(self):
        """
        Returns a single Path object of the entire laid out text.

        [Not strictly necessary, but might be useful for textpath
        functionality]
        """
        pass
Graphic backends that want to output subset of fonts would likely build up a file-global dictionary of characters where the keys are (fontname, glyph_id) and the values are the paths so that only one copy of the path for each character will be stored in the file.

Special casing: The "usetex" functionality currently is able to get Postscript directly from TeX to insert directly in a Postscript file, but for other backends, parses a DVI file and generates something more abstract. For a case like this, TextLayout would implement get_spans for most backends, but add get_ps for the Postscript backend, which would look for the presence of this method and use it if available, or fall back to get_spans. This kind of special casing may also be necessary, for example, when the graphics backend and text engine belong to the same ecosystem, e.g. Cairo and Pango, or MacOSX and CoreText.

There are three main pieces to the implementation:

1) Rewriting the freetype wrapper, and removing ttconv.
   a) Once (1) is done, as a proof of concept, we can move to the upstream STIX .otf
fonts

b) Add support for web fonts loaded from a remote URL. (Enabled by using freetype for font subsetting).

2) Refactoring the existing "builtin" and "usetex" code into separate text engines and to follow the API outlined above.

3) Implementing support for advanced text layout libraries.

(1) and (2) are fairly independent, though having (1) done first will allow (2) to be simpler. (3) is dependent on (1) and (2), but even if it doesn't get done (or is postponed), completing (1) and (2) will make it easier to move forward with improving the "builtin" text engine.

39.8.6 Backward compatibility

The layout of text with respect to its anchor and rotation will change in hopefully small, but improved, ways. The layout of multiline text will be much better, as it will respect horizontal alignment. The layout of bidirectional text or other advanced Unicode features will now work inherently, which may break some things if users are currently using their own workarounds.

Fonts will be selected differently. Hacks that used to sort of work between the "builtin" and "usetex" text rendering engines may no longer work. Fonts found by the OS that weren't previously found by matplotlib may be selected.

39.8.7 Alternatives

TBD

39.9 MEP15 - Fix axis autoscaling when limits are specified for one axis only

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Backward compatibility
- Alternatives
39.9.1 Status

Discussion

39.9.2 Branches and Pull requests

None so far.

39.9.3 Abstract

When one axis of a 2-dimensional plot if overridden via `set_xlim` or `set_ylim`, automatic scaling of the remaining axis should be based on the data that falls within the specified limits of the first axis.

39.9.4 Detailed description

When axis limits for a 2-D plot are specified for one axis only (via `set_xlim` or `set_ylim`), matplotlib currently does not currently rescale the other axis. The result is that the displayed curves or symbols may be compressed into a tiny portion of the available area, so that the final plot conveys much less information than it would with appropriate axis scaling.

The proposed change of behavior would make matplotlib choose the scale for the remaining axis using only the data that falls within the limits for the axis where limits were specified.

39.9.5 Implementation

I don't know enough about the internals of matplotlib to be able to suggest an implementation.

39.9.6 Backward compatibility

From the standpoint of software interfaces, there would be no break in backward compatibility. Some outputs would be different, but if the user truly desires the previous behavior, he/she can achieve this by overriding the axis scaling for both axes.
39.9.7 Alternatives

The only alternative that I can see is to maintain the status quo.

39.10 MEP19: Continuous Integration

39.10.1 Status

Completed

39.10.2 Branches and Pull requests

39.10.3 Abstract

matplotlib could benefit from better and more reliable continuous integration, both for testing and building installers and documentation.

39.10.4 Detailed description

Current state-of-the-art

Testing

matplotlib currently uses Travis-CI for automated tests. While Travis-CI should be praised for how much it does as a free service, it has a number of shortcomings:

- It often fails due to network timeouts when installing dependencies.
- It often fails for inexplicable reasons.
- build or test products can only be saved from build off of branches on the main repo, not pull requests, so it is often difficult to "post mortem" analyse what went wrong. This is particularly frustrating when the failure can not be subsequently reproduced locally.
- It is not extremely fast. matplotlib's cpu and memory requirements for testing are much higher than the average Python project.
- It only tests on Ubuntu Linux, and we have only minimal control over the specifics of the platform. It can be upgraded at any time outside of our control, causing unexpected delays at times that may not be convenient in our release schedule.

On the plus side, Travis-CI's integration with github -- automatically testing all pending pull requests -- is exceptional.

Builds
There is no centralized effort for automated binary builds for matplotlib. However, the following disparate things are being done [If the authors mentioned here could fill in detail, that would be great!]:

- @sandrotosi: builds Debian packages
- @takluyver: Has automated Ubuntu builds on Launchpad
- @cgohlke: Makes Windows builds (don't know how automated that is)
- @r-owen: Makes OS-X builds (don't know how automated that is)

**Documentation**

Documentation of master is now built by travis and uploaded to [http://matplotlib.org/devdocs/index.html](http://matplotlib.org/devdocs/index.html)

@NelleV, I believe, generates the docs automatically and posts them on the web to chart MEP10 progress.

**Peculiarities of matplotlib**

matplotlib has complex requirements that make testing and building more taxing than many other Python projects.

- The CPU time to run the tests is quite high. It puts us beyond the free accounts of many CI services (e.g. ShiningPanda)
- It has a large number of dependencies, and testing the full matrix of all combinations is impractical. We need to be clever about what space we test and guarantee to support.

**Requirements**

This section outlines the requirements that we would like to have.

1. Testing all pull requests by hooking into the GitHub API, as Travis-CI does
2. Testing on all major platforms: Linux, Mac OS-X, MS Windows (in that order of priority, based on user survey)
3. Retain the last n days worth of build and test products, to aid in post-mortem debugging.
4. Automated nightly binary builds, so that users can test the bleeding edge without installing a complete compilation environment.
5. Automated benchmarking. It would be nice to have a standard benchmark suite (separate from the tests) whose performance could be tracked over time, in different backends and platforms. While this is separate from building and testing, ideally it would run on the same infrastructure.
6. Automated nightly building and publishing of documentation (or as part of testing, to ensure PRs don't introduce documentation bugs). (This would not replace the static documentation for stable releases as a default).

7. The test systems should be manageable by multiple developers, so that no single person becomes a bottleneck. (Travis-CI's design does this well -- storing build configuration in the git repository, rather than elsewhere, is a very good design.)

8. Make it easy to test a large but sparse matrix of different versions of matplotlib's dependencies. The matplotlib user survey provides some good data as to where to focus our efforts: https://docs.google.com/spreadsheet/ccc?key=0AjrPjlTMRTwTdHpQS25pcTZIRWdqX0pNckNSU01sMHc

9. Nice to have: A decentralized design so that those with more obscure platforms can publish build results to a central dashboard.

39.10.5 Implementation

This part is yet-to-be-written.

However, ideally, the implementation would be a third-party service, to avoid adding system administration to our already stretched time. As we have some donated funds, this service may be a paid one if it offers significant time-saving advantages over free offerings.

39.10.6 Backward compatibility

Backward compatibility is not a major concern for this MEP. We will replace current tools and procedures with something better and throw out the old.

39.10.7 Alternatives

39.10.8 Hangout Notes

CI Infrastructure

- We like Travis and it will probably remain part of our arsenal in any event. The reliability issues are being looked into.
- Enable Amazon S3 uploads of testing products on Travis. This will help with post-mortem of failures (@mdboom is looking into this now).
- We want Mac coverage. The best bet is probably to push Travis to enable it for our project by paying them for a Pro account (since they don't otherwise allow testing on both Linux and Mac).
- We want Windows coverage. Shining Panda is an option there.
• Investigate finding or building a tool that would collect and synthesize test results from a number of sources and post it to GitHub using the GitHub API. This may be of general use to the Scipy community.

• For both Windows and Mac, we should document (or better yet, script) the process of setting up the machine for a build, and how to build binaries and installers. This may require getting information from Russel Owen and Christoph Gohlke. This is a necessary step for doing automated builds, but would also be valuable for a number of other reasons.

The test framework itself

• We should investigate ways to make it take less time
  - Eliminating redundant tests, if possible
  - General performance improvements to matplotlib will help
• We should be covering more things, particularly more backends
• We should have more unit tests, fewer integration tests, if possible

39.11 MEP21: color and cm refactor

39.11.1 Status

• Discussion: This MEP has not commenced yet, but here are some ongoing ideas which may become a part of this MEP:
39.11.2 Branches and Pull requests

39.11.3 Abstract

- color
  - tidy up the namespace
  - Define a "Color" class
  - make it easy to convert from one color type to another `hex -> RGB`, `RGB -> hex`, `HSV -> RGB` etc.
  - improve the construction of a colormap - the dictionary approach is archaic and overly complex (though incredibly powerful)
  - make it possible to interpolate between two or more color types in different modes, especially useful for construction of colormaps in HSV space for instance

- cm
  - rename the module to something more descriptive - mappables?

Overall, there are a lot of improvements that can be made with matplotlib color handling - managing backwards compatibility will be difficult as there are some badly named variables/modules which really shouldn't exist - but a clear path and message for migration should be available, with a large amount of focus on this in the API changes documentation.

39.12.3 Abstract

The main goal of this MEP is to make it easier to modify (add, change, remove) the way the user interacts with the figures.

The user interaction with the figure is deeply integrated within the Canvas and Toolbar. Making extremely difficult to do any modification.

This MEP proposes the separation of this interaction into Toolbar, Navigation and Tools to provide independent access and reconfiguration.

This approach will make easier to create and share tools among users. In the far future, we can even foresee a kind of Marketplace for Tools where the most popular can be added into the main distribution.
39.12.4 Detailed description

The reconfiguration of the Toolbar is complex, most of the time it requires a custom backend.

The creation of custom Tools sometimes interferes with the Toolbar, as example see https://github.com/matplotlib/matplotlib/issues/2694 also the shortcuts are hardcoded and again not easily modifiable https://github.com/matplotlib/matplotlib/issues/2699

The proposed solution is to take the actions out of the Toolbar and the shortcuts out of the Canvas. This actions and shortcuts will be in the form of Tools.

A new class Navigation will be the bridge between the events from the Canvas and Toolbar and redirect them to the appropriate Tool.

At the end the user interaction will be divided into three classes:

- NavigationBase: This class is instantiated for each FigureManager and connect the all user interactions with the Tools
- ToolbarBase: This existing class is relegated only as a GUI access to Tools.
- ToolBase: Is the basic definition of Tools.

39.12.5 Implementation

ToolBase(object)

Tools can have a graphical representation as the SubplotTool or not even be present in the Toolbar as Quit

The ToolBase has the following class attributes for configuration at definition time

- keymap = None: Key(s) to be used to trigger the tool
- description = "": Small description of the tool
- image = None: Image that is used in the toolbar

The following instance attributes are set at instantiation:

- name
- navigation

Methods

- trigger(self, event): This is the main method of the Tool, it is called when the Tool is triggered by: * Toolbar button click * keypress associated with the Tool Keymap * Call to navigation.trigger_tool(name)
- set_figure(self, figure): Set the figure and navigation attributes
- destroy(self, *args): Destroy the Tool graphical interface (if exists)
Available Tools

- ToolQuit
- ToolEnableAllNavigation
- ToolEnableNavigation
- ToolToggleGrid
- ToolToggleFullScreen
- ToolToggleYScale
- ToolToggleXScale
- ToolHome
- ToolBack
- ToolForward
- SaveFigureBase
- ConfigureSubplotsBase

**ToolToggleBase(ToolBase)**

The *ToolToggleBase* has the following class attributes for configuration at definition time

- radio_group = None: Attribute to group 'radio' like tools (mutually exclusive)
- cursor = None: Cursor to use when the tool is active

The **Toggleable** Tools, can capture keypress, mouse moves, and mouse button press

**It defines the following methods**

- enable(self, event): Called by *ToolToggleBase.trigger* method
- disable(self, event): Called when the tool is untoggled
- toggled : **Property** True or False

Available Tools

- ToolZoom
- ToolPan
NavigationBase

Defines the following attributes

- canvas:
- **keypresslock**: Lock to know if the `canvas.key_press_event` is available and process it
- messagelock: Lock to know if the message is available to write

Public methods for User use:

- `nav_connect(self, s, func)`: Connect to navigation for events
- `nav_disconnect(self, cid)`: Disconnect from navigation event
- `message_event(self, message, sender=None)`: Emit a `tool_message_event` event
- `active_toggle(self)`: Property. The currently toggled tools or None
- `get_tool_keymap(self, name)`: Return a list of keys that are associated with the tool
- `set_tool_keymap(self, name, *keys)`: Set the keys for the given tool
- `remove_tool(self, name)`: Removes tool from the navigation control.
- `add_tools(self, tools)`: Add multiple tools to Navigation
- `add_tool(self, name, tool, group=None, position=None)`: Add a tool to the Navigation
- `tool_trigger_event(self, name, sender=None, canvasevent=None, data=None)`: Trigger a tool and fire the event
- `tools(self)`: Property: Return a dict with available tools with corresponding keymaps, descriptions and objects
- `get_tool(self, name)`: Return the tool object

ToolbarBase

Methods for Backend implementation

- `add_toolitem(self, name, group, position, image, description, toggle)`: Add a toolitem to the toolbar. This method is a callback from `tool_added_event` (emitted by navigation)
- `set_message(self, s)`: Display a message on toolbar or in status bar
- `toggle_toolitem(self, name)`: Toggle the toolitem without firing event.
- `remove_toolitem(self, name)`: Remove a toolitem from the Toolbar
39.12.6 Backward compatibility

For backward compatibility added 'navigation' to the list of values supported by `rcParams['toolbar']` (default: 'toolbar2'), that is used for Navigation classes instantiation instead of the NavigationToolbar classes.

With this parameter, it makes it transparent to anyone using the existing backends.

[@pelson comment: This also gives us an opportunity to avoid needing to implement all of this in the same PR - some backends can potentially exist without the new functionality for a short while (but it must be done at some point).]

39.13 MEP23: Multiple Figures per GUI window

39.13.1 Status

Discussion

39.13.2 Branches and Pull requests

Previous work - https://github.com/matplotlib/matplotlib/pull/2465 To-delete

39.13.3 Abstract

Add the possibility to have multiple figures grouped under the same FigureManager

39.13.4 Detailed description

Under the current structure, every canvas has its own window.
This is and may continue to be the desired method of operation for most use cases.
Sometimes when there are too many figures open at the same time, it is desirable to
be able to group these under the same window [see](https://github.com/matplotlib/matplotlib/issues/2194).

The proposed solution modifies FigureManagerBase to contain and manage more than
one canvas. The settings parameter `rcParams["backend.multifigure"]` control when the
MultiFigure behaviour is desired.

Note

It is important to note, that the proposed solution, assumes that the [MEP22](https://github.com/matplotlib/matplotlib/wiki/Mep22) is already in place. This is simply be-
cause the actual implementation of the Toolbar makes it pretty hard to switch between
canvases.

39.13.5 Implementation

The first implementation will be done in GTK3 using a Notebook as canvas container.
**FigureManagerBase**

will add the following new methods

- **add_canvas**: To add a canvas to an existing FigureManager object
- **remove_canvas**: To remove a canvas from a FigureManager object, if it is the last one, it will be destroyed
- **move_canvas**: To move a canvas from one FigureManager to another.
- **set_canvas_title**: To change the title associated with a specific canvas container
- **get_canvas_title**: To get the title associated with a specific canvas container
- **get_active_canvas**: To get the canvas that is in the foreground and is subject to the gui events. There is no set_active_canvas because the active canvas, is defined when show is called on a Canvas object.

**new_figure_manager**

To control which FigureManager will contain the new figures, an extra optional parameter `figuremanager` will be added, this parameter value will be passed to `new_figure_manager_given_figure`

**new_figure_manager_given_figure**

- If `figuremanager` parameter is given, this FigureManager object will be used instead of creating a new one.
- If `rcParams['backend.multifigure']` is True: The last FigureManager object will be used instead of creating a new one.

**NavigationBase**

Modifies the NavigationBase to keep a list of canvases, directing the actions to the active one

**39.13.6 Backward compatibility**

For the **MultiFigure** properties to be visible, the user has to activate them directly setting `rcParams['backend.multifigure'] = True`

It should be backwards compatible for backends that adhere to the current FigureManagerBase structure even if they have not implemented the MultiFigure magic yet.
39.13.7 Alternatives

Instead of modifying the `FigureManagerBase` it could be possible to add a parallel class, that handles the cases where `rcParams['backend.multifigure'] = True`. This will warranty that there won't be any problems with custom made backends, but also makes bigger the code, and more things to maintain.

39.14 MEP24: negative radius in polar plots

39.14.1 Status

Discussion

39.14.2 Branches and Pull requests

None

39.14.3 Abstract

It is clear that polar plots need to be able to gracefully handle negative r values (not by clipping or reflection).
39.14.4 Detailed description

One obvious application that we should support is bB plots (see https://github.com/matplotlib/matplotlib/issues/1730#issuecomment-40815837), but this seems more generally useful (for example growth rate as a function of angle). The assumption in the current code (as I understand it) is that the center of the graph is \( r=0 \), however it would be good to be able to set the center to be at any \( r \) (with any value less than the offset clipped).

39.15 MEP25: Serialization
39.15.1 Status

Rejected
This work is important, but this particular effort has stalled.

39.15.2 Branches and Pull requests

- development branches:
- related pull requests:

39.15.3 Abstract

This MEP aims at adding a serializable Controller objects to act as an Artist managers. Users would then communicate changes to an Artist via a Controller. In this way, functionality of the Controller objects may be added incrementally since each Artist is still responsible for drawing everything. The goal is to create an API that is usable both by graphing libraries requiring high-level descriptions of figures and libraries requiring low-level interpretations.

39.15.4 Detailed description

Matplotlib is a core plotting engine with an API that many users already understand. It's difficult/impossible for other graphing libraries to (1) get a complete figure description, (2) output raw data from the figure object as the user has provided it, (3) understand the semantics of the figure objects without heuristics, and (4) give matplotlib a complete figure description to visualize. In addition, because an Artist has no conception of its own semantics within the figure, it's difficult to interact with them in a natural way.

In this sense, matplotlib will adopt a standard Model-View-Controller (MVC) framework. The Model will be the user defined data, style, and semantics. The Views are the ensemble of each individual Artist, which are responsible for producing the final image based on the model. The Controller will be the Controller object managing its set of Artist objects.

The Controller must be able to export the information that it's carrying about the figure on command, perhaps via a to_json method or similar. Because it would be extremely extraneous to duplicate all of the information in the model with the controller, only user-specified information (data + style) are explicitly kept. If a user wants more information (defaults) from the view/model, it should be able to query for it.

- This might be annoying to do, non-specified kwargs are pulled from the rcParams object which is in turn created from reading a user specified file and can be dynamically changed at run time. I suppose we could keep a dict of default
defaults and compare against that. Not clear how this will interact with the
style sheet [[MEP26]] - @tacaswell

Additional Notes:

• The "raw data" does not necessarily need to be a list, ndarray, etc. Rather, it
can more abstractly just have a method to yield data when needed.

• Because the Controller will contain extra information that users may not want
to keep around, it should not be created by default. You should be able to both
(a) instantiate a Controller with a figure and (b) build a figure with a Controller.

Use Cases:

• Export all necessary informat
• Serializing a matplotlib figure, saving it, and being able to rerun later.
• Any other source sending an appropriately formatted representation to mat-
plotlib to open

39.15.5 Examples

Here are some examples of what the controllers should be able to do.

1. Instantiate a matplotlib figure from a serialized representation (e.g., JSON):

   ```python
   import json
   from matplotlib.controllers import Controller
   with open('my_figure') as f:
       o = json.load(f)
   c = Controller(o)
   fig = c.figure
   ```

2. Manage artists from the controller (e.g., Line2D):

   ```python
   # not really sure how this should look
   c.axes[0].lines[0].color = 'b'
   # ?
   ```

3. Export serializable figure representation:

   ```python
   o = c.to_json()
   # or... we should be able to throw a figure object in there too
   o = Controller.to_json(mpl_fig)
   ```
39.15.6 Implementation

1. Create base Controller objects that are able to manage Artist objects (e.g., Hist)

   Comments:
   - initialization should happen via unpacking **, so we need a copy of call signature parameter for the Artist we're ultimately trying to control. Unfortunate hard-coded repetition...
   - should the additional **kwargs accepted by each Artist be tracked at the Controller
   - how does a Controller know which artist belongs where? E.g., do we need to pass axes references?

   Progress:
   - A simple NB demonstrating some functionality for Line2DController objects: https://nbviewer.jupyter.org/gist/theengineear/f0aa8d79f64325e767c0

2. Write in protocols for the Controller to update the model.

   Comments:
   - how should containers be dealt with? E.g., what happens to old patches when we re-bin a histogram?
   - in the link from (1), the old line is completely destroyed and redrawn, what if something is referencing it?

3. Create method by which a json object can be assembled from the Controllers

4. Deal with serializing the unserializable aspects of a figure (e.g., non-affine transforms?)

5. Be able to instantiate from a serialized representation

6. Reimplement the existing pyplot and Axes method, e.g. pyplot.hist and Axes.hist in terms of the new controller class.

> @theengineer: in #2 above, what do you mean by get updates from each Artist?

^ Yup. The Controller shouldn't need to get updated. This just happens in #3. Delete comments when you see this.
39.15.7 Backward compatibility

- pickling will change
- non-affine transformations will require a defined pickling method

39.15.8 Alternatives

PR #3150 suggested adding semantics by parasitically attaching extra containers to axes objects. This is a more complete solution with what should be a more developed/flexible/powerful framework.

39.16.1 Status

Rejected

39.16.2 Branches and Pull requests

39.16.3 Abstract

This MEP proposes a new stylesheet implementation to allow more comprehensive and dynamic styling of artists.

The current version of matplotlib (1.4.0) allows stylesheets based on the rcParams syntax to be applied before creation of a plot. The methodology below proposes a new syntax, based on CSS, which would allow styling of individual artists and properties, which can be applied dynamically to existing objects.

This is related to (and makes steps toward) the overall goal of moving to a DOM/tree-like architecture.

39.16.4 Detailed description

Currently, the look and appearance of existing artist objects (figure, axes, Line2D etc...) can only be updated via set_ and get_ methods on the artist object, which is quite laborious, especially if no reference to the artist(s) has been stored. The new style sheets introduced in 1.4 allow styling before a plot is created, but do not offer any means to dynamically update plots or distinguish between artists of the same type (i.e. to specify the line color and line style separately for differing Line2D objects).

The initial development should concentrate on allowing styling of artist primitives (those Artists that do not contain other Artists), and further development could expand the CSS syntax rules and parser to allow more complex styling. See the appendix for a list of primitives.

The new methodology would require development of a number of steps:

- A new stylesheet syntax (likely based on CSS) to allow selection of artists by type, class, id etc...
- A mechanism by which to parse a stylesheet into a tree
- A mechanism by which to translate the parse-tree into something which can be used to update the properties of relevant artists. Ideally this would implement a method by which to traverse the artists in a tree-like structure.
- A mechanism by which to generate a stylesheet from existing artist properties. This would be useful to allow a user to export a stylesheet from an existing figure (where the appearance may have been set using the matplotlib API)...
### 39.16.5 Implementation

It will be easiest to allow a '3rd party' to modify/set the style of an artist if the 'style' is created as a separate class and store against the artist as a property. The `GraphicsContext` class already provides a the basis of a `Style` class and an artist's `draw` method can be refactored to use the `Style` class rather than setting up it's own `GraphicsContext` and transferring it's style-related properties to it. A minimal example of how this could be implemented is shown here: [https://github.com/JamesRamm/mpl_experiment](https://github.com/JamesRamm/mpl_experiment)

IMO, this will also make the API and code base much neater as individual `get/set` methods for artist style properties are now redundant... Indirectly related would be a general drive to replace `get/set` methods with properties. Implementing the style class with properties would be a big stride toward this...

For initial development, I suggest developing a syntax based on a much (much much) simplified version of CSS. I am in favour of dubbing this Artist Style Sheets :+1:

### BNF Grammar

I propose a very simple syntax to implement initially (like a proof of concept), which can be expanded upon in the future. The BNF form of the syntax is given below and then explained

```plaintext
RuleSet ::= SelectorSequence "{"Declaration"}"

SelectorSequence ::= = Selector {"," Selector}

Declaration ::= propName":" propValue":";

Selector ::= ArtistIdent"#"Ident

propName ::= Ident

propValue ::= Ident | Number | Colour | "None"
```

`ArtistIdent`, `Ident`, `Number` and `Colour` are tokens (the basic building blocks of the expression) which are defined by regular expressions.

### Syntax

A CSS stylesheet consists of a series of **rule sets** in hierarchical order (rules are applied from top to bottom). Each rule follows the syntax

```
selector {attribute: value;}
```

Each rule can have any number of `attribute: value` pairs, and a stylesheet can have any number of rules.
The initial syntax is designed only for Artist primitives. It does not address the question of how to set properties on Container types (whose properties may themselves be Artists with settable properties), however, a future solution to this could simply be nested RuleSets.

Selectors

Selectors define the object to which the attribute updates should be applied. As a starting point, I propose just 2 selectors to use in initial development:

Artist Type Selector

Select an Artist by its type. E.g Line2D or Text:

```
Line2D {attribute: value}
```

The regex for matching the artist type selector (ArtistIdent in the BNF grammar) would be:

```
ArtistIdent = r'(\bLine2D\b|\bText\b|\bAxesImage\b|\bFigureImage\b|\bPatch\b)'
```

GID selector

Select an Artist by its gid:

```
Line2D#myGID {attribute: value}
```

A gid can be any string, so the regex could be as follows:

```
Ident = r'(\b[a-zA-Z_][a-zA-Z_0-9]*)' '
```

The above selectors roughly correspond to their CSS counterparts (http://www.w3.org/TR/CSS21/selector.html)

Attributes and values

- Attributes are any valid (settable) property for the Artist in question.
- Values are any valid value for the property (Usually a string, or number).
Parsing

Parsing would consist of breaking the stylesheet into tokens (the python cookbook gives a nice tokenizing recipe on page 66), applying the syntax rules and constructing a Tree. This requires defining the grammar of the stylesheet (again, we can borrow from CSS) and writing a parser. Happily, there is a recipe for this in the python cookbook as well.

Visitor pattern for matplotlib figure

In order to apply the stylesheet rules to the relevant artists, we need to 'visit' each artist in a figure and apply the relevant rule. Here is a visitor class (again, thanks to python cookbook), where each node would be an artist in the figure. A visit_ method would need to be implemented for each mpl artist, to handle the different properties for each

```python
class Visitor:
    def visit(self, node):
        name = 'visit_' + type(node).__name__
        meth = getattr(self, name, None)
        if meth is None:
            raise NotImplementedException
        return meth(node)
```

An evaluator class would then take the stylesheet rules and implement the visitor on each one of them.

39.16.6 Backward compatibility

Implementing a separate Style class would break backward compatibility as many get/set methods on an artist would become redundant. While it would be possible to alter these methods to hook into the Style class (stored as a property against the artist), I would be in favor of simply removing them to both neaten/simplify the codebase and to provide a simple, uncluttered API...

39.16.7 Alternatives

No alternatives, but some of the ground covered here overlaps with MEP25, which may assist in this development
39.16.8 Appendix

Matplotlib primitives

This will form the initial selectors which stylesheets can use.

39.17 MEP27: decouple pyplot from backends

- Status
- Branches and Pull requests
- Abstract
- Detailed description
- Implementation
- Future compatibility
- Backward compatibility
- Alternatives
- Questions

39.17.1 Status

Progress
39.17.2 Branches and Pull requests

Main PR (including GTK3): + https://github.com/matplotlib/matplotlib/pull/4143

39.17.3 Abstract

This MEP refactors the backends to give a more structured and consistent API, removing generic code and consolidate existing code. To do this we propose splitting:

1. FigureManagerBase and its derived classes into the core functionality class FigureManager and a backend specific class WindowBase and
2. ShowBase and its derived classes into Gcf.show_all and MainLoopBase.

39.17.4 Detailed description

This MEP aims to consolidate the backends API into one single uniform API, removing generic code out of the backend (which includes _pylab_helpers and Gcf), and push code to a more appropriate level in matplotlib. With this we automatically remove inconsistencies that appear in the backends, such as FigureManagerBase.resize(w, h) which sometimes sets the canvas, and other times set the entire window to the dimensions given, depending on the backend.

Two main places for generic code appear in the classes derived from FigureManagerBase and ShowBase.

1. FigureManagerBase has three jobs at the moment:
   1. The documentation describes it as a ```Helper class for pyplot mode, wraps everything up into a neat bundle```
   2. But it doesn't just wrap the canvas and toolbar, it also does all of the windowing tasks itself. The conflation of these two tasks gets seen the best in the following line: `python self.set_window_title("Figure %d" % num)` This combines backend specific code `self.set_window_title(title)` with matplotlib generic code `title = "Figure %d" % num`.
   3. Currently the backend specific subclass of FigureManager decides when to end the mainloop. This also seems very wrong as the figure should have no control over the other figures.

2. ShowBase has two jobs:
1. It has the job of going through all figure managers registered in _pylab_helpers.Gcf and telling them to show themselves.

2. And secondly it has the job of performing the backend specific mainloop to block the main programme and thus keep the figures from dying.

39.17.5 Implementation

The description of this MEP gives us most of the solution:

1. To remove the windowing aspect out of FigureManagerBase letting it simply wrap this new class along with the other backend classes. Create a new WindowBase class that can handle this functionality, with pass-through methods (:arrow_right:) to WindowBase. Classes that subclass WindowBase should also subclass the GUI specific window class to ensure backward compatibility (manager. window == manager.window).

2. Refactor the mainloop of ShowBase into MainLoopBase, which encapsulates the end of the loop as well. We give an instance of MainLoop to FigureManager as a key unlock the exit method (requiring all keys returned before the loop can die). Note this opens the possibility for multiple backends to run concurrently.

3. Now that FigureManagerBase has no backend specifics in it, to rename it to FigureManager, and move to a new file backend_managers.py noting that:

1. This allows us to break up the conversion of backends into separate PRs as we can keep the existing FigureManagerBase class and its dependencies intact.

2. and this also anticipates MEP22 where the new NavigationBase has morphed into a backend independent ToolManager.

</tbody>
</table>
39.17.6 Future compatibility

As eluded to above when discussing MEP 22, this refactor makes it easy to add in new generic features. At the moment, MEP 22 has to make ugly hacks to each class extending from FigureManagerBase. With this code, this only needs to get made in the single FigureManager class. This also makes the later deprecation of NavigationToolbar2 very straightforward, only needing to touch the single FigureManager class.

MEP 23 makes for another use case where this refactored code will come in very handy.

39.17.7 Backward compatibility

As we leave all backend code intact, only adding missing methods to existing classes, this should work seamlessly for all use cases. The only difference will lie for backends that used FigureManager.resize to resize the canvas and not the window, due to the standardisation of the API.

I would envision that the classes made obsolete by this refactor get deprecated and removed on the same timetable as NavigationToolbar2, also note that the change in call signature to the FigureCanvasWx constructor, while backward compatible, I think the old (imho ugly style) signature should get deprecated and removed in the same manner as everything else.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
39.17.8 Alternatives

If there were any alternative solutions to solving the same problem, they should be discussed here, along with a justification for the chosen approach.

39.17.9 Questions

Mdehoon: Can you elaborate on how to run multiple backends concurrently?

OceanWolf: @mdehoon, as I say, not for this MEP, but I see this MEP opens it up as a future possibility. Basically the MainLoopBase class acts a per backend Gcf, in this MEP it tracks the number of figures open per backend, and manages the mainloops for those backends. It closes the backend specific mainloop when it detects that no figures remain open for that backend. Because of this I imagine that with only a small amount of tweaking that we can do full-multi-backend matplotlib. No idea yet why one would want to, but I leave the possibility there in MainLoopBase. With all the backend-code specifics refactored out of FigureManager also aids in this, one manager to rule them (the backends) all.

Mdehoon: @OceanWolf, OK, thanks for the explanation. Having a uniform API for the backends is very important for the maintainability of matplotlib. I think this MEP is a step in the right direction.

39.18 MEP28: Remove Complexity from Axes.boxplot

  - **Variations on the theme**
  - **Doing less**
  - **Doing nothing**

---

**39.18.1 Status**

**Discussion**

**39.18.2 Branches and Pull requests**

The following lists any open PRs or branches related to this MEP:

3. Deprecate passings 2D NumPy arrays as input: None
5. Exposing *cbook.boxplot_stats* through *Axes.boxplot kwargs*: None
6. Remove redundant statistical kwargs in *Axes.boxplot*: None
7. Remove redundant style options in *Axes.boxplot*: None
8. Remaining items that arise through discussion: None

**39.18.3 Abstract**

Over the past few releases, the *Axes.boxplot* method has grown in complexity to support fully customizable artist styling and statistical computation. This lead to *Axes.boxplot* being split off into multiple parts. The statistics needed to draw a boxplot are computed in *cbook.boxplot_stats*, while the actual artists are drawn by *Axes.bxp*. The original method, *Axes.boxplot* remains as the most public API that handles passing the user-supplied data to *cbook.boxplot_stats*, feeding the results to *Axes.bxp*, and pre-processing style information for each facet of the boxplot plots.

This MEP will outline a path forward to rollback the added complexity and simplify the API while maintaining reasonable backwards compatibility.
39.18.4 Detailed description

Currently, the `Axes.boxplot` method accepts parameters that allow the users to specify medians and confidence intervals for each box that will be drawn in the plot. These were provided so that advanced users could provide statistics computed in a different fashion that the simple method provided by matplotlib. However, handling this input requires complex logic to make sure that the forms of the data structure match what needs to be drawn. At the moment, that logic contains 9 separate `if`/`else` statements nested up to 5 levels deep with a for loop, and may raise up to 2 errors. These parameters were added prior to the creation of the `Axes.bxp` method, which draws boxplots from a list of dictionaries containing the relevant statistics. Matplotlib also provides a function that computes these statistics via `cbook.boxplot_stats`. Note that advanced users can now either a) write their own function to compute the stats required by `Axes.bxp`, or b) modify the output returned by `cbook.boxplot_stats` to fully customize the position of the artists of the plots. With this flexibility, the parameters to manually specify only the medians and their confidences intervals remain for backwards compatibility.

Around the same time that the two roles of `Axes.boxplot` were split into `cbook.boxplot_stats` for computation and `Axes.bxp` for drawing, both `Axes.boxplot` and `Axes.bxp` were written to accept parameters that individually toggle the drawing of all components of the boxplots, and parameters that individually configure the style of those artists. However, to maintain backwards compatibility, the `sym` parameter (previously used to specify the symbol of the fliers) was retained. This parameter itself requires fairly complex logic to reconcile the `sym` parameters with the newer `flierprops` parameter at the default style specified by `matplotlibrc`.

This MEP seeks to dramatically simplify the creation of boxplots for novice and advanced users alike. Importantly, the changes proposed here will also be available to downstream packages like seaborn, as seaborn smartly allows users to pass arbitrary dictionaries of parameters through the seaborn API to the underlying matplotlib functions.

This will be achieved in the following way:

1. `cbook.boxplot_stats` will be modified to allow pre- and post- computation transformation functions to be passed in (e.g., `np.log` and `np.exp` for lognormally distributed data)
2. `Axes.boxplot` will be modified to also accept and naïvely pass them to `cbook.boxplot_stats` (Alt: pass the stat function and a dict of its optional parameters).
3. Outdated parameters from `Axes.boxplot` will be deprecated and later removed.
Importance

Since the limits of the whiskers are computed arithmetically, there is an implicit assumption of normality in box and whisker plots. This primarily affects which data points are classified as outliers.

Allowing transformations to the data and the results used to draw boxplots will allow users to opt-out of that assumption if the data are known to not fit a normal distribution.

Below is an example of how Axes.boxplot classifies outliers of lognormal data differently depending on these types of transforms.

```python
import numpy as np
import matplotlib.pyplot as plt
from matplotlib import cbook
np.random.seed(0)

fig, ax = plt.subplots(figsize=(4, 6))
ax.set_yscale('log')
data = np.random.lognormal(-1.75, 2.75, size=37)

stats = cbook.boxplot_stats(data, labels=['arithmetic'])
logstats = cbook.boxplot_stats(np.log(data), labels=['log-transformed'])

for lsdict in logstats:
    for key, value in lsdict.items():
        if key != 'label':
            lsdict[key] = np.exp(value)

stats.extend(logstats)
ax.bxp(stats)
fig.show()
```

39.18.5 Implementation

Passing transform functions to cbook.boxplots_stats

This MEP proposes that two parameters (e.g., transform_in and transform_out be added to the cookbook function that computes the statistics for the boxplot function. These will be optional keyword-only arguments and can easily be set to lambda x: x as a no-op when omitted by the user. The transform_in function will be applied to the data as the boxplot_stats function loops through each subset of the data passed to it. After the list of statistics dictionaries are computed the transform_out function is applied to each value in the dictionaries.

These transformations can then be added to the call signature of Axes.boxplot with little impact to that method's complexity. This is because they can be directly passed to cbook.boxplot_stats. Alternatively, Axes.boxplot could be modified to accept an op-
tional statistical function kwarg and a dictionary of parameters to be directly passed to it.

At this point in the implementation users and external libraries like seaborn would have complete control via the `Axes.boxplot` method. More importantly, at the very least, seaborn would require no changes to its API to allow users to take advantage of these new options.

**Simplifications to the `Axes.boxplot` API and other functions**

Simplifying the boxplot method consists primarily of deprecating and then removing the redundant parameters. Optionally, a next step would include rectifying minor terminological inconsistencies between `Axes.boxplot` and `Axes.bxp`.

The parameters to be deprecated and removed include:

1. `usermedians` - processed by 10 SLOC, 3 if blocks, a for loop
2. `conf_intervals` - handled by 15 SLOC, 6 if blocks, a for loop
3. `sym` - processed by 12 SLOC, 4 if blocks

Removing the `sym` option allows all code in handling the remaining styling parameters to be moved to `Axes.bxp`. This doesn't remove any complexity, but does reinforce the single responsibility principle among `Axes.bxp`, `cbook.boxplot_stats`, and `Axes.boxplot`.

Additionally, the `notch` parameter could be renamed `shownotches` to be consistent with `Axes.bxp`. This kind of cleanup could be taken a step further and the `whis`, `bootstrap`, `autorange` could be rolled into the kwargs passed to the new `statfxn` parameter.

**39.18.6 Backward compatibility**

Implementation of this MEP would eventually result in the backwards incompatible deprecation and then removal of the keyword parameters `usermedians`, `conf_intervals`, and `sym`. Cursory searches on GitHub indicated that `usermedians`, `conf_intervals` are used by few users, who all seem to have a very strong knowledge of matplotlib. A robust deprecation cycle should provide sufficient time for these users to migrate to a new API.

Deprecation of `sym` however, may have a much broader reach into the matplotlib user-base.
Schedule

An accelerated timeline could look like the following:

1. v2.0.1 add transforms to cbook.boxplots_stats, expose in Axes.boxplot

2. v2.1.0 Initial Deprecations, and using 2D NumPy arrays as input
   a. Using 2D NumPy arrays as input. The semantics around 2D arrays are generally confusing.
   b. usermedians, conf_intervals, sym parameters

3. v2.2.0
   a. remove usermedians, conf_intervals, sym parameters
   b. deprecate notch in favor of shownotches to be consistent with other parameters and Axes.bxp

4. v2.3.0
   a. remove notch parameter
   b. move all style and artist toggling logic to Axes.bxp Such Axes.boxplot is little more than a broker between Axes.bxp and cbook.boxplots_stats

Anticipated Impacts to Users

As described above deprecating usermedians and conf_intervals will likely impact few users. Those who will be impacted are almost certainly advanced users who will be able to adapt to the change.

Deprecating the sym option may import more users and effort should be taken to collect community feedback on this.

Anticipated Impacts to Downstream Libraries

The source code (GitHub master as of 2016-10-17) was inspected for seaborn and python-ggplot to see if these changes would impact their use. None of the parameters nominated for removal in this MEP are used by seaborn. The seaborn APIs that use matplotlib's boxplot function allow user's to pass arbitrary **kwargs through to matplotlib's API. Thus seaborn users with modern matplotlib installations will be able to take full advantage of any new features added as a result of this MEP.

Python-ggplot has implemented its own function to draw boxplots. Therefore, no impact can come to it as a result of implementing this MEP.
39.18.7 Alternatives

Variations on the theme

This MEP can be divided into a few loosely coupled components:

1. Allowing pre- and post-computation transformation function in cbook.boxplot_stats
2. Exposing that transformation in the Axes.boxplot API
3. Removing redundant statistical options in Axes.boxplot
4. Shifting all styling parameter processing from Axes.boxplot to Axes.bxp.

With this approach, #2 depends on #1, and #4 depends on #3.

There are two possible approaches to #2. The first and most direct would be to mirror the new transform_in and transform_out parameters of cbook.boxplot_stats in Axes.boxplot and pass them directly.

The second approach would be to add statfxn and statfxn_args parameters to Axes.boxplot. Under this implementation, the default value of statfxn would be cbook.boxplot_stats, but users could pass their own function. Then transform_in and transform_out would then be passed as elements of the statfxn_args parameter.

```python
def boxplot_stats(data, ..., transform_in=None, transform_out=None):
    if transform_in is None:
        transform_in = lambda x: x
    if transform_out is None:
        transform_out = lambda x: x

    output = []
    for _d in data:
        d = transform_in(_d)
        stat_dict = do_stats(d)
        for key, value in stat_dict.items():
            if key != 'label':
                stat_dict[key] = transform_out(value)
        output.append(d)
    return output

class Axes(...):
    def boxplot_option1(data, ..., transform_in=None, transform_out=None):
        stats = cbook.boxplot_stats(data, ..., transform_in=transform_in, transform_out=transform_out)
        return self.bxp(stats, ...)

    def boxplot_option2(data, ..., statfxn=None, **statopts):
        if statfxn is None:
            (continues on next page)
Both cases would allow users to do the following:

```python
fig, ax1 = plt.subplots()
artists1 = ax1.boxplot_optionX(data, transform_in=np.log,
                                         transform_out=np.exp)
```

But Option Two lets a user write a completely custom stat function (e.g., `my_box_stats`) with fancy BCA confidence intervals and the whiskers set differently depending on some attribute of the data.

This is available under the current API:

```python
fig, ax1 = plt.subplots()
my_stats = my_box_stats(data, bootstrap_method='BCA',
                         whisker_method='dynamic')
ax1.bxp(my_stats)
```

And would be more concise with Option Two

```python
fig, ax = plt.subplots()
statopts = dict(transform_in=np.log, transform_out=np.exp)
ax.boxplot(data, ..., **statopts)
```

Users could also pass their own function to compute the stats:

```python
fig, ax1 = plt.subplots()
ax1.boxplot(data, statfxn=my_box_stats, bootstrap_method='BCA',
            whisker_method='dynamic')
```

From the examples above, Option Two seems to have only marginal benefit, but in the context of downstream libraries like seaborn, its advantage is more apparent as the following would be possible without any patches to seaborn:

```python
import seaborn
tips = seaborn.load_data('tips')
g = seaborn.factorplot(x="day", y="total_bill", hue="sex", data=tips,
                        kind='box', palette="PRGn", shownotches=True,
                        statfxn=my_box_stats, bootstrap_method='BCA',
                        whisker_method='dynamic')
```

This type of flexibility was the intention behind splitting the overall boxplot API in the current three functions. In practice however, downstream libraries like seaborn support versions of matplotlib dating back well before the split. Thus, adding just a bit more flexibility to the `Axes.boxplot` could expose all the functionality to users of the downstream libraries with modern matplotlib installation without intervention from the downstream library maintainers.
Doing less

Another obvious alternative would be to omit the added pre- and post- computation transform functionality in `cbook.boxplot_stats` and `Axes.boxplot`, and simply remove the redundant statistical and style parameters as described above.

Doing nothing

As with many things in life, doing nothing is an option here. This means we simply advocate for users and downstream libraries to take advantage of the split between `cbook.boxplot_stats` and `Axes.bxp` and let them decide how to provide an interface to that.

39.19 MEP29: Text light markup

- Status

- Abstract
- Detailed description
- Implementation
  - Improvements
  - Problems
- Backward compatibility
- Alternatives

39.19.1 Status

Discussion
39.19.2 Branches and Pull requests

None at the moment, proof of concept only.

39.19.3 Abstract

This MEP proposes to add lightweight markup to the text artist.

39.19.4 Detailed description

Using different size/color/family in a text annotation is difficult because the `text` method accepts argument for size/color/family/weight/etc. that are used for the whole text. But, if one wants, for example, to have different colors, one has to look at the gallery where one such example is provided: http://matplotlib.org/examples/text_labels_and_annotations/rainbow_text.html

This example takes a list of strings as well as a list of colors which makes it cumbersome to use. An alternative would be to use a restricted set of pango-like markup and to interpret this markup.

Some markup examples:

```
Hello <b>world!</b>\`
Hello <span color="blue">world!</span>
```

39.19.5 Implementation

A proof of concept is provided in `markup_example.py` but it currently only handles the horizontal direction.

Improvements

- This proof of concept uses regex to parse the text but it may be better to use the html.parser from the standard library.
- Computation of text fragment positions could benefit from the OffsetFrom class. See for example item 5 in Using Complex Coordinates with Annotations
Problems

- One serious problem is how to deal with text having both latex and html-like tags. For example, consider the following:

\[<b>Bold</b>\]

Recommendation would be to have mutual exclusion.

39.19.6 Backward compatibility

None at the moment since it is only a proof of concept

39.19.7 Alternatives

As proposed by @anntzer, this could be also implemented as improvements to math-text. For example:

\[r"\text{Hello \textbf{world}}"\]
\[r"\text{Hello \textcolor{blue}{world}}"\]
\[r"\text{Hello \textsf{\small world}}"\]
Matplotlib only uses BSD compatible code. If you bring in code from another project make sure it has a PSF, BSD, MIT or compatible license (see the Open Source Initiative licenses page for details on individual licenses). If it doesn't, you may consider contacting the author and asking them to relicense it. GPL and LGPL code are not acceptable in the main code base, though we are considering an alternative way of distributing L/GPL code through an separate channel, possibly a toolkit. If you include code, make sure you include a copy of that code's license in the license directory if the code's license requires you to distribute the license with it. Non-BSD compatible licenses are acceptable in Matplotlib toolkits (e.g., basemap), but make sure you clearly state the licenses you are using.

40.1 Why BSD compatible?

The two dominant license variants in the wild are GPL-style and BSD-style. There are countless other licenses that place specific restrictions on code reuse, but there is an important difference to be considered in the GPL and BSD variants. The best known and perhaps most widely used license is the GPL, which in addition to granting you full rights to the source code including redistribution, carries with it an extra obligation. If you use GPL code in your own code, or link with it, your product must be released under a GPL compatible license. i.e., you are required to give the source code to other people and give them the right to redistribute it as well. Many of the most famous and widely used open source projects are released under the GPL, including linux, gcc, emacs and sage.

The second major class are the BSD-style licenses (which includes MIT and the python PSF license). These basically allow you to do whatever you want with the code: ignore it, include it in your own open source project, include it in your proprietary product, sell it, whatever. python itself is released under a BSD compatible license, in the sense that, quoting from the PSF license page:

There is no GPL-like "copyleft" restriction. Distributing binary-only versions of Python, modified or not, is allowed. There is no requirement to release any of your source code. You can also write extension modules for Python and provide them only in binary form.
Famous projects released under a BSD-style license in the permissive sense of the last paragraph are the BSD operating system, python and TeX.

There are several reasons why early Matplotlib developers selected a BSD compatible license. Matplotlib is a python extension, and we choose a license that was based on the python license (BSD compatible). Also, we wanted to attract as many users and developers as possible, and many software companies will not use GPL code in software they plan to distribute, even those that are highly committed to open source development, such as enthought, out of legitimate concern that use of the GPL will "infect" their code base by its viral nature. In effect, they want to retain the right to release some proprietary code. Companies and institutions who use Matplotlib often make significant contributions, because they have the resources to get a job done, even a boring one. Two of the Matplotlib backends (FLTK and WX) were contributed by private companies. The final reason behind the licensing choice is compatibility with the other python extensions for scientific computing: ipython, numpy, scipy, the enthought tool suite and python itself are all distributed under BSD compatible licenses.
As discussed at length elsewhere [insert links], jet is an empirically bad color map and should not be the default color map. Due to the position that changing the appearance of the plot breaks backward compatibility, this change has been put off for far longer than it should have been. In addition to changing the default color map we plan to take the chance to change the default color-cycle on plots and to adopt a different color map for filled plots (imshow, pcolor, contourf, etc) and for scatter like plots.

41.1 Default Heat Map Colormap

The choice of a new color map is fertile ground to bike-shedding ("No, it should be _this_ color") so we have a proposed set criteria (via Nathaniel Smith) to evaluate proposed color maps.

- it should be a sequential colormap, because diverging colormaps are really misleading unless you know where the "center" of the data is, and for a default colormap we generally won't.

- it should be perceptually uniform, i.e., human subjective judgments of how far apart nearby colors are should correspond as linearly as possible to the difference between the numerical values they represent, at least locally.

- it should have a perceptually uniform luminance ramp, i.e. if you convert to greyscale it should still be uniform. This is useful both in practical terms (greyscale printers are still a thing!) and because luminance is a very strong and natural cue to magnitude.

- it should also have some kind of variation in hue, because hue variation is a really helpful additional cue to perception, having two cues is better than one, and there's no reason not to do it.

- the hue variation should be chosen to produce reasonable results even for viewers with the more common types of colorblindness. (Which rules out things like red-to-green.)

- For bonus points, it would be nice to choose a hue ramp that still works if you throw away the luminance variation, because then we could use the version with varying luminance for 2d plots, and the version with just hue variation for 3d
plots. (In 3d plots you really want to reserve the luminance channel for lighting/shading, because your brain is really good at extracting 3d shape from luminance variation. If the 3d surface itself has massively varying luminance then this screws up the ability to see shape.)

• Not infringe any existing IP

41.1.1 Example script

41.1.2 Proposed Colormaps

41.2 Default Scatter Colormap

For heat-map like applications it can be desirable to cover as much of the luminance scale as possible, however when color mapping markers, having markers too close to white can be a problem. For that reason we propose using a different (but maybe related) color map to the heat map for marker-based. The design parameters are the same as above, only with a more limited luminance variation.

41.2.1 Example script

```python
import numpy as np
import matplotlib.pyplot as plt

np.random.seed(1234)

fig, (ax1, ax2) = plt.subplots(1, 2)

N = 50
x = np.random.rand(N)
y = np.random.rand(N)
colors = np.random.rand(N)
area = np.pi * (15 * np.random.rand(N))**2  # 0 to 15 point radiuses

ax1.scatter(x, y, s=area, c=colors, alpha=0.5)

X,Y = np.meshgrid(np.arange(0, 2*np.pi, .2),
                  np.arange(0, 2*np.pi, .2))
U = np.cos(X)
V = np.sin(Y)
Q = ax2.quiver(X, Y, U, V, units='width')
qd = np.random.rand(np.prod(X.shape))
Q.set_array(qd)
```
41.2.2 Proposed Colormaps

41.3 Color Cycle / Qualitative color map

When plotting lines it is frequently desirable to plot multiple lines or artists which need to be distinguishable, but there is no inherent ordering.

41.3.1 Example script

```python
import numpy as np
import matplotlib.pyplot as plt

fig, (ax1, ax2) = plt.subplots(1, 2)

x = np.linspace(0, 1, 10)
for j in range(10):
    ax1.plot(x, x * j)

th = np.linspace(0, 2*np.pi, 1024)
for j in np.linspace(0, np.pi, 10):
    ax2.plot(th, np.sin(th + j))

ax2.set_xlim(0, 2*np.pi)
```

41.3.2 Proposed Color cycle
Part VII

Glossary
AGG

The Anti-Grain Geometry (Agg) rendering engine, capable of rendering high-quality images

Cairo

The Cairo graphics engine

FreeType

FreeType is a font rasterization library used by matplotlib which supports TrueType, Type 1, and OpenType fonts.

GTK

The GIMP Toolkit (GTK) graphical user interface library

PyGObject

PyGObject provides Python wrappers for the GTK widgets library

pyqt

pyqt provides python wrappers for the Qt widgets library and is required by the matplotlib Qt5Agg and Qt4Agg backends. Widely used on linux and windows; many linux distributions package this as 'python-qt5' or 'python-qt4'.

Qt

Qt is a cross-platform application framework for desktop and embedded development.

Qt4

Qt4 is the previous, but most widely used, version of Qt cross-platform application framework for desktop and embedded development.

Qt5

Qt5 is the current version of Qt cross-platform application framework for desktop and embedded development.

Tk

Tk is a graphical user interface for Tcl and many other dynamic languages. It can produce rich, native applications that run unchanged across Windows, Mac OS X, Linux and more.

wxpython

wxpython provides python wrappers for the wxWidgets library for use with the WX and WXAgg backends. Widely used on linux, OS-X and windows, it is often packaged by linux distributions as 'python-wxgtk'

wxWidgets
WX is cross-platform GUI and tools library for GTK, MS Windows, and MacOS. It uses native widgets for each operating system, so applications will have the look-and-feel that users on that operating system expect.

validate_webagg_address() (in module matplotlib.rcsetup), 2677
validate_whiskers() (in module matplotlib.rcsetup), 2677
ValidateInStrings (class in module matplotlib.rcsetup), 2672
validCap (matplotlib.lines.Line2D attribute), 2175
validCap (matplotlib.patches.Patch attribute), 2314
validJoin (matplotlib.lines.Line2D attribute), 2175
validJoin (matplotlib.patches.Patch attribute), 2314
validAlign (matplotlib.quiver.QuiverKey attribute), 2664
value_escape() (in module matplotlib.fontconfig_pattern), 2120
value_unescape() (in module matplotlib.fontconfig_pattern), 2120
Vbox (class in matplotlib.mathtext), 2203
VBoxDivider (class in mpl_toolkits.axes_grid1.axes_divider), 2883
VCentered (class in matplotlib.mathtext), 2203
Verbatim (class in matplotlib.backends.backend_pdf), 1626
VertexSelector (class in matplotlib.lines), 2177
vertices() (matplotlib.path.Path property), 2346
 verts() (matplotlib.widgets.PolygonSelector property), 2834
Vf (class in matplotlib.dviread), 2061
view_init() (mpl_toolkits.mplot3d.axes3d.Axes3D method), 3053
view_limits() (matplotlib.projections.polar.PolarAxes.RadialLocator method), 2633
view_limits() (matplotlib.projections.polar.PolarAxes.ThetaLocator method), 2634
view_limits() (matplotlib.ticker.LinearLocator method), 2748
view_limits() (matplotlib.ticker.MultipleLocator method), 2753
view_limits() (matplotlib.ticker.MaxNLocator method), 2757
view_limits() (matplotlib.ticker.LogLocator method), 2765
view_transformation() (in module mpl_toolkits.mplot3d.proj3d), 3079
viewlim_to_dt() (matplotlib.dates.DateLocator method), 2045
ViewsPositionsBase (class in matplotlib.backend_tools), 1594
violin() (matplotlib.axes.Axes method), 1309
violin_stats() (in module matplotlib.cbook), 1670
viewplot() (in module matplotlib.pyplot), 2602
violinplot() (matplotlib.axes.Axes method), 1306
visible_edges() (matplotlib.table.Cell property), 2707
vpack() (matplotlib.mathtext.Vlist method), 2203
Vrule (class in matplotlib.mathtext), 2204
W
w_xaxis() (mpl_toolkits.mplot3d.axes3d.Axes3D property), 3054
w_yaxis() (mpl_toolkits.mplot3d.axes3d.Axes3D property), 3054
w_zaxis() (mpl_toolkits.mplot3d.axes3d.Axes3D property), 3054
Vpacker (class in matplotlib.offsetbox), 2243
Vlist (class in matplotlib.mathtext), 2203
Vpack() (matplotlib.mathtext.Vlist method), 2203
wait (matplotlib backend tools.Cursors attribute), 1585
**Matplotlib, Release 3.3.3**
